28. *Austrian Offensive.*—The position of assembly was excellently chosen, but unfortunately the Austrians took the initiative. On the 9th of April their main body of six corps crossed the Inn between Braunau and Passau, and simultaneously two additional corps moved from Pilsen in Bohemia on Regensburg. At this moment Davout was entering Regensburg with his leading troops, the remainder still some marches in rear, and it was evident that the whole concentration could no longer be carried out before the Austrians would be in a position to intervene. Berthier received the news while still on his way to the front, and quite failed to grasp the situation. Reaching Donauwörth at 8 P.M. on the 13th of April, he ordered Davout and Oudinot to remain at Regensburg, whilst Lefebvre and Wrede (Bavarians) who had fallen back before the Austrians were directed to reoccupy Landshut. This was in direct contradiction with the instructions Napoleon had given him on the 18th of March in view of this very emergency. Davout obeyed, but remonstrated. On the 16th Berthier went on to Augsburg, where he learnt that Lefebvre's advanced troops had been driven out of Landshut, thus opening a great gap seventy-six miles wide between the two wings of the French army. Meanwhile Napoleon, who had left Paris at 4 A.M. on the 13th of April, was hastening towards the front, but remained still in ignorance of Berthier's doings until on the 16th at Stuttgart he received a letter from the Marshal dated the 13th, which threw him into consternation. In reply he immediately wrote: "You do not inform me what has rendered necessary such an extraordinary measure which weakens and divides my troops"—and—"I cannot quite grasp the meaning of your letter yet, I should have preferred to see my army concentrated between Ingolstadt and Augsburg, the Bavarians in the first line, with the duke of Danzig in his old position, until we know what the enemy is going to do. Everything would be excellent if the duke of Auerstädt had been at Ingolstadt and the duke of Rivoli with the Württembergers and Oudinot's corps at Augsburg, . . . so that just the opposite of what should have been done has been done" (C. N. to Berthier, Ludwigsburg, 16th April).

29. *Napoleon takes command.*—Having despatched this severe reprimand he hastened on to Donauwörth, where he arrived at 4 A.M. on the 17th, hoping to find Berthier, but the latter was at Augsburg. Nevertheless, at 10 A.M. he ordered Davout and Oudinot to withdraw at once to Ingolstadt; and Lefebvre and Wrede on the right to support the movement. About noon Berthier returned and after hearing his explanation Massena received orders to move from Augsburg towards Ingolstadt. "To-morrow will be a day of preparation spent in drawing closer together, and I expect to be able by Wednesday to manœuvre against the enemy's columns according to circumstances."

Meanwhile the Austrians had approached so near that by a single day's march it would have been possible to fall upon and crush by superior numbers either wing of the French army, but though the Austrian light cavalry successfully covered the operations of the following troops they had not yet risen to a conception of their reconnoitring mission, and the archduke, in ignorance of his opportunity and possessed, moreover, with the preconceived idea of uniting at Regensburg with the two corps coming from Bohemia, moved the bulk of his forces in that direction, leaving only a covering body against Davout altogether insufficient to retain him. Davout, however, had left a garrison of 1800 men in Regensburg, who delayed the junction of the Austrian wings until the 20th inst., and on the same day the emperor, having now reunited his whole right wing and centre, overwhelmed the covering detachments facing him in a long series of disconnected engagements lasting forty-eight hours, and the archduke now found himself in danger of being forced back into the Danube. But with the Bohemian reinforcements he had still four corps in hand, and Napoleon, whose intelligence service in the difficult and intersected country had lamentably failed him, had weakened his army by detaching a portion of his force in pursuit of the beaten right wing, and against the archduke's communications.

30. *Eckmühl.*—When, therefore, the latter, on the 22nd, marched southward to reopen his communications by the defeat of the enemy's army, always the surest means of solving this difficulty, he actually reached the neighbourhood of Eckmühl with a sufficient numerical superiority had he only been prompt enough to seize his opportunity. But the French had been beforehand with him. Napoleon, who had personally taken part in the fighting of the previous day, and followed the pursuit as far as Landshut, whence he had despatched Massena to follow the retreating Austrians along the Isar, seems to have realized about 3 A.M. in the morning that it was not the main body of the enemy he had had before him, but only its left wing, and that the main body itself must still be northward towards Regensburg. Issuing orders to Davout, Oudinot and his cavalry to concentrate with all speed towards Eckmühl, he himself rode back along the Regensburg road and reached the battle-field just as the engagement between the advance troops had commenced. Had the Austrians possessed mobility equal to that of the French the latter should have been overwhelmed in detail, but whilst the French covered 17 and 19 m. the Austrians only marched 10, and, owing to the defect in their tactical training alluded to above, the troops actually on the ground could not hold out long enough for their reserves to arrive. The retreat of the front lines involved the following ones in confusion, and presently the whole mass was driven back in considerable disorder. It seemed as if nothing could save the Austrians from complete disaster, but at the critical moment the emperor, yielding to the protestations of his corps commanders, who represented the excessive fatigue of their troops, stopped the pursuit, and the archduke made the most of his opportunity to restore order amongst his demoralized men, and crossed to the north bank of the Danube during the night.

31. *Austrian Retreat.*—On the following morning the French reached Regensburg and at once proceeded to assault its medieval walls, but the Austrian garrison bravely defended it till the last of the stragglers was safely across on the north bank. It was here that for the only time in his career Napoleon was slightly wounded. Then, leaving Davout to observe the archduke's retreat, the emperor himself rode after Massena, who with the major portion of the French army was following the Austrian weaker wing under Hiller The latter was not so shaken as Napoleon believed, and turning to bay inflicted a severe check on its pursuers, who at Ebelsberg lost 4000 men in three

fruitless assaults. Thus covered by his rearguard Hiller gained space and time to pass his troops over to the north bank of the Danube and remove all boats on the river. This left the direct road to Vienna open, and Napoleon, hoping to find peace in the enemy's capital, pushed the whole of his army down the right bank, and with Murat's cavalry entered the city on the 12th of May, after somewbat severe resistance lasting three days. Meanwhile the archduke and Hiller, both now unmolested, effected their junction in the vicinity of Wagram, picketing the whole line of the Danube with their outposts and collecting all the boats.

32. *Aspern and Wagram.*—The reconnaissance of the river was at once taken in hand by the French upon their arrival in Vienna, and a point opposite the island of Lobau selected for the crossing. Thanks to the Austrian precautions it took four days to collect the necessary material to span the main branch of the river, here some 2000 yds. across, and though Napoleon personally spurred on all to activity nearly four days more were required for its construction. It was not till the night of the 19th of May that orders for the passage were finally issued, and during the night the troops commenced to occupy the island of Lobau. Surprise, of course, was out of the question, but the Austrians did not attempt to dispute the passage, their object being to allow as many French as they felt they could deal with to pass over and then to fall on them. Thus on the 21st of May the battle of Aspern (*q.v.*) or Essling began. It ended on the night of the 22nd with the complete defeat of Napoleon, the first ever inflicted upon him. The French retreated into the island of Lobau. By nightfall upwards of 100,000 men, encumbered with at least 20,000 wounded, were crowded together on the little island scarcely a mile square, short of provisions and entirely destitute of course of all hospital accessories. The question then arose whether the retreat was to be continued across the main stream or not, and for the second time in his career Napoleon assembled his generals to take their opinion. They counselled retreat, but having heard them all he replied, in substance: "If we leave here at all we may as well retire to Strassburg, for unless the enemy is held by the threat of further operations he will be free to strike at our communications and has a shorter distance to go. We must remain here and renew operations as soon as possible."

Immediate orders were despatched to summon every available body of troops to concentrate for the decisive stroke. Practically the lines of communication along the Danube were denuded of combatants, even Bernadotte being called up from Passau, and the viceroy of Italy, who driving the archduke Johann before him (action of Raab) had brought up 56,000 men through Tirol, was disposed towards Pressburg within easy call. The arsenal of Vienna was ransacked for guns, stores and appliances, and preparations in the island pushed on as fast as possible. By the end of June 200,000 troops were stationed within call, and on the 4th July the French began to cross over to the left bank of the Danube. The events which followed are described under WAGRAM. The great battle at this place, fought on the 5th and 6th of July, ended in the retirement of the Austrians. The only other event which occurred before peace was made was an unimportant action at Znaym on the 11th of July.

33. *The Russian War of 1812.*—Whilst the campaign of 1809 had seriously shaken the faith of the marshals and the higher ranks in the infallibility of the emperor's judgment, and the slaughter of the troops at Aspern and Wagram had still further accentuated the opposition of the French people to conscription, the result on the fighting discipline of the army had, on the whole, been for good. The panics of Wagram had taught men and officers alike a salutary lesson.

Aware of the growing feeling against war in France, Napoleon had determined to make his allies not only bear the expenses of the coming campaign, but find the men as well, and he was so far master of Europe that of the 363,000 who on the 24th of June crossed the Niemen no less than two-thirds were Germans, Austrians, Poles or Italians. But though the battlefield discipline of the men was better, the discipline in camp and on the march was worse, for the troops were no longer eager to reach the battlefield, and marched because they were compelled, not of their own goodwill. The result was apparent in a sudden diminution in mobility, and a general want of punctuality which in the event very seriously influenced the course of the campaign. On the other hand, the Russians, once their fatherland was invaded, became dominated by an ever-growing spirit of fanaticism, and they were by nature too obedient to their natural leaders, and too well inured to the hardships of campaigning, to lose their courage in a retreat.

34. *The Strategic Deployment.*—By the middle of June 1812 the emperor had assembled his army along the line of the Niemen. On the extreme right stood the Austrian contingent under Schwarzenberg (34,000 men). Next, centring about Warsaw, a group of three corps (19,000 men) under the chief command of Napoleon's brother Jerome. Then the main army under Napoleon in person (220,000 men; with 80,000 more under the viceroy of Italy on his right rear); and on the extreme left at Tilsit a flanking corps, comprising the Prussian auxiliary corps and other Germans (in all 40,000 strong). The whole army was particularly strong in cavalry; out of the 450,000, 80,000 belonged to that arm, and Napoleon, mindful of the lessons of 1807, had issued the most minute and detailed orders for the supply service in all its branches, and the forwarding of reinforcements, no less than 100,000 men being destined for that purpose in due course of time.

Information about the Russians was very indifferent; it was only known that Prince Bagration with about 33,000 men lay grouped about Wolkowysk; Barclay de Tolly with 40,000 about Vilna; and on the Austrian frontier lay a small corps under Tormassov in process of formation, while far away on the Turkish frontiers hostilities with the sultan retained Tschitschagov with 50,000 more. Of the enemy's plans Napoleon knew nothing, but, in accordance with his usual practice, the position he had selected met all immediate possible moves.

35. *Opening of the Campaign.*—On the 24th of June the passage of the Niemen began in torrid heat which lasted for a few days. The main army, with the emperor in person, covered by Murat and the cavalry, moved on Vilna, whilst Jerome on his right rear at once threatened Bagration and covered the emperor's outer flank. From the very first, however, the inherent weakness of the vast army, and the vicious choice of time for the beginning of the advance, began to make itself felt. The crops being still green, and nothing else available as forage for the horses, an epidemic of colic broke out amongst them, and in ten days the mounted arms had lost upwards of one-third of their strength; men died of sunstroke in numbers, and serious straggling began. Still everything pointed to the concentration of the Russians at Vilna, and Jerome, who on the 5th of July had reached Grodno, was ordered to push on. But Jerome proved quite inadequate to his position, listening to the complaints of his subordinates as to want of supplies and even of pay; he spent four whole days in absolute inertia, notwithstanding the emperor's reprimands. Meanwhile the Russians made good their retreat—Barclay towards the entrenched camp of Drissa on the Dvina, Bagration towards Mohilev.

The emperor's first great *coup* thus failed. Jerome was replaced by Davout, and the army resumed its march, this time in the hope of surrounding and overwhelming Barclay, whilst Davout dealt with Bagration. The want of mobility, particularly in the cavalry, now began to tell against the French. With horses only just recovering from an epidemic, they proved quite unequal to the task of catching the Cossacks, who swarmed round them in every direction, never accepting an engagement but compelling a constant watchfulness for which nothing in their previous experience had sufficiently prepared the French.

Before their advance, however, the Russian armies steadily retired, Barclay from Vilna via Drissa to Vitebsk, Bagration from Wolkowysk to Mohilev. Again arrangments were made for a Napoleonic battle; behind Murat's cavalry came the "general advanced guard" to attack and hold the enemy, whilst the main body and Davout were held available to swing in on his rear. Napoleon, however, failed to allow for the psychology

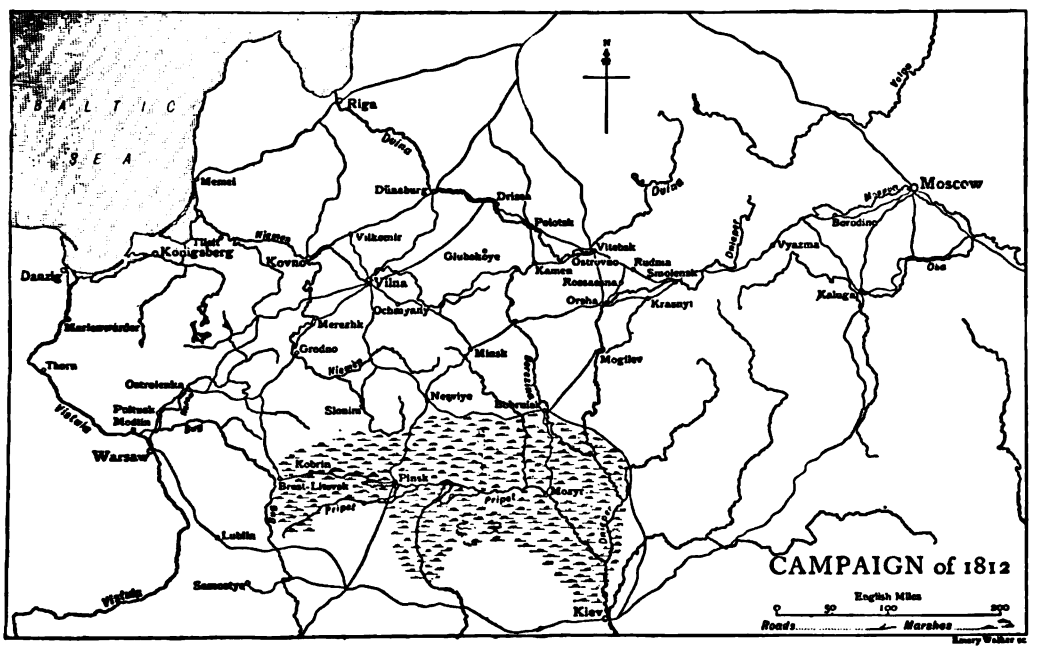
of his opponents, who, utterly indifferent to the sacrifice of life, refused to be drawn into engagements to support an advance or to extricate a rearguard, and steadily withdrew from every position when the French gained touch with them.

Thus the manœuvre against Vitebsk again miscarried, and Napoleon found himself in a far worse position, numerically and materially, than at the outset of the campaign. Then he had stood with 420,000 men on a front of 160 m., now he had only 229,000 men on a front of 135; he had missed three great opportunities of destroying his enemy in detail, and in five weeks, during which time he had only traversed 200 m., he had seen his troops reduced numerically at least one-third, and, worse still, his army was now far from being the fighting machine it had been at the outset.

36. *Smolensk.*—Meanwhile the Russians had not lost a single gun and the *moral* of their men had been improved by the result of the many minor encounters with the enemy, further, the junction of Bagration and Barclay was now assured in the vicinity of Smolensk. Towards this place the French advance was now resumed, and the Russian generals at the head of a united force of 130,000 men marched forward to meet them. Here, however, the inefficiency of the Russian staff actually saved them from the disaster which must certainly have overtaken them had they realized their intention of fighting the French. The Russians marched in two columns, which lost touch of one another, and as it was quite impossible for either to engage the French single-handed, they both retired again towards Smolensk, where with an advanced guard in the town itself—which possessed an old-fashioned brick *enceinte* not to be breached by field artillery alone—the two columns reunited and deployed for action behind the unfordable Dnieper.

Murat and Ney as "general advanced guard" attacked the town in the morning of the 16th of August, and whilst they fought the main body was swung round to attack the Russian left and rear. The whole of the 17th was required to complete the movement, and as soon as its purpose was sufficiently revealed to the Russians the latter determined to retreat under cover of night. Their manœuvre was carried out with complete success, and then began a series of rearguard actions and nocturnal retreats which completely accomplished their purpose of wearing down the French army. The Russian government, however, failed to see the matter in its true light, and Marshal Kutusov was sent to the front to assume the chief command. His intention was to occupy a strong position and fight one general action for the possession of Moscow, and to this end he selected the line of the Kalatscha where the stream intersects the great Moscow road.

37. *Borodino.*—Here he was overtaken by Murat and Ney, but the French columns had straggled so badly that four whole days elapsed before the emperor was able to concentrate his army for battle and then could only oppose 128,000 men to the Russians' 110,000. About 6 a.m. the battle began, but Napoleon was suffering from one of those attacks of illness and depression which henceforth became such an important factor in his fate. Till about midday he followed the course of the action with his usual alertness, then he appears to have been overcome by a kind of stupor and allowed his marshals to fight by themselves. There was no final decisive effort as at Wagram and the Guard was not even called on to move. Ultimately the sun went down on an undecided field on which 25,000 French and 38,000 Russians had fallen, but the moral reaction on the former was far greater than on the latter.



38. *Moscow.*—Kutusov continued his retreat, and Murat with his now exhausted horsemen followed as best he might. Sebastiani, commanding the advanced guard, overtook the Russians in the act of evacuating Moscow, and agreed with the latter to observe a seven hours' armistice to allow the Russians to clear the town, for experience had shown the French that street fighting in wooden Russian townships always meant fire and the consequent destruction of much-needed shelter and provisions. Towards nightfall Napoleon reached the scene, and the Russians being now clear the troops began to enter, but already fires were observed in the farther part of the city. Napoleon passed the night in a house in the western suburb and next morning rode to the Kremlin, the troops moving to the quarters assigned to them, but in the afternoon a great fire began and, continuing for two days, drove the French out into the country again.

The emperor was now in the direst perplexity. Kutusov was hovering on the outskirts of the city, his main body at Kaluga, some marches to the S.W., where he was in full communication with the richest portion of the empire; and now news arrived that St. Cyr, who had relieved Macdonald on his extreme left, had only 17,000 men left under arms against upwards of 40,000 Russians under Witgenstein; and to the south Tschitschagov's army, being no longer detained on the Turkish frontier, peace having been made, was marching to join Tormassov about Brest-Litewski with forces which would bring the total of the two well over 100,000 men. Meanwhile Schwarzenberg's force opposing these had dwindled to a bare 30,000.

The French army was thus disposed almost in an equilateral triangle with sides of about 570 m., with 95,000 men at the apex at Moscow opposed to 120,000, 30,000 about Brest opposite 100,000, and 17,000 about Drissa confronted by 40,000, whilst in the centre of the base at Smolensk lay Victor's corps, about 30,000. From Moscow to the Niemen was 550 m. In view of this situation Napoleon on the 4th of October sent General Lauriston to the Russian headquarters to treat. Whilst waiting his return Murat was enjoined to skirmish with Kutusov, and the emperor himself worked out a scheme to assume the offensive with his whole army towards St Petersburg, calling in Victor and St Cyr on the way. This project was persisted with, until on the 18th Murat was himself attacked and severely handled (action of Tarutino or Vinkovo). On the morning of the 19th the whole army moved out to accept this challenge, and the French were thoroughly worsted on the 24th in the battle of Maloyaroslavetz.

39. *The Retreat from Moscow.*—Then began the celebrated retreat. It has generally been forgotten that the utter want of march discipline in the French, and not the climatic conditions, was responsible for the appalling disasters which ensued. Actually the frost came later than usual that year, the 27th of October, and the weather was dry and bracing; not till the 8th of November did the cold at night become sharp. Even when the Beresina was reached on the 26th November, the cold was far from severe, for the slow and sluggish stream was not frozen over, as is proved by the fact that Eblé's pioneers worked in the water all through that terrible day. But the French army was already completely out of hand, and the degree to which the panic of a crowd can master even the strongest instinct of the individual is shown by the conduct of the fugitives who crowded over the bridges, treading hundreds under foot, whilst all the time the river was easily fordable and mounted men rode backwards and forwards across it.

To return to the actual sequence of events. Kutusov had been very slow in exploiting his success of the 24th and indeed had begun the pursuit in a false direction; but about the 2nd of November, headquarters of the French being at Vyazma, the Cossacks became so threatening that the emperor ordered the army to march (as in Egypt) in hollow square. This order, however, appears only to have been obeyed by the Guards, with whom henceforward the emperor marched.

Kutusov had now overtaken the French, but fortunately for them he made no effort to close with them, but hung on their flank, molesting them with Cossacks and picking up stragglers. Thus the wreck of the *Grande Armée*, now not more than fifty thousand strong, reached Smolensk on the 9th and there rested till the 14th. The march was then resumed, the Guard leading and Ney commanding the rearguard. Near Krasnoi on the 16th the Russian advanced guard tried to head the column off. Napoleon halted a whole day to let the army close up; and then attacked with his old vigour and succeeded in clearing the road, but only at the cost of leaving Ney and the rearguard to its fate. By a night march of unexampled daring and difficulty Ney succeeded in breaking through the Russian cordon, but when he regained touch with the main body at Orcha only 800 of his 6000 men were still with him (21st).

40. *The Beresina.*—From here Napoleon despatched orders to Victor to join him at Borisov on the Beresina. The cold now gave way and thaw set in, leaving the country a morass, and information came that Tschitschagov from the south had reached Borisov. He now selected Viesselovo as the point of passage and at 1 a.m. on the 23rd sent orders to Oudinot to march thither and construct bridges. In the execution of these orders Oudinot encountered the Russian advanced guard near Borisov and drove the latter back in confusion, though not before they had destroyed the existing bridge there. This sudden reassumption of the offensive threw Tschitschagov into confusion. Thus time was gained for Victor also to come up and for Oudinot to construct the bridges at Studienka near the above-mentioned place, but a spot in many respects better suited for the purpose. Thither therefore Napoleon sent his pontonniers under General Eblé, but on their arrival they found that no preparations had been made and much time was lost. Meanwhile Victor, in doubt as to the real point of passage, had left the road to Studienka open to Wittgenstein, who had followed hard on his heels.

By 4 p.m. on the 26th the bridges were finished and the passage began, but not without resistance by the Russians, who were gradually closing in. The crossing continued all night, though interrupted from time to time by failures of the bridges. All day during the 27th stragglers continued to cross, covered by such combatants as remained under sufficient discipline to be employed. At 8 a.m. on the 28th, however, Tschitschagov and Wittgenstein moved forward on both banks of the river to the attack, but were held off by the splendid self-sacrifice of the few remaining troops under Ney, Oudinot and Victor, until about 1 p.m. the last body of regular troops passed over the bridges, and only a few thousand stragglers remained beyond the river.

The number of troops engaged by the French that day cannot be given exactly. Oudinot's and Victor's men were relatively fresh and may have totalled 20,000, whilst Ney can hardly have had more than 6000 of all corps fighting under him. How many were killed can never be known, but three days later the total number of men reported fit for duty had fallen to 8800 only.

41. *Final Operations.*—Henceforward the retreat of the army became practically a headlong flight, and on the 5th of December, having reached Smorgoni and seeing that nothing further could be done by him at the front, the emperor handed over the command of what remained to Murat, and left for Paris to organize a fresh army for the following year. Travelling at the fullest speed, he reached the Tuileries on the 18th, after a journey of 312 hours.

After the emperor's departure the cold set in with increased severity, the thermometer falling to 23°. On the 8th of December Murat reached Vilna, whilst Ney with about 400 men and Wrede with 2000 Bavarians still formed the rearguard; but it was quite impossible to carry out Napoleon's instructions to go into winter quarters about the town, so that the retreat was resumed on the 10th and ultimately Königsberg was attained on the 19th of December by Murat with 400 Guards and 600 Guard cavalry dismounted.

Meanwhile on the extreme French right Schwarzenberg and his Austrians had drifted away towards their own frontier, and the Prussian contingent, which under Yorck (see YORCK VON WARTENBURG) formed part of Macdonald's command about Riga, had entered into a convention with the Russians at Tauroggen (December 30) which deprived the French of their last support upon their left. Königsberg thus became untenable, and Murat fell back to Posen, where on the 10th of January he handed over his command to Eugène Beauharnais and returned to Paris.

The Russian pursuit practically ceased at the line of the Niemen, for their troops also had suffered terrible hardships and a period of rest had become an absolute necessity.

42. *The War of Liberation.*—The Convention of Tauroggen became the starting-point of Prussia's regeneration. As the news of the destruction of the *Grande Armée* spread, and the appearance of countless stragglers convinced the Prussian people of the reality of the disaster, the spirit generated by years of French domination burst out. For the moment the king and his ministers were placed in a position of the greatest anxiety, for they knew the resources of France and the boundless versatility of their arch-enemy far too well to imagine that the end of their

sufferings was yet in sight. To disavow the acts and desires of the army and of the secret societies for defence with which all north Germany was honeycombed would be to imperil the very existence of the monarchy, whilst an attack on the wreck of the Grand Army meant the certainty of a terrible retribution from the new armies now rapidly forming on the Rhine.

But the Russians and the soldiers were resolved to continue the campaign, and working in collusion they put pressure on the not unwilling representatives of the civil power to facilitate the supply and equipment of such troops as were still in the field; they could not refuse food and shelter to their starving countrymen or their loyal allies, and thus by degrees the French garrisons scattered about the country either found themselves surrounded or were compelled to retire to avoid that fate. Thus it happened that the viceroy of Italy felt himself compelled to depart from the positive injunctions of the emperor to hold on at all costs to his advanced position at Posen, where about 14,000 men had gradually rallied around him, and to withdraw step by step to Magdeburg, where he met reinforcements and commanded the whole course of the lower Elbe.

43. *Napoleon's Preparations.*—Meanwhile the emperor in Paris had been organizing a fresh army for the reconquest of Prussia. Thanks to his having compelled his allies to fight his battles for him, he had not as yet drawn very heavily on the fighting resources of France, the actual percentage of men taken by the conscriptions during the years since 1806 being actually lower than that in force in continental armies of to-day. He had also created in 1811–1812 a new National Guard, organized in "cohorts" to distinguish it from the regular army, and for home defence *only*, and these by a skilful appeal to their patriotism and judicious pressure applied through the prefects, became a useful reservoir of half-trained men for new battalions of the active army. Levies were also made with rigorous severity in the states of the Rhine Confederation, and even Italy was called on for fresh sacrifices. In this manner by the end of March upwards of 200,000 men were moving towards the Elbe,[1] and in the first fortnight of April they were duly concentrated in the angle formed by the Elbe and Saale, threatening on the one hand Berlin, on the other Dresden and the east.

44. *Spring Campaign of 1813.*—The allies, aware of the gradual strengthening of their enemy's forces but themselves as yet unable to put more than 200,000 in the field, had left a small corps of observation opposite Magdeburg and along the Elbe to give timely notice of an advance towards Berlin; and with the bulk of their forces had taken up a position about Dresden, whence they had determined to march down the course of the Elbe and roll up the French from right to left. Both armies were very indifferently supplied with information, as both were without any reliable regular cavalry capable of piercing the screen of outposts with which each endeavoured to conceal his disposition, and Napoleon, operating in a most unfriendly country, suffered more in this respect than his adversaries.

On the 25th of April Napoleon reached Erfurt and assumed the chief command. On this day his troops stood in the following positions. Eugène, with Lauriston's, Macdonald's and Regnier's corps, on the lower Saale, Ney in front of Weimar, holding the defile of Kösen; the Guard at Erfurt, Marmont at Gotha, Bertrand at Saalfeld, and Oudinot at Coburg, and during the next few days the whole were set in motion towards Merseburg and Leipzig, in the now stereotyped Napoleonic order, a strong advanced guard of all arms leading, the remainder—about two-thirds of the whole—following as "masse de manœuvre," this time, owing to the cover afforded by the Elbe on the left, to the right rear of the advanced guard.

Meanwhile the Russians and Prussians had concentrated all available men and were moving on an almost parallel line, but somewhat to the south of the direction taken by the French. On the 1st of May Napoleon and the advanced guard entered Lützen. Wittgenstein, who now commanded the allies in place of Kutusov, hearing of his approach, had decided to attack the French advanced guard, which he took to be their whole force, on its right flank, and during the morning had drawn together the bulk of his forces on his right in the vicinity of Gross-Görschen and Kaya.

45. *Battle of Lützen.*—About 9 a.m. on May 2nd he began an attack on the French advance guard in Lützen, whilst the remainder of his army was directed against Napoleon's right and rear. Just as the latter were moving off the heads of the French main body suddenly appeared, and at 11 a.m. Napoleon, then standing near the Gustavus Adolphus monument on the field of Lützen, heard the roar of a heavy cannonade to his right rear. He realized the situation in a moment, galloped to the new scene of action, and at once grouped his forces for decisive action—the gift in which he was supreme. Leaving the leading troops to repulse as best they might the furious attack of both Russians and Prussians, and caring little whether they lost ground, he rapidly organized for his own control a battle-reserve. At length when both sides were exhausted by their efforts he sent forward nearly a hundred guns which tore asunder by their case-shot fire the enemy's line and marched his reserve right through the gap. Had he possessed an adequate cavalry force the victory would have been decisive. As it was, the allies made good their retreat and the French were too exhausted for infantry pursuit.

Perhaps no battle better exemplifies the inherent strength of the emperor's strategy, and in none was his grasp of the battlefield more brilliantly displayed, for, as he fully recognized, "These Prussians have at last learnt something—they are no longer the wooden toys of Frederick the Great," and, on the other hand, the relative inferiority of his own men as compared with his veterans of Austerlitz called for far more individual effort than on any previous day. He was everywhere, encouraging and compelling his men—it is a legend in the French army that the persuasion even of the imperial boot was used upon some of his reluctant conscripts, and in the result his system was fully justified, as it triumphed even against a great tactical surprise.

46. *Bautzen.*—As soon as possible the army pressed on in pursuit, Ney being sent across the Elbe to turn the position of the allies at Dresden. This threat forced the latter to evacuate the town and retire over the Elbe, after blowing up the stone bridge across the river. Napoleon entered the town hard on their heels, but the broken bridge caused a delay of four days, there being no pontoon trains with the army. Ultimately on the 18th of May the march was renewed, but the allies had continued their retreat in leisurely fashion, picking up reinforcements by the way. Arrived at the line of the Spree, they took up and fortified a very formidable position about Bautzen (*q.v.*). Here, on the 20th, they were attacked, and after a two days' battle dislodged by Napoleon; but the weakness of the French cavalry conditioned both the form of the attack, which was less effective than usual, and the results of the victory, which were extremely meagre.

The allies broke off the action at their own time and retired in such good order that the emperor failed to capture a single trophy as proof of his victory. The enemy's escape annoyed him greatly, the absence of captured guns and prisoners reminded him too much of his Russian experiences, and he redoubled his demands on his corps commanders for greater vigour in the pursuit. This led the latter to push on without due regard to tactical precautions, and Blücher took advantage of their carelessness when at Haynau (May 26), with some twenty squadrons of Landwehr cavalry, he surprised, rode over and almost destroyed Maison's division. The material loss inflicted on the French was not very great, but its effect in raising the *moral* of the raw Prussian cavalry and increasing their confidence in their old commander was enormous.

Still the allies continued their retreat and the French were unable to bring them to action. In view of the doubtful attitude of Austria, Napoleon became alarmed at the gradual lengthening of his lines of communication and opened negotiations. The enemy, having everything to gain and nothing to lose thereby, agreed finally to a six weeks' suspension of arms. This was perhaps the gravest military error of Napoleon's whole career,

[1] Napoleon always gave them out as 300,000, but this number was never attained.

and his excuse for it, "want of adequate cavalry," is the strongest testimony as to the value of that arm.

47. *The Autumn Campaign.*—As soon as a suspension of arms (to 15th of August) had been agreed to, Napoleon hastened to withdraw his troops from the dangerous position they occupied with reference to the passes leading over the mountains from Bohemia, for he entertained no doubt now that Austria was also to be considered as an enemy. Finally he decided to group his corps round Görlitz and Bautzen whence they could either meet the enemy advancing from Breslau or fall on his flank over the mountains if they attempted to force their way into Saxony by the valley of the Elbe. This latter manœuvre depended, however, on his maintenance of Dresden, and to this end he sent the I. Corps up the Elbe to Pirna and Königstein to cover the fortifications of Dresden itself. His instructions on this point deserve the closest study, for he foresaw the inevitable attraction which a complete entrenched camp would exercise even upon himself, and, therefore, limited his engineers to the construction of a strong bridge head on the right bank and a continuous enceinte, broken only by gaps for counter attack, around the town itself.

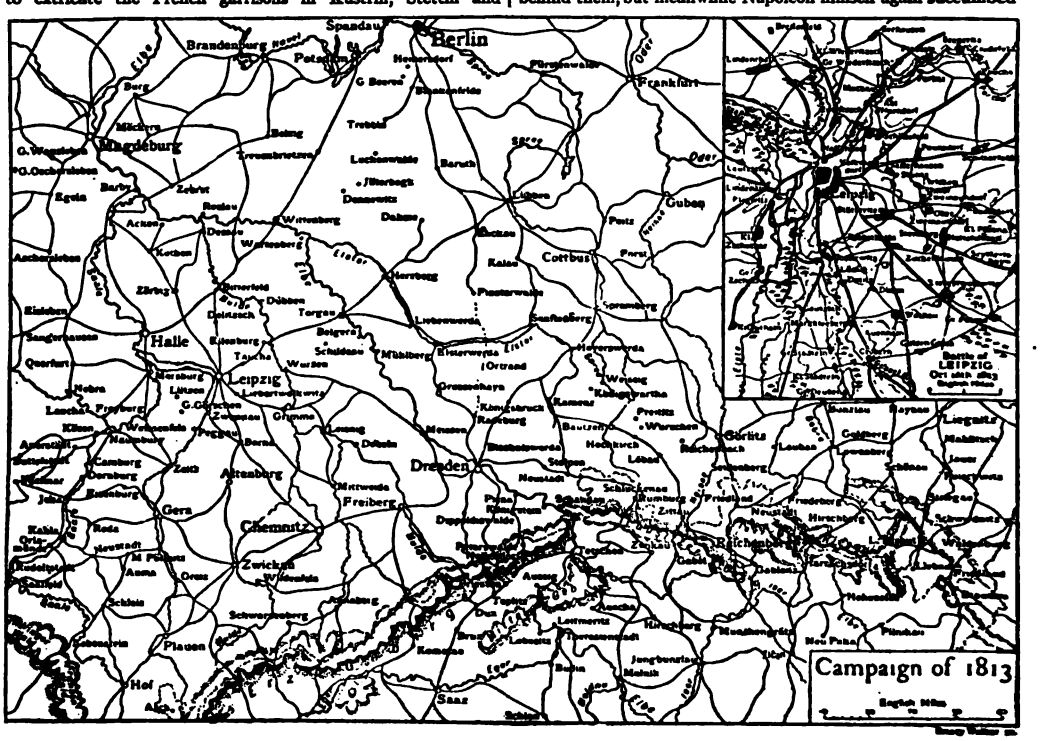
Then he turned his attention to the plan for the coming campaign. Seeing clearly that his want of an efficient cavalry precluded all ideas of a resolute offensive in his old style, he determined to limit himself to a defence of the line of the Elbe, making only dashes of a few days' duration at any target the enemy might present.

Reinforcements had been coming up without ceasing and at the beginning of August he calculated that he would have 300,000 men available about Bautzen and 100,000 along the Elbe from Hamburg via Magdeburg to Torgau. With the latter he determined to strike the first blow, by a concentric advance on Berlin (which he calculated he would reach on the 4th or 5th day), the movement being continued thence to extricate the French garrisons in Küstrin, Stettin and Danzig. The moral effect, he promised himself, would be prodigious, and there was neither room nor food for these 100,000 elsewhere.

Towards the close of the armistice he learned the general situation of the allies. The crown prince of Sweden (Bernadotte), with his Swedes and various Prussian levies, 135,000 in all, lay in and around Berlin and Stettin; and knowing his former marshal well, Napoleon considered Oudinot a match for him. Blücher with about 95,000 Russians and Prussians was about Breslau, and Schwarzenberg, with nearly 180,000 Austrians and Russians, lay in Bohemia. In his position at Bautzen he felt himself equal to all his enemy's combinations.

48. *Dresden.*—The advance towards Berlin began punctually with the expiration of the armistice, but with the main army he himself waited to see more clearly his adversaries' plans. At length becoming impatient he advanced a portion of his army towards Blücher, who fell back to draw him into a trap. Then the news reached him that Schwarzenberg was pressing down the valley of the Elbe, and, leaving Macdonald to observe Blücher, he hurried back to Bautzen to dispose his troops to cross the Bohemian mountains in the general direction of Königstein, a blow which must have had decisive results. But the news from Dresden was so alarming that at the last moment he changed his mind, and sending Vandamme alone over the mountains, he hurried with his whole army to the threatened point. This march remains one of the most extraordinary in history, for the bulk of his forces moved, mainly in mass and across country, 90 m. in 72 hours, entering Dresden on the morning of the 27th, only a few hours before the attack of the allies commenced. For the events which followed see DRESDEN (*battle*).

Dresden was the last great victory of the First Empire. By noon on the 27th August the Austrians and Russians were completely beaten and in full retreat, the French pressing hard behind them, but meanwhile Napoleon himself again succumbed



to one of his unaccountable attacks of apparent intellectual paralysis. He seemed unaware of the vital importance of the moment, crouched shivering over a bivouac fire, and finally rode back to Dresden, leaving no specific orders for the further pursuit.

49. *French Defeats.*—The allies, however, continued to retreat, but unfortunately Vandamme, with his single corps and unsupported, issued out of the mountains on their flank, threw himself across their line of retreat near Kulm, and was completely overwhelmed by sheer weight of numbers (29th). In spite of this misfortune, Napoleon could claim a brilliant success for himself, but almost at the same moment news reached him that Oudinot at Grossbeeren near Berlin, and Macdonald on the Katzbach opposed to Blücher, had both been severely defeated.

50. *Napoleon's Movements.*—During the next two days the emperor examined his situation and dictated a series of notes which have been a puzzle to every strategical thinker ever since. In these he seems suddenly to have cut adrift from every principle the truth of which he had himself so brilliantly demonstrated, and we find him discussing plans based on hypothesis, not knowledge, and on the importance of geographical points without reference to the enemy's field army. From these reveries he was at length awakened by news which indicated that the consequences of Macdonald's defeat had been far more serious to the moral of that command than he had imagined. He immediately rode over to establish order, and his manner and violence were so improper that Caulaincourt had the greatest difficulty in concealing the scandal. Blücher, however, hearing of his arrival, at once retreated and the emperor followed, thus uncovering the passes over the Bohemian mountains, a fact of which Schwarzenberg was quick to take advantage. Learning of his approach, Napoleon again withdrew to Bautzen. Then hearing that the Austrians had counter-marched and were again moving towards Dresden, he hastened back there, concentrated as many men as could conveniently be handled, and advanced beyond Pirna and Königstein to meet him. But the Austrians had no intention of attacking him, for time was now working on their side and, leaving his men to starve in the exhausted district, the emperor again returned to Dresden, where for the rest of the month he remained in an extraordinary state of vacillation. On the 4th of October he again drew up a review of the situation, in which he apparently contemplated giving up his communications with France and wintering in and around Dresden, though at the same time he is aware of the distress amongst his men for want of food.

51. *Campaign of Leipzig.*—In the meanwhile Blücher, Schwarzenberg and Bernadotte were working round his flanks. Ney, who had joined Oudinot after Grossbeeren, had been defeated at Dennewitz (6th Sept.), the victory, won by Prussian troops solely, giving the greatest encouragement to the enemy. Suddenly Napoleon's plans are again reviewed and completely changed. Calling up St Cyr, whom he had already warned to remain at Dresden with his command, he decides to fall back towards Erfurt, and go into winter quarters between that place and Magdeburg, pointing out that Dresden was of no use to him as a base and that if he does have a battle, he had much better have St Cyr and his men with him than at Dresden. He then on the 7th of October drew up a final plan, in which one again recognizes the old commander, and this he immediately proceeded to put into execution, for he was now quite aware of the danger threatening his line of retreat from both Blücher and Schwarzenberg and the North Army; yet only a few hours afterwards the portion of the order relating to St Cyr and Lobau was cancelled and the two were finally left behind at Dresden. From the 10th to the 13th Napoleon lay at Düben, again a prey to the most extraordinary irresolution, but on that day he thought he saw his opportunity. Blücher was reported near Wittenberg, and Schwarzenberg was moving slowly round to the south of Leipzig. The North Army under Bernadotte, unknown to Napoleon, lay on Blücher's left around Halle. The emperor decided to throw the bulk of his force on Blücher, and, having routed him, turn south on Schwarzenberg and sever his communications with Bohemia. His concentration was effected with his usual sureness and celerity, but whilst the French moved on Wittenberg, Blücher was marching to his right, indifferent to his communications as all Prussia lay behind him.

This move on the 14th brought him into touch with Bernadotte, and now a single march forward of all three armies would have absolutely isolated Napoleon from France; but Bernadotte's nerve failed him, for on hearing of Napoleon's threat against Wittenberg he decided to retreat northward, and not all the persuasions of Blücher and Gneisenau could move him. Thus if the French movement momentarily ended in a blow in the air, it was indirectly the cause of their ultimate salvation.

52. *The "Battle of the Nations."*—On the 15th Napoleon concentrated his forces to the east of Leipzig, with only a weak detachment to the west, and in the evening the allies were prepared to attack him. Schwarzenberg, with 180,000 men available at once and 60,000 on the following day; Blücher had about 60,000, but Bernadotte now could not arrive before the 18th.

Napoleon prepared to throw the bulk of his force upon Schwarzenberg and massed his troops south-east of the town, whilst Schwarzenberg marched concentrically against him down the valley of the Elster and Pleisse, the mass of his troops on the right bank of the latter and a strong column under Giulay on the left working round to join Blücher on the north. The fighting which followed was most obstinate, but the Austrians failed to make any impression on the French positions, and indeed Giulay felt himself compelled to withdraw to his former position. On the other hand, Blücher carried the village of Möckern and came within a mile of the gates of the town. During the 17th there was only indecisive skirmishing, Schwarzenberg waiting for his reinforcements coming up by the Dresden road, Blücher for Bernadotte to come in on his left, and by some extraordinary oversight Giulay was brought closer in to the Austrian centre, thus opening for the French their line of retreat towards Erfurt, and no imformation of this movement appears to have been conveyed to Blücher. The emperor when he became aware of the movement, sent the IVth Corps to Lindenau to keep the road open.

On the 18th the fighting was resumed and by about noon Bernadotte came up and closed the gap to the N.E. of the town between Blücher and the Austrians. At 2 p.m. the Saxons, who had remained faithful to Napoleon longer than his other German allies, went over to the enemy. All hope of saving the battle had now to be given up, but the French covered their retreat obstinately and by daybreak next morning one-half of the army was already filing out along the road to Erfurt which had so fortunately been left for them.

53. *Retreat of the French and Battle of Hanau.*—It took Blücher time to extricate his troops from the confusion into which the battle had thrown them, and the garrison of Leipzig and the troops left on the right bank of the Elster still resisted obstinately—hence no direct pursuit could be initiated and the French, still upwards of 100,000 strong, marching rapidly, soon gained distance enough to be reformed. Blücher followed by parallel and inferior roads on their northern flank, but Schwarzenberg knowing that the Bavarians also had forsaken the emperor and were marching under Wrede, 50,000 strong, to intercept his retreat, followed in a most leisurely fashion. Blücher did not succeed in overtaking the French, but the latter, near Hanau, found their way barred by Wrede with 50,000 men and over 100 guns in a strong position.

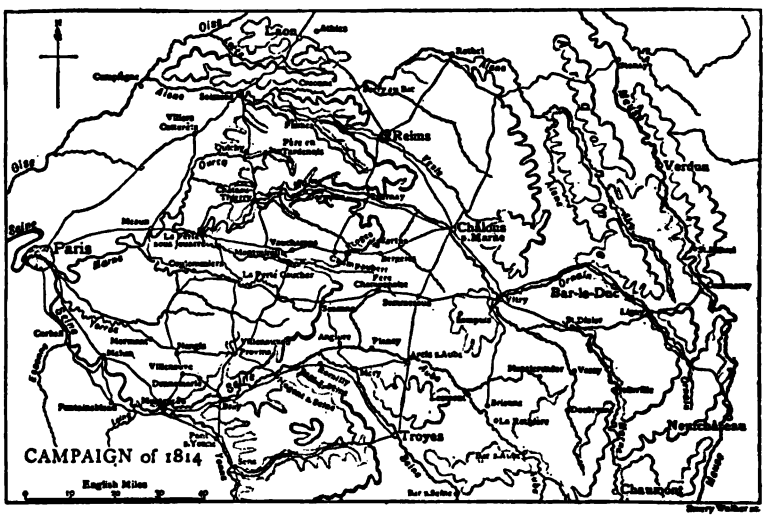
To this fresh emergency Napoleon and his army responded in most brilliant fashion. As at Krasnoi in 1812, they went straight for their enemy and after one of the most brilliant series of artillery movements in history, directed by General Drouot, they marched right over their enemy, practically destroying his whole force. Henceforward their march was unmolested, and they reached Mainz on the 5th of November.

54. *The Defensive Campaign.*—When the last of the French troops had crossed to the western bank of the Rhine, divided counsels made their appearance at the headquarters of the allies. Every one was weary of the war, and many felt that it would be unwise to push Napoleon and the French nation to extremes.

Hence a prolonged halt arose, utilized by the troops in renewing their equipment and so forth, but ultimately the Young German party, led by Blücher and the principal fighting men of the army, triumphed, and on the 1st of January 1814 the Silesian army (50,000) began its passage of the Rhine at Kaub. They were to be supported by Schwarzenberg with 200,000 men, who was to advance by Basel and Neu Breisach to the south, and Bernadotte with the Northern army, about 120,000, was to move in support on the right flank through the Netherlands and Laon; this force was not yet ready and did not, in fact. reach the latter place till March.

To meet these forces the emperor could not collect 100,000 men in all, of whom upwards of 100,000 were held by Wellington on the Spanish frontier, and 20,000 more were required to watch the debouches from the Alps. Hence less than 80,000 remained available for the east and north-eastern frontier. If, however, he was weak in numbers, he was now again operating in a friendly country, able to find food almost everywhere and practically indifferent as to his communications.

On the 25th of January, Blücher entered Nancy, and, moving rapidly up the valley of the Moselle, was in communication with the Austrian advanced guard near La Rothière on the afternoon of the 28th. Here his headquarters were surprised and he himself nearly captured by a sudden rush of French troops, and he learnt at the same time that the emperor in person was at hand. He accordingly fell back a few miles next morning to a strong position covering the exits from the Bar-sur-Aube defile. There he was joined by the Austrian advance guard, and together they decided to accept battle—indeed they had no alternative, as the roads in rear were so choked with traffic that retreat was out of the question. About noon the 2nd of February Napoleon attacked them, but the weather was terrible, and the ground so heavy that his favourite artillery, the mainstay of his whole system of warfare, was useless and in the drifts of snow which at intervals swept across the field, the columns lost their direction and many were severely handled by the Cossacks. At nightfall the fighting ceased and the emperor retired to Lesmont, and thence to Troyes, Marmont being left to observe the enemy.



55. *Montmirail.*—Owing to the state of the roads, more perhaps to the extraordinary lethargy which always characterized Schwarzenberg's headquarters, no pursuit was attempted. But on the 4th of February Blücher, chafing at this inaction, obtained the permission of his own sovereign to transfer his line of operations to the valley of the Marne; Pahlen's corps of Cossacks were assigned to him to cover his left and maintain communication with the Austrians.

Believing himself secure behind this screen, he advanced from Vitry along the roads leading down the valley of the Marne, with his columns widely separated for convenience of subsistence and shelter—the latter being almost essential in the terrible weather prevailing. Blücher himself on the night of the 7th was at Sézanne, on the exposed flank so as to be nearer to his sources of intelligence, and the rest of his army were distributed in four small corps at or near Épernay, Montmirail and Étoges; reinforcements also were on their way to join him and were then about Vitry.

In the night his headquarters were again surprised, and he learnt that Napoleon himself with his main body was in full march to fall on his scattered detachments. At the same time he heard that Pahlen's Cossacks had been withdrawn forty-eight hours previously, thus completely exposing his flank. He himself retreated towards Étoges endeavouring to rally his scattered detachments, but Napoleon was too quick for him and in three successive days he defeated Sacken at Montmirail, York at Champ Aubert and Blücher and his main body at Étoges, pursuing the latter towards Vertus. These disasters compelled the retreat of the whole Silesian army, and Napoleon, leaving Mortier and Marmont to deal with them, hurried back to Troyes with his main body to strike the flank of Schwarzenberg's army, which had meanwhile begun its leisurely advance, and again at Mormant on the 17th of February, Montereau the 18th and Méry the 21st, he inflicted such heavy punishment upon his adversaries that they fell back precipitately to Bar-sur-Aube.

56. *Laon.*—In the meantime Blücher had rallied his scattered forces and was driving Marmont and Mortier before him. Napoleon, as soon as he had disembarrassed himself of Schwarzenberg, counter-marched his main body and moving again by Sézanne, fell upon Blücher's left and drove him back upon Soissons. This place had been held by a French garrison, but had capitulated only twenty-four hours beforehand, a fact of which Napoleon was naturally unaware. The Silesian army was thus able to escape, and marching northwards combined with Bernadotte at Laon—this reinforcement bringing the forces at Blücher's disposal up to over 100,000 men.

On the 7th of March Napoleon fell upon the advance guard of this force at Craonne and drove it back upon Laon, where a battle took place on the 9th. Napoleon was here defeated, and with only 30,000 men at his back he was compelled to renounce all ideas of a further offensive, and he retired to rest his troops to Reims. Here he remained unmolested for a few days, for Blücher was struck down by sickness, and in his absence nothing was done. On the 14th of March, however, Schwarzenberg, becoming aware of Napoleon's withdrawal to Reims, again began his advance and had reached Arcis-sur-Aube when the news of Napoleon's approach again induced him to retreat to Brienne.

57. *The Allies March on Paris.*—Thus after six weeks' fighting the allies were hardly more advanced than at the beginning. Now, however, they began to realize the weakness of their opponent, and perhaps actuated by the fear that Wellington from Toulouse might, after all, reach Paris first, they determined

to march to Paris (then an open city), and let Napoleon do his worst to their communications. Actually this was exactly what he was preparing to do. He had determined to move eastward to St Dizier, rally what garrisons he could find, and raise the whole country against the invaders, and had actually started on the execution of this plan when his instructions fell into the enemy's hands and his projects were exposed. Regardless of the threat, the allies marched straight for the capital. Marmont and Mortier with what troops they could rally took up a position on Montmartre heights to oppose them, but seeing further resistance to be hopeless they gave way on the 31st of March, just as Napoleon, with the wreck of the Guards and a mere handful of other detachments, was hurrying across the rear of the Austrians towards Fontainebleau to join them.

This was the end of the First Empire. The story of the Waterloo Campaign is told under its own heading.

The Military Character of Napoleon.

No military career has been examined more often and more freely than that of Napoleon. Yet even so the want of complete documentary evidence upon which to base conclusions has vitiated all but the most recent of the countless monographs and histories that have appeared on the subject. Fortunately the industry and ability of the military history section of the French General Staff have rendered available, by the publication of the original orders issued during the course of his campaigns, a mass of information which, taken in conjunction with his own voluminous correspondence, renders it possible to trace the growth of his military genius with a reasonable approach to accuracy. Formerly we could only watch the evolution of his powers of organization and the purely psychic gifts of resolution and command. The actual working of his mind towards that strategic and tactical ascendancy that rendered his presence on the battlefield, according to the testimony of his opponents, equal to a reinforcement of 40,000 men, was entirely undiscernible.

The history of his youth reveals no special predilection for the military service—the bent of his mind was political far more than military, but unlike the politicians of his epoch he consistently applied scientific and mathematical methods to his theories, and desired above all things a knowledge of facts in their true relation to one another. His early military education was the best and most practical then attainable, primarily because he had the good fortune to come under the influence of men of exceptional ability—Baron du Keile, Bois Roger and others. From them he derived a sound knowledge of artillery and fortification, and particularly of mountain warfare, which latter was destined to prove of inestimable service to him in his first campaigns of 1794–95 and 1796. In these, as well as in his most dramatic success of Marengo in 1800, we can discern no trace of strategical innovation. He was simply a master of the methods of his time. Ceaseless industry, energy and conspicuous personal gallantry were the principal factors of his brilliant victories, and even in 1805 at Ulm and Austerlitz it was still the excellence of the tactical instrument, the army, which the Revolution had bequeathed to him that essentially produced the results.

Meanwhile the mathematical mind, with its craving for accurate data on which to found its plans (the most difficult of all to obtain under the conditions of warfare), had been searching for expedients which might serve him to better purpose, and in 1805 he had recourse to the cavalry screen in the hope of such results. This proved a palliation of his difficulty, but not a solution. Cavalry can only observe, it cannot hold. The facts as to the position of an opponent accurately observed and correctly reported at a given moment, afford no reliable guarantee of his position 48 hours later, when the orders based on this information enter upon execution. This can only be calculated on the ground of reasonable probability as to what it may be to the best interest of the adversary to attempt. But what may seem to a Napoleon the best course is not necessarily the one that suggests itself to a mediocre mind, and the greater the gulf which separates the two minds the greater the uncertainty which must prevail on the side of the abler commander.

It was in 1806 that an improved solution was first devised. The general advanced guard of all arms now followed immediately behind the cavalry screen and held the enemy in position, while the remainder of the army followed at a day's march in a "bataillon carrée" ready to manœuvre in any required direction. The full reach of this discovery seems as yet scarcely to have impressed itself upon the emperor with complete conviction, for in the succeeding campaign in Poland we find that he twice departed from this form—at Pultusk and Heilsberg—and each time his enemy succeeded in escaping him. At Friedland, however, his success was complete, and henceforth the method recurs on practically every battlefield. When it fails it is because its inventor himself hesitates to push his own conception to its full development (Eckmühl 1809, Borodino 1812). Yet it would seem that this invention of Napoleon's was intuitive rather than reasoned; he never communicated it in its entirety to his marshals, and seems to have been only capable of exercising it either when in full possession of his health or under the excitement of action. Thus we find him after the battle of Dresden—itself a splendid example of its efficacy—suddenly reverting to the terminology of the school in which he had been brought up, which he himself had destroyed, only to revive again in the next few days and handle his forces strategically with all his accustomed brilliancy.

In 1814 and in 1815 in the presence of the enemy he again rises supremely to each occasion, only to lapse in the intervals even below the level of his old opponents; and that this was not the consequence of temporary depression naturally resulting from the accumulated load of his misfortunes, is sufficiently shown by the downright puerility of the arguments by which he seeks to justify his own successes in the St Helena memoirs, which one may search in vain for any indication that Napoleon was himself aware of the magnitude of his own discovery. One is forced to the conclusion that there existed in Napoleon's brain a dual capacity—one the normal and reasoning one, developing only the ideas and conceptions of his contemporaries, the other intuitive, and capable only of work under abnormal pressure. At such moments of crisis it almost excelled human comprehension; the mind seems to have gathered to itself and summed up the balance of all human passions arranged for and against him, and to have calculated with unerring exactitude the consequences of each decision.

A partial explanation of this phenomenon may perhaps be found in the economy of nervous energy his strategical method ensured to him. Marching always ready to fight wherever his enemy might stand or move to meet him, his mind was relieved from all the hesitations which necessarily arise in men less confident in the security of their designs. Hence, when on the battlefield the changing course of events left his antagonists mentally exhausted, he was able to face them with will power neither bound nor broken. But this only explains a portion of the mystery that surrounds him, and which will make the study of his career the most fascinating to the military student of all times.

Amongst all the great captains of history Cromwell alone can be compared to him. Both, in their powers of organization and the mastery of the tactical potentialities of the weapons of their day, were immeasurably ahead of their times, and both also understood to the full the strategic art of binding and restraining the independent will power of their opponents, an art of which Marlborough and Frederick, Wellington, Lee and Moltke do not seem ever even to have grasped the fringe.

(F. N. M.)

NAVAL OPERATIONS

The French navy came under the direct and exclusive control of Napoleon after the 18th Brumaire. At the close of 1799 (see FRENCH REVOLUTIONARY WARS) he had three purposes to serve by the help of his fleet: the relief of the French garrison besieged by the British forces in Malta; the reinforcement of the army he had left in Egypt; and the distraction of Great Britain by the threat of invasion of England across the Channel, or of Ireland. The deficiencies both in number and in quality of his naval resources doomed him to fail in all three. Though he had control of what remained of the navies of Holland and Spain, as well as of the French, he was outnumbered at every point, while the efficiency of the British fleet gave it a mobility which doubled its material superiority. All Napoleon's efforts to support his troops in Malta and Egypt were necessarily made under the hampering obligation to evade the British forces barring the road. The inevitable result was that only an occasional blockade-runner could succeed in escaping detection and attack. The relief thus brought to Malta and Egypt was not sufficient. In February 1800, the "Généreux" (74), one of the few ships which escaped from the Nile, sailed from Toulon with three corvettes, under Rear-admiral Perrée, to relieve Malta. On the 18th she was sighted by the blockading squadron, surrounded and captured. Three other survivors of the Nile were at anchor in Malta—the "Guillaume Tell" (80), and two frigates, the "Diane" and the "Justice." On the 29th of July the "Guillaume Tell" endeavoured to slip out in the night. She was sighted, pursued and overpowered, after a singularly gallant resistance. The frigates made an attempt to get off on the 24th of August, but only the "Justice," a solitary survivor of the squadron which fought at the Nile, reached Toulon. Malta, starved out by the British fleet, surrendered on the 5th of September 1800. Very similar was the fate of the efforts to reach and reinforce the army of Egypt. The British squadrons either stopped the relieving forces at their point of departure, or baffled, when they did not take them, at their landfall. A squadron of seven sail of the line, under Admiral Ganteaume, succeeded in slipping out of Brest, when a gale had driven the British blockading force off the coast. Ganteaume met with some measure of success in capturing isolated British men-of-war, one of them being a 74, the "Swiftsure." But he failed to give effectual help to the Egyptian army. He sailed on the 23rd of January 1801, entered the Mediterranean and, his squadron being in a bad condition, steered for Toulon, which he reached on the 18th of February. On the 19th of March he sailed again for Egypt, but was again driven back by the same causes on the 5th of April. On the 25th he was ordered out once more. Three of his ships had to be sent back as unfit to keep the sea. With the other four he reached the coast of Egypt, on the 7th of May, only to sight a powerful British force, and to be compelled to escape to Toulon, which he did not reach till the 22nd of July. The French in Egypt were in fact beaten before he reached the coast. At the beginning of 1801, a British naval force, commanded by Lord Keith, had sailed from Gibraltar, escorting an army of 18,000 men under General Abercromby. It reached Marmorice Bay, in Asia Minor, on the 31st of January, to arrange a co-operation with the Turks, and after some delay the army was transported and landed in Egypt, on the 7th and 8th of March. Before the end of September the French army was reduced to capitulate. In the interval another effort to carry help to it was made from Toulon. On the 13th of June 1801 Rear-admiral Linois left Toulon with three sail of the line, to join a Spanish squadron at Cadiz and go on to Egypt. In the straits he was sighted by the British squadron under Sir J. Saumarez, and driven to seek the protection of the Spanish batteries in Algeciras. On the 6th of July he beat off a British attack, capturing the "Hannibal," 74. On the 9th a Spanish squadron came to his assistance, and the combined force steered for Cadiz. During the night of the 12th/13th of July they were attacked by Sir J. Saumarez. Two Spanish three-deckers blew up, and a 74-gun ship was taken. The others were blockaded in Cadiz. The invasion scheme was vigorously pushed after the 3rd of March 1801. Flat-bottomed boats were gradually collected at Boulogne. Two attempts to destroy them at anchor, though directed by Nelson himself, were repulsed on the 4th and 16th of August. But the invasion was so far little more than a threat made for diplomatic purposes. On the 1st of October 1801 an armistice was signed in London, and the Peace of Amiens followed, on the 27th of March 1802. (For the operations in the Baltic in 1801, see COPENHAGEN, BATTLE OF.)

The Peace of Amiens proved to be only an uneasy truce, and it was succeeded by open war, on the 18th of May 1803. From that date till about the middle of August 1805, a space of some two years and two months, the war took the form of a most determined attempt on the part of Napoleon to carry out an invasion of Great Britain, met by the counter measures of the British government. The scheme of invasion was based on the Boulogne flotilla, a device inherited from the old French royal government, through the Republic. Its object was to throw a great army ashore on the coast between Dover and Hastings. The preparations were made on an unprecedented scale. The Republic had collected some two hundred and forty vessels. Under the direction of Napoleon ten times as many were equipped. They were divided into: *prames*, ship-rigged, of 35 metres long and 8 wide, carrying 12 guns; *chaloupes canonières*, of 24 metres long and 5 wide, carrying 5 guns and brig-rigged; *bateaux canoniers*, of 19 metres long by 1·56 wide, carrying 2 guns and mere boats. All were built to be rowed, were flat-bottomed, and of shallow draft so as to be able to navigate close to the shore, and to take the ground without hurt. They were built in France and the Low Countries, in the coast towns and the rivers—even in Paris—and were collected gradually, shore batteries both fixed and mobile being largely employed to cover the passage. A vast sum of money and the labour of thousands of men were employed to clear harbours for them, at and near Boulogne. The shallow water on the coast made it impossible for the British line-of-battle ships, or even large frigates, to press the attack on them home. Smaller vessels they were able to beat off and so, in spite of the activity of the British cruisers and of many sharp encounters, the concentration was effected at Boulogne, where an army of 130,000 was encamped and was incessantly practised in embarking and disembarking. Before the invasion was taken in hand as a serious policy, there had been at least a profession of a belief that the flotilla could push across the Channel during a calm. Experience soon showed that when the needful allowance was made for the time required to bring them out of harbour (two tides) and for the influence which the Channel currents must have upon their speed, it would be extremely rash to rely on a calm of sufficient length. Napoleon therefore came

early to the conclusion that he must bring about a concentration of his seagoing fleet in the Channel, which would give him a temporary command of its waters.

He had a squadron at Brest, ships at L'Orient and Rochefort, some of his vessels had taken refuge at Ferrol on their way back from San Domingo when war broke out, one was at Cadiz, and he had a squadron at Toulon. All these forces were watched by British blockading squadrons. The problem was to bring them together before the British fleet could be concentrated to meet them. Napoleon's solution grew, as time went on and circumstances changed, in scope and complexity. In July 1804 he ordered his admiral commanding at Toulon, Latouche Tréville, to seize an opportunity when Nelson, who was in command of the blockade, was driven off by a northerly gale, to put to sea, with 10 sail of the line, pick up the French ship in Cadiz, join Villeneuve who was in the Aix roads, and then effect a junction with Ganteaume and the 21 sail of the line at Brest. He hoped that if the British ships in the North Sea concentrated with the squadron in the Channel, he would be able to make use of Dutch vessels from the Texel. The death of Latouche Tréville, 20th of August 1804, supplied an excuse for delay. He was succeeded by Villeneuve. Napoleon now modified the simple plan prepared for Latouche Tréville, and began laying elaborate plans by which French vessels were to slip out and sail for distant seas, to draw the British fleet after them, and then return to concentrate in the Channel. A further modification was introduced by the end of 1804. Spain, which was bound by treaty to join Napoleon, was allowed to preserve a show of neutrality by paying a monthly subvention. The British government, treating this as a hostile action—as it was—seized the Spanish treasure ships on their way from America, near Cape Santa Maria, on the 5th of October 1804, and Spain declared war on the 12th of December. New plans were now made including the co-operation of the Spanish fleet. Amid all the variation in their details, and the apparent confusion introduced by Napoleon's habit of suggesting alternatives and discussing probabilities, and in spite of the preparations ostensibly made for an expedition to Ireland, which was to have sailed from Brest and to have carried 30,000 troops commanded by Augereau, the real purpose of Napoleon was neither altered nor concealed. He worked to produce doubt and confusion in the mind of the British government by threats and attacks on its distant possessions, which should lead it to scatter its forces. One of these ventures was actually carried out, without, however, securing the co-operation, or effecting the purpose he had in view. On the 11th of January 1805 Admiral Missiessy left Rochefort with 5 sail of the line, undetected by the British forces on the coast. Missiessy carried out a successful voyage of commerce-destroying, and returned safely to Rochefort on the 20th of May, from the West Indies. But the force sent in pursuit of him was small, and the British government was not deceived into weakening its hold on the Channel. It was in fact well supplied with information by means of the spy service directed by an exiled French royalist, the count d'Antraigues, who was established at Dresden as a Russian diplomatic agent. Through his correspondents in Paris, some of whom had access to Napoleon's papers, the British government was able to learn the emperor's real intentions. The blockade of Brest was so strictly maintained that Ganteaume was allowed no opportunity to get to sea. Villeneuve, who was to have co-operated with Missiessy, did indeed leave Toulon, at a moment when Nelson, whose policy it was to encourage him to come out by not staying too near the port, was absent, on the 17th of January 1805. The British admiral, when informed that the French were at sea, justified Napoleon's estimate of his probable course in such a contingency, by making a useless cruise to Egypt. But Villeneuve's ill-appointed ships, manned by raw crews, suffered loss of spars in a gale, and he returned to Toulon on the 21st. His last start came when he sailed, unseen by Nelson, on the 30th of March. Aided by lucky changes of wind, he reached Cadiz, was joined by 1 French and 6 Spanish ships under Admiral Gravina, which, added to the 11 he had with him, gave him a force of 18 sail. He left Cadiz on the night of the 9th 10th of April, and reached Fort de France in Martinique on the 14th of May. Here he was to have remained till joined by Ganteaume from Brest. On the 1st of June he was joined by a frigate and two line-of-battle ships sent with orders from Rochefort, and was told to remain in the West Indies till the 5th of July, and if not joined by Ganteaume to steer for Ferrol, pick up the French and Spanish ships in the port, and come on to the Channel. Villeneuve learnt on the 8th of June that Nelson had reached Barbadoes in pursuit of him on the 4th. The British admiral, delayed by contrary winds, had not been able to start from the entry to the Straits of Gibraltar till the 11th of May. An action in the West Indies would have ruined the emperor's plan of concentration, and Villeneuve decided to sail at once for Ferrol. Nelson, misled by false information, ranged the West Indies as far south as the Gulf of Paria, in search of his opponent whom he supposed to be engaged in attacks on British possessions. By the 13th of June he had learnt the truth, and sailed for Gibraltar under the erroneous impression that the French admiral would return to Toulon. He sent a brig home with despatches; on the 19th of June, in lat. 33° 12′ N. and long. 58° W., the French were seen by this vessel heading for the Bay of Biscay. Captain Bettesworth who commanded the brig hurried home, and the information he brought was at once acted on by Lord Barham, the First Lord of the Admiralty, who took measures to station a force to intercept Villeneuve outside Ferrol. On the 22nd of July, 35 leagues N.W. of Finisterre, Villeneuve was met by the British admiral sent to intercept him, Sir Robert Calder. A confused action in a fog ended in the capture of 2 Spanish line-of battle ships. But Sir R. Calder, who had only 15 ships to his opponent's 20 and was nervous lest he should be overpowered, did not act with energy. He retreated to join the blockading fleet off Brest. Villeneuve was now able to join the vessels at Ferrol. Nelson, who reached Gibraltar on the very day the action off Ferrol was fought, was too far away to interfere with him. But Villeneuve, who was deeply impressed by the inefficiency of the ships of his fleet and especially of the Spaniards, and who was convinced that an overwhelming British force would be united against him in the Channel, lost heart, and on the 15th of August sailed south to Cadiz. By this movement he ruined the emperor's elaborate scheme. Napoleon at once broke up the camp at Boulogne and marched to Germany. The further movements of Villeneuve's fleet are told under TRAFALGAR, BATTLE OF.

With the collapse of the invasion scheme, the naval war between Napoleon and Great Britain entered on a new phase. It lost at once the unity given to it by the efforts of the emperor to effect, and of the British government to baffle the passage of the Channel by an army. In place of the movements of great fleets to a single end, we have a nine years' story (1805–1814) of cruising for the protection of commerce, of convoy, of colonial expeditions to capture French, Dutch or Spanish possessions and of combined naval and military operations in which the British navy was engaged in carrying troops to various countries, and in supporting them on shore. Napoleon continued to build line-of-battle ships in numbers from Venice to Hamburg, but only in order to force the British government to maintain costly and wearing blockades. He never allowed his fleets to go to sea to seek battle. The operations of the British fleet were therefore divided between the work of patrolling the ocean roads and ancillary services to diplomacy, or to the armies serving in Italy, Denmark and, after 1808, in Spain. The remaining colonial possessions of France, and of Holland, then wholly dependent on her, were conquered by degrees, and the ports in which privateers were fitted out to cruise against British commerce in distant seas were gradually rendered harmless. Though privateering was carried on by the French with daring and a considerable measure of success, it did not put an appreciable check on the growth of British merchant shipping. The function of the British navy in the long conflict with Napoleon was of the first importance, and its services were rendered in every sea, but their very number, extent and complexity render it impossible here to record them in detail.

BIBLIOGRAPHY.—Captain Mahan, *Influence of Sea Power upon the French Revolution and the Empire* (London, 1892); Chevalier, *Histoire de la marine française sous le consulat et l'empire* (Paris, 1886). All the operations connected with the successive invasion schemes are recorded, with exhaustive quotations of documentary evidence, in *Projets et tentatives de débarquement aux Iles Britanniques*, by Captain Desbrière (Paris, 1901). Captain Desbrière's exhaustive work was done for the historical section of the French general staff, and is a fine example of the scholarly and conscientious modern French historical school. (D. H.)

NAPOLEONITE, also called Corsite because the stone is found in the island of Corsica, a variety of diorite which is characterized by orbicular structure. The grey matrix of the stone has the normal appearance of a diorite, but contains many rounded lumps 1 or 2 in. in diameter, which show concentric zones of light and dark colours. In these spheroids also a distinct and well-marked radial arrangement of the crystals is apparent. The centre of the spheroid is usually white or pale grey and consists mainly of felspar; the same mineral makes the pale zones while the dark ones are rich in hornblende and pyroxene. The felspar is a basic variety of plagioclase (anorthite or bytownite). Though mostly rounded, the spheroids may be elliptical or subangular; sometimes they are in contact with one another but usually they are separated by small areas of massive diorite. When cut and polished the rock makes a beautiful and striking ornamental stone. It has been used for making paper-weights and other small ornamental articles.

Spheroidal structure is found in other diorites and in quite a number of granites in various places, such as Sweden, Russia, America, Sardinia, Ireland. It is by no means common, however, and usually occurs in only a small part of a granitic or dioritic mass, being sometimes restricted to an area of a few square yards. In most cases it is found near the centre of the outcrop, though exceptionally it has been found quite close to the margin. It arises evidently from intermittent and repeated crystallization of the rock-forming minerals in successive stages. Such a process would be favoured by complete rest, which would allow of supersaturation of the magma by one of the components. Rapid crystallization would follow, producing deposits on any suitable nuclei, and the crystals then formed might have a radial disposition on the surfaces on which they grew. The magma might then be greatly impoverished in this particular substance, and another deposit of a different kind would follow, producing a zone of different colour. The nucleus for the spheroidal growth is sometimes an early porphyritic crystal, sometimes an enclosure of gneiss, &c., and often does not differ essentially in composition from the surrounding rock. When spheroids are in contact their inner zones may be distinct while the outer ones are common to both individuals having the outlines of a figure of eight. This proves that growth was centrifugal, not centripetal.

Many varieties of spheroids are described presenting great differences in composition and in structure. Some are merely rounded balls consisting of the earliest minerals of the rock, such as apatite, zircon, biotite and hornblende, and possessing no regular arrangement. Others have as centres a foreign fragment such as gneiss or hornfels, with one or more zones, pale or dark, around this. Radial arrangement of the crystals, though often very perfect, is by no means universal. The spheroids are sometimes flattened or egg-shaped, apparently by fluxion movements of the magma at a time when they were semi-solid or plastic. As a general rule the spheroids are more basic and richer in the ferromagnesian minerals than the surrounding rock, though some of the zones are often very rich in quartz and felspar. Graphic or perthitic intergrowths between the minerals of a zone are frequent. The spheroids vary in width up to 1 or 2 ft. In some cases they contain abnormal constituents such as calcite, sillimanite or corundum, (J. S. F.)

NAQUET, ALFRED JOSEPH (1834–), French chemist and politician, was born at Carpentras (Vaucluse), on the 6th of October 1834. He became professor in the faculty of medicine in Paris in 1863, and in the same year professor of chemistry at Palermo, where he delivered his lectures in Italian. He lost his professorship in 1867 with his civic rights, when he was condemned to fifteen months' imprisonment for his share in a secret society. On a new prosecution in 1869 for his book *Religion, propriété, famille* he took refuge in Spain. Returning to France under the government of Émile Ollivier he took an active share in the revolution of the 4th of September 1870, and became secretary of the commission of national defence. In the National Assembly he sat on the extreme Left, consistently opposing the opportunist policy of successive governments. Re-elected to the Chamber of Deputies he began the agitation against the marriage laws with which his name is especially connected. His proposal for the re-establishment of divorce was discussed in May 1879, and again in 1881 and 1882, and became law two years later. Naquet, although he disapproved in principle of a second chamber, secured his election to the senate in 1883 to pilot his measure through that body. In 1886 by his efforts divorce became legal after three years of definite separation on the demand of one of the parties concerned. In 1890 he resigned from the senate to re-enter the Chamber of Deputies, this time for the 5th arrondissement of Paris, and took his seat with the Boulangist deputies. After Boulanger's suicide his political influence declined, and was further compromised by accusations (of which he was legally cleared) in connexion with the Panama scandals.

The thesis written for his doctorate, *Application de l'analyse chimique à la toxicologie* (1859), was followed by many papers on chemistry contributed to learned journals, and his *Principes de chimie fondés sur les théories modernes* (1865) reached its 5th edition in 1890. He is better known by his political works, *Socialisme collectiviste et socialisme libéral* (1890, Eng. trans., 1891), *L'Humanité et la patrie* (1901), *Loi du divorce* (1903), *L'Anarchie et le collectivisme* (1904), *Désarmement ou alliance anglaise* (1908).

NARA, an important water channel in Sind, India, probably representing a former bed of the Indus, though now traversing the desert far E. of the river. Its total length is 250 m.; and by means of cross cuts, weirs and embankments, it has been made to irrigate no less than 429 sq. m., with a navigable length of 425 m.

NARA, a town of Japan, in the province of Yamato, 25½ m. from Osaka by rail. Pop. 32,000. It lies on the slope of a range of picturesque hills, beautifully wooded with cryptomerias, evergreen oaks, &c. This was the first permanent capital of Japan. Up to the beginning of the 8th century the imperial court changed its location at the accession of each sovereign, and the court's place of residence naturally became the official metropolis. But Nara remained the metropolis during seven consecutive reigns (709 to 784), and its seventy-five years of favoured existence sufficed for the building and furnishing of several imposing shrines and temples, for the laying out of a noble park, for the casting of a colossal image of Buddha, and for the execution of many other beautiful specimens of applied art. Not much is known of the Nara palace in its original form, but many of the articles and ornaments used by its inmates survive in a celebrated collection which, during nearly twelve hundred years, had been preserved in a store-house (Shoso-in) near the temple of Todai-ji. This collection cannot be visited by strangers more than once a year, and even then only by special permission. The vigorous growth of the Buddhist creed throughout the Nara epoch was remarkable, and found outward expression in many striking architectural and artistic works. The best of these, namely, those dating from the first half of the 8th century, show Indo-Grecian affinities, which gradually grow fainter as the end of the epoch approaches. The temple called Todai-ji was completed about 750. At present the buildings enclose a quadrangle 520 ft. by 620, the south side being mainly occupied by the huge, ungainly and no longer perpendicular hall containing the Dai Butsu, or colossal statue of Buddha. The casting of this wonderful piece of work was accomplished after eight failures in 749 by Takusho, an artist from Korea. On two occasions the head was melted during the burning of the temple (1180 and 1567) and from 1567 to 1697 the statue stood exposed to the weather. The height of the figure is 53 ft. On a hill to the east of the temple stands a bell-house with a huge bell, cast in 732, 13½ ft. high, 9 ft. across the mouth and weighing 37 tons. The great Buddha is often spoken of as the most remarkable of the Nara relics; but restorations have so marred it that it can no longer be compared with many smaller examples of contemporaneous and subsequent sculpture. More worthy of close attention are two effigies of Brahma and Indra preserved among the relics of Kobuku-ji, which, with Kasuga-no-Miya, Ni-gwatsu-do and Todai-ji, constitute the chief religious edifices. These figures, sculptured in wood, have suffered much from the ravages of time, but nothing could destroy the grandeur of their proportions or the majesty and dignity of their pose. Several other

works of scarcely inferior excellence may be seen among the relics, and at the shrine of Kasuga is performed a religious dance called Kagura, in which the costumes and gestures of the dancers are doubtless the same as those of twelve centuries back. Kasuga-no-Miya was founded in 767, and its chapels with their rough red-painted log-work afford fine examples of primitive Japanese architecture. In the temple-park are herds of tame deer; and little images of deer and trinkets from deer's horn are the favourite charms purchased by the pilgrims. Within the enclosure stands a curious old trunk of seven plants entwined, including a camellia, cherry and wistaria. Of the great Buddhist temple Kobuku-ji, founded in 710, and burnt for the third time in 1717, there remains little save two lofty pagodas. A railway now gives access to the town, but every effort is made to preserve all the ancient features of Nara. A museum has been formed, where many antique objects of great interest are displayed, as well as works from the hands of comparatively modern artists. Nara in the days of its prosperity is said to have had a population of a quarter of a million.

NARAINGANJ, or NARAYANGANJ, a town of India, in the Dacca district of eastern Bengal and Assam, situated near the junction of two rivers with the Meghna, 10 m. by rail S. of Decca city. Pop. (1901) 24,472. As the port of Dacca, having steamer communication with both Calcutta and Chittagong, it has become the chief entrepôt for the jute trade of eastern Bengal. There are 73 jute-presses, employing 6000 hands, and the annual export of jute exceeds 300,000 tons. It also ranks as the model municipality of Bengal.

NARBONNE, a city of France, capital of an arrondissement in the department of Aude, situated in a vine-growing plain 5 m. from the Mediterranean, on the railway from Toulouse to Cette, 37 m. E. of Carcassonne. Pop. (1906) 23,289. The Robine canal, a branch of the Canal du Midi, divides Narbonne into two distinct portions, the *bourg* and the *cité*. The latter is one of the oldest and most interesting of French towns. The former cathedral (St Just), which consists only of a choir 130 ft. high and transept, was begun in 1272, and the transept was still unfinished at the end of the 15th century. The towers (194 ft. high) at each extremity of the transept were built about 1480. Some additions towards the west were made early in the 18th century. An unusual effect is produced by a double row of crenellation taking the place of balustrades on the roof of the choir chapels and connecting the pillars of the flying buttresses. Among the sepulchral monuments, which are the chief feature of the interior, may be noticed the alabaster tomb of Cardinal Guillaume Briçonnet, minister of state under Charles VIII. The chapter-house, of the 15th century, has a vaulted roof supported on four free pillars. The treasury preserves many interesting relics. The apse of the cathedral was formerly joined to the fortifications of the archiepiscopal palace, and the two buildings are still connected by a mutilated cloister of the 14th and 15th centuries. On the front of the palace are three square towers of unequal height. Between the Tour des Télégraphes (1318), crenellated and turreted at the corners, and that of St Martial (1374), machicolated and pierced by Gothic openings, a new façade was erected in the style of the 13th century after the plans of Viollet-le-Duc. This portion of the building now serves as hôtel de ville, and its upper stories are occupied by the Narbonne museum of art and archaeology, which includes a fine collection of pottery. The palace garden also contains many fragments of Roman work once built into the now dismantled fortifications; and the Musée Lapidaire in the Lamourguier buildings (formerly the church of a Benedictine convent) has a collection of Roman remains derived from the same source. The church of St Paul, though partly Romanesque, is in the main striking, and for the south of France a rare example of a building of the first half of the 13th century in the Gothic style of the north. It possesses some ancient Christian sarcophagi and fine Renaissance wood carving. Narbonne has a sub-prefecture, tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce, a communal college for boys and a school of commerce and industry. It has a good trade in wine and spirituous liquors, and is famous for its honey. The industries include cooperage, sulphur-refining, brandy-distilling and the manufacture of bricks and tiles and verdigris.

Long before the Roman invasion of Gaul Narbonne was a flourishing city, being capital of the Volcae Tectosages. It was there that the Romans in 118 B.C. founded their first colony in Gaul, which bore the name of *Narbo Martius*; they constructed great works to protect the city from inundation and to improve its port, situated on a lake now filled up but at that time communicating with the sea. Capital of Gallia Narbonensis, the seat of a proconsul and a station for the Roman fleet, Narbo Martius became the rival of Massilia. But in A.D. 150 it suffered greatly from a conflagration, and the division of Gallia Narbonensis into two provinces lessened its importance as a capital. Alans, Suevi, Vandals, each held the city for a brief space, and at last, in 413, it was occupied by the Visigoths, whose capital it afterwards became. In 719, after a siege of two years, it was captured by the Saracens, and by them its fortifications were restored and extended. Charles Martel, after the battle of Poitiers, and Pippin the Short, in 752, were both repulsed from its walls; but on a new attempt, after an investment of seven years, and by aid of a traitor, the Franks managed again to force their way into Narbonne. Charlemagne made the city the capital of the duchy of Gothia, and divided it into three lordships—one for the bishop, another for a Frankish lord, and the third for the Jews, who, occupying their own quarter, possessed schools, synagogues and a university famous in the middle ages. The viscounts who succeeded the Frankish lord sometimes acknowledged the authority of the counts of Toulouse, sometimes that of the counts of Barcelona. In the 13th century the crusade against the Albigenses spared the city, but the archbishopric was seized by the pope's legate, Arnaud Amaury, who took the title of viscount of Narbonne. Simon de Montfort, however, deprived him of this dignity, receiving from Philip Augustus the duchy of Narbonne along with the county of Toulouse. By his expulsion of the Jews Philip the Fair hastened the decay of the city; and about the same period the Aude, which had formerly been diverted by the Romans, ceased to flow towards Narbonne and the harbour was silted up, to the further disadvantage of the place. In 1642 Henri Marquis de Cinq-Mars was arrested at Narbonne for conspiring against Richelieu. United to the French crown in 1507, Narbonne was enclosed by a new line of walls under Francis I., but having ceased to be a garrison town it had the last portions of its ramparts demolished in 1870. The archbishopric was founded about the middle of the 3rd century, its first holder being Sergius Paulus; it was suppressed in 1790.

NARBONNE-LARA, LOUIS MARIE JACQUES AMALRIC, COMTE DE (1755–1813), French soldier and diplomatist, was born at Colorno, in the duchy of Parma, on the 24th of August 1755. He was the son of one of the ladies-in-waiting of Elizabeth, duchess of Parma, and his father was either a Spanish nobleman or—as has been alleged—Louis XV. himself. He was brought up at Versailles with the princesses of France, and was made colonel at the age of twenty-five. He became *maréchal-de-camp* in 1791, and, through the influence of Madame de Stael, was appointed minister of war. But he showed incapacity in this post, gave in his resignation, and joined the Army of the North. Incurring suspicion as a *Feuillant* and also by his policy at the war office, he emigrated after the 10th of August 1792, visited England, Switzerland and Germany, and returned to France in 1801. In 1809 he re-entered the army as general of division, and was subsequently minister plenipotentiary at Munich and *aide de camp* to Napoleon. In 1813 he was appointed French ambassador at Vienna, where he was engaged in an unequal diplomatic duel with Metternich (*q.v.*) during the fateful months that witnessed the defection of Austria from the cause of Napoleon to that of the Allies. He died at Torgau, in Saxony, on the 17th of November 1813.

See A. F. Villemain, *Souvenirs contemporains* (Paris, 1854).

NARBOROUGH, SIR JOHN (d. 1688), English naval commander, was descended from an old Norfolk family. He received his commission in 1664, and in 1666 was promoted lieutenant for gallantry in the action with the Dutch fleet off the Downs in June of that year. After the peace he was chosen to conduct a voyage of exploration in the South Seas. He set sail from Deptford on the 26th of November 1669, and entered the Straits of Magellan in October of the following year, but returned home in June 1671 without accomplishing his original purpose. A narrative of the expedition was published at London in 1694 under the title *An Account of several late Voyages and Discoveries to the South and North*. During the second Dutch War Narborough was second captain of the lord high-admiral's ship the

"Prince," and conducted himself with such conspicuous valour at the battle of Solebay (Southwold Bay) in May 1672 that he won special approbation, and shortly afterwards was made rear-admiral and knighted. In 1675 he was sent to suppress the Tripoline piracies, and by the bold expedient of despatching gun-boats into the harbour of Tripoli at midnight and burning the ships he induced the dey to agree to a treaty. Shortly after his return he undertook a similar expedition against the Algerines. In 1680 he was appointed commissioner of the navy, an office he held till his death in 1688. He was buried at Knowlton church, Kent, where a monument has been erected to his memory.

See Charnock, *Biog. Nav.* i.; Hist. MSS. Comm. 12th Rept.

NARCISSUS, in Greek mythology, son of the river god Cephissus and the nymph Leiriope, distinguished for his beauty. The seer Teiresias told his mother that he would have a long life, provided he never looked upon his own features. His rejection of the love of the nymph Echo (*q.v.*) drew upon him the vengeance of the gods. Having fallen in love with his own reflection in the waters of a spring, he pined away (or killed himself) and the flower that bears his name sprang up on the spot where he died. According to Pausanias, Narcissus, to console himself for the death of a favourite twin-sister, his exact counterpart, sat gazing into the spring to recall her features by his own. Narcissus, representing the early spring-flower, which for a brief space beholds itself mirrored in the water and then fades, is one of the many youths whose premature death is recorded in Greek mythology (cf. Adonis, Linus, Hyacinthus); the flower itself was regarded as a symbol of such death. It was the last flower gathered by Persephone before she was carried off by Hades, and was sacred to Demeter and Core (the cult name of Persephone), the great goddesses of the underworld. From its associations Wiescler takes Narcissus himself to be a spirit of the underworld, of death and rest. It is possible that the story may have originated in the superstition (alluded to by Artemidorus, *Oneirocritica*, ii. 7) that it was an omen of death to dream of seeing one's reflection in water.

See Ovid, *Metam.* iii. 341-510; Pausanias ix. 31; Conon, *Narrationes*, 24; F. Wieseler, *Narkissos* (1856); Greve in Roscher's *Lexikon der Mythologie*; J. G. Frazer, *The Golden Bough* (1900), i. 293.

NARCISSUS, a genus of bulbous plants belonging to the family Amaryllidaceae, natives of central Europe and the Mediterranean region; one species *N. Tazetta*, extends through Asia to Japan. From these, or rather from some of these, by cultivation and hybridization, have arisen the very numerous modern varieties. The plants have long narrow leaves springing from the bulb and a central scape bearing one or more generally large, white or yellow, drooping or inclined flowers, which are enveloped before opening in a membranous spathe. The flowers are regular, with a perianth springing from above the ovary, tubular below, with spreading segments and a central corona; the six stamens are inserted within the tube. The most interesting feature botanically is the "corona" or "cup," which springs from the base of the flower-segments. This gives the special character to the flower, and the members of the genus are classified according to the length of this organ as compared with that of the segments. The most probable supposition is that the cup is simply an excrescence or "enation" from the mouth of the flower-tube, and is connected with the fertilization of the flowers by insect agency.

FIG. 1.—Flowers of Narcissus (*Narcissus Tazetta*) bursting from the sheathing bract or spathe, *b*.

There are five well-marked sections.

1. The hoop-petticoat narcissi, sometimes separated as the genus *Corbularia*, are not more than from 3 to 6 in. in height, and have grassy foliage and yellow or white flowers. These have the coronet in the centre of the flower very large in proportion to the other parts, and much expanded, like the old hooped petticoats. They are now all regarded as varieties or forms of the common hoop-petticoat, *N. Bulbocodium*, which has comparatively large bright yellow flowers; *N. tenuifolius* is smaller and somewhat paler and with slender erect leaves; *N. citrinus* is pale lemon yellow and larger; while *N. monophyllus* is white. The small bulbs should be taken up in summer and replanted in autumn and early winter, according to the state of the season. They bloom about March or April in the open air. The soil should be free and open, so that water may pass off readily.

2. A second group is that of the Pseudonarcissi, constituting the genus *Ajax* of some botanists, of which the daffodil, *N. Pseudonarcissus* is the type. The daffodil (fig. 2) is common in woods and

FIG. 2.—Daffodil—(*Narcissus Pseudonarcissus*).
1, Flower cut open; 2, pistil; 3, horizontal plan of flower.

thickets in most parts of the north of Europe, but is rare in Scotland. Its leaves are five or six in number, are about 1 ft. in length and 1 in. in breadth, and have a blunt keel and flat edges. The stem is about 18 in. long and the spathe single-flowered. The flowers are large, yellow, scented and a little drooping, with a corolla deeply cleft into six lobes and a bell-shaped corona which is crisped at the margin; they appear in March or April. In this species the corona is also very large and prominent, but is more elongated and trumpet-shaped, while the other members are regarded as subspecies or varieties of this. Of this group the most striking one perhaps is *N. bicolor*, which has the perianth almost white and the corona deep yellow; it yields a number of varieties, some of the best known being Empress, Horsfieldi, Grandee, Ellen Willmott, Victoria, Weardale Perfection, &c. *N. moschatus*, a native of the Pyrenees and the Spanish peninsula, is a cream-coloured subspecies of great beauty with several forms. *N. cyclamineus* is a pretty dwarf subspecies, native of Portugal, with narrow linear leaves and drooping flowers with reflexed lemon-yellow segments and an orange-yellow corona. *N. major* is a robust form with leaves ½–¾ in. broad and bright lemon-yellow flowers 2–2½ in. long; *maximus* is a closely-related but still finer form; *obvallaris* (the Tenby daffodil) is an early form with

uniformly yellow flowers. *N. minor* and *minimus* are miniature repetitions of the daffodil. All these grow well in good garden soil, and blossom from March onwards, coming in very early in genial seasons.

3. Another group, the mock narcissi or star daffodils, with coronets of medium size, includes the fine and numerous varieties of *N. incomparabilis*, one of which, with large, double flowers, is known as butter-and-eggs; *N. odorus*, known as the campernelle jonquil, has two to four uniform bright yellow flowers, and is considered a hybrid between *N. Jonquilla* and *N. Pseudonarcissus*. A form with sweet-scented double flowers is known as Queen Ann's jonquil; *N. juncifolius*, a graceful little plant from Spain, Portugal and south France, has one to four small bright yellow flowers on each scape. The hardier forms of this set thrive in the open border, but the smaller sorts, like Queen Ann's jonquil, are better taken up in autumn and replanted in February; they bloom freely about April or May. *N. triandrus*—Ganymede's Cup—is a pretty little species with white flowers about 1 in. long; in several of its varieties the flowers are a pale or deeper yellow; they make attractive pot plants.

4. The polyanthus or bunch narcissi form another well-marked group, whose peculiarity of producing many flowers on the stem is indicated by the name. In these the corona is small and shallow as compared with the perianth. Some of the hardier forms, as *N. Tazetta* itself, the type of the group, succeed in the open borders in light well-drained soil, but the bulbs should be deeply planted, not less than 6 or 8 in. below the surface, to escape risk of injury from frost. Many varieties of this form of narcissus, such as Grand Monarque, Paper white, Soleil d'or, are grown. They admit of being forced into early bloom, like the hyacinth and tulip. They vary with a white, creamy or yellow perianth, and a yellow, lemon, primrose or white cup or coronet; and, being richly fragrant, they are general favourites amongst spring flowers. Many tons of these flowers are exported from the Scilly Isles to the London markets in spring. The "Chinese sacred lily" or "joss flower" is a form of *N. Tazetta*. The jonquil, *N. Jonquilla*, with yellow flowers, a native of south Europe and Algeria, of which there are single and double flowered varieties, is also grown in pots for early flowering, but does well outside in a warm border.

5. There remains another little group, the poet's or pheasant's-eye narcissi (*N. poeticus*), in which the perianth is large, spreading and conspicuous, and the corona very small and shallow. These pheasant's-eye narcissi, of which there are several well-marked varieties, as *radiiflorus*, *poetarum*, *recurvus*, &c., blossom in succession during April and May, and all do well in the open borders as permanent hardy bulbs. *N. biflorus*, the primrose peerless, a two-flowered whitish yellow-cupped species, equally hardy and easy of culture, is a natural hybrid between *N. poeticus* and *Tazetta*. *N. gracilis*, a yellow-flowered species, has also been regarded as a hybrid between *N. Tazetta* and *N. juncifolius*, and blooms later.

Of late years some remarkably fine hybrids have been raised between the various distinct groups of narcissi, and the prices asked for the bulbs in many cases are exceedingly high. One of the most distinct groups is that known under the name of "Poetaz"—a combination of *poeticus* and *Tazetta*. The best forms of *poeticus ornatus* have been crossed with the bunch-flowered Tazettas, and have resulted in producing varieties with large trusses of exquisite flowers more or less resembling the ornatus parents, and varying in colour from the purest white to yellow, the rim of the corona being in most cases conspicuously and charmingly coloured with red or crimson. This is an excellent group for cutting purposes, but it will take a few more years to make the varieties common.

For an account of the history and culture of the narcissus see F. W. Burbidge, *The Narcissus* (1875); a more recent scientific treatment of the genus will be found in J. G. Baker's *Handbook of Amaryllideae* (1888); see also Nicholson, *Dictionary of Gardening* (1886); and J. Weathers, *Practical Guide to Garden Plants* (1901).

NARCOTICS (Gr. *ναρκωτικός*, making numb), a general term for substances having the physiological action, in a healthy animal, of producing lethargy or stupor, which may pass into a state of profound coma or unconsciousness along with complete paralysis, terminating in death. Certain substances of this class are used in medicine for the relief of pain, and are then called anodynes, whilst another group produce profound sleep, and are consequently known as hypnotics. In one sense, anaesthetics, such as chloroform and ether, may be held to be narcotics, but, as they are usually volatile substances causing unconsciousness for a comparatively short time, they are conveniently separated from the true narcotics, the effects of which are much more lasting. These distinctions are to a great extent artificial, as it is evident that a substance capable of producing partial insensibility to pain, or sleep, will inevitably in larger doses cause profound coma ending in death. Hence we find the same substances sometimes classed as anodynes and at other times as hypnotics. For example, small doses of opium, or of one or other of its preparations, relieve pain, whilst larger doses act as hypnotics, causing deep sleep passing into coma. Cannabis Indica, belladonna and hyoscyamus, are also anodyne in their action. The chief narcotics are mentioned below.

Opium is the inspissated juice of the *Papaver somniferum*, containing 7·5 to 10·5% of anhydrous morphine. Besides morphine some of the other alkaloids contained in it are of a narcotic nature, notably papaverine, narceine, meconine, cryptopine and narcotine, but the principal anodyne and narcotic effects are due to the morphine alkaloid. Though seasoned opium takers may take 20 to 30 grs. without noticeable effects, 1 to 3 grs. produces marked symptoms in the western races. Idiosyncrasy is marked in regard to the amount of opium a person can safely take. The medicinal dose is up to 2 grs., and the smallest dose that has been known to cause death in an adult is ½ gr. The narcotic properties of *Morphine* vary as to whether it is taken by the stomach or injected under the skin; 2 grs. by the stomach is dangerous, and a safe medicinal dose by the skin is ¼ to ½ gr. The smallest dose that has produced death in an adult was ¼ gr. given hypodermically. The motor centres of the brain and spinal cord are first stimulated by opium and morphine and later depressed; death in fatal cases being from paralysis of the respiratory centre of the medulla. For the treatment of poisoning see under OPIUM.

Cannabis indica or Indian Hemp (see HEMP).—The part used in medicine is the non-fertilized female spikes of the *Cannabis sativa*. The active constituent is the resin containing cannabin with the active principle cannabinol, the alkaloids cannabinene and tetanocannabine. *Cannabis indica* is sold in the East under various names. A confection of the drug made in Arabia is called hashisch. Churrus is the resin scraped off the leaves, and the dried leaf is called bang, gunga or ganga being the name given to the dried flowering tops sold for smoking. The medicinal dose is ½ to 1 gr. of the extract, 2 to 3 grs. is a poisonous dose, but there is no recorded fatal case in man. In Eastern countries the smoking of *Cannabis indica* produces a form of mania. The effects of smaller doses are intoxication of a pleasant character, exaltation, hallucinations and delirium, later dilatation of the pupils, drowsiness, sleep and coma. Indian hemp is an uncertain anodyne and hypnotic. When large quantities have been taken an emetic should be given or the stomach pump used, and endeavour to allay excitement until the effects have passed off.

Belladonna and Atropine.—The leaves of the *Atropa Belladonna* or deadly nightshade of which the active principle is atropine principally used as a sulphate. A small dose of belladonna or atropine causes dryness of the throat and mouth, dilatation of the pupils, dimness of vision except for distant objects and often double vision. The pulse becomes quick, rising, in an adult, from 80 to 120 or 160 beats per minute; and there is often a bright red flush over the skin. The intellectual powers are at first acute and strong, but they soon become confused. There is giddiness, confusion of thought, excitement, a peculiar talkative wakeful restiveness, in which the person shows that his mind is occupied by a train of fancies or is haunted by visions and spectres. Often there is violent delirium before sleep comes on. The sleep after a large dose deepens into stupor, with great muscular prostration or paralysis. During all the time the pupils are widely dilated. Death occurs from failure both of the heart's action and of respiration. The minimum lethal dose is not known, but 80 grs. of the root have caused death; ⅓ to ½ gr. hypodermically have caused dangerous symptoms and ¼ gr. would almost certainly be fatal. For the medicinal preparations and treatment of poisoning see BELLADONNA.

Stramonium.—The part of the plant used is the leaves and seed of the *Datura Stramonium* or thorn apple, the alkaloidal constituent being daturine, a variable mixture of hyoscine and atropine. The physiological action is almost identical with belladonna. Poisoning is usually due to children eating the seeds; the lethal dose is unknown. The symptoms produced are divided into three stages—delirium, sleep and deep coma. In case of slight poisoning a rash is one of the toxic symptoms. The treatment of poisoning is to give emetics, wash out the stomach and give stimulants and pilocarpine subcutaneously, also to apply warmth and to use artificial respiration if necessary.

Hyoscyamus, the leaves of the *Hyoscyamus niger* or henbane (*q.v.*). The active principle is hyoscyamine. The physiological action is almost similar to belladonna, with excitement and cardiac stimulation and afterwards depression and stupor, but the action of hyoscyamus on the heart is more powerful. In large doses it is a strong cerebral depressant, and produces dilatation of the pupil; ⅓ gr. of hyoscamine produces marked effects, sleepiness and dryness of the mouth; ¼ gr. by subcutaneous injection has produced fatal results. The treatment of hyoscyamus poisoning is similar to that of stramonium.

Hops (the *Humulus Lupulus*), containing the active principle lupuline, and *Lactucarium*, the juice of the *Lactuca virosa* (lettuce), containing an alkaloid lactucine, are very feeble narcotics, causing heaviness and sleep if taken in large doses.

Chloral Hydrate is a pure hypnotic which in larger doses is a powerful narcotic, producing prolonged sleep with depression of the cardiac and motor centres. It is an intrinsic cardiac poison, the

heart being arrested in diastole, with coincident respiratory failure. Chloral hydrate is not uniform in its action, some people manifesting great susceptibility to the drug. It is safe in small doses of 10 to 20 grs. It is difficult to say what is a lethal dose. Cases are recorded of recovery after 336 grs. taken with an equal amount of potassium bromide and even after a dose of 595 grs., but in susceptible persons 10 to 15 grs. have produced toxic symptoms and death has occurred after doses of from 30 to 45 grs. If seen early, the treatment is an emetic, but if the poison should have been already absorbed, stimulants, hot coffee, strychnine or digitalin hypodermically, with perhaps artificial respiration, may be required.

Alcohol in large quantities is a strong narcotic, producing the typical stages of preliminary excitement followed by drowsiness and profound coma, during which death may occur. The treatment is washing out the stomach to prevent the absorption of the poison and the use of strychnine hypodermically.

NARDI, JACOPO (b. 1476), Florentine historian, occupied various positions in the service of the Florentine republic after the expulsion of the Medici in 1494, and even on their return in 1512 he continued in the public service. In 1527 he joined in the movement for the expulsion of the family and was instrumental in defeating the Medicean troops under Cardinal Passerini, who were attacking the Palazzo della Signoria. When the Medici again definitely became masters of Florence in 1530, Nardi was exiled from the city and his property confiscated. He spent the rest of his days in various parts of Italy, chiefly in Venice, and wrote a statement of the claims of the Florentine exiles against the Medici, addressed to the emperor Charles V. The exact date of his death is unknown. His chief work is his *Istorie della Città di Firenze*, covering the period from 1498 to 1538, in part based on Biagio Buonaccorsi's *Diario*.

L. Arbib's edition of Nardi's history (Florence, 1842) contains a biography of the author, and so does that of Agenore Gelli (Florence, 1888).

NARES, SIR GEORGE STRONG (1831–), English Arctic explorer, son of a captain in the navy, was educated at the Royal Naval College at New Cross, and entered the navy in 1846. After being employed for some time on the Australian station, in 1852 he became mate of the "Resolute" in the Arctic expedition which was sent out in that year. Serving in the Crimea upon his return, he was appointed lieutenant in charge of the naval cadets on the inauguration of the "Britannia" training ship, and was then employed in surveying work on the N.E. coast of Australia and in the Mediterranean, attaining the rank of captain in 1869. While in command of the "Challenger" (1872–1874), in the famous voyage of deep-sea exploration round the world, he was ordered home to take command of the Arctic expedition which set sail in the spring of 1875 in the ships "Alert" and "Discovery." He published a narrative of the voyage on his return, and for his services was made K.C.B. (1876). Two years later he was sent in command of the "Alert" to survey Magellan Strait. From 1879 to 1896 he was attached to the Harbour Department of the Board of Trade. He retired from active service in 1886, and became a vice-admiral in 1892. (See POLAR REGIONS.)

NARGILE or NARGILEH, the Persian and Turkish name for a "hookah," a tobacco pipe with a long flexible tube for stem passing through a vessel containing water, often perfumed. This bowl was originally made of a coco-nut (Persian *nārgīl*), whence the name, but now glass, metal or porcelain, are also used.

NARNI (anc. Umbrian *Nequinum*, Rom. *Narnia*), a town and episcopal see of the province of Perugia, Italy, 65 m. N. of Rome by rail. Pop. (1901) 5200 (town), 12,773 (commune). It is picturesquely situated on a lofty rock (787 ft. above sea-level), 480 ft. above the Nera valley, at the point where the river traverses a narrow ravine, and commands a fine view. The cathedral and the portico of S. Maria della Pensola are buildings of the 11th century with flat arches; the former has some good Renaissance sculptures. There are other interesting churches; S. Francesco has a good doorway of the 14th century. In the town hall is a "Coronation of the Virgin" by D. Ghirlandaio. The town also contains some picturesque Gothic houses and palaces. Near the station, below the town, are factories of india-rubber and calcium carbide.

The Umbrian Nequinum was taken by the Romans after a long siege in 299 B.C., and a colony planted there against the Umbrians, taking its name from the river. It was among the twelve colonies that were punished for refusing help to Rome in 209 B.C. It was considered a suitable point to oppose a threatened march of Hasdrubal on Rome. It stood on the Via Flaminia, the great bridge of which over the river lies below the town. The original main road ran to Nuceria by Mevania; a branch by Interamna and Spoletium joined it at Forum Flaminii. According to some authors, the emperor Nerva was born at Narnia. The town is mentioned in the history of the Gothic wars. Procopius (*B.G.* i. 17) describes the site of the town, the river and the bridge—the latter as built by Augustus, and as having the highest arches that he knew. In the middle ages Narni was under the papal power. It was the birthplace of the well-known condottiere Erasmo Gattamelata.

See G. Eroli, *Miscellanea Storica Narnese* (2 vols., Narni, 1858–1862), and other works by the same author.

NARRAGANSETT, a township of Washington county, Rhode Island, U.S.A. on the W. shore of Narragansett Bay, about 25 m. S. of Providence and about 8 m. W.S.W. of Newport. Pop. (1890) 1408; (1900) 1523; (1905) 1469; (1910) 1250. Area about 15 sq. m. It is connected at Kingston Station (about 9 m. N.W.) by the Narragansett Pier railway with the shore line of the New York, New Haven & Hartford railway; an electric line connects with Providence. The southern part of the township is a peninsula, lying between the mouth of Narragansett Bay and an inlet separating this part of the township from South Kingstown. Narragansett Pier, within the township, has a fine bathing beach, which extends along the indented coast between the village and the mouth of the Pattaquamscutt river; the force of the surf is somewhat broken by Point Judith, about 5 m. S. (also in the township), on which there is a lighthouse. On a ridge overlooking the ocean and commanding a fine view is the Point Judith Country Club, with golf courses, tennis courts and a polo-field, on which is held a horse show at the close of each season. Many of the summer visitors at Narragansett Pier are from New England, New York and Philadelphia, but there is a sufficient number from Baltimore, Washington, Richmond, Louisville and other Southern cities to give to its society a noticeably Southern tone. Narragansett Pier was so-named from the piers that were built here late in the 18th century and early in the 19th to provide a port for the Narragansett Country, or southern Rhode Island, and it still has a coal wharf, and a yacht landing at the Casino. The development of the place as a summer resort was begun about the middle of the 19th century by the erection of a bathing-house and the conversion of some farm houses into boarding houses. The erection of large hotels and private residences soon followed, and the completion of the railway to the pier in 1876 increased its popularity. The District of Narragansett (in the town of South Kingstown) was organized in 1888 and in 1901 was incorporated as a separate township.

The town is named from the Narraganset Indians, a once-powerful Algonquian tribe, which occupied much of the shore of Narragansett Bay. Under their chief Canonicus (d. 1647) they were friendly to the early Rhode Island settlers, and under Miantonomo (*q.v.*) entered into a tripartite treaty with the Connecticut colonists and the Mohegans; but after the execution of Miantonomo the Narragansets under Miantonomo's son, Canonchet or Nanuntenoo, were less friendly. Their loyalty to the whites was suspected at the time of King Philip's War, and on the 19th of December 1675, at the Great or Cedar Swamp (Narragansett Fort) in the present town of South Kingstown (immediately west of the town of Narragansett), they were decisively defeated by the whites, under Governor Josiah Winslow of the Plymouth Colony. The site of the engagement is marked by a granite monument erected in 1906 by the Rhode Island Society of Colonial Wars. Canonchet escaped, but on the 2nd of August 1676 was captured near Stonington, Connecticut, and on the following day was executed. Most of the survivors of the tribe were later settled among the Niantic, to whom the name Narraganset has been transferred. There are now few survivors of pure Indian blood.

NARSES, NARSEH, NARSEUS, king of Persia, son of Shapur I. He rose as pretender to the throne against his grand-nephew Bahram III. in A.D. 292, and soon became sole king. He attacked

the Romans, but after defeating the emperor Galerius near Callinicum on the Euphrates in 296 was completely defeated in 297, and forced to conclude a peace, by which western Mesopotamia and five provinces on the left bank of the upper Tigris were ceded to the Romans and their sovereignty over the kingdom of Armenia was acknowledged. This peace, concluded in 297, lasted for forty years. Narses died in 303 and was succeeded by his son Hormizd II. (Ed. M.)

NARSES (*c.* 478–573) an important officer of Justinian, in the 6th century. He was a eunuch, but we are nowhere distinctly informed that he was of servile origin. A native of Persarmenia (that portion of Armenia which was allotted to Persia by the partition of 384), he may have been prepared and educated by his parents for service in an oriental court. If the statement that he died at the age of ninety-five be correct, he was born about 478. He was probably brought young to Constantinople, and attained a footing in the *officium* of the grand chamberlain. He rose to be one of the three (spectabiles) "chartularii," a position implying some literary attainment, and involving the custody of the archives of the household. Hence, probably in middle life, he became "praepositus sacri cubiculi," an "illustris," and entitled along with the praetorian prefects and the generals to the highest rank at the imperial court. In this capacity, in 530, he received into the emperor's obedience another Narses, a fellow-countryman, with his two brothers, Aratius and Isaac. These Persarmenian generals, having formerly fought under the standard of Persia, now in consequence of the successes of Belisarius transferred their allegiance to the emperor Justinian, came to Constantinople, and received costly gifts from the great minister.

In 532 the insurrection known as the Nika broke out in Constantinople, when for some hours the throne of Justinian seemed doomed to overthrow. It was saved partly by the courage of his wife, Theodora, and partly by the timely prodigality of Narses, who stole out into the capital, and with large sums of money bribed the leaders of the "blue" faction, which was aforetime loyal to the emperor, to shout as of old "Justiniane Auguste tu vincas."

The African and Italian wars followed. In the fourth year of the latter war (538) the splendid successes of Belisarius had awakened both joy and fear in the heart of his master. Reinforcements were sent into Italy, and Narses was placed at their head. Belisarius understood that Narses came to serve under him like any other officer of distinguished but subordinate rank, and he received a letter from Justinian which seemed to support this conclusion. But the friends of Narses continually plied him with suggestions that he, a great officer of the household, in the secrets of the emperor, had been sent to Italy, not to serve as a subaltern, but to hold independent command and win military glory for himself. The truth probably lay between the two. Justinian could not deprive his great general of the supreme command, yet he wished to have a very powerful emissary of the court constantly at his side. He would have him watched but not hampered.

The two generals met (A.D. 538) at Fermo on the Adriatic coast. The first interference of Narses with the plans of Belisarius was beneficial. John, one of the officers highest in rank under Belisarius, had pressed on to Rimini, contrary to the instructions of his chief, leaving in his rear the difficult fortress of Osimo (Auximum) untaken. His daring march had alarmed the Goths for Ravenna, and induced them to raise the siege of Rome; but he himself was now shut up in Rimini, and on the point of being forced by famine to surrender. Belisarius and his followers were prepared to let him pay the penalty of his rashness and disobedience. But his friend Narses so insisted on the blow to the reputation of the imperial arms which would be produced by the surrender of Rimini that he carried the council of war with him, and Belisarius had to plan a brilliant march across the mountains, in conjunction with a movement by the fleet, whereby Rimini was relieved while Osimo was still untaken. When Belisarius and John met, the latter ostentatiously thanked Narses alone for his preservation.

His next use of his authority was less fortunate. Milan, which was holding out for the Romans, was also hard pressed by famine. The two generals who were sent to relieve it loitered disgracefully over their march, and, when Belisarius wished to despatch further reinforcements, the commanders of these new troops refused to stir till Narses gave them orders. Belisarius wrote to the eunuch pointing out the necessity of unity of purpose in the imperial army. At length, grudgingly, Narses gave his consent, and issued the required orders; but it was too late. Milan had been compelled by extremity of famine to surrender, and with it the whole province of Liguria fell into the hands of the enemy. This event forced Justinian to recognize the dangers of even a partially divided command, and he recalled Narses to Constantinople.

Twelve years elapsed before Narses returned to Italy. Meanwhile there had been great vicissitudes of fortune both for the Romans and the Goths. Italy, which appeared to have been won by the sword of Belisarius, had been lost again by the exactions and misgovernment of Alexander. Totila had raised up a new army, had more than kept Belisarius at bay in five difficult campaigns (544–548) and now held nearly all the country. Belisarius, however, in this his second series of campaigns, had never been properly seconded by his master. In the spring of 552 Narses set sail from Salona on the Dalmatian coast with a large and well-appointed army. It was a Roman army only in name. Lombards, Heruli, Huns, Gepidae and even Persians followed the standard of Narses, men equal in physical strength and valour to the Goths, and inspired by the liberal pay which they received, and by the hope of plunder.

The eunuch seems to have led his army round the head of the Adriatic Gulf. By skilfully co-operating with his fleet, he was able to cross the rivers of Venetia without fighting the Gothic general Teias, who intended to dispute their passage. Having mustered all his forces at Ravenna, he marched southward. He refused to be detained before Rimini, being determined to meet the Gothic king as soon as possible with his army undiminished. The occupation of the pass of Furlo (Petra Pertusa) by the Goths prevented his marching by the Via Flaminia, but, taking a short circuit, he rejoined the great road near Cagli. A little farther on, upon the crest of the Appenines, he was met by Totila, who had advanced as far as Tadini, called by Procopius Tagina. Parleys, messages and harangues by each general followed. At length the line of battle was formed, and the Gothic army, probably greatly inferior in number to the Byzantine was hopelessly routed (July 552), the king receiving a mortal wound as he was hurrying from the battlefield.

With Totila fell the last hopes of the Gothic kingdom of Italy. Teias, who was proclaimed his successor, protracted for a few months a desperate resistance in the rocky peninsula of Castellamare, overlooking the bay of Naples. At length want of provisions forced him into the plain, and there by the river Sarno, almost in sight of Pompeii, was fought (553) a battle which is generally named from the overlooking range of Mons Lactarius (Monte Lettere). The actual site of the battle, however, is about half a mile from the little town of Angri, and its memory is still vaguely preserved by the name *Pozzo dei Goti* (well of the Goths). In this battle Teias was killed. He was the last king of the Ostrogoths.

The task of Narses, however, was not yet ended. By the invitation of the Goths an army of 75,000 warlike Alamanni and Franks, the subjects of King Theudibald, crossed the Alps under the command of two Alamannic nobles, the brothers Lothair and Buccelin (553). The great strategic talents of Narses were shown even more conspicuously in this, than in his previous and more brilliant campaigns. Against the small but gallant bands of Totila and Teias he had adopted the policy of rapid marches and imperative challenges to battle. His strategy in dealing with the great host from Gaul was of the Fabian kind. He kept them as long as he could north of the Apennines, while he completed the reduction of the fortresses of Tuscany. At the approach of winter he gathered his troops into the chief cities and declined operations in the field, while the Alamannic brothers marched through Italy, killing and

plundering. When the spring of 554 appeared, Lothaire with his part of the army insisted on marching back to Gaul, there to deposit in safety the plunder which they had reaped. In an unimportant engagement near Pesaro he was worsted by the Roman generals, and this hastened his northward march. At Ceneda in Venetia he died of a raging fever. Pestilence broke out in his army, which was so wasted as to be incapable of further operations in Italy. Meanwhile his brother Buccelin, whose army was also suffering grievously from disease, partly induced by free indulgence in the grapes of Campania, encamped at Casilinum, the site of modern Capua. Here, after a time, Narses accepted the offered battle (554). The barbarians, whose army was in the form of a wedge, pierced the Roman centre. But by a most skilful manœuvre Narses contrived to draw his lines into a curve, so that his mounted archers on each flank could aim their arrows at the backs of the troops who formed the other side of the Alamannic wedge. They thus fell in whole ranks by the hands of unseen antagonists. Soon the Roman centre, which had been belated in its march, arrived upon the field and completed the work of destruction. Buccelin and his whole army were destroyed, though we need not accept the statement of the Greek historian (Agathias ii. 9) that only five men out of the barbaric host of 30,000 escaped, and only eighty out of the Roman 18,000 perished.

The only other important military operation of Narses which is recorded—and that indistinctly—is his defeat of the Herulian king Sindbal, who had served under him at Capua, but who subsequently revolted, was defeated, taken captive and hanged by the eunuch's order (565). In the main the thirteen years after the battle of Capua (554–567) were years of peace, and during them Narses ruled Italy from Ravenna with the title of prefect.[1] He rebuilt Milan and other cities destroyed in the Gothic War; and two inscriptions on the Salarian bridge at Rome have preserved to modern times the record of repairs effected by him in the year 564.

His administration, however, was not popular. The effect of the imperial organization was to wring the last *solidus* out of the emaciated and fever-stricken population of Italy, and the belief of his subjects was that no small portion of their contributions remained in the eunuch's private coffers. At the close of 565 Justinian died, and a deputation of Romans waited upon his successor Justin II., representing that they found "the Greeks" harder taskmasters than the Goths, that Narses the eunuch was determined to reduce them all to slavery, and that unless he were removed they would transfer their allegiance to the barbarians. This deputation led to the recall of Narses in 567, accompanied, according to a somewhat late tradition, by an insulting message from the empress Sophia, who sent him a golden distaff, and bade him, as he was not a man, go and spin wool in the apartments of the women. "I will spin her such a hank," Narses is represented as saying, "that she shall not find the end of it in her lifetime"; and forthwith he sent messengers to the Lombards in Pannonia, bearing some of the fruits of Italy, and inviting them to enter the land which bore such goodly produce. Hence came the invasion of Alboin (568), which wrested the greater part of Italy from the empire, and changed the destinies of the peninsula.[2]

[1] Gibbon's statement that Narses was "the first and most powerful of the exarchs" is more correct in substance than in form. The title of exarch does not appear to be given to Narses by any contemporary writer. He is always "Praefectus Italiae," "Patricius" or "Dux Italiae," except when he bears the style of his former offices in the imperial household, "Ex-Praepositus [Cubiculi]" or "Chartularius."

[2] This celebrated story seems to be unknown to strictly contemporary authors. We find no hint of it in Agathias (who wrote between 566 and 582), in Marius (532–596), or in Gregory of Tours (540–594). The possibly contemporary *Liber Pontificalis* and Isidore of Seville (560–636) hint at the invitation to the Lombards. Fredegarius (so-called), who probably wrote in the middle of the 7th century, and Paul the Deacon, towards the close of the 8th, supply the saga-like details, which become more minute the farther the narrators are from the action. On the whole, the transaction, though it is too well vouched for to allow us to dismiss it as entirely fabulous, cannot take its place among the undoubted facts of history.

Narses, who had retired to Naples, was persuaded by the pope (John III.) to return to Rome. He died there about 573, and his body, enclosed in a leaden coffin, was carried to Constantinople and buried there. Several years after his death the secret of the hiding-place of his vast stores of wealth is said to have been revealed by an old man to the emperor Tiberius II., for whose charities to the poor and the captives they furnished an opportune supply.

Narses was short in stature and lean in figure. His freehandedness and affability made him very popular with his soldiers. Evagrius tells us that he was very religious, and paid especial reverence to the Virgin, never engaging in battle till he conceived that she had given him the signal. Our best authorities for his life are his contemporaries Procopius and Agathias. See Gibbon, *Decline and Fall*, vols. iv. and v., edited by J. B. Bury (1898). (T. H.)

NARSINGHGARH, a native state of Central India, in the Bhopal agency. Area, 741 sq. m.; pop. (1901) 92,093; estimated revenue, £33,000; tribute to Holkar, £4000. The chief, whose title is raja, is a Rajput of the Omat clan. The state was founded about 1681 by a minister of Rajgarh, who compelled the ruler of that state to transfer to him half his territory. The town of Narsinghgarh had a population in 1901 of 8778.

NARSINGHPUR, a town and district of British India, in the Nerbudda division of the Central Provinces. The town is on the river Singri, and has a railway station 52 m. E. of Jubbulpore; pop. (1901) 11,233. The district has an area of 1976 sq. m. It forms a portion of the upper part of the Nerbudda valley. The first of those wide alluvial basins which, alternating with rocky gorges, give so varied a character to the river's course, opens out just below the famous marble rocks in Jubbulpore, and extends westward for 225 m., including the whole of Narsinghpur, together with the greater part of Hoshangabad. The Satpura hills to the south are here a generally regular range, nowhere more than 500 ft. above the plain, and running almost parallel to the river, at a distance of 15 or 20 m. In the intervening valley, the rich level of black wheat land is seldom broken, except by occasional mounds of gravel or nodular limestone, which afford serviceable village sites. Along the foot of the boundary hills the alluvium gives way to belts of red gravelly soil, rice and sugar-cane take the place of wheat, and forest trees that of mango groves. The population in 1901 was 315,518, showing a decrease of 14·5% in the decade, due to famine. The principal crops are wheat, millets, rice, pulses, oil-seeds and cotton. There are manufactures of cotton, silk, brass and iron-ware. At Mohpani are coal-mines. The Great Indian Peninsula railway runs through the district, with a branch to Mohpani.

See *Narsinghpur District Gazetteer* (Bombay, 1906).

NARTHEX (Gr. νάρθηξ, the name of the plant giant-fennel, in Lat. *ferula*), the name applied in architecture, probably from a supposed resemblance in shape to the reed-like plant, to the long arcaded porch forming the entrance into a Christian church, to which the catechumens and penitents were admitted. Sometimes there was a second narthex or vestibule within the church, when the outer one was known as the exonarthex. In Byzantine churches this inner narthex formed part of the main structure of the church, being divided from it by a screen of columns. A narthex is found in some German churches, where, however, it had no ritual meaning but was introduced as a western transept to give more importance to the west end. One of the finest examples to be found in England is that of Ely cathedral, where its northern portion, however, was apparently never completed.

NARVA (*Rugodiv* of Russian annals, also *Ivangorod*), a seaport and fortress of Russia, in the government of St Petersburg, 100 m. by rail W.S.W. of the city of St Petersburg. Pop. (1897) 16,577. It stands on the Narova river, which flows from Lake Peipus or Chudskoye, and enters the Gulf of Finland in Narva Bay, 8 m. below this town. The town was founded in 1223 by Danes, and changed hands between the Teutonic knights, Danes, Swedes and Russians until it was taken by Peter the Great in 1704, after the Russians had suffered here a terrible defeat at the hands of Charles XII. of Sweden four years

before. Its fortress, built on the right bank of the river, and known as Ivangorod, has lost its importance, and was abandoned in 1864. The cathedral and the town hall (1683) contain interesting antiquities. There are here an arsenal, a small museum and a school of navigation. Several manufactories utilize the waterfalls of the Narova, *e.g.* cotton-mills, woollen cloth mills, flax and jute mills, saw-mills and steam flour mills. The total trade falls short of half a million sterling annually. A watering-place has grown up at Ust-Narova, or Hungerburg, at the mouth of the Narova.

NARVACAN, a town of the province of Ilocos Sur, Luzon, Philippine Islands, near the coast and on the main road 13 m. S.S.E. of Vigan, the capital. Pop. (1903) 19,575. It lies in a level valley surrounded by mountains, and has a cool and healthy climate. The soil, both in the valley and on the neighbouring mountain-sides, is very fertile, and produces rice, vegetables, Indian corn, indigo, cotton, tobacco, maguey and sugar-cane. Cotton fabrics are woven by the women and sold to the mountain tribes. The language of the town is Ilocano.

NARVAEZ, PÁNFILO DE (*c.* 1480–1528), Spanish adventurer, was an hidalgo of Castile, born at Valladolid about 1480. He was one of the subordinates of Velazquez in the reduction of Cuba, and, after having held various posts under his governorship, was put at the head of the force sent to the Aztec coast to compel Cortes to renounce his command; he was surprised and defeated, however, by his abler and more active compatriot at Cempoalla, and made prisoner with the loss of an eye (1520). After his return to Spain he obtained from Charles V. a grant of Florida as far as the River of Palms; sailing in 1527 with five ships and a force of about 600 men, he landed, probably near Pensacola Bay, in April 1528, and, striking inland with some 300 of his followers, reached "Apalache" on June 25. The prospects of fabulous wealth which had sustained them in their difficult and perilous journey having proved illusory a return to the coast was determined, and the Bahia de los Caballos, at or near St Mark's, was reached in the following month. Having built rude boats, the much-reduced company sailed hence for Mexico on September 22, but the vessel which carried Narvaez was driven to sea in a storm and perished. His lieutenant, Cabeza de Vaca, with three others who ultimately reached land, made his way across Texas to the Gulf of California. (See FLORIDA.)

See Prescott, *Conquest of Mexico*; H. H. Bancroft, *Mexico* (1882–1890); and the *Naufragio* of Alvaro Nuñez Cabeza de Vaca in the *Biblioteca* of Rivadeneyra, xxii.

NARVAEZ, RAMON MARIA (1800–1868), Spanish soldier and statesman, was born at Loja, Granada, on the 4th of August 1800, entered the army at an early age, and saw active service under Mina in Catalonia in 1822. He was in his sympathies a Conservative, and could not go all lengths with the Radical opposition to Ferdinand VII., whom he served after his restoration. When the king died, Narvaez became one of the Conservative supporters of Isabel II. He achieved great popularity by his victory over Gomez, the Carlist general, near Arcos, in November 1836, and after clearing La Mancha of brigands by a vigorous policy of suppression in 1838 he was appointed captain-general of Old Castile, and commander-in-chief of the army of reserve. In 1840, for the part he had taken at Seville in the insurrection against Espartero and the Progresista party, he was compelled to take refuge in France, where, in conjunction with Maria Cristina, he planned the expedition of 1843 which led to the overthrow of his adversary. In 1844 he became prime minister, and was created field-marshal and duke of Valencia, but his policy was too reactionary to be tolerated long, and he was compelled to quit office in February 1846. He now held the post of ambassador at Paris, until again called to preside over the council of ministers in 1847; but misunderstandings with Maria Cristina led to his resignation in the following year. His ministry succeeded that of O'Donnell for a short time in 1856–1857, and he again returned to power for a few months in 1864–1865. He once more replaced O'Donnell in July 1866, and was still in office when he died at Madrid on the 23rd of April 1868.

Some very curious notices of Narvaez may be found in the letters of Prosper Merimée to Panizzi (1881). For his general political career see Hermann Baumgarten, *Geschichte Spaniens v. Ausbruch d. französ. Revol. bis auf unsere Tage* (1865–1871); and the *Historia Contemporanea* of Antonio Pirala (1871–1879).

NARVIK or VICTORIAHAVN, a seaport on the Ofoten Fjord of the north-west coast of Norway, in Nordland *amt* (county), 68° 30′ N. It is wholly modern, developed by the construction and completion (1903) of the Ofoten railway, the most northerly in the world. There are extensive quays, from which is shipped the iron ore from the rich districts traversed by the line. Narvik is 167 m. N.W. of Gellivara, and 982 N. by W. of Stockholm by the railway. In summer express trains cover the whole distance in two days. Narvik is a convenient point from which to visit the beautiful Lofoten Islands.

NARWHAL, the Scandinavian name of a cetacean (*Monodon monoceros*), characterized by the presence in the male of a long horn-like tusk. In the adult of both sexes there are only two teeth, both in the upper jaw, which lie horizontally side by side, and in the female remain throughout life concealed in cavities of the bone. In the male the right tooth usually remains similarly concealed, but the left is immensely developed, attaining a length equal to more than half that of the entire animal. In a narwhal 12 ft. long, from snout to end of tail, the exserted portion of the tusk may measure 6 or 7 and occasionally 8 ft. in length. It projects horizontally forwards from the head in the form of a cylindrical or slightly tapering, pointed tusk, composed of ivory, with a central cavity reaching almost to the apex, without enamel, and with the surface marked by spiral grooves and ridges, running in a sinistral direction. Occasionally both left and right tusks are developed, in which case the direction of the grooves is the same in both. No instance has ever been met with of the complete development of the right tusk associated with a rudimentary condition of the left. In young animals several small additional teeth are present, but these usually disappear soon after birth.

The head is rather short and rounded; the fore limbs or paddles are small and broad compared with those of most dolphins; and (as in the beluga) a dorsal fin, found in nearly all other members of the group, is wanting. The general colour of the surface is dark grey above and white below, variously marbled and spotted with shades of grey.

The narwhal is an Arctic whale, frequenting the icy circumpolar seas, and rarely seen south of 65° N. lat. Four instances have, however, been recorded of its occurrence on the British coasts, one on the coast of Norfolk in 1588, one in the Firth of Forth in 1648, one near Boston in Lincolnshire in 1800, while a fourth entangled itself among rocks in the Sound of Weesdale, Shetland, in September 1808. Like most cetaceans it is gregarious and usually met with in "schools" or herds of fifteen or twenty individuals. Its food appears to be cuttlefishes, small fishes and crustaceans. The purpose served by the tusk—or "horn"—is not known; and little is known of the habits of narwhals. Scoresby describes them as "extremely playful, frequently elevating their horns and crossing them with each other as in fencing." They have never been known to charge and pierce the bottom of ships with their weapons, as the swordfish does. The name "sea-unicorn" is sometimes applied to the narwhal. The ivory of which the tusk is composed is of very good quality, but owing to the central cavity, only fitted for the manufacture of objects of small size. The entire tusks are sometimes used for decorative purposes, and are of considerable, though fluctuating, value. (See CETACEA.) (W. H. F.)

NASCIMENTO, FRANCISCO MANOEL DE (1734–1819), Portuguese poet, better known by the literary name of *Filinto Elysio*, bestowed on him by the Marqueza de Alorna, was the reputed son of a Lisbon boat-owner. In his early years he acquired a love of national customs and traditions which his humanist education never obliterated, while, in addition, he learnt to know the whole range of popular literature (*litteratura de cordel*)—songs, comedies, knightly stories and fairy tales, which were then printed in loose sheets (*folhas volantes*) and sold by the blind in the streets of the capital. These circumstances

explain the richness of his vocabulary, and joined to an ardent patriotism they fitted him to become the herald of the literary revival known as Romanticism, which was inaugurated by his distinguished follower Almeida Garrett. Nascimento began to write verses at the age of fourteen. He was ordained a priest in 1754, and shortly afterwards became treasurer of the Chagas church in Lisbon. He led a retired life, and devoted his time to the study of the Latin classics, especially Horace, and to the society of literary friends, among whom were numbered some cultivated foreign merchants. These men nourished the common ambition to restore Camoens, then half forgotten, to his rightful place as the king of the Portuguese Parnassus, and they proclaimed the cult of the Quinhentistas, regarding them as the best poetical models, while in philosophy they accepted the teaching of the French Encyclopaedists.

Nascimento's first publication was a version of one of Metastasio's operas, and his early work consisted mainly of translations. Though of small volume and merit, it sufficed to arouse the jealousy of his brother bards. At this time the Arcadia was working to restore good taste and purify the language of gallicisms, but the members of this society forgot the traditions of their own land in their desire to imitate the classics. Nascimento and other writers who did not belong to the Arcadia, formed themselves into a rival group, which met at the Ribeira das Náos, and the two bodies attacked one another in rhyme without restraint, until the "war of the poets," as it was called, ended with the collapse of the Arcadia. Nascimento now conceived a strong but platonic affection for D. Maria de Almeida, afterwards Condessa da Ribeira, sister of the famous poetess the Marqueza de Alorna. This lady sang the chansonnettes he wrote for her, and their poetical intercourse drew from him some lyrics of profound emotion. This was the happiest epoch of his life, but it did not last long. The accession of D. Maria I. inaugurated an era of reaction against the spirit and reforms of Pombal, and religious succeeded to political intolerance. In June 1778 Nascimento was denounced to the Inquisition on the charge of having given vent to heterodox opinions and read "the works of modern philosophers who follow natural reason." The tribunal held a secret inquiry, and without giving him an opportunity of defence issued an order for his arrest, which was to take place early in the morning of the 14th of July. He had received a warning, and succeeded in escaping to the house of a French merchant, Verdier, where he lay hid for eleven days, at the end of which his friend the Marquez de Marialva put him on board a French ship which carried him to Havre. Nascimento took up his residence in Paris, and his first years there passed pleasantly enough. Soon, however, his circumstances changed for the worse. He received the news of the confiscation of his property by the Inquisition; and though he strove to support himself by teaching and writing he could hardly make both ends meet. In 1792 his admirer Antonio de Araujo, afterwards Conde de Barca, then Portuguese minister to Holland, offered the poet the hospitality of his house at the Hague, but neither the country, the people, nor the language were congenial, and when his host went to Paris on a diplomatic mission in 1797 Nascimento accompanied him, and spent the rest of his life in-and near the French capital. He retained to the end an intense love of country, which made him wish to die in Portugal, and in 1796 a royal decree permitting his return there and ordering the restoration of his goods was issued, but delays occurred in its execution, and the flight of the court to the Brazils as a result of the French invasion finally dashed his hopes. Before this the Conde de Barca had obtained him a commission from the Portuguese government to translate the *De Rebus Emanuelis* of Osorio; the assistance of some fellow-countrymen in Paris carried him through his last years, which were cheered by the friendship of his biographer and translator Alexandre Sané and of the Lusophil Ferdinand Dénis. Lamartine addressed an ode to him; he enjoyed the esteem of Chateaubriand; and his admirers at home, who imitated him extensively, were called after him *Os Filintistas*. Exile and suffering had enlarged his ideas and given him a sense of reality, making his best poems those he wrote between the ages of seventy and eighty-five, and when he passed away, it was recognized that Portugal had lost her foremost contemporary poet.

Garrett declared that Nascimento was worth an academy in himself by his knowledge of the language, adding that no poet since Camoens had rendered it such valuable services; but his truest title to fame is that he brought literature once more into touch with the life of the nation. By his life, as by his works, Nascimento links the 18th and 19th centuries, the Neo-Classical period with Romanticism. Wieland's *Oberon* and Chateaubriand's *Martyrs* opened a new world to him, and his *contos* or scenes of Portuguese life have a real romantic flavour; they are the most natural of his compositions, though his noble patriotic odes—those "To Neptune speaking to the Portuguese" and "To the liberty and independence of the United States"—are the most quoted and admired. On leaving Portugal, he abandoned the use of rhyme as cramping freedom of thought and expression; nevertheless his highly polished verses are generally robust to hardness and overdone with archaisms. His translations from Latin, French and Italian, are accurate though harsh, and his renderings of Racine and the Fables of Lafontaine entirely lack the simplicity and grace of the originals. But Nascimento's blank verse translation of the *Martyrs* is in many ways superior to Chateaubriand's prose.

BIBLIOGRAPHY.—The most useful edition of his collected works is that in 22 vols., Lisbon, 1836–1840. See Innocencio da Silva, *Diccionario bibliographico Portugues*, ii. 446-457 and ix. 332-336; also *Filinto Elysio e a sua Epoca*, by Pereira da Silva (Rio, 1891); and *Filinto Elysio*, by Dr Theophilo Braga (Oporto, 1891).

(E. Pa.)

NASEBY, a village of Northamptonshire, England, 7 m S.S.W. of Market Harborough, famous as the scene of the battle of June 14, 1645, which decided the issue of the first Civil War (see GREAT REBELLION). The army of King Charles I. was less than 10,000 strong, while the "New Model" army of the parliament, commanded by Sir Thomas Fairfax, numbered some 13,000, yet it was not without considerable hopes of victory that the Royalists drew up for battle, for although Lieutenant-General Cromwell had made the New Model cavalry formidable indeed, the Royalist foot had become professionalized in several years of war, whereas the Parliamentarian foot was newly organized, and in part at least but half-trained. Fairfax and Cromwell, however, were still more confident, and with better reason. The battlefield lies between Naseby and Sibbertoft (3 m. N. of Naseby) and is an undulating ridge which, near the centre of England, forms the "divide" between the Avon and the Welland rivers. Across this ridge the two armies were drawn up, the New Model facing north and the king's army south, the horse on the flanks and the foot in the centre in each army.

At the first shock the Royal foot asserted its superiority over the opposing infantry, four out of five regiments in the first line were broken, and Skippon, the major-general of the foot, was wounded. But Fairfax's regiment held its ground, until the second line of infantry advanced and re-established the front. Meantime the Royalist right wing of horse, led by Prince Rupert, had completely routed the horse of Colonel Ireton which opposed them. But the victors as usual indulged in a disorderly pursuit, and attempted to overpower the baggage guard of the enemy near Naseby village. Their incoherent attack was repulsed, and when Rupert, gathering as many of his men as he could, returned to the battlefield, the decisive stroke had been delivered by Cromwell and the right wing of Parliamentary horse. In front of him, in somewhat broken ground, was Sir Marmaduke Langdale's cavalry, which the lieutenant-general with his own well-trained regiments scattered after a short, fierce encounter. Cromwell's "godly" troopers did not scatter in pursuit. A few squadrons were ordered to keep the fugitives on the run, and with the rest, and such of Ireton's broken troops as he could gather, Cromwell attacked the Royalist centre in rear while Fairfax and his foot pressed it in front. Gradually the Royalist infantry, inferior in numbers, was disintegrated into small groups, which surrendered one after the other. But one brigade, called

the "Bluecoats," held out to the last, and was finally broken by a combined charge of Fairfax's regiment of foot, led by Cromwell, and the general's personal escort, led by Fairfax himself, who captured a colour with his own hand. The remnant of the king's army, re-formed by Rupert, stood inactive and irresolute while its infantry was being destroyed and then fled. The spoils included 100 standards and colours and the king's private papers. But more important than trophies was the practical annihilation of the last field army of which the king disposed. Half the Royalists were captured, and about 1000 fell, in the battle and the pursuit which followed it. In addition all the artillery and the muskets (to the number of 8000) and ammunition without which the king could scarcely create a new army, fell into the hands of the victors.

NASH, RICHARD (1674–1762), English dandy, better known as "BEAU NASH," was born at Swansea on the 18th of October 1674. He was descended from an old family of good position, but his father from straitened means had become partner in a glass business. Young Nash was educated at Carmarthen grammar school and at Jesus College, Oxford. He obtained a commission in the army, which, however, he soon exchanged for the study of law at the Temple. Here among "wits and men of pleasure" he came to be accepted as an authority in regard to dress, manners and style. When the members of the Inns of Court entertained William III. after his accession, Nash was chosen to conduct the pageant at the Middle Temple. This duty he performed so much to the satisfaction of the king that he was offered knighthood, but he declined the honour, unless accompanied by a pension. As the king did not take the hint, Nash found it necessary to turn gamester. The pursuit of his calling led him in 1705 to Bath, where he had the good fortune almost immediately to succeed Captain Webster as master of the ceremonies. His qualifications for such a position were unique, and under his authority reforms were introduced which rapidly secured to Bath a leading position as a fashionable watering-place. He drew up a new code of rules for the regulation of balls and assemblies, abolished the habit of wearing swords in places of public amusement and brought duelling into disrepute, induced gentlemen to adopt shoes and stockings in parades and assemblies instead of boots, reduced refractory chairmen to submission and civility, and introduced a tariff for lodgings. Through his exertions a handsome assembly-room was also erected, and the streets and public buildings were greatly improved. Nash adopted an outward state corresponding to his nominal dignity. He wore an immense white hat as a sign of office, and a dress adorned with rich embroidery, and drove in a chariot with six greys, laced lackeys and French horns. When the act of parliament against gambling was passed in 1745, he was deprived of an easy though uncertain means of subsistence, but the corporation afterwards granted him a pension of six score guineas a year, which, with the sale of his snuff-boxes and other trinkets, enabled him to support a certain faded splendour till his death on the 3rd of February 1762. He was honoured with a public funeral at the expense of the town. Notwithstanding his vanity and impertinence, the tact, energy and superficial cleverness of Nash won him the patronage and notice of the great, while the success of his ceremonial rule, as shown in the increasing prosperity of the town, secured him the gratitude of the corporation and the people generally. He was a man of strong personality, and considerably more able than Beau Brummell, whose prototype he was.

See Lewis Melville, *Bath under Beau Nash* (1908), with full list of authorities; Oliver Goldsmith, *Life of Richard Nash* (1762). See also *Gentleman's Magazine* (1762); *London Magazine*, vol. xxxi.; "The Monarch of Bath" in *Blackwood's Magazine*, vol. xlviii.

NASHE (or NASH), **THOMAS** (1567–1601), English poet, playwright and pamphleteer, was born at Lowestoft in 1567. His father belonged to an old Herefordshire family, and is vaguely described as a "minister." Nashe spent nearly seven years, 1582 to 1589, at St John's College, Cambridge, taking his B.A. degree in 1585–1586. On leaving the university he tried, like Greene and Marlowe, to make his living in London by literature. It is probable that his first effort was *The Anatomie of Absurditie* (1589) which was perhaps written at Cambridge, although he refers to it as a forthcoming publication in his preface to Greene's *Menaphon* (1589). In this preface, addressed to the gentlemen students of both universities, he makes boisterous ridicule of the bombast of Thomas Kyd and the English hexameters of Richard Stanihurst, but does not forget the praise of many good books. Nashe was really a journalist born out of due time; he boasts of writing "as fast as his hand could trot"; he had a brilliant and picturesque style which, he was careful to explain, was entirely original; and in addition to his keen sense of the ridiculous he had an abundance of miscellaneous learning. As there was no market for his gifts he fared no better than the other university wits who were trying to live by letters. But he found an opening for his ready wit and keen sarcasm in the Martin Marprelate controversy. His share in this war of pamphlets cannot now be accurately determined, but he has, with more or less probability, been credited with the following: *A Countercuffe given to Martin Junior* (1589), *Martins Months Minde* (1589), *The Returne of the renowned Cavaliero Pasquill and his Meeting with Marforius* (1589), *The First Parte of Pasquils Apologie* (1590), and *An Almond for a Parrat* (1590). He edited an unauthorized edition of Sidney's poems with an enthusiastic preface in 1591, and *A Wonderfull Astrologicall Prognostication*, in ridicule of the almanac-makers, by "Adam Fouleweather," which appeared in the same year, has been attributed to him. *Pierce Penilesse, His Supplication to the Divell*, published in 1592, shows us his power as a humorous critic of national manners, and tells incidentally how hard he found it to live by the pen. It seems to Pierce a monstrous thing that brainless drudges wax fat while "the seven liberal sciences and a good leg will scarce get a scholar bread and cheese." In this pamphlet, too, Nashe began his attacks upon the Harveys by assailing Richard, who had written contemptuously of his preface to Greene's *Menaphon*. Greene died in September 1592, and Richard's brother, Gabriel Harvey, at once attacked his memory in his *Foure Letters*, at the same time adversely criticizing *Pierce Penilesse*. Nashe replied, both for Greene and for himself, in *Strange Newes of the intercepting certaine Letters*, better known, from the running title, as *Foure Letters Confuted* (1592), in which all the Harveys are violently attacked. The autumn of 1592 Nashe seems to have spent at or near Croydon, where he wrote his satirical masque of *Summers Last Will and Testament* at a safe distance from London and the plague. He afterwards lived for some months in the Isle of Wight under the patronage of Sir George Carey, the governor. In 1593 he wrote *Christs Teares over Jerusalem*, in the first edition of which he made friendly overtures to Gabriel Harvey. These were, however, in a second edition, published in the following year, replaced by a new attack, and two years later appeared the most violent of his tracts against Harvey, *Have with you to Saffron-walden, or, Gabriell Harveys Hunt is up* (1596). In 1599 the controversy was suppressed by the archbishop of Canterbury. After Marlowe's death Nashe prepared his friend's unfinished tragedy of *Dido* (1596) for the stage. In the next year he was in trouble for a play, now lost, called *The Isle of Dogs*, for only part of which, however, he seems to have been responsible. The "seditious and slanderous matter" contained in this play induced the authorities to close for a time the theatre at which it had been performed, and the dramatist was put in the Fleet prison. Besides his pamphlets and his play-writing, Nashe turned his energies to novel-writing. He may be regarded as the pioneer in the English novel of adventure. He published in 1594 *The Unfortunate Traveller, Or the Life of Jack Wilton*, the history of an ingenious page who was present at the siege of Térouenne, and afterwards travelled in Italy with the earl of Surrey. It tells the story of the earl and Fair Geraldine, describes a tournament held by Surrey at Florence, and relates the adventures of Wilton and his mistress Diamante at Rome after the earl's return to England. The detailed, realistic manner in which Nashe relates his improbable fiction resembles that of Defoe. His last work is entitled *Lenten Stuffe* (1599)

and is nominally "in praise of the red herring," but really a description of Yarmouth, to which place he had retired after his imprisonment, written in the best style of a "special correspondent." Nashe's death is referred to in Thomas Dekker's *Knight's Conjuring* (1607), a kind of sequel to *Pierce Penilesse*. He is there represented as joining his boon companions in the Elysian fields "still haunted with the sharp and satirical spirit that followed him here upon earth." Had his patrons understood their duty, he would not, he said, have shortened his days by keeping company with pickled herrings. It may therefore be reasonably supposed that he died from eating bad and insufficient food. The date of his death is fixed by an elegy on him printed in Fitzgeffrey's *Affaniae* (1601).

The works of Thomas Nashe were edited by Dr A. B. Grosart in 1883–1885, and more recently by Ronald B. McKerrow (1904). An account of his work as a novelist may be found in the *English Novel in the Time of Shakespeare*, by J. J. Jusserand (Eng. trans., 1890). *The Unfortunate Traveller* was edited with an introduction by Edmund Gosse in 1892. See also "Nash's Unfortunate Traveller und Head's English Rogue, die beiden Hauptvertreter des englischen Schelmenromans," by W. Kollmann in *Anglia* (Halle, vol. xxii., 1899, pp. 81-140).

NASHUA, a city and one of the county seats of Hillsboro county, New Hampshire, U.S.A., at the confluence of the Nashua and Merrimac rivers, 35 m. S.S.E. of Concord and 40 m. N.W. of Boston by rail. Pop. (1890) 19,311; (1900) 23,898, of whom 8093 were foreign-born; (1910 census) 26,005. Nashua is served by the Boston & Maine railroad, whose several divisions centring here give the city commercial importance, and by electric lines to Hudson, Litchfield, Pelham, Dracut and Tyngsboro. The area of the city in 1906 was 30·71 sq. m. To the N.,W. and S.W. of the city there are beautiful hills and mountains. The church of Saint Francis Xavier and the First Congregational church are architecturally noteworthy. The city has a soldiers' monument, a public library, a court house and two hospitals. There is a United States fish hatchery here, and until after the close of the 18th century fishing was the principal industry of the place, as manufacturing is now. Water-power is furnished by the Nashua river and by Salmon Brook, and the city is extensively engaged in manufactures, notably cotton goods, boots, shoes, and foundry and machine-shop products. The value of the city's factory products increased from $10,096,064 in 1900 to $12,858,382 in 1905, or 27·4%, and in 1905 Nashua ranked second among the manufacturing cities of the state. Nashua is one of the oldest interior settlements of the state. The first settlement here was established about 1665; and in 1673 the township of Dunstable was incorporated by the General Court of Massachusetts. In 1741, when the boundary between Massachusetts and New Hampshire was settled, the jurisdiction of this portion of Dunstable was transferred to New Hampshire; five years later it was incorporated under the laws of that state; and in 1803 the settlement, originally known as Indian Head, was incorporated as a village under the name of Nashua, and in 1836 the township of Dunstable also received the name Nashua. The town of Nashville was set apart from the town of Nashua in 1842, but the two towns were united under a city charter obtained in 1853. In 1795 the first stage coach was run through here from Boston to Amherst, and at about the same time a canal was built around Pawtucket Falls on the Merrimac at Lowell. In 1822 a manufacturing company was formed, which at once began to develop the water-power and in 1825 erected the first cotton mill. Thirteen years later the Nashua & Lowell railroad (now leased to the Boston & Maine) first reached Nashua.

See *The History of the City of Nashua*, edited by E. E. Parker (Nashua, 1897).

NASHVILLE, the capital of Tennessee, U.S.A., and the county-seat of Davidson county, on the Cumberland river, 186 m. S.S.W. of Louisville, Kentucky. Pop. (1890) 76,168; (1900) 80,865, of whom 3037 were foreign-born and 30,044 were negroes; (1910 census) 110,364. Nashville is served by the Tennessee Central, the Louisville & Nashville, and the Nashville, Chattanooga & St Louis railways, and by several steamboat lines. The Cumberland river is crossed here by four foot-bridges. Nashville is situated on and between hills and bluffs in an undulating valley; its streets are paved with brick or granite blocks in the business section and macadamized or paved with asphalt in the residential sections. The city has fine public buildings, many handsome residences, and several beautiful parks. The principal building is the State House, a fine example of pure Greek architecture, on the most prominent hill-top, with a tower 205 ft. in height. On the grounds about it are a bronze equestrian statue of Andrew Jackson, by Clark Mills (1815–1883), and the tomb of President James K. Polk, who lived in Nashville. Other prominent buildings and institutions are the United States Government Building, the County Court House, the City Hall, the Tennessee School for the Blind, the Tennessee Industrial School, the State Library, the Library of the State Historical Society housed in Watkins Institute; a Carnegie library, park buildings, the State Penitentiary, Vendôme Theatre, the Board of Trade Building, the City Hospital, the St Thomas Hospital (Roman Catholic), and, near the city, a Confederate Soldiers' Home and a State Hospital for the Insane. Eleven miles east of the city is the "Hermitage," which was the residence of President Andrew Jackson.

The grounds of the Tennessee Centennial Exposition of 1897 (commemorating the admission of Tennessee into the Union) on the west border of the city now constitute Centennial Park, in which still stand the reproduced Parthenon of Athens, the History Building, which in general outline is a reproduction of the Erectheum and contains a museum and an art gallery, and a monument to the memory of James Robertson (1742–1814), the founder of the city. Besides this there are four other parks: Glendale Park in the south section, a place of much natural beauty; Shelby Park, in the eastern part of the city, fronting the river; Watkins Park, on the north; and Cumberland Driving Park. In Mount Olivet Cemetery is a beautiful Confederate Soldiers' monument surrounded by the graves of 2000 Confederate soldiers, and a little to the north of the city is a National Cemetery in which 16,643 Federal soldiers are buried, the names of 4711 of them being unknown.

Nashville is one of the foremost educational centres in the Southern states. In the western part of the city is Vanderbilt University. This institution, opened in 1875, is under the patronage of the Methodist Episcopal Church, South, and was named in honour of Cornelius Vanderbilt, who contributed $1,000,000 to its funds, and whose son, W. H. Vanderbilt, and grandsons, W. K. Vanderbilt and Cornelius Vanderbilt, gave to the university about $820,000. It is coeducational and embraces an academic department, a biblical department, and departments of engineering, law, medicine, pharmacy and dentistry; in 1909 it had 125 instructors and 959 students. The University of Nashville is a non-sectarian institution embracing a college department, a medical department, a preparatory department, and the George Peabody College for Teachers; it was incorporated under the laws of North Carolina as Davidson Academy in 1785 and under the laws of Tennessee as Cumberland College in 1806, and the present name was adopted in 1826. The George Peabody College for Teachers, an important part of the institution, was opened as a normal school in 1875; in 1907–1908 it had an enrolment (including the summer session) of 647 students. In 1909 it received $1,000,000 from the Peabody Fund, later supplemented by $250,000 from the state, $200,000 from the city and $100,000 from Davidson county. The University of Tennessee, located mainly at Knoxville, has at Nashville its medical and dental departments. Ward Seminary, opened in 1865, Boscobel College, opened in 1889, and Buford, Belmont and Radnor colleges are all non-sectarian institutions of Nashville for the higher education of women. For the education of negroes the city has Fisk University (opened in 1866, incorporated in 1867), under the auspices of the American Missionary Association and the Western Freedman's Aid Commission of the Congregational Church (noted since 1871 for its Jubilee Singers, who raised money for Jubilee Hall, finished in 1876); it embraces a college department, a preparatory department, a normal department and departments of theology, music and physical training; and Walden University, founded as Central Tennessee College in 1866, under the auspices of the

Methodist Episcopal Church, and embracing a college department, a normal department, an industrial department, and departments of English, commerce, law, medicine, dentistry, pharmacy, music, bible training, nurse training and domestic science. The Baptist, the Methodist Episcopal (South), the Cumberland Presbyterian, and the African Baptist and the African Methodist Episcopal churches have publishing houses in Nashville.

The leading manufactures of the city are flour and grist mill products (valued at $4,242,491 in 1905), lumber and timber products—Nashville is one of the greatest hard wood markets in the United States, and in 1905 the value of lumber and timber products was $1,119,162 and of planing-mill products, $1,299,066—construction and repair of steam railway cars ($1,724,007 in 1905), tobacco ($1,311,019 in 1905), fertilizers ($846,511 in 1905), men's clothing ($720,227 in 1905), saddlery, harness, soap and candles. The total value of the products of the factories increased from $15,301,096 in 1900 to $23,109,601 (16·8% of the entire factory product of the state) in 1905, amounts greater than those of any other city in the state. Nashville has a large trade in grain, cotton, groceries, dry goods, drugs, and boots and shoes. The water-works and the electric lighting plant are owned and operated by the municipality.

Nashville was founded in 1780 as "the advance guard of western civilization" by a company of two hundred or more pioneers under the leadership of James Robertson, the nearest settlement being at the time about three hundred miles distant. When first settled it was named Nashborough in honour of Abner Nash (1716–1786), who was at the time governor of North Carolina, or more probably in honour of the Revolutionary general, Francis Nash (1720–1777), a brother of Abner, killed at Germantown; but when, in 1784, it was incorporated as a town by the North Carolina legislature the present name was substituted. In 1806 Nashville was chartered as a city. Although it was not made the capital of the state until 1843, the legislature met here from 1812 with the exception of the period from 1815 to 1826. Many of the pioneers of Nashville were slain by the Creek and Cherokee Indians, and at times the settlement was saved from destruction only by the heroism of Robertson, but in 1794 the savages were dealt a crushing blow at Nickojack on the lower Tennessee and much more peaceful relations were established. On the 3rd of June 1850 a convention, known as the Southern or Nashville Convention, whose action was generally considered a threat of disunion, met here to consider the questions at issue between the North and the South. Since such a meeting had first been proposed by a state convention of Mississippi, the famous Compromise Measures of 1850 had been introduced in Congress and the support of the movement had been greatly weakened thereby except in South Carolina and Mississippi. Nine states, however, were represented by about 100 delegates, mostly Democrats, and the convention denounced the Wilmot Proviso, and, as "an extreme concession on the part of the South," promised to agree that, W. of Missouri, there should be slavery only in the territory S. of 36° 30′ N. lat. At an adjourned meeting in November it expressed its dissatisfaction with the Compromise Measures of Congress, and asserted the right of the South to secede.

During the Civil War Nashville was at first held by the Confederates, but early in 1862 it was occupied by the Federals, who retained possession of it to the end. The battle of Nashville was fought on the 15th and 16th of December 1864 between the Union army under Major-General G. H. Thomas and the Confederates under General J. B. Hood. The Union defences extended in a semicircle round Nashville, the flanks on the river above and below. Hood's army was to the south-east, lightly entrenched, with its flanks on two creeks which empty into the Cumberland above and below Nashville. This position he desired to maintain as long as possible so as to gather recruits and supplies in safety. If Thomas, whose army was of motley composition, attacked, he hoped to defeat him and to enter Nashville on his heels. Thomas, however, would not strike until he had his army organized. Then, on the 15th, he emerged from the entrenchments and by a vigorous attack on the Confederate left forced back Hood's line to a second position 1½ m. to the south. Hood, having detached a part of his army, desired to gain time to bring in his detachments by holding this line for another day. Thomas, however, gave him no respite. On the 16th the Union army deployed in front of him, again over-lapping his left flank, and although a frontal attack was repulsed, the extension of the Federal right wing compelled Hood to extend his own lines more and more. Then the Federals broke the attenuated line of defence at its left centre, and Hood's army drifted away in disorder. The pursuit was vigorous, and only a remnant of the Confederate forces reassembled at Columbia, 40 m. to the south, whence they fell back without delay behind the Tennessee.

NASI, JOSEPH (16th century), Jewish statesman and financier, was born in Portugal of a Jewish (Marano) family. Emigrating from his native land, he founded a banking house in Antwerp. Despite his financial and social prosperity there, he felt it irksome to be compelled to wear the guise of Catholicism, and determined to settle in a Mahommedan land. After two troubled years in Venice, Nasi betook himself to Constantinople. Here he proclaimed his Judaism, and married his beautiful cousin Reyna. He rapidly rose to favour, the sultans Suleiman and Selim promoting him to high office. He founded a Jewish colony at Tiberias which was to be an asylum for the Jews of the Roman Campagna. In 1566 when Selim ascended the throne, Nasi was made duke of Naxos. He had deserved well of Turkey, for he had conquered Cyprus for the sultan. Nasi's influence was so great that foreign powers often negotiated through him for concessions which they sought from the sultan. Thus the emperor of Germany, Maximilian II., entered into direct correspondence with Nasi; William of Orange, Sigismund August II., king of Poland, also conferred with him on political questions of moment. On the death of Selim in 1574, Nasi receded from his political position, but retained his wealth and offices, and passed the five years of life remaining to him in honoured tranquillity at Belvedere (Constantinople). He died in 1579. His career was not productive of direct results, but it was of great moral importance. It was one of the tokens of the new era that was to dawn for the Jews as trusted public officials and as members of the state.

See Graetz, *History of the Jews* (Eng. trans.), vol. iv. chs. xvi.-xvii.; *Jewish Encyclopedia*, ix. 172. (I. A.)

NASIK, a town and district of British India, in the central division of Bombay. The town is on the Godavari river, connected by a tramway (5 m.) with Nasik Road railway station, 107 m. N.E. of Bombay. Pop. (1901) 21,490. It is a very holy place of Hindu pilgrimage, being 30 m. from the source of the Godavari. Shrines and temples line the river banks, and some stand even in the river. In the vicinity there are a number of sacred caves, among which those of Pandu Lena are the most noteworthy. They are ancient Buddhist caves dating from the 3rd century before Christ to the 6th century after. There are numerous inscriptions of the highest historical value. Nasik has manufactures of cotton goods, brass-ware and mineral waters.

The DISTRICT OF NASIK has an area of 5850 sq. m. With the exception of a few villages in the west, the whole district is situated on a tableland from 1300 to 2000 ft. above sea-level. The western portion is hilly, and intersected by ravines, and only the simplest kind of cultivation is possible. The eastern tract is open, fertile and well cultivated. The Sahyadri range stretches from north to south; the watershed is formed by the Chander range, which runs east and west. All the streams to the south of that range are tributaries of the Godavari. To the north of the watershed, the Girna and its tributary the Mosam flow through fertile valleys into the Tapti. The district generally is destitute of trees, and the forests which formerly clothed the Sahyadri hills have nearly disappeared; efforts are now being made to prevent further destruction, and to reclothe some of the slopes. The district contains several old hill forts, the scenes of many engagements during the Mahratta wars. Nasik district

became British territory in 1818 on the overthrow of the peshwa. The population in 1901 was 816,504, showing a decrease of 3% in the decade. The principal crops are millet, wheat, pulse, oil-seeds, cotton and sugar cane. There are also some vineyards of old date, and much garden cultivation. Yeola is an important centre for weaving silk and cotton goods. There are flour-mills at Malegaon, railway workshops at Igatpuri, and cantonments at Deolali and Malegaon. At Sharanpur is a Christian village, with an orphanage of the C.M.S., founded in 1854. The district is crossed by the main line and also by the chord line of the Great Indian Peninsula railway.

NĀSIR KHOSRAU (Nasiri Khusru), Abū Mu'in-ed-din Nāsir b. Khosrau (1004–1088), whose *nom de plume* was Hujjat, the first great didactic poet of Persia, was born, according to his own statement, A.H. 394 (A.D. 1004), at Kubādiyān, near Balkh in Khorāsān. The first forty-two years of his life are obscure; we learn from incidental remarks of his that he was a Sunnite, probably according to the Hanifite rite, well versed in all the branches of natural science, in medicine, mathematics, astronomy and astrology, in Greek philosophy, and the interpretation of the Koran; that he was much addicted to worldly pleasures, especially to excessive wine drinking. He had studied Arabic, Turkish, Greek, the vernacular languages of India and Sind, and perhaps even Hebrew; he had visited Multān and Lahore, and the splendid Ghaznavide court under Sultān Mahmūd, Firdousī's patron. Later on he chose Merv for his residence, and was the owner of a house and garden there. In A.H. 437 (A.D. 1045) he appears as financial secretary and revenue collector of the Seljūk sultan Toghrul Beg, or rather of his brother Jāghir Beg, the emīr of Khorāsān, who had conquered Merv in 1037. About this time, inspired by a heavenly voice (which he pretends to have heard in a dream), he abjured all the luxuries of life, and resolved upon a pilgrimage to the holy shrines of Mecca and Medina, hoping to find there the solution of all his religious doubts. The graphic description of this journey is contained in the *Safarnāma*, which possesses a special value among books of travel, since it contains the most authentic account of the state of the Mussulman world in the middle of the 11th century. The minute sketches of Jerusalem and its environs are even now of practical value. During the seven years of his journey (A.D. 1045–1052) Nāsir visited Mecca four times, and performed all the rites and observances of a zealous pilgrim; but he was far more attracted by Cairo, the capital of Egypt, and the residence of the Fātimite sultan Mostanṣir billāh, the great champion of the Shī'a, and the spiritual as well as political head of the house of 'Alī, which was just then waging a deadly war against the 'Abbāside caliph of Bagdād, and the great defender of the Sunnite creed, Toghrul Beg the Seljūk. At the very time of Nāsir's visit to Cairo, the power of the Egyptian Fātimites was in its zenith; Syria, the Hejāz, Africa, and Sicily obeyed Mostanṣir's sway, and the utmost order, security and prosperity reigned in Egypt. At Cairo he became thoroughly imbued with Shī'a doctrines, and their introduction into his native country was henceforth the sole object of his life. The hostility he encountered in the propagation of these new religious ideas after his return to Khorāsān in 1052 and Sunnite fanaticism compelled him at last to flee, and after many wanderings he found a refuge in Yumgān (about 1060) in the mountains of Badakshān, where he spent as a hermit the last decades of his life, and gathered round him a considerable number of devoted adherents, who have handed down his doctrines to succeeding generations.

Most of Nāsir's lyrical poems were composed in his retirement, and their chief topics are—an enthusiastic praise of 'Alī, his descendants, and Mostanṣir in particular; passionate outcries against Khorāsān and its rulers, who had driven him from house and home; the highest satisfaction with the quiet solitude of Yumgān; and utter despondency again in seeing himself despised by his former associates and for ever excluded from participation in the glorious contest of life. But scattered through all these alternate outbursts of hope and despair we find precious lessons of purest morality, and solemn warnings against the tricks and perfidy of the world, the vanity of all earthly splendour and greatness, the folly and injustice of men, and the hypocrisy, frivolity and viciousness of fashionable society and princely courts in particular. It is the same strain which runs, although in a somewhat lower key, through his two larger mathnawis or double-rhymed poems, the *Rushanāināma*, or "book of enlightenment," and the *Sa'ādatnāma*, or "book of felicity." The former is divided into two sections: the first, of a metaphysical character, contains a sort of practical cosmography, chiefly based on Avicenna's theories, but frequently intermixed both with the freer speculations of the well-known philosophical brotherhood of Basra, the Ikhwān-es-safā'i, and purely Shi'ite or Isma'ilite ideas; the second, or ethical section of the poem, abounds in moral maxims and ingenious thoughts on man's good and bad qualities, on the necessity of shunning the company of fools and double-faced friends, on the deceptive allurements of the world and the secret snares of ambitious craving for rank and wealth. It concludes with an imaginary vision of a beautiful world of spirits who have stripped off the fetters of earthly cares and sorrows and revel in the pure light of divine wisdom and love. If we compare this with a similar allegory in Nāsir's diwān, which culminates in the praise of Mostanṣir, we are fairly entitled to look upon it as a covert allusion to the eminent men who revealed to the poet in Cairo the secrets of the Isma'ilitic faith, and showed him what he considered the "heavenly ladder" to superior knowledge and spiritual bliss. The passage, thus interpreted, lends additional weight to the correctness of Dr Ethé's reconstruction of the date of the *Rushanāināma*, viz. A.H. 440 (A.D. 1049), which, notwithstanding M. Schefer's objections, is warranted both by the astronomical details and by the metrical requirements of the respective verses. That of course does not exclude the possibility of the bulk of the poem having been composed at an earlier period; it only ascribes its completion or perhaps final revision to Nāsir's sojourn in Egypt.

A similar series of excellent teachings on practical wisdom and the blessings of a virtuous life, only of a severer and more uncompromising character, is contained in the *Sa'ādatnāma*; and, judging from the extreme bitterness of tone manifested in the "reproaches of kings and emīrs," we should be inclined to consider it a protest against the vile aspersions poured out upon Nāsir's moral and religious attitude during those persecutions which drove him at last to Yumgān. Of all the other works of our author mentioned by Oriental writers there has as yet been found only one, the *Zād-elmusāfirin* or "travelling provisions of pilgrims" (in the private possession of M. Schefer, Paris), a theoretical description of his religious and philosophical principles; and we can very well dismiss the rest as being probably just as apocryphal as Nāsir's famous autobiography (found in several Persian tadhkiras or biographies of poets), a mere forgery of the most extravagant description, which is mainly responsible for the confusion in names and dates in older accounts of our author.

See Sprenger's *Catalogue of the Libraries of the King of Oudh* (1854); H. Ethé, "Nāsir Chusrau's *Rushanāināma*," in *Zeitschrift der deutschen morgenländischen Gesellschaft*, xxxiii., xxxiv., 1879–1880; E. Fagnan, "Le Livre de la félicité," in vol. xxxiv. of the same journal, 643-674; Ch. Schefer, *Sefer Nameh, publié, traduit et annoté* (Paris, 1881), and by Guy le Strange in *Pilgrims' Text Society* (1888); H. Ethé, in *Göttinger Nachrichten*, 1882, pp. 124-152, *Z.D.M.G.*, 1882, pp. 478-508; and Geiger's *Grundriss der iranischen Philologie* ii. p. 278; Fagnan in *Journ. As.* 7th ser. vol. xiii. pp. 164 seq., and Rieu, *Cat. Pers. MSS. in Br. Mus.*, concluded that the poet and the pilgrim were different persons. The opposite view was developed by Ethé. (H. E.)

NASIRABAD, or MYMENSINGH, a town of British India, headquarters of Mymensingh district in Eastern Bengal and Assam, situated on the left bank of the old channel of the Brahmaputra, which is only navigable during the rainy season. Pop. (1901) 14,668. It has a station on the branch of the Eastern Bengal railway from Dacca to Jagannathganj, on the Jamuna or main stream of the Brahmaputra. The earthquake of the 12th of June 1897 destroyed the church and the high school, and seriously damaged other public buildings.

NASIRABAD is also the name of a town and cantonment in the district of Ajmere, Rajputana. Pop. (1901) 22,494. It forms the headquarters of a brigade in the 5th division of the Southern army.

NASMYTH, ALEXANDER (1758–1840), Scottish portrait and landscape painter, was born in Edinburgh on the 9th of September 1758. He studied at the Trustees' Academy under Runciman, and, having been apprenticed as an heraldic painter to a coach-builder, he, at the age of sixteen, attracted the attention of Allan Ramsay, who took the youth with him to London, and employed him upon the subordinate portions of his works. Nasmyth returned to Edinburgh in 1778, and was soon largely patronised as a portrait painter. He also assisted Mr Miller of Dalswinton, as draughtsman, in his mechanical researches and experiments; and, this gentleman having generously offered the painter a loan to enable him to pursue his studies abroad, he left in 1782 for Italy, where he remained two years. On his return he painted

the excellent portrait of Burns, now in the Scottish National Gallery, well known through Walker's engraving. Political feeling at that time ran high in Edinburgh, and Nasmyth's pronounced Liberal opinions, which he was too outspoken and sincere to disguise, gave offence to many of his aristocratic patrons, and led to the diminution of his practice as a portraitist. In his later years, accordingly, he devoted himself mainly to landscape work, and did not disdain on occasion to set his hand to scene-painting for the theatres. He has been styled, not unjustly, the "father of Scottish landscape art." His subjects are carefully finished and coloured, but are wanting in boldness and freedom. Nasmyth was also largely employed by noblemen throughout the country in the improving and beautifying of their estates, in which his fine taste rendered him especially skilful; and he was known as an architect, having designed the Dean Bridge, Edinburgh, and the graceful circular temple covering St Bernard's Well. Nasmyth died in his native city on the 10th of April 1840. His youngest son, James, was the well-known inventor of the steam-hammer. His six daughters all attained a certain local reputation as artists, but it was in his eldest son, Patrick (1787–1831), that the artistic skill of his family was most powerfully developed. Having studied under his father, Patrick went to London at the age of twenty, and soon attracted attention as a clever landscapist. He was a diligent student of the works of Claude and Richard Wilson, and of Ruysdael and Hobbema, upon whom his own practice was mainly founded. His most characteristic paintings are of English domestic scenery, full of quiet tone and colour, and detailed and minute expression of foliage, and with considerable brilliancy of sky effect. They were executed with his left hand, his right having in early life been injured by an accident.

For an account of the Nasmyth family see James Nasmyth's *Autobiography* (1883).

NASMYTH, JAMES (1808–1890), Scottish engineer, was born in Edinburgh on the 19th of August 1808, and was the youngest son of Alexander Nasmyth, the "father of Scottish landscape art." He was sent to school in his native city, and then attended classes in chemistry, mathematics and natural philosophy at the university. From an early age he showed great fondness for mechanical pursuits, and the skill he attained in the practical use of tools enabled him to make models of engines, &c., which found a ready sale. In 1829 he obtained a position in Henry Maudslay's works in London, where he stayed two years, and then, in 1834, started business on his own account in Manchester. The beginnings were small, but they quickly developed, and in a few years he was at the head of the prosperous Bridgewater foundry at Patricroft, from which he was able to retire in 1856 with a fortune. The invention of the steam-hammer, with which his name is associated, was actually made in 1839, a drawing of the device appearing in his note-book, or "scheme-book," as he called it, with the date 24th November of that year. It was designed to meet the difficulty experienced by the builders of the *Great Britain* steamship in finding a firm that would undertake to forge the large paddle-wheel shaft required for that vessel, but no machine of the kind was constructed till 1842. In that year Nasmyth discovered one in Schneiders' Creuzot works, and he found that the design was his own and had been copied from his "scheme-book." His title, therefore, to be called the inventor of the steam-hammer holds good against the claims sometimes advanced in favour of the Schneiders, though apparently he was anticipated in the idea by James Watt. Nasmyth did much for the improvement of machine-tools, and his inventive genius devised many new appliances—a planing-machine ("Nasmyth steam-arm"), a nut-shaping machine, steam pile-driver, hydraulic machinery for various purposes, &c. In his retirement he lived at Penshurst in Kent, and amused himself with the study of astronomy, and especially of the moon, on which he published a work, *The Moon considered as a Planet, a World and a Satellite*, in conjunction with James Carpenter in 1874. He died in London on the 7th of May 1890.

His *Autobiography*, edited by Dr Samuel Smiles, was published in 1883.

NASR-ED-DIN [NÁṢIRU'D-DIN] (1829–1896), shah of Persia, was born on the 4th of April 1829. His mother, a capable princess of the Kajar family, persuaded Shah Mahommed, his father, to appoint him heir apparent, in preference to his elder brothers; and he was accordingly made governor of Azerbaijan. His succession to the throne, 13th October 1848, was vigorously disputed, especially by the followers of the reformer El Bab, upon whom he wreaked terrible vengeance. In 1855 he re-established friendly relations with France, and coming under the influence of Russia, signed a treaty of amity on the 17th of December with that power, but remained neutral during the Crimean war. In 1856 he seized Herat, but a British army under Outram landed in the Persian Gulf, defeated his forces and compelled him to evacuate the territory. The treaty of peace was signed at Paris, on the 4th of March 1857, and to the end of his reign he treated Great Britain and Russia with equal friendship. In 1866 the shah authorized the passage of the telegraph to India through his dominions and reminted his currency in the European fashion. In 1873, and again in 1889, he visited England in the course of his three sumptuous journeys to Europe, 1873, 1878, 1889. The only results of his contact with Western civilization appear to have been the proclamation of religious toleration, the institution of a postal service, accession to the postal union and the establishment of a bank. He gave the monopoly of tobacco to a private company, but was soon compelled to withdraw it in deference to the resistance of his subjects. Abstemious in habits, and devoted to music and poetry, he was a cultured, able and well-meaning ruler, and his reign, already unusually long for an Eastern potentate, might have lasted still longer had it not been for the unpopular sale of the tobacco monopoly, which was probably a factor in his assassination at Teheran on the 1st of May 1896 by a member of the Babi faction. He was succeeded by his son Muzaffar-ed-din.

NASRIDES, THE, of Granada, were the last of the Mahommedan dynasties in Spain. They ruled from 1232 to 1492. They arose at the time when the king of Castile, Fernando the Saint, was conquering Andalusia. The dynasty was of remote Arabic origin, but its immediate source was the mountain range of the Alpujarra, and the founder was Yusuf (or Yahia) l'Nasr, a chief who was engaged in perpetual conflict with rival chiefs and in particular with the family of Beni-Hud, once kings at Saragossa, who held the fortress of Granada. Yusuf's nephew (or son) Mahommed completed the defeat of the Beni-Hud largely by the help of the king of Castile, to whom he did homage and paid tribute. Mahommed I., called el Ghalib, *i.e.* the Conqueror (1238–1273), served the Christian king against his own co-religionists at the siege of Seville and contrived to escape in the general wreck of the Mahommedan power. The internal history of the dynasty is largely made up of civil dissensions, personal rivalries, palace and harem intrigues. The direct male line of Mahommed el Ghalib ended with the fourth sultan, Nasr, in 1314. Nasr was succeeded by his cousin Imail (1314–1325), who is said to have been connected with the original stock only through women. From Mahommed el-Ghalib to Mahommed XI., called Boabdil, and also the little king "El Rey Chico" by the Christians, who lost Granada in 1492, there are counted twenty-nine reigns of the Nasrides, giving an average of nine years. But there was not the same number of sultans, for several of them were expelled and restored two or three times. Nor did all the members of the house who were allowed to have been sultans reign over all the territory still in Mahommedan hands. There were contemporary reigns in different parts, and tribal or local rivalries between plain and hill, and the chief towns, Granada, Malaga and Guadix. The dissensions of the Nasrides reached their greatest pitch of fury during the very years in which the Catholic sovereigns were conquering their territory piecemeal, 1482–1492. Their position imposed a certain consistency of policy on these sultans. They submitted and paid tribute to the kings of Castile when they could not help doing so, but they endeavoured to use the support of Mahommedan rulers of northern Africa whenever it was to be obtained. Granada became the recognized place of refuge for rebellious subjects of the kings of Castile, and on occasion

supported them against rebels. The end came when the weakness of Mahommedan rulers in Morocco coincided with the rule of strong sovereigns in Castile. Frontier wars between Mahommedan and Christian borderers were incessant, and at long intervals the kings of Castile made invasions on a considerable scale, without, however, following up any successes they might gain. The comparative prosperity of Granada was due to the concentration of a large population driven from other parts of Spain, and the consequent necessity for the intensive cultivation of the rich valleys lying among the ranges of mountains which encircle the kingdom, and the extensive "Vega" or plain of Granada. The reputation for civilization which the agitated Mahommedan state enjoys in history is based on the surviving parts of the highly decorated fortress palace of the Alhambra, which was mainly the work of three of the sultans, the founder, Mahommed el Ghalib, and his two successors.

See S. Lane-Poole, *The Mahommedan Dynasties* (London, 1894); and *Historia de Granada*, by Don M. Lafuente Alcántara (Granada, 1884).

NASSARAWA, a province of the British protectorate of northern Nigeria, lying approximately between 6° 40′ and 9° E. and between 7° 40′ and 9° 40′ N. It is situated on the northern bank of the river Benue, which in its windings forms the southern frontier of the province. Nassarawa is bounded E. by the province of Muri, N.E. by Bauchi, N. by Zaria and W. by Nupe and the trans-Nigerian portion of the province of Kabba. It has an area of 18,000 sq. m. and an estimated population of 1,500,000. The province, like that of Bauchi, is traversed by mountainous regions. It possesses valuable forests and many fertile river valleys. Native products include rubber, palm kernels and beni seed. Cotton is grown extensively.

Until the middle of the 18th century Nassarawa appears to have been peopled by many native tribes of a primitive type. About 1750 an important pagan tribe, the Igbira, came from the south-west across the Niger and established two rival kingdoms in the western portion of the province. Later the native inhabitants of Zaria, driven before the Fula, came from the north and occupied the central portion of Nassarawa. Later still (about 1840) certain Fula of Zaria themselves conquered portions of the province, founded Keffi, spread as far as the Benue in the south-west corner and occupied the town and district of Abuja in the west. Fula also made a settlement at the town of Nassarawa and at Darroro in the N.E. A colony from Bornu entered the province and founded the important town of Lafia Berebere in the eastern district. As a result of these movements the aboriginal tribes were driven into the hilly regions of the S.E. and N.E. The Munshi, a truculent and hardy people, hold a portion of the northern bank of the Benue, and the Kagoro and Attakar tribes hold the hilly country to the N.E., through which the road passes from Keffi and Lafia to the Bauchi highlands. Before the British occupation the state of Nassarawa had become a partially subdued Fula emirate, exercising doubtful sway over the native pagans and paying a scarcely less doubtful allegiance on its own part to the Fula ruler of Zaria. The riverain tribes of Nassarawa were among the first to break into open aggression against the British administration established at Lokoja. In January 1900 they attacked a telegraph construction party in the Munshi country on the banks of the Benue. The result was the occupation of Keffi by British troops and the gradual subjugation of the province. In 1902 the first British resident, Captain Moloney, was murdered at Keffi by an official of the emir's court. The emir repudiated all responsibility for the crime, and the murderer fled to Kano, where his reception on friendly terms was among the incidents which determined the Sokoto-Kano campaign of 1903. The British were now recognized as the rulers of Nigeria, and the emir of Nassarawa threw in his lot with the British government. Slave raiding was abolished and the slave trade made illegal. A British court of justice was established at the provincial headquarters and native courts in every district. Roads have been opened and trade is steadily increasing. In 1905 an expedition was required against the Kagoro people, who occupy a vast open plateau having an elevation of about 1800 ft. through which a short road to the Bauchi tin mines passes from the Benue. These people had been raiding the Fula for cattle and murdering traders upon the road. A splendid grazing country, healthy and also rich in rubber, was opened. The road to the tin mines was rendered safe and is now the Bauchi mail route. There is a cart road from Loko on the Benue to Keffi. (F. L. L.)

NASSAU, a territory of Germany, now forming the bulk of the government district of Wiesbaden, in the Prussian province of Hesse-Nassau, but until 1866 an independent and sovereign duchy of Germany. It consists of a compact mass of territory, 1830 sq. m. in area, bounded on the S. and W. by the Main and Rhine, on the N. by Westphalia and on the E. by Hesse. This territory is divided into two nearly equal parts by the river Lahn, which flows from east to west into the Rhine. The southern half is almost entirely occupied by the Taunus Mountains, which attain a height of 2900 ft. in the Great Feldberg, while to the north of the Lahn is the barren Westerwald, culminating in the Salzburgerkopf (2000 ft.). The valleys and low-lying districts, especially the Rheingau, are very fertile, producing abundance of grain, flax, hemp and fruit; but by far the most valuable product of the soil is its wine, which includes several of the choicest Rhenish varieties, such as Johannisberger, Marcobrunner and Assmannshäuser. Nassau is one of the most thickly wooded regions in Germany, about 42% of its surface being occupied by forests, which yield good timber and harbour large quantities of game. The rivers abound in fish, the salmon fisheries on the Rhine being especially important. There are upwards of a hundred mineral springs in the district, most of which formerly belonged to the duke, and afforded him a considerable part of his revenue. The best known are those of Wiesbaden, Ems, Soden, Schwalbach, Schlangenbad, Geilnau and Fachingen. The other mineral wealth of Nassau includes iron, lead, copper, building stone, coals, slate, a little silver and a bed of malachite. Its manufactures, including cotton and woollen goods, are unimportant, but a brisk trade is carried on by rail and river in wine, timber, grain and fruit. There are few places of importance besides the above-named spas; Höchst is the only manufacturing town. Wiesbaden, with 100,955 inhabitants, is the capital of the government district as it was of the duchy. In 1864 the duchy contained 468,311 inhabitants, of whom 242,000 were Protestants, 215,000 Roman Catholics and 7000 Jews. The ecclesiastical jurisdiction was in the hands of the Protestant bishop of Wiesbaden and the Roman Catholic bishop of Limburg. Education was amply provided for in numerous higher and lower schools. The annual revenue of the dukedom was about £400,000 and it furnished a contingent of 6000 men to the army of the German Confederation.

History.—During the Roman period the district enclosed by the Rhine, the Main and the Lahn was occupied by the Mattiaci and later by the Alamanni. The latter were subdued by the Franks under Clovis at the end of the 5th century, and at the partition of Verdun in 843 the country became part of the East Frankish or German kingdom. Christianity seems to have been introduced in the 4th century. The founder of the house of Nassau is usually regarded as a certain Drutwin (d. 1076), who, with his brother Dudo, count of Laurenburg, built a castle on a hill overlooking the Lahn, near the present town of Nassau. Drutwin's descendant Walram (d. 1198) took the title of count of Nassau, and placed his lands under the immediate suzerainty of the German king; previously he had been a vassal of the archbishop of Trier. Then in 1255 Walram's grandsons, Walram and Otto, divided between them their paternal inheritance, which had been steadily increasing in size. Walram took the part of Nassau lying on the left bank of the Lahn and made Wiesbaden his residence; Otto took the part on the right bank of the river and his capital was Siegen. The brothers thus founded the two branches of the house of Nassau, which have flourished to the present time.

The fortunes of the Ottonian, or younger line, belong mainly to the history of the Netherlands. The family was soon divided into several branches, and in the 15th century one of its members.

Count Engelbert I. (d. 1442), obtained through marriage lands in Holland. Of his two sons one took the Dutch, and the other the German possessions of the house, but these were united again in 1504 under the sway of John, count of Nassau-Dillenburg, the head of a branch of the family which, in consequence of a series of deaths, the last of which took place in 1561, was a few years later the sole representative of the descendants of Count Otto. John's son was Count William the Rich (d. 1559), and his grandson was the hero, William the Silent, who inherited the principality of Orange in 1544 and surrendered his prospective inheritance in Nassau to his brother John (d. 1606). William and his descendants were called princes of Orange-Nassau, and the line became extinct when the English king William III. died in 1702. Meanwhile the descendants of Count John, the rulers of Nassau, were flourishing. They were divided into several branches, and in 1702 the head of one of these, John William Friso of Nassau-Dietz (d. 1711), whose ancestor had been made a prince of the Empire in 1654, inherited the title of prince of Orange and the lands of the English king in the Netherlands. A few years later in 1743 a number of deaths left John William's son, William, the sole representative of his family, and as such he ruled over the ancestral lands both in Nassau and in the Netherlands. In 1806, however, these were taken from a succeeding prince, William VI., because he refused to join the Confederation of the Rhine. Some of them were given in 1815 to the other main line of the family, the one descended from Count Walram (see below). In 1815 William VI. became king of the Netherlands as William I., and was compensated for this loss by the grant of parts of Luxemburg and the title of grand-duke. When in 1890 William's male line died out Luxemburg, like Nassau, passed to the descendants of Count Walram. In the female line he is now represented by the queen of the Netherlands.

Adolph of Nassau, a son of Walram, the founder of the elder line of the house of Nassau, became German king in 1292, but was defeated and slain by his rival, Albert of Austria, in 1298. The territories of his descendants were partitioned several times, but these branch lines did not usually perpetuate themselves beyond a few generations, and Walram's share of Nassau was again united in 1605 under Louis II. of Nassau-Weilburg (d. 1626). Soon, however, the family was again divided; three branches were formed, those of Saarbrücken, Idstein and Weilburg, the heads of the first two becoming princes of the Empire in 1688. Other partitions followed, but at the opening of the 19th century only two lines were flourishing, those of Nassau-Usingen and Nassau-Weilburg. In 1801 Charles William, prince of Nassau-Usingen, was deprived by France of his lands on the left bank of the Rhine, but both he and Frederick William of Nassau-Weilburg, who suffered a similar loss, received ample compensation. In 1806 both Frederick William and Frederick Augustus, the brother and successor of Charles William, joined the Confederation of the Rhine and received from Napoleon the title of duke, but after the battle of Leipzig they threw in their lot with the allies, and in 1815 joined the German Confederation. As a result of the changes of 1815 Frederick Augustus of Nassau-Usingen ceded some of his newly-acquired lands to Prussia, receiving in return the greater part of the German possessions of the Ottonian branch of the house of Nassau (see above). In March 1816 he died without sons and the whole of Nassau was united under the rule of Frederick William of Nassau-Weilburg as duke of Nassau. Already in 1814 Frederick William had granted a constitution to his subjects, which provided for two representative chambers, and under his son William, who succeeded in 1816, the first landtag met in 1818. At once, however, it came into collision with the duke about the ducal domains, and these dissensions were not settled until 1836. In this year the duchy took an important step in the development of its material prosperity by joining the German Zollverein. In 1848 Duke Adolph, the son and successor of Duke William, was compelled to yield to the temper of the times and to grant a more liberal constitution to Nassau, but in the following years a series of reactionary measures reduced matters to their former unsatisfactory condition. The duke adhered stedfastly to his conservative principles, while his people showed their sympathies by electing one liberal landtag after another. In 1866 Adolph espoused the cause of Austria, sent his troops into the field and asked the landtag for money. This was refused, Adolph was soon a fugitive before the Prussian troops, and on the 3rd of October 1866 Nassau was formally incorporated with the kingdom of Prussia. The deposed duke entered in 1867 into a convention with Prussia by which he retained a few castles and received an indemnity of about £1,500,000 for renouncing his claim to Nassau. In 1890, on the extinction of the collateral line of his house, he became grand-duke of Luxemburg, and he died on the 17th of November 1905.

The town of Nassau (Lat. *Nasonga*) on the right bank of the Lahn, 15 m. above Coblenz, is interesting as the birthplace of the Prussian statesman, Freiherr von Stein. Pop. (1905) 2238. It has a Roman Catholic and an Evangelical church, while its main industries are brewing and mining. Near the town are the ruins of the castle of Stein, first mentioned in 1138, with a marble statue of Stein, while the ruins of the ancestral castle of the house of Nassau may also be seen.

For the history of Nassau see Hennes, *Geschichte der Grafen von Nassau bis 1255* (Cologne, 1843); von Schütz, *Geschichte des Herzogtums Nassau* (Wiesbaden, 1853); von Witzleben, *Genealogie und Geschichte der Fürstenhauses Nassau* (Stuttgart, 1855); F. W. T. Schliephake and K. Menzel, *Geschichte von Nassau* (Wiesbaden, 1865–1889); the *Codex diplomaticus nassoicus*, edited by K. Menzel and W. Sauer (1885–1887); and the *Annalen des Vereins für nassauische Alterthumskunde und Geschichtsforschung* (1827 fol.).

NAST, THOMAS (1840–1902), American caricaturist, was born on the 27th of September 1840, in the military barracks of Landau, Germany, the son of a musician in the Ninth regiment Bavarian band. His mother took him to New York in 1846. He studied art there for about a year with Theodore Kaufmann and then at the school of the National Academy of Design. At the age of fifteen he became a draughtsman for *Frank Leslie's Illustrated Newspaper*; three years afterwards for *Harper's Weekly*. In 1860 he went to England for the *New York Illustrated News* to depict the prize-fight between Heenan and Sayers, and then joined Garibaldi in Italy as artist for *The Illustrated London News*. His first serious work in caricature was the cartoon "Peace" in 1862, directed against those in the North who opposed the prosecution of the Civil War. This and his other cartoons during the Civil War and Reconstruction days were published in *Harper's Weekly*; they attracted great attention, and Nast was called by President Lincoln "our best recruiting sergeant." Even more able were Nast's cartoons against the Tweed Ring conspiracy in New York city; his caricature of Tweed being the means of the latter's identification and arrest at Vigo. In 1873, 1885 and 1887 Nast toured the United States as lecturer and sketch-artist, but with the advent of new methods and younger blood his vogue decreased. He had been an ardent Republican in his earlier years; had bitterly attacked President Johnson and his Reconstruction policy; had ridiculed Greeley's candidature, and had opposed inflation of the currency, notably with his famous "rag-baby" cartoons, but his advocacy of civil service reform and his distrust of Blaine forced him to become a Mugwump and in 1884 an open supporter of the Democratic party, from which in 1892 he returned to the Republican party and the support of Harrison. He had lost practically all of his earnings by the failure of Grant and Ward, and in May 1902 was appointed by President Roosevelt consul-general at Guayaquil, Ecuador, where he died on the 7th of December in the same year. He did some painting in oil and some book illustrations, but these were comparatively unimportant, and his fame rests on his caricatures and political cartoons. Nast introduced the donkey to typify the Democratic party, the elephant to typify the Republican party, and the tiger to typify Tammany Hall, and introduced into American cartoons the practice of modernizing scenes from Shakespeare for a political purpose.

See A. B. Paine, *Thomas Nast, his Period and his Pictures* (New York, 1904).

NASTURTIUM, or INDIAN CRESS, *Tropaeolum majus*, a perennial climber, native of Peru, but in cultivation treated as a hardy annual. It climbs by means of the long stalk of the peltate leaf which is sensitive to contact like a tendril. The irregular flowers have five sepals united at the base, the dorsal one produced into a spurred development of the axis; of the five petals the two upper are slightly different and stand rather apart from the lower three; the eight stamens are unequal and the pistil consists of three carpels which form a fleshy fruit separating into three one-seeded portions. The flowers are sometimes eaten in salads, and the leaves and young green fruits are pickled in vinegar as a substitute for capers. The pungency of the *nasturtium officinale*, the water-cress, gave it its name *nasi-tortium*, that which twists the nose. The plant should have a warm situation, and the soil should be light and well enriched; sow thinly early in April, either near a fence or wall, or in an open spot, where it will require stakes 6 to 8 ft. high.

The dwarf form known as Tom Thumb (*T. m. nanum*), is an excellent bedding or border flower, growing about a foot high. Sow in April in the beds or borders; and again in May for a succession. Other fine annual Tropaeolums are *T. Lobbianum* with long spurred orange flowers and numerous varieties; and *T. minus*, a kind of miniature *T. majus* with yellow, scarlet and crimson varieties.

The genus *Tropaeolum*, native of South America and Mexico, includes about 35 species of generally climbing annual and perennial herbs with orange, yellow, rarely purple or blue, irregular flowers, *T. peregrinum* is the well-known canary creeper. The flame nasturtium with brilliant scarlet blossoms is *T. speciosum* from Chile; it has tuberous roots, as have also such well-known perennials as *T. polyphyllum*, *T. pentaphyllum*. Of these *T. speciosum* should be grown in England in positions facing north; it flourishes in Scotland.

NATAL, a maritime province of the Union of South Africa, situated nearly between 27° and 31° S., 29° and 33° E. It is bounded S.E. by the Indian Ocean, S.W. by the Cape province and Basutoland, N.W. by the Orange Free State province, N. and N.E. by the Transvaal and Portuguese East Africa. It has a coast line of 376 m.; its greatest length N. to S. in a direct line is 247 m.; its greatest breadth E. to W., also in a direct line, 200 m. Natal has an area of 35,371 sq. m., being nearly three-quarters the size of England. (For map see SOUTH AFRICA.) The province consists of two great divisions, namely Natal proper and Zululand (*q.v.*). Natal proper has a seaboard of 166 m. and an area of 24,910 sq. m., Zululand, in which is included Amatongaland, a seaboard of 210 m. and an area of 10,461 sq. m. It lies north-east of Natal. In this article the description of the physical features, &c. refers only to Natal proper.

Physical Features.—The terrace formation of the land characteristic of other coast regions of South Africa prevails in Natal. The country may be likened to a steep and gigantic staircase leading to a broad and level land lying beyond its borders. The rocky barrier which shuts off this land is part of the Drakensberg range. From the mountain sides flow many rivers which dash in magnificent waterfalls and through deep gorges to the sea. Falling 8000 or more feet in little over 200 m., these streams are unnavigable. The south-eastern sides of the mountains are in part covered with heavy timber, while the semi-tropical luxuriance of the coast belt has earned for Natal the title of "the garden colony."

The coast trends, in an almost unbroken line, from S.W. to N.E. It extends from the mouth of the Umtamvuna river (31° 4′ S., 30° 12′ E.), which separates Natal from the Cape, to the mouth of the Tugela (29° 15′ S., 31° 30′ E.), which marks the frontier between Natal and Zululand. The only considerable indentation is at Durban, about two-thirds of the distance from the Umtamvuna to the Tugela, where there is a wide and shallow bay, covering with its islands nearly 8 sq. m. The coast, though low and sandy in places, is for the most part rocky and dangerous. The warm Mozambique current sweeps down from the N.E., setting up a back drift close in shore. The southern entrance to Durban harbour is marked by a bold bluff, the Bluff of Natal, which is 250 ft. high and forested to the water's edge. Opposite the Bluff a low sandy spit called the Point forms the northern entrance to the harbour. North of Durban the coast belt, hitherto very narrow, widens out and becomes more flat. But the greater part of the coast region, which has an average depth of 15 m., is broken and rugged. Ranges of hills lead to the first plateau, which has an average elevation of 2000 ft. and is of ill-defined extent. Here the land loses its semi-tropical character and resembles more the plains of the Orange Free State and the Transvaal. The second plateau, reached by a steep ascent, has an elevation of from nearly 4000 to fully 5000 ft. It is an undulating plain, grass-covered, but for the most part without trees or bush. It continues to the foot of the Drakensberg range, the mountains rising towards the S.W., with almost perpendicular sides, 6000 to 7000 ft. above the country at their base. North-west, towards the Transvaal, the mountains are of lower elevation and more rounded contours.

Mountains.—Although the division of the country into terraces separated by ranges of hills is clearly marked in various districts, as for instance between Durban and Colenso, the province is traversed by many secondary chains, as well as by spurs of the Drakensberg. The highest points of that range, and the highest land in Africa south of Kilimanjaro, lie within the borders of Natal. The Drakensberg (*q.v.*), from Majuba Hill on the N.W. to Bushman's Nek in the S.W., form the frontier of the province, the crest of the range being generally within Natal. This is the case in the Mont-aux-Sources (11,170 ft.) and Cathkin Peak or Champagne Castle (10,357 ft.); the top of the third great height, Giant's Castle (9657 ft.), is in Basutoland, but its seaward slopes are in Natal. From Giant's Castle to Mont-aux-Sources, in which, forsaking their general direction, the Drakensberg run S.E. to N.W., the mountains attain an elevation of 10,000 to 11,000 ft., with few breaks in their face. North of Mont-aux-Sources the mountain ridge sinks to 8000 and less feet, and here are several passes leading into the Orange Free State. Laing's Nek is a pass into the Transvaal. The chief heights in Natal between Mont-aux-Sources and Laing's Nek are Tintwa (7500 ft.), Inkwelo (6808 ft.) and the flat-topped Majuba (7000 ft.). Spurs from the Drakensberg, at right angles to the main range, cross the plateaus. The most northern, which runs E. from Majuba to the Lebombo Mountains, coincides roughly with the northern frontier of Natal. It is one of the transverse chains connecting the eastern coast range with the higher terraces and goes under a variety of names, such as Elands Berg and Ingome Mountains. A second range, the Biggarsberg, starts from the Drakensberg near Mount Malani and goes E.S.E. to the junction of Mooi, Buffalo and Tugela rivers. This range contains, in Indumeni (7200 ft.), the highest mountain in Natal outside the main Drakensberg. A third range runs N.E. from Giant's Castle towards the Biggarsberg. It lies north of the Mooi river, and its most general name is Mooi River Heights. A fourth range also diverges from Giant's Castle and ramifies in various branches over a large tract of country, one branch running by Pietermaritzburg to the Berea hills overlooking Durban. The chief height in this fourth range is Spion Kop (7037 ft.), about 25 m. S.E. of Giant's Castle. This is not the Spion Kop rendered famous during the Anglo-Boer War of 1899–1902. That Spion Kop, with Vaal Kranz and Pieter's Hills, are heights on the northern bank of the upper Tugela.

Secondary ranges with heights of 5000 and more feet are numerous, whilst lofty isolated mountains rise from the plateaus. The greatest of these isolated masses is Mahwaqa (6834 ft.), in the south-west part of the country. Of many flat-topped hills the best known is the Table Mountain east of Pietermaritzburg.

Rivers.—All the rivers of Natal not purely coast streams have their origin in the Drakensberg or its secondary ranges. The largest and longest, the Tugela, with the Buffalo, Mooi, Klip and other tributaries is treated separately. The Tugela basin drains the whole country north of a line drawn in a direct line east from Giant's Castle. The Umkomaas ("gatherer of waters") rises in Giant's Castle and flows in a south-easterly course to the sea. Though it makes no large sweeps it has so tortuous a course that its length (some 200 m.) is twice that of the valley through which it flows. Its banks in its upper course are wild and picturesque, with occasional wide deep valleys, with climate and vegetation resembling the coast belt. The Umzimkulu river rises in Bamboo Castle, in the Drakensberg, and, with bolder curves than the Umkomaas, runs in a course generally parallel with that stream S.E. to the sea, its mouth being about 40 m. south of that of the Umkomaas. The Ingwangwane rises in the Drakensberg south of the Umzimkulu, which it joins after a course of some 50 m. Below the junction the Umzimkulu forms for some distance the frontier between Natal and the Griqualand East division of the Cape. The scenery along the river valley (120 m. long) is very striking, in turns rugged and desolate, verdant and smiling, with patches of dense forest and heights wooded to their summit. Port Shepstone is situated at the mouth of the river, which, like that of all others in Natal, is obstructed by a bar. As a

result of harbour works, however, a channel has been cleared and steamers can ascend the river for 6 m.

The Pongola rises in the Transvaal in high ground N.E. of Wakkerstroom and flows E., forming, for the greater part of its course, the northern frontier of the province. After piercing the Lebombo Mountains, it turns N. and joins the Maputa, a river emptying into Delagoa Bay. The Umgeni, which rises in the Spion Kop hills some 30 m. S.E. of Giant's Castle, passes through the central part of Natal and reaches the sea 4 m. N. of Durban. It flows alternately through mountainous and pastoral country, and is known for two magnificent waterfalls, both within 12 m. of Pietermaritzburg. The upper fall is close to the village of Howick. Here the Umgeni leaps in a single sheet of water down a precipice over 350 ft. high, more than double the height of Niagara, forming, when the river is swollen by the rains, a spectacle of rare magnificence. Some 12 m. below are the Karkloof or Lower Falls, where in a series of beautiful cascades the water descends to the plain. Other rivers of Natal which rise in the spurs of the Drakensberg or in the higher terraces are the Umvoti, which runs south of the Tugela and gives its name to a county division, the Umlaas (which gives Durban its main water supply, the Illovo, which traverse the country between the Umgeni and Umkomaas, and the Umtamvuna, noteworthy as forming the boundary between Natal and Pondoland. There are also seventeen distinct coast streams in the colony.

[*Geology.*[1]—The general geological structure of Natal and Zululand is simple. It consists of a series of plateaus formed of sedimentary rocks which mainly belong to three formations of widely separated ages, and which rest on a platform of granitic and metamorphic rocks.

The geological formations represented include:—

Post-Cretaceous and Recent	
Cretaceous	Littoral of Zululand.
U. Karroo	Plateau Basalts. Cave Sandstone. Red Beds.
L. Karroo	Stormberg Series. Beaufort Series. Ecca Series. Ecca Glacial Series (Dwyka Conglomerate).
Cape System	Table Mountain Sandstone Series.
Pre-Cape Rocks	Quartzites, Conglomerates and Shales of Nkandhla, Umfolosi river. Gneisses, Schists, Marbles, Granites (Swaziland Series).

Pre-Cape Rocks.—The granites and schists occur in close association. The series covers considerable areas in the lowest parts of the valleys and near the coast. The widest areas are in Zululand. In the Umzimkulu river and in the Tugela river below its junction with the Buffalo, metamorphic limestones are associated with schists, gneisses and granites. A group of highly inclined quartzites, altered conglomerates and jasperoid rocks which crop out on the Umhlatuzi river, between Melmoth and Nkandhla and on the White Umfolosi river above Ulundi Plains, is considered by Anderson to represent some portion of the Lower Witwatersrand series. The conglomerates are true "banket" and are auriferous, but the gold has not been met with in payable quantities.

Table Mountain Sandstone Series.—This rests unconformably on the pre-Cape rocks. Traced northwards, the series becomes thinner and finally dies out. As a rule denudation, which has acted on a magnificent scale, has removed all but a few hundred feet of the basement beds. The maximum thickness of 2000 ft. occurs near Melmoth. The beds are usually thin false-bedded sandstones with an almost complete absence of shales. A conglomerate at the base contains traces of gold. Griesbach mentions the occurrence of some small bivalves in the shales of Greytown, but Anderson failed to find any fossils.

Ecca Glacial Series.—A great unconformity separates the Table Mountain and Ecca series. In the Cape this gap is represented by the Witteberg and Bokkeveld series. The Dwyka conglomerate rarely attains any great thickness though forming wide outcrops. It is usually a hard compact rock containing striated stones. The Umgeni quarries, where the rock is used for road-metal, furnish the best exposures.

Ecca Series.—With the Beaufort series this occupies over two-thirds of the western portion of the province and has wide outcrops in Zululand and in the Vryheid districts. The Ecca shales contain some of the best coals of South Africa, but the seams contain much unmarketable coal. Around Dundee and Newcastle the coals are bituminous. In Zululand they are chiefly anthracitic. The fossils include several species of *Glossopteris* among them: *Glossopteris browniana var indica; Bunb. Phyllotheca Zeilleri eth. fil.; Estheria Greyii, Jones*, indicating a Permo-Carboniferous age.

Beaufort Series.—The Ecca series graduates upwards into the highly coloured sandstones and shales of the Beaufort series. Fossil reptilian remains, chiefly *Dicynodon*, are abundant.

Stormberg Series.—This consists of sandstones and shales with thin seams of coal. The chief outcrops occur around Biggarsberg and along the upper slopes of the Drakensberg. The fossil flora—*Thinnfeldia odontopteroides*, Morr. and a *Pterophyllum*—indicate a Rhaetic age. No reptilian remains have been found.

Upper Karroo.—The Red beds and Cave sandstones occur along the eastern flanks of the Drakensberg.

Cretaceous.—Deposits of this age are confined to the littoral. They are exceedingly prolific in fossils which prove them to be of Upper Cretaceous age. A long list of fossils has been obtained from Umkivelane Hill, Zululand. W.G.*]

Climate.—With a rise in level (not reckoning the mountain tops) of 5500 ft. in a distance of 170 m., Natal possesses several varieties of climate but is nowhere unhealthy. The climate is comparable to that of north Italy. The valleys and coast belt, though practically free from malarial fever, are hot and humid, and fires in dwelling houses are seldom required even in the coolest months; the lower plateaus are cool and the air dry; the uplands are bracing and often very cold, with snow on the ground in winter. The year is divided into two seasons, summer, which begins in October and ends in March, and winter, which fills up the rest of the year. Summer is the rainy season, and May, June and July the driest months of the year. The mean temperature at Durban, records taken at 260 ft. above the sea, is 70° F., varying from 42° in winter to 98° in summer. The average summer humidity is 76%, that of winter 74%. At Pietermaritzburg, 41 m. inland and 2200 ft. above the sea, the temperature is about 64°. In the uplands the heat of summer is often greater than on the coast, but the air is less humid and the nights are generally cool. Both the humidity and the temperature are increased by the great mass of water, the Mozambique current, flowing south from the equatorial regions. At Durban the annual rainfall is about 40 in., at Pietermaritzburg 38. The average for the province is believed to be about 30 in. In 1893, the year of highest recorded rainfall, 70 in. fell on the coast districts. Thunderstorms, averaging nearly one hundred in the year, and violent hailstorms, occur in summer, being most severe in the interior. The storms serve to modify the intense heat, though the lightning and hail cause considerable damage. The prevailing winds on the coast are north-east, warm and humid, and south-west, cool and bracing, though in summer the south-west wind brings rain. Inland, chiefly in early summer, a hot dry wind, often accompanied by a dust storm, blows from the north. These winds, which blow on an average twenty-five days in the year, seldom reach the coast and are generally followed by rain. Inhabitants of Natal are practically exempt from chest diseases.

Flora.—Botanically, Natal is divided into three zones: (1) the coast belt, extending from the sea inland to heights of 1500 ft., and in some cases to 1800 and 2000 ft.; (2) the midland region, which rises to 4000 ft.; (3) the upper regions. In these zones the flora varies from sub-tropical to sub-alpine. The heaths and proteads common at the Cape peninsula, in Basutoland and other parts of South Africa, are rare in Natal, but almost any species of the flora of semi-tropical and temperate countries introduced attains perfection. The trees and plants characteristic of each zone are not always confined to that zone, but in several instances, when common to the coast belt and the midlands, their character alters according to the elevation of the land. The dense bush or jungle of evergreen trees, climbers and flowering shrubs, which up to the middle of the 19th century covered the greater part of the coast belt, has largely disappeared. There are still, however, in the coast belt woods of leguminous evergreens bearing bright-coloured flowers. The trees in these woods are generally from 20 to 50 ft. in height and include the knob-thorn, water-boom, kafir-boom (with brilliant scarlet flowers), the Cape chestnut and milkwoods (*Mimusops*). But the most striking of the coast-belt flora are the tropical forms—the palm, mangrove, wild banana (*Strelitzia augusta*), tree-ferns, tree euphorbia, candelabra spurge and *Caput medusae*. Of palms there are two varieties, the ilala (*Hyphaene crinita*), found only by the sea shore and a mile or two inland, and the isundu (*Phoenix reclinata*), more widespread and found at heights up to 2000 ft. or even higher. The amatungulu or Natal plum, found chiefly near the sea, is one of the few wild plants with edible fruit. Its leaves are of a glossy dark green, its flower white and star-shaped, and its fruit resembles the plum. Other wild fruits are the so-called Cape gooseberry (not native to Natal) and the kaw apple or Dingaan apricot, which grows on a species of ebony tree.

The midland region is characterized by grass lands (the Natal grasses are long and coarse) and by considerable areas of flat-topped thorn bush mimosa. The bush is not as a rule dense, nor is it of any great height. A tree peculiar to this zone is the *Alberta magna*. It has dull pink flowers, succeeded by seed vessels, each of which is crowned by two scarlet-coloured leafy lobes. A grass belt separates the thorn bush from the districts carrying heavy timber, found mainly in the upland zone, along the sides of the mountains exposed to the rains and in kloofs. The indigenous timber trees are

[1] See C. L. Griesbach, "On the Geology of Natal in South Africa," *Quart. Journ. Geol. Soc.* vol. xxvii. pp. 53-72 (1871); P. C. Sutherland, "Notes on an Ancient Boulder Clay of Natal," *Quart. Journ. Geol. Soc.* vol. xxvi. pp. 514-517 (1870); W. Anderson, *Reports, Geol. Survey, Natal and Zululand* (Pietermaritzburg, 1901; London, 1904); and "Science in South Africa," *Handbook, Brit. Assoc.* pp. 260-272 (Cape Town, 1905).

principally the yellow wood (*Podocarpus*), sneezewood (*Pteroxylon utile*), stinkwood (*Oreodaphne bullata*), black ironwood (*Olea laurifolia*), white ironwood (*Vepris lanceolata*), and umtomboti (*Exoecaria africana*); all are very useful woods, and the yellow wood, sneezewood, stinkwood and ironwood when polished have grain and colour equal to maple, walnut and ebony. The "rooibesje," red pear and milkwood trees are used for boatbuilding. The Australian *Eucalyptus* and *Casuarina* in great variety, and many other imported trees, including syringas, wattles, acacias, willows, pines, cypress, cork and oak all thrive when properly planted and protected from grass fires. The black wattle has been extensively planted and flourishes at elevations of from 1000 to 3000 ft. Its bark forms a valuable article of commerce.

Flowers which bloom in the early spring are abundant, especially on the edges of forests. Among those found throughout the country are the *Dierama pendula*, the orchid and the "everlasting." As a rule flowers common to all zones are on the coast smaller and with paler colours than they are in the midlands. Aloes are common; in part of the midland zone they form when in bloom with abundance of orange and scarlet flowers a most picturesque sight. Of Cycadaceae the *Stangeria paradoxa* is peculiar to Natal. There is but one cactus indigenous to Natal; it is found hanging from perpendicular rocks in the midlands. There are, however, several species of euphorbia of the miscalled cacti. Climbing plants with gorgeous flowers are common, and there are numerous species of Compositae and about a hundred cinchonaceous plants. Bulbous plants are also very numerous. The most common are the Natal lily with pink and white ribbed bells, the fire-lily, with flame-coloured blossoms, ixias, gladiolas, the Ifafa lily, with fuchsia-like clusters, and the arum lily. A conspicuous veld plant is the orange and crimson *leonotis*, growing 6 ft. high. Geraniums are somewhat scarce. Fern life is abundant; 126 species are indigenous, two being tree-ferns. One of these, *Cyathea dregei*, found in moist places and open land, has a stem 20 ft. high; the stem of the other, *Hemitelia capensis*, sometimes reaches 30 ft. The ferns are most common in the midland zone and in the heavy timber forests. Sixty different species have been identified in one valley not more than 1 m. long and about 100 yds. in breadth. Among fruit trees, besides the wild fruits already mentioned, are the pineapple, mango, papua, guava, grenadilla, rose apple, custard apple, soursop, loquat, naartje, shaddock and citrous fruits.

Fauna.—The larger animals which abounded in Natal in the first half of the 19th century have been exterminated or driven out of the country. This fate has overtaken the elephant, giraffe, the buffalo, quagga, gnu, blesbok, gemsbok and ostrich. If the Vryheid district be excluded, the lion and rhinoceros may be added to this list; and the Vryheid district belongs geographically to Zululand. Hippopotami are still found in the Umgeni river and crocodiles in several of the coast streams. Leopards and panthers are found in thickly wooded kloofs. Hyenas, jackals, wild pig, polecats and wild dogs (*Canis pictus*) of different species are still found in or about bush jungles and forest clumps; elands (*Antilope oreas*) are preserved on some estates, and there are at least ten distinct species of antelope (hartebeest, bushbok, duiker, rietbok, rhebok, rovibok, blauwbok, &c.). In the Vryheid district the kudu, blue wildebeest, waterbuck, reedbuck, impala, steinbok and klipspringer are also found. Several of these species are now preserved. Ant-eaters (*Orycteropus capensis*), porcupines, weasels, squirrels, rock rabbits, hares and cane rats are common in different localities. Baboons (*Cynocephalus porcarius*) and monkeys of different kinds frequent the mountains and rocky kloofs and bush and timber lands. The birds of Natal[1] are of many species: some have beautiful plumage, but none of them, with the exception of the canary, are to be considered as songsters. Among the larger birds are cranes, herons, the ibis, storks, eagles, vultures, falcons, hawks, kites, owls, the secretary birds, pelicans, flamingoes, wild duck and geese, gulls, and of game birds, the paauw, koraan, pheasant, partridge, guinea fowl and quail. The other birds include parrots, toucans, gaudily coloured cuckoos, lories, swallows, shrikes, sun-birds, kingfishers, weavers, finches, wild pigeons and crows. The otter is found in some of the rivers, which are also frequented, near their mouths, by turtles. These last are also found in the coast lagoons and sometimes are of great size. Iguanas, 4 and 5 ft. long, are found on the wooded banks of the rivers; small lizards and chameleons are common, and there are several varieties of tortoise.

Of snakes there are about forty distinct species or varieties. The most dreaded by the natives are called "*imamba*," of which there are at least eight different kinds; these snakes elevate and throw themselves forward, and have been known to pursue a horseman. One sort of imamba, named by the natives "*indhlondhlo*," is crested, and its body is of a bright flame colour. The sluggish puff-adder (*Clotho arietans*) is common and very dangerous. A hooded snake (*Naja haemachates*), the *impfee* of the natives, is dangerous, and spits or ejects its poison; besides this there are a few other varieties of the cobra species. The largest of the serpent tribe, however, is the python (*Hortulia natalensis*), called *inhlwati* by the natives; its usual haunts are by streams amongst rocky boulders and in jungles, and instances are recorded of its strangling and crushing adult natives. It is common in the coast districts, and is sometimes 20 ft. long. Insects abound in great numbers, the most troublesome and destructive being the tick (*Ixodes natalensis*), which infests the pasturage, and the white ant (*Termes mordax*). Occasionally vast armies of locusts or caterpillars advance over large tracts of country, devouring all vegetation in their line of march. The fish moth, a steel-grey slimy active fish-shaped insect, is found in every house and is very destructive. Fish of excellent quality and in great quantities abound on the coast. They include shad, rock cod, mackerel, mullet, bream and soles; sharks, stingrays, cuttlefish and the octopus are also common in the waters off the coast of Natal. Prawns, crayfish and oysters are also obtainable, and turtle (*Chelonia mydas*) are frequently captured. Freshwater scale-fish are mostly full of bones, but fine eels and barbel are plentiful in the rivers. Trout have been introduced into some of the higher reaches of the rivers.

Inhabitants.—At the census of 1904 the population of the province, including Zululand, was 1,108,754.[2] Of this total 8·8%, or 97,109, were Europeans, 9%, or 100,918, Asiatics and the rest natives of South Africa, mainly of Zulu-Kaffir stock. Of the 824,063 natives, 203,373 lived in Zululand. The white and Asiatic population nearly doubled in the thirteen years since the previous census, allowance being made for the Utrecht and Vryheid districts, which in 1891 formed part of the Transvaal. Of the total population 985,167 live in rural areas, the average density for the whole country being 31·34 per sq. m. The white population is divided into 56,758 males and 40,351 females. Of the white inhabitants the great majority are British. Some 12,500 are of Dutch extraction; these live chiefly in the districts of Utrecht and Vryheid. There are also about 4500 Natalians of German extraction, settled mainly in the New Hanover and Umzimkulu districts. The Asiatics at the 1904 census were divided into 63,497 males and 37,421 females. They include a few high caste Indians, Arabs and Chinese, but the great majority are Indian coolies. The Asiatics are mainly congregated in the coast districts between the Umzimkulu and Tugela rivers. In this region (which includes Durban) the Asiatic population was 61,854. In none of the inland districts did the Asiatic inhabitants number 2000. The coolies are employed chiefly on the sugar, coffee, cotton and other plantations, a small proportion being employed in the coal-mines.

The native inhabitants of Natal proper were almost exterminated by the Zulus in the early years of the 19th century. Before that period the natives of what is now Natal proper were estimated to number about 100,000. In 1838 when the Zulu power was first checked the natives had been reduced to about 10,000. The stoppage of intertribal wars by the British, aided by a great influx of refugees from Zululand, led to a rapid increase of the population. With the exception of a few Bushmen, who cling to the slopes of the Drakensberg, all the natives are of Bantu stock. Before the Zulu devastations the natives belonged to the Ama-Xosa branch of the Kaffirs and are said to have been divided into ninety-four different tribes; to-day all the tribes have a large admixture of Zulu blood (see KAFFIRS, ZULULAND and BANTU LANGUAGES). The Natal natives have preserved their tribal organization to a considerable extent. Nearly 50% live in special reserves or locations, the area set apart for native occupation being about 4000 sq. m. exclusive of Zululand. Most of the remainder are employed on or live upon farms owned by whites, paying annual rents of from £1 to £5 or more. There were, however, in 1904, 69,746 male natives and 10,232 female natives in domestic service. Of the tribes who were in Natal before the Zulu invasion about 1812, the two largest are the Abatembu (who are in five main divisions and number about 30,000) and the Amakwabe (seven divisions and about 20,000 people). Other large tribes are the Amanyuswa (ten divisions—38,000 people), the Amakunu (three divisions—26,000 people), and the Amabomvu (five divisions—25,000 people). The three last tribes are among those which sought refuge in Natal from Zulu persecution, before the establishment of British rule in 1843. The number of half-castes is remarkably small, at the census of 1904 the number of "mixed and others," which

[1] See R. B. and J. D. Woodward, *Natal Birds* (Maritzburg, 1899).

[2] The following is the official estimate of the population on the 31st of December 1908: Europeans 91,443, natives 998,264 (including 7386 "mixed and others"), Asiatics 116,679; total 1,206,386.

includes Griquas and Hottentots and non-aboriginal negroes, was only 6686.

Chief Towns.—The seat of the provincial government is Pietermaritzburg (*q.v.*), commonly called Maritzburg (or P.M.B.), with a population (1904) of 31,199. It is 71 m. by rail N.N.W. of Durban (*q.v.*), the seaport and only large city in Natal, pop. 67,842. Ladysmith (*q.v.*), pop. 5568, ranks next in size. It is in the north-west of the province, is famous for its investment by the Boers in 1899–1900 and is an important railway junction. North-east of Ladysmith are Dundee (2811) and Newcastle (2950). Dundee is the centre of the coal-mining district. Newcastle is also a mining town, but depends chiefly on its large trade in wool. It is named after the duke of Newcastle who was secretary for the colonies in 1852 and 1859. Vryheid (2287) is in the centre of a highly mineralized district. Utrecht (860) lies between Newcastle and Vryheid, and was one of the first towns founded by the Transvaal Boers. There are coal-mines on the town lands. Greytown (2436), a wool and wattle trading centre, is in central Natal Verulam (1325), 19 m. along the coast north of Durban, serves as centre for sugar, tobacco and fruit plantations. It was founded by emigrants from St Albans, England—whence the name. Port Shepstone, at the mouth of the Umzimkulu river, is the natural outlet for south-west Natal. Estcourt is a trading centre, 75 m. by rail N.N.W. of Pietermaritzburg and is 29 m. distant from the village of Weenen ("Weeping"), so named by the first Boer settlers in memory of a Zulu raid. Another village, Colenso, on the south bank of the Tugela, 16 m. by rail south of Ladysmith, was the headquarters of Sir Redvers Buller at the battle of Colenso on the 15th of December 1899.

Communications.—Durban (Port Natal) is in regular communication with Europe via Cape Town and via Suez by several lines of steamers, the chief being the boats of the Union-Castle line, which sail from Southampton and follow the west coast route, those of the German East Africa line, which sail from Hamburg and go via the east coast route and those of the Austrian Lloyd from Trieste, also by the east coast route. By the Union-Castle boats there is a weekly mail service to England. There are also two direct lines of steamers between London and Durban (a distance of 6993 nautical miles), average passage about twenty-six days; the mail route taking twenty to twenty-two days. Durban is also in regular and frequent communication by passenger steamers with the other South African ports, as well as Mauritius, Zanzibar, &c., and with India, Australia, the United States and South America. The works which have made Port Natal the finest harbour in South Africa are described under DURBAN.

The first railway built in South Africa was a 2-m. line from The Point (or harbour) to the town of Durban. It was opened for traffic in 1860 and in 1874 was extended some 4 m. to the Umgeni river. This line was of 4 ft. 8½ in. gauge and was privately owned, but, when in 1876 the Natal government determined to build and own a railway system which should in time cover the country, the existing line was bought out and the gauge altered to 3 ft. 6 in. On this, the normal South African gauge, all the Natal railways, save a few 2-ft. branch lines, are built. The main line starts from Durban, and passing through Pietermaritzburg (71 m.), Ladysmith (190 m.) and Newcastle (268 m.) pierces the Drakensberg at Laing's Nek by a tunnel 2213 ft. long, and 3 m. beyond Charlestown reaches the Transvaal frontier at mile 307. Thence the railway is continued to Johannesburg, &c. The distances from Durban to the places mentioned by this route are: Johannesburg, 483 m.; Pretoria 511 m.; Kimberley, 793 m.; Bulawayo, 1508 m.; Delagoa Bay, 860 m.

From Ladysmith a branch line runs north-west into the Orange Free State, crossing the Drakensberg at Van Reenen's Pass. This line is continued via Harrismith and Bethlehem to Kroonstad (393 m. from Durban) on the main Cape Town, Bloemfontein and Johannesburg railway and is the shortest route between Durban and Cape Town (1271 m.). It also affords via Bloemfontein the shortest route (622 m.) between Durban and Kimberley. From Glencoe Junction, 42 m. north of Ladysmith on the direct line to Johannesburg, a branch railway goes N.E. to the Dundee coalfields, Vryheid (59 m.) and Hlobane (76 m.). Two lines branch off from Pietermaritzburg. One (62 m. long) goes N.E. to Greytown, serving the east-central part of the province; the other line (108 m. long) goes S.W. to Riverside Station, forming a link in the scheme for direct communication between Natal and East London and Port Elizabeth.

Durban is the starting-point of two coast lines. The south coast line, which runs close to the sea, goes to Port Shepstone (79 m.). A 2-ft. gauge railway (102 m.), which leaves the south coast line at Alexandra Junction (44 m. from Durban), runs N.W. by Stuartstown and joins the Pietermaritzburg-Riverside line. The north coast railway (167 m. long) crosses the Tugela 70 m. from Durban and continued through Zululand to Somkele, the centre of the Santa Lucia coal-fields.

As might be expected in a country possessing the physical features of Natal, the gradients and curves are exceptionally severe. Not less than 43 m. are upon grades of 1 in 30 and 1 in 35, and curves of 300 to 350 ft. radius, while on over 100 m. more there are grades under 1 in 60 and curves of less than 450 ft. radius. The main trunk line reaches an altitude of 3054 ft. at a point 58 m. distant from Durban; after falling 1000 ft. in its farther progress to Pietermaritzburg, it again rises, 12 m. after leaving that city, to a height of 3700 ft. above the sea; at a point 134 m. from Durban it has reached an altitude of 5152 ft., but on reaching Ladysmith, 191 m. from Durban, the altitude has decreased to 3284 ft. The summit of the Biggarsberg chain is crossed at a point 233 m. from the port, at a height of 4800 ft., and at Laing's Nek the altitude is 5399 ft. The Orange Free State line, after leaving Ladysmith, ascends by steep gradients the whole of its own course in Natal territory, and when it gains the summit at Van Reenen's Pass it is 5500 ft. above the sea. The mileage open in 1910 was 1173. The cost of construction, to the same year, exceeded £14,000,000, the interest earned per cent since 1895 not being less than £3. 12s. in any one year. In outlying districts post carts and ox wagons are the usual means of conveyance. There are about 5000 m. of high roads kept in repair by the government.

There is a well-organized postal and telegraphic service. Land lines connect Natal with every part of South Africa and with Nyasaland and Ujiji. A submarine cable from Durban goes to Zanzibar and Aden, whence there is communication with every quarter of the globe. The first telegraph line in Natal was opened in 1873; in 1878 communication was established with Cape Town and in the following year with Delagoa Bay.

Agriculture and Allied Industries.—The diversity of soil and climate leads to a great diversity in the agricultural produce. The chief drawback to farming in the midland and upper districts is the considerable proportion of stony ground, and, in some cases, the lack of running water. The area of land under tillage is less than a twentieth of the whole surface, the crop most extensively grown being maize or "mealies." This is universally grown by the natives and forms their staple food; it is also grown by the Indians, and by the white farmers for export. Besides maize the crops cultivated by the natives are Kaffir corn or amabele (*Sorghum caffrorum*)—used in the manufacture of *utywala*, native beer—imfi (*Sorghum saccharatum*), tobacco, pumpkins and sweet potatoes. The chief wealth of the natives consists, however, in their large herds of cattle (see *infra*). While maize thrives in every part of the country, wheat, barley and oats—cultivated by the white farmers—flourish only in the midlands and uplands. More important than the cereal crops are the tropical and sub-tropical products of the coast zone. Besides fruits of nearly all kinds there are cultivated in the low moist regions the sugar-cane, the tea, coffee and tobacco plants, arrowroot, cayenne pepper, cotton, &c. The area under sugar in 1905 was 45,840 acres and the produce 532,067 cwt. (a large quantity of sugar-cane is grown for feeding stock). In the same year the production of tea was 1,633,178 lb; of coffee, 24,859 lb; of maize, 2,101,470 bushels; of potatoes, 419,046 bushels; and of sweet potatoes, 181,195 bushels. The tea plant was first introduced in Natal in 1850, but little attention was paid to it until the failure of the coffee plantations about 1875, since when only small quantities of coffee have been produced. In 1877 renewed efforts were made to induce tea cultivation, and by 1881 it had become an established industry. The variety chiefly grown is the Assam indigenous. Most of the tea estates are situated in the coast belt north of Durban. The sugar cane, like tea, was first introduced in 1850, the first canes being brought from Mauritius. The industry is steadily growing, as are the dependent manufactures of molasses and rum. The fruit industry is of considerable importance and by 1905 had reached a turnover of over £100,000 a year.

Extensive areas in the midland and upland districts are devoted to the raising of stock. Horse-breeding is successfully carried on in the upper districts. The higher the altitude the healthier the animals and the greater their immunity from disease. Horse-sickness, a kind of malarial fever, which takes an epidemic form in very wet seasons, causes considerable loss. The Natal horse is small, wiry, and has great powers of endurance. Cattle-breeding is probably the most lucrative branch of stock-farming, the country being pre-eminently adapted for horned cattle. Rinderpest in 1896–1897 swept through South Africa, and probably carried off in Natal from 30 to 40 % of the stock of Europeans, while the natives' losses were even heavier. Serum and bile inoculation were the means of saving a considerable percentage of the herds. The farmers soon began to recover from their losses, but in 1908–1909 another serious loss of stock resulted from the ravages of East Coast fever. The cattle consist chiefly of the Zulu and Africander breeds, but attention has been given to improving the breed by the introduction of Shorthorn, Devon and Holstein (or Friesland) stock. The chief market for cattle is Johannesburg. The principal breed of sheep is the merino, which does well in the higher altitudes. A Scab Act is in force, and is stringently carried out by government inspectors with most satisfactory results. The Angora goat thrives well in certain districts. Ostriches do well in the dry, arid valleys of the Tugela and Mooi rivers. In 1908 Europeans were returned as owning 32,000 horses, 220,000 horned cattle, 765,000 sheep, 68,000 goats, 25,000 pigs, 960 ostriches and 384,000 poultry. Large herds of cattle—over 500,000 in the aggregate—are owned by the natives, who also possess vast flocks of goats and sheep. The dairy industry is well established, and Natal butter commands a ready sale.

Valuable timber is obtained from the forests. Stinkwood is largely employed in the making of wagons, and is also used for making furniture. Black ironwood is likewise used in building wagons, while sneezewood is largely utilized for supports for piers and other marine structures, being impervious to the attacks of the *Teredo navalis*. More important is the cultivation of the black wattle (*Acacia mollissima*), which began in 1886, the bark being exported for tanning purposes, the wood also commanding a ready sale. This wattle thrives well in most localities, but especially in the highlands of central Natal. In 1905 the production of wattle bark was 13,620 tons, and the area planted with the tree over 60,000 acres. Aloes and ramie are cultivated to some extent for their fibre.

The government maintains experimental farms and forestry plantations and a veterinary department to cope with lung sickness, rinderpest, East Coast fever and such like diseases. It also conducts campaigns against locusts and other pests and helps irrigation settlements. By means of an Agricultural Bank it affords assistance to farmers.

Mining.—There are several highly mineralized areas in the country. The existence of coal in the north-east districts on or near the surface of the ground was reported as early as 1839, but it was not until 1880 that steps were taken to examine the coalfields. This was done by F. W. North, who reported in 1881 that in the Klip river (Dundee) district there was an area of 1350 sq. m. that might be depended upon for the supply of coal, which is of all characters from lignite to anthracite. In 1889 the extension of the railway from Ladysmith through the coal area first made coal-mining profitable. In 1896 the total output of coal was 216,106 tons (valued at £108,053 at the pit's mouth), in 1908 it had increased to 1,669,774 tons (valued at the pit's mouth at £737,169). There is a considerable trade in bunker and export coal at Durban, the coal bunkered having increased from 118,740 tons in 1900 to 710,777 in 1908. In the last-named year 446,915 tons of coal were exported. Besides the mines in the Newcastle and Dundee district there are extensive coal-fields at Hlobane in the Vryheid district and in Zululand (*q.v.*). Iron ore is widely distributed and is found in the neighbourhood of all the coal-fields. There are extensive copper and gold-yielding areas, and in some districts these metals are mined. On the lower Umzimkulu, near Port Shepstone, marble is found in great quantities.

Commerce.—The chief exports, not all products of the province, are coal, wool, mohair, hides and skins, wattle bark, tea, sugar, fruits and jams. The import trade is of a most varied character, and a large proportion of the goods brought into the country are in transit to the Transvaal and Orange Free State, Natal affording, next to Delagoa Bay, the shortest route to the Rand. Textiles, largely cotton goods, hardware, mining and agricultural machinery, tobacco and foodstuffs form the bulk of the imports. In 1896 the value of exports was £1,785,000; in 1908 the value was £9,622,000. In 1896 the imports were valued at £5,437,000, in 1908 at £8,330,000 (a decrease of £2,300,000 compared with 1905). The bulk of these exports are to the Transvaal and neighbouring countries, and previously figure as imports, other exports, largely wool and hides, are first imported from the Transvaal. Over three-fifths of the imports are from Great Britain, and about one-seventh of the exports go to Great Britain. The shipping, which in 1874 was 126,000 tons, was in 1884 1,013,000; in 1894, 1,463,000; in 1904 4,263,000; and in 1908, 5,028,000. Over six-sevenths of the shipping is British.

Government and Constitution.—Natal was from 1893 to 1910 a self-governing colony. It is now represented in the Union Parliament by eight senators and seventeen members of the House of Assembly. The qualifications for electors and members of the Assembly are the same, namely men of full age owning houses or land worth £50, or who rent such property of the yearly value of £10; or who, having lived three years in the province, have incomes of not less than £96 a year.

Coloured persons are not, by name, excluded from the franchise, but no persons "subject to special laws and tribunals,"[1] in which category all natives are included, are entitled to vote. Another law,[2] directed against Indians, excludes from the franchise, natives, or descendants of natives in the male line, of countries not possessing elective representative institutions. Exemption from the scope of these provisions may be granted by the governor-general and under such exemption a few Kaffirs are on the roll of electors.

At the head of the provincial government is an administrator, appointed by the Union Ministry, who holds office for five years. He is assisted by an executive committee of four members elected by the provincial council. This council to which is entrusted the management of affairs purely provincial consists of 25 members, elected by the parliamentary voters and each representing a separate constituency. The council sits for a statutory period of three years. For local government purposes the province is divided into counties or magisterial divisions; Zululand being under special jurisdiction. The chief towns—Durban, Maritzburg, Ladysmith, Newcastle and Dundee—are governed by municipal corporations and minor towns by local boards.

[1] Act No. 2 (of the Natal Legislature) of 1883.

[2] Act No. 8 of 1896. The Indians whose names were "rightly contained" in the voters' rolls at the date of the act retain the franchise.

Revenue and Expenditure.—Revenue is derived chiefly from customs and excise, railways, land sales, posts and telegraphs and a capitation tax. The expenditure is largely on reproductive works (railways, harbours, post office, &c.), on the judiciary and police, education and military defence. The majority of these services are, since 1910, managed by the Union Government, but the provincial council has power to levy direct taxation, and (with the consent of the Union Government) to raise loans for purely provincial purposes. Its revenues and powers are those pertaining to local government. Some particulars follow as to the financial position of Natal previous to the establishment of the Union.

In 1846, the first year of Natal's separate existence, the revenue was £3073 and the expenditure £6905. In 1852 the revenue was £27,158 and the expenditure £24,296, and in 1862 the corresponding figures were £98,799 and £85,928. In 1872 revenue had risen to £180,499 and expenditure to £132,978. Ten years later the figures were, revenue £657,738, expenditure £659,031. The rise of Johannesburg and the opening up of the Dundee coal-fields, as well as the development of agriculture, now caused a rapid increase on both sides of the account. In 1888 the revenue for the first time exceeded a million, the figures for that year being, revenue £1,130,614, expenditure £781,326; in 1898–1899 the figures were £2,081,349 and £1,914,725. The Anglo-Boer War (1899–1902) caused both revenue and expenditure to rise abnormally, while the depression in trade which followed the war adversely affected the exchequer. In 1903–1904 there was a slight credit balance, the figures being, revenue £4,160,145, expenditure £4,071,439. For the next four years there were deficits, but in 1908–1909 a surplus was realized, the revenue being £3,569,275 and the expenditure £3,530,576. For 1909–1910, the last year of Natal's existence as a colony, the revenue, £4,035,000, again exceeded the expenditure. The public debt, £2,101,500 in 1882, had risen at the close of the Boer War in 1902 to £12,519,000, and was in June 1909, £21,420,000.

Defence.—A small garrison of imperial troops is quartered at Maritzburg. The provincial force consists of a militia, fully equipped and armed with modern weapons. It is divided into mounted riflemen, about 1900 strong, four field batteries of 340 men and two infantry battalions, each of over 800 men. There is also an armed and mounted police force of 870 Europeans. Military training is compulsory on all lads over ten attending government schools. The boys are organized in cadet corps. A senior cadet corps is formed of youths between sixteen and twenty. There are also many rifle associations, the members of which are liable to be called out for defence. Durban harbour is defended by batteries with heavy modern guns. The batteries are manned by the naval corps (150 strong) of the Natal militia. Natal makes an annual contribution of £35,000 towards the upkeep of the British navy.

Law and Justice.—The South Africa Act 1909 established a Supreme Court of South Africa, the former supreme court of Natal becoming a provincial division of the new supreme court. The Roman-Dutch law, as accepted and administered by the courts of Cape Colony up to 1845 (the date of the separation of Natal from the Cape), is the law of the land, save as modified by ordinances and laws enacted by the local legislature, mostly founded upon imperial statute law. The law of evidence is the same as that of the courts of England. Natives, however, are not justiceable under the Roman-Dutch law, but by virtue of letters patent passed in 1848 they are judged by native laws and customs, except so far as these may be repugnant to natural equity. The native laws were first codified in 1878, in 1887 a board was appointed for their revision, and the new code came into operation in 1901. Provision is made whereby a native can obtain relief from the operation of native law and be subject to the colonial law (Law No. 28 of 1865). Special laws have been passed for the benefit of the coolie immigrants. The administration of justice is conducted by magistrates' courts, circuit courts and the provincial division of the supreme court. The magistrates have both civil and criminal jurisdiction in minor cases. Appeals can be made from the magistrates' decisions to the provincial or circuit court. The provincial court, consisting of a judge president and three puisne judges, sits in Pietermaritzburg and has jurisdiction over all causes whether affecting natives or Europeans. The judges also hold circuit courts at Durban and other places. Appeals from the circuit courts can be made to the provincial court; and from the provincial court appeals lie to the appellate division of the Supreme Court of South Africa, sitting at Bloemfontein. Criminal cases are tried before a single judge and a jury of nine—of whom not fewer than seven determine the verdict. There is a vice-admiralty court, of which the judge-president is judge and

commissary. In native cases the chiefs have civil jurisdiction in disputes among their own tribesmen and criminal jurisdiction over natives except in capital cases, offences against the person or property of non-natives, pretended witchcraft, cases arising out of marriages by Christian rites, &c. An appeal lies to a magistrates' court from every judgment of a native chief, and from the magistrates' judgment on such appeal to a native high court. This native high court consists of a judge-president and two other judges, and sits in full court at Maritzburg not less than three months and at Eshowe not less than once in the year. There is no jury in this tribunal and single judges may hold circuit courts. With certain exceptions reserved for the provincial court (such as insolvency, ownership of immovable property and divorce), the native high court exercises jurisdiction when all parties to the suit are natives; it also has jurisdiction when the complainant is not a native, but all other parties to the suit are natives.

Religion.—The majority of the white inhabitants are Protestants, the bodies with the largest number of adherents being the Anglicans, Dutch Reformed Church, Presbyterians and Wesleyans. The Anglicans are divided into two parties—those belonging to "the Church of the Province of South Africa," the body in communion with the Church of England, and those who act independently and constitute "the Church of England in Natal." The schism arose out of the alleged heterodox views of Bishop Colenso (*q.v.*), who had been created bishop of Natal by letters patent in 1853. In 1863 the metropolitan of Cape Town, as head of the Church of the Province of South Africa, excommunicated Dr Colenso and consecrated a rival bishop for Natal, who took the title of bishop of Pietermaritzburg. Dr Colenso, who obtained a decision of the privy council confirming his claim to be bishop of Natal and possessor of the temporalities attached to the bishopric, died in 1883. After his death those members of the Anglican community who objected to the constitution of the provincial church maintained their organization while the temporalities were placed in the hands of curators. Reunion in spiritual matters has, however, been practically effected. Moreover, an act of the Natal parliament passed in 1909 placed the temporalities into commission in the persons of the bishop and other trustees of the Natal diocese of the Provincial Church; reservations being made in favour of four congregations at that time unwilling to unite with the main body of churchmen.[1] At the census of 1904 the Anglicans numbered 40,880. The Presbyterians numbered 12,184, the Wesleyan Methodists 11,992, the Dutch Reformed Church 11,340, the Lutherans 4852, and the Baptists 2193. The Roman Catholics, at whose head is a vicar-apostolic, numbered 10,419. All these figures are exclusive of natives, of whom the churches named—notably the Anglicans and Wesleyans—have many converts. The Jewish community in 1904 numbered 1496. Of the Asiatics, 87,234 were classed as Hindus and 10,111 as Mahommedans.

Education.—Education other than elementary is controlled by the Union government. Public schools, and private schools aided by provincial grants provide elementary education for white children. Education is neither compulsory nor free; but the fees are low (1s. to 5s. a month) and few children are kept away from school. There are government secondary and art schools at Durban and Maritzburg, and a Technical Institute at Durban. For higher education provision was made by the affiliation of Natal to the Cape of Good Hope University and by exhibitions tenable at English universities. An act of the Natal legislature, passed December 1909, provided for the establishment at Maritzburg of the Natal University College, the course of studies to be such as from time to time prescribed by the Cape University. In 1910 £30,000 was voted for the University College buildings. State aid and inspection is given to private schools for natives. In the native schools—almost all maintained by Christian missions—Zulu and English are taught, the subjects taken being usually reading, writing, arithmetic, grammar, geography and history. The state provides elementary and higher grade schools for Indian children. In 1908 there were 52 government schools and 472 schools under inspection; 304 European, 21 coloured, 168 native and 31 Indian, with an aggregate attendance of 30,598 scholars. There are in addition many private and denominational schools and colleges not receiving state aid. Of these, two of the best known are Hilton College and Hermansberg College, many prominent Natalians having been educated at one or the other of these establishments. To encourage the instruction of children who by reason of distance cannot attend a government or government-aided school, grants-in-aid are made for each pupil attending farm schools.

The Press.—The first newspaper in Natal was the *Natalier*, a Dutch print published at Maritzburg; it was succeeded by the *Patriot*. The first English paper was the *Natal Witness*, started in 1845 and still one of the leading organs of public opinion. In 1851 the *Natal Times* appeared, and is now continued as the *Times of Natal*. Another leading paper, the *Natal Mercury*, dates from 1852. It is a morning newspaper and is issued at Durban. The *Natal Advertiser* is a Durban evening paper. Sir John Robinson, the first premier of Natal under responsible government, was the editor of the *Mercury* from 1860 until he became prime minister in 1893. In 1886 a new Dutch paper, *De Afrikaner*, was started at Maritzburg. The Kaffirs have their own organ, *Ipipa lo Hlunga* (the paper of grievances), issued at Maritzburg, and the Asiatics, *Indian Opinion* a weekly paper started in 1903 and printed in English, Gujarati, Hindi and Tamil. Local papers are published weekly at Ladysmith, Dundee and Greytown. The *Agricultural Journal*, a government publication issued fortnightly is of great service in the promotion of agricultural knowledge.

[1] For a summary of the Natal church controversy see *The Guardian* (London March 11, 1910).

History.

Discovery and early history.

Vasco da Gama on his voyage to India sighted the bluff at the entrance to the bay now forming the harbour of Durban on Christmas Day 1497 and named the country Terra Natalis. Da Gama made no landing here and, like the rest of South Africa, Natal was neglected by the Portuguese, whose nearest settlement was at Delagoa Bay. In 1576 Manuel de Mesquita Perestrello, commanded by King Sebastian to explore the coast of South Africa and report on suitable harbours, made a rough chart, even then of little use to navigators, which is of value as exhibiting the most that was known of the country by its discoverers before the advent of their Dutch rivals, who established themselves at Cape Town in 1652. Perestrello states that Natal has no ports but otherwise he gives a fairly accurate description of the country—noting particularly the abundance of animals and the density of the population. The first detailed accounts of the country were received from shipwrecked mariners. In 1683 the English ship "Johanna" went ashore near Delagoa Bay and the crew made a remarkable journey overland to Cape Town, passing through Natal, where they were kindly received by the natives. About the same time (in 1684) an English ship put into Port Natal (as the bay came to be known) and purchased ivory from the natives, who, however, refused to deal in slaves. In May 1685 another English ship the "Good Hope" was wrecked in crossing the bar at Port Natal and in February 1686 the "Stavenisse," a Dutch East Indiaman, was wrecked a little farther south. Survivors of both vessels lived for nearly a year at Port Natal and there built a boat in which they made the voyage to Cape Town in twelve days. They brought with them 3 tons of ivory. This fact and their reports of the immense herds of elephants which roamed the bush led Simon van der Stell, then governor at Cape Town to despatch (1689) the ship "Noord" to Port Natal, with instructions to her commander to open up a trade in ivory and to acquire possession of the bay. From the chief of the Amatuli tribe, who inhabited the adjacent district, the bay was "purchased" for about £50 worth of goods. No settlement was then made and in 1705 the son of the chief repudiated the bargain. In 1721 the Cape government did form a settlement at the bay, but it was soon afterwards abandoned. Thereafter for nearly a hundred years Natal was again neglected by white men. A ship now and again put into the bay, but the dangerous bar at its entrance militated against its frequent use. When in 1824 the next attempt was made by Europeans to form a settlement at the bay, Cape Colony had passed from the Dutch into the possession of Great Britain, while in Natal great changes had come over the land as a result of wars between the natives.

From the records of the 17th and 18th centuries it is apparent that the people then inhabiting Natal were Bantu-negroes of the Kaffir (Ama Xosa) branch. There is no mention of Hottentots, and the few Bushmen who dwelt in the upper regions by the Drakensberg did not come into contact with Europeans. The sailors of the "Stavenisse" reported the most numerous and most powerful tribe to be the Abambo, while that which came most in contact with the whites was the Amatuli, as it occupied a considerable part of the coast-land. These Kaffirs appear to have been more given to agriculture and more peaceful than their neighbours in Kaffraria and Cape Colony. But the quiet of the country was destroyed by the inroads of Chaka, the chief of the Zulus (see ZULULAND). Chaka between 1818 and 1820 ravaged the whole of what is now known as Natal, and after beating his foes in battle, butchered the women, children and old men, incorporating the young men in his impis. The population was greatly reduced and large areas left without a single

inhabitant. By right of conquest Chaka became undisputed master of the country.

Such was the situation when the first British settlement was made in Natal. In 1823 Francis George Farewell, formerly a lieutenant in the British navy, with other merchants of Cape Town, formed a company to trade with the natives of the south-east coast. In the brig "Salisbury," commanded by James S. King, who had been a midshipman in the navy, Farewell visited Port Natal, St Lucia and Delagoa Bays. The voyage was not successful as a trading venture, but Farewell was so impressed with the possibilities of Natal both for trade and colonization that he resolved to establish himself at the port. He went thither with ten companions, among them Henry Francis Fynn. All the rest save Farewell and Fynn speedily repented of their adventure and returned to the Cape, but the two who remained were joined by three sailors, John Cane, Henry Ogle and Thomas Holstead, a lad. Farewell, Fynn and the others went to the royal kraal of Chaka, and, having cured him of a wound and made him various presents, obtained a document, dated the 7th of August 1824, ceding to "F. G. Farewell & Company entire and full possession in perpetuity" of a tract of land including "the port or harbour of Natal." On the 27th of the same month Farewell hoisted the Union Jack at the port and declared the territory he had acquired a British possession. In 1825 he was joined by King, who had meantime visited England and had obtained from the government a letter of recommendation to Lord Charles Somerset, governor of the Cape, granting King permission to settle at Natal. Farewell, King and Fynn made independent settlements at various parts of the bay, where a few Amatuli still lingered. They lived, practically, as Kaffir chiefs, trading with Chaka and gathering round them many refugees from that monarch's tyranny. Early in 1828 King, accompanied by two of Chaka's indunas, voyaged in the "Elizabeth and Susan," a small schooner built by the settlers, to Port Elizabeth. He appears to have been coldly received by the authorities, who were even unable to ascertain the nature of Chaka's embassy. Soon after his return to Natal King died, and in the same month (September 1828) Chaka was murdered by his brother Dingaan. In the December following Farewell went in the "Elizabeth and Susan" to Port Elizabeth. On this occasion the authorities were more hostile than before to the Natal pioneers, for they confiscated the schooner on the ground that it was unregistered and that it came from a foreign port. Farewell was not daunted, and in September 1829 set out to return overland to Port Natal. He was, however, murdered in Pondoland by a chief who was at enmity with the Zulus. Fynn thus became leader of the whites at the port, who were much at the mercy of Dingaan. In 1831 that chief raided their settlements, the whites all fleeing south of the Umzimkulu; but at Dingaan's invitation they soon returned. Dingaan declared Fynn his representative and "great chief of the Natal Kaffirs." In 1834, however, Fynn accepted a post under the Cape government and did not return to Natal for many years. It was in this year that a petition from Cape Town merchants asking for the creation of a British colony at Natal was met by the statement that the Cape finances would not permit the establishment of a new dependency. The merchants, however, despatched an expedition under Dr Andrew Smith to inquire into the possibilities of the country, and the favourable nature of his report induced a party of Dutch farmers under Piet Uys to go thither also. Both Dr Smith and Uys travelled overland through Kaffraria, and were well received by the English living at the bay. The next step was taken by the settlers at the port, who in 1835 resolved to lay out a town, which they named Durban, after Sir Benjamin d'Urban, then governor of Cape Colony. At the same time the settlers, who numbered about 50, sent a memorial to the governor calling attention to the fact that they were acknowledged rulers over a large tract of territory south of the Tugela, and asking that this territory should be proclaimed a British colony under the name of Victoria and that a governor and council be appointed. To all these requests no official answer was returned. The settlers had been joined in the year named (1835) by Captain Gardiner, a naval officer, whose chief object was the evangelization of the natives. With the support of the traders he founded a mission station on the hill overlooking the bay. In 1837 Gardiner was given authority by the British government to exercise jurisdiction over the traders. They, however, refused to acknowledge Gardiner's authority, and from the Cape government he received no support.[1] It was not until their hand was forced by the occupation of the interior by Dutch farmers that the Cape authorities at length intervened.

The first British settlement.

The British settlers had, characteristically, reached Natal mainly by way of the sea; the new tide of immigration was by land—the *voortrekkers* streamed through the passes of the Drakensberg, bringing with them their wives and children and vast herds of cattle. The reasons which caused the exodus from the Cape are discussed elsewhere (see SOUTH AFRICA and CAPE COLONY), here it is only necessary to point out that those emigrants who entered Natal shared with those who settled elsewhere an intense desire to be free from British control. The first emigrant Boers to enter the country were led by Pieter Retief (*c.* 1780–1838), a man of Huguenot descent and of marked ability, who had formerly lived on the eastern frontier of Cape Colony and had suffered severely in the Kaffir wars. Passing through the almost deserted upper regions Retief arrived at the bay in October 1837. He went thence to Dingaan's kraal with the object of securing a formal cession of territory to the Dutch farmers. Dingaan consented on condition that the Boers recovered for him certain cattle stolen by another chief; this task Retief accomplished, and with the help of the Rev. F. Owen, a missionary then living at Dingaan's kraal, a deed of cession was drawn up in English and signed by Dingaan and Retief on the 4th of February 1838. Two days after the signature of the deed Retief and all of his party, 66 whites, besides Hottentot servants, were treacherously murdered by Dingaan's orders. The Zulu king then commanded his impis to kill all the Boers who had entered Natal. The Zulu forces crossed the Tugela the same day, and the most advanced parties of the Boers were massacred, many at a spot near where the town of Weenen now stands, its name (meaning wailing or weeping) commemorating the event. Other of the farmers hastily laagered and were able to repulse the Zulu attacks; the assailants suffering serious loss at a fight near the Bushman's river. Nevertheless in one week after the murder of Retief 600 Boers—men, women and children—had been killed by the Zulus. The English settlers at the bay, hearing of the attack on the Boers, determined to make a diversion in their favour, and some 20 men under the command of R. Biggar and with a following of 700 friendly Zulus crossed the Tugela near its mouth. In a desperate fight (April 17) with a strong force of the enemy the English were overwhelmed and only four Europeans escaped to the bay. Pursued by the Zulus, all the surviving inhabitants of Durban were compelled for a time to take refuge on a ship then in harbour. After the Zulus retired, less than a dozen Englishmen returned to live at the port; the missionaries, hunters and other traders returned to the Cape. Meantime the Boers, who had repelled the Zulu attacks on their laagers, had been joined by others from the Drakensberg, and about 400 men under Hendrik Potgieter and Piet Uys advanced to attack Dingaan. On the 11th of April, however, they fell into a trap laid by the Zulus and with difficulty cut their way out. Among those slain were Piet Uys and his son Dirk, aged 15, who rode by his side. The Boer farmers were now in a miserable plight, but towards the end of the year they received reinforcements, and in December 460 men set out under Andries Pretorius to avenge themselves on the Zulus. On Sunday the 16th of December, while laagered near the Umslatos river, they were attacked by over 10,000 Zulus. The Boers had firearms, the Zulus their assegais only, and after a three hours' fight the Zulus were totally defeated, losing thousands killed, while the farmers' casualties were under

Arrival of the Dutch voortrekkers.

[1] Captain Allen Francis Gardiner (1794–1851) left Natal in 1838, subsequently devoting himself to missionary work in South America, being known as the missionary to Patagonia. He died of starvation in Tierra del Fuego.

a dozen. (This memorable victory is annually commemorated by the Boers as Dingaan's Day, while the Umslatos, which ran red with the blood of the slain, was renamed Blood river.) Dingaan fled, the victorious Boers entered the royal kraal, gave decent burial to the skeletons of Retief and his party, and regarded themselves as now undisputed masters of Natal. They had recovered from a leather pouch which Retief carried the deed by which Dingaan ceded "to Retief and his countrymen the place called Port Natal together with all the lands annexed . . . as far as the land may be useful and in my possession." This was the 5th or 6th cession made by Chaka or Dingaan of the same territory to different individuals. In every case the overlordship of the Zulus was assumed.

Returning south, Pretorius and his commando were surprised to learn that Port Natal had been occupied on the 4th of December by a detachment of the 72nd Highlanders sent thither from the Cape. The emigrant farmers had, with the assent of the few remaining Englishmen at Port Natal, in May 1838 issued a proclamation taking possession of the port. This had been followed by an intimation from the governor of the Cape (Major-General Sir George Napier) inviting the emigrants to return to the colony, and stating that whenever he thought it desirable he should take military possession of the port. In sanctioning the occupation of the port the British government of the day had no intention of making Natal a British colony, but wished to prevent the Boers establishing an independent republic upon the coast with a harbour through which access to the interior could be gained. After remaining at the port just over a year the Highlanders were withdrawn, on Christmas Eve 1839. Meantime the Boers had founded Pietermaritzburg and made it the seat of their volksraad. They rendered their power in Natal absolute, for the time, in the following month, when they joined with Panda, Dingaan's brother, in another attack on the Zulu king. Dingaan was utterly defeated and soon afterwards perished, Panda becoming king in his stead by favour of the Boers.

At this time, had the affairs of the Boer community been managed with prudence and sagacity they might have established an enduring state. But their impatience of control, reflected in the form of government adopted, led to disastrous consequences. Legislative power was vested, nominally, in the volksraad (consisting of twenty-four members), while the president and executive were changed every three months. But whenever any measure of importance was to be decided a meeting was called of *het publiek*, that is, of all who chose to attend, to sanction or reject it. "The result," says Theal, "was utter anarchy. Decisions of one day were frequently reversed the next, and every one held himself free to disobey any law that he did not approve of. . . . Public opinion of the hour in each section of the community was the only force in the land" (*History of South Africa 1834–1854*, chap. xliv.). While such was the domestic state of affairs during the period of self-government, the settlers cherished large territorial views. They were in loose alliance with and in quasi-supremacy over the Boer communities which had left the Cape and settled at Winburg and at Potchefstroom. They had declared themselves a free and independent state under the title of "The Republic of Port Natal and adjacent countries,"[1] and sought (September 1840) from Sir George Napier at the Cape an acknowledgment of their independence by Great Britain. Sir George, being without definite instructions from England, could give no decisive answer, but he was friendly disposed to the Natal farmers. This feeling was, however, changed by what Sir George (and many of the Dutch in Natal also) thought a wilful and unjustifiable attack (December 1840) on a tribe of Kaffirs on the southern, or Cape Colony, frontier by a commando under Andries Pretorius, which set out, nominally, to recover stolen cattle. Having at length received an intimation from London that the queen "could not acknowledge the independence of her own subjects, but that the trade of the emigrant farmers would be placed on the same footing as that of any other British settlement, upon their receiving a military force to exclude the interference with or possession of the country by any other European power," Sir George communicated this decision to the volksraad in September 1841. Under the arrangement proposed the Boers might easily have secured the benefits of self-government, subject to an acknowledgment of British supremacy, together with the advantage of military protection, for the British government was then extremely reluctant to extend its colonial responsibilities. The Boers, however, strongly resented the contention of the British that they could not shake off British nationality though beyond the bounds of any recognized British possession, nor were they prepared to see their only port garrisoned by British troops, and they rejected Napier's overtures. Napier, therefore, on the 2nd of December 1841, issued a proclamation in which he stated that in consequence of the emigrant farmers refusing to be treated as British subjects and of their attitude towards the Kaffir tribes he intended resuming military occupation of Port Natal. This proclamation was answered in a lengthy minute, dated the 21st of February 1842, drawn up by J. N. Boshof (afterwards president of the Orange Free State), by far the ablest of the Dutch who had settled in Natal. In this minute the farmers ascribed all their troubles to one cause, namely, the absence of a representative government, which had been repeatedly asked for by them while still living in Cape Colony and as often denied or delayed, and concluded by a protest against the occupation of any part of their territory by British troops. An incident which happened immediately after these events greatly encouraged the Boers to persist in their opposition to Great Britain. In March 1842 a Dutch vessel sent out by G. G. Ohrig, an Amsterdam merchant who sympathized warmly with the cause of the emigrant farmers, reached port Natal, and its supercargo, J. A. Smellekamp (a man who subsequently played a part in the early history of the Transvaal and Orange Free State), concluded a treaty with the volksraad assuring them of the protection of Holland. The Natal Boers believed the Netherlands to be one of the great powers of Europe, and were firmly persuaded that its government would aid them in resisting England.

British and Dutch in conflict.

On the 1st of April Captain T. C. Smith with a force of 263 men left his camp at the Umgazi, on the eastern frontier of Cape Colony, and marching overland reached Durban without opposition, and encamped, on the 4th of May, at the base of the Berea hills. The Boers, cut off from their port, called out a commando of some 300 to 400 men under Andries Pretorius and gathered at Congella at the head of the bay. On the night of the 23rd of May Smith made an unsuccessful attack on the Boer camp, losing his guns and fifty men killed and wounded. On the 26th the Boers captured the harbour and settlement, and on the 31st blockaded the British camp, the women and children being removed, on the suggestion of Pretorius, to a ship in the harbour of which the Boers had taken possession. Meantime, an old Durban resident, Richard (commonly called Dick) King, had undertaken to convey tidings of the perilous position of the British force to the commandant at Graham's Town. He started on the night of the 24th and escaping the Boer outposts rode through the dense bush and across the bridgeless rivers of Kaffraria at peril of his life from hostile natives and wild beasts, and in nine days reached his destination—a distance of 360 m. in a direct line, and nearly 600 by the route to be followed. This remarkable ride was accomplished with one change of mount, obtained from a missionary in Pondoland. A comparatively strong force under Colonel A. J. Cloete was at once sent by sea to Port Natal, and on the 26th of June Captain Smith was relieved. The besieged had suffered greatly from lack of food. Within a fortnight Colonel Cloete had received the submission of the volksraad at Pietermaritzburg. The burghers represented that they were under the protection of Holland, but this plea was peremptorily rejected by the commander of the British forces.

The British government was still undecided as to its policy towards Natal. In April 1842 Lord Stanley (afterwards 14th earl of Derby), then secretary for the colonies in the second Peel Administration, wrote to Sir George Napier that the establishment of a colony in Natal would be attended with little prospect of

[1] Commonly called the Republic of Natalia or Natal.

advantage, but at the same time stated that the pretensions of the emigrants to be regarded as an independent community could not be admitted. Various measures were proposed which would but have aggravated the situation. Finally, in deference to the strongly urged views of Sir George Napier, Lord Stanley, in a despatch of the 13th of December, received in Cape Town on the 23rd of April 1843, consented to Natal becoming a British colony. The institutions adopted were to be as far as possible in accordance with the wishes of the people, but it was a fundamental condition "that there should not be in the eye of the law any distinction or disqualification whatever, founded on mere difference of colour, origin, language or creed." Sir George then appointed Mr Henry Cloete (a brother of Colonel Cloete) a special commissioner to explain to the Natal volksraad the decision of the government. There was a considerable party of Natal Boers still strongly opposed to the British, and they were reinforced by numerous bands of Boers who came over the Drakensberg from Winburg and Potchefstroom. Commandant Jan Mocke of Winburg (who had helped to besiege Captain Smith at Durban) and others of the "war party" attempted to induce the volksraad not to submit, and a plan was formed to murder Pretorius, Boshof and other leaders, who were now convinced that the only chance of ending the state of complete anarchy into which the country had fallen was by accepting British sovereignty. In these circumstances the task of Mr Henry Cloete was one of great difficulty and delicacy. He behaved with the utmost tact and got rid of the Winburg and Potchefstroom burghers by declaring that he should recommend the Drakensberg as the northern limit of Natal. On the 8th of August 1843 the Natal volksraad unanimously agreed to the terms proposed by Lord Stanley. Many of the Boers who would not acknowledge British rule trekked once more over the mountains into what are now the Orange Free State and Transvaal provinces. At the end of 1843 there were not more than 500 Dutch families left in Natal. Cloete, before returning to the Cape, visited Panda and obtained from him a valuable concession. Hitherto the Tugela from source to mouth had been the recognized frontier between Natal and Zululand. Panda gave up to Natal all the territory between the Buffalo and Tugela rivers, now forming Klip River county.

Natal annexed by Great Britain.

Although proclaimed a British colony in 1843, and in 1844 declared a part of Cape Colony, it was not until the end of 1845 that an effective administration was installed with Mr Martin West as lieutenant-governor, and the power of the volksraad finally came to an end. In that year the external trade of Natal, almost entirely with Cape Colony, was of the total value of £42,000—of which £32,000 represented imported goods.

The new administration found it hard to please the Dutch farmers, who among other grievances resented what they considered the undue favour shown to the Kaffirs, whose numbers had been greatly augmented by the flight of refugees from Panda. In 1843, for instance, no fewer than 50,000 Zulus crossed the Tugela seeking the protection of the white man. The natives were settled in 1846 in specially selected locations and placed under the general supervision of Sir (then Mr) Theophilus Shepstone (*q.v.*). Sir Harry Smith, newly appointed governor of the Cape, met, on the banks of the upper Tugela, a body of farmers preparing to recross the Drakensberg, and by remedying their grievances induced many of them to remain in Natal. Andries Pretorius and others, however, declined to remain, and from this time Pretorius (*q.v.*) ceased his connexion with Natal. Although by this migration the white population was again considerably reduced, those who remained were contented and loyal, and through the arrival of 4500 emigrants from England in the years 1848–1851 and by subsequent immigration from oversea the colony became overwhelmingly British in character. From the time of the coming of the first considerable body of British settlers dates the development of trade and agriculture in the colony, followed somewhat later by the exploitation of the mineral resources of the country. At the same time schools were established and various churches began or increased their work in the colony. Dr Colenso, appointed bishop of Natal, arrived in 1854. In 1856 the dependence of the country on Cape Colony was put to an end and Natal constituted a distinct colony with a legislative council of sixteen members, twelve elected by the inhabitants and four nominated by the crown. At the time the white population exceeded 8000. While dependent on the Cape, ordinances had been passed establishing Roman-Dutch law as the law of Natal, and save where modified by legislation it remained in force.

The British settlers soon realized that the coast lands were suited to the cultivation of tropical or semi-tropical products, and from 1852 onward sugar, coffee, cotton and arrow-root were introduced, tea being afterwards substituted for coffee. The sugar industry soon became of importance, and the planters were compelled to seek for large numbers of labourers. The natives, at ease in their locations, did not volunteer in sufficient numbers, and recourse was had to coolie labour from India. The first coolies reached Natal in 1860. They came under indentures, but at the expiration of their contract were allowed to settle in the colony.[1] This proved one of the most momentous steps taken in the history of South Africa, for the Indian population rapidly increased, the "free" Indians becoming market gardeners, farmers, hawkers, traders, and in time serious competitors with the whites. But in 1860 and for many years afterwards these consequences were not foreseen, and alone among the South Africa states Natal offered a welcome to Asiatics.

Indian coolies introduced.

In 1866 the borders of the colony were extended on the south-west by the annexation of part of Kaffraria that had formerly been under the sway of the Pondo chief Faku, who found himself unable to maintain his authority in a region occupied by many diverse tribes. The newly acquired territory was named Alfred county in memory of a visit paid to Natal by Prince Alfred (afterwards duke of Saxe-Coburg-Gotha). In 1867 R. W. Keate (1814–1873) became lieutenant-governor, a post which he filled until 1872. His administration is notable, not so much for internal affairs but from the fact that he twice acted as arbitrator in disputes in which the Boer states were involved. In a dispute between the Transvaal and the Orange Free State he decided (February 1870) that the Klip river and not the upper Vaal was the frontier stream. A more famous decision, that known as the Keate Award, was given in October 1871. It concerned the south-western frontiers of the Transvaal, and the award, which was against the Transvaal pretensions, had important effects on the history of South Africa (see TRANSVAAL and SOUTH AFRICA).

The Keate awards.

During all this time little was done to alter the condition of the natives. There was scarcely an attempt to copy the policy, deliberately adopted in Cape Colony, of educating and civilizing the black man. Neither was Natal faced with the Cape problem of a large half-caste population. The Natal natives were left very much in the state in which they were before the advent of the white men. While this opportunity of educating and training a docile people was in the main neglected, savage abuse of power by their chiefs was prevented. Under the superintendence of Shepstone the original refugees were quiet and contented, enjoying security from injustice and considerable freedom. This ideal lot, from the native point of view, drew such numbers of immigrants from disturbed districts that with the natural increase of population in thirty years the native inhabitants increased from about 100,000 to fully 350,000. New generations grew up almost as ignorant as their fathers, but not with the same sense of dependence upon the white men. In this way was sown the seed of future trouble between the two races. The first serious collision between the natives and the government occurred in 1873. The Amahlubi, one of the highest in rank of the Bantu tribes of South Africa, fleeing from the cruelties of

[1] Between 1860 and 1866 some 5000 Indians entered the colony. Immigration then ceased, and was not resumed until 1874. By that year the natives from Portuguese territory and elsewhere who had found employment in Natal had been attracted to the Kimberley diamond mines, and the Natal natives not coming forward (save under compulsion), the importation of Indian coolies was again permitted (see the Natal Blue Book, *Report of the Indian Immigration Commission, 1909*).

Panda, had been located by the Natal government under their chief Langalibalele (*i.e.* the great sun which shines and burns) in 1848 at the foot of the Drakensberg with the object of preventing the Bushmen who dwelt in the mountains plundering the upland farmers. Here the Amahlubi prospered, and after the diamond fields had been discovered many of the young men who had been to Kimberley brought back firearms. These Langalibalele refused to register, and entered into negotiations with several tribes with the object of organizing a general revolt. Prompt action by Sir Benjamin Pine, then lieutenant-governor of the colony, together with help from the Cape and Basutoland, prevented the success of Langalibalele's plan, and his own tribe, numbering some 10,000 persons, was the only one which rebelled. The chief was captured, and exiled to Cape Colony (August 1874). Permitted to return to Natal in 1886, he died in 1889.

Langalibalele's rebellion.

This rebellion drew the attention of the home government to the native question in Natal. The colonists, if mistaken in their general policy of leaving the natives in a condition of mitigated barbarism, had behaved towards them with uniform kindness and justice. They showed indeed in their dealings both with the natives within their borders and with the Zulus beyond the Tugela a disposition to favour the natives at the expense of their white neighbours in the Transvaal and Orange Free State, and their action against Langalibalele was fully justified and the danger of a widespread native revolt real. But there were those, including Bishop Colenso, who thought the treatment of the Amahlubi wrong, and their agitation induced the British government to recall Sir Benjamin Pine, Sir Garnet Wolseley being sent out as temporary governor. Sir Garnet reported the natives as "happy and prosperous—well off in every sense." As a result of consultations with Shepstone certain modifications were made in native policy, chiefly in the direction of more European supervision.

Meantime the colony had weathered a severe commercial crisis brought on in 1865 through over-speculation and the neglect of agriculture, save along the coast belt. But the trade over berg largely developed on the discovery of the Kimberley diamond mines, and the progress of the country was greatly promoted by the substitution of the railway for the ox wagon as a means of transport. There already existed a short line from the Point at Durban to the Umgeni, and on the 1st of January 1876 Sir Henry Bulwer, who had succeeded Wolseley as governor, turned the first sod of a new state-owned railway which was completed as far as Maritzburg in 1880. At this date the white inhabitants numbered about 20,000. But besides a commercial crisis the colony had been the scene of an ecclesiastical dispute which attracted widespread attention. Bishop Colenso (*q.v.*), condemned in 1863 on a charge of heresy, ignored the authority of the court of South African bishops and was maintained in his position by decision of the Privy Council in England. This led to a division among the Anglican community in the colony and the consecration in 1869 of a rival bishop, who took the title of bishop of Maritzburg. Colenso's bold advocacy of the cause of the natives —which he maintained with vigour until his death (in 1883)— attracted almost equal attention. His native name was Usobantu (*father of the people*).

The Colenso affair.

For some years Natal, in common with the other countries of South Africa, had suffered from the absence of anything resembling a strong government among the Boers of the Transvaal, neighbours of Natal on the north. The annexation of the Transvaal to Great Britain, effected by Sir Theophilus Shepstone in April 1877, would, it was hoped, put a period to the disorders in that country. But the new administration at Pretoria inherited many disputes with the Zulus, disputes which were in large measure the cause of the war of 1879. For years the Zulus had lived at amity with the Natalians, from whom they received substantial favours, and in 1872 Cetywayo (*q.v.*), on succeeding his father Panda, had given assurances of good behaviour. These promises were not kept for long, and by 1878 his attitude had become so hostile towards both the Natal and Transvaal governments that Sir Bartle Frere, then High Commissioner for South Africa, determined on his reduction. During the war (see ZULULAND) Natal was used as the British base, and the Natal volunteers rendered valuable service in the campaign, which, after opening with disasters to the British forces, ended in the breaking of the Zulu power. (F. R. C.)

Scarcely had the colony recovered from the shock of the Zulu War than it was involved in the revolt of the Transvaal Boers (1880–1881), an event which overshadowed all domestic concerns. The Natalians were intensely British in sentiment, and resented deeply the policy adopted by the Gladstone administration. At Ingogo, Majuba and Laing's Nek, all of them situated within the colony, British forces had been defeated by the Boers. And the treaty of retrocession was never regarded in Natal as anything but a surrender. It was clearly understood that the Boers would aim to establish a republican government over the whole of South Africa, and that the terms of peace simply meant greater bloodshed at no distant date. The protest made by the Natalians against the settlement was in vain. The Transvaal Republic was established, but the prediction of the colonists, ignored at the time, was afterwards fulfilled to the letter. In justice, however, to the colonists of Natal it must be recorded that, finding their protest with regard to the Transvaal settlement useless, they made up their minds to shape their policy in conformity with that settlement. But it was not long before their worst fears with regard to the Boers began to be realized, and their patience was once more severely taxed. The Zulu power, as has been recorded, was broken in 1879. After the war quarrels arose among the petty chiefs set up by Sir Garnet Wolseley, and in 1883 some Transvaal Boers intervened, and subsequently, as a reward for the assistance they had rendered to one of the combatants, demanded and annexed 8000 sq. m. of country, which they styled the "New Republic." As the London Convention had stipulated that there should be no trespassing on the part of the Boers over their specified boundaries, and as Natal had been the basis for those operations against the Zulus on the part of the British in 1879, which alone made such an annexation of territory possible, a strong feeling was once more aroused in Natal. The "New Republic," reduced in area, however, to less than 2000 sq. m., was nevertheless recognized by the British government in 1886, and in 1888 its consent was given to the territory (the Vryheid district) being incorporated with the Transvaal. Meantime, in 1887, the remainder of Zululand had been annexed to Great Britain (see ZULULAND).

Natal and the war of 1880–81.

In 1884 the discovery of gold in De Kaap Valley, and on Mr Moodie's farm in the Transvaal, caused a considerable rush of colonists from Natal to that country. Railways were still far from the Transvaal border, and Natal not only sent her own colonists to the new fields, but also offered the nearest route for prospectors from Cape Colony or from Europe. Durban was soon thronged; and Pietermaritzburg, which was then practically the terminus of the Natal railway, was the base from which nearly all the expeditions to the goldfields were fitted out. The journey to De Kaap by bullock-waggon occupied about six weeks. "Kurveying" (the conducting of transport by bullock-waggon) in itself constituted a great industry. Two years later, in 1886, the Rand goldfields were proclaimed, and the tide of trade which had already set in with the Transvaal steadily increased. Natal colonists were not merely the first in the field with the transport traffic to the new goldfields; they became some of the earliest proprietors of mines, and for several years many of the largest mining companies had their chief offices at Pietermaritzburg or Durban. In this year (1886) the railway reached Ladysmith, and in 1891 it was completed to the Transvaal frontier at Charlestown, the section from Ladysmith northward opening up the Dundee and Newcastle coalfields. Thus a new industry was added to the resources of the colony.

Growth of industries.

The demand which the growing trade made upon the one port of Natal, Durban, encouraged the colonists to redouble their efforts to improve their harbour. The question of a fairway

from ocean to harbour has been a difficult one at nearly every port on the African coast. A heavy sea from the Indian Ocean is always breaking on the shore, even in the finest weather, and at the mouth of every natural harbour a bar occurs. To deepen the channel over the bar at Durban so that steamers might enter the harbour was the cause of labour and expenditure for many years. Harbour works were begun in 1857, piers and jetties were constructed, dredgers imported, and controversy raged over the various schemes for harbour improvement. In 1881 a harbour board was formed under the chairmanship of Mr Harry Escombe. It controlled the operations for improving the sea entrance until 1893, when on the establishment of responsible government it was abolished. The work of improving the harbour was however continued with vigour, and finally, in 1904, such success was achieved that vessels of the largest class were enabled to enter port (see DURBAN). At the same time the railway system was continually developing.

Self-government granted.

For many years there had been an agitation among the colonists for self-government. In 1882 the colony was offered self-government coupled with the obligations of self-defence. The offer was declined, but in 1883 the legislative council was remodelled so as to consist of 23 elected and 7 nominated members. In 1890 the elections to the council led to the return of a majority in favour of accepting self-government, and in 1893 a bill in favour of the proposed change was passed and received the sanction of the Imperial government. At the time the white inhabitants numbered about 50,000. The electoral law was framed to prevent more than a very few natives obtaining the franchise. Restrictions in this direction dated as far back as 1865, while in 1896 an act was passed aimed at the exclusion of Indians from the suffrage. The leader of the party which sought responsible government was Sir John Robinson (1839–1903) who had gone to Natal in 1850, was a leading journalist in the colony, had been a member of the legislative council since 1863, and had filled various official positions. He now became the first premier and colonial secretary with Mr Harry Escombe (*q.v.*) as attorney-general and Mr F. R. Moor as secretary for Native Affairs. The year that witnessed this change in the constitution was also notable for the death of Sir Theophilus Shepstone, Natal's most prominent citizen. In the same year Sir Walter Hely-Hutchinson became governor. His immediate predecessors had been Sir Charles Mitchell (1889–1893) and Sir Arthur Havelock (1886–1889). Sir John Robinson remained premier until 1897, a year marked by the annexation of Zululand to Natal. In the following year Natal entered the Customs Union already existing between Cape Colony and the Orange Free State. Sir John Robinson had been succeeded as premier by Mr Harry Escombe (February-October 1897) and Escombe by Sir Henry Binns, on whose death in June 1899 Lieut.-Colonel (afterwards Sir) Albert Hime formed a ministry which remained in office until after the conclusion of the Anglo-Boer War. Meantime (in 1901) Sir Henry McCallum had succeeded Sir Walter Hely-Hutchinson as governor.

For some years Natal had watched with anxiety the attitude of increasing hostility towards the British adopted by the Pretoria administration, and, with bitter remembrance of the events of 1881, gauged with accuracy the intentions of the Boers. So suspicious had the ministry become of the nature of the military preparations that were being made by the Boers, that in May 1899 they communicated their apprehensions to the High Commissioner, Sir Alfred Milner, who telegraphed on the 25th of May to Mr Chamberlain, informing him that Natal was uneasy. The governor expressed his views to the prime minister that the Natal government ought to give the British government every support, and Colonel Hime replied that their support would be given, but at the same time he feared the consequences to Natal if, after all, the British government should draw back. In July the Natal ministry learnt that it was not the intention of the Imperial government to endeavour to hold the frontier in case hostilities arose, but that a line of defence considerably south of the frontier would be taken up. This led to a request on their part that if the Imperial government had any reason to anticipate the breakdown of negotiations, "such steps may be at once taken as may be necessary for the effectual defence of the whole colony." Sir William Penn Symons, the general commanding the British forces in Natal in September, decided to hold Glencoe. On the arrival of Lieut.-General Sir George White from India, he informed the governor that he considered it dangerous to attempt to hold Glencoe, and urged the advisability of withdrawing the troops to Ladysmith. The governor was strongly opposed to this step, as he was anxious to protect the coal supply, and also feared the moral effect of a withdrawal. Eventually Sir Archibald Hunter, then chief of staff to Sir Redvers Buller, was consulted, and stated that in his opinion, Glencoe being already occupied, "it was a case of balancing drawbacks, and advised that, under the circumstances, the troops be retained at Glencoe." This course was then adopted.

The war of 1899–1902.

On the 11th of October 1899 war broke out. The first act was the seizure by the Boers of a Natal train on the Free State border. On the 12th Laing's Nek was occupied by the Boer forces, who were moved in considerable force over the Natal border. Newcastle was next occupied by the Boers unopposed, and on the 20th of October occurred the battle of Talana Hill outside Dundee. In this engagement the advanced body of British troops, 3000 strong, under Symons, held a camp called Craigside which lay between Glencoe and Dundee, and from this position General Symons hoped to be able to hold the northern portion of Natal. There is no doubt that this policy strongly commended itself to the governor and ministers of Natal, and that they exercised considerable pressure to have it adopted. But from a military point of view it was not at all cordially approved by Sir George White, and it was afterwards condemned by Lord Roberts. Fortunately Symons was able to win a complete victory over one of the Boer columns at Talana Hill. He himself received a mortal wound in the action. Brigadier-General Yule then took command, and an overwhelming force of Boers rendering the further occupation of Dundee dangerous, he decided to retire his force to Ladysmith. On the 21st of October General Sir George White and General (Sir John) French defeated at Elandslaagte a strong force of Boers, who threatened to cut off General Yule's retreat. He again attacked the Boer forces at Rietfontein on the 24th of October, and on the 26th General Yule reached Ladysmith in safety. Ladysmith now became for a time the centre of military interest. The Boers gradually surrounded the town and cut off the communications from the south. Various engagements were fought in the attempt to prevent this movement, including the actions of Farquhar's Farm and Nicholson's Nek on the 30th (see TRANSVAAL). The investment of Ladysmith continued till the 28th of February 1900, when, after various attempts to relieve the beleaguered garrison, Sir Redvers Buller's forces at last entered the town. During the six weeks previous to the relief, 200 deaths had occurred from disease alone, and altogether as many as 8424 were reported to have passed through the hospitals. The relief of Ladysmith soon led to the evacuation of Natal by the Boer forces, who trekked northwards.

During the Boer invasion the government and the loyal colonists, constituting the great majority of the inhabitants of the colony, rendered the Imperial forces every assistance. A comparatively small number of the Dutch colonists joined the enemy, but there was no general rebellion among them. As the war progressed the Natal volunteers and other Natal forces took a prominent part. The Imperial Light Horse and other irregular corps were recruited in Natal, although the bulk of the men in the forces were Uitlanders from Johannesburg. As the nearest colony to the Transvaal, Natal was resorted to by a large number of men, women and children, who were compelled to leave the Transvaal on the outbreak of the war. Refugee and Uitlander committees were formed both at Durban and Maritzburg, and, in conjunction with the colonists, they did all in their power to assist in recruiting irregular corps, and also in furnishing relief to the sick and needy.

As one result of the war, an addition was made to the territory comprised in Natal, consisting of a portion of what had previously been included in the Transvaal. The Natal government originally made two proposals for annexing new territory:—

1. It was proposed that the following districts should be transferred to Natal, viz. the district of Vryheid, the district of Utrecht and such portion of the district of Wakkerstroom as was comprised by a line drawn from the north-eastern corner of Natal, east by Volksrust in a northerly direction to the summit of the Drakensberg Range, along that range, passing just north of the town of Wakkerstroom, to the head waters of the Pongola river, and thence following the Pongola river to the border of the Utrecht district. In consideration of the advantage to Natal from this addition of territory, Natal should take over £700,000 of the Transvaal debt.

2. It was proposed to include in Natal such portions of the Harrismith and Vrede districts as were comprised by a line following the Elands river north from its source on the Basutoland border to its junction with the Wilge river, and thence drawn straight to the point where the boundaries of Natal, the Transvaal and the Orange River Colony meet on the Drakensberg. In consideration of this addition to her territory, Natal should take over a portion of the Orange River Colony debt, to be raised at the end of the war, to the amount of £200,000.

Annexations to the northern territories.

The Imperial government decided to sanction only the first of these two proposals. For this course there were many reasons, the Transvaal territory annexed, or the greater part of it (the Vryheid district), having been only separated from the rest of Zululand in 1883 by a raid of armed Boers. "In handing over this district to the administration which controls the rest of Zululand, His Majesty's government," wrote Mr Chamberlain, under date March 1902, "feel that they are reuniting what ought never to have been separated."

With regard, however, to the proposed transfer of territory from the Orange River Colony, the circumstances were different. "There is," said Mr Chamberlain, "no such historical reason as exists in the case of Vryheid for making the transfer. On the contrary, the districts in question have invariably formed part of the state from which it is now proposed to sever them, and they are separated from Natal by mountains which form a well-defined natural boundary. In these circumstances, His Majesty's government have decided to confine the territory to be transferred to the districts in the Transvaal."

The districts added to Natal contained about 6000 white inhabitants (mostly Dutch), and some 92,000 natives, and had an area of nearly 7000 sq. m., so that this annexation meant an addition to the white population of Natal of about one-tenth, to her native population of about one-tenth also, and to her territory of about one-fourth. An act authorizing the annexation was passed during 1902 and the territories were formally transferred to Natal in January 1903. (A. P. H.; F. R. C.)

The period following the war was succeeded by commercial depression, though in Natal it was not so severely felt as in other states of South Africa. The government met the crisis by renewed energy in harbour works, railway constructions and the development of the natural resources of the country. A railway to the Zululand coalfields was completed in 1903, and in the same year a line was opened to Vryheid in the newly annexed territories. Natal further built several railway lines in the eastern half of the Orange River Colony, thus opening up new markets for her produce and facilitating her transit trade. Mr Chamberlain on his visit to South Africa came first to Natal, where he landed in the last days of 1902, and conferred with the leading colonists. In August 1903 the Hime ministry resigned and was succeeded by a cabinet under the premiership of Mr (afterwards Sir) George Sutton, the founder of the wattle industry in Natal and one of the pioneers in the coal-mining industry. In May 1905 Sir George Sutton was replaced by a coalition ministry under Mr C. J. Smythe, who had been colonial secretary under Sir Albert Hime. These somewhat frequent changes of ministry, characteristic of a country new to responsible government, reflected, chiefly, differences concerning the treatment of commercial questions and the policy to be adopted towards the natives. Towards those Dutch colonists who had joined the enemy during the war leniency was shown, all rebels being pardoned.

Commercial depression and native rebellion.

The attitude of the natives both in Natal proper and in Zululand caused much disquiet. As early as July 1903 rumours were current that Dinizulu (a son of Cetywayo) was disaffected and the power he exercised as representative of the former royal house rendered his attitude a matter of great moment. Dinizulu, however, remained at the time quiescent, though the Zulus were in a state of excitement over incidents connected with the war, when they had been subject to raids by Boer commandoes, and on one occasion at least had retaliated in characteristic Zulu fashion. Unrest was also manifested among the natives west of the Tugela, but it was not at first cause for alarm. The chief concern of the Natal government was to remodel their native policy where it proved inadequate, especially in view of the growth of the movement for the federation of the South African colonies. During 1903–1904 a Native Affairs' Commission, representative of all the states, obtained much evidence on the status and conditions of the natives. Its investigations pointed to the loosening of tribal ties and to the corresponding growth of a spirit of individual independence. Among its recommendations was the direct political representation of natives in the colonial legislatures on the New Zealand model, and the imposition of direct taxation upon natives, which should not be less than £1 a year payable by every adult male. The commission also called attention to the numerical insufficiency of magistrates and native commissioners in certain parts of Natal. With some of the recommendations the Natal commissioners disagreed; in 1905, however, an act was passed by the Natal legislature imposing a poll-tax of £1 on all males over 18 in the colony, except indentured Indians and natives paying hut-tax (which was 14s. a year). Every European was bound to pay the tax. In 1906 a serious rebellion broke out in the colony, attributable ostensibly to the poll-tax, and spread to Zululand. It was suppressed by the colonial forces under Colonel (afterwards Sir) Duncan McKenzie, aided by a detachment of Transvaal volunteers. An incident which marked the beginning of this rebellion brought the Natal ministry into sharp conflict with the Imperial government (the Campbell-Bannerman administration). Early in the year a farmer who had insisted that the Kaffirs on his farm should pay the poll-tax was murdered, and on the 8th of February some forty natives in the Richmond district forcibly resisted the collection of the tax and killed a sub-inspector of police and a trooper at Byrnetown. Two of the natives implicated were court-martialled and shot (February 15); others were subsequently arrested and tried by court martial. Nineteen were sentenced to death, but in the case of seven of the prisoners the sentence was commuted. On the day before that fixed for the execution Lord Elgin, then Secretary of State for the Colonies, intervened and directed the governor to postpone the execution of the sentence. Thereupon the Natal ministry resigned, giving as their reason the importance of maintaining the authority of the colonial administration at a critical period, and the constitutional question involved in the interference by the imperial authorities in the domestic affairs of a self-governing colony. The action of the British cabinet caused both astonishment and indignation throughout South Africa and in the other self-governing states of the empire. After a day's delay, during which Sir Henry McCallum reiterated his concurrence, already made known in London, in the justice of the sentence passed on the natives, Lord Elgin gave way (March 30). The Natal ministry thereupon remained in office. The guilty natives were shot on the 2nd of April.[1] It was at this time that Bambaata, a chief in the Greytown district who had been deposed for misconduct, kidnapped the regent appointed in his stead. He was pursued and escaped to Zululand, where he received considerable help. He was killed in battle in June, and by the close of July the rebellion was at an end. As has been stated, it was ostensibly attributable to the poll-tax, but the causes were more deep-seated. Though somewhat obscure they may be found in the

Conflict with the home government.

[1] Subsequently three other natives, after trial by the supreme court, were condemned and executed for their share in the Byrnetown murders.

growing sense of power and solidarity among all the Kaffir tribes of South Africa—a sense which gave force to the "Ethiopian movement," which, ecclesiastical in origin, was political in its development. There were moreover special local causes such as undoubted defects in the Natal administration.[1] Those Africans whose "nationalism" was greatest looked to Dinizulu as their leader, and he was accused by many colonists of having incited the rebellion. Dinizulu protested his loyalty to the British, nor was it likely that he viewed with approval the action of Bambaata, a comparatively unimportant and meddlesome chief. As time went on, however, the Natal government, alarmed at a series of murders of whites in Zululand and at the evidences of continued unrest among the natives, became convinced that Dinizulu was implicated in the rebellious movement. When a young man, in 1889, he had been convicted of high treason and had been exiled, but afterwards (in 1897) allowed to return. Now a force under Sir Duncan McKenzie entered Zululand. Thereupon Dinizulu surrendered (December 1907) without opposition, and was removed to Maritzburg. His trial was delayed until November 1908, and it was not until March 1909 that judgment was given, the court finding him guilty only on the minor charge of harbouring rebels. Meantime, in February 1908, the governor—Sir Matthew Nathan, who had succeeded Sir Henry McCallum in August 1907—had made a tour in Zululand, on which occasion some 1500 of the prisoners taken in the rebellion of 1906 were released.

The intercolonial commission had dealt with the native question as it affected South Africa as a whole; it was felt that a more local investigation was needed, and in August 1906 a strong commission was appointed to inquire into the condition of the Natal natives. The general election which was held in the following month turned on native policy and on the measures necessary to meet the commercial depression. The election, which witnessed the return of four Labour members, resulted in a ministerial majority of a somewhat heterogeneous character, and in November 1906 Mr Smythe resigned, being succeeded by Mr F. R. Moor, who in his election campaign had criticized the Smythe ministry for their financial proposals and for the "theatrical" manner in which they had conducted their conflict with the home government. Mr Moor remained premier until the office was abolished by the establishment of the Union of South Africa. In August 1907 the report of the Native Affairs' Commission was published. The commission declared that the chasm between the native and white races had been broadening for years and that the efforts of the administration—especially since the grant of responsible government—to reconcile the Kaffirs to the changed conditions of rule and policy and to convert them into an element of strength had been ineffective. It was not sufficient to secure them, as the government had done, peace and ample means of livelihood. The commission among other proposals for a more liberal and sympathetic native policy urged the creation of a native advisory Board entrusted with very wide powers. "Personal rule," they declared, "supplies the keynote of successful native control"—a statement amply borne out by the influence over the natives exercised by Sir T. Shepstone. The unrest in Zululand delayed action being taken on the commission's report. But in 1909 an act was passed which placed native affairs in the hands of four district commissioners, gave to the minister for native affairs direct executive authority and created a council for native affairs on which non-official members had seats. While the district commissioners were intended to keep in close touch with the natives, the council was to act as a "deliberative, consultative and advisory body."

Native Affairs' Commission.

Concurrently with the efforts made to reorganize their native policy the colony also endeavoured to deal with the Asiatic question. The rapid growth of the Indian population from about 1890 caused much disquiet among the majority of the white inhabitants, who viewed with especial anxiety the activities of the "free," *i.e.* unindentured Indians. An act of 1895, which did not become effective until 1901, imposed an annual tax of £3 on time-expired Indians who remained in the colony and did not reindenture. In 1897 an Indian Immigration Restriction Act was passed with the object of protecting European traders; in 1903 another Immigration Restriction Act among other things, permitted the exclusion of all would-be immigrants unable to write in the characters of some European language. Under this act thousands of Asiatics were refused permission to land. In 1906 municipal disabilities were imposed upon Asiatics, and in 1907 a Dealers' Licences Act was passed with the object, and effect, of restricting the trading operations of Indians. In 1908 the government introduced a bill to provide for the cessation of Indian emigration at the end of three years; it was not proceeded with, but a strong commission was appointed to inquire into the whole subject. This commission reported in 1909, its general conclusion being that in the interests of Natal the importation of indentured Indian labour should not be discontinued. For sugar, tea and wattle growing, farming, coal-mining and other industries indentured Indian labour appeared to be essential. But the evidence was practically unanimous that the Indian was undesirable in Natal other than as a labourer and the commission recommended compulsory repatriation. While desirous that steps should be taken to prevent an increase in the number of free Asiatic colonists, the commission pointed out that there were in Natal over 60,000 "free" Indians whose rights could not be interfered with by legislation dealing with the further importation of coolies. But these Indians by reindenturing might come under the operation of the repatriation proposal. Nothing further was done in Natal up to the establishment of the Union of South Africa, when all questions specially or differentially affecting Asiatics were withdrawn from the competence of the provincial authorities.

Restrictions on Indians.

Not long after the conclusion of the war of 1899–1902 the close commercial relations between the Transvaal and Natal led to suggestions for a union of the two colonies, but these suggestions were not seriously entertained. The divergent interests of the various colonies threatened indeed a tariff and railway war when the Customs Convention (provisionally renewed in March 1906) should expire in 1908. But at the close of 1906 the Cape ministry formally reopened the question of federation, and at a railway conference held in Pretoria in May 1908 the Natal delegates agreed to a motion affirming the desirability of the early union of the self-governing colonies. The movement for union rapidly gained strength, and a National Convention to consider the matter met in Durban in October 1908. In Natal, especially among the older colonists, who feared that in a united South Africa Natal interests would be overborne, the proposals for union were met with suspicion and opposition, and the Natal ministry felt bound to submit the question to the people. A referendum act was passed in April 1909, and in June following the electors by 11,121 votes to 3701 decided to join the Union. (See SOUTH AFRICA.)

The movement for union.

Natal was concerned not only with the political aspects of union, and with its natives and Indian problems, but had to safeguard its commercial interests and to deal with a revenue insufficient for its needs. In 1908 an Income Tax and a Land Tax Act was passed; the land tax being a halfpenny in the £ "on the aggregate unimproved value"—it brought in £30,000 in 1908–1909. Meantime it was agreed by the Cape, Transvaal and Natal governments that, subject to Natal entering the Union, its share of the Rand import trade should be 25% before and 30% after the establishment of the Union. Previously Natal had only 22½% of the traffic, and this agreement led to a revival in trade. Moreover, the development of its coal-mines and agriculture was vigorously prosecuted, and in 1910 it was found possible to abolish both the Income Tax and Land Tax and yet have a surplus in revenue. The closing months of Natal's existence as a separate colony thus found her peaceful and prosperous. The governor, Sir Matthew Nathan, had

[1] The causes, both local and general, are set forth in a despatch by the governor of the 21st of June 1906 and printed in the Blue Book, Cd. 3247.

returned to England in December 1909, and Lord Methuen was governor from that time until the 31st of May 1910. On that date the Union of South Africa was established, Natal becoming one of the original provinces of the Union.

NATAL, a city and port of Brazil and capital of the state of Rio Grande do Norte, on the right bank of the Rio Potengy, or Rio Grande do Norte, about 2 m. above its mouth. Pop. of the municipality (1890) 13,725. Natal is the starting-point of the Natal and Nova Cruz railway, and is a port of call for coast-wise steamers, which usually anchor outside the bar. It is a stagnant, poorly built town of one-storeyed houses and mud-walled cabins, with few public edifices and business houses of a better type. The only industry of note is the manufacture of cotton. The exports are chiefly sugar and cotton. Natal was founded in 1597 as a military post to check an illicit trade in Brazil-wood. In 1633 it was occupied by the Dutch, who remained until 1654. It became the capital of a province in 1820. In early works it is sometimes termed Cidade dos Reis (City of the Kings).

NATANZ, a minor province of Persia, situated in the hilly district between Isfahan and Kashan, and held in fief by the family of the Hissam es Saltaneh (Sultan Murad Mirza, d. 1882). It contains eighty-two villages and hamlets, has a revenue of about £4000, and a population of about 23,000. It is divided into four districts: Barzrud, Natanzrud, Tarkrud and Badrud. Natanz pears are famous throughout the country. The western part of the province is traversed from north to south by the old high-road between Kashan and Isfahan, with the well-known stations of Kuhrud (7140 ft.) and So (7560 ft.). This road was practically abandoned when the Indian government telegraph line, which ran along it, was removed to a road farther east in 1906. The capital of the little province is NATANZ, a large village with a population of about 3000, situated 69 m. north of Isfahan, at an elevation of 5670 ft. It has an old mosque, with a minaret 123 ft. in height, built in 1315.

NATCHEZ, a city and the county-seat of Adams county, Mississippi, U.S.A., on the Mississippi river, about 100 m. S.W. of Jackson. Pop. (1890) 10,101, (1900) 12,210, of whom 7090 were negroes, (1910 census) 11,791. It is served by the Yazoo & Mississippi Valley, the St Louis, Iron Mountain & Southern, the New Orleans & North-Western and the Mississippi Central railways, and by steamboats on the Mississippi river. The city, which has an area of 2·19 sq. m., is mostly on a bluff that rises 200 ft. above the river, the wharfs and landings, and a few old buildings being the only reminders of what was before the Civil War the principal business section. Among the city's institutions are the Fisk Public Library, a charity hospital, two sanatoriums, three orphan asylums, Stanton College for girls (non-sectarian; opened in 1894 and lodged in the old Fisk mansion), St Joseph's College for girls, the Jefferson Military College (1802), 6 m. from the city, and Natchez College for negroes. The city has four public parks, three on the river front, and one, Memorial Park, in honour of Confederate dead, in the heart of the city. On a neighbouring bluff is a national cemetery. Just outside the city limits, at Gloster, the former estate of Winthrop Sargent, first governor of the Territory of Mississippi, are the graves of Sargent and S. S. Prentiss, who lived in Natchez for some years. In and near the city are many handsome old residences typical of *ante-bellum* Natchez, among them being: Monmouth, General Quitman's estate; Somerset and Oakland, long in the Chotard family; and The Briars, the home during girlhood of Varina Howell, the wife of Jefferson Davis. A Roman Catholic cathedral (1841), Trinity Protestant Episcopal Church (1825) and a Presbyterian church (1829) are the principal church buildings. The Prentiss and the Elk are the leading clubs. Mardi Gras is annually celebrated. The leading industries are the shipment of cotton (70,000 to 90,000 bales are handled annually) and the manufacture of cottonseed oil and cake—the first cottonseed-oil mill in the country was built here in 1834—cotton goods, rope and yarns, lumber, brick, drugs and ice. Natchez was the first city in the state to own municipal water-works and sewage system.

The city was named from the Natchez Indians who lived on its site when the country was first settled. In 1716 on the bluff Le Moyne de Bienville built Fort Rosalie for the protection of some French warehouses, and later the French demanded a neighbouring hill for another settlement. This offended the Natchez, and on the 28th of November 1729 they massacred the French and destroyed the fort, which was immediately rebuilt, and in 1764 was handed over to the English in accordance with the treaty of Paris, and became Fort Panmure; in 1779 it was turned over to the Spanish, who held it until 1798, when they withdrew and United States troops occupied the place. Under Spanish rule Natchez was the seat of government of a large district, and from 1798 to 1802 and from 1817 to 1821 it was the capital of Mississippi. It was chartered as a city in 1803. On the 7th of May 1840 a large part of the city was destroyed by a tornado, but it was soon rebuilt, and at the outbreak of the Civil War was a place of considerable wealth and culture. For several years it was the home of General John Anthony Quitman (1799–1858). Natchez surrendered to Union forces during the Vicksburg campaigns, first on the 12th of May 1852, and again on the 13th of July 1863. On the 2nd of September 1862 the Union iron-clad "Essex," commanded by William David Porter, bombarded the city and put an end to the commercial importance of the river front section.

NATHANAEL, a character in the New Testament, who appears in John i. 45 sqq. as one of the first disciples of Jesus. In John xxi. 2 he is described as belonging to Cana of Galilee. The account of his call reveals to us a man of a deeply spiritual and sincere nature. Otherwise we know nothing beyond the mention of his name as one of the seven to whom, after the Resurrection, Christ revealed himself at the sea of Tiberias (John xxi. 2). But the interest he has evoked is shown by the attempts to identify him with other New Testament characters. Of these the one which has found most favour sees in him the apostle Bartholomew (*q.v.*). The actual identification must however remain a matter of pure conjecture. Still less can be said for the attempts to find in Nathanael another name for the apostle Matthew, or for Matthias, or for Paul "the

apostle of visions," or even for the writer of the Fourth Gospel himself.

BIBLIOGRAPHY.—For the story of Nathanael's call see Archbishop Trench, *Studies in the Gospels*, No. 2, and on his character, J. H. Newman's *Sermons for the Festivals of the Church*, No. 27.

NATHUBHOY, SIR MANGALDAS (1832–1890), Seth or head of the Kapol Bania caste, well known for their thrift and keen commercial instincts. He was born on the 15th of October 1832, of a family whose ancestors emigrated from Diu to Bombay soon after Bombay came into British possession. His grandfather, Ramdas Manordas, amassed a considerable fortune, which, owing to the premature death of his father, came into the sole possession of Mangaldas at the age of eleven. He had to take charge of the business in early life, though he gave some time to English studies. On the death of his wife he established a dispensary at Kalyan in her memory and also a special female ward in connexion with the David Sassoon hospital in Poona. As a merchant Mangaldas was upright and successful. In social matters he stood forth as a reformer, and to him the change to election from hereditary succession to the headship of the caste is due. In 1862 he founded a fellowship in Bombay university to allow graduates to spend some years in Europe. A bequest in his will enabled the university to establish seven similar scholarships. He took keen interest in learning, and in such institutions as the Asiatic and geographical societies. In 1866 he was nominated to the legislative council and sat till 1874. In 1867 he revived the Bombay association, a political body, over which he presided for a time. In 1872 he was made C.S.I., and in 1875 the dignity of Knight Bachelor was conferred on him. Besides a large donation to the Indian Famine Fund, Sir Mangaldas is known to have expended £500,000 on charities. He died at Bombay on the 9th of March 1890

NATICK, a township of S.E. Middlesex county, Massachusetts, U.S.A., on the S.E. end of Cochituate Lake. Pop. (1890) 9118; (1900) 9488, of whom 1788 were foreign-born; (1910 census) 9866. The area of the township is 12·375 sq. m. The township's largest village, also named Natick, lying 18 m. W.S.W. of Boston, is served by the Boston & Albany railroad; it has the Walnut Hill preparatory school, the Leonard Morse hospital, and a public library, the Morse institute, which was given by Mary Ann Morse (1825–1862) and was built in 1873. In the village of South Natick is the Bacon Free Library (1880), in which is housed the Historical, Natural History and Library Society. In 1905 the factory product was valued at $3,453,094; the boots and shoes manufactured in 1905 were valued at $2,896,110 or 83·9% of the town's total, the output of brogans being especially important. Other distinctive manufactures are shirts and base-balls. Natick is the Indian name, signifying "our land," or "hilly land," of the site (originally part of Dedham) granted in 1650 to John Eliot, for the "praying" Indians. There was an Indian church in Natick, at what is now called South Natick or "Oldtown," from 1660 to 1716; and for some years the community was governed, in accordance with the eighteenth chapter of Exodus, by "rulers of tens," "rulers of fifties," and "rulers of hundreds." Until 1719 the Indians held the land in common. In 1735 the few Indians remaining were put under guardianship. The township owns a copy of Eliot's Indian Bible. An Eliot monument was erected in 1847 on the Indian burying-ground near the site of the Indian church, now occupied by a Unitarian church. Of the Eliot oaks, made famous by Longfellow's sonnet, one was cut down in 1842, the other still stands. Henry Wilson learned to make shoes here, and in the presidential campaign in 1840 gained the sobriquet of the "Natick cobbler." By the colonial authorities Natick was considered as a "plantation" until the establishment of the church; in 1762 the parish (erected in 1745) became a district, and in 1781 this was incorporated as a town.

See "Natick," by S. D. Hosmer, Daniel Wight and Austin Bacon, in vol. 2 of S. A. Drake's *History of Middlesex County* (Boston, 1880); and Oliver N. Bacon, *History of the Town of Natick* (Boston, 1856).

NATIONAL ANTHEMS OR HYMNS. The selection of some particular songs, words and music, as the formal expression of national patriotism, is a comparatively modern development of ceremonial usage. In Europe the chief national antheme are: *The United Kingdom*: "God save the king" (see below); *France*: "The Marseillaise," by Rouget de Lisle; *Germany*: "Heil dir im Siegeskrana," words by Balthasar Gerhard Schumacher, music of "God save the King"; *Switzerland*: "Rufst du, mein Vaterland," music of "God save the King"; *Italy*: the "Royal March" by G. Gabetti; *Austria*: "Gott erhalte unsern Kaiser," words by L. L. Haschka, music by Haydn; *Hungary*: "Isten ald meg a Magyart"; *Belgium*: "La Brabançonne," by F. Campenhout; *Holland*: "Wien Nierlansch"; *Denmark*: "Heil dir, dem Liebenden," words by H. Harries, music of "God save the King," and "King Kristian stod ved hojen mast," words by Ewald, music by Hartman; *Sweden*: "Ur Svenska hjertans"; *Russia*: "Bozhe Zaria chrany," words by J. J. Canas, music by D. Jenko; *Rumania*: "Traeasca Regale," words by V. Alexandri, music by E. A. Hübsch; *Spain*: "Himno de Riego," music by Herta. In the *United States*, the "Star Spangled Banner" (1814; words by F.S. Key, music by J. S. Smith) and "Hail Columbia" (1798; words by Joseph Hopkinson, music by Fyles) share the duties of a national anthem, while the tune of "God save the King" is sung to words beginning "My country, 'tis of thee," by Samuel F. Smith (1808–1895).

The most celebrated of all national anthems is the English "God save the King," which is said to have been first sung as his own composition by Henry Carey in 1740; and a version was assigned by W. Chappell (*Popular Music*) to the *Harmonia Anglicana* of 1742 or 1743, but no copy exists and this is now doubted. Words and music were printed in the *Gentleman's Magazine* for October 1745. There has been much controversy as to the authorship, which is complicated by the fact that earlier forms of the air and the words are recorded. Such are an "Ayre" of 1619, attributed to John Bull, who has long been credited with the origin of the anthem; the Scottish carol, "Remember, O thou man," in Ravenscroft's *Melismata*, 1611; the ballad "Franklin is fled away" (printed 1669; and a piece in Purcell's *Choice Collection for the Harpsichord* (1696). The words or part of them are also found in various forms from the 16th century. The question was discussed in Richard Clarke's *Account of the National Anthem* (1822), and has been reinvestigated by Dr W. H. Cummings in his *God save the King* (1902). Carey and Bull, in the general opinion of musical historians, divide the credit; but in his *Minstrelsy of England* (1901) Frank Kidson introduced a new claimant, James Oswald, a Scotsman who settled in London in 1742, and worked for John Simpson, the publisher of the early copies of *God save the King*, and who became chamber composer to George III. What appears to be certain is that 1745 is the earliest date assignable to the substantial national anthem as we know it, and that both words and music had been evolved out of earlier forms. Bull's is the earliest form of the air; Carey's claim to the remodelling of the anthem rests on an unauthoritative tradition; and, on general probabilities, Oswald is a strong candidate. The tune was adopted by Germany and by Denmark before the end of the 18th century.

NATIONAL DEBT. Details as to the recent figures of the national debts of individual countries are given under the heading of each country, and the reader is also referred to the article FINANCE. Here the subject is considered in its technical aspects—including the special character of the institution, the different classes of debt, the various methods of raising loans, interest, funding systems, comparative statistics of national debts and other points.

National debt is so universal that it has been described as the first stage of a nation towards civilization. A nation, so far as its finances are concerned, may be regarded as a corporate body or even as an individual. Like the one or the other it may borrow money at rates of interest, and with securities, general or special, proportionate to its resources, credit and stability. But, while in this respect there are certain points of analogy between a state and an individual, there are important points of difference so far as the question of debt is concerned. A state,

for example, may be regarded as imperishable, and its debt as a permanent institution which it is not bound to liquidate at any definite period; the interest, unless specially stipulated, being thus of the nature of transferable permanent annuities. While an individual who borrows engages to pay interest to the lender personally, and to reimburse the entire debt by a certain date, a state may have an entirely different set of creditors every six months, and may make no stipulation whatever with regard to the principal. A state, moreover, is the sole judge of its own solvency, and is not only at liberty either to repudiate its debts or compound with its creditors, but even when perfectly solvent may materially alter the conditions on which it originally borrowed. These distinctions explain many of the peculiarities of national debts as contrasted with those of individuals—though a nation, like an individual, may by reckless bad faith utterly destroy its credit and exhaust its borrowing powers.

A well-organized state ought to have within itself the means of meeting all its ordinary expenses; where this is not the case, either through insufficiency of resources or maladministration, and where borrowing is resorted to for what may be regarded as current expenses, a state imperils, not only its credit, but, when any crisis occurs, its very existence; in illustration of this we need only refer to the cases of Turkey in Europe and some of the states of Central and South America. Even for meeting emergencies it is not always inevitable that a state should incur debt; its ordinary resources, from taxation or from state property, may so exceed its ordinary expenses as to enable it to accumulate a fund for extraordinary contingencies. This, it would seem, was a method commonly adopted in ancient states. The Athenians, for example, amassed 10,000 talents in the interval between the Persian and the Peloponnesian wars, and the Lacedaemonians are said to have done the same. At Susa and Ecbatana Alexander found a great treasure which had been accumulated by Cyrus. In the early days of Rome the revenue from certain sources was accumulated as a sacred treasure in the temple of Saturn; and we know that when Pompey left Italy he made the mistake of leaving behind him the public treasury, which fell into the hands of Caesar. In later times, also, the more prudent emperors were in the habit of amassing a hoard. We find that the method of accumulating reserves prevailed among some of the early French kings, even down to the time of Henry IV. This system long prevailed in Prussia. Frederick II., when he ascended the throne, found in the treasury a sum of 8,700,000 thalers, and it is estimated that at his death he left behind him a hoard of from 60 to 70 million thalers. And similarly, in our own time, of the five milliards of indemnity paid by France as a result of the Franco-German War, 150 millions were set apart to reconstitute the traditional war-treasury. The German empire, apart from the individual states which comprise it, had in 1882 a debt of about £24,000,000, while its invested funds amounted to £37,390,000, including a war-treasure of £6,000,000. The majority of economists disapprove of such an accumulation of funds by a state as a bad financial policy, maintaining that the remission of a proportionate amount of taxation would be much more for the real good of the nation. At the same time the possession of a moderate war-fund, it must be admitted, could not but give a state a great advantage in the case of a sudden war. In the case of England, apart from the private hoardings of a few sovereigns, there does not seem to have existed any deliberately accumulated public treasure; before the time of William and Mary English monarchs borrowed money occasionally from Jews and from the city of London, but emergencies were generally met by "benevolences" and increased imposts.

All modern states, it may be said, have been compelled to have recourse to loans, either to meet war expenses, to carry out great public undertakings or to make up the recurrent deficits of a mismanaged revenue. Resources obtained in this way are what constitute national debt proper. Loans have been divided into forced and voluntary. Forced loans can, of course, only be raised within the bounds of the borrowing country; and, apart from the injustice which is sure to attend such an impost, it is always economically mischievous. The loans which the kings of England were wont to exact from the Jews were really of the character of forced loans, though the method has never been used in England in modern times so extensively as on the continent. There the sum sought to be obtained in this way has never been anything like realized. In 1793, for example, a loan of this class was imposed in France, on the basis of income; and of the milliard (francs) which it was sought to raise only 100 millions were realized. In Austria and Spain, also, recourse has been had at various times to forced loans, but invariably with unsatisfactory results. Other methods of a more or less compulsory character have been and are made use of in various states for obtaining money, which, as they involve the payment of interest, may be regarded as of the nature of loans; but the debt incurred by such methods is comparatively insignificant, and some of the methods adopted are peculiarly irritating and mischievous. On the other hand, it has occasionally been attempted to raise voluntary loans by appeals to a nation's patriotism; the method has been confined almost exclusively to France. After the revolutions of 1830 and 1848 appeals were thus made to the patriotism of French capitalists to buy 5% direct from the government at par, at a time when the French 5% were selling at 80; but the results were quite insignificant. In short, the only economically sound method of meeting expenses which the ordinary resources of a state cannot meet is by borrowing in the open market on the most advantageous terms obtainable. On this normal method of borrowing, loans are divided into different categories, though there are really only two main classes, which may be designated perpetual and terminable. Borrowing in quasi-perpetuity has hitherto been the mode adopted by most states in the creation of the bulk of their debt. Not that any state ever borrows with the avowed intention of never paying off debts; but either no definite period for reimbursement is fixed, or the limit has been so extended as to be practically perpetual, or in actual practice the debt has been got rid of by the creation of another of equal amount under similar or slightly differing conditions as to interest. Of course a state is not bound to retain any part of its debt as a perpetual burden; it is at liberty to liquidate whenever it suits its convenience. This quasi-perpetuity of debt in the case of a state in a sound financial condition involves no hardship upon its creditors, who may at any moment realize their invested capital by selling their titles as creditors in the open money market, it may be at the price they paid, or it may be a little below or a little above it, according to the state of the market at the time. Loans, again, contracted on the terminable principle are of various classes; the chief of these are (1) life annuities, (2) terminable annuities, (3) loans repayable by instalments at certain intervals, (4) loans repayable entirely at a fixed date.

From the time of William III. life and terminable annuities have been a favourite mode in England either of borrowing money or of commuting, and thus gradually paying off, the existing funded debt. At first, and indeed until comparatively recent times, the system of life annuities resulted in serious loss to the country, owing to the calculation of the rate of annuity on too high a scale, a result arising from imperfect data on which to base estimates of the average duration of life. The system of life annuities was sometimes combined in England with that of perpetual annuities, or interest on the permanent debt—the life annuity forming a sort of additional inducement to lenders of limited means to invest their money. At one time the form of life annuities known as tontine was much in vogue both in England and France, the principle of the tontine being that the proceeds of the total amount invested by the contributors should be divided among the survivors, the last survivor receiving the whole interest or annuity. The results of this system were not, however, encouraging to the state. In England, at least, the terminable annuity has been a favourite mode of borrowing from the time of William III.; it has been generally conjoined with a low rate of permanent interest on the sum borrowed. Thus in 1700 the interest on the consolidated debt amounted to only £260,000, while the terminable annuities payable amounted to £308,407. In 1780 a loan of 12 millions was raised

at 4% at par, with the additional benefit of an annuity of £1, 16s. 3d.% for eighty years. Even so late as the Crimean War in 1855, a loan of 16 millions at 3% at par was contracted, the contributors receiving in addition an annuity of 14s. 6d.% for thirty years.

The third method of contracting terminable loans, that of gradual repayment or amortization within a certain limit of years, has been a favourite one among certain nations, and specially commends itself to those whose credit is at a low ebb. When the final term of repayment is fixed upon, a calculation is easily made as to how much is to be paid half-yearly until the expiry of the term, so that at the end the whole, principal and interest, will have been paid. At first, of course, the amount paid will largely represent interest, but, as at each half-yearly drawing of the numbers of the bonds to be finally paid off the principal will be gradually reduced, there will be more and more money set free from interest for the reduction of the actual debt. This method, as we have said, has its advantages, and when conjoined with stipulations as to liberty of conversion to debt bearing a lower rate of interest than that originally offered, and when the bonds are not issued at a figure much below par, might be the most satisfactory method of raising money for a state under certain emergencies. What is known as the "Morgan loan" of France in 1870 was contracted on such conditions.

The last form of temporary loan, that repayable in bulk at a fixed date, is one which, when the sum is of considerable amount, is apt to be attended with serious disadvantages. The repayment may have to be made at a time when a state may not be in a position to meet it, and so to keep faith with its creditors may have to borrow at a higher rate in order to pay their claims. It has, however, worked well in the United States, most of the debt of which has been contracted on the principle of optional payment at the end of a short period, say five years, and compulsory payment at the end of a longer period, say twenty years. Thus the loan of 515 millions of dollars contracted in 1862 was issued on this principle, at 6%, and so with other loans between that year and 1868. In European states, however, the risks of embarrassment are too great to permit of the application of this method on an extensive scale; and for loans of great amount the methods most likely to yield satisfactory results are loans bearing quasi-perpetual interest, or those repayable by instalments on the basis of half-yearly drawings within a certain period.

What are known as lottery loans are greatly favoured on the continent, either as an independent means of raising money, or as an adjunct to any of the methods referred to above. These must not be confounded with the lottery pure and simple, in which the contributors run the risk of losing the whole of their investment. The lottery loan has been found to work well for small sums, when the interest is but little below what it would have been in an ordinary loan, and when the percentage thus set aside to form prizes of varying amounts forms but a small fraction of the whole interest payable. The principle is that each contributor of such a loan has a greater or less chance of drawing a prize of varying amount, over and above the repayment of his capital with interest.

What are known in England as exchequer bills and treasury bills may be regarded as loans payable at a fixed period of short duration, from three months upwards, and bearing very insignificant interest, even so low as ½%. They are a useful means of raising money for immediate wants and for local loans, and form handy investments for capitalists who are reserving their funds for a special purpose. Exchequer bonds are simply a special form of the funded debt, to be paid off generally within a certain period of years.

There are two principal methods of issuing or effecting a loan. Either the state may appeal directly to capitalists and invite subscriptions, or it may delegate the negotiation to one or more bankers. The former method has been occasionally followed in France and Russia, but in practice it has been found to be attended with so many disadvantages to the borrowing state or city that the best financial authorities consider it unsound. The great banking-houses have such a command over the money-market that it is difficult to keep even a direct loan out of their hands. The majority of loans, therefore, are negotiated by one or more of these houses, and the name of Rothschild is familiar to every one in connexion with such transactions. By this method a borrowing state can assure itself of having the proceeds of the loan with the least possible delay and with the minimum of trouble. A loan may be issued at, above, or below par, though generally it is either at or below par—"par" being the normal or theoretical price of a single share in the loan, the sum which the borrowing government undertakes to pay back for each share on reimbursement, without discount or premium. Very generally, as an inducement to investors, a loan is offered at a greater or less discount, according to the credit of the borrowing government. Sometimes a state may offer a loan to the highest bidders; for example, the city of Auckland in 1875 invited subscriptions through the Bank of New Zealand to a loan of £100,000 at 6%; offers were made of six times the amount, but only those were accepted which were at the rate of 98% or above. The rate of interest offered generally depends on the credit of the state issuing the loan. England, for example, would have no difficulty in raising any amount at 3% or even less, while less stable states may have to pay 8 or 9%. The nominal percentage is by no means, however, always an index of the cost of a loan to a state, as the history of the debt of England disastrously shows. During the 18th century various expedients were employed, besides that of terminable annuities already referred to, to raise money for the great wars of the period, at an apparently low percentage. For example, from 3 to 5% would be offered for a loan, the actual amount of stock per cent. allotted being sometimes 107½ or even 111; so that between 1776 and 1785, for the £91,763,842 actually borrowed by the government, £115,267,993 was to be paid back. In 1797 a loan of £1,620,000 was contracted, for every £100 of which actually subscribed, at 3%, the sum of £219 was allotted to the lender. In 1793 a 3% loan of 4½ millions was offered at the price of £72%, the government thus making itself liable for £6,250,000. Greatly owing to this reckless method the debt of Great Britain in 1815 amounted to over 900 millions. France in this respect has been quite as extravagant as England; many of her loans during the 19th century were issued at from 52½ to 84%, one indeed (1848) so low as 45%—as a rule with 5% interest. The enormous and embarrassing increase of the French debt during the 19th century was doubtless greatly due to this disastrous system. Nearly every European state and most of the Central and South American states have at one time or another aggravated their debts by this method of borrowing, and got themselves into difficulty with their creditors. Financiers almost unanimously maintain that in the long run it is much better for a state to borrow at high interest at or near par, than at an apparently low interest much below par. A state of even the highest rank may find itself in the midst of a crisis that will for a time shake its credit; but when the crisis is past and its credit revives it will be in a much more sound position with a high interest for a debt contracted at par than with a comparatively low interest on a debt much in excess of what it really received. If a state, for example, borrows at par at 6% when its credit is low, it may easily when again in a flourishing condition reduce the interest on its debt to 4 or even 3%. The United States government actually did so with the debt it had to contract at the time of the Civil War. This method of reducing the burden of a debt is evidently no injustice to the creditors of a government, when used in a legitimate way. A state is at liberty at any time to pay off its debts, and, if it can borrow at 3% to pay off a 6% debt, it may with perfect justice offer its creditors the option of payment of the principal or of holding it at a reduced interest. Government debts are, however, sometimes reduced after a fashion by no means so legitimate as this. Other states have been even more unprincipled, and have got rid of their debts at one sweep by the simple method of repudiation.

When a state has a variety of loans at varying rates of interest, it may consolidate them into a single debt at a uniform interest. For example, in 1751 several descriptions of English debt were consolidated into one fund bearing a uniform interest of 3%, an operation which gave origin to the familiar term "consols" ("consolidated annuities"). In the early days of the English national debt, a special tax or fund was appropriated to the payment of the interest on each particular loan. This was the original meaning of "the funds," a term which has now come to signify the national debt generally. So also the origin of the term "funded" as applied to a debt which has been recognized as at least quasi-permanent, and for the payment of the interest on which regular provision is made. Unfunded or floating debt, on the other hand, means strictly loans for which no permanent provision requires to be made, which have been obtained for temporary purposes with the intention of paying them off within a brief period. Exchequer and treasury bills are included in this category, and such other moneys in the hands of a government as it may be required to reimburse at any moment. Where a government is the recipient of savings banks deposits, these may be included in its floating debt, and so also may the paper-money which has been issued so largely by some governments. A state with an excessive floating debt must be regarded as in a very critical financial condition.

National debt, again, is divided into external and internal, according as the loans have been raised within or without the country—

some states, generally the smaller ones, having a considerable amount of exclusively internal debt, though it is obvious that the bulk of national debts are both external and internal.

We referred above to various ways of reducing the burden of a debt, and also to methods of contracting loans by which within a certain period they are amortized or extinguished. Most states, however, are burdened with enormous quasi-permanent debts, the reduction or extinction of which gives ample scope for the financial skill of statesmen. A favourite method of accomplishing this is by the establishment of what is known as a sinking fund, formed by the setting aside of a certain amount of national revenue for the reduction of the principal of the debt. (J. S. K.)

The following table shows the general state of the world's public indebtedness at the beginning of the 20th century, divided according to the more important countries, the bracketed figures in black type indicating the position of the country referred to under each heading in the list. The figures are given by preference for the year 1900, as more representative, in a case like this, than for some later years; for the Boer War, as regards the United Kingdom, and also the Russo-Japanese War, introduced new debt and new considerations, hardly fair to the comparison, while this stands at the end of a long period of peace. The figures in every case are not to be supposed to be absolutely accurate; statistics of national debts differ, often remarkably, and it is practically impossible to give a perfectly satisfactory comparison, owing partly to difficulties of computing the exchange, partly to inaccurate accounts, and partly to the varieties of debt (reproductive or non-reproductive, &c.).

The Principal Public Debts of the World, 1900.

Brazil	17,000,000	(19) 81,710,000	(20) 4 16 0		

The total indebtedness of the countries named in the table amounted to £6,311,017,478, and the total indebtedness of the world (*i.e.* including countries not here mentioned) for the year 1898 was computed by Lord Avebury (*Journ. Roy. Stat. Soc.* vol. lxiv. part i.) as £6,432,757,000, as against £5,097,910,000 in 1888. This compares (taking figures compiled by Mr Dudley Baxter in *Journ. Roy. Stat. Soc.*, March 1874) with a total indebtedness of 4680 millions sterling in 1874 and 1700 millions sterling in 1848. The United Kingdom had diminished its total debt since 1883 by 127 millions, the amount per head by £6, the annual charge by 6 millions, and the charge per head by 5s. 8d. The United States debt was lower by nearly a hundred millions. Japan, Egypt and Brazil had sensibly improved their positions. But the following countries had increased their debts: France (by 86 millions), Russia (by some 240 millions), Italy (by 140 millions), Austria-Hungary (by 70 millions), Spain (by 190 millions), Prussia (by 227 millions), Portugal (by 80 millions), Holland (by 18 millions), Belgium (by 32 millions), and Argentina (by 73 millions).

The result is that, whereas in 1883 the total debt of the United Kingdom (756 millions) stood second to that of France (1000 millions), in 1900 it stood third to France and Russia; whereas in 1883 its weight per head of population was third, in 1900 it was eleventh; whereas in 1883 its annual charge stood second, in 1900 it stood fourth; and whereas the weight of the charge per head of population in 1883 was fifth, in 1900 it was eleventh. The indebtedness of the great British dependencies, on the other hand, had increased from 302 millions to 544 millions sterling, or by 242 millions; and the local (municipal) debt of Great Britain had risen from about 100 millions to upwards of 300 millions.

History of British debt.

It is interesting to recall the history of the British national debt during the 19th century. The debt at the close of the Napoleonic war (1816) was nearly 887 millions sterling, and at the beginning of 1900 this debt had been reduced to 621 millions,[1] or a decrease of 266 millions—notwithstanding interim additions of about 367 millions, which made the gross reduction during that period 633 millions sterling, an amount actually larger than the whole (dead-weight[2]) debt at the end of the century. No country (except the United States, to a smaller amount) has ever redeemed its obligations on such a scale, and this was done while all other European countries of similar standing were piling up debt.

This enormous reduction was effected at different rates of speed. Between 1817 and 1830, when what was known as Pitt's sinking fund was in operation (depending upon the devotion of surplus income to the repayment of debt, but much complicated by the raising of fresh loans), a net reduction was made of £29,488,072—an *annual average* of £2,268,313. From 1830 to 1876 the system of using surplus revenue—the so-called old sinking fund—for redeeming debt, was steadily applied, together with the creation of terminable annuities, by which definite blocks of debt were cancelled and the whole amount paid off in a term of years. During this period the debt was reduced by £85,175,782, an *annual average* of £1,851,647. In 1876 Sir Stafford Northcote's (Lord Iddesleigh's) new sinking fund came into operation, in addition to previous methods of redeeming debt. By this system a definite annual sum was set aside for the service of the debt, the difference between it and

[1] Leaving out of account 8 millions of unfunded debt raised for the Boer War.

[2] The "dead-weight" debt, or national debt proper, excludes what are treated in the public accounts as "other capital liabilities," the interest on which is not included in the fixed charge; but it is taken to include the new debt of all sorts raised in 1900, 1901 and 1902 for the Boer War.

the amount required for payment of interest forming a (new) sinking fund devoted to repayment of capital. This fixed charge was gradually reduced from about 29 millions to 26 millions in 1888, to 25 millions in 1890, and to 23 millions in 1899. The amount paid off during this period by means of old sinking fund, terminable annuities and new sinking fund, down to March 1900, was £155,238,639, or an *annual average* of £6,468,276.

It will be observed that the burden of the debt incurred previously to 1817 has thus been borne very unequally by different ages of "posterity." While the generations immediately succeeding the Napoleonic war paid off about £2,000,000 a year, the taxpayers between 1876 and 1900 paid at three times that rate. They did so largely without knowing it, since a large part of the amount was wrapped up in the terminable annuities; but it is very questionable justice that so large a proportion of the burden should have been imposed upon them.

The great bulk of the funded national debt consists of what are known as "consols." This name dates from 1751, when nine different government annuities at 3% were consolidated into one, amounting to £9,137,821. These "consolidated annuities" formed the germ of what has since become the type of British government stock. At the same time some of the annuities at a higher rate of interest were combined and the interest reduced to 3%, and this stock was known as "reduced," the two 3% stocks remaining side by side, until in 1854 the 3½% government stock was also converted into 3%, under the style of "new threes." "Consols," "reduced" and "new threes" formed thenceforth a solid body of British 3% stock, until in 1888 the whole amount was converted (see *Conversions* below) by Mr (afterwards Lord) Goschen into 2¾%. "Consols" were added to from time to time when fresh loans were needed: from 39 millions in 1771 they rose to 71 millions in 1781, to 101 millions in 1783, 278 millions in 1801, 334 millions in 1811, and 400 millions in 1858; but in 1888 they had decreased, by redemptions, to £322,681,035. "Reduced" were also added to: from 17 millions in 1751 they rose to 164 millions in 1815, and then gradually diminished to 102 millions in 1869, and to £68,912,433 in 1887, when they were converted with "consols" into the new consols (or "Goschens") at 2¾%, to be reduced to 2½% in 1903.

Consols.

The lowest price ever quoted for "consols" was 47⅞ on 20th September 1797, owing to the mutiny at the Nore; the highest was 114 in 1896 owing to scarcity of stock, the operation of the sinking funds, and the demand for investment of savings bank moneys.

The high premium to which consols rose towards the end of the century may be briefly explained. *Pari passu* with the reduction of the debt went a dwindling of the amount of consols open to investors, and hence occurred a continued normal appreciation of the stock. In 1817 the amount of British government stock per head of the population was £40, 10s.; in 1896 this figure had decreased to £14, 12s. The ordinary law of supply and demand would therefore in any case tend to increase the price of government stock. This has always happened. The amount of 3% diminished from 528 millions in 1817 to 498 in 1827, and to 497 in 1837, and the average prices in these years were 73, 83 and 90; additions were made to the stock, and in 1847 (the amount being 510 millions) the price was 86⅛; again the amount decreased, and in 1852 (500 millions) the price was 98; then a great conversion raised the amount to 734 millions in 1854, and the price went down to 90¼; but by 1887 the amount decreased by about 200 millions, and the price rose well above par; and though the reduction in interest in 1888 set back the price, it rose again as the amount of available stock diminished. Many causes, into which it is not necessary to enter, operated no doubt in keeping up the demand for British government credit. Moreover, apart from the fact that in 1882 there were 689 millions of 3% and in 1900 only 501 millions of 2½% in existence, the amount held by government departments and therefore practically locked up from the market, gradually increased, until from this cause alone the amount of available stock was diminished by upwards of 200 millions; and a large amount more was practically locked up by being held by trustees, or by banks, insurance societies, &c. The savings banks deposits, increasing as they did by about £1,000,000 per month (owing partly to the raising in 1894 of the maximum limit), had to be invested in government securities; and the compulsory activity of the government as a buyer of consols, both on this account and also for sinking fund purposes (in order to obtain stock to redeem debt on the increased scale already indicated) operated as an abnormal cause for sending the price of consols high above par. Even at that figure (the average prices for consols being 101⅛ in 1894, 106½ in 1895, 110¾ in 1896, 112⅛ in 1897, 110⅛ in 1898 and 106⅜—having fallen owing to war prospects—in 1899) it was difficult for the government brokers to obtain consols, and it was principally owing to this state of things that in 1899 Sir Michael Hicks-Beach reduced the fixed annual charge for the debt (and *pro tanto* the new sinking fund) from £25,000,000 to £23,000,000.

It may be useful to give the figures for the British national debt in 1902, after the disturbance due to the South African War. During the years 1900 and 1901 the new sinking fund was suspended, as well as the payments on the terminable annuity debt applicable to repayment of capital (except in so far as annuities to individuals were concerned); so that the debt was not reduced, as it would otherwise have been, by £4,547,000 in 1900 and by £4,681,000 in 1901. On the contrary, it was increased by fresh borrowings. Consols were raised (in 1901 and 1902) to the extent of £92,000,000; a "War Loan" of 2½% stock and bonds, redeemable in 1910, was raised (1900) to the amount of £30,000,000; 2½% exchequer bonds were raised (in 1900) to the amount of £24,000,000, and treasury bills (in 1899 and 1900), £13,000,000. The total war borrowing amounted accordingly to £159,000,000, raised at a discount of (£6,585,000) 4·14%. This includes the whole new borrowing in 1902, a portion of which was intended after the peace to be paid back in the current year; but for this no allowance can here be made. The accompanying table shows the totals for the "dead-weight debt" in 1900, 1901 and 1902, and, for convenience, also the "other capital liabilities."

	"Dead-weight Debt."	Chief Cause of Difference.[1]	"Other Liabilities."
31st March 1900 . .	£628,978,782	+"War Loan," £30,000,000	£10,186,482
" 1901 . .	690,992,621	+Exch. Bonds, 24,000,000	
		+Treas. Bills, 5,000,000	14,731,256
" 1902 . .	747,876,000	+Consols, 60,000,000	20,532,000
July 1902 . .	779,876,000	+Consols, 32,000,000	

"Other liabilities" it must be remembered, represent money advanced (generally by terminable annuity) on reproductive objects—telegraphs, barracks, public works, Uganda railway, &c.—and they could not, obviously, be properly included in the national debt unless at the same time a set-off were made for the valuable assets held by the British government, such as the Suez canal shares, which in 1902 were alone worth upwards of £26,000,000. (H. Ch.)

British National Debt Conversions.—The great bulk of the funded debt of the United Kingdom consists of annuities, which are described as perpetual, because the state is under no obligation to pay off at any time the capital debt which they represent. All that the public creditor can claim is to receive payment of the instalments of annuity as they fall due. On the other hand, the government has the right to redeem the annuities ultimately by payment of the capital debt; though it may, and frequently does, bind itself not to exercise that right as regards a particular stock of annuities until after a definite period. So long as a stock is thus guaranteed against redemption, the only way in which the annual charge for that portion of the debt can be reduced is by the government buying back the annuities in the open market at their current price, which may be more or may be less than the nominal debt, according to general financial conditions and to the state of the national credit. The liability of the stock to redemption at par, when the period of guarantee has expired, prevents its market price from rising materially above that level. To enable the right of compulsory redemption to be enforced, it is only necessary that the government should

[1] Other causes are redemption of land tax, variation in capital value of terminable annuities and minor treasury operations.

have command of sufficient funds for the purpose of paying off the stockholders, or should be able to raise those funds by borrowing at a rate of interest lower than that borne by the stock. Any circumstances which might tend to raise the price of the stock above par would also assist the government in raising its redemption money on more favourable terms. When the amount of stock to be dealt with is large, the raising by a fresh loan of the amount required for redemption would occasion great disturbance. A more convenient method is the conversion of the existing stock to a lower rate of interest by agreement with the stockholders, whose reluctance to accept a reduction of income is overborne by their knowledge that the power of redemption exists and will be put in force if necessary. The opportunity for conversion may be looked for when the price of a redeemable stock stands steadily at or barely above par. Observation of the movements in the price of other securities will serve to show whether this stationary price represents the real market value of the stock, or whether that value is subject to depression owing to an expectation of the stock being converted or redeemed. Accordingly, the course of prices of other government stocks which are free from the liability to redemption, of the stocks of foreign countries and the colonies, and of the large municipalities, must be watched by government in order to determine, first, whether the conversion of a redeemable stock is feasible, and, secondly, to what extent the reduction of the interest in the stock may be carried.

The credit for the first measure of conversion belongs to Walpole, though it was carried through by Stanhope, his successor as chancellor of the exchequer. In 1714 the legal rate of interest for private transactions, which had been fixed at 6% in the year of the Restoration, was reduced to 5% by the act 12 Anne, stat. 2, c. 16 But the bulk of the national debt still bore interest at 6%, the doubtful security of the throne and the too frequent irregularities in public payment having hitherto precluded any considerable borrowing at lower rates. Walpole saw that the first requirement was to give increased confidence to the public creditors. Three acts were passed dealing respectively with debts due to the general public, to the Bank of England and to the South Sea Company. Three separate funds—the general fund, the aggregate fund and the South Sea fund—were assigned to the service of the several classes of debt, each of these funds being credited with the produce of specified taxes, which were made permanent for the purpose; and it was further provided that any surplus of the funds, after payment of the interest of the debts, should be applied in reduction of the principal. Such was the success of this measure that, in spite of the reduction of interest from 6 to 5% which was also enacted, the passing of the acts was followed by a rise in the price of stocks. A curious preliminary to the introduction of these measures was the passing of a resolution by the House of Commons, which invited advances not exceeding £600,000, to be repaid with interest at 4% out of the first supplies of the year. The result showed that the time was not ripe for such a reduction of interest, as only a sum of £45,000 was offered on those terms. A further resolution was then passed, substituting 5% as the rate of interest, and the whole sum was at once subscribed. Besides accepting the reduction of interest on their own debts, the Bank of England and the South Sea Company agreed to assist the government by advancing 4½ millions at the reduced rate, to be employed in paying off any of the general creditors who might refuse assent to the conversion. The assistance was not required, as all the creditors signified assent. The debts thus dealt with amounted altogether to about 25½ millions, and the annual saving of interest effected (including that upon a large quantity of exchequer bills for which the Bank had been receiving over 7%) was £329,000. *1717.*

Walpole had a further opportunity of effecting a conversion in 1737. In the meantime much of the 5% debt had been reduced to 4% by arrangements with the Bank of England and the South Sea Company, and further borrowings had taken place at that rate and even at 3%. In 1737 the 3% stood above par, and Sir John Barnard proposed to the House of Commons a scheme for the gradual reduction of the 4 %. As a financial measure the scheme would doubtless have succeeded; but Walpole, moved apparently by consideration for his capitalist supporters, opposed and for the time defeated it. A scheme on similar lines was carried through by Pelham as chancellor of the exchequer in 1749 and embodied in the act 23 Geo. II. c. 1. By that act holders of the 4% securities, amounting to nearly £58,000,000, were offered a continuance of interest at 4% for one year, followed by 3½% for seven years, during which they were guaranteed against redemption, with a final reduction to 3% thereafter. It was necessary to continue the rate of 4% for the first year, as any objecting stockholders could not be paid off without a year's notice. Three months were allowed for signifying assent to the proposal. At first it was viewed with disfavour, and both the Bank and the East India Company opposed it. But the pens of the government pamphleteers were busily occupied in showing the advantages of the offer, and at the close of the three months acceptances had been received from the holders of nearly £39,000,000 of the stocks, or more than two-thirds of the whole. A further opportunity was afforded to waverers by a second act (23 Geo. II. c. 22), which allowed three months more for consideration; but for holders accepting under this act the intermediate period of 3½% interest was reduced from seven years to five. These terms brought in an additional £15,600 000 of stock; and the balance left outstanding, amounting to less than 3½ millions, was paid off at par by means of a new loan. The annual saving of interest on the stock converted was at first £272,000, increasing to £544,000 after seven years. *1749.*

For nearly three-quarters of a century no further conversion was attempted. In that period the total debt had been increased tenfold, and the practice of borrowing in times of war by the issue of an inflated capital, bearing nominally a low rate of interest, prevented recourse to conversion as a means of reducing the burden after peace was restored. But in 1822 Mr Vansittart—who four years earlier had effected a conversion in the opposite direction, turning £27,000,000 of stock from 3 into 3½%, in order to obtain from the holders an advance of £3,000,000 without adding to the capital of the debt—was able to deal with the 5%. These stocks amounted to £152,000,000 out of a total funded debt of £795,000,000. The prices at which the chief denominations of government stocks stood in the market in the early part of 1822 indicated a normal rate of interest of more than 4 but considerably less than 4½%. In these circumstances, to propose the conversion of the 5% stocks to 4½% would probably have been futile, unless the new stock were guaranteed for a long period, as holders would have stood in fear of a speedy further reduction. Nor could the government hope to succeed in a reduction to 4%. Mr Vansittart's plan was to offer £105 of stock bearing 4% in exchange for £100 of 5% stock, thus adding slightly to the capital of the debt, but effecting a large annual saving in interest. These terms were highly successful. Holders of nearly £150,000,000 accepted, leaving less than £3,000,000 of the stock to be paid off, and the annual saving obtained was £1,197,000. The new 4% stock was made irredeemable for seven years (act 3, Geo. IV c. 9). *1822.*

There were, however, other 4% stocks, amounting to £76,000,000, which were not secured against redemption. Two years later, the conditions being favourable for their conversion, the act 5 Geo. IV. c. 24 was passed, offering holders in exchange a 3½% stock, irredeemable for five years. The offer was accepted as regards £70,000,000, and the remaining £6,000,000 paid off, the annual saving on interest being £381,000. *1824.*

In 1830 the guarantee given to the 4% stock of 1822 had expired, and the stock stood at a price of 102½. Mr Goulburn decided to attempt its conversion without delay, and accordingly by the act 11 Geo. IV. c. 13 holders were offered in exchange for each £100 of the stock, either £100 of a 3½% stock, irredeemable for ten years, or £70 of a 5% stock, irredeemable for forty-two years, these two options being considered of approximately equal value. No difficulty was found in securing assent. Over £150,000,000 of the stock was converted, almost wholly into the 3½% stock; the balance of less than £3,000,000 was paid off, and an annual saving of £754,000 in interest was the result. *1830.*

It was again Mr Goulburn's fortune to carry out a large and successful conversion in 1844. At that date the funded debt was made up of 3% and 3½% stocks in the proportions of about two to one, the only other denomination being the trifling amount of 5% stock created in connexion with the conversion of 1830. The price of 3% consols ranged about 98, and that of the new 3½%, created in 1830, about 102. A reduction straightway from 3½ to 3% was not to be looked for, but it was hoped to ensure that reduction ultimately by offering 3½% for the first few years and a guarantee against redemption for a long term. Accordingly the holders of the several 3½% stocks were offered an exchange to a new stock bearing interest at 3½% for ten years and at 3% for the following twenty years. Practically the whole of the stock, amounting to £249,000.000, was converted on these terms, only £103,000 being left to be paid off at par. The immediate saving of interest was £622,000 a year for ten years, and twice that rate in subsequent years (acts 7 & 8 Vict. cc. 4 and 5). *1844.*

Mr Gladstone's only attempt at the conversion of the debt was made in his first year as chancellor of the exchequer. His primary purpose was to extinguish some small remnants of 3% stocks which stood outside the main stocks of that denomination. The act 16 Vict. c. 23 offered to holders of these minor stocks, amounting altogether to about 9½ millions, the option of exchanging every £100 for either £82, 10s. of a 3½% stock guaranteed for 40 years, or £110 of a 2½% stock guaranteed for the same period, or else for exchequer bonds at par. In the result stock to the amount of only about £1,500,000 was converted, and the remaining £8,000,000 had to be paid off at par, with some apparent loss of capital, as the current market price of the 3% was less than par. The failure was largely owing to the fact that, between the initiation and the execution of the scheme, the train of events leading up to the Crimean War had become manifest, with unfavourable results *1853.*

from ocean to harbour has been a difficult one at nearly every port on the African coast. A heavy sea from the Indian Ocean is always breaking on the shore, even in the finest weather, and at the mouth of every natural harbour a bar occurs. To deepen the channel over the bar at Durban so that steamers might enter the harbour was the cause of labour and expenditure for many years. Harbour works were begun in 1857, piers and jetties were constructed, dredgers imported, and controversy raged over the various schemes for harbour improvement. In 1881 a harbour board was formed under the chairmanship of Mr Harry Escombe. It controlled the operations for improving the sea entrance until 1893, when on the establishment of responsible government it was abolished. The work of improving the harbour was however continued with vigour, and finally, in 1904, such success was achieved that vessels of the largest class were enabled to enter port (see DURBAN). At the same time the railway system was continually developing.

Self-government granted.

For many years there had been an agitation among the colonists for self-government. In 1882 the colony was offered self-government coupled with the obligations of self-defence. The offer was declined, but in 1883 the legislative council was remodelled so as to consist of 23 elected and 7 nominated members. In 1890 the elections to the council led to the return of a majority in favour of accepting self-government, and in 1893 a bill in favour of the proposed change was passed and received the sanction of the Imperial government. At the time the white inhabitants numbered about 50,000. The electoral law was framed to prevent more than a very few natives obtaining the franchise. Restrictions in this direction dated as far back as 1865, while in 1896 an act was passed aimed at the exclusion of Indians from the suffrage. The leader of the party which sought responsible government was Sir John Robinson (1839–1903) who had gone to Natal in 1850, was a leading journalist in the colony, had been a member of the legislative council since 1863, and had filled various official positions. He now became the first premier and colonial secretary with Mr Harry Escombe (*q.v.*) as attorney-general and Mr F. R. Moor as secretary for Native Affairs. The year that witnessed this change in the constitution was also notable for the death of Sir Theophilus Shepstone, Natal's most prominent citizen. In the same year Sir Walter Hely-Hutchinson became governor. His immediate predecessors had been Sir Charles Mitchell (1889–1893) and Sir Arthur Havelock (1886–1889). Sir John Robinson remained premier until 1897, a year marked by the annexation of Zululand to Natal. In the following year Natal entered the Customs Union already existing between Cape Colony and the Orange Free State. Sir John Robinson had been succeeded as premier by Mr Harry Escombe (February-October 1897) and Escombe by Sir Henry Binns, on whose death in June 1899 Lieut.-Colonel (afterwards Sir) Albert Hime formed a ministry which remained in office until after the conclusion of the Anglo-Boer War. Meantime (in 1901) Sir Henry McCallum had succeeded Sir Walter Hely-Hutchinson as governor.

For some years Natal had watched with anxiety the attitude of increasing hostility towards the British adopted by the Pretoria administration, and, with bitter remembrance of the events of 1881, gauged with accuracy the intentions of the Boers. So suspicious had the ministry become of the nature of the military preparations that were being made by the Boers, that in May 1899 they communicated their apprehensions to the High Commissioner, Sir Alfred Milner, who telegraphed on the 25th of May to Mr Chamberlain, informing him that Natal was uneasy. The governor expressed his views to the prime minister that the Natal government ought to give the British government every support, and Colonel Hime replied that their support would be given, but at the same time he feared the consequences to Natal if, after all, the British government should draw back. In July the Natal ministry learnt that it was not the intention of the Imperial government to endeavour to hold the frontier in case hostilities arose, but that a line of defence considerably south of the frontier would be taken up. This led to a request on their part that if the Imperial government had any reason to anticipate the breakdown of negotiations, "such steps may be at once taken as may be necessary for the effectual defence of the whole colony." Sir William Penn Symons, the general commanding the British forces in Natal in September, decided to hold Glencoe. On the arrival of Lieut.-General Sir George White from India, he informed the governor that he considered it dangerous to attempt to hold Glencoe, and urged the advisability of withdrawing the troops to Ladysmith. The governor was strongly opposed to this step, as he was anxious to protect the coal supply, and also feared the moral effect of a withdrawal. Eventually Sir Archibald Hunter, then chief of staff to Sir Redvers Buller, was consulted, and stated that in his opinion, Glencoe being already occupied, "it was a case of balancing drawbacks, and advised that, under the circumstances, the troops be retained at Glencoe." This course was then adopted.

The war of 1899–1902.

On the 11th of October 1899 war broke out. The first act was the seizure by the Boers of a Natal train on the Free State border. On the 12th Laing's Nek was occupied by the Boer forces, who were moved in considerable force over the Natal border. Newcastle was next occupied by the Boers unopposed, and on the 20th of October occurred the battle of Talana Hill outside Dundee. In this engagement the advanced body of British troops, 3000 strong, under Symons, held a camp called Craigside which lay between Glencoe and Dundee, and from this position General Symons hoped to be able to hold the northern portion of Natal. There is no doubt that this policy strongly commended itself to the governor and ministers of Natal, and that they exercised considerable pressure to have it adopted. But from a military point of view it was not at all cordially approved by Sir George White, and it was afterwards condemned by Lord Roberts. Fortunately Symons was able to win a complete victory over one of the Boer columns at Talana Hill. He himself received a mortal wound in the action. Brigadier-General Yule then took command, and an overwhelming force of Boers rendering the further occupation of Dundee dangerous, he decided to retire his force to Ladysmith. On the 21st of October General Sir George White and General (Sir John) French defeated at Elandslaagte a strong force of Boers, who threatened to cut off General Yule's retreat. He again attacked the Boer forces at Rietfontein on the 24th of October, and on the 26th General Yule reached Ladysmith in safety. Ladysmith now became for a time the centre of military interest. The Boers gradually surrounded the town and cut off the communications from the south. Various engagements were fought in the attempt to prevent this movement, including the actions of Farquhar's Farm and Nicholson's Nek on the 30th (see TRANSVAAL). The investment of Ladysmith continued till the 28th of February 1900, when, after various attempts to relieve the beleaguered garrison, Sir Redvers Buller's forces at last entered the town. During the six weeks previous to the relief, 200 deaths had occurred from disease alone, and altogether as many as 8424 were reported to have passed through the hospitals. The relief of Ladysmith soon led to the evacuation of Natal by the Boer forces, who trekked northwards.

During the Boer invasion the government and the loyal colonists, constituting the great majority of the inhabitants of the colony, rendered the Imperial forces every assistance. A comparatively small number of the Dutch colonists joined the enemy, but there was no general rebellion among them. As the war progressed the Natal volunteers and other Natal forces took a prominent part. The Imperial Light Horse and other irregular corps were recruited in Natal, although the bulk of the men in the forces were Uitlanders from Johannesburg. As the nearest colony to the Transvaal, Natal was resorted to by a large number of men, women and children, who were compelled to leave the Transvaal on the outbreak of the war. Refugee and Uitlander committees were formed both at Durban and Maritzburg, and, in conjunction with the colonists, they did all in their power to assist in recruiting irregular corps, and also in furnishing relief to the sick and needy.

As one result of the war, an addition was made to the territory comprised in Natal, consisting of a portion of what had previously been included in the Transvaal. The Natal government originally made two proposals for annexing new territory:—

1. It was proposed that the following districts should be transferred to Natal, viz. the district of Vryheid, the district of Utrecht and such portion of the district of Wakkerstroom as was comprised by a line drawn from the north-eastern corner of Natal, east by Volksrust in a northerly direction to the summit of the Drakensberg Range, along that range, passing just north of the town of Wakkerstroom, to the head waters of the Pongola river, and thence following the Pongola river to the border of the Utrecht district. In consideration of the advantage to Natal from this addition of territory, Natal should take over £700,000 of the Transvaal debt.

2. It was proposed to include in Natal such portions of the Harrismith and Vrede districts as were comprised by a line following the Elands river north from its source on the Basutoland border to its junction with the Wilge river, and thence drawn straight to the point where the boundaries of Natal, the Transvaal and the Orange River Colony meet on the Drakensberg. In consideration of this addition to her territory, Natal should take over a portion of the Orange River Colony debt, to be raised at the end of the war, to the amount of £200,000.

Annexations to the northern territories.

The Imperial government decided to sanction only the first of these two proposals. For this course there were many reasons, the Transvaal territory annexed, or the greater part of it (the Vryheid district), having been only separated from the rest of Zululand in 1883 by a raid of armed Boers. "In handing over this district to the administration which controls the rest of Zululand, His Majesty's government," wrote Mr Chamberlain, under date March 1902, "feel that they are reuniting what ought never to have been separated."

With regard, however, to the proposed transfer of territory from the Orange River Colony, the circumstances were different. "There is," said Mr Chamberlain, "no such historical reason as exists in the case of Vryheid for making the transfer. On the contrary, the districts in question have invariably formed part of the state from which it is now proposed to sever them, and they are separated from Natal by mountains which form a well-defined natural boundary. In these circumstances, His Majesty's government have decided to confine the territory to be transferred to the districts in the Transvaal."

The districts added to Natal contained about 6000 white inhabitants (mostly Dutch), and some 92,000 natives, and had an area of nearly 7000 sq. m., so that this annexation meant an addition to the white population of Natal of about one-tenth, to her native population of about one-tenth also, and to her territory of about one-fourth. An act authorizing the annexation was passed during 1902 and the territories were formally transferred to Natal in January 1903. (A. P. H.; F. R. C.)

The period following the war was succeeded by commercial depression, though in Natal it was not so severely felt as in other states of South Africa. The government met the crisis by renewed energy in harbour works, railway constructions and the development of the natural resources of the country. A railway to the Zululand coalfields was completed in 1903, and in the same year a line was opened to Vryheid in the newly annexed territories. Natal further built several railway lines in the eastern half of the Orange River Colony, thus opening up new markets for her produce and facilitating her transit trade. Mr Chamberlain on his visit to South Africa came first to Natal, where he landed in the last days of 1902, and conferred with the leading colonists. In August 1903 the Hime ministry resigned and was succeeded by a cabinet under the premiership of Mr (afterwards Sir) George Sutton, the founder of the wattle industry in Natal and one of the pioneers in the coal-mining industry. In May 1905 Sir George Sutton was replaced by a coalition ministry under Mr C. J. Smythe, who had been colonial secretary under Sir Albert Hime. These somewhat frequent changes of ministry, characteristic of a country new to responsible government, reflected, chiefly, differences concerning the treatment of commercial questions and the policy to be adopted towards the natives. Towards those Dutch colonists who had joined the enemy during the war leniency was shown, all rebels being pardoned.

Commercial depression and native rebellion.

The attitude of the natives both in Natal proper and in Zululand caused much disquiet. As early as July 1903 rumours were current that Dinizulu (a son of Cetywayo) was disaffected and the power he exercised as representative of the former royal house rendered his attitude a matter of great moment. Dinizulu, however, remained at the time quiescent, though the Zulus were in a state of excitement over incidents connected with the war, when they had been subject to raids by Boer commandoes, and on one occasion at least had retaliated in characteristic Zulu fashion. Unrest was also manifested among the natives west of the Tugela, but it was not at first cause for alarm. The chief concern of the Natal government was to remodel their native policy where it proved inadequate, especially in view of the growth of the movement for the federation of the South African colonies. During 1903–1904 a Native Affairs' Commission, representative of all the states, obtained much evidence on the status and conditions of the natives. Its investigations pointed to the loosening of tribal ties and to the corresponding growth of a spirit of individual independence. Among its recommendations was the direct political representation of natives in the colonial legislatures on the New Zealand model, and the imposition of direct taxation upon natives, which should not be less than £1 a year payable by every adult male. The commission also called attention to the numerical insufficiency of magistrates and native commissioners in certain parts of Natal. With some of the recommendations the Natal commissioners disagreed; in 1905, however, an act was passed by the Natal legislature imposing a poll-tax of £1 on all males over 18 in the colony, except indentured Indians and natives paying hut-tax (which was 14s. a year). Every European was bound to pay the tax. In 1906 a serious rebellion broke out in the colony, attributable ostensibly to the poll-tax, and spread to Zululand. It was suppressed by the colonial forces under Colonel (afterwards Sir) Duncan McKenzie, aided by a detachment of Transvaal volunteers. An incident which marked the beginning of this rebellion brought the Natal ministry into sharp conflict with the Imperial government (the Campbell-Bannerman administration). Early in the year a farmer who had insisted that the Kaffirs on his farm should pay the poll-tax was murdered, and on the 8th of February some forty natives in the Richmond district forcibly resisted the collection of the tax and killed a sub-inspector of police and a trooper at Byrnetown. Two of the natives implicated were court-martialled and shot (February 15); others were subsequently arrested and tried by court martial. Nineteen were sentenced to death, but in the case of seven of the prisoners the sentence was commuted. On the day before that fixed for the execution Lord Elgin, then Secretary of State for the Colonies, intervened and directed the governor to postpone the execution of the sentence. Thereupon the Natal ministry resigned, giving as their reason the importance of maintaining the authority of the colonial administration at a critical period, and the constitutional question involved in the interference by the imperial authorities in the domestic affairs of a self-governing colony. The action of the British cabinet caused both astonishment and indignation throughout South Africa and in the other self-governing states of the empire. After a day's delay, during which Sir Henry McCallum reiterated his concurrence, already made known in London, in the justice of the sentence passed on the natives, Lord Elgin gave way (March 30). The Natal ministry thereupon remained in office. The guilty natives were shot on the 2nd of April.[1] It was at this time that Bambaata, a chief in the Greytown district who had been deposed for misconduct, kidnapped the regent appointed in his stead. He was pursued and escaped to Zululand, where he received considerable help. He was killed in battle in June, and by the close of July the rebellion was at an end. As has been stated, it was ostensibly attributable to the poll-tax, but the causes were more deep-seated. Though somewhat obscure they may be found in the

Conflict with the home government.

[1] Subsequently three other natives, after trial by the supreme court, were condemned and executed for their share in the Byrnetown murders.

above sea-level, is the great natural curiosity from which it derives its name—a bridge of natural rock 90 ft. long and from 50 to 150 ft. wide, which spans Cedar Creek at a height of 215 ft. above that stream. It consists of horizontal limestone strata, and is the remains of the roof of a cave or underground tunnel through which the creek once flowed. It is crossed by a public road. In the village are magnesia and lithia springs and a saltpetre cave, which was worked during the War of 1812 and the Civil War. A royal grant dated the 5th of July 1774 conveyed to Thomas Jefferson a tract of 157 acres, "including the Natural Bridge on Cedar Creek," and it did not pass from his estate until 1833.

NATURAL GAS, the name given to the inflammable gas occurring in petroliferous formations. It consists mainly of hydrocarbons of the paraffin series, principally marsh gas, which constitutes from 50 to 90 % of the Pennsylvanian gas. Members of the olefine series are also present, especially in the gas of Baku. Varying amounts of carbon dioxide, sometimes as much as 10% or more, and small quantities of carbon monoxide, nitrogen, hydrogen and oxygen are also found. For particulars of the geological occurrence, and the collection and distribution, of natural gas, see PETROLEUM.

NATURALISM. "Nature" is a term of very uncertain extent, and the "natural" has accordingly several antitheses, often more or less conflicting, and only to be learnt from the context in which they occur. Thus, though Man and the World are often opposed as respectively subject and object, yet the word nature is applied to both: hence Naturalism is used in both a subjective and an objective sense. In the subjective sense the natural, as the original or essential, is opposed to what is acquired, artificial, conventional or accidental. On this opposition the casuistry and paradoxes of the Sophists largely turned; it determined also, at least negatively, the conduct of the Cynics in their contempt for the customary duties and decencies; and it led the Stoics to seek positive rules of life in "conformity to nature." This deference for the "natural" generally, and distrust of traditional systems of thought and even of traditional institutions, has played a large part in modern philosophy, especially British philosophy. It was perhaps the inevitable outcome of the reaction, which began with the Renaissance, against the medieval domination of mere authority. "L'homme qui médite est un animal dépravé," said Rousseau; and again, "Tout est bien sortant des mains de l'auteur des choses, tout dégénère entre les mains de l'homme."[1]

In psychology and epistemology, "no one," as Green has said, "is more emphatic than Locke in opposing what is real to what we 'make for ourselves'—the work of nature to the work of the mind. Simple ideas or sensations we certainly do not 'make for ourselves.' They therefore, and matter supposed to cause them, are, according to Locke, real. But relations are neither simple ideas nor their material archetypes. They therefore, as Locke explicitly holds, fall under the head of the work of the mind, which is opposed to the real."[2] This opposition again led Hume, in the first place, to distinguish between natural and philosophical relations—the former determined simply by association, the latter by an abitrary union of two ideas, which we may think proper to compare—and then, in the next, to reduce identity and causality, the two chief "philosophical relations," to fictions resulting from "natural relations," that is to say, from associations of similarity and contiguity. Subjective naturalism thus tended to become, and in the end became, what is more commonly called *Sensationalism* or *Associationism*, thereby approximating towards that objective naturalism which reduces the external world to a mechanism describable in terms of matter and motion—a result already foreshadowed when Hartley connected ideas and their association with brain vibrations and vibratiuncles. In ethics, also, the striving to get back to the natural entailed a similar downward trend. From the Cambridge Platonists, from Locke and Clarke, we hear much of rational principles of conduct, comparable in respect of intelligibility with the truths of mathematics; but already we find that in Shaftesbury the centre of ethical interest is transferred from the Reason, conceived as apprehending either abstract moral distinctions or laws of divine legislation, to the "natural affections" that prompt to social duty;[3] and when we reach Bentham, with pleasure and pain as "sovereign masters," and the Mills, with love of virtue explained by the laws of association, all seems to be non-rational.[4] There is much resemblance, as well as some historical connexion, between the naturalism of moralists such as Shaftesbury and Hutcheson and the Common-Sense metaphysics of Reid and his school.[5] Hence Kant, distinguishing between a "naturalistic" and "scientific" or critical method in metaphysics, styles Reid and his followers "naturalists of pure reason," satirically comparing them to people who think they can settle the size and distance of the moon by direct eyesight better than by the roundabout calculations of mathematics.

So far we have seen the natural approximating to the non-rational. But when used in a subjective sense in opposition to the supernatural, it means the rational as opposed to what is above reason, or even contrary to reason. It is in this sense that the term Naturalism most frequently occurs; and it was so applied specially to the doctrines of the English Deists and the German Illuminati of the 17th and 18th centuries: those of them who held that human reason alone was capable of attaining to the knowledge of God were called theological naturalists or rationalists, while those who denied the possibility of revelation altogether were called philosophical naturalists or naturalists simply.[6] In these controversies the term Naturalist was also sometimes used in an objective sense for those who identified God and Nature, but they were more frequently styled Spinozists, Pantheists or even Atheists. But it is at once obvious that dispute as to what is natural and what supernatural is vain and hopeless till the meanings of reason and nature are clearly defined. "The only distinct meaning of the word" [natural], said Butler, "is *stated, fixed* or *settled*; since what is natural as much requires and presupposes an intelligent agent to render it so, *i.e.* to effect it continually, or at stated times, as what is supernatural or miraculous does to effect it for once. And from hence it must follow that persons' notion of what is natural will be enlarged in proportion to their greater knowledge. . . . Nor is there any absurdity in supposing that there may be beings in the universe, whose capacities . . . may be so extensive, as that the whole Christian dispensation may to them appear natural, *i.e.* analogous or conformable to God's dealings with other parts of His creation; as natural as the visible known course of things appears to us."[7]

The antithesis of natural to spiritual (or ideal) has mainly determined the use of the term Naturalism in the present day.[8] But current naturalism is not to be called materialism, though these terms are often used synonymously, as by Hegel, Ueberweg and other historians of philosophy; nor yet pantheism, if by that is meant the immanence of all things in one God. We know only material phenomena, it is said; matter is an abstract conception simply, not a substantial reality. It is therefore meaningless to describe mind as its effect. Moreover, mind also is but an abstract conception; and here again all our knowledge is confined to the phenomenal. To identify the two classes of phenomena is, however, impossible, and indeed absurd; nevertheless we find a constant concomitance of *psychosis* and *neurosis*; and the more sensationalist and associationist our psychology, the easier it becomes to correlate the

[8] In aesthetics we find Naturalism used in a cognate sense: the Flemish painters, such writers as Flaubert or Zola, for example, being called naturalistic or realistic, in contrast to the Italian painters or writers like George Sand or the Brontës.

psychical and the physical as but "two aspects" of one and the same fact. It is therefore simplest and sufficient to assume an underlying, albeit unknown, unity connecting the two. A monism—so far neutral, neither materialistic nor spiritualistic—is thus a characteristic of the prevailing naturalism. But when the question arises, how best to systematize experience as a whole, it is contended that we must begin from the physical side. Here we have precise conceptions, quantitative exactness and thoroughgoing continuity; every thought that has ever stirred the hearts of men, not less than every breeze that has ever rippled the face of the deep, has meant a perfectly definite redistribution of matter and motion. To the mechanical principles of this redistribution an ultimate analysis brings us down; and—beginning from these—the nebular hypothesis and the theory of natural selection will enable us to explain all subsequent synthesis.[1] Life and mind now clearly take a secondary place; the cosmical mechanism determines *them*, while they are powerless to modify it. The spiritual becomes the "epiphenomenal," a merely incidental phosphorescence, so to say, that regularly accompanies physical processes of a certain type and complexity. (See also PSYCHOLOGY.)

This absolute naturalism, as we may call it, the union, that is, of psychological and cosmological naturalism, is in fact a species of Fatalism, as Kant indeed entitled it.[2] It is the logical outcome of a sensationalist psychology, and of the epistemology which this entails. As long as association of ideas (or sensory residua) is held to explain judgment and conscience, so long may naturalism stand.

The naturalistic work of chief account at the present day is E. Haeckel's *Die Welträtsel, gemeinverständliche Studien über monistische Philosophie* (5th ed., 1900), of which an English translation has appeared. Effective refutations will be found in the works of two of Haeckel's colleagues, O. Liebmann, *Zur Analysis der Wirklichkeit* (3rd ed., 1900); R. Eucken, *Die Einheit des Geisteslebens in Bewusstsein und That der Menschheit* (1888, Eng. trans.); *Der Kampf um einen geistigen Lebensinhalt* (1898). See also A. J. Balfour, *Foundations of Belief* (8th ed., 1901); J. Ward, *Naturalism and Agnosticism* (1899). (J. W.*)

NATURALIZATION, the term given in law to the acquisition by an alien of the national character or citizenship of a certain state, always with the consent of that state and of himself, but not necessarily with the consent of the state to which he previously belonged, which may refuse to its subjects the right of renouncing its nationality, called "expatriation," or may allow the right only on conditions which have not been fulfilled in the particular case. Hence although nationality in strict theory is always single, as liege homage was and allegiance in its proper sense is, it often happens that two states claim the same person as their national or subject. This conflict arises not only from naturalization having been granted without the corresponding expatriation having been permitted, but also from the fact that birth on the soil was the leading determinant of nationality by feudal law, and still is so by the laws of England and the United States (*jus soli*), while the nationality of the father is its leading determinant in those countries which have accepted Roman principles of jurisprudence (*jus sanguinis*). The conflict is usually solved for practical purposes by an understanding which is approximately general, namely that, in cases not provided for by treaty, no state shall protect those whom it claims as its nationals while residing in the territory of another state which claims them as its own nationals by any title, whether *jus soli*, *jus sanguinis*, naturalization, or the refusal to allow expatriation. On this footing the British foreign office, while it grants passports for travel to naturalized persons, will extend no protection to them against a claim of their former country, if they return to it, to exact military service due to it. The United States, asserting that expatriation is an inalienable right of man, maintains that, to lose his right to American protection, the emigrant who has been naturalized in the United States must have done that for which he might have been tried and punished at the moment of his departure; it claims to protect him against the exaction of what at that moment was merely a future liability to military service, and this doctrine has been practically accepted by France in her dealings with America. Germany also accepted it by the treaty of 1868 between the United States and the North German Confederation, now in force for the German empire, subject to provisions that the emigrant's fixing his domicile in the old country shall be deemed a renunciation of his naturalization in the new, and that his living in the old country for more than two years may be deemed to imply the absence of an intention to return to the new. Between the United States and Great Britain the convention of the 13th of May 1870 provides that naturalization in either is to be valid for all purposes immediately on its completion, but that if the resident shall renew his residence in his old country he may be readmitted to his old nationality, on his application and on such conditions as the readmitting government may impose.

The Naturalization Act 1870, which now governs the matter for England, does not say that the person naturalized becomes thereby a British subject, to which, if it had been said, a proviso might have been added saving the above-mentioned policy of the foreign office as to not protecting him in his old country, although even without such a proviso the foreign office would have been free to follow that policy. The act in question (s. 7) gives him the rights and imposes on him the duties of a natural-born British subject in the United Kingdom, and provides that, when within the limits of his old country, he shall not be deemed a British subject unless he has ceased to be a subject of that country, by its laws or in pursuance of a treaty. On this wording it has been maintained that British naturalization is not really naturalization at all; but leaves the naturalized person as he was with the addition of a certain quality within the United Kingdom; and on that ground it has been considered in France that a Frenchman, obtaining naturalization in England, does not fall within the French law (Code Civil, Art. 17) which pronounces the expatriation of citizens who cause themselves to be naturalized abroad. This is the *Bourgoise Case*, 41 Ch. D. 310, in which, when it came before the English courts, Mr Justice Kay inclined to the same view, but the court of appeal avoided giving an opinion on the point. Professor Dicey leans to the same view (5 *Law Quarterly Review*, 438); but Sir Thomas Barclay (4 *L.Q.R.* 226), Sir Malcolm McIlwraith (6 *L.Q.R.* 379), and Professor Westlake (*International Law—Peace*, 2nd ed. p. 234; *Private International Law*, 4th ed. p. 356) adopt the view that the Naturalization Act 1870 makes the naturalized person a full British subject, only to be treated in his old country in accordance with the international principles recognized by the British executive. And the foreign office, by granting passports to naturalized persons, acts on the same view. The point is important with reference to the question whether the naturalization of the father in the United Kingdom confers the character of British subjects on his children afterwards born abroad. (See ALIEN.)

An analogous question arises on the provision in the Naturalization Act 1870, sec. 16, that the legislature of any British possession may make laws "for imparting to any person the privileges of naturalization, to be enjoyed by such person within the limits of such possession." This, in accordance with the wider view of the effect of naturalization in the United Kingdom, may mean that naturalization in pursuance of a colonial law confers the full character of a British subject, only without removing disabilities, such as that to hold land, under which the naturalized person may have lain as an alien in any other British possession. On that footing the foreign office grants passports to the holders of colonial certificates of naturalization, and protects them in all foreign countries but that of their origin; and the Merchant Shipping Act 1894, sec. 1, allows persons naturalized in British possessions to be owners of British ships. On the other hand, those who maintain the narrower view of the effect of naturalization in the United Kingdom naturally hold that colonial naturalization has no effect at all outside the British possession in which it is granted.

Naturalization in India is regulated by the British Indian Naturalization Act, No. 30 of 1852, under which it may be granted to subjects of the several princes and states in India

[1] Cf. Spencer, *First Principles* (1867), p. 398.
[2] Cf. *Prolegomena*, § 60.

as well as to those who are entirely aliens to the British empire. The former, however, are treated for several purposes as British subjects even without being so naturalized.

In most countries a lengthened sojourn is a condition precedent to naturalization. In Belgium, the United Kingdom, North America and Russia the period of such sojourn is fixed at five years, in France, Greece and Sweden at three, in the Argentine Republic two, while in Portugal a residence of one year is sufficient. In Germany, Austria and Italy no period of residence is prescribed, while in Austria a ten years' residence confers *per se* the rights of citizenship. In the United States an alien desiring to be naturalized must declare on oath his intention to become a citizen of the United States; two years afterwards must declare on oath his intention to support the constitution of the United States and renounce allegiance to every foreign power, including that of which he was before a subject; must prove residence in the United States for five years, and in the state where his application is made for one year, as a good citizen; and must renounce any title of nobility. In France an alien desiring naturalization, if he has not resided continuously in the country for ten years, must obtain permission to establish his domicile in France; three years after (in special cases one year) he is entitled to apply for naturalization, which involves the renunciation of any existing allegiance.

NAUARCHIA (Gr. *ναῦς*, ship, *ἀρχή*, command), the supreme command of the Spartan navy. The office was an annual one and could not be held more than once by the same man (Xen. *Hell.* ii. 1. 7). This law might be evaded in special cases; the new admiral might not be sent to take over the command until some time after his election, which took place at midsummer (Beloch in *Philologus*, xliii. p. 272 sqq.), and meanwhile his predecessor remained *de facto* admiral; or the retiring admiral might, after the expiry of his term, hold an appointment as secretary (*ἐπιστολεύς*) to one who, though titular admiral, was really placed under his orders or even kept at Sparta altogether. Being independent of the kings and hampered by no colleague, the nauarch wielded such power that Aristotle is hardly going too far when he says (*Politics*, ii. 9. 22), *ἡ ναυαρχία σχεδὸν ἑτέρα βασιλεία κατέστησεν*. He was subject only to the ephors, who, if he proved incompetent, could depose him (Thuc. viii. 39), though they usually preferred to send out an advisory committee (*σύμβουλοι*). An admiral might appoint his *ἐπιστολεύς* to command a portion, or even the whole, of the fleet, and if the former died in office the secretary succeeded to his post.

For a detailed discussion see J. Beloch, "Die Nauarchie in Sparta," in the *Rheinisches Museum*, xxxiv. (1879) 117-130, where a complete list of nauarchs known to us will be found; regarding the time of the election this is corrected by a later article of the same writer (*Philologus*, *loc. cit.*). See also A. Solari, *Ricerche Spartane* (Livorno, 1907), 1-58; G. Busolt, "Staats- und Rechtsaltertümer" (Iwan Müller's *Handbuch der klassischen Altertumswissenschaft*, iv.), § 96; G. E. Underhill's edition of Xenophon, *Hellenica*, i., ii., note on i. 5. 1. (M. N. T.)

NAUCK, JOHANN AUGUST (1822–1892), German classical scholar and critic, was born at Auerstädt in Prussian Saxony on the 18th of September 1822. After having studied at Halle and held educational posts in Berlin, he migrated in 1859 to St Petersburg, where he was professor of Greek at the imperial historico-philological institute (1869–1883). He died on the 3rd of August 1892. Nauck was one of the most distinguished textual critics of his day, although, like P. H. Peerlkamp, he was fond of altering a text in accordance with what he thought the author must, or ought to, have written.

The most important of his writings, all of which deal with Greek language and literature (especially the tragedians) are the following: *Euripides, Tragedies and Fragments* (1854, 3rd ed., 1871); *Studia Euripidea* (1859–1862); *Tragicorum Graecorum Fragmenta* (1856, last ed., 1889), his chief work; Index to the Fragments (1892); text of Sophocles (1867); revised edition of Schneidewin's annotated Sophocles (1856, &c.); texts of Homer, *Odyssey* (1874) and *Iliad* (1877–1879); the fragments of Aristophanes of Byzantium (1848), still indispensable; Porphyrius of Tyre (1860, 2nd ed., 1886); Iamblichus, *De Vita Pythagorica* (1884); *Lexikon Vindobonense* (1867), a meagre compilation of the 14th or 15th century. See memoir by T. Zielinski, in Bursian's *Biographisches Jahrbuch* (1894), and J. E. Sandys, *History of Classical Scholarship*, iii. (1908), pp. 149–152.

NAUCRARY, a subdivision of the people of Attica, which was certainly among the most primitive in the Athenian state. The word is derived either (1) from *ναῦς* (a ship) and describes the duty imposed upon each naucrary, of providing one ship and two (or, more probably, ten) horsemen; or (2) from *ναίειν* (to dwell), in which case it has to do with a householder census. The former is generally accepted in view of the fact that the naucraries were certainly the units on which the Athenian fleet was based. The view once held (on the strength of a fragment of Aristotle, quoted carelessly by Photius) that the naucrary was invented by Solon may now be regarded as obsolete (see the Aristotelian *Constitution*, viii. 3). Each of the four Ionian tribes was divided into three *trittyes* ("thirds"), each of which was subdivided into four naucraries; there were thus 48 naucraries. The earliest mention of them is in Herodotus (v. 71), where it is stated that the Cylonian conspiracy was put down by the "Prytaneis (chief men) of the Naucraries." Although it is generally recognized that in this passage we can trace an attempt to shift the responsibility for the murder of the suppliants from the archon Megacles, it is highly improbable that the Prytaneis of the Naucraries did not play a part in the tragedy. Thucydides is probably right, as against Herodotus, in asserting that the nine archons formed the Athenian executive at this period. It may be conjectured, however, that the military forces of Athens were organized on the basis of the naucraries, and that it was the duty of the presidents of these districts to raise the local levies. It is certainly remarkable that the Aristotelian *Constitution of Athens* does not connect the naucrary with the fleet or the army; from chapter viii. it would appear that its importance was chiefly in connexion with finance (*ἀρχὴ τεταγμένη πρός τε τὰς εἰσφορὰς καὶ τὰς δαπάνας*). The naucrary consisted of a number of villages, and was, therefore, a local unit very much in the power of the *naucraros*, who was selected by reason of wealth. The *naucraros* superintended the construction of, and afterwards captained, the ship, and also assessed and administered the taxes in his own area. In the reforms of Cleisthenes, the naucraries gave place to the demes as the political unit. In accordance with the new decimal system, their number was increased to fifty. Whether they continued (and if so, how long) to supply one ship and two[1] (or ten) horsemen each is not certainly known. Cheidemus in Photius asserts that they did, and his statement is to a certain extent corroborated by Herodotus (vi. 89) who records that, in the Aeginetan War before the Persian Invasion, the Athenian fleet numbered only fifty sail.

See Photius (*s.v.*), who is clearly using the *Ath. Pol.* (he quotes from it the last part of his article *totidem verbis*); Schömann, *Antiq.* (p. 326, Eng. trans.)—quoted by J. E. Sandys (*Ath. Pol.* viii., 13)—refutes Gilbert, *Greek Constitutional Antiquities* (Eng. trans., 1895), and in *Jahrb. Class. Phil.* cxi. (1875) pp. 9 seq.; A. H. J. Greenidge, *Handbook of Greek Const. Hist.* p. 134; history of Greece in general; for derivation of name, G. Meyer, *Curtius' Studien* (vii. 175), where Wecklein is refuted. (J. M. M.)

NAUCRATIS, an ancient Greek settlement in Egypt. The site was discovered by Professor W. M. Flinders Petrie in 1884, on the eastern bank of a canal, about 10 m. W. of the present Rosetta branch of the Nile. In ancient times it was approached by the Canopic mouth, which was farther to the west. The identification of the site is placed beyond doubt by the discovery of inscriptions, with the name of the town, and of great masses of early Greek pottery, such as could not have existed anywhere else. The site was excavated in 1884–1886 by the Egypt Exploration Fund, and a supplementary excavation was made by the British School at Athens in 1899. A list of the temples of Naucratis is given by Herodotus (ii. 178); they were the Hellenion, common to all the colonizing cities, and those dedicated

[1] See footnote to CLEISTHENES (1), *ad fin.*

by the Aeginetans to Zeus, by the Samians to Hera, and by the Milesians to Apollo. A temple of Aphrodite is also mentioned by Athenaeus. Traces of all these temples, except that of Zeus, or at least dedications coming from them, have been found in the excavations, and another has been added to them, the temple of the Dioscuri. The two chief sites to be cleared were the temples of Apollo and of Aphrodite, in both of which successive buildings of various date were found. Both were remarkable for the great mass of early painted pottery that was found; in the temple of Apollo this had been buried in a trench; in that of Aphrodite it was scattered over the whole surface in two distinct strata. A great deal of it was local ware, but there were also imported vases from various Greek sites. In addition to these temples, there was also found a great fortified enclosure, about 860 ft. by 750, in the south-eastern part of the town; within it was a square tower or fort; a portico of entrance and an avenue of rows of sphinxes was added in Ptolemaic times, as is shown by the foundation deposits found at the corners of the portico; these consisted of models of the tools and materials used in the buildings, models of instruments for sacrifice or ceremonies, and cartouches of King Ptolemy Philadelphus. Professor Petrie naturally supposed this great enclosure to be the Hellenion or common sanctuary of the Greeks, but Mr. Hogarth subsequently found traces of another great walled enclosure to the north-east of the town, together with pottery dedicated τοῖς τῶν Ἑλλήνων θεοῖς, and he claims with reason that this enclosure is more likely than the other to be the Hellenion, since no early Greek antiquities have been found in the southern part of the town, which seems rather to have been a native settlement. The cemetery of the ancient town was found on two low mounds to the north, but was mostly of Ptolemaic date.

Apart from the historic interest of the site, as the only Greek colony in Egypt in early times, the chief importance of the excavations lies in the rich finds of early pottery and in the inscriptions upon them, which throw light on the early history of the alphabet. The most flourishing period of the town was from the accession of Amasis II. in 570 B.C to the Persian invasion of 520 B.C., when the contents of the temples must have been destroyed. The earlier chronology has been much disputed. There are clear traces of a settlement going back to the 7th century, including a scarab factory, which yielded numerous scarabs, not of native Egyptian manufacture, bearing the names of the kings that preceded Amasis. Among these were fragments of early Greek pottery. It seems a fair inference that the makers of these were Greeks, and that they probably represent the early Milesian colony, settled here in the time of Psammetichus I., before the official assignment of the site by Amasis to the Greek colonists of various cities. The most important of the antiquities found are now in the British Museum.

See W. M. F. Petrie, &c., *Naukratis I.*, third Memoir of the Egypt Exploration Fund (1886); E. A. Gardner, &c., *Naukratis II.*, sixth Memoir of same (1889); D. G. Hogarth, &c., *Annual of the British School at Athens* (1898–1899). (E. Gr.)

NAUDÉ, GABRIEL (1600–1653), French librarian and scholar, was born in Paris on the 2nd of February 1600. He studied medicine at Paris and Padua, and became physician to Louis XIII. In 1629 he became librarian to Cardinal Bagni at Rome, and on Bagni's death in 1641 librarian to Cardinal Barberini. At the desire of Richelieu he began a wearisome controversy with the Benedictines, denying Gerson's authorship of *De Imitatione Christi*. Richelieu intended to make Naudé his librarian, and on his death Naudé accepted a similar offer on the part of Mazarin, and for the next ten years devoted himself to bringing together from all parts of Europe the noble assemblage of books known as the Bibliothèque Mazarine. Mazarin's library was sold by the parlement of Paris during the troubles of the Fronde, and Queen Christina invited Naudé to Stockholm. He was not happy in Sweden, and on Mazarin's appeal that he should re-form his scattered library Naudé returned at once. But his health was broken, and he died on the journey at Abbeville on the 30th of July 1653. The friend of Gui Patin, of Pierre Gassendi and all the liberal thinkers of his time, Naudé was no mere bookworm; his books show traces of the critical spirit which made him a worthy colleague of the humorists and scholars who prepared the way for the better known writers of the "siècle de Louis XIV."

Including works edited by him, a list of ninety-two pieces is given in the *Naudaeana*. The chief are *Le Marfore, ou discours contre les libelles* (Paris, 1620), very rare, reprinted 1868; *Instruction à la France sur la vérité de l'histoire des Frères de la Rose-Croix* (1623, 1624), displaying their impostures, *Apologie pour tous les grands personnages faussement soupçonnez de magie* (1625, 1652, 1669, 1712), Pythagoras, Socrates, Thomas Aquinas and Solomon are among those defended; *Advis pour dresser une bibliothèque* (1627, 1644, 1676; translated by J. Evelyn, 1661), full of sound and liberal views on librarianship; *Addition à l'histoire de Louys XI.* (1630), this includes an account of the origin of printing; *Bibliographia politica* (Venice, 1633, &c.; in French, 1642), a mere essay of no bibliographical value; *De studio liberali syntagma* (1632, 1654), a practical treatise found in most collections of directions for studies; *De studio militari syntagma* (1637), esteemed in its day; *Considérations politiques sur les coups d'état* (Rome [Paris], 1639; first edition rare, augmented by Dumay, 1752), this contains an apology for the massacre of St Bartholomew; *Biblioth. Cordesianae Catalogus* (1643), classified; *Jugement de tout ce qui a été imprimé contre le Card. Mazarin* (1649), Naudé's best work, and one of the ablest defences of Mazarin; it is written in the form of a dialogue between Saint-Ange and Mascurat, and is usually known under the name of the latter.

NAUGATUCK, a township and borough of New Haven county, Connecticut, U.S.A., on the Naugatuck river, 5 m. S. of Waterbury, with an area of 17 sq. m. in 1906. Pop. (1890) 6218, (1900) 10,541, of whom 3432 were foreign-born, (1910 census) 12,722. It is served by the New York, New Haven & Hartford railroad and by interurban electric railways. Among the principal public buildings are the Whittemore Memorial Public Library (1892), a fine high school and the large Salem school (part of the public school system), all given to the borough by John Howard Whittemore of Naugatuck, who in addition endowed the library and the high school. The river furnishes water-power. Among the manufactures are rubber goods, chemicals, iron castings, woollen goods, cutlery, &c. The value of the factory products increased from $8,886,676 in 1900 to $11,009,573 in 1905, or 23·9%. The prominence of the rubber industry here is due to Charles Goodyear (*q.v.*), who in 1821 entered into partnership with his father Amasa Goodyear for the manufacture of hardware. Vulcanized rubber overshoes were first made in Naugatuck, and in 1843 the Goodyear's Metallic Rubber Shoe Company was established here. The township was formed from parts of Waterbury, Bethany and Oxford, and was incorporated in 1844; the borough was chartered in 1893; and the two were combined in 1895.

NAUHEIM, or **Bad-Nauheim**, a watering-place of Germany, in the grand-duchy of Hesse-Darmstadt, situated on the north-east slope of the Taunus Mountains, 24 m. by rail N. of Frankfort-on-Main on the main line of railway to Cassel. Pop. (1905) 5054. It has three Evangelical, a Roman Catholic and an English church. Its thermal waters (84° to 95° F.), although known for centuries, were, prior to 1835, only employed for the extraction of salt. They now yield about 2000 tons annually. The town has several parks, the largest being the Kurpark, 125 acres in extent, in which are the Kurhaus and the two chief springs. The waters, which are saline, strongly impregnated with carbonic acid, and to a less extent with iron, are principally used for bathing, and are specific in cases of gout and rheumatism, but especially for heart affections. Three smaller springs, situated outside the Kurpark, supply water for drinking. In 1899–1900 a new spring (saline) was tapped at a depth of 682 ft. Another attraction of the place is the Johannisberg, a hill 773 ft. high, immediately overlooking the town.

Nauheim, which was bestowed by Napoleon upon Marshal Davout, became a town in 1854. From 1815 to 1866 it belonged to the electorate of Hesse-Cassel, but in 1866 it was ceded to

the grand-duchy of Hesse-Darmstadt. It was the scene of fighting between the French and the Germans in 1762 and again in 1792.

See Grödel, *Bad Nauheim, seine Kurmittel* (9th ed., Friedberg, 1903); Credner, *Die Kurmittel in Bad Nauheim* (Leipzig, 1894); Bode, *Bad Nauheim, seine Kurmittel und Erfolge* (Wiesbaden, 1889); and Weber, *Die Park- und Waldanlagen vom Bad Nauheim* (Nauheim, 1906).

NAULETTE, a large cavern on the left bank of the Lesse, which joins the Meuse above Dinant, Belgium. Here in 1866 Edouard Dupont discovered an imperfect human lower jaw, now in the Brussels Natural History Museum. It is of a very ape-like type in its extreme projection and that of the teeth sockets (teeth themselves lost), with canines very strong and large molars increasing in size backward. It was found associated with the remains of mammoth, rhinoceros and reindeer. The Naulette man is now assigned to the Mousterian Epoch.

See G. de Mortillet, *Le Préhistorique* (1900); E. Dupont, *Étude sur les fouilles scientifiques exécutées pendant l'hiver* (1865–1866), p. 21.

NAUMACHIA, the Greek word denoting a naval battle (*ναῦς*, ship, and *μάχη*, battle), used by the Romans as a term for a mimic sea-fight. These entertainments took place in the amphitheatre, which was flooded with water, or in specially constructed basins (also called *naumachiae*). The first on record, representing an engagement between a Tyrian and an Egyptian fleet, was given by Julius Caesar (46 B.C.) on a lake which he constructed in the Campus Martius. In 2 B.C. Augustus, at the dedication of the temple of Mars Ultor, exhibited a naumachia between Athenians and Persians, in a basin probably in the *horti Caesaris*, where subsequently Titus gave a representation of a sea-fight between Corinth and Corcyra. In that given by Claudius (A.D. 52) on the *lacus Fucinus*, 19,000 men dressed as Rhodians and Sicilians manœuvred and fought. The crews consisted of gladiators and condemned criminals; in later times, even of volunteers.

See L. Friedländer in J. Marquardt, *Römische Staatsverwaltung*, iii. (1885) p. 558.

NAUMACHIUS, a Greek gnomic poet. Of his poems 73 hexameters (in three fragments) are preserved by Stobaeus in his *Florilegium*; they deal mainly with the duty of a good wife. From the remarks on celibacy and the allusion to a mystic marriage it has been conjectured that the author was a Christian.

The fragments, translated anonymously into English under the title of *Advice to the Fair Sex* (1736), are in Gaisford's *Poëtae minores Graeci*, iii. (1823).

NAUMANN, GEORG AMADEUS CARL FRIEDRICH (1797–1873), German mineralogist and geologist, was born at Dresden on the 30th of May 1797, the son of a distinguished musician and composer. He received his early education at Pforta, studied at Freiberg under Werner, and afterwards at Leipzig and Jena. He graduated at Jena, and was occupied in 1823 in teaching in that town and in 1824 at Leipzig. In 1826 he succeeded Mohs as professor of crystallography, in 1835 he became professor also of geognosy at Freiberg; and in 1842 he was appointed professor of mineralogy and geognosy in the university of Leipzig. At Freiberg he was charged with the preparation of a geological map of Saxony, which he carried out with the aid of Bernhard von Cotta in 1846. He was a man of encyclopaedic knowledge, lucid and fluent as a teacher. Early in life (1821–1822) he travelled in Norway, and his observations on that country, and his subsequent publications on crystallography, mineralogy and geology established his reputation. He was awarded the Wollaston Medal by the Geological Society of London in 1868. He died at Leipzig on the 26th of November 1873.

He published *Beitrâge zur Kenntniss Norwegens* (2 vols., 1824); *Lehrbuch der Mineralogie* (1828); *Lehrbuch der reinen und angewandten Krystallographie* (2 vols. and atlas, 1830); *Elemente der Mineralogie* (1846; ed. 9, 1874; the 10th ed. [by F. Zirkel, 1877]; *Lehrbuch der Geognosie* (2 vols. and atlas, 1849–1854, ed. 2, 1858–1872).

NAUMBURG, a town of Germany, in the province of Prussian Saxony, the seat of the provincial law courts and court of appeal for the province and the neighbouring districts. It is situated on the Saale, near its junction with the Unstrut, in the centre of an amphitheatre of vine-clad hills, 29 m. S.W. from Halle, on the railway to Weimar and Erfurt. Pop. (1905) 25,137. The cathedral, an imposing building in the Romanesque Transition style (1207–1242), has a Gothic choir at each end, and contains some interesting medieval sculptures. It is remarkable for its large crypt and its towers, a fourth having been added in 1894, the gift of the emperor William II. There are also four other Protestant churches (of which the town church, dedicated to St Wenceslaus and restored in 1892–1894, possesses two pictures by Lucas Cranach the elder), a Roman Catholic church, a gymnasium, a modern school, an orphanage and three hospitals. A curious feature of the town is the custom, which has not yet died out, of labelling the houses with signs, such as the "swan," the "leopard" and the "lion." The industries of the place mainly consist in the manufacture of cotton and woollen fabrics, chemicals, combs, beer, vinegar and leather. On the hills to the north of the town, across the Unstrut, lies Schenkelburg, once the residence of the poet Gellert, and noticeable for the grotesque carvings in the sandstone rocks.

In the 10th century Naumburg was a stronghold of the margraves of Meissen, who in 1029 transferred to it the bishopric of Zeitz. In the history of Saxony it is memorable as the scene of various treaties; and in 1561 an assembly of Protestant princes was held there, which made a futile attempt to cement the doctrinal dissensions of the Protestants. In 1564 the last bishop died, and the bishopric fell to the elector of Saxony. In 1631 the town was taken by Tilly, and in 1632 by Gustavus Adolphus. It became Prussian in 1814. An annual festival, with a procession of children, which is still held, is referred to an apocryphal siege of the town by the Hussites in 1432, but is probably connected with an incident in the brothers' war (1447–51), between the elector Frederick II. of Saxony and his brother Duke William. Karl Peter Lepsius (1775–1853), the antiquary and his more distinguished son Richard the Egyptologist, were born at Naumburg.

See E. Borkowsky, *Die Geschichte der Stadt Naumburg an der Saale* (Stuttgart, 1897); E. Hoffmann, *Naumburg an der Saale im Zeitalter der Reformation* (Leipzig, 1900); S. Braun, *Naumburger Annalen vom Jahre 799 bis 1613* (Naumburg, 1892); Puttrich, *Naumburg an der Saale, sein Dom und andre alterthümliche Bauwerke* (Leipzig, 1841–1843); and Wispel, *Entwickelungsgeschichte der Stadt Naumburg an der Saale* (Naumburg, 1903).

NAUNTON, SIR ROBERT (1563–1635), English politician, the son of Henry Naunton of Alderton, Suffolk, was educated at Trinity College, Cambridge, becoming a fellow of his college in 1585 and public orator of the university in 1594. Walter Devereux, earl of Essex, enabled him to spend some time abroad, sending information about European affairs. Having returned to England, he entered parliament in 1606 as member for Helston, and he sat in the five succeeding parliaments; in 1614 he was knighted, in 1616 he became master of requests and later surveyor of the court of wards. In 1618 his friend Buckingham procured for him the position of secretary of state. Naunton's strong Protestant opinions led him to favour more active intervention by England in the interests of Frederick V., and more vigorous application of the laws against Roman Catholics. Gondomar, the Spanish ambassador, complained to James, who censured his secretary. Consequently in 1623 Naunton resigned and was made master of the court of wards. He died at Letheringham, Suffolk, on the 27th of March 1635. Naunton's valuable account of Queen Elizabeth's reign was still in manuscript when he died. As *Fragmenta regalia, written by Sir Robert Naunton*, it was printed in 1641 and again in 1642, a revised edition, *Fragmenta Regalia, or Observations on the late Queen Elizabeth, her Times and Favourites*, being issued in 1653. It was again published in 1824, and an edition edited by A. Arber was brought out in 1870. It has also been printed in several collections and has been translated into French and Italian. There are several manuscript copies extant, and some of Naunton's letters are in the British Museum and in other collections.

See *Memoirs of Sir Robert Naunton* (1814).

NAUPACTUS (Ital. *Lepanto*, mod. Gr. *Epakto*), a town in the nomarchy of Acarnania and Aetolia, Greece, situated on a bay on the north side of the straits of Lepanto. The harbour, once the best on the northern coast of the Corinthian Gulf, is now

almost entirely choked up, and is accessible only to the smallest craft. Naupactus is an episcopal see; pop. about 2500. In Greek legend it appears as the place where the Heraclidae built a fleet to invade Peloponnesus. In historical times it belonged to the Ozolian Locrians; but about 455 B.C., in spite of a partial resettlement with Locrians of Opus, it fell to the Athenians, who peopled it with Messenian refugees and made it their chief naval station in western Greece during the Peloponnesian war. In 404 it was restored to the Locrians, who subsequently lost it to the Achaeans, but recovered it through Epaminondas. Philip II. of Macedon gave Naupactus to the Aetolians, who held it till 191, when after an obstinate siege it was surrendered to the Romans. It was still flourishing about A.D. 170, but in Justinian's reign was destroyed by an earthquake. In the middle ages it fell into the hands of the Venetians, who fortified it so strongly that in 1477 it successfully resisted a four months' siege by a Turkish army thirty thousand strong; in 1499, however, it was taken by Bayezid II. The mouth of the Gulf of Lepanto was the scene of the great sea fight in which the naval power of Turkey was for the time being destroyed by the united papal, Spanish and Venetian forces (October 7, 1571). See LEPANTO, BATTLE OF. In 1678 it was recaptured by the Venetians, but was again restored in 1699, by the treaty of Karlowitz to the Turks; in the war of independence it finally became Greek once more (March 1829).

See Strabo ix. pp. 426-427; Pausanias x. 38. 10-13; Thucydides i.-iii. *passim*; Livy. bk. xxxvi. *passim*; E. L. Hicks and G. F. Hill, *Greek Historical Inscriptions* (Oxford, 1901), No. 25.

NAUPLIA, a town in the Peloponnesus, at the head of the Argolic Gulf. In the classical period it was a place of no importance, and when Pausanias lived, about A.D. 150, it was deserted. At a very early time, however, it seems to have been of greater note, being the seaport of the plain in which Argos and Mycenae are situated, and several tombs of the Mycenaean age have been found. A hero Nauplius took part in the Argonautic expedition; another was king of Euboea. The mythic importance of the town revived in the middle ages, when it became one of the chief cities of the Morea. It was captured in 1211 by Godfrey Villehardouin with the help of Venetian ships; a French dynasty ruled in it for some time, and established the feudal system in the country. In 1388 the Venetians bought Argos and Nauplia. In the wars between Venice and the Turks it often changed masters. It was given to the Turks at the peace concluded in 1540; it was recaptured by Venice in 1686, and Palamidhi on the hill overhanging the town was made a great fortress. In 1715 it was taken by the Turks; in 1770 the Russians occupied it for a short time. The Greeks captured it during the War of Independence on the 12th of December 1822, and it was the seat of the Greek administration till 1833, when Athens became the capital of the country. It is the chief town of the department of Argolis (pop. in 1907, 81,943). Pop. about 6000.

NAUSEA (from Gr. *ναῦς*, a ship), sea-sickness, or generally any disposition to vomit; also used figuratively to denote feelings of strong aversion or dislike.

NAUSICAA, in Greek legend, daughter of Alcinous, king of the Phaeacians in the island of Scheria (*Odyssey*, vi. 15-315, viii. 457.) When Odysseus (Ulysses) was swept into the sea from the raft on which he had left the home of Calypso, he swam ashore to Scheria, where he fell asleep on the bank of a river. Here he was found by Nausicaa, who supplied him with clothes and took him to her father's palace, where he was hospitably entertained. She is said to have become the wife of Telemachus. The incident of Odysseus and Nausicaa formed the subject of a lost play by Sophocles and was frequently represented in ancient art.

NAUTCH (Hindostani *nach*), an Indian ballet-dance. The nautch is performed by nautch-girls, who move their feet but little, and the dance consists of swaying the body and posturing with the arms.

NAUTILUS. The term nautilus, meaning simply "the sailor," was applied by the ancient Greeks to the genus of eight-armed cuttlefishes or octopods which is now known as the paper nautilus, and whose scientific name is *Argonauta* (see CEPHALOPODA). This animal is not uncommon in the Mediterranean, and from its habit of floating at the surface attracted the attention of the fishermen and sailors of the Aegean Sea from the earliest times. The popular belief that the expanded arms are raised above the water to act as sails and that the other arms are used as oars was not based on any actual observation of the living animal, and it is now known that although the animal floats at the surface it does not sail, the expanded arms being applied to the exterior surface of the shell, which is secreted by them. The eggs are carried in the shell, and as this structure is entirely absent in the males, there is good reason to conclude that the habit of carrying the eggs and using one pair of arms for that purpose gave rise to the modification of those arms and the secretion of the shell by them. Huxley once expressed the truth of the matter with characteristic felicity in the remark that if the shell of the Argonaut is to be compared to anything of human invention or construction at all, it should be compared, not to a ship or boat, but to a perambulator.

The shell of *Argonauta* (see fig. 1) is spirally coiled and symmetrical, and thus bears a remarkable resemblance to the shell of the pearly nautilus and the extinct ammonites, especially

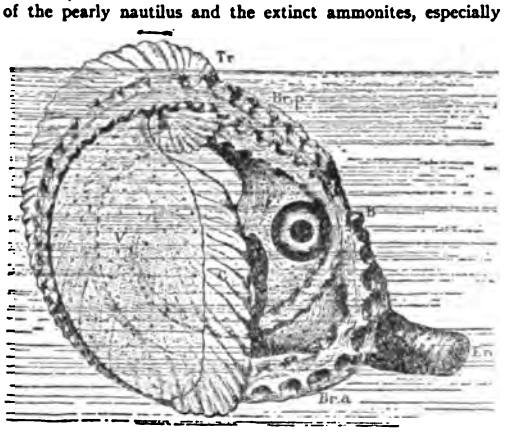

FIG. 1.—The Argonaut in life. (After *Lacaze-Duthiers.*)

Tr, Float; *Br.a*, ventral or posterior arms; *Br.p*, dorsal or anterior arms; *V*, the expanded portion of them, once called the sails; *B*, the beak; *C*, the shell; *En*, the funnel.

as it is like that of the pearly nautilus coiled towards the dorsal or anterior surface of the animal. It is ornamented by ridges and furrows which pass in transverse curves from the inner to the outer margin of the coils. The outer margin or keel is somewhat flattened and the whole shell is compressed from side to side. It differs entirely from the shell of the pearly nautilus in the absence of internal septa and siphuncle and in the absence of any attachment between it and the body. It is in fact entirely different in origin and relations to the body from the typical molluscan shell secreted by the mantle in other Cephalopods and other types of Mollusca. It is a structure *sui generis*, unique in the whole phylum of Mollusca.

The only description of the living animal by a competent observer which we have is that of Lacaze Duthiers, made on a single specimen on the Mediterranean coast of France, and published in 1892, and even this is in some respects incomplete. The specimen after capture was carried in a bucket, and became separated from its shell. When placed with the shell in a large aquarium tank the animal resumed possession of the shell and assumed the attitude shown in fig. 1. The shell floated at the surface, doubtless in consequence of the inclusion of some air in the cavity of the shell. It is not known with certainty that the animal is able in its natural state to descend below the surface; the specimen here considered never did so of its own accord, and when pushed down always rose again.

The siphon or funnel is unusually large and prominent, and is the chief or only organ of locomotion, the water which is expelled from it driving the animal backwards. The arms are usually turned backwards and carried inside the shell, to the inner surface of which the suckers adhere, but one or two arms are from time to time extended in front. This does not apply to the dorsal arms which are applied to the outside of the shell, and the expanded membrane of these arms covers the greater part of its surface. The dorsal arms are turned backwards, and each is twisted so that the oral surfaces face each other and the suckers are in contact with the shell. The membrane or velum is thin, and is really a great expansion of a dorsal membrane similar to that which is found along the median dorsal line of the two posterior arms. The suckers of the originally posterior series of each dorsal arm lie along the external border of the shell, and the arm with its two rows of suckers extends round the whole border of the membrane, the arm being curved into a complete loop, so that its extremity reaches almost to the origin of the membrane near the base of the arm, the extremity being continued on to the internal surface of the membrane. The external row of suckers, originally the posterior row, are united by membrane which is continuous with the velum. The smaller suckers on the more distal part of the arm, which extends along the edge of the shell-aperture, are quite sessile. In the figure of Lacaze-Duthiers (fig. 1) the suckers appear to be turned away from the shell, but this is erroneous. A figure showing the natural position is given in the Monograph of the Cephalopoda in the series of Monographs issued by the Zoological Station of Naples.

The animal described by Lacaze-Duthiers lived a fortnight in captivity, during which time it devoured with avidity small fishes which were presented to it, seizing them, not by throwing out all the ventral arms, but by means of the suckers near the mouth.

Judging from these observations, *Argonauta* is a pelagic animal which lives and feeds near the surface of the ocean. Several species of *Argonauta* are known, distributed in the tropical parts of all the great oceans. The male is much smaller than the female, not exceeding an inch or so in length. It secretes no shell and its dorsal arms are not modified. The third arm on the left side, however, is modified in another way in connexion with reproduction.

Argonauta is one of the Cephalopods in which the process known as hectocotylization of one arm is developed to its extreme degree, the arm affected becoming ultimately detached and left by the male in the mantle cavity of the female where it retains for some time its life and power of movement. The hectocotylus or copulatory arm in the Argonaut is developed at first in a closed cyst (fig. 2), which

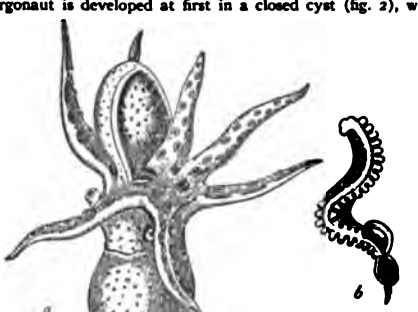

FIG. 2.—*a*, Male of *Argonauta argo*, with the hectocotylized arm still contained in its enveloping cyst, four times enlarged (after H. Müller). *b*, Hectocotylus of *Tremoctopus violaceus* (after Kölliker).

afterwards bursts, allowing the arm to uncoil; the remains of the cyst form a sac on the back of the arm which serves to contain the spermatophores.

The animal known as the Pearly Nautilus was unknown to the ancient Greeks, since its habitat is the seas of the far East, but in the middle ages, when its shell became known in Europe, it was called, from its superficial similarity to that of the original nautilus, by the same name. It was Linnaeus who, in order to distinguish the two animals, took the name "nautilus" from the animal to which it originally belonged and bestowed it upon the very different East Indian Mollusc, giving to the original nautilus the new name *Argonauta*. Zoological nomenclature dates from Linnaeus, and thus the nautilus is now the name of the only living genus of Tetrabranchiate Cephalopods. A detailed description of this animal is given in the article Cephalopoda (*q.v.*); it is only necessary to add here a brief account of its mode of life and habits.

Four species are known from the Indian and Pacific oceans; they are gregarious and nocturnal animals living at some depth and apparently always on the bottom. The natural attitude of the animal as represented by Dr Willey is with the oral surface downwards, the tentacles spread out, and the shell vertical. The chambers of the shell have no communication with one another nor with the siphuncle, they are air-tight cavities and filled, not with water, but with a nitrogenous gas. This necessarily very much reduces the specific gravity of the animal, but it is still heavier than the water and does not seem capable of rising to the surface any more than an octopus. *Nautilus* is rather abundant at some localities in the East Indian Archipelago, for example at Amboyna in the Moluccas. In 1901–1902 Dr Arthur Willey of Cambridge University spent some time in that region for the purpose of investigating the reproduction and development of the animal. He stationed himself at New Britain, known to the Germans as Neu Pommern, an island of the Bismarck Archipelago off the coast of Papua. The natives of this island use the nautilus for food, capturing them by means of a large fish-trap similar in construction to the cylindrical lobster-traps used by British fishermen. Fish is used for bait. Dr Willey found the males much more numerous than the females; of fifteen specimens captured on one occasion only two were females. He kept specimens alive both in vessels on shore and in large baskets moored at the bottom of the sea. He found that when they were placed in a vessel of sea water numbers of a small parasitic crustacea issued from the mantle cavity. Some of the females laid eggs in captivity, but these were found not to be fertilized; they were about 3·5 centimetres long and attached singly by a broad base to the sides of the cage in which the animals were confined.

NAUVOO, a city of Hancock county, Illinois, U.S.A., on the Mississippi river at the head of the lower rapids and about 50 m. above Quincy. Pop. (1900) 1321; (1910) 1020. On the opposite bank of the river is Montrose, Iowa (pop. in 1910, 708), served by the Chicago, Burlington & Quincy railway. Nauvoo is the seat of St Mary's Academy and Spalding Institute (1907), two institutions of the Benedictine Sisters. "Commerce City" was laid out here in 1834 by Connecticut speculators; but the first settlement of importance was made by the Mormons (*q.v.*) in 1839-1840; they named it Nauvoo,[1] in obedience to a "revelation" made to Joseph Smith, and secured a city charter in 1840. Four years later its population was about 15,000, and a large Mormon temple had been built, but internal dissensions arose, "gentile" hostility was aroused, the charter of Nauvoo was revoked in 1845, two of the leaders, Joseph Smith and his brother Hyrum, were killed at Carthage, the county-seat, by a mob, and in 1846 the sect was driven from the state. Traces of Mormonism, however, still remain in the ruins of the temple and the names of several of the streets. Three years after the expulsion of the Mormons Nauvoo was occupied by the remnant (some 250) of a colony of French communists, the Icarians, who had come out under the leadership of Étienne Cabet (*q.v.*). For a few years the colony prospered, and by 1855 its membership had doubled. It was governed under a constitution, drafted by Cabet, which vested the legislative authority in a general assembly composed of all the males twenty years of age or over and the administrative authority in a board of six directors, three of whom were elected every six months for a term of one year. Each family occupied its own home, but property was held in common, all ate at the common table, and the children were taught in the community school. In December 1855 Cabet proposed a revision of the constitution to give him greater authority. This resulted in rending the colony into two irreconcilable factions, and in October 1856 Cabet with the minority (172) withdrew to St Louis, Mo., where he died on the 8th of November. In May 1858 the surviving members of his faction together with a few fresh arrivals from France established a new

[1] The Mormons said the name was of Hebrew origin and meant "beautiful place"; Hebrew "naveh" means "pleasant."

Icarian colony at Cheltenham near St Louis, but this survived only for a brief period. Nauvoo was never intended to be more than a temporary home for the Icarians. Soon after the schism of 1856 those who had rebelled against Cabet began to prepare a permanent home in Adams county, Iowa. There too in 1879 the community split into two factions, the Young Party and the Old Party. Some time before this separation a few members of the colony removed to the vicinity of Cloverdale, Sonoma county, California, and here most of the members of the Young Party joined them early in 1884 in forming the Icaria-Speranza Community. This society tried a government quite different from that first adopted at Nauvoo, but it ceased to exist after about three years. The Old Party also adopted a new constitution, but it too was dissolved in 1895.

See Albert Shaw, *Icaria: A Chapter in the History of Communism* (New York, 1884); Jules Prudhommeaux, *Icaria et son fondateur Etienne Cabet* (Paris, 1907); and H. Lux, *Etienne Cabet und der Ikarische Kommunismus* (Stuttgart, 1894).

NAVAHO, or NAVAJO, a tribe of North American Indians of Athabascan stock. They inhabit the northern part of Arizona and New Mexico. The majority live by breeding horses, sheep and goats. They are well known for their beautiful blanket weaving. (See INDIANS, NORTH AMERICAN.)

NAVAN, a market town of county Meath, Ireland, situated at the confluence of the Blackwater with the Boyne. Pop. (1901) 3839. It is a railway junction of some importance, where the Clonsilla and Kingscourt branch of the Midland Great Western railway crosses the Drogheda and Oldcastle branch of the Great Northern. By the former it is 30 m. N.W of Dublin. Navan is the principal town of county Meath (though Trim is the county town), and has considerable trade in corn and flour, some manufacture of woollens and of agricultural implements, and a tannery. Navan was a barony of the palatinate of Meath, was walled and fortified, and was incorporated by charter of Edward IV. It suffered in the civil wars of 1641, and returned two members to the Irish parliament until the Union in 1800. It is governed by an urban district council, and is a favourite centre for rod-fishing for trout and salmon.

NAVARINO, BATTLE OF, fought on the 20th of October 1827, the decisive event which established the independence of Greece. By the treaty signed in London on the 6th of July 1827 (see GREECE, *History*), England, France and Russia agreed to demand an armistice, as preliminary to a settlement. Sir Edward Codrington, then commander-in-chief in the Mediterranean, received the treaty and his instructions on the night of the 10th/11th of August at Smyrna, and proceeded at once to Nauplia to communicate them to the Greeks. His instructions were to demand an armistice, to intercept all supplies coming to the Turkish forces in the Morea from Africa or Turkey in general, and to look for directions to Stratford Canning (Lord Stratford de Redcliffe), the British ambassador at Constantinople. The ambassador's instructions reached Codrington on the 7th of September. He was accompanied to Nauplia by his French colleague, Rear-Admiral de Rigny. The Greek government agreed to accept the armistice. Admiral de Rigny left for a cruise in the Levant, and Sir Edward Codrington, hearing that an Egyptian armament was on its way from Alexandria, and believing that it was bound for Hydra, steered for that island, which he reached on the 3rd of September, but on the 12th of September found the Egyptians at anchor with a Turkish squadron at Navarino. The Turkish government refused to accept the armistice. On the 19th of September, seeing a movement among the Egyptian and Turkish ships in the bay, Codrington informed the Ottoman admiral, Tahir Pasha, that he had orders to prevent hostile movements against the Greeks. Admiral de Rigny joined him immediately afterwards, and a joint note was sent by them on the 22nd of September to Ibrahim Pasha, who held the superior command for the sultan. On the 25th an interview took place, in which Ibrahim gave a verbal engagement not to act against the Greeks, pending orders from the sultan. The allies, who were in want of stores, now separated, Codrington going to Zante and de Rigny to Cervi, where his store ships were. Frigates were left to watch Navarino. The British admiral had barely anchored at Zante before he was informed that the sultan's forces were putting to sea. On the 29th of September a Greek naval force, commanded by an English Philhellene, Captain Frank Abney Hastings, had destroyed some Turkish vessels in Salona Bay, on the north side of the Gulf of Corinth. From the 3rd to the 5th of October Codrington, who had with him only his flagship the "Asia" (84) and some smaller vessels, was engaged in turning back the Egyptian and Turkish vessels, a task in which he was aided by a violent gale. He resumed his watch off Navarino, and on the 13th was joined by de Rigny and the Russian rear-admiral Heiden with his squadron. By general agreement among the powers the command was entrusted to Codrington, and the allied force consisted of three British, four French and four Russian sail of the line, if the French admiral's flagship the "Sirène" (60), which was technically "a double banked frigate," be included. There were four British, one French and four Russian frigates, and six British and French brigs and schooners. The Egyptians and Turks had only three line of battleships and fifteen large frigates, together with a swarm of small craft which raised their total number to eighty and upwards. Ibrahim Pasha, though unable to operate at sea, considered himself at liberty to carry on the war by land. His men were actively employed in burning the Greek villages, and reducing the inhabitants to slavery. The flames and smoke of the destroyed villages were clearly seen from the allied fleet. On the 17th of October, a joint letter of expostulation was sent in to Ibrahim Pasha, but was returned with the manifestly false answer that he had left Navarino, and that his officers did not know where he was. The admirals, therefore, decided to stand into the bay and anchor among the Egyptian and Turkish ships. A French officer in the Egyptian service, of the name of Letellier, had anchored the vessels of Ibrahim and the Turkish admiral in a horseshoe formation, of which the points touched the entrance to the bay, and there were forts on the lands at both sides of the entry. The allies entered in two lines—one formed of the French and British led by Codrington in the "Asia," the other of the Russians,—and began to anchor in the free water in the midst of Ibrahim's fleet. The officer commanding the British frigate "Dartmouth" (42), Captain Fellowes, seeing a Turkish fireship close to windward of him, sent a boat with a demand that she should be removed. The Turks fired, killing Lieutenant G. W. H. Fitzroy, who brought the message, and several of the boat's crew. The "Dartmouth" then opened "a defensive fire," and the action became general at once. The allies, who were all closely engaged, were anchored among their enemies, and the result was obtained by their heavier broadsides and their better gunnery. Three-fourths of the Turkish and Egyptian vessels were sunk by the assailants, or fired by their own crews. On the allied side the British squadron lost 75 killed and 197 wounded; the French 43 killed and 183 wounded; the Russians 56 killed and 139 wounded. In the British squadron Captain Walter Bathurst of the "Genoa" (74) was slain. The loss of the Turks and Egyptians was never accurately reported, but it was certainly very great.

In its effects on the international situation Navarino may be reckoned one of the decisive battles of the world. It not only made the efforts of the Turks to suppress the Greek revolt hopeless, but it made a breach difficult to heal in the traditional friendship between Great Britain and Turkey, which had its effect during the critical period of the struggle between Mehemet Ali and the Porte (1831–1841). It precipitated the Russo-Turkish war of 1828–1829, and, by annihilating the Ottoman navy, weakened the resisting power of Turkey to Russia and later to Mehemet Ali.

See *Memoir of Admiral Sir E. Codrington*, by his daughter Lady Bourchier (London, 1873); *Naval History of Great Britain*, by W. James and Captain Chamier, vol. vi. (London, 1837). (D. H.)

NAVARRE (Span. *Navarra*), an inland province of northern Spain, and formerly a kingdom which included part of France. The province is bounded on the N. by France (Basses Pyrénées) and Guipúzcoa, E. by Huesca and Saragossa, S. by Saragossa

and Logroño and W. by Álava. It is traversed from east to west by the Pyrenees and the Cantabrian Mountains, and almost the whole of the province is overrun by the ramifications of these ranges. From Navarre there are only three practicable roads for carriages into France—those by the Puerta de Vera, the Puerta de Maya and Roncesvalles. The highest summit in the province is the Monte Adi (4931 ft.). The chief river flowing towards the Atlantic is the Bidasoa, which rises near the Puerta de Maya, and after flowing southwards through the valley of Baztán takes a north-easterly course, and for a short distance above its outfall at Fuenterrabia constitutes the frontier between France and Spain (Guipúzcoa); by far the larger portion of Navarre is drained to the Mediterranean through the Ebro, which flows along the western frontier and crosses the extreme south of the province. The hilly districts consist almost entirely of forest and pasture, the most common trees being the pine, beech, oak and chestnut. Much of the lower ground is well adapted for agriculture, and yields grain in abundance; the principal fruit grown is the apple, from which cider is made in some districts; hemp, flax and oil are also produced, and mulberries are cultivated for silkworms. The wine trade is active, and the products of the vineyards are in great demand in south-west France and at Passages in Guipúzcoa for mixing with French wines. Navarre is one of the richest provinces of Spain in live stock. Game, both large and small, is plentiful in the mountains, and the streams abound with trout and other fish. Gypsum, limestone, freestone and marble are quarried; there are also mines of copper, lead, iron, zinc and rock salt. Mineral and thermal springs are numerous, but none is of more than local fame. The other industries include manufactures of arms, paper, chocolate, candles, alcohol, leather, coarse linens and cloth. The exports both by rail and by the passes in the Pyrenees consist of live stock, oil, wine, wool, leather and paper.

The Ebro Valley railway, which traverses southern Navarre and skirts the western frontier, sends out a branch line from Castejon to Pamplona and Alsasua junction, where it connects with the Northern railways from Madrid to France. Narrow-gauge railways convey timber and ore from the mountains to these main lines. Pamplona, the capital (pop., 1900, 28,886), and Tudela (9449) are described in separate articles. The only other towns with more than 5000 inhabitants are Baztán (9234), Corella (6793), Estella (5736) and Tafalla (5494).

History.—The kingdom of Navarre was formed out of a part of the territory occupied by the Vascones, *i.e.* the Basques and Gascons, who occupied the southern slope of the western Pyrenees and part of the shore of the Bay of Biscay. In the course of the 6th century there was a considerable emigration of Basques to the north of the Pyrenees. The cause is supposed to have been the pressure put upon them by the attacks of the Visigoth kings in Spain. Yet the Basques maintained their independence. The name of Navarre is derived by etymologists from "nava" a flat valley surrounded by hills (a commonplace name in Spain; cf. Navas de Tolosa to the south of the Sierra Morena) and "erri" a region or country. It began to appear as the name of part of Vasconia towards the end of the Visigoth epoch in Spain in the 7th century. Its early history is more than obscure. In recent times ingenious attempts have been made to trace the descent of the first historic king of Navarre from one Semen Lupus, duke of Aquitaine in the 6th century. The reader may consult *La Vasconie* by Jean de Jaurgain (Paris, 1898) for the latest example of this reconstruction of ancient history from fragmentary and dubious materials. Jaurgain has been subjected to very damaging criticism by L. Barrau-Dihigo (*Revue Hispanique*, t. vii. 141). The first historic king of Navarre was Sancho Garcia, who ruled at Pamplona in the early years of the 10th century. Under him and his immediate successors Navarre reached the height of its power and its extension (see SPAIN: *History*, for the reign of Sancho el Mayor, and the establishment of the Navarrese line as kings of Castile and Leon, and of Aragon). When the kingdom was at its height it included all the modern province of the name; the northern slope of the western Pyrenees called by the Spaniards the "Ultra-puertos" or country beyond the passes, and now known as French Navarre; the Basque provinces; the Bureba, the valley between the Basque Mountains and the Montes de Oca to the north of Burgos; the Rioja and Tarazona in the upper valley of the Ebro. In the 12th century the kings of Castile gradually annexed the Rioja and Álava. While Navarre was reunited to Aragon—1076–1134—(see SPAIN: *History*) it was saved from aggression on the east, but did not recover the territory taken by Castile. About the year 1200 Alfonso VIII. of Castile annexed the other two Basque provinces, Biscay (Vizcaya) and Guipúzcoa. Tarazona remained in possession of Aragon. After 1234 Navarre, though the crown was claimed by the kings of Aragon, passed by marriage to a succession of French rulers. In 1516 Spanish Navarre was finally annexed by Ferdinand the Catholic. French Navarre survived as an independent little kingdom till it was united to the crown of France by Henry IV. founder of the Bourbon dynasty. From 1510 until 1833, when it was fully incorporated with Spain, Navarre was a viceroyalty.

As originally organized, Navarre was divided into Merindades, or districts, governed by a Merino (mayorino) as representative of the king. They were the Ultrapuertos (French Navarre), Pamplona, Estella, Judela, Sanguesa. In 1407 Olite was added. The Cortes of Navarre began with the king's council of churchmen and nobles. But in the course of the 14th century the burgesses were added. Their presence was due to the fact that the king had need of their co-operation to raise money by grants and aids. When fully constituted, the Cortes consisted of the churchmen, the nobles and the representatives of twenty-seven "good towns"—that is to say, towns which had no feudal lord, and, therefore, held directly of the king. In the later stages of its history the Cortes of Navarre included the representatives of thirty-eight towns. The independence of the burgesses was better secured in Navarre than in other parliaments of Spain by the constitutional rule which required the consent of a majority of each order to every act of the Cortes. Thus the burgesses could not be outvoted by the nobles and the Church. Even in the 18th century the Navarrese successfully resisted the attempt of the kings of the Bourbon dynasty to establish custom houses on the French frontier. Yet they were loyal to their Spanish sovereigns, and no part of the country offered a more determined or more skilful resistance to Napoleon. Navarre was much under clerical influence. This, and the resentment felt at the loss of their autonomy when they were incorporated with the rest of Spain in 1833, account for the strong support given by many Navarrese to the Carlist cause.

See *Historia Compendiada de Navarra* by Don J. M. Yanguas, (San Sebastian, 1832).

NAVARRETE, JUAN FERNANDEZ (1526–1579), surnamed El Mudo (The Mute), Spanish painter of the Madrid school, was born at Logroño in 1526. An illness in infancy deprived him of his hearing, but at a very early age he began to express his wants by sketching objects with a piece of charcoal. He received his first instructions in art from Fray Vicente de Santo Domingo, a Hieronymite monk at Estella, and afterwards he visited Naples, Rome, Florence and Milan. According to the ordinary account he was for a considerable time the pupil of Titian at Venice. In 1568 Philip II. summoned him to Madrid with the title of king's painter and a salary, and employed him to execute pictures for the Escorial. The most celebrated of the works he there produced are a "Nativity" (in which, as in the well-known work on the same subject by Correggio, the light emanates from the infant Saviour), a "Baptism of Christ" (now in the Madrid Picture Gallery), and "Abraham Receiving the Three Angels" (one of his last performances, dated 1576). He executed many other altarpieces, all characterized by boldness and freedom in design, and by the rich warm colouring which has acquired for him the surname of "the Spanish Titian." He died at Toledo in February 1579.

NAVARRETE, MARTIN FERNANDEZ DE (1765–1844), Spanish historian, was born at Abalos on the 9th of November 1765, and entered the navy in 1780. He was engaged in the unsuccessful operations against Gibraltar in 1782, and afterwards in the suppression of Algerine pirates. Ill-health compelled him for a time to withdraw from active service, but he devoted this forced leisure to historical research, and in 1789 he was appointed by the crown to examine the national archives relating to the maritime history of Spain. Rejoining the navy in 1793, he was present at the siege of Toulon, and afterwards received command of a frigate. From 1797 to 1808 he held in succession various

important posts in the ministry of marine. In 1808 the French invasion led to his withdrawal to Andalusia, and the rest of his life was entirely devoted to literature. In 1819 appeared, as an appendix to the Academy's edition of *Don Quijote*, his *Vida de Cervantes*, and in 1825 the first two volumes of the *Coleccion de los Viajes y Descubrimientos que hicieron por Mar los Españoles desde fines del Siglo XV.* (3rd vol., 1829; 4th vol., 1837). In 1837 he was made a senator and director of the academy of history. At the time of his death, on the 8th of October 1844, he was assisting in the preparation of the *Colcccion de Documentos Ineditos para la Historia de España*. His *Disertacion sobre la Historia de la Nautica* (1846) and *Biblioteca Maritima Española* (1851), were published posthumously.

NAVARRO, PEDRO (*c.* 1460–1528), Spanish military engineer and general, of obscure parentage, was born probably about 1460. He began life as a sailor; and was employed later as *moso de espuela*, or running footman, by the Cardinal Juan de Aragon; on the death of his employer in 1485 he enlisted as a mercenary in a war between Florence and Genoa; and was subsequently engaged for some years in the warfare between the Genoese corsairs and the Mahommedans of Northern Africa. Navarro was not more scrupulous than others, for in 1499 he was at Civitavecchia, recovering from a gunshot wound in the hip received in a piratical attack on a Portuguese trading ship. When Gonsalvo de Córdoba was sent to Sicily, to take part with the French in the partition of Naples, Navarro enlisted under him; and in the expulsion of the Turkish garrison from Cephalonia in 1500 he helped by laying mines to breach the walls, though not at first with much success. The Spanish commander gave him a captain's commission. During the campaigns of 1502 and 1503 he came to the front among the Spanish officers by the defence of Canosa and of Taranto, by his activity in partisan warfare on the French lines of communication, and by the part he took in winning the battle of Cerinola. But his great reputation among the soldiers of the time was founded on the vigour and success of his mining operations against the castles of Naples, held by French garrisons, in 1503, and he was undoubtedly recognized as the first military engineer of his age. When the French were expelled from Naples he received from Gonsalvo a grant of land and the title of count of Olivetto. In 1506 he was in Spain, and for several years he was employed in wars on the north coast of Africa. In 1508 he took Velez de Gomera, largely by means of a species of floating battery which he invented. In 1509 he accompanied Ximenez in the conquest of Oran, and did excellent service. Till 1511 he continued in service in Africa, and took Bougie and Tripoli in 1510. The disasters at Gerba and Kerkenna did not materially affect his reputation. There was some talk of appointing him to command the army of the league formed against the French in 1512; but his humble birth was thought to disqualify him. He was, however, sent as a subordinate general. At the battle of Ravenna he covered the orderly retreat of the Spanish foot, and was struck from his horse by a shot which failed to pierce his armour. Being taken prisoner by the French, he was sent to the Castle of Loches. Ferdinand, whom the soldiers called an Aragonese skinflint, would not pay his ransom, and after three years of imprisonment he entered the service of Francis I. in a pique. The rest of his life was spent as a French officer. He distinguished himself in the passage of the Alps, at the battle of Marignano, by the taking of the citadel of Milan, and in the long siege of Brescia. He was at the battle of Pavia, and in 1522 was taken prisoner at Genoa by his own countrymen. He was confined at Naples till the peace of 1526, but beyond the confiscation of his estate at Olivetto no punishment was inflicted for his treason. His last service was in the disastrous expedition of Lautrec to Naples in 1527, which was ruined by the plague. He died near the end of 1528.

A life of Navarro by Don Martin de los Heros, is published in the *Documentos inéditos para la Historia de España*, vol. xxv. (Madrid, 1854).

NAVE, ecclesiastically considered, that part of a church appropriated to the laity as distinguished from the chancel, the choir or the presbytery, reserved for the clergy. In a 14th-century letter (quoted in Gasquet's *Parish Life in Medieval England*, 1906, p. 45) from a bishop of Coventry and Lichfield to one of his clergy, the reason for this appropriation is given. "Not only the decrees of the holy fathers but the approved existing customs of the Church order that the place in which the clerks sing and serve God according to their offices be divided by screens from that in which the laity devoutly pray. In this way the nave of the church ... is alone to be open to lay people, in order that, in the time of divine service, clerics be not mixed up with lay people, and more especially with women, nor have communication with them, for in this way devotion may be easily diminished." The word "nave" has been generally derived from Lat. *navis*, ship. Du Cange (*Glossarium*, *s.v.* "Navis") quotes from the *Chronicon Moriniacense*, of the 12th century, as to the popular origin of the name, *Exterius etiam tabernaculum, quod ecclesiae navis a populo vocatur* .... Salmasius in his commentary on Solinus (1629) finds the origin in the resemblance of the vaulted roof to the keel of a ship, and refers to Sallust (*Jugurtha*, 18. 8) where is noticed a similar resemblance in the huts (*mapalia*) of the Numidians. The use of the word *navis* may, however, be due to the early adoption of the "ship" as a symbol of the church (see Skeat's note on *Piers Plowman*, xl. 32). The Greek *vabs*, Attic *νεώς* (*ναίω*, to dwell), the inner shrine of a Greek temple, the *cella*, has also been suggested as the real origin of the word. This derivative must presume a latinized corruption into *navis*, for the early application of the word for ship to this part of a church building is undoubted.[1]

Architecturally considered the nave is the central and principal part of a church, extending from the main front to the transepts, or to the choir or chancel in the absence of transepts. When the nave is flanked by aisles, light is admitted to the church through clerestory windows, some of the most ancient examples being the basilica at Bethlehem and the church of St Elias, at Thessalonica, both of the 5th century; numerous churches in Rome; and in the 6th century the two great basilicas at Ravenna; in all these cases the sills of the clerestory windows were raised sufficiently to allow of a sloping roof over the side aisles. When, however, a gallery was carried above the side aisles, another division was required, which is known as the triforium, and this subdivision was retained in the nave even when it formed a passage only in the thickness of the wall. In Late Gothic work in England, the triforium was suppressed altogether to give more space for the clerestory windows, and roofs of low pitch were provided over the side aisles.

The longest nave in England is that of St Albans (300 ft.), in which there are thirteen nave arches or bays on each side; in Winchester (264 ft.) there are twelve bays; in Norwich (250 ft.) fourteen; Peterborough (226 ft.) eleven; and Ely (203 ft.) twelve bays. Most of these dimensions are in excess of those of the French cathedrals; Bourges is 300 ft. long, but as there are no transepts this dimension includes nave and choir. Cluny was 230 ft. with eleven bays; Reims is 235 ft. with ten bays; Paris 170 ft. with ten bays; Amiens 160 with ten bays; and St Ouen, Rouen, 200 ft. with ten bays. In Germany the nave of Cologne cathedral is only 190 ft., including the two bays between the towers. The cathedral at Seville in Spain is 200 ft. long, with only five bays. In Italy the cathedral at Milan is 270 ft. long with nine bays; at Florence, 250 ft. long with only four bays; and St Peter's in Rome 300 ft. long with four bays. On the other hand, the vaults in the nave of the continental cathedrals are far higher than those in England, that of Westminster Abbey being only 103 ft. high, whilst the choir of Beauvais is 150 ft. The result is that the naves of the English cathedrals not only are longer in actual dimensions, but appear much longer in consequence of their inferior height.

[1] Vessels resembling boats or ships are familiar in medieval art and later. Thus "Incense-boats" (*navettes*) somewhat of this shape are found in 12th-century sculptures. By the 16th century they approximated still more closely to a model of a ship. A large vessel, also in the shape of a boat or ship, and known as a *nef*, was used at the table of princes and great personages to contain the knives, spoons, &c. Some very elaborate examples of these survive, such as the 15th-century *nef* of St Ursula in the treasure of the cathedral at Reims, and that of Charles V. of France in the Musée Cluny. A 16th-century *nef*, adapted for use as a cup, is in the Franks Collection at the British Museum. (See DRINKING VESSELS.)

NAVEL (O. Eng. *nafela*, a word common to Teutonic languages; cf. Ger. *Nabel*, Swed. *nafvel*; the Sanskrit is *nábhila*; the English root is also seen in "nave," the hub of a wheel), in anatomy, the umbilicus (Gr. ὀμφαλός), the depression in the abdomen which indicates the point through which the embryo mammal obtained nourishment from its mother (see ANATOMY: section *Superficial and Artistic*).

NAVIGATION (from Lat. *navis*, ship, and *agere*, to move), the science or art of conducting a ship across the seas. The term is also popularly used by analogy of boats on rivers, &c., and of flying-machines or similar methods of locomotion. Navigation, as an art applied properly to ships, is technically used in the restricted sense dealt with below, and has therefore to be distinguished from "seamanship" (*q.v.*), or the general methods of rigging a ship (see RIGGING), or the management of sails, rudder, &c.

History.

The early history of the rise and progress of the art of navigation is very obscure, and it is more easy to trace the gradual advance of geographical knowledge by its means than the growth of the practical methods by which this advance was attained. Among Western nations before the introduction of the mariner's compass the only practical means of navigating ships was to keep in sight of land, or occasionally, for short distances, to direct the ship's course by referring it to the sun or stars; this very rough mode of procedure failed in cloudy weather, and even in short voyages in the Mediterranean in such circumstances the navigator generally became hopelessly bewildered as to his position.

Over the China Sea and Indian Ocean the steadiness in direction of the monsoons was very soon observed, and by running directly before the wind vessels in those localities were able to traverse long distances out of sight of land in opposite directions at different seasons of the year, aided in some cases by a rough compass (*q.v.*). But it is surprising when we read of the progress made among the ancients in fixing positions on shore by practical astronomy that so many years should have passed without its application to solving exactly the same problems at sea, but this is probably to be explained by the difficulty of devising instruments for use on the unsteady platform of a ship, coupled with the lack of scientific education among those who would have to use them.

The association of commercial activity and nautical progress shown by the Portuguese in the early part of the 15th century marked an epoch of distinct progress in the methods of practical navigation, and initiated that steady improvement which in the 20th century has raised the art of navigation almost to the position of an exact science. Up to the time of the Portuguese exploring expeditions, sent out by Prince Henry, generally known as the "Navigator," which led to the discovery of the Azores in 1419, the rediscovery of the Cape Verde Islands in 1447 and of Sierra Leone in 1460, navigation had been conducted in the most rude, uncertain and dangerous manner it is possible to conceive. Many years had passed without the least improvement being introduced, except the application of the magnetic needle about the beginning of the 14th century (see COMPASS and MAGNETISM). Prince Henry did all in his power to bring together and systematize the knowledge then obtainable upon nautical affairs, and also established an observatory at Sagres (near Cape St Vincent) in order to obtain more accurate tables of the declination of the sun. John II., who ascended the throne of Portugal in 1481, followed up the good work. He employed Roderick and Joseph, his physicians, with Martin de Bohemia, from Fayal, to act as a committee on navigation. They calculated tables of the sun's declination, and improved the astrolabe, recommending it as more convenient than the cross-staff. The *Ordenanzas* of the Spanish council of the Indies record the course of instruction prescribed at this time for pilots; it included the *De Sphaera Mundi* of Sacrobosco, the spherical triangles of Regiomontanus, the *Almagest* of Ptolemy, the use of the astrolabe and its mechanism, the adjustments of instruments, cartography and the methods of observing the movements of heavenly bodies

The then backward state of navigation is best understood from a sketch of the few rude appliances which the mariner had, and even these were only intended for the purpose of ascertaining the latitude. The mystery of finding the longitude proved unfathomable for many years after the time of the Armada, and the very inaccurate knowledge existing of the positions of the heavenly bodies themselves fully justified the quaintly expressed advice given in a nautical work of repute at the time, where the writer observes, "Now there be some that are very inquisitive to have a way to get the longitude, but that is too tedious for seamen, since it requireth the deep knowledge of astronomy, wherefore I would not have any man think that the longitude is to be found at sea by any instrument; so let no seamen trouble themselves with any such rule, but (according to their accustomed manner) let them keep a perfect account and reckoning of the way of their ship." Such record of the "way of the ship" appears to have been then and for many years later recorded in chalk on a wooden board (log board), which folded like a book, and from which each day a position for the ship was deduced, or from which the more careful made abstracts into what was termed the "journal."

A compass, a cross-staff or astrolabe, a fairly good table of the sun's declination, a correction for the altitude of the pole star, and occasionally a very incorrect chart formed all the appliances of a navigator in the time of Columbus. For a knowledge of the speed of the ship one of the earliest methods of actual measurement in use was by what was known as the "Dutchman's log," which consisted in throwing into the water, from the bows of the ship, something which would float, and noting the interval between its apparently drifting past two observers standing on the deck at a known distance apart. No other method is mentioned until 1577, when a line was attached to a small log of wood, which was thrown overboard, and the length measured which was carried over in a certain interval of time; this interval of time was, we read, generally obtained by the repetition of certain sentences, which were repeated twice if the ship were only moving slowly. It is unfortunate that the words of this ancient shibboleth are unknown. This is mentioned by Purchas as being in occasional use in 1607, but the more usual method (as we incidentally see in the voyages of Columbus) was to estimate or guess the rate of progress. It was customary by one or other of these methods to determine the speed of a ship every two hours, "royal" ships and those with very careful captains doing so every hour. When a vessel had been on various courses during the two hours, a record of the duration on each was usually kept by the helmsman on a traverse board, which consisted of a board having 32 radial lines drawn on it representing the points of the compass, with holes at various distances from the centre, into which pegs were inserted, the mean or average course being that entered on the log board.

Some idea of the speed of ordinary ships in those days may be gathered from an observation in 1551 of a "certain shipp which, without ever striking sail, arrived at Naples from Drepana, in Sicily, in 37 hours" (a distance of 200 m.); the writer accounting for "such swift motion, which to the common sort of man seemeth incredible," by the fact of the occurrence of "violent floods and outrageous winds." In 1578 we find in Bourne's *Inventions and Devices* a description of a proposed patent log for recording a vessel's speed, the idea (as far as we can gather from its vague description) being to register the revolutions of a wheel enclosed in a case towed astern of a ship (see LOG).

Whether the property of the lodestone was independently discovered in Europe or introduced from the East, it does not appear to have been generally utilized in Europe earlier than about A.D. 1400 (see COMPASS). In Europe the card or "flie" appears to have been attached to the magnet from the first, and the whole suspended as now in gimbal-rings within the "bittacle," or, as we now spell the word, "binnacle." The direction of a ship's head by compass was termed how she "capes." From the accounts extant of the stores supplied to ships in 1588, they appear to have usually had two compasses, costing 3s. 4d. each, which were kept in charge by the boatswain. The fact that the north point of a compass does not, in most places, point to the true pole but eastward or westward of it, by an amount which is termed by sailors "variation," appears to have been noticed at an early date; but that the amount of variation varied in different localities appears to have been first observed by either Columbus or Cabot about 1490, and we find it used to be the practice to ascertain this error when at sea either from a bearing of the pole star, or by taking a mean of the compass bearings of the sun at both rising and setting, the *deviation* of the compass in the ships of those days being too small a quantity to be generally noticed, though there is a very suggestive remark on the effect of moving the position of any iron placed near a compass, by a Captain Sturmy of Bristol in 1679. In order, partially to obviate the error of the compass (variation), the magnets, which usually consisted of two steel wires joined at both ends and opened out in the middle, were not placed under the north and south line of the compass card, but with the ends about a point eastward of north and westward of south, the variation in London when first observed in 1580 being about 11° E.; the *change* of the variation year by year at the *same* base was first noted by Gellibrand in 1635.

The "cross-staff" appears to have been used by astronomers at a very early period and subsequently by seamen for measuring

altitudes at sea. It was one of the few instruments possessed by Columbus and Vasco da Gama. The old cross-staff, called by the Spaniards "ballestilla," consisted of two light battens. The part we may call the staff was about 1¼ in. square and 36 in. long. The cross was made to fit closely and to slide upon the staff at right angles; its length was a little over 26 in., so as to allow the "pinules" or sights to be placed exactly 26 in. apart. A sight was also fixed on the end of the staff for the eye to look through so as to see both those on the cross and the objects whose distance apart was to be measured. It was made by describing the angles on a table, and laying the staff upon it (fig. 1). The scale of degrees was marked on the upper face. Afterwards shorter crosses were introduced, so that smaller angles could be taken by the same instrument. These angles were marked on the sides of the staff.

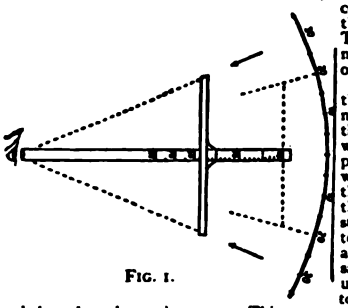

FIG. 1.

To observe with this instrument a meridian altitude of the sun the bearing was taken by compass, to ascertain when it was near the meridian; then the end of the long staff was placed close to the observer's eye, and the transversary, or cross, moved until one end exactly touched the horizon, and the other the sun's centre. This was continued until the sun dipped, when the meridian altitude was obtained.

Another primitive instrument in common use at the beginning of the 16th century was the astrolabe (*q.v.*), which was more convenient than the cross-staff for taking altitudes. Fig. 2 represents an astrolabe as described by Martin Cortes. It was made of copper or tin, about ¼ in. in thickness and 6 or 7 in. in diameter, and was circular except at one place, where a projection was provided for a hole by which it was suspended. Weight was considered desirable in order to keep it steady when in use. The face of the metal having been well polished, a plumb line from the point of suspension marked the vertical line, from which were derived the horizontal line and centre. The upper left quadrant was divided into degrees. The second part was a pointer *pt* of the same metal and thickness as the circular plate, about 1½ in. wide, and in length equal to the diameter of the circle. The centre was bored, and a line was drawn across it the full length, which was called the line of confidence. On the ends of that line were fixed plates, *s*, *s*, having each a small hole, both exactly over the line of confidence, as sights for the sun or stars. The pointer moved upon a centre the size of a goose quill. When the instrument was suspended the pointer was directed by hand to the object, and the angle read on the one quadrant only. Some years later the opposite quadrant was also graduated, to give the benefit of a second reading. The astrolabe was used by Vasco da Gama on his first voyage round the Cape of Good Hope in 1497; but the movement of a ship rendered accuracy impossible, and the liability to error was increased by the necessity for three observers. One held the instrument by a ring passed over the thumb, the second measured the altitude, and the third read off.

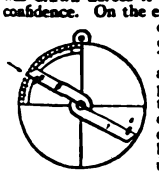

FIG. 2.

For finding latitude at night by altitude of the pole star taken by cross-staff or astrolabe, use was made of an auxiliary instrument called the "nocturnal." From the relative positions of the two stars in the constellation of the "Little Bear" farthest from the pole (known as the Fore and Hind guards) the position of the pole star with regard to the pole could be inferred, and tables were drawn up termed the "Regiment of the Pole Star," showing for eight positions of the guards how much should be added or subtracted from the altitude of the pole star; thus, "when the guards are in the N.W. bearing from each other north and south add half a degree," &c. The bearings of the guards, and also roughly the hour of the night, were found by the nocturnal, first described by M. Coignet in 1581.

The nocturnal (fig. 3) consisted of two concentric circular plates, the outer being about 3 in. in diameter, and divided into twelve equal parts corresponding to the twelve months, each being again subdivided into groups of five days. The inner circle was graduated into twenty-four equal parts, corresponding to the hours of the day, and again subdivided into quarters; the handle was fixed to the outer circle in such a way that the middle of it corresponded with the day of the month on which the guards had the same right ascension as the sun—or, in other words, crossed the meridian at noon. From the common centre of the two circles extended a long index bar, which, together with the inner circle, turned freely and independently about this centre, which was pierced with a round hole. To use the instrument, the projection at twelve hours on the inner plate was turned until it coincided with the day of the month of observation, and the instrument held with its plane roughly parallel to the equinoctial or celestial equator, the observer looking at the pole star through the hole in the centre, and turning the long central index bar until the guards were seen just touching its edge; the hour in line with this edge read off on the inner plate was, roughly, the time. Occasionally the nocturnal was constructed so as to find the time by observations of the pointers in the Great Bear.

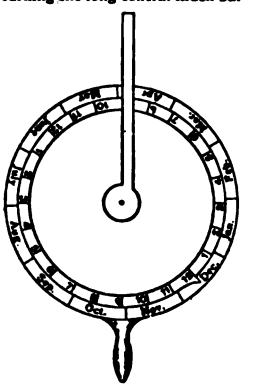

FIG. 3.

The rough charts used by a few of the more expert navigators at the time we refer to will be more fully described later (see also MAP and GEOGRAPHY). Nautical maps or charts first appeared in Italy at the end of the 15th century, but it is said that the first seen in England was brought by Bartholomew Columbus in 1489.

Among the earliest authors who touched upon navigation was John Werner of Nuremberg, who in 1514, in his notes upon Ptolemy's geography, describes the cross-staff as a very ancient instrument, but says that it was only then beginning to be generally introduced among seamen. He recommends measuring the distance between the moon and a star as a means of ascertaining the longitude; but this (though developed many years after into the method technically known as "lunars") was at this time of no practical use owing to the then imperfect knowledge of the true positions of the moon and stars and the non-existence of instrumental means by which such distances could be measured with the necessary accuracy.

Thirty-eight years after the discovery of America, when long voyages had become comparatively common, R. Gemma Frisius wrote upon astronomy and cosmogony, with the use of the globes. His book comprised much valuable information to mariners of that day, and was translated into French fifty years later (1582) by Claude de Bossière. The astronomical system adopted is that of Ptolemy. The following are some of the points of interest relating to navigation. There is a good description of the sphere and its circles; the obliquity of the ecliptic is given as 23° 30′. The distance between the meridians is to be measured on the equator, allowing 15° to an hour of time; longitude is to be found by eclipses of the moon and conjunctions, and reckoned from the Fortunate Islands (Azores). Latitude should be measured from the equator, not from the ecliptic, "as Clarean says." The use of globes is very thoroughly and correctly explained. The scale for measuring distances was placed on the equator, and 15 German leagues, or 60 Italian leagues, were to be considered equal to one degree. The Italian league was 8 stadia, or 1000 paces, therefore the degree is taken much too small. We are told that, on plane charts, mariners drew lines from various centres (*i.e.* compass courses), which were very useful since the virtue of the lodestone had become recognized; it must be remembered that parallel rulers were unknown, being invented by Mordente in 1584. Such a confusion of lines has been continued upon sea charts till comparatively recently. Gemma gives rules for finding the course and distance correctly, except that he treats difference of longitude as departure. For instance, if the difference of latitude and difference of longitude are equal, the course prescribed is between the two principal winds—that is, 45°. He points out that the courses thus followed are not straight lines, but curves, because they do not follow the great circle, and that distances could be more correctly measured on the globe than on charts. The tide is said to rise with the moon, high water being when it is on the meridian and 12 hours later. From a table of latitudes and longitudes a few examples are here selected, by which it appears that even latitude was much in error. The figures in brackets

represent the positions according to modern tables, counting the longitude from the western extremity of St Michael. (Flores is 5° 8′ farther west.)

Alexandria	31° 0′ N.	(31° 13′)	60° 30′ E.	(55° 55′)
Athens	37 15	(37 58)	52 45	(49 46)
Babylon	35 0	(32 32)	79 0	(70 25)
Dantzic	54 30	(54 21)	44 15	(44 38)
London	52 3	(51 31)	19 15	(25 54)
Malta	34 0	(35 43)	38 45	(40 31)
Rome	41 50	(41 54)	36 20	(38 30)

The latitude of Cape Clear is given 34′ in error, and the longitude 4½°; the Scilly Islands are given with an error of one degree in latitude and 1° 10′ in longitude; while Madeira is placed 3° 8′ too far south and 4° 20′ too far west, and Cape St Vincent 1° 25′ too far south and 6° too far west.

In 1534 Gemma produced an "astronomical ring," which he dedicated to the secretary of the king of Hungary. He admitted that it was not entirely his own invention, but asserted that it could accomplish all that had been said of quadrants, cylinders and astrolabes—also that it was a pretty ornament, worthy of a prince. As it displayed great ingenuity, and was followed by many similar contrivances during two centuries, a sketch with brief description is here given (fig. 4).

The outer and principal sustaining circle EPQ represents the meridian, and is about 6 in. in diameter; Pw, are the poles. The upper quadrant is divided into degrees. It is suspended by fine cord or wire placed at the supposed latitude. The second circle EQ is fixed at right angles to the first, and represents the equinoctial line. The upper side is divided into twenty-four parts, representing the hours from noon or midnight. On the inner side of that circle are marked the months and weeks. The third ring CC is attached to the first at the poles, and revolves freely within it. On the interior are marked the months, and on another side the corresponding signs of the zodiac; another is graduated in degrees. It is fitted with a groove

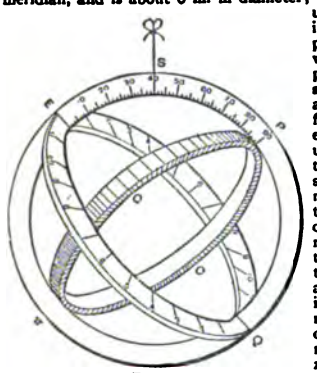

Fig. 4.

which carries two movable sights. On the fourth side are twenty-four unequal divisions (tangents) for measuring heights. Its use is illustrated by twenty problems, showing it capable of doing roughly all that any instrument for taking angles can. Thus, to find the latitude, set the sights C, C to the place of the sun in the zodiac, and shut the circle till it corresponds with 12 o'clock. Look through the sights and alter the point of suspension till the greatest elevation is attained; that time will be noon, and the point of suspension will be the latitude. The figure is represented as slung at lat. 40°, either north or south. To find the hour of the day, the latitude and declination being known: the sights C, C being set to the declination as before, and the suspension on the latitude, turn the ring CC freely till it points to the sun, when the index opposite the equinoctial circle will indicate the time, while the meridional circle will coincide with the meridian of the place.

There is in the museum attached to the Royal Naval College at Greenwich an instrument described as Sir Francis Drake's astrolabe. It is not an astrolabe, but may be a combination of astronomical rings as invented by Gemma with additions, probably of a later date. It has the appearance of a large gold watch, about 2½ in. in diameter, and contains several parts which fall back on hinges. One is a sun-dial, the gnomon being in connexion with a graduated quadrant, by which it could be set to the latitude of the place. There are a small compass and an hour circle. It is very neat, but too small for actual use, and may be simply an ornament representing a larger instrument. There is a table of latitudes engraved inside one lid; that given for London is 51° 34′, about 3 m. too much.

Though clocks are mentioned in 1484 as recent inventions, watches were unknown till about 1530, when Gemma seized the idea of utilizing them for the purpose of ascertaining the difference of longitude between two places by a comparison between their local times at the same instant. They were too inaccurate, however, to be of practical use, and their advocate proposed to correct them by water-clocks or sand-clocks. For rough purposes of keeping time on board ship sand glasses were employed, and it is curious to note that hour and half-hour glasses were used for this purpose in the British Navy until 1839. The outer margin of the compass card was early divided into twenty-four equal parts numbered as hours until the error of thus determining time by the bearings of the sun was pointed out by Davis in 1607.

In 1537 Pedro Nunez (Nonius), cosmographer to the king of Portugal, published a work on astronomy, charts and some points of navigation. He recognized the errors in plane charts, and tried to rectify them. Among many astronomical problems given is one for finding the latitude of a place by knowing the sun's declination and altitude when on two bearings, not less than 40° apart. Gemma did a similar thing with two stars; therefore the problem now known as a "double altitude" is a very old one. It could be mechanically solved on a large globe within a degree. To Nunez has been erroneously attributed the present mode of reading the exact angle on a sextant, the scale of a barometer, &c., the credit of which is due, however, to Vernier nearly a hundred years later. The mode of dividing the scale which Nunez published in 1542 was the following. The arc of a large quadrant was furnished with forty-five concentric segments, or scales, the outer graduated to 90°, the others to 89, 88, 87, &c., divisions. As the fine edge of the pointer attached to the sights passed among those numerous divisions it touched one of them, suppose the fifteenth division on the sixth scale, then the angle was $\frac{15}{45}$ of 90° = 15° 52′ 56″. This was a laborious method; Tycho Brahe tried it, but abandoned it in favour of the diagonal lines then in common use, and still found on all scales of equal parts.

In 1545 Pedro de Medina published *Arte de navigar* at Valladolid, dedicated to Don Philippo, prince of Spain. This appears to be the first book ever published professedly entirely on navigation. It was soon translated into French and Italian, and many years after into English by John Frampton. Though this pretentious work came out two years after the death of Copernicus, the astronomy is still that of Ptolemy. The general appearance of the chart given of the Mediterranean, Atlantic, and part of the Pacific is in its favour, but examination shows it to be very incorrect. A scale of equal parts, near the centre of the chart, extends from the equator to what is intended to represent 75° of latitude; by this scale London would be in 55° instead of 51½°, Lisbon in 37½° instead of 38° 42′. The equator is made to pass along the coast of Guinea, instead of being over four degrees farther south. The Gulf of Guinea extends 14° too far east, and Mexico is much too far west. Though there are many vertical lines on the chart at unequal distances they do not represent meridians; and there is no indication of longitude. A scale of 600 leagues is given (German leagues, fifteen to a degree). By this scale the distance between Lisbon and the city of Mexico is 1740 leagues, or 6960 miles; by the vertical scale of degrees it would be about the same; whereas the actual distance is 4820 miles. Here two great wants become apparent—a knowledge of the actual length of any arc, and the means of representing the surface of the globe on flat paper. There is a table of the sun's declination to minutes; on June 12th and December 11th (o.s.) it was given as 23° 33′. The directions for finding the latitude by the pole star and pointers appear good. For general astronomical information the book is inferior to that of Gemma.

In 1556 Martin Cortes published at Seville *Arte de navigar*. He gives a good drawing of the cross-staff and astrolabe, also a table of the sun's declination for four years (the greatest value being 23° 33′), and a calendar of saints' days. The motions of the heavens are described according to the notions then prevalent, the earth being considered as fixed. He recommends

the altitude of the pole being found frequently, as the estimated distance run was imperfect. He devised an instrument whereby to tell the hour, the direction of the ship's head, and where the sun would set. A very correct table is given of the distances between the meridians at every degree of latitude, whereby a seaman could easily reduce the difference of longitude to departure. In the rules for finding the latitude by the pole star, that star is supposed to be 3° from the pole. Martin Cortes attributes the tides entirely to the influence of the moon, and gives instructions for finding the time of high water at Cadiz, when by means of a card with the moon's age on it, revolving within a circle showing the hours and minutes, the time of high water at any other place for which it was set would be indicated. Directions are given for making a compass similar to those then in common use, also for ascertaining and allowing for the variation. The east is here spoken of as the principal point, and marked by a cross.

The third part of Martin Cortes's work is upon charts; he laments that wise men do not produce some that are correct, and that pilots and mariners will use plane charts which are not true. In the Mediterranean and "Channel of Flanders" the want of good charts is (he says) less inconvenient, as they do not navigate by the altitude of the pole.

As some subsequent writers have attributed to Cortes the credit of first thinking of the enlargement of the degrees of latitude on Mercator's principle, his precise words may be cited. In making a chart, it is recommended to choose a well-known place near the centre of the intended chart, such as Cape St Vincent, which call 37°, "and from thence towards the Arctic pole the degrees increase; and from thence to the equinoctial line they go on decreasing, and from the line to the Antarctic pole increasing." It would appear at first sight that this implied that the degrees increased in length as well as being called by a higher number, but a specimen chart in the book does not justify that conclusion. It is from 34° to 40°, and the divisions are unequal, but evidently by accident, as the highest and lowest are the longest. He states that the Spanish scale was formed by counting the Great Berling as 3° from Cape St Vincent (it is under 2½°). Twenty English leagues are equal to 17¼ Spanish or 25 French, and to 1° of latitude. Cortes was evidently at a loss to know the length of a degree, and consequently the circumference of the globe. The degrees of longitude are not laid down, but for a first meridian we are told to draw a vertical line "through the Azores, or nearer Spain, where the chart is less occupied." It is impossible in such circumstances to understand or check the longitudes assigned to places at that period. Martin Cortes's work was held in high estimation in England for many years, and appeared in several translations. A reprint, with additions, of Richard Eden's (1561), by John Tapp and published in 1609, gives an improved table of the sun's declination from 1609 to 1625—the maximum value being 23° to 30′. The declinations of the principal stars, the times of their passing the meridian, and other improved tables, are given, with a very poor traverse table for eight points. The cross-staff, he said, was in most common use; but he recommends Wright's sea quadrant.

William Cuningham published in 1559 a book called his *Astronomical Glass*, in which he teaches the making of charts by a central meridional line divided into equal parts, with other meridians on each side, distant at top and bottom in proportion to the departure at the highest and lowest latitude, for which purpose a table of departures is given very correctly to the third place of sexagesimals. The chart would be excellent were it not that the parallels are drawn straight instead of being curved. In another example, which shows one-fourth of the sphere, the meridians and parallels are all curved; it would be good were it not that the former are too long. The hemisphere is also shown upon a projection approaching the stereographic; but the eighteen meridians cut the equator at equal distances apart instead of being nearer together towards the primitive. He gives the drawing of an instrument like an astrolabe placed horizontally, divided into 32 points and 360 degrees, and carrying a small magnetic needle to be used as a prismatic compass, or even as a theodolite.

In 1581 Michael Coignet of Antwerp published sea charts, and also a small treatise in French, wherein he exposes the errors of Medina, and was probably the first who said that rhumb lines form spirals round the pole. He published also tables of declination of the sun and observed the gradual decrease in the obliquity of the ecliptic. He described a cross-staff with three transverse pieces, which was then in common use at sea. Coignet died in 1623.

The Dutch published charts made up as atlases as early as 1584, with a treatise on navigation as an introduction.

In 1585 Roderico Zamorano, who was then lecturer at the naval college at Seville, published a concise and clearly-written compendium of navigation; he follows Cortes in the desire to obtain better charts. Andres Garcia de Cespedes, the successor of Zamorano at Seville, published a treatise on navigation at Madrid in 1606. In 1592 Petrus Plancius published his universal map, containing the discoveries in the East and West Indies and towards the north pole. It possessed no particular merit; the degrees of latitude are equal, but the distances between the meridians are varied. He made London appear in 51° 32′ N. and long. 22°, by which his first meridian should have been more than 3° east of St Michael.

For Mercator's great improvements in charts at about this date see MAP; from facsimiles of his early charts in Jomard, *Les Monuments de la géographie*, the following measurements have been made. A general chart in 1569 of North America, from lat. 25° to lat. 79°, is 2 ft. long north and south, and 20 in. wide. Another of the same date, from the equator to 60° south lat. is 15·8 in. long. The charts agree with each other, a slight allowance being made for remeasuring. As compared with J. Inman's table of meridional parts, the spaces between the parallels are all too small. Between 0° and 10° the error is 8′; at 20° it is 5′; at 30°, 16′; at 40°, 39′; at 50°, 61′; at 60°, 104′; at 70°, 158′; and at 79°, 182′—that is, over three degrees upon the whole chart. As the measures are always less than the truth it is possible that Mercator was afraid to give the whole. In a chart of Sicily by Romoldus Mercator in 1589, on which two equal degrees of latitude, 36° to 38°, extend 9½ in., the degree of longitude is quite correct at one-fourth from the top; the lower part is 1 m. too long. One of the north of Scotland, published in 1595, by Romoldus, measures 10½ in. from 58° 20′ to 61°; the divisions are quite equal and the lines parallel; it is correct at the centre only. A map of Norway, 1595, lat. 60° to 70°=9¼ in., has the parallels curved and equidistant, the meridians straight converging lines; the spaces between the meridians at 60° and 70° are quite correct.

In 1594 Blundeville published a description of Mercator's charts and globes; he confesses to not having known upon what rule the meridians were separated by Mercator, unless upon such a table as that given by Wright, whose table of meridional parts is published in the same book, also an excellent table of sines, tangents and secants—the former to seven figures, the latter to eight. These are the tables made originally by Regiomontanus and improved by Clavius.

In 1594 the celebrated navigator John Davis published a pamphlet of eighty pages, in black letter, entitled *The Seaman's Secrets*, in which he proposes to give all that is necessary for sailors—not for scholars on shore. He defines three kinds of sailing: horizontal, paradoxical and great circle. His horizontal sailing consists of short voyages which may be delineated upon a plain sheet of paper. The paradoxical or cosmographical embraces longitude, latitude and distance—the combining many horizontal courses into one "infallible and true," *i.e.* what is now called traverse and Mercator's sailings. His "paradoxical course" he describes correctly as a rhumb line which is straight on the chart and a curve on the globe. He points out the errors of the common or plane chart, and promises if spared to publish a "paradoxall chart." It is not known whether such appeared or not, but he assisted Wright in producing his chart on what is known as Mercator's projection a few years later. Great circle sailing on a globe is clearly described by Davis, and to render it more practicable he divides a long distance into several short rhumb lines quite correctly. From the practice of navigators in using globes the principles of such sailing were not unknown at an earlier date; indeed it is said that S. Cabot projected a voyage across the North Atlantic on the arc of a great circle in 1495.

The list of instruments given by Davis as necessary to a skilful seaman comprises the sea compass, cross-staff, chart, quadrant, astrolabe, an "instrument magnetical" for finding the variation of the compass, a horizontal plane sphere, a globe and a paradoxical compass. The first three are said to be sufficient for use at sea, the astrolabe and quadrant being uncertain for sea observations. The importance of knowing the times of the tides when approaching tidal or barred harbours is clearly pointed out, also the mode of ascertaining them by the moon's age. A table of the sun's declination is given for noon each day during four years 1593–1597, from the ephemerides of J. Stadius. The greatest given value is 23° 28′. Several courses and distances, with the resulting difference of latitude and departure, are correctly worked out. A specimen log-book provides one line only for each day, but the columns are arranged similarly to those of a modern log. Under the head of remarks after leaving Brazil, we read, "the compass varied 9°, the south point westward." He states that the first meridian passed through St Michael, because there was no variation at that place, and therefore that this meridian passed through the magnetic pole as well as the pole of the earth. He makes no mention of Mercator's chart by name nor of Cortes or other writers on navigation. Rules are given for finding the latitude by two altitudes of the sun and intermediate azimuth, also by two fixed stars, using a globe. There is a drawing of a quadrant, with a plumb line, for measuring the zenith distance, and one of a modification of a cross-staff using which the observer stands with his back to the sun, looking at the horizon through a sight on the end of the staff, while the shadow of the top of a movable projection, falls on the sight; this, known as the back-staff, was an improvement on the cross-staff. It was fitted with a reflector, and was thus the first rough idea of the principle of the quadrant and sextant. This remained in common use till superseded in 1731 by Hadley's quadrant. The eighth edition of Davis's work was printed in 1657.

Edward Wright, of Caius College, Cambridge, published in 1599 a valuable work entitled *Certain Errors in Navigation Detected and Corrected*. One part is a translation from Roderico Zamorano; there is a chapter from Cortes and one from Nunez. A year later appeared his chart of the world, upon which both capes and the recent discoveries in the East Indies and America are laid down truthfully and scientifically, as well as his knowledge of their latitudes and longitudes would admit. Just the northern extremity of Australia is shown.

Wright said of himself that he had striven beyond his ability to mend the errors in chart, compass, cross-staff and declination of sun and stars. He considered that the instruments which had then recently come in use "could hardly be amended," as they were growing to "perfection"—especially the sea chart and the compass, though he expresses a hope that the latter may be "freed from that rude and gross manner of handling in the making." He gives a table of magnetic declinations (variation) and explains its geometrical construction. He states that Medina utterly denied the existence of variation, and attributed it to bad construction and bad observations. Wright expresses a hope that a right understanding of the dip of the needle would lead to a knowledge of the latitude, "as the variation did of the longitude." He gives a table of declination of the sun for the use of English mariners during four years—the greatest given value being 23° 31′ 30″. The latitude of London he made 51° 32′. For these determinations a quadrant over 6 ft. in radius was used. He also treats of the "dip" of the sea horizon, refraction, parallax and the sun's motions. With all this knowledge the earth is still considered as stationary—although Wright alludes to Copernicus, and says that he omitted to allow for parallax. Wright ascertained the declinations of thirty-two stars, and made many improvements or additions to the art of navigation, considering that all the problems could be performed trigonometrically, without globe or chart. He devised sea rings for taking observations, and a sea quadrant to be used by two persons, which is in some respects similar to that by Davis. While deploring the neglected state which navigation had been in, he rejoices that the worshipful society at the Trinity House (which had been established in 1514), under the favour of the king (Henry VIII.), had removed "many gross and dangerous enormities." He joins the brethren of the Trinity House in the desire that a lectureship should be established on navigation, as at Seville and Cadiz; also that a grand pilot should be appointed, as Sebastian Cabot had been in Spain, to examine pilots (*i.e.* mates) and navigators. Wright's desire was partially fulfilled in 1845, when an Act of Parliament paved the way for the compulsory qualification of masters and mates of merchant ships; but such was the opposition by shipowners that it was even then left voluntary for a few years. England was in this respect more than a century behind Holland. It has been said that Wright accompanied the earl of Cumberland to the Azores in 1589, and that he was allowed £50 a year by the East India Company as lecturer on navigation at Gresham College, Tower Street.

The great mark which Wright made was the discovery of a correct and uniform method of dividing the meridional line and making charts which are still called after the name of Mercator. He considered such charts as true as the globe itself; and so they were for all practical purposes. He commenced by dividing a meridional line, in the proportion of the secants of the latitude, for every ten minutes of arc, and in the edition of his work published in 1610 his calculations are for every minute. His method was based upon the fact that the radius bears the same proportion to the secant of the latitude as the difference of longitude does to the meridional difference of latitude—a rule strictly correct for small arcs only. One minute is taken as the unit upon the arc and 10,000 as the corresponding secant, 2′ becomes 20,000, 3′ = 30,000, &c., increasing uniformly till 49′, which is equal to 490,001; 1° is 600,012. The secant of 20° is 12,251,192, and for 20° 1′ it will be 12,251,192 + 10,642—practically the same as that used in modern tables.

The principle is simply explained by fig. 5, where *b* is the pole and *bf* the meridian. At any point *a* a minute of longitude: a min. of lat.: : *ea* (the semi-diameter of the parallel): *kf* (the radius). Again *ea* : *kf* : : *kf* : *ki* : : radius : sec. *akf* (sec. of lat). To keep this proportion on the chart, the distances between points of latitude must increase in the same proportion as the secants of the arc contained between those points and the equator, which was then to be done by the "canon of triangles."

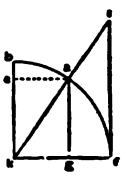

FIG. 5.

Wright gave the following excellent popular description of the principle of Mercator's charts: "Suppose a spherical globe (representing the world) inscribed in a concave cylinder to swell like a bladder equally in every part (that is as much in longitude as in latitude) until it joins itself to the concave surface of the cylinder, each parallel increasing successively from the equator towards either pole until it is of equal diameter to the cylinder, and consequently the meridians widening apart until they are everywhere as distant from each other as they are at the equator. Such a spherical surface is thus by extension made cylindrical, and consequently a plane parallelogram surface, since the surface of a cylinder is nothing else but a plane parallelogram surface wound round it. Such a cylinder on being opened into a flat surface will have upon it a representation of a Mercator's chart of the world."

This great improvement in the principle of constructing charts was adopted slowly by seamen, who, putting it as they supposed to a practical test, found good reason to be disappointed. The positions of most places in the world had been originally laid down erroneously, by very rough courses and estimated distances upon the plane chart, and from this they were transferred to the new projection, so that errors in courses and distances, really due to erroneous positions, were wrongly attributed to the new and accurate form of chart.

When Napier's *Canon Mirificus* appeared in 1614, Wright at once recognized the value of logarithms as an aid to navigation, and undertook a translation of the book, which he did not live to publish (see NAPIER). Gunter's tables (1620) made the application of the new discovery to navigation possible, and this was done by Addison in his *Arithmetical Navigation* (1625), as well as by Gunter in his tables of 1624 and 1636, which gave logarithmic sines and tangents, to a radius of 1,000,000, with directions for their use and application to astronomy and navigation, and also logarithms of numbers from 1 to 10,000. Several editions followed, and the work retained its reputation over a century. Gunter invented the sector, and introduced the meridional line upon it, in the just proportion of Mercator's projection.

The means of taking observations correctly, either at sea or on shore, was about this time greatly assisted by the invention bearing the name of Pierre Vernier, the description of which was published at Brussels in 1631. As Vernier's quadrant was divided into half degrees only, the sector, as he called it, spread over 14½ degrees, and that space carried thirty equal divisions, numbered from 0 to 30. As each division of the sector contained 29 min. of arc, the vernier could be read to minutes. The verniers now commonly adapted to sextants can be read to 10 secs. Shortly after the invention it was recommended for use by P. Bouguer and Jorge Juan, who describe it in a treatise entitled *La Construction, &c., du quadrant nouveau*. About this period Gascoigne applied the telescope to the quadrant as used on shore; and Hevelius invented the tangent screw, to give slow and steady motion when near the desired position. These

practical improvements were not applied to the rougher nautical instruments until the invention of Hadley's sextant in 1731.

In 1635 Henry Gellibrand published his discovery of the annual change in variation of the needle, which was effected by comparing the results of his own observations with those of W. Borough and Edmund Gunter. The latter was his predecessor at Gresham College.

In 1637 Richard Norwood, a sailor, and reader in mathematics, published an account of his most laudable exertions to remove one of the greatest stumbling-blocks in the way of correct navigation, that of not knowing the true length of a degree or nautical mile, in a pamphlet styled *The Seaman's Practices*. Norwood ascertained the latitude of a position near the Tower of London in June 1633, and of a place in the centre of York in June 1635, with a sextant of more than 5 ft. radius, and, having carefully corrected the declination of the sun and allowed for refraction and parallax, made the difference of latitude 2° 28′. He then measured the distance with a chain, taking horizontal angles of all windings, and made a special table for correcting elevations and depressions. A few places which he was unable to measure he paced. His conclusion was that a degree contained 367,176 English feet; this gives 2040 yds. to a nautical mile—only about 12 yds. too much. Norwood's work went through numerous editions, and retained its popularity over a hundred years. In a late edition he says that, as there is no means of discovering the longitude, a seaman must trust to his reckoning. He recommends the knots on the log-line to be placed 51 ft. apart, as the just proportion to a mile when used with the half-minute glass. To Norwood is also attributed the discovery of the "dip" of the magnetic needle in 1576.

The progress of the art of navigation was and is still of course inseparably connected with that of map and chart drawing and the correct astronomical determinations of positions on land. While as we have seen at an early period simple practical astronomical means of finding the latitude at sea were known and in use, no mode could be devised of finding longitude except by the rough method of estimating the run of the ship, so that the only mode of arriving at a port of destination was to steer so as to get into the latitude of such a port either to the eastward or westward of its supposed position, and then approach it on the parallel of its latitude. The success of this method would of course greatly depend upon the accuracy with which the longitude of such port was known. Even with the larger and more accurate instruments used in astronomical observatories on shore the means of ascertaining latitude were far in advance of those by which longitude could be obtained, and this equally applied to the various heavenly bodies themselves upon which the terrestrial positions depended, the astronomical element of declination (corresponding to latitude) being far more accurately determined than that of right ascension (corresponding to longitude).

Almanacs were first published on the continent of Europe in 1457, but the earliest printed work of that kind in England is dated 1497. The only portions of their contents of use to seamen were tables of the declination of the sun, rough elements of the positions of a few stars, and tables for finding latitude by the pole star.

No accurate predictions of the positions of the moon, stars and planets could, however, be made until the laws governing their movements were known, such laws of course involving a knowledge of their actual positions at different widely separated epochs.

In 1699 Edmund Halley (subsequently astronomer royal), in command of the "Paramour," undertook a voyage to improve the knowledge of longitude and of the variation of the compass. The results of his voyage were the construction of the first variation chart, and proposals for finding the longitude by occultations of fixed stars.

The necessity for having more correct charts being equalled by the pressing need of obtaining the longitude by some simple and correct means available to seamen, many plans had already been thought of for this purpose. At one time it was hoped that the longitude might be directly discovered by observing the variation of the compass and comparing it with that laid down on charts. In 1674 Charles II. actually appointed a commission to investigate the pretensions of a scheme of this sort devised by Henry Bond, and the same idea appears as late as 1777 in S. Dunn's *Epitome*. But the only accurate method of ascertaining the longitude is by knowing the difference of time at the same instant at the meridian of the observer and that of Greenwich; and till the invention and perfecting of chronometers this could only be done by finding at two such places the apparent time of the same celestial phenomenon.

A class of phenomena whose comparative frequency recommended them for longitude observations, viz. the eclipses of Jupiter's satellites, became known through Galileo's discovery of these bodies (1610). Tables for such eclipses were published by Dominic Cassini at Bologna in 1668, and repeated in a more correct form at Paris in 1693 by his son, who was followed by J. Pound, J. Bradley, P. W. Wargentin, and many other astronomers. But this method, though useful on land, is not suited to mariners; when W. Whiston, for example, in 1737 recommended that the satellites should be observed by a reflecting telescope, he did not sufficiently consider the difficulty of using a telescope at sea.

Another method proposed was that of comparing the local time of the moon's crossing the meridian of the observer with the predicted time of the same event at Greenwich, the difference of the two depending upon the moon's motion during the time represented by the longitude; thus Herne's *Longitude Unveiled* (1678), proposes to find the time of the moon's meridian passage at sea by equal altitudes with the cross-staff, and then compare apparent time at ship with London time. The accuracy of this, as in the case of lunar problems, would obviously depend upon a more perfect knowledge of the laws of the moon's motion than then existed.

The celebrated problem of finding longitude by lunars (or by measurement of "lunar distances") occupied the attention of astronomers and sailors for many years before being superseded by the more simple and accurate modern method by the use of chronometers, and was the principal reason for establishing the Royal Observatory at Greenwich and the subsequent publication of the Nautical Almanac. The principle was simple, depending upon the comparatively rapid movement of the moon with regard to the heavenly bodies lying in her immediate path in the heavens. It is evident that if the theory of this movement were perfectly understood and the positions of such heavenly bodies accurately determined, the distances of the moon from those at any instant of time at Greenwich could be accurately foretold so that if such predictions were published in advance, an observer at any place in the world, by simply measuring such distances, could accurately determine the Greenwich time, a comparison of which with the local time (which in clear weather can be frequently and simply determined) would give the longitude. This, as previously mentioned, was foreseen by J. Werner as early as 1514, but very great difficulties attended its practical application for many years. Until the establishment of national astronomical observatories it was impossible to accumulate the vast number of observations necessary to fulfil the astronomical conditions, and until the invention of the sextant no instrument existed capable of use at sea which would measure the distances required with the necessary accuracy, while even up to the time when the problem had attained its greatest practical accuracy the calculations involved were far too intricate for general use among those for whom it was chiefly intended. The very principles of a theory of the movements of the moon were unknown before Newton's time, when the lunar problem begins to have a chief place in the history of navigation; the places of stars were formerly derived from various and widely discrepant sources.

The study of the lunar problem was stimulated by the reward of 1000 crowns offered by Philip III. of Spain in 1598 for the discovery of a method of finding longitude at sea; the States-general followed with an offer of 10,000 florins. But for a long time nothing practical came of this; a proposal by J. B. Morin, submitted to Richelieu in 1633, was pronounced by commissioners appointed to judge of it to be impracticable through the imperfection of the lunar tables, and the same objection applied when the question was raised in England in 1674 by a proposal of St Pierre to find the longitude by using the altitudes of the moon and two stars to find the time each was from the meridian. When the king was pressed by St Pierre, Sir J. Moore and Sir C. Wren to establish an observatory for the benefit of navigation, and especially that the moon's exact position might be calculated a year in advance, Flamsteed gave his judgment that the lunar tables then in use were quite useless, and the positions of the stars erroneous. The result was that the king decided upon establishing an observatory in Greenwich Park, and Flamsteed was appointed astronomical observer on March 4, 1675, upon a salary of £100 a year, for which also he was to instruct two boys from Christ's Hospital. While the small building in the Park was in course of erection he resided in the Queen's House (now the central part of Greenwich Hospital school), and removed to the house on the hill on the 10th of July 1676, which came to be known as "Flamsteed House." The institution was placed under the surveyor-general of ordnance—perhaps because that office was then held by Sir Jonas Moore, himself an eminent mathematician. Though this was not the first observatory in Europe, it was destined to become the most useful, and has amply fulfilled the important duties for which it was

designed. It was established to meet the exigencies of navigation, as was clearly stated on the appointment of Flamsteed, and on several subsequent occasions; we see now what an excellent foster-mother it has been to the higher branches of that science. This has been accomplished by much labour and patience; for, though originally the most suitable man in the kingdom was placed in charge, it was so starved and neglected as to be almost useless during many years. The government did not provide a single instrument. Flamsteed entered upon his important duties with an iron sextant of 7 ft. radius, a quadrant of 3 ft. radius, two telescopes and two clocks, the last given by Sir Jonas Moore. Tycho Brahe's catalogue of 777 stars, formed in about 1590, was his only guide. In 1681 he fitted a mural arc which proved a failure. Seven years after another mural arc was erected at a cost of £120, with which he set to work in earnest to verify the latitude, and to determine the position of the equinoctial point, the obliquity of the ecliptic and the right ascensions and declinations of the stars; he obtained the positions of 2884 which appeared in the "British catalogue" in 1723 (see FLAMSTEED, and ASTRONOMY).

Flamsteed died in 1719, and was succeeded by Halley, who paid particular attention to the motions of the moon with a view to the longitude problem. A paper which he published in the *Phil. Trans.* (1731) shows what had been accomplished up to that date, and proves that it was still impossible to find the longitude correctly by any observation depending upon the predicted position of the moon. He repeats what he had published twenty years before in an appendix to Thomas Street's Caroline tables, which contained observations made by him (Halley) in 1683–1684 for ascertaining the moon's motion, which he thought to be the only practical method of "attaining" the longitude at sea. The Caroline tables of Street, though better than those before his time as well as those of Tycho, Kepler, Bullialdus and Horrox, were uncertain; sometimes the errors would compensate one another; at others when they fell the same way the result might lead to a position being 100 leagues in error. He hopes that the tables will be so amended that an error may scarce ever exceed 3 minutes of arc (equal to 1½° of longitude). Sir Isaac Newton's tables, corrected by himself (Halley) and others up to 1713, would admit of errors of 5 minutes, when the moon was in the third and fourth quarters. He blames Flamsteed for neglecting that portion of astronomical work, as he was at the observatory more than two periods of eighteen years. He himself had at this time seen the whole period of the moon's apogee—less than nine years—during which he observed the right ascensions at her transit, with great exactness, almost fifteen hundred times, or as often as Tycho Brahe, Hevelius and Flamsteed together. He hoped to be able to compute the moon's position within 2 minutes of arc with certainty, which would reduce errors of position to 20 leagues at the equator and 15 in the Channel; he thought Hadley's quadrant might be applied to measure lunar distances at sea with the desired accuracy.[1]

The rise of modern navigation may be fairly dated from the invention of the sextant in 1731 and of the chronometer in 1735; the former a complete nautical observatory in itself, and the latter an instrument which in its modern development has become an almost perfect time-keeper. It was a curious coincidence that these two invaluable instruments were invented at so nearly the same time. Until 1731 all instruments in use at sea for measuring angles either depended on a plumb line or required the observer to look in two directions at once.

Their imperfections are clearly pointed out in a paper by Pierre Bouguer (1729) which received the prize of the Paris Academy of Sciences for the best method of taking the altitude of stars at sea. Bouguer himself proposes a modification of what he calls the English quadrant, probably the one suggested by Wright and improved by Davis. Fig. 6 represents the instrument as proposed, capable of measuring fully 90° from E to N. A fixed pinule was recommended to be placed at E, through which a ray from the sun would pass to the sight C. The sight F was movable. The observer, standing with his back to the sun would look through F and C at the horizon, shifting the sight F up or down till the ray from the sun coincided with the horizon. The space from E to F would represent the altitude, and the remaining part F to N the zenith distance. The English quadrant which this was to supersede differed in having about half the arc from E towards N, and, instead of the pinule being fixed at E, it was on a smaller arc represented by the dotted line *e*B, and movable. It was placed on an even number of degrees, considerably less than the altitude; the remainder was measured on the larger arc, as described.

[1] Halley's observations were published posthumously in 1742, and in 1765 the commissioners of longitude paid his daughter £100 for MSS. supposed to be useful to navigation. As the moon passes the stars lying in her course through the heavens at the mean rate of 33″ in one minute of time, it is obvious that an error to that amount in measuring the distance from a star would produce an error of 15 m. in longitude. As the moon's motion with regard to the sun is nearly one degree a day less, a similar error in the distance would produce still more effect.

Hadley's instrument, on the other hand, described to the Royal Society in May 1731 (*Phil. Trans.*), embodies Newton's idea of bringing the reflection of one object to coincide with the direct image of the other. He calls it an octant, as the arc is actually 45°, or the eighth part of a circle; but, in consequence of the angles of incidence and reflection both being changed by a movement of the index, it measures an angle of 90°, and is graduated accordingly; the same instrument has therefore been called a quadrant. It was very slowly adopted, and no doubt there were numerous mechanical difficulties of centring, graduating, &c., to be overcome before it reached perfection. In August 1732, in pursuance of an order from the Admiralty, observations were made with Hadley's quadrant on board the "Chatham" yacht of 60 tons, below Sheerness, in rough weather, by persons—except the master attendant—unaccustomed to the motion; still the results were very satisfactory. A year later Hadley published (*Phil. Trans.*, 1733) the description of an instrument for taking altitudes when the horizon is not visible. The sketch represents a curved tube or spirit-level, attached to the radius of the quadrant, since which time many attempts have been unsuccessfully made to construct some form of artificial horizon adapted to use at sea on board ship, a discovery which would greatly facilitate observations at night and at the many times when the natural or sea horizon is imperfectly visible.

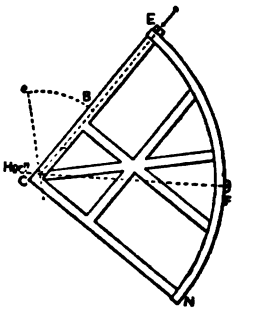

FIG. 6.

From the year 1714 the history of navigation in England is closely associated with that of the "Commissioners for the discovery of longitude at sea," a body constituted in that year with power to grant annually sums not exceeding £2000 to assist experiments and reward minor discoveries, and also to judge on applications for much greater rewards which were from time to time offered to open competition. For a method of determining the longitude within 60 geographical miles, to be tested by a voyage to the West Indies and back, the sum of £10,000 was offered; within 40 m., £15,000; within 30 m., £20,000. £10,000 was also to be given for a method that would determine longitude within 80 m. near the shores of greatest danger. No action seems to have been taken before 1737; the first grant made was in that year, and the last in 1815, but the board continued to exist till 1828, having disbursed in the course of its existence £101,000 in all.[2] In the interval a number of other acts had been passed either dealing with the powers, constitution and funds of the commissioners or encouraging nautical discovery; thus the act 18 George II. (1745) offered £20,000 for the discovery by a British ship of the North-West Passage, and the act 16 George III. (1776) offered the same reward for a passage to the Pacific either north-west or north-east, and £5000 to any one who should approach by sea within one degree of the North Pole. All these acts were swept away in 1828, when the longitude problem had ceased to attract competitors, and voyages of discovery were nearly over.

The suggestions and applications sent in to the commissioners were naturally very numerous and often very trifling; but they sometimes furnish useful illustrations of the state of navigation. Thus, in a memorial by Captain H. Lanoue (1736), he records a number of recent casualties, which shows how carelessly the largest ships were then navigated. Several men-of-war off Plymouth in 1691 were

[2] This total comprises the large sums awarded to Harrison and to the widow of Mayer, the cost of surveys and expeditions in various parts of the globe, large outlays on the *Nautical Almanac* and on subsidiary calculations and tables, rewards for new methods and solutions of problems, and many minor grants to watchmakers or for improvements in instruments. Thus Jesse Ramsden received in 1775 and later about £1600 for his improvements in graduation (*q.v.*), and E. Massey in 1804 got £200 for his log (see LOG).

wrecked through mistaking the Deadman for Berry Head. Admiral Wheeler's squadron in 1694, leaving the Mediterranean, ran on Gibraltar when they thought they had passed the Strait. Sir Cloudesley Shovel's squadron, in 1707, was lost on the rocks off Scilly, by erring in their latitude. Several transports, in 1711, were lost near the river St Lawrence, having erred 15 leagues in the reckoning during twenty-four hours. Lord Belhaven was lost on the Lizard on the 17th of November 1721, the same day on which he sailed from Plymouth.

Many rewards were paid by the commissioners for methods by which the tedious calculations involved in "clearing the lunar distance" could be abbreviated; thus Israel Lyons (1739–1775) received £10 for his solution of this problem from the commissioners in 1769; and in 1772 he and Richard Dunthorne (1711–1775) each obtained £50. George Whichell, master of the Royal Naval Academy, Portsmouth, conceived a plan whereby the correction could be taken from a table by inspection. In October 1765 the commissioners of longitude awarded him £100 to enable him to complete and print 1000 copies of his table. On the following April they gave him £200 more. The work was continued on the same plan by Antony Shepherd, the Plumian professor of astronomy, Cambridge, with some additions by the astronomer-royal. The total cost of the ponderous 4to volume up to the time of publication in June 1772 was £3100, after which £200 more was paid to the Rev. Thomas Parkinson and Israel Lyons for examining the errata. It was a very large and expensive volume—ill-adapted for ship's use. Considerable sums were paid by the commissioners from time to time for other tables to facilitate navigation—not always very judiciously. It is sufficient to mention here the tables of Michael Taylor and those of Mendoza, published in 1815. The proposals submitted to the board to find the longitude by the time of the moon's meridian passage are very numerous.

One of the first points to which the attention of the commissioners was directed was the survey of the coasts of Great Britain, which was pressed on them by Whiston in 1737. He was appointed surveyor of coasts and headlands, and in 1741 received a grant for instruments. An act passed in 1740 enabled the commissioners to spend money on the survey of the coasts of Great Britain and the "plantations." At a later date they bore part of the expenses of Cook's scientific voyages, and of the publication of their results. Indeed it is to them that we owe all that was done by England for surveys of coasts, both at home and abroad, prior to the establishment of the hydrographic department of the Admiralty in 1795. But their chief work lay in the encouragement they gave on the one hand to the improvement of timepieces, and on the other to the perfecting of astronomical tables and methods, the latter being published from time to time in the *Nautical Almanac*. Before we pass on to these two important topics we may with advantage take a view of the state of practical navigation in the middle of the 18th century as shown in two of the principal treatises then current.

John Robertson's *Elements of Navigation* passed through six editions between 1755 and 1796. It contains good teaching on arithmetic, geometry, spherical trigonometry, astronomy, geography, winds and tides, also a small useful table for correcting the middle time between the equal altitudes of the sun—all good, as is also the remark that "the greater the moon's meridian altitude the greater generally the tides will be." He states that Lacaille recommends equal altitudes being observed and worked separately, in order to find the time from noon, and the mean of the results taken as the truth. There is a sound article on chronology, the ancient and modern modes of reckoning time. A long list of latitudes, longitudes and times of high water finishes vol. i. The second volume is said by the author to treat of navigation mechanical and theoretical; by the former he means seamanship. He gives instructions for all kinds of sailings, for marine surveying and making Mercator's chart. There are two good traverse tables, one to quarter points, the other to every 15 minutes of arc; the distance to each is 120 m. There is a table of meridional parts to minutes, which is more minute than customary. Book ix., upon what is now called "the day's work," or dead-reckoning, appears to embrace all that is necessary. A great many methods, we are told, were then used for measuring a ship's rate of sailing, but among the English the log and line with a half-minute glass were generally used. Bouguer and Lacaille proposed a log with a diver to avoid the drift motion (1753 and 1760). Robertson's rule of computing the equation of equal altitudes is as good as any used at the present day. He gives also a description of an equal-altitude instrument, having three horizontal wires, probably such as was used at Portsmouth for testing Harrison's timekeeper. The mechanical difficulties must have been great in preserving a perpendicular stem and a truly horizontal sweep for the telescope. It gave place to the improved sextant and artificial horizon. The second edition of Robertson's work in 1764 contains an excellent dissertation on the rise and progress of modern navigation by Dr James Wilson, which has been greatly used by all subsequent writers.

Don Jorge Juan's *Compendio de Navegacion*, for the use of midshipmen, was published at Cadiz in 1757. Chapter i. explains what pilotage is, practical and theoretical. He speaks of the change of variation, "which sailors have not believed and do not believe now." He describes the lead, log and sand-glass, the latter corrected by a pendulum, charts plane and spherical. Supposing his readers to be versed in trigonometry, he explains what latitude and longitude are, and shows a method for finding the latter different from what has been taught. He explains the error of middle latitude sailing, and shows that the longitude found by it is always less than the truth. (It is strange that while reckoning was so rough and imperfect in many respects such a trifle as that is in low latitudes should be noticed.) After speaking of meridional parts, he offers to explain the English method, which was discovered by Edmund Halley, but omits the principles upon which Halley founded his theory, as it was "too embarassing." He gives instructions for allowing for currents and leeway, tables of declination, positions of a few stars, meridional parts, &c. It is worthy of remark that, after giving a form for a log-book, he adds that this had not been previously kept by any one, but he thought it should not be trusted to memory. He only requires the knots, fathoms, course, wind and leeway to be marked every two hours. He gives a sketch of Halley's quadrant, but without a clamping screw or tangent screw.

To ascertain *local* time at sea by astronomical observations by the altitude of suitably-situated heavenly bodies was an old, well-known and frequently practised operation, so that a comparison could thus be easily made between such local time and the Greenwich time if known at the same instant. The introduction of timekeepers by which Greenwich time can be carried to any part of the world, and the longitude found with ease, simplicity and certainty is due to the invention of John Harrison.

The idea of keeping time at sea by watches was no novelty, but the practical difficulty arose from their very irregular rates owing to changes of temperature and the motion of the ship. Huygens had applied pendulums to the regulation of clocks on shore in 1656, and in 1675 his application of spiral springs as regulators of watches made them available for use at sea. William Derham published a scientific description of various kinds of timekeepers in *The Artificial Clock-Maker*, in 1700, with a table of equations from Flamsteed to facilitate comparison of mean time with that shown by the sun-dial or apparent time. In 1714 Henry Sully, an Englishman, published a treatise at Vienna, on finding time artificially. He went to France, and spent the rest of his life in trying to make a timekeeper for the discovery of the longitude at sea. In 1716 he presented a watch of his own make to the Academy of Sciences, which was approved; and ten years later he went to Bordeaux to try his marine watches, but died before embarking. Julien le Roy was his scholar, and perfected many of his inventions in watchmaking.

Harrison's great invention was the principle of compensation through the unequal contraction of two metals, which he first applied in the invention in 1726 of the compensation (gridiron) pendulum, still in use, and then modified so as to fit it to a watch, devising at the same time a means by which the watch retains its motion while being wound up. With regard to the success of the trial journey (see HARRISON, JOHN) to Jamaica in 1761–1762, it may be noted that by the journal of the House of Commons we find that the error of the watch was ascertained by equal altitudes at Portsmouth and Barbados, the calculations being made by Short; these errors came greatly within the limits of the act. At Jamaica the watch was only in error five seconds (assuming that the longitude previously found by the transit of Mercury could be closely depended on, which as we now know, was not the case, the observations being too few in number, and taken with an untrustworthy instrument). Short at Portsmouth found the whole unallowed-for error from November 6th, 1761, till April 2nd, 1762, to be $1^m 54^s.5 = 18$ geographical miles in the latitude of Portsmouth. During the passage home in the "Merlin" sloop-of-war the timekeeper was placed in the after part of the ship, because it was the dryest place, and there it received violent shocks which retarded its motion. It lost on the voyage home $1^m 49^s = 16$ geographical miles.

One might have supposed that Harrison had now secured the prize; but there were powerful competitors who hoped to gain it by lunars, and a bill was passed through the House in 1763 which left an open chance for a lunarian during four years. A second West Indies trial of the watch took place between November 1763 and March 1764, in a voyage to Barbados, which occupied four months; during which time it is said, in the preamble to act 5 Geo. III. 1765, not to have erred 10 geographical miles in longitude. We only find in the public records the equal altitudes taken at Portsmouth and at Bridgetown, Barbados. William Harrison assumed an average rate of 1^s a-day gaining, and he anticipated that it would go slower by 1^s for every 10° increase in temperature. The longitude of Bridgetown was determined by N. Maskelyne and C. Green by nine emersions of Jupiter's first satellite, against five of Bradley's and

two at Greenwich Observatory, to be $3^h\ 54^m\ 20^s$ west of Greenwich. In February 1765 the commissioners of longitude expressed an opinion that the trial was satisfactory, but required the principles to be disclosed and other watches made. Half the great reward was paid to Harrison under act of parliament in this year, and he and his son gave full descriptions and drawings, upon oath, to seven persons appointed by the commissioners of longitude.[1] The other half of the great reward was promised to Harrison when he had made other timekeepers to the satisfaction of the commissioners, and provided he gave up everything to them within six months. The second half was not paid till 1773, after trials had been made with five watches. These trials were partly made at Greenwich by Maskelyne, who, as we shall see, was a great advocate of lunars, and was not ready to admit more than a subsidiary value to the watch. A bitter controversy arose, and Harrison in 1767 published a book in which he charges Maskelyne with exposing his watch to unfair treatment. The feud between the astronomer-royal and the watchmakers continued long after this date.

Even after Harrison had received his £20,000, doubts were felt as to the certainty of his achievement, and fresh rewards were offered in 1774 both for timekeepers and for improved lunar tables or other methods. But the tests proposed for timekeepers were very discouraging, and the watchmakers complained that this was due to Maskelyne. A fierce attack on the astronomer's treatment of himself and other watchmakers was made by Thomas Mudge in 1792, in *A Narrative of Facts*, addressed to the first lord of the Admiralty, and Maskelyne's reply does not convey the conviction that full justice was done to timekeepers. Maskelyne at this date still says that he would prefer an occultation of a bright star by the moon and a number of correspondent observations of transits of the moon compared with those of fixed stars, made by two astronomers at remote places, to any timekeeper. The details of these controversies, and of subsequent improvements in timekeepers, need not detain us here. In England the names of John Arnold and Thomas Earnshaw as watchmakers are prominent, each of whom received, up to 1805, £3000 reward from the commissioners of longitude. It was Arnold who introduced the name chronometer. The French emulated the English efforts for the production of good timekeepers, and favourable trials were made between 1768 and 1772 with watches by Le Roy and F. Berthoud.

The marvellous accuracy with which the modern chronometer is constructed is doubtless greatly stimulated by the annual competition at Greenwich, from which the Admiralty purchase for the British navy. These chronometers are all fitted with secondary compensation balances, and it is therefore unusual in the navy to apply any temperature correction to the rate. The perfection obtainable in compensation may be illustrated by the performance of a chronometer at the Royal Observatory in 1886, which at a mean temperature of 50° F. had a *weekly* rate of 1·6 secs. losing; and on being further tested at a mean temperature of 92° F., it only changed its *weekly* rate to 2·9 secs. losing. In the mercantile marine cheaper chronometers without secondary compensation are more commonly used, and temperature corrections applied, calculated from a formula originally proposed by Hartnup, formerly of the Liverpool Observatory. Great success attends this mode of procedure, as illustrated by the following facts. From the discussion of the records of performance of the chronometers of the Pacific Steam Navigation Company during twenty-six voyages from London to Valparaiso and back, by giving equal weight to each of the three chronometers carried by each ship, the mean error of longitude for an average voyage of 101 days was less than three minutes of arc. As a single instance, in the s.s. *Orellana*, on applying temperature rates during a voyage of 63 days, the mean accumulated error of the three chronometers was only 2·3 sec. of time.

While chronometers were thus rapidly approaching their present perfection the steady progress of astronomy both by the multiplication and increased accuracy of observations, and by corresponding advances in the theory, had made it possible to construct greatly improved tables. In observations of the moon Greenwich still took the lead; and it was here that Halley's successor Bradley made his two grand discoveries of aberration and nutation which have added so much to the precision of modern astronomy. Kepler's Rudolphine tables of 1627 and Street's tables of 1661, which had held their ground for almost a century, were rendered obsolete by the observations of Halley and his successor. At length, in 1753, in the second volume of the *Commentarii* of the Academy of Göttingen, Tobias Mayer printed his new solar and lunar tables, which were to have so great an influence on the history of navigation. Mayer afterwards constructed and submitted to the English government in 1755 improved MS. tables. Bradley found that the moon's place by these tables was generally correct within 1′, so that the error in a longitude found by lunar would not be much more than half a degree if the necessary observations could be taken accurately at sea. Thus the lunar problem seemed to have at length become a practical one for mariners, and in England it was taken up with great energy by Nevil Maskelyne—"the father," as he has been called, "of lunar observations."

In 1761 Maskelyne was sent to St Helena to observe the transit of Venus. On his voyage out and home he used Mayer's printed tables for lunar determinations of the longitude, and from St Helena he wrote a letter to the Royal Society (*Phil. Trans.*, 1762), in which he described his observations made with Hadley's quadrant of 20 in. radius, constructed by John Bird, and the glasses ground by Dollond. He took the observations both ways to avoid errors. The arc and index were of brass, the frame mahogany; the vernier was subdivided to minutes. The telescope was 6 in. long, magnified four times, and inverted. Very few seamen in that day possessed so good an instrument. He considered that ship's time should be ascertained within twelve hours before or after observing the lunar distance, as a good common watch will scarcely vary above a minute in that time. This shows that he must have intended the altitudes to be calculated—which would lead to new errors. He considered that his observations would give the longitude within 1½ degrees. On the 11th of February he took ten observations; the extremes were a little over one degree apart.

On his return to England Maskelyne prepared the *British Mariner's Guide* (1763), in which he undertakes to furnish complete and easy instructions for finding the longitude at sea or on shore, within a degree, by observing the distance between the moon and sun, or a star, by Hadley's quadrant. How far that promise was fulfilled, and the practicability of the instructions, are points worth consideration, as the book took a prominent place for some years. The errors which he said were inseparable from the dead-reckoning "even in the hands of the ablest and most skilful navigators," amounting at times to 15 degrees, appear to be overestimated. On the other hand, the equations to determine the moon's position at time of observation from Mayer's tables, would, he believed, always determine the longitude within a degree, and generally to half a degree, if applied to careful observations. He recommends the two altitudes and distance being taken simultaneously when practicable. The probable error of observation in a meridian altitude he estimated at one or two minutes, and in a lunar distance at two minutes. He then gave clear rules for finding the moon's position and distance by ten equations, too laborious for seamen to undertake. Admitting the requisite calculations for finding the moon's place to be difficult, he desired to see the moon's longitude and latitude computed for every twelve hours, and hence her distance from the sun and from a proper star on each side of her carefully calculated for every six hours, and published beforehand.

In 1765 Maskelyne became astronomer-royal, and was able to give effect to his own suggestion by organizing the publication of the *Nautical Almanac*. The same act of 1765 which gave Harrison his first £10,000 gave the commissioners authority and funds for this undertaking. Mayer's tables, with his MS. improvements up to his death in 1762, were bought from his widow for £3000; £300 was granted to the mathematician L. Euler, on whose theory of the moon Mayer's later tables were formed; and the first *Nautical Almanac*, that for 1767, was published in the previous year, at the cost and under the authority of the commissioners of longitude. In 1696 the French nautical almanac for the following year appeared, an improvement on what had been before issued by private persons, but it did not

[1] The explanations and drawings are at the British Museum; and two of his watches, one of which was used by Captain Cook in the "Resolution," are at Greenwich Observatory. In 1767 Harrison estimates that a watch could be made for £100, and ultimately for £70 or £80.

attempt to give lunar distances.[1] In the English *Nautical Almanac* for 1767 we find everything necessary to render it worthy of confidence, and to satisfy every requirement at sea. The great achievement was that of giving the distance from the moon's centre to the sun, when suitable, and to about seven fixed stars, every three hours. The mariner has only to find the apparent time at ship, and clear his own measured lunar distance from the effects of parallax and refraction (for which at the end of the book are given the methods of Lyons and Dunthorne), and then by simple proportions, or proportional logarithms, find the time at Greenwich. The calculations respecting the sun and moon were made from Mayer's last manuscript tables under the inspection of Maskelyne, and were so continued till 1804.[2] The calculations respecting the planets are from Halley's tables, and those of Jupiter's satellites from tables made by Wargentin and published by Lalande in 1759 (except those for the fourth satellite). The original *Nautical Almanac* contained all the principal points of information which the seaman required, but the great value of such an authentic publication to the whole astronomical world led soon to a considerable increase to its contents. As much of this was unnecessary for the ordinary requirements of navigation, since 1903 it has been issued in two forms, the larger for observatory purposes, the smaller for the class for whom it was originally intended.

Various useful rules and tables were appended to early volumes of the *Almanac*. Thus that for 1771 contains a method and table for determining the latitude by two altitudes and the elapsed time (first published by Cornelius Downes of Amsterdam in 1740). At the end of the *Almanac* for 1772 Maskelyne and Whichell gave three special tables for clearing the lunar distance; still their rule is neither short nor easily remembered. An improvement of Dunthorne's solution is also given. In the edition for 1773 a new table for equations of equal altitude was given by W. Wales. In those for 1797 and 1800 tables were added by John Brinkley for rendering the calculations for double altitudes easier.

The plan of the *Nautical Almanac* was soon imitated by other nations. In France the Académie Royale de Marine had all the lunar distances translated from the British *Nautical Almanac* for 1773 and following years, retaining Greenwich time for the three-hourly distances. The tables were considered excellent, and national pride was satisfied by their having been formed on the plan proposed by Lacaille. They did not imitate the mode given for clearing the lunar distance, considering their own better.

Though the Spaniards were leaders in the art of navigation during the 16th and 17th centuries, it was not till November 4, 1791, that their first nautical almanac was printed at Madrid, having been previously calculated at Cadiz for the year 1792. They acknowledge borrowing from the English and French. The excellent Berlin *Astronomisches Jahrbuch* began to appear in 1776, the *American Ephemeris* in 1849. These two ephemerides and the French *Connaissance des temps* are independent and valuable works.

A book of *Tables Requisite to be Used with the Nautical Ephemeris* was published by Maskelyne at the same time as the first *Almanac*, and ten thousand copies were quickly sold. A second edition, prepared by Wales, appeared in 1781, an octavo of 237 pages, in the preface of which it is stated that it contains everything necessary for computing the latitude and longitude by observation. There are in all twenty-three tables, the traverse table and table of meridional parts alone being deficient as compared with modern works of the kind; dead-reckoning Maskelyne did not touch. He gave practical methods for working several problems; that for computing the lunar especially is an improvement on those by Lyons and Dunthorne, and a rule given for clearing the distance, called Dunthorne's improved method, is remarkably short. Maskelyne's rule for finding the latitudes by two altitudes and the elapsed time is also good. The third edition of the *Tables* was issued in 1802.

The publication of the *Requisite Tables* met a great want, and the existence of such accurate and conveniently-arranged mathematical tables for the special purposes of nautical calculations led to the more general use of many refinements which had been previously neglected. They formed the original of many subsequent and greatly extended collections, of which those by J. W. Norie are the more generally used in modern times in the mercantile marine, and the very accurate and comprehensive tables by James Inman (originally published in 1823) are constantly used in the British navy.

Until the middle of the 17th century mariners generally employed small collections of Dutch charts, known as "waggoners" from Waghenair, the name of a celebrated Dutch hydrographer in 1584. In 1671 appeared the *English Pilot* by John Sellers, who is styled the "Hydrographer Royal." It forms a collection of rude sketches of the coasts of England, the North Sea, France and Spain, with sailing directions, and on its appearance the importation of Dutch charts was prohibited. Private enterprise, for many years after that, supplied both the British navy and the British mercantile marine with constantly improving charts, especially latterly, under the powerful patronage of the East India Company, whose hydrographer (Alexander Dalrymple), in 1795, was selected as the first hydrographer of the Admiralty. This post has since been occupied by a succession of distinguished naval officers under whom have grown up a large school of able nautical surveyors, the results of whose labours are now published in the well-known Admiralty charts.

Prior to the issue of charts by the Admiralty, the instructions to masters of vessels in the British navy enjoined them to "provide such charts and instruments as they considered necessary for the safe navigation of the ship," while on the completion of a voyage of discovery it was customary for the results to be published for the Admiralty by private firms.

The establishment of the Admiralty Hydrographic Office in 1795 marked a great step in the advancement of the art of navigation. On the 12th of August of that year an order in council placed all such nautical documents as were then in the possession of the Admiralty in charge of Dalrymple, whose catalogue, compiled for the use of the East India Company in 1786, contained 347 charts between England, the Cape, India and China; thus the germ of the present hydrographic department was established. The expense was then limited to £650 a year. The first official catalogue of Admiralty charts was issued in 1830, the total number being then 962.

After the close of the long devastating war in 1815 both trade and science revived, and several governments besides that of Great Britain saw the necessity of surveying the coasts in various parts of the globe; the greater portion of the work fell to the English hydrographical department, which took under its charge nearly every place where the inhabitants were not able to do it for themselves. Since that time its career of usefulness has steadily developed, and it not merely undertakes the constant improvement of the charts of the whole world, but periodically issues for the use of the seafaring community a vast amount of most accurate and practical nautical information on the various closely allied subjects of navigation, tides, compass adjustment and ocean meteorology.

A knowledge of the times and heights of high and low water and the directions of the tidal streams due to those phenomena are in many parts of the world (and especially round our own coasts) of vital importance to navigation. The theory of the tides was first laid down by Newton and Laplace, and in *Phil. Trans.*, 1683, there is an account of Flamsteed's tide table for London Bridge, which gave the times of each high tide on every day in the year. For a long subsequent period empirical tide tables for a few places in England were published by private individuals, but in 1832 the researches of Dr W. Whewell and Sir J. W. Lubbock enabled official tide tables to be issued by the Admiralty. These have steadily advanced in detail and accuracy, being now in many cases based on continuous tidal observations for a whole lunar period of 18½ years, and represent the practical epitome of our knowledge of the tides and tidal currents of the whole world. The formulae and tables on which these predictions are based are given in the introduction to each annual volume (see TIDE).

MODERN NAVIGATION

Having thus sketched the progress of the art of navigation from an early period to the present time, we will now describe the modern methods by which it is brought into practical use,

[1] The French nautical almanac or *Connaissance des temps* appeared under letters patent from the king, dated 24th March 1679—seventeen years before the first issue. The following is a literal translation of its advertisement: "This little book is a collection of holy days and festivals in each month. The rising and setting of the moon when it is visible, and of the sun every day. The aspects of the planets as with respect to each other, the moon and the fixed stars. The lunations and eclipses. The difference of longitude between the meridian of Paris and the principal towns in France. The time of the sun's entrance into the twelve signs of the zodiac. The true place of the planets every fifth day, and of the moon every day of the year, in longitude and latitude. The moon's meridian passage, for finding the time of high water, 'as well as for the use of dials by moonlight.' A table of refraction. The equation of time [this table is strangely arranged, as though the clock were to be reset on the first of every month, and the explanation speaks of the 'premier mobile']. The time of twilight at Paris. The sun's right ascension to hours and minutes. The sun's declination at noon each day to seconds. The whole accompanied by necessary instructions."

[2] Mayer's tables were printed at London under Maskelyne's superintendence in 1770.

referring our readers for more technical information to the professional text-books enumerated at the end of this article. The great development in both size and speed of modern ships enormously increases the responsibilities of those who command and navigate them, and has led to a careful examination of the existing modes of determining a ship's position at all times by day or night, both when in sight of land and on the open ocean. An examination of the present text-books on the subject of navigation shows how problems and methods which were formerly considered chiefly as theoretical exercises have now, from the altered conditions of the navigation of very fast ships, become methods of frequent practice, while corresponding improvements have been made in the instruments, such as compasses, charts and chronometers, by the aid of which more satisfactory results are now attained. Much has also been done to advance the study of this and its numerous allied subjects by the development of the Royal Naval College at Greenwich and the United Service Institution; also by the establishment of shipmasters' societies (of which the well-known society in London is typical), where during the year valuable papers are read and useful discussions take place among those actually carrying out the practice of navigation.

In planning out in advance a long ocean voyage the experienced navigator would first, by laying down the track from port to port on a great circle chart, ascertain the shortest route between them, remembering that the greatest saving in distance over other routes is when the ports are far apart in longitude and both in high latitudes of the same name. On examining such a track in conjunction with the wind and current charts it will be seen what modifications the intervention of land, unfavourable currents or winds, ice or unduly high latitude render necessary, and such modified route would be finally adopted subject to possible change as the voyage progressed. The judgment formed on the best route to follow would also be largely influenced by the remarks in the volumes of Sailing directions or "Pilots" relating to the region about to be traversed, while among the many excellent modern publications of the Hydrographic Office of the Admiralty perhaps the *Ocean Passage Book* is one of the most generally useful, since, when used in combination with the admirable charts of suggested full-powered and auxiliary tracks, it very greatly assists all navigators in planning out a successful voyage. Finally the intended route would be transferred from the great circle chart to one on Mercator's projection, which is the more convenient for purposes of navigation since in constructing the former for the sake of simplicity a projection of the coast's surface is adopted on which great circles are correctly shown as straight lines (gnomonic), while for practical purposes in navigation such a representation on which a ship's track when steering a continuous course (technically termed a rhumb line) is truly shown as a straight line (Mercator) is the most convenient, although in high latitudes giving a very distorted representation of the surface depicted. It is well to remember that on great circle charts rhumb lines become curves and great circles straight lines, and, vice versa, on Mercator charts, the rhumb line on each projection being that nearer to the equator, all meridians and the equator on both projections are shown as straight lines.

Ships rarely steer *on* great circles, which would generally theoretically involve continually altering course, but a series of chords of such circles are described of lengths such as involve a practical change of course of one or two degrees on the completion of each.

Great circle charts are very useful for drawing what is known as a composite track where if the great circle route would lead into too high a latitude the shortest route to and from the highest desirable parallel is readily laid down, the intervening track being pursued on that parallel.

A method of drawing approximate great circles directly on Mercator charts was proposed by Airy in 1858, and is sometimes very useful. The excellent idea, originally suggested by M. F. Maury, of establishing steam "lanes" in localities where there is much ocean traffic, so as to minimize the risks of collision between outward and homeward bound ships, has been successfully carried out in the North Atlantic. The leading transatlantic steamship companies now agree to follow great circle routes from the Irish coast to points on the Banks of Newfoundland, which vary somewhat in position with the season of the year, but are published in advance. These "lanes" being avoided by sailing vessels, risks of collision are materially lessened.

Having thus planned the most desirable general track to pursue, three methods are employed to ascertain the position of the ship at any time during such voyage: these are (1) projecting the track on charts; (2) simple trigonometrical calculations where the data are the course steered and distance run; and (3) astronomical observations, which form an entirely independent method.

Of these the first is the least trustworthy, owing to the usual difficulties attending accurate graphic methods and the small scales on which ocean charts are necessarily drawn. When near the land the larger scale coast charts are used, and in the approaches to harbours still larger scale plans give increasing accuracy to this record of a ship's position. Index charts of all parts of the world are provided, by referring to which the navigator ascertains which chart or plan to employ, always preferably using that on the largest scale.

On leaving harbour, and while near the coast, the position is not found by calculation but by frequently observing (when a variety of objects is in sight) (1) simultaneous sextant angles between suitably situated objects subsequently laid down on the chart by a station pointer; (2) simultaneous compass bearings of two or more objects (technically known as cross bearings); or (3) a combination of both methods by employing one bearing and one angle. All such methods are capable of considerable accuracy if the observations are made simultaneously. Should only a small number of objects, or sometimes only one, be visible (as frequently occurs at night) other and rougher methods are practised, depending upon the change of bearing of an object while a certain distance in a certain direction is traversed by the ship, such knowledge being based in many cases on an estimate of the action of the tide. When a ship is steaming at the rate of 20 knots the navigator remembers that a mile is passed over in three minutes, and that if in sight of land and fixing positions by objects on shore, it is essential to adopt some rapid method; otherwise when laid down on the chart the position shows where the ship *was*, and not where she *is*. This difficulty has led to the more general use of methods of obtaining positions by angles instead of bearings, and laying them down on the chart by the aid of the station pointer. Many advantages accrue from this, as the observer is not restricted in position on board, as is the case when using the compass, and especially if a double sextant (having two index glasses and one horizon glass) is employed two angles can be measured simultaneously, the result on the chart being very rapidly arrived at. An ingenious combination of sextant and station pointer in one has been proposed, and most simply carried out by attaching vertical sights to the legs of a station pointer, which is put on a suitable horizontal stand, and the legs moved until the sights are in line with the objects observed. To assist the navigator in the choice of suitable objects between which to measure the angles, a very useful pamphlet is issued by the Admiralty, from the diagrams in which it can be seen at a glance which combination of objects in sight gives the most favourable result, always remembering as a broad principle that nearer objects are more suitable than distant ones, and that the accuracy of position determined depends on the relative *distances* of the objects as well as on the magnitude of the *angles* between them.

In these circumstances, which render these rougher methods those only available, and especially in hazy weather in many known localities (such as the English Channel), a *continuous* line of deep sea soundings at fairly even distances apart affords an additional verification of position, remembering that only an *occasional* sounding might prove very misleading.

The chronicle of progress in the art of navigation would be very

incomplete without reference to the extended use of Lord Kelvin's sounding machines, either in the original form, where the increased pressure at different depths is recorded by discoloration of chemical tubes, or in the later form known as the "depth recorder," where similar results are obtained by the automatic record of the position of a piston forced upwards in a tube by this increased pressure. Very satisfactory results can be obtained at speeds of 15 or 16 knots, enabling that great safeguard of navigation in many places, viz. a *continuous* line of soundings, to be accurately and rapidly obtained. In connexion with this should be mentioned a most ingenious invention known as the "submarine sentry," which on being set for any desired depth and towed overboard remains at that depth whatever the speed of the ship may be. On striking bottom it at once floats to the surface and rings a warning bell. Such an instrument is of obvious value in ships where, owing to the small number of available men, it is difficult to maintain a continuous line of soundings. To avoid an unnecessarily wide *détour* in rounding points and shoals, extensive use is now made of both horizontal and vertical danger angles; the former is the angle on the arc of a horizontal circle passing through a point at the required distance from the danger, and through two previously selected, easily recognized, fixed objects. Should circumstances enable the selection to be made of an angle of about 90°, the ship by continually measuring the angle may be steered on the arc of such a circle with great precision, and may even be safely taken through a channel *between* two dangers. The vertical danger angle enables similar results to be attained by measuring the vertical angle subtended by a known height; but except where the selected object is one whose height is *well* determined, such as a lighthouse, this method is not so trustworthy as the former.

Before losing sight of land the latitude and longitude of the last well-determined position found by the methods referred to is taken from the coast chart, transferred to the ocean or small scale chart, and considered to be the "departure" or starting-point of the ocean voyage, and from that point the course and distance run by the ship is laid down, being rectified on every occasion when the position is more accurately determined by astronomical means. To obviate the inevitable inaccuracies attending this graphic method and as a corroboration of the ship's position, the changes of latitude and longitude involved in each alteration of course are daily calculated by plane trigonometry, such calculations being materially abbreviated by the use of the Traverse Table, which is a tabulated expression of the solutions of right-angled plane triangles.

The foregoing modes of keeping account of a ship's position are technically known as "dead reckoning." The general introduction of compasses with short needles and slow periods of vibration has done very much towards improving the accuracy with which a ship's "dead reckoning" is kept. The original model of these was that patented by Lord Kelvin in 1876, and since adopted in the British navy as the standard. In this instrument we have a compass specially designed to enable the principles of compensation or correction proposed by Sir G. B. Airy in 1837 to be accurately carried out, while its slow period of swing renders it in all circumstances extremely steady.

The record of distance run is always obtained from the patent log, usually in the form of the Cherub or Taffrail log introduced in 1878. The common or hand log has ceased to be regarded as anything but the very roughest of guides, and the patent log in its original form, in which it recorded the revolutions of a small screw towed by the ship, does not give satisfactory results at great speeds, nor can anything more favourable be said of those forms where pressure on known areas is employed. The revolutions of the engines, with due allowance made for the condition of the ship's bottom, afford now perhaps the best means of estimating speed (see Log).

Astronomical observations afford the most accurate means of ascertaining positions at sea, other methods (dead reckoning) being only relied upon when the weather does not admit of the practice of these, though by utilizing twilight and night observations of moon, stars and planets, the navigator in most parts of the world need seldom proceed far without the means of astronomically rectifying his position either in latitude, longitude or both at the same time.

The practical problems involved are precisely those employed at astronomical observatories, but it is not possible to attain similar accuracy of results, for though the sextant (the instrument always employed at sea in making such observations) is capable of marvellous accuracy, yet, as practically all such observations depend directly upon altitudes measured above the sea horizon, the uncertainty and variability of the true position of this, due to the changing effects of refraction, much affect observations made at any one time. This error in practice is greatly reduced by methods of combining several observations made at different times and using their mean or average result.

A notable feature of the progress of the art of modern navigation is the greatly increased practice of star navigation, and many of the supposed difficulties of night observations are found to be removed by experience. Determinations of positions at sea by twilight observations, when the brighter stars become visible while the horizon is still well defined, are probably the most accurate means we possess; and the careful navigator, by combining for latitude stars passing north and south of the zenith, and for longitude those near the prime vertical both east and west, can generally depend upon a good result, especially if suitable stars can be found for each pair at about the same altitudes. For these purposes the armillary sphere is extremely useful: this is a small celestial globe on which are depicted the principal stars visible to the naked eye. On elevating the pole to the approximate latitude of the observer, and turning the sphere until the sidereal time is under the fixed meridian, a correct representation of the heavens at the time of observation is obtained; the stars are then easily identified by their bearings and altitudes. This valuable instrument is not merely useful when at twilight, only a few of the brighter stars being visible, the constellations to which they belong are difficult of recognition, but it enables arrangement to be made in advance for such observations as are desired to be taken during the night. By marking in pencil on the globe the positions of the planets in right ascension and declination, the same sphere is also available for their identification. The heavenly bodies commonly observed at sea are: The Sun, Moon, Venus, Mars, Jupiter, Saturn, the Pole star, and the larger (or first magnitude) fixed stars, the positions of all of which in the heavens are given in the *Nautical Almanac* for fixed epochs at Greenwich, with the requisite data for computing their positions at all other times in all other places.

The chief astronomical observations made at sea are those for ascertaining (1) latitude, (2) time and thence longitude, (3) error of compass, and (4) latitude and longitude simultaneously.

To ascertain latitude by itself altitudes of heavenly bodies are measured above the horizon when they are on or near the meridian and therefore exactly or nearly north or south of the observer; in the case of the sun, of course, this means at or near noon, and in the case of other bodies such local times are previously accurately ascertained by a simple calculation made from the *Nautical Almanac* or more roughly found from an armillary sphere. The principle involved is the simple one that by subtracting the observed altitude when on the meridian from 90° the distance of the zenith or point overhead north or south of the heavenly body is found; then by combining with this the distance, obtained from the *Nautical Almanac*, of the body considered north or south of the celestial equator at the same instant, it is found how far the zenith is north or south of the celestial equator, and this is exactly the same as the latitude of the observer since the celestial equator is merely the imaginary extension of that of the earth. Such observations are not necessarily restricted to that which can be taken at the instant when the body observed is *on* the meridian (meridian altitude); equally accurate and multiplied observations can be made on either or both sides of the meridian if the body is somewhat near it (ex-meridian and circum-meridian altitudes), and a simple calculation or reference to a specially constructed table or graphic curve gives the required result.

Errors arising from uncertainty as to the true position of the horizon are with twilight and night observations largely counteracted by taking the means of results obtained from observations made of heavenly bodies crossing the meridian both north and south of the observer, taken as nearly at the same time as convenient. In northern latitudes the pole star is so near to the pole that

observations of it can be taken at any time when it is visible, and from a convenient table given in the *Nautical Almanac* the altitude of the pole itself (which equals the latitude) is readily obtained.

Longitude at sea is in modern navigation always found by comparing local or ship mean time with Greenwich mean time, the latter being accurately known from the chronometers and the former from astronomical observations of suitably placed heavenly bodies. It may be assumed in all well found modern ships that on applying the known errors and accumulated rates to the times shown by the chronometers the Greenwich time at any instant is practically accurately known, and as the distance east or west of any place is merely the difference between the two local times at any instant expressed in degrees, so also is the distance east or west of Greenwich (longitude) the difference between time at place and Greenwich time at any one instant. The connexion between time and degrees depends upon the complete rotation of the earth in twenty-four hours, causing meridians 15° apart to pass under the same fixed point in the heavens at intervals of one hour, those east of Greenwich passing earlier and those west later, resulting in local time being in advance of Greenwich time in east longitude and vice versa in west longitude.

The errors and rates of gaining or losing of the chronometer referred to are known from observations made on shore prior to the beginning of the voyage with a sextant and artificial horizon, and these observations are capable of almost as great accuracy as those taken at fixed astronomical observatories. As this knowledge is absolutely essential every opportunity is taken at each principal port visited of either repeating such observations or obtaining the information from time balls dropped from observatories on shore at the Greenwich times indicated in the Time-ball pamphlet. Local or ship time can only be found with fair accuracy from calculations based on altitudes of heavenly bodies, when they are nearly east or west of the observer or technically on the prime vertical. Such times can be approximately seen from the azimuth diagrams or from tables of true bearings of heavenly bodies, and the error involved by uncertainty as to the position of the horizon can be greatly obviated in twilight or at night by taking the mean of results arising from nearly simultaneous observations of bodies bearing both east and west. In the usual case of determining time by observations of the sun the results arising from morning observations are compared with those similarly obtained in the afternoon. It will of course be remarked that should any unallowed-for error in the chronometer exist it will affect the resulting longitude by its full amount.

In considering the foregoing methods of astronomically fixing a ship's position we notice that always when the two elements of latitude and longitude are determined at different times, and generally, as we shall presently see, when they are determined together (though usually for a shorter time) the navigator has to depend for some time on the accuracy of the course steered and estimated distance run; also when cloudy weather prevails he has to depend entirely on those elements for a knowledge of the ship's position. The frequent astronomical observation of the error of the compass is therefore a most important and fortunately simple duty. In practice the error is found by a comparison between the compass bearing of a heavenly body and its true bearing, obtained either by calculation, or more generally from a graphic diagram (Weir's azimuth diagram) or tables from which at practically any time when above the horizon the true bearings of the principal heavenly bodies are taken by inspection. These important observations are most accurately made when the body observed is bearing nearly east or west true, if not too high, but if clouds prevent observations at such times, fairly good results can be obtained by observing the compass bearing when the object is on the meridian (if not too high) and therefore lying north or south true.

The causes of the changing errors of a compass in an iron ship are described elsewhere (see COMPASS), but by making comparisons as above the navigator can at once ascertain what is termed the "total" error, and if he takes from that the portion of error due to the earth, or what is termed variation (known from a chart of such elements), the remaining error is that caused by the iron of the ship, technically known as deviation. The latter method of procedure has the great advantage of enabling the navigator to ascertain during a voyage whatever magnetic changes in the ship are taking place other than those he would expect to occur on change of position. The total error is that applied to compass courses.

Deviations greater than a few degrees are not merely inconvenient but in modern compasses produce unsteadiness or oscillation of the compass card, so that, especially in new ships, the skilful navigator reduces such errors by adjusting the compensating magnets when favourable occasions offer. Recognizing the great value of a sound knowledge of compass adjustment, the British Board of Trade have included this among the compulsory subjects of examination for the rank of master, thus following the example of the navy, where all navigating officers have to attend a practical course of study on the subject.

The practical problem of finding both latitude and longitude at the same time is the most important of all in modern navigation, and is rapidly superseding other modes of ascertaining a ship's position. The principle involved depends upon the fact that every heavenly body is at each particular instant of time directly overhead or in the zenith of *some* place on the earth. Thus, if we take the sun as an instance, it is noon at all places on the meridian of 60° W. when it is exactly 4 p.m. at Greenwich, and at the *one* spot on that meridian where the observer is as far north or south of the terrestrial equator as the sun is north or south of the celestial equator (declination) it will not only be noon but the sun will be immediately overhead and will have an altitude of 90°. This, therefore, at any instant defines the position where the sun is vertical; its latitude must equal the sun's declination and its longitude in time equal the time since noon at Greenwich. Now at a distance of 60 m. in every direction on the surface of the earth from the point thus defined the sun will have an altitude of 89° and in all directions at a distance of 1200 m. its altitude will be 70° (=90°−20°), so that on a globe, by marking the position where at a certain instant the sun is vertical and taking that as a centre, a series of concentric circles may be drawn, on all points of each of which the sun's altitude will be the same. When, therefore, at sea we measure with a sextant at any time the altitude of the sun (say 60° 10′) we at once know we are somewhere on the arc of a circle having for its centre the spot where the sun is vertical at that instant, and for radius a distance equal to 1790′ (=90°−60° 10′). Such information, combined with the best and most recent knowledge we have of the ship's latitude at the time, will of itself afford valuable information as to the position, but by making two such observations, separated by a sufficiently long interval for the position having the sun vertical to have moved considerably (owing to the rotation of the earth), we are able to consider with certainty that we must be at one or other of the widely separated intersections of two such circles, the movement of the ship in the interval between the two observations being duly allowed for. The dead reckoning affords information as to which of these intersections is the true position.

Now even on a large globe it would be practically impossible to obtain very accurate results from this problem by drawing such circles, but on a large scale chart (or ordinary squared paper) much greater accuracy is obtainable. The method commonly used on a Mercator chart involves two suppositions: (1) that the concentric circles we have referred to will be correctly represented as circles on the chart, and (2) that these are of such diameters, that a portion of say 100 m. of arc may be considered to be a straight line coincident with the tangent to the circle and therefore at right angles to the direction of the sun. Except in high latitudes (above 60°) Mercator's projection fulfils the first condition sufficiently well for practical purposes, and, except when the altitude is greater than 70°, the second condition is also approximately true since the radii of such circles will exceed 1200 m.

Premising these conditions, suppose that on a certain day at 9 a.m. when the ship's approximate position, known from previous observations and laid down on the chart, is supposed to be at A (fig. 7), an observation of the sun is made from which the longitude is calculated, the result being that on the supposition that the latitude of A is correct, the ship's position is probably at B. Now by drawing a straight line *ab* through B at right angles to the true bearing of the sun at the time of observation (which is most readily known from the azimuth tables) we are obviously right in assuming the ship's position to be somewhere on that line if we consider it as approximately an arc of a large circle having the place where the sun is then vertical as a centre, the direction of such place being indicated by an arrow.

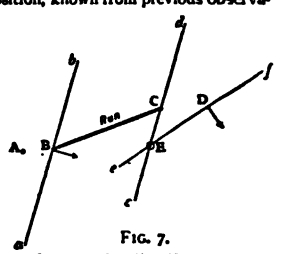

FIG. 7.

If our supposed latitude be right the position will be at B, but if not correct it must still be on the line *ab*, and if near land or any danger the direction of this line, even if no subsequent observation be available, will often give most valuable information. If, while waiting for the sun to change its bearing, the ship runs from B to C, a line *cd* drawn through C parallel to *ab* will represent an arc on which the position lies when she is probably at C, which at this instant (10·30 a. m.) is the most probable position of the ship.

If another observation of the sun for longitude is now made and the resulting position is D (lying of course in the same latitude as C), on drawing through D a line *ef* at right angles to the bearing of the sun (indicated by an arrow) we are right in assuming the position to be somewhere on such an arc as is represented by this line.

Hence E, the intersection of the two arcs on which the position lies at the same instant, must be the true place when the last observation was taken at the supposed position D, the discrepancies being entirely due to the original unknown error in the assumed latitude of A, for had that been accurate the position on the original line *ab* would have been such that on laying off the course and distance from that position C would have coincided with E.

Errors in the assumed latitude of as much in many cases as 30 m. will often be found to produce no practical difference in the resultant position, but of course the accuracy of the longitude found is entirely dependent upon the chronometer, and in such cases as arise when the intersecting arcs make a small angle with each other great accuracy

is required in the course and distance run between the times of observation.

This method of finding both latitude and longitude at the same time is commonly known as "Sumner's" method from the publicity given to it in 1847 by the publication of an excellent pamphlet on the subject by a master of that name in the American mercantile marine, although in a modified form it was practised at a much earlier date in the British navy under the name of "cross bearings of the sun." Prior to the publication of azimuth tables in 1866 the calculation was more lengthy and troublesome, the work being practically doubled.

We have taken an illustration from observations of the sun, but the method is obviously applicable to all heavenly bodies provided they are so situated that the arcs drawn will intersect at a good angle; this in twilight or at night-time is readily done by selecting two heavenly bodies whose bearings differ considerably, and in such cases the small complication of allowing for the run of the ship is often obviated by making the observations simultaneously. The armillary sphere or star globe is useful in selecting objects suitably situated.

The principle of Sumner's method has of recent years received a very important and valuable development under the name of the "new navigation." In this method, originally proposed by Marc St Hilaire, a comparison is made between the altitude of a heavenly body as actually *observed* and that *calculated* from the supposed position of the ship. For instance, the position of an observer at the instant of observing a (true) altitude of the sun of 40° 10′ must be somewhere on a portion of the circumference of a circle (usually of such size that the portion considered may be represented on a chart by a straight line) having its centre in latitude equal to the sun's declination, and in longitude equal to the Greenwich apparent time at the instant, the radius of such a circle being equal to the sun's zenith distance of 49° 50′. If at the same time the true altitude of the sun is from the *estimated* position of the ship calculated to be 40° 5′, it is evident that the greater observed altitude must be owing to the ship being nearer to the centre of the circle than was supposed, and a line of position drawn through the estimated position at right angles to the bearing of the sun must be transferred parallel to itself through a distance of 5′ towards the direction of the sun's bearing. The second line of position, obtained when the sun's bearing has altered some 25°, is dealt with in a similar way, and the intersection of the two lines so obtained gives the position of the ship at the time of second observation. This mode of procedure enables all observations, whether near or far from the meridian, to be similarly dealt with; in all cases the altitude the heavenly body *should* have is computed and compared with what it actually *has*. The practice of problems such as the foregoing is greatly facilitated by the extended means of finding at any moment the azimuth or true bearing of a heavenly body. When the azimuth was only required for the determination of compass error, the valuable tables from which the computed results could be obtained by inspection were limited to those cases of most practical importance, but from the ingenious and simple graphical form known as Weir's azimuth diagram azimuths of all heavenly bodies, whose declinations extend from 60° N. to 60° S., can be obtained during the whole time they are above the horizon, thus greatly facilitating the laying down lines of position.

A careful record of everything pertaining to the navigation of the ship, with the results of all observations and calculated positions, is kept in the ship's log, an official book of great importance, a rough original of which is kept on deck with entries made in it of all such events at the time of their occurrence. A copy of the headings of a page of this as transferred into the official log is here given:

Hour.	Knots.	Traverse of Knots.	Course	Wind.		Weather.	Deviation.	Barometer.	Thermometer.	Temperature of Sea.	Remarks.
				Direction.	Force.						

The course entered here is that which would be indicated by the "standard" compass of the ship (placed in the most favourable magnetic position on board); that actually steered by is the one most conveniently seen by the helmsman. Comparisons between the latter and the "standard" are frequently made, their indications generally varying somewhat owing to the difference of deviation in different positions on the ship. The compass card is usually graduated into points and degrees, but the course is always estimated in degrees. The speed is ascertained from the indication of the patent log, the hand log being generally only used as a rough check on this. Wind direction and force are the result of estimation; as the speed and course of the ship so greatly affect the apparent direction and velocity no practical anemometer for use on board ship exists. Wind force is estimated in terms of what is known as the "Beaufort" scale, based on the supposed amount of sail a vessel could carry at the time. The height of the mercurial barometer is carefully read at the end of each watch, as also is the thermometer; the more sensitive aneroid barometer is kept in a very accessible position and more frequently referred to by the officer of the watch. When navigating in localities and during seasons at which circular storms or hurricanes may be expected (as known from the *Barometer Manual*) the barometer is anxiously and frequently watched, and at all times its indication is compared with that normally experienced in the locality traversed as shown on the barometer charts, due allowance being made in the tropics for the ordinary daily movement. All observations relating to ocean meteorology are of great service in the compilation and improvement of wind and current charts, and in many ships more extensive meteorological journals are voluntarily kept on forms supplied by the Meteorological Office. A knowledge of the temperature of the surface of the sea is often of great practical use in navigation as giving warning of change in direction of the surface ocean current, especially in localities where there exist near to each other warm and cold currents setting in different directions, as, for instance, near the edge of the Gulf Stream. As an indication of the vicinity of ice such observations are usually much less trustworthy.

On the completion of the calculations giving the ship's position at noon each day the results are tabulated in the ship's log on the following form:

Course made good	Distance.		Latitude.	Longitude	Variation Allowed.	True Bearings and Distance.
	Made Good.	Through the water.	D.R.	D.R.		
Current.			Obs.	Obs.		

The course and distance made good each day are calculated by trigonometry between the best determined positions at two successive noons, such positions in fine weather being always those determined astronomically, and the current being considered the difference in the positions at noon as determined astronomically and as calculated by dead reckoning since the previous noon; such differences, however, obviously include the errors of *all* kinds. The latitude and longitude found by dead reckoning are entered under that heading (D.R.). The astronomical positions of latitude and longitude (entered as "obs." or "by observation") are very seldom both determined *at* noon, but are carried up or back to that instant by calculation from the intervening dead reckoning. The variation allowed is taken from the published variation chart, on which the latest results of such observations are embodied at intervals of about ten years with the annual changes (as far as known) in different localities, thus enabling the navigator to obtain its value at intermediate dates. Finally the course and distance are calculated from the position of the ship at noon to either the port of destination or some prominent position or danger near to which the vessel must pass. This is entered under the heading "true bearings and distance."

AUTHORITIES.—The following list of some writers of navigation whose works have not been already mentioned may be found useful to refer to: Thomas Addison, *Arithmetical Navigation* (1625)—he was the first to apply logarithms; Antonio de Najera (Lisbon, 1628) follows Nuñez and Cespedes, but corrects the declination of sun and stars; Sir R. Dudley, *L'arcano del mare* (1630–1646, 2nd ed., Florence, 1661)—too ponderous for the use of seamen; Sir Jonas Moore (1681)—one of the best books of the period; William Jones (1702)—a useful compendium containing trigonometry applied to the various sailings, the use of the log, and tables of logarithms; Pierre Jean Bouguer, *Traité complet de la navigation* (folio, 1698)—good but too large; Manuel Pimental, *L'Arte de navegar* (Lisbon, 1712); Pierre Bouguer, jun., *Nouveau traité de navigation* (1753)—without tables, published at the request of the minister of marine, improved and shortened in 1769 under the superintendence of the astronomer Lacaille; Nathaniel Colson, *The Mariner's New Calendar* (1735)—a good book; Seller, *Practical Navigation*—a book very popular in its time (there was an edition as late as 1739); Samuel Dunn published good star charts and tables of latitude and longitude (1737), and framed concise rules for many problems on navigation (published by the board of longitude); John H. Moore, *The Practical Navigator and Seaman's New Daily Assistant* (1772)—very popular, and generally used in the British navy—the 18th and 19th editions (1810,1814) were improved by J. Dessiou; W. Wilson (Edinburgh, 1773)—a treatise of good repute at the time; Samuel Dunn, *New Epitome of Practical Navigation, or Guide to the Indian Seas* (1777)—for the longitude he depends chiefly on a variation chart from observations by East Indiamen, and he still makes no mention of the *Nautical Almanac* or of parallel rulers; Samuel Dunn (probably a son of the last named, 1781) is the last writer who gives instructions for the use of the astrolabe; he also wrote on "lunars" (1783, 1793), a name which was generally adopted about this time, and published an excellent traverse table (1785), and *Daily Uses of the Nautical Sciences*, (1790); Horsburgh, *Directory for East India Voyages* (1805); A Mackay, *The Complete Navigator* (about 1791); 2nd ed. 1810)—there is no instruction for finding longitude by the chronometer. Kelly, *Spherical Trigonometry and Nautical Astronomy* (1796, 4th ed., 1813)—clear and simple; N. Bowditch, *Practical Navigator* (1800)—passed through many editions and is now (in a revised form) the official text-book of the United States navy; J. W. Norie, *Epitome of Navigation* (1803, 21st ed. 1878)—still a favourite in the mercantile marine from its simplicity, and because navigation can be learned from it without a teacher; T. Kerigan, *The Young Navigator's Guide to Nautical Astronomy* (1821); Inman, *Epitome of Navigation* (1821)—with an excellent volume of tables, formerly

largely used in the British navy, 9th ed. (1854); E. Riddle, *Navigation and Nautical Astronomy* (3rd ed. 1824, 9th ed., by Escott, 1871), still worthy of its high reputation; J. T. Towson, *Tables for Reduction of Ex-meridian Altitudes* (4th ed. 1854), very useful; H. Raper, *Practice of Navigation* (1840, 10th ed. 1870), an excellent book; H. Evers, *Navigation and Great Circle Sailing* (1850), other works on the same subject by Merrifield and Evers (1868) and Evers (1875); R. M. Inskip, *Navigation and Nautical Astronomy* (1865), a useful book, without tables; T. H. Sumner, *A Method of finding a Ship's Position by two Observations and Greenwich Time by Chronometer*—this is set forth as a novelty, but was published by Captain R. Owen, R.N., early in the century, and practised by many officers; H. W. Jeans, *Navigation and Nautical Astronomy* (1858); Harbord, *Glossary of Navigation* (1863, enlarged ed. 1883), a very excellent book of reference; W. C. Bergen, *Practice and Theory of Navigation* (1872); Sir W. Thomson, *Navigation, a Lecture* (1876), well worth reading; Lecky, *Wrinkles in Navigation* (1880); Martin, *Navigation and Nautical Astronomy*, sanctioned for use in the British navy.

(W. R. M.*)

NAVIGATION LAWS. The laws grouped under this title are a branch rather of municipal law than of the general maritime law. They are based upon the right of a state to regulate the navigation of its own waters and to protect its own commerce. One of the most curious early books on the subject is Captain G. St Lo, *England's Safetie or a Bridle to the French King, proposing a sure Method for encouraging Navigation* (London, 2nd ed. 1693). Navigation laws may be divided into two classes. The first class includes all laws designed to secure a commercial monopoly to the state which enacted them. In Great Britain the object was attained by the Navigation Acts, the earliest of which were those of 1381 and 1390, ordaining that no merchandise should be shipped out of the realm except in British ships on pain of forfeiture. The principal Navigation Act was that of 1660 (Scottish, 1661, c. 45). Up to 1854 coasting trade was wholly restricted to British ships, and a British ship must have been navigated by a master who was a British subject, and by a crew of whom a certain proportion must have been British subjects. After 1854 the only relics of such restrictions were found in the provisions of the Customs Consolidation Act 1853, § 324, by which, in order to secure reciprocity, prohibitions or restrictions may by order in council be imposed upon the ships of any country in which British ships are liable to similar prohibitions or restrictions. Subject to these exceptions, a foreign ship is in the same position as a British ship with regard to British trade. This right of foreign ships is expressly recognized by the Customs Law Consolidation Act 1876; by § 141 of that act foreign ships engaged in the coasting trade are not to be subject to higher rates than British ships. Any advantages which a British ship has, *e.g.* the right of claiming protection for her flag, the non-attachment to her of a maritime lien for necessaries supplied in a British port, are not directly connected with the policy under which the Navigation Acts have become obsolete. These advantages are not secured to a British ship until she is registered. United States law agrees with British in this respect. "The United States have imitated the policy of England and other commercial nations in conferring peculiar privileges upon American-built ships and owned by our own citizens. . . . The object of the Registry Acts is to encourage our own trade, navigation and shipbuilding by granting peculiar or exclusive privileges of trade to the flag of the United States, and by prohibiting the communication of those immunities to the shipping and mariners of other countries" (Kent, *Comm.* iii. 139). It may be noticed that an alien is generally incapable of becoming the owner of a ship. This incapacity was specially preserved in the case of British ships by the Naturalization Act 1870, § 14.

The second class of navigation laws includes those which deal with the navigation of any waters over which a state has any control, and embraces all that is necessary for the due use of such waters, as rules of the road, management of harbours and lighthouses, and licensing and control of pilots. Such laws may deal with (1) the high seas, (2) tidal waters other than the high seas, (3) non-tidal waters.

1. The claims of various nations to dominion over parts of the high seas have now become matters of merely historical interest. Such claims have been at different times advanced by Great Britain, Holland, Spain and Portugal, and were once sufficiently important to evoke the *Mare Liberum* of Grotius and the *Mare Clausum* of John Selden. It may be noted that in 1893 the Court of Arbitration on the Bering Sea Fisheries found that Russia had never claimed or exercised exclusive jurisdiction over the Bering Sea outside territorial waters and that the United States had no further right than had Russia at the time of the cession of Alaska in 1867. Rules for the navigation of the high seas may still be promulgated by any government. In Great Britain such rules, generally known as the "Sailing Rules," have been made by order in council under the powers of the Merchant Shipping Act 1862; the rules at present in force are those contained in the order of the 27th of November 1896, L.G. No. 1082, as amended by subsequent orders in council. The order of 1896 was extended by the order of 1897, L.G. No. 572, to the ships of most foreign countries, with a special provision as to China. In the case of a state which has not assented to them, the only rules enforceable are the general rules of the sea, gradually ascertained by individual cases before courts of admiralty.

2. For the navigation of its tidal waters—as far as they are territorial—a state may legislate without the assent of other states. An example of such legislation is afforded by the Territorial Waters Jurisdiction Act 1878, a measure passed in consequence of the celebrated case of *R. v. Keyn*, L.R. 2 Ex. D., 126 (the "Franconia" case), in 1876. Under the head of territorial waters would fall the "narrow seas" (as the Bristol Channel, Great Belt or Straits of Messina), bays and harbours, estuaries and arms of the sea, navigable tidal rivers, and the sea for the distance of a marine league from the shore. Such waters being *res publicae* though not *res communes*, as are the high seas, are prima facie subject to the jurisdiction of the state. In England the soil under such waters, or at least under all but the last kind, is prima facie vested in the crown, subject to the public rights of fishery and anchorage. For the distance of a marine league from low-water mark the crown has certainly jurisdiction for police and revenue purposes. This is a rule of general international law. It may be noted that the *Institut de Droit International* proposed to double this limit. See Hall, *International Law* (5th ed.), p. 154. In England the navigation of most of the principal tidal waters is governed by rules contained in acts of parliament and orders in council, the latter for the most part promulgated under the authority given by the Merchant Shipping Act 1862. For instance, there are numerous orders relating to the Thames, Mersey, Tees and other important rivers.

3. Non-tidal waters, even though navigable, are in Great Britain prima facie private waters, in which the right of navigation does not exist as a public franchise, but can only be acquired by prescription founded on a presumed grant by an owner. In Roman law and in the Code Napoléon it is otherwise. Navigable rivers in those systems are always *publici juris*, whether tidal or non-tidal. Navigation of non-tidal waters in the United Kingdom, whether natural or artificial, is now almost entirely regulated by various Navigation and Conservancy Acts, *e.g.* the Thames Conservancy Acts, the Shannon, Trent, Lee, &c., Navigation Acts, and the various Canal Acts, especially the Manchester Ship Canal Act 1885. It may be noticed that the crown is empowered by the Merchant Shipping Act 1862 to make rules for the navigation of inland waters, even when artificial, on the application of the proprietors. Examples of such rules are the orders in council regulating the Mersey and Irwell navigation and the Bridgewater navigation, 18th May 1870. Such waters being private property, the application for the rules by the proprietors is recited in the order in council.

The distinction drawn in the United States between navigable and boatable rivers seems to be peculiar to that country, unless indeed it is analogous to the "fleuves et rivières navigables ou flottables" of the Code Napoléon, § 538. It is at least unknown in Great Britain.

Remedies for Obstruction and Pollution.—These may be either criminal or civil—the criminal by indictment or information, the civil by action for damages or for an injunction, in addition to the criminal remedy, where special damage has been sustained. Pollution is expressly provided for by the Rivers Pollution Prevention Act 1876, which gives jurisdiction to county courts in cases within the act.

International Law.—The international law as to the navigation of the high seas has been sketched above. Reference should also be made to what is known as the "Rule of the War of 1756" to the effect that where a colonial or coasting trade is prohibited to other nations in time of peace, a neutral by engaging in this trade by permission of a belligerent in time of war is liable to the other belligerent. The leading case is *The Immanuel* (1799), 2 C. Robinson's Rep. 186. Regulations for the coasting trade may be made by the government of India under the powers of the Customs Consolidation Act 1853, § 329, and by the legislature of a British possession under the Merchant Shipping Act 1894, § 736. As to territorial waters, it is the general though not the universal opinion of jurists that the state to which the territorial waters belong has a right to forbid their navigation by foreigners. The free navigation of rivers has often been the subject of treaties, almost necessarily so where a river is the boundary between two states. In such a case, if a state were to maintain the strict letter of its rights, navigation would be almost impossible, as each state is proprietor down to the middle line of the bed of the river, the *medium filum aquae* or *thalweg*.

By the treaty of Vienna in 1815 it was provided that the navigation of all rivers separating or traversing the states that were parties thereto should be open for commercial purposes to the vessels of all nations, subject to a uniform system of police and tolls. The treaty of Paris, 1856, extended this principle to the Danube. In America the cases of the Mississippi and the St Lawrence are important. By the treaty of Versailles, 1783, it was provided that "the navigation of the Mississippi shall for ever remain free and open to the subjects of Great Britain and the citizens of the United States." But the United States afterwards acquired Louisiana and Florida; and, the stipulation as to British subjects not being renewed in the treaty of Ghent, 1814, the United States maintains that the right of navigating the Mississippi is vested exclusively in its citizens. As to the St Lawrence, after disputes for a long period between Great Britain and the United States, the right of free navigation for purposes of commerce was secured to the United States by the treaty of Washington, 1871. There are some waters, such as the Suez Canal and the Panama Canal, which are subject to peculiar engagements by treaty or convention. The former depends on the Convention of Constantinople, 29th of October 1888, the latter—as far as regards the United Kingdom and the United States—on the Hay-Pauncefote Treaty, 18th of November 1901. But as a rule it may be said that in time of peace the territorial waters of a state are open to foreigners for commercial purposes, subject to observance of any rules as to police, pilotage, &c., imposed by the state. Tolls may be imposed by the state upon foreigners. This right is expressly recognized in most commercial treaties. A notable instance was the claim of Denmark to charge what were called the "Sound dues" from all vessels passing Elsinore, though the Sound was not strictly her territorial water. The right was not universally recognized, though it had prescription in its favour and was invariably paid. In 1857 the dues were abolished, and compensation paid to Denmark for the loss of her alleged right. (J. W.)

NAVIUS, ATTUS, in Roman legendary history, a famous augur during the reign of Tarquinius Priscus. When the latter desired to double the number of the equestrian centuries, Navius opposed him, declaring that it must not be done unless the omens were propitious, and, as a proof of his powers of divination, cut through a whetstone with a razor. Navius's statue with veiled head was afterwards shown in the comitium; the whetstone and razor were buried in the same place, and a puteal placed over them. Hard by was a sacred fig-tree, called after him the Navian fig-tree. It was reported that Navius was subsequently put to death by Tarquinius. According to Schwegler, the puteal originally indicated that the place had been struck by lightning, and the story is a reminiscence of the early struggle between the state and ecclesiasticism.

See Livy i. 36; Dion. Halic. iii. 70; Aurelius Victor, *De viris illustribus*, 6; Schwegler, *Römische Geschichte*, bk. xv. 16.

NAVVY, a labourer employed in the digging and excavating of earth, &c., in the construction of railways, docks, canals or other engineering operations. The word is a shortened form of "navigator," applied during the 18th and early part of the 19th centuries to a labourer at work on canals, to which the name "navigation" is often applied. Power-machines (excavators) for performing such work are consequently known as "steam-navvies."

NAVY and NAVIES. The navy of a country was in its original meaning the total body of its shipping, whether used for war, for oversea and coasting traffic, or for fishing—the total in fact of its ships (Lat. *naves*). By custom, however, the word has come to be used only of that part of the whole which is set aside for purposes of war and police. Every navy consists of a material part (see SHIP), *i.e.* the vessels, with their means of propulsion and their armament, and of a human organization, namely the crews of all ranks, by which the vessels are handled. Ships and men are combined in divisions, and are ruled by an organ of the government to which they belong (see ADMIRALTY ADMINISTRATION)

PERSONNEL

The personnel of the British navy is composed of two different bodies of men, the seamen and the marines, each of which has its appropriate officers. The marines are the subject of a separate article.

The officers of the navy are classed as follows in the order of their rank: flag-officers (see ADMIRAL), commodores, captains, staff captains, commanders, staff commanders, lieutenants, navigating lieutenants, sub-lieutenants, chief gunners, chief boatswains, chief carpenters, gunners, boatswains, carpenters, midshipmen, naval cadets.

Flag-officers are divided into three ranks, viz. rear-admiral, vice-admiral, admiral. There is also the rank of "admiral of the fleet": such an officer, if in command, would carry the union flag at the main.

All flag-officers, commanders-in-chief, are considered as responsible for the conduct of the fleet or squadron under their command. They are bound to keep them in perfect condition for service; to exercise them frequently in forming orders of sailing and lines of battle, and in performing all such evolutions as may occur in the presence of an enemy; to direct the commanders of squadrons and divisions to inspect the state of each ship under their command; to see that the established rules for good order, discipline and cleanliness are observed; and occasionally to inquire into these and other matters themselves. They are required to correspond with the secretary of the admiralty, and report to him all their proceedings.

Every flag-officer serving in a fleet, but not commanding it, is required to superintend all the ships of the squadron or division placed under his orders—to see that their crews are properly disciplined, that all orders are punctually attended to, that the stores, provisions and water are kept as complete as circumstances will admit, that the seamen and marines are frequently exercised, and that every precaution is taken for preserving the health of their crews. When at sea, he is to take care that every ship in his division preserves her station in whatever line or order of sailing the fleet may be formed; and in battle he is to observe attentively the conduct of every ship near him, whether of the squadron or division under his immediate command or not; and at the end of the battle he is to report it to the commander-in-chief, in order that commendation or censure may be passed, as the case may appear to merit; and he is empowered to send an officer to supersede any captain who may misbehave in battle, or whose ship is evidently avoiding the engagement. If any flag-officer be killed in battle his flag is to be kept flying, and signals to be repeated, in the same manner as if he were still alive, until the battle shall be ended; but the death of a flag-officer, or his being rendered incapable of attending to his duty, is to be conveyed as expeditiously as possible to the commander-in-chief.

The captain of the fleet is a temporary rank, where a commander-in-chief has ten or more ships of the line under his command; it may be compared with that of adjutant-general in the army. He may either be a flag-officer or one of the senior captains; in the former case, he takes his rank with the flag-officers of the fleet; in the latter, he ranks next to the junior rear-admiral, and is entitled to the pay and allowance of a rear-admiral. All orders of the commander-in-chief are issued through him, all returns of the fleet are made through him to the commander-in-chief, and he keeps a journal of the proceedings of the fleet, which he transmits to the admiralty. He is appointed and can be removed from this situation only by the lords commissioners of the admiralty.

A commodore is a temporary rank, and of two kinds—the one having a captain under him in the same ship, and the other without a captain. The former has the rank, pay and allowances of a rear-admiral, the latter the pay and allowances of a captain and special allowance as the lords of the admiralty may direct. They both carry distinguishing pennants.

When a captain is appointed to command a ship of war he commissions the ship by hoisting his pennant; and if fresh out of the dock, and from the hands of the dockyard officers, he proceeds immediately to prepare her for sea, by demanding her stores, provisions, guns and ammunition from the respective departments, according to her establishment. He enters such petty officers, leading seamen, able seamen, ordinary seamen, artificers, stokers, firemen and boys as may be sent to him from the flag or receiving ship. If he be appointed to succeed the captain of a ship already in commission, he passes a receipt to the said captain for the ship's books, papers and stores, and becomes responsible for the whole of the remaining stores and provisions.

The duty of the captain of a ship, with regard to the several books and accounts, pay-books, entry, musters, discharges, &c., is regulated by various acts of parliament; but the state of the internal discipline, the order, regularity, cleanliness and the health of the crews will depend mainly on himself and his officers. In all these respects the general printed orders for his guidance contained in the King's Regulations and Admiralty Instructions are particularly precise and minute. And, for the information of the ship's company, he is directed to cause the articles of war, and abstracts of all acts of parliament for the encouragement of seamen, and all such orders and regulations for discipline as may be established, to be hung up in some public part of the ship, to which the men may at all times have access. He is also to direct that they be read to the ship's company, all the officers being present, once at least in every month. He is desired to be particularly careful that the chaplain have shown to him the attention and respect due to his sacred office by all the officers and men, and that divine service be performed every Sunday. He is not authorized to inflict summary punishment on any commissioned or warrant-officer, but he may place them under arrest, and suspend any officer who shall misbehave, until an opportunity shall offer of trying such officer by a court-martial. He is enjoined to be very careful not to suffer the inferior officers or men to be treated with cruelty and oppression by their superiors. He is the authority who can order punishment to be inflicted, which he is never to do without sufficient cause nor ever with greater severity than the offence may really deserve, nor until twenty-four hours after

the crime has been committed, which must be specified in the warrant ordering the punishment. He may delegate this authority to a limited extent to certain officers. All the officers and the whole ship's company are to be present at every punishment, which must be inserted in the log-book, and an abstract sent to the admiralty every quarter.

The commander has the chief command in small vessels. In larger vessels he is chief of the staff to the captain and assists him in maintaining discipline, and in sailing and fighting the ship.

The lieutenants take the watch by turns, and are at such times entrusted, in the absence of the captain, with the command of the ship. The one on duty is to inform the captain of all important occurrences which take place during his watch. He is to see that the whole of the duties of the ship are carried on with the same punctuality as if the captain himself were present. In the absence of the captain, the commander or senior executive officer is responsible for everything done on board.

The navigating officer receives his orders from the captain or the senior executive officer. He is entrusted, under the command of the captain, with the charge of navigating the ship, bringing her to anchor, ascertaining the latitude and longitude of her place at sea, surveying harbours, and making such nautical remarks and observations as may be useful to navigation in general.

The warrant-officers of the navy may be compared with the non-commissioned officers of the army. They take rank as follows, viz. gunner, boatswain, carpenter; and, compared with other officers, they take rank after sub-lieutenants and before midshipmen.

The midshipmen are the principal subordinate officers, but have no specific duties assigned to them. In the smaller vessels some of the senior ones are entrusted with the watch; they attend parties of men sent on shore, pass the word of command on board, and see that the orders of their superiors are carried into effect; in short, they are exercised in all the duties of their profession, so as, after five years' service as cadets and midshipmen, to qualify them to become lieutenants, and are then rated sub-lieutenants provided they have passed the requisite examination.

The duties and relative positions of these officers remain practically unaffected by recent changes; but a profound modification was made in the constitution of the corps of officers at the close of 1902. Up to the end of that year, officers who belonged to the "executive" branch, *i.e.* from midshipmen to admiral, to the marines and the engineers, had entered at different ages, had been trained in separate schools, and had formed three co-operating but independent lines. For reasons set forth in a memorandum by Lord Selborne (December 16, 1902)—from the desire to give a more scientific character to naval education, and to achieve complete unity among all classes of officers—it was decided to replace the triple by a single system of entry, and to coalesce all classes of officers, apart from the purely civil lines—surgeons and paymasters (formerly "pursers")—into one. Lads were in future to be entered together, and at one training establishment at Osborne in the Isle of Wight, on the distinct understanding that it was to be at the discretion of the admiralty to assign them to executive, marine or engineer duties at a later period. After two years' training at Osborne, and at the Naval College at Dartmouth, all alike were to go through the rank of midshipman and to pass the same examination for lieutenant. When in the intermediate position of sub-lieutenant, they were to be assigned to their respective branches as executive officer, marine or engineer. The engineers under this new system were to cease to be a civil branch, as they had been before, and become known as lieutenant, commander, captain or rear-admiral E. (Engineer).

The crew of a ship of war consists of leading seamen, able seamen, ordinary seamen, engine-room artificers, other artificers, leading stokers, stokers, coal-trimmers, boys and marines. The artificers and stokers and the marines are always entered voluntarily, the latter in the same manner as soldiers, by enlisting into the corps, the former at some rendezvous or on board particular ships. The supply of boys for the navy, from whom the seamen class of men and petty officers is recruited, is also obtained by voluntary entry.

Merchant seamen are admitted into the royal naval reserve, receive an annual payment by way of retainer, perform drill on board His Majesty's ships, and are engaged to serve in the navy in case of war or emergency.

There are two schemes for forming reserves. The Royal Naval Reserve scheme draws men from the mercantile marine and fishing population of the United Kingdom. The Royal Fleet Reserve scheme, introduced in 1901, while it gave a better system of training to the pensioners, was mainly designed to obtain the services in war of the men who had quitted the navy after the expiration of their twelve years' service.

So far as other countries are concerned, the staff of officers does not differ materially from one navy to another. In all it consists of admirals, captains, lieutenants, midshipmen and cadets receiving their training in special schools. With the exception of the navy of the United States, all the important naval forces of the world are raised by conscription.

The strength and general condition of navies at any given time must be learnt from the official publications of the various powers, and from privately composed books founded on them. The yearly statements of the First Lord of the Admiralty in Great Britain, the Reports of the Secretary of the Navy in the United States, and the Reports of the Budget Committees of the French-Chamber contain masses of information. The *Naval Annual*, founded by Lord Brassey in 1886, is the model of publications which appear in nearly every country which possesses a navy. Mr F. T. Jane's *All the World's Fighting Ships* is a survey of the *matériel* of navies since 1898.

History of Navies

Every navy was at its beginning formed of the fighting men of the tribe, or city, serving in the ship or large boat, which was used indifferently for fishing, trade, war or piracy. The development of the warship as a special type, and the formation of organized bodies of men set aside for military service on the sea came later. We can follow the process from its starting-point in the case of the naval powers of the dark and middle ages, the Norsemen, the Venetians, the French, the English fleet and others. But centuries, and indeed millenniums, before the modern world emerged from darkness the nations of antiquity who lived on the shores of the Mediterranean had formed navies and had seen them culminate and decline. The adventures of the Argonauts and of Ulysses give a legendary and poetic picture of an "age of the Vikings" which was coming to an end two thousand years before the Norsemen first vexed the west of Europe. At a period anterior to written history necessity had dictated the formation of vessels adapted to the purposes of the warrior. Long ships built for speed (*μακραὶ νῆες, naves longae*) as distinguished from round ships for burden (*στρογγύλαι νῆες, naves onerariae*) are of extreme antiquity (see Ship). Greek tradition credited the Corinthians with the invention, but it is probable that the Hellenic peoples, in this as in other respects, had a Phoenician model before them. So little is known of the other early navies, whether Hellenic or non-Hellenic, that we must be content to take the Athenian as our example of them all, with a constant recognition of the fact that it was certainly the most highly developed, and that we cannot safely argue from it to the rest.

Athenian.

The Athenian navy began with the provision of warships by the state, because private citizens could not supply them in sufficient numbers. The approach of the Persian attack in 483 B.C. drove Athens to raise its establishment from 50 to 100 long ships, which were paid for out of the profits of the mines of Moroneia (see Themistocles). The Persian danger compelled the Greeks to form a league for their common naval defence. The League had its first headquarters at Delos, where its treasury was guarded and administered by the Ἑλληνοταμίαι (Hellenotamiai), or trustees of the Hellenic fund. Her superiority in maritime strength gave Athens a predominance over the other members of the League like that which Holland enjoyed for the same reason in the Seven United Provinces. The Hellenotamiai were chosen from among her citizens, and Pericles transferred the fund to Athens, which became the mistress of the League. The allies sank in fact to subjects, and their contributions, aided by the produce of the mines, went to the support of the Athenian navy. The hundred long ships of the Persian War grew to three hundred by the end of the 5th century B.C. (see Peloponnesian War), and at a later period (when, however, the quality of ships and men alike had sunk) to three hundred and sixty. The ancient world did not attain to the formation of a civil service—at least until the time of the Roman Empire—and Athens had no admiralty or navy office. In peace the war-vessels were kept on slips under cover in sheds. In war a *strategos* was appointed to the general command, and he chose the trierarchs, whose duty it was to commission them partly at their own expense, under supervision of the state exercised by special inspectors (ἀποστολεῖς). The hulls, oars, rigging and pay of the crews were provided by the state, but it is certain that heavy charges fell upon the trierarchs, who had to fit the ships for sea and return them in good condition. The burden became so heavy that the trierarchies were divided, first between two citizens in the Peloponnesian War, and then among groups (*symtelciai*) consisting of from five to sixteen persons Individual Athenians who were wealthy and patriotic or ambitious might fit out ships or spend freely on

their command. But these voluntary gifts were insufficient to maintain a great navy. The necessity which compelled modern nations to form permanent state navies, instead of relying on a levy of ships from the ports, and such vessels as English nobles and gentlemen sent to fight the Armada, prevailed in Athens also. The organization of the crews bore a close resemblance in the general lines to that of the English navy as it was till the 16th and even the 17th century. The trierarch, either the citizen named to discharge the duty, or some one whom he paid to replace him, answered to the captain. There was a sailing master (κυβερνήτης), a body of petty officers, mariners and oarsmen (ὑπηρεσία), with the soldiers or marines (ἐπιβάται). As the ancient warship was a galley, the number of rowers required was immense. A hundred triremes would require twenty thousand men in all, or more than the total number of crews of the twenty-seven British line of battleships which fought at Trafalgar. And yet this would not have been a great fleet, as compared with the Roman and Carthaginian forces, which contended with hundreds of vessels and multitudes of men, numbering one hundred and fifty thousand or so, on each side, in the first Punic War.

Until the use of broadside artillery and the sail became universal at the end of the 16th century, all navies were forcibly organized on much the same lines as the Athenian, even in the western seas. In the Mediterranean the differences were in names and in details. The war fleets of the successors of Alexander, of Carthage, of Rome, of Byzantium, of the Italian republics, of the Arabs and of Aragon, were galleys relying on their power to ram or board. Therefore they present the same elements—a chief who is a general, captains who were soldiers, or knights, sailing masters and deck hands who navigate and tend the few sails used, marines and rowers. A few words may, however, be said of Rome, which transmitted the tradition of the ancient world to Constantinople, and of the Constantinopolitan or Byzantine navy, which in turn transmitted the tradition to the Italian cities, and had one peculiar point of interest.

Rome.

As a trading city Rome was early concerned in the struggle for predominance in the western Mediterranean between the Etruscans, the Greek colonies and the Carthaginians. Its care of its naval interests was shown by the appointment of navy commissioners as early as 311 B.C. (*Duoviri navales*). In the first Punic War it had to raise great fleets from its own resources, or from the dependent Greek colonies of southern Italy. After the fall of Carthage it had no opponent who was able to force it to the same efforts. The prevalence of piracy in the 1st century B.C. again compelled it to attend to its navy (see POMPEY). The obligation to keep the peace on sea as well as on land required the emperors to maintain a navy for police purposes. The organization was very complete. Two main fleets, called the Praetorian, guarded the coasts of Italy at Ravenna and Misenum (*classes Praetoriae*), other squadrons were stationed at Forum Julii (Fréjus), Seleucia at the mouth of the Orontes (Nahr-el-Asy), called the *classis Syriaca*, at Alexandria (*classis Augusta Alexandriae*), at Carpathos (Scarpanto, between Crete and Rhodes), Aquileia (the *classis Venetum* at the head of the Adriatic), the Black Sea (*classis Pontica*), and Britain (*classis Britannica*). River flotillas were maintained on the Rhine (*classis Germanica*), on the Danube (*classis Pannonica* and *Maesica*) and in later days at least on the Euphrates. All these squadrons did not exist at the same time. The station at Forum Julii was given up soon after the reign of Augustus, and the *classis Venetum* was formed later. But an organized navy always existed. A body of soldiers, the *classici*, was assigned for its service. The commander was the *Praefectus Classis*.

Byzantine.

When Constantine founded his New Rome on the site of Byzantium, the navy of the Eastern Empire may be said to have begun. Its history is obscure and it suffered several eclipses. While the Vandal kingdom of Carthage lasted (428–534), the eastern emperors were compelled to attend to their fleet. After its fall their navy fell into neglect till the rise of the Mahommedan power at the end of the 7th century again compelled them to guard their coasts. The eastern caliphs had fleets for purposes of conquest, and so had the emirs and caliphs of Cordova. The Byzantine navy reached its highest point under the able sovereigns of the Macedonian dynasty (867–1056). It was divided into the imperial fleet, commanded by the Great Drungarios, the first recorded lord high admiral, and the provincial or thematic squadrons, under their *strategoi*. Of these there were three, the Cibyrhaeotic (Cyprus and Rhodes), the Samian and the Aegean. The thematic squadrons were maintained permanently for police purposes. The imperial fleet, which was more powerful when in commission than all three, was kept for war. A peculiar feature of the Byzantine navy was the presence in it of a corps answering to the seaman gunners and gunnery officers of modern navies. These were the *siphonarioi*, who worked the *siphons* (σιφῶνες) used for discharging the "Greek fire." When the Turkish invasions disorganized the Eastern Empire in the 12th century, the Byzantine navy withered, and the emperors were driven to rely on the help of the Venetians.

Medieval.

The Italian republics of the middle ages, and the monarchical states bordering on the Mediterranean, always possessed fleets which did not differ in essential particulars from that of Athens. There is, however, one fact which must not be overlooked. It is that the seamen of some of them, and more especially of Genoa, served the powers of western Europe from a very early date. Diego Gelmirez, the first archbishop of Santiago in Gallicia, employed Genoese to construct a dockyard and build a squadron at Vigo in the 12th century.

Edward III. of England employed Genoese, and others were engaged to create a dockyard for the French kings at Rouen. By them the naval science of the Mediterranean was carried to the nations on the shores of the Atlantic. The Mediterranean navies made their last great appearance in history at the battle of Lepanto (1571). Thenceforth the main scene of naval activity was on the ocean, with very different ships, other armaments and organizations.

The great navies of modern history may best be discussed by taking first certain specially important national navies in their earlier evolution, and then considering those which are of present day interest in their relations to one another.

The British Navy.

The Royal Navy of Great Britain stands at the head of the navies of the modern world, not only by virtue of its strength, but because it has the longest and the most consistent historical development. The Norse invasions of the 9th century forced the English people to provide for their defence against attack from oversea. Though their efforts were but partially successful, and great Norse settlements were made on the eastern side of the island, a national organization was formed. Every shire was called upon to supply ships "in proportion to the number of hundreds and from the produce of what had been the folkland contained in it" (Stubbs, *Const. Hist.* i. 116). Alfred and his successors had also ships of their own, maintained out of the royal revenue of which they had complete control. Before the Conquest the system of contribution by the shires had largely broken down. Yet in its main lines the method of providing a navy adopted by Alfred and his immediate successors remained in existence. There were the people's ships which represented the naval side of the *fyrd—i.e.* the general obligation to defend the realm; and there were the king's own vessels which were his property. By the 11th century a third source of supply had been found. This was the feudal array. Towns on the sea coast were endowed with privileges and franchises, and rendered definite services in return.

The Norman Conquest introduced no fundamental difference. In the 12th century the kings of the Angevine dynasty made the military resources of their kingdom available in three ways; the feudal array, the national militia and the mercenaries. Dover, Sandwich, Romney, and the other towns on the south-east coast which formed the Cinque Ports represented the naval part of the feudal array. In the reign of Henry III. (1216–1272) their service was fixed at 57 ships, with 1197 men and boys, for

fifteen days in any year, to count from the time when they weighed anchor. During these fifteen days they served at the expense of the towns. Beyond that date they were maintained by the king. The Cinque Ports Squadron has been spoken of as the foundation of the Royal Navy. But a feudal array is wholly alien in character to a national force. The Cinque Ports, after playing a prominent part in the 13th century, sank into insignificance. They were always inclined to piracy at the expense of other English towns. In 1297, during one of the expeditions to Flanders, they attacked and burnt twenty ships belonging to Yarmouth under the eyes of Edward I. (1272–1307). The national militia had a longer life. The obligation of the coast towns and counties to provide ships and men for the defence of the realm was enforced till the 17th century. Nor did the method of enforcing that obligation differ materially. In the reign of King John (1109–1216), when the records began to be regularly kept, but when there was no radical change in system, the reeves and bailiffs of the seaports were bound to ascertain by a jury the number, size and quality of all ships belonging to the port. When the ships were required for the king's service they were embargoed. The local authorities were then bound to see that they were properly equipped and manned. It was the duty of the reeves and bailiffs to arrange that they should reach the place named by the king as rendezvous at the time fixed by him. These embargoes inflicted heavy loss even when they were honestly imposed, and loud complaints were heard in Parliament from the later years of Edward III. (1327–1377) that they afforded the king's officers many openings for oppression and corruption.

The true ancestors of the modern navy must be sought in the third element of the navy of the middle ages—the king's ships and his "mercenaries." Under King John we find the full record of a regular organization of a Royal Navy as apart from the feudal array of the Cinque Ports or the *fyrd*. In 1205 he had in all 50 "galleys"—long ships for war—distributed in various ports. William of Wrotham, archdeacon of Taunton, one of the king's "clerks," or ecclesiastical persons who formed his civil service, is named, sometimes in combination with others, as "keeper of the king's ships," "keeper of the king's galleys" and "keeper of the king's seaports." The royal vessels cannot have differed from the 57 warships of the Cinque Ports, and at first his navy was preferable to the feudal array, or the levy from the counties, mainly because it was more fully under his own control. They were indeed so wholly his that he could hire them out to the counties, and at a much later period the ships of Henry V. (1413–1422) were sold to pay his personal debts after his death. Yet though the process by which the king's ships became the national navy was slow, the affiliation is direct from them to the fleet of to-day, while the permanent officials at Whitehall are no less the direct descendants of William of Wrotham and the king's clerks of the 13th century. When on active service the command was exercised by representatives of the king, who were not required to be bred to the sea or even always to be laymen. In the crusade of 1190 the fleet of Richard the Lion Hearted (1189–1199), drawn partly from England and partly from his continental possessions, was governed by a body of which two of the members were churchmen. They and their lay colleagues were described as the *ductores et gubernatores totius navigii Regis*. The first commanders of squadrons were known as *justiciarii navigii Regis, ductores et constabularii Regis*.

The crusade of 1190 doubtless made Englishmen acquainted with the title of "admiral"; but it was not till much later that the word became, first as "admiral and captain," then as "admiral" alone, the title of an officer commanding a squadron. The first admiral of all England was Sir John Beauchamp, appointed for a year in 1360. The permanent appointment of a lord admiral dates from 1406, when John Beaufort, natural son of John of Gaunt, and marquess of Somerset and Dorset, was named to the post. The crews consisted of the two elements which, in varying proportions and under different names, have been and are common to all navies—the mariners whose business it was to navigate the ship, and the soldiers who were put in to fight. Until the vessel had been developed and the epoch of ocean voyages began, the first were few and subordinate. As the seas of Britain were ill adapted for the use of the galley in the proper sense, though the French employed them, English ships relied mainly on the sail. They used the oar indeed but never as a main resource, and had therefore no use for the "turma" (*ciurma* in Italian, *chiourme* in French, and *chusma* in Spanish) of rowers formed in the Mediterranean craft. Crews were obtained partly by free enlistment, but also to a great extent, by the press (see IMPRESSMENT). The code of naval discipline was the laws of Oleron (see SEA LAWS), which embodied the general "custom of the sea." By the reign of Edward III. (1327–1377) the duties and jurisdiction of the admiral were fixed. He controlled the returns of the ships made by the reeves, selected them for service, and chose his officers, who had their commission from him. A rudimentary code of signals by lights or flags was in use.

The history of the middle ages bears testimony to the general efficiency and energy of the navy. Under weak kings, and at certain periods, for instance in the latter years of Edward III. and the reign of his grandson Richard II. (1377–1399), it fell into decay, and the coast was ravaged by the French and their allies the Basque seamen, who manned the navy of Castile. Henry IV. (1399–1413), though an astute and vigorous ruler, was driven to make a contract with the merchants, mariners and shipowners, to take over the duty of guarding the coast in 1406–1407. Their admirals Richard Clitherow and Nicholas Blackburne were appointed, and exercised their commands. But the experiment was not a success, and was not renewed. Apart from these periods of eclipse, the navy in all its elements, feudal, national and royal, was more than a match for its enemies. The destruction of the fleet prepared by Philip Augustus, the French king, for the invasion of England in 1213 at Damme, the defeat of Eustace the Monk in 1217 off Dover, the victory over the French fleet at Sluys in 1340, and the defeat of the Spaniards off Winchelsea in 1350, were triumphs never quite counterbalanced by any equivalent overthrow. Still better proofs of the ability of any navy to discharge its duties were the long retention of Calais, and the constant success of the rulers of England in their invasions of France. The claim to the sovereignty of the seas has been attributed on insufficient evidence to King John, but it was enforced by Edward III.

Under the sovereigns of the Tudor dynasty (1485–1603) the development of the navy was steady. Though Henry VII. (1485–1509) made little use of his fleet in war, he built ships. His son Henry VIII. (1509–1547) took a keen interest in his navy. Shipbuilding was improved by the importation of Italian workmen. The large resources he obtained by the plunder of the Church enabled Henry VIII. to spend on a scale which had been impossible for his predecessors, and was to be impossible for his successors without the aid of grants from Parliament. But the most vital service which he rendered to the navy was the formation of, or rather the organization of existing officials into, the navy office. This measure was taken at the very end of his reign, when the board was constituted by letters patent dated 24th of April 1546. It consisted of a lieutenant of the admiralty, a treasurer, a comptroller, a surveyor, a clerk of the ships, and two officials without special title. A master of the ordnance for the ships was also appointed. Henry's board, commonly known as the navy board, continued, with some periods of suspension, and with the addition of different departments—the victualling board, the transport board, the pay office, &c., added at various times—to be the administrative machinery of the navy till 1832. They were all theoretically subject to the authority of the lord high admiral, or the commissioners for discharging his office, who had the military and political control of the navy and issued all commissions to its officers. In practice the boards were very independent. The double government of the navy, though it lasted long, was undoubtedly the cause of much waste—partly by the creation

of superfluous officials, but more by the opening it provided for corruption.

The 16th century in England as elsewhere saw a great development in the size and capacity of ships, in the length of voyages, and consequently in the sciences of navigation and seamanship, which brought with them the predominance of the seaman element hitherto subordinate. In the reign of Henry VIII., when a squadron was commissioned in 1512, out of a total of 3000 men, 1750 were soldiers. By the end of the reign of his daughter Elizabeth (1558–1603) it was calculated that of the 8346 men required to man her fleet 5534 were seamen, 804 were gunners, and only 2008 were soldiers. In the early years of his reign Henry VIII. equipped his squadrons on a system which bears some resemblance to the Athenian trierarchies. He made a contract with his admiral Sir Edward Howard (1477–1513), by which the king supplied ships, guns and a sum of money. The admiral, who had full power to "press," named the officers and collected the crews. Among them are named contingents from particular towns—the representatives of the *fyrd*. With the exception of the captain, who received eighteen pence a day, all were paid at the same rate, 5s. wages and 5s. for rations per month. Extra sums called "dead shares," the wages of so many imaginary men, and rewards, were provided for the master and warrant officers. Until the regular returns known as the "weekly progress of the dockyards" and the "monthly lists of ships in sea pay" were established in 1773, no constant strict account of the strength of the navy was kept. The figure must therefore be accepted as subject to correction, but King Henry's navy is estimated to have consisted of 53 vessels of 11,268 tons, carrying 237 brass guns and 1848 of iron. It sank somewhat during the agitated reigns of his successors Edward VI. (1547–1553) and Mary (1553–1558). By Elizabeth it was well restored. In mere numbers her navy never equalled her father's. At the end of her reign it was composed of 42 vessels, but they were of 17,055 tons, and therefore on the average much larger. The military services rendered by the great queen's fleet were brilliant. No organic change was introduced, and fleets continued to be made up by including vessels belonging to the different ports.

The two most notable advances in organization were the establishment of a graduated scale of pay by rank in 1582, and the formation of a fund for the relief of sick and wounded seamen. This was not a grant from the state but a species of compulsory insurance. All men employed by the navy, including shipwrights, were subject to a small deduction from their pay. The amount was kept in the chest at Chatham, from which the fund took its name, and was managed by a committee of five, each of whom had a key, and of whom four were elected by the contributors. The commissioner of the dockyard presided.

It was between the accession and the fall of the House of Stuart (1603–1688) that the navy became a truly national force, maintained out of the revenue voted by parliament, and acting without the co-operation of temporary levies of trading ships. The reign of James I. (1603–1625) is a period of great importance in its history. The policy of the king was peaceful, and he only once sent out a strong fleet—in 1620 when an expedition was despatched against the Barbary pirates. He took, however, a lively interest in shipbuilding, and supported his master shipwright Phineas Pett (1507–1647) against the rivals whom he offended by disregarding their rules of thumb. Under the lax administration of the lord high admiral Nottingham, better known as Lord Howard of Effingham, many abuses crept into the navy. Though more money was spent on it than in the reign of the queen, it had sunk to a very low level of effective strength in 1618. In 1619 the old lord admiral was persuaded to retire, and was succeeded by George Villiers, duke of Buckingham, the king's favourite. Nottingham's retirement was made compulsory by the report of a committee appointed to inquire into the condition of the navy in 1618. They reported that while numbers of new offices had been created at a cost treble the whole expense of the permanent staff of Queen Elizabeth's time, the dockyards had become nests of pilfering and corruption. Ships were rotting, and money was yearly drawn for vessels which had ceased to exist. The committee undertook to meet the whole ordinary and extraordinary charges of the navy (upkeep and new building) for £30,000 a year. The ships in commission at that time during peace were confined to the diminutive winter and summer guards, whose duty was to transport ambassadors to and fro across the Channel and to hunt the pirates who still swarmed on the coast. Buckingham left the administration of the navy in the hands of the commissioners, who by dismissing superfluous officers and paying better salaries had by 1624 fulfilled their promise to restore the fleet. The establishment they proposed was only of 30 ships, but they were larger in aggregate tonnage by 3050 tons than Queen Elizabeth's.

Charles I. (1625–1649) carried on the work of his father as far as his limited resources allowed. The pay of the sailors, fixed in 1585 at 10s., was increased to 15s. A captain received from £4, 6s. 8d. a month of 28 days (the standard of the navy) to £14, according to the size of his ship. Lieutenants, who were only carried in the larger ships, received from £2, 16s. to £3, 10s., the sailing-master from £2, 6s. 8d. to £4, 13s. 9d., and the warrant officers from £1, 3s. to £2, 4s. The rating of ships by the number of men carried was introduced in this reign. Vessels of good quality were built for the king, and he showed a real understanding of the necessity for maintaining a strong fleet.

But the time was coming when the hereditary royal revenue was no longer adequate to meet the expense of a navy. By the middle of the 17th century a costly warship, far larger than the trading-ship in size and much more strongly built, had been developed. The extension of British commerce called for protection which an establishment of 40 to 50 vessels could not give. When the Great Rebellion broke out in 1641 the navy of King Charles consisted of only 42 vessels of 22,411 tons. At the Restoration (1660) it had grown to 154 ships for sea service, of 57,463 tons. Such a force could only be maintained out of taxes granted by the parliament. The efforts of King Charles to obtain funds for his navy had a large influence in provoking the rebellion (see SHIP MONEY). The government of the navy during this reign remained in the hands of the committee of 1618, under the lord high admiral Buckingham, till he was murdered in 1628. It was then entrusted to a special commission, who were to have held it till the king's second son James, duke of York, was of age. In 1638 the king restored the office of lord high admiral "during pleasure" in favour of Algernon Percy, 10th earl of Northumberland, by whom the fleet was handed over to the parliament.

During the Great Rebellion and the Protectorate the navy was governed by parliamentary committees, or by a committee named by the Council of State, or by Cromwell. The need, first for cutting the king off from foreign support, and then for conducting successive struggles in Ireland, or with the king's partisans on the sea, with the Dutch and with the Spaniards during the Protectorate, led to a great increase in its size. These, too, were years of much internal development. Blake and the other parliamentary officers found that the pressed or hired merchant ships were untrustworthy in action. The ships were not strong enough, and the officers had no military spirit. Parliament therefore provided its own vessels and its own officers. The staff was strengthened by the appointment of second lieutenants. The Dutch War of 1652–53 may be said to have seen the last of the national militia, *fyrd* or levy of ships from the ports for warlike purposes. After the war a code of "fighting instructions" was issued. During it a code of discipline in 39 articles was established. Both embodied ancient practices rather than new principles, yet it marked a notable advance in the progress of the navy towards complete organization that it should pass from the state of being governed by traditional use and wont, or by the will of the commander for the time being, to the condition of being ruled by fixed and published codes to which all were subject. The high military command during the interregnum 1649–1660 was entrusted to committees of admirals and generals at sea.

With the restoration of Charles II. (1660–1685) the modern period in the history of the navy began. The first steps were taken to form a corps of officers. Lads of gentle birth were sent on board ships in commission with a letter of service—from which came their popular name of "king's letter boys"—to the captain, instructing him to treat them on the footing of gentlemen and train them to become officers. After the Dutch War of 1664–67 a body of flag-officers were retained by fixed allowances from the crown. This was the beginning of the half-pay list, which was extended by successive steps to include select bodies of captains and lieutenants, and then all commissioned officers. The process of forming the corps was not complete till the end of the reign of Queen Anne (1702–1714). Special training and a right to permanent payment are the essentials of a state service. The fleet was, at least in the earlier part of the reign, used for the promotion of British interests and the protection of trade in distant seas. One squadron was sent to take possession of Bombay, which formed part of the dower of Queen Catherine. Tangier, which was acquired in the same way, was occupied as a naval station till the cost of maintaining it proved excessive and it was evacuated in 1685. A series of effective attacks was made on the Barbary pirates, and ships were stationed in the West Indies to check piracy and buccaneering. Until 1673, when he was driven out of office by the Test Act, the king's brother James, duke of York, afterwards James II., held office as lord high admiral. He proved an able administrator. The navy office was thoroughly organized on the lines laid down by the earl of Northumberland, and revised "sailing and fighting instructions," as well as a code of discipline, were issued. During the latter years of the reign of Charles II. the administrative corruption of the time affected the navy severely. The fixed charge for ordinary and extraordinary expenses which had risen to £300,000 a year was mostly wasted, under the lax or dishonest supervision of the commission appointed by the king after his brother left office. James II. (1685–1688), who kept the admiralship in his own hands and governed largely through his able secretary, the diarist Samuel Pepys, did much to restore its efficiency. The navy he left was estimated to consist of 173 ships of 101,892 tons carrying when in commission 42,003 men and armed with 6930 guns.

The evolution of the navy was completed by the Revolution of 1688. It now, though still called royal, became a purely national force, supported by the yearly votes of parliament, and governed by parliamentary committees, known as the commission for discharging the office of lord high admiral. A lord high admiral has occasionally been appointed, as in the case of Prince George of Denmark, husband of Queen Anne, or the duke of Clarence, afterwards King William IV. But these were formal restorations. As no organic change was made till 1832, it will now be enough to describe the organization as it was during this century and a half.

The discipline of the navy was based on the Navy Discipline Act of 1660 (13th of Charles II.). The act was found to require amending acts, and the whole of them were combined, and revised by the 22nd of George II., passed in 1749. Some scandals of the previous years had caused great popular anger, and the alternative to death was taken from the punishment threatened against officers who failed to show sufficient zeal in the presence of the enemy. It was under this severe code that Admiral Byng was executed. In 1780 an amending act was passed which allowed a court martial to assign a lighter penalty.

The government, political and military, was in the hands of the admiralty. The administration was carried on in subordination to the admiralty by the navy board and the other civil departments, the victualling board, the board of transport, the pay office, the sick and hurt office and some others. At the head were the flag-officers, who were divided as follows:—

Admiral of the Fleet.	Vice-Admiral Red.	Rear-Admiral Red.
,, ,, White.	,, ,, White.	,, ,, White.
,, ,, Blue.	,, ,, Blue.	,, ,, Blue.

The Red, White and Blue squadrons had been the divisions of the great fleets of the 17th century, but they became formal terms indicating only the seniority of the flag-officers. It was the intention of parliament to confine the flag list to these nine officers, but as the navy grew this was found to be impossible. The rank of admiral of the fleet remained a solitary distinction. The captains, commanders and lieutenants were the commissioned officers and received their commissions from the admiralty. Promotion from them to flag rank was not at first limited by strict rules, but it tended to be by seniority. During the war of the Austrian Succession, in 1747, a regular system was introduced by which when a captain was promoted for active service—to hoist his flag, as the phrase went—he was made rear-admiral of the Blue squadron. Captains senior to him were promoted rear-admiral in general terms, and were placed on the retired list. They were familiarly called "yellow" admirals, and to be promoted in this way was to be "yellowed." Promotion to a lieutenant's commission could be obtained by any one who had served, or whose name had been on the books of a sea-going ship, for five years. Whether he entered with a king's letter of service or from the naval academy at Portsmouth, as a sailor or as a ship's boy, he was equally qualified to hold a commission if he had fulfilled the necessary conditions and could pass an examining board of captains, a test which in the case of lads who had interest was generally a pure formality. He was supposed to show that he knew some navigation, and was a practical seaman who could hand, reef and steer. As captains were allowed a retinue of servants, a custom arose by which they put the names of absent or imaginary lads on the books as servants and drew the pay allowance for them. It was quite illegal, and constituted the offence known as "false musters," punishable by dismissal from the service. But this regulation was even less punctually observed than the rule which forbade the carrying of women. Till the beginning of the 19th century many distinguished officers were borne on a ship's books for two or three years before they went to sea. The navigation was entrusted to the sailing-master and his mates. He had often been a merchant captain or sailor.. The captains and lieutenants were supposed to understand navigation, but it was notorious that many of them had forgotten the little they had learnt in order to pass their qualifying examination. As the navy was cut down to the quick in peace, the supply of officers was insufficient at the beginning of a war, and it was found necessary to give commissions to men who were illiterate but were good practical seamen. Officers who had not begun as gentlemen "on the quarter deck" were said to have come in "through the hawse hole"—the hole by which the cable runs out at the bow. Some among them rose to distinction. The accountant's work was done by the purser, who in bad times was said to be often in league with the captain to defraud both the government and the crew. The medical service in the navy during the 18th century was bad. The position of the surgeons who were appointed by the navy office was not an enviable one, and the medical staff of the navy was much recruited from licentiates of Edinburgh, or Apothecaries Hall. Finally it is to be observed that when a ship was paid off only the commissioned officers, masters and surgeons were entitled to half-pay, or had any further necessary connexion with the navy.

The crews were formed partly by free enlistment and partly by impressment. When these resources failed, prisoners, criminal and political, were allowed to volunteer or were drafted from the jails. The Patriotic Society, formed at the beginning of the Seven Years' War, educated boys for the navy. During the Revolutionary and Napoleonic Wars the counties were called upon to supply quotas, which they commonly secured from the debtors' prison or the workhouse. A ship was supposed to be well manned when she had one-fifth of her crew of marines, and one-third of men bred to the sea. This proportion of seamen was rarely reached. As the navy did not train its men from boyhood in peace, the genuine sailors, known as "prime seamen" and "sailormen," who were the skilled artificers of the time, had to be sought for among those who had served their apprenticeship in the merchant service. They never enlisted voluntarily, for they disliked the discipline of the navy, and the pay was

both bad and given in an oppressive way. The pay of a seaman was 22s. 6d. a month for able seamen, the rate fixed in the reign of Charles II., and 19s. for ordinary seamen. This sum was not paid at fixed dates, but at first only at the end of a commission, and after 1758 whenever a ship which had been a year in commission returned home—up to six months before the date of her arrival, the balance being kept as a security against desertion, which was then incessant and enormous. As men were often turned over from ship to ship they had a sheaf of pay notes to present on reaching home. The task of making up accounts was slow, and the men were often driven to sell their pay notes to low class speculators at a heavy discount. Discipline was mainly enforced by the lash, and the abuse of their power by captains was often gross.

These grievances led to a long series of single ship mutinies, which culminated in the great mutiny of 1797. The fleets at Spithead, the Nore, Plymouth, the South of Ireland and Cape of Good Hope mutinied one after another. The government had aggravated the danger by drafting numbers of the United Irish into the fleet, and the quotas from the counties contained many dangerous characters. The crisis which seemed to threaten the country with ruin passed away. Concessions were made to the just claims of the men. When political agitators endeavoured to make use of the discontent of the sailors for treasonable ends, the government stood firm, and the patriotism of the great bulk of the men enabled it to restore discipline. The "breeze at Spithead," as the mutiny was nicknamed in the navy, was the beginning of the reforms which made the service as popular as it was once hateful.

The administration of the navy throughout the 18th century, and in a less degree after 1806 up to 1832, was in many respects slovenly, and was generally corrupt. The different branches, military and civil, were scattered and worked in practical independence, though the board of admiralty was supposed to have absolute authority over all. The admiralty was at Whitehall, the navy office in Seething Lane near the Tower, and after 1780 at Somerset House. The victualling office was on Tower Hill, the pay office in Broad Street, where also was the Sick and Hurt office. In 1749, when the state of the navy excited just discontent, the admiralty first established regular visitations of the dockyards which in a time of general laxity had become nests of corruption. These visitations were, however, not regularly made. By the end of the century, and in spite of sporadic efforts at reform, the evil had become so generally recognized that Earl St Vincent, then first lord, persuaded parliament in 1802 to appoint a parliamentary commission of inquiry. Its reports, thirteen in number, were given between 1804 and 1806. They revealed much waste, bad management and corruption. The tenth report showed that money voted for the navy was used by the then treasurer, Henry Dundas (Lord Melville), for purposes which he refused to reveal. In 1806 another commission was appointed to revise and digest the civil affairs of the navy, and a considerable improvement was effected. Much remained to be done. There was no strict appropriation of money. Accounts were kept in complicated, old-fashioned ways which made it impossible to strike a balance.

In 1832 Sir James Graham, first lord in Earl Grey's administration, obtained the support of parliament for his policy of sweeping away the double administration of the navy, by admiralty and navy office, and combining them into one divided into five departments. With this great organic change the navy entered on its modern stage.

Subject to the warning that for the reason given above, the figures do not deserve absolute confidence, the material strength of the British navy from the death of Queen Anne to the fall of Napoleon was:—

	Ships.	Tons.
At the death of Queen Anne, 1714	247	167,219
" " George I., 1727	233	170,862
" " George II., 1760	412	321,104
In 1783	617	500,781
In 1793	411	402,555
In 1816	776	724,810

The figures for 1783, and for 1816, are swollen by prizes and worn out ships. All the figures include vessels unfit for service, or useful only for harbour work, or ordered to be built, but not actually in existence. The number of men varied enormously from a peace to war establishment. Thus in 1755 on the eve of the Seven Years' War parliament voted 12,000 seamen. In 1762 the vote was for 70,000 men, including 19,061 marines—the corps having been created in the interval. In 1775, on the eve of the American War of Independence, the vote was for 18,000 men for the sea service, including 4354 marines. At the close of the war in 1783 the vote was for 110,000 men, including 25,291 marines, from which it fell in 1784 to 26,000 (marines 4495 included) and in 1786 to 18,000 men, of whom 3860 were marines. In 1812, when the navy was at the highest level of strength it reached, the vote was for 113,000 seamen and 31,400 marines. From this level it fell in 1816 to 24,000 seamen and 9000 marines. These figures represent paper strength. Owing to the prevalence of desertion, and the difficulty of obtaining men, the actual strength was always appreciably lower.

The French Navy.

Before the French monarchy could possess a fleet, its early kings, whose rule was effective only in the centre of the country, had first to conquer their sea coast from their great vassals. Philip Augustus (1180–1223) began by expelling King John of England from Normandy and Poitou. The process was not completed until Louis XII. (1498–1515) united the duchy of Brittany to the crown by his marriage with the duchess Anne. Long before the centralization of authority had been completed the French kings possessed a fleet, or rather two fleets of very distinct character. Her geographical position has always compelled France to draw her navy from two widely different sources—from the Channel and the coast of the Atlantic on the north and west and on the south from the Mediterranean. This separation has imposed on her the difficult task of concentrating her forces at times of crisis, and the concentration has always been hazardous. Like their English rivals, the French kings of the middle ages drew their naval forces from the feudal array, the national levy and their own ships. But the proportion of the elements was not the same. Many of the great vassals owed the service of ships, and their obedience was always less certain than that of the Cinque Ports. The trading towns were less able, and commonly less willing, than the English to supply the king with ships. He was thus driven to trust mainly to his own vessels—and they were drawn at first exclusively, and always to a great extent, from the Mediterranean seaboard. His own territories in the south were insufficiently provided with seamen, and the French king had therefore to seek his captains, his men and his vessels by purchase or by subsidies from Genoa, or in a less degree from Aragon. When Saint Louis (1226–1270) sailed on his first crusade in 1249, he formed the first French royal fleet, and created the first French dockyard at Aigues Mortes. Ships and dockyard were bought from, or were built by, the Genoese at the king's expense. His admirals, the first appointed by the French crown, Ugo Lercari and Jacobo di Levante, were Genoese. Saint Louis created the office of admiral of France. When in later times Aigues Mortes was cut off from the sea by the encroachment of the land, Narbonne and Marseilles were used as ports of war. This fleet was purely Mediterranean in character. It consisted of galleys, and though the sail was used it was dependent on the oar, and therefore on the "turma" (*chiourme*) of rowers, who in earlier times were hired men, but from the middle of the 15th century began to be composed of galley slaves—prisoners of war, slaves purchased in Africa, criminals and vagabonds condemned by the magistrate to the chain and the oar. Philip IV. le Bel (1285–1314) was led by his rivalry with Edward I. of England to create a naval establishment on the Channel. He found his materials in the existing Mediterranean fleet. A dockyard was built for him at Rouen, again by the Genoese Enrico Marchese, Lanfranc Tartaro and Albertino Spinola. It was officially known as the Tersenal or Dorsenal, but was commonly called the *clos des galtes* or galley yard, and it existed from 1294 to 1419. The French navy has always suffered from alternations of attention and neglect. In times of disastrous wars on land it has fallen into confusion and obscurity. Except when Francis I. (1515–1547) made a vigorous attempt to revive it at the very close of his reign, the French navy languished till the 17th century. Its very unity of administration disappeared in the 15th century, when

the jurisdiction of the admiral of France was invaded and defied by the admiralties of Guyenne, Brittany and the Levant. These local admiralties were suppressed by Francis I.

Richelieu, the great minister of Louis XIII., found the navy extinct. He was reduced to seeking the help of English ships against the Huguenots. From him dates the creation of the modern French navy. In 1626 he abolished the office of admiral of France, which had long been no more than a lucrative place held by a noble who was too great a man to obey orders. He himself assumed the title of *grand maître et surintendant de la navigation*, and the military command was entrusted to the admirals *du Ponant*, *i.e.* of the west or Atlantic and Channel, and *du Levant*, *i. e.* of the Mediterranean. But Richelieu's establishment shrivelled after his death. It was raised from its ruins by the pride and policy of Louis XIV. (1643–1715). Under his direction a numerous and strongly organized navy was created. A very full code of laws—the *ordonnance*—was framed by Colbert and Lyonne with the advice of the ablest officers, and was promulgated on the 5th of April 1689. Though modified by other *ordonnances* in 1765, 1772, 1774, 1776 and 1786, in the main lines it governed the French navy till the Revolution.

By this code the French navy was based on the *Inscription maritime*, a very severe law of compulsory service, affecting the inhabitants of the coast and of the valleys of rivers as far up as they were capable of floating a lighter. The whole body of officials and officers was divided into the civil branch known as *la plume*, and the military branch called *l'épée*. The first had the entire control of the finances, and the dockyards of Toulon, Brest and Rochfort, with an *intendant de la marine* at the head of each. The general chief was the *sous secrétaire au département de la marine*, the title of the French minister of marine till the Revolution. Under Louis XIV. a civil officer, the *intendant des armées navales*, who ranked as an admiral, sat on councils of war and reported on the conduct of the naval officers. He must not be confused with the *intendant de la marine*. The military branch had at its head the admiral of France, the office having been re-created in 1669 by Louis XIV. in favour of his natural son the duc de Vermandois. In theory the admiral was the administrative military and judicial head of the admiralty. In practice the admirals were princes of the blood, who drew pay and fees, but who never went to sea, with the one exception of the count of Toulouse, another natural son of Louis XIV. Two vice-admirals of France *du Ponant* and *du Levant* commanded in the Mediterranean and on the ocean. A third office of vice-admiral of France was created for Suffren. The *lieutenant général* (vice-admiral) came next, and below him the *chef d'escadre* (rear-admiral), *capitaine de vaisseau* (post captain), *capitaine de brûlot* (fireship) or *de frégate* (commander), and the *major*, a chief of the staff on board who commanded all landing parties. There was no permanent body of marines in the French navy, the *infanterie de la marine* being troops for service in the colonies, which were administratively connected with the navy and governed by naval officers. The lieutenant needs no explanation, and the *enseigne* was a sub-lieutenant. The corps of officers was recruited from *les gardes de la marine*, answering more or less to the English midshipmen—who received a careful professional education and were required to be of noble birth. Besides the *grand corps de la marine* there was a fleet of galleys with a general at its head, and a staff of officers also of noble birth. It was suppressed in 1748 as being a useless expense. Officers not belonging to the *grand corps* were sometimes taken in from the merchant service. They were known as *officiers bleus*, because their uniform was all blue, and not, as in the case of the noble corps, blue and red.

On paper the organization of the French royal navy was very thorough. In reality it worked ill; the severity of the *inscription maritime* made it odious, and owing to the prevailing financial embarrassment of the crown after 1692 the sailors were ill-paid, ill-fed and defrauded of the pensions promised them. They fled abroad, or went inland and took up other trades. The military and civil branches were always in a state of hostility to one another, and their pay also was commonly in arrears. The noble corps was tenacious of its privileges, and extremely insolent towards the *officiers bleus*. By Louis XV. (1715–1774) the navy was neglected till the last years of his reign, when it was revived by the duc de Choiseul. Under Louis XVI. (1774–1792) when the Revolution broke out the long accumulated hatred felt for the noble officers had free play. Louis XVI. had indeed relaxed the rule imposing the presentation of proofs of nobility on all naval officers, but the change was made only in 1786 and it came too late. The majority of the noble officers were massacred by the Jacobins or driven into exile.

The Revolution subjected the French navy to a series of disorganizations and reorganizations by which all tradition and discipline were destroyed. Old privileges and the office of Grand Admiral were suppressed. The attempt to revive the navy in the face of the superior power of England was hopeless. Neither the Republic nor the Empire was able to create an effective navy. They had no opportunity to form a new body of officers out of the lads they educated.

The strength of the French Royal Navy is difficult to estimate, since for long periods of the 18th century it was rotting in harbour and its ships were rarely commissioned. Louis XIV. is credited with 95 ships of the line and 29 frigates, together with many smaller vessels, in 1692. At the close of the Seven Years' War it had sunk to 44 ships of the line and 9 frigates. By 1778 the French navy had risen to 78 of the line with frigates and smaller vessels which brought the total to 264. In 1793 on the outbreak of the revolutionary war, it was estimated to consist of 82 ships of the line, mostly fine vessels, and of frigates with lesser craft which brought it to a total of 250. Under Napoleon the mere number was very much more considerable and included ships built in the annexed territories, but they were largely constructed of green timber, were meant merely to force England to maintain blockades, and were never sent to sea.

Spanish Navy.

The administrative history of the Spanish navy is singularly confused and broken. It might almost be said that the country had no navy in the full sense of the word—that is to say, no organized maritime force provided and governed by the state for warlike purposes only—until one was created on the French model by the sovereigns of the Bourbon dynasty *i.e.* after 1700. Yet the kings of the Spanish peninsula, whether they wore the crown of Castile and Leon or of Aragon, had fleets, formed, like all the others of the middle ages, partly of ships supplied by the coast towns and populations, partly of the royal vessels. Aragon was a purely Mediterranean power. Its fleets, which were chiefly supported by Barcelona, a flourishing commercial city, were composed of galleys. With the union of the crown in 1479 Aragon fell into the background, and its navy continued to be represented only by a few galleys, for service in the Mediterranean against the pirates. The dominions of Castile stretched from the Bay of Biscay to the Mediterranean. Its kings, therefore, had need both of ships (*naos*) and galleys. The first beginnings of the Castilian navy were not due to the king, but to the foresight and enterprise of Diego Gelmirez, bishop and afterwards first archbishop of Santiago in Gallicia. In or about 1120 he employed the Genoese Ogerio to form a dockyard at Iria, and to build vessels. The naval activity of the coast of the Bay of Biscay developed so rapidly that in 1147 a squadron from the northern ports took part in the conquest of Almeria by Alfonso VII. (1120–1157) in alliance with the Pisans. A century later (1248) another squadron constructed at the expense of the king Fernando III. El Santo (1217–1252), and commanded by Count Ramon Bonifaz of Burgos, the first admiral of Castile, took a decisive part in the conquest of Seville. The annexation of Andalucia and the necessity for guarding against invasions from Africa called for a great extension of the navy of Castile. Alfonso X. El Sabio (1252–1284) founded the great galley dockyards of Seville—the *arenal*. It was also the work of Genoese builders and administrators. In the course of the 13th century the towns of the northern coast formed one of the associations so common in Spanish history, and known as *hermandades* (brotherhoods). The first meeting of its delegates took place at Castrourdiales near Bilbao in 1296, when the towns of Santander, Laredo, Bermeo, Guetaria, San Sebastian and Vitoria were represented. The *hermandad de la marisma* (of the seafarers)

of Castile supplied the squadrons which took an active part in the wars of the 14th and 15th centuries between France and England as allies of the French. Its history is obscure, and it came to an end with the establishment of the full authority of the crown by the Catholic sovereigns Ferdinand and Isabel.

The discovery of America, the acquisition by marriage or conquest of Sicily, Naples and Flanders, gave the kings of Spain a yet stronger motive for maintaining a powerful navy. The maxim that their ships were the bridges which joined their widely scattered dominions was fully accepted by them and their servants. But neither the Catholic sovereigns nor the Habsburgs who held the throne till 1700, made any attempt to organize a common navy. The sources from which the naval armaments of Spain were drawn during the greatness and decline of the country were these. Galleys were maintained in the Mediterranean, but they were mainly found by Sicily and Naples, or by the contracts which the kings of Spain made with the Genoese house of Doria. On the ocean the chief object of the Spanish government was to conduct and protect the severely regulated trade with America. Thus it was mainly concerned for long to obtain the lumbering and roomy vessels called "galleons," first designed by Alvaro de Bazan, marquess of Santa Cruz, which were rather armed traders than real warships. The crown did not build its own ships, but contracted for them with its admirals. The American convoys sailed from and returned to the Bay of Cadiz. One squadron, the *flota*, carried the trade, was navigated by the admiral, with whom was associated a general, who commanded the few warships proper, and was answerable for the protection of the whole. Another squadron, called of Cantabria, was maintained on the north coast, and was employed to see the convoy on its way and meet it on its return home. It had its own admiral and general. The ships were always treated as if they were transports for carrying soldiers. The seamen element was neglected. The command was divided between the *capitan de mar* (sea captain) who was responsible for the navigation and the *capitan de guerra* (soldier captain) who fought the ship. The same division went through all ranks. The soldiers would neither help to work the ship nor fight the guns. They used musketry only, or relied on a chance to board with sword and pike. Properly speaking there was no class of naval officers, and the overworked and depressed seamen could not supply good gunners. No general naval administration existed. The office of admiral of Castile became purely ornamental and hereditary in the family of Henriquez. It was not replaced by a navy office. One of the innumerable *juntas* or boards, through which the Spanish kings governed, looked after the making of contracts, and co-operated with the council of the Indes which was specially concerned with the American convoys. After the disasters of the later years of Philip II. (see ARMADA) some efforts at improvement were made. Better ships were built, and something was done to raise the condition of the seamen. But no thorough-going organization was ever created, and in the utter decadence of the 17th century the Spanish navy and seafaring population alike practically disappeared.

Under the Bourbon dynasty which attained the throne in 1700 the Spanish navy was revived, or rather a navy was created on the French model. Don Jose Patiño, a very able man, was named *intendente de la marina* in 1715, and in 1717 he drew up a draft naval organization and code, founded on the French *ordonnance* of 1689. Patiño's draft was the basis of the *ordenanzas generales* (general code) issued in 1748. The Spaniards even set up a squadron of galleys with a separate staff of officers, also on the French model, which was, however, suppressed in the year of the issue of the *ordenanzas generales*. Fine arsenals were organized at Ferrol and Carthagena. The navy thus created produced some distinguished officers, and fought some brilliant single ship actions. But the embarrassments of the treasury, the tendency of several of the kings to sacrifice their navy to political schemes requiring mainly the employment of troops and the ruin of the seafaring population during the 17th century, prevented it from ever attaining to a high level of efficiency. During the Peninsular War the new navy all but disappeared as the old had done. The want of pecuniary resources and internal instability have prevented its revival on any considerable scale.

The navy created by Patiño consisted in 1737 of 56 ships in all, of which 28 were of the line, of from 50 to 80 guns, with one of 114 guns. In 1746 the number of ships of the line had increased to 37. In 1759 the list of line of battle ships was 50—of which the majority, if not all, had been constructed by English shipbuilders, in the service of the Spanish government. In 1778, when at the height of its power, it contained 62 ships of the line.

Dutch Navy.

The Dutch fleet arose out of the great struggle with Spain in the 16th century. The Netherlanders had been a maritime people from the earliest antiquity. Under their medieval rulers, the counts of Holland and of Flanders and the House of Burgundy, they had rendered service at sea. The freemen owed the service known as the *riemtal* (*riem*, an oar). An admiralty office was established in 1397. But during the revolt against Philip II. of Spain, new naval forces were formed which had no connexion with the medieval navy, save in so far as the governments established in the different states which afterwards formed the Seven Provinces took possession of the jurisdiction and the dues of the medieval admiralty. The naval part of the war with Spain was for long conducted by the adventurers known as the "beggars of the sea," and was mainly confined to the coasts and rivers. In 1597, when the Confederation was formed and had provided itself with a common government in the states-general, the need for a regularly organized sea-going fleet was felt. In that year the banner of the states-general, the red lion with the arrows in its paw, was first hoisted during the expedition to Cadiz in alliance with England. On the 13th of August 1597 the states-general issued the decree (*Instructie*) which regulated the naval administration of the Republic until 1795. The attachment of the Netherlanders to their local franchises was too strong to permit of the establishment of a central authority with absolute powers. It was therefore necessary to make a compromise by which some measure of unity was secured while the freedom of the various confederate states was effectually guarded. Five boards of admiralty (*Admiraliteits collegien*) were recognized. They were: South Holland, or the Maas, sitting at Rotterdam; North Holland, or Amsterdam; Westfriesland (the western side of the Zuyder Zee), at Hoorn or Enkhuizen on alternate years; Zealand at Middleburg; and Friesland at Dokhum, or after 1645 at Harlingen. These bodies enjoyed all the rights of the admiralty and collected the port dues, out of which they provided for the current expenses of their respective squadrons. Extra-ordinary charges for war were met by grants from the province to which each board belonged. Some measure of unity was secured among these five independent authorities by three devices. Each board consisted of seven persons, of whom four were named by the province and required confirmation by the states-general, while three were chosen from other provinces to secure a representation of the commonwealth. The members of the boards took an oath of fealty to the states-general. The stadtholder was admiral-general. He presided at the board, and commanded the squadron. In his absence his place was taken by his lieutenant admiral-general. An oath of fealty was also taken to him, and all armed ships whether men-of-war or privateers sailed with his commission. He chose the captains from two candidates presented to him by the board. Delegates from the boards met twice a year to consult on the general interest. When the stadtholdership was suspended in 1650 the powers of the admiral-general were absorbed by their high mightinesses (*Hunne Hogen Mogen*) of the states-general. The staff of officers began with the lieutenant admiral-general and descended through the vice-admiral, the quaintly named *Schout-bij-nacht*, who was and is the rear-admiral, and whose title means "commander by night." These flag officers were named by the admiral-general or states-general. The captain (*Zeecapitän*) was selected from the provincial list. The lieutenants

were appointed by the local boards. No regular method of recruiting the corps of officers existed.

This compromise was in itself a bad system. With the exception of the board of North Holland, which was supported by the wealth of Amsterdam, the admiralties were commonly distressed for money. Unity of action was difficult to obtain. Much of the work of convoy which the state squadrons should have performed was thrown in the 17th century on directorates (*Directiën*) of merchants who fitted out privateers at their own expense. When there was no stadtholder, the local governing bodies trenched on the authority of the states-general, and indulged in a great deal of favouritism. In one respect the navy of the Dutch republic might have been taken as a model by its neighbours. The feeding of the crews was contracted for by the captains, who were required to enter into securities for the execution of the contract, and who had a reputation for probity. The Dutch crews, being better fed and looked after than the English, suffered less from disease. The clumsy organization of the Dutch navy put it at a disadvantage in its wars with England, but the seamanship of the crews, their good gunnery, and the great ability of many of their admirals made them at all times formidable enemies. No organic change was made till 1795, when the victories of the French revolutionary armies led to the formation of the Batavian republic. The five admiralties were then swept away and replaced by a committee for the direction of naval affairs, with a unified administration, organized by Pieter Paulus, a former official of the board of the Maas. As Holland was now swept into the general convulsion of the French Revolution, it followed the fortunes of France. Its navy, after belonging to the Batavian republic, passed to the ephemeral kingdom of Holland, created by Napoleon in favour of his brother Louis in 1806 and annexed to France in 1810. The Dutch navy then became absorbed in the French. After the fall of Napoleon a navy was created for the kingdom of the Netherlands out of the Dutch fragments of the Imperial force.

The United States.

The American navy came into existence shortly after the Declaration of Independence. As early as October 1775 Congress authorized the construction of two national cruisers, and, at the same time, appointed a marine committee to administer naval affairs. The first force, consisting of purchased vessels, badly fitted and built, and insufficiently equipped and manned, embraced two ships of 24 guns each, six brigs carrying from 10 to 12 guns, two schooners each with 8 guns, and four sloops, three of 10 guns and one of 4 guns. On December 22nd a personnel of officers was selected, one of the lieutenants being the well-known Paul Jones. Esek Hopkins was made commander-in-chief, but, having incurred the censure of Congress, he was dismissed early in 1777, and since then the title has never been revived except in the person of the president. In November 1776 the grades of admiral, vice-admiral, rear-admiral and commodore were assimilated in rank and precedence to relative army titles, but they were never created by law until 1862. During the war a number of spirited engagements occurred, but there was a great lack of efficient material at home, and agents abroad were not able to enlist the active sympathies of nations or rulers. Benjamin Franklin did manage to equip one good squadron, but this was rendered almost useless by internal dissensions, and it required the victory of Paul Jones in the "Bon Homme Richard" over the "Serapis" to bring about any tangible result for the risk taken. During the war 800 vessels of all classes were made prizes, but the navy lost by capture 11 vessels of war and a little squadron of gunboats on the lakes; and, with 13 ships destroyed to avoid capture by the British, 5 condemned, and 3 wrecked at sea, the country was practically without a naval force between 1780 and 1785.

Owing to the depredations upon commerce of the Barbary powers, Congress in 1794 ordered the construction of six frigates, prescribing that four of them should be armed with 44 guns and two with 36 guns; but, the Berbers having made peace, the number of vessels was reduced one-half, and no additions were made until 1797, when the "Constitution," "United States" and "Constellation" were built. The navy was at first placed under the war department, but a navy department with a secretary of its own was created in 1798. From 1815 to 1842 the secretary was aided by a board of commissioners chosen from among the naval officers, but in the latter year the department was reorganized into five bureaus, which were increased to eight in 1862. Each has a naval officer at its head. They deal with navigation, ordnance, equipment, navy yards, medicines, provisions, steam engineering and construction. The excellent naval academy at Annapolis was founded in 1845 by the then secretary of the navy, G. Bancroft. The war college for officers at Coasters Harbor, Newport, R.I., dates from 1884.

The Balance of Navies in History.

The five navies above discussed claim special notice on various grounds: the British, Dutch and French because they have been leaders and models; the Spanish because it has been closely associated with the others; the American because it was the first of the extra-European sea forces. But these great examples by no means exhaust the list of navies, old and new, which have played or now play a part. Every state which has a coast has also desired to possess forces on the sea. Even the papacy maintained a fighting force of galleys which took part in the naval transactions of the Mediterranean for centuries. The Turkish sultans have fitted out fleets which once were a menace to southern Europe. But in a survey of general naval history it is not necessary to give all these navies special mention, even though some of them have a certain intrinsic interest. Some, the Scandinavian navies for instance, have been confined to narrow limits, and have had no influence either by their organization, nor, save locally, by action. Others again have been the purely artificial creation of governments. Instances of these on a small scale are the navies of the grand duchy of Tuscany, or of the Bourbon kings of Naples.

Russia.

A much greater instance is the navy of Russia. Founded by Peter the Great (1689–1725), it has been mainly organized and has been most successfully led by foreigners. When the Russian government has desired for political reasons to make a show of naval strength, it has been numerous. In 1770, during the reign of Catherine II. (1762–1796), a Russian fleet, nominally commanded by the empress's favourite Orloff, but in reality directed by two former officers of the British navy, John Elphinston (1722–1785) and Samuel Greig (1735–1788), gained some successes against the Turks in the Levant. But when opposed to formidable enemies, as in the Crimean War, it has either remained in port, or has, as in the case of the war with Japan (1904–1905), proved that its vitality was not in proportion to its size.

The innumerable navies of South American republics are small copies of older forces.

Italy. Germany. Japan. Austria.

The 19th century did indeed see the rise of three navies, which are of a very different character—the Italian, which was the result of the unification of Italy, the German, which followed the creation of the German Empire, and the Japanese. But all three are contemporary in their origin, and have inevitably been modelled on older forces—the British and the French. With them must go the Austrian navy, excellent but unavoidably small.

Influence of sea power.

If we look at the relations which the navies of the modern world have had to one another, it will be seen that the great discoveries of the later 15th century shifted the seat of naval power to the ocean for two reasons. In the first place they imposed on all who wished to sail the wider seas opened to European enterprise by Vasco de Gama and Columbus the obligation to use a vessel which could carry water and provisions sufficient for a large crew during a long voyage. The Mediterranean states and their seamen were not prepared by resources or habit to meet the call. But there was a second and equally effective reason. The powers which had an Atlantic coast were incomparably better placed

than the Italian states, or the cities of the Baltic, to take advantage of the maritime discoveries of the great epoch which stretches from 1492 to 1526. In the natural course the leadership fell to Portugal and Spain. Both owed much to Italian science and capital, but the profit fell inevitably to them. The reasons why Spain failed to found a permanent naval power have been given, and they apply equally to Portugal. Neither achieved the formation of a solid navy. The claim of both to retain a monopoly of the right to settle in, or trade with, the New World and Asia was in due course contested by neighbouring nations. France was torn by internal dissensions (the Wars of Religion and the Fronde) and could not compete except through a few private adventurers. England and Holland were able to prove the essential weakness of the Spaniards at sea before the end of the 16th century. In the 17th century the late allies against Spain now fought against one another. Her insular position, her security against having to bear the immense burden of a war on a land frontier, and the superiority of her naval organization over the divided administration of Holland, gave the victory to Great Britain. She was materially helped by the fact that the French monarch attacked Holland on land, and exhausted its resources. Great Britain and France now became the competitors for superiority at sea, and so remained from 1689 till the fall of Napoleon in 1815.

During this period of a century and a quarter Great Britain had again the most material advantage: that her enemy was not only contending with her at sea, but was engaged in endeavouring to establish and maintain a military preponderance over her neighbours on the continent of Europe. Hence the necessity for her to support great and costly armies, which led to the sacrifice of her fleet, and drove Holland into alliance with Great Britain (Wars of the League of Augsburg, of the Spanish Succession, of the Austrian Succession and the Seven Years' War). During the War of American Independence France was in alliance with Spain and Holland, and at peace on land. She and her allies were able to impose terms of peace by which Great Britain surrendered positions gained in former wars. But the strength of the British navy was not broken, and in quality it was shown to be essentially superior.

The French Revolution undid all that the government of France had gained between 1778 and 1783 by attention to its navy and abstinence from wars on land. The result of the upheaval in France was to launch her into schemes of universal conquest. Other nations were driven to fight for existence with the help of Great Britain. In that long struggle all the navies of Europe disappeared except the French, which was broken by defeat and rendered inept by inaction, and the victorious British navy. When Napoleon fell, the navy of Great Britain was not merely the first in the world; it was the only powerful navy in existence.

The pre-eminent position which the disappearance of possible rivals had given to Great Britain lasted for several years unchallenged. But it was too much the consequence of a combination of circumstances which could neither recur nor endure. The French navy was vigorously revived under the Restoration and the government of Louis Philippe (the periods from 1815 to 1830 and 1830 to 1848). The emperor Nicholas I. of Russia (1825–1855) built ships in considerable numbers. As early as 1838 the fear that the naval superiority of Great Britain would be destroyed had already begun to agitate some observers. The "extremely reduced state" of the British navy, and the danger that an overwhelming force would be suddenly thrown on the English coast, were vehemently set forth by Commander W. H. Craufurd, and by an anonymous flag-officer. The peril to be feared, it was argued, was an alliance between France and Russia. In 1838 the British navy contained, built and building, 90 ships of the line, 93 frigates and 12 war steamers; the French, 49 of the line, 60 frigates and 37 war steamers, including armed packets; Russia, 50 of the line, 25 frigates and 8 steamers; the United States, 15 of the line, 35 frigates and 16 war steamers. The agitation of 1838 passed away, and the Crimean War, entailing as it did the destruction of a great part of the Russian fleet at Sebastopol, and proving the weakness of the Baltic fleet; and having, moreover, been conducted by an alliance of France and Great Britain against Russia, would seem to have shown that the anxieties of 1838 were exaggerated. But the rivalry which is inherent in the very position of states possessing sea coasts and maritime interests could not cease. The French imperial government was anxious to develop its navy. By the construction of the armoured floating batteries employed in bombardment of Kinburn in October 1855, and by the launch of the first seagoing ironclad "La Gloire" in 1859, it began a new race for superiority at sea, which has shown no sign of slackening since. The launch of the "Gloire" was followed by political events in Europe which brought forward new competitors, while great navies were developed in America and Asia.

Growth of modern rivalry in armaments.

The year 1871 was the beginning of a vast growth of naval armaments. It saw the completion of the unity of Italy and the formation of the German empire, two powers which could not dispense with strong fleets. But for some years the Italian and German navies, though already in existence, were still in a youthful stage. The rapid growth of the United States navy dates from about 1890, and the Japanese is a few years younger. France, Russia and Great Britain, in answer to them, began the race in which the efforts of each had a stimulating effect on the others. Though the alliance between France and Russia was not formed till later, their common interests had marked them out as allies from the first, and it will be no less convenient than accurate to treat Great Britain and the partners in the Dual Alliance as for some time opposed to one another.

England and the Dual Alliance.

In the general reorganization of her armaments undertaken by France after the war of 1870–71, her navy was not neglected. Large schemes of construction were taken in hand. The instability of French ministries, and the differences of principle which divided the authorities who favoured the construction of battleships from those who were partisans of cruisers and torpedo-vessels, militated against a coherent policy. Yet the French navy grew in strength, and Russia began to build strong vessels. As early as 1874 the approaching launch of a coast-defence ironclad at Kronstadt (the "Peter the Great" designed by the English constructor Sir E. J. Reed) caused one of the successive "naval scares" which recurred frequently in the coming years. It was, however, largely fictitious, and passed away without producing much effect. In 1878 the prospect of a war arising out of the Russian and Turkish conflict of that year, again stirred doubts as to the sufficiency of her naval armaments in England. Yet it was not till about 1885 that an agitation for the increase of the British fleet was begun in a consistent and continuous way. The controversy of the succeeding years was boundless, and was perhaps the more heated because the controversialists were not controlled by the necessity for using terms of definite meaning, and because the lists published for the purpose of making comparisons were inevitably of doubtful value; when ships built, building and ordered to be built, but not begun, were counted together—or as not infrequently happened, were all added on one side, but not on the other. The belief that the British navy was not so strong as it should be, in view of the dependence of the British empire on strength at sea, spread steadily. Measures were first taken to improve the opportunities for practice allowed to the fleet by the establishment of yearly naval manœuvres in 1885, and the lessons they afforded were utilized to enforce the necessity for an increase of the British fleet. In 1888 a committee of three admirals (Sir W. Dowell, Sir Vesey Hamilton and Sir R. Richards), appointed to report on the manœuvres of that year, gave it as their opinion that "no time should be lost in placing the British navy beyond comparison with that of any two powers." This verdict met a ready acceptance by the nation, and in 1889 Lord George Hamilton, then first lord of the admiralty, introduced the Naval Defence Act, which provided for the addition to the navy within four and a half years of 70 vessels of 318,000 tons at a cost of £21,500,000. The object was to obviate the risk of sudden reductions for reasons of economy in the building vote.

Later experience proved that the practice of fixing the amount to be spent for a period of years operated to restrict the freedom of government to make additions, for which the necessity had not been foreseen when the money was voted. But the act of 1889 did effect an immediate addition to the British fleet, while as was inevitable it stimulated other powers to increased efforts.

The rivalry between Great Britain and the states composing the Dual Alliance may be said to have lasted till 1904, when the course of the war in the Far East removed Russia from the field. It must be borne in mind that during the latter part of these twenty years Russia was largely influenced by the desire to arm against the growing navy of Japan. Comparisons between the additions to the fleets made on either side, even when supported by a great display of figures, are of uncertain value. Number is no sufficient test of strength when taken apart from quality, distribution, the command of coaling stations—which are of extreme value to a modern fleet—and other considerations. But the respective lists of battleships supply a rough and ready standard, and when taken with the number of men employed and the size of the budgets (both subject to qualifications to be mentioned) does enable us to see with some approximation to accuracy how far the rivals have attained their desired aims. In 1889, before the passing of the Naval Defence Act, the British navy contained 32 battleships of 262,340 tons. The united French and Russian fleets had 22 of 150,653 tons: of these 17 were French, 7 being vessels of wood plated with iron and therefore of no value when exposed to the fire of modern explosives. This is but one of many examples which might be given of the fallacious character of mere lists of figures. In 1894, when the Naval Defence Act had produced its effect, the comparative figures were: for Great Britain, 46 ironclads (or battleships) of 441,640 tons, and for the Dual Alliance 35 of 270,953—in which, however, the seven wooden vessels were still included. France and Russia had then large schemes of new construction—60,300 tons of ships over 10,000 tons for France, and 78,000 tons for Russia. The British figure was 70,000 tons. But the French and Russian list included mere names of vessels, of which the plans were not then drafted.

The rivalry in building went on as eagerly after 1894 as before. At the beginning of 1904 Great Britain had 67 battleships of 895,370 tons, as against 57 of 635,500 belonging to the powers of the Dual Alliance. The difference in favour of Great Britain was therefore 10 battleships, and 259,870 tons. Vessels not ready for service were included in the list, which therefore includes potential as well as actual strength. The balance in favour of Great Britain was less in 1904 than it had been in 1885 in mere numbers. During this period the naval budget of Great Britain had risen from £12,000,000 in 1885 to £34,457,500 in 1903–1904. The number of men employed had grown from 57,000 to 127,000. The figures for the Dual Alliance cannot be given with equal confidence. France had transferred the *troupes de la marine* or colonial troops from the navy to the army, which introduced a confusing element into the comparison, and the figures for Russian expenditure are very questionable. The total credit demanded for the French navy in 1890, the year after the passing of the British Naval Defence Act, was frs. 217,147,462. By 1903 the sum had risen to frs. 351,471,524. The Russian figures for 1890 are not attainable, but her budget for 1903 was £11,067,889 sterling. A comparison in numbers of men available is wholly misleading, since the British navy contains a large number of voluntarily enlisted men who serve for many years, and a small voluntary reserve, while France and Russia include all who are liable to be called out for compulsory service during a short period. There is no equality between them and the highly trained men of the British navy. The immense increase in its staff represents an addition to real power to which there is nothing to correspond in the case of continental states.

While this vast growth of naval power was going on in Great Britain, France and Russia, other rivals were entering into the lists with various fortunes. Italy may be said to have been the first comer. Her national navy, formed out of the existing squadrons of Sardinia, Tuscany and Naples, had stood the strain of war in 1866 very ill. The conditions in which the unity of the country had been achieved during the Franco-Prussian War of 1870–71, together with the obvious need for a navy in the case of a nation with a very extended sea coast, animated the Italians to great and even excessive efforts. Their policy was controlled by the knowledge that they could not hope to rival France in numbers, and they therefore aimed at obtaining individual vessels of a high level of strength. Italy may be said to have set the example of building monster ships, armed with monster guns. But she was unable to maintain her position in the race. The too hopeful finance in which she had indulged in the first enthusiasm of complete political unification led to serious embarrassment in 1894. Her naval budget sank from £4,960,000 in 1891 to £3,776,845 in 1897–1898, and only rose slowly to £5,037,642 in 1905–1906. As a candidate in the race for naval strength she necessarily held a subordinate place, though always to be ranked among the important sea powers. In 1903, when the rivalry of Great Britain and the Dual Alliance was at its height, her strength in battleships was 18, of 226,630 tons. In number, therefore, they did more than cover the balance in favour of Great Britain as against the Dual Alliance, but not in tonnage, in which the difference in favour of Great Britain was 259,870.

Competition of new navies: Italy.

The history of the German navy is one of foresight, calculation, consistency and therefore steady growth. The small naval force maintained by Prussia became the navy of the North German Federation after the war of 1866, and the Imperial navy after 1871. Until 1853 it had been wholly dependent on the war office. In that year an admiralty was created in favour of Prince Albrecht, but this office was abolished in 1861, and the navy was again placed under the war office. The first ministers of the navy under the North German Federation were generals; so was the first imperial minister, General Stosch (1871). Admiral Tirpitz, appointed in 1897, was the first minister who was bred a seaman. His predecessor, General Stosch, had been an excellent organizer and had done much for the efficiency of the service. It has been the rule of the German government, both before and since the foundation of the empire, to advance by carefully framed plans, without adhering to them pedantically when circumstances called for a modification of their lines. As early as 1867 a scheme had been formed for the construction of a navy of 16 ironclads and 50 smaller vessels, at a cost of £5,395,833. It was not sufficiently advanced in execution to allow Germany to make any efforts at sea in the war of 1870–71. In 1872 a supplementary grant of £3,791,666 was made for construction in view of the increased cost of armour and armaments. In 1882 a revised scheme was made which contemplated the construction of 100 vessels, and it was completed in 1888 by another which provided for the construction of 28 vessels, of which 4 should be battleships of the largest size, within the next six years. In 1894 and for some years afterwards the Reichstag showed itself hostile to a heavy expenditure on the navy, and refused many votes asked for by the government. Under the pressure of ambition and of the real needs of a nation with an extensive and growing maritime commerce, the expenditure grew in spite of the opposition of the Reichstag. Between 1874 and 1889 it rose from £1,950,000 to £2,750,000, and was increased in the following year to £3,600,000, from which figure it advanced by 1898 to £5,756,135. Another building scheme was framed in that year, but it was swept aside in 1900, under the combined influence of the exhortations of the emperor William II., and of the anger caused in Germany through the arrest by a British cruiser of a German steamer (the "Bundesrath") on the coast of Africa on a charge of carrying contraband of war to the Boers. The emperor was now able to obtain the consent of the Reichstag to an extended Naval Defence Act. By the terms of this measure it was proposed to spend £74,000,000 on construction, and £20,000,000 on the dockyards. With this money, by the year 1917 Germany was to be provided with a fleet of 38 battleships, together with a proportionate number of cruisers and other smaller vessels. Rapid progress was made not only with the programme itself but with the equipment of German dockyards

Germany.

and other establishments for providing the *matériel* of a great navy. In the spring of 1909 the serious menace to British supremacy at sea, represented by the growth of the new German fleet of battleships, led in England to a "scare" which recalled that of 1888, and to an energetic campaign for additional expenditure on the British navy.

During the years following on the American Civil War (1862–66) the United States paid small attention to the navy. In 1881 a board was appointed to advise on the needs of the navy, and in 1890, the board recommended the formation of a fleet of 100 vessels of which 20 should be battleships of the largest class. The reviving interest in the navy was greatly stimulated by the diplomatic difference with Great Britain which arose over the frontier question between her and the republic of Venezuela in 1896. Resolutions were passed in congress approving of an increase of the navy. The war with Spain in 1898 completed the revival of American interest in the navy. The acquisition of Porto Rico, and the protectorate of Cuba in the West Indies, together with the annexation of the Philippines, and the visible approach of the time when the relations of the powers interested in the Pacific would call for regulation, confirmed the conviction that a powerful fleet must be maintained. In 1889 the United States possessed no modern battleship. In 1899 there were 4 built and 8 building. At the close of 1903 there were built and building 27 of 353,260 tons, only two of them being of less than 10,000 tons. From £5,119,850 in 1890 the expenditure grew to £16,355,380 in 1903.

United States.

The navy of Japan, the last comer among the great naval forces of the world, may be said to date from 1895, from, in fact, the eve of the war with China. As an insular power with a large seafaring population, Japan is called upon to possess a fleet. Even in the days of its voluntary isolation it had a known capacity for maritime warfare. Its capacity for assimilating the ideas and mastering the mechanical skill of Europe have been in no respect better shown than in naval matters. From the moment it was compelled to open its ports it began not only to acquire steamers but to apply itself under European guidance to learning how to make and use them. A navy on the western model was already organized by 1895, but it was still of trifling proportions. In 1896 the Japanese navy had become an object of serious attention to the world. A plan was drafted in that year, and confirmed in the next, by which Japan arranged to supply itself, mainly by purchase in Europe, with a fleet containing 4 of the most powerful battleships. The scheme was modified in detail in 1898, when the decision was taken to increase the tonnage of the vessels. A little later additions were arranged for, and vessels building for South America states in English ports were purchased. The British model was carefully followed in naval organization, the alliance with England giving special facilities for this. And by 1904, when the war with Russia began, the unknown Japanese fleet proved its competence by victories at sea which put the seal on her position as a naval power.

Japan.

Conclusion.—When we look over the whole period from the end of the Napoleonic wars, one great fact is patent to our view. It is that this was an epoch of revival or development in the naval power of the whole world, in the course of which the position held by Great Britain in 1816 was partially lost simply by the growth of other powers. The situation in that year was by its very nature temporary, and a quotation of the respective numbers of warships then possessed by the world would have no value. An instructive comparison can, however, be made between the year 1838, when Great Britain began to be seriously concerned with the rise of possible enemies at sea, and the eve of the war between Russia and Japan. Battleships may again be taken as the test of strength, since nothing happened in the Russo-Japanese War to show that they do not still form the most vital element of naval power. We may also leave aside the many small fleets which cannot act collectively, and which individually do not weigh in the balance. The figures for 1838 are given above, but may be repeated for comparison. In that year Great Britain possessed, built and building, 90 ships of the line; France 49; Russia 50; the United States 15. In 1903 the number of vessels recognized as battleships, possessed by the great powers, was for Great Britain 67; for France 39; for Russia 18; for the United States 27; for Germany 27; for Italy 18; for Japan 5. At the first date the British fleet was among great powers as 90 to 114. At the latter it was as 67 to 134.

Such comparisons, however, as these become much more complicated in later years, when the importance of the preponderance of "Dreadnoughts"—the new type of battleship—(see SHIP and SHIPBUILDING)—was realized. By the invention of this type Great Britain appeared to obtain a new lead; and in 1907, when it was calculated that by 1910 there would be ten British "Dreadnoughts" actually in commission while neither in Europe nor America would a single similar ship have been completed by any foreign power, the situation seemed to be entirely in favour of complete supremacy at sea for the British fleet. But the progress of German and American construction, and particularly the experience gained of German ability to build and equip much more rapidly than had been supposed, showed by 1909 that, so far as "Dreadnoughts" were concerned at all events, the lead of Great Britain could only be maintained by exceptional effort and exceptional expenditure. It was admitted in parliament by the prime minister, first lord of the admiralty and foreign secretary—themselves Liberals who had flirted with proposals for disarmament, and who depended for office on the support of more extreme "pacifists" who objected on principle to heavy military and naval expenditure—that, while for the moment the British "two-power standard" was still in existence, the revelations as to German shipbuilding showed that it could only be maintained in the future by the creation of a new fleet on a scale previously not contemplated. The supremacy of Great Britain in ships of the older types would be of no avail as years went by and other powers were equalling her in the output of ships of the new type, and a new race thus began, of which it is impossible here to indicate more than the start. It was no longer a question of completed ships, but one still more of programmes for building and of the rate at which these programmes could be accomplished. At the beginning of 1910, while Great Britain had her ten "Dreadnoughts," it was not the case that other powers had none: Germany already had four and the United States two; and a knowledge of the naval programmes of both these countries, to speak of no others, showed that, unless either their policy changed or the British shipbuilding programme was modified so as to keep up with their progress, it would not take many years before the theory of the equality of the British fleet in "capital ships" to those of the next two naval powers would have to be abandoned. In England this situation created a profound sensation in 1909, since it was common ground that her fleet was her all in all, on which her empire depended; and the result was seen, not only in a considerable increase in the Naval Estimates of 1910–1911, but also in the beginning of a serious attempt to organize their fleets on the part of the British colonial dominions, which should co-operate with the mother country.

The British Admiralty figures for the state of the principal fleets as on March 31st, 1910, are summarized below. The letters at the heads of the columns have the following signification: E., England; F., France; R., Russia; G., Germany; I., Italy; U., United States; and J., Japan:—

BIBLIOGRAPHY.—*Ancient and General*:—Accounts of the naval organizations of the ancient world, and of the sea fighting of the time are to be found in the historians of Greece and Rome: Signor G. Corazzini has written a *Storia della marina militare antica* (Livorno, 1882). Valuable details of the Imperial Roman navy and of the Byzantine navy will be found in Professor Bury's appendices to his edition of Gibbon's *Decline and Fall*, vol. i. apx. 5, and vol. vi. apx. 5. General histories of the navies of the world have been written, but they are inevitably apt to be little more than jejune reviews of the dates, and results of battles. This is certainly the case with the great folio of the English writer Josiah Burchett, *A Complete History of the most remarkable transactions at Sea, from the earliest accounts of time to the conclusion of the last war with France, wherein is given an account of the most considerable Naval Expeditions, Sea Fights, Stratagems, Discoveries and other Maritime Occurrences that have happened among all nations that have flourished at Sea; and in a more particular manner of Great Britain from the time of the Revolution in 1688 to the aforesaid period* (1720). The later part is however valuable, for Burchett, who was secretary to the admiralty, had access to good authorities for his own time, and had served at sea as secretary to Russell, Lord Orford. There is an *Histoire de la marine de tous les peuples*, by M. A. du Sein (Paris, 1879) which is of no great value.

Medieval:—As regards the medieval navies the first place may be allowed to the Italians. A general bibliography of Italian nautical literature, *Saggio de una bibliografia marittima italiana*, occupying fifty-eight pages, drawn up by Signor Enrico Celani, will be found in the *Revista marittima*, supplement for 1894 (Rome). The histories of the different Republics of the middle ages record their maritime enterprises. An excellent book, which gives far more than its title promises, is the *Storia della marina pontificia* of A. Guglielmotti, O.P., in 10 volumes published at different times, and in two editions, at Florence 1856, &c. The general maritime history of the Mediterranean in the middle ages is well illustrated in the *Memorias sobre la marina comercio y artes de Barcelona* (1779–1792) by Don A. Capmany. The naval enterprises of the Norsemen are dealt with in a scholarly fashion by M. G. B. Depping, *Histoire des expéditions maritimes des Normands* (1826); and with newer knowledge by Mr C. F. Keary, *The Vikings of Western Christendom* (1891). The medieval periods of Western navies are treated in their respective naval histories.

Great Britain:—*The History of the Royal Navy to the French Revolution*, by Sir N. Harris Nicolas (1847), is unfortunately incomplete. It ends at the year 1422, but is the work of a most laborious and exact antiquary, who had been a naval officer in his youth. The administrative history of the British navy until 1660 is the subject of the *History of the Administration of the Navy and of Merchant Shipping in relation to the Navy* (1896) by Mr M. Oppenheim —a most valuable collection of materials. The campaigns and battles of the navy are told, generally from the public letters of the admirals, and with no great measure of criticism in several compilations. *The Naval History of England* (1735) by Mr T. Lediard, is copious and useful. The *Naval Chronology, or an Historical Summary of Naval and Maritime Events from the Time of the Romans to the Treaty of Peace 1802*, by Captain Isaac Schomberg (1802), contains a mass of valuable information, lists of ships, dates of construction, &c., and some administrative details. Less comprehensive, but still useful, is such a compilation as *The General History of the Late War* (that is, the Seven Years' War), by Dr John Entick "and other gentlemen" (1763). A much better book is *The Naval and Military Memoirs of Great Britain 1727 to 1783* (1804) by Mr R. Beatson, a very careful and well-informed writer who had seen some service as a marine officer. The *Lives of the British Admirals, containing a new and accurate Naval History from the earliest periods*, by Dr J. Campbell (1779), may be profitably consulted, with caution, for it by no means justifies its claim to novelty and accuracy in all parts. The *Naval History of Great Britain*, from 1793 to the accession of George IV., by Mr W. James (1827), republished with a continuation by Captain Chamier in 1837, is a standard authority. A far less useful work, which, however, is in parts written from first-hand knowledge, is *The Naval History of Great Britain* by Captain W. P. Brenton, first published in 1823, and republished in 1836. *The Field of Mars*, a compilation in dictionary form published in 1781, with an enormous title-page, is not without value for some of the naval transactions of the 18th century. The *History of the British Navy from the Earliest Period to the Present Time* (1863) by Dr C. D. Yonge, contains some original matter for the naval transactions of the 19th century. *The Royal Navy*, in 7 large volumes (1897–1903), edited and partly written by Sir W. L. Clowes, is a compilation of unequal value. Some of Sir W. L. Clowes's coadjutors, notably Captain Mahan and Sir C. R. Markham, are of high standing and authority. The book is copiously illustrated. *The Naval Chronicle*, 1799–1818, a magazine, contains masses of useful matter, for the Revolutionary and Napoleonic Wars. *The Royal Naval Biography* of Captain John Marshall, giving the lives of all officers on the list in 1823 or promoted later (1823–1835), with a supplement (1827–1830), may be consulted, but is too uncritical and too uniformly laudatory. *The Naval Biographical Dictionary: life and services of every living officer* (1846), by Lieutenant W. R. O'Bryne, is a solid book of reference. The publications of the Navy Record Society (1894 and subsequent years) contain large and valuable publications of original matter, with some reprints of old authorities, such as Sir W. Monson's *Tracts*, which were difficult of access. See also *A Short History of the Royal Navy*, by David Hannay.

France:—The naval history of France has been much written about since 1840. Not many of the books published have been of considerable value. The *Histoire maritime de la France* of M. Léon Guérin (1844), was meant to meet a popular demand and satisfy national vanity. The *Histoire de la marine française* of M. Eugène Sue (1845–1846) is mainly a romance, but it contains some useful evidence. The *Histoire de la marine française* of Le Comte de Bonfils Lablénie (1845), a naval officer, is of more value, but is somewhat wanting in criticism. The *Précis historique de la marine française* of M. Chasseriau (1845); the *Histoire générale de la marine* (1853); the *Histoire de la marine française* of M. le Saint (1877); and the *Histoire nationale de la marine française depuis Jean Bart* (1878) of M. Trousset are compilations. *La Marine de guerre, ses institutions militaires depuis son origine jusqu'à nos jours*, by Capne Gougeard (1877); the *Essai sur l'histoire de l'administration de la marine française* of M. Lambert de Sainte Croix (1892); and the excellent little book of M. Loir on *La Marine royale, 1789* (n.d.), may be consulted with pleasure and profit. The three books of M. Jal, *Archéologie navale* (1840), *Glossaire nautique* (1848) and *Abraham du Quesne et la marine de son temps* (1872) are all of high value. *Les Batailles navales de la France* of Capne Troude (1867), is a carefully written account of naval actions. The *Histoire de la marine française, pendant la guerre de l'indépendence américaine* (1877); *Sous la première république* (1886); *Sous le consulat et l'empire* (1886); *De 1815 à 1870* (1900); and *La Marine française et la marine allemande, 1870–1871* (1873) of Capne Chevalier, are thorough and critical. M. G. Lacour-Gayet, Professor at L'École supérieure de la Marine, has published two books of serious research, but marked by some national prejudice, *La Marine militaire de la France sous le règne de Louis XV.* (1902), and *La Marine militaire de la France sous le règne de Louis XVI.* (1905). The *Recherches sur l'ancien clos des galées de Rouen* (1864) of M. C. de Robillard de Beaurepaire, and the life of *Jean de Vienne* by the Marquis Terrier de Loray (1878), are valuable monographs on passages of early French naval history. The *Projets et tentatives de débarquement aux Iles britanniques* by Capne Desbrière (1900 seq.) is a most valuable authority. A very scholarly *Histoire de la marine française* was begun in 1899 by M. C. de la Roncière.

Miscellaneous:—The standard authorities for Spanish naval history are, *La Marina de Castilla* (1892), and *La Armada Españols desde la union de Castilla y Aragon* (1895–1901), of Captain Cesareo Fernandez Duro. The *Geschienes van het Nederlandsche Zeewezen* of Mr J. C. de Jonghe (1858), is an admirable and exhaustive history of the Dutch navy. *The History of the Maritime Wars of the Turks*, by Haji Khalfa (or Hugji Chalifa), translated by Mr J. Mitchell for the Oriental Translation Fund (1831), may be read with curiosity and some profit. There are two general histories of the navy of the United States by Fenimore Cooper (1839), and by Mr E. S. Maclay (1894); the second is the fuller, and the more critical. Captain Mahan's *Influence of Sea Power on History 1660–1783* (1890), and his *Influence of Sea Power upon the French Revolution and Empire 1793–1812* (1892), must be classed apart as studies of the general interaction of navies on one another and on international relations. The long series of readable monographs by Admiral Jurien de la Gravière, covering the whole field of naval warfare from the Peloponnesian War to his own time, contain much information and sound criticism. (D. H.)

NAVAL STRATEGY AND TACTICS

Historical Evolution.—That the methods of conducting war at sea have been conditioned by the capacity of the ships and their armament, and that capacity and armament have interacted upon one another, may appear to be platitudes. But they are none the less truths which must always be borne in mind when we are considering the history of naval strategy, that is, of the large movements by which a commander secures the advantage of fighting at a place convenient to himself, or of tactics—which are the movements he makes in battle. Throughout antiquity and the middle ages till the 16th century, the weapons relied on were—(1) the ship itself, used as a ram, (2) the swords of the crew, (3) such missile weapons as bolts from heavy crossbows

fired on the bulwarks, bows and arrows, weights dropped from a yard or pole rigged out, and the various means of setting an enemy alight; by shooting arrows with burning tow or by Greek fire or wild fire, blown through tubes (*cannae*, whence "cannon"). The nature of the "Greek fire" is still an unsettled question, and it is believed by some authorities that the Byzantines of the middle ages were acquainted with the use of gunpowder. However that may be, it is certain that even after the introduction of artillery in the 14th century, the means of injuring an enemy at a distance were nil, or were very feeble. All actions, therefore, were fought at close quarters, where ramming and boarding were possible. But the use of the ram was only available for a vessel driven by oars. A sailing vessel could not ram unless she were running before a good breeze. In a light wind her charge would be ineffective, and it could not be made at all from leeward. Therefore, while fleets depended on the methods of battle at close quarters, two conditions were imposed on the warship. She must be small and light, so that her crew could row her with effect, and she must carry a numerous crew to work her oars and board or repel boarders. Sails were used by the triremes and other classes of warship, ancient and medieval, when going from point to point—to relieve the rowers from absolutely exhausting toil. They were lowered in action, and when the combatant had a secure port at hand, they were left ashore before battle. These conditions applied alike to Phormio, the Athenian admiral of the 5th century B.C., to the Norse king Olaf Tryggveson of the 10th century A.D., and to the chiefs of the Christian and Turkish fleets which fought the battle of Lepanto in A.D. 1571. There might be, and were, differences of degree in the use made of oar and sail respectively. Outside the Mediterranean, the sea was unfavourable to the long, narrow and light galley of 120 ft. long and 20 ft. of beam. But the Norse ship found at Gokstad, though her beam is a third of her length, and she is well adapted for rough seas, is also a light and shallow craft, to be easily rowed or hauled up on a beach. Some medieval vessels were of considerable size, but these were the exception; they were awkward, and were rather transports than warships.

Early history.

Given a warship which is of moderate size and crowded with men, it follows that prolonged cruises, and blockade in the full sense of the word, were beyond the power of the sea commanders of antiquity and the middle ages. There were ships used for trade which with a favourable wind could rely on making six knots an hour—that is to say, twice the average speed attained by Captain Cook in his voyages of exploration. But a war fleet could not provide the cover, or carry the water and food, needed to keep the crews efficient during a long cruise. So long as galleys were used, that is to say, till the middle of the 18th century, they were kept in port as much as possible, and a tent was rigged over the deck to house the rowers. The fleet was compelled to hug the shore in order to find supplies. It always endeavoured to secure a basis on shore to store provisions and rest the crews. Therefore the wider operations were slowly made. Therefore too, when the enemy was to be waited for, or a port watched, some point on shore was secured and the ships were drawn up. It was by holding such a point that the Corinthian allies of the Syracusans were able to pin in the Athenians. The Romans watched Lilybeum in the same way, and Hannibal the Rhodian could run the blockade before they were launched and ready to stop him. The Norsemen hauled their ships on shore, stockaded them and marched inland. The Greeks of Homer had done the same and could do nothing else. Roger di Lauria, in A.D. 1285, waited at the Hormigas with his galleys on the beach till the French were seen to be coming past him. Edward III. in A.D. 1350, stayed at Winchelsea till the Spaniards were sighted. The allies at Lepanto remained at anchor near Dragonera till the last moment.

Given again that the fighting was at close quarters with ram, stroke of sword, crossbow bolt, arrow, pigs of iron or lead and wild fire blown through tubes, it follows that the formations and tactics were equally imposed on the combatants. The formation was inevitably the *line abreast*—the ships going side by side—for the object was to bring all the rams, or all the boarders into action at once. It was quite as necessary to strike with the prow when boarding as when ramming. If the vessels were laid side by side the oars would have prevented them from touching. It may be added that this rule prevailed equally with the sailing ship of later times, since they were built with what is technically called "a tumble home," that is to say, their sides sloped inwards from the water line, and the space from the top of the bulwarks of one to the other was too great to be jumped. The extent to which ramming or boarding would be used respectively would depend on the skill of the rowers. The highly trained Athenian crews of the early Peloponnesian War relied mainly on the ram. They aimed at dashing through an enemy's line, and shaving off the oars from one side of an opponent. When successfully practised, this manœuvre would be equivalent to the dismasting of a sailing line of battle ship. It was the *διέκπλους*, and it enabled the assailant to turn, and ram his crippled enemy in the stern (*περίπλους*) But an attack with the ram might be exceedingly dangerous to the assailant, if he were not very solidly built. His ram might be broken off in the shock. The Athenians found this a very real peril, and were compelled to construct their triremes with stronger bows, to contend with the more heavily built Peloponnesian vessels—whereby they lost much of their mobility. In fact success in ramming depended so much on a combination of skill and good fortune that it played a somewhat subordinate part in most ancient sea fights. The Romans baffled the ramming tactics of the Carthaginians by the invention of the *corvus* or crow, which grappled the prow of the rammer, and provided a gangway for boarders. After the introduction of artillery in the 14th century, when guns were carried in the bows of the galley, it was considered bad management to fire them until the prow was actually touching the enemy. If they were discharged before the shock there was always a risk that they would be fired too soon, and the guns of the time could not be rapidly reloaded. The officer-like course was to keep the fire for the last moment, and use it to clear the way for the boarders. As a defence against boarding, the ships of a weaker fleet were sometimes tied side to one another, in the middle ages, and a barrier made with oars and spars. But this defensive arrangement, which was adopted by Olaf Tryggveson of Norway at Swolder (A.D. 1000), and by the French at Sluys (A.D. 1340), could be turned by an enemy who attacked on the flank. To meet the shock of ramming and to ram, medieval ships were sometimes "bearded," *i.e.* fortified with iron bands across the bows.

Ancient Greek methods.

The principles of naval warfare known to the ancient world descended through Byzantium to the Italian Republics and from them to the West. With the growth of ships, the development of artillery, and the beginning of the great sailing fleets capable of keeping the sea for long periods together, came the need for a new adaptation of old principles. A ship which depended on the wind for its motive power could not hope to ram. It could still board, and the Spaniards did for long make it their main object to run their bow over an enemy's sides, and invade his deck. In order to carry out this kind of attack they would naturally try to get to windward and then bear down before the wind in line abreast ship upon ship. But an opponent to leeward could always baffle this attack by edging away, and in the meantime fire with his broadside to cripple his opponent's spars. Experience soon showed the more intelligent sea officers of all nations, that a ship which relied on broadside fire, must present her broadside to the enemy; it was also soon seen that in order to give full play to the guns of the fleet, the ships must follow one another. Thus there arose the practice of arranging ships in the *line ahead*, one behind the other. For a time sea-officers were inclined to doubt whether order could be maintained among vessels subject to the forces of wind and tide. But in the very first years of the 16th century, a Spanish writer of the name of Alonso de Chaves argued with force that even an approach to order is superior to none—and that, given the accidents of

Sailing ships.

wind and tide, the advantage would rest with him who took his precautions. The truth was so obvious that it could not but be universally accepted. The line ahead then became "the line of battle." This term has a double meaning. It may mean the formation, but it may also mean the ships which are fit to form parts of the line in action. The practice of sorting out ships, so as to class those fit to be in a line of battle apart from others, dates from the second half of the 17th century. Its advantages had been seen before, but the classification was not made universal till then. The excessive number of ships collected in those naval wars, their variety in size, and the presence in the fleets of a large proportion of pressed or hired merchant ships had led to much bad execution. But in the final battles of the first war between England and the Dutch Republic (1652–53), the Parliamentary admirals enforced the formation of the line by strong measures. On the conclusion of the war, they drew up the first published code of fighting instructions. These give the basis of the whole tactical system of the 17th and 18th centuries in naval warfare. The treatises of Paul Hoste, Bigot de Morogues and Bourdé de Villehuet, which were the text-books of the time, all French in origin but all translated into other languages, are commentaries upon and developments of this traditional code of practice.

"Line of battle."

The governing principles were simple and were essentially sound. The ships were arranged in a line, in order that each should have her broadside free to fire into the enemy without running the risk of firing into her own friends. In order to remove the danger that they would touch each other, a competent space, to allow for a change of course in case of need, was left between them. It was fixed at two cables—that is, 200 fathoms, or 400 yds. —though less room was occasionally taken. To reduce the number of men required to handle the sails, and leave them free to fight the guns, the ships fought under reduced canvas. But it was necessary to retain the power to increase the speed of a ship rapidly. This was secured by not sheeting home one of the sails—that is to say, it was left loose, and the wind was "spilt out of it." When the vessel was required to shoot ahead it was easy to sheet the sail home, and "let all draw." The fleets would fight "on the wind"—that is to say, with the wind on the side, because they were then under better control. With the wind blowing from behind they would take the wind out of one another's sails. When the course had to be altered, the ships turned by tacking—that is, head to wind—or by wearing—that is, stern to wind, either together or in succession. To tack or wear a large fleet in succession was a very lengthy operation. The second ship did not tack, or wear, till she had reached the place where the first had turned, and so on, down the whole line. By tacking or wearing together the order of a fleet was reversed, the van becoming the rear, and the rear the van. It must be remembered that a fleet was divided into van, centre and rear, which kept their names even when the order was reversed. Orders were given by signals from the flag-ship, but as they could not be seen by the ships in a line with her, frigates were stationed on the side of the line opposite to that facing the enemy "to repeat signals."

Principles of fighting tactics.

A main object which the admirals who drafted the orders had before them was to obviate the risk that the enemy would double on one end of the line and put it between two fires. It is obvious that if two fleets, A and B, are sailing, both with the wind on the right side, and the leading ship of A comes into action with the seventh or eighth of B, then six or seven leading ships of B's line will be free to turn and surround the head of A's line. This did actually happen at the battle of Beachy Head. Therefore, the orders enjoin on the admiral the strict obligation to come into action in such a way that his leading ship shall steer with the leading ship of the enemy, and his rear with the rear. The familiar expression of the British navy was "to take every man his bird."

The regular method of fighting battles was thus set up. In itself it was founded on sound principles. As it was framed when the enemies kept in view were the Dutch, who in seamanship and gunnery were fully equal to the British, its authors were justified in prescribing the safe course. Unhappily they added the direction that a British admiral was to keep his fleet, throughout the battle, in the order in which it was begun. Therefore he could take no advantage of any disorder which might occur in the enemy's lines. When therefore the conflict came to be between the British and the French in the 18th century, battles between equal or approximately equal forces were for long inconclusive. The French, who had fewer ships than the British, were anxious to fight at the least possible cost, lest their fleet should be worn out by severe action, leaving Great Britain with an untouched balance. Therefore, they preferred to engage to leeward, a position which left them free to retreat before the wind. They allowed the British fleet to get to windward, and, when it was parallel with them and bore up before the wind to attack, they moved onwards. The attacking fleet had then to advance, not directly before the wind with its ships moving along lines perpendicular to the line attacked, but in slanting or curving lines. The assailants would be thrown into "a bow and quarter line"—that is to say, with the bow of the second level with the after part of the first and so on from end to end. In the case of a number of ships of various powers of sailing, it was a difficult formation to maintain. The result was that the ships of the assailing line which were steering to attack the enemy's van came into action first and were liable to be crippled in the rigging. If the same formation was to be maintained, the others were now limited to the speed of the injured vessels, and the enemy to leeward slipped away. At all times a fleet advancing from windward was liable to injury in spars, even if the leeward fleet did not deliberately aim at them. The leeward ships would be leaning away from the wind, and their shot would always have a tendency to fly high. So long as the assailant remained to windward, the ships to leeward could always slip off.

The inconclusive results of so many battles at sea excited the attentions of a Scottish gentleman, Mr Clerk of Eldin (1728–1812), in the middle of the 18th century. He began a series of speculations and calculations, which he embodied in pamphlets and distributed among naval officers. They were finally published in book form in 1790 and 1797. The hypothesis which governs all Clerk's demonstrations is that as the British navy was superior in gunnery and seamanship to their enemy, it was their interest to produce a mêlée. He advanced various ingenious suggestions for concentrating superior forces on parts of the enemy's line—by preference on the rear, since the van must lose time in turning to its support. They are all open to the criticism that an expert opponent could find an answer to each of them. But that must be always the case, and victory is never the fruit of a skilful movement alone, but of that superiority of skill or of moral strength which enables one combatant to forestall or to crush another by more rapid movement or greater force of blow. Clerk's theories had at least this merit that they must infallibly tend to make battles decisive by throwing the combatants into a furious mingled strife.

Clerk's theories.

The unsatisfactory character of the accepted method of fighting battles at sea had begun to be obvious to naval officers, both French and English, who were Clerk's contemporaries. The great French admiral Suffren condemned naval tactics as being little better than so many excuses for avoiding a real fight. He endeavoured to find a better method, by concentrating superior forces on parts of his opponent's line in some of his actions with the British fleet in the East Indies in 1782 and 1783. But his orders were ill obeyed, and the quality of his fleet was not superior to the British. Rodney, in his first battle in the West Indies in 1780, endeavoured to concentrate a superior force on part of his enemy's line by throwing a greater number of British ships on the rear of the French line. But his directions were misunderstood and not properly executed. Moreover he did not then go beyond trying to place a larger number of ships in action to windward against a smaller number to leeward by arranging them at a less distance than two-cables length. But

an enemy who took the simple and obvious course of closing his line could baffle the attack, and while the retreat to leeward remained open could still slip away. On the 12th of April 1782 (battle of Dominica) Rodney was induced, by the disorder in the French line, to break his own formation and pass through the enemy. He took the French flag-ship and five other vessels. The favourable result of this departure from the old practice of keeping the formation intact throughout the battle ruined the moral authority of the orthodox system of tactics. In the French war which began in 1793 Lord Howe (battle of 1st of June) ordered his fleet to steer through the enemy, and to put themselves on his line only as a means of bringing his fleet into action, and then played to produce a mêlée in which the individual superiority of his vessels would have free play. Throughout the war, which lasted, with a brief interval of peace, from 1793 to 1815, British admirals grew constantly bolder in the method they adopted for producing the desired mêlée (battles of St Vincent, Camperdown, Trafalgar). It has sometimes been argued that their line of attack was rash and would have proved disastrous if tried against more skilful opponents. But this is one of those criticisms which are of value only against those who think that there can be a magic efficacy in any particular attack, which makes its success infallible. That the tactics of British admirals of the great wars of 1793–1815 had in themselves no such virtue was amply demonstrated at the engagement off Lissa in 1811. They were justified because the reliance of admirals on the quality of their fleets was well founded. It should be borne in mind that a vessel while bearing down on an enemy's line could not be exposed to the fire of three enemies at once when at a less distance than 750 yds., because the guns could not be trained to converge on a nearer point. The whole range of effective fire was only a thousand yards or a very little over. The chance that a ship would be dismasted and stopped before reaching the enemy's line was small.

Influence of improved ship-building.

The improvements in the construction of ships, which had so much influence on the development of tactics, had its effect also on strategy. The great aims of a fleet in war must be to keep the coast of its own country free from attack, to secure the freedom of its trade, and to destroy the enemy's fleet or confine it to port. The first and second of these purposes can be attained by the successful achievement of the third—the destruction or paralysis of the hostile fleet. But till after the end of the 17th century it was thought impossible, or at least very rash, to keep the great ships out of port between September and May or June. Therefore continuous watch on an enemy by blockading his ports was beyond the power of any navy. Therefore too, as the opponent might be at sea before he could be stopped, the movements of fleets were much subordinated to the need for providing convoy to the trade. It was not till the middle of the 18th century that the continuous blockade first carried out by Lord Hawke in 1758–59, and then brought to perfection by Earl St Vincent and other British admirals between 1793 and 1815, became possible.

Modern Times.—The interval of ninety years between 1815 and 1904 (the opening of the Russo-Japanese conflict) was marked by no naval war. There was fighting at sea, and there were prolonged blockades, but there were no encounters between large and well appointed navies. During this period an entire revolution took place in the means of propulsion, armament and material of construction of ships. Steam was applied to war-ships, at first as an auxiliary force, in the second quarter of the 19th century. The Crimean War gave a great stimulus to the development of the guns. It also brought about the application of iron to ships as a cuirass. Very soon metal was adopted as the material out of which ships were made. The extended use of shells, by immensely increasing the danger of fire, rendered so inflammable a substance as wood too dangerous for employment in a war-ship. France has the honour of having set the example of employing iron as a cuirass, while England was the first to take it as the sole material. Changes so sweeping as these could not take place without affecting all the established ideas as to the conduct of war at sea. The time of revolution in means of propulsion, armament and construction was also a time of much speculation. Doubts and obscurities remained unsolved because they had never been brought to the test of actual fighting on an adequate scale. As the 19th century drew to a close, another element of uncertainty was introduced by the development of the torpedo. A weapon which is a floating and moving mine, capable up to a certain point of being directed on its course, invisible or very hard to trace, and able to deliver its blow beneath the water-line, was so complete a novelty that its action was hard indeed to foresee and therefore particularly liable to be exaggerated. From the torpedo sprang too the submarine vessel, which aims at striking below the surface, where it itself is, like its weapon, invisible, or nearly so.

How to solve the problems which science has set has been the task of thoughtful naval officers—and of the governments which the military seaman serves. The questions to be solved may be stated in the following order. What would be the effect: 1st, of the employment of steam, or of any substitute for steam other than the wind or the oar; 2nd, of the development of the gun; 3rd, of the use of metal as a material of construction; 4th, of the use of a weapon and a vessel acting below the surface of the water, and if not wholly invisible at least very much hidden?

The belief that steam had given the lesser fleet an advantage over the greater—that it had, in a phrase once popular among Englishmen, "bridged the Channel,"—need only be touched on for its historical interest. It was an intelligible, perhaps pardonable, example of the confusion produced by a novelty of improved capacity on the minds of those who were not prepared to consider it in all its bearings. A moment's thought ought to have shown that where both sides had the command of steam, the proportion between them would remain what it was before. The only exception would be that the fleet which was steering in a direction already laid down would have a somewhat greater advantage than of old, over another which was endeavouring to detect its presence and course. Its movements would be more rapid, and it could steam through a fog by which it would be hidden in a way impossible for a sailing ship. On the other hand, such a fleet could be much more rapidly pursued and interrupted when once its course was known. The influence which the freedom and certainty of movement conferred by steam would have on the powers of fleets and ships presented a problem less easy to dispose of. Against the advantage they conferred was to be set the limitation they imposed. The necessity for replacing indispensable fuel was a restriction unknown to the sailing ship, which needed only to renew its provisions and water—stores more easily obtained all the world over than coal. Hence doubts naturally arose as to how far a state which did not possess coaling stations in all parts of the world could conduct extensive operations over great distances. The events of the recent Russo-Japanese War lead to the conclusion that the obligation to obtain coal has not materially limited the freedom of movement of fleets. By carrying store vessels with him, by coaling at sea, and taking advantage of the friendly neutrality of certain ports on his route, the Russian admiral, Rojdesvensky, reached the Far East in 1905 in less time and with less difficulty than he could have done in days when he would have been liable to delay by calms, contrary winds and loss of spars in gales. The amount of skill on the part of the crews required to carry a fleet a long distance would even appear to be less than it was of old. From this it would seem to follow that modern fleets possess no less capacity than the old sailing fleets for the great operations of war at a distance, or for maintaining blockades. Advantage and disadvantage counterbalance one another, and the proportion remains the same. Blockade is only another name for the maintenance of a watch on an enemy's squadron in port by a force capable of fighting him if he comes out. Admiral Togo blockaded the Russian squadron at Port Arthur in 1904 as effectually as any admiral has done the work in the past. The mobility given to the blockaded fleet by steam has been exactly counterbalanced by the increased mobility of the watch. The proportions remain the same.

But if the power to undertake far-ranging operations, and to confine an enemy to port by keeping him under observation, and driving him back when he comes out remains the same, the strategy of war at sea cannot have undergone any material alteration. The possession of ports where stores can be accumulated and repairs effected is an advantage as it always was. But a powerful fleet when operating far from its own country can supply itself with a store-house (a base) on the enemy's coast, or can be served at sea by store-ships, as of old. If beaten, it will suffer from the want of places of refuge as it always did.

"Fleet in being."

Among the speculations of recent years, a good deal has been heard of the "fleet in being." If this phrase is only used to mean that, so long as any part of an enemy's navy is capable of acting with effect, its existence cannot be ignored with the certainty of safety, then the words convey a truth which applies to all war whether by land or sea. If it means, as it was at least sometimes clearly intended to mean, that no such operation as the transport of troops oversea can be undertaken with success, so long as the naval forces of an opponent are not wholly destroyed, it is contrary to ancient experience. The Japanese in the beginning of 1904 began transporting troops to Korea before they had beaten the Russians, and they continued to send them in spite of the risk of interruption by the Vladivostok squadron. There was a risk, but risk is inseparable from war. The degree which can be incurred with sanity depends on the stake at issue, the nature of the circumstance and the capacity of the persons, which vary infinitely and must be separately judged.

Ramming.

The war of 1904–05 may also be said to have shown that the vast change in the construction of ships, together with the development of old and the invention of new weapons, has done far less to alter the course of battles at sea than had been thought likely. Two calculations have been successively made and have been supported with plausibility. The first was that steam would enable the ship herself to be used as a projectile and that the use of the ram would again become common. The sinking of the "Re d'Italia" by the Austrian ironclad Ferdinand Max at the battle of Lissa in 1866 seemed to give force to this supposition. Accidental collisions such as those between the British war-ships "Vanguard" and "Iron Duke," "Victoria" and "Camperdown" have also shown how fatal a wound may be given by the ram of a modern ship. But the sinking of the "Re d'Italia" was largely an accident. As between vessels both under full control, a collision is easily avoided where there is space to move. In a mêlée, or pell-mell battle, to employ Nelson's phrase, opportunities would occur for the use of the ram. But the activity of science has developed one weapon to counterbalance another. The torpedo has made it very dangerous for one fleet to rush at another. A vessel cannot fire torpedoes ahead, and when charging home at an opponent presenting his broadside would be liable to be struck by one. The torpedo may be said therefore to have excluded the pell-mell battle and the use of the ram except on rare occasions. But then arose the question whether the torpedo itself would not become the decisive weapon in naval warfare. It is undoubtedly capable of producing a great effect when its power can be fully exerted. A school arose, having its most convinced partisans in France, which argued that, as a small vessel could with a torpedo destroy a great battle-ship, the first would drive the second off the sea. The battle-ship was to give place to the torpedo-boat or torpedo-boat-destroyer which was itself only a torpedo-boat of a larger growth. But the torpedo is subject to close restrictions. It cannot be used with effect at more than two thousand yards. It passes through a resisting medium, which renders its course uncertain and comparatively slow, so that a moving opponent can avoid it. The vessel built to use it can be easily sunk by gun-fire. By night the risk from gun-fire is less, but science has nullified what she had done. The invention of the search-light has made it possible to keep the waters round a ship under observation all night. In the war between Russia and Japan the torpedo was at first used with success, but the injury it produced fell below expectations, even when allowance is made for the fact that the Russian squadron at Port Arthur had the means of repair close at hand. In the sea fights of the war it was of subordinate use, and indeed was not employed except to give the final stroke to, or force the surrender of, an already crippled ship. This war (and as much may be said for the war between the United States and Spain) confirmed an old experience. A resolute attempt was made by the Americans to block or blind (in the modern phrase to "bottle-up") the entrance to Santiago de Cuba by sinking a ship in it. The Japanese renewed the attempt on a great scale, and with the utmost intrepidity, at Port Arthur; but though a steamer can move with a speed and precision impossible to a sailing ship, and can therefore be sunk more surely at a chosen spot, the experiment failed. Neither Americans nor Japanese succeeded in preventing their enemy from coming out when he wished to come.

Torpedoes.

Gun-fire.

Since neither ram nor torpedo has established the claim made for it, the cannon remains "the queen of battles at sea." It can still deliver its blows at the greatest distance, and in the greatest variety of circumstances. The change has been in the method in which its power is applied. Now, as in former times, the aim of a skilful officer is to concentrate a superior force on a part of his opponent's formation. When the range of effective fire was a thousand or twelve hundred yards, and when guns could only be trained over a small segment of a circle because they were fired out of ports, concentration could only be effected by bringing a larger number of ships into close action with a smaller. To-day when gun-fire is effective even at seven thousand yards, and when guns fired from turrets and barbettes have a far wider sweep, concentration can be effected from a distance. The power to effect it must be sought by a judicious choice of position. It is true that greater rapidity and precision of fire produce concentration in one way. If of two forces engaged one can bring forty guns to bear on a chosen point of its opponent's formations, while that opponent can bring fifty guns to bear on a part of it, the superiority would seem to be with the larger number. But this is by no means necessarily the case. The smaller number of guns may give the greater number of blows if fired with greater speed and accuracy. Yet no commander has a right to rely on such a superiority as this till it has been demonstrated, as it had been in the case of the British fleet by the time that Trafalgar was fought. Therefore an able chief will always play for position. He will do so all the more because an advantage of position adds to any other which he may possess. He may dispense with it for a particular reason at a given moment and in reliance on other sources of strength, but he will not throw it away.

Position.

When position is to be secured the first condition to be thought of is the order in which it is to be sought for. The "line ahead" was imposed on the sailing fleets by the peremptory need for bringing, or at least retaining the power to bring, all their broadsides into action. Experiments made during manœuvres by modern navies, together with the experience gained in the war of 1904–05 in the Far East, have combined to show that no material change has taken place in this respect. It is still as necessary as ever that all the guns should be so placed as to be capable of being brought to bear, and it is still a condition imposed by the physical necessities of the case that this freedom can only be obtained when ships follow one another in a line. When in pursuit or flight, or when steaming on the look-out for a still unseen enemy, a fleet may be arranged in the "line abreast." A pursuing fleet would have to run the risk of being struck by torpedoes dropped by a retreating enemy. But it would have the advantage of being able to bring all its guns which can fire ahead to bear on the rear-ship of the enemy. When an opponent is prepared to give battle, and turns his broadside so as to bring the maximum of his gun-fire to bear, he must be answered by a similar display of force—in other words, the line ahead must be formed to meet the line ahead.

Both fleets being in this formation, how is the concentration of a superior force to be effected? If the opponents are equal in number, speed, armament, gunnery and the leadership of the

chiefs, accident alone can confer an advantage on either of them. Where equal weights are tried on accurate scales one cannot force up the other, but this evenness of power is rarely met in war by land or sea. The knowledge that it existed would probably prevent an appeal to arms between nations, since no decisive result could be hoped for. It is needless to insist that superior numbers make the task of concentrating comparatively easy, unless counterbalanced by a great inferiority in speed. Speed is the quality which an admiral will wish his fleet to possess, in order that he may have the power to choose his point of attack. The swifter of two forces, otherwise equal, can always get ahead of its opponent, and then by turning inwards bring the leading ship of the force it is attacking into a curve of fire. The leader of the slower fleet can avoid the danger by also turning inwards. By so doing he will keep the assailant on his beam, opposite his side. Then the two fleets will tend to swing round in two circles having a common centre, the swifter going round the outer circumference and the slower round the inner. As the difference in length of these two lines would be always great and perhaps immense, the less speedy fleet could easily avoid the risk of being headed. On the other hand the outer fleet will be in a concave formation, and therefore able to bring all its guns to bear on the same point, while the inner fleet will be in a convex line, so that it will be unable to bring the guns of both van and rear to bear on the same mark. The advantage is obvious, but it may perhaps be easily exaggerated. The swifter fleet on the larger circle can in theory concentrate all its fire on one point, but all its ships will still be under fire, and in practice it is found very difficult to make men neglect the enemy who is actually hitting them, and apply their attention entirely to another. Moreover the ships on the outer circle, having the larger line to cover, cannot allow themselves the same margin of steam-power to make good loss of speed by injury from shot. A fleet would not go at its maximum rate of common speed in action. A blow on the water-line might fill part of the ship's watertight compartments and reduce her speed. She must be able to make good the loss by putting on a greater pressure of steam, which she would not be able to do if already going at her maximum rate. In actual battle very much will depend on the respective skill of the gunnery. The swifter fleet might well find its superiority neutralised by the crippling of two or three of its leading ships. In such an action as this it will be, if not impossible, at least exceedingly difficult to give orders by signal. An admiral will therefore have to direct by example, which he cannot do except by placing his flag-ship at the head of the line. In that place he will be marked out as a target for the enemy's concentrated fire. He may indeed decide to direct the battle by signal from outside the line. Yet the difficulty he will find in seeing what is happening, as well as the difficulty the captains will find in seeing the signals, will always be so great, that in all probability the admirals of the future, will, like Nelson, be content to lay down the general principles on which the battle is to be fought, and trust the captains to apply them as circumstances arise. A large measure of independence must needs be allowed to the captains in the actual stress of battle. Ships must be placed at such a distance apart as will allow them room to manœuvre so as to avoid collision with their own friends. The interval cannot be less than 800 yds. When the length of the vessels themselves is added, it will be seen that a line of twelve vessels will stretch six miles. Modern powder is nominally smokeless, and it certainly does not create the dense bank of smoke produced by the old explosives. Yet it does create a sufficient haze to obscure the view from the van to the rear of an extended line. The movements must be rapid, and there will be little time indeed in which to take decisions. The torpedo may not be used during the actual battle. Its part will be to complete the destruction or enforce the surrender of a beaten enemy, and to cover retreats.

Speed.

The submarine and submergible vessel were brought into prominence by France in the hope that by diminishing the value of battleships they would reduce the superiority of the British navy. The example of France was followed by other powers, and particularly by Great Britain; but their value as weapons of war is necessarily a matter of speculation.

BIBLIOGRAPHY.—Naval strategy can hardly be said to have been dealt with at all till Captain Mahan published his *Influence of Sea Power on History*. The tactics of the ancient world are only very briefly dealt with in the *De re Militari* of Vegetius, in book iv. Vegetius was much copied and read in the middle ages, and was translated in 1284 by Jean de Meung, one of the authors of the *Roman de la Rose*. His translation is printed, together with the verse paraphrase of Priorats, in the *Anciens Textes français*. Naval tactics are dealt with in the treatise of Leo VI. the Tactician, and his son Constantine VII., or perhaps Constantine VIII., printed in Meursius' *Opera Omnia*, vol. vi. They were emperors of the Macedonian dynasty. The tactics of the medieval galleys are described, with references to authorities, both by A. Guglielmotti in *Marine Pontificia*, and by Admiral Jurien de la Gravière in *Les Derniers jours de la marine à rames* (1885). The chief writers on the tactics of the sailing fleets were French. At the head of them, in time and in merit, must be put Paul Hoste, whose folio on *Naval Evolutions* appeared in 1697. Hoste was a Jesuit who was secretary to the Count of Tourville. Hoste's treatise was translated into English and published in Edinburgh in 1834 with numerous and excellent illustrations by Captain J. D. Boswall, *A Treatise on Naval Tactics*. Captain Boswall also made use of the passages relating to naval tactics in the *History of the Art of War* by J. G. Hoyer, an officer in the Prussian army (1797–1800). Another excellent French treatise is *Le Manœuvrier* of Bourde de Villehuet (1765), translated into English in 1788 under the title of *The Manœuvrer, or Skilful Seaman*. Particular attention is due to the *Essay on Naval Tactics* by Mr Clerk of Eldin, first published in a collected form in 1804, but known in parts since 1780. Clerk was original in speculation and lucid in exposition. A French treatise, *L'Art de la guerre sur mer*, by the Vicomte de Grenier (1787), was less famous or influential, but was able and original. An exhaustive collection of "Fighting Instructions" and other material necessary to an intelligent understanding of the naval tactics of sailing fleets is the *Fighting Instructions 1530–1816*, edited by Mr Julian S. Corbett for the Navy Record Society (1905). Admiral Ekin's *Naval Battles* (1824) has some passages of value. It is comparatively easy to give authorities for the warfare of galleys and sailing ships. The case is altered when we have to deal with the tactics of steam fleets. Vast quantities of speculation have been written in every country which possesses a fleet, but, no test having been applied on a sufficient scale till the Russo-Japanese War of 1904, little of it can be said to possess approved authority. The facts of such wars as there have been are collected in Captain Mahan's *Life of Farragut* (1893) and *Lessons of the War with Spain* (1899), and in Mr H. W. Wilson's *Ironclads in Action, 1855–1895*. A standard work on evolutions and formations is *Elementary Naval Tactics*, by Captain Wm. Bainbridge Hoff of the United States navy, first published in 1894, but reprinted since with enlargements. The *Naval Warfare* of Admiral P. H. Colomb is a collection of historical examples meant to illustrate the principles of naval strategy for application in modern conditions. The third edition, revised and corrected, with additions, appeared in 1899. (D. H.)

NAWAB, a Mahommedan title for a native ruler in India, answering to the Hindu raja. Nawab originally means a deputy, being the honorific plural of the Arabic *naib*, and it was applied to a delegate of a supreme chief, the viceroy or governor under the Great Mogul, *e.g.* the nawab of Oudh. From this use it became a title of rank, without office, and is now sometimes conferred by the British government on Mahommedan gentlemen for distinguished service.

NAWABGANJ, the name of three towns of British India. (1) The most important is the headquarters of Bara Banki district in the United Provinces, on the Oudh and Rohilkhand railway, 17 m. E. of Lucknow; pop. (1901) 14,478. It has a considerable trade in sugar and cotton goods. It was the scene of a victory by Sir Hope Grant during the Mutiny. (2) A town in Malda district, Eastern Bengal and Assam, on the Mahananda near its junction with the Ganges, a centre of river trade; pop. (1901) 17,016. (3) A town in Gonda district, United Provinces, on the Bengal and North-Western railway; pop. (1901) 7047.

NAWANAGAR, or JAMNAGAR, a native state of India, in Kathiawar, within the Gujarat division of Bombay, situated on the south of the Gulf of Cutch. Area, 3791 sq. m. Pop. (1901) 336,779, showing a decrease of 11% in the decade due to famine. Estimated revenue, £170,000; tribute, £8000. The chief, whose title is Jam, is a Jareja Rajput of the same clan as the rao of Cutch. Prince Ranjitsinjhi (b. 1872), well known in England as a cricketer, was educated at the Rajkumar College,

Rajkot, and Trinity College, Cambridge. He had been adopted by his uncle, the Jam Shri Vibhaji, but the adoption was set aside, with British sanction, in favour of a son by a Mahommedan mother. This son succeeded, but died in 1906 aged twenty-four, and Ranjitsinjhi obtained the throne in March 1907. A branch railway, constructed at the expense of the state, was opened in 1898 from Rajkot to Nawanagar town.

The town of Nawanagar is about 5 m. from the seaport of Bedi. Pop. (1901) 53,844. Founded by Jam Rawal in 1540, it is built of stone, and has manufactures of silk and gold embroidery, and perfumed oils and red powder for ceremonial purposes. Its water is supplied from a reservoir covering 600 acres and an aqueduct 8 m. long.

NAWĀWĪ [ABŪ ZAKARĪYYA IBN SHARAF UN-NAWĀWĪ] (1233–1278), Arabian writer, was born at Nawā near Damascus. In the latter city he studied from his eighteenth year, and there, after making the pilgrimage in 1253, he settled as a private scholar until 1267, when he succeeded Abu Shāma as professor of tradition at the Ashrafiyya school. He died at Nawā from overwork.

His manual of Moslem law according to the Shāfi'ite school has been edited with French translation by van den Bergh, 2 vols., Batavia (1882–1884), and published at Cairo (1888). The *Tahdhīb ul-Asmā'i* has been edited as the *Biographical Dictionary of Illustrious Men chiefly at the Beginning of Islam* by F. Wüstenfeld (Göttingen, 1842–1847). The *Taqrīb wa Taisīr*, an introduction to the study of tradition, was published at Cairo, 1890, with Suyūṭi's commentary. It has been in part translated into French by M. Marcais in the *Journal asiatique*, series ix., vols. 16-18 (1900–1901). Nawāwi's collection of the forty (actually forty-two) chief traditions has been frequently published with commentaries in Cairo. For other works see C. Brockelmann's *Gesch. der arabischen Litteratur*, vol. i. (Weimar, 1898), pp. 395-397. (G. W. T.)

NAXOS, the largest of the Cyclades (about 22 m. by 16 m.), a fertile island in the Aegean Sea, east of Paros, with which, and adjacent smaller islands, it forms an *eparchia*. In ancient times it was also called Dia or Strongyle. It was rich in vines and famous for its wine, and a centre of the worship of Bacchus. The god found Ariadne asleep on its shore, when she was deserted by Theseus. The sculptors of Naxos formed an important school of early Greek art; several unfinished colossal statues are still to be seen in the quarries, notably one in Apollona Bay, to the N.E. of the island. A tyrant Lygdamis ruled Naxos in alliance with Peisistratus of Athens during the 6th century B.C. In 501 a Persian fleet unsuccessfully attacked it, but in 490 it was captured and treated with great severity. Four Naxian ships took part in the expedition of Xerxes, but deserted and fought on the Greek side at Salamis in 480. Naxos was a member of the Delian League (*q.v.*); it revolted in 471, was captured by Athens, and remained in her possession till her empire was destroyed. In later times the most remarkable event was its capture, in A.D. 1207, by the Venetian Marco Sanudo, who founded the duchy of Naxos, which flourished till the Turks took the island in 1566. Since the War of Independence it has belonged to the Greek kingdom. The only ancient remains of any importance are those of a temple (Palati), supposed to be that of Dionysus, on an island just off the town. Naxos is still rich in fruit trees, and also exports corn, wine and oil, as well as emery, its richest and most important mineral product. Pop. (1907) 25,185 (province), 2064 (commune).

NAXOS, the earliest Greek colony in Sicily, was founded by Theocles from Chalcis in 735 B.C., on the E. coast, S. of Tauromenium (mod. Taormina), in a low-lying situation just N. of the mouth of the river Alcantara, where the castle of Schiso now stands. The adoption of the name of Naxos, the island in the Aegean Sea, seems to indicate that there were Naxians among its founders. Within a few years it became strong enough to found Leontini and Catana. Naxos was the warmest ally of Athens in the Sicilian expedition. In 403 B.C. it was destroyed by Dionysius and handed over to the Sicels, but was never rebuilt. Its place was supplied in 358 by Tauromenium. Scanty traces of its walls are to be seen, of irregular blocks of lava, especially on the south, parallel to the river (E. A. Freeman, *Hist. of Sic.* i. 323). Without the city stood the altar of Apollo Archegetes, at which all sacred embassies that left Sicily sacrificed before their departure (Thuc. vi. 3).

NAY, or NEY, the long flute of the ancient Egyptians, held obliquely and played by directing the breath, as in the pipes of the syrinx, across the open end, which had no embouchure of any kind. Performers on the nay are represented on many of the frescoes which decorated the tombs at Thebes, their flutes reaching nearly to the ground while they are in the familiar half-kneeling posture. The acoustic principles involved in the production of sound are the same as for the flute. The narrowness of the bore in proportion to the length would facilitate the production of harmonics and so give the nay an extended compass. Victor Loret[1] has compiled a list of all the real pipes of ancient Egypt which have survived, having for the most part been preserved in mummy cases. The nay was not restricted to ancient Egypt, but has remained in general use in various parts of the East until the present day. (K. S.)

NAYAGARH, a native state in India, in the Orissa division of Bengal. Area, 588 sq. m.; pop. (1901) 140,779; revenue, £8000. It contains hills rising to 5000 ft.; and exports much agricultural produce. In 1894 a revolt of the hill tribe of Khonds against the raja required the intervention of British military police. Nayagarh village (pop. 3340) is connected by road with Khurda in Puri district.

NAYAR, or NAIR, a caste or tribe on the W. coast of S. India, who form the dominant race in Malabar. Traditionally they are soldiers, but many have taken to professions, and one was in 1910 a judge of the high court at Madras. Their total number in all India in 1901 was just over one million. Their most peculiar customs are: (1) *marumakkattayam* = "descent through sister's children," or inheritance in the female line; and (2) *sambandham*, a loose form of union, taking the place of marriage, without any responsibility of the husband towards either wife or children. In 1896 an act of the Madras legislature enabled a *sambandham* to be registered, and have the force of a legal marriage. Little advantage has been taken of this act, while it is alleged that the *sambandham* now usually lasts for a lifetime.

See *Malabar District Gazetteer* (Madras, 1908).

NAYLER (or NAYLOR), **JAMES** (1618–1660), English Puritan, was born at Andersloe or Ardsley, in Yorkshire, in 1618. In 1642 he joined the parliamentary army, and served as quartermaster in John Lambert's horse. In 1651 he adopted Quakerism, and gradually arrived at the conviction that he was a new incarnation of Christ. He gathered round him a small band of disciples, who followed him from place to place. At Appleby in 1653 and again at Exeter in 1655 he suffered terms of imprisonment. In October 1655, in imitation of Christ's procession into Jerusalem, he entered Bristol on horseback riding single—"a rawboned nude figure, with lank hair reaching below his cheeks"—attended by seven followers, some on horseback, some on foot, he in silence and they singing "Hosanna! Holy, holy! Lord God of Sabaoth!" At the High Cross he and his followers were arrested. His trial occupied the second parliament of Cromwell for several days, and on the 16th of December 1656 he was convicted of blasphemy and sentenced to be whipped from the Palace Yard to the Old Exchange, to be branded in the forehead with "B" (for blasphemer), to have his tongue bored with a red-hot iron, to be whipped through the streets of Bristol, and to suffer imprisonment with hard labour for two years. On his release he was readmitted into the communion of the Quakers, and spent some time in Westmorland with George Whitehead (1636?–1723). In October 1660 Nayler set out to visit his long-forsaken family in Yorkshire, but died on the journey in Huntingdonshire.

A collected edition of the *Tracts* of Nayler appeared in 1716. See *A Relation of the Life, Conversion, Examination, Confession, and Sentence of James Nayler* (1657); a *Memoir of the Life, Ministry, Trial, and Sufferings of James Nayler* (1719); and a *Refutation of some of the more Modern Misrepresentations of the Society of Friends commonly called Quakers, with a Life of James Nayler*, by Joseph Gurney Bevan (1800).

NAZARENES (*Nαζωραῖοι*), an obscure Jewish-Christian sect, existing at the time of Epiphanius (fl. A.D. 370) in Coele-Syria, Decapolis (Pella) and Basanitis (Cocabe). According to that authority (*Panarion*, xxix. 7) they dated their settlement in Pella from the time of the flight of the Jewish Christians from Jerusalem, immediately before the siege in A.D. 70; he characterizes them as neither more nor less than Jews pure and simple, but adds that they recognized the new covenant as well as the old, and believed in the resurrection, and in the one God and His Son Jesus Christ. He cannot say whether their christological views were identical with those of Cerinthus and his school, or whether they differed at all from his own. But Jerome (*Ep.* 79, to Augustine) says that they believed in Christ the Son of God, born of the Virgin Mary, who suffered under Pontius Pilate, and rose again, but adds that, "desiring to be both Jews and Christians, they are neither the one nor the other." They used the Aramaic recension of the Gospel according to Matthew, which they called the Gospel to the Hebrews, but, while adhering as far as possible to the Mosaic economy as regarded circumcision, sabbaths, foods and the like, they did not refuse to recognize the apostolicity of Paul or the rights of heathen Christians (Jer., *Comm. in Isa.*, ix. 1). These facts, taken along with the name (cf. Acts xxiv. 5) and geographical position of the sect, lead to the conclusion that the Nazarenes of the 4th century are, in spite of Epiphanius's distinction, to be identified with the Ebionites (*q.v.*).

NAZARETH (mod. *en-Nāṣira*), a town in Galilee, in a hollow of the hills on the southern border of the plain of Esdraelon. It first appears as a village (John i. 46) in which Joseph and Mary lived (Luke i. 26) and to which they returned from Egypt (Matt. ii. 23). Here the unrecorded years of Christ's boyhood were spent. From the name of the town comes *naṣāra* (*i.e.* "Nazarenes"), the ordinary oriental word for "Christians." There was here a synagogue (Matt. xiii. 54) in which Christ preached the sermon that led to his rejection by his fellow townsmen. The growth of legends and traditional identifications can be traced in the writings of the pilgrims who have visited the town from Jerome's time till our own. For none of these can anything be said, save that it is possible that the village spring (called "St Mary's Well") is the same as that used in the time of Christ. A large basilica stood here about A.D. 600: the crusaders transferred here the bishopric of Scythopolis. It was taken by Saladin in 1187. In 1517 it was captured by the Turks. The population is now estimated at about 3500 Moslems and 6500 Christians; there are numerous schools, hospitals, &c., conducted by Greeks, Latins and Protestants. Visitors are shown the "Church of the Annunciation" with caves (including a fragment of a pillar hanging from the ceiling, and said to be miraculously supported) which are described as the scene of the annunciation, the "workshop of Joseph," the "synagogue," and a stone table, said to have been used by Christ.

NAZARITE, or rather NAZIRITE, the name given by the Hebrews to a peculiar kind of devotee. The characteristic marks of a Nazarite were unshorn locks and abstinence from wine (Judges xiii. 5; 1 Sam. i. 11; Amos ii. 11 seq.); but full regulations for the legal observance of the Nazarite vow are given in Num. vi., where every product of the grape-vine is forbidden, and the Nazarite is enjoined not to approach a dead body, even that of his nearest relative. The law in question is in its present form post-exilic, and is plainly directed to the regulation of a known usage. It contemplates the assumption of the vow for a limited period only, and gives particular details as to the atoning ceremonies at the sanctuary by which the vow must be recommenced if broken by accidental defilement, and the closing sacrifice, at which the Nazarite on the expiry of his vow cuts off his hair and burns it on the altar, thus returning to ordinary life. Among the later Jews the Nazarite vow, of course, corresponded with the legal ordinance, which was further developed by the scribes in their usual manner (Mishna, tractate *Nāzīr*; cf. 1 Macc. iii. 49; Acts xxi. 23 seq.; Joseph. *Ant.* xix. 6. 1, *Wars* ii. 15. 1). On the other hand, in the earliest historical case, that of Samson, and in the similar case of Samuel (who, however, is not called a Nazarite), the head remains unshorn throughout life, and in these times the ceremonial observances as to uncleanness must have been less precise. Samson's mother is forbidden to eat unclean things during pregnancy, but Samson himself touches the carcass of a lion and is often in contact with the slain, nor does he abstain from giving feasts.[1]

In the cases of Samuel and Samson the unshorn locks are a mark of consecration to God (Judges xiii. 5) for a particular service—in the one case the service of the sanctuary, in the other the deliverance of Israel from the Philistines. Since, moreover, the Hebrew root *n-z-r* is only dialectically different from *n-d-r*, "to vow," both corresponding to the same original Semitic root (Arab. *n-dh-r*), it would seem that the peculiar marks of the Nazarite are primarily no more than the usual sign that a man is under a vow of some kind. To leave the locks unshorn during an arduous undertaking in which the divine aid was specially implored, and to consecrate the hair after success, was a practice among various ancient nations, but the closest parallel to the Hebrew custom is found in Arabia.[2] There the vow was generally one of war or revenge, and, till it was accomplished, the man who vowed left his hair unshorn and unkempt, and abstained from wine, women, ointment and perfume. Such is the figure of Shanfara as described in his *Lāmīya*. The observances of the *iḥrām* (period of consecration) belong to the same usage (see MECCA), and we find that at Tāif it was customary to shear the hair at the sanctuary after a journey. The consecration of Samuel has also its Arabic parallel in the dedication of an unborn child by its mother to the service of the Ka'ba (Ibn Hishām, p. 76; Azraḳī, p. 128). The spirit of warlike patriotism that characterized the old religion of Israel could scarcely fail to encourage such vows (cf. 2 Sam. xi. 11, and perhaps 1 Sam. xxi. 4 seq.), and from the allusion in Amos we are led to suppose that at one time the Nazarites had an importance—perhaps even an organization—parallel to that of the prophets, but of a very different religious type from the Canaanite nature-worship.

See RECHABITES; *Encyc. Bibl.* col. 3362 seq.; G. B. Gray, *Numbers*, pp. 56-61; E. Kautzsch (*l.c.* n. 1 below); W. R. Harper, *Amos and Hosea*, p. li. sq., with references. (W. R. S.; S. A. C.)

NAZARIUS (4th century A.D.), Latin rhetorician and panegyrist, was, according to Ausonius, a professor of rhetoric at Burdigala (Bordeaux). The extant speech of which he is undoubtedly the author (in E. Bährens, *Panegyrici Latini*, No. 10) was delivered in 321 to celebrate the fifteenth anniversary of the accession of Constantine the Great, and the fifth of his son Constantine's admission to the rank of Caesar. The preceding speech (No. 9), celebrating the victory of Constantine over Maxentius, delivered in 313 at Augusta Trevirorum (Trier), has often been attributed to Nazarius, but the difference in style and vocabulary, and the more distinctly Christian colouring of Nazarius's speech, are against this.

See M. Schanz, *Geschichte der römischen Litteratur*, iii. (1896); Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans., 1900), 401. 6.

NEAGH, LOUGH, the largest lake (Irish, "lough") in the British Isles, situated in the north-east of Ireland, in the province of Ulster, its waters being divided between counties Antrim (N. and E.), Down (S.E.), Armagh (S.), Tyrone and Londonderry (W.). Its shape is an irregular oblong, its extreme measurements being 18 m. from N.E. to S.W. 16 from N. to S., and 11 from E. to W. Its circumference, without including minor indentations, is about 64 m., and its area 98,255 acres or about 153 sq. m. The shores are generally flat and marshy, or very gently sloping, but flat-topped hills rise near the northern shore, where the lake reaches its extreme depth of 102 ft. The mean height above sea-level is 48 ft. Though the lough receives a large number of

[1] The prohibition to Samson's mother to abstain from wine does not appear to belong to the original narrative (see E. Kautzsch, Hastings's *D.B.* v. 657 col. *b*, following Böhme). John the Baptist is a later example of lifelong consecration (Luke i. 15); cf. also the tradition as to James the Just (Euseb. *H.E.* ii. 23).

[2] On consecration of the hair, see Spencer, *De Legibus Hebr.* iii. 1, 6; I. Goldziher, *Rev. Hist. Rel.* xiv. 49 sqq. (1886); J. G. Frazer, *Golden Bough*[2], i. 368 sqq.; and W. R. Smith, *Rel. Sem.*[2], Index, *s.v.* "hair."

streams, the river Bann alone carries off its waters, flowing northward. The principal feeders are the Main on the north, the Crumlin (whose waters have petrifying powers) on the east, the Bann and Blackwater on the south, and the Ballinderry and Moyola on the west. Antrim and Toome, at the N.E. and N.W. respectively, are the only towns immediately on the shores. The islands are few and near the shores; namely, Skady Tower on the north, Ram's Island (with a ruined round tower) on the east, Ready and Coney Islands on the southwest. The lough abounds in fish, including gillaroo trout, char and pullen or fresh-water herring. A tradition that the lough rose suddenly from a fountain, inundating a populous district, and that remains of buildings may be seen below the waters, finds place in Thomas Moore's ballad *Let Erin remember*.

NEAL, DANIEL (1678–1743), English historian, born in London on the 14th of December 1678, was educated at the Merchant Taylors' School, and at the universities of Utrecht and Leiden. In 1704 he became assistant minister, and in 1706 sole minister, of an independent congregation worshipping in Aldersgate Street, and afterwards in Jewin Street, London, where he remained almost until his death on the 4th of April 1743. He married Elizabeth Lardner (d. 1748), by whom he had one son, Nathanael, and two daughters. In 1720 Neal published his *History of New England*, which obtained for its author the honorary degree of M.A. from Harvard college. He also undertook to assist Dr John Evans in writing a history of Nonconformity. Evans, however, died in 1730, and, making use of his papers for the period before 1640, Neal wrote the whole of the work himself. This *History of the Puritans* deals with the time between the Reformation and 1689; the first volume appearing in 1732, and the fourth and last in 1738. The first volume was attacked in 1733 for unfairness and inaccuracy by Isaac Maddox, afterwards bishop of St Asaph and of Worcester, to whom Neal replied in a pamphlet, *A Review of the principal facts objected to in the first volume of the History of the Puritans*; and the remaining volumes by Zachary Grey (1688–1766), to whom the author made no reply.

The *History of the Puritans* was edited, in five volumes, by Dr Joshua Toulmin (1740–1815), who added a life of Neal in 1797. This was reprinted in 1822, and an edition in two volumes was published in New York in 1844.

NEAL, DAVID DALHOFF (1838–), American artist, was born at Lowell, Massachusetts, on the 20th of October 1838. He was a pupil of the Royal Academy, Munich, under Max. E. Ainmiller, whose daughter he subsequently married. Later he entered the studio of Piloty, with whom he remained from 1869 to 1876. His picture, "The First Meeting of Mary Stuart and Rizzio," won for him the great medal of the Royal Bavarian Academy of Art. Besides portraits his canvases include "James Watt," a large historical composition shown at the Royal Academy, 1874, "Chapel of the Kings at Westminster" (collection of F. Cutting, Boston) and "Cromwell visiting Milton" (Hurlbut collection, Cleveland, Ohio).

NEALE, EDWARD VANSITTART (1810–1892), English co-operator and Christian Socialist, was born at Bath on the 2nd of April 1810, the son of a Buckinghamshire clergyman. After receiving his earlier education at home he went to Oriel College, Oxford. In 1837 he was called to the bar at Lincoln's Inn. He became a member of the Christian Socialists in 1850 and also joined the council of the Society for Promoting Working Men's Associations. His wealth enabled him to carry out experiments in co-operation on a larger scale than had been previously attempted. He founded the first co-operative store in London, and advanced the capital for two builders' associations, both of which failed. In 1851, though strongly opposed by other members of the promoting "Council," he started on his own initiative the Central Co-operative Agency, similar in many respects to the Co-operative Wholesale Society of a later day. The failure of this scheme, together with that of the operatives' cause in the engineering lock-out of 1852 is said to have cost him £40,000. It is certain that until in later life he inherited the estate of Bisham Abbey in Berkshire he was, comparatively speaking, a poor man. He was closely associated with the movement which resulted in the Industrial and Provident Societies Act of 1876, and the passing of the Consolidation Act of 1862 was almost entirely due to his efforts. Besides publishing pamphlets on co-operation he served on the executive committee which afterwards developed into the Central Co-operative Board, and took an active part in the formation of the North of England Co-operative Wholesale Society in 1863. One of the founders of the Cobden mills in 1866, and the Agricultural and Horticultural Association in 1867, he also promoted the annual co-operative congress, afterwards becoming general secretary of the Central Board. He was also a director of the Co-operative Insurance Company and a member of the Co-operative Newspaper Society for many years. He visited America in 1875 with a deputation whose object was to open up a direct trade between the farmers of the western states and the English co-operative stores. After resigning the post of secretary to the congress board in 1891, he became a member of the Oxford University branch of the Christian Social Union. He died on the 16th of September 1892.

NEALE, JOHN MASON (1818–1866), English divine and scholar, was born in London on the 24th of January 1818, and was educated at Trinity College, Cambridge. Here he was affected by the Oxford movement, and helped to found the Camden (afterwards the Ecclesiological) Society. Though he took orders in 1841, ill-health prevented his settling in England till 1846, when he became warden of Sackville College, an almshouse at East Grinstead, an appointment which he held till his death on the 6th of August 1866.

Neale was strongly high-church in his sympathies, and had to endure a good deal of opposition, including a fourteen years' inhibition by his bishop. In 1855 he founded a nursing sisterhood named St Margaret's. He occupies a high place as a hymnologist, but principally as a translator of ancient and medieval hymns, the best known being probably "Brief life is here our portion," "To thee, O dear, dear country," and "Jerusalem, the golden," which are included in the poem of Bernard of Cluny, *De Contemptu Mundi*, translated by him in full. He also published *An Introduction to the History of the Holy Eastern Church* (1850, 2 vols.); *History of the so-called Jansenist Church of Holland* (1858); *Essays on Liturgiology and Church History* (1863); and many other works.

See *Life* by his daughter, Mrs Charles Towle (1907); the *Memoir* by his friend, R. F. Littledale; and the *Letters of John Mason Neale* (1910), selected and edited by his daughter. For a complete list of Neale's works see article in *Dict. of Nat. Biog.* xl. 145.

NEAMTZU (*Neamtu*), a town in Rumania, situated among the lower slopes of the Carpathian Mountains, and on the left bank of the river Neamtzu, an affluent of the Moldova. Pop. (1900) 8578, about half being Jews. Neamtzu gives its name to the Department of which Piatra is the capital. Lying 15 m. S. by E. of Falticheni, the nearest railway station, it has little trade. Near it is the ruined fortress of Neamtzu, constructed early in the 13th century by the Teutonic knights of Andrew II., king of Hungary, in order to repel the incursions of the Cumanians. An hour's drive to the west of the town is the monastery of Neamtzu, founded in the 14th century, and containing two churches and many ancient and interesting relics. Before the secularization of the monastic lands in 1864, it was one of the richest and most important of the Rumanjan monasteries. Baltzatesti, 10 m. W. by S. of Neamtzu, is locally famous for its mineral springs and baths.

NEANDER, JOACHIM (1650–1680), German hymnwriter, was born at Bremen. The family name, originally Neumann, had, according to the prevailing fashion a century earlier, been Graecized as Neander. After studying at Heidelberg and Frankfort, where he formed friendships with Friedrich Spanheim (1632–1701) and Philipp Jakob Spener (1635–1705), he settled at Düsseldorf as rector of the Latin school in connexion with the Reformed Church. In 1676 he incurred church censure for abstaining and inducing others to abstain from joining in the celebration of the communion. It was during the term of

his suspension from his teaching office that many of his hymns were written. He ultimately renounced his connexion with the separatists, and in 1679 returned to Bremen as one of the preachers of St Martin's church. In the same year he published the *Bundeslieder* and *Dankpsalmen*, a collection of 71 hymns, of which many are still in use. He died on the 31st of May 1680. The Neanderthal, near Düsseldorf, takes its name from him. For his place in hymnology see HYMNS.

See J. F. Iken, *Joachim Neander, sein Leben und seine Lieder* (1880).

NEANDER, JOHANN AUGUST WILHELM (1789–1850), German theologian and church historian, was born at Göttingen on the 17th of January 1789. His father, Emmanuel Mendel, is said to have been a Jewish pedlar, but August adopted the name of Neander on his baptism as a Christian. While still very young, he removed with his mother to Hamburg. There, as throughout life, the simplicity of his personal appearance and the oddity of his manners attracted notice, but still more, his great industry and mental power. From the grammar-school (Johanneum) he passed to the gymnasium, where the study of Plato appears especially to have engrossed him. Considerable interest attaches to his early companionship with Wilhelm Neumann and certain others, among whom were the writer Karl August Varnhagen von Ense and the poet Adelbert von Chamisso.

Baptized on the 25th of February 1806, in the same year Neander went to Halle to study divinity. Here Schleiermacher was then lecturing. Neander found in him the very impulse which he needed, while Schleiermacher found a pupil of thoroughly congenial feeling, and one destined to carry out his views in a higher and more effective Christian form than he himself was capable of imparting to them. But before the year had closed the events of the Franco-Prussian War compelled his removal to Göttingen. There he continued his studies with ardour, made himself yet more master of Plato and Plutarch, and became especially advanced in theology under the venerable G. J. Planck (1751–1833). The impulse communicated by Schleiermacher was confirmed by Planck, and he seems now to have realized that the original investigation of Christian history was to form the great work of his life.

Having finished his university course, he returned to Hamburg, and passed his examination for the Christian ministry. After an interval of about eighteen months, however, he definitively betook himself to an academic career, "habilitating" in Heidelberg, where two vacancies had occurred in the theological faculty of the university. He entered upon his work here as a theological teacher in 1811; and in 1812 he became a professor. In the same year (1812) he first appeared as an author by the publication of his monograph *Über den Kaiser Julianus und sein Zeitalter*. The fresh insight into the history of the church evinced by this work at once drew attention to its author, and even before he had terminated the first year of his academical labours at Heidelberg, he was called to Berlin, where he was appointed professor of theology.

In the year following his appointment he published a second monograph *Der Heilige Bernhard und sein Zeitalter* (Berlin, 1813), and then in 1818 his work on Gnosticism (*Genetische Entwickelung der vornehmsten gnostischen Systeme*). A still more extended an elaborate monograph than either of the preceding followed in 1822, *Der Heilige Johannes Chrysostomus und die Kirche, besonders des Orients in dessen Zeitalter*, and again, in 1824, another on Tertullian (*Antignostikus*). He had in the meantime, however, begun his great work, to which these several efforts were only preparatory studies. The first volume of his *Allgemeine Geschichte der christlichen Religion und Kirche* embracing the history of the first three centuries, made its appearance in 1825. The others followed at intervals—the fifth, which appeared in 1842, bringing down the narrative to the pontificate of Boniface VIII. A posthumous volume, edited by C. F. T. Schneider in 1852, carried it on to the period of the council of Basel. Besides this great work he published in 1832 his *Geschichte der Pflanzung und Leitung der christlichen Kirche*, and in 1837 his *Das Leben Jesu Christi, in seinem geschichtlichen Zusammenhang und seiner geschichtlichen Entwickelung*, called forth by the famous *Life* of David Strauss. In addition to all these he published *Denkwürdigkeiten aus der Geschichte des Christentums* (1823–1824, 2 vols., 1825, 3 vols., 1846); *Das Eine und Mannichfaltige des christlichen Lebens* (1840); papers on Plotinus, Thomas Aquinas, Theobald Thamer, Blaise Pascal, J. H. Newman, Blanco White and T. Arnold, and other occasional pieces (*Kleine Gelegenheitsschriften*, 1820), mainly of a practical, exegetical and historical character. He died on the 14th of July 1850, worn out and nearly blind with incessant study. After his death a succession of volumes, representing his various courses of lectures, appeared (1856–1864), in addition to the *Lectures on the History of Dogma* (*Theologische Vorlesungen*), admirable in spirit and execution, which were edited by J. L. Jacobi in 1857.

Neander's theological position can only be explained in connexion with Schleiermacher, and the manner in which while adopting he modified and carried out the principles of his master. Characteristically meditative, he rested with a secure footing on the great central truths of Christianity, and recognized strongly their essential reasonableness and harmony. Alive to the claims of criticism, he no less strongly asserted the rights of Christian feeling. "Without it," he emphatically says, "there can be no theology; it can only thrive in the calmness of a soul consecrated to God." This explains his favourite motto: "Pectus est quod theologum facit."

His *Church History* (*Allgemeine Geschichte der christlichen Religion und Kirche*) remains the greatest monument of his genius. In this "Neander's chief aim was everywhere to understand what was individual in history. In the principal figures of ecclesiastical history he tried to depict the representative tendencies of each age, and also the types of the essential tendencies of human nature generally. His guiding principle in treating both of the history and of the present condition of the church was—that Christianity has room for the various tendencies of human nature, and aims at permeating and glorifying them all; that according to the divine plan these various tendencies are to occur successively and simultaneously and to counterbalance each other, so that the freedom and variety of the development of the spiritual life ought not to be forced into a single dogmatic form" (Otto Pfleiderer, *Development of Theology*, p. 280). Several of his books have passed into new and revised editions and have been translated into English. Among these English versions may be mentioned *General History of the Christian Religion and Church*, translated by J. Torrey (1850–1858); *History of the Planting and Training of the Church by the Apostle*, by J. E. Ryland (1851); *Julian and his Generation*, by G. V. Cox (1850); *Life of Jesus*, by J. M'Clintock and C. E. Blumenthal (1848); and *Memorials of Christian Life in the Early and Middle Ages*, by J. E. Ryland (1852).

See O. C. Krabbe, *August Neander* (1852), and a paper by C. F. Kling (1800–1861) in the *Stud. u. Krit.* for 1851; J. L. Jacobi, *Erinnerungen an August Neander* (1882); Philipp Schaff, *Erinnerungen an Neander* (1886); Adolph Harnack, *Rede auf August Neander* (1889); A. F. J. Wiegand, *Neanders Leben* (1889); L. T. Schulze, *August Neander* (1890); and K. T. Schneider, *August Neander* (1894). Cf. Herzog-Hauck, *Realencyklopädie*, and P. Schaff, *Germany: its Universities and Theology* (1857).

NEANDERTHAL, a ravine near the village of Hochdal between Düsseldorf and Elberfeld, Rhenish Prussia. Here in 1856 were discovered in a Quaternary bed in the Feldhofen Cave human remains which have been referred to a type commonly called Neanderthal Man. The bones found were a brain-cap, two femora, two humeri and other fragments, now in the Fuhlrott Collection, Elberfeld. The cranium, pronounced by Huxley to be the most ape-like yet discovered, was remarkable for its enormous superciliary ridges. Professor Virchow and others contended that the remarkable shape was pathological or caused by disease during the lifetime of the individual. The subsequent discovery of two other skulls, almost identical in form, at Spy in Belgium, have helped to prove its typical character. The now generally accepted view is that the Neanderthal skull represents the oldest known dolichocephalic race of Europe.

NEAP, a word only used of tides in which the high-water mark is at its lowest, there being the least difference in level between high and low water, opposed to "spring tides" (see TIDE). The word is obscure in origin. It appears in O. Eng. in *nēpflōd*, and only once alone in the expression *forthganges nēp*, "without power of advancing." It may possibly be connected with "nip," in the sense of "pinched," "scanty."

NEARCHUS, one of the officers in the army of Alexander the Great. A native of Crete, he settled at Amphipolis in Macedonia. In 325, when Alexander descended the Indus to the sea, he ordered Nearchus to conduct the fleet to the head of the Persian Gulf. The success with which Nearchus accomplished this arduous enterprise led to his selection by Alexander for the more difficult task of circumnavigating Arabia from the mouth of the Euphrates to the Isthmus of Suez. But this project was cut short by the illness and death of the king (323). In the troubles that followed Nearchus attached himself to Antigonus, under whom he held the government of his old provinces of Lycia and Pamphylia, and probably therefore shared in the downfall (301) of that monarch.

He wrote a detailed narrative of his expedition, of which a full abstract was embodied by Arrian in his *Indica*—one of the most interesting geographical treatises of antiquity.

The text, with copious geographical notes, is published in C. Müller's *Geographi Graeci Minores*, i. (1856); on the topography see W. Tomaschek, "Topographische Erläuterung der Küstenfahrt Nearchs vom Indus bis zum Euphrat" in *Sitzungsberichte der K. K. Acad. der Wissenschaften*, cxxi. (Vienna, 1890). See also E. H. Bunbury, *Ancient Geography*, i. ch. 13; and ALEXANDER THE GREAT. Ancient authorities.—Arrian, *Anab.* vi. 19, 21; vii. 4, 19, 20, 25; Plutarch, *Alexander*, 10, 68, 75; Strabo xv. pp. 721, 725; Diod. Sic. xvii. 104; Justin xiii. 4.

NEATH (Welsh, *Castell-Nêdd*), a municipal and contributory parliamentary borough, seaport and market-town of Glamorganshire, south Wales, prettily situated near the mouth of the Neath or Nêdd, on the Great Western and the Rhondda and Swansea Bay railways, 7¼ m. E.N.E. of Swansea and 183¼ m. by rail from London, via Badminton. The Neath and Brecon railway has a terminus in the town. Pop. (1901) 13,720. The principal buildings are the parish church of St Thomas (restored 1874), the church of St David (1866), a Roman Catholic church, and Baptist, Calvinistic, Methodist, Congregational and Wesleyan chapels; the intermediate and technical schools (1895), Davies's endowed (elementary) school (1789), the Gwyn Hall (1888), the town hall, with corn exchange in the basement storey, and the market-house. According to tradition Iestyn-ap-Gwrgan, the last prince of Glamorgan, had a residence somewhere near the present town, but Fitzhamon, on his conquest of Glamorgan, gave the district between the Neath and the Tawê to Richard de Granaville (ancestor of the Granvilles, marquesses of Bath), who built on the west banks of the Neath first a castle and then in 1129 a Cistercian abbey, to whose monks he later gave all his possessions in the district. All traces of this castle have disappeared. Another castle, built in the same century, on the east bank, was held direct by the lords of Glamorgan, as the westernmost outpost of their lordship. It was frequently attacked by the Welsh, notably in 1231 when it was taken, and the town demolished by Llewelyn ab Iorwerth. The portcullis gate and a tower are all that remain of it; of the abbey which was at one time the finest in Wales, there still exist the external walls, with parts of the chapel, vaulted chapter-house, refectory and abbot's house. This abbey was the spot where Edward II. found shelter after his escape from Caerphilly. At the dissolution the abbey and the manor of Cadoxton (part of its possessions) were sold to Sir Richard Williams or Cromwell. Its cartulary has been lost. Copper smelting has been carried on in or near the town since 1584 when the Mines Royal Society set up works at Neath Abbey; the industry attained huge proportions a century later under Sir Humphrey Mackworth, who from 1695 carried on copper and lead smelting at Melincrythan. Besides its copper works the town at present possesses extensive tinplate, steel and galvanized sheet works as well as iron and brass foundries, steam-engine factories, brick and tile works, engineering works, flannel factories and chemical works. In the neighbourhood there are numerous large collieries, and coal is shipped from wharves on the riverside, vessels of 300 or 400 tons being able to reach the quays at high tide. The Neath Canal, from the upper part of the Vale of Neath to Briton Ferry (13 m.) passes through the town, which is also connected with Swansea by another canal. There is a large export trade in coal, copper, iron and tin, mostly shipped from neighbouring ports, while the principal imports are timber and general merchandise. Neath is included in the Swansea parliamentary district of boroughs.

The town perhaps occupies the site of the ancient Nidus or Nidum of the Romans on the Julia Maritima from which a vicinal road branched off here for Brecon. No traces of Roman antiquities, however, have been found. Neath is a borough by prescription and received its first charter about the middle of the 12th century from William, earl of Gloucester, who granted its burgesses the same customs as those of Cardiff. Other charters were granted to it by successive lords of Glamorgan in 1290, 1340, 1359, 1397, 1421 and 1423. By the first of these (1290) the town was granted a fair on St Margaret's Day (July 20) and as the abbey had extensive sheep walks the trade in wool was considerable. In 1685 James II. granted a charter, which, however, was not acted upon except for a short time.

NEBO, or NABU ("the proclaimer"), the name of one of the chief gods of the Babylonian pantheon, the main seat of whose worship was at Borsippa—opposite the city of Babylon. It is due to the close association of Borsippa with Babylon after the period when Babylon became the centre of the Babylonian empire that the cult of Nebo retained a prominence only some degrees less than that of Marduk. The amicable relationship between the two was expressed by making Nebo the son of Marduk. In this case the expression of the relationship in this form was intended to symbolize the superiority of Marduk, different, therefore, from the view involved in making Marduk the son of Ea (*q.v.*), which meant that the prerogatives of Ea were transferred to Marduk by the priests of Babylon.

Borsippa became in the course of time so completely a mere adjunct to Babylon that one might fairly have expected the Nebo cult to have been entirely absorbed by that of Marduk. Since that did not happen, the legitimate inference is that other deterrent factors were at play. One of these factors was the position that Nebo had acquired as the "god of wisdom" to whom more particularly the introduction of writing was ascribed. He takes his place, therefore, by the side of Ea as a cultural deity. The wisdom associated with him had largely to do with the interpretation of the movements in the heavens, and the priests of Nebo at an early age must have acquired widespread fame as astrologers. Assuming now, for which there is a reasonable amount of confirmatory evidence, that the priestly school of Nebo had acquired a commanding position before Babylon rose to political importance we can understand why the worshippers of Marduk persisted in paying homage to Nebo, and found a means of doing so without lowering the dignity and standing of their own god. If Assur-bani-pal, the king of Assyria (668–626 B.C.), in the subscripts to the copies of Babylonian literary tablets invokes as he invariably does Nebo and his consort Tashmit as the gods of writing to whom all wisdom is traced, it is fair to assume that in so doing he was following ancient tradition and that the priests of Marduk likewise were dependent upon the school at Borsippa for their knowledge and wisdom.

Nebo is therefore an older god than Marduk in the sense that his specific prerogative as the god of wisdom was too firmly recognized when Marduk became the head of the Babylonian pantheon to be set aside.

The temple school at Borsippa continued to flourish until the end of the neo-Babylonian empire, and school texts of various contents, dated in the reigns of Artaxerxes, Cambyses and Darius, furnish the evidence that the school survived even the conquest of Babylonia by Cyprus (538 B.C.). The original character of Nebo can no longer be determined with any degree of definiteness. He may have been a solar deity, but there are also decided indications which point to his being a water-deity—like Ea. It may be, therefore, that if he shows the traits of a solar deity, this may be due to the influence of the neighbouring Marduk cult, just as in return Marduk takes on attributes that belong of right to Nebo. Thus, as the god of writing, Nebo has charge of the tables of fate on which he inscribes the names

of men and decides what their lot is to be. If in the systematized religious system, Marduk appears as the arbiter of human fates, the conclusion is warranted that Marduk is here imbued with the authority which originally was in the hands of his son. A reconciliation between the rival claims was effected by continuing Nebo in the rôle of scribe, but as writing at the dictation of the gods, thus recording what the divine assembly, gathered in the "chamber of fates" (known as Ubshu Kinakku) within the precincts of E-Saggila—Marduk's temple at Babylon—under the presidency of Marduk, had decided.

Nebo also does homage to his father by paying him an annual visit during the New Year celebration, when the god was solemnly carried across to Babylon, and in return Marduk accompanied his son part way back to his shrine at Borsippa. Within E-Saggila, Nebo had a sanctuary known, as was his chief temple at Borsippa, as E-Zida, "the legitimate (or 'firm') house," and the close bond existing between father and son was emphasized by providing for Marduk within the precinct of E-Zida, a sanctuary which bore the same name, E-Saggila, "the lofty house," as Marduk's temple at Babylon. The kings, and more particularly those of the neo-Babylonian dynasty, devote themselves assiduously to the worship and embellishment of both E-Saggila and E-Zida. In their inscriptions Marduk and Nebo are invoked together and the names of the two temples constantly placed side by side. The symbols of the two gods are similarly combined. On boundary stones and cylinders, when Marduk's symbol—the lance—is depicted, Nebo's symbol—the stylus—is generally found adjacent. The dragon, though of right belonging to Marduk (*q.v.*), as the conqueror of Tiamat, also becomes the symbol of Nebo, and similarly in other respects the two form a close partnership. Such is the relation between the two that occasionally, as in the official reports of astrologers and in official letters, Nebo is even mentioned before Marduk without fear of thereby offending the pride of the priests of Marduk.

In Assyria the Nebo cult likewise enjoyed great popularity, and there is a record of one Assyrian ruler who made Nebo his specific deity and called upon his subjects to put their whole trust in him. One may discern, indeed, a tendency in Assyria to take advantage of the almost equal plane on which Nebo stands with Marduk in Babylonia, to play off Nebo as it were against Marduk. The Assyrian kings in this way, by glorifying at times Nebo at the expense of Marduk, paid their debt of homage to the south without any risk of lowering the grade of their own chief deity Assur. Marduk was in a measure Assur's rival. This was not the case, however, with Nebo, and they accordingly showed a desire to regard Nebo rather than Marduk as the characteristic representative of the southern pantheon. In the astral-theological system Nebo was identified with the planet Mercury. His consort, known as Tashmit, plays no independent part, and is rarely invoked except in connexion with Nebo.

NEBRASKA, a state just N. of the centre of the U.S.A., lying approximately between 40° and 43° N. and between 18° 18′ W., and 27° W. from Washington. It is bounded on the N. by South Dakota, on the E. by Iowa and a corner of Missouri, on the S. by Kansas, on the S. and W. by a corner of Colorado, and on the W. by Wyoming. The Missouri river extends along the eastern and north-eastern border. The extreme length of the state is about 430 m., and extreme breadth about 210 m. The area is 77,520 sq. m., of which 712 are water surface.

Physical Features.—The state lies partly in the physiographic province of the Great Plains (covering more than four-fifths of its area) and partly in that of the Prairie Plains, and slopes gently from the N.W. to the S.E. The altitudes of extreme geographical points are as follows: Rulo, in the S.E. corner of the state, 842 ft.; Dakota city, in the N.E., 1102; Benkelman, in the S.W. in Dundy county, 2968; Kimball, in the S.W. in Kimball county, 4697; Harrison, in the N.W. corner, 4849 ft. There are three physiographic subdivisions: the foot-hills (and Bad Lands), the sand-hills and the prairie—all three being portions of three great corresponding regions of the Great Plains and Prairie Plains provinces.

The western portion of the state lies in the foot-hills of the Rocky Mountain system, and is much rougher than western Kansas. The surface of western Nebraska is characterized by high, barren tablelands, broken by canyons, dotted with buttes, and dominated by some bold and lofty ridges. Pine Ridge, a picturesque escarpment of the Great Plains, cuts across the N.W. corner of Nebraska from Wyoming into South Dakota. A ridge of low hills and bluffs, often precipitous, marked by buttes and deeply cut in places by cañons, it is the most striking surface feature of the state. The altitude in this region varies from 3500 to 5000 ft. In the fork of the North and South Platte are the Wild Cat Mountains with contours rising to 5300 ft., in which Wild Cat Mountain, long reported as the highest point in the state, attains 5038 ft., Hogback Mountain 5082 ft., and various other hills—Gabe Rock (5006), Big Horn Mountain (4718), Coliseum Rock (5050), Scotts Bluff (4662) &c.—rise to heights of 4500 to 5000 ft. In the extreme N.W. the White river and Hat Creek have carved canyons in deep lacustrine deposits, creating fantastic cliffs and buttes, bare of vegetation, gashed with drainage channels, and baked by the sun. The buttes—bare, pyramidal or conical, flat-topped, precipitous hills, and often fantastic, towering pinnacles—are rather widely distributed through the foot-hill region. They are never more than 600 to 1000 ft. above the surrounding country. Nature is not grand in any part of Nebraska, but the Bad Lands are imposing, and in the wooded foot-hills there is an abundance of bold and attractive scenery, particularly in Sioux county, and in Cherry county around Valentine and on the canyon of the Snake river. East of the Bad Lands is the sand-hill region, which includes an area of possibly 20,000 sq. m. The sand-hills proper are scattered over an area of perhaps 15,000 sq. m., between the meridians of 98° and 103° W. long., lying mainly N. of the Platte; though there are some along the Republican river. In places they rise in tiers, one above another, like miniature mountains, and are 200 to 300 ft. high; but in general they are very low (25-50 ft. high) and are scattered over a plain. Their present contours are wholly the result of wind action. Save in rare instances, however, they have long ceased to be shifting dunes; for, with the cessation of prairie fires and the increase of settlement, they have become well grassed over and stable; although sand-draws, and even occasional "blow-outs" scooped by the winds in the summits or sides of the hills are still characteristic landmarks. All about and inter-penetrating the foot-hill and sand-hill regions are the prairies, which include three-fourths of the state. They are sometimes characteristically flat over wide areas, but are usually gently rolling. Stream valleys and bottom lands are the conspicuous modifying feature of the prairie region; but in general, owing to the gentle slope of the streams and the great breadth of the plains, erosion has been slight; and indeed the streams, overloaded in seasonal freshets, are building up their valley floors. The water-partings are characteristically level uplands, often with shallow depressions, once lakes, and some of them still so. The valleys of the greatest streams are huge shallow troughs. The valley floor of the North Platte in the foot-hills, the flood-plain of an older river, is in places 700 ft. or more below the bounding tableland, and 10 to 15 m. wide; the present flood-plain being from 1 to 4 m. in width. Hundreds of small tributaries to the greater streams (especially along the Republican and the Logan) complicate and beautify the landscape. No farming country is richer in quiet and diversified scenic charm than the prairies of the eastern half of the state. The Missouri is noteworthy for high bluffs cut by ravines, which border it almost continuously on at least one side. In the foot-hills there are typical canyons, as along the Platte forks, and in the northern edge of the sand-hills. Those of the upper Republican are the largest, those of the Bad Lands are the most peculiar; and the Niobrara tributary system is the most developed.

Rivers.—The Missouri skirts the eastern border for perhaps 500 m. It is not navigated, and save at Sioux City and Omaha serves practically no economic purposes, irrigation being unnecessary in the counties on which it borders. Its bluffs, cut for the most part in the loess but at places in the rock, are frequently from 100 to 200 ft. high. At Vermilion, South Dakota, its alluvial plain, 1131 ft. above the sea, is 330 ft. above the mouth of the Nemaha. The current is always rapid and heavily loaded with sediment,[1] and its axis is forever shifting. Large areas of soil are thus shifted back and forth between Nebraska and the bordering states, to the encouragement of border lawlessness and uncertainty of titles; some portions E. of the thread and apparently well within Iowa remain under the jurisdiction of Nebraska, or vice versa; and Yankton has been seriously threatened with a sudden transfer from the South Dakota to the Nebraska side. The Platte system is also heavily loaded with sediment in Nebraska. The North and South forks both rise in Colorado; each, especially the latter, has a rapid primary descent, and a very gradual fall down the foot-hills of the Great Plains.[2] Across Nebraska it maintains a remarkably straight course and an extraordinarily even gradient (about 6 ft. per mile). In the spring freshets it is a magnificent stream, but in summer its volume greatly shrinks, and it is normally a broad, shallow, sluggish, stream, flowing through interlacing channels among the sand-bars it heaps athwart its course. The underflow is probably much greater than the summer

[1] About 52 grains per gallon at low water, 404 at high.

[2] The North Platte falls 3700 ft. in 510 m., the South, 7200 ft. in 427 m., above their junction; the latter falling 2692 ft. in 308 m. after leaving its canyon in the Rockies.

surface flow in volume. The Loup system is remarkable for the even dip of its parallel feeders, which once joined the Platte separately, until the latter banked up its deposits across the mouths of their more sluggish currents. The Republican and South Platte—the former an intermittent stream—suffer in their flow from the drain made upon their waters in Colorado for irrigation. The upper course of the Niobrara above the Keya Paha is in a narrow gorge. Its immediate bluffs and the shores of some of its tributaries, notably the Snake, are modified by cañons. This system is also notable among Nebraska streams for a number of pretty water-falls. The White river, heading on Pine Ridge, falls 1100 ft. in 20 m. Some streams wholly dry up in the dry seasons, and in the foot-hills and sand-hills there are a few that disappear by sinking or evaporation.

Surface Water.—Swamps and bogs, apart from purely temporary weather ponds, are confined to a few restricted regions of the Missouri river bottoms and the prairies of the S.E. There are some cut-offs or oxbow lakes along the Missouri, and many lakelets originally such are scattered along the Platte, Elkhorn, Big Blue and other rivers. Scores of lakes are scattered about the heads of streams rising in the sand-hills, especially in Cherry county. Some of them are fresh and some alkaline. Springs also are numerous in the sand-hills, where they form considerable streams. They often flow with force and are known locally from this peculiarity as "artesian" springs, or sometimes, from this and their large size, as "mound" springs. The state fish-hatchery is on springs at South Bend; at Long Pine springs of large flow supply the town and railway shops with water, and led to the establishment here of Chautauqua grounds.

Underground Water.—The so-called blowing-wells are peculiar. They occur over much of the state, but most frequently S. of the Platte, and are evidently sensitive to barometric conditions; alternately "blowing" or "sucking" as these vary; so that, in cold weather water-pipes may be frozen 100 or more feet below the surface of the ground. Atmospheric pressure is probably the principal cause of their action; they are therefore termed "weather wells" in some localities. Nearly all counties have a practically inexhaustible supply of ground water. Well-depths vary from 15 to 20 ft. in the stream valleys and from 30 to 35 ft. on the loess prairies to 100-400 ft. in the western foot-hill region and isolated prairie areas. Artesian water is also available in many parts of the state. At Niobrara, in Knox county, a well 656 ft. deep, drilled in 1896, yielded for a time 2500 gallons per minute at 95-lb pressure (in 1903 1900 gallons at 65-lb pressure), and furnishes power for a flour-mill and municipal water and electric lighting works; the pressure forces the water about 210 ft. above the mouth of the well, *i.e.* to a height of 1450 ft. Another (1430 ft. deep), in the environs of Omaha, supplies a daily flow of 1,100,000 gallons under a pressure of 15 lb. In some small and exceptional regions the water is very alkaline, and in the counties of the south-east it is so generally saline that it is difficult, below 150 ft., to avoid an inflow of salt water. Saline wells at Lincoln (2463, 1050 and 570 ft. deep) and at Beatrice (1260 ft.) are notable in this regard.

Geology.—The eastern part of the state is covered with a thick mantle of Quaternary (Pleistocene), and the greatest part of the western portion with very thick deposits of Miocene and Pliocene (Tertiary). To the Pleistocene belong the alluvium, loess and glacial drift, and in part the sand-hills. The drift covers the eastern fifth of the state. In striking contrast to Iowa, the Nebraska deposit is very thin, seldom thicker than 1 or 2 ft. Above the drift there is usually a heavy covering of loess or "bluff deposit" (particularly typical in the neighbourhood of Omaha and Council Bluffs). Though thin and worn out in places, it averages probably 100 ft., and is often as much as 200 ft. in thickness, and runs diagonally across the state from the N.E. to the Colorado inset. The opinion that it is of aqueous origin (and probably dates from the close of the glacial time) has the weight of authority. It was spread by the rivers: some evidences of wind action may be attributed to a later period. The sand-hills, which overlap the loess N. of the Platte, are probably mainly derived from the Arikaree, but probably also in part from the early Pleistocene. West of 102° long. there are beds several hundred feet thick of late Tertiary sands and clays. The Arikaree (Miocene) and Ogallala (Pliocene) formations of the North Loup beds are superficial over much of the western half of the state, the former to the N., the latter to the S. The buttes are characteristically Arikaree or Gering formations topping Brule clay. The same is true of at least considerable parts of Pine Ridge. In the Bad Lands there are scanty outcrops of the Chadron formation (known also as "Titanotherium beds"), the oldest of the Tertiary beds. The thick superficial coverings over the state make difficult the determination of the underlying strata. There are only very scanty outcrops except along the rivers. No Archean rocks are exposed in Nebraska, and the sedimentary formations are undisturbed *in situ*. The Palaeozoic era is represented only by the Pennsylvanian series of the Upper Carboniferous and a scanty strip of Kansas-Nebraska Permian, and is confined to the S.E. counties. But, though small in area, the Carboniferous is by far the most important formation as regards mineral resources within the state. It is buried probably 2000 or 3000 ft. in central Nebraska, outcropping again only in the Rocky Mountains. Upon it, in the trough thus formed, rest conformably the basal strata of the Cretaceous; the Jurassic and Triassic being wholly absent (unless in the extreme north-west). The E. limit of the Cretaceous extends across the state from N. to S. between [illegible] and 99° W. long. Its groups include the Dakota formation, ch[illegible] acterized by a very peculiar rusty sandstone, and the Benton, l[illegible] of which are rather widely accessible and heavy; the Niobrara; Pierre shales, which apparently underlie about three-quarters of state in a deep and heavy bed; and, in the extreme west, Laramie. There are almost no Cretaceous outcrops except on[illegible] streams, especially the Niobrara, Republican and Platte rive[illegible] and in the Bad Lands. The superficial Miocene and Plio[illegible] deposits in the west, above referred to, are underlaid by the W[illegible] river groups of the Oligocene, whose outcrops of Brule clay Chadron formation also have been mentioned. The Bad Land[illegible] essentially nothing but fresh-water mud excessively weathered eroded. They are often intersected by dikes of chalcedony, form[illegible] mistaken for lava. The Bad Lands and the Arikaree are fa[illegible] fossil fields, the latter being the source of the *Daemonelix*, or "D[illegible] cork-screw," a large spiral fossil, apparently a lacustrine alga. was once generally supposed that the Pliocene epoch in Nebr[illegible] was distinguished by the activity of geysers; but the so-c[illegible] "geyserite" now known commonly and correctly as "na[illegible] pumice" and "volcanic ash," which is found in the Oligocene[illegible] later formations, has no connexion whatever with geysers, b[illegible] produced by the shattering of volcanic rock. It occurs wide[illegible] Nebraska and adjoining states.

Minerals.—Mineral resources are decidedly limited; the value of the mineral output (excluding coal) in 1907 was $1,383[illegible] of which $953,432 was the value of clay products, $324,239 of s[illegible] and $54,227 of sand and gravel. The state, however, is particu[illegible] rich in good clays, which are probably its greatest mineral reso[illegible] Calcite of excellent quality is the commonest mineral. Gra[illegible] widely obtainable, and sand of the finest quality is availab[illegible] inexhaustible quantities, and is an important article of ex[illegible] Flint (valuable for railway ballast) occurs in immense quan[illegible] about Wymore and Blue Springs. The underground salt water[illegible] promised once to be a resource of value, especially in the vic[illegible] of Lincoln, but has proved of little or no value in comparison[illegible] the great salt-beds of Kansas. A native plaster is yielded by[illegible] Arikaree and Ogallala rocks, but though otherwise of exce[illegible] qualities it is ruined by slight exposure to the water. A diatomac[illegible] earth in central Nebraska, occurring especially in the region of L[illegible] is a good polishing powder, and is used for packing steam p[illegible] Limonite in the form of ochre occurs in considerable quantity. building stones limestones are the most abundant and impor[illegible] the best comes from the Benton beds and when "green" ca[illegible] sawed into blocks. The Dakota formation, though its sand-s[illegible] are in general coarse or otherwise inferior, yields some of sple[illegible] quality. Its clays, which are of all colours, are the most valuab[illegible] the state. The finest building stone is a beautiful green quar[illegible] rock of dense, fine texture and lasting quality. It is related t[illegible] Ogallala beds and occurs only in small areas. The quarries and pits of the state are mainly in the Carboniferous region of the Cretaceous lignite occurs in small quantities in the N.E., and more widely. The Carboniferous formations carry only thin s[illegible] of coal, never thicker than about 2 ft., and rarely readily access and they can never be of more than small and merely local imp[illegible] ance.

Flora.—Nebraska lies partly in the arid, or Upper Sonoran, partly in the humid, or Carolinian, area of the Upper Austral zone; the divisional line being placed by the United States Biolo[illegible] Survey at about 100° W. long. The most marked characteristi[illegible] Nebraskan vegetation is its immigrant character, and the state been called "one of the finest illustrations of the commingling contiguous species to be found anywhere in America" (C. E. Bess[illegible] Immigrant species have even come from Texas and New Mex[illegible] from the Dakotas and the Rockies. From the last-named var[illegible] species have crept two-thirds of the way across the state, one [illegible] buffalo berry) wholly covers it, and some have barely crossed the border foot-hills from Wyoming. A very few trees and shr[illegible] and some grasses, are strictly endemic to the plains and to Nebra[illegible] Four floral regions lying in north to south belts across the state, closely corresponding to—though in boundaries by no means coin[illegible] ing with—its great topographic divisions are distinguished in regions of the Missouri border, the prairies, sand-hills and foot-h[illegible] In 1896 some 3196, and by 1905 fully 3300 species had been lis[illegible] "representing every branch and nearly every class of the vegeta[illegible] kingdom" (C. E. Bessey). There are at least 64 trees and at l[illegible] 77 shrubs growing native in the state; but of their joint numb[illegible] mere half-dozen or so can be classed as strictly endemic. Sn[illegible] woods of broad-leaf trees (and red cedars) grow very generally al[illegible] all the water-courses of the state; and coniferous species grow ab[illegible] Pine Ridge and the Wild Cat Mountains. In the East, various tr[illegible] are readily grown on the uplands; in the West the honey-locust, Osage orange and Russian mulberry for windbreaks; the green a[illegible] and red cedar are perhaps the most valuable drought resist[illegible] species. The conifers are spreading naturally. In the sand-hills [illegible] sand-bar willow of the rivers and the cottonwood growing natural evidence the good conditions of moisture; and the forestation much of the region is undoubtedly possible. Forest reserves w[illegible] established on the Dismal river in 1902 and millions of seedlings h[illegible] been grown by 1906 for transplantation in Nebraska and other sta[illegible]

of the Great Plains. Arbor Day (the 10th of April) was instituted by the Nebraska State Board of Agriculture in 1872 at the instance of J. Sterling Morton, later secretary of agriculture of the United States (see ARBOR DAY). It has been yearly observed by the public schools of the state, and no state has done more than Nebraska for the forestation of its waste and prairie lands. In such a purely agricultural state a large wooded area is not desired. Plums, grapes and the dwarf "sand-cherry" (*Prunus demissa*) of the sand-hills are prominent among many wild fruits. The flora is decidedly rich in species as compared with other states, but less so in the number of individuals. Grasses are perhaps the most noteworthy vegetable forms. Nebraska claims a greater variety of native hay and forage species than grow in any other state of the Union. No less than 200 grasses, at least 154 being wild or commonly cultivated, had been listed in 1904. Of the total 200 species 150 (130 indigenous) are valuable for forage, 34 (20 indigenous) are classed economically as weeds, 10 are non-indigenous cereals and 6 are ornamental. The short buffalo-grass was originally everywhere abundant, but it had practically disappeared by 1890 from the eastern half of the state, and since then has steadily become more restricted in habitat. The native prairie grasses have been in considerable part displaced by grasses introduced from more humid regions. Weeds are very numerous (about 125); and some, notably the sand-bur (*Solanum rostratum*) cockle-bur, and tumble-weeds among indigenous, and the Russian thistle (*Salsola tragus*) and purslane among non-indigenous species, are agricultural pests. Nothing can surpass in beauty the rank grasses and bright flowers that grow on the lowlands and rolling uplands of a virgin prairie—now hardly to be found in the state. The common sunflower (the most conspicuous weed of the state) and allied flowers, which spring up in myriads even in the midst of unbroken prairie wherever this is disturbed, line the roads with yellow bands from horizon to horizon, enclose the broken fields and choke waste places.

Fauna.—The fauna of the state is not known with the same thoroughness and detail as the flora, but it too is varied. This is notably true of birds and of insects. Of the latter there are probably 12,000 to 15,000 species, including 140 butterflies, at least 180 grasshoppers, several hundred bees, &c. The so-called "grass hoppers," true locusts, have done great damage at times in Nebraska. About a third of all the species known in the United States are found within the state or close to its borders, and of these, 9 or 10 are so common that their increase under conditions favourable to their development may be a danger Such conditions are found in dry years, unfavourable to their chief parasitic enemies, favourable to their own breeding, and the cause of their migrations. There were locust plagues in 1874, 1876 and 1877. Fungus parasites have been used with some, but on the whole rather slight, success, and mechanical appliances with perhaps greater success, in combating these pests. Birds are more effective. As in the case of plants, western, eastern, northern and southern avian species meet in Nebraska. In 1905 some 415 to 420 species had been found within its borders, and more than half of these were known to nest in the state; 120 had been counted in the winter. The lakes of the sand-hills are the breeding-place—less so as settlement increases—of myriads of water-fowl. Before the advent of the white man Nebraska was full of wild mammals, the buffalo, elk, black and white tailed deer, antelope, bears, timber wolves, panthers (pumas), lynx, otter and mink being common. Almost all that remain are black bears, foxes, coyotes (prairie wolves), mink, musk-rats, raccoons and prairie dogs (or gophers). Antelope were not uncommon in the west and northwest until after 1890. The coyote is still so common even in the east as to be a nuisance to the farmer; in 1907 a bounty law was in force which provided for the payment of a state bounty of $5, on every grey wolf, $1·25 on every coyote and $1 on every lynx (wild cat). A few rodents have increased in numbers; the prairie dog especially is a pest in the alfalfa fields of the arid lands (as are pocket-gophers at places in the east).

Climate.—The climate of Nebraska is typically inland or continental; *i.e.* it is characterized by "winters of considerable severity, summers of unusual warmth, rainfall in limited quantities, marked and sudden changes of temperature, large seasonal and daily temperature ranges, and dry, salubrious atmosphere, with a small percentage of cloudiness, and a large percentage of sunshine."[1] The average wind velocity for the High Plains of Nebraska and adjoining states is about 10 to 12 m.; 25 m. is not uncommon; and a velocity of 40 m. and over is recorded a half-dozen or more times every year. In spring velocities of 15 to 20 m. are common. The average velocity of winds for the entire state for 11 years preceding 1906 was 9·8 m. per hour. The prevailing directions are those common to a large part of the western Mississippi valley. The prevailing wind of the year is N.W.; but in the spring, the summer and much of the autumn its predominance is greatly reduced or overcome by S. and S.W. winds blowing from the Gulf of Mexico (but deflected by the rotation of the earth). Sometimes these winds blow in the winter—causing the curious phenomenon of melting snows on the coldest days of the year; in the summer in seasons of drought, especially in the western part of the state, this wind from the Gulf sometimes reaches Nebraska wrung dry of its moisture and so hot that in a day or two it shrivels and ruins the crops in its path. Such calamities are, however, uncommon, and the belief that Nebraska is often visited by tornadoes is erroneous.

The normal mean-annual temperature of the state is about 48·7° F, and the normals for the six approximately equal weather sections into which the state is divided by the National Weather Service are respectively about 48°, 50·5°, 48·6°, 50·4°, 47·9° and 46·6° F. This illustrates the extraordinary homogeneity of climatic conditions. But there is a considerable difference in the averages for different months—the normal means of January and July through 30 years being 20·9° and 74·6° F., and the means of spring, summer, autumn and winter respectively about 48°, 72°, 53° and 23·5° F. Thus there is for any particular locality a wide range in absolute temperature through the year, which averages for the state probably about 120° (1897–1905). Similarly, the range is large through the day, especially in the higher altitudes, where the nights are almost invariably cool and refreshing after even the hottest day. The number of continuous days with a mean temperature above 50° F., averages probably about 175 for the state. The actual growing-season between frosts is, however, not so great. Temperature is of course lower as one moves to the N. and N.W., the initial planting and harvesting of each crop progressing wave-like across the state in from one to two weeks. Especially in the W. and N.W. there are in some winters occasional anti-cyclonic or high-area storms known as blizzards—wind-storms preceded or accompanied by snow-fall—which are very severe. They continue from one to three days, and are habitually followed by very low temperature. They are the cause of great loss to the cattle owners. Such storms are, however, rare. In the S.E. portion of the state the winters are characteristically mild and open. Temperatures below zero are rare for any locality; and the same may be said of temperatures above 95° in summer.

The normal mean-annual precipitation for the whole state is about 23·84 in. in rain and melted snow, the actual yearly fall varying through 30 years between 13·30 and 31·65 in. Such rainfall might seem inadequate for an agricultural country: moreover, the eastern half of the state is more favoured than the western, which belongs, indeed, to the semi-arid Great Plains on which the Reclamation Service of the United States Government is active. But aridity is a matter of the efficiency rather than of the mere quantity of rainfall, and in this regard Nebraska is very fortunately situated. Rain is most plenteous in the critical months of the year. Seven-tenths of all precipitation falls in the growing season, giving the state, especially in the east, a greater amount at this time than many other states whose aggregate yearly rainfall is greater; so that Nebraska has an abundance for the safest cultivation. Moreover, nine-tenths of the rainfall is absorbed by the loess and sandy soils, only one-tenth being "run-off." It is a widely spread but unfounded belief in Nebraska that the rainfall has been increasing since the settlement of the state. That its storage has very greatly increased as cultivation has been extended (the prairie sod sheds water like a roof) is true; moreover, the spread of scientific principles of farming has increased the advantage derived from the ground-water stored. Efficient rainfall has thus been greatly increased. Intermittent streamlets may well become perennial, and many are probably, as reported, becoming so. It is even conceivable that the settlement of the state may affect the seasonal distribution of precipitation; and that an advantageous alteration has in fact resulted is believed by many.

The climate of Nebraska is exceptionally healthy. Its beneficial qualities must be attributed to the state's inland situation, its dry and pure air, constant winds and splendid drainage, to which its even slope and peculiar soil alike contribute. In some people, however, nervousness is induced; and the winds, in particular, often have this effect. Autumn is perhaps the finest season; the fields are green into the winter, the air is pure and fresh, though dry and warm, and the long season is delightfully mild and beautiful. The arid portion, as compared with the eastern portion, of the state has alike the advantages and disadvantages of a climate more sharply characterized.

Soil.—Geologically Nebraska is one of the most typical agricultural states of the Union; although in the present distribution of industrial interests agriculture is by no means so predominant as in some southern states. The basis of the soils is sands (coarse, fine or silt); clay beds, though economically important, are in quantity relatively scant. In the eastern half silt, and in the western fine sand, form the bulk of the soil. There are five well-defined soil regions corresponding to the geologic-topographic divisions already indicated of drift loess, sand-hills, foot-hills and Bad Lands. The loess is a "salt, fine sandy loam with a large percentage of sand or silt, and considerable calcareous matter, and usually a small amount of clay." It contains considerable humic matter, discolouring rapidly in the air (when exposed it is characteristically a bright buff). It is of extraordinary fertility, and its great depth (in Lincoln and Dawson counties bluffs 200 ft. thick are found) is a guarantee of almost inexhaustible resources. The glacial drift is also a useful deposit, coarse ingredients in it being of small amount (rare boulders, and some gravel). The superficial soil over most of the state, and everywhere in the E. except rarely where the loess or drift is bare, is a rich, black vegetable mould, 1 to 5 ft. thick on the uplands. The sand-hills are not inherently infertile; the soil never bakes, is always receptive of moisture,

[1] Senate Executive Document 115 (vol. 10), 51 Congress, 1 Session (1890), *Climate of Nebraska.*

absorbing water like a sponge and holding it well. There is a great amount of fertile valley land, adequately watered. Alfalfa and other cultivated grasses are encroaching on the whole region, and even the natural arid-land bunch grasses make excellent grazing. The "butte" soil of the W. is a fine sandy soil, characteristically calcareous, derived from the Arikaree. With it also moisture is a great factor in its productivity. The Bad Lands are by no means infertile (their name, it should be noted, was originally *Mauvaises terres à traverser*); but they are almost destitute of ground water, though containing many green "pockets" where surface water can be stored. They contain much clay and marls, non-absorbent and subject to such excessive wash that vegetation cannot gain a foothold. In various parts of the west are small tracts of so-called "gumbo" soil; they are due to the Pierre shale, are poorly drained and characteristically alkaline. Small alkaline areas also occur about lakes in the sand-hills. Where surface water is adequate the regions of the Pierre shale make splendid grazing lands; but in general they are not very useful for agriculture. Salt lands occur about Salt Creek notably around Lincoln. The stream bottoms of alluvium are modified by loess and humic deposits, and are of course very fertile; but hardly more so than the loess of the uplands.

Agriculture.—Agriculture is not only the chief industry but is also the foundation of the commerce and manufactures of the state. In 1900, of the total area 60·8% was reported as included in farms, and 37·3% as actually improved. The rank of the state in the Union was 13th in value of farm property, and 10th in value of farm products. The farm value was $747,950,057, an increase since 1890 of 46·1%; while the total product-value was $162,696,386—an increase (partly factitious) of 143·4% in the same period. A greater part of the state was reported improved in 1890 than in 1900; the change was due to the increase of stock-raising in the West. Similarly, the size of the average farm increased from 156·9 acres in 1880 to 190·1 in 1890, and 246·1 in 1900, although in eastern Nebraska there was a contrary tendency. Under the Kincaid law, which permits entire sections instead of quarter sections (160 acres) to be homesteaded, this movement has been fostered. In the years 1880–1900 the number of farms operated by cash tenants rose from 3·1 to 9·6%; of share tenants from 14·9 to 27·3% of the total. There is no appreciable tendency toward management for absentee owners. The census of 1900 showed that not less than two-fifths of the total net income came from live stock or from hay, grain and forage on farms representing together 96% of the farm-value of the state—live stock being a trifle more important; dairying was similarly predominant for 1·6%, and beet-sugar for 0·1%. Other crops were unimportant sources of revenue. Sugar-beet culture has developed since about 1889; it is localized largely in Lincoln county, near North Platte, though beets are raised over a large part (especially the western part) of the state. In 1907 about 11,000 acres were planted to sugar beets. The principal factory for the slicing of the beets is one built at Grand Island, Hall county, in 1890. The dairy interest is rapidly growing, but is still exceeded in other states. Omaha is a great dairy market. Nebraska ranks very high in the production of cattle and hogs. A fourth of all animal products are represented by milk, butter and cheese, eggs and poultry; the rest by animals killed on the farm or sold for slaughter, most of them going to supply the meat-packing industry of South Omaha. Wild, salt and prairie grasses make up the bulk of the forage acreage, but the cultivated crops—especially millet and Hungarian grasses and alfalfa—are more important. Holt county in the Elkhorn valley, and Sheridan county in the foot-hills, produce more than half the hay-crop of the state. Alfalfa can be grown with more or less success in every county of the state, not excepting areas where clay or sand form the sub-soil; but on the uplands of the central part of the state it is produced with the greatest success and in the greatest quantities. In 1908, according to the reports of the state Board of Agriculture, the crop of Custer, Dawson and Buffalo counties was about 15% of the total crop (1,846,703 tons) of the state. The product was quintupled between 1899 and 1905, and between 1905 and 1908 the increase was about 40%. It has been a great aid to western Nebraska as to other portions of the Great Plains. Sorghum and kafir corn are also excellent, and broom-corn fairly good, as drought-resistant crops; the last, which is of lessening importance, is localized in Cass, Saunders and Polk counties. Cereals are by far the most important crops, representing in 1899 four-fifths of farmed land and crop values. Allowing for variations in "off years," but speaking with as much exactness as is possible, Nebraska has established her position since about 1900 in the third, fourth and fifth rank respectively among the states of the Union, in the production of Indian corn, wheat and oats. Of these, Indian corn is by far the most important, representing normally about two-thirds of the total crop value; while wheat and oats each represented in 1906 about one-seventh of the total crop, and rye, barley, kafir-corn and buckwheat make up the small remainder. Indian corn is grown to some extent all over the state, except in the north-west, but the great bulk of the crop is produced east of the 99th meridian. It is rarely cut, but is left to mature and dry on the stalk in the field. The yearly yield in the decade 1895–1904, according to the most conservative state statistics, varied from 298,599,638 to 72,445,227 bushels, and the average was 178,941,084 bushels, or 190,773,957, omitting the failure of 1901; the yield per acre being similarly 26·35 or 27·9 bushels (12·4 in 1901);[1] in 1906 the crop was 249,782,500 bushels, and the average yield per acre 34·1 bushels; in 1907 the crop was 179,328,000 bushels, and the average yield only 24 bushels per acre. According to the report of the state Board of Agriculture, Custer, Lancaster and Saunders counties produced the largest amounts (each more than 5,000,000 bushels) of Indian corn in 1908. Since 1900 Nebraska has become one of the foremost winter wheat states, second only to Kansas. Little spring wheat is now sown except in the northern counties, the state being on the northern edge of the winter wheat belt. From 1880 to 1890 the acreage devoted to wheat greatly diminished, because the spring variety was not relatively remunerative, but the acreage trebled in the next decade as autumn planting increased. The winter varieties have the advantages of larger yield, earlier ripening and lesser loss from insects, and afford protection to the soil. The growth of durum (macaroni) wheat is also increasing, but is hampered by the uncertainty of market, which is for the most part foreign. The wheat crops of the decade 1895–1904 averaged 33,208,805 bushels a year; or ranged from a minimum of 9·8 to a maximum of 20·9, averaging 15·8 bushels to the acre; in 1906 the crop was 52,288,692 bushels, and the average yield 22 bushels per acre; and in 1907 the crop was 45,911,000 bushels, and the average yield 18·1 bushels per acre. In 1908 Clay, Adams and Hamilton were the principal wheat-growing counties in the state. The corresponding figures for oats were: average yield for the decade, 48,145,185 (range, 28,287,707 in 1901 to 66,810,065 in 1904); range of yield per acre, 17·9 to 34·0, and average 27·6 bushels per acre; in 1906 the crop was 72,275,000 bushels and the average yield per acre 29.5 bushels; in 1907 the crop was 51,490,000 bushels, and the average yield 20·4 bushels per acre. In the decade 1890–1900 the state did not rise above the 10th rank in the Union; after 1900 her rise was rapid. The same is even more markedly true of rye; in 1907 the crop was 1,502,000 bushels (from 88,400 acres), a yield exceeded in only five states in the country. Apples are raised in the N.E. and S.E. sections of the state, and are much the most important fruit grown. Peaches are next in importance, and horticultural enthusiasts believe that the possibilities of this crop are very great. Other fruits are raised with much success, and in 1904 at St Louis the horticultural exhibit of the state led those of all other states in the medals received for excellence; but nevertheless its relative rank in the Union as a fruit-producing state is still low.

In a period of 30 years (1869–1898) there were, according to the state Board of Agriculture, four seasons whose crops could reasonably be classed as failures, three more as "short," one as fair, eighteen as good, and four as great. Compared with adjoining states—Iowa, Minnesota, South Dakota, Kansas, Missouri—none shows a greater, if indeed any shows so great an average value per acre in the yield of Indian corn, wheat, oats, barley and rye; and this despite the assumed handicap of the western half of the state. In fact the yield of this section relatively to cultivated acreage is normally fully equal to that of the eastern section; a result quite consistent with the scientifically proven fertility of semi-arid lands. The real handicap of the western counties would be shown in comparing aggregate yields per given area; for much land is normally inarable. Alfalfa, stock raising and dairying, afforestation, "dry-farming" and irrigation are, however, proving that the West can maintain prosperity by not relying upon ordinary agriculture. Alfalfa is not easily started, however, on the uplands of the extreme western part of the state; and dry-farming (the Campbell dust-mulch system) has the expensiveness in labour of intensive cultivation. The above-mentioned delusion that climate is changing and adapting itself to agriculture, thus relieving the farmer of accommodating his methods to the climate, has considerably handicapped him in progress. Systematic experiments in dry-farming throughout the Great Plains were provided for on a great scale by Congress in 1906. By attention to crop rotation, soil physics and world-wide search for plants adapted to the Great Plains (such as the U.S. Department of Agriculture has long been conducting), a very great deal can be accomplished—no one can say how much; but certainly the Western must long remain at a great disadvantage in comparison with the Eastern portion of the state as regards the growth of cereals.

Irrigation.—Water for the western part of the state is a resource of primary importance, and irrigation therewith a fundamental problem. Very generally, especially in the butte regions, the country lends itself to the impounding of surface water. The lakes are of great importance for the stock ranges of the sand-hills. It is commonly believed that of underground water, and generally of artesian water, even the driest counties have an abundance. This is great exaggeration. Though both in central and western Nebraska there are strata that generally yield a considerable flow, the supply is usually limited and the expense is great. Up to 1906 dependence was mainly upon the streams, which it is estimated might furnish 3 or 4 million acre-feet—enough to irrigate between 10 and 15% of the arid section—were all the water available, and the land

[1] Data of the State Bureau of Labor and Industrial Statistics, which are lower than those of the state Board of Agriculture, and (in census years) the Federal Census. The yearly average given by the Board of Agriculture for 1895–1904 is 219,196,000 bushels. The statistics for 1906 and 1907 are taken from the *Year-books* of the Department of Agriculture.

irrigable. As compared with the streams of Colorado, where irrigation is much more advanced, the streams of Nebraska have a very constant flow; the relative supply-capacities of the Arkansas and Poudre in Colorado, and the Loup and North Platte in Nebraska being about as 1·000, 1·193, 3·347 and 4·632 respectively, according to the estimates of the state engineer (Nebraska *Public Documents* 1901–1902, vol. iii. p. 144). An irrigation law was first passed by Nebraska in 1895. One of the greatest improvement projects undertaken by the national Reclamation Service is one on the North Platte, begun in 1903, which contemplates a reservoir in Wyoming of sufficient capacity to store all the surplus waters of that stream, about 600 m. of canals, and the reclamation of 107,000 acres in Nebraska; it was 74% completed in 1909. The work of the national service began in Nebraska in 1902. Some farmers on the uplands between the valleys in western Nebraska irrigate by means of wind-mills, and although the underground water is 175 ft. or more below the surface one wind-mill often supplies sufficient water to irrigate ten acres. The extent of irrigated acreage increased about thirteen-fold from 1889 to 1899. In the latter year there were 1701 m. of ditch costing about $751.00 per m., irrigating 148,538 acres, which yielded crops averaging $6.61 per acre in value. The greatest part of the irrigated acreage is in the valley of the North Platte and the Upper Platte—probably nine-tenths in 1906—in Scotts Bluff, Lincoln, Cheyenne, Dawson, Keith and Deuel counties. There is, however, a large ditch in Platte county—the farthest E. of any large ditch in the country; and though agriculture is normally quite "successful" here without irrigation, nevertheless it is more profitable with it. In fact, in 1899 about a quarter of the irrigated acreage lay E. of the section classed as arid.

Manufactures.—The rank of Nebraska among the states of the Union in 1900 in population, in value of agricultural products, and in value of manufactured products, was respectively twenty-seventh, tenth and nineteenth. In the decade 1890–1900 the state increased the value of its manufactures somewhat more than half. The *per capita* product-values for agriculture and manufactures in 1900 were $153 and $135 (as compared with $63 and $38 in 1890). Only 2·3% of the population were engaged in manufacturing in 1900. Of the total factory product (in 1900, $130,302,453; in 1905, $154,918,220), 84·7% were urban (*i.e.* were for the three cities which in 1900 had a population of at least 8000) in 1900, and 81·7 in 1905; the percentage for these cities being 53·3 in 1900 and 43·5 in 1905 for South Omaha, 29·2 in 1900 and 34·9 in 1905 for Omaha, and 2·1 in 1900 and 3·4 in 1905 for Lincoln; Nebraska City, Fremont, Grand Island, Beatrice, Hastings, Plattsmouth and Kearney were the only other manufacturing centres of any importance. In 1907 there was a beet-sugar factory at Grand Island; at Nebraska City there are several distinctive industries; at South Omaha very important meat-packing houses; and the other cities have interests rather extensive or varied than distinctive. As yet manufactures are insignificant except in lines immediately dependent upon agriculture, the combined output of the packing, flour and grist mill, dairy and malt-liquor establishments constituting in 1900 nine-tenths of the total state output. Meat-packing is by far the most important single interest, South Omaha being the third greatest packing centre of the country, employing in 1900 and in 1905 a quarter of all wage-earners and yielding nearly one-half the total product-value of the state ($71,018,339 in 1900; $69,243,468 in 1905). The malt-liquor industry is favoured by the great production of barley in Iowa; the value of malt liquors manufactured in 1900 was $1,433,501, and in 1905 $1,663,788. Nebraska wheat, like that of Kansas, combines for milling the splendid qualities of winter wheat with those characteristic of grain grown on the edge of the semi-arid West; flour and grist-mill products were valued at $7,794,130 in 1900 and at $12,190,303 in 1905. The first creamery in Nebraska was established in 1881. A creamery at Lincoln is said to be the largest in the United States. Many co-operative dairies have persisted since the early days of farmers' granges. The value of cheese, butter and other dairy products was $2,253,893 in 1900 and $3,326,110 in 1905. Of manufactures not dependent upon agriculture perhaps the most promising is that of brick and tile products (valued at $839,815 in 1900 and at $1,131,913 in 1905), and the largest in 1905 was the manufacture and repair of steam railway cars (valued at $2,624,461 in 1900 and at $4,394,685 in 1905).

Communications.—There is no longer any river navigation. There were 6,101·5 m. of railway in the state at the end of 1907; the great period of railway building was 1870–1890, the mileage in 1870 being 705, in 1880, 1953, and in 1890, 5407. The eastern half of the state is much better covered by railways than the western. Six great east and west trunk-lines connecting the Rocky Mountain region and Chicago enter the state at Omaha (*q.v.*), and two others, giving rather an outlet southward, enter the same city and serve the eastern part of the state. In 1908 all but 5 counties out of 90 had railway outlets. A marked tendency toward north and south railway lines is of great promise to the state, as outlets towards the Gulf of Mexico are important, especially for local freight. Omaha and Lincoln are Federal ports of entry for customs.

Population.—In 1900 the population of the state was 1,066,300 and in 1910, 1,192,214. In 1900 16·6% were foreign-born, and 43·3% natives of other states than Nebraska. The latter came mainly from the north-central states. Of the foreigners, Germans, Scandinavians and British (including English Canadians) made up four-fifths of the total. The most numerous individual races were Germans (65,506), Swedes (24,693), Bohemians (16,138), Danes (12,531), Irish (11,127), English (9757), Russians (8083) and English Canadians (8010). In 1900 three cities had a population above 25,000—Omaha, 102,555; Lincoln, 40,169; South Omaha, 26,001—and seven others had a population between 5000 and 8000—Beatrice, Grand Island, Nebraska City, Fremont, Hastings, Kearney and York. The population of Nebraska was 28,841 in 1860, 122,993 in 1870, 452,402 in 1880 and 1,062,656 in 1890. The increases of population by decades following 1860 were 326·5, 267·8, 134·1, 0·3, and 11·8%. From 1880–1890 the absolute increase was exceeded in only four states, and was greater than in any state W. of the Mississippi except the enormous state of Texas; from 1890–1900 it was less than in any state of the Union except Nevada (whose population decreased). In this decade 35 counties out of 90 in the state showed a decrease: the shrinkage was mainly in the first half of the decade, and was due to the cumulative effects of national hard times, a reaction from an extraordinarily inflated land "boom" of the late 'eighties, and a remarkable succession of drought years, and consequent crop failure in the West. Between 1885 and 1895 Kansas and Colorado went through much the same experience, due to a too rapid settlement of their arid areas before the conditions of successful agriculture were properly understood. Many homes, and even small settlements in Nebraska—though not to the same extent as in Colorado and Kansas—were abandoned. Urban population (the population in places having 4000 or more inhabitants) also fell, constituting 25·8% in 1890, and in 1900 only 20·8% of the total population of the state. In the case of some cities that showed a great decrease (*e.g.* Lincoln 27·2%, and Omaha 27%) notoriously "padded" censuses in 1890 were in part responsible for the bad showing ten years later.

In 1906 there were in the state 345,803 communicants of various religious denominations; of these 100,763 were Roman Catholics, 64,352 Methodists, 59,485 Lutherans, 23,862 Presbyterians, 19,121 Disciples of Christ, 17,939 Baptists and 15,247 Congregationalists.

In 1890 there were in the state 2893 untaxed and 3538 taxed Indians, the latter being citizens; in 1900 there were 3,322 altogether, all of them taxed; and in 1908 there were 3720, of whom 1270 were Omaha, 1116 Santee Sioux, 1060 Winnebago and 274 Ponca.

Among the Indians who occupied Nebraska immediately before the advent of the whites and thereafter, the only families of much importance in the state's history were the Caddoan and the Siouan. The Caddoan family was represented by the Middle or Pawnee Confederacy; the Siouan family by its Dakota, Thegiha, Chiwere and Winnebago branches. Included in the Dakota branch were the Santee and Teton tribes, the latter comprising the Brulé, Blackfeet and Oglala Indians; in the Thegiha branch were the Omaha and Ponca tribes; and in the Chiwere branch, the Iowa, Oto and the Missouri tribes. Other tribes were of less importance; and tribes of other families—with the exception of the Cheyennes and Arapahoes of the Algonquian family, whose permanent hunting grounds embraced the foot-hill country of the West—were of negligible importance, being only roamers within the borders of the state. The Pawnees contested the plains against the Sioux with undying enmity. Before the Civil War there were no very general troubles between Indians and whites, despite constant frontier difficulties, except the bloodless "Pawnee War" of 1859–60; but in 1863–64 the Indians rose rather generally along the frontier, and many settlers were killed. In 1890–91 there was another war—with the Sioux—marked by the battle of Wounded Knee, just across the line in South Dakota. In dealings with the Indians there have been in Nebraska the usual discreditable features of administration. The maltreatment of the Poncas, a fine and peaceable tribe, was peculiarly and inexcusably harsh. Segregation on reservations was generally accomplished in 1870–1880. There were in 1900 small reservations for Omahas and Winnebagoes in Thurston county and for the Sioux in Sheridan county, and an agency for the Santees and Poncas near the mouth of the Niobrara; and at Genoa, where the Pawnee agency and reservation had been located, there was in 1908 an Indian school maintained by the United States government with 350 boarding

pupils. In 1908, however, almost all the tribal lands had been distributed in severalty: the Niobrara Reservation (under the Santee government boarding school for the Santee Sioux and the Ponca) had only 1130·7 acres reserved for agency, school and mission purposes; the Ponca Reservation (under the same school) had only 160 acres reserved for agency and school buildings; the Omaha Reservation (under the Omaha School) had 12,421 acres unallotted; the Sioux Reservation (under the Pine Ridge Agency) for Oglala Sioux had 640 acres; and the Winnebago Reservation (under the Winnebago School) had 1710·8 acres unallotted and 480 reserved for agency, &c.

Government.—The present constitution, adopted in 1875, replaced one adopted in 1866. In 1871 a convention framed a constitution that was rejected by the people. It provided for compulsory education, and for the taxation of church property; prohibited the grant by counties or cities of financial aid to railway or other corporations, and enjoined that railways should have an easement only in their right of way. The last two provisions were mainly responsible for the defeat of the constitution. The instrument of 1875 presents a few variations from the normal type, and under it a few interesting problems have arisen. The constitution provides two methods for amendment. A convention for revising or amending the constitution is to be held in case a recommendation to that effect made by the legislature (a three-fifths vote of all the members of each house being required) is accepted by a majority of the electors voting at the next election for members of the legislature, but no amendment agreed upon by the convention is to take effect until approved by a majority of electors voting on it. Without calling a convention, however, the legislature may, by a three-fifths vote of all the members of each house, adopt an amendment, which is to come into effect only if approved by a majority of electors voting at the next election of senators and representatives—the publication of the proposed amendment in some newspaper in each county once a week for three months before the election being required. This has been interpreted by the courts as requiring a majority of the votes actually cast for senators and representatives. As there is less interest in amendments than in the election of members of the legislature, only two out of a large number of amendments proposed from time to time by three-fifths of the members elected to each house have been adopted. The first of these, increasing the pay per day to the members of the legislature and providing for longer sessions,[1] was declared lost by the official canvassers, but when (1886) the ballots had been recounted by the legislature it was declared adopted. The second (1906), creating a railway commission, was endorsed by a political party in state convention, was printed on the same ballot-paper with the names of the party candidates for office in order to secure for it all "straight" party votes, and by this procedure, which was upheld by the state supreme court in 1907, it was adopted. All male persons who are citizens of the United States or have declared their intention to become such at least thirty days before an election have the right of suffrage provided they have attained the age of twenty-one years, have resided in the state six months, are not of unsound mind, and have not been convicted of treason or felony. Women who have either children or taxable property may vote on questions relating to schools. The general election of state and local officers is held annually on the first Tuesday succeeding the first Monday in November, but municipal and school district elections may be held at other times. The secret ballot was adopted in 1891; the use of the voting machines was authorized in 1899; and the nomination of candidates by primaries was made mandatory in 1907. By a provision unique in 1875, the constitution authorized the legislature to provide that the electors might express their preferences for United States senators; but this was not treated as mandatory on the legislature, and though votes were at times taken (1886, 1894), they were not officially canvassed, nor were any senatorial elections materially affected by them.[2] In 1907, under a direct primary law, the nomination of candidates for United States senator was transferred from the party convention directly to the people; and in 1909 the "Oregon plan" was adopted, whereby each candidate for the legislature must go on record as promising, or not, always to vote for the people's choice for United States senator; on the ballot which bears the name of each candidate for the legislature there appears a statement that he "promises," or that he "will not promise," to vote for the "people's choice." In the same year the state enacted a law providing for the non-partisan nomination of all judges, of all superintendents of public instruction and of regents of the state university; nominations are by petition, and there is a separate "official non-partisan ballot" bearing the names and addresses of the nominees and the titles of the office for which they are nominated. The legislature of 1909 also provided for open election primaries and for the framing of state party platforms by convention before the time of the primary.

The governor is the chief executive officer of the state, but quite independent of him are a lieutenant-governor, a secretary of state, an auditor of public accounts, a treasurer, a superintendent of public instruction, an attorney-general and a commissioner of public lands and buildings, who, as well as the governor, are elected for a term of two years. The governor's appointing power is almost entirely limited to officers of state institutions, and for every appointment he makes the approval of the Senate is required; but he need not ask the consent of that body to remove for incompetency, neglect of duty or malfeasance in office "any officer whom he may appoint." His constitutional power to pardon is regulated by an act of the legislature (1907) which requires that he shall in no instance grant a pardon until the attorney-general shall have investigated the case and conducted a public hearing. His veto power extends to items in appropriation bills, but any bill or item may be passed over his veto by three-fifths of the members elected to each house of the legislature. The most important board of which he is chairman is the state board of equalization. As the present constitution was adopted in the year after a grasshopper plague, which had caused great financial loss, it limited the salary of the governor, auditor of public accounts and treasurer, as well as that of the judges of the supreme and district courts, to $2500 each and that of other important officers (including the secretary of state, the attorney-general and the superintendent of public instruction) to $2000. This economy has somewhat hampered the growing state. Salaries have been too low to attract the ablest men; and as the constitution forbade the creation of new offices, and no amendment of this clause could be secured, resort was had to the creation of additional "secretaries" and of boards constituted of existing state officials or their secretaries.

The legislature consists of a Senate of 33 members and a House of Representatives of 100 members, and meets in regular session on the first Tuesday in January of every odd-numbered year at Lincoln, the capital. Both senators and representatives are apportioned according to population, and are elected by districts in November of each even-numbered year for a term of two years. They are paid at the rate of five dollars a day during 60 days of a regular session and not exceeding 100 days during their entire term. No bill or joint resolution may be introduced at a regular session after its fortieth day except at the request of the governor. Special legislation of various kinds is expressly prohibited, and in the bill of rights it is declared that "all powers not herein delegated remain with the people." This clause would seem to leave the state government with no powers not expressly granted, and to make the rule for interpreting the Nebraska constitution similar to that for interpreting the Federal constitution; but in their practice the Nebraska courts have been little influenced by it, and it is chiefly of historical interest.[3]

The administration of justice is vested in a supreme court, 15 district courts, county courts and courts of justices of the peace and police magistrates. The supreme court consists of three judges elected for a term of six years, one retiring every two years; each district court consists of one to seven judges elected for a term of four years, and each county court consists of one judge elected for a term of two years. The county courts have exclusive original jurisdiction in the probate of wills and the administration of estates, concurrent jurisdiction with the district courts in civil suits for sums not exceeding $1000, and important jurisdiction in criminal cases. Perhaps the most unique provision of the Nebraska constitution is that

[1] The amendment increased the pay of members from three dollars to five dollars a day "during their sitting," and provided that sessions should last at least sixty days, and that members should not receive pay "for more than sixty days at any one sitting"; the original constitution had provided that they should "not receive pay for more than forty days at any one session" and had prescribed no minimum length for a session.

[2] An almost identical clause was inserted in the Ohio constitution of 1802, and one in exactly the same language appears in the present (1851) constitution of that state; it appears also in the Kansas constitutions of 1855, 1858 and 1859 (present), in the Nebraska constitution of 1866, in the North Carolina and South Carolina constitutions of 1868, and was retained in the present constitution of North Carolina as amended in 1876.

relating to appeals; it appears in the bill of rights and reads as follows: "The right to be heard in all civil cases in the court of last resort, by appeal, error or otherwise, shall not be denied." Regardless of this provision, however, the civil code denies the right of an appeal from an inferior court in cases that have been tried by a jury, and in which the amount claimed does not exceed $20, and the courts have decided that this denial is not in conflict with the constitution; but in at least one instance an appeal was allowed because of the constitutional guaranty, and that guaranty has doubtless had much influence on judicial legislation.

County government exists under both the district-commissioner system and the township supervisor system, the latter being rare. Cities are governed in classes according to population.

Except in Omaha there is no great field for social economic legislation; but the record of the state has been normally good in this respect. Railways have given rise to the most notable laws. Regulation has been a burning political question since 1876, the constitution making it the duty of the legislature to "correct abuses and prevent unjust discriminations and extortions in all charges of express, telegraph and railroad companies" within the state. The influence of the railways has been very great, and a constant drag on just taxation and other legislative reforms. In 1885, 1887 and 1897 the legislature created a Board of Transportation consisting of existing state executive officers or their secretaries, but this could do little except gather statistics, investigate alleged abuses, and advise the legislature, upon which the regulation of rates remained mandatory by the constitution. The Board was eventually declared unconstitutional by the state supreme court. In 1893 a maximum freight-rate Act was passed, but the rates thus fixed were declared by the United States Supreme Court to conflict with the Fourteenth Amendment, being "unreasonable." The right of the state to fix "reasonable" rates remained unquestioned, but American experience has not found such laws efficacious. In 1906 all political parties conducted campaigns on promises of radical legislation on railway rates, passenger and freight; and a constitutional amendment creating a railway commission was adopted in the manner above described. A result of this campaign was a remarkable series of enactments in 1907 for the regulation of railways. The legislature framed a stringent anti-pass law, reduced passenger fares and express and freight charges, provided for equitable local taxation of railway terminals, regulated railway labour in the interest of safe travel, fixed upon railways the responsibility for the death or injury of their employés, and gave to the newly-created railway commission complete jurisdiction over all steam-railways in the state, over the street railways of the cities, and over express companies, telegraph companies, telephone companies and all other common carriers. In 1909 provision was made for an annual corporation licence tax and for the physical valuation of railways. In the same year, following the example of Oklahoma, Nebraska passed a law guaranteeing bank deposits from a fund created by an assessment on the basis of total deposits. Useful child-labour and pure-food laws were enacted in 1907. Prohibition of the liquor traffic had been established in the Territory in 1855, but liquor licences were introduced in 1858; in 1909 the licence fee was fixed at $1000. A law enacted in 1907 made it illegal for breweries to own retail liquor houses, and one of 1909 required all saloons to close from 8 P.M. to 7 A.M. A homestead law exempts from judgment liens and forced sale a homestead not exceeding $2000 in value and consisting either of a farm not exceeding 160 acres or of property not exceeding two lots in a city or village; the exemption, however, does not extend to mechanics', labourers' or vendors' liens upon said homestead or to a mortgage upon it that has been signed by both husband and wife or by an unmarried claimant. A woman's rights to her property are not affected by marriage, except that it becomes liable for payment of debts contracted for necessaries to the family when a judgment against the husband for the payment of the same cannot be satisfied. The rights of dower and courtesy have been abolished, and husband and wife have instead equal rights to inherit property from the other; but the portion of the property of a deceased spouse that descends to the survivor varies from one-fourth to all according to whose and how many are the children concerned. The grounds for a divorce are adultery, incompetency at the time of marriage, sentence to imprisonment for a term of three years or more, abandonment without just cause for two years, habitual drunkenness, extreme cruelty, and refusal or neglect of the husband to provide a suitable maintenance for his wife. The period of residence in the state required to secure a divorce was formerly six months, but in 1909 it was made two years.

Finance.—The constitution limited the debt that the state might contract to meet casual deficits to $100,000, unless in time of war, and required taxes to be laid to maintain interest on such debt (bonds). These provisions were construed to mean that not more than $100,000 of debt could be contracted in addition to appropriations made by the legislature. There was from the beginning a constant issue of state "warrants" on the general fund, dependent on taxation. These warrants when issued and presented for payment were paid by the state treasurer, were sold to the permanent school fund, and drew 4% interest until cancelled from the general fund. The floating debt of warrants was practically cancelled in 1909, after a one-mill levy for four years for this purpose. Since 1900 there has been no bonded debt whatever. The constitution also prohibited state aid to railways and other corporations, leaving this to cities and counties under limitations. In 1903 the assessed valuation of property was $188,458,379; in 1905, $304,470,961; in 1906, $313,060,301; in 1907, $328,757,578, and in 1908, $391,529,673. The increase was due largely to a new revenue law of 1903 ordering property to be assessed at one-fifth of its actual value. The average tax-rate in the year 1904 was 6⅞ mills; in 1905, 1906 and 1907, 7 mills; and in 1908, 6½ mills.

Education.—The public schools have been endowed by the United States, beginning in 1854, and by the state; in 1909 the permanent school funds derived from the sale of educational lands amounted to $8,450,557, invested in state securities, county, school district and municipal bonds. The percentage of illiterate population (*i.e.* population unable to write) above 10 years of age was in 1880 and 1890 smaller than that in any other state in the Union, and in 1900, when it was 2·3% (for native whites, foreign whites and negroes respectively 0·8, 6·8 and 11·8), was smaller than that in any other state except Iowa (whose percentage was also 2·3); the percentage for males of voting age (2·5%) being the least in the Union. There are four state normal schools—one at Peru (opened 1867), one at Kearney (1905), one at Wayne (originally private; purchased by the state in 1909) and one, provided for by the legislature of 1909, situated in the north-western part of the state. The university of Nebraska at Lincoln was established in 1869 by an act of the state legislature, and was opened in 1871. The university is governed by a board of six regents, elected by the electors of the state at large, each for six years, two going out of office each year. The revenue of the university is from the income of Congressional land grants under the Morrill Acts and from a one mill per one dollar tax on the current assessment roll of the state.[1] Connected with it and governed by the same regents are the State College of Agriculture (including the School of Agriculture) and the Agricultural Experiment Station, on the university farm of 320 acres, 2½ m. E. of the university, which receive support from the United States government, and an experimental sub-station at North Platte. The botanical and geological surveys of the state are carried on by the university; the former has been largely under the supervision of Charles Edwin Bessey (b. 1845), professor of botany. The university as reorganized in 1909 embraces a college of arts and sciences, a graduate college, a college of agriculture, a college of engineering, a teachers' college (1908), a college of law (1891), a college of medicine, a school of pharmacy, a school of fine arts, an affiliated school of music and a summer session. The medical school is in Omaha. The university has no preparatory department. Its library in 1909 had about 85,000 volumes. In 1908–1909 the university had an enrolment of 3611 students (2077 men and 1534 women). The granting of university degrees is conditioned by a "credit-hour" system; 125 credit hours are required for a bachelor's degree. Elisha Benjamin Andrews[2] (b. 1844) became chancellor of the university in 1900; in 1909 he was succeeded by Samuel Avery (b. 1865). Most of the educational institutions of the state are coeducational. Among the private educational institutions of the state are: Nebraska Wesleyan University (1888, Methodist Episcopal), at University Place, a suburb of Lincoln; Union College (1891, Adventist), at College View, suburb of Lincoln; Creighton University (1879, Roman Catholic), at Omaha; York College (1890, United Baptist), at York; Cotner University (1889; legally "The Nebraska Christian University"), at Bethany, a suburb of Lincoln; Grand Island College (1892, Baptist), at Grand Island; Doane College (1872, Congregational), at Crete; Hastings College (1882, Presbyterian), at Hastings; and Bellevue College (1883, Presbyterian), at Bellevue. State penal and charitable institutions include soldiers' and sailors' homes at Grand Island and Milford, an Institute for the Blind at Nebraska City (1875), an Institute for the Deaf and Dumb at Omaha (1867), an Institute for Feeble Minded Youth at Beatrice (1885), an Industrial School for Juvenile Delinquents (boys) at Kearney (1879), a Girls' Industrial School at Geneva (1881), an Industrial Home at Milford (1887) for unfortunate and homeless girls guilty of a first offence, asylums or hospitals for the insane at Lincoln (1869), Norfolk (1886) and Hastings (1887), an Orthopedic Hospital (1905) for crippled, ruptured and deformed children and a state penitentiary (1867), both at Lincoln. A Home for the Friendless, at Lincoln, incorporated in 1876, was taken over by the state in 1897; admission was restricted to children, and in 1909 its name was changed to the State Public School.

[1] In 1909 the state legislature refused to accept for the university the Carnegie education pensions.

[2] He was born in Hinsdale, New Hampshire, on the 10th of January 1844; served in the Union army during the Civil War; graduated at Brown University in 1870 and at Newton Theological Institution in 1874; taught homiletics at Newton in 1879–1882, history and economics at Brown in 1882–1888, and political economy and finance at Cornell in 1888–1889; and was president of Brown University in 1889–1898. He was an ardent bi-metallist, and in 1892 was a member of the International Monetary Conference at Brussels. He wrote on the currency question, and published a *History of the United States in our Own Times* (1904) and other works on American history and economics.

History.—Local pride has prompted some Nebraskans to begin the history of the white race in their state with the march of Coronado, in 1541, across the buffalo plains to "Quivira," N. of the Arkansas river in Kansas; but the claim is not warranted by the evidence. Marquette mapped the Platte from hearsay in 1673; French explorers followed it to the Forks in 1739; and, after Nebraska passed to the United States in 1803 as part of the Louisiana Purchase, successive American exploring expeditions left traces in its history. Major Stephen H. Long, in particular, followed the Platte and South Platte across the state in 1819, and his despairing account of the semi-arid buffalo plains—whence arose the myth of the Great American Desert—finely contrasts with the later history and latter-day optimism of dry-farming and irrigation. Meanwhile, fur traders who drew their goods from the country of the Platte had long been active on the Missouri. Trading posts were probably established in Nebraska in 1795, 1802, 1807 and 1812; the last two near the present towns of Ft. Calhoun (about 20 m. N. by W. from Omaha) and Bellevue. Manuel de Lisa, a noted Cuban trader and plainsman, was probably the first white settler (1807). In 1823 Bellevue became an Indian agency, and in 1849 the first United States post-office in Nebraska. Ft. Atkinson was maintained near the present town of Ft. Calhoun in 1819–1827; in 1825 the government acquired the first Indian lands, and in the 'thirties of the 19th century missionaries began to settle among the tribes; the first Ft. Kearney was maintained where Nebraska City now stands in 1847–1848, and in the latter year was re-established on the Platte, some 175 m. inland from the Missouri. Meanwhile there had begun the passage of the Mormons across the state (1845–1857), marked by important temporary settlements near Omaha (*q.v.*) and elsewhere, the travel to Oregon, and to California, for which depôts of supplies were established at Bellevue, Plattsmouth, Nebraska City and old Ft. Kearney, or Dobey Town.[1] Thus the country was well and favourably known before Congress organized it as a Territory in 1854.

Movements in Congress for the creation of a new Territory on the Platte began in 1844, several attempts at organization failing in the succeeding decade. In 1852–1853 Iowans and Missourians along the border of what are now Kansas and Nebraska held elections W. of the Missouri and sent delegates to Congress. A provisional Territorial government formed by Wyandot Indians and licensed white residents on Indian lands in Kansas (*q.v.*) forced Congress to take action. With what followed, the rivalry of the Platte and Kansas river valleys for the Pacific railway route, and the opposing interests of pro-slavery Missouri and anti-slavery Iowa, and possibly the personal ambitions of Stephen A. Douglas and Thomas H. Benton, had important relations. In the outcome Nebraska was one of the two Territories created by the Kansas-Nebraska Bill of 1854. This creative act bore evident traces of the pro-slavery sentiments of the Congress that passed it in the limitation of the suffrage to whites, and the explicit application of the national fugitive-slave laws for the last time in a federal statute. Under the provision of "popular-sovereignty" it was thought that Nebraska, as the more northerly Territory, would become a "free" state, if not a free Territory. There were slaves within its borders from the beginning, and anti-slavery ideas were embodied in several legislative bills, until a territorial law of 1861 excluded slavery. But the future of slavery was settled in Kansas, and events in Nebraska throw only a small side-light on that struggle. John Brown and James H. Lane spent considerable time in the south-eastern counties, and across these an "underground railroad" ran, by which slaves were conducted from Kansas to Iowa and freedom.

As organized in 1854 Nebraska extended from 40° N. lat. to British America, and from the Missouri and White Earth rivers to the "summit" of the Rockies; but in 1861 and 1863 it was reduced, by the creation of other Territories, to its present boundaries. By 1860 settlement had spread 150 m. W. from the Missouri, following the river valleys and the freighting routes. Many who had migrated to Pike's Peak in 1859, stopped in Nebraska on their return eastward; and settlement was stimulated by the national Homestead Act of 1862 (one of the first patents granted thereunder, on the 1st of January 1863, was for a claim near Beatrice, Nebraska), and by the building and land-sales of the Union Pacific and Burlington railways following 1863. Thus in 1861 there were probably 30,000 inhabitants in the Territory, and 3300 men were sent into the field for the Union army in the Civil War. Until well into the 'sixties freighting across the plains was a great business. The "Oregon Trail," the "Old California Trail," and the "Old Salt Lake Trail"—all nearly identical in Nebraska— ran along the Platte across the entire state with various terminal branches near the eastern border, to the Missouri river towns; while branches from St Joseph, Missouri and Leavenworth, Kansas, ran up the valleys of the Big Blue and Little Blue rivers and joined the Nebraska roads near Ft. Kearney. The Oregon and California migration was of large magnitude by 1846. St Joseph, Leavenworth and Nebraska City (*q.v.*) were the great freighting terminals of the West. Over these roads was run in 1860–1861 the famous "pony express" whose service ended with the completion of the overland telegraph in the latter year; it covered the distance from St Joseph, Missouri, to Sacramento, California, in eight days, and even less. Freighting ended when the Union Pacific was extended across Nebraska between 1863 and 1867.

Political interest in the Territorial period centred mainly in a fight for the capital, waged between the towns of the Missouri river front, Bellevue, Brownville, Nebraska City, Plattsmouth, Omaha and Florence, those of the North Platte interior, and of the South Platte. This struggle engendered extraordinary bitterness, since success might mean continued life, and defeat prompt demise, to competing towns. As population increased the question of the capital was complicated by the question of statehood. Both were involved in the agitation in 1858–1859 for the annexation of the South Platte to Kansas (*q.v.*), which gained considerable strength; annexation promising to the former much earlier statehood than continued union with the backward region of the North Platte, and to northern Kansas also promising earlier statehood, and an advantage in the sectional struggle with southern Kansas. As the expenses of Territorial government were partly borne by the United States, statehood was voted against in 1860, and again (virtually) in 1864 after Congress had passed an Enabling Act; but in 1866 a constitution framed by the legislature was declared carried by the people by a majority of 100 votes in 7776, and Nebraska was admitted as a state (in spite of President Johnson's veto) in 1867, after her legislature had accepted a fundamental condition imposed by Congress removing the limitation of the suffrage to whites by the new constitution. Fraud was charged in the Territorial election. At any rate the Republican party had worked for admission because it needed senators in Congress, and it got them. During part of 1866–1867 there were two *de facto* governments, the Territorial and the state.

The capital of the Territory remained always at Omaha, although in 1858 a majority of the legislature removed to Florence leaving the governor and a legislative rump at Omaha. In 1867 the South Platte region, having obtained a predominance in population capable of overcoming a gerrymander that had favoured the North Platte (and incidentally the Democrats), secured the appointment of a legislative committee to locate the state capital S. of the Platte. Several of the old Missouri river contestants had as representatives of their previous claims young towns located at strategic points in the interior. The committee avoided these and selected the site of Lincoln. Just ten years earlier the legislature had considered removal to another site on the Salt, to be called "Douglas" in honour of Stephen A. Douglas, then still in the heyday of his popularity.

The decade 1870–1880 was marked by the work of the two constitutional conventions described above. The first legislature under the constitution of 1875 met in 1877. The following decade was marked by a tremendous growth in population,

[1] In 18 months of 1849–1850 it was officially reported that 8000 wagons, with 80,000 draught-animals and 30,000 people, passed Ft. Kearney on the way to Oregon, California or Utah.

by a feverish activity in railway construction (the mileage in the state being increased from 1953 to 5407 m. in the ten years), and by an extraordinary rise in land values, urban and rural. Farm-land prices were raised to a basis of maximum productiveness when the best interests, especially of the western section, demanded steady growth based on average crop results under average conditions. The early 'nineties were marked by an economic collapse of false values, and succeeding years by a painful recovery of stable conditions.

The Democratic and Republican parties were first effectively organized in opposition, as parts of national bodies, in the territorial campaigns of 1858. Till then there were practically only Democratic factions; after 1861 the Republicans held the state securely until 1890. After about 1890 the national tendencies towards a re-alignment of political parties on social-economic issues were sharply displayed in Nebraska. This was in the main only an indication of the general Farmers' Movement (*q.v.*),[1] but this found in Nebraska special stimulus in large losses (almost $900,000) suffered by the state from the negligence and defalcation of certain Republican office-holders. Following 1890 the "Fusion" movement—the fusion, that is, of Populists, Democrats and (after 1896) of Silver Republicans—was of great importance. The only year in which these elements carried the state against the Republicans for presidential elctors was in 1896, when William J. Bryan of Lincoln was their presidential candidate; although the state delegation of representatives and senators in Congress was for a time divided. The Fusionists practically controlled the state government from 1897–1899; they held the legislature from 1891–1895 and from 1897–1899, the supreme court from 1899–1901, and the governorship and executive departments from 1895–1901; they elected a Democratic governor also for 1891–1893; but he was not of the true Fusion type, and vetoed a maximum railway freight-rate bill, although his Republican successor approved one. The year 1891 was the most feverish political year of this period. Apart from these temporary Fusion successes the Republicans have always controlled the state.

The governors of Nebraska have been as follows:—

Territorial Period.

Francis Burt	11 days, Oct. 1854
Thomas B. Cuming (secretary, acting governor)	Oct. 1854–Feb. 1855
Mark W. Izard	Feb. 1855–Oct. 1857
Thomas B. Cuming (secretary, acting governor)	Oct. 1857–Jan. 1858
William A. Richardson	Jan. 1858–Dec. 1858
J. Sterling Morton (secretary, acting governor)	Dec. 1858–May 1859
Samuel W. Black	May 1859–May 1861
Alvin Saunders	May 1861–Mar. 1867
Algernon S. Paddock (secretary, several times acting governor, 1861–1867).	

State.

David Butler (impeached and removed from office 1871)	1867–1871	Republican
W. H. James (lieut.-governor, succeeding)	1871–1873	"
Robert W. Furnas	1873–1875	"
Silas Garber	1875–1879	"
Albinus Nance	1879–1883	"
James W. Dawes	1883–1887	"
John M. Thayer	1887–1891	"
James E. Boyd[2]		Democrat
John M. Thayer (acting governor)	1891–1892	"
James E. Boyd	1892–1893	"
Lorenzo Crounse	1893–1895	Republican
Silas A. Holcombe	1895–1899	Fusion
William A. Poynter	1899–1901	"
Charles H. Dietrich (elected U.S. Senator)	1901	Republican
Ezra P. Savage (lieut.-governor, succeeding)	1901–1903	"
John H. Mickey	1903–1907	"
George L. Sheldon	1907–1909	"
A. C. Shallenberger	1909–1911	Democrat
Chester H. Aldrich	1911–	Republican

[1] Nebraska was one of the states in which the collapse of the co-operative enterprises of the Grange was particularly severe. The Farmers' Alliance was organized for the state in 1887, became a secret organization in 1889, and, as in other states, was a power by 1890. The membership of Grange, Alliance and Knights of Labour went over generally speaking into the People's party.

[2] Removed by decision of state supreme court on grounds of non-citizenship, 5th of May 1891; reinstated by decision of U.S. Supreme Court, 1st of February 1892.

NEBRASKA CITY, a city and the county-seat of Otoe county, Nebraska, U.S.A., situated on the high W. bank of the Missouri river, about 40 m. below Omaha. Pop. (1880) 4183; (1890) 11,494; (1900) 7380 (882 foreign-born); (1910) 5488. It is served by the Chicago, Burlington & Quincy, and the Missouri Pacific railway systems. A railway and wagon bridge spans the Missouri. The city is the seat of the state Institute for the Blind (1875), and has three public parks and a public library. The city is a distributing centre for a beautiful farming region, the trade in grain being especially large. In 1900 Nebraska City ranked third among the manufacturing cities of the state, the manufactures including canned fruits and vegetables, packed pork, flour, oatmeal, hominy, grits, meal, starch, cider-vinegar, agricultural implements, windmills, paving bricks, concrete, sewer pipe, beer, over-alls and shirts. It is one of the oldest settlements of the state. The first "old Fort Kearney" was established on the site of Nebraska City in 1847, but was abandoned in 1848, and the fort was re-established farther W. on the Platte river (see KEARNEY). Otoe county was organized in 1855, and the original Nebraska City was incorporated and made the county-seat in the same year. This city, together with Kearney City, incorporated in 1855—adjacent to the first "old" Fort Kearney—and South Nebraska City, were consolidated by the legislature into the present Nebraska City in 1858. (Twelve other city "additions" and so-called "towns," all within or closely adjacent to the present city, were in existence in 1857.) Nebraska City was for some years the largest city of the state. In 1858 it became the headquarters of a great freighting-firm that distributed supplies for the United States government among the army posts between the Missouri river and the Rocky Mountains; in seven months in 1859 this one firm employed 602 men, used 517 wagons, 5682 oxen, and 75 mules, and shipped 2,782,258 lb. of freight. Nebraska City was the initial point of several roads, parts at one time or another of the "Oregon," "Old California," and "Great Salt Lake" trails. (See NEBRASKA (State): *History*.) Nebraska City became a city of the second class in 1871 and a city of the first class in 1901.

NEBUCHADREZZAR, or NEBUCHADNEZZAR, king of Babylon, the Ναβουκοδρόσορος of the Greeks. The first and last are nearer to the original name as it is found on the cuneiform monuments, viz. Nabu-kudurri-uṣur, "Nebo, defend the landmark." Nebuchadrezzar seems to have been of Chaldean origin. He married Amuhia, daughter of the Median king, according to Abydenus, and in 605 B.C. defeated Necho at Carchemish, driving the Egyptians out of Asia and annexing Syria to the Babylonian empire. In the following year he succeeded his father Nabopolassar on the Babylonian throne,

and continued the restoration of Babylon, which he made one of the wonders of the world. His "new palace" there was built in fifteen days; temples were erected to the gods, the great walls of the city were constructed with a moat surrounding them, the Euphrates was lined with brick and a strong fortress erected. Canals were dug throughout the country and a great reservoir excavated near the capital. Only a fragment of his annals has been preserved, recording his campaign against Amasis (Aḥmosi) of Egypt in his thirty-seventh year (567 B.C.) when he defeated the soldiers of "Phut of the Ionians." Tyre revolted in the seventh year of his reign, and was besieged for thirteen years; a contract-tablet dated in his fortieth year shows that at that time it was under Babylonian officials. After the investment of Tyre Nebuchadrezzar marched against Jerusalem, put Jehoiakim to death and placed Jehoiachin on the throne. Three months later Jehoiachin was deposed and Zedekiah made king in his place. Zedekiah's revolt in 588 B.C. led to another siege of Jerusalem, which was taken and destroyed in 586 B.C. (see JEWS and JERUSALEM). To this period probably belong an inscription of Nebuchadrezzar on the north bank of the Nahr el-Kelb near Beirut, and another in the Wadi Brissa in the Lebanon. From his inscriptions we gather that Nebuchadrezzar was a man of peculiarly religious character. A younger brother of his is called Nabo-sum-lisir.

See Josephus, *Cont. Apion*, i. 19; Eusebius, *Praep. Evangel.* x.

NEBULA (Lat. for "cloud," connected with the Gr. νεφέλη, mist or cloud), in astronomy, the name given to certain luminous cloudy patches in the heavens. They resemble the stars in that they retain the same relative positions, and thus may be distinguished from the comets which appear to wander across the stars. When examined with sufficient telescopic power, a great many of these luminous patches are perceived to be composed of clusters of little stars, which in a smaller telescope are invisible separately, but whose rays of light blend together so as to produce a confused luminous appearance. Others, however, cannot be resolved into individual stars even with the best telescopes, and in many cases the spectroscope gives direct evidence that the nebula has a constitution altogether different from that of a star-cluster. We thus distinguish between the nebulae proper and the star-clusters; but owing to the difficulty of deciding the nature in any particular case, and especially owing to the fact that some of the earlier observers believed it probable that all nebulae would with sufficient telescopic power become resolvable into stars, the term nebula is often used to cover both star-clusters and the true nebulae.

An enumeration of nebulae was made by Charles Messier in Paris in 1771, who recorded 103; Sir William Herschel increased the number known to over 2500; whilst Sir John Herschel between 1825 and 1847 catalogued and described 3926 nebulae (including 1700 observed at the Cape of Good Hope). About 1848 the earl of Rosse with his famous six-foot reflector at Parsonstown began his examination of the nebulae, which added greatly to our knowledge of their forms and structure. In more modern times the development of photography has enabled the features of the nebulae to be ascertained and recorded with a certainty, which, unfortunately, the older visual observations and drawings cannot claim to possess. In this connexion the photographic work of Isaac Roberts, A. A. Common, E. E. Barnard and J. E. Keeler in particular must be mentioned. The total number of known nebulae has, too, been enormously increased; Perrine estimates that the number within the power of the Crossley reflector at Lick is not less than half a million.

Nebulae may be conveniently classified according to their telescopic appearance; we enumerate below some of the principal forms that have been recognized, but it must be observed that this classification is rather superficial, and that the differentiation is often one of appearance only and not of real structure. The types are: (1) *Irregular nebulae*, examples: the great nebula of Orion (M. 42),[1] the "key-hole" nebula near η Argus, the "Omega" nebula (M. 17); (2) *Annular nebulae*, example: M. 37 in Lyra; (3) *Double nebulae*, example: the dumb-bell nebula (M. 27) in Vulpecula; (4) *Planetary nebulae*, examples: the "owl" nebula (M. 97) in Ursa Major, M. 1 in Taurus; (5) *Elliptical nebulae*, example: the great nebula of Andromeda (M. 31); (6) *Spiral nebulae*, example: M. 51 in Canes Venatici; (7) *Nebulous stars*; (8) *Diffused nebulosities*. Most of these names require little explanation. The first class have ill-defined irregular boundaries; their forms often suggest the appearance of curdled liquid or wreaths of smoke. The annular nebulae have a ringed appearance, the centre being much darker than the outer parts, though it is filled with faintly luminous matter. Double nebulae have two principal centres of condensation. The planetary nebulae are nearly uniformly illuminated compact patches of light generally circular or elliptical in shape; they were so called because they appeared to possess disks like planets. Elliptical nebulae are usually nebulae of some flat type (such as annular or spiral) seen rather edgeways, so that the structure is not readily recognizable. The typical spiral nebulae are in the form of a double spiral, the two branches of which proceed from diametrically opposite points of a bright nucleus and wind round it in the same sense; the whole is generally studded with points of condensation. The great majority of the nebulae, including the abundant small nebulae which shine with a *white* light (in contrast with the blue-green light of the planetary and irregular nebulae—see below *Spectra of nebulae*), are generally classed as spiral nebulae. The spiral structure has been shown to exist in a few of them, but for the remainder it is only inferred. Nebulous stars are true stars surrounded by an atmosphere or aureole of nebulous light. Diffused nebulosities are very faint nebulae of enormous extent, sometimes forming the background of a whole constellation. We proceed to describe some of the more famous nebulae.

One of the most remarkable nebulae is that which is situated in the sword-handle of Orion and about the multiple star θ Orionis; it is faintly visible to the naked eye. It seems to have been first noticed by Huygens in 1656, who described and figured it in his *System Saturnium*. It has now been found that nebulous streamers connected with the bright nucleus wind through the whole constellation of Orion. It is well known that all the brighter stars of the constellation except Betelgeuse appear to be related to one another by their similarity both of spectra and of proper motion; it seems probable that they are actually situated in the nebula and in some way connected with it.

The only other nebula which can be seen with the naked eye is the elliptical nebula in Andromeda. Modern photographs show very clearly that its structure is spiral. The nucleus is large and appears circular, but the spirals proceeding from it lie in a plane inclined at a rather sharp angle to the line of sight, and this gives to the nebula its elliptical appearance. Two small dense nebulae accompany it, and appear to belong to the system.

The finest example of a ring nebula is M. 57 between β and γ Lyrae. The ring is slightly elliptical, its dimensions being 87″ by 64″. At the ends of the major axis the ring becomes very faint, so that the form of the bright part may justly be compared to a pair of marks of parenthesis ( ). The centre is marked by a star which appears to be intimately associated with the ring, for the whole space within the ring is filled with a very faint nebulosity. According to Schaeberle, there is evidence of a spiral structure in this nebula also. It must, however, clearly be of an essentially different character from the structure of an ordinary spiral nebula, and the spectroscope reveals a fundamental difference between the annular and spiral nebulae.

The "dumb-bell" nebula in Vulpecula consists of two almost separated fan-shaped patches of light. It exhibits a close resemblance to the annular nebula; for we have only to assume a continuation of the thinning out along the longest diameter and a slight filling in of the centre of the Lyra nebula to obtain the dumb-bell form.

[1] *i.e.* No. 42 in Messier's catalogue. Nebulae not contained in that catalogue are generally known by their number in Dreyer's *New General Catalogue* (N.G.C.).

Of planetary nebulae one of the best known is the "owl nebula" in the Great Bear about midway between "the pointers." As seen with Lord Rosse's reflector, it presented a startling appearance, resembling the face of a goblin; two faint stars shone in the centres of the two dark circles which represented the saucer-eyes of the creature. Some change has certainly taken place since then, for the two stars no longer could be supposed to represent the pupils of the eyes; the cause may, however, be merely the proper motion of the stars or of the nebula.

The discovery of great regions having a faint nebulous background is one of the most remarkable results of modern work. Particularly interesting is the fact that, whilst the large telescopes are unable to render them perceptible to the eye or to photograph them, they are revealed by what at first sight seems an absurdly simple apparatus. For the study of the ordinary nebulae large reflecting telescopes (preferably of short focal length) are used, the great light-gathering power being all important; but for photographing these diffused nebulosities portrait lenses of very small aperture and focal length are most successful Thus the great extension of the Orion nebula was photographed by W H Pickering in 1890 with a lens 2·6 in. in aperture and of 8·6 in focal length; the exposure was rather more than six hours. Other extensive nebulous regions of a similar character have been found by Barnard in the constellations Ophiuchus, Scorpio and Taurus.

Spectra of Nebulae.—Owing to the feebleness of their light the study of the spectra of nebulae is one of particular difficulty. Two varieties of spectra are recognized; the one consists of a few narrow bright lines with sometimes a faint continuous spectrum for a background; the other consists of a continuous spectrum crossed by dark lines and is indistinguishable from that of ordinary stars. The former variety unmistakably shows that the light proceeds from diffuse incandescent vapour; nebulae showing this spectrum are accordingly called "gaseous." Irregular, annular and planetary nebulae are of this nature. The visual spectrum is marked by three bright lines in the blue and green of wave-lengths 5007, 4959 and 4861. Of these the last is the line H β of the hydrogen series; the other two are of unknown origin, and as they are always found together and have always the same relative intensity, they have both been attributed to the same unknown element, which has been named "nebulium." Usually there are no other conspicuous lines in the visual spectrum, but in the ultra-violet region numerous lines can be photographed, including most of the hydrogen series. The yellow line (D_3) of helium can be detected in many nebulae. The great majority of the nebulae, however, show the second variety of spectrum, and are thus indistinguishable spectroscopically from irresolvable star-clusters. The great nebula of Andromeda and the spiral nebulae are of this kind. It is not necessary to conclude that they, therefore, are star-clusters whose components are, owing to their remoteness from us, too faint and close together to be separately distinguishable. A gaseous mass only gives a bright line spectrum when it is so rarefied as to be transparent through and through. If the density and thickness are such that a ray of light cannot pass through it the spectrum will, in general, be continuous like that of a solid body.

The inquiry into the physical state and constitution of the nebulae raises problems of great difficulty. In the case of "gaseous" nebulae it is very hard to understand how such extremely tenuous masses are maintained in a state of incandescence. Only one theory has been put forward which at all accounts for this fact, and unfortunately, it is not altogether satisfactory in other respects. This is Sir Norman Lockyer's "Meteoritic Hypothesis," which attributes the light to collisions between numbers of small discrete solid particles, these being vaporized and made luminous owing to the heat developed by their impacts. Formidable difficulties, however, prevent the entire acceptance of this suggestion.

The spiral nebulae are not distributed at random over the sky, nor are they condensed along the galactic plane like the clusters which they spectroscopically resemble. There is a well-marked centre of aggregation of the northern nebulae near the north galactic pole. In the southern hemisphere they are more evenly distributed, but the avoidance of the galactic plane is marked. The remarkable *Nubeculae* or *Magellanic Clouds* in the southern hemisphere, which look like detached portions of the Milky Way, are found on telescopic examination to consist, not of stars alone, like the Milky Way, but of stars and nebulae clustering together. In the greater cloud Sir John Herschel counted 286 nebulae; in the lesser cloud they are rather less numerous.

REFERENCES.—The characters of nebulae receive treatment in all text-books on descriptive astronomy; mention may be made of Miss A. M Clerke, *The System of the Stars* (2nd ed., 1905), which contains a full account of these objects, illustrated by many photographs; the same work is replete with references to original papers. Of recent catalogues of nebula, we notice J. L. E. Dreyer, "A new general catalogue of nebulae and clusters of stars," *Memoirs R.A.S.* (1888), published separately in 1890; and "Index Catalogue of Nebulae (1888–1894), "*Mem. R.A.S.* (1895). Excellent photographs of the more famous nebulae are given in Sir R. Ball's *Popular Guide to the Heavens* (1905); a more comprehensive collection is given in Isaac Roberts, *Photographs of Stars, Star Clusters and Nebulae* (2 vols., 1873–1899). (A. S. E.)

NEBULAR THEORY, a theory advanced to account for the origin of the solar system. It is emphatically a speculation; it cannot be demonstrated by observation or established by mathematical calculation. Yet the boldness and the splendour of the nebular theory have always given it a dignity not usually attached to a doctrine which from the very nature of the case can have but little direct evidence in its favour.

There are very remarkable features in the solar system which point unmistakably to some common origin of many of the different bodies which it contains. We may at once put the comets out of view. It does not appear that they bear any testimony on either side of the question. We do not know whether the comets are really indigenous to the solar system or whether they may not be merely imported into the system from the depths of space. Even if the comets be indigenous to the system, they may, as many suppose, be merely ejections from the sun. In any case the orbits of comets are exposed to such tremendous perturbations from the planets that it is unsafe from the present orbit of a comet to conjecture what that orbit may have been in remote antiquity. On these grounds we discuss the nebular theory without much reference to comets. But even after the omission of all cometary objects we can still count in the solar system upwards of five hundred bodies, almost every one of which pronounces distinctly, though with varying emphasis, in favour of the nebular theory.

The first great fact to be noticed is that the planets revolve around the sun in the same direction. This is true not only of the major planets Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus and Neptune; it is also true of the host of more than five hundred minor planets. It is also remarkable that all the great planets and many of the small ones have their orbits very nearly in the same plane, and nearly circular in form. Viewed as a question in probabilities, we calculate the chance that five hundred bodies revolving round the sun shall all be moving in the same direction. The improbability of such an arrangement is enormously great. It is represented by the ratio of a number containing about a hundred and sixty figures to unity, and so we are at once forced to the conclusion that this remarkable feature of the planetary motions must have some physical explanation. In a minor degree this conclusion is strengthened by observing the satellites. Discarding those of Uranus, in which the orbits of the satellites are highly inclined to the ecliptic, and in which manifestly some exceptional influences have been at work, we find that the satellites revolve around the primaries also in the same direction;[1] while, to make the argument complete, the planets, so far as they can be observed, rotate on their axes in the same manner.

The nebular theory offers an explanation of this most remarkable uniformity. Laplace supposed the existence of a primeval

[1] Exceptions are Saturn ix. (Phoebe), Jupiter vii. (?) and viii., and the satellite of Neptune.

nebula which extended so far out as to fill all the space at present occupied by the planets. This gigantic nebulous mass, of which the sun was only the central and somewhat more condensed portion, is supposed to have a movement of rotation on its axis. There is no difficulty in conceiving how a nebula, quite independently of any internal motion of its parts, shall also have had as a whole a movement of rotation. In fact a little consideration of the theory of probabilities will show it to be infinitely probable that such an object should really have *some* movement of rotation, no matter by what causes the nebula may have originated. As this vast mass cooled it must by the laws of heat have contracted towards the centre, and as it contracted it must, according to a law of dynamics, rotate more rapidly. The time would then come when the centrifugal force on the outer parts of the mass would more than counterbalance the attraction of the centre, and thus we would have the outer parts left as a ring. The inner portion will still continue to contract, the same process will be repeated, and thus a second ring will be formed. We have thus grounds for believing that the original nebula will separate into a series of rings all revolving in the same direction with a central nebulous mass in the interior. The materials of each ring would continue to cool and to contract until they passed from the gaseous to the liquid condition. If the consolidation took place with comparative uniformity we might then anticipate the formation of a vast multitude of small planets such as those we actually do find in the region between the orbit of Mars and that of Jupiter. More usually, however, the ring might be expected not to be uniform, and, therefore, to condense in some parts more rapidly than in others. The effect of such contraction would be to draw the materials of the ring into a single mass, and thus we would have a planet formed, while the satellites of that planet would be developed from the still nascent planet in the same way as the planet itself originated from the sun. In this way we account most simply for the uniformity in the direction in which the planets revolve, and for the mutual proximity of the planes in which their orbits are contained.

Such was the nebular theory as it was originally sketched. At the present day when the nebulae that are spiral in form have been shown to be so numerous, next to the fixed stars themselves, our view of the nebular theory has been somewhat modified. It now seems probable that the spiral nebula is the fittest illustration of the transformation of a diffused nebula into a system of sun and planets.

The rotation of the planets on their axes is also explained as a consequence of the nebular theory, for at the time of the first formation of the planet it must have participated in the rotation of the whole nebula, and by the subsequent contraction of the planet the speed with which the rotation was performed must have been accelerated.

There is quite a different method of considering the nebular origin of our system, which leads in a very striking manner to conclusions practically identical with those we have just sketched. We may commence by dealing with the sun as we find it at the present moment, and thence inferring what must have been the progress of events in the earlier epochs of the history of our system.

The daily outpour of heat from the sun at the present time suggests a profound argument in support of the nebular theory. The amount of the sun's heat has been estimated, but we receive on the earth less than one two-thousand-millionth part of the whole radiation. It would seem that the greater part of the rest flows away to be lost in space. Now what supplies this heat? We might at first suppose that the sun was really an intensely heated body radiating out its heat as does white-hot iron, but this explanation cannot be admitted, for there is no historical evidence that the sun is growing colder. We have not the slightest reason to think that the radiation from the sun is measurably weaker now than it was a couple of thousand years ago, yet it can be shown that, if the sun were merely radiating heat as simply a hot body, then it would cool some degrees every year, and must have cooled many thousands of degrees within the time covered by historical records. We, therefore, conclude that the sun has some other source of heat than that due simply to incandescence. It might, for example, be suggested that the heat of the sun was supplied by chemical combination analogous to combustion. It would take 20 tons of coal a day burned on each square foot of the sun's surface to supply the daily radiation. Even if the sun were made of one mass of fuel as efficient as coal, that mass must be entirely expended in a few thousand years if the present rate of radiation was to be sustained. We cannot, therefore, admit that the source of the heat in the sun is to be found in any chemical combination taking place in its mass. Where then can we find an adequate supply of heat? Only one external source can be named: the falling of meteors into the sun must yield some heat just as a shooting star yields some heat to our atmosphere, but the question is whether the quantity of heat obtainable from the shooting stars is at all adequate for the purpose. It can be shown that unless a quantity of meteors in collective mass equal to our moon were to plunge into the sun every year the supply of heat could not be sustained from this source. Now there is no reason to believe that meteors in anything like this quantity can be supplied to the sun, and, therefore, we must reject this source as also inadequate.

The truth about the sun's heat appears to be that the sun is really an incandescent body losing heat, but that the operation of cooling is immensely retarded owing to a curious circumstance due jointly to the enormous mass of the sun and to a remarkable law of heat. It is well known that if energy disappears in one form it reappears in another, and this principle applied to the sun will explain the famous difficulty.

As the sun loses heat it contracts, and every pair of particles in the sun are nearer to each other after the contraction than they were before. The energy due to their separation is thus less in the contracted state than in the original state, and as that energy cannot be lost it must reappear in heat. The sun is thus slowly contracting; but as it contracts it gains heat by the operation of the law just referred to, and thus the further cooling and further contraction of the sun is protracted until the additional heat obtained is radiated away. In this way we can reconcile the fact that the sun is certainly losing heat with the fact that the change in temperature has not been large enough to be perceived within historic times.

It has been estimated that the sun is at present contracting so that its diameter diminishes 10 m. every century; there is, however, now reason to think that the rate of contraction is by no means so rapid as this would indicate. This is an inappreciable distance when compared with the diameter of the sun, which is nearly a million of miles, but the significance for our present purpose depends upon the fact that this contraction is always taking place. Assuming the accuracy of the estimate just made, we see that a thousand years ago the sun must have had a diameter 100 m. greater than at present, ten thousand years ago that diameter must have been 1000 m. more than it is now, and so on. We cannot perhaps assert that the same rate is to be continued for very many centuries, but it is plain that the further we look back into the past time the greater must the sun have been.

Dealing then simply with the laws of nature as we know them, we can see no limit to the increasing size of the sun as we look back. We must conceive a time when the sun was swollen to such an extent that it filled up the entire space girdled by the orbit of Mercury. Earlier still the sun must have reached to the earth. Earlier still the sun must have reached to where Neptune now revolves on the confines of our system, but the mass of the sun could not undergo an expansion so prodigious without being made vastly more rarefied than at present, and hence we are led by this mode of reasoning to the conception of the primaeval nebula from which our system has originated.

Considering that our sun is but a star, or but one of the millions of stars, it is of interest to see whether any other systems present indication of a nebulous origin analogous to that which Laplace

proposed for the solar system. In one of his papers, Sir W. Herschel marshals the evidence which can be collected on this point. He arranges a selection from his observations on the nebulae in such a way as to give great plausibility to his view of the gradual transmutation of nebulae into stars. Herschel begins by showing us that there are regions in the heavens where a faint diffused nebulosity is all that can be detected by the telescope. There are other nebulae in which a nucleus can be just discerned, others again in which the nucleus is easily seen, and still others where the nucleus is a brilliant star-like point. The transition from an object of this kind to a nebulous star is very natural, while the nebulous stars pass into the ordinary stars by a few graduated stages. It is thus possible to exhibit a series of objects beginning at one end with the most diffused nebulosity and ending at the other with an ordinary fixed star or group of stars. Each object in the series differs but slightly from the object just before it and the object just after it. It seemed to Herschel that he was thus able to view the actual changes by which masses of phosphorescent or glowing vapour became actually condensed down into stars. The condensation of a nebula could be followed in the same manner as we can study the growth of the trees in the forest, by comparing the trees of various ages which the forest contains at the same time. In attempting to pronounce on the evidence with regard to Herschel's theory, we must at once admit that the transmutation of a nebula into a star has never been seen. It is indeed very doubtful whether any changes of a nebula have ever been seen which are of the same character as the changes Herschel's theory would require. It seems, however, most likely that the periods of time required for such changes are immense and that the changes accomplished in only a century or two are absolutely inappreciable.

The nebular theory is a noble speculation supported by plausible argument, and the verdict of science on the whole subject cannot be better expressed than in the words of S. Newcomb: "At the present time we can only say that the nebular hypothesis is indicated by the general tendencies of the laws of nature, that it has not been proved to be inconsistent with any fact, that it is almost a necessary consequence of the only theory by which we can account for the origin and conservation of the sun's heat, but that it rests on the assumption that this conservation is to be explained by the laws of nature as we now see them in operation. Should any one be sceptical as to the sufficiency of these laws to account for the present state of things, science can furnish no evidence strong enough to overthrow his doubts until the sun shall be found growing smaller by actual measurement, or the nebulae be actually seen to condense into stars and systems."

NECESSITAS (Gr. Ἀνάγκη), in Orphic theology, the personification of absolute necessity. She appears as the mother of the Moerae (Fates), as the wife of Demiurgus (Fashioner of the World) and mother of Heimarmenē (Destiny) Her power is irresistible, even greater than that of the gods; to her was due the strife (battles with Titans, Giants) that raged amongst them of old, before the rule of love began; the world revolves round the spindle, which she holds in her lap. According to the Egyptian theory, she is one of the four deities present at the birth of every human being, her companions being the Daemon (guardian spirit), Tyche (Fortune) and Eros. On the citadel of Corinth there was a temple sacred to her and Bia (Violence), which none were permitted to enter The Roman Necessitas is represented in the well-known ode of Horace (i 35) as the forerunner and companion of Fortuna, holding in her brazen hand huge nails, a clamp and molten lead, symbolical of fixedness and tenacity

See Plato, *Rep.* 616 c, *Symp* 195 c, 197 b: Macrobius. *Saturnalia*. i. 19: Pausanias ii. 4. 6.

NECESSITY (Lat. *necessitas*), a term used technically in philosophy for the quality of inevitable happening; for example, hot air *necessarily* tends to rise. Thus it corresponds in the sphere of action to certainty in the sphere of knowledge. That the sun will rise to-morrow is a *necessary* event; and men anticipate the rising with *certainty*. In ordinary language the conception of necessity is rendered meaningless by being referred to the present or even to the past. A current definition of necessity is "the state which cannot be otherwise than it is." Such a definition tells us nothing. How can any state be otherwise than it is? Necessity can have meaning only in reference to the future: it means absence of spontaneous power in that which acts necessarily. For the origin of the conception we must look to our inward personal experience of constraint. When we are acting under physical or mathematical or logical or moral necessity we are so far precluded from spontaneous action—in common phrase, we can do no otherwise—though the causes of constraint may be of very different kinds. In ethics the term necessitarianism is applied to that view of human action which regards all action as dictated by external causes (cf. DETERMINISM). The sense in which, if at all, the human mind can cognize necessity, *i.e.* causal connexion between events or states, has been the subject of vigorous discussion among philosophers. By sceptics and empiricists it is held that a law is merely a crystallized summary of observed phenomena. Thus J. S. Mill denies that a general proposition is more than an enumeration of particulars, and hence that syllogistic reasoning cannot amplify knowledge (see SYLLOGISM). It is clear that the senses cannot apprehend causal connexion, and this impossibility gives rise to a prior conception according to which the conception of necessity is purely intellectual (see METAPHYSICS).

NECK (O. Eng. *hnecca*; the word appears in many Teutonic languages; cf. Dutch *nek*, Ger. *Nacken*; in O. E. the common word was *heals*; cf. Ger. *Hals*), that part of the body which connects the head with the trunk (see ANATOMY: *Superficial* and *Artistic*). The word is transferred to many objects resembling this part of the body in shape or function; it is thus applied to an isthmus, or to the narrowest portion of a promontory, to the narrow part of a musical stringed instrument connecting the head and body, as in the violin, or to a narrow pass between mountains, which in the Dutch form *nek*, appears in place-names in South Africa. In architecture, the "neck" is that part of the capital just above the "astragal," and the term "necking" is applied to the annulet or round, or series of horizontal mouldings, which separates the capital of a column from the plain part or a shaft. In Romanesque work this is sometimes corded.

In Geology, the term "neck" is given to the denuded stump of an extinct volcano. Beneath every volcano there are passages of conduits up which the volcanic materials were forced, and after the mass has been levelled by denudation there is always a more or less circular pipe which marks the site of the crater. This pipe, which is filled with consolidated ashes or with crystalline lava, is the characteristic of a volcanic neck. Active volcanoes often stand on the sea-bottom and when the eruption comes to an end the volcano is slowly buried under layers of sediment. In tropical seas the coral animals cover over the submarine volcanoes which rise nearly to the surface and form great reefs of limestone around them. Should elevation take place after long ages the removal of the overlying strata will bring the volcanic mass to light, and in the normal course of things this will suffer denudation exactly like a recent volcano. Many instances of this are furnished by the geological history of the British Isles. In Carboniferous times, for example, before the Coal-measures were deposited, a shallow sea occupied the southern part of Scotland and the north of England. Volcanic activity broke out on the sea-bottom, and many volcanic cones, both small and large, were produced. These have long since been uplifted and the superjacent strata denuded away over a large part of the area which they occupied. In Derbyshire, Fife, the Lothians and the Glasgow district the remains of Carboniferous volcanoes occur in every state of preservation. Some have the conical hills of lavas and ashes well preserved (*e.g.* Largo Law in Fifeshire); others retain only a small part of the original volcanic pile (*e.g.* Arthur's Seat, Edinburgh; the Binn of Burntisland) and of the larger number nothing remains but the "neck" which shows where once the crater was situated.

In regions of former volcanic activity necks are the most persistent of all volcanic structures, because the active volcanic magma is located deep within the earth's crust, and the pipe by which it rises to the surface is of great length and traverses a great thickness of

strata. Many volcanic necks stand on lines of fault. In other cases there are groups of necks lying in a straight or sinuous line, which may indicate the position of a fracture or at least of a line of least resistance. But in Scotland it is often impossible to adduce any evidence of the connexion between faults or fissures and the position of volcanic necks; and it seems likely that the pressure of the gases in the igneous magma increased till an explosion took place which perforated the rocks above with a clean tubular passage often nearly circular in cross section. This pipe was usually vertical, and nearly uniform in diameter for great depths; the material occupying it, when exposed by denudation, has a circular ground plan, or if shown in vertical section (or elevation) in a cliff is a pillar-shaped mass crossing the bedding planes of the strata nearly at right angles. It terminates upwards in the remains of the volcanic cone and communicates below with the reservoir from which the lavas were emitted, represented in most cases, where it has been exposed, by a large irregular mass (a batholith or boss) of coarsely crystalline igneous rock. The site of such a neck is generally indicated by a low conical hill consisting of volcanic rock, surrounded by sedimentary or igneous strata of a different kind. The low cone is due to the greater hardness and strength of the volcanic materials and is not connected with the original shape of the volcano. Such hills are common in some parts of Scotland and well-known examples are Arthur's Seat and the Castle Rock (Edinburgh), North Berwick Law, the Bass Rock; they occur also in the Peak district of Derbyshire, and the Wolf Rock off the coast of Cornwall is probably a neck. Two splendid sugar-loaf cones known as the Pitons of St Lucia in the West Indies, rising from the sea with almost vertical sides to a height of nearly 3000 ft., are old volcanic necks. In Texas, New Mexico, Arizona, California and many of the western states of North America geologists have observed conical volcanic hills having all the features which belong to necks.

Where the volcanic rocks are soft and easily disintegrated they may be reduced more rapidly than the strata around them and the position of a neck may be indicated by a cup-shaped hollow; this is the case with some of the diamond-bearing basic pipes of South Africa. Sometimes necks are encountered in underground mining operations; in the coal-field of Fife, for instance, the coals are sometimes replaced by a circular mass of volcanic rock, a quarter of a mile or more in diameter, which rise vertically to the surface. Better examples are the Kimberley diamond mines. The blue-ground (or serpentine breccia) occupies great pipes or funnels, circular in outline with nearly vertical sides, extending downwards to unknown depths; these are undoubtedly the necks of old volcanoes. If any lavas were poured out from these pipes at the surface they have since been carried away by denudation.

The size of necks varies considerably; the smallest may be only 20 or 30 yds. in diameter, the largest are several miles. In this respect they resemble active craters, but no necks have been met with on the earth's surface with dimensions approaching those of the so-called "craters" of the moon. Small necks are usually simple, *i.e.* they contain only one or two kinds of igneous rock (ashes and dikes) and have been produced, so far as we can judge, by a single eruption. Not infrequently they contain no volcanic rock but are filled with pieces of slate, sandstone or whatever strata the pipe traverses. Such necks must have been produced by a single eruption with an outburst of steam, not followed by lava; the disrupted fragments of the surrounding rocks and the materials tumbling down from the crater's walls ultimately filled up the cavity. Instances occur in Fifeshire and in Shetland, and among the recent volcanoes of the Eifel there are some which have thrown out more slate and sandstone than lava.

Large necks, on the other hand, are often of complex structure, contain many kinds of rock and seem to have been produced by repeated eruptions, each of which more or less completely cleared out the material obstructing the orifice, and introduced a series of fresh accumulations. The beds of ashes which line the interior of an active crater have in nearly all cases a slope or dip towards a central point where the base of the depression is situated, and in volcanic necks which have been filled with ash (tuffs and agglomerates) this funnel-like inward dip is very constant. If there has been only a single eruption the beds of ashes have a very conformable or uniform arrangement, but if activity has been resumed after a period of quiescence a large part of the old material may have been projected and a new series of beds laid down, transgressing unconformably the edges of the earlier ones. By these structures we can sometimes trace a neck within a neck, or of a lateral crater on the margin of a principal one.

Where the crater has filled up with very coarse ashes, or agglomerate, the bedding is rarely visible. Sometimes large empty craters were occupied temporarily by lakes, and level sheets of mud and silt have gathered on their floors: hence bedded sediments are not infrequently found in volcanic necks. Mixed with the volcanic ashes and bombs there are often large broken pieces of sedimentary rocks which may have been crystallized and hardened by the heat and vapours emitted by the volcano. Sometimes great fragments of the walls have foundered or collapsed into the crater, and masses of non-volcanic rock, an acre or more in extent, may occur in a volcanic neck. In Arran, for example, there is a large neck which contains lumps of Cretaceous rocks nowhere else known to occur on the island; they have fallen down from strata once occupying part of the walls of the crater but now removed by denudation.

The lava which rises and flows out from the crater leaves its trace also in the necks. Sometimes it forms thin beds or flows alternating with the tuffs and having the same basin-shaped dip. More commonly it appears as the material filling fissures and pipes, traversing the ashes irregularly or rising as a central plug in the interior of the neck, and sending out branching veins. Occasionally a whole neck is composed of solid crystalline rock representing the last part of the magma which ascended from the underground focus and congealed within the crater. In Mont Pelée, for instance, the last stage of the eruptions of 1902 to 1905 was the protrusion of a great column of solidified lava which rose at one time to a height of 900 ft. above the lip of the crater, but has since crumbled down. The Castle Rock of Edinburgh is a neck occupied by a plug of crystalline basalt. Necks of this kind weather down very slowly and tend to form prominent hills.

After the eruptions terminate gases or hot solutions given out by deep-lying masses of molten rock may find a passage upward through the materials occupying the crater, greatly modifying their mineral nature and laying down fresh deposits. A good example of secondary deposits within a volcanic neck is provided by the Cripple Creek mining district of Colorado. The ore-bearing veins are connected with volcanic rocks and part of these occupy a vertical circular pipe which is a typical volcanic neck. A phonolitic breccia, greatly altered, is the principal rock, and is cut by dikes of phonolite, dolerite, &c. The country rock is mostly granite and gneiss, and blocks of these are common in the breccia. A large volcano was built up in Tertiary times on the granite plateau, and has since been almost entirely removed by denudation. The gold ores were carried upwards by currents of hot water derived from the volcanic magma and were deposited along cracks and fissures in the materials which occupied the crater, and also in the surrounding rocks (see VOLCANO).

(J. S. F.)

NECKAM, ALEXANDER (1157–1217), English schoolman and man of science, was born at St Albans in September 1157, on the same night as King Richard I. Neckam's mother nursed the prince with her own son, who thus became Richard's foster-brother. He was educated at St Albans Abbey school, and began to teach as schoolmaster of Dunstable, dependent on St Albans Abbey. Later he resided several years in Paris, where by 1180 he had become a distinguished lecturer of the university. By 1186 he was back in England, where he again held the place of schoolmaster at Dunstable. He is said to have visited Italy with the bishop of Worcester, but this statement has been doubted; the assertion that he was ever prior of St Nicolas, Exeter, seems a mistake: on the other hand, he was certainly much at court during some part of his life. Having become an Augustinian canon, he was appointed abbot of Cirencester in 1213. He died at Kempsey in Worcestershire in 1217, and was buried at Worcester. Besides theology he was interested in the study of grammar and natural history, but his name is chiefly associated with nautical science. For in his *De naturis rerum* and *De utensilibus* (the former of which, at any rate, had become well known at the end of the 12th century, and was probably written about 1180) Neckam has preserved to us the earliest European notices of the magnet as a guide to seamen—outside China, indeed, these seem to be the earliest notices of this mystery of nature that have survived in any country or civilization. It was probably in Paris, the chief intellectual centre of his time, that Neckam heard how a ship, among its other stores, must have a needle placed above a magnet (the *De utensilibus* assumes a needle mounted on a pivot), which needle would revolve until its point looked north, and thus guide sailors in murky weather or on starless nights. It is noteworthy that Neckam has no air of imparting a startling novelty: he merely records what had apparently become the regular practice of at least many seamen of the Catholic world.

See Thomas Wright's edition of Neckam's *De naturis rerum* and *De laudibus divinae sapientiae* in the Rolls Series (1863), and of the *De utensilibus* in his *Volume of Vocabularies*. Neckam also wrote *Corrogationes Promethei*, a scriptural commentary prefaced by a treatise on grammatical criticism; a translation of Aesop into Latin elegiacs (six fables from this version, as given in a Paris MS., are printed in Robert's *Fables inédites*); commentaries, still unprinted, on portions of Aristotle, Martianus Capella and Ovid's *Metamorphoses*, and other works. Of all these the *De nat. rer.*, a sort of manual of the scientific knowledge of the 12th century, is much the most important: the magnet passage herein is in book ii. chap. xcviii. (*De vi attractiva*), p. 183 of Wright's edition. The corresponding section in the *De utensil*, is on p. 114 of the *Vol. of Vocabs.*

Roger Bacon's reference to Neckam as a grammatical writer (*in multis vera et utilia scripsit: sed . . . inter auctores non potest . . . numerari*) may be found in Brewer's (Rolls Series) edition of Bacon's *Opera inedita*, p. 457. See also Thomas Wright, *Biographia Britannica literaria, Anglo-Norman Period*, pp. 449–459 (1846: some points in this are modified in the 1863 edition of *De nat. rer.*); C. Raymond Beazley, *Dawn of Modern Geography*, iii. 508–509. (C. R. B.)

NECKAR, a river of Germany, and a right-bank tributary of the Rhine, rises between the Black Forest and the Swabian Alb, near Schwenningen, in Württemberg, at an altitude of 2287 ft. As far as Rottweil only a mountain stream, it here attains the volume of a river, flows N. as far as Horb, thence in a north-easterly direction, and with rapid current it passes Rottenburg and the university town of Tübingen, taking then a generally northerly course. From Esslingen the Neckar becomes broader and deeper and its valley very picturesque, and after passing Cannstatt, from which point it is navigable for small craft, it flows through vine-clad hills by the pleasant village of Marbach, Schiller's birthplace, receives at Besigheim the waters of its most considerable tributary, the Enz, swirls down by Lauffen, and enters the beautiful vale of Heilbronn. Hence, between hills crowned by frequent feudal castles, it runs by Wimpfen and by Hornberg, where Götz von Berlichingen lived, to Eberbach, where it enters the sandstone formation of the Odenwald. It now takes a tortuous westerly course, and the scenery on its banks becomes more romantic. Winding down by Neckarsteinach and Neckargemünd between lofty wooded heights, it sweeps beneath the Königsstuhl (1900 ft.), washes the walls of Heidelberg, and now quitting the valley enters the plain of the Rhine and falls into that river from the right at Mannheim. Its length is 247 m., and its drainage area 4790 sq. m. Its more important tributaries are the Enz, Eschach and Glatt (left), and the Fils, Rems, Kocher and Jagst (right). It is navigable for small steamboats up to Heilbronn, for boats up to Cannstatt, and for rafts from Rottweil. It is the principal waterway of Württemberg, and is greatly used for floating down timber. From Rottenburg downwards its banks are almost everywhere planted with vineyards. Up to Frankfort it has been deepened and the channel otherwise improved. A committee, chiefly promoted by the Württemberg government and the Stuttgart chamber of commerce, reported in 1901 that it was both desirable and practicable to dredge the river and to canalize it, from Esslingen down to Mannheim, and that the cost would probably be between 2 and 2½ millions sterling.

See T. Eckart, *Bilder aus dem Neckartal* (1893).

NECKARGEMÜND, a town and climatic health resort of Germany, in the grand duchy of Baden, situated amid densely wooded hills, on the left bank of the Neckar, 6 m. E. from Heidelberg by the railway to Würzburg and at the junction of a line to Jagstfeld. Pop. (1905) 2200. It has an important trade in wine. The other industries are quarrying, tanning and shipbuilding, and there are electrical works. Neckargemünd, one of the favourite tourist resorts in the Neckar valley, was founded in the 10th century and became a free town in 1286. In 1395 it passed to the elector palatine and, together with the surrounding district, was apportioned to Baden in 1814.

NECKER, JACQUES (1732–1804), French statesman, finance minister of Louis XVI., was born at Geneva in Switzerland. His father was a native of Cüstrin in Pomerania, and had, after the publication of some works on international law, been elected as professor of public law at Geneva, of which he became a citizen. Jacques Necker had been sent to Paris in 1747 to become a clerk in the bank of a friend of his father, M. Vernet. He soon afterwards established, with another Genevese, the famous bank of Thellusson & Necker. Thellusson superintended the bank in London (his grandson was made a peer as Lord Rendlesham), while Necker was managing partner in Paris. Both partners became very rich by loans to the treasury and speculations in grain. In 1763 Necker fell in love with Madame de Verménou, the widow of a French officer. But while on a visit to Geneva, Madame de Verménou met Suzanne Curchod, the daughter of a pastor near Lausanne, to whom Gibbon had been engaged, and brought her back as her companion to Paris in 1764. There Necker, transferring his love from the widow to the poor Swiss girl, married Suzanne before the end of the year. She encouraged her husband to try and make himself a public position. He accordingly became a syndic or director of the French East India Company, and, after showing his financial ability in its management, defended it in an able memoir against the attacks of A. Morellet in 1769. Meanwhile he had made interest with the French government by lending it money, and was appointed resident at Paris by the republic of Geneva. Madame Necker entertained the chief leaders of the political, financial and literary worlds of Paris, and her Fridays became as greatly frequented as the Mondays of Madame Geoffrin, or the Tuesdays of Madame Helvetius. In 1773 Necker won the prize of the Académie Française for an *éloge* on Colbert, and in 1775 published his *Essai sur la législation et le commerce des grains*, in which he attacked the free-trade policy of Turgot. His wife now believed he could get into office as a great financier, and made him give up his share in the bank, which he transferred to his brother Louis. In October 1776 Necker was made finance minister of France, though with the title only of director of the treasury, which, however, he changed in 1777 for that of director-general of the finances. He did great good in regulating the finances by attempting to divide the taille or poll tax more equally, by abolishing the "vingtième d'industrie," and establishing *monts de piété* (establishments for loaning money on security). But his greatest financial measures were his attempt to fund the French debt and his establishment of annuities under the guarantee of the state. The operation of funding was too difficult to be suddenly accomplished, and Necker rather pointed out the right line to be followed than completed the operation. In all this he treated French finance rather as a banker than as a profound political economist, and thus fell far short of Turgot, who was the very greatest economist of his day. Politically he did not do much to stave off the coming Revolution, and his establishment of provincial assemblies was only a timid application of Turgot's great scheme for the administrative reorganization of France. In 1781 he published his famous *Compte rendu*, in which he drew the balance sheet of France, and was dismissed from his office. Yet his dismissal was not really due to his book, but to the influence of Marie Antoinette, whose schemes for benefiting the duc de Guines he had thwarted. In retirement he occupied himself with literature, and with his only child, his daughter, who in 1786 married the ambassador of Sweden and became Madame de Staël (*q.v.*). But neither Necker nor his wife cared to remain out of office, and in 1787 Necker was banished by "lettre de cachet" 40 leagues from Paris for attacking Calonne. In 1788 the country, which had at the bidding of the literary guests of Madame Necker come to believe that Necker was the only minister who could "stop the deficit," as they said, demanded Necker's recall, and in September 1788 he became once more director-general of the finances. Throughout the momentous months which followed the biography of Necker is part of the history of the French Revolution (*q.v.*). Necker put a stop to the rebellion in Dauphiné by legalizing its assembly, and then set to work to arrange for the summons of the states general. Throughout the early months of 1789 he was regarded as the saviour of France, but his conduct at the meeting of the states general showed that he regarded it merely as an assembly which should grant money, not organize reforms. But as he had advised the calling of the states general, and the double representation of the third estate, and then permitted the orders to deliberate and vote in common, he was regarded as the cause of the Revolution by the court, and on July 11 was ordered to leave France at once. Necker's dismissal brought about the taking of the Bastille, which induced the king to recall him. He was received with joy in every city he traversed, but at Paris he again proved to be no statesman. Believing that he could save France alone, he refused to act with Mirabeau or La Fayette. He caused the king's acceptance of the suspensive veto, by which he sacrificed his chief prerogative in September, and destroyed all chance of a strong executive

by contriving the decree of November 7, by which the ministry might not be chosen from the assembly. Financially he proved equally incapable for a time of crisis, and could not understand the need of such extreme measures as the establishment of assignats in order to keep the country quiet. His popularity vanished when his only idea was to ask the assembly for new loans, and in September 1790 he resigned his office, unregretted by a single Frenchman. Not without difficulty he reached Coppet, near Geneva, an estate he had bought in 1784. Here he occupied himself with literature, but Madame Necker pined for her Paris *salon* and died in 1794. He continued to live on at Coppet, under the care of his daughter, Madame de Staël, and his niece, Madame Necker de Saussure, but his time was past, and his books had no political influence. A momentary excitement was caused by the advance of the French armies in 1798, when he burnt most of his political papers. He died at Coppet in April 1804.

AUTHORITIES.—*Mémoires sur la vie privée de M. Necker* (Paris and London, 1818), by his daughter, Madame de Staël-Holstein, and the *Notice sur la vie de M. Necker* (Paris, 1820), by Auguste de Staël-Holstein, his grandson, published in the collection of his works edited by the latter in 1820–1821 (Paris, 15 vols.). The bibliography of his works is as follows:—*Réponse au mémoire de M. l'Abbé Morellet* (1769); *Éloge de J. B. Colbert* (1773); *Essai sur la législation et le commerce des grains* (1775); *Compte rendu au roi* (1781); *De l'administration des finances de la France* (3 vols., 1784); *Mémoire en réponse au discours prononcé par M. de Calonne* (1787); *De l'importance des opinions religieuses* (1788); *Sur l'administration de M. Necker, par lui-même* (1791); *Du pouvoir exécutif dans les grands états* (2 vols., 1792); *Réflexions sur le procès de Louis XVI.* (1792); *De la révolution française*, several editions, the last in 4 vols. (1797); *Cours de la morale religieuse* (1800); *Dernières vues de politique et de finance* (1802); *Manuscrits de M. Necker*, published by his daughter (1804); *Suites funestes d'une seule faute*, published after his death. See also *Le Salon de Madame Necker*, by the Vicomte d'Haussonville (2 vols., 1882), compiled from the papers at Coppet; Ch. Gomel, *Les Causes financières de la révolution française* (Paris, 1892); and for contemporary tracts and pamphlets M. Tourneux, *Bibl. de l'histoire de Paris pendant la révolution* (vol. iv., 1906); also (for the earlier ones) *Collection complète de tous les ouvrages pour et contre M. Necker, avec des notes critiques* . . . (3 vols., Utrecht, 1781).

(H. M. S.; J. T. S.*)

NECROLOGY (from Med. Lat. *necrologium*, Gr. *νεκρός*, corpse, the termination being formed from *λόγιος*, *λέγειν* to read, in the sense of list, register; cf. "martyrology"), a register in a monastery or other ecclesiastical establishment of the names of the deceased members of the society, or of those for whom the prayers of the foundation were offered as benefactors; hence any roll or list of deceased persons or collection of obituaries.

NECROMANCY (Gr. *νεκρομαντεία*, or *νεκυομαντεία*, from *νεκρός* or *νέκυς*, corpse, and *μαντεία*, divination), properly divination by communicating with the dead. The latinized form of the Greek word was corrupted into *nigromantia*, connecting the word with *niger*, black, and so was applied to the "black art," "black magic," in the sense of witchcraft, sorcery. This corrupted form is common in English to the 17th century (see MAGIC and WITCHCRAFT).

NECROPOLIS, a cemetery (*q.v.*) or burying-place, literally a "city of the dead" (Gr. *νεκρός*, corpse, and *πόλις*, city). Apart from the occasional application of the word to modern cemeteries outside large towns, the term is chiefly used of burial-grounds near the sites of the centres of ancient civilizations.

NECROSIS (Gr. *νεκρός*, corpse), a term restricted in surgery to death of bone. A severe inflammation, caused by a violent blow, by cold, or by the absorption of various poisons, as mercury and phosphorus, is the general precursor of necrosis. The dead part, analogous to the slough in the soft tissues, is called a sequestrum or exfoliation. At first it is firmly attached to the living bone around; gradually, however, the dead portion is separated from the living tissue. The process of separation is a slow one. New bone is formed around the sequestrum, which often renders its removal difficult. As a rule the surgeon waits until the dead part is loose, and then cuts down through the new case and removes the sequestrum. The cavity in which it lay gradually closes, and a useful limb is the result.

NECTAR, in ancient mythology generally coupled with ambrosia, the nourishment of the gods in Homer and in Greek literature generally. Probably the two terms were not originally distinguished; but usually both in Homer and in later writers nectar is the drink and ambrosia the food. On the other hand, in Alcman nectar is the food, and in Sappho and Anaxandrides ambrosia the drink. Each is used in Homer as an unguent (*Iliad*, xiv. 170; xix. 38). Both are fragrant, and may be used as perfume. According to W. H. Roscher (*Nektar und Ambrosia*, 1883; see also his article in Roscher's *Lexikon der Mythologie*) nectar and ambrosia were originally only different forms of the same substance—honey, regarded as a dew, like manna, fallen from heaven, which was used both as food and drink. (See also AMBROSIA.)

NEED-FIRE, or WILD-FIRE (Ger. *Notfeuer*, O. Ger. *nodfyr*), a term used in folklore to denote a curious superstition which survived in the Highlands of Scotland until a recent date. Like the fire-churning still customary in India for kindling the sacrificial fire, the need- or wild-fire is made by the friction of one piece of wood on another, or of a rope upon a stake. Need-fire is a practice of shepherd peoples to ward off disease from their herds and flocks. It is kindled on occasions of special distress, particularly at the outbreak of a murrain, and the cattle are driven through it. Its efficacy is believed to depend on all other fires being extinguished. The kindling of the need-fire in a village near Quedlinburg was impeded by a night light burning in the parsonage (Pröhle, *Harz-Bilder*, Leipzig, 1855). According to one account, in the Highlands of Scotland the rule that all common fires must be previously extinguished applied only to the houses situated between the two nearest running streams (Kelly, *Curiosities of Indo-European Tradition and Folklore*, p. 53 seq.). In Bulgaria even smoking during need-fire is forbidden. Two naked men produce the fire by rubbing dry branches together in the forest, and with the flame they light two fires, one on each side of a cross-road haunted by wolves. The cattle are then driven between the two fires, from which glowing embers are taken to rekindle the cold hearths in the houses (A. Strausz, *Die Bulgaren*, p. 198). In Caithness the men who kindled the need-fire had previously to divest themselves of all metal. In some of the Hebrides the men who made the fire had to be eighty-one in number and all married. In the Halberstadt district in Germany, the rope which was wound round the stake, must be pulled by two chaste boys; while at Wolfenbüttel, contrary to usual custom, it is said that the need-fire had to be struck out of the cold anvil by the smith. In England the need-fire is said to have been lit at Birtley within the last half-century. The superstition had its origin in the early ideas of the purifying nature of flame.

NEEDLE (O. Eng. *nædl*; the word appears in various forms in Teutonic languages, Ger. *Nadel*, Dutch *naal*, the root being *ne-*, to sew, cf. Ger. *nähen*, and probably Lat. *nere*, to spin, Gr. *νῆσις*, spinning), an instrument adapted for passing a thread through fabrics in sewing, consisting of a thin rod of steel, having a pointed end and pierced with a hole or "eye" to carry the thread. The term is also applied to various other objects that more or less resemble a sewing needle in form, though differing in function, such as the magnetized piece of steel that points north and south in the mariner's compass, the pointer or indicator of certain forms of electric telegraph instruments, the slender tube by which the contents of a hypodermic syringe are injected beneath the skin, a sharp-pointed mountain peak or isolated mass of rock, &c.

Sewing needles have been in use from prehistoric times. Originally they were made of fishbone, bone or ivory, and their first form was probably a rude bodkin having a hook instead of an eye, though bone needles with an eye, sometimes at the end and sometimes in the middle, have been found in cave deposits in Great Britain and France and in the Swiss lakes. Bone

needles continue to be used by uncivilized tribes, but since the discovery of bronze metal needles have been employed in civilized communities. Steel needles were introduced into Europe by the Moors, and it is on record that they were being made at Nuremberg in 1370. In England their manufacture was established about 1650. The centre of the trade in England is Redditch, in Worcestershire, with several other small towns in Warwickshire. Originally the industry was domestic in its character, but it is now carried on in factories where mechanical appliances have to a great extent supplanted handwork. Large quantities of needles are also manufactured on the continent of Europe, Aix-la-Chapelle being an important centre of their production. In the United States ordinary sewing needles are not made, though there is a large output of the special forms used in sewing machines.

The raw material of needle-manufacture consists of Sheffield crucible steel drawn down into wire of suitable gauge. The wire is supplied in coils of definite weight and diameter, and the first operation is to cut the coils into lengths, each sufficient for two needles. These lengths are next straightened. For this purpose a bundle containing several thousand lengths is packed within two strong iron rings, is heated to red heat, and is then pressed on an iron plate having two parallel grooves in which the iron rings run. Over this plate the bundle is worked backward and forward by the pressure of an oblong slightly curved iron tool having two longitudinal slits through which the edges of the rings project. Thus, by combined pressure and rolling the whole of the lengths quickly become perfectly straight and even. The next operation consists in pointing both ends of the wires. This was formerly done by hand by a grinder who, holding several dozen wires against a grindstone with his left hand and slightly revolving them with his right, was able to point about 100,000 needles a day, the number depending, however, to some extent on the size treated. This method, however, is now largely superseded by machinery, which is still more expeditious. The wires are fed out from a hopper to a revolving wheel, on the periphery of which they are held by an india-rubber band. This wheel revolves at right angles to a revolving hollow grindstone, and so each wire is brought up to the stone in rapid succession and pointed at one end, the process being repeated for the other end. The next operations are to stamp the grooves which are to be found at the head of a needle and to punch the oval eyes, both being done by automatic machinery. Each wire now forms two needles attached head to head by a broad thin scarf of steel. The operation of separating them is largely performed by machines which pass the double blanks over the face of an emery wheel, but an older method is to spit them on two flattened wires, clamp them tightly in a frame, file away the scarf and break the blanks in halves, so that two lots of single needles are obtained, each spitted on a wire. The next step, after the heads have been filed smooth, is to harden and temper the needles, which are heated to redness, plunged into cold oil, and then gently heated by being placed on a continuous band passing over a series of gas flames. After the tempering comes the process of scouring, and then the eyes are smoothed and polished so that they will not cut the thread. For this purpose the heads used to be softened by blueing, and the needles strung loosely on wires covered with a paste of emery and oil. These wires were then suspended between uprights on a frame platform to which a jerking motion was communicated; in this way the needles were made to swing on the wires and the gentle friction effected the desired end. Generally, however, the eyes are cleared by the action of a concave wire brush, before the scouring process, and then subsequent burnishing becomes unnecessary. The bodies are next polished by being passed between revolving leather rollers which have also a lateral motion in the direction of their axes. The heads of the finished needles have now to be brought all in one direction. Formerly this was done by a "header," wearing a cloth cap on one of her fingers; this being pressed against a batch of the needles which had previously been arranged parallel to each other, those whose heads were presented to the cloth stuck in it and thus were withdrawn. A more modern device is to roll them down a smooth inclined plane, when the pointed ends, owing to their conical form, travel more slowly than the thicker ends, and thus the needles are all brought round so that they point the same way. They are then sorted according to their lengths, and are done up into packets for the market.

Besides ordinary needles for hand sewing, many varieties are made for use in sewing machines, and in their production automatic machinery is largely utilized. Those used for sewing leather have points of various special forms (twist, chisel, wedge, diamond, &c.) instead of the round point of the ordinary needle, and sometimes have a hook in place of an eye. Knitting needles are long slender rods, usually of steel but sometimes of bone or other material, having neither hooks nor eyes. Crochet needles are provided with a hook. Hooked needles again are employed in knitting and stockinet machines; having to be periodically closed by the operation of the mechanism the hooks in one type are made flexible so that they can be pushed down on the shank, while in another the same end is served by providing them with a minute latch. Another special class is constituted by the numerous varieties of needles used by surgeons for suturing wounds, &c. (see SURGICAL INSTRUMENTS).

NEEDLE-GUN (ZÜNDNADELGEWEHR), a military breech-loading rifle, famous as the arm of the Prussians in 1866 and of the Germans in 1870–1871. It was the invention of the gunsmith Johann Nicholas von Dreyse (1787–1867), who, beginning in 1824, had made many experiments, and in 1836 produced the complete needle-gun. From 1841 onwards the new arm was gradually introduced into the Prussian service, and later into the military forces of many other German states. Dreyse was ennobled in 1864. The principal details of the arm (pattern 1841) are as follows:—

Breech	Bolt system
Calibre	·607 in.
Weight without bayonet	10 lb 4 oz.
Charge (black powder)	74·15 grains
Bullet (lead)	478 grains
Muzzle velocity	1000 f.s.
Sighted to	800 paces (656 yds.)

In practice the needle-gun proved to have numerous defects; its effective range was very short compared to that of the muzzle-loading rifles of the day, and conspicuously so as against the chassepot: the escape of gas at the breech was, moreover, very great. A paper cartridge was used. An improved model, giving greater muzzle velocity and increased speed in loading, was introduced later, but this was soon replaced by the Mauser rifle.

NEEDLEWORK. This subject may be considered under the two headings of (1) Plain Needlework, used for purely utilitarian purposes, and (2) Art Needlework for decorative purposes. Plain needlework requires no such further explanation as may be given in the case of art needlework, under which title are included (*a*) embroidery, and (*b*) other methods of decorative needlework, such as applied or appliqué work, ornamental quilting, patchwork and couching. In these last-mentioned methods the needlework is subservient to the decorative effect, which depends almost wholly upon the materials selected for the purpose; whereas in embroidery the needlework itself constitutes and is the visible decoration. The aim of this article is to indicate briefly different stitches of plain needlework and then to show that these stitches are also used in the domain of art needlework.

The more necessary stitches in plain needlework for making clothes are tacking, running, hemming, feather-stitching or herring-boning (all of which are practically of the same type), and button-holing in which the thread is looped as each stitch is made. Button-holing is allied to another looped stitch, namely chain-stitching, which though frequently used in embroidery is rarely if ever used in plain needlework. For repairs of clothes and household linen, &c., the principal stitch is darning; grafting, however, is a substitute for it, and varies with the character of the stuff to be repaired, *e.g.* knitted stockings, damask linen, cloth, &c. Darning is allied to running, and grafting to patchwork. Patchwork as a form of decorative needlework is exemplified in sumptuous canopies and seat covers made several centuries B.C. by Egyptians, and rich hangings made by Italian and French workers in the 16th century.

Long and short stitches, kindred in principle to the running stitch in plain needlework, are perhaps the more frequent of any stitches used in embroidery, and are especially appropriate when the blending of tints with a flat even surface is the effect to be aimed at. Much medieval work of this character, as well as that done with chain stitch and its allied split stitch, is regarded as typical of *opus anglicanum*. Chain stitch produces a comparatively broken surface in decided contrast with the smooth one of long and short stitch, split stitch and satin stitch embroidery. Satin stitch is well adapted to express, with even flat surface in designs for colour effects, each mass which is to be of one tint. In this respect, therefore, satin stitch serves a purpose in contrast to that of long and short stitch. A characteristic of satin-stitching is the sheeny effect produced, on both

sides of the material embroidered, by parallel stitches taken closely together. Buttonhole stitch in relation to art needlework prevails to a great extent in cut linen and drawn-thread work (often called Greek lace), and predominates in the making of needlepoint lace (see LACE). In much of the Persian drawn-thread work, however, it is superseded by whipping or tightly and closely twisting a thread round the undrawn threads of the linen. Whipping has been put to another use in certain 16th-century art needlework for ecclesiastical purposes, where round the gold threads employed as the ground of a design coloured silks are dexterously whipped, closely and openly, producing gradations of tint suffused with a corresponding variation of golden shimmer. Another important branch of art needlework with gold and silver threads is couching. When the metallic threads, arranged so as to lie closely together, are simply stitched flatly to the foundation material, the work is called flat couching or laying, a kind of treatment more frequent in Chinese and Japanese than in European art needlework. Flat couching is also carried out with floss silks. When a design for couching includes effects in relief, stout strings or cords as required by the design are first fastened to the foundation materials, and over them the metallic threads or in some cases coloured gimps are laid, and so stitched as to have an appearance in miniature of varieties of willow-twisting or basket work.

The principle of relief couching is carried much further in certain English art needlework, having cumbersome and grotesque peculiarities, which was done during the reigns of the Stuarts. Crude compositions were wrought in partial relief with padded work, of costumed figures of kings and queens and scriptural persons with a medley of disproportionate animals, insects and trees, &c., in which foliage, wings, &c., were of coloured silk needlepoint lace—the whole being set as often as not in a background of tent or cross-stitch work on canvas. But tent and cross-stitch work (in French *point compté*) was also used by itself for cushion covers and later for upholstery. In its earlier phases it seems to come under the medieval classification of *opus pulvinarum*. The reticulations of the canvas or those apparent in finer material governed the stitching and imparted a stiff formal effect to the designs so carried out, a characteristic equally strong in the *lacis* work, or darning on square mesh net (see LACE).

Appliqué or applied work belongs as much as patchwork to the medieval category of *opus consutum*, or stitching stuffs together according to a decorative design, the greater part of which was cut out of material different in colour, and generally in texture, from that of the ground to which it was applied and stitched. Irish art needlework, called Carrickmacross lace, is for the most part of cambric applied or appliqué to net.

Quilting is also a branch of art needlework rather than embroidery. Indians and Persians using a short running stitch have excelled in it in past times. Some good quilting was done in England in the 18th century with chain-stitching which lay on the inner side of the stuff, the outer displaying the design in short stitches. In the account of his voyage to the East Indies, published in 1655, Edward Terry (1590–1665) writes of the Indians "making excellent quilts of satin lined with taffeta betwixt which they put cotton wool and worked them together with silk." For less bulky quilting, cords have been used; and elaborate designs for quilted linen waistcoats were well done in the 18th century, with fine short stitches that held the cords between the inner and outer materials.

A large number of names have been given to the many modifications of the limited number of essentially different stitches used in plain and art needlework, and on the whole are fanciful rather than really valuable from a technical point of view. Much descriptive information about them, with an abundance of capital illustrations, is given in the *Dictionary of Needlework*, by J. F. Caulfield and Blanche Saward (London, 1903).

NEEMUCH, or NIMACH, a town of Central India, with a British military cantonment, within the state of Gwalior, on the border of Rajputana, with a station on the Rajputana railway, 170 m. N. of Mhow. Pop. (1901) 21,588. In 1857 it was the most southerly place to which the Mutiny extended. The brigade of native troops of the Bengal army, which was stationed there, mutinied and marched to Delhi, the European officers taking refuge in the fort, where they were besieged by a rebel force from Mandasor, and defended themselves gallantly until relieved by the Malwa field force. Since 1895 it has been the headquarters of the political agent in Malwa.

NEENAH, a city of Winnebago county, Wisconsin, U.S.A., on the N.W. shore of Lake Winnebago, 82 m. N. by E. of Milwaukee. Pop. (1890) 5083; (1900) 5954, of whom 1559 were foreign-born; (1905) 6047; (1910) 5734. It is served by the Chicago & North-Western, the Chicago, Milwaukee & St Paul, and the Milwaukee, St Paul & Sault Ste Marie railways, by two interurban electric railways, and by steamboat lines on the lake and on the Fox river, which flows out of Lake Winnebago at this point. Several bridges connect it with Menasha, on the opposite side of the river, and the two cities form one industrial community. Doty Island, at the mouth of the river, belongs partly to Neenah and partly to Menasha. Neenah is a trade centre of the surrounding agricultural region, in which dairying, especially cheese-making, is carried on extensively. The Fox river (with a fall of 12 ft.) furnishes good water-power for the manufactories. There was a trading post at or near the site of Neenah during the French régime in Wisconsin, but there was no actual settlement until well into the 19th century. Neenah was chartered as a city in 1873; its name is derived from an Indian word meaning "running water" or "rapids."

NEER, VAN DER. Aernout and Eglon van der Neer, father and son, were Dutch painters whose lives filled almost the whole of the 17th century.

1. AERNOUT VAN DER NEER (1603–1677), commonly called Aert or Artus, was the contemporary of Albert Cuyp and Hobbema, and so far like the latter that he lived and died in comparative obscurity. Aernout was born at Gorkum and died at Amsterdam. Houbraken's statement that Aernout had been a steward to a Dutch nobleman, and an amateur painter, before he settled in Amsterdam and acquired skill with his brush, would account for the absence of any pictures dating from his early years. He died in abject poverty, and his art was so little esteemed that the pictures left by him were valued at about five shillings apiece. Even as early as 1659 he found it necessary to supplement his income by keeping a wine tavern. The earliest pictures in which Aernout coupled his monogram of A. V. and D. N. interlaced with a date are a winter landscape in the Rijks Museum at Amsterdam (dated 1639), and another in the Martins collection at Kiel (1642)—immature works both, of poor quality. Far better is the "Winter Landscape" (1643) in Lady Wantage's collection, and the "Moonlight Scene" (1644) in the d'Arenberg collection in Brussels. In 1652 Aernout witnessed the fire which consumed the old town-hall of Amsterdam. He made this accident the subject for two or three pictures, now in the galleries of Berlin and Copenhagen. Though Amsterdam appears to have been constantly van der Neer's domicile, his pictures tell that he was well acquainted with the canals and woods about Haarlem and Leiden, and with the reaches of the Maes and Rhine. Dort, the home of Albert Cuyp, is sometimes found in his pictures, and substantial evidence exists that there was friendship between the two men. At some period of their lives they laid their hands to the same canvases, on each of which they left their joint mark. On some it was the signature of the name, on others the more convincing signature of style. There are landscapes in the collections of the dukes of Bedford and Westminster, in which Cuyp has represented either the frozen Maes with fishermen packing herrings, or the moon reflecting its light on the river's placid waters. These are models after which van der Neer appears to have worked. The same feeling and similar subjects are found in Cuyp and van der Neer, before and after their partnership. But Cuyp was the leading genius. Van der Neer got assistance from him; Cuyp expected none from van der Neer. He carefully enlivened his friend's pictures, when asked to do so, with figures and cattle. It is in pictures jointly produced by them that we discover van der Neer's presence at Dort. We are near

Dort in the landscape sunset of the Louvre, in which Cuyp evidently painted the foreground and cows. In the National Gallery picture Cuyp signs his name on the pail of a milkmaid, whose figure and red skirt he has painted with light effectiveness near the edge of van der Neer's landscape. Again, a couple of fishermen with a dog, and a sportsman creeping up to surprise some ducks, are Cuyp's in a capital van der Neer at the Staedel Institute in Frankfort.

Van der Neer's favourite subjects were the rivers and water-courses of his native country either at sunset or after dark. His peculiar skill is shown in realizing transparence which allows objects—even distant—to appear in the darkness with varieties of warm brown and steel greys. Another of his fancies is to paint frozen water, and his daylight icescapes with golfers, sleighers, and fishermen are as numerous as his moonlights. But he always avoids the impression of frostiness, which is one of his great gifts. His pictures are not scarce. They are less valuable in the market than those of Cuyp or Hobbema; but, possessing a charm peculiarly their own, they are much sought after by collectors. Out of about one hundred and fifty pictures accessible to the public, the choicest selection is in the Hermitage at St Petersburg. In England paintings from his brush are to be found at the National Gallery and Wallace Collection, and, amongst others, in the collections of the marquess of Bute and Colonel Holford.

2. EGLON VAN DER NEER (1643–1703) was born at Amsterdam, and died at Düsseldorf on the 3rd of May 1703. He was first taught by his father, and then took lessons from Jacob van Loo, whose chief business then consisted in painting figures in the landscapes of Wynants and Hobbema. When van Loo went to Paris in 1663 to join the school from which Boucher afterwards emerged, he was accompanied or followed by Eglon. But, leaving Paris about 1666, he settled at Rotterdam, where he dwelt for many years. Later on he took up his residence at Brussels, and finally went to Düsseldorf, where he entered the service of the elector-palatine Johann Wilhelm von der Pfalz. In each of the places where he stopped Eglon married, and having had three wives became the father of twenty-five children. A portrait of the princess of Neuberg led to his appointment as painter to the king of Spain.

Eglon van der Neer has painted landscapes imitating those of his father, of Berchem, and of Adam Elsheimer. He frequently put the figures into the town views of Jan van der Heyden in competition with Berchem and Adrian van der Velde. His best works are portraits, in which he occasionally came near Ter Borch or Metsu in delicacy of touch, de Hooch in effectiveness of lighting, or Mieris in polish of surface. One of his earliest pieces in which the influence of Ter Borch is apparent is the "Lady with the Book," of 1665, which was sold with the Bredel collection in 1875. A young woman in white and red satin at Rotterdam, of 1669, recalls Mieris, whose style also reappears in Eglon's "Cleopatra" at Buckingham Palace. Two landscapes with "Tobit and the Angel," dated 1685 and 1694, in the museums of Berlin and Amsterdam, illustrate his fashion of setting Scripture scenes in Dutch backgrounds. The most important of his sacred compositions is the "Esther and Ahasuerus," of 1696, in the Uffizi at Florence. But Eglon varied his practice also with arrangements of hunting and hawking parties, pastures and fords, and cavalry skirmishes. The latest of his panels is a mountain landscape of 1702 in the gallery of Augsburg. (J. A. C.; P. G. K.)

NEERWINDEN, a village of Belgium in the province of Liége, a few miles E. by S. of Tirlemont, which gives its name to two great battles, the first fought in 1693 between the Anglo-Allied army under William III. of England and the French under the duke of Luxemburg, and the second in 1793 between the Austrians under Prince Josias of Coburg and the French under General Dumouriez.

Battle of Neerwinden or Landen, 1693 (see GRAND ALLIANCE, WAR OF THE).—Luxemburg, having by feints induced William to detach portions of his army, rapidly drew together superior numbers in face of the Allied camps, which lay in a rough semicircle from Elissem on the right to Neerlanden, and thence along the Landen brook on the left (July 18-28, 1693). William had no mind to retire over the Geete river, and entrenched a strong line from Laer through Neerwinden to Neerlanden. On the right section of this line (Laer to Neerwinden) the ground was much intersected and gave plenty of cover for both sides, and this section, being regarded as the key of the position, was strongly garrisoned; in the centre the open ground between Neerwinden and Neerlanden was solidly entrenched, and in front of it Rumsdorp was held as an advanced post. The left at Neerlanden rested upon the Landen brook and was difficult of access. William's right, as his line of retreat lay over the Geete, was his dangerous flank, and Luxemburg was aware that, the front of the Allies being somewhat long for the numbers defending it, the intervention of troops drawn from one wing to reinforce the other would almost certainly be too late. Under these conditions Luxemburg's general plan was to throw the weight of his attack on the Laer-Neerwinden section, and specially on Neerwinden itself, and to economize his forces—as "economy of force" was understood before Napoleon's time—elsewhere, delivering holding attacks or demonstrations as might be necessary, and thus preventing

the Allied centre and left from assisting the right. Luxemburg had about 80,000 men to William's 50,000. Opposite the entrenchments of the centre he drew up nearly the whole of his cavalry in six lines, with two lines of infantry intercalated. A corps of infantry and dragoons was told off for the attack of Neerlanden and Rumsdorp, and the troops destined for the main attack, 28,000 of all arms, formed up in heavy masses opposite Neerwinden. This proportion of about one-third of the whole force to be employed in the decisive attack in the event proved insufficient. The troops opposite the Allied centre and left had to act with the greatest energy to fulfil their containing mission, and at Laer-Neerwinden the eventual success of the attack was bought only at the price of the utter exhaustion of the troops.

After a long cannonade the French columns moved to the attack, converging on Neerwinden; a smaller force assaulted Laer. The edge of the villages was carried, but in the interior a murderous struggle began, every foot of ground being contested, and after a time William himself, leading a heavy counter-attack, expelled the assailants from both villages. A second attack, pushed with the same energy, was met with the same determination, and meanwhile the French in other parts of the field had pressed their demonstrations home. Even the six lines of cavalry in the centre, after enduring the fire of the Allies for many hours, trotted over the open and up to the entrenchments to meet with certain defeat, and at Neerlanden and Rumsdorp there was

severe hand to hand fighting. But, meantime, the two intact lines of infantry in the French centre had been moved to their left and formed the nucleus for the last great assault on Neerwinden, which proved too much for the exhausted defenders. They fell back slowly and steadily, defying pursuit, and the British Coldstream Guards even captured a colour. But at this crisis the initiative of a subordinate general, the famous military writer Feuquières (*q.v.*), converted the hard-won local success into a brilliant victory. William had begun to move troops from his centre and left to the right in order to meet the great assault on Neerwinden, and Feuquières, observing this, led the cavalry of the French centre once again straight at the entrenchments. This time the French squadrons, surprising the Allies in the act of manœuvring, rode over every body of troops they met, and nothing remained for the Allies but a hurried retreat over the Geete. A stubborn rearguard of British troops led by William himself alone saved the Allied army, of which all but the left wing was fought out and in disorder. Luxemburg had won his greatest victory, thanks in a measure to Feuquières' exploit; but had the assaults on Neerwinden been made—as Napoleon would have made them—with one-half or two-thirds of his forces instead of one-third, the victory would have been decisive, and Feuquières would have won his laurels, not in forcing the decision at the cost of using up his cavalry, but in annihilating the remnants of the Allied army in the pursuit. The material results of the battle were twelve thousand Allies (as against eight thousand French) killed, wounded and prisoners, and eighty guns and a great number of standards and colours taken by the French.

The battle of the 18th March 1793 marked the end of Dumouriez's attempt to overrun the Low Countries and the beginning of the Allies' invasion of France. The Austrians under Coburg, advancing from Maestricht in the direction of Brussels, encountered the heads of the hurriedly assembling French army at Tirlemont on the 15th of March, and took up a position between Neerwinden and Neerlanden. On the 18th, however, after a little preliminary fighting Coburg drew back a short distance and rearranged his army on a more extended front between Racour and Dormael, thus parrying the enveloping movement begun by the French from Tirlemont. Dumouriez was consequently compelled to fight after all on parallel fronts, and though in the villages themselves the individuality and enthusiasm of the French soldier compensated for his inadequate training and indiscipline, the greater part of the front of contact was open ground, where the superiority of the veteran Austrian regulars was unchallengeable. In these conditions an attempt to win a second Jemappes with numerical odds of 11 to 10 instead of 2 to 1 in favour of the attack was foredoomed to disaster, and the repulse of the Revolutionary Army was the signal for its almost complete dissolution. Neerwinden was a great disaster, but not a great battle. Its details merely show the impossibility of fighting on the 18th-century system with ill-trained troops. The methods by which such troops could compass victory, the way to fight a "sans culotte" battle, were not evolved until later.

NEES VON ESENBECK, CHRISTIAN GOTTFRIED (1776–1858), German botanist and entomologist, was born at Erbach on the 14th of February 1776, and was educated at Darmstadt and at Jena, where he took the degree of M.D. After spending some time in medical practice he was appointed professor of botany in Erlangen in 1816. Three years later he became professor of natural history in Bonn, and in 1831 he was appointed to the chair of botany in the university of Breslau. In 1848 he entered political life and made himself so obnoxious to the government that in 1851 he was deprived of his professorship, and in consequence the latter years of his life were spent in great poverty. He died in Breslau on the 16th of March 1858.

For about forty years he edited the *Nova acta* of the "Acad. Leopold-Carolina," in which several of his own papers were published. His earliest memoirs dealt with the ichneumons, and he published a *Monographie der Ichneumone* in 2 vols. in 1828, and *Hymenopterorum Ichneumonibus affinium monographiae*, in 2 vols. in 1834. His other separate works include: *Die Algen des süssen Wassers nach ihren Entwickelungsstufen dargestellt* (1814); *Das System der Pilze und Schwämme* (1816); *Naturgeschichte der europäischen Lebermoose*, in 4 vols. (1833–1838); "Agrostologia Brasiliensis," in the *Flora Brasiliensis*; and a *Systema Laurinearum* (1836). He also wrote numerous monographs in *Flora*, in *Linnaea* and in other scientific German magazines, either alone or along with other well-known botanists. His best-known works are those that deal with the *Fungi*, the *Hepaticae* and the *Glumiferae*, in all which groups he made valuable additions to knowledge.

His brother THEODOR FRIEDRICH LUDWIG (1787–1837), inspector of the botanic gardens at Leiden, and afterwards professor of pharmacy at Bonn, also wrote numerous papers on botanical subjects, dealing more particularly with medicinal plants and their products.

NEFF, FELIX (1798–1829), Swiss Protestant divine and philanthropist, was born at Geneva on the 8th of October 1798. Originally a sergeant of artillery, he decided in 1819 to devote himself entirely to evangelistic work. He was ordained to the ministry in 1822, and soon afterwards settled in the valley of Freissinières, where he laboured in the manner of J. F. Oberlin, being at one and the same time pastor, schoolmaster, engineer and agriculturist. He was so successful that he changed the character of the district and its inhabitants. In 1827, worn out by his labours, he was obliged to return to his native place, where he died two years later.

NEGAPATAM, a seaport of British India, in the Tanjore district of Madras, forming one municipality with Nagore, a port 3 m. N. at the mouth of the Vettar river. Pop. (1901) 57,190. It carries on a brisk trade with the Straits Settlements and Ceylon, steamers running once a week to Colombo. The chief export is rice. Negapatam is the terminus of a branch of the South Indian railway, and contains large railway workshops. It is also a depot for coolie emigration. Negapatam was one of the earliest settlements of the Protuguese on the Coromandel coast. It was taken by the Dutch in 1660, becoming their chief possession in India, and by the English in 1781. From 1799 to 1845 it was the headquarters of Tanjore district. There is a large population of Labbais, Mahommedans of mixed Arab descent, who are keen traders. Jesuit and Wesleyan missions are carried on.

NEGAUNEE, a city of Marquette county, Michigan, U.S.A., about 12 m. W. by S. of Marquette and 3 m. E. of Ishpeming, in the N. part of the upper peninsula. Pop. (1904) 6797; (1910) 8460. It is served by the Chicago & North-Western, the Duluth, South Shore & Atlantic, and the Lake Superior & Ishpeming railways. It is built on a ridge called Iron Mountain, 1564 ft. above sea-level, and under and near it are some of the most productive iron-ore deposits in the state, the mining of which is the principal industry of the city. The settlement of Negaunee began about 1870, and the city was chartered in 1873. The name is a Chippewa word meaning "first" or "he goes before," and is said to have been chosen at the request of the Pioneer Iron Company as an equivalent for "Pioneer."

NEGLIGENCE (Lat. *negligentia*, from *negligere*, to neglect, literally "not to pick up"), a ground of civil law liability, and in criminal law an element in several offences, the most conspicuous of which is manslaughter by negligence. In order to establish civil liability on the ground of negligence, three things must be proved—a duty to take care, the absence of due care, and actual damage caused directly by the absence of due care. Mere carelessness gives no right of action unless the person injured can show that there was a legal duty to take care. The duty may be to the public in general, on the ground that any person who does anything which may involve risk to the public is bound to take due care to avoid the risk. For instance, in the words of Lord Blackburn, "those who go personally or bring property where they know that they or it may come into collision with the persons or property of others have by law a duty cast upon them to use reasonable care and skill to avoid such a collision." Where a special duty to an individual is alleged, the duty must rest on a contract or undertaking or some similar specific ground. Thus, where a surveyor has carelessly given incorrect progress certificates, and a mortgagee who has had no contractual relation with the surveyor has advanced money on the faith of the certificate, the surveyor is not liable to the mortgagee in an action of negligence; because he owed no duty to the mortgagee to be careful. When a duty to take care is established, the degree of care required is now determined by a well-ascertained standard. This standard is the amount of care which would be exercised

in the circumstances by an "average reasonable man." This objective standard excludes consideration of the capacity or state of mind of the particular individual. It also gets rid of the old distinctions between "gross," "ordinary" and "slight" negligence, though no doubt the degree of care required varies with the circumstances of the case. The application of such a standard is a task for which a jury is a very appropriate tribunal. In fact the decision of the question whether there has been a want of due care is left almost unreservedly to the jury. There is this amount of control, that if the judge is of opinion that the evidence, if believed, cannot possibly be regarded as showing want of due care, or in technical language that there is "no evidence of negligence," it is his duty to withdraw the case from the jury and give judgment for the defendant. Unless the judge decides that there is no duty to take care, or that there is no evidence of want of care, the question of negligence or no negligence is wholly for the jury.

Ordinarily a man is responsible only for his own negligence and for that of his servants and agents acting within the scope of their authority. For the acts or defaults of the servants of an independent contractor he is not liable. But in certain cases a stricter obligation is imposed on him by law. The occupier of premises is under a duty to all persons who go there on business which concerns him to see that the premises are in a reasonably safe condition so far as reasonable care and skill can make them so. Thus he cannot release himself by employing an independent contractor to maintain or repair the premises. The effect of this doctrine is that the occupier may be liable if it can be shown that the independent contractor or his servant has been guilty of a want of due care. A similar obligation has been enforced in the case of a wreck stranded in a navigable river, and the owner was held liable for damage caused by the carelessness of the servant of an independent contractor who had undertaken to light the wreck. So too any person who undertakes a work likely to cause danger if due care is not taken is liable for damage caused by the carelessness of the servant of an independent contractor, so long as the carelessness is not casual or collateral to the servant's employment.

In an action of negligence a familiar defence is "contributory negligence." This is a rather misleading expression. It is not a sufficient defence to show that the plaintiff was negligent, and that his negligence contributed to the harm complained of. The plaintiff's negligence will not disentitle him to recover unless it is such that without it the misfortune would not have happened, nor if the defendant might by the exercise of reasonable care on his part have avoided the consequences of the plaintiff's negligence. The shortest and plainest way of expressing this rule is, that the plaintiff's negligence is no defence unless it was the proximate or decisive cause of the injury. There was an attempt in recent times to extend this doctrine so as to make the contributory negligence of a third person a defence, in cases where the plaintiff, though not negligent himself, was travelling in a vehicle or vessel managed by the negligent third person, or was otherwise under his control. In such circumstances it was said that the plaintiff was "identified" with the third person. (*Waite* v. *North-Eastern Ry. Co.*, 1858, E. B. & E., 719). This case, in the Exchequer Chamber, was an action on behalf of an infant by his next friend. The infant, which was five years of age, was with its grandmother, who took a half-ticket for the child and a ticket for herself to travel by the defendants' line; as they were crossing the railway to be ready for the train the child was injured by a passing train. The jury found that the defendants were guilty of negligence, and that the grandmother was guilty of negligence which contributed to the accident, while there was no negligence of the infant plaintiff. A verdict was entered for the plaintiff, but in the Queen's Bench the verdict was entered for the defendants, without calling on them to argue, on the ground that the infant was identified with its grandmother. But the case of the "Bernina," decided in 1888, where a passenger and an engineer on board the "Bushire" were killed in a collision between the "Bernina" and the "Bushire" caused by fault in both ships, but without fault on the part of the deceased, exploded this supposed doctrine, and made it clear that the defence of contributory negligence holds good only when the defendant contends and proves that the plaintiff was injured by his own carelessness.

The American law of negligence is founded on the English common law; but the decisions in different states have occasionally contradicted English decisions, and also one another.

See T. Beven, *Negligence in Law*, 3rd ed., 1908; Shearman and Redfield, *The Law of Negligence* (New York), Thompson, *Commentaries on Negligence* (Indianapolis). (A. Ll. D.)

NEGOTIABLE INSTRUMENT, in law, a document or other instrument purporting to represent so much money, and the property in which passes, like money, by mere delivery. Negotiable instruments arise in either of two ways: (1) by statute, (2) by custom of merchants. The most commonly recognized negotiable instruments are bills of exchange, promissory notes, bills of lading, foreign bonds and debentures payable to bearer. Negotiable instruments constitute an exception to the general rule that a man cannot give a better title than he has himself (see BILL OF EXCHANGE).

NEGRI, ADA (1870–), Italian poet, was born at Lodi, of an artisan family, and became a village school-teacher. Her first book of poems, *Tempeste* (1891), tells the helpless tragedy of the forsaken poor, in words of vehement beauty. Her second volume of lyrics, *Fatalità* (1893), confirmed her reputation as a poet, and led to her appointment to the normal school at Milan; but her later verse, while striking in its sincerity, suffered by a tendency to repetition and consequent mannerism.

NEGRITOS (Span. for "little negroes"), the name originally given by the Spaniards to the aborigines of the Philippine Islands. They are physical weaklings, of low, almost dwarf, stature, with very dark skin, closely curling hair, flat noses, thick lips and large clumsy feet. The term has, however, been more generally applied to one of the great ethnic groups into which the population of the East Indies is divided, and to an apparently kindred race in Africa (see NEGRO). A. de Quatrefages suggests that from the parent negroid stem were thrown off two negrito branches to the west and east, the Indo-Oceanic and African, and that the Akkas, Wochuas, Batwas and Bushmen of the Dark Continent are kinsmen of the Andaman Islanders, the Sakais of the Malay Peninsula and the Aetas of the Philippines. This view has found much acceptance among ethnologists. The result of Quatrefages's theory would be to place the negrito races closest to the primitive human type, a conclusion apparently justified by their physical characteristics. The true negritos are always of little stature (the majority under 5 ft.), have rounded forms and their skull is brachycephalic or subbrachycephalic, that is to say, it is relatively short and broad and of little height. Their skin is dark brown or black, sometimes somewhat yellowish, their hair woolly (scanty on face and body), and they have the flat nose and thick lips and other physical features of the negro. Among peoples undoubtedly negrito are those of the Andaman Islands (*q.v.*), the Malay Peninsula (*q.v.*) and some of the Philippines (*q.v.*), the best types being the Sakais (*q.v.*), Mincopies and Aetas. The question of the so-called negrito races of India, the Oraons, Gonds, &c., is in much dispute, Quatrefages believing the Indian aborigines to have been negritos, while other ethnologists find the primitive people of Hindustan in the Dravidian races. Some authorities have placed the Veddahs of Ceylon among the negritos, but their straight hair and dolichocephalic skulls are sufficient arguments against their inclusion. The negrito is often confounded with the Papuan; but the latter, though possessing the same woolly hair and being of the same colour, is a large, often muscular man, with a long, high skull.

See A. de Quatrefages, *Les Pygmées* (Paris, 1887; Eng. trans. 1895); E. H. Man, *The Aborigines of the Andaman Islands* (London, 1885); Giglioli, *Nuove notizie sui populi negroidi dell' Asia e specialmente sui Negriti* (Florence, 1879); Meyer, *Album von Philippinen-Typen* (Dresden, 1885); Blumentritt, *Ethnographie der Philippinen* (Gotha, 1892); A. B. Meyer, *Die Negritos* (Dresden, 1899); A. H. Keane, *Ethnology*; A. C. Haddon in *Nature* for September 1899.

NEGRO (from Lat. *niger*, black), in anthropology, the designation of the distinctly dark-skinned, as opposed to the fair, yellow, and brown variations of mankind. In its widest sense it embraces all the dark races, whose original home is the intertropical and sub-tropical regions of the eastern hemisphere, stretching roughly from Senegambia, West Africa, to the Fijian Islands in the Pacific, between the extreme parallels of the Philippines and Tasmania. It is most convenient, however, to refer to the dark-skinned inhabitants of this zone by the collective term of *Negroids*, and to reserve the word *Negro* for the tribes which are considered to exhibit in the highest degree the characteristics taken as typical of the variety.

These tribes are found in Africa; their home being south of the Sahara and north of a not very well-defined line running roughly from the Gulf of Biafra with a south-easterly trend across the equator to the mouth of the Tana. In this tract are found the true negroes; and their nearest relatives, the Bantu-negroids, are found to the south of the last-mentioned line. The relation of the yellowish-brown Bushman and Hottentot peoples of the southern extremity of Africa to the negro is uncertain; they possess certain negroid characters, the tightly curled hair, the broad nose, the tendency towards prognathism; but their colour and a number of psychological and cultural differences would seem to show that the relation is not close. Between the two a certain affinity seems to exist, and the Hottentot is probably the product of an early intermixture of the first Hamito-Bantu immigrants with the Bushman aborigines (see AFRICA: *Ethnology*). The relation of the negroids of Africa to those of Asia (southern India and Malaysia) and Australasia cannot be discussed with profit owing to lack of evidence; still less the theories which have been put forward to account for the wide dispersal from what seems to be a single stock. It will be sufficient to say that the two groups have in common a number of well-defined characteristics of which the following are the chief: A dark skin, varying from dark brown, reddish-brown, or chocolate to nearly black; dark tightly curled hair, flat in transverse section,[1] of the "woolly" or the "frizzly" type; a greater or less tendency to prognathism; eyes dark brown with yellowish cornea; nose more or less broad and flat; and large teeth.

Sharing these characteristics, but distinguished by short stature and brachycephaly, is a group to which the name *Negrito* (*q.v.*) has been given; with this exception the tendency among the negroids appears to be towards tall stature and dolichocephaly in proportion as they approach the pure negro type. As the most typical representatives of the variety are found in Africa, the Asiatic and Australasian negroids may be dismissed with this introduction. The negro and negroid population of America, the descendants of the slaves imported from West Africa, and in a less degree, from the Mozambique coast, before the abolition of the slave-trade, are treated separately below.

In Africa three races have intermingled to a certain extent with the negro; the Libyans (Berbers: *q.v.*) in the Western Sudan; and the Hamitic races (*q.v.*) and Arabs (*q.v.*) in the east. The identity of the people who have amalgamated with the negro to form the Bantu-speaking peoples in the southern portion of the continent is not certain, but as the latter appear to approach the Hamites in those characteristics in which they differ from the true negroes, it seems probable that they are infused with a proportion of Hamitic blood. The true negroes show great similarity of physical characteristics; besides those already mentioned they are distinguished by length of arm, especially of fore arm, length of leg, smallness of calf and projection of heel; characteristics which frequently fail to appear to the same degree among the Bantu, who are also as a rule less tall, less prognathous, less platyrrhine and less dark. A few tribes in the heart of the negro domain (the Welle district of Belgian Congo) show a tendency to round head, shorter stature and fairer complexion; but there seems reason to suppose that they have received an infusion of Libyan (or less probably Hamitic) or Negrito blood.

The colour of the skin, which is also distinguished by a velvety surface and a characteristic odour, is due not to the presence of any special pigment, but to the greater abundance of the colouring matter in the Malpighian mucous membrane between the inner or true skin and the epidermis or scarf skin.[2] This colouring matter is not distributed equally over the body, and does not reach its fullest development until some weeks after birth; so that new-born babies are a reddish chocolate or copper colour. But excess of pigmentation is not confined to the skin; spots of pigment are often found in some of the internal organs, such as the liver, spleen, &c. Other characteristics appear to be a hypertrophy of the organs of excretion, a more developed venous system, and a less voluminous brain, as compared with the white races.

In certain of the characteristics mentioned above the negro would appear to stand on a lower evolutionary plane than the white man, and to be more closely related to the highest anthropoids. The characteristics are length of arm, prognathism, a heavy massive cranium with large zygomatic arches, flat nose depressed at base, &c. But in one important respect, the character of the hair, the white man stands in closer relation to the higher apes than does the Negro.

Mentally the negro is inferior to the white. The remark of F. Manetta, made after a long study of the negro in America, may be taken as generally true of the whole race: "the negro children were sharp, intelligent and full of vivacity, but on approaching the adult period a gradual change set in. The intellect seemed to become clouded, animation giving place to a sort of lethargy, briskness yielding to indolence. We must necessarily suppose that the development of the negro and white proceeds on different lines. While with the latter the volume of the brain grows with the expansion of the brainpan, in the former the growth of the brain is on the contrary arrested by the premature closing of the cranial sutures and lateral pressure of the frontal bone.[3] This explanation is reasonable and even probable as a contributing cause; but evidence is lacking on the subject and the arrest or even deterioration in mental development is no doubt very largely due to the fact that after puberty sexual matters take the first place in the negro's life and thoughts. At the same time his environment has not been such as would tend to produce in him the restless energy which has led to the progress of the white race; and the easy conditions of tropical life and the fertility of the soil have reduced the struggle for existence to a minimum. But though the mental inferiority of the negro to the white or yellow races is a fact, it has often been exaggerated; the negro is largely the creature of his environment,

[1] This point has been fully determined by P. A. Brown (*Classification of Mankind by the Hair*, &c.), who shows conclusively that, unlike true hair and like true wool, the negro hair is flat, issues from the epidermis at a right angle, is spirally twisted or crisped, has no central duct, the colouring matter being disseminated through the cortex and intermediate fibres, while the cortex itself is covered with numerous rough, pointed filaments adhering loosely to the shaft; lastly, the negro pile will felt, like wool, whereas true hair cannot be felted.

[2] It is also noteworthy that the dark colour seems to depend neither on geographical position, the isothermals of greatest heat, nor even altogether on racial purity. The extremes of the chromatic scale are found in juxtaposition throughout the whole negro domain, in Senegambia, the Gabun, upper Nile basin, lower Congo, Shari valley, Mozambique. In the last region M de Froberville determined the presence of thirty-one different shades from dusky or yellow-brown to sooty black. Some of the sub-negroid and mixed races, such as many Abyssinians, Galla, Jolof and Mandingo, are quite as black as the darkest full-blood negro. A general similarity in the outward conditions of soil, atmosphere, climate, food charged with an excess of carbon, such as the fruit of the butter-tree, and other undetermined causes have tended to develop a tendency towards dark shades everywhere in the negro domain apart from the bias mainly due to an original stain of black blood. Perhaps the most satisfactory theory explains the excessive development of pigment in the dark-skinned races as a natural protection against the ultra-violet rays in which tropical light is so rich and which are destructive of protoplasm (see C. E. Woodruff, *Tropical Light*, London, 1905). The expression "jet black" is applied by Schweinfurth to the upper-Nilotic Shilluk, Nuer and Dinka, while the neighbouring Bongo and Mittu are described as of a "red-brown" colour "like the soil upon which they reside" (*Heart of Africa*, vol. i. ch. iv.).

[3] *La Razza Negra nel suo stato selvaggio*, &c. (Turin, 1864), p. 20.

and it is not fair to judge of his mental capacity by tests taken directly from the environment of the white man, as for instance tests in mental arithmetic; skill in reckoning is necessary to the white race, and it has cultivated this faculty; but it is not necessary to the negro.

On the other hand negroes far surpass white men in acuteness of vision, hearing, sense of direction and topography. A native who has once visited a particular locality will rarely fail to recognize it again. For the rest, the mental constitution of the negro is very similar to that of a child, normally good-natured and cheerful, but subject to sudden fits of emotion and passion during which he is capable of performing acts of singular atrocity, impressionable, vain, but often exhibiting in the capacity of servant a dog-like fidelity which has stood the supreme test. Given suitable training, the negro is capable of becoming a craftsman of considerable skill, particularly in metal work, carpentry and carving. The bronze castings by the *cire perdue* process, and the cups and horns of ivory elaborately carved, which were produced by the natives of Guinea after their intercourse with the Portuguese of the 16th century, bear ample witness to this. But the rapid decline and practical evanescence of both industries, when that intercourse was interrupted, shows that the native craftsman was raised for the moment above his normal level by direct foreign inspiration, and was unable to sustain the high quality of his work when that inspiration failed.

In speaking of the form or forms of culture found among negro and negroid tribes, the dependence of the native upon his environment must be kept in mind, particularly in Africa, where interchange of customs is continually taking place among neighbours.

Thus the forest regions are distinguished by a particular form of culture which differs from that prevailing in the more open country (see AFRICA: *Ethnology*). But it may be said generally that the negro is first and foremost an agriculturist. The negritos are on a lower cultural plane; they are nomadic hunters who do no cultivation whatever. Next in importance to agriculture come hunting and fishing and, locally, cattle-keeping. The last is not strictly typical of negro culture at all; nearly all the tribes by whom it is practised are of mixed origin, and their devotion to cattle seems to vary inversely with the purity of race. The most striking exception to this statement is the Dinka of the upper Nile, the whole of whose existence centres round the cattle pen. Of the other tribes where pastoral habits obtain to a greater or less extent, the Masai have a large percentage of Hamitic blood, the eastern and southern Bantu-speaking negroids are also of mixed descent, &c.

The social conditions are usually primitive, especially among the negroes proper, being based on the village community ruled by a chief. Where the country is open, or where the forest is not so thick as to present any great obstacle to communication, it has often happened that a chief has extended his rule over several villages and has ultimately built up a kingdom administered by sub-chiefs of various grades, and has even established a court with a regular hierarchy of officials. Benin and Dahomey are instances of this. But the region where this "empire-building" has reached its greatest proportions lies to the south of the forest belt in the territory of the Bantu negroids, where arose the states of Lunda, Cazembe, &c.

The domestic life of the negro is based upon polygyny, and marriage is almost always by purchase. So vital is polygyny to the native social system that the attempts made by missionaries to abolish plurality of wives would, if successful (a contingency unthinkable under present conditions), result in the most serious social disorder. Not only would an enormous section of the population be deprived of all means of support, but the native wife would be infinitely harder worked; agriculture, the task of the women, would be at a standstill; and infanticide would probably assume dangerous proportions.

Descent in the negro world is on the whole more often reckoned through the female, though many tribes with a patriarchal system are found. Traces of totemism are found sporadically, but are rare.

Of the highest importance socially are the secret societies, which are found in their highest development among the negroes of the west coast, and in a far less significant form among some of the Bantu negroids of the western forest district. In their highest form these societies transcend the tribal divisions, and the tie which binds the individual to the society takes precedence of all others. But the secret society cannot be called a definitely negro institution, since it is found in the west only.

As an agriculturist the negro is principally a vegetarian, but this form of diet is not the result of direct choice; meat is everywhere regarded as a great delicacy, and no opportunity of obtaining it is ever neglected, with one exception—that the cattle-keeping tribes rarely slaughter for food, because cattle are a form of currency. Fish is also an important article of diet in the neighbourhood of large rivers, especially the Nile and Congo. It is worthy of note that the two cultivated plants which form the mainstay of native life, manioc in the west and centre and mealies in the south and east, are neither of African origin.

Cannibalism is found in its simplest form in Africa. In that continent the majority of cannibal tribes eat human flesh because they like it, and not from any magical motive or from lack of other animal food. In fact it is noticeable that the tribes most addicted to this practice inhabit just those districts where game is most plentiful. Among the true negroes it is confined mainly to the Welle and Ubangi districts, though found sporadically (and due to magical motives) on the west coast, and among the Bantu negroids in the south-western part of Belgian Congo and the Gabun.

With regard to crafts the most important and typical is that of iron smelting and working. No negro tribe has been found of which the culture is typical of the Stone age; or, indeed, which makes any use of stone implements except to crush ore and hammer metal. Even these are rough pieces of stone of convenient size, not shaped in any way by chipping or grinding. Doubtless the richness of the African soil in metal ores rendered the Stone age in Africa a period of very short duration (see AFRICA: *Ethnology*). A good deal of aptitude is shown in the forging of iron, considering the primitive nature of the tools. Considerable skill in carving is also found in the west and among the Bantu negroids, especially of Belgian Congo south of the Congo. Weaving is practised to a large extent in the west; the true native material being palm-leaf fibre. The cultivation of cotton, which has become important in West Africa, deals with an exotic material and has been subjected to foreign influences. Among the Bantu of the Kasai district the art of weaving palm-cloth reaches its highest level, and in the east cotton-weaving is again found. Pottery-making is almost universal, though nowhere has it reached a very advanced stage; the wheel is unknown, though an appliance used on the lower Congo displays the principle in very rudimentary form. The production of fire by means of friction was universal, the method known as "twirling" being in vogue, *i.e.* the rapid rotation between the palms of a piece of hard wood upon a piece of soft wood.

Trading is practised either by direct barter or through the medium of rude forms of currency which vary according to locality. Value is reckoned among the tribes with pastoral tendencies in cattle and goats; among the eastern negroes by hoe-and spear-blades and salt blocks; in the west by cowries, brass rods, and bronze armlets (manilas); in Belgian Congo variously by *olivella* shells, brass rods, salt, goats and fowls, copper ingots and iron spear-blades, &c.

As regards religion, the question of environment is again important; in the western forests where communities are small the negro is a fetishist, though his fetishism is often combined more or less with nature worship. Where communication is easier the nature worship becomes more systematic, and definite supernatural agencies are recognized, presiding over definite spheres of human life.[1] Where feudal kingdoms have been formed, ancestor-worship begins to appear and often assumes paramount

[1] The three volumes by Colonel Ellis mentioned in the bibliography form an excellent study of the development of negro religion.

importance. In fact this form of religion is typical of all the eastern and southern portion of the continent (see AFRICA: *Ethnology*). With the negro, as with most primitive peoples, it is the malignant powers which receive attention from man, with a view to propitiation or coercion. Beneficent agencies require no attention, since, from their very nature, they must continue to do good. The negro attitude towards the supernatural is based frankly on fear; gratitude plays no part in it. A characteristic feature of the western culture area, among both negro and Bantu negroid tribes, is the belief that any form of death except by violence must be due to evil magic exercised by, or through the agency of, some human individual; to discover the guilty party the poison ordeal is freely used. A similar form of ordeal is found in British Central Africa to discover magicians, and the wholesale "smelling-out" of "witches," often practised for political reasons, is a well-known feature of the culture of the Zulu-Xosa tribes. Everywhere magic, both sympathetic and imitative, is practised, both by the ordinary individual and by professional magicians, and most medical treatment is based on this, although the magician is usually a herbalist of some skill. Where the rainfall is uncertain, the production of rain by magical means is one of the chief duties of the magician, a duty which becomes paramount in the eastern plains among negroes and Bantu negroids alike. But the negroes and negroids have been considerably influenced by exotic religions, chiefly by Mahommedanism along the whole extent of country bordering the Sahara and in the east. Christianity has made less progress, and the reason is not far to seek. Islam is simple, categorical and easily comprehended; it tends far less to upset the native social system, especially in the matter of polygyny, and at the same time discourages indulgence in strong drink. Moreover the number of native missionaries is considerable. Christianity has none of these advantages, but possesses two great drawbacks as far as the negro is concerned. It is not sufficiently categorical, but leaves too much to the individual, and it discountenances polygyny. The fact that it is divided into sects, more or less competitive among themselves, is another disadvantage which can hardly be overrated. This division has not, it is true, as yet had much influence upon the evangelization of Africa, since the various missions have mostly restricted themselves each to a particular sphere; still, it is a defect in Christianity, as compared with Islam, which will probably make itself felt in Africa as it has in China.

As regards language, the Bantu negroids all speak dialects of one tongue (see BANTU LANGUAGES). Among the negroes the most extraordinary linguistic confusion prevails, half a dozen neighbouring villages in a small area often speaking each a separate language. All are of the agglutinating order. No absolutely indigenous form of script exists; though the Hausa tongue has been reduced to writing without European assistance.[1]

Negroes in the United States.

After the migration of the European fair-skinned races in large numbers to other parts of the earth occupied by people of darker colour, the adjustment of relations between the diverse races developed a whole series of problems almost unknown to the ancient world or to the life of modern Europe. The wider the diversity of physique and especially of skin colour, the greater the danger of friction. The more serious the effort to secure industrial and social co-operation under representative institutions, the graver have become the difficulties. They have been and are perhaps more acute in the United States than elsewhere, because there the lightest and the darkest races have commingled, because of the theory on which the government of the country nominally rests, that each freeman should be given an equal chance to improve his industrial position and an equal voice in deciding political questions, and because of the almost irreconcilable differences in the public opinion of the two great sections to only one of which do the problems come home as everyday matters. They were not solved by the Civil War and emancipation, but their nature was radically altered. Neither the earlier system of slavery nor the governmental theory during the radical reconstruction period that race differences should be ignored has proved workable, and the trend is now towards some *modus vivendi* between these extremes.

The only definition of negro having any statutory basis in the United States is that given in the legislation of many Southern states prohibiting intermarriage between a white person and "a person who has one-eighth or more of African blood." Census enumerators in their counts of the American people since 1790 have distinguished the two main races of whites and negroes, but in so doing they have never been given a definition or criterion of race. Consequently they followed the judgment of the community enumerated, which usually classes as negro all persons known or believed to have in their veins any admixture of negro blood. It is probable that this line, the so-called "colour line," which is emphasized in regions where negroes are numerous by many legal, economic and social discriminations between the races, is drawn with substantial accuracy. Far different has been the result of governmental efforts to draw another line within the group of negroes as thus defined, that between the negroes of pure African blood and those of mixed negro and white blood. This distinction has no legal significance, for negroes of pure blood and negroes of mixed blood are subject to the same provisions of law, and at least for the whites it has little social or economic significance. An attempt to draw it was made at each census betweeen 1850 and 1890 inclusive, and the results, so far as they were published, indicate that between one-sixth and one-ninth of the negroes in the United States have some admixture of white blood. The figures were reached through thousands of census enumerators, nearly all of whom were white. Of recent years an effort has been made on the part of negro investigators to get an answer to the same question by the careful study of communities selected as typical. The classification of about 39,000 coloured people, most of them in different parts of Georgia, with a study of the other available data and inferences from a somewhat wide observation, led Dr Dubois to the conclusion that "at least one-third of the negroes of the United States have recognizable traces of white blood."

Perhaps we may believe with some confidence that the information from white sources understates, and that from negro sources overstates, the proportion, and that the true proportion of mulattoes in the United States is between one-sixth and one-third of all negroes. To infer that the true proportion in 1850, 1860, 1870 and 1890, the dates to which the census figures relate, was much less than the true proportion in 1895 to 1900, to which the unofficial figures relate, is contrary to the general trend of the evidence. As the law and the social opinion of the Southern whites make little or nothing of this distinction between negroes of pure blood and mulattoes, it is often regarded as less important than it really is. The recognized leaders of the race are almost invariably persons of mixed blood, and the qualities which have made them leaders are derived certainly in part and perhaps mainly from their white ancestry. Wherever large numbers of full-blooded negroes and of persons of mixed central or north European and negro blood have lived in the same community for some generations, there is a strong and growing tendency to establish a social line between them.

The difficulty of ascertaining the number of mulattoes in the United States and the tendency of the testimony to be modified by the opinion or desire of the race from which it comes are typical. There is hardly any important aspect of the subject upon which the testimony of seemingly competent and impartial witnesses is not materially affected by the influence of the race

[1] The Vai alphabet, "invented" by a native, Doalu Bukere, in the first half of the 19th century, owed its inspiration to European influence, and of the characters "many . . . are clumsy adaptations of Roman letters or of conventional signs used by Europeans" (Sir H. H. Johnston, *Liberia*, p. 1107 foll., London, 1906).

to which the witnesses belong. Under these circumstances it seems necessary to assume that the testimony of the official documents of the federal government is correct, unless clear evidence, internal or external, refutes it. The following statements of fact rest mainly on those sources.

The number of negroes living in the (continental) United States in 1908 was about nine and three-quarter millions, and if those in Porto Rico and Cuba be included it reached ten and two-thirds millions. This number is greater than the total population of the United States was in 1820, and nearly as great as the population of Norway, Sweden and Denmark.

During the colonial period, and down to the changes initiated by the invention of the cotton gin, negroes were distributed with some evenness along the Atlantic coast. Between the date of that invention and the Civil War, and largely as a result of the changes the cotton gin set in motion, the tendency was towards a concentration of the negroes in the great cotton-growing area of the country. In 1700, for example, one-ninth of the population of the colony of New York was negro; in 1900 only one-seventieth of the population of the empire state belonged to that race. The division line between the Northern and Southern states adopted by the Census Office in 1880, and employed since that date in its publications, is Mason and Dixon's line, or the southern boundary of Pennsylvania, the Ohio river from Pennsylvania to its mouth and the southern boundary of Missouri and Kansas. In the states north of that line, the Northern states, in all of which but Missouri negro slavery either never existed or else was abolished before the Civil War, the white population increased tenfold and the negro population only fourfold between 1790 and 1860. In the states south of that line, on the contrary, the Southern states, the negro population in the same period increased sixfold and the white population not so fast. It was a widespread opinion shortly after the Civil War that the emancipated slaves would speedily disperse through the country, and that this process would greatly simplify the problems arising from the contact of the two races. This expectation has not been entirely falsified by the result. Between 1860 and 1900 the negroes in the Northern states increased somewhat more rapidly than the northern whites, and those in the Southern states much less rapidly than the Southern whites. As a result, one-tenth of the American negroes lived in 1908 in the Northern states, a larger proportion than at any time during the 19th century. But this process of dispersion is so slow as not materially to affect the prospects for the immediate future, and it is still almost as true as at any earlier date that the region in which cotton is a staple crop coincides in the main with the region in which negroes are more than one-half of the total population.

This appears if a comparison is made between the northern boundary of the so-called Austroriparian zone of plant and animal life in the United States, that is "the zone of the cotton plant, sugar cane, rice, pecan and peanut," and the northern boundary of the "black belt" or region in which the negroes are a majority of the population. The coincidence of the two is very close, and was much closer in 1900 than in 1860. It appears yet more clearly by a comparison between a map showing the counties in which at least 5% of the area was planted to cotton in 1899 and another map showing the "black belt" counties in 1900. The black belt stretches north through eastern Virginia beyond the cotton belt, and the cotton belt stretches south-west through eastern central Texas beyond the black belt, but between these two extremes there is a close agreement in the boundaries of the two areas.

The question "Have the American negroes progressed, materially and morally, since emancipation?" is generally answered in the affirmative. But even on this question entire unanimity is lacking. A considerable body of men could still be found in 1910, mainly among Southern whites, who held that the condition of the race was worse than it was in the days of slavery. Probably all competent students would admit, however, that the race has differentiated since 1865, that the distance separating the highest tenth from the lowest tenth has become wider, that the highest tenth is far better and far better off than formerly, and the lowest tenth is worse and perhaps also worse off than in slavery. Under such circumstances there are no adequate objective tests of progress. The pessimist points to the alleged increase of idleness and crime, the meliorist to a demonstrated decrease of illiteracy and to considerable accumulations of property. The large majority of competent students believe that the American negroes have progressed, materially and morally, since emancipation, that the central or average point is higher than in 1865, although such persons differ widely among themselves regarding the amount of that progress.

It would be generally but not universally held, also, that the negroes in the United States progressed under slavery, that they were far better qualified for incorporation as a vital and contributing element of the country's civilization at the time of their emancipation than they were on arrival or than an equal number of their African kindred would have been. But probably the rate of progress has been more rapid under freedom than it was under slavery.

The evidence regarding the progress of the American negro may be grouped under the following heads: numbers, birth-rate, health, wealth, education, occupations, morals, citizenship.

Numbers.—The dictum of Adam Smith, "The most decisive mark of the prosperity of any country is the increase of the number of its inhabitants," may be applied, perhaps after changing the word "decisive" to "obvious," to the negro population of the United States. The negro population of Africa is probably not increasing at all. But during the 19th century the negroes in the United States increased nearly ninefold. They are now much the most thriving offshoot of the race and the most civilized and progressive group of negroes in the world. Under a slavery system not permitting the importation of new supplies a high rate of increase by excess of births over deaths is an advantage to the master class. During the slavery period and until about 1880 the increase of southern whites and of southern negroes proceeded at about the same rate. But during the last score of years in the century the increase of negroes was much less rapid, the rate being only about three-fifths of that prevailing among southern whites.

Birth-rate.—As the increase of negro population is slackening, as the immigration and emigration of negroes are insignificant in amount, and as the death-rate is about stationary, it is reasonable to infer that the birth-rate is dwindling. This cannot be stated with certainty, for there are no registration records giving the number of births for any large and representative group of American negroes. A good index to the birth-rate, however, may be derived from the proportion of children under 5 years of age to women 15 to 49 years of age. In the returns negroes are not distinguished from Indians and Mongolians. To minimize this slight source of error and at the same time to secure a more representative and homogeneous population group, the following figures are confined to the Southern or former slave states:—

Date.	Children under 5 Years of Age to 1000 Women 15 to 49 Years of Age in the Southern States	
	Negroes.	Whites
1850	705	695
1860	688	682
1870	661	601
1880	737	656
1890	601	580
1900	577	581

These figures indicate that the proportion of children to child-bearing women, and hence probably the birth-rate, changed in the same direction during each decade between 1850 and 1890. Between 1850 and 1870 the proportion of negro children decreased about 6% and that of white children about 14%; between 1870 and 1880 the proportion of negro children increased about 12% and that of white children about 9%; between 1880 and 1890 the proportion of negro children decreased about 18% and that of white children about 12%; between 1890 and 1900 the proportion of negro children decreased about 4% and that of white children remained practically the same. Before the war the proportion of living children to potential mothers was about the same for the two races at the South, for the first three censuses after the war the proportion of negro children was much greater than of white children, but by 1900 that proportion was less, and the movement during the decade suggests that the proportions may have begun to change in opposite directions.

Some light upon the influences at work may be derived from the comparison between city and country at the south.

Date.	Children under 5 Years of Age to 1000 Women 15 to 44 Years of Age in the Southern States.			
	Cities having at least 25,000 Inhabitants.		Smaller Cities and Country Districts.	
	Negroes.	Whites.	Negroes.	Whites.
1890	319	391	688	665
1900	271	374	668	671

The noteworthy inference from these figures is that the proportion of negro children in southern cities was very low and decreasing. In 1890 it was about five-sixths, and in 1900 less than three-fourths of the proportion of children among whites in these cities. The differences in northern cities are equally marked. City life appears to exercise a powerful and increasing influence in reducing the birth-rate among the negroes.

Health.—The prosperity and progress of a population group are indicated, not merely by growth in numbers but also by the longevity of its members. This vitality is roughly measured by the death-rate. Other things being equal, a low and sinking death-rate is evidence of a high and increasing average duration of life. In the United States vital statistics are in charge of the several states and cities, and are often defective or entirely lacking. In 1890 and 1900 the Federal government compiled such as were of importance, and in 1864 an official compilation was made of death-rates of negroes before the war. The results are worth consideration.

Date.	Negro Deaths.	Negro Death-rate.	White Death-rate at same Time and Places.
Mainly between 1818–1863	106,217	35·0	27·0
1890	28,579	29·9	19·1
1900	37,029	29·6	17·3

These figures indicate that the death-rate of each race decreased during a half century, but that the decrease among negroes was much less rapid than among whites. The negro death-rate at the earliest period exceeded that of the whites by 8·0 per thousand, or three-tenths of the smaller rate. At the latest period the difference was 12·3 per thousand, or seven-tenths of the smaller rate. But these figures speak for negroes living mainly in cities where the proportion of children and elderly persons is small and that of negroes at the healthy ages is large. After making a proper allowance for these differences in sex and age composition, it is found that the true death-rate of negroes in the registration area is about twice as high as that of a white population of like sex and age structure. Whether the difference between negro and white residents of the country districts in the south is equally great, we have no means for judging.

The leading causes of death among negroes in the registration area arranged in the order of importance are stated below. The ratio to the corresponding death-rate among whites is added, but the differences are affected partly by the greater proportion of negroes in the southern cities and the different incidence of diseases in the two regions, and partly by probable differences in the accuracy of diagnosis of disease in the two sections and by physicians attending the two races.

Causes of Death.	Negro Death-rate per 1000.	Ratio to White Death-rate = 100.
Consumption	4·85	280
Pneumonia	3·55	192
Diseases of the nervous system	3·08	144
Heart disease and dropsy	2·21	161
Diarrheal diseases	2·14	165
Diseases of the urinary organs	1·57	157
Typhoid fever	·68	204
Old age	·67	125
Malarial fever	·63	969
Cancer and tumour	·48	72
Diphtheria and croup	·32	69
Influenza	·32	136
Whooping cough	·29	239
Diseases of the liver	·21	92
Measles	·15	115
Scarlet fever	·03	25

These figures bring out in a striking way the very high mortality, absolute and relative, of the American negro from consumption. When one considers both the great number of deaths caused by consumption and pneumonia, 28·4 % of the deaths from all causes in 1900 and the very high death-rate of negroes from these diseases, it is no exaggeration to say that the main cause that the death-rate of that race is double that of the white race lies in the ravages of these two scourges of mankind. The difference between the two races in this respect has apparently increased since 1890, for at that date the death-rate of negroes in the registration area from consumption was only 2·37 times that of the whites, and its death-rate from pneumonia only 1·53 times that of the whites. Here as elsewhere there has been an improvement as measured by an absolute standard, and at the same time an increased divergence from the conditions prevailing among the more numerous race.

Wealth.—An estimate of the property now held by American negroes made in 1904 by a committee of the American Economic Association indicated about $300,000,000, with a probable error of perhaps $50,000,000. This figure indicates a *per capita* wealth of about $34. We have no means for judging what the possessions of the race were at the time of its emancipation, but in 1860 there were nearly half a million free negroes in the country, many of them holding property and some of them wealthy. The *per capita* wealth of the white population of the United States in 1900 was about $1320 and that of southern whites about $885, indicating that the property of the average negro person or family was about one twenty-fifth that of the average southern white person or family.

Education.—It is often supposed that the American negroes in 1865 were without any accumulated property and without any start in education. Neither assumption is warranted. On the contrary, about two-fifths of the adult free negroes in the country were reported in 1850 and 1860 as able to read and write, and there is some reason to believe that not far from one-twelfth of the adult slaves also had learned to write. In 1900 more than half of the negroes at least ten years of age could write, and the proportion was rising at a rate which, if continued, would almost eliminate illiteracy by the middle of the present century.

The problem of providing adequate educational facilities for negro children is made more difficult by the maintenance in all the former slave states of two sets of schools, one for each race. At the present time those states with one-third of their population negro assign about one-fifth of their public school funds to the support of negro schools. About $155,000,000 or one-sixth of the entire amount spent by southern communities for public schools between 1870 and 1906, has gone to support schools for the negroes. The same cause has been aided by many private gifts from individuals and organizations interested in negro education, among which the Peabody Education Fund of about $2,000,000, now in course of dissolution, and the John F. Slater Fund, now of about $1,500,000, may be mentioned. Wide differences of opinion exist regarding the character of education needed for the race, and the present trend is towards a greater emphasis upon manual and industrial training as of prime importance for the great majority.

Occupations.—The slavery system furnished industrial training to many slaves who seemed likely to turn it to their master's advantage. When this system was abolished the opportunities for such training open to the race were decreased, and it is doubtful whether even yet as large a proportion of skilled negro artizans are being trained in the south as were produced there before the Civil War. The demand for skilled labour in the south is being met more and more by white labour. This derives an advantage from a prejudice in its favour on the part of white employers even when other things are equal, from its greater skill and efficiency in most cases, its better opportunity to accumulate or to borrow the requisite capital, its superior industry, persistence and thrift. In consequence negroes are being more and more excluded from the field of skilled labour in the south.

Morals.—As the death-rate is believed to vary inversely as health and longevity and thus to afford a measure of those characteristics, so the crime-rate is often thought to vary inversely as morality, and thus to measure the self-control, good order and moral health of the community. But the analogy cannot be pushed. The crime-rate is everywhere far more difficult, and in the United States impossible to ascertain. And even if known the connexion between the infrequency of crime or of specific sorts of crime and the prevalence of good order, obedience to law and morality is far more indirect and subject to far more qualifications than the connexion between the death-rate and health. Still the data regarding crime with all their defects are the best available index of moral progress or retrogression. It must be remembered that the comparative infrequency of crime among slaves, even if it existed, is no proof of the absence of criminal tendencies and actions. Offences on the part of slaves, or at least minor offences which are always far more numerous than serious offences, were dealt with in most cases privately and without invoking the machinery of the law. An apparent increase of crime since emancipation might be due merely to the becoming patent of what was before latent. The only statistical measure of crime now possible in the United States is the number of prisoners in confinement at a given date, and these figures are an inadequate and misleading substitute for true judicial statistics. The evidence they afford, however, is far better than any other in existence and

deserves careful attention. Enumerations of prisoners affording comparable results were made in 1880, 1890 and 1904.

Date.	Negro Prisoners.	Number per 100,000 Pop.
1880.	16,089	244
1890	24,277	324
1904	26,087	278

These figures show a rapid increase between 1880 and 1890 in the number and proportion of negro prisoners, and between 1890 and 1904 a slow increase in the number and a notable decrease in the proportion.

But in order to make the figures for 1890 and 1904 comparable, it is necessary to exclude from those for the earlier date 4473 negro prisoners mainly belonging to two classes, persons in confinement prior to sentence and persons in prison because of their inability to pay a fine, but all belonging to classes which were excluded from the enumeration for 1904. This gives the following result:—

Date.	Negro Prisoners.	Number per 100,000 Pop.	Whites.
1880	16,089	244	96
1890	19,804	264	84
1904	26,087	278	77

The proportion of negro prisoners to population increased rapidly between 1880 and 1890 and slightly between 1890 and 1904, the increase for the first period being most accurately shown by the first set of figures and that for the second period by the second set of figures. It is noteworthy also that the proportion of white prisoners to population decreased during the same period. Perhaps a more significant comparison is that between the proportion of prisoners of each race to the population of that race in the northern states and the southern states respectively, the distribution of population and the systems of penal legislation and administration being widely different in the two sections. It is impossible to make the correction just referred to except for the United States as a whole, but it must be remembered that the figures for 1890 are not comparable with those for 1904, and that the true figures for that year would be decidedly less.

Number of Prisoners to each 100,000 People.

Date.	Southern States.		Northern States.	
	Negroes.	Whites.	Negroes.	Whites.
1880	157	58	495	99
1890	285	62	681	111
1904	221	40	743	83

These figures indicate that in the southern states in 1890 there were about four and a half times as many negro prisoners to population as white prisoners, and in 1904 about five and a half times as many; that in the northern states in 1890 there were about six times as many negro prisoners to population as white prisoners, and in 1904 about nine times as many. They throw no light whatever upon a point they are often quoted as establishing, the comparative criminality of the northern and southern negroes. Those residing in the north include an abnormal number of males, of adults, and of city population, influences all tending to increase the proportion of prisoners. It seems likely that if the figures for the south in 1890 could be made strictly comparable with those for the same region in 1904 the apparent decrease of 22% in the proportion of negro prisoners to population would almost but not quite disappear. The evidence regarding crime indicates a continued but slow and slackening increase in the proportion of negro prisoners to negro population in the country as a whole and in its two main sections, an increase in the proportion of white prisoners to white population during the first interval and a decrease during the second, and a growing difference between the two races in the proportion of prisoners.

Citizenship.—When the Fourteenth and Fifteenth Amendments to the Federal Constitution were adopted, the former conferring United States citizenship on all native negroes and the latter providing that the right of such citizens to vote should not be abridged by any state on account of race, colour or previous condition of servitude, it was not the practice in northern states to allow negroes to vote. Proposals to grant them the suffrage were submitted to the voters in 1865 in Connecticut, Wisconsin, Minnesota and Colorado, and in each state they were rejected. In all states containing a large proportion of negroes the results of the Federal policy of reconstruction were disastrous, and those bitter years probably contributed more than the Civil War itself to estrange the two sections. Since the withdrawal of Federal troops in 1877 the prevailing and persistent judgment of southern whites regarding the laws and the policy to be adopted upon this subject has been accorded more and more weight in determining the action of the states and the Federal government. The number of negroes voting or entitled to vote has been reduced at first by intimidation or fraud, later by legislation or provisions of the state constitutions. If such enactments are nominally directed not against any race but against certain characteristics which may appear mainly in the race, such as illiteracy, inability or unwillingness to pay an annual poll tax or to register each year, they have been and are likely to be held within the constitutional authority of the state. On the part of the overwhelming majority of negroes this practical disfranchisement has aroused no protest, while it has tended to improve the government and to open the way for the gradual development and expression in word and vote of differences within the ranks of white voters regarding questions of public policy.

Along with this decrease of pressure from without the southern states and the development of economic competition between the races within them, there has gone an increased demand on the part of the whites for a complete social separation between the races in school, in church, in public conveyances and hotels, all founded upon a fear that any disregard of such separateness will make intermarriage or fruitful illegal unions between the races more frequent. In short, these developments are towards a more and more rigid caste system.

The negroes in the United States have played and are playing an important and necessary part in the industrial and economic life of the southern states, in which in 1908 they formed about one-third of the population. But that life was changing with marvellous rapidity, becoming less simple, less agricultural and patriarchal, more manufacturing and commercial, more strenuous and complex. It was too early to say whether the negroes would be given an equal or a fair opportunity to show that they could be as serviceable or more serviceable in such a civilization as they had been in that which was passing away, and whether the race would show itself able to accept and improve such chances as were afforded, and to remain in the future under these changing circumstances, as they had been in the past, a vital and essential part of the life of the nation.

BIBLIOGRAPHY.—Writings about the American negro fall naturally into classes. The official governmental publications include those of the Census Bureau, notably *Bulletin* 8, "Negroes in the United States," reprinted in 1906 in the volume called *Supplementary Analysis*, those of the Bureau of Labor, especially important articles in the *Bulletin* of the Bureau, and those of the commissioner of education. The information in these is largely statistical, but in the later publications not a little interpretative matter has been introduced. The point of view is usually that of a dispassionate northern man.

Among southern white men who have written wisely on the subject may be mentioned: Dr J. L. M. Curry, for many years general agent of the Peabody and Slater funds; H. A. Herbert, *Why the Solid South? or Reconstruction and its Results* (Baltimore, 1890); T. N. Page, *The Negro—the Southerner's Problem* (New York, 1904); E. G. Murphy, *Problems of the Present South* (New York, 1904); E. R. Corson, *Vital Equation of the Colored Race*; and A. H. Stone *Studies in the American Race Problem* (New York, 1908). F. L. Hoffman's *Race, Traits and Tendencies of the American Negro* (New York, 1896) contains the most important collection of statistical data in any private publication and interpretations thoroughly congenial to most southern whites.

Among the southern negroes doubtless the most important writers are the two representatives of somewhat antagonistic views, Booker T. Washington, *Up from Slavery* (New York, 1901), *Future of the American Negro* (Boston, 1899), *Tuskegee and its People* (New York, 1905), &c., and W. E. B. Dubois, *The Souls of Black Folk* (Chicago, 1903), *The Philadelphia Negro* (Boston, 1899), *Health and Physique of the Negro American* (1907), &c. With these should be mentioned Atlanta University annual publications, the *Proceedings* of the Hampton Negro Conference and the file of the *Southern Workman*. No northern man since the war has written on the subject with the thoughtfulness and weight of Frederick Law Olmsted, *Journey in the Seaboard Slave States* (New York, 1856). See also Sir H. H. Johnston, *The Negro in the New World* (1910). (W. F. W.)

NEGUS. (1) The title of a king or ruler (Amharic *nəgus* or *n'gus*), in Abyssinia (*q.v.*); the full title of the emperor is *nəgus nagasti*, "king of kings." (2) The name of a drink made of wine, most commonly port, mixed with hot water, spiced and sugared. According to Malone (*Life of Dryden, Prose Works*, i. 484) this drink was invented by a Colonel Francis Negus (d. 1732), who was commissioner for executing the office of master of the horse from 1717 to 1727, when he became master of the buckhounds.

NEHAVEND, a small but very fertile and productive province of Persia, situated south-west of Hamadan, west of Malāyir, and north-west of Burujird. Pop. about 15,000. The capital is the ancient city of Nehavend, where Yazdegird, the last monarch of the Sassanian dynasty, was finally defeated by the Arabs. (A.D. 641). It has a population of about 5000, including 700 to 800 Jews; there are fine gardens, and an old citadel on a hill. It is situated at an elevation of 5540 ft., 27 m. from Doletābād (Malāyir), and 25 m. from Burujird.

NEHEMIAH (Heb. for "Yah[weh] comforts"), governor of Judaea under Artaxerxes (apparently A. Longimanus, 465–424 B.C.). The book of Nehemiah is really part of the same work with the book of Ezra, though it embodies certain memoirs of Nehemiah in which he writes in the first person. Apart from what is related in this book we possess little information about Nehemiah. The hymn of praise by Ben Sira (Ecclesiasticus xlix. 13) extols his fame for rebuilding the desolate city of Jerusalem and for raising up fresh homes for the downtrodden people. According to other traditions he restored the temple-service and founded a collection of historical documents (2 Macc. i. 18-36, ii. 13). See further EZRA AND NEHEMIAH (Books), JEWS. *History* §§ 21 seq.

NEIGHBOUR (O. Eng. *nēahgebūr*, from *nēah*, "nigh," "near") and *gebūr*, "boor," literally "dweller," "husbandman"; cf. Dan. and Swed. *nabo*, Ger. *Nachbar*), properly one who lives in a house close to one, hence any one of a number of persons living in the same locality. From Biblical associations (Luke x. 27) the word is used widely of one's fellow-men.

NEILE, RICHARD (1562–1640), English divine, was educated at Westminster school and at St John's College, Cambridge. His first important preferment was as dean of Westminster (1605), afterwards he held successively the bishoprics of Rochester (1608), Lichfield (1610), Lincoln (1614), Durham (1617) and Winchester (1628), and the archbishopric of York (1631). When at Rochester he appointed William Laud as his chaplain and gave him several valuable preferments. His political activity while bishop of Durham was rewarded with a privy councillorship in 1627. Neile sat regularly in the courts of star-chamber and high commission. His correspondence with Laud and with Sir Dudley Carleton and Sir Francis Windebank (Charles I.'s secretaries of state) are valuable sources for the history of the time.

NEILL, JAMES GEORGE SMITH (1810–1857), British soldier, was born near Ayr, Scotland, on the 26th of May 1810, and educated at Glasgow University. Entering the service of the East India Company in 1827, he received his lieutenant's commission a year later. From 1828 to 1852 he was mainly employed in duty with his regiment, the 1st Madras Europeans (of which he wrote a *Historical Record*), but gained some experience on the general and the personal staffs as D.A.A.G. and as aide-de-camp. In 1850 he received his majority, and two years later set out for the Burmese War with the regiment. He served throughout the war with distinction, became second-in-command to Cheape, and took part in the minor operations which followed, receiving the brevet of lieutenant-colonel. In June 1854 he was appointed second-in-command to Sir Robert Vivian to organize the Turkish contingent for the Crimean War. Early in 1857 he returned to India. Six weeks after his arrival came the news that all northern India was aflame with revolt. Neill acted promptly; he left Madras with his regiment at a moment's notice, and proceeded to Benares. The day after his arrival he completely and ruthlessly crushed the mutineers (4th June 1857). He next turned his attention to Allahabad, where a handful of Europeans still held out in the fort against the rebels. From the 6th to the 15th of June his men forced their way under conditions of heat and of opposition that would have appalled any but a real leader of men, and the place, "the most precious in India at that moment," as Lord Canning wrote, was saved. Neill received his reward in an army colonelcy and appointment of aide-de-camp to the queen. Allahabad was soon made the concentration of Havelock's column. The two officers, through a misunderstanding in their respective instructions, disagreed, and when Havelock went on from Cawnpore (which Neill had reoccupied shortly before) he left his subordinate there to command the lines of communication. At Cawnpore, while the traces of the massacre were yet fresh, Neill inflicted the death penalty on all his prisoners with the most merciless rigour. Meanwhile, Havelock, in spite of a succession of victories, had been compelled to fall back for lack of men; and Neill criticized his superior's action with a total want of restraint. A second expedition had the same fate, and Neill himself was now attacked, though by his own exertions and Havelock's victory at Bithor (16th August) the tension on the communications was ended. Havelock's men returned to Cawnpore, and cholera broke out there, whereupon Neill again committed himself to criticisms, this time addressed to the commander-in-chief and to Outram, who was on the way with reinforcements. In spite of these very grave acts of insubordination, Havelock gave his rival a brigade command in the final advance. The famous march from Cawnpore to Lucknow began on September 19th; on the 21st there was a sharp fight, on the 22nd incessant rain, on the 23rd intense heat. On the 23rd the fighting opened with the assault on the Alum Bagh, Neill at the head of the leading brigade recklessly exposing himself. Next day he was again heavily engaged, and on the 25th he led the great attack on Lucknow itself. The fury of his assault carried everything before it, and his men were entering the city when a bullet killed their commander. Strict as he was, he was loved not less than feared, and throughout the British dominions he had established a name as a skilful and extraordinarily energetic commander. The rank and precedence of the wife of a K.C.B. was given to his widow, and memorials have been erected in India and at Ayr.

See J. W. Kaye, *Lives of Indian Officers* (1889), and J. C Marshman, *Life of Havelock* (1867).

NEILSON, ADELAIDE (1846–1880), English actress, whose real name was Elizabeth Ann Brown, was born in Leeds, the daughter of an actress, and her childhood and early youth were passed in poverty and menial work In 1865 she appeared in Margate as Julia in *The Hunchback*, a character with which her name was long to be associated. For the next few years she played at several London and provincial theatres in various parts, including Rosalind, Amy Robsart and Rebecca (in *Ivanhoe*), Beatrice, Viola and Isabella (in *Measure for Measure*) In 1872 she visited America, where her beauty and talent made her a great favourite, and she returned year after year She died on the 15th of August 1880. Miss Neilson was married to Philip Henry Lee, but was divorced in 1877.

NEISSE, three rivers of Germany. (1) The Glatzer Neisse rises on the Schneegebirge, at an altitude of 1400 ft., flows north past Glatz, turns east and pierces the Eulengebirge in the Wartha pass, then continues east as far as the town of Neisse, and after that flows north-east until at an altitude of 453 ft it joins the Oder between Oppeln and Brieg. Owing to its torrential character the greater part of its course is only used for floating down timber. It abounds in fish, and its total length is 121 m. (2) The Lausitzer or Görlitzer Neisse rises near Reichenberg in Bohemia, on the south side of the Riesengebirge, at an altitude of 1130 ft., flows north past Reichenberg, Görlitz, Forst and Guben, and enters the Oder above Fürstenberg at an altitude of 105 ft. Its length is 140 m., of which less than 40 m. are navigable. (3) The Wütende Neisse is a tributary of the Katzbach.

NEISSE, a town and fortress of Germany, in the province of Prussian Silesia, at the junction of the Neisse and the Biela, 32 m. by rail S.W. of Oppeln. Pop. (1905) 25,394 (mostly Roman Catholics) including a garrison of about 5000. It consists of the town proper, on the right bank of the Neisse, and the Friedrichstadt on the left. The Roman Catholic parish church of St James (Jakobikirche) dates mainly from the 13th century, but was finished in 1430. The chief secular buildings are the old episcopal residence, the new town hall, the old Rathaus, with a tower 205 ft. in height (1499), the beautiful Renaissance *Kämmerei* (exchequer) with a high gabled roof ornamented with frescoes, and the theatre. A considerable trade is carried on in agricultural products.

Neisse, one of the oldest towns in Silesia, is said to have been founded in the 10th century, and afterwards became the capital of a principality of its own name, which was incorporated with the bishopric of Breslau about 1200. Its first walls were erected in 1350, and enabled it to repel an attack of the Hussites in 1424. It was thrice besieged during the Thirty Years' War. The end of the first Silesian War left Neisse in the hands of Frederick the Great, who laid the foundations of its modern fortifications.

The town was taken by the French in 1807. Neisse can, at the will of the garrison, be protected by a system of inundation.

See Kastner, *Urkundliche Geschichte der Stadt Neisse* (Neisse and Breslau, 1854–1867, 3 vols.), Schutte, *Beiträge zur Geschichte von Neisse* (Neisse, 1881), and Ruffert, *Aus Neisse's Vergangenheit* (1903).

NEJD, a central province of Arabia, bounded N. by the Nafud desert, E. by El Hasa, S. by the Dahna desert and W. by Asir and Hejāz. It lies between 20° and 28° N. and 41° and 48° E., extends nearly 550 m from north to south, 450 from east to west, and covers approximately 180,000 sq. m. The name Nejd implies an upland, and this is the distinctive character of the province as compared with the adjoining coastal districts of Hejāz and El Hasa. Its general elevation varies from 5000 ft. on its western border to 2500 in Kasim in the north-east, and somewhat less in Yemāma in the south-east. In the north the double range of Jebel Shammar, and in the east the ranges of J Tuwēk and J 'Arid rise about 1500 ft. above the general level, but on the whole it may be described as an open steppe, sloping very gradually from S W to N.E. of which the western and southern portion is desert, or at best pasture land only capable of supporting a nomad population; while in the north and east, owing to greater abundance of water, numerous fertile oases are found with a large settled population. The principal physical features are described in the article ARABIA.

The main divisions of Nejd are the following: Jebel Shammar, Kasīm, Sudēr, Wushm, 'Arid, Afīāj, Harīk, Yemāma and Wadi Dawāsir J. Shammar is the most northerly: its principal settlements are situated in the valley some 70 m. long, between the two ranges of J. Aja and J. Selma, though a few lie on their outer flanks. Jauf, Tēma and Khaibar, though dependencies of the Shammar principality, lie beyond the limits of Nejd. The capital, Hail, has been visited by several Europeans, by W. G. Palgrave in 1862, when Talāl was emir, and by Mr Wilfrid and Lady Anne Blunt, Charles Doughty, C. Huber, T. Euting and Baron E Nolde during the reign of Mahommed b. Rashid, who from 1892 till his death in 1897 was emir of all Nejd. Its well ordered and thriving appearance is commented on by all these travellers. The town is surrounded by a wall and dominated by the emir's palace, a stately, if somewhat gloomy building, the walls of which are quite 75 ft. high, with six towers, the whole giving the idea of an old French or Spanish donjon.

Hail lies at the northern end of the valley, 2 m. S.E. of J. Aja, at an altitude of about 3000 ft. The highest point of J Aja, the western and higher of the twin ranges, is according to Huber 4600 ft. above sea-level. The valley is about 20 m. in width and is intersected with dry ravines and dotted with low ridges generally of volcanic origin. Wells and springs are the only source of water supply, both for drinking and for irrigation. The principal crops are dates, wheat and barley and garden produce; forage and firewood are very scarce The population was estimated by Nolde in 1893 at 10,000 to 12,000.

Among the other settlements of J Shammar are Jafēfa and Mukāk at the northern foot of J. Aja, Kasr and Kafār at its southern foot, Rauda, Mustajidda and Fēd at the foot of J. Selma, all large villages of 3000 to 5000 inhabitants. 'Akda is a small valley in the heart of J Aja, an hour's ride from Hail; it was the oldest possession of the Ibn Rashid, since 1835 the ruling family of J. Shammar, and is a place of great natural strength. Kasim lies E. of J. Shammar in the valley of the W. Rumma the great wadi of northern Nejd; the chief towns Burēda and 'Anēza are situated about 10 m. apart, on the north and south sides of the wadi respectively. Doughty described 'Anēza in 1879 as clean and well built with walls of sun-dried brick, with well supplied shops. Many inhabitants live in distant houses in gardens outside the town walls. 'Anēza and Burēda each contain some 10,000 inhabitants. The dry bed of the Wadi Rumma in lower Kasīm is about 2 m. across, fringed in places with palm plantations; water is found at 6 or 8 ft. in the dry season and in winter the wells overflow. The staple of cultivation is the date-palm, the fruit ripening in August or September Fruit trees and fields of wheat, maize or millet surround the villages, but the extent of cultivation is limited by the necessity of artificial irrigation. Kahāfa, Kusēba and Kuwāra are the principal villages of upper Kasim, and 'Anēza and Burēda, Madnab, Ayun and Ras of lower Kasim.

Doughty's and Huber's explorations did not extend east of Kasim, and for all details regarding eastern and southern Nejd Palgrave is the only authority. According to him, a long desert march leads from Madnab to Zulfa the first settlement in Sudēr, where the land rises steadily to the high calcareous tableland of J. Tuwēk. The entire plateau is intersected by a maze of valleys, generally with steep banks, as if artificially cut out of the limestone. In these countless hollows is concentrated the fertility and population of Nejd; gardens and houses, cultivation and villages lie hidden from view among the depths while one journeys over the dry flats, till one comes suddenly on a mass of emerald green beneath.

Sudēr forms the northern end of the plateau, 'Arid the southern, while Wushm appears to lie on its west, and Afīāj and el Harīk below it and to the south and south-west respectively. The principal town is Majma the former capital of Sudēr, a walled town situated on an eminence in a broad shallow valley surrounded by luxuriant gardens and trees. Tuwēm, Jalājil and Hula are also described by Palgrave as considerable towns.

'Arid is entered at Sedūs, on the W. Hanifa, a broad valley bottom with precipitous sides, here 2 or 3 m. wide, full of trees and brushwood. Along its course lie the villages of Ayāna, and Deraiya the former Wahhābi capital, destroyed by Ibrahim Pasha in 1817; and a few miles farther E. the new capital Riād, built by the emir Fēsal after his restoration and visited by Palgrave in 1863, and by Pelly two years later. It was then, and still is, a large town of perhaps 20,000 inhabitants with thirty or more mosques, well-stocked bazārs, and like the towns of Kasim, surrounded by well-watered gardens and palm groves. To the south the valley opens out into the great plains of Yemāma, dotted with groves and villages, among which Manfuha is scarcely inferior in size to Riād itself. Still farther to the south-east lies the district of Harīk, with its capital Hauta, the last in that direction of the settled districts of Nejd, and on the borders of the southern desert.

Palgrave visited El Kharfa the chief place of the Afiaj district some 80 m. S.W. of Riād. This district seems to be scantily peopled as compared with Sudēr or Yemāma, and a large proportion of the inhabitants are of mixed negro origin. While there, he made inquiries about the adjoining district of W. Dawāsir. Its length was stated to be ten days' journey or 200 m.; scattered villages consisting of palm-leaf huts lie along the way, which leads in a south or south-westerly direction to the highlands of Asir and Yemen.

The Bedouin who occupy the remainder of Nejd consist in the main of the four great tribes of the Shammar, Harb, 'Ateba and Mutēr. The first-named represent that part of the great Shammar tribe which has remained in its ancestral home on the southern edge of the Nafud (the northern branch long ago emigrated to Mesopotamia); many of its members have settled down to town life, but the tribe still retains its Bedouin character, and its late chief, the emir Mahommed Ibn Rashid, the most powerful prince in Nejd, used to live a great part of the year in the desert with his tribesmen. The Harb are probably the largest of the Bedouin tribes in the peninsula; they are divided into a number of sections, several of which have settled in the oases of Hejāz, while others remain nomadic. Their territory is the steppe between Kasim and Medina, and across the pilgrim road between Medina and Mecca, for the protection of which they receive considerable subsidies from the Turks. The 'Ateba circuits extend from the Hejaz border near Mecca along the road leading thence to Kasim. The Mutēr occupy the desert from Kasim northwards towards Kuwēt.

Nejd became nominally a dependency of the Turkish empire in 1871 when Midhat Pasha established a small garrison in El Hasa, and created a new civil district under the government of Basra, under the title of Nejd, with headquarters at Hofuf Its real independence was not, however, affected, and the emirs

Mahommed Ibn Rashid at Hail, and Abdallah Ibn Sa'ud at Riād, ruled in western and eastern Nejd respectively, until 1892, when the former by his victory at 'Anēza became emir of all Nejd. His successor, Abdul Aziz Ibn Rashid, was, however, unable to maintain his position, and in spite of Turkish support, sustained a severe defeat in 1905 at the hands of Ibn Sa'ud which for the time, at any rate, restored the supremacy to Riād.

No data exist for an accurate estimate of the population; it probably exceeds 1,000,000, of which two-thirds may be settled, and one-third nomad or Bedouin. Palgrave in 1863, perhaps unduly exaggerating the importance of the town population, placed it at nearly double this figure.

The revenue of the emir Mahommed Ibn Rashid of Hail, who died in 1897, was estimated by Blunt in 1879 at £80,000, and his expenditure at little more than half that amount. Nolde who visited Hail in 1893 after the emir's conquest of the Wahhabi state, believed that his surplus income then amounted to £60,000 a year, and his accumulated treasure to £1,500,000.

Huber, *Journal d'un voyage en Arabie* (Paris, 1891); J. Euting, *Reise in inner Arabien* (Leyden, 1896); E. Nolde, *Reise nach inner Arabien* (Brunswick, 1895). (R. A. W.)

NEJEF, or MESHED 'ALI, a town of Asiatic Turkey, in the pashalik of Bagdad, 50 m. S. of Kerbela and 5 or 6 m. W. of the ruins of ancient Kufa, out of the bricks of which it is chiefly built. It stands on the eastern edge of the Syrian desert, on the north-eastern shore of a deep depression, formerly a sea, the *Assyrium Stagnum* of the old geographers, but in latter years drained and turned into gardens for the town. It is a fairly prosperous city, supplied with admirable water by an underground aqueduct from the Hindieh canal, a few miles to the north, which also serves to water the gardens in the deep dry bed of the former lake. The town is enclosed by nearly square brick walls, flanked by massive round towers, dating from the time of the caliphs, but now falling into decay. Outside the walls, over the sterile sand plateau, stretch great fields of tombs and graves; for Nejef is so holy that he who is buried here will surely enter paradise. In the centre of the town stands Meshed (strictly Meshhed) 'Ali, the shrine of 'Ali, containing the reputed tomb of that caliph, which is regarded by the Shi'ite Moslems as being no less holy than the Ka'ba itself, although it should be said that it is at least very doubtful whether 'Ali was actually buried there. The dome of the shrine is plated with gold, and within the walls and roof are covered with polished silver, glass and coloured tiles. The resting-place of 'Ali is represented by a silver tomb with windows grated with silver bars and a door with a great silver lock. Inside this is a smaller tomb of damascened ironwork. In the court before the dome rise two minarets, plated, like the dome, with finely beaten gold from the height of a man and upward. While the population of Nejef is estimated at from 20,000 to 30,000, there is in addition a very large floating population of pilgrims, who are constantly arriving, bringing corpses in all stages of decomposition and accompanied at times by sick and aged persons, who have come to Nejef to die. At special seasons the number of pilgrims exceeds many times the population of the town. Nejef is also the point of departure from which Persian pilgrims start on the journey to Mecca. No Jews or Christians are allowed to reside there. The accumulated treasures of Meshed 'Ali were carried off by the Wahhābites early in the 19th century, and in 1843 the town was deprived of many of its former liberties and compelled to submit to Turkish law; but it is again enormously wealthy, for what is given to the shrine may never be sold or used for any outside purpose, but constantly accumulates. Moreover, the hierarchy derives a vast revenue from the fees for burials in the sacred limits.

See W. K. Loftus, *Chaldaea and Susiana* (1857); J. P. Peters, *Nippur* (1897); B. Meissner, *Hirau Huarnaq* (1901). (J. P. PE.)

NELEUS, in Greek legend, son of Poseidon and Tyro, brother of Pelias. The two children were exposed by their mother, who afterwards married Cretheus, king of Iolcus in Thessaly. After the death of Cretheus, the boys, who had been brought up by herdsmen, quarrelled for the possession of Iolcus. Pelias expelled Neleus, who migrated to Messenia, where he became king of Pylos (Apollodorus i. 9; Diod. Sic. iv. 68) and the ancestor of a royal family called the Neleidae, who are historically traceable as the old ruling family in some of the Ionic states in Asia Minor. Their presence is explained by the legend that, when the Dorians conquered Peloponnesus, the Neleidae were driven out and took refuge in Attica, whence they led colonies to the eastern shores of the Aegean. By Chloris, daughter of Amphion, Neleus was the father of twelve sons (of whom Nestor was the most famous) and a daughter Pero. Through the contest for his daughter's hand (see MELAMPUS) he is connected with the legends of the prophetic race of the Melampodidae, who founded the mysteries and expiatory rites and the orgies of Dionysus in Argolis. According to Pausanias (ii. 2. 2, v. 8. 2) Neleus restored the Olympian games and died at Corinth, where he was buried on the isthmus.

NELLORE, a town and district of India, in the Madras presidency. The town is or the right bank of the Pennar river, and has a station on the East Coast railway, 109 m. N. of Madras city. Pop. (1901) 32,040. There are United Free Church, American Baptist and Catholic missions.

The DISTRICT OF NELLORE has an area of 8761 sq. m. It comprises a tract of low-lying land extending from the base of the Eastern Ghāts to the sea. Its general aspect is forbidding: the coast-line is a fringe of blown sand through which the waves occasionally break, spreading a salt sterility over the fields. Farther inland the country begins to rise, but the soil is not naturally fertile, nor are means of irrigation readily at hand. About one-half of the total area is cultivated; the rest is either rocky waste or is covered with low scrub jungle. The chief rivers are the Pennar, Suvarnamukhi and Gundlakamma. They are not navigable, but are utilized for irrigation purposes, the chief irrigation work being the anicut across the Pennar. Nellore, however, is subject both to droughts and to floods. Copper was discovered in the western hills in 1801, but several attempts by European capitalists to work the ore proved unremunerative, and the enterprise has been abandoned since 1840. Iron ore is smelted by indigenous methods in many places, but the most important mining industry is that of mica. Salt is largely manufactured along the sea-coast. Nellore, with the other districts of the Carnatic, passed under direct British administration in 1801. The population in 1901 was 1,496,987 showing an increase of 2·3% in the decade. In 1904 a portion of the district was transferred to the newly formed district of Guntur, reducing the remaining area to 7965 sq. m., with a population of 1,272,815. The principal crops are millets, rice, other food grains, indigo and oil-seeds. The breed of cattle is celebrated. The East Coast railway, running through the length of the district, was opened throughout for traffic in 1899. The section from Nellore town to Gudur, formerly on the metre gauge, has been converted to the standard gauge. Previously the chief means of communication with Madras was by the Buckingham canal. The sea-borne trade is insignificant.

NELSON, HORATIO NELSON, VISCOUNT (1758–1805), duke of Bronte in Sicily, British naval hero, was born at the parsonage house of Burnham Thorpe, in Norfolk, on the 29th of September 1758. His father, Edmund Nelson (1722–1802), who came of a clerical family, was rector of the parish. His mother, whose maiden name was Catherine Suckling (1725–1767), was a grandniece of Sir Robert Walpole (1st earl of Orford). This connexion proved of little or no value to the future admiral, who, in a letter to his brother, the Rev. William Nelson, written in 1784, speaks of the Walpoles as "the merest set of cyphers that ever existed—in public affairs I mean." His introduction to the navy came from his maternal uncle, Captain Maurice Suckling (1725–1778), an officer of some reputation who at his death held the important post of comptroller of the navy. Horatio, who had received a summary, and broken, education at Norwich, Downham and North Walsham, was entered on the "Raisonable" when Captain Suckling was appointed to her in 1770 on an alarm

of war with Spain. The dispute was settled, and Captain Suckling was transferred to the "Triumph," the guardship at Chatham, whither he took his nephew. In order that the lad might have more practice than could be obtained on a harbour ship, his uncle sent him to the West Indies in a merchant vessel, and on his return gave him constant employment in boat work on the river. In a brief sketch of his life, which he drew up in 1799, Nelson says that in this way he became a good pilot for small vessels "from Chatham to the Tower of London, down the Swin, and the North Foreland; and confident of myself among rocks and sands, which has many times since been of great comfort to me." Between April and October of 1772 he served with Captain Lutwidge in the "Carcass," one of the vessels which went on a not otherwise notable voyage to the Arctic seas with Captain Phipps, better known by his Irish title of Baron Mulgrave. On his return from the north he was sent to the East Indies in the "Seahorse," in which vessel he made the acquaintance of his lifelong friend Thomas Troubridge. At the end of two years he was invalided home. In after times he spoke of the depression under which he laboured during the return voyage, till "after a long and gloomy reverie, in which I almost wished myself overboard, a sudden glow of patrotism was kindled within me, and presented my king and my country as my patron. My mind exulted in the idea. 'Well then,' I exclaimed, 'I will be a hero, and, confiding in Providence, I will brave every danger.'" He spoke to friends of the "radiant orb" which from that hour hung ever before him, and "urged him onward to renown." On his return home he served during a short cruise in the "Worcester" frigate, passed his examination as lieutenant on the 9th April 1777, and was confirmed in the rank next day. He went to the West Indies with Captain Locker in the "Lowestoft" frigate, was transferred to the flagship by the admiral commanding on the station, Sir Peter Parker (1721–1811), and was then by him promoted in rapid succession to the command of the "Badger" brig, and the "Hinchinbrook" frigate. By this appointment, which he received in 1779, he was placed in the rank of post captain (from which promotion to flag rank was by seniority), at the very early age of twenty. His connexion with Captain Suckling may, no doubt, have been of use to him, but in the main he owed his rapid rise to his power of winning the affection of all those he met, whether as comrades or superiors. Sir Peter Parker and Lady Parker remained his friends all through his life. In 1780 he saw his first active service in an expedition to San Juan de Nicaragua, which was rendered deadly by the climate. He was brought to death's door by fever, and invalided home once more. In 1781 he was appointed to the "Albemarle" frigate, and after some convoy service in the North Sea and the Sound was sent to Newfoundland and thence to the North American station. "Fair Canada," as he has recorded in one of his letters, gave him the good health he had so far never enjoyed. At Quebec he formed one of those passionate attachments to women which marked his career. He now made the personal acquaintance of Sir Samuel Hood, Lord Hood. In the autobiographical sketch already quoted he mentions the high opinion formed of him by the admiral who presented him to Prince William, duke of Clarence, afterwards King William IV., as an officer well qualified to instruct him in "naval tactics," by which we must perhaps understand seamanship. Prince William has left a brief but singularly vivid account of their first meeting. He appeared, says the Prince, "to be the merest boy of a captain I ever beheld; and his dress was worthy of attention. He had on a full-laced uniform; his lank unpowdered hair was tied in a stiff Hessian tail of an extraordinary length; the old-fashioned flaps of his waistcoat added to the general quaintness of his figure, and produced an appearance which particularly attracted my notice; for I had never seen anything like it before, nor could I imagine who he was or what he came about. My doubts were, however, removed when Lord Hood introduced me to him. There was something irresistibly pleasing in his address and conversation; and an enthusiasm, when speaking on professional subjects, that showed he was no common being." The slight oddity of appearance, the power to arouse affection, and the glow indicating the fire within, are noted by all who ever looked Nelson in the face.

In March 1783, at the very end of the American War, he saw his second piece of active service. He was repulsed in an attempt to retake Turk's Island from the French. The peace gave him leisure to pay a visit to France, for which country and all its ways he entertained a dislike and contempt characteristic of his time. In France he formed another attachment, and went so far as to apply to a maternal uncle for an allowance to eke out his half-pay. It came to nothing, presumably by refusal on the lady's part. And now when the navy was cut down to the quick on the peace establishment, and the vast majority of naval officers were condemned to idleness on shore, he had the extraordinary good fortune to be appointed to the command of the "Boreas" frigate, for service in the West Indies. Nelson found in this commission an opportunity for the display of his readiness to assume responsibility. He signalized his arrival in the West Indies by refusing to obey an order of the admiral which required him to acknowledge a half-pay officer acting as commissioner of the dockyard at Antigua as his superior. He insisted on enforcing the Navigation Laws against the Americans, who by becoming independent had become foreigners. He called the attention of the government to the corruption prevailing in the dockyard of Antigua. His line was in all cases correct, but it impressed the admiralty as somewhat assuming, and his strong measures against the interloping trade brought on him many lawsuits, which, though he was defended at the expense of the government, caused him much trouble for years. In the West Indies on the 12th of March 1787 he married Frances Nisbet (1761–1831), the widow of a doctor in Nevis, whose favour he first gained by being found romping on all fours with her little boy under the drawing-room table. The marriage was one of affection and prudence, rather than of love.

Though Nelson had as yet seen little active service, and that little had not been specially distinguished, he had already gained that reputation within his own service which commonly precedes public recognition. His character had been fully developed, and his capacity proved. His horizon was narrow, being strictly confined to his profession. He had all the convictions of the typical John Bull of his generation. The loyalty of a devoted subject was strong in him. He burned to win affection, admiration, distinction. He was a man to do whatever there was to be done to the utmost. A more magnificent instrument for use in the great Revolutionary struggle now close at hand could not have been forged.

War having broken out, he was appointed captain of the "Agamemnon" (64) on the 30th of November 1793, and joined his ship on the 7th of February. From this date till June 1800, rather more than seven years, he was engaged on continual active service, with the exception of a few months when he was invalided home. This period is the most varied, the busiest, the most glorious and the most debated of a very full career. It subdivides naturally into three sections; (1) From the date of his appointment as captain of the "Agamemnon" till he was disabled by the loss of his arm in the unsuccessful attack on Santa Cruz de Tenerife on the 24th of July 1797 he served as captain, or commodore, under Hood, Hotham and Jervis, successive commanders-in-chief in the Mediterranean. (2) After an interval of nine months spent at home in recovering from his wound, and from the effects of a badly performed operation, he returned to the Mediterranean, and was at once sent in pursuit of the great French armament which sailed from Toulon under the command of Napoleon for the conquest of Egypt. His victory of the Nile on the 1st of August 1798 placed him at once in the foremost rank among the warriors of a warlike time, and made him a national hero. With his return to Naples on the 22nd of September the second period ends. (3) From now till he landed at Leghorn on the 26th of July 1800, on his return home across Europe, he was entangled at Naples in political transactions and intrigues, which he was ill prepared to deal with either by nature or training, and was plunged into the absorbing passion,

which did increase his popularity with the mob, but cost him many friends.

The first of these three passages in his life is full of events which must, however, be told briefly. In May he sailed for the Mediterranean with Hood, and was engaged under his orders in the occupation of Toulon by the allied British and Spanish forces. In August 1793 he was despatched to Naples to convoy the troops which the Neapolitan government had undertaken to contribute towards the garrison of Toulon. It was on this occasion that he made the acquaintance of Emma Hamilton (*q.v.*), the wife of Sir William Hamilton, minister at the Court of Naples. References to Lady Hamilton begin to appear in his letters to his wife, but, as might be expected, they indicate little beyond respectful admiration, and he makes a good deal of her kindness to his stepson, Josiah Nisbet, whom he had taken to sea. Young Nisbet was afterwards promoted to post captain, and was put in command of a frigate at an improperly early age by Nelson's interest. He proved quite unworthy, and in the end died mad. After the allies had been driven from Toulon by Napoleon, Nelson was employed throughout 1794 in the operations connected with the occupation of Corsica. In April and May he was engaged in the capture of Bastia, and June and July in the taking of Calvi. Both towns really surrendered from want of stores, but the naval brigades under Nelson's personal direction were conspicuously active, and their energy was favourably contrasted with the alleged formality of the troops. During the operations at Calvi, Nelson's right eye was destroyed by gravel driven into it by a cannon shot which struck the ground close to him. From the date of the occupation of Corsica till the island was evacuated, that is to say, from the end of 1794 till the middle of 1796, he was incessantly active. He served under Hotham, who undertook the command when Hood returned to England, and was engaged in the indecisive actions fought by him in the Gulf of Lyons in March and July 1795. The easy-going ways of the new admiral fretted the eager spirit of Nelson, and Hotham's placid satisfaction with the trifling result of his encounters with the French provoked his subordinate into declaring that, for his part, he would never think that the British fleet had done very well if a single ship of the enemy got off while there was a possibility of taking her. His zeal found more satisfaction when he was detached to the Riviera of Genoa, where, first as captain, and then as commodore, he had an opportunity to prove his qualities for independent command by harassing the communications of the French, and co-operating with the Austrians. In Sir John Jervis, who superseded Hotham, he found a leader after his own heart. When Spain, after first making peace with France at Basel, declared war on England, and the fleet under Jervis withdrew from the Mediterranean, Nelson was despatched to Elba on a hazardous mission to bring off the small garrison and the naval stores. He sailed in the "Minerve" frigate, having another with him. After a smart action with two Spanish frigates which he took off Carthagena on the 20th of December, and a narrow escape from a squadron of Spanish line of battle ships, he fulfilled his mission, and rejoined the flag of Jervis on the eve of the great battle off Cape St Vincent on the 14th of February 1797 (see ST VINCENT, BATTLE OF). The judgment, independence and promptitude he showed in this famous engagement, were rewarded by the conspicuous part he had in the victory, and revealed him to the nation as one of the heroes of the navy. Nelson receiving the swords of the Spanish officers on the deck of the "San Josef" became at once a popular figure.

A few days after the victory he became rear-admiral by seniority, but continued with Jervis, who was made a peer under the title of Earl St Vincent. Nelson's own services were recognized by the grant of the knighthood of the Bath. During the trying months in which the fleet was menaced by the sedition then rife in the navy, which came to a head in the mutinies at Spithead and the Nore, he remained with the flag, and in the blockade of Cadiz. In July 1797 he was sent on a desperate mission to Santa Cruz de Tenerife. It was believed that a Spanish Manilla ship carrying treasure had anchored at that place, and Lord St Vincent was desirous of depriving the enemy of this resource. The enterprise was, in fact, rash in the last degree, for the soldiers from the garrisons of Elba and Corsica having gone home, no troops were available for the service, and a fortified town was to be taken by man-of-war boats alone. Nelson's well-established character for daring marked him out for a duty which could only succeed by dash and surprise, if it was to succeed at all. But the Spaniards were on the alert, and the attack, made with the utmost daring on the night of the 24th of July, was repulsed with heavy loss. Some of the boats missed the mole in the dark and were stove in by the surf, others which found the mole were shattered by the fire of the Spaniards. Nelson's right elbow was shot through, and he fell back into the boat from which he was directing the attack. The amputation of his arm was badly performed in the hurry and the dark. He was invalided home, and spent months of extreme pain in London and at Bath. On the 10th of April 1798 he came back to the fleet off Cadiz as rear-admiral, with his flag in the "Vanguard" (74).

He was now one of the most distinguished officers in the navy. Within the next six months he was to raise himself far above the heads of all his contemporaries. It was notorious that a great armament was preparing at Toulon for some unknown destination. To discover its purpose, and to defeat it, the British government resolved to send their naval forces again into the Mediterranean, and Nelson was chosen for the command by Jervis, with whom the immediate decision lay, but also by ministers.

Having joined the flag of Lord St Vincent outside of the straits of Gibraltar on the 30th of April, Nelson was detached on the 2nd of May into the Mediterranean, with three line-of-battle ships and five frigates, to discover the aim of the Toulon armament. Napoleon had, however, enforced rigid secrecy, and the British admiral had to confess that the French were better than the British at concealing their plans. Beyond the fact that a powerful combined force was collected in the French port he could learn nothing. On the 20th of May the "Vanguard" was dismasted in a gale. Nelson bore the check in a highly characteristic manner. "I ought not," he wrote, "to call what has happened by the cold name of accident; but I believe firmly that it was the Almighty's goodness to check my consummate vanity." The "Vanguard" was saved from going on shore by the seaman-like skill of Captain Ball of the "Alexander," against whom Nelson had hitherto had a prejudice, but for whom he had henceforth a peculiar regard. The "Vanguard" was refitted by the exertions of her own crew under cover of the little island of San Pietri on the southern coast of Sardinia. In the meantime the frigates attached to his command had returned to Gibraltar, in the erroneous belief that the liners would be taken there to make good the damage suffered in the gale. "I thought Hope would have known me better," said Nelson. On the 30th of April he was off Toulon again, only to find that the French were gone, and that he could not learn whither they were steering. Racked by anxiety and deprived of his best means of obtaining information by the disappearance of his frigates, he remained cruising till he was joined, on the 7th of June, by Troubridge with ten sail of the line. And now he started on his fierce pursuit of the enemy, seeking him in the dark, for there were no scouts at hand; exasperated at being left without the eyes of his fleet; half maddened at the thought he might, by no fault of his own, miss the renown towards which his prophetic imagination had seemed to guide him; knowing that St Vincent would be blamed for choosing so young an admiral; but resolved to follow the enemy to the antipodes if necessary. From the coast of Sardinia to Naples, from Naples to Messina, from Messina to Alexandria, from Alexandria, where he found the roadstead empty, back to Sicily, and then when at last a ray of light came to him, back to Alexandria—he swept the central and eastern Mediterranean. At no time in his life were the noble qualities of his nature displayed more entirely free from all alloy. He was an embodied flame of resolution, and as yet he showed no sign of the vulgar bluster which was to appear

later. In the midst of his anxieties his kindness of heart shone forth without a trace of the tendency of sentimental gush so irritatingly obvious in after days. Unlike most admirals of his time, he did not live apart from his captains, but saw much of them, and freely discussed his plans with them. He had his reward in their devotion and perfect comprehension of what he wished them to do. At the same time he acquired an absolute confidence in the efficiency of his squadron, the magnificent force which had been formed by years of successful war, and by the careful training of his predecessors. The captains were the band of brothers he himself had made them.

The great victory of the 1st of August 1798 (see NILE, BATTLE OF) brought Nelson yet another wound. He was struck on the forehead by a langridge shot, and had for a time to go below. It is perhaps to be lamented in the interest of his fame that the wound was not severe enough to compel him to return home. After providing for the blockade of what remained of the French fleet in Alexandria, he sailed for Naples, and arrived there on the 22nd of September. There was no rear-admiral of any standing in the navy who could not have done what remained to be done in the Mediterranean, under the supervision of St Vincent, as well as he. For him Naples was a pitfall. There awaited him there precisely the influences to folly which he was least able to resist. He loved being loved, and was the man to think the gift a debt. He had an insatiable appetite for praise. With those weaknesses of character which caused Lord Minto, who yet never ceased to regard him with sincere friendship, to say that he was in some respects a "baby," he was disarmed in the presence of the two women who now made a determined attempt to capture him. Emma Hamilton, who could not help endeavouring to conquer every man she met, was naturally eager to dominate one who had filled Europe with his fame. Behind Emma was the queen of Naples, Maria Carolina, a woman who had a share of the ability of her mother Maria Theresa without any of her fine moral qualities. Maria Carolina was all her life trying to fight the power of revolutionary France, with no better resources than were afforded her by the insignificant kingdom of Naples, and a husband who was the embodiment of all the faults of the Italian Bourbons. She had made use of the English minister's wife as an instrument of political intrigue, and now she employed her to manage Nelson. We have the repeated assertions of Nelson himself in all his ample correspondence from September 1798 to July of 1800, and indeed later, to prove that he was, in his own tell-tale phrase, persuaded to "Sicilyfy" his conscience—in other words to turn his squadron into an instrument for the ambition, the revenge and the fears of Maria Carolina, the "Dear Queen" of his letters to Emma Hamilton. It is highly probable that he was secretly influenced by annoyance at the pedantry of the British government, which only gave him a barony for the splendid victory of the Nile, on the ridiculous ground that no higher title could be given to an officer who was not a commander-in-chief. All doubt as to the character of his relations with Lady Hamilton has been laid at rest by the Morrison papers. None ought ever to have existed, for, if Nelson did not love this woman in the fullest possible sense of the word, his conduct would be inexplicable on any other hypothesis than that he was an imbecile. He allowed her to waste his money, to lead him about "like a bear," and to drag him into gambling, which he naturally hated. For her sake he offended old friends, and quarrelled with his wife in circumstances of vulgar brutality. That he believed she had borne him a child can no longer be disputed, and he carried on with her a correspondence under the name of Thompson which was apparently meant to deceive her husband, but is varied by grotesque explosions which destroy the illusion, such as it was.

In the hands of these two women, and in the intoxication produced on him by flattery, which could not be too copious or gross for his taste, Nelson speedily became a Neapolitan royalist of far greater sincerity than was to be found among the king's subjects except in the ranks of the Lazzaroni. He gratified the headlong queen by egging her torpid husband into an exceedingly foolish attack on the French garrisons then occupying the so-called Roman republic. The collapse of the Neapolitan forces was instant and ignominious. The court fled to Palermo in December, under the protection of the British squadron. At Palermo Nelson remained directing the operations of the ships engaged in blockading Malta, then held by the garrison placed in it by Napoleon when he took it on his way to Egypt, and sinking continually deeper into his slavery to Lady Hamilton, till the spring of the following year. He was then aroused by a double call. A royalist army led by the king's vicar-general, Fabrizio Ruffo (*q.v.*), had succeeded in recovering the greater part of the kingdom of Naples from the government set up by the French, and called, in the pedantic style of the revolutionary epoch, the Parthenopean republic. A French fleet commanded by Admiral Bruix entered the Mediterranean. News of the appearance of Bruix reached Nelson just as he was about to sail for Naples with the heir apparent to co-operate with Ruffo and his "Christian Army." He immediately took steps to concentrate his ships, which had been reinforced by a small Portuguese squadron, at Marittimo on the western coast of Sicily, where he would be conveniently placed to meet the French, if they came, or to unite with the ships of Lord St Vincent. He was, however, half distraught between his sense of what was required by his duty to his own service and the obligations he had assumed towards the sovereigns of Naples. In the end he resolved to sail for Naples, this time without the crown prince, in order to carry out a mission entrusted to him by the king.

The story of Nelson's visit to Naples in the June of 1799 will probably remain a subject for perpetual discussion. His reputation for humanity and probity is considered to depend on the view we take of his actions there and at this period. It is true that the relative importance of these episodes has been much diminished by the publication of the Morrison Papers, and that it has at all times been exaggerated. From the Morrison Papers we know that, when his passions were concerned, he was not incapable of stratagems to deceive his old friend Sir William Hamilton. It is the less incredible that he should have been willing to use deceit against persons whom he hated so fiercely as he did the Neapolitan Jacobins, in his double quality of English Tory and Neapolitan Royalist. But apart from his laxity in the course of a double adultery, his letters, written to many different people during his stay on the coasts of Naples, contain more than sufficient evidence to show that he was utterly unhinged by excitement, and was unable to estimate the real character of many of his own words and deeds. He considered himself as owing an equal allegiance to Ferdinand of Naples and to his own sovereign. His feelings towards the Jacobin subjects of his Italian king are expressed in terms which bear a remarkable likeness to the rhetoric of the Jacobins of France when they were most vigorously engaged in ridding their country of aristocrats. To Troubridge he writes: "Send me word some proper heads are taken off, this alone will comfort me." To St Vincent he reports that "Our friend Troubridge had a present made him the other day of the head of a Jacobin, and makes an apology to me, the weather being very hot, for not sending it here." Some allowance may be made for a rude taste in jocularity, but it is impossible to mistake the scream of fury in Nelson's letters, imitated from the style of Lady Hamilton, who in these things was the sycophant of the queen. A man who allowed his thoughts to dwell in an atmosphere of hysterical ferocity, and was above all a man of action, was well on the way to interpret his words into deeds. It was while he was in this heated state that he was sent to preside over the fall of the Parthenopean republic at the end of June 1799.

King Ferdinand had not been unwilling to offer terms to those of his subjects who had joined with the French to establish the republic, so long as he was under the influence of fear. But when the French had been defeated in northern Italy and had left the Republicans to their own resources, he became more anxious to make an example. In the early parts of June he heard that Ruffo was inclined to clemency, and grew very eager to prevent any such mistake No more effectual way of

enforcing rigour could be imagined than to put the control of events entirely in the hands of Nelson, whose sentiments were well known, who was notoriously under the influence of Emma Hamilton, that is to say, of the queen, and who, as a stranger, would have no family or social attachments with the republicans, no changes of fortune nor future revenges to fear. That he asked Nelson to go to Naples, giving him large powers, may be considered certain. A commission in the full sense he could not give without the consent of the king of Great Britain, and that was not even asked for. But Nelson had general instructions from home to support the Neapolitan government, and though this only meant, and could only mean, as an ally and against the common enemy, he understood it in a much wider sense, while he considered himself as being bound to Ferdinand in the relation of subject to sovereign by the grant of the duchy of Bronté in Sicily, which he had just received. He therefore sailed to Naples resolved to act in the double capacity of English and Neapolitan admiral, of English opponent of the Jacobins, and of Neapolitan royalist. The general cause of Europe and the particular revenge of the king and queen were of equal importance to him. When he entered the Bay of Naples on the 24th of June he found that a capitulation had been agreed upon some thirty-six hours earlier, between Ruffo, acting as vicar-general, with the consent of Captain Foote (1767–1833) of the "Seahorse," the senior British naval officer present, on the one side, and the Neapolitan republicans on the other. The republicans had been reduced to the possession of the castles of Uovo and Nuovo, and had been glad to secure terms which allowed them to go into exile in France. Nelson denounced an arrangement which would have precluded all cutting off of heads as "infamous." He ordered the white flag to be hauled down on the "Seahorse," and told Ruffo that he would not allow the capitulation to be carried out. The same warning was given to the republicans in the forts. There is a question whether the capitulation had been in part already carried into effect. Sir William Hamilton, who, together with his wife, had accompanied Nelson from Palermo, asserts that it had, in an official despatch to Lord Grenville dated on the 14th July. But this letter, written only a fortnight after the transaction, contains many inaccuracies, and can be held to prove only that Hamilton would have seen nothing discreditable in violating a capitulation, or that he was in his dotage, and did not know what he was doing. Ruffo refused to be a party to a breach of faith. On the afternoon of the 25th he had an interview with Nelson on board the flagship the "Foudroyant," which was conducted through the Hamiltons and was of a very heated character. Next morning, as Ruffo showed a determination to stand aside and throw on Nelson the responsibility of provoking a renewal of hostilities, messages were sent to him both by the admiral and by Hamilton that there would be no interference with the "armistice." This assurance put a stop to the dispute between them. The republicans came out of the forts and were transferred to feluccas under the guard of British marines, where they were kept till the king's pleasure was known. As a matter of course it was that they should be mostly hanged or shot. Whether Nelson meant to deceive Ruffo into thinking that he had accepted the capitulation when he named the armistice,—whether the vicar-general was deceived, and then misled the garrisons in good faith—or whether he knew perfectly well that the capitulation was not included, and took the opportunity afforded him by these two English gentlemen to deceive his own countrymen, are points much discussed. The republicans in the forts did claim that they were covered by the capitulation, and that it had been violated. It is difficult to see in what way the service of King George was forwarded by Nelson's zeal for King Ferdinand. Such discredit as fell on him would have been avoided if he had kept to his duty as British admiral, and had not thought it incumbent on him to prove himself a good Neapolitan royalist. On the 29th of June Francesco Caracciolo (*q.v.*), a Neapolitan naval officer who had joined the republicans, was brought to Nelson as a prisoner. Out of his desire to make an example of a proper head, and in the full knowledge that Caracciolo's death would be pleasing to the queen, Nelson, in virtue, seemingly, of his supposed commission as Neapolitan admiral (which he did not possess), ordered a court martial of Italian officers to sit, on an English ship, to try the prisoner. The court could only find him guilty, and Caracciolo was hanged. The sentence was just, but the procedure was indecent, and Nelson's intervention cannot be justified.

At this period of his life it is indeed difficult to represent Nelson's actions in a favourable light. In July he disobeyed the order of Lord Keith to send some of his ships to Minorca, on the ground that they were needed for the defence of Naples. The influence of the queen, exercised through Emma Hamilton was partly responsible for his wilfulness, but a great deal must be put down to his annoyance at finding that Keith, and not he himself, was to succeed St Vincent as commander-in-chief in the Mediterranean. After the victory of the Nile he became, in fact, incapable of acting as a subordinate. Until he left for home in June 1800, except during the short interval when he acted as commander-in-chief in the absence of Keith, he was captious, querulous and avoided leaving Palermo as much as he could, and far more than he ought. When forced out he made his health an excuse for going back. He began a quarrel with Troubridge which ripened into complete estrangement. He wearied out his friends at the Admiralty, and finally extorted leave to return. As Keith would not allow him to take a line of battleship for his journey home with the Hamiltons, and indeed said plainly that Lady Hamilton had commanded the Mediterranean station long enough, he returned across Europe with his friends. Accounts of the figure they cut, and the sensation they created at Vienna and at Dresden, can be found in the Minto correspondence, and in the reminiscences of Mrs St George, afterwards Mrs Trench (1768–1827). He reached home in November.

In England he was received with the utmost popular enthusiasm, but with coldness by the king, the Admiralty, and by the great official and social world. His erratic and self-willed conduct towards Lord Keith sufficiently explains the distrust shown by My Lords of the Admiralty. Their uneasiness was not diminished by their knowledge that his renown made it quite impossible to lay him aside at a crisis. The king, a man of strict domestic habits and strong religious convictions, was undoubtedly offended by the scandals of Nelson's life at Naples, and he cannot but have been displeased by the admiral's openly avowed readiness to devote himself to King Ferdinand. English society as represented by the First Lord, Lord Spencer, and his wife, may not have shared the moral indignation of the pious king; but their taste was offended, and so was their self-respect, when Nelson insisted on forcing Lady Hamilton on them, and would go nowhere where she was not received. When it was discovered that he insisted on making his wife live in the same house as his mistress, he was considered to have infringed the accepted standard of good manners. After enduring insult at once cruel and cowardly, to the verge of poorness of spirit, Lady Nelson rebelled. A complete separation took place, and husband and wife never met again.

On the 1st of January 1801 Nelson became vice-admiral by seniority. The alliance of the Northern powers of which the Tsar Paul was the inspiring spirit, made it necessary for the British government to take vigorous measures in its own defence. A fleet had to be sent on a very difficult and dangerous mission to the Baltic. The Admiralty would have been unpardonable, and would not have been excused by public opinion if, when it had at its disposal such an admirable weapon as the conqueror of the Nile, it had failed to employ him. Nelson was chosen to go as a matter of course, but unfortunately, it was thought proper to put him under the command of Sir Hyde Parker (*q.v.*) an officer of no experience, and, as the Admiralty ought to have known, of commonplace, not to say indolent, character. Nelson bore the subordination with many bitter complaints, but on the whole with patience and tact. Sir Hyde Parker began by keeping his formidable second in command at arm's length, but Nelson handled him with considerable diplomacy. Knowing

his superior to be fond of good living he caused a turbot to be caught for him on the Dogger Bank, and sent it to him with a complimentary message. Sir Hyde was not insensible to the attention, and thawed notably. We have the good fortune to possess the notes taken during the campaign by Colonel Stewart (1774–1827), a military officer who did duty with Nelson as a marine. Colonel Stewart has put on record many stories of Nelson which have a high biographical value. He saw the hero when his character was displayed in all its strength and its weakness. Nelson was at once burning for honour, ardently desirous to serve his country at a great crisis, and yet longing for rest and for the company of Emma Hamilton. His passion had, if possible, been increased by the birth of the child Horatia, whom he believed to be his own, and his jealousy was excited by fears that Emma would become an object of attention to the prince of Wales (afterwards George IV.). His health, as Colonel Stewart justly observed, was always affected by anxiety, and during the Baltic campaign he complained incessantly of his sufferings. Nervous irritation provoked him into odd explosions of excitement, as when, for instance, he suddenly interfered with the working of his flagship while the officer of the watch was tacking her on the south coast of England, and so threw her into disorder. When he saw the consequences of his untimely intrusion he sharply appealed to the officer to tell him what was to be done next, and when the embarrassed lieutenant hesitated to reply, burst out with, "If you do not know, I am sure I don't," and then went into his cabin. His subordinates learnt to take these manifestations as matters of course, knowing that they were wholly without malignity. To them he was always kind, even when they were at fault, taking, as his own phrase has it, a penknife where Lord St Vincent would have taken a hatchet. Colonel Stewart tells how he was wont to invite the midshipmen of the middle watch to breakfast, and romp with them as if he had been the youngest of the party. The playfulness of his nature came out, in combination with his heroism, when he adorned his refusal to obey Sir Hyde's weak signal of recall in the middle of the battle, which would have been disastrous if it had been acted on, by putting his telescope to his blind eye and declaring that he could not see the order to retire. At such moments all could see his agitation; but, as the surgeon of the "Elephant," which bore his flag at Copenhagen, says, they could also see that "it was not the agitation of indecision, but of ardent animated patriotism panting for glory." When Sir Hyde Parker was recalled in May, Nelson assumed the command in the Baltic; but the dissolution of the Northern Confederation left him little to do. His health really suffered in the cold air of high latitudes, and in June he obtained leave to come home. His services were grudgingly recognized by the title of viscount. During the brief interval before the peace he was put in command of a flotilla to combat Napoleon's futile threat of invasion. In the hope of quieting public anxiety rather than in any serious expectation of success, an attack was made on a French flotilla strongly protected by its position, at Boulogne, which was disastrously repulsed. Nelson was not in command on the spot, and if he had been would in all probability have renewed his experience at Santa Cruz. He could not do the impossible more than other men. He was only more ready to try.

While the brief peace made at Amiens lasted, he remained on shore. His home was with the Hamiltons in the strange household in which Sir William showed that his 18th-century training had taught him to accept a domestic division with a good grace, and had not left him too squeamish to profit by the pecuniary advantages which may attend the relation of complacent husband. His death on the 6th of April 1803 made no change in the life of the admiral. He lived almost wholly at Merton, where he had purchased a small house, which Emma filled with memorials of his glory and of her now passing beauty. She fed him profusely with the flattery which he, in Lord Minto's words, swallowed as a child does pap; and she was in turn adored by him, and treated with profound deference by his family, with the exception of his father.

When the ambition of Napoleon made it impossible to keep up the fiction of peace, Nelson was at once called from retirement, and this time there could be no question of putting him under the authority of any other admiral. He was appointed to the Mediterranean command, and hoisted his flag in May 1803. Between this date and his death in the hour of full triumph on the 21st of October 1805, he was in the centre and was one of the controlling spirits of the vast military and naval drama which after filling for more than two years the immense stage bounded by Europe and the West Indies, found its closing scene in Trafalgar Bay (see TRAFALGAR). In spite of the anxieties of an arduous command Nelson was serene and at his best in this last period of his life. Once only did the ill-advised boasting of Latouche Treville provoke him into a scolding mood. The French officer spoke of him as having fled before his French ships, and the vaunt, which had no better foundation than that Nelson had retired before superior numbers when reconnoitring, exasperated him into threatening to make the Frenchman eat his letter if ever they met. Nelson could boast, but his loudest words are not ridiculously out of proportion to his deeds.

The last hours at Trafalgar will never be forgotten by Englishmen. There is no figure in English history at once so magnificent in battle, and so penetrating in its appeal to the emotions, as was Nelson on that last day when under his leadership the fleet annihilated the last lingering fear that Napoleon would ever carry his desolating arms into the British Islands. It matters little that the woman of whom he thought to the last was utterly unworthy of him, had perhaps never rendered the services he supposed her to have done for their country, and was about to dishonour his memory by mercenary immorality. He must be worse than censorious who can think unmoved of Nelson kneeling in prayer by his cabin table as the "Victory" rolled slowly down on the enemy on the 21st of October, appealing to God for help, and writing the codicil in which he left his mistress and his child to the gratitude of his country.

It is said that his famous signal was to have been worded "Nelson confides that every man will do his duty," and that his own name was replaced by that of England on the suggestion of one of his officers. The use of his name as an inspiration and an appeal would have been perfectly consistent with his tone at all times, but he agreed to the alteration with the indifference of a man to whom self and country were one at that hour. "Expects" replaced "confides that" because the signal lieutenant Pascoe pointed out to him that the verb originally chosen must be spelt out letter by letter in a long string of flags. He parted with Captain Blackwood of the "Euryalus" with a prophecy of his approaching fate. The sight of Collingwood, the friend of his youth, leading the lee line into action in the "Royal Sovereign" drew from him a cry of admiration at the noble example his comrade was showing. When the "Victory" had passed astern of the French "Bucentaure," and was engaged with her and the "Redoubtable," he walked up and down the quarter deck of his flagship by the side of his flag-captain, T. M. Hardy, with the brisk short step customary with him. As they turned, a musket shot from the top of the "Redoubtable" struck him on the upper breast, and, plunging down, broke the spine. "They have done for me at last!" were the words in which he acknowledged the fatal stroke. He lingered for a very few hours of anguish in the fetid cockpit of the "Victory," amid the horrors of darkness relieved only by the dim light of lanterns, and surrounded by men groaning, or raving with unbearable pain. The shock of the broadsides made the whole frame of the "Victory" tremble, and extorted a moan from the dying admiral. When Captain Hardy came down to report the progress of the battle, his inherent love for full triumph drew from him the declaration that less than twenty prizes would not satisfy him. He clung to his authority to the end. The suggestion that Collingwood would have to decide on the course to be taken was answered with the eager claim, "Not while I live." But the last recorded words were of affection and of duty. He begged Hardy for a kiss, and he ended with the proud and yet humble claim, "I have done my duty, thank God for that."

His body was brought home in his flagship and laid to rest in St Paul's. He is commemorated in London by the monument in Trafalgar Square, completed in 1849 with a colossal statue by E. H. Baily, and surrounded by Landseer's bronze lions, added in 1867.

In estimating the character of Nelson, and his achievements, there are some elements which must be allowed for more fully than has always been the case. He was, to begin with, the least English of great Englishmen. He had the excitability, the vanity, the desire for approbation without much delicacy as to the quarter from which it came, which the average Englishman of Nelson's time, his judgment obscured by the effects of centuries of racial rivalry culminating in the Napoleonic wars, was wont to attribute to Frenchmen. Where there is vanity there is the capacity for spite and envy. Nor was Nelson altogether free from these unpleasant faults. But in the main his desire to be liked combined with a natural kindness of disposition to make him appeal frankly to the goodwill of those about him. He won to a very great extent the affection he valued, and that from men so widely different in character as Lord Minto and the simple-hearted seamen among whom he passed the best part of his life. He could be cruel when his emotions were aroused by evil influences, with the downright cruelty he displayed at Naples, or the more subtle form of hardness in his conduct to his wife, when his duty to her stood in the way of his love for Emma Hamilton. But they were few to whom the evil side of his nature was shown, while the captains and seamen for whom he did much to make a hard duty more tolerable were to be counted by the thousand.

As a commander he belonged to the race of Pyrrhus and the prince of Condé—the fighters of battles. His victories were won at the head of a force which had been brought to a high level of efficiency by three generations of predecessors, against enemies who had been, as in the case of the French, disorganized by a social revolution which had ruined their discipline, who were inexperienced as the Danes were, or who, as in the case of the Spaniards, were sunk in a moral and intellectual decadence. But he estimated the vices of his opponents with full insight. Wielding a fine instrument, and confronted by inferior enemies, he was entitled to dare much, and it is a proof of his sagacity that he saw how far he could dare, caring but little for the bulk of the force in front of him, and looking to the spirit. Above all, he had the power to inspire the enthusiasm he felt, and to make men act above themselves because he was there, and because they found a joy in pleasing him. Among all the warriors of his generation Napoleon alone was a greater master of the souls of men, and Blücher alone came near him.

Nelson had no children by his wife. His daughter Horatia, by Lady Hamilton, became the wife of the Rev. Philip Ward, and died in 1881. In November 1805, in recognition of Nelson's great services to his country, his brother William (1757–1835) was created Earl Nelson of Trafalgar, an annuity of £5000 being attached to the title. When William died without sons in February 1835 his only daughter Charlotte Mary (1787–1873), wife of Samuel Hood, 2nd Baron Bridport (1788–1868), became duchess of Brontê, while, according to the remainder, his English titles passed to his nephew Thomas Bolton (1786–1835), who became 2nd Earl Nelson. Bolton, who took the name of Nelson, was succeeded as 3rd Earl Nelson in November 1835 by his son Horatio (b. 1823). The duchy of Brontê was in 1910 held by Baroness Bridport's grandson, Arthur Wellington Nelson Hood, 2nd Viscount Bridport (b. 1839).

AUTHORITIES.—Very much has been written about Nelson. A large part of the total mass consists of hasty work done to meet an immediate demand, or of repetition not justified by the critical faculty or literary skill of the writers. The valuable portion may be divided into original authorities, such as correspondence, and the testimony of eyewitnesses; and the narratives or criticisms of students who tell with original power, and judge with knowledge and insight. Under the heading of original authorities, the first place is taken by *The Dispatches and Letters of Vice-Admiral Lord Viscount Nelson*, with notes by Sir N. H. Nicolas (7 vols., 1844–1846). Nicolas spared no pains to make his collection complete and to illustrate it from all trustworthy sources. Thus he includes Sir Edward Berry's *Account of the Battle of the Nile*, Colonel Stewart's *Notes on the Copenhagen Campaign*, Dr Beatey's *Narrative of Nelson's Last Hours*, and passages from the so-called *Reminiscences of the Captain of the Victory*, Dr Scott. This last authority is of little value, for the book consists of recollections by Dr Scott's daughter and son-in-law of what he said years after the events he was speaking of. The student of Nelson's life should make it a rule to exhaust Nicolas before consulting any other authority. A collection of *Letters from Nelson to Emma Hamilton* was published under her direction in 1814, but it is subject to much suspicion. A great mass of correspondence of the Hamiltons and much MS. relating to Nelson came into the hands of Dr Pettigrew, and passed into the possession of Mr A. Morrison, from whose collection they were transferred to the British Museum. A catalogue, in which the text is given, was privately printed and can be consulted in the museum. Isolated letters have appeared from time to time. Between February and April 1898 some valuable extracts from his correspondence with his wife, previously unknown, and the correct text of parts of his diary, appeared in the extinct weekly, *Literature*. Among the lives of Nelson's contemporaries, J. S. Tucker's *Earl of St Vincent* (1844), Ross's *Saumarez*, Lady Bourchier's *Codrington* and the *Letters of Sir William Hoste* throw light on particular points. The *Nelsonian Reminiscences* of Parsons give an interesting picture of the admiral as he appeared to an observant boy. The observations of older and more intelligent witnesses will be found in *The Diaries and Correspondence of George Rose*, in *The Life and Letters of the First Earl of Minto* and in a *Journal kept during a Visit to Germany*, by Mrs St George, afterwards Mrs Trench. Incidental mentions of Nelson are to be found in the *Pagel Papers*, the correspondence of the minister who succeeded Sir W. Hamilton at the court of Naples. Biographies of Nelson are numerous. Emma Hamilton inspired one by a Mr Harrison, an odious book which was in reality an advertisement of herself and which appeared in 1806. The two quartos of Clarke and McArthur (1809), reprinted in three volumes octavo in 1840, were based on papers supplied by the family, but the texts were edited with unpardonable freedom and the originals have in many cases been lost. Southey's classic *Life* was based on Clarke and McArthur. All later biographies have been superseded by Captain Mahan's *Life of Nelson*, first published in two volumes in 1897 and again in one volume, with additions and corrections in 1899. The much-debated Neapolitan episode has given rise to a literature of its own. The controversy began with the appearance of Captain Foote's *Vindication* of his own part in the transaction published in 1810. It drew an immediate *Counter Vindication of Nelson* by Commander Jeaffreson Miles. Italian versions will be found in Sacchinelli's *Fabrizio Ruffo* and in the *Compendio* of Micheroux edited by the Marchese Maresca. The controversy has been revived in England by Mr F. P. Badham with his *Nelson at Naples* (1900), and has provoked the publication of a collection of the documents by the Navy Record Society, in vol. xxv. of their publications, under the title *Nelson and the Neapolitan Jacobins* (1903). Mr C. Jeaffreson's two works, *Lady Hamilton and Lord Nelson* (1888) and the *Queen of Naples and Lord Nelson* (1889), are based on the papers collected by Mr Morrison. See also T. Nelson, *Genealogical History of the Nelson Family* (1908). (D. H.)

NELSON, ROBERT (1656–1715), English philanthropist and religious writer, son of John Nelson, a London merchant, was born on the 22nd of June 1656, and was educated as the private pupil of George Bull, afterwards bishop of St David's. Having inherited a considerable fortune from his father, he followed no profession. About 1680 he went abroad and spent much time on the continent of Europe till 1691, when he settled at Blackheath. For many years he was an intimate friend and correspondent of Archbishop Tillotson, though not in agreement with his views; and he was also on terms of friendship with the astronomer Halley and other men of science. Nelson's sympathies were with the Jacobites; and after his return to England he associated himself with the nonjurors, under whose influence he produced several of his writings on religious subjects. He was an active supporter of the Society for Promoting Christian Knowledge, the Society for the Propagation of the Gospel, and similar associations, and he used his influence largely in the establishment of charity schools and the building of churches in London. In 1687 he had published a controversial work against transubstantiation, and in 1704 appeared his *Companion for the Festivals and Fasts of the Church of England*, which obtained a remarkable popularity lasting till the middle of the 19th century. Within five years of its publication ten thousand copies of the *Companion* were printed, and thirty-six editions appeared in a hundred and twenty years. After the death of Bishop Bull in 1710 Nelson wrote his biography, which was published three years later; and he was also the author of many other devotional and controversial works. He died in January

1715, in which year was published his *Address to Persons of Quality and Estate*, containing suggestions for the establishment of special hospitals, schools and theological colleges, many of his proposals being afterwards carried into effect. Nelson married a Roman Catholic, Lady Theophila Lucy, daughter of the earl of Berkeley, and widow of Sir Kingsmill Lucy of Broxbourne.

See Charles F. Secretan, *Memoirs of the Life and Times of the Pious Robert Nelson* (1860); Thomas Birch, *Life of Tillotson* (2nd ed., 1753); Thomas Lathbury, *History of the Nonjurors* (1845).

NELSON, a river of Keewatin district, Canada, discharging the waters of Lake Winnipeg in a north-easterly direction into Hudson Bay. It drains an area of 360,000 sq. m. and, including its tributary the Saskatchewan, is 1450 m. long. It is navigable for small steamers for a distance of about 80 m., after which it is unnavigable except for canoes. It has a total fall between the lake and sea of 710 ft. Here its chief tributary is the Burntwood. Norway House at its source and York Factory at its mouth are important stations of the Hudson's Bay Company.

NELSON, a town of British Columbia, situated on the west arm of Kootenay lake. Pop. (1906) about 5000. It is the commercial, administrative and railroad centre of the east and west Kootenay districts. It is the northern terminus of a branch of the Great Northern railway and is also connected by rail and steamboat with the main line of the Canadian Pacific railway at Revelstoke and with the Crow's Nest line of the same system at Kootenay landing. It has direct railway communication with Rossland, Grand Forks and Greenwood.

NELSON, a municipal borough in the Clitheroe parliamentary division of Lancashire, England, 32½ m. N. from Manchester by the Lancashire & Yorkshire railway. Pop. (1891) 22,754, (1901) 32,816. It is of modern growth, possessing a town hall, market hall, free library, technical school, pleasant park and recreation grounds, and an extensive system of electric tramways and light railways, connecting with Burnley and Colne. Its chief manufacture is cotton. It was incorporated in 1890, and the corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 3466 acres.

NELSON, a seaport of New Zealand, the seat of a bishop and capital of a provincial district of the same name; at the head of Blind Bay on the northern coast of the South Island. Pop. (1906) 8164. The woods and fields in the neighbourhood abound with English song-birds, and the streams are stocked with trout; while the orchards in the town and suburbs are famous for English kinds of fruit, and hops are extensively cultivated. The town possesses a small museum and art gallery, literary institute, government buildings, and boys' and girls' schools of high repute. The cathedral (Christ Church) is finely placed on a mound which was originally intended as a place of refuge from hostile natives. It is built of wood, the various native timbers being happily combined. Railways connect the harbour with the town, and the town with Motupiko, &c. The harbour, with extensive wharves, is protected by the long and remarkable Boulder Bank, whose southern portion forms the natural breakwater to that anchorage. The settlement was planted by the New Zealand Company in 1842. The borough returns one member to the house of representatives, and its local affairs are administered by a mayor and council.

NELSONVILLE, a city of Athens county, Ohio, U.S.A., on the Hocking river, 62 m. S.E. of Columbus. Pop.(1890) 4558,(1900) 5421, including 328 foreign-born and 204 negroes; (1910) 6082. Nelsonville is served by the Hocking Valley railway. The city is in one of the most productive coal sections of the state; there are large quantities of clay in the vicinity; and the principal industries are the mining and shipping of coal and the manufacture of fire-clay products. Nelsonville was settled in 1818 and was incorporated in 1838; it was named in honour of Elisha Nelson, who built the first house here.

NEMATODA, in zoology, a group of worms. The name Nematoda (Gr. νῆμα, thread, and εἶδος, form) was first introduced by Rudolphi, but the group had been previously recognized as distinct by Zeder under the name Ascarides. They are now by many systematists united with the Acanthocephala and the Nematomorpha to form the group Nemathelminthes.

The Nematoda possess an elongated and thread-like form (see fig. 1), varying in length from a few lines up to several feet. The body is covered externally by a chitinous cuticle which is a product of the subjacent epidermic layer in which no cell limits can be detected though nuclei are scattered through it. The cuticle is frequently prolonged into spines and papillae, which are especially developed at the anterior end of the body. The mouth opens at one extremity of the body and the anus at or near the other. Beneath the epidermis is a longitudinal layer of muscle-fibres which are separated into four distinct groups by the dorsal, ventral and lateral areas; these are occupied by a continuation of the epidermic layer; in the lateral areas run two thin-walled tubes with clear contents, which unite in the anterior part of the body and open by a pore situated on the ventral surface usually about a quarter or a third of the body length from the anterior end. These vessels are the nitrogenous excretory organs. The body-cavity is largely occupied by processes from the large muscle cells of the skin. These processes stretch across the body cavity to be inserted in the dorsal and ventral middle lines.

After Galeb, *Arch. de Zool. Exp.*, 1878.

cd, Vas deferens.
sp, Cloaca.
pa, Papillae.

The body-cavity also contains the so-called phagocytic organs. These consist of enormous cells with nuclei so large as to be in some cases just visible to the naked eye. These cells are disposed in pairs, though the members of each pair are not always at the same level. The number of cells is not large (some 2 to 8), and as a rule they lie along the lateral lines. In some species (*Ascaris decipiens*) the giant cell is replaced by an irregular mass of protoplasm containing a number of small nuclei. Such a plasmodium bears, on its periphery, groups of rounded projections of protoplasm termed end-organs. Similarly the giant cells are produced at their periphery into a number of branching processes which bear similar end-organs on their surface and in some cases terminate in them. These end-organs are the active agents in taking up foreign granules, or bacteria, which may have found their way into the fluid of the body-cavity. From the shape and position of the phagocytic organs it is obvious that they form admirable strainers through which the fluid of the body-cavity filters (figs. 2, 3).

The alimentary tract consists of a straight tube running from the mouth to the anus without any convolutions; it is separable into three divisions: (1) a muscular oesophagus, which is often provided with cuticular teeth; (2) a cellular intestine; and (3) a short terminal rectum surrounded by muscular fibres. Neither here nor elsewhere are cilia found at any period of development.

A nervous system has been shown to exist in many species, and consists of a perioesophageal ring giving off usually six nerves which run forwards and backwards along the lateral and median lines; these are connected by numerous fine, circular threads in the sub-cuticle. Some of the free-living forms possess eye specks. The sexes are distinct (with the exception of a few forms that are hermaphrodite), and the male is always smaller than the female. The generative organs consist of one or two tubes, in the upper

portion of which the ova or spermatozoa are developed, the lower portion serving as an oviduct or vas deferens; the female generative organs open at the middle of the body, the male close to the posterior extremity into the terminal portion of the alimentary canal; from this cloaca a diverticulum is given off in which are developed one to three chitinous spicules that subserve the function of copulation. The spermatozoa differ from those of other animals in having the form of cells which sometimes perform amoeboid movements. Most remarkable sexual conditions are found to occur in the free-living genera *Rhabditis* and

Diplogaster. While some of the species are bisexual, others are protandrous, self-fertilizing hermaphrodites. In cultures of the latter there occur very rare supplemental males which appear in no sense degenerate but as fit for reproduction as the males of the bisexual species. Though possessing a complete copulatory apparatus and producing large quantities of spermatozoa, they have lost their sexual instinct and play no part in the economy of the species. These "psychically decadent" individuals appear to represent the entire male sex of a bisexual species, and become unnecessary owing to the grafting of hermaphroditism on the female sex.

Mode of Life and Metamorphoses.—While the majority of the Nematodes are parasites, there are many that are never at any period of their life parasitic. These free-living forms are found everywhere—in salt and fresh water, in damp earth and moss, and among decaying substances; they are always minute in size, and like many other lower forms of life, are capable of retaining their vitality for a long period even when dried, which accounts for their wide distribution; this faculty is also possessed by certain of the parasitic Nematodes, especially by those which lead a free existence during a part of their life-cycle. The free-living differ from the majority of the parasitic forms in undergoing no metamorphosis; they also possess certain structural peculiarities which led Bastian (*Trans. Linn. Soc.*, 1865) to separate them into a distinct family, the *Anguillulidae*. It is impossible, however, to draw a strict line of demarcation between the free and parasitic species, since—(1) many of the so-called free *Nematoda* live in the slime of molluscs (Villot), and are therefore really parasitic; (2) while certain species belonging to the free-living genus *Anguillula* are normally parasitic (*e.g. A. tritici*, which lives encysted in ears of wheat), other species occasionally adopt the parasitic mode of existence, and become encysted in slugs, snails, &c.; (3) it has been experimentally proved that many normally parasitic genera are capable of leading a free existence;[1] (4) transitional forms exist which are free at one period of their life and parasitic at another. The parasitic Nematodes include by far the greatest number of the known genera; they are found in nearly all the orders of the animal kingdom, but more especially among the *Vertebrata*, and of these the *Mammalia* are infested by a greater variety than any of the other groups. Some two dozen distinct species have been described as occurring in man. The Nematode parasites of the *Invertebrata* are usually immature forms which attain their full development in the body of some vertebrate; but there are a number of species which in the sexually adult condition are peculiar to the *Invertebrata*.[2]

The *Nematoda* contain about as many parasitic species as all the other groups of internal parasites taken together; they are found in almost all the organs of the body, and by their presence, especially when encysted in the tissues and during their migration from one part of the body to another, give rise to various pathological conditions. Although some attain their full development in the body of a single host—in this respect differing from all other *Entozoa*—the majority do not become sexually mature until after their transference from an "intermediate" to a "definitive" host. This migration is usually accompanied by a more or less complete metamorphosis, which is, however, not so conspicuous as in most other parasites, *e.g.* the *Trematoda*. In some cases (many species of *Ascaris*) the metamorphosis is reduced to a simple process of growth.

The parasitic and free-living Nematodes are connected by transitional forms which are free at one stage of their existence and parasitic at another; they may be divided into two classes—those that are parasitic in the larval state but free when adult, and those that are free in the larval state but parasitic when adult.

(1) To the first class belong the so-called "hairworm," *Mermis*, not to be confused with the Gordian worms.[3] The adult forms of *M. nigrescens* live in damp earth and may be seen after storms or early in the morning crawling up the stalks of plants, a fact which causes people to talk about showers of worms. The eggs are laid on

[1] Ercolani successfully cultivated *Oxyuris curvula*, *Strongylus armatus* and other species in damp earth; the free generation was found to differ from the parasitic by its small size, and by the females being ovoviviparous instead of oviparous. To this phenomenon he gave the name of dimorphobiosis.

[2] The genera *Ascaris*, *Filaria*, *Trichosoma* are found throughout the *Vertebrata*; *Cucullanus* (in the adult condition) only in fishes and *Amphibia*; *Ankylostoma*, *Trichocephalus*, *Trichina* and *Pseudalius* live only in the *Mammalia*, the last-mentioned genus being confined to the order *Cetacea*; *Strongylus* and *Physaloptera* are peculiar to mammals, birds and reptiles, while *Dispharagus*, *Syngamus* and *Hystrichis* are confined to birds. *Mermis* (in the larval state) is confined to the *Invertebrata* and *Sphaerularia* to bees. *Oxyuris*, though chiefly parasitic in the *Mammalia*, occurs also in reptiles, *Amphibia* and one or two insects. *Dacnitis* and *Ichthyonema* are only found in fishes.

[3] See NEMATOMORPHA.

the ground and the young larvae make their way into grasshoppers, in whose bodies they pass most of their larval life. (2) To the second class belong *Ankylostoma*, *Strongylus* and many species of *Ascaris*; the embryo on leaving the egg lives free in water or damp earth, and resembles very closely the free-living genus *Rhabditis*. After a longer or shorter period it enters the alimentary canal of its proper host with drinking-water, or it bores through the skin and reaches the blood-vessels, and is so conveyed through the body, in which it becomes sexually mature. *Rhabditis nigrovenosa* has a developmental history which is entirely anomalous, passing through two sexual generations which regularly alternate. The worm inhabits the lung of the frog and toad, and is hermaphrodite (Schneider) or parthenogenetic (Leuckart); the embryos hatched from the eggs find their way through the lungs into the alimentary canal and thence to the exterior; in a few days they develop into a sexual larva, called a *Rhabditiform* larva, in which the sexes are distinct; the eggs remain within the uterus, and the young when hatched break through its walls and live free in the perivisceral cavity of the mother, devouring the organs of the body until only the outer cuticle is left; this eventually breaks and sets free the young, which are without teeth, and have therefore lost the typical *Rhabditis* form. They live for some time in water or mud, occasionally entering the bodies of water snails, but undergo no change until they reach the lung of a frog, when the cycle begins anew. Although several species belonging to the second class occasionally enter the bodies of water snails and other animals before reaching their definitive host, they undergo no alteration of form in this intermediate host; the case is different, however, in *Filaria medinensis* and other forms, in which a free larval is followed by a parasitic existence in two distinct hosts, all the changes being accompanied by a metamorphosis. *Filaria medinensis*—the Guinea worm—is parasitic in the subcutaneous connective tissue of man (occasionally also in the horse). It is chiefly found in the tropical parts of Asia and Africa, but has also been met with in South Carolina and several of the West Indian islands. The adult worm in the female sometimes reaches a length of 6 ft. The males have only recently been discovered. The female is viviparous, and the young, which, unlike the parent, are provided with a long tail, live free in water; it was formerly believed from the frequency with which the legs and feet were attacked by this parasite that the embryo entered the skin directly from the water, but it has been shown by Fedschenko, and confirmed by Manson, Leiper and others, that the larva bores its way into the body of a *Cyclops* and there undergoes further development. It is probable that the parasite is then transferred to the alimentary canal of man by means of drinking-water, and thence makes its way to the subcutaneous connective tissue.

The *Nematoda* which are parasitic during their whole life may similarly be divided into two classes—those which undergo their development in a single host, and those which undergo their development in the bodies of two distinct hosts.

(1) In the former class the eggs are extruded with the faeces, and the young become fully formed within the egg, and when accidentally swallowed by their host are liberated by the solvent action of the gastric juice and complete their development. This simple type of life-history has been experimentally proved by Leuckart to be characteristic of *Trichocephalus affinis*, *Oxyuris ambigua* and other species. (2) The life-history of *Ollulanus tricuspis* is an example of the second class. *Ollulanus tricuspis* is found in the adult state in the alimentary canal of the cat; the young worms are hatched in the alimentary canal, and often wander into the body of their host and become encysted in the lungs, liver and other organs; during the encystment the worm degenerates and loses all trace of structure. This wandering appears to be accidental, and to have nothing to do with the further evolution of the animal which takes place in those embryos which are voided with the excrement. Leuckart proved experimentally that these young forms become encysted in the muscles of mice, and the cycle is completed after the mouse is devoured by a cat. The well-known *Trichinella spiralis* (fig. 4) has a life-history closely resembling that of *Ollulanus*. The adult worm, which is of extremely minute size, the male being only $\frac{1}{12}$th and the female $\frac{1}{6}$ of an inch in length inhabits the alimentary canal of man and many other carnivorous mammalia; the young bore their way into the tissues and become encysted in the muscles—within the muscle-bundles according to Leuckart, but in the connective tissue between them according to Chatin and others. The co-existence of the asexual encysted form and the sexually mature adult in the same host, exceptionally found in *Ollulanus* and other Nematodes, is the rule in *Trichinella*; many of the embryos, however, are extruded with the faeces, and complete the life cycle by reaching the alimentary canal of rats and swine which frequently devour human ordure

FIG. 4.—*Trichinella* encysted among muscular fibres. (After Leuckart.)

Swine become infested with *Trichinella* in this way and also by eating the dead bodies of rats, and the parasite is conveyed to the body of man along with the flesh of "trichinized" swine.

Importance in Pathology.—Among recent advances having medical import in our knowledge of the Nematodes, the chief are those dealing with the parasites of the blood. *F. bancrofti* is known to live in the lymphatic glands, and its embryos *Microfilaria sanguinis hominis nocturna*, passing by the thoracic duct, reach the blood-vessels and circulate in the blood. Manson showed in 1881 that the larvae (*Microfilariae*) were not at all times present in the blood, but that their appearance had a certain periodicity, and the larvae of *F. bancrofti*. *Microfilaria nocturna* swarmed in the blood at night-time and disappeared from the peripheral circulation during the day, hiding away in the large vessels at the base of the lungs and of the heart. Ten years later Manson discovered a second species, *Filaria perstans*, whose larvae live in the blood. They, however, show no periodicity, and are found continuously both by day and by night; and their larval forms are termed *Microfilaria perstans*. The adult stages are found in the sub-peritoneal connective tissue. A third form, *Microfilaria diurna*, is found in the larval stage in blood, but only in the daytime. The adult stage of this form is the *Filaria loa* found in the subcutaneous tissues of the limbs.

The presence of these parasites seems at times to have little effect on the host; and men in whose system it is calculated there are some 40-50 million larvae have shown no signs of disease. In other cases very serious disorders of the lymphatic system are brought about, of which the most marked is perhaps Elephantiasis. Manson and Bancroft suggested that the second host of the parasite is the mosquito or gnat, and for a long time it was thought that they were conveyed to man by the mosquito dying after laying her eggs in water, the larval nematodes escaping from her body and being swallowed by man. It is now held that the parasite enters the blood of man through the piercing mouth-parts at the time of biting. When first sucked up by the insect from an infected man it passes into its stomach, and thence makes its way into the thoracic muscles, and there for some time it grows. Next the larvae make their way into the connective tissue in the pro-thorax, and ultimately bore a channel into the base of the piercing apparatus and come to rest between the hypopharynx and the labium. Usually two are found in this position lying side by side; it would be interesting to know if these are male and female. From their position in the proboscis the larvae can easily enter the blood of man the next time the mosquito bites (Low, *Brit. Med. Journ.*, June 1900; James, *ibid.*, Sept. 1900). Shortly after Low had published his results, Grassi and Noè issued a paper dealing with the larvae of *F. immitis*, which is spread by means of the mosquito *Anopheles* (*Centrbl. Bakter.* I. Abth. xxviii., 1900). The larvae of this parasite develop in the Malpighian tubules of the insect; at a certain stage they cast their cuticle and make their way into the space—part of the haemocoel—found in the labium. During the act of biting the labium is bent back, and as the piercing stylets enter the skin of the sufferer this bending becomes more and more acute. Grassi and Noè think that if the cavity of the labium be full of the larval nematodes this bending will burst the tissue, and through the rent the larvae will escape and make their way into the body of the host. Besides *Anopheles*, two species of *Culex*, *C. penicillaris* and *C. pipiens*, are also accused of transmitting the larvae. A paper by Noè (*Atti Acc. Lincei*, ix., 1900) seems to prove beyond doubt that the larvae of *F. immitis* are transmitted in the manner indicated. The adult worm is chiefly found in the heart of the dog, and usually in the right side, which may be so packed with the worms as seriously to interfere with the circulation (fig. 5). The females produce thousands of larvae, which circulate in the blood, and show a certain periodicity in their appearance, being much more numerous in the blood at night than during the day.

Importance as Pests.—Agriculturists now pay increased attention to the nematodes that destroy their crops. A good example of a fairly typical case is afforded by *Heterodera schachtii*, which attacks beetroot and causes great loss to the Continental sugar manufacturers. The young larvae, nourished by the yolk

which remains over from the egg and by the remains of the mother which they have taken into their alimentary canal, make their way through the earth, and ultimately coming across the root of a beet, begin to bore into it. This they do by means of a spine which can be protruded from the mouth. Once within the root, they absorb the cell sap of the parenchyma and begin to swell until their body projects from the surface of the root in

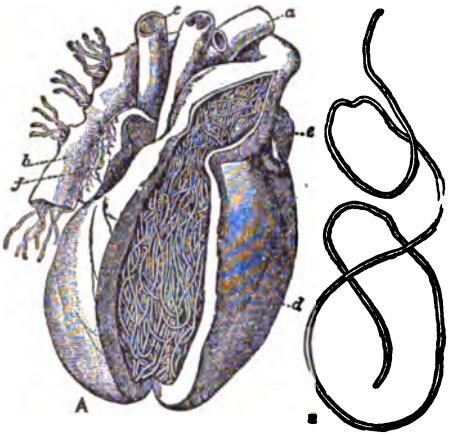

FIG. 5.

the form of a tubercle (fig. 6). The reproductive organs do not begin to appear until the larva has twice cast its skin. After this a marked sexual dimorphism sets in. The female, hitherto indistinguishable from the male, continues to swell until she attains the outlines of a lemon. Doing this she bursts the epidermis of the rootlet, and her body projects into the surrounding earth. The male has a different life-history (fig. 7). After the second larval moult, he passes through a passive stage comparable to the pupa-stadium of an insect, and during this stage, which occurs inside the root, the reproductive organs are perfected. The male next casts his cuticle, and by means of his spine bores through the tissues of the root and escapes into the earth. Here he seeks a female, pairs, and soon afterwards dies. The eggs of the female give rise to embryos within the body of the mother; her other organs undergo a retrogressive change and serve as food for the young, until the body-wall only of the mother remains as a brown capsule. From this the young escape and make their way through the earth to new roots. The whole life-history extends over a period of some 4-5 weeks (fig. 7), so that some 6-7 generations are born during the warmer months. If we assume that each female produces

300 embryos, and that half of these are females, the number of descendants would be, after six generations, some 22,781 milliards (A. Strubell, *Bibl. Zool.*, 1888–1889). Other species which have been recorded in the United Kingdom are *Tylenchus devastatrix* (Kuhn), on oats, rye and clover roots; *T. tritici*, causing the

NEMATOMORPHA. This zoological group includes Gordian worms which are found swimming in an undulatory manner or coiling round water-weeds in ponds and puddles, or knotted together in an apparently inextricable coil. They may be several inches in length and are no thicker than a piece of whip-cord.

The male is distinguishable from the female by the presence of a fork at the posterior end of the body. The body is covered by a cuticle which is sculptured and the various markings are of systematic importance: it is secreted by a hypodermis which also includes nerve-cells and some gland-cells. In the adult aquatic stage the alimentary canal shows signs of degeneration, and it seems probable that in this stage Gordian worms take no food. The mouth is terminal or subterminal; there is a weak sucking pharynx situated behind the brain, and a long intestine lying along the medio-ventral body-cavity; it ends in a cloaca which receives the vasa deferentia in the male. There is a single unsegmented nerve-cord which runs along the ventral middle line and enlarges posteriorly into a caudal ganglion and anteriorly in a ganglion, the brain, which is not supra-oesophageal. The peripheral nervous system is minutely described by T. H Montgomery. There is a median eye on the head.

The Nematomorpha are nearly solid,—quite so at each end,

and only in the middle region of the body are there any body-cavities, the space within the body being usually filled up with parenchyma. There are four closed spaces of the nature of body-cavities, two lateral and a dorso-median and a ventro-median. Into the former the ovaries project, though the lumen of the lateral body-cavity is quite shut off from the lumina of the ovaries or uteri. In the adult male the lateral body-cavities are absent. A curious duct with lateral branches termed the supra-intestinal organ lies above the intestine in the female. There are two series of ovaries extending through a large part of the body and accompanied by two uteri; the latter open by two oviducts which debouch into an atrium which also receives the intestine and a single receptaculum seminis, and is continued backward as the cloaca; this opens posteriorly. The ovaries are epithelial sacs which open into the uteri. The paired testes extend through the greater part of the body and end in two vasa deferentia which unite with the intestine to form a cloaca.

From *Cambridge Natural History*, vol. ii., "Worms," &c., by permission of Macmillan & Co., Ltd.

FIG. 3.—Tarsal joint of an Ephemerid larva into which two Gordius larvae, (a,a) have penetrated. Magnified.

The eggs are laid in the spring as a rule, and after about a week they give rise to a minute, ringed larva with a protrusible boring apparatus consisting of three chitinous rods. By the aid of this the larva makes its way into the soft body of some insect larva, Ephemerids, Chironomids, or even of Molluscs, and encysts in the muscles or fat body. The insect, which may have become an imago with the Gordian larva still in it, is then eaten by a carnivorous insect or by a fish, and the contained Gordian larva becomes elongate and mature in its second host. After a year or more this larva emerges into the water and commences to reproduce.

The unexpected occurrence of these worms in pools and puddles, often in great numbers, has given rise to myths about showers of worms. They occasionally make their way into the human stomach with the drinking-water and are vomited; but this is a case of pseudo-parasitism—they are no true parasite of man.

There are a considerable number of species divided among the four genera: *Gordius*, *Paragordius*, *Chordodes* and *Parachordodes*; the last, a genus of Camerano's, is looked upon with some doubt by Montgomery. A free swimming marine form with longitudinal rows of bristles, known as *Nectonema* A. E. Verrill, may also come here, but at present its life-history is unknown. The Nematomorpha form an isolated group; at first sight they seem to be connected with the Nematoda, but in reality their only common feature is the tubular genitalia opening into a cloaca, and it seems at present impossible to connect them with the Annelida. Until more is known it seems wisest to look upon them as an isolated assemblage of animals with no near affinities to any of the great phyla.

NEMERTINA, or NEMERTEANS (*Nemertea*), a subdivision of worms,[1] characterized by the ciliation of the skin, the presence of a retractile proboscis, the simple arrangement of the generative apparatus, and in certain cases by a peculiar pelagic larval stage to which the name "pilidium" has been given. Many of them are long thread-shaped or ribbon-shaped animals, more or less cylindrical in transverse section. Even the comparatively shortest species and genera can always be termed elongate, the broadest and shortest of all being the parasitic *Malacobdella* and the pelagic *Pelagonemertes*. There are no exterior appendages of any kind. The colours are often very bright and varied. Nemertines live in the sea, some being common amongst the corals and algae, others hiding in the muddy or sandy bottom, and secreting gelatinous tubes which ensheath the body along its whole length. Formerly, they were generally arranged amongst the Platyelminthes as a sub-order in the order of the Turbellarians, but with the advance of our knowledge of these lower worms it has been found desirable to separate them from the Turbellarians and to look upon the Nemertina as a separate phylum.

FIG. 1.—*Lineus geniculatus*. (From Bürger.) 1, Lateral slits on head; 2, anus.

O. Bürger classifies Nemertines into four orders:—

I. **Protonemertini**, in which there are two layers of dermal muscles, external circular and internal longitudinal; the nervous system lies external to the circular muscles; the mouth lies behind the level of the brain; the proboscis has no stylet; there is no caecum to the intestine. Families, CARINELLIDAE, HUBRECHTIIDAE.

II. **Mesonemertini**, in which the nervous system has passed into the dermal muscles and lies amongst them; other characters as in Protonemertini. Family, CEPHALOTHRICIDAE.

III. **Metanemertini**, in which the nervous system lies inside the dermal muscles in the parenchyma; the mouth lies in front of the level of the brain; the proboscis as a rule bears stylets; the intestine nearly always has a caecum. Families, EUNEMERTIDAE, OTOTYPHLONEMERTIDAE, PROSORHOCMIDAE, AMPHIPORIDAE, TETRASTEMMATIDAE, NECTONEMERTIDAE, PELAGONEMERTIDAE, MALACOBDELLIDAE.

This order represents the Hoplonemertini of Hubrecht.

IV. **Heteronemertini**, in which the dermal musculature is in three layers, an external longitudinal, a middle circular, an internal longitudinal; the nervous system lies between the first and second of these layers; the outer layer of longitudinal muscles is a new development; there is no intestinal caecum; no stylets on the proboscis and the mouth is behind the level of the brain. Families, EUPOLIIDAE, LINEIDAE.

[1] Nemertes was a sea nymph, daughter of Nereus and Doris. One of the genera was named *Nemertes* by Cuvier.

This order represents the Schizonemertini of Hubrecht and the family Eupolidae.

The first three orders, which have a double muscular layer, external circular and internal longitudinal, are sometimes grouped together as the DIMYARIA; the Heteronemertini, in which a third coat of longitudinal muscles arises outside the circular layer, are then placed in a second branch, the TRIMYARIA.

The following families and genera are represented on the British coasts: CARINELLIDAE, *Carinella*; CEPHALOTHRICIDAE, *Cephalothrix*, *Carinoma*; EUNEMERTIDAE, *Eunemertes*; OTOTYPHLONEMERTIDAE, *Ototyphlonemertes*; AMPHIPORIDAE, *Amphiporus*, *Drepanophorus*; TETRASTEMMIDAE, *Tetrastemma*, *Prosorhocmus*; MALACOBDELLIDAE, *Malacobdella*; EUPOLIIDAE, *Eupolia*, *Valencinia*, *Oxypolia*; LINEIDAE, *Lineus*, *Euborlasia*. *Micrura*, *Cerebratulus*, *Micrella*.

ANATOMY.—*Proboscis and Proboscidian Sheath.*—The organ most characteristic of a Nemertine is without doubt the proboscis. With very few exceptions (*Malacobdella*, *Akrostomum*, where it has fused

with the mouth into a single exterior opening), there is a terminal opening, the rhynchostome (subterminal in *Valencinia*), at the foremost tip of the body, out of which the proboscis is seen shooting backwards and forwards, sometimes with so much force that both its interior attachments are severed and it is entirely expelled from the body. It then often retains its vitality for a long time, apparently crawling as if it were itself a worm, a phenomenon which is at least partially explained by the extraordinary development of nervous tissue, equally distributed all through the walls of the proboscis, and either united into numerous longitudinal nerve-stems (*Drepanophorus*, *Amphiporus*) or spread out into a uniform and comparatively thick layer (*Cerebratulus*, sp.). This very effective and elaborate innervation, which has been directly traced to the brain, whence strong nerves (generally two) enter the proboscis, renders it exceedingly probable that the most important functions of the proboscis are of a sensiferous, tactile nature. In Nemertines the everted proboscis is retracted in the same way as the tip of a glove finger would be if it were pulled backwards by a thread situated in the axis and attached to the tip. The comparison may be carried still further. The central thread just alluded to is represented in the Nemertean proboscis by that portion which is never everted, and the tip of the glove by the boundary between the evertible and non-evertible portion of the proboscis—a boundary which in the *Metanemertini* is marked by the presence of a pointed or serrated stylet. This stylet is thus situated terminally when the proboscis has reached its maximum eversion. It adds a decisively aggressive character to an organ the original significance of which, as we have seen, was tactile. This aggressive character has a different aspect in several genera which are destitute of a central stylet, but in which the surface that is turned outwards upon eversion of the proboscis is largely provided with nematocysts, sending the urticating rods of different sizes in all directions. In others this surface is beset with thick, glandular, adhesive papillae.

The comparison with the glove-finger is in so far insufficient as the greater portion of the non-evertible half of the proboscis is also hollow and clothed by glandular walls. Only at the very hindermost end does it pass into the so-called retractor-muscle (fig. 2), which is attached to the wall of the space, or rhynchocoel, in which the proboscis moves about. This retractor-muscle, indeed, serves to pull back with great rapidity the extruded proboscis, and is aided in its action by the musculature of the head. The extrusion itself depends entirely upon contraction of the muscular walls of the space just mentioned, the rhynchocoel. As it is (1) closed on all sides, and (2) filled with a corpuscular fluid, the contractions alluded to send this fluid to impinge against the anterior portion, where the proboscis, floating in its sheath, is attached with it to the muscular tissue of the head (fig. 3). Partial extrusion lessening the resistance in this region inevitably follows, and when further contractions of the walls of the sheath ensue total extrusion is the consequence. It is worthy of notice that in those Nemertines which make a very free use of their proboscis, and in which it is seen to be continually protruded and retracted, the walls of the proboscidian sheath are enormously muscular. On the other hand, they are much less considerably or even insignificantly so in the genera that are known to make a rather sparing use of their proboscis. The rhynchocoel is formed by a split which appears in the mesoblast surrounding the epiblastic pit which is the forerunner of the proboscis. It does not seem to be coelomic.

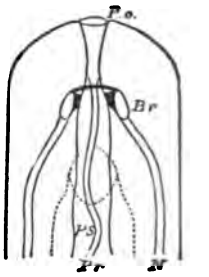

FIG. 3.—Anterior portion of the body of a Nemertine.

N, Lateral nerves.
PS, Proboscidian sheath.
Pr, Proboscis.
P.o., Exterior opening through which the proboscis is everted or rhynchostome. Oesophagus and mouth shown by dotted lines.

The proboscis, which is thus an eminently muscular organ, is composed of two or three, sometimes powerful, layers of muscles—one of longitudinal and one or two of circular fibres. In the posterior retractor the longitudinal fibres become united into one bundle, which, as noticed above, is inserted in the wall of the sheath. At the circular insertion of the proboscis in front of the brain the muscular fibres belonging to the anterior extremity of the body and those connected with the proboscis are very intimately interwoven, forming a strong attachment. The short tube between this circular insertion and the rhynchostome is called the rhynchodaeum.

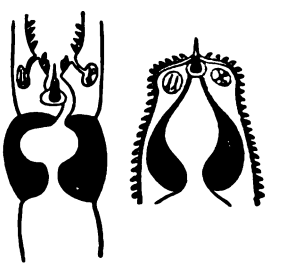

FIG. 4. FIG. 5.

FIGS. 4, 5.—Proboscis with stylet, "reserve" sacs and muscular bulb of a Hoplonemertine. Fig. 4 retracted; fig. 5 everted.

The proboscis broken off and expelled is generally reproduced, the posterior ribbon-like end of this reproduced portion again fusing with the walls of the sheath. There is reason to suppose that, when a wound is inflicted by the central stylet, it is envenomed by the fluid secreted in the posterior proboscidian region being at the same time expelled. A reservoir, a duct and a muscular bulb in the region (fig. 4) where the stylet is attached serve for this purpose. The significance of two or more (in *Drepanophorus* very numerous) small sacs containing so-called "reserve" stylets resembling in shape that of the central dart is insufficiently known.

FIG. 6.—The armature from the proboscis of *Drepanophorus*

The muscular walls of the rhynchocoel, which by their transverse contractions serve to bring about eversion of the proboscis in the way above traced, are attached to the musculature of the head just in front of the ganglionic commissures (fig. 3). In nearly all Nemertines the rhynchocoel extends backwards as far as the posterior extremity, just above the anus; in *Carinella* it is limited to the anterior body-region. The corpuscles floating in the fluid it contains are of definite

shape, and in *Cerebratulus urticans* they are deep red, possibly from the presence of haemoglobin. They are usually larger than the blood corpuscles. Internally the muscular layers are lined by an epithelium. In the posterior portion this epithelium in certain *Heteronemertea* has a more glandular appearance, and sometimes the interior cavity is obliterated by cell-proliferation in this region. Superiorly the sheath either closely adheres to the muscular body-wall, with which it may even be partly interwoven, or it hangs freely in the connective tissue which fills the space between the intestine and the muscular body-wall.

Cutaneous System.—Externally in all species a layer of ciliated cells forms the outer investment. In it are, moreover, enclosed unicellular glands pouring their highly refracting contents, of a more or less rod-like shape, directly to the exterior. They appear to be the principal source of the mucus these animals secrete. In most Heteronemertines these elements are separated by a thin homogeneous basement membrane (fig. 8) from the following—that is, from a layer in which longitudinal muscular fibres are largely intermixed with tortuous glands, which by reason of their deeper situation communicate with the exterior by a much longer and generally very narrow duct. The pigment is also principally localized in this layer, although sometimes it is present even deeper down within the musculature. The passage from this tegumentary layer to the subjacent longitudinal muscular one is gradual, no membrane separating them. In *Carinella, Cephalothrix, Polia* and the Metanemertines the two tegumentary layers with their different glandular elements are fused into one; a thick layer of connective tissue is situated beneath them (instead of between them) and keeps the entire cutaneous system more definitely separate from the muscular (figs. 7, 8).

Musculature and Connective Tissue.—The muscular layers by which the body-wall is constituted have been very differently and to some extent confusingly described by the successive authors on Nemertean anatomy. There is sufficient reason for this confusion. The fact is that not only have the larger subdivisions a different arrangement and even number of the muscular layers, but even within the same genus, nay, in the same species, well-marked differences occur.

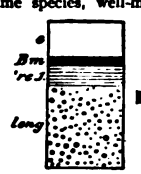

FIG. 8.

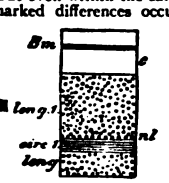

FIG. 9.

FIGS. 7–9.—The layers of the body-wall in *Carinella* (fig. 7), the *Metanemertini* (fig. 8) and the *Heteronemertini* (fig. 9). *c*, Cellular tissue of the integument; *Bm*, basement membrane; *circ.* 1, outer circular, and *long.*, longitudinal layer of muscular tissue; *circ.* 2, *long.* 1, additional circular and longitudinal layers of the same; *nl*, nervous layer.

Increase in size appears sometimes to be accompanied by the development of a new layer of fibres, whereas a difference in the method of preparation may give to a layer which appeared homogeneous in one specimen a decidedly fibrous aspect in another. Nevertheless there are three principal types under which the different modifications can be arranged. One of them is found in the two most primitively organized genera, *Carinella* and *Cephalothrix, i.e.* an outer circular, a longitudinal and an inner circular layer of muscular fibres (fig. 7). The second is common to all the Heteronemertines, as well as to *Polia* and *Valencinia*, and also comprehends three layers, of which, however, two are longitudinal, viz. the external and the internal one, there being a strong circular layer between them (fig. 9). To the third type all the *Metanemertini* correspond; their muscular layers are only two, an external circular and an internal longitudinal one (fig. 8).

The *Heteronemertini* thus appear to have developed an extra layer of longitudinal fibres internally to those which they inherited from more primitive ancestors, whereas the *Metanemertini* are no longer in possession of the internal circular layer, but have on the contrary largely developed the external circular one, which has dwindled away in the *Heteronemertini*. The situation of the lateral nerve-stems in the different genera with respect to the muscular layers lends definite support to the interpretation of their homologies here given and forms the basis of Bürger's classification.

In *Carinella, Cephalothrix* and *Polia*, as well as in all Metanemertines, the basement membrane of the skin already alluded to is particularly strong and immediately applied upon the muscular layers. In the Heteronemertines there is a layer in which the cutaneous elements are largely represented below the thin basement membrane (fig. 8), between it and the bulk of the outer longitudinal muscles. The difference in the appearance of the basement membrane—sometimes wholly homogeneous, sometimes eminently fibrillar—can more especially be observed in differently preserved specimens of the genus *Polia*.

The connective tissue of the integument and basement membrane imperceptibly merges into that which surrounds the muscular bundles as they are united into denser and definite layers, and this is especially marked in those forms (*Akrostomum*) where the density of the muscular body-wall has considerably diminished, and the connective tissue has thus become much more prominent. It can then at the same time be observed, too, that the compact mass of connective tissue ("reticulum," Barrois) which lies between the muscular body-wall and the intestine is directly continuous with that in which the muscular layers are embedded. Nuclei are everywhere present. The omnipresence of this connective tissue tends to exclude the formation of any perivisceral body cavity in Nemertines.

In *Polia* the connective tissue enclosed in the external muscular layer is eminently vacuolar—all the intermediate stages between such cells in which the vacuole predominates and the nucleus is peripheral and those in which the granular protoplasm still entirely fills them being moreover present.

In addition to the musculature of the proboscis and proboscidian sheath, longitudinal muscular fibres are found in the walls of the oesophagus, whilst transverse ones are numerous and united into vertical dissepiments between the successive intestinal caeca, thus bringing about a very regular internal metamerization. The genital products develop in intermediate spaces similarly limited by these dissepiments and alternating with the digestive caeca.

Nervous System and Sense Organs.—The nervous system of Nemertines presents several interesting peculiarities. As central organs we have to note the brain-lobes and the longitudinal lateral cords which form one continuous unsegmented mass of fibrous and cellular nerve-tissue. The fibrous nerve-tissue is more dense in the higher differentiated, more loose and spongy in the lower organized forms; the cellular nerve-tissue is similarly less compact in the forms that are at the base of the scale. No ganglionic swellings whatever occur in the course of the longitudinal cords. The brain must be looked upon as the anterior thickening of these cords, and at the same time as the spot where the two halves of the central nerve system intercommunicate. This is brought about by a double commissure, of which the ventral portion is considerably thicker than the dorsal, and which, together with the brain-lobes, constitutes a ring through which both proboscis and proboscidian sheath pass. The brain-lobes are generally four in number, a ventral and a dorsal pair, respectively united together by the above-mentioned commissures, and moreover anteriorly interfusing with each other, right and left. In *Carinella* this separation into lobes of the anterior thickenings of the cords has not yet commenced, the ventral commissure at the same time being extremely bulky. There is great probability that the central stems, together with the brain, must be looked upon as local longitudinal accumulations of nervous tissue in what was in more primitive ancestors a less highly differentiated nervous plexus, situated in the body-wall in a similar way to that which still is found in the less highly organized Coelenterates. Such a nervous plexus indeed occurs in the body-wall of all Heteronemertines, sometimes even as a comparatively thick layer, situated, as are the nerve stems, between the external longitudinal and the circular muscles (fig. 9). In *Carinella*, where the longitudinal nerve-stems are situated exteriorly to the muscular layers, this plexus, although present, is much less dense, and can more fitly be compared to a network with wide meshes. In both cases it can be shown to be in immediate continuity with the coating of nerve-cells forming part of the longitudinal cords. It stretches forward as far as the brain, and in *Carinella* is again continued in front of it, whereas in the Heteronemertines the innervation of the anterior extremity of the head, in front of the brain, takes the form of more definite and less numerous branching stems. The presence of this plexus in connexion with the central stems, sending out nervous filaments amongst the muscles, explains the absence, in Pro-, Meso- and Heteronemertines, of separate and distinct peripheral nerve stems springing from the central stems innervating the different organs and body-regions, the only exceptions being the

L.N., Lateral nerve-stems.

nerves for the proboscis, those for the sense organs in the head and the strong nerve pair (*n. vagus*) for the oesophagus. At the same time it renders more intelligible the extreme sensitiveness of the body-wall of the Nemertines, a local and instantaneous irritation often resulting in spasmodic rupture of the animal at the point touched.

In the *Metanemertini*, where the longitudinal stems lie inside the muscular body-wall, definite and metamerically placed nerve branches spring from them and divide dichotomously in the different tissues they innervate. A definite plexus can here no longer be traced. In certain Metanemertines the lateral stems have been noticed to unite posteriorly by a terminal commissure, situated above the anus, the whole of the central nervous system being in this way virtually situated above the intestine. In others there is an approximation of the lateral stems towards the median ventral line (*Drepanophorus*); in a genus of Heteronemertines (*Langia*), on the other hand, an arrangement occurs by which the longitudinal stems are no longer lateral, but have more or less approached each other dorsally.

In addition to the nerves starting from the brain-lobes just now especially mentioned, there is a double apparatus which can hardly be treated of in conjunction with the sense organs, because its sensory functions have not been sufficiently made out, and which will therefore rather be considered along with the brain and central nervous system. This apparatus is usually known under the name of the lateral organs. To it belong (*a*) superficial grooves or deeper slits situated on the integument near the tip of the head, (*b*) nerve lobes in immediate connexion with the nervous tissue of the brain, and (*c*) ciliated ducts penetrating into the latter and communicating with the former. Embryology shows that originally these different parts are separately started, and only ultimately become united into one. Two lateral outgrowths of the foremost portion of the oesophagus, afterwards becoming constricted off, as well as two ingrowths from the epiblast, contribute towards its formation, at least as far as both Meta- and Heteronemertines are concerned. As to the *Mesonemertini*, in the most primitive genus, *Carinella*, we do not find any lateral organs answering to the description above given. What we do find is a slight transverse furrow on each side of the head, close to the tip, but the most careful examination of sections made through the tissues of the head and brain shows the absence of any further apparatus comparable to that described above. Only in one species, *Carinella inexpectata*, a step in advance has been made, in so far as in connexion with the furrow just mentioned, which is here also somewhat more complicated in its arrangement, a ciliated tube leads into the brain, there to end blindly amidst the nerve-cells. No other intermediate stages have as yet been noticed between this arrangement and that of the *Heteronemertini*, in which a separate posterior brain-lobe receives a similar ciliated canal, and in which the oesophageal outgrowths have made their appearance and are coalesced with the nerve-tissue in the organ of the adult animal. The histological elements of this portion remain distinct both by transmitted light and in actual sections.

These posterior brain-lobes, which in all Heteronemertines are in direct continuity of tissue with the upper pair of principal lobes, cease to have this intimate connexion in the *Metanemertini*; and, although still constituted of (1) a ciliated duct, opening out externally, (2) nervous tissue surrounding it, and (3) histological elements distinctly different from the nervous, and most probably directly derived from the oesophageal outgrowths, they are nevertheless here no longer constantly situated behind the upper brain-lobes and directly connected with them, but are found sometimes behind, sometimes beside and sometimes before the brain-lobes. Furthermore, they are here severed from the principal lobes and connected with them by one or more rather thick strings of nerve-fibres. In some cases, especially when the lobes lie before the brain, their distance from it, as well as the length of these nervous connexions, has considerably increased.

These curious neuro-glandular pits (fig. 1), absent in the Mesonemertine and one or two aberrant species, have been shown to possess large glandular cells at their base which secrete a mucus. The development of these organs, which in the Protonemertine are but grooves in the epidermis, not far removed from the similar cephalic slits of many Turbellaria, reaches its height in *Drepanophorus*. Here the pits split into two, one part ending in a sac lined with sensory epithelium, and embedded in nervous tissue, the other projecting backwards as a long, glandular, blind canal. The exit of these organs takes many shapes, of value in systematic work. Their function is still little understood. Two lateral, shallow pits occur on the side of the body about the level of the hinder end of the proboscis in some species of the genus *Carinella*, which are termed side-organs. These are capable of being everted, and are probably sensory in function (fig. 20, *17*).

For the Heteronemertines arguments have been adduced to prove that here they have the physiological significance of a special respiratory apparatus for the central nervous tissue, which in all these forms is strongly charged with haemoglobin. The haemoglobin would, by its pre-eminent properties of fixing oxygen, serve to furnish the nerve system, which more than any other requires a constant supply, with the necessary oxygen. Such could hardly be obtained in any other way by those worms that have no special respiratory apparatus, and that live in mud and under stones where the natural supply of freshly oxygenated sea-water is practically limited. Whether in the Metanemertines, where the blood fluid is often provided with haemoglobiniferous disks, the chief functions of the side organs may not rather be a sensory one needs further investigation.

The exterior opening of the duct has been several times alluded to. In the Metanemertines it is generally situated towards the middle of a lateral transverse groove on either side of the head, as was noticed for *Carinella*, and as is also present in *Polia*. Generally a row of shorter grooves perpendicular to the first, and similarly provided with strong cilia, enlarges the surface of these furrows (fig. 14). In *Valencinia* there is nothing but a circular opening without furrow. In all Heteronemertines there is on each side of the head a longitudinal slit of varying length but generally considerable depth, in the bottom of which the dark red brain is very plainly visible by transparency. These slits are continued into the ciliated duct, being at the same time themselves very strongly ciliated. In life they are commonly rhythmically opened and shut by a wavy movement. They are the head slits (cephalic fissures, "Kopfspalten") so characteristic of this subdivision (figs. 10 and 13).

FIG. 13. FIG. 14.

FIGS. 13, 14.—Lateral views of head of a Heteronemertine (fig. 13) with longitudinal slit, and of a Metanemertine (fig 14) with transverse groove and furrows.

With respect to the sense organs of the Nemertines, we find that eyes are of rather constant occurrence, although many Heteronemertines living in the mud appear to be blind. The more highly organized species have often very numerous eyes (*Amphiporus*, *Drepanophorus*), which are provided with a spherical refracting anterior portion, with a cellular "vitreous body," with a layer of delicate radially arranged rods, with an outer sheath of dark pigment, and with a separate nerve-twig each, springing from a common or double pair of branches which leave the brain as *n. optici*, for the innervation of the eyes. Besides these more highly differentiated organs of vision, more primitive eyes are present in others down to simple stellate pigment specks without any refracting apparatus.

Organs of hearing in the form of capsules containing otoliths have only been very rarely observed, apparently only in *Metanemertini*.

As to the organ of touch, the great sensitiveness of the body has already been noticed, as well as the probable primary significance of the proboscis. Small tufts of tactile hairs or papillae are sometimes observed in small number at the tip of the head; sometimes longer hairs, apparently rather stiff, are seen on the surface, very sparingly distributed between the cilia, and hitherto only in a very limited number of small specimens. They may perhaps be considered as sensory.

Digestive System.—The anterior opening, the mouth, is situated ventrally, close to the tip of the head and in front of the brain in the *Metanemertini*, somewhat more backward and behind the brain in the other Nemertines. In most Heteronemertines it is found to be an elongated slit with corrugated borders; in the Metanemertines it is smaller and rounded; in *Malacobdella* and *Akrostomum* it, moreover, serves for the extrusion of the proboscis, which emerges by a separate dorsal opening just inside the mouth. The oesophagus is the anterior portion of the digestive canal; its walls are folded longitudinally, comparatively thick and provided with longitudinal muscular fibres. Two layers are specially obvious in its walls—the inner layer bordering the lumen being composed of smaller ciliated cells, the outer thicker one containing numerous granular cells and having a more glandular character. Outside the wall of the oesophagus a vascular space has been detected which is in direct continuity with the longitudinal blood-vessels. In certain cases, however, the walls of the oesophagus appear to be very closely applied to the muscular body-wall and this vascular space thereby considerably reduced.

The posterior portion of the intestine is specially characterized by the appearance of the intestinal diverticula horizontally and symmetrically placed right and left and opposite to each other.

In the *Metanemertini* there is a curious diverticulum of the intestine which stretches forward in the median line, ventral to the so-called stomach. It is at times sacculated, but its chief interest is that, as Lebedinsky [1] has shown, the tip of the caecum in embryonic life opens to the exterior as the blastopore. This subsequently closes up, and the newly-formed oesophagus and stomach open in the intestine above and behind it. It is a curious feature in Nemertines that the alimentary canal seldom contains traces of food and yet most of these worms are voracious. The food must be digested, absorbed and excreted with great rapidity. There is some evidence that in this group the ectoderm of the oesophagus is chiefly concerned with digestion, whereas the endoderm of the intestine is limited to the absorption of the soluble products.

Cases of asymmetry or irregularity in the arrangement of the intestinal caeca, though sometimes occurring, are not normal. At the tip of the tail, where the growth of the animal takes place, the

[1] *Arch. mikr. Anat.* xlix. (1897) p. 503.

caeca are always eminently regular. So they are throughout the whole body in most of the Metanemertines. In *Carinella* they are generally deficient and the intestine straight; in young specimens of this species, however, they occur, though less regular and more in the form of incipient foldings by which the digestive surface is increased. The inner surface of the intestinal caeca is ciliated, the caeca themselves are sometimes — especially in the hindermost portion of the body — of a considerably smaller lumen than the intermediate genital spaces; sometimes, however, the reverse is the case, and in both cases it is the smaller lumen that appears enclosed between and suspended by the transverse fibres constituting the muscular dissepiments above mentioned.

The anus is situated terminally, the muscular body-wall through which the intestine must find its way outwards probably acting in this region the part of a sphincter. The lateral nerve stems mostly terminate on both sides in closest proximity to the anus; in certain species, however, they interfuse by a transverse connexion *above* the anus. The longitudinal blood-vessels do the same.

Circulatory Apparatus.—The chief vessels are three longitudinal trunks, a median and two lateral ones. They are in direct connexion with each other both at the posterior and at the anterior end of the body. At the posterior end they communicate together by a T-shaped connexion in a simple and uniform way. Anteriorly there is a certain amount of difference in the arrangement. Whereas in the Metanemertines an arrangement prevails as represented in fig. 18, in the Heteronemertines the lateral stems, while entirely uniform all through the posterior portion of the body, no longer individually exist in the oesophageal region, but here dissolve themselves into a network of vascular spaces surrounding this portion of the digestive tract. The median dorsal vessel, however, remains distinct, but instead of continuing its course beneath the proboscidian sheath it is first enclosed by the ventral musculature of this organ, and still farther forwards it even bulges out longitudinally into the cavity of the sheath. Anteriorly it finally communicates with the lacunae just mentioned, which surround the oesophagus, bathe the posterior lobes of the brain, pass through the nerve ring together with the proboscidian sheath, and are generally continued in front of the brain as a lacunar space in the muscular tissue, one on each side.

Special mention must be made of the delicate transverse vessels regularly connecting the longitudinal and the lateral ones. They are metamerically placed, and belong to the same metamere as the digestive caeca, thus alternating with the generative sacs. The blood fluid does not flow in any definite direction; its movements are largely influenced by those of the muscular body-wall. It is colourless and contains definite corpuscles, which are round or elliptical, and in many Metanemertines are coloured red by haemoglobin, being colourless in other species. The circulatory system of *Carinella* is considerably different, being more lacunar and less restricted to definite vascular channels. Two lateral longitudinal lacunae form, so to say, the forerunners of the lateral vessels. A median longitudinal vessel and transverse connecting trunks have not as yet been detected. There are large lacunae in the head in front of the ganglia.

The vascular system is entirely closed. It contains a colourless fluid, with flat, oval nucleated corpuscles, as a rule colourless, but in some cases tinged with yellow or red haemoglobin. Its presence is one of the most distinctive features which separate the Nemertines from the Platyhelminthes. In origin the vascular system is due to a fusion of spaces which arise in the mesoblast of the larva. The blood is probably circulated by the general contraction of the whole animal, since it is very doubtful if there are any intrinsic muscles in the vessel-walls. Its function is less that of respiration than of conveying the digested food-products all over the body, and the excretory products to the nephridia, and doubtless it serves at times to assist in the extension and retraction of parts of the body. The vessels in the more highly-developed genera seem to be partly lacunae and partly true vessels with definite walls.

FIG. 18.—Diagram of the circulatory apparatus in the anterior body-region of a Metanemertine.

Nephridia.—Associated with the lateral blood-vessels are the single pair of nephridia. Each consists of a more or less coiled, ciliated, longitudinal canal, which on its external surface gives origin to one or more transverse canals, which pass to the exterior and open a little way behind the mouth on the sides of the body. On its inner surface the longitudinal canal is adpressed to the lateral blood-vessel, and gives off a number of small, blind caeca or tags, each of which ends in a small clump of cells. These tags indent the blood-vessel. From their inner ends, projecting into the lumen of the tag, hangs a bunch of cilia, which forms the flickering "flame" so well known in the excretory apparatus of the Platyhelminthes and larval Annelids (fig. 19). There is no communication between the nephridia on one side and the other, but in *Eupolia* there are ducts opening into the alimentary canal as well as to the exterior, a condition of things which recalls what obtains in certain Oligochaetes. As a rule these organs only extend a short way along the anterior end of the body, a concentration which we may associate with the development of a vascular system to bring the products of excretion to a fixed spot. In *Stichostemma*, however, Montgomery[1] has described a series of nephridia lying all along the body, and each with a varying number of external pores. The excretory system is epiblastic in its origin.

The two external openings of the nephridia are situated sometimes more towards the ventral, at other times more towards the dorsal side. Even in the larger Heteronemertines these pores are only a few millimetres behind the mouth region. In transverse sections the nephridia can be shown to be generally situated in the region limited by (1) the proboscidian sheath, (2) the upper wall of the intestine, (3) the muscular body-wall. No trace of nephridia is found posterior to the oesophagus.

FIG. 19.—Part of the excretory system lying on the lateral vessel of *Drepanophorus spectabilis*. (Magnified about 750.) 1, The longitudinal excretory canal; 2, one of the tags containing the flame-cells.

Generative System.—In the Nemertines the sexes are separate, with only very few exceptions (*Tetrastemma hermaphroditica*, Marion). The reproductive system is of the simplest, strongly contrasting with the complicated arrangements in the Platyhelminthes. A series of sacs lined with an epithelium, the proliferation of which gives rise to the ova or spermatozoa, alternate between the caeca of the intestine. When mature, each sac pushes out a process to the exterior, and this forms the genital duct. The line of the genital openings is usually dorsal to the lateral nerve. The whole sac, with its epithelial wall and its contained genital cells, arises ultimately from some of the parenchymatous cells of the body. The walls and contents in some forms arise simultaneously; in others the walls are first formed and their lining then proliferates. It has been pointed out that the cavity of the sacs corresponds in many particulars with the coelom of higher animals, and in Lebidinsky's observations on the development there is some support to the view that a coelom exists. Montgomery has also described certain spaces which may be coelomic lying between the alimentary canal and the inner longitudinal layer of muscles in the *Heteronemertini*. The ova and

[1] *Zool. Jahrb. Anat.*, x. (1897) p. 265.

spermatozoa, when mature, present no peculiarities. As the ova are in many species deposited in a gelatinous tube secreted by the body-walls, in which they are arranged (three or more together) in flask-shaped cavities, impregnation must probably take place either before or at the very moment of their being deposited. The exact mode has not yet been noticed.

Prosorhocmus claparedii is a viviparous form.

DEVELOPMENT.—The embryology of the Nemertines offers some very remarkable peculiarities. Our knowledge of the development of the most primitive forms is scanty. Both *Hetero-* and *Metanemertini* have been more exhaustively studied than the other two groups, the first, as was noticed above, being characterized by peculiar larval forms, the second developing without metamorphosis.

The larva of *Cerebratulus* is called the pilidium. In exterior shape it resembles a helmet with spike and ear-lobes, the spike being a strong and long flagellum or a tuft of long cilia, the ear-lobes lateral ciliated appendages (fig. 21). It encloses the primitive alimentary tract. Two pairs of invaginations of the skin, which originally are called the prostomial and metastomial disks, grow round the intestine, finally fuse together, and form the skin and muscular body-wall of the future Nemertine, which afterwards becomes ciliated, frees itself from the pilidium investment and develops into the adult worm without further metamorphosis.

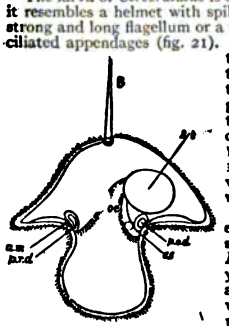

FIG. 21.—Pilidium-larva.
B, Bunch of cilia or flagellum.
oe, Oesophagus.
st, Stomach.
cs, Oesophageal outgrowth for lateral organ.
am, Amnion.
pr.d., Prostomial disk.
po.d., Metastomial disk.

The eggs of these species are not enveloped by such massive gelatinous strings as are those of the genus *Lineus*. In the latter we find the young Nemertines crawling about after a period of from six to eight weeks, and probably feeding upon a portion of this gelatinous substance, which is found to diminish in bulk. In accordance with these more sedentary habits during the first phases of life, the characteristic pilidium larva, which is so eminently adapted for a pelagic existence, appear to have been reduced to a close-fitting exterior layer of cells, which is stripped off after the definite body-wall of the Nemertine has similarly originated out of four ingrowths from the primary epiblast. To this reduced and sedentary pilidium the name of "larva of Desor" has been given.

In the *Metanemertini*, as far as they have been investigated, a direct development without metamorphosis has been observed. It appears probable that this is only a further simplification of the more complicated metamorphosis described above.

As to the development of the different organs, there is still much that remains doubtful. The hypoblast in some forms originates by invagination, in others by delamination. The proboscis is an invagination from the epiblast; the proboscidian sheath appears in the mesoblast, but is perhaps originally derived from the hypoblast. The origin of the lateral organs has already been noticed; that of the nerve system is essentially epiblastic.

AFFINITIES.—The position of the Nemertines in the animal kingdom is now looked upon as more isolated than was formerly thought, and recent writers have been inclined to treat them as a separate phylum. Whether this view be adopted or not, and whether the Turbellaria be regarded as nearly related or only remotely connected, there can be little doubt that the Nemertines resemble the Turbellaria more nearly than they do any other group of animals. Bürger even goes so far as to homologize the proboscis with the Turbellarian pharynx, and he sums up their relationship to the Annelids by the statement that to a certain extent the Nemertines represent Turbellaria which in the course of time have copied certain features of an Annelid character.

(A. A. W. H.; A. E. S.)

NEMESIANUS, MARCUS AURELIUS OLYMPIUS, Roman poet, a native of Carthage, flourished about A.D. 283. He was a popular poet at the court of the Roman emperor Carus (Vopiscus, *Carus*, 11). He wrote poems on the arts of fishing (*Halieutica*), aquatics (*Nautica*) and hunting (*Cynegetica*), but only a fragment of the last, 325 hexameter lines, has been preserved. It is neatly expressed in good Latin, and was used as a school text-book in the 9th century. Four eclogues, formerly attributed to Titus Calpurnius (*q.v.*) Siculus, are now generally considered to be by Nemesianus, and the *Praise of Hercules*, generally printed in Claudian's works, may be by him.

Complete edition of the works attributed to him in E. Bährens,

Poetae Latini Minores, iii. (1881); *Cynegetica*: ed. M. Haupt (with Ovid's *Halieutica* and Grattius Faliscus) 1838, and R. Stern, with Grattius (1832); Italian translation with notes by L. F. Valdrighi (1876). The four eclogues are printed with those of Calpurnius in the editions of H. Schenkl (1885) and E. H. Keene (1887); see L. Cisorio, *Studio sulle Egloghe di N.* (1895) and *Dell' imitazione nelle Egloghe di N.* (1896); and M. Haupt, *De Carminibus Bucolicis Calpurnii et N.* (1853), the chief treatise on the subject.

NEMESIS, the personification of divine justice. This is the only sense in which the word is used in Homer, while Hesiod (*Theog.* 223) makes Nemesis a goddess, the daughter of Night (some, however, regard the passage as an interpolation); she appears in a still more concrete form in a fragment of the *Cypria*. The word Nemesis originally meant the distributor (Gr. *νέμειν*) of fortune, whether good or bad, in due proportion to each man according to his deserts; then, the resentment caused by any disturbance of this proportion, the sense of justice that could not allow it to pass unpunished. Gruppe and others prefer to connect the name with *νεμεσᾶν*, *νεμεσίζεσθαι* ("to feel just resentment"). In the tragedians Nemesis appears chiefly as the avenger of crime and the punisher of arrogance, and as such is akin to Ate and the Erinyes. She was sometimes called Adrasteia, probably meaning "one from whom there is no escape"; the epithet is specially applied to the Phrygian Cybele, with whom, as with Aphrodite and Artemis, her cult shows certain affinities. She was specially honoured in the district of Rhamnus in Attica, where she was perhaps originally an ancient Artemis, partly confused with Aphrodite. A festival called Nemeseia (by some identified with the Genesia) was held at Athens. Its object was to avert the nemesis of the dead, who were supposed to have the power of punishing the living, if their cult had been in any way neglected (Sophocles, *Electra*, 792; E. Rohde, *Psyche*, 1907, i. 236, note 1). At Smyrna there were two divinities of the name, more akin to Aphrodite than to Artemis. The reason for this duality is hard to explain; it is suggested that they represent two aspects of the goddess, the kindly and the malignant, or the goddesses of the old and the new city. Nemesis was also worshipped at Rome by victorious generals, and in imperial times was the patroness of gladiators and *venatores* (fighters with wild beasts) in the arena and one of the tutelary deities of the drilling-ground (*Nemesis campestris*). In the 3rd century A.D. there is evidence of the belief in an all-powerful Nemesis-Fortuna. She was worshipped by a society called Nemesiaci. In early times the representations of Nemesis resembled Aphrodite, who herself sometimes bears the epithet Nemesis. Later, as the goddess of proportion and the avenger of crime, she has as attributes a measuring rod, a bridle, a sword and a scourge, and rides in a chariot drawn by griffins.

See C. Walz, *De Nemesi Graecorum* (Tübingen, 1852); E. Tournier, *Némésis* (1863), and H. Posnansky, "Nemesis und Adrasteia," in *Breslauer philologische Abhandlungen*, v. heft 2 (1890), both exhaustive monographs; an essay, "Nemesis, or the Divine Envy," by P. E. More, in *The New World* (N. Y., Dec. 1899); L. R. Farnell, *Cults of the Greek States*, ii.; and A. Legrand in Daremberg and Saglio's *Dictionnaire des antiquités*. For the Roman Nemesis, see G. Wissowa, *Religion und Kultus der Römer* (Münich, 1902).

NEMESIUS (fl. *c.* A.D. 390), a Christian philosopher, author of a treatise *περὶ φύσεως ἀνθρώπου* (*On Human Nature*), was, according to the title of his book, bishop of Emesa (in Syria); of his life nothing further is known, and even his date is uncertain, but internal evidence points to a date after the Apollinarian controversy and before the strife connected with the names of Eutyches and Nestorius, *i.e.* about the end of the 4th century. His book is an interesting attempt to compile a system of anthropology from the standpoint of the Christian philosophy. Moses and Paul are put side by side with Aristotle and Menander, and there is a clear inclination to Platonic doctrines of pre-existence and metempsychosis. In physiological matters he is in advance of Aristotle and Galen, though we can hardly assert—as has sometimes been thought—that he anticipated Harvey's discovery of the circulation of the blood. The treatise is conclusive evidence as to the mutual influence of Christianity and Hellenism in the 4th century. John of Damascus and the schoolmen, including Albertus Magnus and Thomas Aquinas, held Nemesius in high esteem, believing his book to be the work of Gregory of Nyssa, with whom he has much in common.

Editions: Antwerp, 1575; Oxford, 1671; Halle, 1802; Migne's *Patrol. Gr.* vol. 40. Versions: Latin by Alsanus, ed. Holzinger (1887); by Burgundio, ed. Burkhardt (1891–1896). Literature: Bender, *Untersuch. über Nemesius* (1898). See further Herzog-Hauck's *Realencyklop*, *s.v.*

NEMORENSIS LACUS (mod. *Nemi*), a lake in the Alban Hills, in an extinct subsidiary crater in the outer ring of the ancient Alban crater, E. of the Lake of Albano. It is about 3½ m. in diameter and some 110 ft. deep; the precipitous slopes of its basin are over 300 ft. high, and on the side towards the modern village a good deal more, and are mainly cultivated. It is now remarkable for its picturesque beauty. In ancient times it was included in the territory of Aricia, and bore the name "Mirror of Diana." The worship of Diana here was a very ancient one, and, as among the Scythians, was originally, so it was said, celebrated with human sacrifices; even in imperial times the priest of Diana was a man of low condition, a gladiator or a fugitive slave, who won his position by slaying his predecessor in fight, having first plucked a mistletoe bough from the sacred grove, and who, notwithstanding, bore the title of *rex* (king). It is curious that in none of the inscriptions that have been found is the priest of Diana mentioned; and it has indeed been believed by Morpurgo and Frazer that the *rex* was not the priest of Diana at all, but, according to the former, the priest of Virbius, or, according to the latter, the incarnation of the spirit of the forest. The temple itself was one of the most splendid in Latium; Octavian borrowed money from it in 31 B.C., and it is frequently mentioned by ancient writers. Its remains are situated a little above the level of the lake, and to the N.E. of it. They consist of a large platform, the back of which is formed by a wall of concrete faced with *opus reticulatum*, with niches, resting against the cliffs which form the sides of the crater. Excavations in the 17th and the last quarter of the 19th centuries (now covered in again), and also in 1905, led to the discovery of the temple itself, a rectangular edifice, 98 by 52 ft., and of various inscriptions, a rich frieze in gilt bronze, many statuettes (ex-votos) from the *favissae* of the temple in terra-cotta and bronze, a large number of coins, &c. None of the objects seem to go back beyond the 4th century B.C. A road descended to it from the Via Appia from the S.W., passing through the modern village of Genzano. The lake is drained by a tunnel of about 2 m. long of Roman date. On the W. side of the lake remains of two ships (really floating palaces moored to the shore) have been found, one belonging to the time of Caligula (as is indicated by an inscription on a lead pipe), and measuring 210 ft. long by 66 wide, the other even larger, 233 by 80 ft. The first was decorated with marbles and mosaics, and with some very fine bronze beamheads, with heads of wolves and lions having rings for hawsers in their mouths (and one of a Medusa), now in the Museo delle Terme at Rome, with remains of the woodwork, &c., &c. Various attempts have been made to raise the first ship, from the middle of the 15th century onwards, by which much harm has been done. The neighbourhood of the lake was naturally in favour with the Romans as a residence. Caesar had a villa constructed there, but destroyed again almost at once, because it did not satisfy him.

See F. Barnabei, *Notizie degli scavi* (1895), 361, 461; (1896), 188; V. Malfatti, *Notizie degli scavi* (1895), 471; (1896), 393; *Rivista marittima* (1896), 379; (1897), 293; J. G. Frazer, *The Golden Bough* (London, 1900); L. Morpurgo in *Monumenti dei Lincei*, xiii. (1903), 297 sqq. (T. As.)

NEMOURS, LORDS AND DUKES OF. In the 12th and 13th centuries the lordship of Nemours, in Gâtinais, France, was in possession of the house of Villebeon, a member of which, Gautier, was marshal of France in the middle of the 13th century. The lordship was sold to King Philip III. in 1274 and 1276 by Jean and Philippe de Nemours, and was then made a county and given to Jean de Grailly, captal de Buch in 1364. In 1404 Charles VI. of France gave it to Charles III. of Evreux, king of Navarre, and erected it into a duchy in the peerage of France (*duché-pairie*). Charles III.'s daughter, Beatrix, brought the

duchy to her husband Jacques de Bourbon, count of La Marche, and by the marriage of their daughter, Eleanor, to Bernard of Armagnac, count of Pardiac, it passed to the house of Armagnac. After being confiscated and restored several times, the duchy reverted to the French crown in 1505, after the extinction of the house of Armagnac-Pardiac. In 1507 it was given by Louis XII. to his nephew, Gaston de Foix, who was killed at Ravenna in 1512. The duchy then returned to the royal domain, and was detached from it successively for Giuliano de Medici and his wife Philiberta of Savoy in 1515, for Louise of Savoy in 1524, and for Philip of Savoy, count of Genevois, in 1528. The descendants of the last-mentioned duke possessed the duchy until its sale to Louis XIV. In 1572 Louis gave it to his brother Philip, duke of Orleans, whose descendants possessed it until the Revolution. The title of duc de Nemours was afterwards given to Louis Charles, son of King Louis Philippe, who is dealt with separately below.

The following are the most noteworthy of the earlier dukes of Nemours.

JAMES OF ARMAGNAC, duke of Nemours (*c.* 1433–1477), was the son of Bernard d'Armagnac, count of Pardiac, and Eleanor of Bourbon-La Marche. As comte de Castres, he served under Charles VII. in Normandy in 1449 and 1450; and afterwards in Guienne. On the accession of Louis XI. the king loaded him with honours, married him to his god-daughter, Louise of Anjou, and recognized his title to the duchy of Nemours in 1462. Sent by Louis to pacify Roussillon, Nemours felt that he had been insufficiently rewarded for the rapid success of this expedition, and joined the League of the Public Weal in 1465. He subsequently became reconciled with Louis, but soon resumed his intrigues. After twice pardoning him, the king's patience became exhausted, and he besieged the duke's château at Carlat and took him prisoner. Nemours was treated with the utmost rigour, being shut up in a cage; and was finally condemned to death by the parlement and beheaded on the 4th of August 1477.

See B. de Mandrot, *Jacques d'Armagnac, duc de Nemours* (Paris, 1890).

PHILIP OF SAVOY, duke of Nemours (1490–1533), was a son of Philip, duke of Savoy, and brother of Louise of Savoy, mother of Francis I. of France. Originally destined for the priesthood, he was given the bishopric of Geneva at the age of five, but resigned it in 1510, when he was made count of Genevois. He served under Louis XII., with whom he was present at the battle of Agnadello (1509), under the emperor Charles V. in 1520, and finally under his nephew, Francis I. In 1528 Francis gave him the duchy of Nemours and married him to Charlotte of Orléans-Longueville. He died on the 25th of November 1533.

His son, JAMES (1531–1585), became duke of Nemours in 1533. He distinguished himself at the sieges of Lens and Metz (1552–1553), at the battle of Renty (1554) and in the campaign of Piedmont (1555). He was a supporter of the Guises, and had to retire for some time into Savoy in consequence of a plot. On his return to France he fought the Huguenots, and signalized himself by his successes in Dauphiné and Lyonnais. In 1567 he induced the court to return from Meaux to Paris, took part in the battle of Saint Denis, protested against the peace of Longjumeau, and repulsed the invasion of Wolfgang, count palatine of Zweibrücken. He devoted his last years to letters and art, and died at Annecy on the 15th of June 1585.

By his wife Anne of Este, the widow of Francis, duke of Guise, the duke left a son, CHARLES EMMANUEL (1567–1595), who in his youth was called prince of Genevois. Involved in political intrigues by his relationship with the Guises, he was imprisoned after the assassination of Henry, duke of Guise, and his brother the cardinal of Lorraine, in 1588, but contrived to escape. He fought at Ivry and Arques, and was governor of Paris when it was besieged by Henry IV. After quarrelling with his half-brother Charles of Lorraine, duke of Mayenne, he withdrew to his government of Lyonnais, where he endeavoured to make himself independent. He was imprisoned, however, in the château of Pierre-Encise by the archbishop of Lyons. After his escape he attacked Lyons, but was defeated owing to the intervention of the constable de Montmorency. He died at Annecy in July 1595.

His brother HENRY (1572–1632), called originally marquis de Saint-Sorlin, succeeded him as duke. In 1588 he took the marquisate of Saluzzo from the French for his cousin, the duke of Savoy. The princes of Guise, his half-brothers, induced him to join the League, and in 1591 he was made governor of Dauphiné in the name of that faction. He made his submission to Henry IV. in 1596. After quarrelling with the duke of Savoy he withdrew to Burgundy and joined the Spaniards in their war against Savoy. After peace had been proclaimed on the 14th of November 1616, he retired to the French court. He died in 1632, and was succeeded by his eldest son, Louis, and on the death of the latter in 1641 by his second son, CHARLES AMADEUS (1624–1652), who served in the army of Flanders in 1645, and in the following year commanded the light cavalry at the siege of Courtrai. In 1652 he took part in the war of the Fronde, and fought at Bléneau and at the Faubourg St Antoine, where he was wounded. On the 30th of July of the same year he was killed in a duel by his brother-in-law, François de Vendôme, duke of Beaufort. He had two daughters, Marie Jeanne Baptiste (d. 1724), who married Charles Emmanuel of Savoy in 1665; and Marie Françoise Elisabeth, who married Alphonso VI., king of Portugal, in 1666. His brother Henry (1625–1659), who had been archbishop of Reims, but now withdrew from orders, succeeded to the title. In 1657 he married MARIE D'ORLÉANS-LONGUEVILLE (1625–1707), daughter of Henry II. of Orléans, duke of Longueville. This duchess of Nemours is a famous personage. At an early age she was involved in the first Fronde, which was directed by her father and her stepmother. Anne Geneviève de Bourbon-Condé, the celebrated duchesse de Longueville; and when her husband died in 1659, leaving her childless, the rest of her life was mainly spent in contesting her inheritance with her stepmother. She left some interesting *Mémoires*, which are published by C. B. Petitot in the *Collection complète des mémoires* (1819–1829).

NEMOURS, LOUIS CHARLES PHILIPPE RAPHAËL, DUC DE (1814–1896), second son of the duke of Orleans, afterwards King Louis Philippe, was born on the 25th of October 1814. At twelve years of age he was nominated colonel of the first regiment of chasseurs, and in 1830 he became a chevalier of the order of the Saint Esprit and entered the chamber of peers. As early as 1825 his name was mentioned as a possible candidate for the throne of Greece, and in 1831 he was elected king of the Belgians, but international considerations deterred Louis Philippe from accepting the honour for his son. In February 1831 he accompanied the French army which entered Belgium to support the new kingdom against Holland, and took part in the siege of Antwerp. He accompanied the Algerian expedition against the town of Constantine in the autumn of 1836, and in a second expedition (1837) he was entrusted with the command of a brigade and with the direction of the siege operations before Constantine. General Damrémont was killed by his side on the 12th of October, and the place was taken by assault on the 13th. He sailed a third time for Algeria in 1841, and served under General Bugeaud, taking part in the expedition to revictual Medea on the 29th of April, and in sharp fighting near Miliana on the 3rd to 5th of May. In the expedition against the fortified town of Takdempt he commanded the 1st infantry division. On his return to France he became commandant of the camp of Compiègne. He had been employed on missions of courtesy to England in 1835, in 1838 and in 1845, and to Berlin and Vienna in 1836. The occasion of his marriage in 1840 with Victoria, daughter of Duke Ferdinand of Saxe-Coburg, was marked by a check to Louis Philippe's government in the form of a refusal to bestow the marriage dowry proposed by Thiers in the chamber of deputies. The death of his elder brother, Ferdinand, duke of Orleans, in 1842 gave him a position of greater importance as the natural regent in the case of the accession of his nephew, the young count of Paris. His reserve and dislike of public functions, with a certain haughtiness of manner, however, made him unpopular. On the outbreak of the revolution of

1848 he held the Tuileries long enough to cover the king's retreat, but refrained from initiating active measures against the mob. He followed his sister-in-law, the duchess of Orléans, and her two sons to the chamber of deputies, but was separated from them by the rioters, and only escaped finally by disguising himself in the uniform of a national guard. He embarked for England, where he settled with his parents at Claremont. His chief aim during his exile, especially after his father's death, was a reconciliation between the two branches of the house of Bourbon, as indispensable to the re-establishment of the French monarchy in any form. These wishes were frustrated on the one hand by the attitude of the comte de Chambord, and on the other by the determination of the duchess of Orléans to maintain the pretensions of the count of Paris. Nemours was prepared to go further than the other princes of his family in accepting the principles of the legitimists, but lengthy negotiations ended in 1857 with a letter, written by Nemours, as he subsequently explained, at the dictation of his brother, François, prince de Joinville, in which he insisted that Chambord should express his adherence to the tricolour flag and to the principles of constitutional government. In 1871 the Orleans princes renewed their professions of allegiance to the senior branch of their house, but they were not consulted when the count of Chambord came to Paris in 1873, and their political differences remained until his death in 1883.

Nemours had lived at Bushey House after the death of Queen Marie Amélie in 1866. In 1871 the exile imposed on the French princes was withdrawn, but he only transferred his establishment to Paris after their disabilities were also removed. In March 1872 he was restored to his rank in the army as general of division, and placed in the first section of the general staff. After his retirement from the active list he continued to act as president of the Red Cross Society until 1881, when new decrees against the princes of the blood led to his withdrawal from Parisian society. During the presidency of Marshal MacMahon, he had appeared from time to time at the Élysée. He died at Versailles on the 26th of June 1896, the duchess having died at Claremont on the 10th of November 1857. Their children were Louis Philippe Marie Ferdinand Gaston, comte d'Eu (b. 1842), who married Isabella, eldest daughter of Don Pedro II. of Brazil; Ferdinand Philippe Marie, duc d'Alençon (b. 1844), who married Sophie of Bavaria (1847–1897), sister of the empress Elizabeth of Austria; Margaret (1846–1893), who married Prince Ladislas Czartoryski; and Blanche (b. 1857).

See R. Bazin, *Le Duc de Nemours* (1907); Paul Thureau-Dangin, *Histoire de la monarchie de juillet* (4 vols., 1884, &c.).

NEMOURS, a town of northern France, in the department of Seine-et-Marne, on the Loing and its canal, 26 m. S. of Melun, on the Paris-Lyon railway. Pop. (1906) 4814. The church, which dates mainly from the 16th century, has a handsome wooden spire, and there is a feudal castle. A statue of the mathematician Bézout (d. 1783), a native of the town, was erected in 1885. In the vicinity is a group of fine sandstone rocks, and sand is extensively quarried. Nemours is supposed to derive its name from the woods (*nemora*) in the midst of which it formerly stood, and discoveries of Gallo-Roman remains indicate its early origin. It was captured by the English in 1420, but derives its historical importance rather from the lordship (afterwards duchy) to which it gave its name. In 1585 a treaty revoking previous concessions to the Protestants was concluded at Nemours between Catherine de Medici and the Guises.

NENADOVICH, MATEYA (1777–1854), Servian patriot, was born in 1777. He is generally called Prota Mateya, since as a boy of sixteen he was made a priest, and a few years later became archpriest (Prota) of Valyevo. His father, Alexa Nenadovich, *Knez* (chief magistrate) of the district of Valyevo, was one of the most popular and respected public men among the Servians at the beginning of the 19th century. When the four leaders of the Janissaries of the Belgrade Pashalic (the so-called Dahis) thought that the only way to prevent a general rising of the Servians was to intimidate them by murdering all their principal men, Alexa Nenadovich was one of the first victims. The policy of the Dahis, instead of preventing, did actually and immediately provoke a general insurrection of the Servians against the Turks. Prota Mateya became the deputy-commander of the insurgents of the Valyevo district (1804), but did not hold the post for long, as Karageorge sent him in 1805 on a secret mission to St Petersburg, and afterwards employed him almost constantly as Servia's diplomatic envoy to Russia, Austria, Bucharest and Constantinople. After the fall of Karageorge (1813), the new leader of the Servians, Milosh Obrenovich, sent Prota Mateya as representative of Servia to the Congress of Vienna (1814–1815), where he pleaded the Servian cause indefatigably. During that mission he often saw Lord Castlereagh, and for the first time the Servian national interests were brought to the knowledge of British statesmen.

Prota Mateya's memoirs are the most valuable authority for the history of the first and second Servian insurrections against the Turks. The best edition of the *Memoari Proṭe Mateye Nenadovicha* was published by the Servian Literary Association in Belgrade in 1893.

NENAGH, a market town of Co. Tipperary, Ireland, finely situated in a rich though hilly country near the river Nenagh, 96½ m. S.W. from Dublin by the Ballybrophy and Limerick branch of the Great Southern & Western railway. Pop. (1901) 4704. Of the old castle, called Nenagh Round, dating from the time of King John, there still exists the circular donjon or keep. There are no remains of the hospital founded in 1200 for Austin canons, nor of the Franciscan friary, founded in the reign of Henry III. and one of the richest religious houses in Ireland. The town is governed by an urban district council. It was one of the ancient manors of the Butlers, who received for it the grant of a fair from Henry VIII. In 1550 the town and friary were burned by O'Carroll. In 1641 the town was taken by Owen Roe O'Neill, but shortly afterwards it was recaptured by Lord Inchiquin. It surrendered to Ireton in 1651, and was burned by Sarsfield in 1688.

NENNIUS (fl. 796), a Welsh writer to whom we owe the *Historia Britonum*, lived and wrote in Brecknock or Radnor. His work is known to us through thirty manuscripts; but the earliest of these cannot be dated much earlier than the year 1000; and all are defaced by interpolations which give to the work so confused a character that critics were long disposed to treat it as an unskilful forgery. A new turn was given to the controversy by Heinrich Zimmer, who, in his *Nennius vindicatus* (1893), traced the history of the work and, by a comparison of the manuscripts with the 11th-century translation of the Irish scholar, Gilla Coemgim (d. 1072), succeeded in stripping off the later accretions from the original nucleus of the *Historia*. Zimmer follows previous critics in rejecting the *Prologus maior* (§§ 1, 2), the *Capitula*, or table of contents, and part of the *Mirabilia* which form the concluding section. But he proves that Nennius should be regarded as the compiler of the *Historia* proper (§§ 7-65). Zimmer's conclusions are of more interest to literary critics than to historians. The only part of the *Historia* which deserves to be treated as a historical document is the section known as the *Genealogiae Saxonum* (§§ 57-65). This is merely a recension of a work which was composed about 679 by a Briton of Strathclyde. The author's name is unknown; but he is, after Gildas, our earliest authority for the facts of the English conquest of England. Nennius himself gives us the oldest legends relating to the victories of King Arthur; the value of the *Historia* from this point of view is admitted by the severest critics. The chief authorities whom Nennius followed were Gildas' *De excidio Britonum*, Eusebius, the *Vita Patricii* of Murichu Maccu Machtheni, the *Collectanea* of Tirechan, the *Liber occupationis* (an Irish work on the settlement of Ireland), the *Liber de sex aetatibus mundi*, the chronicle of Prosper of Aquitaine, the *Liber beati Germani*. The sources from which he derived his notices of King Arthur (§ 56) have not been determined.

See J. Stevenson's edition of the *Historia Britonum* (English Hist. Soc., 1838), based on a careful study of the MSS.; A. de la Borderie, *L'Historia Britonum* (Paris and London, 1883), which summarizes the older negative criticism; H. Zimmer, *Nennius vindicatus* (Berlin, 1893); T. Mommsen in *Neues Archiv der Gesellschaft für ältere deutsche Geschichtskunde*, xix. 283. (H. W. C. D.)

NEO-CAESAREA, SYNOD OF, a synod held shortly after that of Ancyra, probably about 314 or 315 (although Hefele inclines to put it somewhat later). Its principal work was the adoption of fifteen disciplinary canons, which were subsequently accepted as ecumenical by the Council of Chalcedon, 451, and of which the most important are the following: i. degrading priests who marry after ordination; vii. forbidding a priest to be present at the second marriage of any one; viii. refusing ordination to the husband of an adulteress; xi. fixing thirty years as the age below which one might not be ordained (because Christ began His public ministry at the age of thirty); xiii. according to city priests the precedence over country priests; xiv. permitting *Chorepiscopi* to celebrate the sacraments; xv. requiring that there be seven deacons in every city.

See Mansi ii. pp. 539-551; Hardouin i. pp. 282-286; Hefele (2nd ed.) i. pp. 242-251 (Eng. trans. i. pp. 222-230). (T. F. C.)

NEOCOMIAN, in geology, the name given to the lowest stage of the Cretaceous system. It was introduced by J. Thurmann in 1835 on account of the development of these rocks at Neuchâtel (Neocomum), Switzerland. It has been employed in more than one sense. In the type area the rocks have been divided into two sub-stages, a lower, Valanginian (from Valengin, E. Desor, 1854) and an upper, Hauterivian (from Hauterive, E. Renevier, 1874); there is also another local sub-stage, the infra-Valanginian or Berriasian (from Berrias, H. Coquand, 1876). These three sub-stages constitute the Neocomian in its restricted sense. A. von Koenen and other German geologists extend the use of the term to include the whole of the Lower Cretaceous up to the top of the Gault or Albian. Renevier divided the Lower Cretaceous into the Neocomian division, embracing the three sub-stages mentioned above, and an Urgonian division, including the Barremian, Rhodanian and Aptian sub-stages. Sir A. Geikie (*Text Book of Geology*, 4th ed., 1903) regards "Neocomian" as synonymous with Lower Cretaceous, and he, like Renevier, closes this portion of the system at the top of the Lower Greensand (Aptian). Other British geologists (A. J. Jukes-Browne, &c.) restrict the Neocomian to the marine beds of Speeton and Tealby, and their estuarine equivalents, the Weald Clay and Hastings Sands (Wealden). Much confusion would be avoided by dropping the term Neocomian entirely and employing instead, for the type area, the sub-divisions given above. This becomes the more obvious when it is pointed out that the Berriasian type is limited to Dauphine; the Valanginian has not a much wider range; and the Hauterivian does not extend north of the Paris basin.

Characteristic fossils of the Berriasian are *Hoplites euthymi*, *H. occitanicus*; of the Valanginian, *Natica leviathan*, *Belemnites pistiliformis* and *B. dilatatus*, *Oxynoticeras Gevrili*; of the Hauterivian, *Hoplites radiatus*, *Crioceras capricornu*, *Exogyra Couloni* and *Toxaster complanatus*. The marine equivalents of these rocks in England are the lower Speeton Clays of Yorkshire and the Tealby beds of Lincolnshire. The Wealden beds of southern England represent approximately an estuarine phase of deposit of the same age. The Hils clay of Germany and Wealden of Hanover; the limestones and shales of Teschen; the *Aptychus* and *Pygope diphyoides* marls of Spain, and the Petchorian formation of Russia are equivalents of the Neocomian in its narrower sense.

See CRETACEOUS, WEALDEN, SPEETON BEDS. (J. A. H.)

NEOCORATE, a rank or dignity granted by the Senate under the Roman Empire to certain cities of Asia, which had built temples for the worship of the emperors or had established cults of members of the imperial family. The Greek word νεωκόρος meant literally a temple-sweeper (νεώς, temple, κορεῖν, to sweep), and was thence used both of a temple attendant and of a priestly holder of high rank who was in charge of a temple.

NEOLITHIC, or LATER STONE AGE (Gr. νέος, new, and λίθος, stone), a term employed first by Lord Avebury and since generally accepted, for the period of highly finished and polished stone implements, in contrast with the rude workmanship of those of the earlier Stone Age (Palaeolithic). Knowledge of Neolithic times is derived principally from four sources, Tumuli or ancient burial-mounds, the Lake-dwellings of Switzerland, the Kitchen-middens of Denmark and the Bone-Caves. No trace of metal is found, except gold, which seems to have been sometimes used for ornaments. Agriculture, pottery, weaving, the domestication of animals, the burying of the dead in dolmens, and the rearing of megalithic monuments are the typical developments of man during this stage.

See ARCHAEOLOGY; also Lord Avebury, *Prehistoric Times* (1900); Sir John Evans, *Ancient Stone Implements of Great Britain* (1897); Sir J. Prestwich, *Geology* (1886–1888).

NEOPHYTE (Gr. νεόφυτος, from νέος, new, φυτόν, a plant, "newly planted"), a word used in the Eleusinian and other mysteries to designate the newly initiated, and in the early church applied to newly baptized persons. These usually wore the white garments which they received at their admission to the church (see BAPTISM) for eight days, from Easter eve till the Sunday after Easter (hence called *Dominica in albis*), but they were subject to strict supervision for some time longer and, on the authority of 1 Tim. iii. 6, were generally held ineligible for election as bishops, a rule to which, however, history shows some notable exceptions, as in the cases of St Ambrose at Milan in 374 and Synesius of Cyrene at Ptolemais in 400, who were chosen bishops before they were even baptized. By the council of Nicaea (325) this rule was extended to the priesthood. The ancient discipline is still maintained in the Roman Church, and applies to converts from Christian sects as well as to those from heathenism. The period, however, is determined by circumstances. The term "neophyte" is also sometimes applied in the Roman Church to newly ordained priests, and even—though rarely—to novices of a religious order. In a transferred sense the word is also given to one beginning to learn any new subject.

NEOPLATONISM, the name given specially to the last school of pagan philosophy, which grew up mainly among the Greeks of Alexandria from the 3rd century onwards. The term has also been applied to the Italian humanists of the Renaissance, and in modern times, somewhat vaguely, to thinkers who have based their speculations on the Platonic metaphysics or on Plotinus, and incorporated with it a tendency towards a mystical explanation of ultimate phenomena.

Historical Position and Significance.—The political history of the ancient world ends with the formation, under Diocletian and Constantine, of a universal state bearing the cast of Oriental as well as Graeco-Roman civilization. The history of ancient philosophy ends in like manner with a universal philosophy which assimilated elements of almost all the earlier systems, and worked up the results of Eastern and Western culture. Just as the Later Roman empire was at once the supreme effort of the old world and the outcome of its exhaustion, so Neoplatonism is in one aspect the consummation, in another the collapse, of ancient philosophy. Never before in Greek or in Roman speculation had the consciousness of man's dignity and superiority to nature found such adequate expression; never before had real science and pure knowledge been so undervalued and despised by the leaders of culture as they were by the Neoplatonists. Judged from the standpoint of empirical science, philosophy passed its meridian in Plato and Aristotle, declined in the post-Aristotelian systems, and set in the darkness of Neoplatonism. But, from the religious and moral point of view, it must be admitted that the ethical "mood" which Neoplatonism endeavoured to create and maintain is the highest and purest ever reached by antiquity.

It is a proof of the strength of the moral instincts of mankind that the only phase of culture which we can survey in all its stages from beginning to end culminated not in materialism, but in the boldest idealism. This idealism, however, is also in its way a mark of intellectual bankruptcy. Contempt for reason and science leads in the end to barbarism—its necessary consequence being the rudest superstition. As a matter of fact, barbarism did break out after the flower had fallen from Neoplatonism. The philosophers themselves, no doubt, still lived

on the knowledge they repudiated; but the masses were trained to a superstition with which the Christian church, as the executor of Neoplatonism, had to reckon and contend. By a fortunate coincidence, at the very moment when this bankruptcy of the old culture must have become apparent, the stage of history was occupied by barbaric peoples. This has obscured the fact that the inner history of antiquity, ending as it did in despair of this world, must in any event have seen a recurrence of barbarism. The present world was a thing that men would neither enjoy nor master nor study. A new world was discovered, for the sake of which everything else was abandoned; to make sure of that world insight and intelligence were freely sacrificed; and, in the light that streamed from beyond, the absurdities of the present became wisdom, and wisdom became foolishness.

Such is Neoplatonism. The pre-Socratic philosophy took its stand on natural science, to the exclusion of ethics and religion. The systems of Plato and Aristotle sought to adjust the rival claims of physics and ethics (although the supremacy of the latter was already acknowledged); but the popular religions were thrown overboard. The post-Aristotelian philosophy in all its branches makes withdrawal from the objective world its starting-point. It might seem, indeed, that Stoicism indicates a falling off from Plato and Aristotle towards materialism, but the ethical dualism, which was the ruling tendency of the Stoa, could not long endure its materialistic physics, and took refuge in the metaphysical dualism of the Platonists. But this originated no permanent philosophical creation. From one-sided Platonism issued the various forms of scepticism, the attempt to undermine the trustworthiness of empirical knowledge. Neoplatonism, coming last, borrowed something from all the schools. First, it stands in the line of post-Aristotelian systems; it is, in fact, as a subjective philosophy, their logical completion. Secondly, it is founded on scepticism; for it has neither interest in, nor reliance upon, empirical knowledge. Thirdly, it can justly claim the honour of Plato's name, since it expressly goes back to him for its metaphysics, directly combating those of the Stoa. Yet even on this point it learned something from the Stoics; the Neoplatonic conception of the action of the Deity on the world and of the essence and origin of matter can only be explained by reference to the dynamic pantheism of the Stoa. Fourthly, the study of Aristotle also exercised an influence on Neoplatonism. This appears not only in its philosophical method, but also—though less prominently—in its metaphysic. And, fifthly, Neoplatonism adopted the ethics of Stoicism; although it was found necessary to supplement them by a still higher conception of the functions of the spirit.

Thus, with the exception of Epicureanism—which was always treated by Neoplatonism as its mortal enemy—there is no outstanding earlier system which did not contribute something to the new philosophy. And yet Neoplatonism cannot be described as an eclectic system, in the ordinary sense of the word. For, in the first place, it is dominated by one all-pervading interest—the religious; and in the second place, it introduced a new first principle into philosophy, viz. the supra-rational, that which lies beyond reason and beyond reality. This principle is not to be identified with the "idea" of Plato or with the "form" of Aristotle. Neoplatonism perceived that neither sense perception nor rational cognition is a sufficient basis or justification for religious ethics; consequently it broke away from rationalistic ethics as decidedly as from utilitarian morality. It had therefore to find out a new world and a new spiritual function, in order first to establish the existence of what it desiderated, and then to realize and describe what it had proved to exist. Man, however, cannot transcend his psychological endowment. If he will not allow his thought to be determined by experience, he falls a victim to his imagination. In other words, thought, which will not stop, takes to mythology; and in the place of reason we have superstition. Still, as we cannot allow every fancy of the subjective reason to assert itself, we require some new and potent principle to keep the imagination within bounds. This is found in the authority of a sound tradition. Such authority must be superhuman, otherwise it can have no claim on our respect; it must, therefore, be divine. The highest sphere of knowledge—the supra-rational—as well as the very possibility of knowledge, must depend on divine communications—that is, on revelations. In short, philosophy as represented by Neoplatonism, its sole interest being a religious interest, and its highest object the supra-rational, must be a philosophy of revelation.

This is not a prominent feature in Plotinus or his immediate disciples, who still exhibit full confidence in the subjective presuppositions of their philosophy. But the later adherents of the school did not possess this confidence[1]; they based their philosophy on revelations of the Deity, and they found these in the religious traditions and rites of all nations. The Stoics had taught them to overstep the political boundaries of states and nationalities, and rise from the Hellenic to a universal human consciousness. Through all history the spirit of God has breathed; everywhere we discover the traces of His revelation. The older any religious tradition or mode of worship is, the more venerable is it, the richer in divine ideas. Hence the ancient religions of the East had a peculiar interest for the Neoplatonist. In the interpretation of myths Neoplatonism followed the allegorical method, as practised especially by the Stoa; but the importance it attached to the spiritualized myths was unknown to the Stoic philosophers. The latter interpreted the myths and were done with them; the later Neoplatonists treated them as the proper material and the secure foundation of philosophy. Neoplatonism claimed to be not merely the absolute philosophy, the keystone of all previous systems, but also the absolute religion, reinvigorating and transforming all previous religions. It contemplated a restoration of all the religions of antiquity, by allowing each to retain its traditional forms, and at the same time making each a vehicle for the religious attitude and the religious truth embraced in Neoplatonism; while every form of ritual was to become a stepping-stone to a high morality worthy of mankind. In short, Neoplatonism seizes on the aspiration of the human soul after a higher life, and treats this psychological fact as the key to the interpretation of the universe. Hence the existing religions, after being refined and spiritualized, were made the basis of philosophy.

Neoplatonism thus represents a stage in the history of religion; indeed this is precisely where its historical importance lies. In the progress of science and enlightenment it has no positive significance, except as a necessary transition which the race had to make in order to get rid of nature-religion, and that undervaluing of the spiritual life which formed an insuperable obstacle to the advance of human knowledge. Neoplatonism, however, failed as signally in its religious enterprise as it did in its philosophical. While seeking to perfect ancient philosophy, it really extinguished it; and in like manner its attempted reconstruction of ancient religions only resulted in their destruction. For in requiring these religions to impart certain prescribed religious truths, and to inculcate the highest moral tone, it burdened them with problems to which they were unequal. And further, by inviting them to loosen, though not exactly to dissolve, their political allegiance—the very thing that gave them stability—it removed the foundation on which they rested. But might it not then have placed them on a broader and firmer foundation? Was not the universal empire of Rome ready at hand, and might not the new religion have stood to it in the same relation of dependence which the earlier religions had held to the smaller nations and states? This was no longer possible. It is true that the political and spiritual histories of the peoples on the Mediterranean run in parallel lines, the one leading up to the universal monarchy of Rome, the other leading up to monotheism and universal human morality. But the spiritual development had shot far ahead of the political; even the Stoa occupied a height far beyond the reach of anything in the political sphere. It is also true that Neoplatonism sought to come to an understanding

[1] Porphyry wrote a book, περὶ τῆς ἐκ λογίων φιλοσοφίας, but this was before he became a pupil of Plotinus; as a philosopher he was independent of the λόγια.

with the Byzantine Roman empire; Julian perished in the pursuit of this project. But even before his day the shrewder Neoplatonists had seen that their lofty religious philosophy could not stoop to an alliance with the despotic world-empire, because it could not come in contact with the world at all. To Neoplatonism political affairs are at bottom as indifferent as all other earthly things. The idealism of the new philosophy was too heavenly to be naturalized in the Byzantine empire, which stood more in need of police officials than of philosophers. Important and instructive, therefore, as are the attempts made from time to time by the state and by individual philosophers to unite Neoplatonism and the universal monarchy, their failure was a foregone conclusion.

There is one other question which we are called upon to raise here. Why did not Neoplatonism set up an independent religious community? Why did it not provide for its mixed multitude of divinities by founding a universal church, in which all the gods of all nations might be worshipped along with the one ineffable Deity? The answer to this question involves the answer to another—Why was Neoplatonism defeated by Christianity? Three essentials of a permanent religious foundation were wanting in Neoplatonism; they are admirably indicated in Augustine's *Confessions* (vii. 18-21). First, and chiefly, it lacked a religious founder; second, it could not tell how the state of inward peace and blessedness could become permanent; third, it had no means to win those who were not endowed with the speculative faculty. The philosophical discipline which it recommended for the attainment of the highest good was beyond the reach of the masses; and the way by which the masses could attain the highest good was a secret unknown to Neoplatonism. Thus it remained a school for the "wise and prudent"; and when Julian tried to enlist the sympathies of the common rude man for the doctrines and worship of this school, he was met with scorn and ridicule.

It is not as a philosophy, then, nor as a new religion, that Neoplatonism became a decisive factor in history, but, if one may use the expression, as a "mood." The instinctive certainty that there is a supreme good, lying beyond empirical experience, and yet not an intellectual good—this feeling, and the accompanying conviction of the utter vanity of all earthly things, were produced and sustained by Neoplatonism. Only it could not describe the nature of this highest good; and therefore it had to abandon itself to imagination and aesthetic impressions. It changed thought into an emotional dream; it plunged into the ocean of sentiment; it treated the old world of fable as the reflection of a higher reality, and transformed reality into poetry; and after all these expedients, to borrow a phrase of Augustine's, it only saw afar off the land of its desire.

Yet the influence of Neoplatonism on the history of our ethical culture is immeasurable, above all because it begot the consciousness that the only blessedness which can satisfy the heart must be sought higher even than the sphere of reason. That man shall not live by bread alone, the world had learned before Neoplatonism; but Neoplatonism enforced the deeper truth—a truth which the older philosophy had missed—that man shall not live by knowledge alone. And, besides the propaedeutic importance which thus belongs to it, another fact has to be taken into account in estimating the influence of Neoplatonism. It is to this day the nursery of that whole type of devotion which affects renunciation of the world, which strives after an ideal, without the strength to rise above aesthetic impressions, and is never able to form a clear conception of the object of its own aspiration.

Origin.—As forerunners of Neoplatonism we may regard, on the one hand, those Stoics who accepted the Platonic distinction between the sensible world and the intelligible, and, on the other hand, the so-called Neopythagoreans and religious philosophers like Plutarch of Chaeronea and especially Numenius of Apamea. But these cannot be considered the actual progenitors of Neoplatonism; their philosophic method is quite elementary as compared with the Neoplatonic, their fundamental principles are uncertain, and unbounded deference is still paid to the authority of Plato. The Jewish and Christian thinkers of the first two centuries approach considerably nearer than Numenius to the later Neoplatonism.[1] Here we have Philo, to begin with. Philo, who translated the Old Testament religion into the terms of Hellenic thought, holds as an inference from his theory of revelation that the divine Supreme Being is "supra-rational," that He can be reached only through "ecstasy", and that the oracles of God supply the material of moral and religious knowledge. The religious ethics of Philo—a compound of Stoic, Platonic and Neopythagorean elements—already bear the peculiar stamp which we recognize in Neoplatonism. While his system assigns the supremacy to Greek philosophy over the national religion of Israel, it exacts from the former, as a sort of tribute to the latter, the recognition of the elevation of God above the province of reason. The claim of positive religion to be something more than the intellectual apprehension of the reason in the universe is thus acknowledged. Religious syncretism is also a feature of Philo's system, but it differs essentially from what we find in later Neoplatonism. For Philo pays no respect to any cultus except the Jewish; and he believed that all the fragments of truth to be found amongst Greeks and Romans had been borrowed from the books of Moses. The earliest Christian philosophers, particularly Justin and Athenagoras, likewise prepared the way for the speculations of the Neoplatonists—partly by their attempts to connect Christianity with Stoicism and Platonism, partly by their ambition to exhibit Christianity as "hyperplatonic." In the introduction to his *Dialogue with Trypho*, Justin follows a method which bears a striking resemblance to the later method of Neoplatonism: he seeks to base the Christian knowledge of God—that is, the knowledge of the truth—on Platonism, Scepticism and "Revelation." A still more remarkable parallel to the later Neoplatonism is afforded by the Christian Gnostics of Alexandria, especially Valentinus and the followers of Basilides.[2] Like the Neoplatonists, the Basilidians believed, not in an emanation from the Godhead, but in a dynamic manifestation of its activity. The same is true of Valentinus, who also placed an unnameable being at the apex of his system, and regarded matter, not as a second principle, but as a product of the one divine principle. It must be added that the dependence of Basilides and Valentinus on Zeno and Plato is beyond dispute. But the method observed by these Gnostics in thinking out the plan and the history of the universe is by no means thoroughgoing. Ancient myths are admitted without undergoing analysis; the most naïve realism alternates with daring efforts at spiritualizing. Philosophically considered, therefore, the Gnostic systems are very unlike the rigorous self-consistency of Neoplatonism; although they certainly contain almost all the elements which enter into the Neoplatonic theory of the universe.

But were the oldest Neoplatonists really acquainted with the speculations of Philo, or Justin, or Valentinus, or Basilides? Did they know the Oriental religions, Judaism and Christianity in particular? And, if so, did they really derive anything from these sources?

To these questions we cannot give decided, still less definite and precise, answers. Since Neoplatonism originated in Alexandria, where Oriental modes of worship were accessible to every one, and since the Jewish philosophy had also taken its place in the literary circles of Alexandria, we may safely assume that even the earliest of the Neoplatonists possessed

[1] The resemblance would probably be still more apparent if we thoroughly understood the development of Christianity at Alexandria in the 2nd century; but unfortunately we have only very meagre fragments to guide us here.

[2] The dogmas of the Basilidians, as given by Hippolytus, read almost like passages from Neoplatonic works: ἐπεὶ οὐδὲν ἦν, οὐχ ὕλη, οὐκ οὐσία, οὐκ ἀνούσιον, οὐχ ἁπλοῦν, οὐ σύνθετον, οὐκ ἀνόητον, οὐκ ἀναίσθητον, οὐκ ἄνθρωπος. . . . οὐκ ὢν θεὸς ἀνοήτως, ἀναισθήτως, ἀβούλως, ἀπροαιρέτως, ἀπαθῶς, ἀνεπιθυμήτως κόσμον ἠθέλησε ποιῆσαι . οὕτως οὐκ ὢν θεὸς ἐποίησε κόσμον οὐκ ὄντα ἐξ οὐκ ὄντων, καταβαλλόμενος καὶ ὑποστήσας σπέρμα τι ἓν ἔχον πᾶσαν ἐν ἑαυτῷ τὴν τοῦ κόσμου πανσπερμίαν (*Philos.* vii. 20 seq.). See GNOSTICISM, BASILIDES, &c.

an acquaintance with Judaism and Christianity. But if we search Plotinus for evidence of any actual influence of Jewish and Christian philosophy, we search in vain; and the existence of any such influence is all the more unlikely because it is only the later Neoplatonism that offers striking and deep-rooted parallels to Philo and the Gnostics. The Philonic and Gnostic philosophies thus appear to be merely an historical anticipation of the Neoplatonic, without any real connexion. Nor is there anything mysterious in such an anticipation. It simply means that a certain religious and philosophical tendency, which grew up slowly on Greek soil, was already implanted in those who occupied the vantage-ground of a revealed religion of redemption. We have to come down to Iamblichus and his school before we find complete correspondence with the Christian Gnosticism of the 2nd century; that is to say, it is only in the 4th century that Greek philosophy in its proper development reaches the stage at which certain Greek philosophers who had embraced Christianity had arrived in the 2nd century. The influence of Christianity—whether Gnostic or Catholic—on Neoplatonism was at no time very considerable, although individual Neoplatonists, after Amelius, used Christian texts as oracles, and put on record their admiration for Christ.

History and Doctrines.—The founder of the Neoplatonic school in Alexandria is supposed to have been Ammonius Saccas (*q.v.*).

Plotinus. But the *Enneads* of his pupil Plotinus are the primary and classical document of Neoplatonism. The doctrine of Plotinus is mysticism, and like all mysticism it consists of two main divisions. The first or theoretical part deals with the high origin of the human soul, and shows how it has departed from its first estate. In the second or practical part the way is pointed out by which the soul may again return to the Eternal and Supreme. Since the soul in its longings reaches forth beyond all sensible things, beyond the world of ideas even, it follows that the highest being must be something supra-rational. The system thus embraces three heads—(1) the primeval Being, (2) the ideal world and the soul, (3) the phenomenal world. We may also, however, in accordance with the views of Plotinus, divide thus: (A) the invisible world—(1) the primeval Being, (2) the ideal world, (3) the soul; (B) the phenomenal world.

The primeval Being is, as opposed to the many, the One; as opposed to the finite, the Infinite, the unlimited. It is the source of all life, and therefore absolute causality and the only real existence. It is, moreover, the Good, in so far as all finite things have their purpose in it, and ought to flow back to it. But one cannot attach moral attributes to the original Being itself, because these would imply limitation. It has no attributes of any kind; it is being without magnitude, without life, without thought; in strict propriety, indeed, we ought not to speak of it as existing; it is "above existence," "above goodness." It is also active force without a substratum; as active force the primeval Being is perpetually producing something else, without alteration, or motion, or diminution of itself. This production is not a physical process, but an emission of force; and, since the product has real existence only in virtue of the original existence working in it, Neoplatonism may be described as a species of dynamic pantheism. Directly or indirectly, everything is brought forth by the "One." In it all things, so far as they have being, are divine, and God is all in all. Derived existence, however, is not like the original Being itself, but is subject to a law of diminishing completeness. It is indeed an image and reflection of the first Being; but the further the line of successive projections is prolonged the smaller is its share in the true existence. The totality of being may thus be conceived as a series of concentric circles, fading away towards the verge of non-existence, the force of the original Being in the outermost circle being a vanishing quantity. Each lower stage of being is united with the "One" by all the higher stages, and receives its share of reality only by transmission through them. All derived existence, however, has a drift towards, a longing for, the higher, and bends towards it so far as its nature will permit.

The original Being first of all throws out the *nous*, which is a perfect image of the One and the archetype of all existing things. It is at once being and thought, ideal world and idea. As image, the nous corresponds perfectly to the One, but as derived it is entirely different. What Plotinus understands by the nous is the highest sphere accessible to the human mind (*κόσμος νοητός*), and, along with that, pure thought itself.

The image and product of the motionless nous is the soul, which, according to Plotinus is, like the nous, immaterial. Its relation to the nous is the same as that of the nous to the One. It stands between the nous and the phenomenal world, is permeated and illuminated by the former, but is also in contact with the latter. The nous is indivisible; the soul *may* preserve its unity and remain in the nous, but at the same time it has the power of uniting with the corporeal world and thus being disintegrated. It therefore occupies an intermediate position. As a single soul (world-soul) it belongs in essence and destination to the intelligible world; but it also embraces innumerable individual souls; and these can either submit to be ruled by the nous, or turn aside to the sensual and lose themselves in the finite.

Then the soul, a moving essence, generates the corporeal or phenomenal world. This world ought to be so pervaded by the soul that its various parts should remain in perfect harmony. Plotinus is no dualist, like the Christian Gnostics; he admires the beauty and splendour of the world. So long as idea governs matter, or the soul governs the body, the world is fair and good. It is an image—though a shadowy image—of the upper world, and the degrees of better and worse in it are essential to the harmony of the whole. But in the actual phenomenal world unity and harmony are replaced by strife and discord; the result is a conflict, a becoming and vanishing, an illusive existence. And the reason for this state of things is that bodies rest on a substratum of matter. Matter is the basework of each (*τὸ βάθος ἑκάστου ἡ ὕλη*); it is the dark principle, the indeterminate, that which has no qualities, the *μὴ ὄν*. Destitute of form and idea, it is evil; as capable of form it is neutral.

The human souls which have descended into corporeality are those which have allowed themselves to be ensnared by sensuality and overpowered by lust. They now seek to cut themselves loose from their true being; and, striving after independence, they assume a false existence. They must turn back from this; and, since they have not lost their freedom, a conversion is still possible.

Here, then, we enter upon the practical philosophy. Along the same road by which it descended the soul must retrace its steps back to the supreme Good. It must first of all return to itself. This is accomplished by the practice of virtue, which aims at likeness to God, and leads up to God. In the ethics of Plotinus all the older schemes of virtue are taken over and arranged in a graduated series. The lowest stage is that of the civil virtues, then follow the purifying, and last of all the divine virtues. The civil virtues merely adorn the life, without elevating the soul. That is the office of the purifying virtues, by which the soul is freed from sensuality and led back to itself, and thence to the nous. By means of ascetic observances the man becomes once more a spiritual and enduring being, free from all sin. But there is still a higher attainment; it is not enough to be sinless, one must become "God." This is reached through contemplation of the primeval Being, the One—in other words, through an ecstatic approach to it. Thought cannot attain to this, for thought reaches only to the nous, and is itself a kind of motion. It is only in a state of perfect passivity and repose that the soul can recognize and touch the primeval Being. Hence the soul must first pass through a spiritual curriculum. Beginning with the contemplation of corporeal things in their multiplicity and harmony, it then retires upon itself and withdraws into the depths of its own being, rising thence to the nous, the world of ideas. But even there it does not find the Highest, the One; it still hears a voice saying, "not we have made ourselves." The last stage is reached when, in the highest tension and concentration, beholding in silence and utter forgetfulness of all things, it is able as it were to lose itself. Then it may see God, the fountain of life, the source of being, the origin of all good, the root of the soul. In that moment it enjoys the highest indescribable bliss; it is as it were swallowed up of divinity, bathed in the light of eternity.[1]

Such is the religious philosophy of Plotinus, and for himself personally it sufficed, without the aid of the popular religion or worship. Nevertheless he sought for points of support in these. God is certainly in the truest sense nothing but the primeval Being; but He reveals Himself in a variety of emanations and manifestations. The nous is a sort of second god, the *λόγοι* which are wrapped up in it are gods, the stars are gods, and so on. A rigid monotheism appeared to Plotinus a miserable conception. He gave a meaning to the myths of the popular religions, and he had something to say even for magic, soothsaying and prayer. In support of image-worship he advanced

[1] Porphyry tells us that on four occasions during the six years of their intercourse Plotinus attained to this ecstatic union with God.

arguments which were afterwards adopted by the Christian image-worshippers. Still, as compared with the later Neoplatonists, he is comparatively free from crass superstition and wild fanaticism. He is not to be classed amongst the "deceived deceivers," and the restoration of the worship of the old gods was by no means his chief object.

Amongst his pupils, Amelius and Porphyry are the most eminent. Amelius modified the teaching of Plotinus on certain points; and he also put some value on the prologue to the Gospel of John To Porphyry (*q.v.*) belongs the credit of having recast and popularized the system of his master Plotinus. He was not an original thinker, but a diligent student, distinguished by great learning, by a turn for historical and philological criticism, and by an earnest purpose to uproot false teaching—especially Christianity, to ennoble men and train them to goodness. The system of Porphyry is more emphatically practical and religious than that of Plotinus. The object of philosophy, according to Porphyry, is the salvation of the soul. The origin and the blame of evil are not in the body, but in the desires of the soul. Hence the strictest asceticism (abstinence from flesh, and wine, and sexual intercourse) is demanded, as well as the knowledge of God. As he advanced in life, Porphyry protested more and more earnestly against the rude faith of the common people and their immoral worships. But, outspoken as he was in his criticism of the popular religions, he had no wish to give them up. He stood up for a pure worship of the many gods, and maintained the cause of every old national religion and the ceremonial duties of its adherents. His work *Against the Christians* was directed, not against Christ, nor even against what he believed to be Christ's teaching, but against the Christians of his own day and their sacred books, which, according to Porphyry, were the work of deceivers and ignorant people. In his trenchant criticism of the origin of what passed for Christianity in his time, he spoke bitter and severe truths, which have gained for him the reputation of the most rabid and wicked of all the enemies of Christianity. His work was destroyed,[1] but the copious extracts which we find in Lactantius, Augustine, Jerome, Macarius Magnus and others show how profoundly he had studied the Christian writings, and how great was his talent for real historical research.

Porphyry.

Porphyry marks the transition to a new phase of Neoplatonism, in which it becomes completely subservient to polytheism, and seeks before everything else to protect the Greek and Oriental religions from the formidable assault of Christianity. In the hands of Iamblichus (*q.v.*), the pupil of Porphyry, Neoplatonism is changed "from a philosophical theory to a theological doctrine." The distinctive tenets of Iamblichus cannot be accounted for from scientific but only from practical considerations. In order to justify superstition and the ancient forms of worship, philosophy becomes in his hands a theurgy, a knowledge of mysteries, a sort of spiritualism.

Iamblichus.

To this period also belongs a set of "philosophers," with regard to whom it is impossible to say whether they are dupes or impostors—the "decepti deceptores" of whom Augustine speaks. In this philosophy the mystical properties of numbers are a leading feature; absurd and mechanical notions are glossed over with the sheen of sacramental mystery, myths are explained by pious fancies and fine-sounding pietistic reflections, miracles, even the most ridiculous, are believed in, and miracles are wrought. The "philosopher" has become a priest of magic and philosophy a method of incantation. Moreover, in the unbridled exercise of speculation, the number of divine beings was increased indefinitely; and these fantastic accessions to Olympus in the system of Iamblichus show that Greek philosophy is returning to mythology, and that nature-religion is still a power in the world. And yet it is undeniable that the very noblest and choicest minds of the 4th century are to be found in the ranks of the Neoplatonists. So great was the general decline that this Neoplatonic philosophy offered a welcome shelter to many earnest and influential men, in spite of the charlatans and hypocrites who were gathered under the same roof. On certain points of doctrine, too, the dogmatic of Iamblichus indicates a real advance. Thus his emphatic assertion of the truth that the seat of evil is in the will is noteworthy; and so also is his repudiation of Plotinus's theory of the divinity of the soul.

The numerous followers of Iamblichus—Aedesius, Chrysanthius, Eusebius, Priscus, Sopater, Sallust, and, most famous of all, Maximus (*q.v.*), rendered little service to speculation. Some of them (Themistius in particular) are known as commentators on the older philosophers, and others as the missionaries of mysticism. The work *De mysteriis Aegyptiorum* is the best sample of the views and aims of these philosophers. Their hopes rose high when Julian ascended the imperial throne (361–363). But the emperor himself lived long enough to see that his romantic policy of restoration was to leave no results; and after his early death all hope of extinguishing Christianity was abandoned.

But undoubtedly the victory of Christianity in the age of Valentinian and Theodosius had a purifying influence on Neoplatonism. During the struggle for supremacy, the philosophers had been driven to make common cause with everything that was hostile to Christianity. But now Neoplatonism was thrust from the great stage of history. The church and church theology, to whose guidance the masses now surrendered themselves, took in along with them their superstition, their polytheism, their magic, their myths, and all the machinery of religious witchcraft. The more all this settled and established itself—certainly not without opposition—in the church the purer did Neoplatonism become While maintaining intact its religious attitude and its theory of knowledge, it returned with new zest to scientific studies, especially the study of the old philosophers. If Plato still remains the divine philosopher, yet we can perceive that after the year 400 the writings of Aristotle are increasingly read and valued. In the chief cities of the empire Neoplatonic schools flourished till the beginning of the 5th century; during this period, indeed, they were the training-schools of Christian theologians. At Alexandria the noble Hypatia (*q.v.*) taught, to whose memory her impassioned disciple Synesius, afterwards a bishop, reared a splendid monument. But after the beginning of the 5th century the fanaticism of the church could no longer endure the presence of "heathenism." The murder of Hypatia was the death of philosophy in Alexandria, although the school there maintained a lingering existence till the middle of the 6th century. But there was one city of the East which, lying apart from the crowded highways of the world, had sunk to a mere provincial town, and yet possessed associations which the church of the 5th century felt herself powerless to eradicate. In Athens a Neoplatonic school still flourished. There, under the monuments of its glorious past, Hellenism found its last retreat. The school of Athens returned to a stricter philosophical method and the cultivation of scholarship. Still holding by a religious philosophy, it undertook to reduce the whole Greek tradition, as seen in the light of Plotinus, to a comprehensive and closely knit system. Hence the philosophy which arose at Athens was what may fairly be termed scholasticism. For every philosophy is scholastic whose subject-matter is imaginative and mystical, and which handles this subject-matter according to established rules in logical categories and distinctions Now to these Neoplatonists, the books of Plato, along with certain divine oracles, the Orphic poems, and much more which they assigned to a remote antiquity, were documents of canonical authority; they were inspired divine writings. Out of these they drew the material of their philosophy, which they then proceeded to elaborate with the appliances of dialectic.

Influence of Christianity.

The most distinguished teachers at Athens were Plutarch (*q.v.*), his disciple Syrianus (who did important work as a commentator on Plato and Aristotle, and further deserves mention for his vigorous defence of the freedom of the will), but above all Proclus (411–485) Proclus is the great schoolman of Neoplatonism. It was he who, combining religious

Proclus.

[1] It was condemned by an edict of the emperors Theodosius II and Valentinian in the year 448.

ardour with formal acuteness, connected the whole mass of traditional lore into a huge system, making good defects, and smoothing away contradictions by means of distinctions and speculations. "It was reserved for Proclus," says Zeller, 'to bring the Neoplatonic philosophy to its formal conclusion by the rigorous consistency of his dialectic, and, keeping in view all the modifications which it had undergone in the course of two centuries, to give it that form in which it was transferred to Christianity and Mahommedanism in the middle ages." Forty-four years after the death of Proclus the school of Athens was closed by Justinian (A.D. 529); but it had already fulfilled its mission in the work of Proclus. The works of Proclus, as the last testament of Hellenism to the church and the middle ages, exerted an incalculable influence on the next thousand years. They not only formed one of the bridges by which the medieval thinkers got back to Plato and Aristotle; they determined the scientific method of thirty generations, and they partly created and partly nourished the Christian mysticism of the middle ages.

The disciples of Proclus are not eminent (Marinus, Asclepiodotus, Ammonius, Zenodotus, Isidorus, Hegias, Damascius). The last president of the Athenian school was Damascius (*q.v.*). When Justinian issued the edict for the suppression of the school, Damascius along with Simplicius (the painstaking commentator on Aristotle) and five other Neoplatonists set out to make a home in Persia. They found the conditions were unfavourable and were allowed to return (see CHOSROES I.).

At the beginning of the 6th century Neoplatonism had ceased to exist in the East as an independent philosophy. Almost at the same time, however—and the coincidence is not accidental—it made new conquests in the church theology through the writings of the pseudo-Dionysius. It began to bear fruit in Christian mysticism, and to diffuse a new magical leaven through the worship of the church.

In the West, where philosophical efforts of any kind had been very rare since the 2nd century, and where mystical contemplation did not meet with the necessary conditions, Neoplatonism found a congenial soil only in isolated individuals. C. Marius Victorinus (*q.v.*) translated certain works of Plotinus, and thus had a decisive influence on the spiritual history of Augustine (*Confess.* vii. 9, viii. 2). It may be said that Neoplatonism influenced the West only through the medium of the church theology, or, in some instances, under that disguise. Even Boetius (it may now be considered certain) was a catholic Christian, although his whole mode of thought was certainly Neoplatonic (see BOETIUS). His violent death in the year 525 marks the end of independent philosophy in the West. But indeed this last of the Roman philosophers stood quite alone in his century, and the philosophy for which he lived was neither original, nor well-grounded, nor methodically developed.

Neoplatonism and the Theology of the Church.—The question as to the influence of Neoplatonism on the development of Christianity is not easily answered, because it is scarcely possible to get a complete view of their mutual relations. The answer will depend, in the first instance, upon how much is included under the term "Neoplatonism." If Neoplatonism is understood in the widest sense, as the highest and fittest expression of the religious movements at work in the Graeco-Roman empire from the 2nd to the 5th century, then it may be regarded as the twin-sister of the church dogmatic which grew up during the same period; the younger sister was brought up by the elder, then rebelled against her and at last tyrannized over her. The Neoplatonists themselves characterized the theologians of the church as intruders, who had appropriated the Greek philosophy and spoiled it by the admixture of strange fables. Thus Porphyry says of Origen (Euseb. *H.E.* vi. 19), "The outer life of Origen was that of a Christian and contrary to law; but, as far as his views of things and of God are concerned, he thought like the Greeks, whose conceptions he overlaid with foreign myths." This verdict of Porphyry's is at all events more just and apt than that of the theologians on the Greek philosophers, when they accused them of having borrowed all their really valuable doctrines from the ancient Christian books. But the important point is that the relationship was acknowledged on both sides. Now, in so far as both Neoplatonism and the church dogmatic set out from the felt need of redemption, in so far as both sought to deliver the soul from sensuality and recognized man's inability without divine aid—without a revelation—to attain salvation and a sure knowledge of the truth, they are at once most intimately related and at the same time mutually independent. It must be confessed that when Christianity began to project a theology it was already deeply impregnated by Hellenic influences. But the influence is to be traced not so much to philosophy as to the general culture of the time, and the whole set of conditions under which spiritual life was manifested. When Neoplatonism appeared, the Christian church had already laid down the main positions of her theology; or if not, she worked them out alongside of Neoplatonism—*that* is not a mere accident—but still independently. It was only by identifying itself with the whole history of Greek philosophy, or by figuring as pure Platonism restored, that Neoplatonism could stigmatize the church theology of Alexandria as a plagiarism from itself. These assumptions, however, were fanciful. Although our sources are unfortunately very imperfect, the theology of the church does not appear to have learned much from Neoplatonism in the 3rd century—partly because the latter had not yet reached the form in which its doctrines could be accepted by the church dogmatic, and partly because theology was otherwise occupied. Her first business was to plant herself firmly on her own territory, to make good her position and clear away old and objectionable opinions. Origen was quite as independent a thinker as Plotinus; only, they both drew on the same tradition. From the 4th century downwards, however, the influence of Neoplatonism on the Oriental theologians was of the utmost importance. The church gradually expressed her most peculiar convictions in dogmas, which were formulated by philosophical methods, but were irreconcilable with Neoplatonism (the Christological dogmas); and the further this process went the more unrestrainedly did theologians resign themselves to the influence of Neoplatonism on all other questions. The doctrines of the incarnation, the resurrection of the flesh and the creation of the world in time marked the boundary line between the church's dogmatic and Neoplatonism; in every other respect, theologians and Neoplatonists drew so closely together that many of them are completely at one. In fact, there were special cases, like that of Synesius, in which a speculative reconstruction of distinctively Christian doctrines by Christian men was winked at. If a book does not happen to touch on any of the above-mentioned doctrines, it may often be doubtful whether the writer is a Christian or a Neoplatonist. In ethical precepts, in directions for right living (that is, asceticism), the two systems approximate more and more closely. But it was here that Neoplatonism finally celebrated its greatest triumph. It indoctrinated the church with all its mysticism, its mystic exercises and even its magical cultus as taught by Iamblichus. The works of the pseudo-Dionysius contain a gnosis in which, by means of the teaching of Iamblichus and Proclus, the church's theology is turned into a scholastic mysticism with directions on matters of practice and ritual. And as these writings were attributed to Dionysius, the disciple of the apostles, the scholastic mysticism which they unfold was regarded as an apostolic, not to say a divine, science. The influence exercised by these writings, first on the East, and then—after the 9th (or 12th) century—on the West, cannot be overestimated. It is impossible to enlarge upon it here; suffice it to say that the mystical and pietistic devotion of our own day, even in the Protestant churches, is nourished on works whose ancestry can be traced, through a series of intermediate links, to the writings of the pseudo-Areopagite.

In the ancient world there was only one Western theologian who came directly under the influence of Neoplatonism; but that one is Augustine, the most important of them all. It was through Neoplatonism that Augustine got rid of scepticism and the last dregs of Manichaeism. In the seventh book of his *Confessions* he has recorded how much he owed to the perusal of Neoplatonic works. On all the cardinal doctrines—God, matter, the relation of God to the world, freedom and evil—Augustine retained the impress of Neoplatonism; at the same time he is the theologian of antiquity who most clearly perceived and most fully stated wherein Neoplatonism and Christianity differ. The best ever written by any church father on this subject is to be found in chaps. ix.-xxi. of the seventh book of the *Confessions*.

Why Neoplatonism succumbed in the conflict with Christianity is a question which the historians have never satisfactorily answered. As a rule, the problem is not even stated correctly. We have nothing to do here with our own private ideal of Christianity, but solely with catholic Christianity and catholic theology. These are the forces that conquered Neoplatonism, after assimilating nearly everything that it contained. Further, we must consider the arena in which the victory was won. The battlefield was the empire of Constantine and Theodosius. It is only when these and all other circumstances of the case are duly realized that we have a right to inquire how much the essential doctrines of Christianity contributed to the victory, and what share must be assigned to the organization of the church.

In medieval theology and philosophy mysticism appears as the powerful opponent of rationalistic dogmatism. The empirical science of the Renaissance and the two following centuries was itself a new development of Platonism and Neoplatonism, as opposed to rationalistic dogmatism, with its contempt for experience. Magic, astrology and alchemy—all the outgrowth of Neoplatonism—gave the first effectual stimulus to the observation of nature, and consequently to natural science, and in this way finally extinguished barren

rationalism. Thus in the history of science Neoplatonism has played a part and rendered services of which Plotinus or Iamblichus or Proclus never dreamt. So true is it that sober history is often stranger and more capricious than all the marvels of legend and romance.

AUTHORITIES.—On the relation of Neoplatonism to Christianity, and the historical importance of Neoplatonism generally, see the leading church histories, and the *Histories of Dogma* by Baur, Nitzsch, Harnack, &c. Compare also Löffler, *Der Platonismus der Kirchenväter* (1782); Huber, *Die Philosophie der Kirchenväter* (1859); Tzchirner, *Fall des Heidenthums* (1829), pp. 574-618; Burckhardt, *Die Zeit Constantin's des Grossen* (1853); Chastel, *Hist. de la destruction du Paganisme dans l'empire d'Orient* (1850); Beugnot, *Hist. de la destruction du Paganisme en Occident* (1835); E. von Lasaulx, *Der Untergang des Hellenismus* (1854); Vogt, *Neuplatonismus und Christenthum* (1836); Ullmann, "Einfluss des Christenthums auf Porphyrius," in the *Stud. u. Kritiken* (1832); Jean Réville, *La Religion à Rome sous les Sévères* (1886); C. Bigg, *The Christian Platonists of Alexandria* (1886) and *Neoplatonism* (1895); Rufus M. Heinze, "Neuplatonismus," in Herzog-Hauck, *Realencyk.* vol. xiii. (1903). On the after-effects of Neoplatonism on the church's dogmatic, see Ritschl, *Theologie und Metaphysik* (1881). On the relation of Neoplatonism to Monachism, compare Keim, *Aus dem Urchristenthum* (1878). On the history of Neoplatonism with special reference to the decline of Roman polytheism, see, *e.g.*, Samuel Dill, *Roman Society in the Last Century of the Western Empire* (1898), pp. 82 foll. On Plotinus, Porphyry, &c., see separate articles. (A. Ha.; J. M. M.)

NEOPTOLEMUS (also called **PYRRHUS**), in Greek legend, the son of Achilles and Deïdameia. He was brought up by his grandfather Lycomedes in the island of Scyros, and taken to Troy in the last year of the war by Odysseus, since Helenus had declared that the city could not be captured without the aid of a descendant of Aeacus. Neoptolemus was famed for his beauty, eloquence and bravery. He was one of the warriors in the wooden horse and slew Priam at the sack of Troy (*Odyssey*, xi. 508-526; *Aeneid*, ii. 527). Apart from these Trojan tales, Neoptolemus is a prominent figure in the legends of Epirus and of Delphi. He was the ancestor of the Molossian kings, who therefore claimed to be of pure Hellenic stock. He was murdered at Delphi, where he was buried, and a festival was held in his honour every eighth year.

NEOPYTHAGOREANISM, a Graeco-Alexandrian school of philosophy, which became prominent in the 1st century A.D. Very little is known about the members of this school, and there has been much discussion as to whether the Pythagorean literature which was widely published at the time in Alexandria was the original work of 1st-century writers or merely reproductions of and commentaries on the older Pythagorean writings. The only well-known members of the school were Apollonius of Tyana and Moderatus of Gades. In the previous century Cicero's learned friend P. Nigidius Figulus (d. 45 B.C.) had made an attempt to revive Pythagorean doctrines, but he cannot be described as a member of the school. Further, it is necessary to distinguish from the Neopythagoreans a number of Eclectic Platonists, who, during the 1st century of our era, maintained views which had a similar tendency (*e.g.* Apuleius of Madaura, Plutarch of Chaeronea and, later, Numenius of Apamea).

Neopythagoreanism was the first product of an age in which abstract philosophy had begun to pall. The Stoics discovered that their "perfect man" was not to be found in the luxurious, often morbid society of the Graeco-Roman world; that something more than dialectic ethics was needed to reawaken a sense of responsibility. A degenerate society cared nothing for syllogisms grown threadbare by repetition. Neopythagoreanism was an attempt to introduce a religious element into pagan philosophy in place of what had come to be regarded as an arid formalism. The founders of the school sought to invest their doctrines with the halo of tradition by ascribing them to Pythagoras and Plato, and there is no reason to accuse them of insincerity. They went back to the later period of Plato's thought, the period when Plato endeavoured to combine his doctrine of Ideas with the Pythagorean number-theory, and identified the *Good* with the *One*, the source of the duality of the Infinite and the Measured (τὸ ἄπειρον and πέρας) with the resultant *scale of realities* from the *One* down to the objects of the material world. They emphasized the fundamental distinction between the Soul and the Body. God must be worshipped spiritually by prayer and the will to be good, not in outward action. The soul must be freed from its material surrounding, the "muddy vesture of decay," by an ascetic habit of life. Bodily pleasures and all sensuous impulses must be abandoned as detrimental to the spiritual purity of the soul. God is the principle of good; Matter (ὕλη) the groundwork of Evil. In this system we distinguish not only the asceticism of Pythagoras and the later mysticism of Plato, but also the influence of the Orphic mysteries and of Oriental philosophy. The Ideas of Plato are no longer self-subsistent entities; they are the elements which constitute the content of spiritual activity. The Soul is no longer an appanage of *οὐσία*, it is *οὐσία* itself: the non-material universe is regarded as the sphere of mind or spirit.

Thus Neopythagoreanism is a link in the chain between the old and the new in pagan philosophy. It connects the teaching of Plato with the doctrines of Neoplatonism and brings it into line with the later Stoicism and with the ascetic system of the Essenes. A comparison between the Essenes and the Neopythagoreans shows a parallel so striking as to warrant the theory that the Essenes were profoundly influenced by Neopythagoreanism. Lastly Neopythagoreanism furnished Neoplatonism with the weapons with which pagan philosophy made its last stand against Christianity.

See PYTHAGORAS, NEOPLATONISM, ESSENES; and Zeller's *Philosophie d. Griechen*. For members of the school see APOLLONIUS OF TYANA and MODERATUS OF GADES.

NEPAL, NEPAUL or NIPAL, an independent state, situated on the north-eastern frontier of India, lying between 80° 15′ and 88° 10′ E., and 26° 20′ and 30° 10′ N.; area, 54,000 sq. m. Its extreme length is about 525 m., and its breadth varies from 90 to 140 m. It is bounded on the N. by Tibet; on the E. by Sikkim; on the S. by Bengal and the United Provinces; and on the W. by Kumaon, from which it is separated by the Kali river. Its population is estimated by the natives at about 5,200,000, the common phrase used by the rulers in speaking of popular opinion being, "but what will the Bāwan (*i.e.* fifty-two) Lākh say to this."

Nepal consists physically of two distinct territories: (1) the *tarai*, or strip of level, cultivated and forest land lying along the southern border; and (2) the great mountainous tract stretching northwards to Tibet. Along the northern frontier stand many of the highest peaks of the Himalayan range, such as Dhaulagiri (26,837 ft.), Mutsiputra, Gaurishankar and Yasa (24,000), Gosain Than (26,313), Mount Everest (29,002 according to the survey value), Kinchinjunga (28,146), and numerous peaks varying from 20,000 to 24,000 ft. In clear weather this magnificent snowy range may be seen in an almost continuous line from the top of some of the lower ranges near Katmandu. South of these are numerous parallel lower ranges, varying from 16,000 to 6000 ft. in height, which are broken up at intervals by cross ranges, thus forming a series of glens with a few hill-girt valleys interspersed.

These mountain ranges determine the course of the rivers, which are divided by the cross ranges into four groups. The first of these extends from Kumaon eastward as far as Dhaulagiri, and consists of the affluents of the Kali (Sarda), Sarju, Kurnali, Eastern Sarju, and Rapti, all of which ultimately form the Gogra or Gogari, and flow into the Ganges. The second group, known to the Nepalese as the Sapt Gandaki, rises from the peaks between Dhaulagiri and Gosaïn Than, and unite at Trebeni Ghat to form the Gandak. The third is a group of smaller rivers draining the great valley of Nepal, the valleys of Chitlong, Benepa, and Panouti, and portions of the tarai around the Churiaghati range of hills. These are the various branches of the Bara Gandak, the lesser Rapti, the Bagmati and Kumla. East of this again is the fourth group, known to the Nepalese as the Sapt Kosi, rising from the peaks between Gosain Than and Kinchinjunga, and uniting to form the Soon Kosi, which falls into the Ganges.

There is thus a natural division of the country into four portions. The most western is the country of the Baisi (or twenty-two) rajas, and contains the towns of Jumla, Doti and Sulliana. The second is the country of the Chaubisi (or twenty-four) rajas, and contains the towns of Malebum, Palpa, Gurkha and Noakote. The third is the district containing Nepal proper, with the capital and many large towns to be mentioned afterwards. The fourth is the eastern portion of Nepal, comprising the country of the Kiratis, and many small towns, such as Dhankota, Ilam and Bijapur.

Route into Nepal—The portion of Nepal, exclusive of the tarai, which is open to Europeans is the "valley of Nepal," containing the capital of the country, and a few adjacent smaller valleys. There is only one means of access open to Europeans, and this indeed is in general resorted to by the natives, as the other routes to the capital are longer and far more difficult. The road runs nearly north from Segauli, passing through the tarai and sal forests, to Bhichhkhori; then through the beds of mountain streams, through a pass in the Churiyaghati range, and through another sal forest, to Hetoura; thence by a wide and good road to Bhimphedi at the foot of the Sisaghari range of hills. So far the route is practicable for carts and baggage animals, but from this point the road is a mere rugged footpath over the Sisaghari Pass, through the Chitlong valley and over the Chandragiri range. The distance from Segauli to Katmandu is 90 m.

The valley in extreme length from east to west is about 26 m., and in breadth from north to south about 15. The surrounding hills vary in height from 6000 to 9720 ft., the level of the valley itself being about 4500 ft. above the sea. Tradition has it that Nepal was once a lake, and appearances are in favour of this view. It is crossed from east to west by a low limestone range, through which the waters have gradually forced a passage, and in like manner the collected rivers have escaped at the south-east corner of the valley.

There are three principal streams, the Bagmati, Vishnumati, and Manohora, besides many small tributaries of these. All the rivers rise within the valley, except the Bagmati, which springs from the northern side of the Shiupuri peak, and enters the valley through a ravine at the north-east corner. They all unite and pass through a long narrow gorge in the limestone range, already mentioned, at Chobhar, and ultimately escape from the valley at Kotwaldar.

Climate.—In and around the Nepal valley, as in India, the year may be divided into the rainy, cold and hot seasons. The rains begin in June and last till October, but the fall is not so heavy or continuous as in the plains of Hindustan. The cold season extends from the middle of October to the middle of April. During these months the climate is delicious. Hoar-frost and thin ice are common in the mornings, and the thermometer sometimes falls as low as 25° Fahr., but the days are bright and warm. From Christmas to the end of February there are occasional showers of rain; and snow falls on the surrounding low ranges, but is very rarely seen in the valley itself. From April to the beginning of the rains is the hot season, but the thermometer seldom reaches 85° in the shade. The result of observations extending over many years gives an average mean temperature of 60° Fahr., and an annual rainfall of about 60 in. Violent thunderstorms are not uncommon, and occasionally severe earthquakes occur, as in 1833 and 1866.

Flora and Fauna.—In a country possessing such a range of altitudes the flora and fauna are of course very varied. For descriptive purposes, Nepal may again be divided into three zones. These are—(1) the tarai and lower ranges of hills up to 4000 ft. in height; (2) the central ranges and high-lying valleys, up to 10,000 ft.; and (3) the alpine region, from 10,000 to 29,000 ft. in height. These zones are not, however, sharply defined, as the climate varies according to the latitude, the height of intermediate ranges, and the depth of the valleys; so that tropical plants and animals are sometimes found far in the interior, and the more northern species descend along the loftier spurs into the southern zones.

The low alluvial land of the tarai is well adapted for cultivation, and is, so to speak, the granary of Nepal; but owing to scantiness of population and other causes the greater portion of it consists of swamps, jungles and forests. Considerable stretches of land are, however, being reclaimed from year to year. The productions here are those of British India—cotton, rice, wheat, pulse, sugar-cane, tobacco, opium, indigo, and the fruits and vegetables familiar in the plains of India. The forests yield a magnificent supply of sal, sisū, and other valuable forest trees; and the jungles abound with acacias, mimosas, cotton tree (*Bombax*), dak (*Butea frondosa*), large bamboos, rattans, palms, and numerous ferns and orchids. On the Churiaghati range the common *Pinus longifolia* grows freely. Tea can be grown at a height of from 2000 to 4000 ft. The middle zone supplies rice, wheat, maize, barley, oats, ginger, turmeric, chillies, potatoes, Cucurbitaceae, pineapples, and many varieties of European fruits, vegetables and flowers. The forests contain tree rhododendrons, *Pinus longifolia*, oaks, horse-chestnuts, walnuts, maples, hill bamboos, wild cherry, pear, allies of the tea plant, paper plants (*Daphne*), roses, and many other inhabitants of temperate climes, with various orchids, ferns and wild flowers. In the alpine zone exist Coniferae of many kinds, junipers, yew, box, hollies, birch, dwarf rhododendrons and the usual alpine flora.

The wild animals follow a similar distribution, and the following typical species may be mentioned. In the lowest zone are found the tiger, leopard, wolf, hyena and jackal, the elephant and rhinoceros, the gaur (*Gavaeus gaurus*), gayal (*Gavaeus frontalis*), wild buffalo or arna, many species of deer, and the black bear (*Ursus labiatus*). Among the birds are found the pea-fowl, francolins, wild jungle fowl, and the smaller vultures, &c. In the middle zone there are the leopard, the Himalayan black bear (*Ursus tibetanus*), the wild dog, cats of many sorts, squirrels, hares, porcupines, the pangolin, and some species of deer and antelope. Among the birds are the larger vultures and eagles, pheasants (*Gallophasis*), chukor, hill partridges, &c. In the alpine zone are found the true bear (*Ursus isabellinus*, or brown bear), the yak, musk deer, wild goats and sheep, marmots, &c. Among the birds are the eagle-vulture (*Gypaetus*), the blood pheasant (*Ithaginis cruentus*), snow pheasant (*Tetraogallus himalayensis*), snow partridge (*Lerwa nivicola*), the horned pheasant (*Ceriornis satyra*), crested pheasant (*Catreus wallichi*). &c. Geese, ducks, waders of all sorts, and other migratory birds are found in abundance in the two lower zones.

Minerals.—The lowest zone in some directions abounds in fossils; and deposits of lignite, and even of true coal, are met with, the latter notably at a spot south of Palpa. The middle zone is rich in limestone and marbles, and abounds with minerals, such as iron, copper, zinc, lead and sulphur. Copper is found near the surface in many places, and there are remains of mines both at Markhu and in the great valley of Nepal. Mineral springs, both hot and cold, are numerous. Traces of silver, and also of gold, have been found in the alpine zone.

People.—The races occupying Nepal are of mixed Mongol origin. To the north, inhabiting the higher mountains and valleys, dwell the Bhutias or Tibetans. To the west lie the Gurungs and Magars. The Murmis, Gurkhalis and Newars occupy the central parts; and the Kiratis, Limbus and Lepchas occupy the eastern districts. There are also Brahmans and Chhatris in the hills. Besides these there are many small tribes residing in the tarai and some other malarious districts, known as Kumhas, Tharus, Manjis, &c., but generally classed together by the Nepalese as Aoulias, or dwellers in the malarious or *aoul* districts. These are probable descendants of immigrants from the lower castes of Hindus, occupying the borderlands of the tarai. Among the forests of the lower eastern region are also to be found some small savage tribes, known as Chepangs and Kusundas.

All the races except the Aoulias are of a decidedly Mongolian appearance, being generally short and robust, and having flat faces, oblique eyes, yellow complexions, straight black hair, and comparatively hairless faces. The Newars, according to the *Vamçāvalī* or native history, trace their descent from the races of southern India, but this is rendered more than doubtful by both their appearance and language. The Gurkhalis (Gurkhas or Ghurkhas) are descendants of the Brahmans and Rājputs who were driven out of Hindostan by the Moslems, and took refuge in the western hilly lands, where they ultimately became dominant, and where they have become much mixed with the other races by intermarriage.

Religions.—The Bhutias, Newars, Limbus, Keratis, and Lepchas are all Buddhists, but their religion has become so mixed up with Hinduism that it is now hardly recognizable. The Newars have entirely abandoned the monastic institutions of Buddhism, and have in great measure adopted the rules of caste, though even these sit but lightly upon them. They burn their dead, eat the flesh of buffaloes, goats, sheep, ducks, and fowls, and drink beer and spirits. The Gurkhalis, Magars, and Gurungs are Hindus, but the last two are by no means strict in the observance of their religion, though there are some peculiarities which they carefully preserve. Thus, for instance, the Magars will eat pork but not buffalo's flesh, whereas the Gurungs eat the buffalo but not the hog.

Priests.—Where temples are so numerous (there are 2733 shrines in the valley) priests naturally abound, both of the Hindu and Buddhist religions. The festivals too are many in number, and in consequence holidays are incessant. The rāj gurū, or high priest, is an influential person in the state, a member of council, and has a large income from government lands as well as from the fines for offences against caste, &c. Many other priests, gurūs and purohits, have lands assigned to them, and most of the temples have been richly endowed by their founders. Every family of rank has a special priest, whose office is hereditary.

Astrologers are also numerous, and their services are in constant request. One cannot build a house, set out on a journey, commence a war, or even take a dose of physic, without having an auspicious moment selected for him.

Languages.—The various races have all separate languages, or at least dialects. The Gurkhalis and western tribes use Khas (see PAHARI), which, unlike the other dialects, is of Sanskrit origin. The Newars have a distinct language and alphabets, for there are three known to their pandits, though only one is in use now. Their language, called Gubhajius, greatly resembles Tibetan, but is now interspersed with many Sanskrit words. The Bhutias use the Tibetan language and alphabet.

Education.—There is a central educational institution at Katmandu with sixteen branches, or schools, over the valley of Nepal. This central institution has three departments, English, Sanskrit and Persian—or more correctly perhaps Urdu. Education is provided

free by the state, and is encouraged by grants of scholarships and prizes. Boys passing out well are sent at government expense to the various universities of northern India to complete their education, and some have lately been sent to Japan The evil effects of higher education, as taught in the Indian colleges, on the youth of Bengal, &c., has, however, given the Gurkha durbar a distinct shock, and it seems not unlikely that education in Nepal may receive a set-back in consequence. Some of the upper classes speak English fluently, but the bulk of the labouring classes is quite illiterate.

Katmandu is a perfect storehouse of ancient Sanskrit literature, and some of the oldest MSS. in that language as yet known to scholars have been found there. There is also a fair English library. Both are lodged in a good building

Calendar.—There are three principal eras in use in Nepal The Samvat of Vikramaditya begins fifty-seven years before the Christian era, the Saka era of Sālivanhn begins seventy-eight years after the Christian era, and the Nepalese Samvat dates from October A.D. 880. The Sri-Harsha and Kaligat eras are also sometimes used. Day is considered to begin when the tiles on a house can be counted, or when the hairs on the back of a man's hand can be discerned against the sky. Sixty bipalas = 1 pala; 60 palas = 1 ghari or 24 minutes; 60 gharis = 1 day of 24 hours.

Health.—All families of good position have at least one *baid*, or medical man, in constant attendance, and there are also many general practitioners. There is a large central hospital at Katmandu, and some thirteen other smaller hospitals are distributed over the country, with free beds, and provision for outdoor treatment. There is also a small hospital attached to the British Residency. The diseases most prevalent in the country are rheumatism, chronic dyspepsia, skin diseases, syphilis, goitre, smallpox, cholera and leprosy. In the rains a number of cases of mild intermittent fever, diarrhoea, and dysentery are met with. Fever of a severe typhoid type is common in the crowded lanes and dirty villages. Vaccination is being gradually introduced into the country, and the general health of the inhabitants of the principal cities in the valley has greatly improved since the introduction of fresh water, which has been brought in by pipes from mountain springs.

Towns.—There are three large towns in the Nepal valley, Katmandu, the capital, said to contain approximately 50,000 inhabitants, Patan and Bhatgaon about 30,000 each. The houses are from two to four storeys in height, built of brick and tiled. The windows and balconies are of wood, and some are elaborately carved. There are numerous handsome temples in all the towns, the majority of which are pagoda-shaped and built of brick, with roofs of copper, which is sometimes gilt. The streets are narrow, and they, as well as the squares, are all paved with brick or stone. In front of the temples generally stand monoliths surmounted by figures of Garuda, or of the founder, made of brass gilt, or sometimes of black stone Besides these three large towns, there are at least twenty smaller towns and numerous villages in the valley, all of which possess many temples. Some of these, as for instance those of Pashupati, Bodhnatha and Symbhunatha, are considered of great sanctity. Many thousands of pilgrims come at one festival to worship at Pashupati, and it is there that the dying are brought to be immersed in the Bagmati, and the dead are burned on its banks.

Agriculture.—While the Gurkhalis are occupied in military affairs, the agriculture of the valley is carried on by the Newars. The soil is varied in character, from light micaceous sand to dense ferruginous clay. The whole valley is cultivated and irrigated where practicable, and the slopes of the hills are carefully terraced, so that there is little grazing ground, and few sheep or cattle are kept There are some milch cows and buffaloes, which are either stall-fed or grazed in the jungles at the foot of the hills. Animals for consumption and sacrifice are all imported, and are consumed as fast as they are brought in. In the cold season the Bhutias bring large flocks of sheep and goats laden with bags of borax, salt and saltpetre. These are sold for consumption, except a few that are retained to carry back the bags. These droves are generally accompanied by ponies and some of the large Tibetan dogs; the latter are powerful, fierce, shaggy animals, about the size of a small Newfoundland dog. Poultry are kept and used by the Newars, especially ducks, the eggs of which are in great demand even among the orthodox Hindus. The crops grown in the valley consist of rice, both the transplanted and the dry-sown or ghaiya varieties, wheat, pulse, murwah, maize, buckwheat, chillies, radishes, mustard, garlic, onions, ginger, turmeric, sugar-cane, potatoes, ground nuts, many species of cucumbers and pumpkins, &c. Nothing but articles of food are allowed to be grown in the valley; hence its capabilities for producing tea, cotton and tobacco are unknown. All of these, however, are grown in other parts of the country, both in the hills and the tarai. Large cardamoms are extensively grown in the eastern hills, and form an important article of export. The hemp plant (*Cannabis indica*) grows wild, and is used both for manufacturing purposes and for producing the resinous extract and other intoxicating products which are exported. Plants producing dyes, such as madder or manjit, are grown in some places; and drugs, such as chirata, are collected and exported. The better class of soils yields a return of about Rs. 180 per khait, and the poorest about Rs. 90 per khait. From some of the finer soils as many as three crops of various sorts are obtained annually. The land-measures in use are different in different parts of the country. Thus, in the eastern tarai a *bigha* measures 90×90 yds. English, while in the western tarai it is only 15×15 yds. In the hills the unit of land measurement is called *ropni*, which is about twice the size of a western tarai bigha,—and twenty-five ropnis make one khait This measurement applies only to rice lands. Other land measurements for the valley are as follows: One Nepali bigha is 90 yds. × 90 yds. British. (A British Indian bigha is 40 yds. × 40 yds. and 3 Nepali bighas equal about 5 acres.) Sixteen ropnis equal 1 Nepali bigha.

Land Taxes.—The tarai lands pay from two to nine rupees (British) per Nepali bigha according to quality of land. In the hills taxes are charged on the plough, thus: one plough pays 13 annas; one bullock without plough about 10 annas; one spade 6½ annas. These taxes are termed *Hal*, *Patay* and *Kodaley*.

Horticulture.—The Newars are also fond of horticulture. Many European fruits, flowers and vegetables have been introduced and grow freely. The country is famous for its oranges and pine-apples. Flowers are grown and sold for religious purposes, and even wild flowers are brought into the market and much used by the Newar women in adorning their hair, as well as for offerings at the shrines. Many wild fruits are collected and sold in the markets. Apples and pears, of English stock, thrive well; apricots and plums are good; peaches and grapes grow freely and are of large size, but they seldom ripen before the rains begin, when they rot.

Trade.—All the trade and manufactures of the country are in the hands of the Newars, and a few Kashmiris and natives of Hindustan. The trade in European goods is chiefly carried on by the latter, whilst the Newars deal in corn, oil, salt, tobacco and articles of domestic manufacture. The trade with India is carried on at numerous marts along the frontier, at each of which a customs station is established, and the taxes are collected by a *thikadar* or farmer. The Newars also carry on the trade with Tibet, through a colony which has been for many years established at Lhasa, but this trade has been a shrinking item since the opening of the Lhasa-Darjeeling route. There are two principal routes to Tibet. One of these runs north-east from Katmandu to the frontier-station of Kuti or Nilam, crossing the Himalayan range at a height of 14,000 ft.; the other passes out of the valley at the north-west corner, and runs at first upwards along the main branch of the Gandak, crossing the Himalayas, near Kerung, at a height of 9000 ft. All goods on these routes are carried on men's backs, except the salt, &c., carried in bags by the Bhutia sheep and goats. The principal imports from Hindustan are raw cotton, cotton goods, woollen goods, silks and velvets, hardware, cutlery, beads, jewels, coral, saddlery, shoes, guns, gunpowder, glassware, vermilion, indigo, lac, tea, betel-nut, spices, paper, sugar, tobacco, oils, sheet copper, goats, cattle, buffaloes; and from Tibet, musk, medicines, yaks' tails, tea, woollen cloth, blankets, borax, salt, saltpetre, paper-plant, honey, wax, sheep, goats, yaks, ponies, silver, gold. The exports to Hindustan include wax, paper-plant, musk, yaks' tails, medicines, cardamoms, borax, sulphate of copper, brass pots, iron pots, ponies, elephants, hawks, hides and horns (buffalo), rice, ghee, oil seeds, red chillies, madder, cobalt, potatoes, oranges; and to Tibet, broad cloth, raw cotton, cotton goods, tobacco, sugar, opium, coral, jewels, pearls, spices, betel-nut, copper pots, iron pots and hardware. The Nepalese are utterly regardless of statistics, but recent estimates value the exports and imports to and from the British provinces at 3 million sterling annually. Duties are levied on exports and imports, which will be noticed under the head of revenue.

Manufactures.—The Newars are skilful workmen. Their bricks are excellent, and so also is their pottery, for which certain towns are famous, such as Themi and Noakote. As carpenters they excel, though the use of the large saw is still unknown, and planks are cut with chisel and mallet. Some of the wood carvings on the temples and large houses are most artistic in design and bold in execution, though unfortunately they are sometimes of a most obscene character. The manufactures are few, consisting chiefly of coarse cotton cloths, paper made of the inner bark of the paper-plants (*Daphne*), bells, brass and iron utensils, weapons, and ornaments of gold and silver.

Coinage.—At one time Nepal supplied Tibet with its silver coinage, but this was abandoned on account of the adulterations introduced by the Nepalese. The ancient coins, specimens of which are still to be met with, were made by hand. The modern coinage is struck by machinery, a regular mint having been established by Sir Jung Bahadur at Katmandu, and since improved by his successors.

Government.—The Nepalese have relations with China, and occasionally send an embassy with presents to Peking. The British too have considerable influence with the government in regard to their foreign relations, and a British resident is stationed at Katmandu. But in all matters of domestic policy the Nepalese brook no interference, and they are most jealous of anything that has a tendency to encroach on their independence. Theoretically the government of Nepal is a pure despotism, and the maharajah is paramount. Practically, all

real power has long been in the hands of the prime minister, and much of the modern history of the country consists of accounts of the struggles of the various factions for power. Under the prime minister there is a council, consisting of the relations of the king, the raj guru, the generals, and a few other officials known as kajis and sirdars and bhardars, which is consulted on all important business, and which forms a court of appeal for disputed cases from the courts of law. There are separate civil and criminal courts, but the distinction is not always observed, as difficult cases are often transferred from one to the other.

Law and Justice.—The old savage legal code with its ordeals by fire and water, and its punishments by mutilation and torture was abolished by Sir Jung Bahadur after his return from England in 1851. Treason, rebellion and desertion in war-time are punished by death. Bribery and peculation by public servants are punished by dismissal from office, and a fine and imprisonment, the latter of which can be commuted by payments at various rates, according to the nature of the offence. Murder and the killing of cows are capital offences. Manslaughter and maiming cows are punished by imprisonment for life, and other offences against the person or property by imprisonment or fine. Brahmans and women are exempted from capital punishment. Offences against caste are heavily punished by fine and imprisonment. In some cases indeed all the offender's property is confiscated, and he and his family may be sold as slaves. Bankruptcy laws have been recently introduced. The marriage laws are somewhat peculiar. Among the Gurkhas the laws resemble those of other Hindus as regards the marriage of widows, polygamy, &c., but among the Newars every girl while still an infant is married with much ceremony to a bel fruit, which is then thrown into some sacred stream. As the fate of the fruit is unknown, a Newari is supposed never to become a widow. At the age of puberty a husband is selected, but the woman can at any moment divorce herself by placing a betel-nut under her husband's pillow and taking her departure. Adultery is punished by the imprisonment and fine of both the adulteress and her paramour. Sati has been abolished in Nepal by law.

Gaols.—There are three large prisons in the Nepal valley, one for males and two for females; there are also a considerable number of gaols throughout the country. The prisoners are kept in irons, and employed in public works of various sorts. They are allowed six pice a day for subsistence at the capital, and five pice in other places. Their relatives are allowed to minister to their creature comforts.

Slavery is an institution of the country, and all families of rank possess many slaves, who are employed in domestic and field work. They are generally treated well, and are carefully protected by law. The price of slaves ranges from Rs. 100 to Rs. 200.

Revenue.—The revenue of Nepal is about one hundred and fifty lakhs of rupees, *i.e.* £10,000,000. The chief sources of it are the land-tax, customs, mines, forests and monopolies. About 10% of the tarai lands, and 20% of the hill lands, are private property. Some lands were assigned by the Gurkhali rajas to Brahmans, soldiers and others, and these are untaxed. Others, which were the gifts of the old Newar kings, pay from 4 to 8 annas per bigha. All such grants of land, however, are subject to a heavy fine on the coronation of a new raja. Land which does not produce rice is lightly taxed, but in the valley of Nepal, and wherever rice is grown, the government tax or rent is one-half of the produce of the land. Waste lands, when brought into cultivation, are rent free for ten years, after which for five years the tax is only 4 annas per bigha, and the cultivator receives one-tenth of the cleared land rent free for his life. A considerable revenue in the shape of royalty is obtained from mines of copper, iron, &c. The taxes on merchandise amount to from 12 to 14% on the value of the goods carried to and from British India, and from 5 to 6% is charged on goods exported to Tibet.

Army.—Much attention is devoted by the Gurkhalis to military matters, and the bulk of that race may be said to be soldiers. The standing army consists of about 50,000 men, in a fair state of efficiency. Besides this force there is a reserve, consisting of men who have served for a few years and taken their discharge, but in case of necessity can be called on again to enter the ranks. These would probably raise the strength to between 70,000 and 80,000 men. The regiments are formed on the European system, and similarly drilled and officered. Each man carries in addition to a bayonet a *kukri* or native knife. There is practically no cavalry, as the country is not suited for horses. The artillery, however, is on a larger scale, and consists nearly entirely of batteries of mountain artillery. There is a large arsenal well provided with supplies of gunpowder and military stores. There are workshops where cannon are cast, and rifles, and ammunition of all sorts turned out in large quantities, but of an indifferent quality.

In addition to its own army, Nepal supplies to the British army in India a large force of splendid soldiers, who were raised under the following circumstances. In 1815 the British enlisted three battalions of Gurkhas from amongst the soldiers of that race who were thrown out of employment, owing to the termination of the first phase of the war with Nepal. These regiments were styled the 1st, 2nd and 3rd Gurkhas, and were soon employed on active service. The 1st and 2nd behaved with much gallantry at the siege and storming of Bharatpur, and in the First Sikh War, while the 2nd and 3rd won a great name for loyalty and courage during the Mutiny of 1857–58, especially at the siege of Delhi. This induced the British to raise, in 1858, two more battalions, which they numbered the 4th and 5th, and the whole Gurkha force has since proved its usefulness and loyalty on many occasions, particularly during the Afghan War of 1878–80, and on many frontier expeditions. Battalions have also been sent on service to Burma, Egypt, China and Tibet. The Gurkhas in the British service now consist of ten regiments of riflemen of two battalions each, and number about 20,000 men.

History.—Nepal and the somewhat similar country of Kashmir are peculiar among the Hindu states of India in possessing an historical literature. The Nepalese *Vamçâvalî* professes to start from a very early period in the Satya Yuga, when the present valley was still a lake. The earlier portion of it is devoted to the Satya and Treta Yugas, and contains mythological tales and traditions having reference to various sacred localities in the country. During these two Yugas, and also the Dwapur Yuga, the *Vamçâvalî* deals in round numbers of thousands of years.

In the beginning of the Kali Yuga, the Gupta dynasty is said to have been founded by Ne-Muni, from whom the country takes its name of Nepal. Lists are then given of the various dynasties, with the lengths of the reigns of the rajas. The dynasties mentioned are the Gupta, Ahir, Kirâti, Somavanshi, Suryavanshi, Thakuri or first Rajput, Vaishya Thakurî, second Rajput and Karnataki dynasties. The country was then invaded by Mukundasena, and after his expulsion various Vaishya Thakuri dynasties are said to have held the throne for a period of 225 years. The chronology of the *Vamçâvalî* up to this period is very confused and inaccurate; and, though the accounts of the various invasions and internal struggles, mixed up as they are with grotesque legends and tales, may be interesting and amusing, they can hardly be considered authentic. Some of the names of the rajas, and the dates of their reigns, have been determined by coins, the colophons of old MSS., and certain inscriptions on the temples and ancient buildings. For instance, Ançuvarma, of the Thakuri dynasty, reigned about A.D. 633, as he is mentioned by the Chinese traveller Hsuan Tsang, who visited Nepal. His name too is found in an inscription still extant. In like manner it is ascertained from MSS. that Rudra-deva-Varma was reigning in 1008; Lakshmikama-deva from 1015 to 1040; Padma-deva, of the Vaishya Thakuri dynasty, in 1065; Manadeva, of the second Rajput dynasty, in 1139; Ananta-Malla, 1286–1302; Harisinha-deva, 1324; Jayastithi-Malla, 1385–1391. Much information as to the chronology of the various dynasties can be obtained from the catalogue of the Cambridge MSS. compiled by Cecil Bendall, and also from his papers on the ancient coins of the country. Inscriptions too have been edited by Professor Bühler in the *Indian Antiquary*, vol. ix. Detailed lists of the rajas are to be found in Kirkpatrick's *Account of Nepâl*, in Hodgson's *Essays*, Prinsep's papers in the *Asiatic Society's Journal* and Wright's *History of Nepâl*.

The records begin to be more accurate from the time of the invasion and conquest of the country by Harisinha-deva, the raja of Simraun, 1324. This raja was driven from Simraun by Tughlak Shah of Delhi, but seems to have found little difficulty in the conquest of Nepal. There were only four rajas of this Ayodhya dynasty, and then the throne was occupied by Jayabhadra-Malla, a descendant of Abhaya-Malla, one of the Rajput dynasty, who reigned in the 13th century. There were eight rajas of this dynasty. The seventh, Jayastithi-Malla, who reigned for forty-three years (1386–1429), appears to have done much in forming codes of laws, and introducing caste and its rules among the Newars. In the reign of the eighth raja, Yaksha-Malla, the kingdom was divided into four separate states—namely, Banepa, Bhatgaon or Bhaktapur, Kantipur or Katmandu, and Lalitapur or Patan. There was only one raja of Banepa, who died without issue. The Malla dynasty in the other

three branches continued in power up to the conquest of the country by the Gurkhas in 1768.

The Gurkhas claim descent from the Rajputs of Chitor, in Rajputana. They were driven out of their own country by the victorious Moslems, and took refuge in the hilly districts about Kumaon, whence they gradually pushed their way eastwards to Lamjung, Gurkha, Noakote and ultimately to the valley of Nepal, which under Raja Prithwi Narayana they finally captured. In the struggle which took place at Bhatgaon, Jayaprakasa (the raja of Katmandu) was wounded, and shortly afterwards he died at Pashupati. Ranjit-Malla, the aged raja of Bhatgaon, was allowed to retire to Benares, where he ended his days. Tej Narsinha, the raja of Patan, was kept in confinement till his death. During the latter years of the war Jayaprakasa applied to the British for assistance, and a small force, under Captain Kinloch, was sent into the tarai in 1765, but it was repulsed by the Gurkhas.

Prithwi Narayana died in 1774. He left two sons, Pratapasinha Sah and Bahadur Sah. The former succeeded his father, but died in 1777, leaving an infant son, Rana Bahadur Sah. On the death of Pratapa-sinha, his brother, who had been in exile, returned to Nepal and became regent. The mother of the infant king, however, was opposed to him, and he had again to flee to Bettia, in British territory, where he remained till the death of the rani, when he again became regent, and continued so till 1795. During this time the Gurkhas were busily annexing all the neighbouring petty states, so that in 1790 their territories extended from Bhutan to the Sutlej river, and from Tibet to the British provinces. At length, in 1790, they invaded Tibet, and were at first successful; but they were thus brought into contact with the Chinese, who in 1791 sent a large force to invade Nepal. In 1792 the Chinese advanced as far as Noakote, and there dictated terms to the Nepalese.

In 1791 the Gurkhas had entered into a commercial treaty with the British and hence, when hard pressed, they applied for assistance against the Chinese to Lord Cornwallis. In consequence of this Kirkpatrick was despatched to Nepal, and reached Noakote in the spring of 1792, but not till after peace had been concluded. One result of this embassy was the ratification of another commercial treaty on the 1st of March 1792.

In 1795 Rana Bahadur removed his uncle, Bahadur Sah, from the regency, and two years subsequently put him to death. From this time up to 1799 the king, who seems to have been insane, perpetrated the most barbarous outrages, till at length his conduct became so intolerable that he was forced to abdicate in favour of his son, Girvan-yuddha Vikrama Sah, who was still an infant. Rana Bahadur once again recovered the throne in 1804, but was assassinated in 1805.

In October 1801 another treaty was signed by the British and Nepalese authorities, and a British resident was sent to the Nepalese court, but was withdrawn in 1803, owing to the conduct of the Nepalese. From this time the Nepalese carried on a system of encroachment and outrage on the frontier, which led to a declaration of war by the British in November 1814. At first the British attacks were directed against the western portion of the Nepalese territory, and under Generals Marly, Wood and Gillespie several disasters were met with. General Gillespie himself was killed while leading an assault on a small fort called Kalunga. General Ochterlony was more successful, and the Gurkhas were driven eastward beyond the Kali river, and began to negotiate for peace. Arms, however, were soon taken up again, and Ochterlony, who was put in command, in January 1816, advanced directly on the capital in the line of the route that is now in use. He soon fought his way as far as Mukwanpur, and the Nepalese sued for peace. A treaty was concluded in March, by which the Nepalese relinquished much of their newly acquired territory, and agreed to allow a British residency to be established at Katmandu. In November the raja died, and was succeeded by his infant son, Surendra Bikran Sah, the reins of government being held by General Bhimsena Thapa.

From this time the records for many years furnish little of interest except a history of struggles for office between the Thapa and Pandry factions, and futile attempts at forming combinations with other states in Hindustan against the British.

In 1839 Bhimsena's enemies succeeded in driving him from power, and he committed suicide, or was murdered, in prison. The Kala Pandry faction then came into power, and there were frequent grave disputes with the British. War, however, was averted by the exertions of the resident, Mr Brian Hodgson.

In 1843 Matabar Singh, the nephew of Bhimsena, returned from exile, soon got into favour at court, and speedily effected the destruction of his old enemies the Kala Pandrys, who were seized and executed in May 1843. At this time mention begins to be made of a nephew of Matabar Singh, Jung Bahadur, the eldest of a band of seven brothers, sons of a kaji or state official. He rose rapidly in the army and in favour at the court, especially with one of the ranis, who was of a most intriguing disposition. In 1844 he was a colonel, and on the 18th of May 1845 killed his uncle, and immediately, with the aid of the rani, took a prominent part in the government. After a short but turbulent interval of intrigue, he got rid of his enemies at one fell swoop, by what is known as the Kot massacre, on the 15th of September 1846. From that time till the day of his death Jung Bahadur was in reality the ruler of Nepal. His old friend, the rani, was banished, and all posts of any consequence in the state were filled by Jung, his brothers and other relatives. In 1850, finding himself securely seated in power, Jung Bahadur paid a visit to England, which made a great impression on his acute intellect, and ever after he professed and proved himself to be a stanch friend of the British. On his return in 1851 he at once devoted himself to reforming the administration of the country, and, whatever may have been the means by which he gained power, it must be allowed that he exercised it so as to prove himself the greatest benefactor his country has ever possessed. In 1853 a treaty for the extradition of criminals was proposed, but it was not ratified till February 1855. In 1854 the Nepalese entered into a war with Tibet, which lasted with varying success till March 1856, when peace was concluded on terms very favourable to Nepal.

In June 1857 intelligence of the mutiny of the native troops in Hindustan reached Nepal, and produced much excitement. Jung Bahadur, in spite of great opposition, stood firm as a friend of the British. On the 26th June 4000 troops were sent off to assist, and these rendered good service in the campaign against the mutineers. Jung himself followed on the 10th of December, with a force of 8000 men, 500 artillerymen and 24 guns, but too late to be of much use. Many of the mutineers and rebels, including the infamous Nana Sahib, took refuge in the Nepalese tarai, and it was not till the end of 1859 that they were finally swept out of the country. The Nana was said to have died of fever in the tarai, and it is probable that this was the case. His wives and a few attendants resided for many years near Katmandu.

In return for the aid afforded to the British, Jung Bahadur was well rewarded. He was created a G.C.B., and in 1873 a G.C.S.I., honours of which he was not a little proud. The troops employed received food and pay from the day of leaving Katmandu; handsome donations were given to those severely wounded, and to the relatives of the killed; great quantities of muskets and rifles were presented to the Nepalese government; and, to crown all, a large portion of the tarai was restored to Nepal. This ground contains most valuable sal and sisu forests, and yields a revenue of several lākhs of rupees yearly.

From the termination of the mutiny Nepalese history has been uneventful. The country has been prosperous, and the relations with the British have continued to be most friendly. Nevertheless the restrictions on commerce, and the prohibitions against Europeans entering the country, or travelling beyond certain narrow limits, are as rigidly enforced as they were a hundred years ago. Sir Jung Bahadur died suddenly in the tarai in 1877. In spite of all the exertions he had made to bring about a better state of things, three of his wives were allowed to immolate themselves on his funeral pyre. His brother, Sir Ranadip Singh Bahadur, G.C.S.I., succeeded him as prime minister. Shortly after his accession to power a plot was formed against him, but nearly forty of the conspirators were seized and executed, while

others escaped into exile. He was, however, murdered in 1885 and was succeeded by his nephew Sir Shamsher Jung, G.C.S.I., who died in 1901 and was succeeded by his brother Deb Shamsher Jung. But in June of that year a palace revolution placed another brother, Chandra Shamsher Jung, in power, whilst Deb Shamsher fled to India. Maharajah Chandra Shamsher has ruled Nepal with much ability. He gave effective aid to the British during the Tibet war of 1904, and the relations with the government of India became more cordial after his accession to power. In 1906 Chandra Shamsher was created a G.C.S.I., and in 1908 he visited England as a guest of the government, when he was invested with the G.C.B. by King Edward VII. He was also made a major-general in the British army, and honorary colonel of the 4th Gurkha Rifles.

For authorities see Dr Daniel Wright, *History of Nepal* (1877); Colonel Kirkpatrick, *Account of Nepal*; Brian Houghton Hodgson's essays; Dr H. A. Oldfield's sketches; Sir C. M. Aitchison, *Treaties and Engagements*; Sir Joseph Hooker's writings; and Sir Richard Temple, *Hyderabad and Nepal* (1887). (D. Wr.; H. Wy.)

NEPENTHES (Gr. *νηπενθές*, *sc.* *φάρμακον*, a drug that takes away grief, from *νη-* privative, and *πένθος*, "grief"), an Egyptian drug spoken of by Homer in the *Odyssey* (iv. 221). Generally in the form "nepenthe" the name is given to any drug having a like property, and also occasionally to the herb or plant from which such a drug is produced. It is also applied to a special genus of plants, chiefly East Indian, known as the "pitcher-plants," on account of the formation of the leaves.

NEPHELINE, a rock-forming mineral consisting of sodium, potassium and aluminium silicate, $Na_6K_2Al_8Si_9O_{34}$. Its crystals belong to the hexagonal system, and usually have the form of a short six-sided prism terminated by the basal plane. The unsymmetrical etched figures produced artificially on the prism faces indicate, however, that the crystals are hemimorphic and tetartohedral, the only element of symmetry being a polar hexad axis. The hardness is 5½. The specific gravity (2·6), the low index of refraction and the feeble double refraction are nearly the same as in quartz; but since in nepheline the sign of the double refraction is negative, whilst in quartz it is positive, the two minerals are readily distinguished under the microscope. An important determinative character of nepheline is the ease with which it is decomposed by hydrochloric acid, with separation of gelatinous silica (which may be readily stained by colouring matters) and cubes of salt. A clear crystal of nepheline when immersed in acid becomes for this reason cloudy; hence the name nepheline, proposed by R. J. Haüy in 1801, from Gr. *νεφέλη*, a cloud.

Although in naturally occurring nepheline sodium and potassium are always present in approximately the atomic ratio 3 : 1, artificially prepared crystals have the composition $NaAlSiO_4$; the corresponding potassium compound, $KAlSiO_4$, which is the mineral kaliophilite, has also been prepared artificially. It has therefore been suggested that the orthosilicate formula, $(NaK)AlSiO_4$, represents the true composition of nepheline.

The mineral is one specially liable to alteration, and in the laboratory various substitution products of nepheline have been prepared. In nature it is frequently altered to zeolites (especially natrolite), sodalite, kaolin, or compact muscovite. Gieseckite and liebenerite are pseudomorphs.

Two varieties of nepheline are distinguished, differing in their external appearance and in their mode of occurrence, being analogous in these respects to sanidine or glassy orthoclase and common orthoclase respectively. "Glassy nepheline" has the form of small, colourless, transparent crystals and grains with a vitreous lustre. It is characteristic of the later volcanic rocks rich in alkalis, such as phonolite, nepheline-basalt, leucite-basalt, &c., and also of certain dike-rocks, such as tinguaite. The best crystals are those which occur with mica, sanidine, garnet, &c., in the crystal-lined cavities of the ejected blocks of Monte Somma, Vesuvius. The other variety, known as elaeolite, occurs as large, rough crystals, or more often as irregular masses, which have a greasy lustre and are opaque, or at most translucent, with a reddish, greenish, brownish or grey colour. It forms an essential constituent of certain alkaline plutonic rocks of the nepheline-syenite series, which are typically developed in southern Norway.

The colour and greasy lustre of elaeolite (a name given by M. H. Klaproth in 1809, from Gr. *ἔλαιον*, oil, and *λίθος*, stone; Ger. *Fettstein*) are due to the presence of numerous microscopic enclosures of other minerals, possibly augite or hornblende. These enclosures sometimes give rise to a chatoyant effect like that of cat's-eye and cymophane; and elaeolite when of a good green or red colour and showing a distinct band of light is sometimes cut as a gem-stone with a convex surface.

Closely allied to nepheline, and occurring with it in some nepheline-syenites, is the species cancrinite, which has the composition $H_6Na_8Ca(NaCO_3)_2Al_6(SiO_4)_6$. It is frequently of a bright yellow colour, and has sometimes been cut as a gem-stone. (L. J. S.)

NEPHELINE-SYENITE, or **ELAEOLITE-SYENITE**, a holocrystalline plutonic rock which consists largely of nepheline and alkali felspar. The rocks are mostly pale coloured, grey or pink, and in general appearance they are not unlike granites, but dark green varieties are also known. They do not contain quartz, as that mineral and nepheline are mutually exclusive. From ordinary syenites they are distinguished not only by the presence of nepheline but also by the occurrence of many other minerals rich in alkalis or in rare earths. Orthoclase and albite are the principal felspars; usually they are intergrown to form perthite. In some rocks the potash felspar, in others the soda felspar predominates. Soda-lime felspars such as oligoclase and andesine are rare or entirely absent. Fresh clear microcline is very characteristic of some types of nepheline-syenite. Sodalite, colourless and transparent in the slides, but frequently pale blue in the hand specimens, is the principal felspathoid mineral in addition to nepheline. As a rule these two crystallize before felspar, but they may occur in perthitic intergrowth with it. The commonest ferro-magnesian mineral is pale green augite, which may be surrounded by rims of dark-green, pleochroic soda-augite (aegirine). The latter forms long flat prisms or bundles of radiating needles. A dark reddish-brown biotite is very common in some of these rocks and a white mica, probably not muscovite but lepidolite, is occasionally present. The hornblende may be brown, brownish-green, blue or blue-black, belonging as a rule to the varieties which contain soda; it is often intergrown with the pyroxene or enclosed in it. The dark-brown triclinic hornblende aenigmatite occurs also in these rocks. Olivine is rare, but may be found in some basic forms of nepheline-syenite.

The commonest accessories are sphene, zircon, iron ores and apatite. Cancrinite occurs in several nepheline-syenites; in others there is fluor-spar or melanite garnet. A great number of interesting and rare minerals have been recorded from nepheline-syenites and the pegmatite veins which intersect them. Among these we may mention eudialyte, eukolite, mosandrite, rinkite, johnstrupite, lavenite, hiortdahlite, perofskite and lamprophyllite. Many of these contain fluorine and the rare earths.

Nepheline-syenites are rare rocks; there is only one occurrence in Great Britain and one in France and Portugal. They are known also in Bohemia and in several places in Norway, Sweden and Finland. In America these rocks have been found in Texas, Arkansas and Massachussetts, also in Ontario, British Columbia and Brazil. South Africa, Madagascar, India, Tasmania, Timor and Turkestan are other localities for the rocks of this series. They exhibit also a remarkable individuality as each occurrence has its own special features; moreover a variety of types characterizes each occurrence, as these rocks are very variable. For these reasons, together with the numerous rare minerals they contain, they have attracted a great deal of attention from petrographers.

Many types of nepheline-syenite have received designations derived from the localities in which they were discovered. The laurdalites (from Laurdal in Norway) are grey or pinkish, and in many ways closely resemble the laurvikites of southern Norway, with which they occur. They contain anorthoclase felspars of lozenge-shaped forms, biotite or greenish augite, much apatite and sometimes olivine. Some of these rocks are porphyritic. The

foyaites include the greater number of known nepheline-syenites and are called after Foya in the Serra de Monchique (southern Portugal), from which they were first described. They are grey, green or reddish, and mostly of massive structure with preponderating potash felspar, some nepheline, and a variable (often small) amount of femic minerals. Pyroxene-, hornblende- and biotite-foyaites have been recognized according to their mineral composition. Examples of the first-named occur in southern Norway with the laurdalites; they contain aegirine and black mica. At Alnó Island in the Gulf of Bothnia (Sweden) similar rocks are found bearing enclosures or altered limestone with wollastonite and scapolite. In Siebenburgen (Hungary) there is a well-known rock of this group, very rich in microcline, blue sodalite and cancrinite. It contains also orthoclase, nepheline, biotite, aegirine, acmite, &c. To this type the name ditroite has been given from the place where it occurs (Ditro). Pyroxene-foyaite has been described also from Pouzac in the Pyrenees (S. France). Mica-foyaite is not very common, but is known at Miask in the Ural Mountains (miaskite), where it is coarse-grained, and contains black mica, sodalite and cancrinite. The hornblende-foyaites are usually brown or blue, and intensely dichroic, but may contain also biotite or augite. Rocks of this class occur in Brazil (Serra de Tingua) containing sodalite and often much augite, in the western Sahara and Cape Verde Islands; also at Zwarte Koppies in the Transvaal, Madagascar, São Paulo (in Brazil), Paisano Pass (West Texas) and Montreal, Canada. The rock of Salem, Mass., U.S.A., is a mica-foyaite rich in albite and aegirine; it accompanies granite and essexite.

Litchfieldite is another well-marked type of nepheline-syenite, in which albite is the dominant felspar. It is named after Litchfield, Maine, U.S.A., where it occurs in scattered blocks. Biotite, cancrinite and sodalite are characteristic of this rock. A similar nepheline-syenite is known from Hastings Co., Ontario, and contains hardly any orthoclase, but only albite felspar. Nepheline is very abundant and there is also cancrinite, sodalite, scapolite, calcite, biotite and hornblende. The lujaurites are distinguished from the rocks above described by their dark colour, which is due to the abundance of minerals such as augite, aegirine, arfvedsonite and other kinds of amphibole. Typical examples are known near Lujaur on the White Sea, where they occur with umptekites and other very peculiar rocks. Other localities for this group are at Julianehaab in Greenland (with sodalite-syenite); at their margins they contain pseudomorphs after leucite. The lujaurites frequently have a parallel-banding or gneissose structure.

Sodalite-syenites in which sodalite very largely or completely takes the place of nepheline occur in Greenland, where they contain also microcline-perthite, aegirine, arfvedsonite and eudialyte. Cancrinite-syenite, with a large percentage of cancrinite, has been described from Dalekarlia (Sweden) and from Finland. We may also mention urtite from Lujaur Urt on the White Sea, which consists very largely of nepheline, with aegirine and apatite, but no felspar. Jacupirangite (from Jacupiranga in Brazil) is a blackish rock composed of titaniferous augite, magnetite, ilmenite, perofskite and nepheline, with secondary biotite.

The chemical peculiarities of the nepheline-syenites are well marked, as will be seen from the following analyses. They are exceedingly rich in alkalis and in alumina (hence the abundance of felspathoids and alkali felspars) with silica varying from 50 to 56%, while lime, magnesia and iron are never present in great quantity, though somewhat more variable than the other components. As a group, also, these rocks have a low specific gravity.

	SiO_2.	Al_2O_3	FeO.	Fe_2O_3.	CaO.	MgO.	K_2O.	Na_2O.
Laurdalite .	54·55	19·07	3·12	2·41	3·15	1·98	4·84	7·67

Litchfieldite	60·39	22·57	2·26	0·42	0·32	0·13	4·77	8·44
Lujaurite .	54·14	20·61	2·08	3·28	1·85	0·83	5·25	9·87

(J. S. F.)

NEPHELINITES. The group of effusive rocks which contains nepheline with plagioclase felspar is subdivided into nepheline-tephrites and nepheline-basanites, while those which contain nepheline but not felspar are nephelinites and nepheline-basalts. The tephrites differ from the basanites in the absence of olivine, and the same distinction subsists between the nephelinites and nepheline-basalts.

Lavas with nepheline, plagioclase and augite = nepheline-tephrites.

Lavas with nepheline, plagioclase, augite and olivine = nepheline-basanites.

Lavas with nepheline and augite = nephelinites.

Lavas with nepheline, augite and olivine = nepheline-basalts.

In their essential and accessory minerals, appearance and structure, these rocks have much in common, and they tend to occur in a natural association as basic rocks comparatively rich in alkalis and alumina. The nephelinites and tephrites are rather closely linked to the phonolites and pass into them by various gradations. They are usually richer in alkalis and silica and contain less iron, lime and magnesia than the basanites and nepheline-basalts, a difference which finds expression in the presence of olivine and the smaller amount of felspars and felspathoids in the latter.

The nepheline is colourless and transparent when fresh, often in six-sided prisms, but also as irregular interstitial masses filling the spaces between the other minerals, and hard to identify owing to its low double refraction and frequent decomposition. Leucite appears in some tephrites; haüyne is more frequent as small dodecahedra often filled with black inclusions. The augite varies a good deal, being bright green or dark green (aegirine) and rich in soda in some tephrites and nephelinites, while in basanites and basalts it is often brown "basaltic" augite or purple "titaniferous" augite. It has often good crystalline form, and occurs as eight-sided monoclinic prisms, but the soda augites may be of late crystallization and form mossy or irregular growths in the matrix. Brown hornblende is much less common, and a red biotite is very characteristic of certain nephelinites. Of the felspars, labradorite is probably the most common, with more acid varieties of plagioclase. Sanidine is by no means absent, but may be considered as an accessory. The olivine presents no peculiarities. Melilite, perofskite, pseudobrookite, melanite garnet, iron oxides, apatite and chromite are occasionally met with.

All these rocks are practically confined to lavas of Tertiary and recent age, though some occur as dikes or small intrusive masses. The plutonic facies of these rocks are found among the theralites, shonklnites, essexites and ijolites. In the British Isles they are exceedingly scarce, though nepheline-basanite occurs in a dike which is presumably Tertiary, cutting the Triassic rocks at Butterton in Staffordshire, and nepheline-basalt has been found in a single neck at John o' Groat's in Caithness and at one or two places near North Berwick in Haddingtonshire. They attain a great development in the Canary Islands (Teneriffe, Grand Canary, &c.) and in the Azores, Cape Verde Islands and Fernando Noronha. In Germany they are represented among the Tertiary eruptive rocks of the Rhine district and Thuringia, at the extinct craters of the Eifel and at the Kaiserstuhl. In central Bohemia there are many occurrences of nepheline-tephrites, basanites and basalts which though fine grained contain all their minerals in excellent preservation. The nephelinite of Katzenbuckel in the Odenwald is well known. Contrasted with the phonolites and leucitophyres these rocks are scarce in Italy and the Mediterranean province, but leucite-bearing nepheline-tephrites occur at Monte Vulture and nepheline-basalts in Tripoli. In America these rocks occur in Texas, in the Bearpaw Mountains of Montana and at Cripple Creek, Colorado. From Argentina some members have been described: thay have a great extension in East Africa (Somaliland and Masai-land) and occur also in North Nigeria. A few also have been described from New South Wales, New Zealand (Dunedin) and Tasmania. (J. S. F.)

NEPHEW, the son of a brother or sister. The word is adapted from Fr. *neveu*, Lat. *nepos* (originally "grandson" or "descendant"). The O. Eng. *nefa* survived in the form *neve* till the 15th century; this represents the Teutonic branch, cf. Ger. *Neffe*, Dutch *neef*; the ultimate root is seen in the cognate Gr. *ἀνεψιός*, "descendants," *ἀνεψιός*, "kinsman," and Sans. *napāt*, *napt*, "descendants" or "descendant." The correlative "niece," the daughter of a brother or sister, is from Fr. *nièce*, Lat. *neptis*, the feminine form of *nepos*; the O. Eng. word was *nift*, cf. Ger. *Nichte*. A euphemistic use of "nephew" is that of the natural son of a pope, cardinal or other ecclesiastic; and from the practice of granting preferments to such children the word "nepotism" is used of any favouritism shown in finding positions for a man's family.

NEPI (anc. *Nepet* or *Nepete*), a town and episcopal see of Italy, in the province of Rome, 7½ m. S.W. of the town of Civita Castellana, 738 ft. above sea-level. Pop. (1901) 2973. The site, surrounded by ravines and accessible only on the W., is naturally strong and characteristic of an Etruscan town; on this side there is a considerable fragment of the ancient Etruscan wall, built of rectangular blocks of tufa (whether the rest of the site was protected by walls is uncertain), and a ruined castle, erected by Antonio da Sangallo the elder in 1499, for Pope Alexander VI., and restored by Pope Paul III. The municipio (town hall) is from the designs of Vignola, and contains some ancient

inscriptions. The cathedral was burnt down by the French in 1789 and restored in 1831. A mile and a half E.N.E. is the Romanesque church of S Elia, founded about A.D. 1000, with frescoes of the period. It contains a pulpit of the time of Pope Gregory IV. (827–844), the sculptures of which are scattered about the church (F. Mazzanti in *Nuovo Bollettino d'Archaeologia Cristiana*, 1896, 34).

Nepet had become Roman before 386 B.C., when Livy speaks of it and Sutrium as the keys of Etruria. In that year it was surrendered to the Etruscans and recovered by the Romans, who beheaded the authors of its surrender. It became a colony in 383 B.C. It was among the twelve Latin colonies that refused further help to Rome in 209 B.C. After the Social War it became a *municipium*. It is hardly mentioned in imperial times, except as a station on the road (Via Amerina) which diverged from the Via Cassia near the modern Settevene and ran to Ameria and Tuder. In the 8th century A.D. it was for a short while the seat of a dukedom.

See G. Dennis, *Cities and Cemeteries of Etruria* (London, 1883, i. 82). (T. As.)

NEPOMUK (or POMUK), **JOHN OF**, the national saint of Bohemia. It is necessary to distinguish between the John of Nepomuk of history and the legendary one. In 1393 a dispute arose between King Wenceslaus IV. of Bohemia and the archbishop of Prague, John of Jenzenstein. Wenceslaus, wishing to found a new bishopric in south-western Bohemia, determined to seize the revenues of the abbey of Kladrub as soon as the aged abbot Raček should die. The archbishop opposed this plan, and by his orders his vicar-general, John of Pomuk—son of a German named Wölfel, a citizen of Pomuk—advised the monks to elect a new abbot immediately after Raček's death. This greatly incensed the king, who summoned the archbishop and some of his clergy—among whom was Pomuk—to appear before him. He ordered them to be immediately arrested, and though the archbishop escaped his four companions—among them Pomuk—were seized and subjected to cruel torture. They were ordered to abandon the archbishop. Three of them consented, but Pomuk, who refused to submit and was already on the point of death, was carried to the bridge of Prague and thrown into the Vltava. It is difficult to connect this historical event with the legend of St John of Nepomuk, who was canonized by the church of Rome in 1729, mainly by the influence of the Jesuits, who hoped that this new cult would obliterate the memory of Hus. The Austrian chronicler Thomas Ebendorffer of Haselbach, who lived two generations later, first states that it was reported that King Wenceslaus had ordered that the confessor of his queen—an office that John of Pomuk never held—should be thrown into the Vltava because he would not reveal the secret of confession. The story is afterwards told in greater detail by the untrustworthy Bohemian historian Wenceslaus Hajek. It appears certain that the person canonized in 1729 was not the historical John of Pomuk or Nepomuk.

See A. H. Wratislaw, *Life, Legend and Canonisation of St John Nepomuk* (1873), a valuable work founded on the best Bohemian authorities; also A. Frind, *Der geschichtliche Heilige Johann von Nepomuk* (1861); O. Abel, *Die Legende vom heiligen Johann von Nepomuk* (1855); and particularly vol. iii. of W. W. Tomek's *History of the Town of Prague* (Czech) (12 vols., Prague, 1855–1901).

NEPOS, CORNELIUS (*c.* 99–24 B.C.), Roman historian, friend of Catullus, Cicero and Atticus, was born in Upper Italy (perhaps at Verona or Ticinum). He wrote: *Chronica*, an epitome of universal history; *Exempla*, a collection of anecdotes after the style of Valerius Maximus; letters to Cicero; lives of Cato the elder and Cicero; and *De viris illustribus*, parallel lives of distinguished Romans and foreigners, in sixteen books. One section of this voluminous work (*De excellentibus ducibus exterarum gentium*, more commonly known as *Vitae excellentium imperatorum*) and the biographies of Cato and Atticus from another (*De Latinis historicis*) have been preserved. Erotic poems and a geographical treatise are also attributed to him. Nepos is not altogether happy in the subjects of his biographies, and he writes rather as a panegyrist than as a biographer, although he can rebuke his own countrymen on occasion. The *Lives* contain many errors (especially in chronology), but supply information not found elsewhere. The language is as a rule simple and correct. The *Lives* were formerly attributed to Aemilius Probus of the 4th century A.D.; but the view maintained by Lambinus (in his famous edition, 1569)—that they are all the work of Nepos—is now generally accepted. A dedicatory epigram written by Probus to the emperor Theodosius and inserted after the life of Hannibal, was the origin of the mistake. This dedication, if genuine, would only prove that Probus copied (and perhaps modified and abridged) the work. In modern times G. F. Unger (*Der sogenannte C. N.*, 1881) has attempted to prove that the author was Hyginus, but his theory has not been favourably received.

Editions of the *Lives* (especially selections) are extremely numerous; text by E. O. Winstedt (Oxford, 1904), C. L. Roth (1881), C. G. Cobet (1881), C. Halm and A. Fleckeisen (1889), with lexicon for school use; with notes, O. Browning and W. R. Inge (1888), J. C. Rolfe (U.S. 1894), A. Weidner and J. Schmidt (1902), C. Erbe (1892), C. Nipperdey and B. Lupus (ed. maj., 1879, school ed., 1895), J. Siebelis and O. Stange (1897).

NEPOS, JULIUS, the last but one of the Roman emperors of the West (474–475). He was a nephew of Marcellinus, prince of Dalmatia, whom he succeeded in his principality. After the death of Olybrius the throne of the West remained vacant for some months, during which Italy was abandoned to barbarians. Being connected by marriage with Leo I., emperor of the East, he was selected by him to succeed Olybrius on the Western throne, and proclaimed at Ravenna. After capturing his rival Glycerius, who had been nominated by the army in 473, at the mouth of the Tiber, he was recognized as emperor in Rome, Italy and Gaul. The only event of the reign of Nepos was the inglorious cession to the Visigoths of the province of Auvergne. In 475 Orestes, father of Augustulus, afterwards the last emperor of the West, raised the standard of revolt and marched against Nepos at Ravenna. The emperor fled into Dalmatia, and continued to reside at Salona until his assassination by two of his own officers in 480, possibly at the instigation of Glycerius, who had been compelled to enter the church and had been appointed bishop of Salona.

See Tillemont, *Hist. des empereurs*, vi.; Gibbon, *Decline and Fall*, ch. 36.

NEPTUNE (Lat. NEPTUNUS), an Italian god, of unknown origin and meaning, paired with Salacia, possibly the goddess of the salt water. At an early date (309 B.C.) he was identified with the Greek Poseidon (*q.v.*), when the Sibylline books ordered a lectisternium in his honour (Livy v. 13). His festival, Neptunalia, at which tents were made from the branches of trees, was celebrated on the 23rd of July, and his temple, containing a famous marine group by Scopas, stood near the Circus Flaminius. In earlier times it was the god Fortunus who was thanked for naval victories; but Sextus Pompeius called himself son of Neptune, and Agrippa dedicated to Neptune a temple (Basilica Neptuni) in the Campus Martius in honour of the naval victory of Actium.

NEPTUNE, in astronomy, the outermost known planet of our solar system; its symbol is ♆. Its distance from the sun is a little more than 30 astronomical units, *i.e.* 30 times the mean distance of the earth from the sun, or about 2,796,000,000 m. It deviates greatly from Bode's law, which would give a distance of nearly 39. Its orbit is more nearly circular than that of any other major planet, Venus excepted. Its time of revolution is 165 years. Being of the 8th stellar magnitude it is invisible to the naked eye. In a small telescope it cannot be distinguished from a fixed star, but in a large one it is seen to have a disk about 2·3″ in diameter, of a pale bluish hue. No features and no change of appearance can be detected upon it, so that observation can give no indication of its rotation. Both its optical aspect and the study of its spectrum seem to show that it resembles Uranus. Its spectrum shows marked absorption-bands in the red and yellow, indicating an atmosphere of great depth of which hydrogen would seem to be a constituent. (See PLANET.)

Only a single satellite of Neptune is yet known. This was discovered by William Lassell soon after the discovery of the planet. Its period of revolution is 5*d.* 21 *h.* Its motion is retrograde, in a plane making an angle of about 35° with the orbit of the planet. This was the first case of retrograde motion found in any of the

planets or satellites of the solar system. The most noteworthy feature connected with the satellite is a secular change which is going on in the position of its orbital plane. Were the planet spherical in form, no such change could occur, except an extremely slow one produced by the action of the sun. The change is therefore attributed to a considerable ellipticity of the planet, which is thus inferred to be in rapid rotation. It will ultimately be possible to determine from this motion the position of the axis of rotation of Neptune with much greater precision than it could possibly be directly observed.

The following elements of the satellite were determined by H. Struve from all the observations available up to 1892:

Varying Elements of Neptune's Satellite.

Inclination to earth's equator	119 ·35° − 0 ·165° (t−1890)
R.A. of node on earth's equator	185 ·15° + 0 ·148 (t−1890)
Distance from node at epoch	234 ·42
Mean daily motion	61 ·25748°
Mean distance at log Δ = 1·47814	16 ·271″
Epoch, 1890, Jan. 0, Greenwich mean noon	

The eccentricity, if any, is too small to be certainly determined. From the above mean distance is derived as the mass of Neptune $\frac{1}{19\,380}$. The motion of Uranus gives a mass $\frac{1}{17,112}$.

Discovery of Neptune.—The detection of Neptune through its action upon Uranus before its existence had been made known by observation is a striking example of the precision reached by the theory of the celestial motions. So many agencies were concerned in the final discovery that the whole forms one of the most interesting chapters in the history of astronomy. The planet Uranus, before its actual discovery by Sir William Herschel in 1781, had been observed as a fixed star on at least 17 other occasions, beginning with Flamsteed in 1690. In 1820 Alexis Bouvard of Paris constructed tables of the motion of Jupiter, Saturn and Uranus, based upon a discussion of observations up to that year. Using the mutual perturbations of these planets as developed by Laplace in the *Mécanique Céleste*, he was enabled satisfactorily to represent the observed positions of Jupiter and Saturn; but the case was entirely different with Uranus. It was found impossible to represent all the observations within admissible limits of error, the outstanding differences between theory and observation exceeding 1′. In these circumstances one of two courses had to be adopted, either to obtain the best general representation of all the observations, which would result in the tables being certainly erroneous, or to reject the older observations which might be affected with errors, and base the tables only on those made since the discovery by Herschel. A few years of observation showed that Uranus was deviating from the new tables to an extent greater than could be attributed to legitimate errors of theory of observation, and the question of the cause thus became of growing interest. Among the investigators of the question was F. W. Bessel,[1] who tried to reconcile the difficulty by an increase of the mass of Saturn, but found that he could do so only by assigning a mass not otherwise admissible. Although the idea that the deviations were probably due to the action of an ultra-Uranian planet was entertained by Bouvard, Bessel and doubtless others, it would seem that the first clear statement of a conviction that such was the case, and that it was advisable to reach some conclusion as to the position of the disturbing body, was expressed by the Rev. T. J. Hussey, an English amateur astronomer. In a letter to Sir George B. Airy in 1834 he inquired Airy's views of the subject, and offered to search for the planet with his own equatorial if the required estimate of its position could be supplied. Airy expressed himself as not fully satisfied that the deviation might not arise from errors in the perturbations. He therefore was not certain of any extraneous action; but even if there was, he doubted the possibility of determining the place of a planet which might produce it. In 1837 Bouvard, in conjunction with his nephew Eugène, was again working on the problem; but it does not seem that they went farther than to collect observations and to compare the results with Bouvard's tables.

In 1835 F. B. G. Nicolai, director of the observatory at Mannheim, in discussing the motion of Halley's comet, considered the possibility that it was acted upon by an ultra-Uranian planet, the existence of which was made probable by the disagreement between the older and more recent observations.[2]

In 1838 Airy showed in a letter to the *Astronomische Nachrichten* that not only the heliocentric longitude, but the tabulated radius vector of Uranus was largely in error, but made no suggestions as to the cause.[3]

In 1843 the Royal Society of Sciences of Göttingen offered a prize of 50 ducats for a satisfactory working up of the whole theory of the motions of Uranus, assigning September 1846 as the time within which competing papers should be presented.

It is also recorded that Bessel, during a visit to England in 1842, in a conversation with Sir John Herschel, expressed the conviction that Uranus was disturbed by an unknown planet, and announced his intention of taking up the subject.[4] He went so far as to set his assistant Fleming at the work of reducing the observations, but died before more was done.

The question had now reached a stage when it needed only a vigorous effort by an able mathematician to solve the problem. Such a man was found in John Couch Adams, then a student of St John's College, Cambridge, who seriously attacked the problem in 1843, the year in which he took his bachelor's degree. He soon found that the observations of Uranus could be fairly well represented by the action of a planet moving in a radius of twice the mean distance of Uranus, which would closely correspond to Bode's law. During the two following years he investigated the possible eccentricity of the orbit, and in September 1845 communicated his results to Professor James Challis. In 1845, about the 1st of November, Adams also sent his completed elements to Airy, stating that according to his calculations the observed irregularities in the motion of Uranus could be accounted for by the action of an exterior planet, of which the motions and orbital elements, were given. It is worthy of note that the heliocentric longitude of the unknown body as derived from these elements is only between one and two degrees in error, while the planet was within half a degree of the ecliptic. Two or three evenings assiduously devoted to the search could not therefore have failed to make the planet known. Adams's paper was accompanied by a comparison of his theory with the observations of Uranus from 1780, showing an excellent agreement. Airy in replying to this letter inquired whether the assumed perturbation would also explain the error of the radius-vector of Uranus, which he seemed to consider the crucial test of correctness. It does not seem that any categorical reply to this question was made by Adams.

Meanwhile, at the suggestion of Arago, the investigation had been taken up by U. J. J. Leverrier, who had published some excellent work in theoretical astronomy. Leverrier's first published communication on the subject was made to the French Academy on the 10th of November 1845, a few days after Adams's results were in the hands of Airy and Challis. A second memoir was presented by Leverrier in 1846 (June 1). His investigation was more thorough than that of Adams. He first showed that the observations of Uranus could not be accounted for by the attraction of known bodies. Considering in succession various explanations, he found none admissible except that of a planet exterior to Uranus. Considering the distances to be double that of Uranus he then investigated the other elements of the orbit. He also attempted, but by a faulty method, to determine the limits within which the elements must be contained.

The following are the elements found by Adams and Leverrier:

	Leverrier.	Adams.	
		Hypothesis I.	Hypothesis II.
Semi-major axis	36·154	38·38	37·27
Eccentricity	0·1076	0·16103	0·12062
Long. of perihelion	284° 45′	315° 57′	299° 11′
Mean longitude	318° 47′	325° 8′	323° 2′
Epoch	1847, Jan. 1	1846, Oct. 1	1846, Oct. 1
True longitude	326° 32′	328°	329°

The longitude of the actual planet was 327° 57′ on the 1st of October 1846.

The close agreement of these elements led Airy to suggest to Challis, on the 9th of July 1846, a search for the planet with the Northumberland telescope. He proposed an examination of a part of the heavens 30° long in the direction of the ecliptic and 10° broad, and estimated the number of hours' work likely to be employed in this sweep. The proposed sweeps were commenced by Challis on the 29th of July. The plan required each region to be swept through twice, and the positions of all the known stars found to be compared, in order that the position of the planet might be detected by its motion. On the 31st of August Leverrier's concluding paper was presented to the French Academy, and on the 18th of September he wrote to John G. Galle (1812–1910), then chief assistant at the Berlin observatory, suggesting that he should search for the computed planet, with the hope of detecting it by its disk, which was probably more than 3″ in diameter. This letter, probably received on the 23rd of September, was communicated to J. F. Encke, the director of the observatory, who approved of the search. H. L. d'Arrest, a student living at the observatory, expressed a wish to assist. In the evening the search was commenced, but it was not found possible to detect any planet by its disk. Star charts were at the time being prepared at the observatory under the auspices of the Berlin Academy of Sciences. It was suggested by d'Arrest that this region might be covered by one of the charts. Referring to the chart, which was lying in a drawer, it was found that such was the case. Comparing the stars on the chart one by one with the heavens it was found that an eighth magnitude star now visible was not on the chart. This object was observed until after midnight, but no certain motion was detected. On the following evening the object was again looked for, and found to have actually moved. The existence of the planet was thus established. It was afterwards found that Challis in his sweeps had observed the planet on the 4th of August, but, not having compared his observations with those made subsequently, had failed to detect it.

The question whether Leverrier should receive the sole credit of the discovery was warmly discussed. Arago took the extreme ground that actual publication alone should be considered, rejecting Adams's communications to Airy and Challis as quite unworthy of consideration. He also suggested that the name of Leverrier should be given to the planet, but this proposal was received with so little favour outside of France that he speedily withdrew it, proposing that of Neptune instead.

The observations at the first opposition showed that the planet was moving in a nearly circular orbit, and was at a mean distance from the sun much less than that set by Leverrier as the smallest possible. The latter had in fact committed the error of determining the limits by considering the variations of the elements one at a time, assuming in the case of each that while it varied the others remained constant. But a simultaneous variation of all the elements would have shown that the representation of the observations of Uranus would be improved by a simultaneous diminution of both the eccentricity and the mean distance, the orbit becoming more nearly circular and the planet being brought nearer to the sun. But this was not at first clearly seen, and Benjamin Peirce of Harvard University went so far as to maintain that there was a discontinuity between the solution of Adams and Leverrier and the solution offered by the planet itself, and that the coincidence in direction of the actual and computed planet was an accident. But this view was not well founded, and the only explanation needed was to be found in Leverrier's faulty method of determining the limits within which the planet must be situated. As a matter of fact the actual motion of the planet during the century preceding, as derived from Leverrier's elements, was much nearer the truth than the elements themselves were. This arose from the fact that his very elliptic orbit, by its large eccentricity, brought the planet near to the sun, and therefore near to its true position, during the period from 1780 to 1845, when the action on Uranus was at its greatest.

The observations of the first opposition enabled Sears Cook Walker of the National Observatory, Washington, in February 1847 to compute the past positions of the planet, and identify it with a star observed by Lalande at Paris in May 1795. This being communicated to the Paris observatory, an examination of Lalande's manuscript showed that he had made two observations of the planet, on the 8th and 10th of May, and finding them discordant had rejected one as probably in error, and marked the other as questionable. A mere re-examination of the region to see which observation was in error would have led him to the discovery of the planet more than half a century before it was actually recognized. The identity of Lalande's star with Neptune was also independently shown by Petersen of Altona, before any word of Walker's work had reached him.

BIBLIOGRAPHY.—The principal sources for the history of the discovery of Neptune are the *Astronomische Nachrichten*, vols. xxv., xxvi., xxviii., and Lindenau's paper in the *Ergänzungsheft* to this publication, pp. 1-31 (Altona, 1849). In the *Memoirs of the Royal Astronomical Society*, vol. xvi., Airy gave a detailed history of the circumstances connected with the discovery, so far as he was cognizant of them. Documents pertaining to the subject are found in the *Monthly Notices of the Royal Astron. Society*. B. A. Gould, *Report to the Smithsonian Institution on the History of the Discovery of Neptune*, published by the Smithsonian Institution (Washington, 1850), is the most complete and detailed history of all the circumstances connected with the discovery, and with the early investigations on the orbit of the planet, that has been published. Leverrier's investigation was published *in extenso* as an addition to the *Connaissance des temps*, and Adams's as an appendix to the *Nautical Almanac* for 1851. Peirce's discussions, so far as published at all, are found in the *Proceedings of the American Academy of Arts and Sciences*. The first computations of the orbit after the discovery were made by Sears Cook Walker, and published by the Smithsonian Institution (1848–1850). General tables of the motion of Neptune are in Kowalski's *Tables du mouvement de la planète Neptune*; Newcomb's *Investigation of the Orbit of Neptune*, Washington, Smithsonian Institution (1866); Leverrier's *Annales de l'Observatoire de Paris*; *Memoirs*, vol. xiv. (1877), and lastly Newcomb's "Tables" in *Astron. Papers of the American Ephemeris*, vol. vii., part iv. Tables of the satellite are found in Newcomb, *The Uranian and Neptunian Systems*; appendix to the Washington observations for 1873. (S. N.)

NÉRAC, a town of south-western France, capital of an arrondissement in the department of Lot-et-Garonne, 16 m. W.S.W. of Agen by road. Pop. (1906) town, 4018; commune, 6318. The town, once the capital of the dukes of Albret, is divided by the Baise into two parts, Grand-Nérac on the left bank and Petit-Nérac on the right bank. The river is spanned by a bridge of the 16th century, called the Pont Vieux, and by the Pont Neuf, of modern construction. Narrow winding streets often bordered by old houses ascend from the narrow quays on both banks. From the left bank a staircase leads to the Rue Henri Quatre, where stands a wing of the castle in which Henry IV. lived. A statue of the king stands in one of the squares. The former palace of the Chambre des Comptes is now occupied by the tribunal of commerce, the library and the museum. The church of Grand-Nérac of the 18th century and the church of Petit-Nérac of the 19th century offer no remarkable features. On the left bank of the Baise, above Grand-Nérac, market gardens have taken the place of the old gardens of the Sires d'Albret, but remains of the Palais des Mariannes and of the Pavillon des Bains du Roi de Navarre, both of Renaissance architecture, are left. The famous promenade of La Garenne laid out by Antoine de Bourbon, king of Navarre, stretches for more than a mile along the opposite bank of the river. The remains of a Roman villa, including a fragment of mosaic, have been found there. A road leads from the south end of La Garenne to the ruins of the feudal castle of Nazareth. The Château du Tasta of the 15th century is within a short distance of Nérac. The town has a sub-prefecture, and the industries include brewing and cork-working.

Nérac appears at the beginning of the 11th century as a possession of the monks of St Pierre de Condom. The lords of Albret gradually deprived them of their authority over the town, and at the beginning of the 14th century founded a castle on the left bank of the Baise. In the 16th century the castle was the residence of Henry IV. during much of his youth and of

Marguerite de Valois, sister of Francis I., of Jeanne d'Albret, and of the second Marguerite de Valois, wife of Henry IV., who held a brilliant court there. Nérac, the inhabitants of which had adopted the Reformed religion, was seized by the Catholics in 1562. The conferences, held there at the end of 1578 between the Catholics and Protestants, ended in February 1579 in the peace of Nérac. In 1580 the town was used by Henry IV. as a base for attacks on the Agenais, Armagnac and Guienne. A Chambre de l'Edit for Guienne and a Chambre des Comptes were established there by Henry IV. In 1621, however, the town took part in the Protestant rising, was taken by the troops of Louis XIII. and its fortifications dismantled. Soon after it was deprived both of the Chambre de l'Edit and of the Chambre des Comptes, and its ruin was completed by the revocation of the Edict of Nantes in 1685.

NERBUDDA, or NARBADA, a river of India. It is traditionally regarded as the boundary between Hindustan proper and the Deccan. It rises on the summit of Amarkantak hill in Rewa state, and for the first 200 m. of its course winds among the Mandla hills, which form the head of the Satpura range; then at Jubbulpore, passing through the "Marble Rocks," it enters its proper valley between the Vindhyan and Satpura ranges, and pursues a direct westerly course to the Gulf of Cambay. Its total course through the Central Provinces and Gujarat amounts to about 800 m., and it falls into the sea in the Bombay district of Broach. It receives the drainage of the northern slopes of the Satpuras, but not that of the Vindhyan tableland, the streams from which flow into the Ganges and Jumna. After leaving the Central Provinces, the river widens out in the fertile district of Broach, with an average breadth of ½ m. to 1 m. Below Broach city it forms an estuary which is 13 m. broad where it enters the Gulf of Cambay. The Nerbudda is nowhere utilized for irrigation, and navigation is confined to the lower section. In the rainy season boats of considerable size sail about 60 m. above Broach city. Sea-going vessels of about 70 tons frequent the port of Broach, but they are entirely dependent on the tide. In sanctity the Nerbudda ranks only second to the Ganges among the rivers of India, and along its whole course are special places of pilgrimage. The most meritorious act that a pilgrim can perform is to walk from the sea to the source of the river and back along the opposite bank. This pilgrimage takes from one to two years to accomplish.

The Nerbudda has given its name to a division of the Central Provinces, comprising the five districts of Narsinghpur, Hoshangabad, Nimar, Betul and Chhindwara. Area, 18,382 sq. m.; pop. (1901) 1,785,008.

NERCHINSK, a town of Eastern Siberia, in the government of Transbaikalia, 183 m. by rail E. of Chita, on the left bank of the Nercha, 2½ m. above its confluence with the Shilka. Pop. (1897) 6713. It is badly built of wood, and its lower parts frequently suffer from inundations. It has a small museum. The inhabitants support themselves mainly by agriculture, tobacco-growing and cattle-breeding; a few merchants trade in furs and cattle, in brick-tea from China, and manufactured wares from Russia.

The fort of Nerchinsk dates from 1654, and the town was founded in 1658 by Pashkov, who in that year opened direct communication between the Russian settlements in Transbaikalia and those on the Amur which had been founded by Cossacks and fur-traders coming from the Yakutsk region. In 1689 was signed between Russia and China the treaty of Nerchinsk, which stopped for two centuries the farther advance of the Russians into the basin of the Amur. After that Nerchinsk became the chief centre for the trade with China. The opening of the western route through Mongolia, by Urga, and the establishment of a custom-house at Kiakhta in 1728 diverted this trade into a new channel. But Nerchinsk acquired fresh importance from the influx of immigrants, mostly exiles, into eastern Transbaikalia, the discovery of rich mines and the arrival of great numbers of convicts, and ultimately it became the chief town of Transbaikalia. In 1812 it was transferred from the banks of the Shilka to its present site, on account of the floods. Since the foundation, in 1851, of Chita, the present capital of Transbaikalia, Nerchinsk has been falling into decay.

NERCHINSK (in full NERCHINSKIY ZAVOD), a town and silver-mine of East Siberia, in the government of Transbaikalia, 150 m. E.S.E. of another Nerchinsk (*q.v.*) (with which it is often confused), on a small affluent of the Argun. Pop. (1897) 3000. It lies in a narrow valley between barren mountains, and is much better built than any of the district towns of East Siberia. It has a chemical laboratory for mining purposes, and a meteorological observatory (51° 18′ N., 119° 37′ E., 2290 ft. above sea-level), where meteorological and magnetical observations have been made every hour since 1842. The average yearly temperature is 25·3° F., with extremes of 97·7° and −52·6°.

NERCHINSK MINING DISTRICT extends over an area of 29,450 sq. m., and includes all the silver-mines and gold-fields between the Shilka and the Argun, together with a few on the left bank of the Shilka. It is traversed by several parallel chains of mountains which rise to 4500 ft., and are intersected by a complicated system of deep, narrow valleys; densely wooded, with a few expansions along the larger rivers, where the inhabitants with difficulty raise some rye and wheat. The population (75,625 in 1897) consists of Russians, Buryats and Tunguses. Included in this number were some 2300 convicts. The mountains, so far as they have been geologically explored, consist of crystalline slates and limestones—probably Upper Silurian and Devonian—interspersed with granite, syenite and diorite; they contain rich ores of silver, lead, tin and iron, while the diluvial and alluvial valley formations contain productive auriferous sands.

The Nerchinsk silver mines began to be worked in 1704, but during the first half of the 18th century their yearly production did not exceed 8400 oz., and the total amount for the first 150 years (1704–1854) amounted to 11,540,000 oz. The lead was mostly neglected on account of the difficulties of transport, but its production is at present on the increase. Gold was first discovered in 1830, and between 1833 and 1855 260,000 oz. of gold dust were obtained. In 1864 a large number of auriferous deposits were discovered. Until 1863 all the labour was performed by serfs, the property of the emperor, and by convicts, numbering usually nearly four thousand.

NEREUS, in Greek mythology, the eldest son of Pontus and Gaea, and father of the fifty Nereids. He is a beneficent and venerable old man of the sea, full of wisdom and skilled in prophecy, but, like Proteus, he will only reveal what he knows under compulsion. Thus Heracles seized him when asleep, and, although he attempted to escape by assuming various forms, compelled him to reveal the whereabouts of the apples of the Hesperides (Apollodorus ii. 5). His favourite dwelling-place is a cavern in the depths of the Aegean. The fifty daughters of Nereus, the Nereids, are personifications of the smiling, quiet sea. Of these, Thetis and Amphitrite rule the sea according to the legend of different localities; Galatea is a Sicilian figure, who plays with and deludes her rustic lover of the shore, Polyphemus. Nereus is represented with the sceptre and trident; the Nereids are depicted as graceful maidens, lightly clad or naked, riding on tritons and dolphins. The name has nothing to do with the modern Greek νερό (really νεαρόν, "fresh" [water]): it is probably a short form of Νήριτος.

NERGAL, the name of a solar deity in Babylonia, the main seat of whose cult was at Kutha or Cuthah, represented by the mound of Tell-Ibrahim. The importance of Kutha as a religious and at one time also as a political centre led to his surviving the tendency to concentrate the various sun-cults of Babylonia in Shamash (*q.v.*). He becomes, however, the representative of a certain phase only of the sun and not of the sun as a whole. Portrayed in hymns and myths as a god of war and pestilence, there can be little doubt that Nergal represents the sun of noontime and of the summer solstice which brings destruction to mankind. It is a logical consequence that Nergal is pictured also as the deity who presides over the nether-world, and stands at the head of the special pantheon assigned to the government of the dead, who are supposed to be gathered in a large subterranean cave known as Arâlu or Irkalla. In this capacity there is associated with him a goddess Allatu, though there are indications that at one time Allatu was regarded as the sole mistress of Arâlu, ruling

in her own person. Ordinarily the consort of Nergal is Laz. Nergal was pictured as a lion and on boundary-stone monuments his symbol is a mace surmounted by the head of a lion.

As in the case of Ninib, Nergal appears to have absorbed a number of minor solar deities, which accounts for the various names or designations under which he appears, such as Lugalgira, Sharrapu (" the burner," perhaps a mere epithet), Ira, Gibil (though this name more properly belongs to Nusku, *q.v.*) and Sibitti. A certain confusion exists in cuneiform literature between Ninib and Nergal, perhaps due to the traces of two different conceptions regarding these two solar deities. Nergal is called the " raging king," the " furious one," and the like, and by a play upon his name—separated into three elements Ne-urugal " lord of the great dwelling "—his position at the head of the nether-world pantheon is indicated. In the astral-theological system he is the planet Mars, while in ecclesiastical art the great lion-headed colossi serving as guardians to the temples and palaces seem to be a symbol of Nergal, just as the bull-headed colossi are probably intended to typify Ninib.

The name of his chief temple at Kutha was E-shid-lani, from which the god receives the designation of Shidlamtilla, " the one that rises up from Shidlam." The cult of Nergal does not appear to have been as widespread as that of Ninib. He is frequently invoked in hymns and in votive and other inscriptions of Babylonian and Assyrian rulers, but we do not learn of many temples to him outside of Kutha. Sennacherib speaks of one at Tarbisu to the north of Nineveh, but it is significant that although Nebuchadrezzar II. (606–586 B.C.), the great temple-builder of the neo-Babylonian monarchy, alludes to his operations at E-shid-lam in Kutha, he makes no mention of a sanctuary to Nergal in Babylon. Local associations with his original seat—Kutha—and the conception formed of him as a god of the dead acted in making him feared rather than actively worshipped. (M. Ja.)

NERI, PHILIP (Filippo de) (1515–1595), Italian churchman, was born at Florence on the 21st of July 1515. He was the youngest child of Francesco Neri, a lawyer of that city, and his wife Lucrezia Soldi, a woman of noble birth, whose family had long served the state. He was carefully brought up, and received his early teaching from the friars at San Marco, the famous Dominican monastery in Florence. He was accustomed in after life to ascribe most of his progress to the teaching of two amongst them, Zenobio de' Medici and Servanzio Mini. When he was about sixteen years old, a fire destroyed nearly all his father's property. Philip was sent to his father's childless brother Romolo, a merchant at San Germano, a Neapolitan town near the base of Monte Cassino, to assist him in his business, and with the hope that he might inherit his possessions. So far as gaining Romolo's confidence and affection, the plan was entirely successful, but it was thwarted by Philip's own resolve to take holy orders. In 1533 he left San Germano, and went to Rome, where he became tutor in the house of a Florentine gentleman named Galeotto Caccia. Here he was able to pursue his own studies under the guidance of the Augustinians, and to begin those labours amongst the sick and poor which gained him in later life the title of "Apostle of Rome," besides paying nightly visits for prayer and meditations to the churches of the city and to the catacombs. In 1538 he entered on that course of home mission work which was the distinguishing characteristic of his life; somewhat in the manner of Socrates he traversed the city, seizing opportunities of entering into conversation with persons of all ranks, and of leading them on, with playful irony, with searching questions, with words of wise and kindly counsel, to consider the topics he desired to set before them.

In 1548 he founded the celebrated confraternity of the Santissima Trinità de' Pellegrini e de' Convalescente, whose primary object is to minister to the needs of the thousands of poor pilgrims who flock to Rome, especially in years of jubilee, and also to relieve the patients discharged from hospitals, but still too weak for labour. In 1551 he passed through all the minor orders, and was ordained deacon, and finally priest on the 23rd of May. He had some thought of going to India as a missionary, but was dissuaded by his friends who saw that there was abundant work to be done in Rome, and that he was the man to do it. Accordingly he settled down, with some companions, at the hospital of San Girolamo della Carità, and while there tentatively began, in 1556, the institute with which his name is more especially connected, that of the Oratory. The scheme at first was no more than a series of evening meetings in a hall (the Oratory), at which there were prayers, hymns, readings from Scripture, from the fathers, and from the *Martyrology*, followed by a lecture, or by discussion of some religious question proposed for consideration. The musical selections (settings of scenes from sacred history) were called *oratorios*. The scheme was developed, and the members of the society undertook various kinds of mission work throughout Rome, notably the preaching of sermons in different churches every evening, a wholly novel agency at that time. In 1564 the Florentines requested him to leave San Girolamo, and to take the oversight of their church in Rome, San Giovanni dei Fiorentini, then newly built. He was at first reluctant, but by consent of Pius IV. he accepted, while retaining the charge of San Girolamo, where the exercises of the Oratory were kept up. At this time the new society included amongst its members Caesar Baronius, the ecclesiastical historian, Francesco Maria Tarugi, afterwards archbishop of Avignon, and Paravicini, all three subsequently cardinals, and also Gallonius, author of a well-known work on the *Sufferings of the Martyrs*, Ancina, Bordoni, and other men of ability and distinction.

The Florentines, however, built in 1574 a large oratory or mission-room for the society contiguous to San Giovanni, in order to save them the fatigue of the daily journey to and from San Girolamo, and to provide a more convenient place of assembly, and the headquarters were transferred thither. As the community grew, and its mission work extended, the need of having a church entirely its own, and not subject to other claims, as were San Girolamo and San Giovanni, made itself felt, and the offer of the small parish church of Santa Maria in Vallicella, conveniently situated in the middle of Rome, was made and accepted. The building, however, as not large enough for their purpose, was pulled down, and a splendid church erected on the site. It was immediately after taking possession of their new quarters that Neri formally organized, under permission of a bull dated July 15, 1575, a community of secular priests, entitled the Congregation of the Oratory. The new church was consecrated early in 1577, and the clergy of the new society at once resigned the charge of San Giovanni dei Fiorentini, but Neri himself did not migrate from San Girolamo till 1583, and then only in virtue of an injunction of the pope that he, as the superior, should reside at the chief house of his congregation. He was at first elected for a term of three years (as is usual in modern societies), but in 1587 was nominated superior for life. He was, however, entirely free from personal ambition, and had no desire to be general over a number of dependent houses, so that he desired that all congregations formed on his model outside Rome should be autonomous, governing themselves, and without endeavouring to retain control over any new colonies they might themselves send out—a regulation afterwards formally confirmed by a brief of Gregory XV. in 1622. Much as he mingled with society, and with persons of importance in church and state, his single interference in political matters was in 1593, when his persuasions induced the pope, Clement VIII., to withdraw the excommunication and anathema of Henry IV. of France, and the refusal to receive his ambassador, even though the king had formally abjured Calvinism. Neri saw that the pope's attitude was more than likely to drive Henry to a relapse, and probably to rekindle the civil war in France, and directed Baronius, then the pope's confessor, to refuse him absolution, and to resign his office of confessor, unless he would withdraw the anathema. Clement yielded at once, though the whole college of cardinals had supported his policy; and Henry, who did not learn the facts till several years afterwards, testified lively gratitude for the

timely and politic intervention. Neri continued in the government of the Oratory until his death, which took place on the 26th of May 1595 at Rome. He was succeeded by Baronius. There are many anecdotes told of him which attest his possession of a playful humour, united with shrewd mother-wit. He considered a cheerful temper to be more Christian than a melancholy one, and carried this spirit into his whole life. This is the true secret of his popularity and of his place in the folk-lore of the Roman poor. Many miracles were attributed to him alive and dead, and it is said that when his body was dissected it was found that two of his ribs had been broken, an event attributed to the expansion of his heart while fervently praying in the catacombs about the year 1545. This phenomenon is in the same category as the stigmata of St Francis of Assisi. Neri was beatified by Paul V. in 1600, and canonized by Gregory XV. in 1622.

"Practical commonplaceness," says Frederick William Faber in his panegyric of Neri, was the special mark which distinguishes his form of ascetic piety from the types accredited before his day. "He looked like other men . . . he was emphatically a modern gentleman, of scrupulous courtesy, sportive gaiety, acquainted with what was going on in the world, taking a real interest in it, giving and getting information, very neatly dressed, with a shrewd common sense always alive about him, in a modern room with modern furniture, plain, it is true, but with no marks of poverty about it—in a word, with all the ease, the gracefulness, the polish of a modern gentleman of good birth, considerable accomplishments, and a very various information." Accordingly, he was ready to meet the needs of his day to an extent and in a manner which even the versatile Jesuits, who much desired to enlist him in their company, did not rival; and, though an Italian priest and head of a new religious order, his genius was entirely unmonastic and unmedieval; he was the active promoter of vernacular services, frequent and popular preaching, unconventional prayer, and unsystematized, albeit fervent, private devotion.

Neri was not a reformer, save in the sense that in the active discharge of pastoral work he laboured to reform individuals. He had no difficulties in respect of the teaching and practice of his church, being in truth an ardent Ultramontane in doctrine, as was all but inevitable in his time and circumstances, and his great merit was the instinctive tact which showed him that the system of monasticism could never be the leaven of secular life, but that something more homely, simple, and everyday in character was needed for the new time.

Accordingly, the congregation he founded is of the least conventional nature, rather resembling a residential clerical club than a monastery of the older type, and its rules (never written by Neri, but approved by Paul V. in 1612) would have appeared incredibly lax, nay, its religious character almost doubtful, to Bruno, Stephen Harding, Francis or Dominic. It admits only priests aged at least thirty-six, or ecclesiastics who have completed their studies and are ready for ordination. The members live in community, and each pays his own expenses, having the usufruct of his private means—a startling innovation on the monastic vow of poverty. They have indeed a common table, but it is kept up precisely as a regimental mess, by monthly payments from each member. Nothing is provided by the society except the bare lodging, and the fees of a visiting physician. Everything else—clothing, books, furniture, medicines—must be defrayed at the private charges of each member. There are no vows, and every member of the society is at liberty to withdraw when he pleases, and to take his property with him. The government, strikingly unlike the Jesuit autocracy, is of a republican form; and the superior, though first in honour, has to take his turn in discharging all the duties which come to each priest of the society in the order of his seniority, including that of waiting at table, which is not entrusted in the Oratory to lay brothers, according to the practice in most other communities. Four deputies assist the superior in the government, and all public acts are decided by a majority of votes of the whole congregation, in which the superior has no casting voice. To be chosen superior, fifteen years of membership are requisite as a qualification, and the office is tenable, as all the others, for but three years at a time. No one can vote till he has been three years in the society; the deliberative voice is not obtained before the eleventh year. There are thus three classes of members—novices, triennials and decennials. Each house can call its superior to account, can depose, and can restore him, without appeal to any external authority, although the bishop of the diocese in which any house of the Oratory is established is its ordinary and immediate superior, though without power to interfere with the rule. Their churches are non-parochial, and they can perform such rites as baptisms, marriages, &c., only by permission of the parish priest, who is entitled to receive all fees due in respect of these ministrations. The Oratory chiefly spread in Italy and in France, where in 1760 there were 58 houses all under the government of a superior-general. Malebranche, Thomassin, Mascaron and Massillon were members of the famous branch established in Paris in 1611 by Bérulle (after cardinal), which had a great success and a distinguished history. It fell in the crash of the Revolution, but was revived by Père Pététot, curé of St Roch, in 1852, as the "Oratory of Jesus and the Immaculate Mary"; the Church of the Oratory near the Louvre belongs to the Reformed Church. An English house, founded in 1847 at Birmingham, is celebrated as the place at which Cardinal Newman fixed his abode after his submission to the Roman Catholic Church. In 1849 a second congregation was founded in King William Street, Strand, London, with F. W. Faber as superior; in 1854 it was transferred to Brompton. The society has never thriven in Germany, though a few houses have been founded there, in Munich and Vienna.

NERO (37–68), Roman emperor 54–68, was born at Antium on the 15th of December 37. He was the son of Gnaeus Domitius Ahenobarbus and Agrippina the younger, and his name was originally L. Domitius Ahenobarbus. His father died when Nero was scarcely three years old. In the previous year (39) his mother had been banished by order of her brother Caligula (Gaius) on a charge of treasonable conspiracy, and Nero, thus early deprived of both parents, found shelter in the house of his aunt Domitia, where two slaves, a barber and a dancer, began his training. The emperor Claudius recalled Agrippina, who spent the next thirteen years in the determined struggle to win for Nero the throne which had been predicted for him. Her first decisive success was gained in 48 by the disgrace and execution of Messallina (*q.v.*), wife of Claudius. In 49 followed her own marriage with Claudius, and her recognition as his consort in the government.[1] The Roman populace already looked with favour on Nero, as the grandson of Germanicus, but in 50 his claims obtained formal recognition from Claudius himself, who adopted him under the title of Nero Claudius Caesar Drusus Germanicus.[2] Agrippina's next step was to provide a suitable training for her son. The scholar L. Annaeus Seneca was recalled from exile and appointed his tutor. On the 15th of December 51 Nero completed his fourteenth year, and Agrippina, in view of Claudius's failing health, determined to delay no longer his adoption of the *toga virilis*. The occasion was celebrated in a manner which seemed to place Nero's prospects of succession beyond doubt. He was introduced to the senate by Claudius himself. The proconsular *imperium* and the title of *princeps juventutis* were conferred upon him.[3] He was specially admitted as an extraordinary member of the great priestly colleges; his name was included by the Arval Brethren in their prayers for the safety of the emperor and his house; at the games in the circus his appearance in triumphal dress contrasted significantly with the simple *toga praetexta* worn by Britannicus. During the next two years Agrippina followed this up with energy. Britannicus's leading partisans were banished or put to death, and the all-important command of the praetorian guard was transferred to Afranius Burrus, a Gaul by birth, who had been the trusted agent first of Livia and then of Tiberius and Claudius. Nero himself was put prominently forward. The petitions addressed to the senate by the town of Bononia and by the communities of Rhodes and Ilium were gracefully supported by him in Latin and Greek speeches, and during Claudius's absence in 52 at the Latin festival it was Nero who, as praefect of the city, administered justice in the forum. Early in 53 his marriage with

[3] Tac. *Ann.* xii. 41.

Claudius's daughter Octavia drew still closer the ties which connected him with the imperial house. Agrippina determined to hasten the death of Claudius, and the absence, through illness, of the emperor's trusted freedman Narcissus, favoured her schemes. On the 13th of October 54 Claudius died, poisoned, as all our authorities declare, by her orders, and Nero was presented to the soldiers on guard as their new sovereign. From the steps of the palace he proceeded to the praetorian camp to receive the salutations of the troops, and thence to the senate-house, where he was promptly invested with all the honours, titles and powers of emperor.[1]

Agrippina's bold stroke had been completely successful. Only a few voices were raised for Britannicus; nor is there any doubt that Rome was prepared to welcome the new emperor with genuine enthusiasm. His prestige and his good qualities, carefully fostered by Seneca, made him popular, while his childish vanity, ungovernable selfishness and savage temper were as yet unsuspected. His first acts confirmed this favourable impression. He modestly declined the title of *pater patriae*; the memory of Claudius, and that of his own father Domitius were duly honoured. The senate listened with delight to his promises to rule according to the maxims of Augustus, and to avoid the errors which had rendered unpopular the rule of his predecessor, while his unfailing clemency, liberality and affability were the talk of Rome. Much no doubt of the credit of all this is due to Seneca and Burrus. Seneca had seen from the first that the real danger with Nero lay in the savage vehemence of his passions, and he made it his chief aim to stave off by every means in his power the dreaded outbreak. The policy of indulging his tastes and helping him to enjoy the sweets of popularity without the actual burdens of government succeeded for the time. During the first five years of his reign, the golden *quinquennium Neronis*, little occurred to damp the popular enthusiasm. Nero's promises of constitutional moderation were amply fulfilled, and the senate found itself free to discuss and even to decide important administrative questions. Abuses were remedied, the provincials protected from oppression, and the burdens of taxation lightened. On the frontiers, thanks chiefly to Corbulo's energy and skill, no disaster occurred serious enough to shake the general confidence, and even the murder of Britannicus seems to have been accepted as a necessary measure of self-defence. But Seneca's fear lest Nero's sleeping passions should once be roused were fully verified, and he seems to have seen all along where the danger lay, namely in Agrippina's imperious temper and insatiable love of power. The success of Seneca's own management of Nero largely depended on his being able gradually to emancipate the emperor from his mother's control. During the first few months of Nero's reign the chances of such an emancipation seemed remote, for he treated his mother with elaborate respect and consulted her on all affairs of state. In 55, however, Seneca found a powerful ally in Nero's passion for the beautiful freedwoman Acte, a passion which he deliberately encouraged. Agrippina's angry remonstrances served only to irritate Nero, and caresses equally failed. She then rashly tried intimidation and threatened to espouse the cause of Britannicus. Nero retaliated by poisoning Britannicus. Agrippina then tried to win over Nero's neglected wife Octavia, and to form a party of her own. Nero dismissed her guards, and placed her in a sort of honourable confinement (Tac. *Ann.* xiii. 12-20). During nearly three years she disappears from the history, and with her retirement things again for the time went smoothly In 58, however, fresh cause for anxiety appeared, when Nero was enslaved by Poppaea Sabina, a woman of a very different stamp from her predecessor. High-born, wealthy and accomplished, she was resolved to be Nero's wife, and set herself to remove the obstacles which stood in her way. Her first object was the final ruin of Agrippina, and by rousing Nero's jealousy and fear she induced him to seek her death, with the aid of a freedman Anicetus, praefect of the fleet of Misenum. Agrippina was invited to Baiae, and after an affectionate reception, was conducted on board a vessel so constructed as, at a given signal, to fall to pieces. But Agrippina saved herself by swimming, and wrote to her son, announcing her escape, and affecting entire ignorance of the plot. A body of soldiers under Anicetus then surrounded her villa, and murdered her in her own chamber. Nero was horrorstruck at the enormity of the crime and terrified at its possible consequences. But a six months' residence in Campania, and the congratulations which poured in upon him from the neighbouring towns, where the report had been officially spread that Agrippina had fallen a victim to her treacherous designs upon the emperor, gradually restored his courage. In September 59 he re-entered Rome amid universal rejoicing. A prolonged carnival followed. Chariot races, musical and dramatic exhibitions, games in the Greek fashion rapidly succeeded each other. In all the emperor was a prominent figure, but these revels at least involved no bloodshed, and were civilized compared with the gladiatorial shows.

A far more serious result of the death of Agrippina was the growing influence over Nero of Poppaea and her friends. In 62 Burrus died, it was said by poison, and Seneca retired from the unequal contest. Their place was filled by Poppaea, and the infamous Tigellinus, whose sympathy with Nero's sensual tastes had gained him the command of the praetorian guards in succession to Burrus. The haunting fear of conspiracy was skilfully used by them to direct Nero's suspicions against possible opponents. Cornelius Sulla, who had been banished to Massilia in 58, was put to death on the ground that his residence in Gaul was likely to arouse disaffection in that province, and a similar charge proved fatal to Rubellius Plautus, who had for two years been living in retirement in Asia.[2] Nero's taste for blood thus whetted, Octavia was divorced, banished to the island of Pandateria and barbarously murdered. Poppaea's triumph was now complete. She was formally married to Nero; her head appeared on the coins side by side with his; and her statues were erected in the public places of Rome.

In the course of the year 61 Rome was startled by the news of a disaster in Britain. At the time of the Claudian invasion of Britain in A.D. 43 Prasutagus, the king of the Iceni, had concluded a treaty with Claudius, by which no doubt he recognized the suzerainty of Rome and was himself enrolled among "the allies and friends of the Roman people." The alliance was of value to Claudius, for the territory of the Iceni (Norfolk, Suffolk, and Cambridgeshire) lay immediately north of the new province and its capital town Colchester, and Prasutagus had loyally kept faith with Rome. But in A.D. 61 he died, leaving no male heir. His kingdom therefore lapsed to Rome, and Prasutagus, anxious that the transfer should be effected in an orderly way, divided his accumulated wealth between his two daughters and the emperor. His plan failed, for the local Roman officials acted as though the kingdom had been conquered in war; they seized on the property of the late king and his chiefs and insulted his family. Fearing that worse might follow when the kingdom should be annexed, and encouraged by the absence of the legate and his legions, the Iceni, led by Prasutagus's daughter Boudicca (Boadicea) rose in revolt and were joined by the Trinobantes in Essex, who had been long subject to Rome and had their own grievances to redress. Colchester, since A.D. 50 a Roman colony, was sacked. The ninth legion which had hurried from Lincoln was cut to pieces, and the insurgents prepared to march on London. The news of the outbreak found the legate Suetonius Paulinus engaged in attacking Anglesey. His resolution was at once taken. At the head of such light troops as he could collect, he marched in haste along the Watling Street, leaving orders for the legions to follow. Though the tribes along the road were rising, Suetonius succeeded in reaching London, only however to find himself too weak to hold it. He was obliged to fall back along the road by which he had come. London first, and then Verulam, were abandoned to the Britons. At last at some undefined point on the Watling Street his legions joined him. Thus reinforced he turned to face the enemy. The engagement was severe but the Roman victory was decisive, and Roman authority was restored throughout central and southern Britain.

The profound impression produced in Rome by the "British disaster" was confirmed two years later in A.D. 63 by the partial destruction of Pompeii by an earthquake, and the news of the evacuation of Armenia by the Roman legions. A far deeper and more lasting impression was produced by the great fire in Rome. The fire broke out on the night of the 18th of July, 64, among the wooden booths at the south-east end of the Circus Maximus. Thence in one direction it rapidly spread over the Palatine and

[1] Tac. *Ann.* xii. 96; Suet. *Nero*, 8.

[2] Tac *Ann* xiv. 59.

Velia up to the low cliffs of the Esquiline, and in another it laid waste the Aventine, the Forum Boarium and Velabrum till it reached the Tiber and the solid barrier of the Servian wall. After burning fiercely for six days it suddenly started afresh in the northern quarter of the city and desolated the regions of the Circus Flaminius and the Via Lata, and by the time that it was finally quenched only four of the fourteen regiones remained untouched; three had been utterly destroyed and seven reduced to ruins. The conflagration is said by all authorities later than Tacitus to have been deliberately caused by Nero himself.[1] But Tacitus, though he mentions the rumours, declares that its origin was uncertain, and in spite of such works as Profumo's *Le fonti ed i tempi dello incendio Neroniano* (1905), there is no proof of his guilt.[2] By Nero's orders, the open spaces in the Campus Martius were utilized to give shelter to the homeless crowds, provisions were brought from Ostia and the price of corn lowered. In rebuilding the city every precaution was taken against the recurrence of such a calamity. Broad regular streets replaced the narrow winding alleys. The new houses were limited in height, built partly of hard stone and protected by open spaces and colonnades. The water-supply, lastly, was carefully regulated.

There is, however, no doubt that this great disaster told against Nero in the popular mind. It was regarded as a direct manifestation of the wrath of the gods, even by those who did not suspect the emperor. This impression no religious ceremonies, nor even the execution of a number of Christians, as convenient scapegoats, could altogether dispel. But Nero proceeded with the congenial work of repairing the damage. In addition to the rebuilding of the streets, he erected a splendid palace, the "golden house," for himself. The wonders of his *Domus aurea* were remembered and talked of long after its partial demolition by Vespasian. It stretched from the Palatine across the low ground, afterwards occupied by the Colosseum, to the Esquiline. Gold, precious stones and Greek masterpieces adorned its walls. Most marvellous of all were the grounds in which it stood, with their meadows and lakes, their shady woods and their distant views. To defray the enormous cost, Italy and the provinces, says Tacitus, were ransacked, and in Asia and Achaia especially the rapacity of the imperial commissioners recalled the days of Mummius and of Sulla.[3] It was the first occasion on which the provincials had suffered from Nero's rule, and the discontent it caused helped to weaken his hold over them at the very moment when the growing dissatisfaction in Rome was gathering to a head. Early in 65 Nero was panic-stricken by the discovery of a formidable conspiracy involving such men as Faenius Rufus, Tigellinus's colleague in the prefecture of the praetorian guards, Plautius Lateranus, one of the consuls elect, the poet Lucan, and, lastly, not a few of the tribunes and centurions of the praetorian guard itself. Their chosen leader, whom they destined to succeed Nero, was C. Calpurnius Piso (*q.v.*), a handsome, wealthy and popular noble, and a boon companion of Nero himself. The plan to murder Nero was frustrated by a freedman Milichus, who, in the hope of a large reward, disclosed the whole plot. Piso, Faenius Rufus, Lucan and many of their less prominent accomplices, and even Seneca himself (though there seems to have been no evidence of his complicity) were executed.

But, though largesses and thanksgivings celebrated the suppression of the conspiracy, and the round of games and shows was renewed with even increased splendour, the effects of the shock were visible in the long list of victims who during the next few months were sacrificed to his restless fears and resentment. Conspicuous among them was Paetus Thrasea, whose unbending virtue had long made him distasteful to Nero, and who was now suspected, possibly with reason, of sympathy with the conspirators. The death of Poppaea in the autumn of 65 was probably not lamented by any one but her husband, but the general gloom was deepened by a pestilence, caused, it seems, by the overcrowding at the time of the fire.

Early, however, in the summer of 66, the Parthian prince Tiridates visited Italy. This event was a conspicuous tribute to the ability both as soldier and statesman of Cn. Domitius Corbulo. As long ago as 54 the news reached Rome that the Parthian king Vologaeses had expelled the king recognized by Rome from Armenia and installed in his place his own brother Tiridates. Orders were at once issued to concentrate all available forces on the Cappadocian frontier under Corbulo, the first soldier of his day. After some time spent in making his army efficient, Corbulo invaded Armenia and swept victoriously through the country. Armenia was rescued and Corbulo proposed that Tiridates should become king of Armenia on condition of his receiving his crown as a gift from Nero. But the government in Rome had a plan of its own, and a certain Tigranes, long resident in Rome, but a stranger to the Armenians, was sent out, and Corbulo was obliged reluctantly to seat him on the Armenian throne. Tigranes's position, always insecure, soon became untenable, and it became necessary for Rome to intervene once more. A Roman force under Caesennius Paetus was sent to restore Tigranes and re-establish Roman predominance. Paetus, however, was no Corbulo. He was defeated, and Corbulo, now legate of Syria, was obliged to come to his rescue. The result was the final triumph of Corbulo's policy. Tiridates agreed to accept the crown of Armenia from the hands of Nero. In royal state he travelled to Italy, and the ceremony of investiture was performed at Rome with the utmost splendour. Delighted with this tribute to his greatness, Nero for a moment dreamt of rivalling Alexander. Expeditions were talked of to the Caspian Sea and Ethiopia, but Nero was no soldier and quickly turned to a more congenial field. He had already, in 64, appeared on the stage before the half-Greek public of Naples. But his mind was now set on challenging the applause of the Greeks themselves in the ancient home of art. Towards the end of 66 he arrived in Greece with a retinue of soldiers, courtiers, musicians and dancers. The spectacle presented by Nero's visit was unique.[4] He went professedly as an enthusiastic worshipper of Greek art and a humble candidate for the suffrages of Greek judges. At each of the great festivals, which to please him were for once crowded into a single year, he entered in regular form for the various competitions, scrupulously conformed to the tradition and rules of the arena, and awaited in nervous suspense the verdict of the umpires. The dexterous Greeks humoured him to the top of his bent. Everywhere the imperial competitor was victorious, and crowded audiences importuned him to display his talents. The emperor protested that only the Greeks were fit to hear him, and rewarded them when he left by the bestowal of immunity from the land tax on the whole province, and by the gift of the Roman franchise; he also planned and actually commenced the cutting of a canal through the Isthmus of Corinth. If we may believe report, Nero found time in the intervals of his artistic triumphs for more vicious excesses. The stories of his mock marriage with Sporus, his execution of wealthy Greeks for the sake of their money, and his wholesale plundering of the temples were evidently part of the accepted tradition about him in the time of Suetonius, and are at least credible. Far more certainly true is his ungrateful treatment of Domitius Corbulo, who, when he landed at Cenchreae, fresh from his successes in Armenia, was met by an order for his instant execution and at once put an end to his life.

Meanwhile the general dissatisfaction was coming to a head, as we may infer from the urgency with which the imperial freedman Helius insisted upon Nero's return to Italy. Far more serious was the disaffection which now showed itself in the rich and warlike provinces of the west. In northern Gaul, early in 68, the standard of revolt was raised by Julius Vindex, governor of Gallia Lugdunensis, and himself the head of an ancient and noble Celtic family. South of the Pyrenees, P. Sulpicius Galba, governor of Hispania Tarraconensis, and Poppaea's former

[2] This work is a reply to C. Pascal's *L'Incendio di Roma e i primi Cristiani* (Milan, 1900), which throws the guilt on the Christians.

[3] Tac. *Ann.* xv. 42; Suet. *Nero*, 31; cf. Friedländer, *Sittengeschichte*, iii. 67-69.

[4] Suet. *Nero*, 19-24; Dio Cass. *Epit.* lxiii. 8-16.

husband, Marcus Salvius Otho, governor of Lusitania, followed Vindex's example. At first, however, fortune seemed to favour Nero. It is very probable that Vindex had other aims in view than the deposition of Nero and the substitution of a fresh emperor in his place, and that the liberation of northern Gaul from Roman rule was part of his plan.[1] If this was so, it is easy to understand both the enthusiasm with which the chiefs of northern Gaul rallied to the standard of a leader belonging to their own race, and the opposition which Vindex encountered from the Roman colony of Lugdunum and the legions on the Rhine. For it is certain that the latter at any rate were not animated by loyalty to Nero. Though they defeated Vindex and his Celtic levies at Vesontio (Besançon), their next step was to break the statues of Nero and offer the imperial purple to their own commander Virginius Rufus. He declined their offer, but appealed to them to declare for the senate and people of Rome. Meanwhile in Spain Galba had been saluted imperator by his legions, had accepted the title, and was already on his march towards Italy. On the road the news met him that Vindex had been crushed by the army of the Rhine, and for the moment he resolved to abandon his attempt. Meanwhile, Nero had reluctantly left Greece, but returned to Italy only to renew his revels. When on the 19th of March the news reached him at Naples of the rising in Gaul, he allowed a week to elapse before he could tear himself away from his pleasures, and then contented himself with proscribing Vindex, and setting a price on his head. The revolts in Spain and Germany terrified him too late into something like energy. The senate almost openly intrigued against him, and the populace were silent or hostile. The fidelity of the praetorian sentinels even was more than doubtful. When finally the palace guards forsook their posts, Nero despairingly stole out of Rome to seek shelter in a freedman's villa some four miles off. There he heard of the senate's proclamation of Galba as emperor, and of the sentence of death passed on himself. On the approach of the horsemen sent to drag him to execution, he collected sufficient courage to save himself by suicide. Nero died on the 9th of June 68, in the thirty-first year of his age and the fourteenth of his reign, and his remains were deposited by the faithful hands of Acte in the family tomb of the Domitii on the Pincian Hill. With his death ended the line of the Caesars, and Roman imperialism entered upon a new phase. His statues were broken, his name everywhere erased, and his golden house demolished; yet, in spite of all, no Roman emperor has left a deeper mark upon subsequent tradition. The Roman populace for a long time reverenced his memory as that of an open-handed patron, and in Greece the recollections of his magnificence, and his enthusiasm for art, were still fresh when the traveller Pausanias visited the country a century later. The belief that he had not really died, but would return again to confound his foes, was long prevalent, not only in the remoter provinces, but even in Rome itself; and more than one pretender was able to collect a following by assuming the name of the last of the race of Augustus. More lasting still was the implacable hatred of those who had suffered from his cruelties. Roman literature, faithfully reflecting the sentiments of the aristocratic salons of the capital, while it almost canonized those who had been his victims, fully avenged their wrongs by painting Nero as a monster of wickedness. In Christian tradition he even appears as the mystic Antichrist, who was destined to come once again to trouble the saints. Even in the middle ages, Nero was still the very incarnation of splendid iniquity, while the belief lingered obstinately that he had only disappeared for a time, and as late as the 11th century his restless spirit was supposed to haunt the slopes of the Pincian Hill.

The chief ancient authorities for Nero's life and reign are Tacitus (*Annals*, xiii.-xvi., ed. Furneaux), Suetonius, Dio Cassius (*Epit.* lxi., lxii., lxiii.), and Zonaras (*Ann.* xi.). The most important modern work is that of B. W. Henderson, *The Life and Principate of the Emperor Nero* (London, 1903; see an important notice in *Class. Rev.* vol. xviii. p. 57), which contains complete bibliography of ancient and modern writers; see also H. Schiller's *Nero*, and *Geschichte d. Kaiserzeit*; Lehmann, *Claudius und Nero*; histories of Rome in general. (H. F. P.)

[1] Suet. *Nero*, 40; Dio Cass. *Epit.* lxiii. 22; Plut. *Galba*, 4; cf. also Schiller's *Nero*, pp. 261 seq.; Mommsen in *Hermes*, xiii. 90.

NERVA, MARCUS COCCEIUS, Roman emperor from the 18th of September 96 to the 25th of January 98, was born at Narnia in Umbria on the 8th of November, probably in the year 35. He belonged to a senatorial family, which had attained considerable distinction under the emperors, his father and grandfather having been well-known jurists. A single inscription (*C.I.L.* vi. 31,297) gives the name of his mother as Sergia Plautilla, daughter of Laenas. In his early manhood he had been on friendly terms with Nero, by whom he was decorated in 65 (Tacitus, *Annals*, xv. 72) with the triumphal insignia after the suppression of the Pisonian conspiracy (further valuable information as to his career is given in an inscription from Sassoferrato, (*C.I.L.* xi. 5743).

He was praetor (66) and twice consul, in 71 with the emperor Vespasian for colleague, and again in 90 with Domitian. Towards the close of the latter's reign (93) he is said to have excited suspicion and to have been banished to Tarentum on a charge of conspiracy (Dio Cass. lxvii. 15; Philostr. *Apoll. Tyan.* vii. 8). On the murder of Domitian in September 96 Nerva was declared emperor by the people and the soldiers. He is described as a quiet, kindly, dignified man, honest of purpose, but unfitted by his advanced age and temperament, as well as by feeble health, to bear the weight of empire. Nevertheless, his selection, in spite of occasional exhibitions of weakness, justified the choice. His accession brought a welcome relief from the terrible strain of the last few years. The new emperor recalled those who had been exiled by Domitian; what remained of their confiscated property was restored to them, and a stop was put to the vexatious prosecutions which Domitian had encouraged. But the popular feeling demanded more than this. The countless informers of all classes who had thriven under the previous régime now found themselves swept away, to borrow Pliny's metaphor (Pliny, *Paneg.* 35), by a hurricane of revengeful fury, which threatened to become as dangerous in its indiscriminate ravages as the system it attacked. It was finally checked by Nerva, who was stung into action by the sarcastic remark of the consul Titus Catius Caesius Fronto that, "bad as it was to have an emperor who allowed no one to do anything, it was worse to have one who allowed every one to do everything" (Dio Cass. lxviii. 1).

Nerva seems to have followed the custom of announcing the general lines of his future policy. Domitian had been arbitrary and high-handed, and had heaped favours on the soldiery while humiliating the senate; Nerva showed himself anxious to respect the traditional privileges of the senate, and such maxims of constitutional government as still survived. He pledged himself to put no senator to death. His chosen councillors in all affairs of state were senators, and the hearing of claims against the *fiscus* was taken from the imperial *procuratores* and entrusted to the more impartial jurisdiction of a praetor and a court of *judices* (Dio Cass. lxviii. 2; *Digest*, i. 2, 2; Pliny, *Paneg.* 36).

No one probably expected from Nerva a vigorous administration either at home or abroad, although during his reign a successful campaign was carried on in Pannonia against the Germans (Suebi), for which he assumed the name Germanicus. He appears, however, to have set himself honestly to carry out reforms. The economical condition of Italy evidently excited his alarm and sympathy. The last mention of a *lex agraria* in Roman history is connected with his name, though how far the measure was strictly speaking a law is uncertain. Under the provisions of this *lex*, large tracts of land were bought up and allotted to poor citizens. The cost was defrayed partly from the imperial treasury, but partly also from Nerva's private resources, and the execution of the scheme was entrusted to commissioners (*Dig.* xlvii. 21, 3; Dio Cass. lxviii. 2; Pliny, *Ep.* vii. 31; *Corp. Inscr. Lat.* vi. 1548). He also founded or restored colonies at Verulae, Scyllacium and Sitifis in Mauretania. The agrarian

law was probably as short-lived in its effects as preceding ones had been, but a more lasting reform was the maintenance at the public cost of the children of poor parents in the towns of Italy (Aur. Vict. *Ep.* 24), the provision being presumably secured by a yearly charge on state and municipal lands. Private individuals were also encouraged to follow the imperial example. In the hands of Trajan, Hadrian and the Antonines, Nerva's example bore fruit in the institution of the *alimentationes*, the most genuinely charitable institution of the pagan world. These measures Nerva supplemented by others which aimed at lightening the financial burdens on the declining industry of Italy. The cost of maintaining the imperial postal system (*vehiculatio*) was transferred to the *fiscus*; from the same source apparently money was found for repairing the public roads and aqueducts; and lastly, the lucrative but unpopular tax of 5% on all legacies or inheritances (*vicesima hereditatum*), was so readjusted as to remove the grosser abuses connected with it (Pliny, *Paneg.* 37). At the same time Nerva did his best to reduce the overgrown expenditure of the state (Pliny, *Ep.* ii. 1). A commission was appointed to consider the best modes of retrenchment, and the outlay on shows and games was cut down to the lowest possible point. Nerva seems nevertheless to have soon wearied of the uncongenial task of governing, and his anxiety to be rid of it was quickened by the discovery that not even his blameless life and mild rule protected him against intrigue and disaffection. Early, apparently, in 97 he detected a conspiracy against his life headed by L. (or C.) Calpurnius Crassus, but he contented himself with a hint to the conspirators that their designs were known, and with banishing Crassus to Tarentum. This ill-judged lenity provoked a few months later an intolerable insult to his dignity. The praetorian guards had keenly resented the murder of their patron Domitian, and now, at the instigation of one of their two prefects, Casperius Aelianus, whom Nerva had retained in office, they imperiously demanded the execution of Domitian's murderers, the chamberlain Parthenius and Petronius Secundus, Aelianus's colleague. Nerva vainly strove to save, even at the risk of his own life, the men who had raised him to power, but the soldiers brutally murdered the unfortunate men, and forced him to propose a vote of thanks for the deed (Dio Cass. *Epit.* lxviii. 4; Aur. Vict. *Ep.* 24). This humiliation convinced Nerva of the necessity of placing the government in stronger hands than his own. Following the precedent set by Augustus, Galba and Vespasian, he resolved to adopt as his colleague and destined successor, M. Ulpius Trajanus, a distinguished soldier, at the time in command of the legions on the Rhine. In October 97, in the temple of Jupiter on the Capitol, Trajan was formally adopted as his son and declared his colleague in the government of the empire (Pliny, *Paneg.* 8). For three months Nerva ruled jointly with Trajan (Aur. Vict. *Ep.* 24); but on the 25th (according to others, the 27th) of January 98 he died somewhat suddenly. He was buried in the sepulchre of Augustus, and divine honours were paid him by his successor. The verdict of history upon his reign is best expressed in his own words—"I have done nothing which should prevent me from laying down my power, and living in safety as a private man." The memory of Nerva is still preserved by the ruined temple in the Via Alessandrina (il Colonacce) which marks the site of the Forum begun by Domitian, but which Nerva completed and dedicated (Suet. *Dom.* 5; Aur. Vict. 12).

NERVAL, GÉRARD DE (1808–1855), the adopted name of Gérard Labrunie, French man of letters, born in Paris on the 22nd of May 1808. His father was an army doctor, and the child was left with an uncle in the country, while Mme Labrunie accompanied her husband in his campaigns. She died in Silesia. In 1811 his father returned, and beside Greek and Latin taught the boy modern languages and the elements of Arabic and Persian. Gérard found his favourite reading in old books on mysticism and the occult sciences. He distinguished himself by his successes at the Collège Charlemagne, however, and his first work, *La France guerrière, élégies nationales*, was published while he was still a student. In 1828 he published a translation of Goethe's *Faust*, the choruses of which were afterwards used by Berlioz for his legend-symphony, *The Damnation of Faust*. A number of poetical pieces and three comedies combined to acquire for him, at the age of twenty-one, a considerable literary reputation, and led to his being associated with Théophile Gautier in the preparation of the dramatic *feuilleton* for the *Presse*. He conceived a violent passion for the actress Jennie Colon, in whom he thought he recognized a certain Adrienne, who had fired his childish imagination. Her marriage and her death in 1842 were blows from which his nervous temperament never really recovered. He travelled in Germany with Alexandre Dumas, and alone in various parts of Europe, leading a very irregular and eccentric life. In 1843 he visited Constantinople and Syria, where, among other adventures, he nearly married the daughter of a Druse sheikh. He contributed accounts of his travels to the *Revue des Deux Mondes* and other periodicals. After his return to Paris in 1844 he resumed for a short time his *feuilleton* for the *Presse*, but his eccentricities increased and he committed suicide by hanging, on the 25th of January 1855. The literary style of Gérard is simple and unaffected, and he has a peculiar faculty of giving to his imaginative creations an air of naturalness and reality. In a series of novelettes, afterwards published under the name of *Les Illuminés, ou les précurseurs du socialisme* (1852), containing studies on Rétif de la Bretonne, Cagliostro and others, he gave a sort of analysis of the feelings which followed his third attack of insanity. Among his other works the principal are *Les Filles du feu* (1854), which contains his masterpiece, the semi-autobiographical romance of *Sylvie*; *Scènes de la vie orientale* (1848–1850); *Contes et facéties* (1852); *La Bohème galante* (1856); and *L'Alchimiste*, a drama in five acts, the joint composition of Gérard and Alexandre Dumas. His *Poésies complètes* were published in 1877.

There are many accounts of Gérard de Nerval's unhappy life. Among them may be mentioned notices by his friend Théophile Gautier and by Arsène Houssaye, prefixed to the posthumous *Le Rêve et la vie* (1855); Maurice Tourneux's sketch in his *Âge du romantisme* (1887); and a sympathetic study of temperament in the *Névrosés* (1898) of Mme Arvède Barine. See also G. Ferrières, *Gérard de Nerval* (1906).

NERVE (Lat. *nervus*, Gr. νεῦρον, a bowstring), originally a sinew or tendon (and still so used in the phrase "to strain every nerve"), but now a term practically confined to the fibres of the *nervous system* in anatomy, though consequentially employed as a general psychical term in the sense of courage or firmness, and sometimes (but more usually "nervousness") in the opposite sense. In the present article the anatomy of the nerves is dealt with; see also NERVOUS SYSTEM, MUSCLE AND NERVE, NEUROPATHOLOGY, &c.

I. CRANIAL

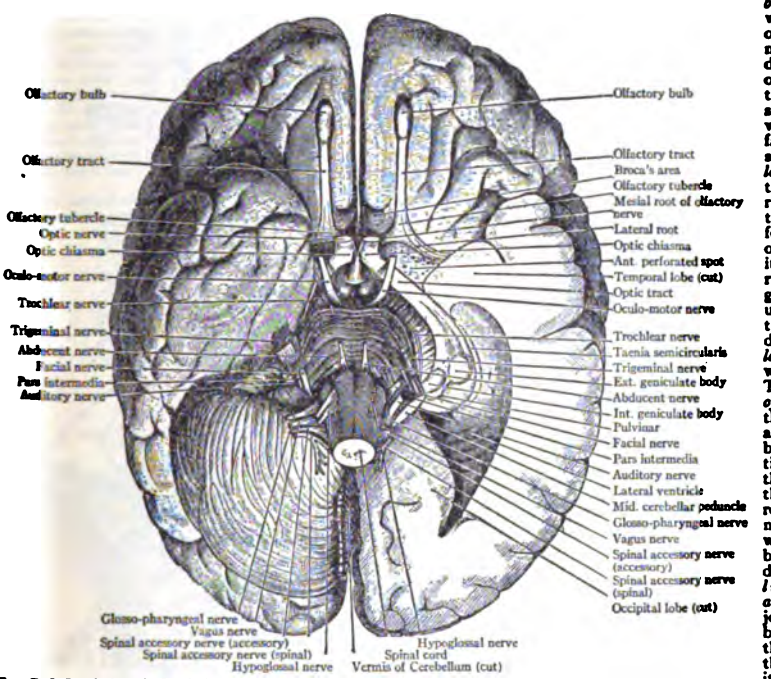
The cranial nerves are those which rise directly from the brain, and for the most part are concerned with the supply of the head. With one exception they all contain medullated fibres (see NERVOUS SYSTEM). Twelve pairs of these nerves are recognized, and they are spoken of as often by their numbers as by their names. The following is a list:—

(1) Olfactory; (2) Optic; (3) Oculo-motor or Motor oculi; (4) Trochlearis or Patheticus; (5) Trigeminal or Trifacial; (6) Abducens; (7) Facial; (8) Auditory; (9) Glosso-pharyngeal; (10) Vagus or Pneumogastric; (11) Spinal accessory; (12) Hypoglossal.

The *first*, or *olfactory nerve*, consists of the *olfactory bulb* and *tract*, which are a modified lobe of the brain and lie beneath the sulcus rectus on the frontal lobe of the brain (see fig. 1). At its posterior end the tract divides to become continuous with the two extremities of the limbic lobe (see BRAIN), while at its anterior end is the bulb from which some twenty small non-medullated nerves pass through the cribriform plate of the ethmoid to supply the sensory organs in the olfactory mucous membrane (see OLFACTORY ORGAN).

The *second* or *optic nerve* consists of the *optic tract*, the optic *commissure* or *chiasma*, and the *optic nerve* proper. The optic tract begins at the lower visual centres or internal and external geniculate bodies, the superior quadrigeminal body and the pulvinar (see fig. 1), but these again are connected with the higher visual centre in the occipital lobe by the optic radiations (see fig. 2). In the chiasma some of the fibres cross and some do not, so that the right optic tract forms the right half of both the right and left optic nerves. In addition to this the fibres coming from the internal geniculate body of one side cross in the chiasma to the same body of the opposite side, forming *Gudden's commissure*. The optic nerve passes through the optic foramen in the skull into the orbit, where it is penetrated by the central artery of the retina, and eventually pierces the sclerotic just internal to the posterior pole of the eyeball. Its final distribution is treated in the article EYE.

The *third* or *oculomotor nerve* rises from a nucleus in the floor of the aqueduct of Sylvius (see BRAIN, fig. 8), and comes to the surface



From D. J. Cunningham, in Cunningham's *Text-book of Anatomy*.

FIG. 1.—View of the Under Surface of the Brain, with the lower portion of the temporal and occipital lobes, and the cerebellum on the left side removed, to show the origins of the cranial nerves.

in a groove on the inner side of the crus cerebri (fig. 1); it soon pierces the dura mater, and lies in the outer wall of the cavernous sinus, where it divides into an upper and lower branch. Both these enter the orbit through the sphenoidal fissure, the upper branch supplying the superior rectus and levator palpebrae superioris muscles, the lower the inferior and internal rectus and the inferior oblique, so that it supplies five of the seven orbital muscles.

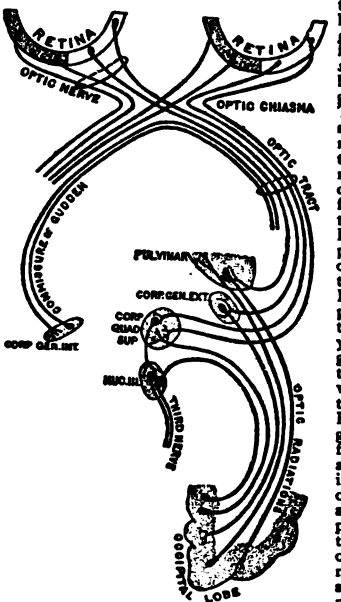
The *fourth* or *trochlear nerve* is very small, and comes from a nucleus a little lower than that of the third nerve. It is specially remarkable in that it crosses to the opposite side in the substance of the valve of Vieussens of the fourth ventricle, after which it winds round the outer side of the crus cerebri (fig. 1) and enters the outer wall of the cavernous sinus to reach the orbit through the sphenoidal fissure. Here it enters the superior oblique muscle on its orbital surface.

The *fifth* or *trigeminal nerve* consists of motor and sensory roots. The motor root rises from a nucleus in the upper lateral part of the floor of the fourth ventricle, as well as by a descending (mesencephalic) tract from the neighbourhood of the Sylvian aqueduct (see fig. 3). The large sensory root goes to a sensory nucleus a little external to the motor one, and also, by a spinal or descending root, to the substantia gelatinosa Rolandi as low as the second spinal nerve (see fig. 3). The superficial origin of the fifth nerve is from the side of the pons (see fig. 1), and the two roots at once pass into a small compartment of the dura mater, in front of the apex of the petrous bone, known as *Meckel's cave*; here the large crescentic *Gasserian ganglion* is formed upon the sensory root, and from this the three branches come off, earning the nerve its name of trigeminal. The first of these divisions is the ophthalmic, the second the maxillary, and the third the mandibular, while the motor root only joins the last of these. The *first* or *ophthalmic division of the fifth* runs in the outer wall of the cavernous sinus, where it divides into frontal, lachrymal and nasal branches. They all enter the orbit through the sphenoidal fissure. The *frontal nerve* divides into *supraorbital* and *supratrochlear*, which pass out of the upper part of the anterior opening of the orbit and supply the skin of the forehead and upper part of the scalp as well as the inner part of the eyelids. The *lachrymal nerve* supplies that gland and the outer part of the upper eyelid. The *nasal nerve* gives off a branch to the *ciliary* or *lenticular ganglion*, which lies in the outer part of the orbit, and through which, as well as through its own *long ciliary branches*, it supplies the eyeball with sensation. It leaves the orbit through the anterior ethmoidal canal, and lies for a short distance on the cribriform plate of the ethmoid; it then enters the nasal cavity through the nasal slit and supplies this cavity, as well as the surface of the nose as far as the tip, with ordinary sensation. The *second* or *maxillary division of the fifth nerve* leaves the skull through the foramen rotundum, and then runs across the roof of the spheno-maxillary fossa; here the *spheno-maxillary* or *Meckel's ganglion* hangs from it by two roots. The nerve then runs in the floor of the orbit, giving off *superior dental* branches, until it emerges on to the face at the infraorbital foramen, where it divides into *palpebral*, *nasal* and *labial branches*, the names of which indicate their distribution. The *third* or *mandibular division of the fifth* leaves the skull through the foramen ovale, and at once gives off a set of motor branches for the muscles of mastication; these are derived from the motor root of the fifth, except that for the buccinator, which really supplies only the skin and mucous membrane in contact with the muscle. After the motor branch is given off, the third division of the fifth divides into *lingual*, *inferior dental* and *auriculo-temporal*. The *lingual* is joined by the *chorda tympani* branch of the facial nerve, and then passes to the anterior two-thirds of the tongue. In its course it passes deep to the submaxillary gland, and here the small *submaxillary ganglion* is connected with it by two roots. The *inferior dental nerve* gives off a small motor branch to the mylohyoid and posterior belly of the digastric muscles, and then enters a canal in the lower jaw, where it gives off twigs to all the lower teeth. A *mental branch* comes out through the mental foramen to supply the skin of the chin. The *auriculo temporal nerve* rises by two roots, which embrace the middle meningeal artery, and runs backward and then upward close to the lower jaw joint to supply the parotid gland, the skin on the outer side of the ear, and the side of the scalp. At its beginning it communicates with the *otic ganglion*, which lies just internal to it below the foramen ovale, and also receives a communication from the nerve to the internal pterygoid muscle.

The *sixth* or *abducent nerve* rises from a nucleus in the floor of the fourth ventricle deep to the eminentia teres (see fig. 3). It appears on the surface of the brain just below the pons and close to the middle line (see fig. 1), soon after which it pierces the dura mater and runs in the floor of the cavernous sinus to the sphenoidal fissure. Entering the orbit through this, it quickly supplies the external rectus muscle.

The *seventh* or *facial nerve* begins in a nucleus which is about the same level as that for the sixth, but much deeper from the floor of the fourth ventricle as well as farther from the middle line (see fig. 3). The fibres of the facial loop round the nucleus of the sixth, and then emerge in the triangular interval between the medulla, pons and cerebellum, close to the eighth nerve, and having the pars

intermedia between (see fig. 1). Entering the internal auditory meatus with these structures the facial nerve soon passes into a canal in the petrous bone known as the *aqueductus Fallopii*, and in this it makes a sudden bend and forms the *geniculate ganglion*, from which the *great superficial petrosal* branch to Meckel's ganglion is given off. The canal ends at the stylo-mastoid foramen on the base of the skull, and here the nerve enters the parotid gland, in which it forms a plexus called the *pes anserinus*. From this, branches pass to all the muscles of the face except those of mastication. In the aqueduct the pars intermedia joins the seventh, and, beyond the geniculate ganglion, leaves it as the *chorda tympani*, which runs through the tympanum (see EAR) to join the lingual branch of the fifth. It is probable that the pars intermedia, geniculate ganglion and chorda tympani, represent the sensory root of the facial nerve. Just outside the stylo-mastoid foramen the facial gives off the *posterior auricular branch* to the occipitalis and posterior auricular muscles, as well as a branch of supply to the stylo-hyoid and posterior belly of the digastric muscles.



From D. J. Cunningham, in Cunningham's *Text-Book of Anatomy*.

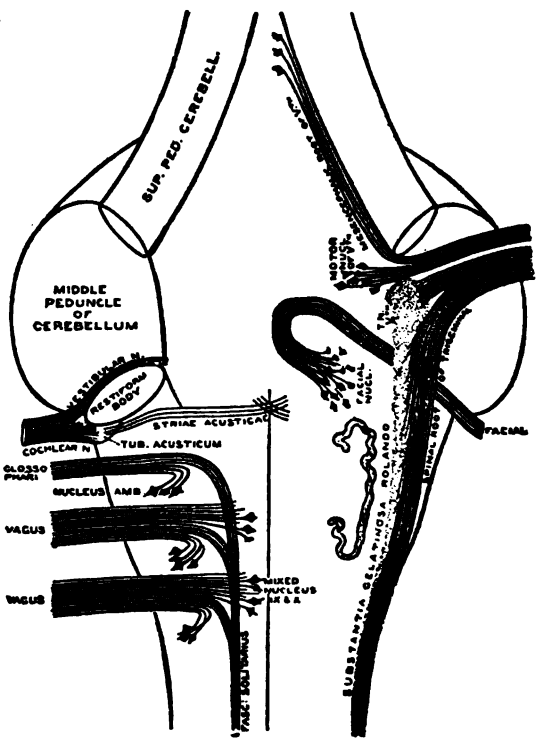
FIG. 2.—Diagram of the Central Connexions of the Optic Nerve and Optic Tract.

The *eighth* or *auditory nerve* is in two bundles, *cochlear* and *vestibular*. The former comes from the cochlear nuclei which lie deep to the acoustic tubercle in the floor of the fourth ventricle (see fig. 3), while the latter rises from the dorsal nucleus, nucleus of Deiters and the nucleus of the descending root, which are more deeply placed. The *nucleus of Deiters* is connected with the cerebellum, and is concerned in maintaining the equilibrium (*q.v.*) of the body, while, as is pointed out in the article BRAIN, the cochlear nuclei are connected with the inferior quadrigeminal body by the lateral fillet as well as with the internal geniculate body, while this body again is connected with the higher auditory centre in the grey cortex of the temporo-sphenoidal lobe by the auditory radiations. The vestibular root passes in front of the restiform body (see fig. 3), and the cochlear behind that body. Together they enter the internal auditory meatus, and, at the end of it, pierce the lamina cribrosa, the vestibular nerve supplying the utricle and superior and external semicircular canals, the cochlear nerve the posterior canal, the saccule and the cochlea (see EAR).

The *ninth* or *glossopharyngeal nerve* is chiefly, if not entirely, sensory, and its deep termination in the brain is the solitary bundle (see fig. 3; and BRAIN, fig. 4). It appears on the surface between the olive and restiform body (see fig. 1), and leaves the skull through the posterior lacerated foramen; as it does so two ganglia, the *jugular* and *petrous*, are formed on it, after which it runs downward and forward, between the internal and external carotid arteries, and eventually reaches the back of the tongue (see TONGUE). On its way it supplies the tympanum, the stylopharyngeus muscle, though there is grave doubt as to whether these fibres are not really derived from the facial nerve, contributions to the pharyngeal plexus, the tonsil and part of the epiglottis.

The *tenth nerve* or *vagus* has sensory and motor fibres; the former go to the solitary bundle mentioned in the description of the last nerve (see fig. 3), while the latter come from the dorsal nucleus and nucleus ambiguus, both of which are found deep to the lower half of the fourth ventricle. The nerve appears on the surface between the olive and restiform body and just below the ninth (see fig. 1). It leaves the skull through the posterior lacerated foramen, and, like the glossopharyngeal, has two ganglia developed on it; the upper of these is the *ganglion of the root*, and the lower the *ganglion of the trunk* (see fig. 4). From the former the *auricular branch* or *Arnold's nerve* (see EAR) comes off, while from the latter are given off the *pharyngeal branches* to the pharyngeal plexus (fig. 4, Ph.) and the *superior laryngeal branch* which is the sensory nerve of the larynx (fig. 4, S.L.). Between the two ganglia the accessory part of the eleventh nerve joins the tenth, and it is from this communication that the motor twigs to the pharynx, larynx, alimentary and respiratory tracts are derived, as well as the inhibitory fibres of the heart. In the neck the vagus accompanies the carotid artery and internal jugular vein, and here it gives off superior and inferior cardiac branches. The left inferior cardiac branch passes to the superficial, while the three others go to the deep cardiac plexus. The nerve now enters the thorax, passing between the subclavian artery and vein. On the right side its recurrent laryngeal branch loops under the subclavian artery (fig. 4, R.), and runs up to supply all the muscles of the larynx except one (see RESPIRATORY SYSTEM). In the thorax the left vagus passes in front of the arch of the aorta, under which the left recurrent laryngeal loops, and on both sides a thoracic cardiac branch is given to the deep cardiac plexus. Both vagi pass behind the root of their own lung, and break up to form the *posterior pulmonary plexus* after giving off some branches for the much smaller *anterior pulmonary plexus*; they then reach the oesophagus, where they again break up into an *oesophageal plexus* or *plexus gulae*. As the diaphragm is approached the two nerves become distinct again, but the left one now lies in front and the right behind the food tube, so that, when the stomach is reached, the left vagus supplies the front of the organ and communicates with the *hepatic plexus*, while the right goes to the back and communicates with the *coeliac*, *splenic* and *renal plexuses*.

The *eleventh* or *spinal accessory nerve* is entirely motor, and consists of a *spinal* and an *accessory* part. The former rises from the



From D. J. Cunningham, in Cunningham's *Text-Book of Anatomy*.

FIG. 3.—Deep Origins of Cranial Nerves from the Fourth Ventricle.

anterior horn of the grey matter of the spinal cord as low as the fifth cervical nerve. Its fibres come to the surface mid-way between the anterior and posterior nerve-roots, and run up through the foramen magnum to join the accessory part, the deep origin of which is the lower part of the nucleus ambiguus. The accessory part, as has been noticed, joins the vagus, while the spinal part pierces the sterno-mastoid muscle and runs obliquely downward

and backward across the posterior triangle of the neck to enter the trapezius; both these muscles are in part supplied by the nerve.

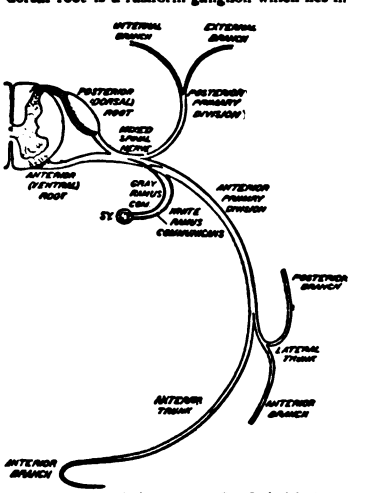
The *twelfth* or *hypoglossal nerve* is motor, and rises from a nucleus in the floor of the fourth ventricle deep to the trigonum hypoglossi (see BRAIN, fig. 3). It emerges from the brain between the anterior pyramid and the olive (see fig. 1), and leaves the skull in two bundles through the anterior condylar foramen. Soon after this it is closely bound to the vagus, and, in front of the atlas, receives an important contribution from the loop between the first and second cervical nerves. The nerve then passes downward until it reaches the origin of the occipital artery, round which it loops, and then runs forward on the surface of the hyo-glossus to the muscles of the tongue. As it bends round the occipital artery it gives off its *descendens hypoglossi branch*, which derives its fibres from the communication with the first cervical already mentioned. This branch runs down and forms a loop with the *communicans cervicis* branch from the second and third cervical nerves, and from this loop (*ansa hypoglossi*) many of the depressor muscles of the hyoid bone and larynx are supplied. Farther forward special branches are given off to the thyro-hyoid and genio-hyoid muscles, and these, like the descendens hypoglossi, are derived from the first and second cervical loop, thus leaving all the true muscles of the tongue to be supplied by the medullary part of the nerve.

For the embryology and comparative anatomy of the cranial nerves, see NERVOUS SYSTEM.

II. SPINAL.

The spinal nerves are those which arise from each side of the spinal cord and are distributed to the trunk and limbs, though some of the upper ones supply the lower parts of the head and face. As is shown in the article NERVOUS SYSTEM, the division between cranial and spinal nerves is rather one of convenience than of any real scientific difference. There are generally thirty-one pairs of these nerves, which are subdivided according to the part of the vertebral column through which they pass out; thus there are eight cervical (abbreviated C.), twelve thoracic (Th.)—formerly called dorsal,—five lumbar (L.), five sacral (S.) and one coccygeal (Coc.). As the thoracic nerves are the simplest and most generalized in their arrangement, a typical one of these, say the fourth or fifth, will be first described.

The nerve is attached to the spinal cord by two roots, of which the ventral is purely efferent or motor and the dorsal purely afferent or sensory. On the dorsal root is a fusiform ganglion which lies in the foramen between the vertebrae through which the nerve passes. The two roots then join together to form a mixed nerve (see fig. 5), but very soon divide once more into anterior (ventral) and posterior (dorsal) primary divisions. These, however, each contain sensory and motor fibres. Just before it divides in this way the mixed nerve gives and receives its rami communicantes with the sympathetic (see NERVOUS SYSTEM).



From A. M. Paterson, in Cunningham's *Text-Book of Anatomy.*

FIG. 5.—Scheme of the Distribution of a Typical Spinal Nerve.

The anterior primary division runs round the trunk, between the ribs, forming an intercostal nerve and giving off a lateral cutaneous branch, when the side of the body is reached, which divides into anterior and posterior secondary branches. The rest of the division runs forward, supplying the intercostal muscles, as far as the edge of the sternum, when it ends in an anterior cutaneous branch to the front of the chest. The dorsal primary division divides into an external (lateral) and internal

(mesial) branch through which the skin and muscles of the back are supplied.

It will be seen from the foregoing that the thoracic nerves are almost completely segmental in their distribution, in other words,

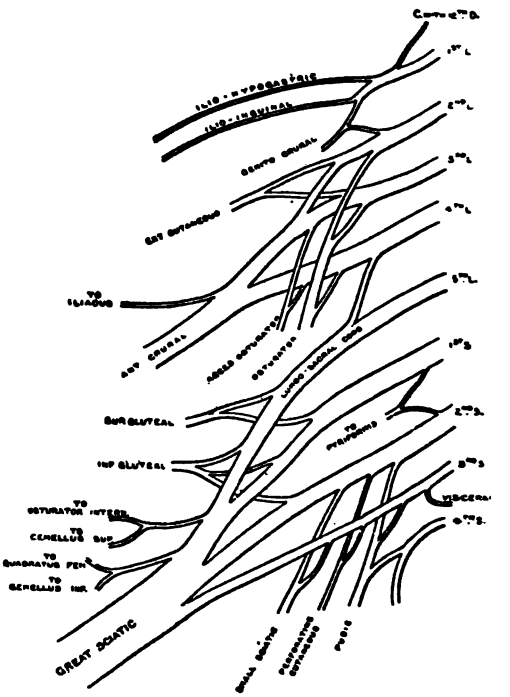
S.Sc, Branches of small sciatic nerve.

each supplies a slice of the body, but in the other regions this segmental character is masked by the development of the branchial skeleton and the limbs. In the cervical region the first cervical or *suboccipital nerve* comes out between the occiput and atlas and does not always have a posterior root. When it has not, it obviously can supply no skin. Its anterior primary division joins those of the second, third and fourth cervical nerves to form the *cervical plexus*, from which the skin of the side of the neck and lower part of the head and face are supplied by means of the *small occipital*, *great auricular*, *superficial cervical*, *suprasternal*, *supraclavicular* and *supra-acromial* nerves (see fig. 7), as well as those muscles of the neck which are not supplied by the cranial nerves. The *phrenic nerve*, which comes chiefly from the fourth cervical, deserves special notice because it runs down, through the thorax, to supply the greater part of the diaphragm. The explanation of this long course (see DIAPHRAGM) is that the diaphragm is formed in the neck region of the embryo. The posterior primary division of the second cervical nerve is very large, and its inner (mesial) branch is called the *great occipital* and supplies most of the back of the scalp (fig. 7). The fifth, sixth, seventh and eighth anterior primary divisions of the cervical nerves as well as a large part of that of the first thoracic are prolonged into the arm, and in the lower part of the neck and armpit communicate with one another to form the *brachial plexus*. As a general law underlies the composition of the limb plexuses it will be worth while to study the structure and distribution of this one with some little care. It will be seen from the accompanying diagram (fig. 8) that each component nerve with the exception of the first thoracic divides into an anterior (ventral) and a posterior (dorsal) division which are best spoken of as secondary divisions in order to prevent any confusion with the anterior and posterior primary divisions which all the spinal nerves undergo. In the diagram the anterior secondary divisions are white, while the posterior are shaded. It has been suggested by A. M. Paterson that the posterior secondary branches correspond with the lateral branches of the thoracic nerves already mentioned, but there are still certain difficulties to be explained before altogether accepting this. Later on in the plexus three cords are formed of which the posterior is altogether made up of the posterior secondary divisions, while the anterior secondary divisions of the fifth, sixth and seventh cervical nerves form the

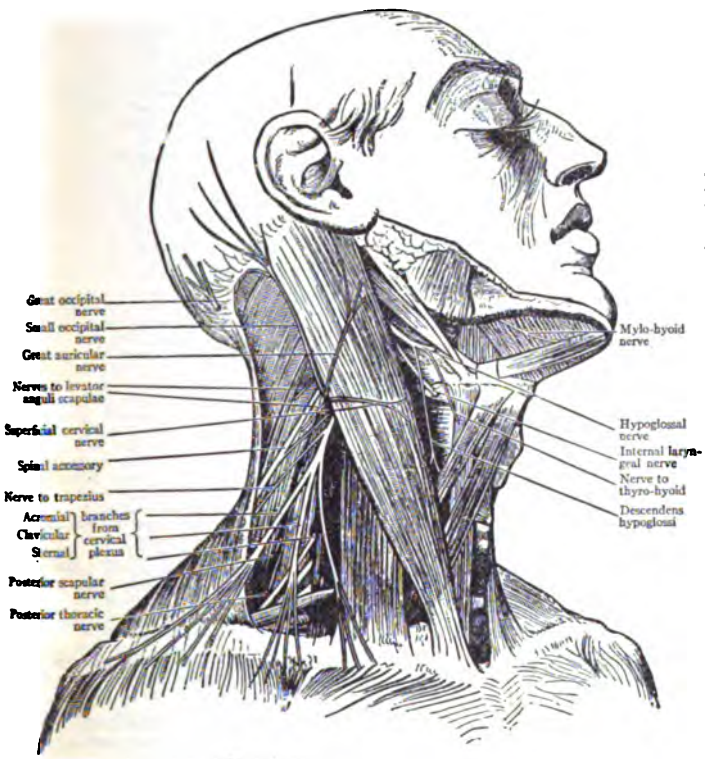


From Gray's *Anatomy, Descriptive and Surgical*.

FIG. 9.—Plan of the Lumbar and Sacral Plexuses.

external cord, and those of the eighth cervical and first thoracic the inner. As a general rule the nerves which rise from the ventral secondary divisions of the limb plexuses run only to that surface of the limb which was ventral in the embryo, while the dorsal secondary divisions are confined to the original dorsal area, but, in order to apply this to the human adult, it must be realized that the limbs

are at one time flattened buds coming off at right angles from the side of the body and having dorsal and ventral surfaces, one (preaxial) border toward the head of the embryo, and one (postaxial) toward the tail. If a person lies prone upon the floor with the arms outstretched and the palms downward the embryological position of the forelimb is to some extent restored, and it will now be easily understood that the more preaxial part of the limb will be supplied by those nerves which enter it from nearer the head, while the postaxial part draws its nerve supply from lower down the spinal cord. To use Herringham's words: "(A) Of two spots on the skin, that nearer the preaxial border tends to be supplied by the higher nerve. (B) Of two spots in the preaxial area the lower tends to be supplied by the lower nerve, and of two spots in the postaxial area the lower tends to be supplied by the higher nerve." Other points of general importance in regard to cutaneous nerve supply are, firstly, that the area of skin supplied by one spinal nerve is not sharply marked off from that of the next, but the two are separated



From A. M. Paterson, in Cunningham's *Text-book of Anatomy.*

FIG. 7.—The Triangles of the Neck (Nerves).

by an overlapping region; and, secondly, that the area supplied by any one spinal nerve is liable to variation in different individuals within moderate limits. This variation may affect the whole plexus, and the term "prefixed plexus" has been devised by C. S. Sherrington to indicate one in which the spinal nerves entering into its formation are rather higher than usual, while, when the opposite is the case, the plexus is spoken of as "postfixed."

With regard to the muscular supply of a limb the general rule is that each muscle is supplied by fibres derived from more than one spinal nerve; this, of course, is made possible by the redistribution of fibres in the plexuses. Moreover, the muscular supply does not necessarily correspond to that of the overlying skin, because (see MUSCULAR SYSTEM) some of the primitive muscles have been suppressed, others have fused together, while others have shifted their position to a considerable distance. Bearing the foregoing facts in mind, the main distribution of the nerves of the brachial plexus may be surveyed, though the exact details must be sought in the human anatomy text-books. The outer cord of the plexus gives off the *external anterior thoracic nerve* (C. 5, 6, 7) to the pectoralis major, the *musculo-cutaneous* nerve (C. 5, 6) to the muscles on the front of the arm, and to the skin of the outer side of the forearm and the outer head of the *median nerve* (C. 5?, 6, 7), which joins the inner head (C. 8, Th. 1) and supplies most of the flexor muscles of the front of the forearm as well as those of the ball of the thumb, the outer two lumbricals and also the skin of the outer part of the palm including the outer three digits and half the fourth.

From the inner cord come the inner head of the median just mentioned, the *ulnar nerve* (C. 8, Th. 1), which passes down behind the internal condyle of the humerus, where it is popularly known as the "funny bone" and supplies the flexor carpi ulnaris, half the flexor profundus digitorum, and most of the muscles of the hand as well as the inner digit and a half on the palmar and dorsal aspects. Other branches of the inner cord are the *internal cutaneous* (C. 8, Th. 1) supplying the inner side of the forearm, the *lesser internal cutaneous* (Th. 1) which often joins the *intercosto-humeral* or lateral cutaneous branch of the second intercostal nerve to supply the skin on the inner side of the upper arm, and the *internal anterior thoracic nerve* (C. 8, Th. 1) to the pectoralis minor and major.

From the posterior cord are derived the three *subscapular nerves* (C. 5, 6, 7, 8) which supply the subscapularis, teres major and latissimus dorsi muscles, the *circumflex nerve* (C. 5, 6) supplying the deltoid and teres minor muscles, and the skin over the lower part of the deltoid, and the *musculo-spiral nerve* (C. 5, 6, 7, 8) which is the largest branch of the brachial plexus and gives off cutaneous twigs to the outer side and back of the arm and to the back of the forearm, as well as muscular twigs to the triceps and adjacent muscles. At the elbow this nerve divides into the *radial* and *posterior* interosseous. The radial is entirely sensory and supplies the skin of the outer side of the back of the hand, including three digits and a half, while the posterior interosseous is wholly muscular, supplying the muscles on the back of the forearm. It will be seen that the posterior cord is derived altogether from posterior secondary divisions of the plexus, but there are three other nerves derived from these which should be mentioned.

The *posterior thoracic* or respiratory nerve of Bell comes off the back of the fifth, sixth and seventh cervical nerves before the anterior and posterior secondary divisions separate, and runs down to supply the serratus magnus muscle.

The *posterior scapular* or nerve to the rhomboid muscles runs to those muscles from the fifth cervical.

The *suprascapular nerve* (C, 5, 6) passes through the suprascapular notch to supply the supraspinatus and infraspinatus muscles.

The spinal nerves which are distributed to the lower limbs first intercommunicate in the *lumbar* and *sacral* plexuses, which, with the perineal nerves, are sometimes spoken of together as the *lumbo sacral plexus*. The *lumbar plexus* (see fig. 9) is formed as a rule of the first four lumbar nerves, though the greater part of the first number is segmental in its distribution and resembles one of the thoracic nerves. It early divides into an *ilio-hypogastric* and *ilio-inguinal* branch, which run round the abdominal wall in the substance of the muscles, and of which the former gives off an iliac branch, which is in series with the lateral cutaneous branches of the intercostal nerves and passes over the crest of the ilium to the gluteal region, while the hypogastric branch runs round to the skin of the pubic region. The ilio-inguinal on the other hand, gives off no lateral cutaneous or iliac branch, but is prolonged down the inguinal canal to supply the skin of the scrotum as well as that of the thigh which touches it. In all probability the hypogastric branch of the ilio-hypogastric and the whole of the ilio-inguinal represent the anterior secondary division of the first lumbar nerve, while the posterior secondary division is the iliac branch of the ilio-hypogastric.

The other anterior secondary divisions of the lumbar plexus is the obturator (see fig. 8). The *obturator nerve* (L. 2, 3, 4) supplies the adductor group of muscles on the inner side of the thigh as well as the hip and knee joints; it occasionally has a cutaneous branch on the inner side of the thigh. The posterior secondary branches of the plexus are the genito-crural, the external cutaneous and the anterior crural. The genito-crural nerve (L. 1, 2) is partly anterior (ventral) and partly posterior (dorsal). It sends one anterior branch through the inguinal canal to supply the cremaster

muscle, and another (posterior) to the skin of the thigh just below the groin.

The *external cutaneous nerve* (L.2, 3) supplies the skin of the outer side of the thigh, while the *anterior crural* (L.2, 3, 4) innervates the muscles on the front of the thigh, the skin on the front and inner side of the thigh, through its *middle* and *internal cutaneous* branches, and the skin of the inner side of the leg and foot through the *internal saphenous* branch. At first sight it is difficult to understand how the anterior crural nerve, which supplies the skin of the front of the thigh, is a posterior secondary division of the lumbar plexus, but the explanation is that the front of the human thigh was originally the dorsal surface of the limb bud, and the distribution of the nerve is quite easily understood if the position of the hind limb of a lizard or crocodile is glanced at. The fourth lumbar nerve is sometimes called the *nervus furcalis*, because, dividing, it partly goes to the lumbar, and partly to the sacral plexus (fig. 8), though, when the plexus is prefixed, the third lumbar may be the nervus furcalis, or, when it is postfixed, the fifth lumbar. Under ordinary conditions the descending branch of the fourth lumbar nerve joins the fifth, and together they make the *lumbo-sacral cord*, which, with the first three sacral nerves, forms the *sacral plexus*. This plexus, like the others, contains anterior and posterior secondary divisions of its spinal nerves, and it resembles the brachial plexus in that the lowest nerve to enter it contributes no dorsal secondary division.

All the constituent nerves of the plexus run into one huge nerve, the *great sciatic*, which runs down the back of the thigh and, before reaching the knee, divides into *external* and *internal popliteal nerves*. These two nerves are sometimes separate from their first formation in the plexus, and may always be separated easily by the handle of a scalpel, since they are only bound together by loose connective tissue to form the great sciatic nerve. When they are separated in this way it is seen that the external popliteal is made up entirely of posterior (dorsal) secondary divisions (see fig. 9), and is derived from the fourth and fifth lumbar and first and second sacral nerves, while the internal popliteal is formed by the anterior (ventral) secondary divisions of the fourth and fifth lumbar and first, second and third sacral nerves. The *external popliteal nerve* supplies the short head of the biceps femoris (see MUSCULAR SYSTEM), and, just below the knee, divides into anterior tibial and musculo-cutaneous branches, which both supply the dorsal surface of the leg and foot. The *anterior tibial nerve* is chiefly muscular, innervating the muscles in front of the tibia and fibula as well as the extensor brevis digitorum pedis on the dorsum of the foot, though it gives one small cutaneous branch to the cleft between the first and second toes. The *musculo-cutaneous nerve* supplies the peroneus longus and brevis muscles, and the rest of the skin of the dorsum, of the foot, and lower part of the leg, while the skin of the upper part of the dorsum of the leg, below the knee, is supplied by the external popliteal before its division. The *internal popliteal nerve*, after supplying the hamstrings, is continued into the calf of the leg as the *posterior tibial* and innervates all the muscles on this, the ventral, surface. Behind the inner ankle it divides into the *external* and *internal plantar nerves*, from which the muscles and skin of the sole are supplied. A little above the knee each popliteal nerve gives off a contribution to help form the *external* or *short saphenous nerve*. That from the internal popliteal is called the *communicans tibialis*, while that from the external popliteal is the *communicans fibularis*. These join about the middle of the back of the calf, and the, now formed, *short saphenous nerve* runs down behind the outer ankle to supply the outer side of the foot. Sometimes it encroaches on the dorsum of the foot, replacing part of the musculo-cutaneous, though, when this is the case, its dorsal contribution from the external popliteal (communicans fibularis) is always larger than usual. To return to the sacral plexus: branches are given off from the anterior secondary divisions to the short external rotator muscles of the hip (pyriformis, quadratus femoris, &c.), while from the posterior secondary divisions come the superior gluteal (L. I.S. 4, 5) and the inferior gluteal (L.5, S. 1, 2) to the muscles of the buttocks.

In modern descriptions the lower branches of the lumbo-sacral plexus are grouped into a *pudendal plexus*, and the plan, though open to criticism on morphological grounds, has such descriptive advantages that it is followed here. Contributions from the first, second, third and fourth sacral, and the coccygeal nerve, form it, and these contributions are almost all anterior (ventral) secondary divisions. The branches of this plexus are the small sciatic, pudic, visceral, perforating cutaneous, muscular and sacro-coccygeal nerves. The *small sciatic* (S.1, 2, 3) is partly dorsal and partly ventral in its origin and distribution; it supplies the skin of the perineum, buttock and the back of the thigh. The *pudic nerve* (S.2, 3, 4) helps to supply the skin and muscles of the perineum and genital organs. The *visceral branches* form the pelvic stream of white rami communicantes (see NERVOUS SYSTEM); they run from the second and third or third and fourth sacral nerves to the pelvic plexuses of the sympathetic system. The *perforating cutaneous nerve* (S.2, 3) pierces the great sacro-sciatic ligament and supplies the skin over the lower internal part of the buttock. The *muscular branches* (S.3, 4) supply the external sphincter, levator ani and coccygeus.

The *sacro-coccygeal nerve* (S.4, 5, Coc.1) runs down on each side of the coccyx to supply the adjacent skin, and represents the ventro-lateral nerve of the tail of lower mammals. (F. G. P.)

NERVI, a coast town of Liguria, Italy, in the province of Genoa, from which it is 7½ m. S.E. by rail (also electric tramway), 82 ft. above sea-level. Pop. (1901) 3480 (town); 6317 (commune). It is much frequented as a winter resort. It is surrounded with groves of olives, oranges and lemons, and its villas have beautiful gardens. It is moister and less dusty than the western Riviera, and is especially in favour with those who suffer from lung complaints. At Quarto, 2½ m. N.W., 1000 Garibaldians (1 mille) embarked for Marsala in 1860.

NERVOUS SYSTEM. The nervous system forms an extremely complicated set of links between different parts of the body, and is divided into (A) the central nervous system, composed of (1) the brain, and (2) spinal cord; (B) the peripheral nervous system, consisting of (1) the cranial nerves, (2) the spinal nerves, (3) the various sense organs, such as the eye, ear, olfactory organ, taste organ and tactile organs, and (4) the motor end plates; (C) the sympathetic system. The anatomy and physiology of many of these parts are treated in separate articles (see BRAIN, SPINAL CORD, NERVE, EYE, EAR, OLFACTORY ORGAN, TASTE, TOUCH, MUSCLE AND NERVE, SYMPATHETIC NERVOUS SYSTEM). The object here is to deal with anatomical points which are

common to the whole system, or for which a place does not conveniently occur elsewhere.

Histology of the Nervous System.

Three kinds of tissue are found in the nervous system, *nerve fibres*, *nerve cells*, and a supporting tissue called *neuroglia*. Nerve fibres may be medullated or non-medullated, but, whichever they are, they consist of the long process or *axon* of a nerve cell; in a non-medullated nerve this process is either naked or enclosed in a delicate membrane called the *primitive sheath* or *neurilemma*, but in a medullated nerve the process or *axis cylinder* is encased by a white fatty substance called myelin, and so the term "myelinated" is often used instead of "medullated" for these nerves (see fig. 1). Outside this white sheath the neurilemma is present in most nerves, but is lost when they are massed to form the white matter of the central nervous system and in the optic nerve. At regular intervals the myelin is interrupted by some substance which stains deeply with silver nitrate, and these breaks are known as *nodes of Ranvier*. They do not, however, affect the axis cylinder. In a large nerve, such as the median, the nerve fibres are collected into small bundles called *funiculi*, enclosed in a connective tissue sheath, the *perineurium*, and separated from it by a lymph space. From this sheath delicate processes penetrate among the fibres, and these are known as the *endoneurium*. The funiculi are collected into bundles called *fasciculi*, and the whole nerve consists of a variable number of fasciculi surrounded by a dense fibrous sheath, the *epineurium*. The various bundles do not remain distinct, but break up and rearrange themselves, so that following them up with the scalpel is a difficult and tedious work. The nerve fibres, however, never join one another and are often several feet in length.

Cunningham's *Text-Book of Anatomy*.

Fig. 1.—Nerve-fibre from a Frog. (After v. Kölliker.)

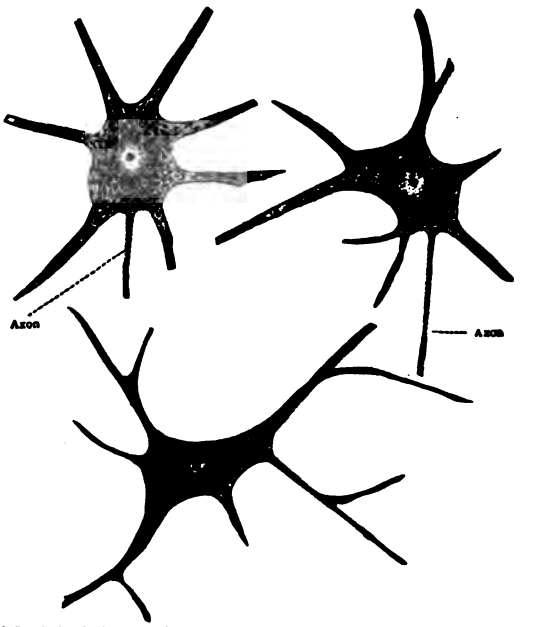
Nerve cells are unipolar, bipolar or multipolar. *Unipolar cells* are found in the ganglia on the posterior roots of the spinal nerves, and only give off an axon or axis cylinder process; this, however, soon divides in a T-shaped manner, and all these cells were originally bipolar, though the cell has grown away from its two axons (or, as they are often regarded, axon and dendrite), leaving a stalk joining it to them at right angles. *Bipolar cells* are found as an embryonic stage of unipolar, though in fish they persist in the spinal ganglia throughout life. They are also sometimes found in the sympathetic ganglia. *Multipolar cells* are found in the brain and cord, and are best studied in the anterior horns of the grey matter of the latter, where they are nearly visible to the naked eye (see fig. 2). Of their many processes only one is an axon, and it becomes the axial cylinder of a motor spinal nerve. The other fibres are called dendrites, and break up into delicate branches some of which surround, but, it is generally believed, are not actually continuous with, neighbouring cells or their processes. It is known that the axons are made up of delicate fibrils, and it is thought by some observers that there is actual continuity between some of these and those of an adjacent *neuron*, as the combination of a nerve cell, its axon and dendrites, is called. The cells of Purkinje in the cerebellum show a particularly rich arborization of dendrites (see Brain, fig. 7). Nerve cells have generally a large clear nucleus.

The Neuroglia is the delicate connective tissue which supports and binds together the nervous elements of the central nervous system. One part of it, which lines the central canal of the cord and ventricles of the brain, is formed of columnar cells, and is called *ependyma*, while the rest consists of small cells with numerous processes which sometimes branch and sometimes do not. These fibres interlace with one another to form a delicate felt-work which is unmixed with nervous elements on the surface of the grey matter of the brain (see Brain, figs. 7 and 15), though elsewhere it is interwoven with them.

Nerve Endings.—Sensory nerves end by breaking up into fibrillae or by various tactile organs. In the former case the minute fibrils, of which it has been shown that the axons or nerve fibres consist, separate and end among epithelial cells of the mucous membrane or skin. In the latter case the nerve fibres lose their coating of myelin and end in one of the seven following organs:—

1. *End bulbs of Krause* (fig. 3, A), oval bulbs composed of elongated cells among which the nerve fibrils end in knobs or coils; each is surrounded by a sheath of neurilemma, and the organs are found in the lips, tongue, conjunctiva, epineurium of nerves, synovial membranes of joints, and in the glans penis et clitoridis, where they have a mulberry-like appearance.

2. *Pacinian corpuscles* (fig. 3, B) are large enough to be seen by the naked eye, and are oval bodies made up of a series of concentric capsules of connective tissue rather resembling the structure of an onion; in the centre of this is a structureless core, at the distal extremity of which the nerve fibre ends in one or more knobs. These



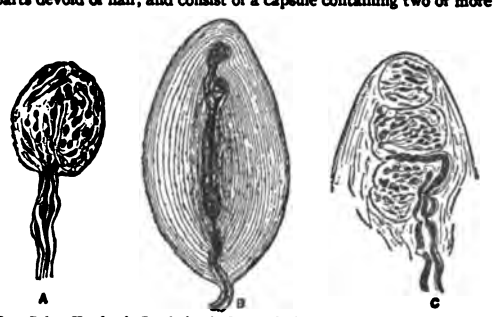
Cunningham's *Text-Book of Anatomy*.

Fig. 2.—Three Nerve-Cells from the Anterior Horn of Gray Matter of the Human Spinal Cord.

bodies are found in the palm and sole, in the mesentery, the genital organs and in joints.

3. *Tactile corpuscles of Meissner and Wagner* (fig. 3, C) are oval bodies found in certain of the skin papillae and mucous membrane, especially of very sensitive parts like the hand and foot, lips, tongue and nipple. They are oval and made of a connective tissue capsule from which septa enter the interior. The nerve fibre generally takes a spiral course through them, loses its myelin sheath, and ends by breaking up into its fibrils, which eventually become bulbous.

4. *Tactile corpuscles of Grandry* are found in the skin of those parts devoid of hair, and consist of a capsule containing two or more



From Robert Howden, in Cunningham's *Text-Book of Anatomy*.

Fig. 3.—Tactile Corpuscles. A, End bulb (Krause); B, Corpuscle of Pacini; C, Corpuscle of Meissner. (B, C, after Ranvier.)

largish cells, between which the nerve fibre ends in the so-called tactile discs.

5. *Ruffini's endings* are flattened oval bodies with a thick connective tissue capsule, in which the nerve fibre divides into many

branches which have a varicose appearance, form a rich plexus, and end in knobs. These organs are found between the true skin and subcutaneous tissue of the fingers.

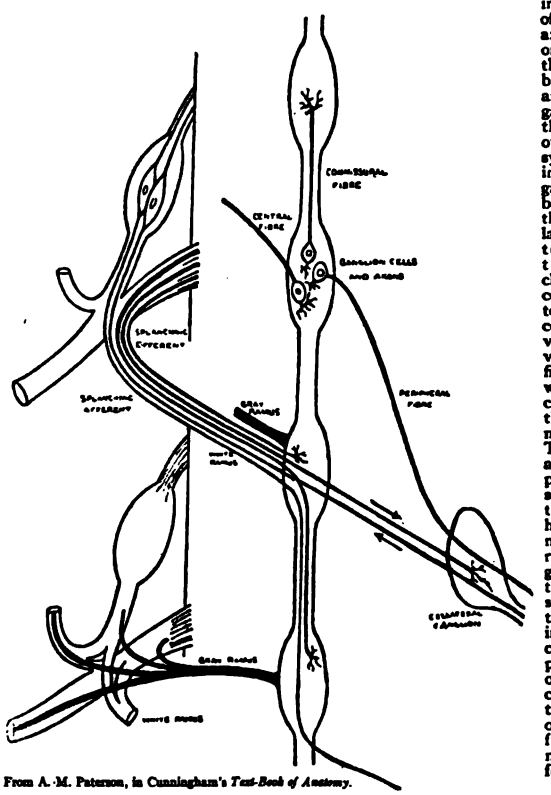
6. *Organs of Golgi* are found in tendons. Nerve fibres penetrate the tendon bundles and divide in a tree-like manner to end in little disks and varicosities.

7. *Neuro-muscular spindles* are small fusiform bundles of embryonic muscle fibres among which the nerve fibres end by encircling them and forming flattened disks. These are sensory endings, and must not be confused with the motor end plates. They are found in most of the striped muscles of the body.

Motor nerves end in striped muscle by *motor end plates*. These are formed by a nerve fibre approaching a muscle fibre and suddenly losing its myelin sheath while its neurilemma becomes continuous with the sarcolemma of the muscle fibre. The axis cylinder divides, and its ramifications are surrounded by a disk of granular matter containing many clear nuclei. In very long muscle fibres more than one of these end plates are sometimes found. *Involuntary motor endings* are usually found in sympathetic nerves going to unstriped muscle. The fibres form minute plexuses, at the points of union of which small triangular ganglion cells are found. After this the separate fibrils of the nerve divide, and each ends opposite the nucleus of an unstriped muscle cell.

The Sympathetic System

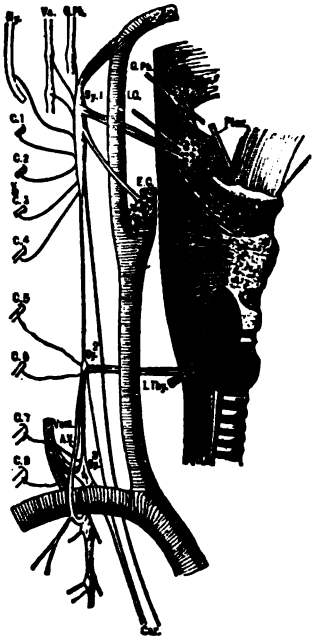
This system is made up of two gangliated cords running down one on each side of the vertebral column and ending below in the median coccygeal ganglion (*g. impar*). In the neck the cords lie in front of the anterior tubercles of the transverse processes of the cervical vertebrae, in the thorax, in front of the heads of the ribs, while in the abdomen they lie in front of the sides of the bodies of the vertebrae. In addition to these cords there are numerous ganglia and plexuses through which the sympathetic nerves pass on their way to or from the viscera and blood-vessels.



From A. M. Paterson, in Cunningham's *Text-Book of Anatomy*.

Fig. 4.—Scheme of the Constitution and Connexions of the Gangliated Cord of the Sympathetic. The gangliated cord is indicated on the right, with the arrangement of the fibres arising from the ganglion cells. On the left the roots and trunks of spinal nerves are shown, with the arrangement of the white ramus communicans above and of the gray ramus below.

A typical ganglion of the sympathetic chain is connected with its corresponding spinal nerve by two branches called *rami communicantes*, one of which is grey and the other white (see fig. 4). The white consists of medullated fibres belonging to the central nervous system, and these are splanchnic afferent or centripetal, and efferent or centrifugal. The efferent fibres lie in the anterior roots of the spinal nerves, and, like all the fibres there, are either motor or secretory. They are the motor paths for the unstriped muscle of the vessels and viscera, and the secretory paths for the cells of the viscera. In the course of each fibre from the nerve cell in the spinal cord, of which it is an axon, to the vessel or viscus it supplies, there is always a break where it arborizes round a ganglion cell, and this may be in its own ganglion of the sympathetic chain, in a neighbouring ganglion above or below, or in one of the so-called collateral ganglia interposed between the sympathetic chain and the viscera. In addition to these there are a certain number of vaso-dilator and viscero-inhibitory fibres, which run without any cell connexions from the spinal or cranial nerve to the viscera. The splanchnic afferent or centripetal fibres are the sensory nerves from the viscera, and have no cell connexions until they reach the spinal ganglia on the posterior roots of the spinal nerves, which they do by traversing the gangliated cord of the sympathetic. The fibres of the white rami communicantes are remarkable for their small diameter, and the efferent fibres, at all events, are only found in two regions, one of which is called the thoracico-lumbar stream and extends from the first or second thoracic to the second or third lumbar nerve, while the pelvic stream is found from the second to the fourth sacral nerves.



From A. M. Paterson, in Cunningham's *Text-Book of Anatomy*.

Car,	Cardiac branches.

The grey rami communicantes are found in connexion with all the spinal nerves, though they are irregular in the paths by which they reach the sympathetic ganglia from the cells of which they spring; their fibres are mainly non-medullated, and pass into both roots of the spinal nerves and also into the anterior and posterior primary divisions of those nerves. In this way they reach the body wall and limbs, and are somatic vaso-motor, secretory and pilo-motor fibres, supplying the vessels, glands and hair muscles of the skin and its glands. The sympathetic ganglia, from which these nerves come, contain multipolar nerve cells with one axon and several dendrites as well as a number of medullated fibres passing through, and much connective tissue.

Some of the axons of these cells pass in the connectives to ganglia above and below, while others pass with the splanchnic efferent nerves to the viscera.

The above sketch will give the general scheme of the sympathetic system, but its exact topographical details in man must be sought in the modern text-books such as those of Gray, Quain or Cunningham. Here only the larger and more important details can be given. In the gangliated chain there is a ganglion corresponding to nearly each spinal nerve, except in the neck, where only three are found; of these the superior cervical ganglion is more than an inch long, and is connected with the first four spinal nerves as well as with the ninth, tenth and twelfth cranial nerves (see fig. 5, *Sy.*1). Branches of distribution pass from it to the pharyngeal plexus, the heart and the two carotid arteries. Of these the branch accompanying the internal carotid artery passes to the carotid and cavernous plexuses, and through these communicates with the sphenomaxillary, otic and ciliary ganglia, while the branch to the external carotid communicates with the submaxillary ganglion. The middle cervical ganglion (fig. 5, *Sy.*2), when it is present, gives rami communicantes to the fifth and sixth cervical nerves, as well as branches of distribution to the thyroid body and heart.

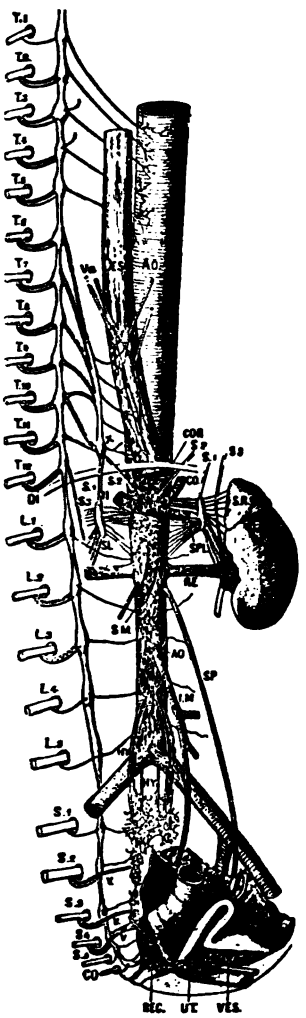
The inferior cervical ganglion (fig. 5, *Sy.*3) lies behind the subclavian artery, and, besides the main connective cord, has a loop (ansa Vieussenii) joining it to the middle cervical ganglion in front of that vessel. It communicates with the seventh and eighth spinal nerves, and gives branches of distribution to the heart and to the subclavian artery and its branches, especially the vertebral. The thoracic part of the sympathetic cord has usually eleven ganglia, which receive both white and grey rami communicantes from the spinal nerves (fig. 6); of the former the upper ones run up in the chain and come off from the cervical ganglia as already described, while the lower ones form the three abdominal splanchnics which pass through the diaphragm (*q.v.*) and join the abdominal plexuses.

The *great splanchnic* (fig. 6, *S.*1) comes from the sixth to the ninth ganglia, and ends in the semi-lunar ganglion of the solar plexus (fig. 6, *SL*). The small splanchnic (fig. 6, *S.*2) comes from the ninth and tenth, or tenth and eleventh ganglia, and ends in the aortico-renal ganglion of the solar plexus, while the smallest splanchnic (fig. 6, *S.*3) comes from the last thoracic ganglion, whether it be the tenth or eleventh, and ends in the renal plexus.

In the lumbar region the gangliated cord is very irregular; there may be four or more ganglia, and these are often fused. Grey rami communicantes are given to all the lumbar spinal nerves, and white ones are received from the first two. Most of the branches of distribution pass to the aortic plexus. The sacral gangliated cord runs down just internal to the anterior sacral foramina; it usually has four small ganglia, and the two cords end by joining the *coccygeal ganglion* or *ganglion impar*, though the two-fourth sacral ganglia are united by transverse interfunicular commissures. The white rami communicantes, already mentioned as the pelvic stream, from the second to the fourth sacral spinal nerves, do not enter the ganglia but pass directly to the pelvic plexuses (fig. 6, *V*).

Sympathetic Plexuses.—In the thorax are the *superficial* and *deep cardiac plexuses* and the *coronary plexuses*; the former receives the left superior cervical cardiac of the vagus, and lies in the concavity of the arch of the aorta. The deep cardiac plexus is larger, and lies in front of the bifurcation of the trachea; it receives all the other cardiac nerves, and communicates with the anterior pulmonary plexuses of the vagus (see NERVES: *Cranial*). The right and left coronary plexuses accompany the coronary arteries; the former communicates with both the cardiac plexuses, the latter only with the deep cardiac plexus.

In the abdomen the solar plexus is by far the most important. It lies behind the stomach and surrounds the coeliac axis; in it are situated the semilunar, aortico-renal and superior mesenteric ganglia, and from it are prolonged subsidiary plexuses along the main arteries, so that *diaphragmatic, suprarenal, renal, spermatic, coeliac, superior mesenteric, aortic* and *inferior mesenteric plexuses*, are recognized. The *hypogastric plexus* is the continuation downward of the aortic, and lies just below the bifurcation of the aorta (see fig. 6, *Hy*); it divides into two branches, which accompany the internal iliac arteries and are joined by the pelvic stream of white rami communicantes from the sacral spinal nerves and some twigs from the ganglia of the sacral sympathetic to form the pelvic plexuses. These are prolonged to the viscera along the branches of the internal iliac artery, so that *haemorrhoidal, vesical, prostatic, vaginal* and *uterine plexuses* are found. By the side of the neck of the uterus in the last-named plexus several small ganglia are seen. (For the literature of the sympathetic system, see Quain's *Anatomy*, London, 1895.)



From A. M. Paterson, in Cunningham's *Text-Book of Anatomy*.

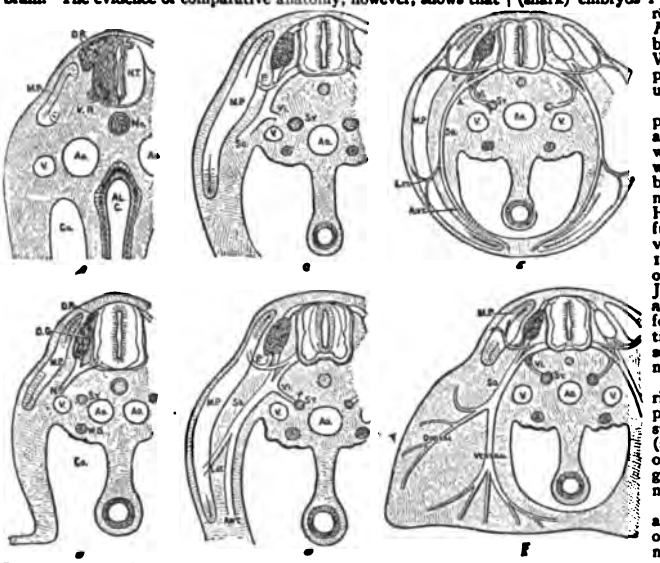
EMBRYOLOGY OF NERVOUS SYSTEM

The development of the brain, spinal cord and organs of special sense (eye, ear, tongue), will be found in separate articles. Here that of the cranial and spinal nerves and the sympathetic system is dealt with. The thoracic spinal nerves are the most typical, and one of them is the best to begin with. In fig. 7, A the ganglion on the dorsal root (*DR*) is seen growing out from the neural crest, and the cells or neuroblasts of which it is composed become fusiform and grow in two directions as the ganglion recedes from the cord. Those which run toward the spinal cord are the axons, while those growing into the mesoderm are probably enlarged dendrites. The ventral roots (*VR*) rise as the axons of the large cells in the ventral horn of the grey matter, and meet the fibres of the dorsal root on the distal side of the ganglion (fig. 7, B). As the two roots join each divides into an anterior (ventral) and a posterior (dorsal) primary division (fig. 7, D), the latter growing into the dorsal segment of its muscle plate and the skin of the back. The anterior primary division grows till it reaches the cardinal vein and dorsal limit of the coelom, and there forks into a somatic branch to the body wall (fig. 7, C, *So*), and a splanchnic or visceral branch (fig. 7, C, *Vi*) which joins the sympathetic and forms the white ramus communicans. The somatic branch grows round the body wall and gives off lateral and anterior branches (fig. 7, E). In the limb regions the anterior primary divisions of the nerves divide into anterior and posterior secondary divisions, which probably correspond to the anterior and lateral branches of the thoracic nerves (fig. 7, *E* and F). These unite with neighbouring nerves to form plexuses, and divide again, but the anterior nerves keep to the ventral side of the limb and the posterior to the dorsal.

The cranial nerves are developed in the same way as the spinal, so far as concerns the facts that the motor fibres are the axons of cells situated in the basal lamina of the mesencephalon and

rhombencephalon (see BRAIN), and the sensory are the axons and dendrites of cells situated in ganglia which have budded off from the brain. The evidence of comparative anatomy, however, shows that there are two ventral roots to one dorsal. In the fishes and higher vertebrates the dorsal and ventral roots unite, though in selachian (shark) embryos F. M. Balfour says that the dorsal and ventral roots alternate (*The Development of Elasmobranch Fishes*, London, 1878). When limbs are developed, beginning with fishes, limb plexuses are formed. Where the limbs are suppressed rudimentary plexuses may persist, as in the snake, though usually they disappear.



From A. M. Paterson, in Cunningham's *Text-book of Anatomy*.

Ant, Anterior, branches.

F, Formation of nerve trunks in relation to the limb; dorsal and ventral trunks corresponding to lateral and anterior trunks in D and E.

The cranial nerves are only represented by two pairs in *Amphioxus*. In the Cyclostomata, fishes and Amphibia, ten pairs of nerves are found, which in their distribution do not always agree with those of man. In the Amniota or reptiles, birds and mammals, the eleventh and twelfth nerves have been added. The researches of W. H. Gaskell ("On the structure, distribution and functions of the nerves which innervate the visceral and vascular systems," *J. of Phys.* vii. 1, 1886), O. S. Strong ("The cranial nerves of Amphibia," *J. Morph.* x. 101), J. B. Johnston (*J. Comp. Neurol.* xii. 2 and 87), and others, show that the cranial nerves are formed of at least five components: (1) Ventral motor, (2) Lateral motor, (3) Somatic sensory, (4) Visceral sensory, (5) Lateral line nerves.

The *ventral motor components* are those which rise from cells situated close to the mid line, and probably correspond to the ventral roots of the spinal nerves. The nerves to the eye muscles (motor oculi, trochlearis and abducens) have this origin (see NERVE: *Cranial*), as also has the hypoglossal, which doubtless is a cephalized spinal nerve.

The *lateral motor components* rise from cells situated more laterally, and comprise the motor roots of the fifth (trigeminal), seventh (facial), and ninth, tenth and eleventh (glossopharyngeal, vagus and spinal accessory). These nerves supply muscles belonging to the branchial skeleton, instead of the muscles of the primitive cranium, of which the eye muscles are the remnants.

The *somatic sensory components* supply the skin, and end in cells which, among the cyclostomes and fishes, form a considerable elevation in the rhombencephalon, known as the lobus trigemini (fig. 8, *Nuc. V.*). These components, in the lower forms, are found in the fifth, seventh and tenth nerves, but in mammals practically only the fifth contains them. They correspond to the dorsal roots of the spinal nerves.

The *splanchnic sensory* or *viscero sensory components* end in the brain in the medullary cells known as the *fasciculus communis* in fishes, and *fasciculus solitarius* in mammals (see BRAIN, fig. 4), as well as in the lobus trigemini and lobus vagi (fig. 8, *Nuc. X.*). They are found in the fifth, seventh, ninth, tenth and eleventh nerves, and supply visceral surfaces. In mammals the lingual and palatine branches of the fifth, the chorda tympani and great superficial petrosal (?) of the seventh, and all the sensory fibres of the ninth and tenth except Arnold's nerve, represent these. In fishes and Amphibians the palate is supplied by the seventh nerve instead of

the cranial nerves cannot be directly homologized with the spinal, nor can the fact of there being twelve of them justify us in assuming that the head contains the rudiments of twelve fused or unsegmented somites. To this we will return later. The case of the optic nerve is different to that of any of the others. A. Robinson (*Journ. Anat. and Phys.*, vol. 30, p. 319) has shown that most of its fibres are the axons of ganglion cells in the retina, and, as the retina is part of the optic vesicle and an outgrowth from the brain, the so-called optic nerve is only comparable to a tract of fibres within the brain.

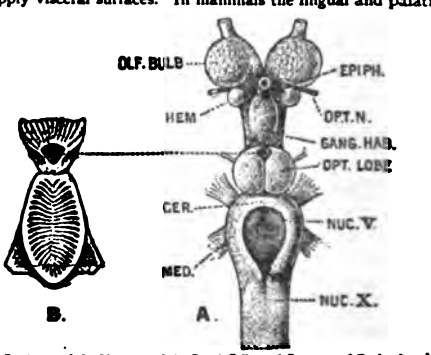
The twelfth or hypoglossal nerve is regarded as a fusion of the motor roots of three spinal nerves, and embryology bears this out, for Froriep has described a small and transitory ganglion corresponding to the posterior root ganglion of this nerve. Another link in the chain of reasoning is that the first spinal or sub-occipital nerve often has its posterior root suppressed.

The sympathetic system is developed from the posterior root ganglia of the spinal nerves, by cells which in man migrate a few at a time. A. M. Paterson, however, believes that the sympathetic is developed, independently of the cerebro-spinal system, in the mesoderm (*Phil. Trans.* clxxxi. pt. B. p. 159). In embryos of 14·5 m.m. there are found masses of cells on each side of the abdominal aorta, permeated with blood vessels, and having the same structure as the carotid and coccygeal bodies. They are known as the organs of Zuckerkandl, and disappear soon after birth.

COMPARATIVE ANATOMY

The comparative anatomy of the brain and spinal cord is dealt with in the separate articles devoted to them.

Spinal Nerves.—In *Amphioxus* the dorsal and ventral roots do not unite with one another but alternate, a dorsal root on one side being opposite a ventral on the other. The dorsal roots are both sensory and motor, the ventral only motor. In the Cyclostomata (*Petromyzon*) the arrangement is nearly the same, but in some regions



From *Catalogue of the Museum of the Royal College of Surgeons of England*, vol. 1 2nd ed.

FIG. 8.—Brain (A) and Choroid Plexuses (B) of Lamprey.

the fifth, but the explanation given for this difference is that in these lower forms the Gasserian and geniculate ganglia are not distinct, and so fibres from the compound ganglion may pass into either nerve. These splanchnic sensory components of the cranial nerves evidently correspond to the branches which have already been mentioned as the splanchnic afferent fibres of the sympathetic.

The system of the *lateral line* or *acustico-lateralis component* is sometimes regarded merely as a subdivision of the somatic sensory. It is best developed in the fish, and may be divided into pre- and post-auditory, and auditory. The pre-auditory part comprises the pit and canal end organs supplied by the seventh, and also probable the olfactory organ supplied by the first nerve. The auditory apparatus, supplied by the eighth nerve, is, according to modern opinion, undoubtedly a part of this system, while the tenth nerve sends a large branch along the lateral line supplying the special end organs of the post-auditory part. All these components of the lateral line pass to the tuberculum acusticum in the fourth ventricle, as well as to the cerebellum, which J. B. Johnston (*Zool. Bull.* 1, 5, p. 221, Boston) regards as a derivative of the rostral (anterior) end of the acusticum. In mammals no doubt the olfactory and auditory apparatus and nerves have the same morphological significance as in fishes, but the seventh does not supply any cutaneous sense organs on the head or face, and the only vestige of the post-auditory supply of the tenth nerve to the lateral line is the small auricular branch of the vagus, often called Arnold's nerve.

The following table, slightly modified from the one drawn up by J. McMurrich, gives a fair idea of the present state of our knowledge of the nerve components in the Mammalia.

For further details and literature of the nervous system see Quain's *Anatomy* (latest edition); R. Wiedersheim's *Comp. Anat. of Vertebrates* (Lond. 1907); Bronn's *Classen und Ordnungen des Thierreichs*; C. S. Minot's *Human Embryology* (1892); McMurrich's *Development of the Human Body* (London, 1906). For the theory of nerve components see Onéra Merritt, *Journ. Anat. and Phys.*, vol. 39, p. 199. A general discussion on the comparative anatomy and morphology of limb plexuses will be found in Miss C. W. Saberton's paper on the "Nerve Plexuses of Troglodytes Niger" *Studies in Anatomy*, University of Manchester, vol. iii. (1906), p. 165. She refers to most of the literature on the subject, but the papers of H. Braus, *Jena Zeitschr.* v. 31 (1898), p. 239 on fish, of M. Davidoff, *Morph. Jahrb.* v. 5 (1879), p. 450 on the pelvic plexuses of fish, and of M. Fürbringer, *Gegenb. Festschr.* v. 3 (1897), on the spino-occipital nerves and brachial plexus of fish, are also very important. (F. G. P.)

NESFIELD, WILLIAM EDEN (1835–1888), British architect, one of the leaders of the Gothic revival in England, was born in Bath on the 2nd of April 1835. His father, Major William Andrew Nesfield, a well-known landscape gardener, laid out Regent's Park and St James's Park, and remodelled Kew. Educated at Eton, Nesfield was articled first to Mr Burn, a classicist, and then to his uncle, Anthony Salvin, who took the Gothic side in the "battle of the styles." Nesfield travelled for study in France, Italy and Greece, afterwards publishing a volume, *Sketches from France and Italy* (London, 1862), which became one of the text-books of the Gothic revival. In 1859 Nesfield settled down in London. His first important commission was to build a new wing to Combe Abbey for Lord Craven. In 1862 began a nominal partnership with Norman Shaw, the fruits of which have been exaggerated; they shared rooms in Argyle Street for some years, but never collaborated. It was in Argyle Street that the principal work of Nesfield's life was conceived—Combe Abbey, Cloverly Hall and Kinmel Park. Here he showed a mastery of planning and construction, a conscientious regard for detail, an eye for the picturesque, an unfailing regard for dignity, which make his achievements landmarks in the history of his art. He built the lodge in Regent's Park (1864) and that in Kew Gardens (1866). Combe Abbey and Cloverly are somewhat "early French" in style, but as Nesfield developed he adopted a purely English manner, and presented his newer ideas in Loughton Hall and Kinmel Park. The gate lodge at Kinmel Park, Abergele, is entirely "English Renaissance"; Cloverly Hall (1864), planned when he was twenty-nine, with its great hall, fine approaches to the staircase, and the staircase itself, is already half English, and Eastlake, in his *History of Gothic Revival*, praises it on that very ground. The full development of the revived classic taste in Nesfield came with his addition to Kinmel Park—red brick, stone dressings, grey-green slated roofs—which elevated that originally unpretentious 18th-century building into a small Renaissance palace. For contrast in style, harmonious as they are in artistic expression, Cloverly and Kinmel are the typical examples of the artist's style. Other works are Farnham Royal House near Slough, Lea Wood, Loughton Hall and Westcombe Park. His more notable urban works are the bank at Saffron Walden (1873), and the Rose and Crown Hotel; they stand next door to each other and exhibit another contrast, the former being medieval and the latter what is called "Queen Anne." Though he built no new important church, Nesfield rebuilt the Early Decorated St Mary's, Farnham Royal, near Slough, mainly on the old lines. He restored King's Walden church, Herts (1868), and Radwinter church, Essex (1871), and Cora church near Whitchurch, Salop; but no great public building came from him. Nesfield's career was a comparatively short one. On the 3rd of September 1885 he married Mary Annetta, eldest daughter of John Sebastian Guilt and granddaughter of Joseph Guilt, and he retired from practice some years before his death at Brighton on the 25th of March 1888. He left behind him a valuable series of sketches and measured drawings, most of which are now in the library of the Royal Institute of British Architects. (J. M. Bt.)

NESLE, the name of a place in France (dep. of Somme), which gave its name to an old feudal family. This family became extinct at the beginning of the 13th century, and the heiress brought the lordship to the family of Clermont in Beauvaisis. Simon de Clermont, seigneur de Nesle, was regent of the kingdom of France during the second crusade of St Louis. Raoul de Clermont, constable of France, and Guy I. (d. 1302) and Guy II. (d. 1352) de Clermont, both marshals of France, were members of the family. The lordship of Nesle was erected into a countship for Charles de Sainte-Maure in 1467 and into a marquisate for Louis de Sainte-Maure in 1546. It was acquired in 1666 by Louis Charles de Mailly. His grandson, Louis de Mailly, had five daughters, of whom four (the countess of Mailly, the duchess of Lauragais, the countess of Vintimille, and the marquise de la Tournelle, afterwards duchess of Châteauroux) were successively, or simultaneously, mistresses of Louis XV.

NESSELRODE, KARL ROBERT, COUNT (1780–1862), Russian diplomatist and statesman, was born on the 14th of December 1780 at Lisbon, where his father (d. 1810) was Russian ambassador. In deference to his mother's Protestantism he was baptized in the chapel of the British embassy, thus becoming a member of the Church of England. The Nesselrodes were of Westphalian origin, but had long been settled in Livonia. Nesselrode's German origin was emphasized by his education in a Berlin gymnasium, his father having been appointed ambassador to the Prussian court about 1787. When he was sixteen he entered the Russian navy, and his father's influence procured for him the position of naval aide-de-camp to the emperor Paul. He presently exchanged into the army, obtained a further court appointment, and entered the diplomatic service. Nesselrode was attached to the Russian embassy at Berlin, and transferred thence to the Hague. In August 1806 he received a commission to travel in South Germany to report on the French troops; he was then attached as diplomatic secretary to Generals Kamenskl, Buxhoewden and Bennigsen in succession. He was present at the battle of Eylau in January 1807, and assisted at the negotiation of the peace of Tilsit. Immediately afterwards

he was sent to Paris to join the embassy of Count Peter Tolstoy, whom he accompanied in the spring of the next year to the meeting of the two emperors at Erfurt. After his return to Paris he strengthened the understanding between Alexander I. and Talleyrand consequent on the Erfurt meeting, and acted as intermediary between the two. On the appointment of a successor to Count Tolstoy he retired to St Petersburg, but returned to Paris early in 1810 charged with a commission from Speranski to Talleyrand and the marquis de Caulaincourt, formerly ambassador in St Petersburg, both of whom were hostile to Napoleon's policy of aggression. After the breach of diplomatic relations with Russia in 1811, Nesselrode returned to St Petersburg by way of Vienna in order to exchange views with Metternich. He sought to persuade Alexander to open negotiations with Napoleon, if only to throw the onus of breaking the peace entirely on the French side. He joined the tsar's headquarters at Vilna in March 1812 and, though Rumiantzov was still foreign minister, it was Nesselrode who directed the foreign policy of Russia from this time forward. He was present at the battle of Leipzig, and accompanied the invading army to Paris; he negotiated the capitulation of Marmont and Mortier at Clichy, and signed the treaty of Chaumont on the 1st of March 1814. His former relations with Talleyrand facilitated negotiations in Paris, and his great influence with the emperor was used in favour of the restoration of the Bourbons, and, after Waterloo, against the imposition of a ruinous war indemnity on France. At the congress of Vienna he was associated with Count Capo d'Istria, and when, in August 1816, Alexander made him secretary of state for foreign affairs in succession to Rumiantzov, it was again in conjunction with the Greek statesman, from whom he differed widely in temperament and ideas. The emperor Alexander I., however, was apt to keep the direction of affairs in his own hands and so long as Alexander inclined to Liberalism Capo d'Istria was the interpreter of his will, but as the emperor veered towards Metternich's system Nesselrode became his mouthpiece. After Alexander's final "conversion" to reactionary principles, Capo d'Istria was dismissed (1822) and Nesselrode definitely took his place. He had consistently advocated Alexander's project of a "universal union," symbolized by the Holy Alliance, in contradistinction to the narrower system of the alliance of the great powers; and, when the Greek insurrection broke out, he did much to determine the tsar to sacrifice his sympathy with the Orthodox Greeks to his dream of the European confederation (see ALEXANDER I., emperor of Russia).

After Alexander's death in 1825 Nesselrode retained office under Nicholas I. He was responsible for the change of policy of Russia towards the Ottoman empire after 1829, viz. that of abandoning the traditional idea of conquering Constantinople in favour of keeping the Ottoman power weak and dependent on the tsar. This was his policy during the revolt of Mehemet Ali (*q.v.*), and it was Nesselrode who inspired the terms of the famous treaty of Unkiar Skelessi (1833). Nicholas I. was, however, even less inclined than his brother to place himself in the hands of a minister; and Nesselrode showed himself amenable, though when his views differed from those of the emperor he stated them with great frankness. He conducted the negotiations which led to the shelving of the treaty of Unkiar Skelessi and to the alliance between Russia and Great Britain which, issuing ultimately in the Straits Convention of 1841—to which France also was a party—healed the breach which had so long divided the powers of eastern and western Europe.

In 1849 it was Nesselrode who suggested the intervention of Russia in Hungary in favour of the Austrian government, although he restrained the tsar from active intervention in France then as in 1830. During the crisis of 1853 he prolonged negotiation in the hope of averting war. The last of his important political acts, the signing of the treaty of Paris in 1856, undid the results of his patient efforts to establish Russian preponderance in the Balkan peninsula. He then retired from the foreign office, retaining the chancellorship, which he had held since 1844. He died at St Petersburg on the 23rd of March 1862.

See *Lettres et papiers du chancelier comte de Nesselrode 1760–1850*, the first volume of which was issued by his grandson Count Anatole Nesselrode at Paris in 1904. This work includes letters of the chancellor's father, Count William, Nesselrode's correspondence, and important state papers. In vol. ii. is a fragment of an autobiography (to 1814), which Count Nesselrode did not live to complete. See also *Correspondance diplomatique du comte Posso di Borgo et du comte de Nesselrode*, edited by Charles Pozzo di Borgo (Paris, 2 vols., 1890–1897).

NEST, the place where a bird lays its eggs, hatches them out, and shelters them until they are fledged. The word is used by analogy of other animals than birds, insects, &c. It appears in much the same form in Teutonic languages; related to it are Irish *nead*, and Lat. *nidus*, whence Fr. *nid*. It has been referred to the Gr. *νόστος*, return home, but it is now established that it represents a form *nizdo-* for *nisido-*, from *ni-*, down; cf. "nether," and *sed-*, to sit. Sanskrit has *nīda*. The Lat. *nidus* has given the scientific term for nest-building, *nidification* (*q.v.*).

NESTOR, in Greek legend, son of Neleus and Chloris, king of Pylos in Messenia. When all his brothers were slain by Heracles, in consequence of the refusal of Neleus to purify him for the murder of Iphitus, Nestor alone escaped, being absent at Gerenia—hence his epithet Gerenios in Homer (Apollodorus i. 9). He is the old warrior of the *Iliad* and the wise counsellor of the Greeks before Troy. After the fall of the city he returned to Pylos, where Telemachus visited him to obtain news of his father. In his earlier years he took part in the battle of the Centaurs and Lapithae, the Calydonian boar hunt, and the Argonautic expedition. The name is used in modern times for any old man of ripe experience, or the oldest member of a class or corporation.

NESTOR (*c.* 1056–*c.* 1114), the reputed author of the earliest Russian chronicle, was a monk of the Pecherskiy cloister of Kiev from 1073. The only other fact of his life is that he was commissioned with two other monks to find the relics of St Theodosius, a mission which he succeeded in fulfilling. The chronicle begins with the deluge, as those of most chroniclers of the time did. The compiler appears to have been acquainted with the Byzantine historians; he makes use especially of John Malalas and George Hamartolus. He also had in all probability other Slavonic chronicles to compile from, which are now lost. Many legends are mixed up with Nestor's *Chronicle*; the style is occasionally so poetical that perhaps be incorporated *bilini* which are now lost. The early part is rich in these stories, among which are the arrival of the three Varangian brothers, the founding of Kiev, the murder of Askold and Dir, the death of Oleg, who was killed by a serpent concealed in the skeleton of his horse, and the vengeance taken by Olga, the wife of Igor, on the Drevlians, who had murdered her husband. The account of the labours of Cyril and Methodius among the Slavs is also very interesting, and to Nestor we owe the tale of the summary way in which Vladimir suppressed the worship of Perun and other idols at Kiev. As an eyewitness he could only describe the reigns of Vsevolod and Sviatopolk (1078–1112), but he gathered many interesting details from the lips of old men, two of whom were Giurata Rogovich of Novgorod, who gave him information concerning the north of Russia, Petchora, and other places, and Jan, a man ninety years of age, who died in 1106, and was son of Vishata the voivode of Yaroslavl and grandson of Ostromir the Posadnik, for whom the *Codex* was written. Many of the ethnological details given by Nestor of the various races of the Slavs are of the highest value.

The latest theory about Nestor is that the *Chronicle* is a patchwork of many fragments of chronicles, and that the name of Nestor was attached to it because he wrote the greater part or perhaps because he put the fragments together. The name of a certain Sylvester, an Igumen, is affixed to several of the manuscripts as the author.

The *Chronicle* has come down to us in several manuscripts, but unfortunately no contemporary ones, the oldest being the so-called Lavrientski of the 14th century (1377). It was named after the monk Lavrentii, who copied it out for Dimitri Constantinovich, the prince of Souzdal. The work, as contained in this manuscript,

has had many additions made to it from previous and contemporary chronicles, such as those of Volinia and Novgorod. Soloviev, the Russian historian, remarks that Nestor cannot be called the earliest Russian chronicler, but he is the first writer who took a national point of view in his history, the others being merely local writers. The language of his work, as shown in the earliest manuscripts just mentioned, is Palaeo-Slavonic with many Russisms. It has formed the subject of a valuable monograph by Professor Miklosich.

The *Chronicle* has been translated into Polish, Bohemian, German and French. The compiler cannot very well be the author of the lives of Boris and Gleb, the martyrs, and of the life of St Theodosius, because they contradict many passages in the *Chronicle*. The work is of primary importance for early Russian history, and, although devoid of literary merit, is not without its amusing episodes of an Herodotean character. The reputed body of the ancient chronicler may be seen among the relics preserved in the Pecherskiy monastery at Kiev.

See Louis Leger's *Chronique dite de Nestor* (Paris, 1884); Bestuzhev Riumin, *On the Composition of the Russian Chronicles till the end of the 14th century* (in Russian), (St Petersburg, 1869).

(W. R. M.)

NESTOR, the name of a small but remarkable group of parrots peculiar to the New Zealand sub-region, of which the type is the *Psittacus meridionalis* of Gmelin, founded on a species described by J. Latham (*Gen. Synopsis* i. 264), and subsequently termed by him *P. nestor*, in allusion to its hoary head, but now usually known as *Nestor meridionalis*, the "*Kaka*" of the Maories and English settlers in New Zealand, in some parts of which it was very abundant, though its numbers are fast decreasing. Forster, who accompanied Cook in his second voyage, described it in his MSS. in 1773, naming it *P. hypopolius*, and found it in both the principal islands. The general colour of the kaka is olive-brown, nearly all the feathers being tipped with a darker shade, so as to give a scaly appearance to the body. The crown is light grey, the ear-coverts and nape purplish-bronze, and the rump and abdomen of a more or less deep crimson-red; but much variation is presented in the extent and tinge of the last colour, which often becomes orange and sometimes bright yellow. The kaka is about the size of a crow; but a larger species, generally resembling it, though with plumage mostly dull olive-green, the *Nestor notabilis* of J. Gould, was discovered in 1856 by Walter Mantell, in the higher mountain ranges of the Middle Island. This is the "*Kea*" of the Maories, and incurred the enmity of colonists by developing an extraordinary habit of assaulting sheep, picking holes with its powerful beak in their side, wounding the intestines, and so causing death. The bird is admittedly an eater of carrion in addition to its ordinary food, which, like that of the kaka, consists of fruits, seeds and the grubs of wood-destroying insects, the last being obtained by stripping the bark from trees infested by them. The amount of injury the kea inflicts on flock-masters has doubtless been much exaggerated, for Dr Menzies states that on one "run," where the loss was unusually large, the proportion of sheep attacked was about one in three hundred, and that those pasturing below the elevation of 2000 ft. are seldom disturbed.

On the discovery of Norfolk Island (October 10 1774) a parrot, thought by Forster to be specifically identical with the kaghâá (as he wrote the name) of New Zealand—though his son (*Voyage*, ii. 446) remarked that it was "infinitely brighter coloured"—was found in its hitherto untrodden woods. Among the drawings of Bauer, the artist who accompanied Robert Brown and Flinders, is one of a *Nestor* marked "Norfolk Isl. 19 Jan. 1805," on which Herr von Pelzeln in 1860 founded his *N. norfolcensis*. Meanwhile Latham, in 1822, had described, as distinct species, two specimens evidently of the genus *Nestor*, one said, but doubtless erroneously, to inhabit New South Wales, and the other from Norfolk Island. In 1836 Gould described an example, without any locality, in the museum of the Zoological Society, as *Plyctolophus productus*, and when some time after he was in Australia, he found that the home of this species, which he then recognized as a *Nestor*, was Phillip Island, a very small adjunct of Norfolk Island, and not more than 5 m. distant from it. Whether the birds of the two islands were specifically distinct or not we shall perhaps never know, since they are all extinct, and no specimen undoubtedly from Norfolk Island seems to have been preserved. The Phillip-Island *Nestor* may be distinguished from both of the New-Zealand species by its somewhat smaller size, orange throat, straw-coloured breast, and the generally lighter shade of its tints.

The position of the genus *Nestor* in the order *Psittaci* must be regarded as uncertain, but it is now usually placed in the sub-family *Nestorinae* of the *Trichoglossidae* (see PARROT).

Further knowledge of this very interesting form may be facilitated by the following references to the *Transactions and Proceedings of the New Zealand Institute*, ii. 64, 65, 387, iii. 45-52, 81-90, v. 207, vi. 114, 128, ix. 340, x. 192, xi. 377; and to Sir W. Buller's *Birds of New Zealand*.

(A. N.)

NESTORIANS. §1. *The Early Nestorians.*—Among those who had been present at Ephesus in support of Nestorius (*q.v.*) was Ibas, presbyter and head of the theological school of Edessa. In 435 he became bishop of Edessa and under his influence the Nestorian teaching made considerable progress. On the accusation of the orthodox he was deposed by the "Robber Synod" of Ephesus, but at Chalcedon in 451 was pardoned on condition of anathematizing both Nestorius and Eutyches and accepting the Tome of Leo. He had not, however, changed his views, and this was generally recognized. Meanwhile one of his pupils, Barsumas, had settled at Nisibis in Persian territory where he became bishop in 435 and established a Nestorian school. And when the emperor suppressed the school of Edessa ("the Athens of Syria") in 489, and expelled its members, they travelled far afield as eager and successful missionaries of the Gospel. In Persia their numbers and their zeal stimulated the old churches into vigour and led to the founding of new ones. And as they were under ban from Rome and out of communion with the Byzantine Church the Persian government welcomed them as a political ally, though the religious opposition of the Magi was still largely retained. In their new environment the Nestorians abandoned some of the rigour of Catholic asceticism, and at a synod held in 499 abolished clerical celibacy even for bishops and went so far as to permit repeated marriages, in striking contrast not only to orthodox custom but to the practice of Aphraates at Edessa who had advocated celibacy as a condition of baptism. The liberty here granted to bishops was enjoyed as late as the 12th century, but since then the Nestorian Church has assimilated its custom to that of the Greek Church. That the ascetic ideal was by no means wholly extinct is evident from the *Book of Governors* written by Thomas, bishop of Marga, in 840 which bears witness to a Syrian monasticism founded by one Awgin of Egyptian descent, who settled in Nisibis about 350, and lasting uninterruptedly until the time of Thomas, though it had long been absorbed in the great Nestorian movement that had annexed the church in Mesopotamia.

The Nestorian Church in Eastern Syria and Persia was under the jurisdiction of an archbishop (*catholikos*), who in 498 assumed the title "Patriarch of the East" and had his seat at Seleucia-Ctesiphon on the Tigris, a busy trading city and a fitting centre for the great area over which the evangelizing activity of the Nestorians now extended. The church traced its doctrines to Theodore of Mopsuestia rather than to Nestorius, whose name at first they repudiated, not regarding themselves as having been proselytized to any new teaching.

§ 2. *The Later Nestorians.*—In 608 Magian influence was so strong in Persia that the Christians were persecuted and the office of catholicus was vacant for 20 years, being filled again by Jesu-Jabus, during whose patriarchate the Mahommedan invasion overran Persia. The patriarch was able to secure from the caliph permission for the Christians to practice their religion in return for tribute money and this was afterwards remitted. Ibn Ali Talib, anxious to perpetuate their severance from the orthodox church and the Byzantine empire, confirmed these privileges by charter and in 762 the patriarchate was removed to Bagdad. For five centuries the Nestorians were a recognized institution within the territory of Islam, though their treatment varied from kindly to harsh. Bîrûnî, a Mahommedan writer, who lived at Khiva *c.* A.D. 1000, speaks of them as comprising the bulk of the population of Syria, Irak and Khorasan, and as superior to the orthodox in intellectual ability.

They agreed with Byzantines in observing Lent, Christmas and Epiphany, but differed from them in the observance of all other feasts and fasts. The Latin church tried in vain during the Crusades to secure their adhesion to Rome. The barbaric invasions of the 13th and 14th centuries fell with crushing force on the Nestorians. In 1258 Hulagu Khan took Bagdad, and about 1400 Timur again seized and sacked the city. Though the Nestorians were numerous, their moral influence and their church life had greatly deteriorated. Those who escaped capture by Timur fled to the mountains of Kurdistan, and the community that had played so large a part in Mesopotamian history for a thousand years was thus shattered. In 1552 they were further weakened by a large secession known as "the Chaldeans" arising out of a dispute about the succession to the patriarchate. The discontented appealed to Rome, and the pope (Julius III.) consecrated the Chaldean catholikos. The Chaldeans are now chiefly found in rural districts east of the Tigris. They have a see at Bagdad, a monastery (Rabban Hormuz) at Elkoŏsh, and are called by those Syrian Christians who have resisted the papal overtures, *Maghlabin* ("the conquered"). Other attempts during the 16th century to promote union between the Nestorians and Rome proved fruitless, but the Roman Church has never ceased in its efforts to absorb this ancient community. The history of the Jacobites or Syrian Monophysites who, like the Nestorians, diverged from the Byzantine Church, but in an exactly opposite direction, is told elsewhere (see JACOBITE CHURCH, &c.). Like the Nestorians they were great missionaries, and up to the 7th century, and again in the 12th and 13th, produced the bulk of Syriac literature (*q.v.*). The chief Nestorian authors were (*a*) in the 7th, 8th and 9th centuries, Babbai the elder and Isho-yabh of Gedhala, commentators; Sahdona, who wrote on the monastic life; Abraham the Lame, a devotional and penitential writer; Dionysius of Tell Mahre (see DIONYSIUS TELMAHARENSIS), whose *Annals* are important; and Thomas (*q.v.*) of Marga; (*b*) in the 14th century, Abdh-isho bar Berikha (d. 1318) the author of a theological treatise *Marganitha* ("the Pearl"), 1298, and the *Paradise of Eden*, a collection of 50 theological poems.

§ 3. *The Nestorian Missionary Enterprise.*—The combined hostility of the orthodox church and the Byzantine empire drove the Nestorians into exile, but they went much further than was needed simply to secure immunity from persecution. They showed a zeal for evangelization which resulted in the establishment of their influence throughout Asia, as is seen from the bishoprics founded not only in Syria, Armenia, Arabia and Persia, but at Halavan in Media, Merv in Khorasan, Herat, Tashkent, Samarkand, Baluk, Kashgar, and even at Kambaluk (Pekin) and Singan fu Hsi'en fu in China, and Kaljana and Kranganore in India. In 1265 they numbered 25 Asiatic provinces and over 70 dioceses. Mongolian invasions and Mahommedan tyranny have, of course, long since swept away all traces of many of these. The 400,000 Syrian Christians ("Christians of St Thomas," see THOMAS, ST) who live in Malabar no doubt owe their origin to Nestorian missionaries, the stories of the evangelization of India by the Apostles Thomas and Bartholomew having no real historical foundation, and the Indian activity of Pantaenus of Alexandria having proved fruitless, in whatever part of India it may have been exercised. The theology of the Indian Syrian Christians is of a Nestorian type, and Cosmas Indicopleustes (6th century) puts us on the right track when he says that the Christians whom he found in Ceylon and Malabar had come from Persia (probably as refugees from persecution, like the Huguenots in England and the Pilgrim Fathers in America). Pahlavi inscriptions[1] found on crosses at St Thomas's Mount near Madras and at Kottayam in Travancore, are evidence both of the antiquity of Christianity in these places (7th or 8th century), and for the semi-patripassianism (the apparent identification of all three persons of the Trinity in the sufferer on the cross) which marked the Nestorian teaching. In 745 Thomas of Kana brought a new band of emigrants from Bagdad and Nineveh, and possibly the name "Christians of St Thomas" arose from confusion between this man and the apostle. Other reinforcements came from Persia in 822, but the Malabar church never developed any intellectual vigour or missionary zeal. They had their own kings, lived as a close caste, and even imitated the Hindus in caste regulations of food and avoidance of pollution. In 1330 Pope John XXII. issued a bull appointing Jordanus, a French Dominican, bishop of Quilon, and inviting the Nestorians to enter "the Christian Church." The invitation was declined, but in the 16th century the Syrian Christians sought the help of the Portuguese settlers against Mussulman oppression, only to find that before long they were subjected to the fiercer perils of Jesuit antagonism and the Inquisition. The Syrians submitted to Rome at the synod of Dampier in 1599, but it was a forced submission, and in 1653 when the Portuguese arrested the Syrian bishop just sent out by the catholicus of Babylon, the rebellion broke out. The renunciation was not quite thorough, one party adhering to the Roman Church as Romo-Syrians, the others reverting wholly to Syrian usages and forming to-day about three-fourths of the whole community. In 1665 a curious thing happened. Gregory, the Jacobite metropolitan of Jerusalem, visited Malabar, and, as the people had no consecrated bishop at the time, he consecrated Mar Thomas, who had been filling the office at the people's request, and remained in the country jointly administering the affairs of the Church with Thomas. Thus the Nestorian Church in India, voluntarily and with perfect indifference to theological dogmas, passed under Jacobite rule, and when early in the 18th century, Mar Gabriel, a Nestorian bishop, came to Malabar, he had a cool reception, and could only detach a small following of Syrians whom he brought back to the old Nestorianism. The approaches of the Anglican Church through the Church Missionary Society in the first part of the 19th century were politely repelled. On the death of the bishop Mar Athanasius Matthew in 1877, litigation began as to his successor; it lasted ten years, and the decision (since reversed) was given against the party that held by the Nestorian connexion and the habitual autonomy of the Malabar church in favour of the supremacy of the Jacobite patriarch of Antioch. The great need of the Indian Syrian church to-day is an educated ministry.

Early evidence of Nestorian missions in China is extant in the tablet found in 1625 at Chang'an in the district of Hsi'en-fu, province of Shensi. It commemorates "the introduction and propagation of the noble law of Ta t'sin in the Middle Kingdom," and beneath an incised cross sets out in Chinese and Syriac an abstract of Christian doctrine and the course of a Syrian mission in China beginning with the favourable reception of Olopan, who came from Judaea in 636. For two generations the little cause prospered, and again after persecutions in 699 and 813. Later on a second mission arrived, many churches were built and several emperors patronized the faith. This evidence is confirmed by (*a*) the canon of Theodore of Edessa (800) allowing metropolitans of China, India and other distant lands to send their reports to the catholikos every six years; (*b*) the edict of Wu Tsung destroying Buddhist monasteries and ordering 300 foreign priests to return to the secular life that the customs of the empire might be uniform; (*c*) two 9th-century Arab travellers one of whom, Ibn Wahhab, discussed the contents of the Bible with the emperor; (*d*) the discovery in 1725 of a Syrian MS. containing hymns and a portion of the Old Testament.

In the 10th century the Nestorians introduced Christianity into Tartary proper; in 1274 Marco Polo saw two of their churches. The legend of Prester John is based on the idea of the conversion of a Mongol tribe, the Karith, whose chieftain Ung Khan at baptism received the title Malek Juchana (King John). And there has lately come to light a MS. of the 9th or 10th century in Sogdianese, an Indo-Iranian language spoken in the north-east of Asia, which shows that the Nestorians had translated the New Testament into that tongue and had taught the natives the alphabet and the doctrine. Their activity may well be said to have covered the continent. Their campaign was one of deliberate conquest, one of the greatest ever planned by

[1] "In punishment by the cross (was) the suffering of this One; He who is the true Christ, and God alone, and Guide ever pure."

Christian missionaries. Marco Polo is witness that there were Nestorian churches all along the trade routes from Bagdad to Pekin. (A. J. G.)

§ 4. *The Modern Nestorians.*—The Nestorians or East Syrians (*Surayi*) of Turkey and Persia now inhabit a district bounded by Lake Urmia, or Urumia, on the east, stretching westwards into Kurdistan, to Mosul on the south, and nearly as far as Van on the north. They are divided into the Persian Nestorians of the plain of Azerbaijan, and the Turkish Nestorians, inhabiting chiefly the sanjak of Hakkiari in the vilayet of Van, who are subdivided into the *Rayat* or subject, and the *Ashiret* or tribal, the latter being semi-independent in their mountain fastnesses. Forming at once a church and a nation, they own allegiance to their hereditary patriarch, Mar Shimun, Catholicus of the East, who resides at Qudshanis, a village about 7000 ft. above the sea-level, near the Kurdish town of Julamerk. It is only of late years, under the influence of the different missions, that education, ruined by centuries of persecution, has revived amongst the Nestorians; and even now the mountaineers, cut off from the outer world, are as a rule destitute of learning, and greatly resemble their neighbours, the wild and uncivilized Kurds. They are, however, extraordinarily tenacious of their ancient customs, and, almost totally isolated from the rest of Christendom since the 5th century, they afford an interesting study to the ecclesiastical student. Their churches are rude buildings, dimly lighted and destitute of pictures or images, save that of the Cross, which is treated with the deepest veneration. The *qankî*, or sanctuary, is divided from the nave, by a solid wall, pierced by a single doorway; it contains the altar, or *madhb'kha* (literary, *the sacrificing place*), and may be entered only by persons in holy orders who are fasting. Here is celebrated the Eucharist (*Qurbana*, or the *offering*; cf. "Corban"), by the priest (*qasha*), attended by his deacon (*shamasha*). Vestments are worn only at the ministration of the sacraments; incense is used invariably at the Eucharist and frequently at other services. There are three liturgies—of the Holy Apostles, of Theodore and of Nestorius. The first is quite free from Nestorian influence, dates from some remote period, perhaps prior to 431, and is certainly the most ancient of those now in use in Christendom; the other two, though early, are undoubtedly of later date. The Nestorian canon of Scripture seems never to have been fully determined, nor is the sacramental system rigidly defined. Nestorian writers, however, generally reckon the mysteries as seven, *i.e.* Priesthood, Oil of Unction, the Offering of the Body and Blood of Christ, Absolution, The Holy Leaven, the Signation of the life-giving Cross. The "Holy Leaven" is reputed to be a part of the original bread of the first Eucharist, brought by Addai and Mari[1] and maintained ever since in the Church; it is used in the confection of the Eucharistic wafers, which are rather thicker than those used in the Western Church. Communion is given in both kinds, as throughout the East; likewise, confirmation is administered directly after baptism. Sacramental confession is enjoined, but has recently become obsolete; prayers for the departed and invocation of saints form part of the services. The bishops are always celibates and are chosen from episcopal families. The service-books were wholly in MS. until the press of the archbishop of Canterbury's mission at Urmia issued the *Takksa* (containing the liturgies, baptismal office, &c.) and several other liturgical texts.

The Nestorians commemorate Nestorius as a saint, and invoke his aid and that of his companions. They reject the Third Oecumenical Council, and though showing the greatest devotion to the Blessed Virgin, deny her the title of *Theotokos, i.e.* the mother or bearer of God. Their theological teaching is misty and perplexing; their earliest writings contain no error, and the hymns of their great St Ephrem, still sung in their services, are positively antagonistic to "Nestorianism"; their theology dating from the schism is not so satisfactory. They attribute two *Kiani*, two *Qnumi* and one *Parsopa* in Christ (see J. F. Bethune-Baker's *Nestorius and his Teaching*). To say that the modern Nestorians are not definitely and firmly orthodox is perhaps fairer than to charge them with being distinctly heretical.

[1] The legendary founders of the Syrian Church. Addai was supposed to be one of the Seventy of Luke x. 1, and Mari his disciple.

§ 5. *Missions amongst the Nestorians.*—The peculiar circumstances, both ecclesiastical and temporal, of the Nestorians have attracted much attention in western Christendom, and various missionary enterprises amongst them have resulted.

1. *The Roman Catholic Missions.*—In Turkey these consist of the Dominican mission, established at Mosul during the 18th century, and in Persia of the French Lazarist mission, which sprang out of some schools established by a French layman and scientific traveller, Eugène Boré, in 1838. At M. Boré's entreaty the Propaganda sent the first Lazarist father to Persia in 1840. The chief stations of the Lazarists are at Khosrova and Urmia. At the latter place there is an orphanage under the superintendence of the Sisters of St Vincent de Paul. The work of these missions is to extend and consolidate that Catholicized and partly Latinized offshoot of the Nestorians known as the *Uniat-Chaldean Church* (see *ante*).

2. The *American Presbyterian Mission*, established in Persia in 1834–1835 by the Rev. Justin Perkins and Dr A. Grant, comprises large buildings near Urmia, a college and a hospital. The influence of this mission does not extend much beyond the Turkish frontier, but it is strong in the Persian plains. The original aim was to influence the old Nestorian Church rather than to set up a new religious body but the wide difference between Presbyterians and an Oriental Church rendered the attempt abortive, and the result of the labours of the Americans has been the establishment since 1862 of a Syrian Protestant community in Persia, with some adherents in Turkey.

3. *The Archbishop of Canterbury's Mission to the Assyrian Christians.*—This Anglican mission was promoted by Archbishop Tait, and finally established by Archbishop Benson in 1886. Its aim is thus officially defined: "To aid an existing Church, . . . not to Anglicanize, . . . not to change any doctrines held by them which are not contrary to that faith which the Holy Spirit, speaking through the Oecumenical Councils of the Undivided Church of Christ, has taught us as necessary to be believed by all Christians, but . . . to strengthen an ancient Church, at the earnest request of the Catholicos, and with the knowledge and blessing of the Catholic patriarch of Antioch, one of the four patriarchs of the Holy Orthodox Eastern Church, and occupant of the Apostolic See from which the Church of the East revolted at the time of Nestorius." This mission has its headquarters at Urmia, with a college for candidates for holy orders and a printing-press. Two mission-priests reside in Turkey, one at Qudshanis with Mar Shimun, the Nestorian Catholicus and Patriarch. The Anglican Church in America co-operates with the mission.

4. *The Russian Mission.*—One of the Nestorian bishops joined the Russian Orthodox Church in 1898, and returned the same year with a small band of missionaries sent by the Holy Synod of Russia. This mission enrolled a very large number of adherents drawn from the old Church, the Protestant Nestorians, and the Uniat-Chaldeans, but it can hardly be said to have commenced any active work, although the Anglican mission withdrew from competition by closing its schools in the dioceses occupied by the Russians.

NESTORIUS (d. *c.* 451), Syrian ecclesiastic, patriarch of Constantinople from 428 to 431, was a native of Germanicia at the foot of Mount Taurus, in Syria. The year of his birth is unknown. He received his education at Antioch, probably under Theodore of Mopsuestia. As monk in the neighbouring monastery of Euprepius, and afterwards as presbyter, he became celebrated in the diocese for his asceticism, his orthodoxy and his eloquence; hostile critics, such as the church historian Socrates, allege that his arrogance and vanity were hardly less conspicuous. On the death of Sisinnius, patriarch of Constantinople (December 427), Theodosius II., perplexed by the various claims of the local clergy, appointed the disinguished preacher of Antioch to the vacant see. The consecration took place on the 10th of April 428, and then, almost immediately afterwards, in what is

said to have been his first patriarchal sermon, Nestorius exhorted the emperor in the famous words—"Purge me, O Caesar, the earth of heretics, and I in return will give thee heaven. Stand by me in putting down the heretics and I will stand by thee in putting down the Persians." In the spirit of this utterance, steps were taken within a few days by the new prelate to suppress the assemblies of the Arians, these, by a bold stroke of policy, anticipated his action by themselves setting fire to their meeting-house, Nestorius being forthwith nicknamed "the incendiary." The Novatians and the Quartodecimans were the next objects of his orthodox zeal—a zeal which in the case of the former at least was reinforced, according to Socrates, by his envy of their bishop; and it led to serious and fatal disturbances at Sardis and Miletus. The toleration the followers of Macedonius had long enjoyed was also rudely broken, the recently settled Pelagians alone finding any respite. While these repressive measures were being carried on outside the pale of the catholic church, equal care was taken to instruct the faithful in such points of orthodoxy as their spiritual head conceived to be the most important or the most in danger. One of these was that involved in the practice, now grown almost universal, of bestowing the epithet Θεοτόκος, "Mother of God," upon Mary the mother of Jesus. In the school of Antioch the impropriety of the expression had long before been pointed out, by Theodore of Mopsuestia, among others, in terms precisely similar to those afterwards attributed to Nestorius. From Antioch Nestorius had brought along with him to Constantinople a co-presbyter named Anastasius, who enjoyed his confidence and is called by Theophanes his "syncellus." This Anastasius, in a pulpit oration which the patriarch himself is said to have prepared for him, caused great scandal to the partisans of the Marian cultus then beginning by saying, "Let no one call Mary the mother of God, for Mary was a human being; and that God should be born of a human being is impossible." The opposition, which was led by one Eusebius, a "scholasticus" or pleader who afterwards became bishop of Dorylaeum, chose to construe this utterance as a denial of the divinity of Christ, and so violent did the dispute upon it become that Nestorius judged it necessary to silence the remonstrants by force. The situation went from bad to worse, and the dispute not only grew in intensity but reached the outer world.

Matters were soon ripe for foreign intervention, and the notorious Cyril (*q.v.*) of Alexandria, in whom the antagonism between the Alexandrian and Antiochene schools of theology,[1] as well as the jealousy between the patriarchate of St Mark and that of Constantinople, found a determined and unscrupulous exponent, did not fail to make use of the opportunity. He stirred up his own clergy, he wrote to encourage the dissidents at Constantinople, he addressed himself to the sister and wife of the emperor (Theodosius himself being known to be still favourable to Nestorius), and he beggared the clergy of his own diocese to find bribes for the officials of the court.[2] He also sent to Rome a careful selection of Nestorius's sayings and sermons. Nestorius himself, on the other hand, having occasion to write to Pope Celestine I. about the Pelagians (whom he was not inclined to regard as heretical), gave from his own point of view an account of the disputes which had recently arisen within his patriarchate.[3] While ordinarily Rome might have been expected to hold the balance between the contrasted schools of thought, as Leo was able later to do, it is not surprising that this implied appeal proved unsuccessful, for Celestine naturally resented any questioning of the Roman decision concerning the Pelagians and was jealous of the growing power of the upstart see of the *Nova Roma* of the East. He was not slow to use the opportunity of gaining what was at once an official triumph and a personal satisfaction. In a synod which met in 430, he decided in favour of the epithet Θεοτόκος, and bade Nestorius retract his erroneous teaching, on pain of instant excommunication, at the same time entrusting the execution of this decision to the patriarch of Alexandria. On hearing from Rome, Cyril at once held a synod and drew up a doctrinal formula for Nestorius to sign, and also twelve anathemas covering the various points of the Nestorian dogmatic. Nestorius, instead of yielding to the combined pressure of his two great rivals, merely replied by a counter excommunication.

In this situation of affairs the demand for a general council became irresistible, and accordingly Theodosius and Valentinian III. issued letters summoning the metropolitans of the catholic church to meet at Ephesus at Whitsuntide 431, each bringing with him some able suffragans. Nestorius, with sixteen bishops and a large following of armed men, was among the first to arrive; soon afterwards came Cyril with fifty bishops. Juvenal of Jerusalem and Flavian of Thessalonica were some days late. It was then announced that John of Antioch had been delayed on his journey and could not appear for some days; he, however, is stated to have written politely requesting that the opening of the synod should not be delayed on his account. Cyril and his friends accordingly assembled in the church of the Theotokos on the 22nd of June, and summoned Nestorius before them to give an account of his doctrines. The reply they received was that he would appear as soon as all the bishops were assembled; and at the same time the imperial commissioner, Candidian, presented himself in person and formally protested against the opening of the synod. Notwithstanding these circumstances, Cyril and the one hundred and fifty-nine bishops who were with him proceeded to read the imperial letter of convocation, and afterwards the letters which had passed between Nestorius and his adversary. Almost immediately the entire assembly with one voice cried out anathema on the impious Nestorius and his impious doctrines, and after various extracts from the writings of church fathers had been read the decree of his exclusion from the episcopate and from all priestly communion was solemnly read and signed by all present, whose numbers had by this time swelled to one hundred and ninety-eight. The accused and his friends never had a hearing. As Nestorius himself said, "the Council was Cyril"; it simply registered the Alexandrian patriarch's views.

When the decision was known the populace, who had been eagerly waiting from early morning till night to hear the result, accompanied the members with torches and censers to their lodgings, and there was a general illumination of the city. A few days afterwards (June 26th or 27th) John of Antioch arrived, and efforts were made by both parties to gain his ear; whether inclined or not to the cause of his former co-presbyter, he was naturally excited by the precipitancy with which Cyril had acted, and at a *conciliabulum* of forty-three bishops held in his lodgings shortly after his arrival he was induced by Candidian, the friend of Nestorius, to depose the bishops of Alexandria and Ephesus on the spot. The efforts, however, to give effect to this act on the following Sunday were frustrated by the zeal of the Ephesian mob. Meanwhile a letter was received from the emperor declaring invalid the session at which Nestorius had been deposed unheard; numerous sessions and counter-sessions were afterwards held, the conflicting parties at the same time exerting themselves to the utmost to secure an effective superiority at court. In the end Theodosius decided to confirm the depositions which had been pronounced on both sides, and Cyril and Memnon as well as Nestorius were by his orders laid under arrest. Representatives from each side were now summoned before him to Chalcedon, and at last, yielding to the sense of the evident majority, he gave a decision in favour of the "orthodox," and the council of Ephesus was dissolved. Maximian, one of the Constantinopolitan clergy, a native of Rome, was promoted to the vacant see, and Nestorius was henceforward represented in the city of his former patriarchate only by one small congregation, which also a short time afterwards became extinct. The commotion which had been thus raised did not so easily subside in the more eastern section of the church; the Antiochenes continued to maintain for a considerable time an attitude

[1] At Alexandria the mystic and allegorical tendency prevailed, at Antioch the practical and historical, and these tendencies showed themselves in different methods of study, exegesis and presentation of doctrine.

[2] Letters of the archdeacon Epiphanius to the patriarch Maximianus (Migne, *Patr. Gr.* lxxxiv. 826).

[3] The letter is given in F. Loofs, *Nestoriana* 166-168, partly translated in J. F. Bethune-Baker, *Nestorius and his Teaching*, p. 16 seq.

of antagonism towards Cyril and his creed, and were not pacified until an understanding was reached in 433 on the basis of a new formula involving some material concessions by him. The union even then met with resistance from a number of bishops, who, rather than accede to it, submitted to deposition and expulsion from their sees; and it was not until these had all died out that, as the result of stringent imperial edicts, Nestorianism may be said to have become extinct throughout the Roman empire. Their school at Edessa was closed by Zeno in 489. As for Nestorius himself, immediately after his deposition he withdrew into private life in his old monastery of Euprepius, Antioch, until 435, when the emperor ordered his banishment to Petra in Arabia. A second decree, it would seem, sent him to Oasis, probably the city of the Great Oasis, in Upper Egypt, where he was still living in 439, at the time when Socrates wrote his *Church History*. He was taken prisoner by the Blemmyes, a nomad tribe that gave much trouble to the empire in Africa, and when they set him free in the Thebaid near Panopolis (Akhmim) *c.* 450, they exposed him to further persecution from Schenute the great hero of the Egyptian monks. There is some evidence that he was summoned to the Council of Chalcedon,[1] though he could not attend it, and the concluding portion of his book known as *The Bazaar of Heraclides* not only gives a full account of the "Robber Synod" of Ephesus 449, but knows that Theodosius is dead (July 450) and seems aware of the proceedings of Chalcedon and the flight of Dioscurus the unscrupulous successor of Cyril at Alexandria. Nestorius was already old and ailing and must have died very soon after.

The Nestorian Heresy.—What is technically and conventionally meant in dogmatic theology by "the Nestorian heresy" must now be noticed. As Eutychianism is the doctrine that the God-man has only one nature, so Nestorianism is the doctrine that He has two complete persons. So far as Nestorius himself is concerned, however, it is certain that he never formulated any such doctrine;[2] nor does any recorded utterance of his, however casual, come so near the heresy called by his name as Cyril's deliberately framed third anathema (that regarding the "physical union" of the two hypostases or natures) approaches Eutychianism. It must be remembered that Nestorius was as orthodox at all events as Athanasius on the subject of the incarnation, and sincerely, even fanatically, held every article of the Nicene creed. Hefele himself, one of the most learned and acute of Cyril's partisans, is compelled to admit that Nestorius accurately held the duality of the two natures and the integrity of each, was equally explicitly opposed to Arianism and Apollinarianism, and was perfectly correct in his assertion that the Godhead can neither be born nor suffer; all that he can allege against him is that "the fear of the *communicatio idiomatum* pursued him like a spectre." But in reality the question raised by Nestorius was not one as to the *communicatio idiomatum*, but simply as to the proprieties of language. "I cannot speak of God," he said, "as being two or three months old," a remark which was twisted to his disadvantage. He did not refuse to speak of Mary as being the mother of Christ or as being the mother of Emmanuel, but he thought it improper to speak of her as the mother of God, and Leo in the Letter to Flavian which was endorsed at Chalcedon uses the term "Mother of the Lord" which was exactly what Nestorius wished. And there is at least this to be said for him that even the most zealous desire to frustrate the Arian had never made it a part of orthodoxy to speak of David as *θεοπάτωρ* or of James as *ἀδελφόθεος*. The secret of the enthusiasm of the masses for the analogous expression Theotokos is to be sought not so much in the Nicene doctrine of the incarnation as in the recent growth in the popular mind of notions as to the dignity of the Virgin Mary, which were entirely unheard of (except in heretical circles) for nearly three centuries of the Christian era. That the Virgin should be given a title that was quasi-divine mattered little. The danger was that under cover of such a title an unhistorical conception of the facts of the Gospel should grow up, and a false doctrine of the relations between the human and the Divine be encouraged, and this was to Nestorius a double danger that needed to be exposed. He was thus forced into the position of one who brings technical objections against a popular term.

The fact that Nestorius was trained at Antioch and inherited the Antiochene zeal for exact biblical exegesis and insistence upon the recognition of the full manhood of Christ is of the first importance in understanding his position. From the days of Ignatius, down through Paul of Samosata and Lucian to the great controversies of the 5th century which began with the theories of Apollinarius, the theologians of Antioch started from the one sure fact, that Christ lived on earth the life of man, and without questioning the equally genuine Divine element laid stress on this genuine human consciousness. There is no reason to suppose that Nestorius intended to introduce any innovations in doctrine, and in any estimate of him his strong religious interest and his fervent pastoral spirit must have due weight. He was a great extempore preacher and exposed to the peril of the unconsidered "telling" phrase. That a man of such conspicuous ability, who impressed himself at the outset on the people of Constantinople as an uncompromising opponent of heresy should within a few short years be an excommunicated fugitive, sacrificed to save the face of Cyril and the Alexandrians, is indeed, as Duchesne says, a tragedy. No successor of Chrysostom was likely to receive much good-will from the nephew and successor of Theophilus of Alexandria.

It is only within recent years that an attempt has been made to judge Nestorius from some other evidence than that afforded by the accusations of Cyril and the inferences drawn therefrom. This other evidence consists partly of letters from Nestorius, preserved among the works of those to whom they were written, some sermons collected in a Latin translation by Marius Mercator, an African merchant who was doing business in Constantinople at the time of the dispute, and other material gathered from Syriac manuscripts. Since the helpful collection of *Nestoriana* published by Dr F. Loofs in 1905 there has also come to our knowledge the most valuable evidence of all, Nestorius's own account of the whole difficulty, viz. *The Bazaar*[3] *of Heraclides of Damascus*. This pseudonym served to protect the book against the fate that overtook the writings of heretics, and in a Syriac version it was preserved in the Euphrates valley where the followers of Nestorius settled. Ebed Jesu in the 14th century mentions it together with *Letters* and *Homilies*, as well as the *Tragedy*, or a *Letters to Cosmas*, the *Theopaschites* (of which some fragments are still extant) and the *Liturgy*, which is still used by the Nestorian Church. The discovery of *The Bazaar*, which is the *Apologia* of Nestorius, was made public by Dr H. Goussen (though members of the Archbishop of Canterbury's Mission to the Assyrian Christians had previously been acquainted with the book). The text has been edited by P. Paul Bedjan (Leipzig, 1910) and a French translation has been made by M. l'abbé F. Nau. A representative selection of extracts has been given to English readers in J. F. Bethune-Baker's *Nestorius and his Teaching* (Cambridge, 1908), chapter ii. of which describes the MS. and its accounts. Much of the argument is thrown into the form of a dialogue between (1) Nestorius and an imaginary opponent Superianus, (2) Nestorius and Cyril. The book reveals a strong personality and helps us to know the man and his teaching, even though we have to gather his own views largely from his criticism of his antagonists. He is throughout more concerned for the wrong done to the faith at Ephesus than to himself, saying that if he held the views attributed to him by Cyril he would be the first to condemn himself without mercy. All through the years of conflict he had "but one end in view, that no one should call the Word of God a creature, or the Manhood which was assumed incomplete." In his letters to Celestine he had laid stress on the point that the teaching he attacked was derogatory to the Godhead and so he called its champions Arians. "If the Godhead of the Son had its origin in the womb of the Virgin it was not Godhead as the Father's, and He who was born could not be *homoousios* with God, and that was what the Arians denied Him to be." It is thus increasingly difficult to believe that Nestorius was a "Nestorian." Père J. Mahé has shown (*Revue d'Inst. eccl.* July, 1906) that in spite of notable differences of terminology and form the chronologies of Antioch and Alexandria were in essence the same. Personal rather than doctrinal reasons had by far the larger part in determining the fate of Nestorius, who was sacrificed to the agreement between the two great schools. This view is confirmed by the evidence of the *Synodicon Orientale* (the collection of the canons of Nestorian Councils and Synods), which shows that the Great Syriac Church built up by the adherents of Nestorius and ever memorable for its zeal in carrying the Gospel into Central Asia, China and India cannot, from its inception, be rightly described as other than orthodox. The "attenuated" (*i.e.* un-"Nestorian") form which some historians have noted in the early centuries of Persian Nestorianism was really there from the beginning. The Nestorian Church, following its leader, formally recognizes the Letter of Leo to Flavian and the decrees of the Council of Chalcedon. "When I came," said Nestorius (*Bas. Herac.*), "upon that exposition and read it, I gave thanks to God that the Church of Rome was rightly and blamelessly making confession. even though they happened to be against me personally." His aim, he tells us, had been to maintain the distinct continuance of the two natures of Christ when united through the Incarnation into one Person. "In the Person the natures use their properties mutually. . . . The manhood is the person of the Godhead and the Godhead is the person of the manhood." The ultimate union of these two natures appears to lie in the will—"For there was one and the same will and mind in the union of the natures, so that both should will or not will exactly the same things. The natures have, moreover, a

[3] Syriac, *tgŭrtā*, lit. "merchandise." The Greek word may have been *ἐμπόριον*. Nothing is certainly known of any such Heraclides.

mutual will, since the person of this is the person of that, and the person of that the person of this." The manner in which this union is realized is thus stated by Nestorius: "The Word also passed through Blessed Mary inasmuch as He did not receive a beginning by birth from her, as is the case with the body which was born of her. For this reason I said that God the Word passed and not was born, because He did not receive a beginning from her. But the two natures being united are one Christ. And He who was born of the Father as to the Divinity, and from the Holy Virgin as to the humanity is and is styled one; for of the two natures there was a union." It may truly be said that the ideas for which Nestorius and the Antiochene school strove "won the day as regards the doctrinal definitions of the church. The manhood of Christ was safeguarded, as distinct from the Godhead: the union was left an ineffable mystery."

AUTHORITIES.—On Nestorius, in addition to the modern literature cited in the article, and the standard histories of dogma (A. Harnack, F. Loofs, R. L. Ottley's *Doctrine of the Incarnation*, &c.) see R. Seeberg, *Lehrbuch der Dogmengeschichte*, Bd. ii. § 27 (Leipzig, 1910), L. Duchesne, *Histoire ancienne de l'église*, vol. iii. chs. x. xi. (Paris, 1910). (J. S. Bl.; A. J. G.)

NESZLER, VICTOR (1841–1890), German musical composer, was born on the 28th of January 1841 at Baldenheim, near Schlettstadt. At Strassburg he began his university career with the study of theology, but he concluded it with the production of a light opera entitled *Fleurette* (1864). To complete his knowledge of music Neszler went to Leipzig to study under Hauptmann. His opera *Der Trompeter von Säckingen*, based on Scheffel's poem, was composed and performed in 1884. Besides a number of other operas, Neszler wrote many songs and choral works; but it is with the *Trompeter von Säckingen* that his name is associated. He died at Strassburg on the 28th of May 1890. In 1895 a monument to him by Marzolff was erected there.

NET,[1] a fabric of thread, cord or wire, the intersections of which are knotted so as to form a mesh. The art of netting is intimately related to weaving, knitting, plaiting and lace-making, from all of which, however, it is distinguished by the knotting of the intersections of the cord. It is one of the most ancient and universal of arts, having been practised among the most primitive tribes, to whom the net is of great importance in hunting and fishing.

Net-making, as a modern industry, is principally concerned with the manufacture of the numerous forms of net used in fisheries, but netting is also largely employed for many other purposes, as for catching birds, for the temporary division of fields, for protecting fruit in gardens, for screens and other furniture purposes, for ladies' hair, bags, appliances used in various games, &c. Since the early part of the 19th century numerous machines have been invented for netting, and several of these have attained commercial success. Fishing nets were formerly made principally from hemp fibre—technically called "twine"; but since the adaptation of machinery to net-making cotton has been increasingly used, such nets being more flexible and lighter, and more easily handled and stowed.

The forms of fishing nets vary according to the manner in which they are intended to act. This is either by entangling the fish in their complicated folds, as in the trammel; receiving them into pockets, as in the trawl; suspending them by the body in the meshes, as in the mackerel-net; imprisoning them within their labyrinth-like chambers, as in the stake-net; or drawing them to shore, as in the seine. The parts of a net are the head or upper margin, along which the corks are strung upon a rope called the head-rope; the foot is the opposite or lower margin, which carries the foot-rope, on which in many cases leaden plummets are made fast. The meshes are the squares composing the net. The width of a net is expressed by the term "over"; *e.g.* a day-net is three fathoms long and one over or wide. The lever is the first row of a net. There are also accrues, false meshes or quarterings, which are loops inserted in any given row, by which the number of meshes is increased. To bread or breathe a net is to make a net. Dead netting is a piece without either accrues or stole (stolen) meshes, which last means that a mesh is taken away by netting into two meshes of the preceding row at once.

Hand-Netting.—The tools used in hand-netting are the needle, an instrument for holding and netting the material; it is made with an eye E, a tongue T, and a fork F (fig. 1). The twine is wound on it by being passed alternately between the fork and round the tongue, so that the turns of the string lie parallel to the length of the needle, and are kept on by the tongue and fork. A spool or mesh-pin is a piece of round or flat wood on which the loops are formed, the perimeter of the spool determining the size of the loops. Each loop contains two sides of the square mesh; therefore, supposing that it be required to make a mesh 1 in. square—that is, measuring 1 in. from knot to knot, —a spool 2 in. in circumference must be used. Large meshes may be formed by giving the twine two or more turns round the spool, as occasion may require; or the spool may be made flat, and of a sufficient width. The method of making the hand-knot in nets known as the fisherman's knot is more easily acquired by example than described in writing. Fig. 2 shows the course of the twine in forming a single knot. From the last-formed knot the twine passes over the front of the mesh-pin *h*, and is caught behind by the little finger of the left hand, forming the loop *s*, thence it passes to the front and is caught at *d* by the left thumb, then through the loops *s* and *m* as indicated, after which the twine is released by the thumb and the knot is drawn "taut" or tight. Fig. 3 is a bend knot used for uniting two ends of twine.

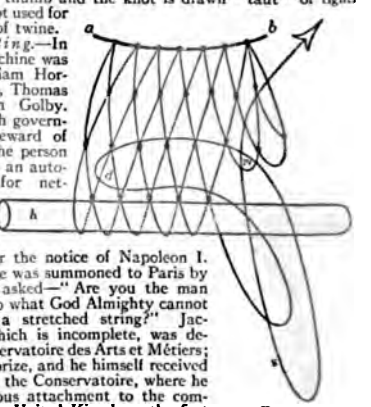

FIG. 2.

Machine-Netting.—In 1778 a netting-machine was patented by William Horton, William Ross, Thomas Davies and John Golby. In 1802 the French government offered a reward of 10,000 francs to the person who should invent an automatic machine for net-making. Jacquard submitted a model of a machine which was brought under the notice of Napoleon I. and Carnot, and he was summoned to Paris by the emperor who asked—"Are you the man who pretends to do what God Almighty cannot —tie a knot in a stretched string?" Jacquard's model, which is incomplete, was deposited in the Conservatoire des Arts et Métiers; it was awarded a prize, and he himself received an appointment in the Conservatoire, where he perfected his famous attachment to the common loom. In the United Kingdom, the first to succeed in inventing an efficient machine and in establishing the industry of machine net-making was James Paterson of Musselburgh. Paterson, originally a cooper, served in the army through the Peninsular War, and was discharged after the battle of Waterloo. He established a net factory in Musselburgh about 1820; but the early form of machine was imperfect, the knots it formed slipped readily, and, there being much prejudice against machine nets, the demand was small. Walter Ritchie, native of Musselburgh, devised a method for forming the ordinary hand-knot on the machine nets, and the machine, patented in July 1835, became the foundation of an extensive and flourishing industry.

FIG. 3.

The Paterson machine is very complex. It consists of an arrangement of hooks, needles and sinkers, one of each being required for every mesh in the breadth being made. The needles hold the meshes, while the hooks seize the lower part of each and twist it into a loop. Through the series of loops so formed a steel wire is shot, carrying with it twine for the next range of loops. This twine the sinkers successively catch and depress sufficiently to form the two sides and loop of the next mesh to be formed. The knot formed by threading the loops is now tightened up, the last formed mesh is freed from the sinkers and transferred to the hooks, and the process of looping, threading and knotting thus continues.

Another form of net-loom, working on a principle distinct from that of Paterson, was invented and patented in France by Onésiphore Pecqueur in 1840, and again in France and in the United Kingdom in 1849. This machine was improved by many subsequent

[1] This is a common Teut. word, of which the origin is unknown; it is not to be connected with "knit" or "knot." The term "net," *i.e.* remaining after all deductions, charges, &c., have been made, as in "net profit," is a variant of "neat," tidy, clean, Lat. *nitidus*, shining.

inventors; especially by Baudouin and Jouannin, patented in the United Kingdom in 1861. In this machine separate threads or cords running longitudinally for each division of the mesh are employed (fig. 4). It will be observed that the alternate threads *a* and *b* are differently disposed—the *a* series being drawn into simple loops over and through which the threads of the *b* series have to pass. On the machine the *a* series of threads are arranged vertically, while the *b* series are placed horizontally in thin lenticular spools. Over the horizontal *b* series is a range of hooks equal in number with the threads, and set so that they seize the *b* threads, raise them, and give them a double twist, thus forming a row of open loops. The loops are then depressed, and, seizing the vertical *a* threads, draw them crotchet-like through the *b* loops into loops sufficiently long and open to pass right over the spools containing the *b* threads (fig. 5), after which it only remains to tighten the threads and the mesh is complete.

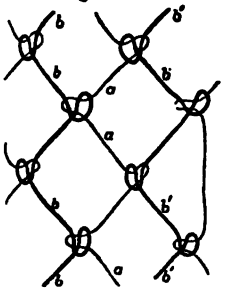

FIG. 4.

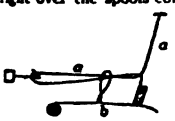

FIG. 5.

Wire-netting, which is in extensive demand for garden use, poultry coops, and numerous like purposes, is also a twisted structure made principally by machine power. The industry was mainly founded by Charles Barnard in 1844, the first netting being made by hand on wooden rollers. The first machine appeared in 1855, and, since that time many devices, generally of extremely complex construction, have come into use. The wire chiefly used is common annealed Bessemer or mild steel (see B. Smith, *Wire, Its Manufacture and Uses*, New York, 1891).

NETHERLANDS. The geographical features of the countries formerly known collectively as the Netherlands or Low Countries are dealt with under the modern English names of HOLLAND and BELGIUM. Here we are concerned only with their earlier history, which is put for convenience under this heading in order to separate the account of the period when they formed practically a single area for historical purposes from that of the time when Holland and Belgium became distinct administrative units.

The sources of our knowledge of the country down to the 8th century are Caesar's *De Bello Gallico*, iv., the history of Velleius Paterculus, ii. 105, the works of Tacitus, the *Historia Francorum* (i.-iii.) of Gregory of Tours, the Fredegar's *Chronica* (for the last two of which see D. Bouquet's *Recueil de historiens des Gaules et de la France, 1738–1876*). The Netherlands first became known to the Romans through the campaigns of Julius Caesar. He found the country peopled partly by tribes of Gallo-Celtic, partly by tribes of Germanic stock, the river Rhine forming roughly the line of demarcation between the races. Several of the tribes along the borderland, however, were undoubtedly of mixed blood. The Gallo-Celtic tribes bore the general appellation of Belgae, and among these the Nervii, inhabiting the district between the Scheldt and the Sambre were at the date of Caesar's invasion, 57 B.C., the most warlike and important. To the north of the Meuse, and more especially in the low-lying ground enclosed between the Waal and the Rhine (*insula Batavorum*) lived the Batavi, a clan of the great Germanic tribe, the Chatti. Beyond these were found the Frisians (*q.v.*), a people of German origin, who gave their name to the territory between the Rhine and the Ems. Of the other tribes the best known are the Caninefates, Chauci, Usipetes, Sicambri, Eburones, Menapii, Morini and Aduatici.

Early inhabitants.

Julius Caesar, after a severe struggle with the Nervii and their confederates, was successful in bringing the Belgic tribes into subjection to Rome. Under Augustus, 15 B.C., the conquered territory was formed into an imperial province, *Gallia Belgica*, and the frontier line, the Rhine, was strongly held by a series of fortified camps. With regard to the region north of the Rhine we first obtain information from the accounts of the campaigns of Nero, Claudius, Drusus and Tiberius. The Batavians were first brought under Roman rule in the governorship of Drusus, A.D. 13. They were not incorporated in the empire, but were ranked as allies, *socii* or *auxilia*. Their land became a recruiting ground for the Roman armies, and a base for expeditions across the Rhine. The Batavians served with fidelity and distinction in all parts of the empire, and from the days of Augustus onwards formed a considerable part of the Praetorian guard. The Frisians struggled against Roman over-lordship somewhat longer, and it was not until A.D. 47 that they finally submitted to the victorious arms of Domitius Corbulo. The Frisian auxiliaries were likewise regarded as excellent troops.

Their relations with the Romans.

In the confusion of the disputed succession to the imperial throne after the death of Nero, the Batavians (A.D. 69–70) under the influence of a great leader, known only by his Roman name, Claudius Civilis, rose in revolt. Civilis had seen much service in the Roman armies, and was a man of statesmanlike ability. In revenge for his own imprisonment, and the death of his brother by order of Nero, he took advantage of the disorder in the empire not only to stir up his fellow-countrymen to take up arms for independence, but to persuade a large number of German and Belgic tribes to join forces with them. A narrative of the revolt is given in detail by Tacitus. At first success attended Civilis and the Romans were driven out of the greater part of the Belgic province. Even the great fortress of Castra Vetera (Xanten) was starved into submission and the garrison massacred. But dissensions arose between the German and Celtic elements of Civilis's following. The Romans, under an able general, Cerealis, took advantage of this, and Civilis, beaten in fight, retired to the island of the Batavians. But both sides were exhausted, and it was arranged that Cerealis and Civilis should meet on a broken bridge over the Nabalia (Yssel) to discuss terms of peace. At this point the narrative of Tacitus breaks off, but it would appear that easy conditions were offered, for the Batavians returned to their position of *socii*, and were henceforth faithful in their steady allegiance to Rome. The *insula Batavorum*, lined with forts, became for a long period the bulwark of the empire against the inroads of the Germans from the north.

The revolt of Civilis.

Of this period scarcely any record remains, but when at the end of the 3rd century the Franks (*q.v.*) began to swarm over the Rhine into the Roman lands, the names of the old tribes had disappeared. The peoples within the frontier had been transformed into Romanized provincials; outside, the various tribes had become merged in the common appellation of Frisians. The branch of the Franks—who were a confederacy, not a people—which gradually overspread Gallia Belgica, bore the name of the Salian Franks. Nominally they were taken under the protection of the empire, in reality they were its masters and defenders. In the days of their great king Hlodwig or Clovis (481–511) they were in possession of the whole of the southern and central Netherlands. The strip of coast from the mouth of the Scheldt to that of the Ems remained, however, in the hands of the free Frisians (*q.v.*), in alliance with whom against the Franks were the Saxons (*q.v.*), who, pressing forward from the east, had occupied a portion of the districts known later as Gelderland, Overyssel and Drente. Saxon was at this period the common title of all the north German tribes; there was but little difference between Frisians and Saxons either in race or language, and they were closely united for some four centuries in common resistance to the encroachments of the Frankish power.

The Franks.

The conversion of Clovis and his rude followers to Christianity tended gradually to civilize the Franks, and to facilitate the fusion which soon took place between them and the Gallo-Roman population. It tended also to accentuate the enmity to the Franks of the heathen Frisians and Saxons. In the south (of the Netherlands) Christianity was spread by the labours of devoted missionaries, foremost amongst whom were St Amandus, St Bavon and St Eligius, and bishoprics were set up at Cambrai, Tournai, Arras, Thérouanne and Liége. In the north progress was much slower, and

Spread of Christianity.

though a church was erected at Utrecht by Dagobert I. about A.D. 630, it was destroyed by the Frisians, who remained obstinately heathen. The first successful attempt to convert them was made, under the powerful protection of Pippin of Heristal, by Willebrord, a Northumbrian monk, who became, A.D. 695, the first bishop of Utrecht (see UTRECHT). His labours were continued with even more striking results by another Englishman, Winfred, better known as St Boniface, the Apostle of the Germans, who suffered martyrdom at Dokkum in A.D. 754 at the hands of some heathen Frisians. The complete conversion was, however, in the end due rather to the arms of the Carolingian kings than to the unaided efforts of the missionaries. Towards the end of the century, Charlemagne, himself a Netherlander by descent and ancestral possessions, after a severe struggle, thoroughly subdued the Frisians and Saxons, and compelled them to embrace Christianity.

The ducky of Lower Lorraine.

In the triple partition of the Carolingian empire at Verdun in 843, the central portion was assigned to the emperor Lothaire, separating the kingdoms of East Francia (the later Germany) from West Francia (the later France). This middle kingdom formed a long strip stretching across Europe from the North Sea to Naples, and embraced the whole of the later Netherlands with the exception of the portion on the left bank of the Scheldt, which river was made the boundary of West Francia. On the death of the emperor, his son Lothaire II. received the northern part of his father's domain, known as Lotharii or Hlutharii Regnum, corrupted later into Lotharingia or Lorraine. Lothaire had no heir, and in 870 by the treaty of Meerssen his territory was divided between the kings of East and West Francia. In 879 East Francia acquired the whole; from 912 to 924 it formed part of West Francia. Finally in 924 Lorraine passed in the reign of Henry the Fowler under German (East Frankish) overlordship. Henry's son, Otto the Great, owing to the disordered state of the country, placed it in 953 in the hands of his able brother, Bruno, archbishop of Cologne, for pacification. Bruno, who kept for himself the title of archduke, divided the territory into the two duchies of Upper and Lower Lorraine. Godfrey of Verdun was invested by him with the government of Lower Lorraine (Nieder-Lothringen). The history of the Netherlands from this time forward—with the exception of Flanders, which continued to be a fief of the French kings—is the history of the various feudal states into which the duchy of Lower Lorraine was gradually broken up.

Growth of the feudal states.

It is a melancholy history, telling of the invasion of the Northmen, and of the dynastic struggles between the petty feudal sovereigns who carved out counties and lordships for themselves during the dark centuries which followed the fall of the Carolingian empire. It was a time of oppression and cruelty, and of war and devastation, during which the country remained chiefly swamp and tangled woodland, with little communication save up and down the rivers and along the old Roman roads. Its remoteness from the control of the authority of the German and French kings, together with its inaccessibility, gave special facilities in Lower Lorraine to the growth of a number of practically independent feudal states forming a group or system apart. Chief among these states were the duchy of Brabant, the counties of Flanders, Hainault, Holland, Gelderland, Limburg and Luxemburg, and the bishoprics of Utrecht and Liége. For their separate local histories and their dynasties, their wars and political relations with one another and with neighbouring countries, reference must be made to the separate articles FLANDERS, HOLLAND, BRABANT, GELDERLAND, LIMBURG, LUXEMBURG, UTRECHT, LIÉGE.

The invasions of the Northmen.

During the 9th and 10th centuries the Netherlands suffered cruelly from the attacks of the Northmen, who ravaged the shores and at times penetrated far inland. In 834 Utrecht and Dorestad were sacked, and a few years later all Holland and Friesland was in their hands. Year after year the raids went on under a succession of leaders—Heriold, Roruk, Rolf, Godfrey—and far and wide there was pillaging, burning, murder and slavery. In 873 Rolf seized Walcheren, and became the scourge of the surrounding districts. In 880 the invaders took Nijmwegen, erected a permanent camp at Elsloo and pushed on to the Rhine. Liège, Aix-la-Chapelle, Cologne and Bonn fell into their hands. The emperor, Charles the Fat, was roused to collect a large army, with which he surrounded the main body of the Northmen under their leader Godfrey in the camp at Elsloo. But Charles preferred negotiation and bribery to fighting. Godfrey received a large sum of money, was confirmed in the possession of Friesland, and on being converted to Christianity in 882, received in marriage Gisela, daughter of Lothaire II. Three years later, however, Godfrey was murdered, and although the raids of the Northmen did not entirely cease for upwards of another century, no further attempt was made to establish a permanent dynasty in the land.

The Crusades.

At the close of the 11th century the system of feudal states had been firmly established in the Netherlands under stable dynasties hereditary or episcopal, and, despite the continual wars between them, civilization had begun to develop, orderly government to be carried on, and the general condition of the people to be less hopeless and miserable. It was at this time that the voice of Peter the Hermit roused the whole of western Europe to enthusiasm by his preaching of the first crusade. Nowhere was the call responded to with greater zeal than in the Netherlands, and nowhere had the spirit of adventure and the stimulus to enterprise, which was one of the chief fruits of the crusades, more permanent effects for good. The foremost heroes of the first crusade were Netherlanders. Godfrey of Bouillon, the leader of the expedition and the first king of Jerusalem, was duke of Lower Lorraine, and the names of his brothers Baldwin of Edessa and Eustace of Boulogne, and of Count Robert II. of Flanders are only less famous. The third crusade numbered among its chiefs Floris III. of Holland, Philip of Flanders, Otto I. of Gelderland and Henry I. of Brabant. The so-called Latin crusade of 1203 placed the imperial crown of Constantinople on the head of Baldwin of Flanders. At the siege and capture of Damietta (1218) it was the contingent of North-Netherlanders (Hollanders and Frisians under Count William I. of Holland) who bore the brunt of the fighting and specially distinguished themselves. To the Netherlands, as to the rest of western Europe, the result of the crusades was in the main advantageous. They broke down the intense narrowness of the life of those feudal times, enlarged men's conceptions and introduced new ideas into their minds. They first brought the products and arts of the Orient into western Europe; and in the Netherlands, by the impulse that they gave to commerce, they were one of the primary causes of the rise of the chartered towns.

Rise of the cities in the Netherlands.

Little is known about the Netherland towns before the 12th century. The earliest charters date from that period. No place was reckoned to be a town unless it had received a charter from its sovereign or its local lord. The charters were of the nature of a treaty between the city and its feudal lord, and they differed much in character according to the importance of the place and the pressure it was able to put upon its sovereign. The extent of the rights which the charter conceded determined whether the town was a free town (*wlje stadt—villa franca*) or a commune (*gemeente—communia*). In the case of a commune the concessions included generally the right of inheritance, justice, taxation, use of wood, water, &c. The lord's representative, entitled "justiciary" (*schout*) of "bailiff" (*baljuw*), presided over the administration of justice and took the command of the town levies in war. The *gemeente*—consisting only of those bound by the communal oath for mutual help and defence—elected their own magistrates. These electors were often a small proportion of the whole body of inhabitants: sometimes a few influential families alone had the right, and it became hereditary. This governing oligarchy was known as "the patricians." The magistrates bore the name of *scabini* (*schepenen* or *échevins*), and at their head was the seigneurial official—the *schout* or *baljuw*. These *schepenen* appointed in their turn from the

citizens to assist them a body of sworn councillors (*gezworenen* or *jurés*), whose presidents, styled "burgomasters," had the supervision of the communal finances. Thus grew up a number of municipalities—practically self-governing republics—semi-independent feudatories in the feudal state.

The Flemish communes.

The most powerful and flourishing of all were those of Flanders—Ghent, Bruges and Yprès. In the 13th century these towns had become the seat of large industrial populations (varying according to different estimates from 100,000 to 200,000 inhabitants), employed upon the weaving of cloth with its dependent industries, and closely bound up by trade interests with England, from whence they obtained the wool for their looms. Bruges, at that time connected with the sea by the river Zwijn and with Sluis as its port, was the central mart and exchange of the world's commerce. In these Flemish cities the early oligarchic form of municipal government speedily gave way to a democratic. The great mass of the townsmen organized in trade gilds—weavers, fullers, dyers, smiths, leather-workers, brewers, butchers, bakers and others, of which by far the most powerful was that of the weavers—as soon as they became conscious of their strength rebelled against the exclusive privileges of the patricians and succeeded in ousting them from power. The patricians (hence called *leliaerts*) relied upon the support of the French crown, but the fatal battle of Courtrai (1302), in which the handicraftsmen (*clauwaerts*) laid low the chivalry of France, secured the triumph of the democracy. The power of the Flemish cities rose to its height during the ascendancy of Jacques van Artevelde (1285–1345), the famous citizen-statesman of Ghent, but after his downfall the mutual jealousies of the cities undermined their strength, and with the crushing defeat of Roosebeke (1382) in which Philip van Artevelde perished, the political greatness of the municipalities had entered upon its decline.

Other Netherland municipalities.

In Brabant—Antwerp, Louvain, Brussels, Malines (Mechlin)—and in the episcopal territory of Liège—Liège, Huy, Dinant—there was a feebler repetition of the Flemish conditions. Flourishing communities were likewise to be found in Hainault, Namur, Cambrai and the other southern districts of the Netherlands, but nowhere else the vigorous independence of Ghent, Bruges and Yprès, nor the splendour of their civic life. In the north also the 13th century was rich in municipal charters. Dordrecht, Leiden, Haarlem, Delft, Vlaardigen, Rotterdam in Holland, and Middleburg and Zierikzee in Zeeland, repeated with modifications the characteristics of the communes of Flanders and Brabant. But the growth and development of the northern communal movement, though strong and instinct with life, was slower and less tempestuous than the Flemish. In the bishopric of Utrecht, in Gelderland and Friesland, the privileges accorded to Utrecht, Groningen, Zutphen, Stavoren, Leeuwarden followed rather on the model of those of the Rhenish "free cities" than of the Franco-Flemish commune. In the northern Netherlands generally up to the end of the 14th century the towns had no great political weight; their importance depended upon their river commerce and their markets. Thus at the close of the 14th century, despite the constant wars between the feudal sovereigns who held sway in the Netherlands, the vigorous municipal life had fostered industry and commerce, and had caused Flanders in particular to become the richest possession in the world.

The Burgundian dominion.

It was precisely at this time that Flanders, and gradually the other feudal states of the Netherlands, by marriage, purchase, treachery or force, fell under the dominion of the house of Burgundy. The foundation of the Burgundian rule in the Netherlands was laid by the succession of Philip the Bold to the counties of Flanders and Artois in 1384 in right of his wife Margaret de Mâle. In 1404 Antony, Philip's second son (killed at Agincourt 1415), became duke of Brabant by bequest of his great-aunt Joan. The consolidation of the Burgundian power was effected by Philip the Good, grandson of Philip the Bold, in his long and successful reign of 48 years, 1419–1467. He inherited Flanders and Artois, purchased the county of Namur (1427) and compelled his cousin Jacqueline, the heiress of Holland, Zeeland, Hainault and Friesland, to surrender her possessions to him, 1428. On the death in 1430 of his cousin Philip, duke of Brabant, he took possession of Brabant and Limburg; the duchy of Luxemburg he acquired by purchase, 1443. He made his bastard son David bishop of Utrecht, and from 1456 onwards that see continued under Burgundian influence. Two other bastards were placed on the episcopal throne of Liège, an illegitimate brother on that of Cambrai. Philip did not live to see Gelderland and Liège pass definitively under his rule; it was reserved for his son, Charles the Bold, to crush the independence of Liège (1468) and to incorporate Gelderland in his dominions (1473).

Philip the Good.

This extension of dominion on the part of the dukes of Burgundy implied the establishment of a strong monarchical authority. They had united under their sway a number of provinces with different histories and institutions and speaking different languages, and their aim was to centralize the government. The nobility and clergy were on the side of the ducal authority; its opponents were the municipalities, especially those of Flanders. Their strength had been seriously weakened by the overthrow of Roosebeke, but Philip on his accession found them once more advancing rapidly in power and prosperity. He was quite aware that the industrial wealth of the great Flemish communes was financially the mainstay of his power, but their very prosperity made them the chief obstacle to his schemes of unifying into a solid dominion the loose aggregate of states over which he was the ruler. On this matter Philip would brook no opposition. Bruges was forced after strenuous resistance to submit to the loss of its most cherished privileges in 1438, and the revolt of Ghent was quenched in the "red sea" (as it was styled) of Gavre in 1453. The splendour and luxury of the court of Philip surpassed that of any contemporary sovereign. A permanent memorial of it remains in the famous Order of the Golden Fleece, which was instituted by the duke at Bruges in 1430 on the occasion of his marriage with Isabel of Portugal, a descendant of John of Gaunt, and was so named from the English wool, the raw material used in the Flemish looms, for which Bruges was the chief mart. The reign of Philip, though marred by many acts of tyranny and harshness, was politically great. Had his successor been as prudent and able, he might have made a unified Netherlands the nucleus of a mighty middle kingdom, interposing between France and Germany, and a revival of that of the Carolingian Lothaire.

Charles the Bold.

Before the accession of Charles, the only son of Philip, two steps had been taken of great importance in the direction of unification. The first was the appointment of a grand council with supreme judicial and financial functions, whose seat was finally fixed at Malines (Mechlin) in 1473; the other the summoning of deputies of all the provincial "states" of the Netherlands to a states-general at Brussels in 1465. But Charles, rightly surnamed the Bold or Headstrong, did not possess the qualities of a builder of states. Impatient of control and hasty in action, he was no match for his crafty and plotting adversary, Louis XI. of France. His ambition, however, was boundless, and he set himself to realize the dream of his father—a Burgundian kingdom stretching from the North Sea to the Mediterranean. At first all went well with him. By his ruthless suppression of revolts at Dinant and Liège he made his authority undisputed throughout the Netherlands. His campaigns against the French king were conducted with success. His creation of a formidable standing army, the first of its kind in that age of transition from feudal conditions, gave to the Burgundian power all the outward semblance of stability and permanence. But Charles, though a brave soldier and good military organizer, was neither a capable statesman nor a skilful general. He squandered the resources left to him by his father, and made himself hateful to all classes of his subjects by his exactions and tyranny. When at the very height of power, all his schemes of aggrandisement came to sudden ruin through a succession of disastrous defeats at the hands of the Swiss at Grandson (March 2, 1476), at Morat (June 22, 1476)

and at Nancy (January 5, 1477). At Nancy Charles was himself among the slain, leaving his only daughter Mary of Burgundy, then in her twentieth year, sole heiress to his possessions.

Mary of Burgundy and Maximilian of Austria.

The catastrophe of Nancy threatened the loosely-knit Burgundian dominion with dissolution. Louis XI. claimed the reversion of the French fiefs, and seized Burgundy, Franche Comté and Artois. But the Netherland provinces, though not loving the Burgundian dynasty, had no desire to have a French master. Deputies representing Flanders, Brabant, Hainault and Holland met at Ghent, where Mary was detained almost as a prisoner, and compelled her (February 10, 1477) to sign the "Great Privilege." This charter provided that no war could be declared nor marriage concluded by the sovereign, nor taxes raised without the assent of the states, that natives were alone eligible for high office, and that the national language should be used in public documents. The central court of justice at Malines was abolished, but the Grand Council was reorganized and made thoroughly representative. The Great Privilege was supplemented by provincial charters, the Flemish Privilege granted (February 10), the Great Privilege of Holland and Zeeland (February 17), the Great Privilege of Namur and the *Joyeuse Entrée* of Brabant, both in May, thus largely curtailing the sovereign's power of interference with local liberties. On these conditions Mary obtained the hearty support of the states against France, but her humiliations were not yet at an end; two of her privy councillors, accused of traitorous intercourse with the enemy, were, despite her entreaties, seized, tried and beheaded (April 3). Her marriage four months later to Maximilian of Austria was the beginning of the long domination of the house of Habsburg. The next fifteen years were for Maximilian a stormy and difficult period. The duchess Mary died from the effects of a fall from her horse (March 1482), and Maximilian became regent (*mambourg*) for his son. The peace of Arras with France (March 1483) freed him to deal with the discords in the Netherland provinces, and more especially with the turbulent opposition in the Flemish cities. With the submission of Ghent (June 1485) the contest was decided in favour of the archduke, who in 1494, on his election as emperor, was able to hand over the country to his son Philip in a comparatively tranquil and secure state. Philip, surnamed the Fair, was fifteen years of age, and his accession was welcomed by the Netherlanders with whom Maximilian had never been popular. Gelderland, however, which had revolted after Nancy, had Charles of Egmont for its duke, and the two bishoprics of Liége and Utrecht were no longer subject to Burgundian authority. In 1496 Philip married Joanna of Aragon, who in 1500 became heiress apparent to Castile and Aragon. That same year she gave birth at Ghent to a son, afterwards the emperor Charles V. Philip's reign in the Netherlands was chiefly noteworthy for his efforts for the revival of trade with England. On the death of Queen Isabel, Philip and Joanna succeeded to the crown of Castile and took up their residence in their new kingdom (January 1506). A few months later Philip unexpectedly died at Burgos (September 25th). His Burgundian lands passed without opposition to his son Charles, then six years of age.

Philip and Joanna.

The claim of the emperor Maximilian to be regent during the minority of his grandson was recognized by the states-general. Maximilian nominated his daughter Margaret, widow of Philibert, duke of Savoy, to act as governor-general, and she filled the difficult post for eight years with great ability, courage and tact; and when Charles at the age of fifteen assumed the government he found the Netherlands thriving and prosperous. In the following year, by the death of Ferdinand of Aragon, his maternal grandfather, and the incapacity of his mother Joanna, who had become hopelessly insane, he succeeded to the crowns of Castile and Aragon, which carried with them large possessions in Italy and the dominion of the New World of America. In 1519 Maximilian died, and the following year his grandson, now the head of the house of Austria, was elected emperor. Charles V. had been born and brought up in the Netherlands, and retained a strong predilection for his native country, but necessarily he had to pass the larger part of his life, at that great crisis of the world's history, in other lands. During his frequent absences he entrusted the government of the Netherlands to the tried hands of his aunt, Margaret, who retained his confidence until her death (November 1530), and secured the affection of all Netherlanders. Margaret was assisted by a permanent council of regency, and there was a special minister charged with the administration of the finances, sometimes under the name of superintendent of the finances, sometimes under the title of treasurer-general and controller-general. The duties of this minister were of special importance, for it was to the Netherlands that Charles looked for much of the resources wherewith to carry on his many wars. During this time Charles consolidated his dominion over the Netherlands. In 1524 he became lord of Friesland by purchase, and in 1528 he acquired the temporalities of Utrecht. He now ruled over seventeen provinces—*i.e.* four duchies, Brabant, Gelderland, Limburg and Luxemburg; seven counties, Flanders, Artois, Hainault, Holland, Zeeland, Namur and Zutphen; the margraviate of Antwerp; and five lordships—Friesland, Mechlin, Utrecht, Overyssel, and Groningen with its dependent districts.

Margaret of Austria.

Charles V.

After the death of Margaret, Charles appointed his sister Mary, the widowed queen of Hungary, to the regency, and for twenty years she retained her post, until the abdication in fact of Charles V. in 1555. She too governed ably, though in entire subservience to her nephew, but was not in such intimate touch with the national peculiarities of the Netherlanders as her predecessor. At the time of her accession to office Charles changed the form of administration by the creation of three separate councils, those of State, of Finance, and the Privy Council. The regent was president of the council of state, of which the knights of the Golden Fleece were members. The policy of Charles towards the Netherlands was for many years one of studied moderation. He redressed many grievances, regulated the administration of justice, encouraged commerce, reformed the coinage, but as time went on he was compelled to demand larger subsidies and to take severer measures against heretical opinions. Mary was forced to impose taxation which met with violent resistance, especially in 1539 from the stiff-necked town of Ghent. The emperor himself was obliged to intervene. On the 14th of February 1540 he entered Ghent at the head of a large army and visited the city with severe punishment. All its charters were annulled, its privileges and those of its gilds swept away, and a heavy fine imposed. It was a lesson intended to teach the Netherlanders the utter futility of opposition to the will of their lord. The struggle, however, with the Protestant princes of Germany not only led to continual demands of Charles for men and money from his Netherland dominions, but to his determination to prevent the spread of Protestant opinions; and a series of edicts was passed, the most severe of which (that of 1550) was carried out with extreme rigour. Its preamble stated that its object was "to exterminate the root and ground of this pest." By its enactments, men holding heretical opinions were condemned to the stake, women to be buried alive. Yet despite the efforts of the government the Reformation made progress in the land. In 1548 Charles laid before the states a scheme for making the Netherlands an integral part of the empire under the name of the Circle of Burgundy; but the refusal of the German Electors to make his only son Philip king of the Romans led him to abandon the project, which was never renewed. Already the emperor was beginning to feel weary of the heavy burdens which the government of so many realms had imposed upon him, and in 1549 he presented Philip to the states of the Netherlands, that they might take the oath of allegiance to him, and Philip swore to maintain all ancient rights, privileges and customs.

Mary of Hungary.

The abdication of Charles V. took place on the 25th of October 1555 in the great hall of the palace at Brussels, and Philip II. entered upon his long and eventful reign. His external policy

was at first successful. Chiefly through the valour of Lamoral, count of Egmont, two great victories were won over the French at St Quentin (August 10, 1557) and at Gravelines (July 13, 1558). The terms of the treaty of Cateau-Cambrésis (February 1559) were entirely favourable to Philip. Internal difficulties, however, confronted him. His proposal to impose a tax of 1% on real property and of 2% on movable property was rejected by all the larger provinces. As a thorough Spaniard who did not even understand the language of his Netherland subjects Philip was from the first distrusted and his acts regarded with suspicion. He himself never felt at home at Brussels, and in August 1559 he set sail for Spain, never again to revisit the Netherlands.

Philip II.

He appointed as regent, Margaret, duchess of Parma, a natural daughter of Charles V. by a Flemish mother, and like the other women of the House a strong and capable ruler. She was nominally assisted by the members of the three councils—the Council of State, the Privy Council and the Council of Finance, but in reality all power had been placed by Philip in the hands of three confidential councillors styled the *Consulta*—Barlaymont, president of the Council of Finance, Viglius, president of the Privy Council, and Antony Perrenot, bishop of Arras, better known by his later title as Cardinal Granvelle. This extremely able man, a Burgundian by birth, was the son of one of Charles V.'s most trusted councillors, and it was largely to him that the government of the Netherlands was confided. Two burning questions at the outset confronted Margaret and Granvelle—the question of the new bishoprics and the question of the presence in the Netherlands of a number of Spanish troops. The proposal to reorganize the bishoprics of the Netherlands was not a new one, but was the carrying out of a long-planned project of Charles V. In 1555 there were but three dioceses in the Netherlands—those of Tournay, Arras and Utrecht,—all of unwieldy size and under the jurisdiction of foreign metropolitans. It was proposed now to establish a more numerous hierarchy, self-contained within the limits of Burgundian rule, with three archbishops and fifteen diocesans. The primatial see was placed at Malines (Mechlin), having under it Antwerp, Hertogenbosch, Roermond, Ghent, Bruges, and Ypres constituting the Flemish province; the second archbishopric was at Cambray, with Tournay, Arras, St Omer, and Namur,—the Walloon province; the third at Utrecht, with Haarlem, Middleburg, Leeuwarden, Groningen and Deventer,—the northern (Dutch) province. All these with the exception of Cambray and St Omer were within the boundaries of the Netherlands. The scheme aroused almost universal distrust and opposition. It was believed that its object was the introduction of the dreaded form of the Inquisition established in Spain, and in any case more systematic and stringent measures for the stamping out of heresy. It excited also the animosity of the nobles jealous of their privileges, and of the monasteries, which were called upon to furnish the revenues for the new sees.

Margaret of Parma.

Granvelle was made first archbishop of Malines, and all the odium attaching to the increase of the episcopate was laid at his door, though he was in reality opposed to it. The continued presence of the Spanish troops caused also great dissatisfaction. The Netherlanders detested the Spaniards and everything Spanish, and this foreign mercenary force, together with the new bishops, was looked upon as part of a general plan for the gradual overthrow of their rights and liberties. So loud was the outcry that Margaret and Granvelle on their own responsibility sent away the Spanish regiments from the country (January 1561). The most serious difficulty with which Margaret had to deal arose from the attitude of the great nobles, and among these especially of William (the "Silent") of Nassau, prince of Orange, Lamoral, count of Egmont, and Philip de Montmorency, count of Hoorn. These great magnates, all of them Knights of the Fleece and men of peculiar weight and authority in the country, were disgusted to find that, though nominally councillors of state, their advice was never asked, and that all power was placed in the hands of the *Consulta*. They began to be alarmed by the severity with which the edicts against heresy were being carried out, and by the rising indignation among the populace. William, Egmont, and Hoorn therefore placed themselves at the head of a league of nobles against Granvelle (who had become cardinal in 1561) with the object of undermining his influence and driving him from power. They resigned their positions as councillors of state, and expressed their grievances personally to Margaret and by letter to the king in Madrid, asking for the dismissal of Granvelle. The duchess, herself aggrieved by the dictatorial manners of the cardinal, likewise urged upon her brother the necessity of the retirement of the unpopular minister. At last Philip unwillingly gave way, and he secretly suggested to the cardinal that he should ask permission from the regent to visit his mother at Besançon. Granvelle left Brussels on the 13th of March 1564, never to return. But the king was only temporizing; he had no intention of changing his policy. He did but bide his time.

The Council of Trent had recently brought its long labours to a close (December 4, 1563), and Philip resolved to enforce its decrees throughout his dominions. He issued an order to that effect (August 18, 1564), and it was sent to the duchess of Parma for publication. The nobles protested, and Egmont was deputed to go to Madrid and try to obtain from the king a mitigation of the edicts and redress of grievances. Philip was inexorable. The activity of the Inquisition was redoubled, and persecution raged throughout the Netherlands. Everywhere intense indignation was aroused by the cruel tortures and executions. In the presence of the rising storm the duchess was bewildered, seeing clearly the folly of the policy she was obliged to carry out no less than its difficulty. Following the example of William of Orange, Hoorn, Berghen and other governors, the magistrates generally declined to enforce the edicts, and offered to resign rather than be the instruments for burning and maltreating their fellow-countrymen. It was at this time that the lesser nobility, foremost among whom were Louis of Nassau (brother of William), Philip de Marnix, lord of Sainte Aldegonde, and Henry, count of Brederode, began to organize resistance, and in 1566 a confederacy was formed, all the members of which signed a document called "The Compromise," by which they bound themselves to help and protect one another against persecution, and to extirpate the Inquisition from the land. The signatories drew up a petition, known as the "Request," which was presented by the confederates to the regent (April 5, 1566) in the council chamber at Brussels. As they approached, Barlaymont had been heard to say to Margaret, "What, Madam, is your Highness afraid of these beggars (*gueux*)?" The phrase was seized upon and made a party name, and it became the fashion for patriots to wear beggar's garb and a medal round the neck, bearing Philip's image on one side and a wallet on the other, with two hands crossed, and the legend *Fidèles au roi jusqu'à la besace.*

The Tridentine decrees.

The Compromise.

The Beggars.

William of Orange, Egmont, and Hoorn were alarmed at the violent passions that had been aroused, and held aloof at first from Brederode and his companions. At their instance, and carrying with them instructions from the regent and the council, the marquis of Berghen and Hoorn's brother (the lord of Montigny) were persuaded to go to Spain and lay before Philip the serious character of the crisis. Philip received them courteously, but took care that neither of them should return home. Meanwhile in the Netherlands the sectaries had been making rapid headway in spite of the persecution. Open-air conventicles were held in all parts of the provinces, and the fierce Calvinist preachers raised the religious excitement of their hearers to such a pitch that it found vent in a furious outburst of iconoclasm. During the month of August bands of fanatical rioters in various parts of the country made havoc in the churches and religious houses, wrecking the altars, smashing the images and pictures, and carrying off the sacred vessels and other treasures on which they could lay their hands. These acts of wild and sacrilegious destruction reached their climax at Antwerp (August 16 and 17), where a small body of rioters forced their way into the cathedral and were permitted without

The Iconoclasts.

any interference on the part of the magistracy to wreak their will upon its spendid and priceless contents.

The effect of the outbreak was in every way disastrous. The regent was alienated from the popular leaders, and was no longer disposed to help William of Orange, Egmont, and Hoorn to secure a mitigation of religious persecution; and the heart of Philip was hardened in its resolve to exterminate heresy in the Netherlands. He dissembled until such time as he could despatch his greatest general, the duke of Alva, to Brussels at the head of a picked force to crush all opposition.

William of Orange was not deceived by the specious temporizing of the king. He foresaw the coming storm, and he did his utmost to induce Egmont, Hoorn and other prominent members of the patriotic party to unite with him in taking measures for meeting the approaching danger. Egmont and Hoorn refused to do anything that might be construed into disloyalty; in these circumstances William felt that the time had come to provide for his personal safety. He withdrew (April 1567) first to his residence at Breda, and then to the ancestral seat of his family at Dillenburg in Nassau.

Flight of Orange.

Margaret of Parma meanwhile, with the aid of a considerable body of German mercenaries, had inflicted exemplary punishment upon the iconoclasts and Calvinist sectaries. A body of some 2000 men drawn principally from Antwerp were cut to pieces at Austruweel (March 13, 1567), and their leader John de Marnix, lord of Thouseule, slain. Valenciennes, the chief centre of disturbance in the south, was besieged and taken by Philip de Noircarmes, governor of Hainault, who inflicted a savage vengeance (April 1567). The regent therefore represented to her brother that the disorders were entirely put down and that the time had come to show mercy. But Philip's preparations were now complete, and Alva set out from Italy at the head of a force of some 10,000 veteran troops, Spaniards and Italians, afterwards increased by a body of Germans, with which, after marching through Burgundy, Lorraine and Luxemburg, he reached the Netherlands (August 8), and made his entry into Brussels a fortnight later.

Punishment of the sectaries.

The powers conferred on Alva were those of military dictator. The title of regent was left to the duchess Margaret, but she speedily sent in her resignation, which was accepted (October 6). Before this took place events had been moving fast. On the 9th of September Egmont and Hoorn were arrested as they left a council at the duke's residence and were confined in the castle of Ghent. At the same time Orange's friend, the powerful burgomaster of Antwerp, Anthony van Stralen, was seized. The next step of Alva was to create a special tribunal which was officially known as the "Council of Troubles," but was popularly branded with the name of the "Council of Blood," and as such it has passed down to history. As a tribunal it had no legal status. The duke himself was president and all sentences were submitted to him. Two members only, Vargas and del Rio, both Spaniards, had votes. A swarm of commissioners ransacked the provinces in search of delinquents, and the council sat daily for hours, condemning the accused, almost without a hearing, in batches together. The executioners were ceaselessly at work with stake, sword and gibbet. Crowds of fugitives crossed the frontier to seek refuge in Germany and England. The prince of Orange was publicly declared an outlaw and his property confiscated (January 24, 1568). A few weeks later his eldest son, Philip William, count of Buren, a student at the university of Louvain, was kidnapped and carried off to Madrid. William had meanwhile succeeded in raising a force in Germany with which his brother Louis invaded Friesland. He gained a victory at Heiligerlee (May 23) over a Spanish force under Count Aremberg. Aremberg himself was killed, as was Adolphus of Nassau, a younger brother of William and Louis. But Alva himself took the field, and at Jemmingen (July 21) completely annihilated the force of Louis, who himself narrowly escaped with his life. One result of the victory of Heiligerlee was the determination of Alva that Egmont and Hoorn should die before he left Brussels for the campaign in Friesland. They were pronounced by the Council of Blood to be guilty of high treason (June 2, 1568). On the 6th of June they were beheaded before the Broodhuis at Brussels.

The Council of Blood.

Orange outlawed.

Execution of Egmont and Hoorn.

A few months after the disaster of Jemmingen, Orange, who had now become a Lutheran, himself led a large army into Brabant. He was met by Alva with cautious tactics. The Spaniards skilfully avoided a battle, and in November the invaders were compelled to withdraw across the French frontier through lack of resources, and were disbanded. Alva was triumphant; but though Alva's master had supplied him with an invincible army, he was unable to furnish him with the funds to pay for it. Money had to be raised by taxation, and at a meeting of the states-general (March 20, 1569) the governor-general proposed (1) an immediate tax of 1% on all property, (2) a tax of 5% on all transfers of real estate, (3) a tax of 10% on the sale of all articles of commerce, the last two taxes to be granted in perpetuity. Everywhere the proposal met with uncompromising resistance. After a prolonged struggle, Alva succeeded in obtaining a subsidy of 2,000,000 fl. for two years only. All this time the brutal work of the Blood Council went on, as did the exodus of thousands upon thousands of industrious and well-to-do citizens, and with each year the detestation felt for Alva and his rule steadily increased.

Alva triumphant.

All this time William and Louis were indefatigably making preparations for a new campaign, and striving by their agents to rouse the people to active resistance. The first successes were however to be not on land, but on the sea. In 1569 William in his capacity as sovereign prince of Orange issued letters-of-marque to a number of vessels to prey upon the Spanish commerce in the narrow seas. These corsairs, for such they were, were known by the name of Sea-Beggars (*Gueux-de-Mer*). Under the command of the lord of Lumbres, the lord of Treslong, and William de la Marck (lord of Lumey) they spread terror and alarm along the coast, seized much plunder, and in revenge for Alva's cruelty committed acts of terrible barbarity upon the priests and monks and catholic officials, as well as upon the crews of the vessels that fell into their hands. Their difficulty lay in the lack of ports in which to take refuge. At last by a sudden assault the Sea-Beggars seized the town of Brill at the mouth of the Maas (April 1, 1572). Encouraged by this success they next attacked and took Flushing, the port of Zeeland, which commanded the approach to Antwerp; and the inhabitants were compelled to take the oath to the prince of Orange, as stadtholder of the king. They next mastered Delfshaven and Schiedam. These striking successes caused a wave of revolt to spread through Holland, Zeeland, Gelderland, Utrecht and Friesland. The principal towns gave in their submission to the prince of Orange, and acknowledged him as their lawful stadtholder. Within three months of the capture of Brill, Amsterdam was the only town in Holland in the hands of the Spaniards.

The Sea-Beggars.

Capture of Brill and Flushing.

Revolt in the northern provinces.

This revolt of the northern provinces was facilitated by the fact that Alva had withdrawn many of the garrisons, and was moving to oppose an invasion from the south. Louis of Nassau, with a small force raised in France with the connivance of Charles IX., made a sudden dash into Hainault (May 1572) and captured Valenciennes and Mons. Here he was shut in by a superior force of Spaniards, and made preparations to defend himself until relieved by the army which Orange was collecting on the eastern frontier. On the 9th of July William crossed the Rhine, and captured Malines, Termonde and Oudenarde, and was advancing southwards when the news reached him of the massacre of St Bartholomew, which deprived him of the promised aid of Coligny and his army of 12,000 men. He made an attempt, however, to relieve Mons, but his camp at Harmignies was surprised by a night attack, and William himself narrowly escaped capture. The next morning he retreated, and six days later Mons surrendered.

The campaign of Mons.

Orange however did not despair, and resolved to throw in his lot for good and all with the rebel province of the north. Already at his summons the states of Holland had met at Dort (July 15) under the presidency of Philip de Marnix, lord of Sainte Aldegonde, and they had unanimously recognized William as their lawful stadtholder and had voted a large grant of supplies. The prince now took up his permanent residence at Delft, and a regular government was established, in which he exercised almost dictatorial authority.

Orange takes up his residence at Delft.

Alva was now free to deal with rebellion in the north. Malines, which had surrendered to William, was given over for three days to the mercy of a brutal soldiery. Then the army under Alva's son, Don Frederick of Toledo, marched northwards, and the sack of Zutphen and the inhuman butchery of Naarden are among the blackest records of history. But the very horrors of Don Frederick's advance roused a spirit of indomitable resistance in Holland.

The famous defence of Haarlem, lasting through the winter of 1572 to July 1573, cost the besiegers 12,000 lives, and gave the insurgent provinces time to breathe. The example of Haarlem was followed by Alkmaar, and with better success. The assault of the Spaniards was repulsed, the dykes were cut, and Don Frederick, fearing for his communications, beat a hasty retreat (August). A few weeks later (Oct. 11) the fleet of Alva on the Zuyder Zee was completely defeated by the Sea-Beggars and its admiral taken prisoner. Disgusted by these reverses, in bad odour with the king, and with his soldiers mutinying for lack of pay, the governor-general resigned. On the 18th of December 1573 Alva, who to the end had persisted in his policy of pitiless severity, left Brussels, carrying with him the curses of the people over whom he had tyrannized for six terrible years of misery and oppression.

Siege of Haarlem and Alkmaar.

Alva withdraws from the Netherlands.

Philip sent the grand commander, Don Luis Requesens, as governor-general in his place, and after some futile attempts at negotiation the war went on. The prince of Orange, who had now formally entered the Calvinist communion, was inexorable in laying down three conditions as indispensable: (1) Freedom of worship and liberty to preach the gospel according to the Word of God; (2) the restoration and maintenance of all the ancient charters, privileges, and liberties of the land; (3) the removal of all Spaniards and other foreigners from all posts and employments civil and military. In February 1574 the Spaniards by the fall of Middleburg lost their last hold upon Walcheren and Zeeland. This triumph was however far more than counterbalanced by the complete defeat of the army, led by Count Louis of Nassau, at Mookerheide near Nijmwegen (14th March). The gallant Louis and his younger brother Henry both lost their lives. This was a grievous blow to William, but his courage did not fail. The Spaniards laid siege to Leiden, and though stricken down by a fever at Delft the prince spared no exertion to save the town. The dykes were cut, the land flooded, but again and again a relieving force was baulked in its attempts to reach the place, which for more than four months bravely defended itself. But when at the very last extremity through famine, a tempestuous flood enabled the vessels of Orange to reach Leiden, and the investing force was driven to retreat (October 3, 1574). This was the turning-point of the first stage in the struggle for Dutch independence. In honour of this great deliverance, the state of Holland founded the university, which was speedily to make the name of Leiden illustrious throughout Europe.

Don Luis Requesens, governor-general.

The siege and relief of Leiden.

In the spring of 1575 conferences with a view to peace were held at Breda, and on their failure Orange, in the face of Spanish successes in Zeeland, was forced to seek foreign succour. He sought at first in vain. The sovereignty of Holland and Zeeland was offered to the queen of England, but she, though promising secret support, declined. The situation was, however, relieved through the sudden death of Requesens (March 1576). The stadtholder summoned a meeting of the states of Holland and Zeeland to Delft, and on the 25th of April an act of federation between the two provinces was executed. By this compact the prince was invested with all the prerogatives belonging to the sovereign. He was made commander-in-chief of both the military and naval forces with supreme authority, and in his hands was placed the final appointment to all political and judicial posts and to vacant city magistracies. He was required to maintain the Protestant reformed religion and to suppress "all religion at variance with the gospel." He also had authority to confer the protectorate of the federated provinces upon a foreign prince.

Death of Requesens.

Act of Federation between Holland and Zeeland.

In June 1576 the long siege of Zierikzee, the capital of Schouwen, ended in its surrender to the Spanish general Mondragon, after the failure of a gallant attempt by Admiral Boisot to break the leaguer, in which he lost his life. Things looked ill for the patriots, and Zeeland would have been at the mercy of the conqueror had not the success been followed by a great mutiny of the Spanish and Walloon troops, to whom long arrears of pay were due. They chose their leader (*elello*), marched into Brabant, and established themselves at Alost, where they were joined by other bands of mutineers. The principal fortresses of the country were in the hands of Spanish garrisons, who refused obedience to the council. William seized his opportunity, and with a body of picked troops advanced into Flanders, occupied Ghent, and entered into negotiations with the leader of the states-general at Brussels, for a union of all the provinces on the basis of exclusion of foreigners and non-interference with religious belief. The overtures were favourably received, the council at Brussels was forcibly dissolved, and a congress met at Ghent on the 19th of October to consider what measures must be taken for the pacification of the country. In the midst of their deliberations the news arrived that the mutineers had marched from Alost on Antwerp, overpowered the troops of Champagney, and sacked the town with terrible barbarities (Nov. 3). This tragedy, known as "the Spanish Fury," silenced all disputes and differences among the representatives of the provinces. A treaty establishing a firm alliance between the provinces, represented by the states-general, assembled at Brussels on the one part, and on the other by the prince of Orange, and the states of Holland and Zeeland, was agreed upon and ratified under the title of the "Pacification of Ghent." It was received with great enthusiasm. The provinces agreed first to eject the foreigner, then to meet in states-general and regulate all matters of religion and defence. It was stipulated that there was to be toleration for both Catholics and Protestants; that the Spanish king should be recognized as *de jure* sovereign, and the prince of Orange as governor with full powers in Holland and Zeeland.

The great Spanish Mutiny.

"The Spanish Fury."

The Pacification of Ghent.

Meanwhile Philip had appointed his natural brother, Don John of Austria, to be governor-general in the place of Requesens. After many delays he reached Luxemburg on the 4th of November (the date of the Spanish Fury at Antwerp) and notified his arrival to the council of state. His letter met with a cold reception. On the advice of the prince of Orange the states-general refused to receive him as governor-general unless he accepted the "Pacification of Ghent." Negotiations were entered into, but a deadlock ensued. At this crisis the hands of Orange and the patriotic party were greatly strengthened by a new compact entitled "The Union of Brussels," which was extensively signed, especially in the southern Netherlands. This document (Jan. 1577) engaged all its signatories to help in ejecting the foreign soldiery, in carrying out the "Pacification," in recognizing Philip's sovereignty, and at the same time in maintaining the charters and constitutions which that king on his accession had sworn to observe. The popular support given to the Union of Brussels forced Don John to yield.

Don John of Austria becomes Governor-General.

"Union of Brussels."

He promised to accept the "Pacification of Ghent," and finally an agreement was drawn up, styled the "Perpetual Edict," which was signed by Don John (February 12th) and ratified by Philip a few weeks later. The states-general undertook to accept Don John as governor-general and to uphold the Catholic religion, while Don John, in the name of the king, agreed to carry out the provisions of the "Pacification." The authority conferred upon Orange as stadtholder by the provinces of Holland and Zeeland was thus ratified, but that astute statesman had no confidence that Philip intended to observe the treaty any longer than it suited his convenience. He therefore refused, with the approval of the representatives of these provinces, to allow the publication of the "Perpetual Edict" in Holland and Zeeland. As events were to prove, he was in the right.

"Perpetual Edict."

Don John made his state entry into Brussels on the 1st of May, but only to find that he had no real authority. "The prince of Orange," he informed the king, "has bewitched the minds of all men. They keep him informed of everything, and take no resolution without consulting him." In vain the fiery young soldier strove to break loose from the shackles which hampered him. He was, to quote the words of a contemporary, "like an apprentice defying his master." Irritated and alarmed, the governor suddenly left Brussels in the month of July with some Walloon troops and went to Namur. It was a virtual act of abdication. The eyes of all men turned to the prince of Orange. Through his exertions the Spanish troops had not only been expelled from Holland and Zeeland, but also from the citadels of Antwerp and Ghent, which were now in the hands of the patriots. He was invited to come to Brussels, and after some hesitation, and not without having first obtained the approval of the states of Holland and Zeeland, he assented. William made his triumphal entry into the capital (September 23), which he had quitted as an outlawed fugitive ten years before. In a brief period he was the acclaimed leader of the entire Netherland people.

Orange at Brussels.

But it was not to last. The jealousy of Catholic against Protestant, of south against north, was too deeply rooted. Two distinctive nationalities, Belgian and Dutch, were already in course of formation, and not even the tactful and conciliatory policy of the most consummate statesman of his time could unite those whom the whole trend of events was year by year putting farther asunder. On the 6th of October, at the secret invitation of the Catholic nobles headed by the duke of Aerschot, the archduke Matthias, brother of the emperor, arrived in Brussels to assume the sovereignty of the Netherlands. He was but twenty years of age, and his sudden intrusion was as embarrassing to the prince of Orange as to Don John. William, however, whose position had been strengthened by his nomination to the post of ruwaard of Brabant, determined to welcome Matthias and use him for his own purposes. Matthias was to be the nominal ruler, he himself with the title of lieutenant-general to hold the reins of power.

Archduke Matthias.

But Philip had now become thoroughly alarmed, and he despatched Alexander Farnese, son of the duchess of Parma, to join his uncle Don John with a veteran force of 20,000 troops. Strengthened by this powerful reinforcement, Don John fell upon the patriot army at Gembloux near Namur on the 31st of January 1578, and with scarcely any loss completely routed the Netherlanders. All was now terror and confusion. The "malcontent" Catholics now turned for help from Matthias to the duke of Anjou, who had invaded the Netherlands with a French army and seized Mons. At the same time John Casimir, brother of the elector palatine, at the invitation of the Calvinist party and with the secret financial aid of Queen Elizabeth, entered the country at the head of a body of German mercenaries from the east. Never did the diplomatic talents of the prince of Orange shine brighter than at this difficult crisis. The duke of Anjou at his earnest instigation accepted the title of "Defender of the liberties of the Netherlands," and promised, if the provinces would raise an army of 10,000 foot and 2000 horse, to come to their assistance with a like force. At the same time negotiations were successfully carried on with John Casimir, with Elizabeth and with Henry of Navarre, and their help secured for the national cause. Meanwhile Don John had aroused the mistrust of his brother, who met his urgent appeal for funds with cold silence. Deeply hurt at this treatment and disappointed at his failure, the governor-general fell ill and died on the 1st of October. Philip immediately appointed Alexander Farnese to the vacant post. In him Orange was to find an adversary who was not only a great general but a statesman of insight and ability equal to his own.

The Duke of Anjou and John Casimir.

Death of Don John.

Farnese at once set to work with subtle skill to win over to the royalist cause the Catholic nobles of the south. The moment was propitious, and his efforts met with success. Ghent had fallen into the hands of John Casimir, and under his armed protection a fierce and intolerant Calvinism reigned supreme in that important city. To the "Malcontents" (as the Catholic party was styled) the domination of heretical sectaries appeared less tolerable than the evils attendant upon alien rule. This feeling was widespread throughout the Walloon provinces, and found expression in the League of Arras (5th of January 1579). By this instrument the deputies of Hainault, Artois and Douay formed themselves into a league for the defence of the Catholic religion, and, subject to his observance of the political stipulations of the Union of Brussels, professed loyal allegiance to the king. The Protestant response was not long in coming. The Union of Utrecht was signed on the 29th of January by the representatives of Holland, Zeeland, Utrecht, Gelderland and Zutphen. By it the northern provinces bound themselves together "as if they were one province" to maintain their rights and liberties "with life-blood and goods" against foreign tyranny, and to grant complete freedom of worship and of religious opinion throughout the confederacy. This famous compact was the work of John of Nassau, at that time governor of Gelderland, and did not at first commend itself to his brother. William was still struggling to carry out that larger scheme of a union of all the seventeen provinces, which at the time of the "Pacification of Ghent" had seemed a possibility. But his efforts were already doomed to certain failure. The die was cast, which decreed that from 1579 onwards the northern and southern Netherlands were to pursue separate destinies. For their later history see HOLLAND and BELGIUM.

NETHERSOLE, OLGA (1863–), English actress, of Spanish descent, was born in London, and made her stage début at Brighton in 1887. From 1888 she played important parts in London, at first under John Hare at the Garrick, and in 1894 took the Court Theatre on her own account. She also toured in Australia and America, playing leading parts in modern plays, notably Clyde Fitch's *Sapho* (produced in London in 1902), which was strongly objected to in New York. Her powerful emotional acting, however, made a great effect in some other plays, such as *Carmen*, in which she again appeared in America in 1906.

NETHINIM, the name given to the Temple assistants in ancient Jerusalem. They are mentioned at the return from the Exile and particularly enumerated in Ezra ii. and Neh. vii. The original form of the name was *Nethunim*, as in the *Khetib* (consonantal reading) of Ezra viii. 17 (cf. Numbers iii. 9), and means "given" or "dedicated," *i.e.* to the temple. The Talmud has also the singular form—*Nathin*. In all, 612 Nethinim came back from the Exile and were lodged near the "House of the Nethinim" at Ophel, towards the east wall of Jerusalem so as to be near the Temple, where they served under the Levites and were free of all tolls, from which they must have been supported. It is mentioned that they had been ordered by David and the princes to serve the Levites (Ezra viii. 20).

Notwithstanding their sacred service, the Nethinim were regarded by later Jewish tradition as especially degraded, being placed in tables of precedence below bastards (Talm. *Jer. Hor.* iii. 5, *Jeb.* vii. 5) and in the Mishna (*Jeb.* viii. 3) it is stated that the prohibition against intermarriage with the Moabites, Ammonites, Egyptians and Edomites, though given in the Bible, only applied for a certain number of generations and did not apply at all to their daughters, but, it is added, "Bastards and Nethinim are prohibited (to marry Israelites), and this prohibition is perpetual and applies both to males and females."

To explain this combination of sacred service and exceptional degradation, it has been suggested by Joseph Jacobs that the Nethinim were the descendants of the *Kedisholh*, *i.e.* women dedicated to the worship of Astarte and attached to the Temple before the Exile. There is evidence of these practices from the time of Solomon (1 Kings xi. 5) down to Josiah (2 Kings xiii. 4-6), and even as late as Ezekiel (Ezek. xxiii. 36-48), giving rise to the command of Deuteronomy xxiii. 17.

An examination of the name lists given in duplicate in Ezra ii. 43-58, Neh. vii. 46-59, together with the additional names in the Greek Esdras (v. 29-35), shows that the Nethinim were in charge of the rings and hooks connected with the temple service; they sheared the sheep offered for sacrifice in the temple and poured the libations. Some of them were derived from the wars with the Meunim; others from the campaign with Rezin of Damascus. One of the names given in 1 Esdras v. 34, *viol Σουβά*, ed. Fritzsche, *Σουβάς*, ed. Swete, would seem to throw light on the puzzling reading שכוי (A.V. "Sabeans," R.V. "Drunkards") of Ezek. xxiii. 42, and if so would directly connect the list of the Nethinim with the degraded worship of Astarte in the Temple.

A large majority of the names of the parents mentioned seem to be feminine in form or meaning, and suggest that the Nethinim could not trace back to any definite paternity; and this is confirmed by the fact that the lists are followed by the enumeration of those who could not "show their father's house" (Ezra ii. 60; Neh. vii. 62). The Greek versions, as well as Josephus, refer to them as *ἱερόδουλοι*, which can mean one thing only.

The Talmudic authorities have an abstract term, *Nethinuth*, indicating the status of a *Nathin* (*Tos. Kidd.* v. 1) ed. Zuckermandel, p. 341), and corresponding to the abstract *Mamsiruth*, "bastardy." The existence of this degraded class up to the Exile throws considerable light upon the phraseology of the prophets in referring to idolatry as adultery and the scenes connected with it as prostitution. Their continued existence as a pariah class after the Exile would be a perpetual reminder of the dangers and degradation of the most popular Syrian creed.

These unfortunate creatures had no alternative but to accept the provisions made for them out of the Temple treasury, but after the fall of the Temple they would naturally disappear by intermarriage with similar degraded classes (*Mishna Kidd.* viii. 3). In the Code of Khammurabi §§ 191, 192, they could be adopted by outsiders.

The above explanation of the special degradation of the Nethinim, though they were connected with the Temple service, seems to be the only way of explaining the Talmudic reference to their tabooed position, and is an interesting example of the light that can be reflected on Biblical research by the Talmud.

See Joseph Jacobs, *Studies in Biblical Archaeology* (1894), 104-122; W. Baudissin, *Geschichte des Alttestamentlichen Priesterthums*, 142 seq. This view, however, is not accepted by Cheyne, *Encyclopaedia Biblica*, s.v. (J. JA.)

NETLEY, a village in the Fareham parliamentary division of Hampshire, England, 3 m. S.E. of Southampton on the east shore of Southampton Water, and on a branch of the London & South Western railway. Here a Cistercian abbey was founded in 1237 by Henry III., and its ruins are extensive, including a great part of the cruciform church, abbot's house, chapter house and domestic buildings. The style is Early English and Decorated, and many beautiful details are preserved. The gatehouse was transformed into a fort in the time of Henry VIII. Netley Hospital for wounded soldiers (1 m. S.E. of the abbey), was built in 1856 after the Crimean War. It is a vast pile giving accommodation for upwards of a thousand patients, and is the principal military hospital in Great Britain.

NETSCHER, GASPAR (1639–1684), German portrait and genre painter, was born at Heidelberg in 1639. His father died when he was two years of age, and his mother, fleeing from the dangers of a civil war, carried him to Arnheim, where he was adopted by a physician named Tullekens. At first he was destined for the profession of his patron, but owing to his great aptitude for painting he was placed under an artist named de Koster, and, having also studied under Ter Borch, he set out for Italy to complete his education there. Marrying, however, at Liége, he settled at Bordeaux, and toiled hard to earn a livelihood by painting those small cabinet pictures which are now so highly valued on account of their exquisite finish. After removing to The Hague, he turned his attention to portrait-painting, and in this branch of his art was more successful. He was patronized by William III., and his earnings soon enabled him to gratify his own taste by depicting musical and conversational pieces. It was in these that Netscher's genius was fully displayed. The choice of these subjects, and the habit of introducing female figures, dressed in glossy satins, were imitated from Ter Borch; they possess easy yet delicate pencilling, brilliant and correct colouring, and pleasing light and shade; but frequently their refinement passes into weakness. The painter was gaining both fame and wealth when he died prematurely in 1684. His sons Constantyn (1668–1722), and Theodorus (1661–1732), were also painters after their father's style, but inferior in merit.

NETTLE (O. Eng. *netele*, cf. Ger. *Nessel*), the English equivalent of Lat. *Urtica*, a genus of plants which gives its name to the natural order Urticaceae. It contains about thirty species in the temperate parts of both east and west hemispheres. They are herbs covered with stinging hairs, and with unisexual flowers on the same or on different plants. The male flowers consist of a

perianth of four greenish segments enclosing as many stamens, which latter, when freed from the restraint exercised upon them by the perianth-segments while still in the bud, suddenly uncoil themselves, and in so doing liberate the pollen. The female perianth is similar, but encloses only a single seed-vessel with a solitary seed. The stinging hairs consist of a bulbous reservoir filled with acrid fluid, prolonged into a long slender tube, the extremity of which is finely pointed. By this point the hair penetrates the skin and discharges its irritant contents beneath the surface. Nettle tops, or the very young shoots of the nettle, may be used as a vegetable like spinach; but from the abundance of crystals (*cystoliths*) they contain they are apt to be gritty, though esteemed for their antiscorbutic properties, which they do not possess in any exceptional degree. The fibre furnished by the stems of several species is used for cordage or paper-making. Three species of nettle are wild in the British Isles: *Urtica dioica*, the common stinging nettle, which is a hairy perennial with staminate and pistillate flowers in distinct plants; *U. urens*, which is annual and, except for the stinging hairs, glabrous, and has staminate and pistillate flowers in the same panicle; and *U. pilulifera* (Roman nettle), an annual with the pistillate flowers in rounded heads, which occurs in waste places in the east of England, chiefly near the sea—the more virulent of the British species. From their general presence in the neighbourhood of houses, or in spots where house refuse is deposited, it has been suggested that the nettles are not really natives, a supposition that to some extent receives countenance from the circumstance that the young shoots are very sensitive to frost. In any case they follow man in his migrations, and by their presence usually indicate a soil rich in nitrogen. The trailing subterranean root-stock renders the common nettle somewhat difficult of extirpation.

NETTLERASH, or URTICARIA, a disorder of the skin characterized by an eruption resembling the effect produced by the sting of a nettle, namely, raised red or red and white patches occurring in parts or over the whole of the surface of the body and attended with great irritation. It may be acute or chronic. In the former variety the attack often comes on after indulgence in certain articles of diet, particularly various kinds of fruit, shellfish, cheese, pastry, &c., also occasionally from the use of certain drugs, such as henbane, copaiba, cubebs, turpentine, &c. There is at first considerable feverishness and constitutional disturbance, together with sickness and faintness, which either precede or accompany the appearance of the rash. The eruption may appear on any part of the body, but is most common on the face and trunk. The attack may pass off in a few hours, or may last for several days, the eruption continuing to come out in successive patches. The chronic variety lasts with interruptions for a length of time often extending to months or years. This form of the disease occurs independently of errors in diet, and is not attended with the feverish symptoms characterizing the acute attack. As regards treatment, the acute variety generally yields quickly to a purgative and the use of some antacid, such as magnesia or liquor potassae. The local irritation is allayed by sponging with a warm alkaline solution (soda, potash or ammonia), or a solution of acetate of lead, and a lotion of ichthyol has been found useful. Chronic cases have been known to benefit from the administration of creosote or salol.

NETTLESHIP, HENRY (1839–1893), English classical scholar, was born at Kettering on the 5th of May 1839. He was educated at Lancing, Durham and Charterhouse schools, and Corpus Christi College, Oxford. In 1861 he was elected to a fellowship at Lincoln, which he vacated on his marriage in 1870. In 1868 he became an assistant master at Harrow, but in 1873 he returned to Oxford, and was elected to a fellowship at Corpus. In 1878 he was appointed to succeed Edwin Palmer in the professorship of Latin, which post he held till his death at Oxford on the 10th of July 1893. Nettleship had been from the first attracted to the study of Virgil, and a good deal of his time was devoted to his favourite poet. After Conington's death in 1869, he saw his edition of Virgil through the press, and revised and corrected subsequent editions of the work. In 1875 he had undertaken to compile a new Latin lexicon for the Clarendon Press, but the work proved more than he could accomplish, and in 1887 he published some of the results of twelve years' labour in a volume entitled *Contributions to Latin Lexicography*, a genuine piece of original work. In conjunction with J. E. Sandys, Nettleship revised and edited Seyffert's *Dictionary of Classical Antiquities*, and he contributed to a volume entitled *Essays on the Endowment of Research* an article on "The Present Relations between Classical Research and Classical Education in England," in which he pointed out the great value of the professorial lecture in Germany. In his views on the research question he was a follower of Mark Pattison, whose essays he edited in 1889 for the Clarendon Press. In *Lectures and Essays on Subjects connected with Latin Literature and Scholarship*, Nettleship revised and republished some of his previous publications. A second series of these, published in 1895, and edited by F. Haverfield, contains a memoir by Mrs M. Nettleship, with full bibliography.

See obituary notices in *The Times* (11th of July, 1893); *Classical Review* (October, 1893); *Oxford Magazine* (18th of October, 1893).

NETTLESHIP, RICHARD LEWIS (1846–1892), English philosopher, youngest brother of Henry Nettleship, was born on the 17th of December 1846, and educated at Uppingham and Balliol College, Oxford, where he held a scholarship. He won the Hertford scholarship, the Ireland, the Gaisford Greek verse prize, a Craven scholarship and the Arnold prize, but took only a second class in Litterae Humaniores. He became fellow and tutor of his college and succeeded to the work of T. H. Green, whose writings he edited with a memoir (London, 1880). He left an unfinished work on Plato, part of which was published after his death, together with his lectures on logic and some essays. His thought was idealistic and Hegelian. His literary style was excellent; but, though he had considerable personal influence on his generation at Oxford, a certain nebulousness of view prevented his making any permanent contribution to philosophy. He was fond of music and outdoor sports, and rowed in his college boat. He died on the 25th of August 1892, from the effects of exposure on Mont Blanc, and was buried at Chamounix.

NETTLE TREE, the name applied to certain trees of the genus *Celtis*, belonging to the family or natural order Ulmaceae. The best-known species have usually obliquely ovate, or lanceolate leaves, serrate at the edge, and marked by three prominent nerves. The flowers are inconspicuous, usually hermaphrodite, with a 4- or 5-parted perianth, as many stamens, a hairy disk and a 1-celled ovary with a 2-parted style. The fruit is succulent like a little drupe, a character which serves to separate the genus alike from the nettles and the elms, to both of which it is allied. *Celtis australis* is a common tree, both wild and planted, throughout the Mediterranean region extending to Afghanistan and the Himalayas; it is also cultivated in Great Britain. It is a rapidly growing tree, from 30 to 40 ft. high, with a remarkably sweet fruit, recalling a small black cherry, and was one of the plants to which the term "lotus" was applied by Dioscorides and the older authors. The wood, which is compact and hard and takes a high polish, is used for a variety of purposes. *C. occidentalis*, a North American species, is the hackberry (*q.v.*).

NETTUNO, a fishing village of the province of Romé, Italy, 2 m. E.N.E. of Anzio by rail, and 39 m. S.S.E. of Rome, 36 ft. above sea-level. Pop. (1901) 3406 (town), 5072 (commune). It has a picturesque castle built by Alexander VI. from the designs of Antonio da Sangallo the elder in 1496. It is said to have been a Saracen settlement. The picturesque costume of the women is now worn only at festivals. To the E. on the sandy coast on the way to Astura is a military camp and a range for the trial of field artillery.

NETZE, a river of Germany, having a small portion of its upper course in Poland. It is a right-bank tributary of the Warthe, and rises in the low-lying lake district, through which the Russo-German frontier runs, to the south of Inowrazlaw. The frontier crosses Lake Goplo, which is not far from the source of the Netze, which on leaving it (in Prussian territory), flows

north-west to the Trlonger lake, and continues thereafter in the same general direction, but with wide fluctuations, to Nakel. Here it joins the Bromberg canal, which gives access to the river Brahe and so to the Vistula. The Netze then turns west-south-west and waters the moorland (much of which, however, has been brought under cultivation) known as the Netzebruch. It joins the Warthe at Zantoch, after a course of 273 m. It is navigable for 130 m. up to the Bromberg canal and thereafter for smaller boats for 40 m. up to Pakosch on the Trlonger lake. Its drainage area is 5400 sq. m. From 1772 to 1807 that part of Poland which was given to Prussia at the first partition was known as the Netze District, as it extended along the Netze. It was almost all given back to Russia at the peace of Tilsit, but was restored to Prussia in 1815 under the treaty of Vienna.

NEU-BRANDENBURG, a town of Germany, in the grand duchy of Mecklenburg-Strelitz, is situated on a small lake called the Tollense See, 58 m. N.W. of Stettin by rail. Pop. (1905) 11,443. It is still partly surrounded with walls, and possesses four interesting old Gothic gates, dating from about 1300. The principal buildings are the Marienkirche, a Gothic building of the 13th century, the Johanniskirche, the town-hall and the grand ducal palace. It possesses a bronze statue of Fritz Reuter (1893); a monument to Bismarck (1895); another commemorating the war of 1870–71 (1895); a small museum of antiquities; and an art collection. On the other side of the lake is the grand-ducal palace, Belvedere. Iron-founding, machine-making, wool-spinning and the making of paper, tobacco and musical instruments are carried on here, and the trade in wool and agricultural products is considerable. The horse fair is also important. Neu-Brandenburg was founded in 1248, and has belonged to Mecklenburg since 1292.

See Boll, *Chronik der Vorderstadt Neubrandenburg* (1875).

NEUBREISACH, a town and fortress of Germany in the imperial province of Alsace-Lorraine, situated on the Rhine-Rhone canal, 12 m. E. from Colmar by the railway to Freiburg-im-Breisgau. Pop. (1905—including a garrison of 2300 men) 3520. It is built in the form of a hectagon, and together with Fort Mortier, which lies on an arm of the Rhine opposite, forms a place of great strategic strength. It contains an Evangelical (garrison) church, a Roman Catholic church and a non-commissioned officers' school. There are electrical works in the town.

Neubreisach was founded by Louis XIV. in 1699 and fortified by Vauban, the Neubreisacher canal being constructed to transport the necessary materials. In the Franco-German War, it was bombarded by the Germans from the 2nd to the 10th of November 1870, when it capitulated.

See Wolff, *Geschichte des Bombardements von Schlettstadt und Neubreisach* (Berlin, 1874); and von Neumann, *Die Eroberung von Schlettstadt und Neubreisach im Jahre 1870* (Berlin, 1876).

NEUBURG, a town of Germany, in the kingdom of Bavaria, is pleasantly situated on the Danube, 12 m. W. of Ingolstadt, on the railway to Neuoffingen. Pop. (1905) 8532. It is a place of ancient origin, but is chiefly noteworthy because formerly for two centuries it was the capital of the principality of Pfalz-Neuburg. Its most important building is the old residence of its princes, the handsomest part of which is in the Renaissance style of the 16th century. The town also contains an Evangelical and seven Roman Catholic churches, a town hall, several schools and convents, a theatre, and an historical museum with a valuable library. It has electrical works and breweries, while fruit and vegetables are cultivated in the neighbourhood, a considerable trade in these products being carried on by the Danube.

Neuburg was originally an episcopal see. In the 10th century it passed to the counts of Scheyern, and through them to Bavaria, being ceded to the Rhenish Palatinate at the close of a war in 1507. From 1557 to 1742 it was the capital of a small principality ruled by a cadet branch of the family of the elector palatine of the Rhine. This principality of Pfalz-Neuburg had an area of about 1000 sq. m. and about 100,000 inhabitants. In 1742 it was united again with the Rhenish Palatinate, with which it passed in 1777 to Bavaria.

See Gremmel, *Geschichte des Herzogtums Neuburg* (Neuburg, 1872); and *Führer durch die Stadt Neuburg und deren Umgebung* (Neuburg, 1904).

NEUCHÂTEL (Ger. *Neuenburg*), one of the cantons of western Switzerland, on the frontier towards France. It is the only Swiss canton that is situated entirely in the Jura, of which it occupies the central portion (its loftiest summit is the Mont Racine, 4731 ft. in the Tête de Rang range). The canton has a total area of 311·8 sq. m., of which 267·1 sq. m. are reckoned "productive" (forests occupying 88·6 sq. m. and vineyards 4·4 sq. m.). It consists, for the most part, of the longitudinal ridges and valleys characteristic of the Jura range, while its drainage is very unequally divided between the Thièle or Zihl, and the Doubs, which forms part of the north-west boundary of the canton, and receives only the streams flowing from the Le Locle and La Chaux de Fonds valley. Three regions make up the territory. That stretching along the shore of the lake is called *Le Vignoble* (from its vineyards) and extends from about 1500 ft. to 2300 ft. above the sea-level. An intermediate region is named *Les Vallées*, for it consists of the two principal valleys of the canton (the Val de Ruz, watered by the Seyon, and the Val de Travers, watered by the Areuse) which lie to a height of about 2300 ft. to 3000 ft. above the sea-level. The highest region is known as *Les Montagnes*, and is mainly composed of the long valley in which stand the industrial centres of La Chaux de Fonds (*q.v.*), and Le Locle (*q.v.*) to which must be added those of La Sagne, Les Ponts and Les Verrières, the elevation of these upland valleys varying from 3000 ft. to 3445 ft. The canton is well supplied with railways, the direct line from Bern past Kerzers (Chiètres), Neuchâtel, the Val de Travers and Les Verrières to Pontarlier for Paris passing right through it, while La Chaux de Fonds is connected by a line past Le Locle with Morteau in France. Other lines join the capital, Neuchâtel, to La Chaux de Fonds, as well as to Yverdon at the south-west extremity of the lake, and to St Blaise at its north-east end, not very far from Bienne.

In 1900 the population numbered 126,279 souls according to the federal census (a cantonal census of 1906 makes the figure at that date 134,014), of whom 104,551 were French-speaking, 17,629 German-speaking and 3664 Italian-speaking, while 107,291 were Protestants, 17,731 Romanists or Old Catholics, and 1020 Jews. There are three "established and state-endowed" churches, the National Evangelical (in 1907 a proposal to disestablish it was rejected by a huge majority), the Roman Catholic, and the Old Catholic (this sect in La Chaux de Fonds only), while the pastors of the Free Evangelical church and of the Jews (mostly in La Chaux de Fonds) are so far recognized as such by the state as to be exempt from military service

Besides the capital, Neuchâtel (*q.v.*), the chief towns are La Chaux de Fonds (the most populous of all), Le Locle and Fleurier (3746), the principal village in the Val de Travers.

The most valuable mineral product is asphalt, of which there is a large and rich deposit in the Val de Travers, belonging to the state but worked by an English company. The wine of the Vignoble region (both sparkling and still) is plentiful and has a good reputation, the red wines of Neuchâtel, Boudry and Cortaillod being largely exported, though the *petit vin blanc* of Neuchâtel is all but wholly consumed within the canton. Absinthe is largely manufactured in the Val de Travers, but lace is no longer made there as of old. The well-known manufactory of Suchard's chocolate is at Serrières, practically a suburb of the town of Neuchâtel, while in the canton there are also cement factories and stone quarries. But the most characteristic industry is that of watch-making and the making of gold watch cases, which is chiefly carried on (since the early 18th century) in the highland valleys of La Chaux de Fonds and of Le Locle, as well as at Fleurier in the Val de Travers. At Couvet, also in the Val de Travers, there is a large factory of screws and knitting machines.

The canton is divided into 6 administrative districts, which

comprise 63 communes. The cantonal constitution dates in its main features from 1858, but has been modified in several important respects. The legislature or *Grand Conseil* consists of members elected (since 1903) in the proportion of one to every 1200 (or fraction over 600) of the population, and holds office for three years, while since 1906 the principles of proportional representation and minority representation obtain in these elections. Since 1906 the executive of 5 members (since 1882) or *Conseil d'État* is elected by a popular vote. The 2 members of the federal *Conseil des États* are named by the Grand Conseil, but the 6 members of the federal *Conseil National* are chosen by a popular vote. Since 1879, 3000 citizens have the right of "facultative referendum" as to all laws and important decrees, while since 1882 the same number have the right of initiative as to all legislative projects, this right as to the *partial* revision of the cantonal constitution dating as far back as 1848, the number in the case of a *total* revision having been raised in 1906 to 5000.

We first hear of the *novum castellum, regalissimam sedem* in the will (1011) of Rudolf III., the last king of Burgundy, on whose death (1032) that kingdom reverted to the empire. About 1034 the emperor Conrad II. gave this castle to the lord of several neighbouring fiefs, his successors establishing themselves permanently there in the 12th century and then taking the title of "count." In 1288 the reigning count resigned his domains to the emperor Rudolf, who gave them to the lord of Châlon-sur-Saône, by whom they were restored to the count of Neuchâtel on his doing homage for them. This act decided the future history of Neuchâtel, for in 1393 the house of Châlon succeeded to the principality of Orange by virtue of a marriage contracted in 1388. The counts gradually increased their dominions, so that by 1373 they held practically all of the present canton, with the exception of the lordship of Valangin (the Val de Ruz and Les Montagnes, this last region only colonized in the early 14th century), which was held by a cadet line of the house till bought in 1592. In 1395 the first house ended in an heiress, who brought Neuchâtel to the count of Freiburg im Breisgau. As early as 1290 the reigning count had made an alliance with the Swiss Fribourg, in 1308 with Bern, and about 1324 with Soleure, but it was not till 1406 that an "everlasting alliance" was made with Bern (later in 1495 with Fribourg, and in 1501 with Lucerne). This alliance resulted in bringing the county into the Swiss confederation four centuries later, while it also led to contingents from Neuchâtel helping the Confederates from the battle of St Jakob (1444) onwards right down into the early 18th century. In 1457, through another heiress, the county passed to the house of the marquises of Baden-Hochberg, and in 1504 similarly to that of Orléans-Longueville (a bastard line of the royal house of France). From 1512 to 1529 the Swiss occupied it as the count was fighting for France and so against them. In 1532 the title of "prince" was taken, while by the treaty of Westphalia (1648) the principality became sovereign and independent of the empire. In 1530 (the very year Farel introduced the Reformation at Neuchâtel) the overlordship enjoyed by the house of Châlon-Orange passed, by virtue of a marriage contracted in 1515, to that of Nassau-Orange, the direct line of which ended in 1702 in the person of William III., king of England. In 1707 the Longueville house of Neuchâtel also became extinct, and a great struggle arose as to the succession. Finally the parliament (states) of Neuchâtel decided in favour of Frederic I., the first king of Prussia, whose mother was the elder paternal aunt of William III., and so heiress of the rights (given in 1288) of the house of Châlon, to which the fief had reverted on the extinction of the line of the counts of Neuchâtel. Thus the act of 1288 determined the fate of the principality, partly because Frederic I. was a Protestant, while the other claimants were Romanists. The nominal rule of the Prussian king (for the country enjoyed practical independence) lasted till 1857, with a brief interval from 1806 to 1814, when the principality was held by Marshal Berthier, by virtue of a grant from Napoleon. In 1814 its admission into the Swiss confederation was proposed and was effected in 1815, the new canton being the only non-republican member, just as the hereditary rulers of Neuchâtel were the last to maintain their position in Switzerland. This anomaly led in 1848 to the establishment (attempted in 1831) of a republican form of government, brought about by a peaceful revolution led by A. M. Piaget. A royalist attempt to regain power in 1856 was defeated, and finally, after long negotiations, the king of Prussia renounced his claims to sovereignty, though retaining the right (no longer exercised) to bear the title of "prince of Neuchâtel." Thus in 1857 Neuchâtel became a full republican member of the Swiss confederation.

NEUCHÂTEL, capital of the above Swiss canton, situated near the north-east corner of the lake of Neuchâtel. It is the meeting-point of several important railway lines, from Bern past Kerzers (27 m.), from Bienne (19 m.), from La Chaux de Fonds (19 m.), from Pontarlier (in France), by the Val de Travers, (33½ m.), and from Yverdon (23 m.). The railway station (1575 ft.) at the top of the town is connected by an electric tramway with the shore of the lake some 150 ft. lower. The older portion of the town is built on the steep slope of the Chaumont, and originally the waters of the lake bathed the foot of the hill on which it stood. But the gradual growth of alluvial deposits, and more recently the artificial embankment of the shore of the lake, have added much dry ground, and on this site the finest modern buildings have been erected. The 16th-century castle and the 13th-century collegiate church of Notre Dame (now Protestant) stand close together and were founded in the 12th century when the counts took up their permanent residence in the town, to which they granted a charter of liberties in 1214. Among the buildings on the quays are the Musée des Beaux Arts (modern Swiss paintings and also various historical collections, including that of Desor relating to the Lake Dwellings), the Gymnase or Collège Latin (in which is also the museum of natural history and the town library), the university (refounded in 1866 and raised from the rank of an academy to that of a university in 1909), the École de Commerce and the post office. The town owes much to the gifts of citizens. Thus David de Purry (1709–1786) founded the town hospital and built the town hall, while James de Purry bequeathed to the town the villa in which the ethnographical museum has been installed (1904). In 1811 J. L. de Pourtalès (1722–1814) founded the hospital which bears his name, while in 1844 A. de Meuron (1789–1852) constructed the lunatic asylum at Préfargier, a few miles from the town. Among natives of the town are the theologians J. F. Ostervald (1663–1747) and Frédéric Godet (1812–1900), the geologist E. Desor (1811–1882), the local historian G. A. Matile (1807–1881) and the politicians A. M. Piaget (1802–1870) and Numa Droz (1844–1899). Neuchâtel (partly because very good French is spoken there) attracts many foreign students, while the town is a literary centre. In 1900 Neuchâtel numbered 20,843 inhabitants (in 1850 only 7727 and in 1870, 12,683), 15,277 being French-speaking and 4553 German-speaking; there were 17,237 Protestants, 3459 Romanists and 80 Jews. (W. A. B. C.)

NEUCHÂTEL, LAKE OF. This lake, in W. Switzerland, is with the neighbouring lakes of Bienne and Morat (both connected with it by canals), the modern representative of the large body of water which at one time seems to have filled the whole of the lower valley of the Aar. It is now the most considerable sheet

of water which is *wholly* within Switzerland (since parts of those of Geneva and Constance belong to foreign countries), though it does not belong entirely to any one Canton—of its total area of 92½ sq. m., 36½ sq. m. are in the Canton of Neuchâtel and rather over 33 sq. m. in that of Vaud, while Fribourg claims 20¾ sq. m. and Berne 2 sq. m. It is about 23½ m. in length, varies from 3½ to 5 m. in width, and has a maximum depth of 502 ft., while its surface is 1427 ft. above sea-level. It is mainly formed by the Thièle or Zihl river, which enters it at its south-western end and issues from it at its north-eastern extremity, but it also receives, near its north-west end, the Areuse (flowing through the Val de Travers) and the Seyon (which traverses the Val de Ruz), as well as, near its north-east end, the Broye (that flows through a canal from the Lake of Morat). Successive drainages have brought to light the remains of many lake dwellings, of which there is a good collection in the natural history museum at Neuchâtel. The scenery of the lake, though pleasing, cannot compare with that of the other Swiss lakes, despite the fact that from it the giants of both the Mont Blanc and Bernese Oberland ranges are clearly seen. The first steamer was placed on the lake in 1827. On the south-eastern shore the picturesque and historical little town of Estavayer is the chief place. At the south-western extremity of the lake is Yverdon (the *Eburodunum* of the Romans and the residence of the educationalist Pestalozzi, 1806–1825). Far more populated is the north-western shore, where, from S.W. to N.E., we find Grandson (famous for the battle of 1476 wherein Charles the Bold, duke of Burgundy, was defeated by the Swiss), Cortaillod (producing excellent sparkling wine), Serrières (with the famous manufactories of Suchard chocolate) and Neuchâtel itself. On the north shore is La Tène, famous for the remarkable relics of the Iron Age that have been discovered there. (W. A. B. C.)

NEUENAHR, a spa of Germany, in the Prussian Rhine province, situated at the foot of a basalt peak, in the pleasant valley of the Ahr, 10 m. N.W. of Remagen on the Rhine by the railway to Adenau. Pop. (1905) 3388. It is well laid out, has an Evangelical and two Roman Catholic churches, and carries on a considerable trade in the red wines of the district. There are five alkaline springs with temperatures from 69° to 102° F., the waters of which are specific in chronic catarrh of the respiratory organs, gout, rheumatism and diabetes. In the immediate vicinity lies the Apollinaris spring.

See Schmitz, *Erfahrungen über Bad Neuenahr* (5th ed., Ahrweiler, 1887); and Schwenke, *Die Kurmittel des Bades Neuenahr* (Halle, 1900).

NEUENDORF, a village of Germany, in the province of Brandenburg, 2 m. E. from Potsdam, on the Nuthe, with a station on the railway from Berlin to Potsdam. Pop. (1905) 6877. The place has considerable industries, chief among which are carpet-weaving, jute-spinning and the manufacture of railway plant. Within its area lies the colony of Nowawes laid out by Frederick the Great in 1754.

NEUFCHÂTEAU, a town of eastern France, in the department of Vosges at the confluence of the Meuse and the Mouzon, 49 m. W.N.W. of Épinal by rail. Pop. (1906) 3924. The churches of St Christopher (13th and 15th centuries) and St Nicholas, the latter combining the Romanesque and Gothic styles and built above a Romanesque crypt, are of interest. A sub-prefecture, a tribunal of first instance and communal colleges are among the public institutions. Neufchâteau carries on wool-spinning and the manufacture of embroidery, nails and chains. The town, which is said to occupy the site of the Roman *Neomagus*, belonged in the middle ages to the dukes of Lorraine, ruins of whose château are still to be seen. In 1641 it passed to France.

NEUHALDENSLEBEN, a town of Germany, in the province of Prussian Saxony on the Ohre, situated 18 m. N.W. from Magdeburg by the railway to Öbisfelde and at the junction of a line to Eisleben. Pop. (1905) 10,421. It has an Evangelical church, an old equestrian statue of Henry the Lion and a gymnasium. There are several active industries, notably the manufacture of majolica and terra-cotta wares, machinery, gloves, beer, malt, cheese and sugar, while large pig markets are held here.

See Behrends, *Chronik der Stadt Neuhaldensleben* (new ed., 1903).

NEUHOF, THEODORE STEPHEN, BARON VON (*c.* 1690–1756), German adventurer and for a short time nominal king of Corsica, was a son of a Westphalian nobleman and was born at Metz. Educated at the court of France, he served first in the French army and then in that of Sweden. Baron de Goertz, minister to Charles XII., realizing Neuhof's capacity for intrigue, sent him to England and Spain to negotiate with Cardinal Alberoni. Having failed in this mission he returned to Sweden and then went to Spain, where he was made colonel and married one of the queen's ladies-in-waiting. Deserting his wife soon afterwards he repaired to France and became mixed up in Law's financial affairs; then he wandered about Portugal, Holland and Italy, and at Genoa he made the acquaintance of some Corsican prisoners and exiles, whom he persuaded that he could free their country from Genoese tyranny if they made him king of the island. With their help and that of the bey of Tunis he landed in Corsica in March 1736, where the islanders, believing his statement that he had the support of several of the great powers, proclaimed him king. He assumed the style of Theodore I., issued edicts, instituted an order of knighthood, and waged war on the Genoese, at first with some success. But he was eventually defeated, and civil broils soon broke out in the island; the Genoese having put a price on his head and published an account of his antecedents, he left Corsica in November 1736, ostensibly to seek foreign assistance. After trying in vain to induce the grand duke of Tuscany to recognize him, he started off on his wanderings once more until he was arrested for debt in Amsterdam. On regaining his freedom he sent his nephew to Corsica with a supply of arms; he himself returned to the island in 1738, 1739 and 1743, but the combined Genoese and French forces and the growing strength of the party opposed to him again drove him to wandering about Europe. Arrested for debt in London he regained his freedom by mortgaging his "kingdom" of Corsica, and subsisted on the charity of Horace Walpole and some other friends until his death in London on the 11th of December 1756. His only son, Frederick (*c.* 1725–1797), served in the army of Frederick the Great and afterwards acted as agent in London for the grand-duke of Württemberg.

Frederick wrote an account of his father's life, *Mémoires pour servir à l'histoire de la Corse*, and also an English translation, both published in London in 1768. In 1795 he published a new edition on *Description of Corsica with an account of its union to the crown of Great Britain*. See also Fitzgerald, *King Theodore of Corsica* (London, 1890).

NEUILLY-SUR-SEINE, a town of northern France, in the department of Seine, 3½ m. N.W. of the centre of Paris, of which it is a suburb, between the fortifications and the Seine. Pop. (1906) 39,222. A castle at Neuilly, built by the count of Argenson in the 18th century, ultimately became the property and favourite residence of the duke of Orleans (Louis Philippe), the birthplace of nearly all his children, and the scene of the offer of the crown in 1830. The buildings were pillaged and burned by the mob in 1848. The park, which extended from the fortifications to the river, as well as the neighbouring park of Villiers (also belonging to the princes of Orleans), was broken up into building lots, and is occupied by many small middle-class houses and a few fine villas. Within the line of the fortifications, but on Neuilly soil, stands the chapel of St Ferdinand, on the spot where the duke of Orleans died in 1842 from the results of a carriage accident. The stained-glass windows were made at Sèvres after designs by Ingres; the ducal cenotaph, designed by Ary Scheffer, was sculptured by de Triqueti; and the chapel also contains a "Descent from the Cross," by the last-named artist, and an angel executed in Carrara marble by the princess Marie d'Orleans, sister of the duke. The fine bridge, designed in the 18th century by Perronet, is noteworthy as the first level bridge constructed in France. The Galignani Institution, founded by the brothers Galignani for aged booksellers, printers and others, has accommodation for 100 residents. The manufactures

include perfumery, chocolate, colours, varnish, automobiles, carpets, &c.

NEUMANN, FRANZ ERNST (1798–1895), German mineralogist, physicist and mathematician, was born at Joachimstal on the 11th of September 1798. In 1815 he interrupted his studies at Berlin to serve as a volunteer in the campaign against Napoleon, and was wounded in the battle of Ligny. Subsequently he entered Berlin University as a student of theology, but soon turned to scientific subjects. His earlier papers were mostly concerned with crystallography, and the reputation they gained him led to his appointment as Privatdozent at Königsberg, where in 1828 he became extraordinary, and in 1829 ordinary, professor of mineralogy and physics. In 1831, from a study of the specific heats of compounds, he formulated "Neumann's law," which expressed in modern language runs: "The molecular heat of a compound is equal to the sum of the atomic heats of its constituents." Devoting himself next to optics, he produced memoirs which entitle him to a high place among the early searchers after a true dynamical theory of light. In 1832, by the aid of a particular hypothesis as to the constitution of the ether, he reached by a rigorous dynamical calculation results agreeing with those obtained by A. L. Cauchy, and succeeded in deducing laws of double refraction closely resembling those of A. J. Fresnel; and in subsequent years he attacked the problem of giving mathematical expression to the conditions holding for a surface separating two crystalline media, and worked out from theory the laws of double refraction in strained crystalline bodies. He also made important contributions to the mathematical theory of electrodynamics, and in papers published in 1845 and 1847 established mathematically the laws of the induction of electric currents. His last publication, which appeared in 1878, was on spherical harmonics (*Beiträge zur Theorie der Kugelfunctionen*). He took part in founding the Mathematisch-Physikalisches Seminar, to give students a practical acquaintance with the methods of original research. He retired from his professorship in 1876, and died at Königsberg on the 23rd of May 1895. His son, CARL GOTTFRIED NEUMANN (b. 1832), became in 1858 Privatdozent, and in 1863 extraordinary professor of mathematics at Halle. He was then appointed to the ordinary chair of mathematics successively at Basel (1863), Tübingen (1865) and Leipzig (1868).

NEUMANN, KARL FRIEDRICH (1793–1870), German orientalist, was born, under the name of Bamberger, at Reichsmannsdorf, near Bamberg, on the 28th of December 1793. He studied philosophy and philology at Heidelberg, Munich and Göttingen, became a convert to Protestantism and took the name of Neumann. From 1822 to 1825 he was a teacher at Spires; then he learned Armenian in Venice and visited Paris and London. In 1829 he went to China, where he studied the language and amassed a large library of valuable books and manuscripts. These, about 12,000 in number, he presented to the royal library at Munich. Returning to Germany in 1831 Neumann was made professor of Armenian and Chinese in the university of Munich. He held this position until 1852, when, owing to his pronounced revolutionary opinions, he was removed from his chair. Ten years later he settled in Berlin, where he died on the 17th of March 1870.

Neumann's leisure time after his enforced retirement was occupied in historical studies, and besides his *Geschichte des englischen Reichs in Asien* (Leipzig, 1851), he wrote a history of the United States of America, *Geschichte der Vereinigten Staaten von Amerika* (Berlin, 1863–1866). His other works include *Versuch einer Geschichte der armenischen Literatur* (Leipzig, 1836); *Die Völker des südlichen Russland* (1846, and again 1855); and *Geschichte des englisch-chinesischen Kriegs* (1846, and again 1855). He also issued some translations from Chinese and Armenian: *Catechism of the Shamans* (1831); *Vahram's Chronicle of the Armenian Kingdom in Cilicia* (1831) and *History of the Pirates in the China Sea* (1831). The journal of the Royal Asiatic Society (London, 1871) contains a full list of his works.

NEUMAYR, MELCHIOR (1845–1890), German palaeontologist, was born at Munich on the 24th of October 1845, the son of Max von Neumayr, a Bavarian Minister of State. He was educated in the university of Munich, and completed his studies at Heidelberg, where he graduated Ph.D. After some experience in field-geology under C. W. von Gümbel he joined the Austrian geological survey in 1868. Four years later he returned to Heidelberg, but in 1873 he was appointed professor of palaeontology in Vienna, and occupied this post until his death on the 29th of January 1890. His more detailed researches related to the Jurassic and Cretaceous Ammonites and to the Tertiary freshwater mollusca; and in these studies he sought to trace the descent of the species. He dealt also with the zones of climate during the Jurassic and Cretaceous periods, and endeavoured to show that the equatorial marine fauna differed from that of the two temperate zones, and the latter from that of the arctic zone, much as the faunas of similar zones differ from each other in the present day; see his "Über klimatische Zonen während der Jura und Kreidezeit" (*Denkschr. K. Akad. Wiss. Wien*, 1883); he was author also of *Erdgeschichte* (2 vols., 1887); and *Die Stämme des Thierreiches* (vol. 1 only, 1889).

Obituary by Dr W. T. Blanford in *Quart. Journ. Geol. Soc.* (1890).

NEUMÜNSTER, a town of Germany, in the Prussian province of Schleswig-Holstein, lies on both banks of the small river Schwale, in the basin of the Stör, 40 m. N. of Altona-Hamburg by rail, and at the junction of lines to Kiel, Vamdrup (Denmark) and Tönning. Pop. (1905) 31,347. It has an Evangelical and a Roman Catholic church and several schools. It is, after Altona, the most important industrial town in the province, and contains extensive cloth-factories, besides manufactories of leather, cotton, wadding, carpets, paper, machinery, beer and sweetmeats. Its trade is also brisk. The name, which was originally Wipendorp, is derived from an Augustine monastery, founded in 1130 by Vicelin, the apostle of Holstein, and is mentioned as "novum monasterium" in a document of 1136. Its industrial importance began in the 17th century, when the cloth-workers of Segeberg, a town to the south-east, migrated to it. It became a town in 1870.

See Kirmis, *Geschichte der Stadt Neumünster* (1900); and Dittmann, *Aus dem alten Neumünster* (1879).

NEUNKIRCHEN, or OBER-NEUNKIRCHEN, a town of Germany, in the Prussian Rhine province, on the Blies, 12 m. N.W. of Saarbrücken by rail. Pop. (1905) 32,358, consisting almost equally of Protestants and Roman Catholics. It contains two Gothic Evangelical and a Romanesque Roman Catholic church, several schools, and a monument to Freiherr von Stumm (d. 1901), a former owner of the iron-works here. The principal industrial establishment is a huge iron-foundry, employing upwards of 4800 hands, and producing about 320,000 tons of pig-iron per annum; and there are also boiler-works, saw-mills, soap manufactories and a brewery. Around the town are important coal mines from which about 2½ million tons of coal are raised annually. The castle built in 1570 was destroyed in 1797, and is now a ruin. The town is first mentioned in 1280, and became important industrially during the 18th century.

NEUQUEN, an inland territory of Argentina on the Chilean frontier, between the Colorado and Limay rivers, with the province of Mendoza on the N. and the territory of Rio Negro on the E. and S. Area, 42,345 sq. m. Pop. (1895) 14,517; (1904, estimate) 18,022. The greater part of the territory is mountainous, with fertile, well-watered valleys and valuable forests. The eastern part, however, contains large barren plains, showing some stunted vegetation, and having numerous saline deposits. Long drouths prevail in this region and there is no inducement for settlement, the nomadic Indians visiting it only on their hunting expeditions. Guanacos and Argentine hares are found in abundance in Neuquen, and to a lesser degree the South American ostrich. The Neuquen, which unites with the Limay near the 68th meridian to form the Rio Negro, is the principal river of the territory. The largest of a group of beautiful lakes in the higher Andean valleys is the celebrated Nahuel-Huapi (Lion Grass), which is nearly 50 m. long from E. to W. and about 20 m. from N. to S. at its widest part, and which lies partly in the S.W. angle of the territory, partly in Rio Negro, and partly in the republic of Chile. It is the source of the Rio

Limay and receives the overflow from two smaller neighbouring lakes. The temperature of the Andean region is cold even in summer, but on the lower plains it is hot in summer, and only moderately cold in winter. The principal industry is the raising of stock for the Chilean markets, as there is little cultivation. Cereals, forage crops, vegetables and fruits of the cold temperate zone can be produced easily, but distance from markets and lack of transport have restricted their production to local needs. The territory is reached by a light-draft river steamer which ascends the Rio Negro to Fort Roca at the confluence of the Limay and Neuquen, and by a branch of the Great Southern railway from Bahia Blanca to the same point. The population is concentrated in a few small towns on the rivers and in some colonies, established by the national government to check Chilean invasions, in the fertile districts of the Andes. A majority of the population, however, is of Chilean origin. The capital is Chos Malal, a small town on the upper Neuquen, in the mountainous district in the northern part of the territory.

NEURALGIA (Gr. *νεῦρον*, nerve, and *ἄλγος*, pain), a term denoting strictly the existence of pain in some portion or throughout the whole of the distribution of a nerve without any distinctly recognizable structural change in the nerve or nerve centres. This strict definition, if adhered to, however, would not be applicable to a large number of cases of neuralgia; for in not a few instances the pain is connected with some source of irritation, by pressure or otherwise, in the course of the affected nerve; and hence the word is generally used to indicate pain affecting a particular nerve or its branches from any cause. There are few ailments which give rise to greater human suffering. The existence of neuralgia usually betokens a depressed or enfeebled state of health. It is often found to affect the hereditarily rheumatic or gouty. In weakened conditions of the system from improper or insufficient food, or as a result of any drain upon the body, or in anaemia from any cause, and in such diseases as syphilis or malaria, neuralgia is a frequent concomitant. Any strain upon the nervous system, such as mental overwork or anxiety, is a potent cause; or exposure to cold and damp, which seems to excite irritation in a nerve already predisposed to suffer. But irritation may be produced by numerous other causes besides this—such as a decayed tooth, diseased bone, local inflammations in which nerves are implicated, by some source of pressure upon a nerve trunk, or by swelling of its sheath in its passage through a bony canal or at its exit upon the surface.

The pain is generally localized, but may come to extend beyond the immediate area of its first occurrence. It is usually of paroxysmal character, and not unfrequently periodic, occurring at a certain time of the day or night. It varies in intensity, being often of the most agonizing character, or less severe and more of a tingling kind. Various forms of perverted nerve function may be found co-existing with or following neuralgia. Thus there may be hyperaesthesia, anaesthesia, paralysis, or alterations of nutrition, such as wasting of muscles, whitening of the hair, &c.

The forms in which neuralgia most commonly shows itself are facial neuralgia or tic douloureux, migraine (hemicrania or brow ague), intercostal neuralgia and sciatica.

Facial neuralgia, or *tic douloureux*, affects the great nerve of sensation of the face (fifth nerve), and may occur in one or more of the three divisions in which the nerve is distributed. It is usually confined to one side. When the first or upper division of the nerve is involved the pain is mostly felt in the forehead and side of the head. It is usually of an intensely sharp, cutting or burning character, either constant or with exacerbations, and often periodic, returning at a certain hour each day while the attack continues. The skin over the affected part is often red and swollen, and, even after the attack has abated, feels stiff and tender to the touch. In this, as in all forms of neuralgia, there are certain localities where the pain is more intense, these "painful points," as they are called, being for the most part in those places where the branches of the nerves emerge from bony canals or pierce the fascia to ramify in the skin. Hence, in this form, the greater severity of the pain above the eyebrow and along the side of the nose. There is also pain in the eyelid, redness of the eye, and flow of tears. When the second division of the nerve is affected the pain is chiefly in the cheek and upper jaw, the painful points being immediately below the lower eyelid, over the cheek bone, and about the upper lip. When the third division of the nerve suffers the pain affects the lower jaw, and the chief painful points are in front of the ear and about the chin.

Hemicrania, migraine, brow-ague and *sick headache* are various terms employed to describe what by some is considered to be another form of neuralgia. An attack may come on suddenly, but, in general, begins by a dull aching pain in the brow or temple, which steadily increases in severity and extent, but remains usually limited to one side of the head. It attains at times an extreme degree of violence, and is apt to be aggravated by movement, loud noises or bright light. Accompanying the pain there is more or less of nausea, and when the attack reaches its height vomiting may occur, after which relief comes, especially if sleep supervene. An attack of this kind may last for a few hours or for a whole day, and after it is over the patient feels comparatively well. It may recur periodically, or, as is more common, at irregular intervals. During the paroxysms, or even preceding them, certain sensory disturbances may be experienced, more especially affections of vision, such as ocular spectra, hemiopia, diplopia, &c. Gout, eyestrain and intestinal toxaemia have been put forward as causes of migraine, and Sir W. Gowers regards it as the equivalent of a true epileptic attack.

Intercostal neuralgia is pain affecting the nerves which emerge from the spinal cord and run along the spaces between the ribs to the front of the body. This form of neuralgia affects the left side more than the right, is much more common in women than in men, and occurs generally in enfeebled states of health. It might be mistaken for pleurisy or some inflammatory affection of the lungs; but the absence of any chest symptoms, its occurrence independently of the acts of respiration, and other considerations well establish the distinction. The specially painful points are chiefly at the commencement of the nerve as it issues from the spinal canal, and at the extremities towards the front of the body, where it breaks up into filaments which ramify in the skin. This form of neuralgia is occasionally the precursor of an attack of shingles (*Herpes zoster*) as well as a result of it.

Sciatica is another of the more common forms of neuralgia. It affects the great sciatic nerve which emerges from the pelvis and runs down the leg to the foot. It is in most instances traceable to exposure to cold or damp, to overuse of the limbs in walking, &c. Any source of pressure upon the nerve within the pelvis, such as may be produced by a tumour or even by constipation of the bowels, may excite an attack of sciatica. It is often connected with a rheumatic or gouty constitution. In general the nerve of one side only is affected. The pain which is felt at first a little behind the hip-joint steadily increases in severity and extends along the course of the nerve and its branches in many instances as far as the toes. The specially painful points are about the knee and ankle joints; besides which a feeling of numbness is experienced throughout the whole limb. In severe cases all movement of the limb aggravates the pain, and the patient is obliged to remain in bed. In prolonged attacks the limb may waste and be drawn up and fixed in one position. Attacks of sciatica are often attended with great suffering, and are apt to be very intractable to treatment.

In the treatment of all forms of neuralgia it is of first importance to ascertain if possible whether any constitutional morbid condition is associated with the malady. When the attack is periodic the administration of a large dose of quinine two or three hours previous to the usual time of the seizure will often mitigate, and may even prevent the paroxysm. Many topical applications are of great efficacy. Liniments containing opium, belladonna or aconite rubbed into the affected part will often soothe the most severe local pain. And antipyrin, phenacetin, aspirin and similar analgetics are commonly taken. The plan at one time resorted to of dividing or excising a portion of the affected nerve is now seldom employed, but the operation

of nerve-stretching in some forms of neuralgia, notably sciatica, is sometimes successful. It consists in cutting down upon and exposing the nerve, and in seizing hold and drawing upon it so as to stretch it. Such an operation is obviously justifiable only in cases where other less severe measures have failed to give relief. The employment of electricity, in long continued and intractable forms of neuralgia, proves in many instances eminently serviceable. In the severest forms of tic douloureux complete relief has followed the extirpation of the Gasserian ganglion. (F. W. Mo.)

NEURASTHENIA (Gr. *νεῦρον*, nerve, and *ἀσθένεια*, weakness), the general medical term for a condition of weakness of the nervous system. The symptoms may present themselves as follows: (1) general feeling of malaise, combined with a mixed state of excitement and depression; (2) headache, sometimes with the addition of vertigo, deafness and a transitory clouding of consciousness simulating *petit mal* or *migraine*; (3) disturbed and restless, unrefreshing sleep, often troubled with dreams; (4) weakness of memory, especially for recent events; (5) blurring of sight, noises or ringing in the ears; (6) variable disturbances of sensibility, especially scattered analgesia (partial and symmetrical) affecting the backs of the hands especially, and in women the breasts; (7) various troubles of sympathetic origin, notably localized coldness, particularly in the extremities, morbid heats, flushings and sweats; (8) various phenomena of nervous depression associated with functional disturbances of organs, *e.g.* muscular weakness, lack of tone, and sense of fatigue upon effort, dyspepsia and gastric atony with dilatation of the stomach and gastralgia; pseudo-anginal attacks and palpitation of the heart; loss of sexual power with nocturnal pollutions and premature ejaculations leading to apprehension of oncoming impotence. Objective signs met with in organic disease are absent, but the knee-jerks are usually exaggerated.

According to the complexity of symptoms, the neurasthenia is more particularly defined as cerebral, spinal, gastric and sexual. The cerebral form is sometimes termed *psychasthenia*, and is liable to present morbid fears or phobias, *e.g.* agoraphobia (fright in crowds), monophobia (fright of being alone), claustrophobia (fright of being in a confined place), anthropophobia (fright of society), batophobia (fright of things falling), siderodromophobia (fright of railway travelling). There may also be mental ruminations, in which there is a continuous flow of connected ideas from which there is no breaking away, often most insistent at night and leading to insomnia. Sometimes there is arithmomania (an imperative idea to count). Such cases often exhibit a marked emotionalism and readily manifest joy or sorrow; they may be cynical, pessimistic, introspective and self-centred, only able to talk about themselves or matters of personal interest, yet they frequently possess great intellectual ability, and although there may be mental depression, there is an absence of the insane ideas characteristic of melancholia.

Traumatic neurasthenia is the neurasthenia following shock from injury; it is sometimes termed "railway spine," "railway brain," from the frequency with which it occurs after railway accidents, especially in people of a nervous temperament. The physical injury at the time may be slight, so that the patient is able to resume work, but symptoms develop later which may simulate serious organic disease. As in all forms of neurasthenia, the subjective symptoms may be numerous and varied, whereas the objective signs are but few and slight. Many difficulties, therefore, present themselves in arriving at a sound opinion as to the future in such cases. It is desirable not only to study the case carefully, but to obtain some knowledge of the previous history of an individual who is claiming damages on account of traumatic neurasthenia. (F. W. Mo.)

NEURI, an ancient tribe placed by Herodotus (iv. 105) to the north-east of Scythia. He says of it that it is not Scythian, but has Scythian customs. Every member of it, being a wizard, becomes a wolf once a year. The position assigned to their district appears to be about the head waters of the Dniester and Bug (Bugh) and the central course of the Dnieper just the region which, on general grounds, place-names, recorded migrations and modern distribution, appears to be the original location of the Slavs (*q.v.*). The wolf story again recalls the tales of werewolves so common among Slavonic peoples, and there is much probability in Schafarik's conjecture that the Neuri are nothing but the ancestors of the Slavs. (E. H. M.)

NEURITIS (Gr. *νεῦρον*, nerve), a term applied to the inflammation of one or more bundles of nerve fibres. Two varieties are known, the localized and the multiple. The localized form frequently follows on exposure to cold and may attack a single nerve. Facial paralysis (Bell's palsy) is commonly seen following a neuritis of the facial nerve. Neuritis may follow blows and wounds of a nerve, injuries involving stretching of a nerve or long continued pressure such as may occur in a dislocation of the elbow joint, or the nerve may share in the extension of a neighbouring inflammation. The first symptom of a localized neuritis is pain of a boring character along the course of a nerve and its distribution, the part being sensitive to pressure. There may be slight redness and oedema along the course of the nerve, movement becomes painful in the muscles to which the nerve is distributed, numbness may follow and the tactile sense be impaired, finally the muscles atrophy, and degenerative changes may take place in the nerve or nerve sheath. Slight cases following cold or injury may pass off in a few days, while severe cases such as those following the pressure of an unreduced dislocation may last for months.

Multiple neuritis or polyneuritis is a disease which may affect many of the peripheral nerves symmetrically and at the same time. For the pathological changes see NEUROPATHOLOGY. The difference in these changes is due mostly to the difference in the aetiology of the neuritis. The causes may be divided as follows: (1) The toxins of acute infective diseases, such as diphtheria, influenza, typhoid fever, malaria, scarlet fever and septicaemia. (2) Acute or chronic poisoning by lead, arsenic, mercury, copper and phosphorus. (3) General disorders: gout, rheumatism, tubercle, carcinoma. (4) The local action of leprosy and syphilis. (5) Endemic disease: beri-beri. (6) Alcohol, the most common.

Alcoholic neuritis occurs as a result of constant steady drinking, particularly in those who drink beer rather than spirit. The earliest symptom is numbness of the feet and later of the hands, then painful cramps in the legs appear and there is pain on moving the limbs, or the patient complains of deadness, tingling and burning in the hands and feet, and superficial tenderness is occasionally present. In other varieties of the disease the earliest symptoms are weakness of the legs and extreme fatigue, leading to a characteristic "steppage gait," or marked inco-ordination of movement may occur and the gait become ataxic. Trophic changes soon appear, in some cases early and rapid muscular wasting occurs, the skin becomes dry and glossy, the nails brittle and the hair thin. In time actual contractures takes place, the hip and knee-joints become flexed and the foot dropped at the ankle. In cases that recover there may be permanent deformity. Should the case progress the patient may become bedridden and powerless, and degenerative mental changes may take place, loss of memory, irritability of temper and emotional instability. Various complications such as bronchitis, fatty changes in the heart, albuminuria and a liability to pulmonary tuberculosis, tend to carry off the victim of chronic alcoholic neuritis. Cases seen early in the progress of the disease, who can be placed under supervision, may recover under treatment, but those in whom the attacks have recurred several times and in whom there is much mental impairment rarely make a complete recovery. The treatment consists in putting the patient to bed, with the administration of strychnine hypodermically, and attention should be paid to the position of the limbs so as to avoid the development of contractures, cradles being used, the limbs kept in the correct positions by sand-bags, and gentle massage being employed as soon as possible. Should contractures have already formed some mechanical device adapted to stretch the contracted muscle must be resorted to. Biers' hyperaemic suction apparatus is very useful in the painless stretching of contracted joints, or old-standing adhesions may have to be broken down under an anaesthetic, extension apparatus being afterwards worn. In the later treatment the galvanic and faradaic currents combined with massage are useful in helping to restore the wasted muscles, and hot-air baths and warm applications are appreciated.

Arsenical neuritis mostly affects the lower extremities, as contrasted with lead, which mainly paralyses the fingers and wrists; recovery is even slower than in alcoholic neuritis, the treatment being on the same lines, with the removal of the cause of the disease. In the neuritis of chronic lead poisoning a fine tremor of the hands is an early symptom and sensory symptoms are usually absent; the muscles affected are the extensors of the wrists, thumb and fingers

(see LEAD POISONING). The course of the disease is long, and an attempt should be made to eliminate the lead from the system by purgatives and the administration of potassium iodide.

The diabetic neuritis paraesthesia is slight, and the legs are chiefly affected; weakness and ataxia may be present. Trophic sores on the feet are of frequent occurrence in this variety. The treatment is that of the disease.

Post-diphtheritic neuritis occurs in about 10% of all cases of diphtheria. In this form paralysis of the soft palate is the earliest symptom, and this may be the only one, or the pharynx may be affected. The limbs are affected much later, usually about the 5th or 6th week. Atrophy of the muscles is frequently rapid. If the respiratory muscles are unaffected the prognosis is good, but the paralysis of the limbs may last for several months. The treatment is complete rest, good food and the administration of strychnine.

Acute polyneuritis with numbness and motor weakness has been noted after influenza, together with slight muscular wasting and electrical degeneration. Later, loss of sensation in the peripheral portion of the limbs is complained of, and the motor weakness may affect the muscles of the trunk and face. Such cases tend towards complete recovery.

NEUROPATHOLOGY, the general name for the science concerned with diseases of the nervous system. As regards the anatomy and physiology, see the articles NERVE, NERVOUS SYSTEM, BRAIN, SPINAL CORD, and SYMPATHETIC SYSTEM. The morbid processes affecting the nervous system are numerous and varied, but usually they are clinically divided into two great groups of (1) organic disease, (2) functional disturbance. Such a classification depends upon whether or not symptoms observed during life can be associated with recognizable changes of the nervous system, gross or microscopical, after death. Sometimes this is the morbid process itself, sometimes only the ultimate result of the process. It must be remarked, however, that many diseases which we now look upon as functional may be found due to recognizable changes when suitable methods of investigation shall have been discovered. The paroxysmal neuroses and psychoses may be considered a priori to be due to temporary morbid functional conditions. Our knowledge of the first group is naturally much more advanced than of the latter, for, given certain symptoms during life, we are able, as a rule, to predict not only the nature of the morbid process, but its particular locality.

The histological elements which make up the nervous system may also be divided into two groups: (1) the nervous units or neurones, (2) the supporting, protecting and nutrient tissues. Organic diseases may start primarily in the nervous units or neurones and cause their degeneration; such are true diseases of the nervous system. But the nervous units may be affected secondarily by diseases starting in the supporting, protecting and nutrient tissues of the nervous system; such are essentially diseases *within* the nervous system, and include diseases of the blood-vessels, lymphatics, membranes and the special nervous connective tissue, neuroglia (a residue of the embryonal structure from which the nervous system was developed). Tumours and new growths must also be included.

The modern conception of the "neurone" as an independent complex cell with branching processes, in physiological rather than anatomical association with other neurones, has modified our ideas of the morbid processes affecting the nervous system, especially as regards degenerations of systems, communities or collections of neurones subserving special functions. It was formerly believed, and generally taught, that the primary systemic degenerations were due to a sclerosis; thus locomotor ataxy was believed to be caused by an overgrowth of the supporting glia tissue of the posterior columns of the spinal cord, which caused a secondary atrophy of the nervous tissue. We now know that this overgrowth of glia tissue is secondary to the atrophy of the nervous elements, and the only true primary overgrowth of glia tissue is really of the nature of the new growth (gliosis). But even in this case it is doubtful if the mere proliferation of the glia tissue elements could destroy the nervous elements, if it were not for the fact that it leads to changes in the vessel walls and to haemorrhages.

The symptoms manifested during life depend upon the nature of the morbid process and the portion of the nervous system affected. A correct understanding of neuropathology involves the study of (1) the causes which give rise to morbid conditions, which are often complex and due to various combinations of factors arising from without and within the body, and (2) the changes in the structure and functions of the nervous system brought about by intrinsic and extrinsic causes.

The causes of pathological processes occurring in the nervous units (neurones) may be divided into internal and external, and it may be remarked that in all cases except direct injury the two groups are generally more or less combined.

A. *Internal Causes.*—Of all the causes of nervous disease *hereditary predisposition* stands pre-eminently first; it may be convergent, paternal, maternal; from grandparents or even more remote ancestors. Moreover, no study of heredity is complete that does not take into consideration collaterals. Especially does this statement apply to functional neuroses, *e.g.* epilepsy, migraine, hysteria and neurasthenia; and to psychoses, *e.g.* delusional insanity, mania and melancholia, manic-depressive, recurrent or periodic insanity and dementia-praecox or adolescent insanity.

In 70% of 150 cases of idiocy or imbecility in the London county asylums, Dr Tredgold found a family history of insanity in some form or another. Strictly speaking, it is the tendency to nervous disease rather than the disease itself that is inherited, and this is frequently spoken of as a neuropathic or psychopathic taint. There are, besides, a number of inherited diseases, which, although somewhat rare, are of interest inasmuch as they affect members of a family, the same disease frequently commencing in each individual at about the same age. These are termed *family diseases*, and include hereditary ataxia (Friedreich's disease), myotonia (Thomsen's disease), hereditary (Huntingdon's) chorea, amaurotic idiocy and various forms of idiopathic muscular atrophy. Alcoholism, tuberculosis and syphilis in the parents, especially if one or both come from a neuropathic or psychopathic stock, frequently engender idiocy, imbecility, epilepsy and general paralysis in the offspring, by the production of defects in the vitality of the germinal plasm, causing arrest, imperfect development or premature decay of groups, communities or systems of neurones, especially those which are latest developed—the symptoms manifested depending upon the portions of the nervous system affected. To explain the hereditary neuropathic tendency morphologically, we may suppose that there is an inherited defect in the germinal plasm which is concerned in the formation of the neurones. We may regard the neurone as a complex cell, and the nervous system as a community of neurones arranged in systems and groups having special functions. Like all cells, the neurone nourishes itself and is not nourished; certainly it depends for its development, life and functional activity upon a suitable environment, but it must also possess an inherent vital energy by which it can assimilate and store up nutrient material which may be regarded as *potential* (latent nerve energy), to be converted into nerve force as required. A constant constructive and destructive bio-chemical process occurs in the neurones of a healthy nervous system, latent nervous energy is high and the sense of fatigue is the natural indication for sleep and repose, whereby it is constantly recuperated. In the neuropathic or psychopathic individual it may be conceived that in some portion of the nervous system, especially the brain, there may exist communities, systems or groups of neurones with inherited low potential, readily becoming exhausted, and, under the influence of altered blood states or stress, especially liable to functional depression, from which arise function-paralysis and melancholia. Again, the bio-chemical substance which represents potential in the nervous system may be in a chemically unstable condition, so as readily to fulminate when excited by abnormal conditions (*e.g.* toxic conditions of the blood), thus acting as a centre of discharge of nervous energy, which may be manifested by mental or bodily symptoms. We know that in strychnia and tetanus poisoning the most localized peripheral excitation will cause general muscular spasm; in both toxic conditions the spread is probably due to a bio-chemical change in the protoplasm of the spinal neurones, whereby the excitability is greatly increased and a slight stimulus is sufficient to fulminate the whole system of motor neurones. In epilepsy and other paroxysmal neuroses and psychoses it is possible that some altered condition of the blood, when associated with an inherited bio-chemical instability of certain groups, systems or communities of neurones, may act as a *fulminating agent*. In neuralgia and local hyperaesthesia the slightest general or distant local irritation suffices to produce pain; thus coughing, the vibration of a passing train or the slamming of a door may produce pain by the stimulation of the hyper-excitable neurones. Moreover, it must be borne in mind that the symptoms of nervous disease are due as much to normal physiological functional activity improperly applied, as to actual loss of function occasioned by disease. Thus squint, caused by paralysis of one of the muscles of the eyeball, causes less trouble to the patient than the double vision occasioned by the physiological activity of the two retinae, upon the corresponding points of which the images are prevented by the paralysis from falling.

B. The *external causes* producing morbid changes in the nervous elements are: I. Abnormal conditions of the blood and lymph, by which the neurones are poisoned and their metabolism morbidly affected. II. Excess or deficiency of normal stimulation, or existence of abnormal stimulation. III. Injury or diseases of supporting, enclosing or vascular tissues.

I. *Abnormal Conditions of the Blood and Lymph.*—The immediate environment of all the cellular elements of the body is lymph, and in the central nervous system there is a special form of lymph, the cerebro-spinal fluid, which is secreted by the choroid plexus in the venticles of the brain. The neurones, like other cellular elements, are bathed in the lymph, and extract from it the materials necessary for their growth and vital activities, casting out the waste products incidental to the bio-chemical changes which are continually taking place. The lymph, therefore, serves as a medium of exchange between the blood and the tissues, consequently the essential causes of change in environment of the nervous elements (neurones) are: (1) Deficiency or absence of blood-supply to the nervous system in general (as after severe haemorrhage), or to some particular portion, owing to local vascular disturbance or occlusion. (2) Alterations in the normal condition of the blood, due to (*a*) deficiency or absence of certain essential constituents, (*b*) excess of certain normal constituents, (*c*) the presence of certain abnormal constituents produced within the body, or entering it from without.

(1) *Quantity of Blood Supply.*—Syncope or fainting occurs when the blood supply suddenly fails to reach the higher centres of the brain; this usually arises from sudden reflex arrest of the heart's action. If a portion of the central nervous system is cut off from its arterial blood supply by embolic plugging or by clotting of the blood in a vessel with diseased walls, the portion of the brain substance thus deprived of blood undergoes softening, the nervous elements are destroyed, and the systems of nerve fibres, which have had their trophic and genetic centres in the area destroyed, undergo *secondary degeneration*. Clotting of the blood in the veins may also give rise to destructive softening of the brain, and similar secondary degeneration.

(2) *Quality of Blood Supply.*—(*a*) *Insufficiency of oxygen*, due to poverty of the colouring matter or of the number of the red corpuscles, which constitutes the various forms of anaemia, leads to functional depression, lassitude and mental fatigue. Impoverishment of the blood in women by frequent pregnancies and excessive lactation causes neuralgia, nervous exhaustion and, in the neuropath, hysteria, neurasthenia, melancholia and mania. The mental depression, and the tendency that the various neuroses and psychoses have to occur and recur at the time of the menstrual and climacteric periods in women, suggests the possibility of an alteration in the composition of the blood, either in the nature of an auto-intoxication or "sub-minimal deficiency," as the probable contributory factor of the mental disturbance. It may be remarked that eclampsia, puerperal and lactational mania are relatively common forms of insanity in women; although sometimes of septic origin, they more frequently are occasioned by some morbid metabolism as yet little understood. The most striking examples we have, however, of the effect of absence or "sub-minimal" deficiency of a normal constituent of the blood upon the development and functions of the nervous system are afforded by cretinous idiots, who are born without thyroid glands, and whose brains never develop in consequence; and by those people who suffer from the disease known as *myxoedema*, occasioned by the absence of iodothyrin, a product of the internal secretion of the thyroid gland. The proof of this is shown by the disappearance of the nervous phenomena, slowness of thought, slowness of speech, &c., after a preparation of the gland has been continuously administered by the mouth. Even cretinous idiots when subjected in early life to thyroid treatment improve considerably. The removal of the testicles in the male may produce a profound effect upon the nervous temperament; for probably there is an internal secretion of this gland in the male, as of the ovary in the female, which has some subtle influence upon the functional activity of the nervous system. The seminal fluid contains a large amount of complex phosphorus-containing substances, which, lost to the body by sexual excess or onanism, have to be replaced by the blood; the nervous system, which also needs these complex organic phosphorus compounds, is thereby robbed, and neurasthenia ensues. Brown-Séquard's testicular injection treatment for many nervous complaints, based upon this idea, has not, however, met with much success.

(*b*) *Excess of certain Normal Constituents in the Blood.*—Excess of carbonic acid causes drowsiness, and probably in asphyxia is one of the causes of the convulsions. All the series of the nitrogenous waste products—the most highly oxidized, most soluble and least harmful of which is urea—are normal constituents of the blood; but should the oxidation process be incomplete, owing to functional or organic disease of the liver, or should these substances accumulate in the blood, owing to inadequate function of the kidneys, a toxic condition, called uraemia, may supervene, the nervous manifestations of which are headache, drowsiness, unconsciousness or coma, epileptiform convulsions and sometimes symptoms of polyneuritis. Again, in Graves's disease, nervous phenomena, in the form of exophthalmos, fine tremors, palpitation and mental excitement, have by some authorities been explained by the excess of thyroid internal secretion, due to the enlargement and increased functional activity of the gland. The successful treatment of Graves's disease by the administration of the blood serum and milk of animals (goats), which had the thyroid glands removed, supports this theory.

(*c*) The presence of *abnormal constituents in the blood* is a most important cause of disease of the nervous elements. We may consider the subject under the following headings: Poisons produced within the body (α) by perverted function of organs or tissues, auto-intoxication; (β) by the action of micro-organisms, protozoa and bacteria, upon the living fluids and tissues of the body; (γ) poisons introduced into the body from without, in the food and drink, or by inhalation.

(α) *Poisons resulting from perverted Function of the Organs.*—In the process of digestion a number of poisonous substances, *e.g.* albumoses, &c., are produced, which, although absorbed in the alimentary canal, are prevented by the living epithelium, and possibly by the liver, from entering the systemic circulation. Fatigue products, *e.g.* sarcolactic acid in prolonged muscular spasms, may lead to auto-intoxication. Excess of uric acid in the blood is associated with high arterial pressure, deposits of lithates in the urine, headache and nervous irritability; it is an indication of imperfect metabolism and auto-intoxication, as shown by the fact that marked improvement occurs by suitable diet and treatment. Phosphoruria, oxaluria and glycosuria, tokens of deranged metabolism, may be associated with various nervous phenomena. Bile in the blood, cholaemia, resulting from obstructive jaundice, may be attended by stupor and psychical depression; and the term melancholia, signifying "black bile," indicates the importance which has long been attached to the liver as an organ the derangement of which causes nervous depression. The rapidly fatal results attending acute yellow atrophy of the liver, namely, the profound changes in the urine, the jaundice and the nervous phenomena of delirium, motor irritation, delusions, stupor and coma, demonstrate the important part this organ plays in preserving the normal quality of the blood. The delirium and coma which sometimes supervene in diabetes, heralded by acetonaemia, is another instance of auto-intoxication. The coma is very possibly due to the saturation of the sodium salts of the blood by aceto-acetic and oxybutyric acids, products of imperfect proteid metabolism. The effect of this would be an interference with the elimination of carbonic acid in the processes of tissue and pulmonary respiration. Again, in pernicious and certain grave anaemias, the degenerative changes in the spinal cord found in some cases is due, not so much to the defect in the red corpuscles, as to some neuro-toxin, which probably arises from imperfect metabolism or absorption from the alimentary canal. In this question of auto-intoxication, it must be remarked that all the tissues of the body are mutually interdependent. If one suffers, all suffer, and a disease of one organ or tissue is thereby apt to establish a vicious circle which is constantly enlarging; therefore nervous symptoms manifesting themselves in the course of a disease add much to the gravity of the complaint.

(β) *Poisons produced by Infective Micro-organisms.*—Some of these poisons have a general devitalizing influence, by an alteration of the blood and the production of fever. In the course of the acute infectious diseases, typhoid, typhus, smallpox, scarlet fever, measles, influenza, also tuberculosis and septicaemia, delirium is a frequent complication; it may be the result of high fever or prolonged fever, or directly due to the poison, or the two combined. In severe cases stupor and coma may occur, and it has been shown that in this extreme stage the nerve cells undergo an acute morbid bio-chemical change. These particular poisons have no selective toxic action upon a particular part of the nervous system, and symptoms not only during, but after, the acute illness are liable to supervene, especially in a neuropathic individual. Thus many cases of neurasthenia, insanity, neurosis, also neuritis, date their origin from an acute specific fever. In cerebro-spinal meningitis, tubercular meningitis, acute delirious mania and leprous neuritis, the inflammation of the membranes of the brain and spinal cord is due to the growth of the specific organism in the lymph and interstitial tissue elements.

Poisons may have a *selective influence* upon some part of the nervous system. The syphilitic poison is the most important factor in the production of two progressive degenerations of the nervous system—one affecting especially the afferent conducting tracts of the spinal cord, namely, locomotor ataxy, and the other affecting especially the frontal and central convolutions of the cerebral hemispheres, namely, general paralysis of the insane. A striking instance of the selective action of the syphilitic poison is shown in the fact that only in persons affected with acquired or inherited syphilis is a symptom known as Argyll-Robertson pupil found; this is the absence of the pupil reflex contraction to light, while that for accommodation persists. Seeing that this is the most common objective phenomenon in the two diseases mentioned, it strengthens the presumption.

based on experience, that the syphilitic poison is the cause of these diseases in the majority of instances. Again, syphilis, when it attacks the supporting, enclosing and nutrient vascular tissues, shows a predilection to affect structures about the base of the brain, and paralyses of the third nerve are almost pathognomonic of this disease. In rabies, although the whole nervous system is charged with the poison, the medulla oblongata (as shown by the symptoms) is especially affected. Again, in tetanus the bacilli are only found in the wound; they must therefore be comparatively few in number, but they elaborate a virulent poison, which affects particular groups of neurones. The fact that lockjaw nearly always occurs first, shows that the poison selects the motor nucleus of the fifth nerve; but it is remarkable that experiment has shown that the tetanus toxin, if mixed with an emulsion of nervous matter before injection into an animal, loses its toxicity. This fact indicates its affinity for nervous matter, and also a power of absorption of the poison by some chemical substance in the nervous matter. Another example is offered by diphtheria. A neuro-toxin is produced by the local action of the bacilli, for they do not become freely generalized in the blood and tissues. Whether the poison is a direct production of the bacilli themselves, or is an auto-toxin created in the body itself, by an influence exerted on the living fluids and tissues by a ferment-like product of the bacilli, is not determined. But whatever may be the source of the toxin, its effects upon the neurones are constant, as shown by the sufferings of the patients—paralysis of the soft palate, with nasal speech and regurgitation of fluids through the nose when swallowing is attempted; inability to read, owing to the paralysis of the muscle of accommodation; weakness and inco-ordination of the limbs, which may amount to paralysis; absence of the knee-jerks; and often skin anaesthesia

Protozoa and diseases of the nervous system.

The relation of protozoa to the existence of widespread diseases affecting men and animals is becoming yearly of greater importance and interest. Certain hitherto obscure diseases in which the nervous system is profoundly affected are now explained by the invasion of the tissues of the body by these lowly organisms, for example, Sleeping Sickness, the cause of which has been definitely proved to be the Trypanosoma gambiense (see Plate II. fig. 1).

The discovery by Schaudinn of the presence of the Spirochaete Pallida (see Plate II. fig. 2) in the primary and secondary lesions of seventy successive cases of syphilis, and the general acceptance of this organism as the cause of the disease, taken together with the fact that in many respects it simulates the trypanosome in its mode of division and other characters, tend to prove that syphilis is also a protozoal disease.

The bacterial invasion of tissues is generally characterized by a migration of polymorpho-nuclear leucocytes, but protozoal invasion is characterized by a formative hyperplasia of the fixed cell tissues, endothelial, epithelial and conjunctival, and there is a close similarity in the defensive reaction of the tissues to all forms of protozoal invasion (see Plate II. with explanatory text)

If the cause of rabies be regarded as proved since the discovery of Negri bodies, we may assume that just as in malaria the *Haematozoon malariae* undergoes its endocellular development in the red blood corpuscle, the protozoon of rabies undergoes its endocellular development in the nerve cell.

Only a short time has elapsed since Negri showed that in cases of rabies, whether experimental or otherwise, curious bodies measuring from 1 μ to 20 μ could be constantly found in the nerve cells, and that these bodies are not found in the nerve cells in any other disease; so that even if the theory advanced that they are endocellular forms of protozoa prove not true, yet the discovery affords a valuable and expeditious means of determining whether a suspected animal suffered with rabies or not. It is known that the salivary glands and saliva contain the virus, even before the animal shows symptoms. It is known too that the central nervous system contains the virus and that it multiplies there. Experimental inoculation can be made either from the saliva or an emulsion of the central nervous system of an animal suffering with rabies. Moreover, the virus can pass through a Berkfeldt filter; and if the filtrable product be injected into an animal, the animal thus inoculated will die of rabies and exhibit the Negri bodies. There are only two conclusions to be drawn from these observations: (1) If it be a protozoal disease, the organism at one period of its developmental cycle must be so small as to be able to pass through the pores of the Berkfeldt filter. (2) Negri bodies are the result of intra-cellular degenerative changes caused by an elective affinity of the virus for the protoplasm of the nerve cell. The virus, whatever it may be, does not exist in the blood and other organs and tissues. Seeing that the Negri bodies cannot be found in the saliva, although the saliva contains the virus, nor can they be found in the peripheral nerves, although the virus passes by the lymphatics of the nerves to the nerve cells of the spinal ganglia and central nervous system, it must be concluded that the filtrable virus travels to the central nervous system and there increases.

It is a remarkable fact that before the discovery of the Negri bodies, the diagnosis of rabies was made by microscopic examination of the spinal and sympathetic ganglia, particularly the ganglia of the vagus and fifth nerves. Changes were found similar to those met with in other protozoal diseases, namely, sleeping sickness, dourine and syphilis. These changes were proliferation of the interstitial connective tissue cells forming the supporting structure of the ganglion and hyperplasia of the lymphatic endothelial cells forming the capsule containing the nerve cells.

The diagram here given (fig. 1) after Volpino explains the supposed developmental cycle of the protozoon which is presumed to be the cause of rabies. The weak link in the chain is the assumed sporozoit which is so small as to be capable of passing through a Berkfeldt filter. It has taken twenty years to lead to the complete knowledge of the life history of the malarial parasite and its relation to the disease, and all we can say is that there is now a certain amount of evidence forthcoming which tends to show that rabies is due to a protozoon, which Calkins, who discovered a similar body in the epithelial cells of variola, places among the rhizopods.

Trypanosome diseases and affections of the nervous system.

There are certain chronic trypanosome infections in which the nervous symptoms form a special feature of the disease, notably *sleeping sickness* (see Plate II. fig. 1) and a disease affecting horses, termed mal de coit or dourine.

The chronic trypanosome affections resemble in many respects syphilis; they are characterized by local infection, enlargement of the nearest lymphatic glands, a general polyadenitis and successive eruptions, accompanied by fever. The tissue changes are the same whether we examine the primary seat of infection, papular eruptions on the mucous membrane or the skin, or the lymphatic glands.

When the nervous system is affected a local or general chronic meningo-encephalitis is set up, characterized by a meningeal and

FIG. 1.

perivascular infiltration with lymphocytes and plasma cells, occasioned by a chronic irritative process, presumably caused in the case of sleeping sickness by the presence of trypanosomes in the cerebro-spinal fluid (see fig. 8, Plate II.). The same perivascular and meningeal infiltration with plasma cells and lymphocytes is found in syphilitic and parasyphilitic diseases of the nervous system (see Plate II., figs. 7 and 9).

Pathology of the cerebro-spinal fluid.

The significance of pathological changes in the cerebro-spinal fluid has recently become of great importance in the diagnosis of nervous diseases, and a short account of the subject in this article will therefore not be out of place. The cerebro-spinal fluid is clear like water; it has a specific gravity of 1006 and resembles in its composition the blood *minus* its corpuscular and albuminous constituents. It is secreted by the choroid plexus, and if any cause, such as tumour or meningitis, should interfere with its escape from the ventricles it gives rise by pressure to *internal hydrocephalus* and cerebral anaemia which may occasion epileptic convulsions and various degrees of drowsy stupor, lethargy, unconsciousness and even coma. Withdrawal of the fluid by lumbar puncture and by tapping the ventricles of the brain has been employed in treatment, but without very satisfactory results. If, however, lumbar puncture has proved of but little use in treatment, it has proved of inestimable service in the diagnosis of various diseases of the central nervous system. The fluid withdrawn may be examined in various ways which are complementary to one another.

It should be centrifuged and the deposit examined microscopically if necessary after staining by suitable methods; the existence of cells

in a fluid which normally contains no cellular elements indicates disease of the central nervous system. In general paralysis, syphilis of the nervous system and tabes dorsalis even in early stages of these diseases, the deposit is seen to consist almost entirely of lymphocytes. Some evidence of the progress of the disease and the effect of treatment may be obtained by counting the number of cells at different periods. In tubercular meningitis there are also lymphocytes in abundance although usually tubercle bacilli cannot readily be found, yet bacilli are present, for injection of the fluid into a guinea pig is a certain means of determining whether it is tubercular meningitis or not; for if it is, the animal is sure to develop tubercle. In epidemic cerebro-spinal meningitis the cells in the deposit are polymorpho-nuclear leucocytes, and in the leucocytes can be seen the specific organism *Diplococcus intracellularis* with its characteristic staining and cultural characters. Septic, pneumonic and pyogenic organisms may also invade the central nervous system giving rise to meningitis, and in these cases the deposit will be polymorpho-nuclear leucocytes, and perhaps the specific organisms may be seen in stained preparations; but if not, they can be obtained by cultural methods. In all operations of this kind antiseptic precautions must be adopted both for the safety of the patient and the reliability of the findings, otherwise organisms in the skin may contaminate the fluid withdrawn.

Other formed elements which may be found are large cells, macrophages containing blood pigment; these cells indicate that some haemorrhage has occurred. One of the most important uses of lumbar puncture has been the discovery of the cause of sleeping sickness. The fluid withdrawn and centrifuged contains, as one would expect from the lesions in the brain and spinal cord, large numbers of lymphocytes and plasma cells (see Plate II. fig. 10), but besides, the actively moving organisms (*Trypanosoma gambiense*) (see Plate II. fig. 1) which are the essential cause of the disease. It has been remarked that the normal cerebro-spinal fluid is devoid of proteins, but in the various forms of disease above described as containing cells in the centrifuged deposit, there is also in the fluid an appreciable amount of proteins. If pathological cerebro-spinal fluid be added to an equal quantity of saturated solution of sodium sulphate there will be a distinct turbidity indicating the presence of proteins in appreciable quantity. This appreciable quantity of proteins is especially significant in the case of fluid withdrawn from cases of general paralysis or tabes, for it goes *pari passu* in amount with a reaction which is known as the Wassermann *sero-diagnostic reaction for syphilis*; a reaction, however, which is too complicated to explain here, but which is of the greatest importance for the diagnosis of general paralysis and tabes dorsalis. The finding of the *Trypanosoma gambiense* in the cerebro-spinal fluid in sleeping sickness led to the belief that the specific organism of syphilis, Spirochoete pallidum might be found in the cerebro-spinal fluid in syphilitic diseases of the nervous system, but although in a few instances successful inoculation of animals with syphilis by injection of the cerebro-spinal fluid has been effected, yet the organism has only once been found in the fluid withdrawn by lumbar puncture. It has long been a puzzle why only certain individuals, about 5%-8% of those infected with syphilis, should subsequently suffer with diseases of the nervous system. The skin and mucous orifices are the most common sites of secondary and tertiary lesions and after this the nervous system, but no tissue or structure in the body is exempt. It is probable that the virus attacks tissues when in a low state of resistance in a random metastatic manner. It is necessary to distinguish between these true syphilitic lesions which are the result of the reaction of the tissues to the living virus and the parasyphilitic affections, which own a different cause. The former may be most successfully treated with mercury, which has the power of devitalizing the specific virus and preventing its multiplication, the same as atoxyl prevents the multiplication of the trypanosomes. Iodide of potassium favours the absorption of the degenerative products of the cells, and syphilitic tumours may rapidly resolve and disappear under the influence of these drugs. Nervous symptoms even so severe as to threaten a rapidly fatal termination may disappear with energetic treatment when they are due to the syphilitic virus producing an inflammatory reaction of the tissues; not so, however, when the symptoms are slow, insidious and progressive, due to a primary decay of the neurones, *e.g.* the parasyphilitic affections tabes dorsalis and general paralysis of the insane, which are really one and the same disease owning the same cause. We can understand that it may be a chance whether a man suffers with true brain or spinal cord syphilis, because it may be a chance whether the virus is carried there by the blood-vessels and lymphatics, and if carried there finds a suitable nidus to develop. But the parasyphilitic affections appear to be due to a premature primary decay of the neural elements owing to bio-chemical changes in the body induced by reaction to the syphilitic virus. There are a good many facts now forthcoming which show that the subjects of parasyphilis present mild symptoms of syphilis, and upon an average it is not until ten years later that they develop nervous symptoms, which are aggravated rather than benefited by mercury. Such subjects are immune to a second attack of syphilis, and the examination of the blood and cerebro-spinal fluid by the Wassermann reaction of the deviation of the Complement reveals the fact that there is a bio-chemical change; the presence of this reaction may be correlated with the fact that these fluids contain lipoid substances and a globulin in excess. The cerebro-spinal fluid contains these lipoid substances and globulin in proportion to the degree of decay of the neural structure; they arise from the destructive metabolism of the neural elements. But the same lipoid substances and globulin are found only in the blood of syphilitic individuals, consequently it must be supposed that in general paralysis and tabes certain groups and systems of neurones undergo decay from excessive metabolic activity which is brought about by two factors (1) a bio-chemical stimulus, the syphilitic poison, (2) excessive physiological stress, which in *non*-syphilitic individuals would only lead to cerebral or spinal neurasthenia.

Sleeping Sickness is characterized by a progressive *lethargy*, paresis, tremors and the signs and symptoms of neural exhaustion without neural destruction; it comes on slowly and insidiously often years after infection and eventually terminates fatally by intercurrent disease or paralysis of the bulbar centres. Examination of the central nervous system explains the fatal lethargy; the perivascular and meningeal lymphatics are filled with lymphocytes and plasma cells (Plate II. fig. 6.); moreover, the neuroglia supporting cells have undergone a rapid formative proliferation (Plate II. figs. 3 and 5). The effect of this morbid process is to deprive the neural elements of oxygen and nutrition; the neurones in consequence, although not destroyed, are nevertheless unable to function for more than a brief period.

(7) *Poisons introduced into the Body.*—The most widespread and potent cause of nervous and mental disease is the abuse of alcoholic stimulants. At least 20% of the inmates of the asylums of London are admitted with a history of alcoholism. In not more than 10% is alcohol the efficient cause of the mental disease; in many it is only a contributory factor, and in not a few the lapse from moderation to intemperance is the first sign of the mental breakdown. Most of the patients admitted inherit the neuropathic tendency, and it is a rare thing, among such, to find cirrhosis of the liver with ascites, a condition which indicates long persistent spirit-drinking. The writer, from a very large experience as pathologist to the asylums of London, only remembers one such case, and that was in a notorious woman who was convicted nearly four hundred times for drunkenness before she could be certified as of unsound mind, a fact which indicates that she inherited a very stable nervous constitution. To people with unstable nervous systems a relatively small quantity of alcohol may act as a poison. Thus epileptics, imbeciles, criminals, potential lunatics, hysterics, neurasthenics and the subjects of head injury are liable to become anti-social and dangerous to themselves and others by indulgence in quantities of alcohol which would have no harmful effect upon the mentally stable and sound individual. Alcohol may produce acute delirium, with fine tremors, and, generally, visual hallucinations of a horrible nature, indicating acute toxic influence upon the brain. This apparently acute form of alcohol poisoning is met with in chronic inebriates especially; it is much commoner in men than in women, and it is remarkable how a severe injury or illness, such as pneumonia, will bring out *delirium tremens* in a drunkard. Chronic alcoholism manifests itself in a variety of ways according to the inborn temperament of the individual. The well-fed man with an inborn stable well-balanced mental organization is able to consume daily large quantities of alcohol with no other obvious effect than the lowered moral sense of indulgence in a vicious habit. However, chronic alcoholics form a large proportion of those convicted for crimes of violence, homicide, suicide and sexual offences. Alcohol acts especially upon the higher centres of the brain, and a drunken man may exhibit "the abstract and brief chronicle of insanity, going through its successive phases in a short period of time" (Maudsley). The effect on the nervous system of chronic tippling may be dementia, a very characteristic manifestation of the mental degradation being absence of knowledge of time and place, personal illusions and loss of memory of recent events, indicating a failure of receptivity and of the formation of memory-pictures in the higher centres, mental confusion, delusions of persecution, and especially a morbid jealousy with suspicions of fidelity of the husband by the wife or of the wife by the husband. A certain amount of improvement may occur when total abstinence is enforced, which shows the poison has damaged but not destroyed the nervous elements. There is also a form of mental disease characterized especially by hallucinations of hearing and vision, associated with delusions usually of a persecuting nature, unaccompanied by other marked mental disorder. Abstinence and proper control generally ends in recovery, but such cases so frequently relapse that it is fairly certain that alcohol is an exciting factor to a morbid or insane temperament. Besides mental symptoms of chronic alcoholic poisoning, there is frequently paralysis, affecting especially the lower limbs (structures suffer most where vitality is least), although the upper limbs, and even the respiratory muscles, may be affected in severe cases. The patient, usually of the female sex, becomes helpless and bedridden, and death frequently occurs from heart failure. Characteristic features of this affection are great tenderness on pressure of the muscles, especially of the calves, absence of reflexes, a variable degree of skin anaesthesia, wasting of muscles and alteration of the normal electrical reactions, and frequently pyrexia. There is no loss of control over the bladder and bowels, unless there is very marked dementia. This "complex of symptoms" points to a *peripheral polyneuritis*, although frequently changes occur also in the ganglion cells, from which the axis cylinders of the nerves have their

Fig. 1.—Left hemisphere, case of delusional insanity; this in all respects might pass for a normal brain.

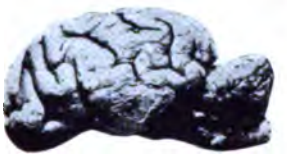

Fig. 2.—Brain of a microcephalic idiot, which weighed only eight ounces although its possessor was an adult woman. The striking lack of development of the hemispheres is shown in their small size, whereby the cerebellum is almost entirely uncovered; moreover the convolutional pattern is simpler than that of an anthropoid ape's brain.

Fig. 3.—Left hemisphere, case of abscess of the frontal lobe: the convolutions and sulci are obliterated and the membranes thickened, so that the fore part of the brain presents the appearance of a membranous bag; this contained a large amount of pus.

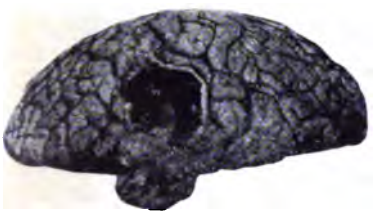

Fig. 4.—Right hemisphere seen from above instead of laterally: a hole corresponding to the middle of the central convolutions is seen, out of which a tumour is displaced towards the middle line.

Fig. 7.—Left hemisphere: a case of advanced dementia, showing atrophy of the convolutions, with deep and wide sulci intervening.

Fig. 5.—Left hemisphere of a woman who for 11 years suffered with *motor aphasia* paralysis of the lower half of the right side of the face, deviation of the tongue to the right and some weakness in the right leg and arm.

Fig. 6.—Brain from a case of apoplexy: the tops of the hemispheres have been sliced off to show the haemorrhage (dark patch) in the right centrum ovale, which has ruptured the fibres proceeding from the motor area of the brain, situated between the basal ganglia.

Fig. 8.—The brain of an adult congenital imbecile. There is a very simple convolutional pattern in comparison with the other brains shown in the figures. The convolutions are small, the secondary gyri are deficient in numbers. The sylvian fissure turns obliquely upwards and there is an obvious deficiency in the superior and inferior parietal lobes.

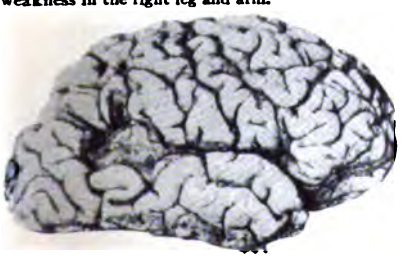

Fig. 9.—Right hemisphere of a woman who for many years was the subject of *sensory aphasia*. The left hemisphere showed a similar lesion to the right but rather more extensive.

Fig. 10.—Left hemisphere and cerebellum of a case of porencephaly. A local atrophy of the convolutions, owing to a vascular lesion before birth, is seen in the parietal lobe.

Photographs of the brain illustrating various pathological conditions.

NEUROPATHOLOGY

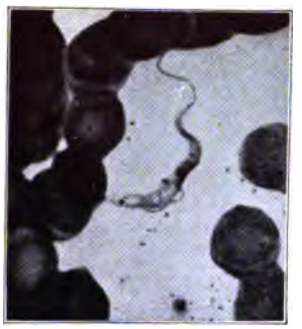

Fig. 1.—Trypanosoma gambiense in the blood from a case of sleeping sickness in a European. The undulatory membrane is clearly seen; the head of the organism with its micronucleus is in contact with a red blood corpuscle.

Fig. 2.—*A*. and *B*. The spirochaete pallidum. *A*. shows the organisms seen in a section of mucous tubercle stained by Levaditi's silver method; the lowest with 8 equal spirals and a pointed end is the most typical. *B*. Spirochaetes in a smear preparation stained by Leishman.

Fig. 3.—Section of the brain of a European who died of sleeping sickness, showing an enormous increase of large branching neuroglia cells around a small vessel of the cortex.

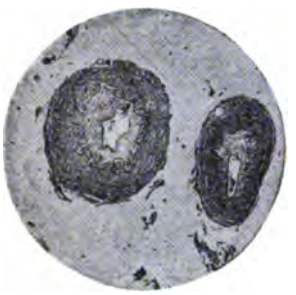

Fig. 4.—Very marked syphilitic arteritis, showing great diminution of the lumen, mainly caused by an inflammatory thickening of the inner coat.

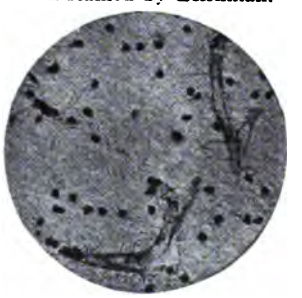

Fig. 5.—Section of the base of the brain of a monkey that died of experimental sleeping sickness caused by inoculation of the Trypanosoma gambiense.

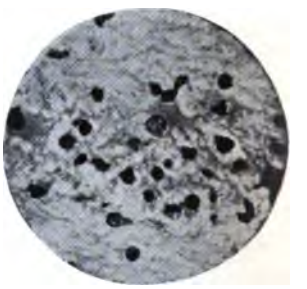

Fig. 6.—Longitudinal section of a perivascular sheath of the cortex of a monkey that died of experimental sleeping sickness. The large branching neuroglia cells are seen undergoing proliferation.

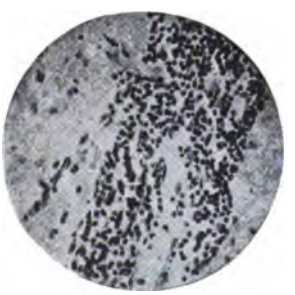

Fig. 7.—Longitudinal section of a small vessel of the cortex from a case of well-marked general paralysis of the insane.

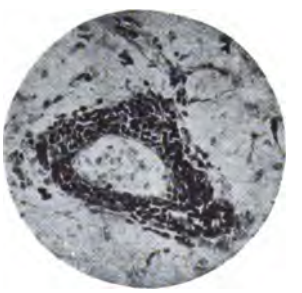

Fig. 8.—Transverse section of a small vessel of the cortex from a case of sleeping sickness, showing the perivascular cell infiltration of lymphocytes and plasma cells.

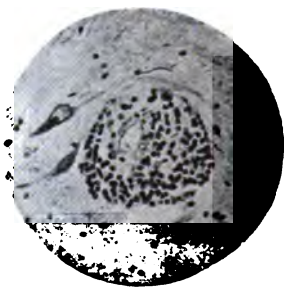

Fig. 9.—Transverse section of a small vessel of the cerebral cortex from a case of syphilitic gummatous meningitis, showing the same perivascular cell infiltration of lymphocytes and plasma cells as seen in figs. 7 and 8.

origin (*vide* figs. 2, 3, 4, and 5). Alcoholic polyneuritic psychosis affecting women in many ways resembles delirium tremens; the fact that neuritis occurs much more frequently in women is probably associated with a greater liability to the influence of microbial toxins by absorption from the organs of reproduction. Many other poisons, notably lead and arsenic, the specific fevers before mentioned, syphilis and alterations of the blood due to imperfect metabolism, such as occur in diabetes and gout, may produce, or become important factors in producing, peripheral neuritis. The outbreak of arsenical neuritis from beer containing this poison in Manchester in 1900 is of interest, from the fact that the symptoms closely resembled acute alcoholic neuritis. A distinctive feature, however, was the pigmentation of the skin and the severity of the nervous symptoms. A disease which is common in the East, termed *Beriberi*, is a form of neuritis, the cause of which is not exactly known (see BERIBERI). Anaesthetic leprosy is an interstitial inflammation of the nerves due to the *Lepra bacillus*. Among the nervous diseases due to occupation may be cited lead-poisoning. This is peculiar in selecting the nerve which supplies the extensor muscles of the wrist and fingers, so that dropped wrist is almost characteristic of this form of toxic neuritis. Lead also produces a chronic inflammation of the cerebral cortex, *Encephalitis saturnina*, causing a complex of symptoms, namely, dementia, loss of memory, weakened intellect, paresis and epileptiform seizures, hallucinations of sight and hearing, and mental exaltation or depression. Mirror-makers suffer with characteristic fine tremors, from the slow absorption of mercury into the system. Workmen at indiarubber factories may suffer from severe mental symptoms, owing to the inhalation of the fumes of bisulphide of carbon. Serious nervous symptoms have followed carbon monoxide poisoning. Cases which have recovered from the immediate effects have suffered with dementia and symptoms of disseminated sclerosis, the result of multiple haemorrhagic softenings.

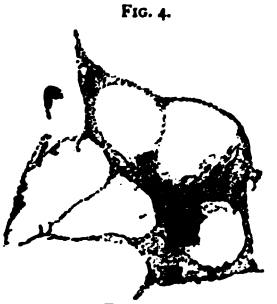

FIG. 5.

FIGS. 2, 3, 4 and 5.—Spinal motor cells in various stages of destruction, from a case of acute alcoholic poly-vacuolation. Compare with the appearances of a normal cell, fig. 12.

There are a certain number of poisons, besides alcohol, which act upon the nervous system when continually entering the body as the result of a *habit*, namely, absinthe, ether, cocaine, opium, morphia, hashish and tobacco. Each of these poisons produces a train of symptoms denoting a selective influence upon certain parts of the nervous system. In illustration thereof may be mentioned impairment of central vision in tobacco amblyopia.

The disease *pellagra*, an affection of the skin associated with degenerative changes in the brain and spinal cord and characterized by melancholy with suicidal impulses, sometimes mania associated with paresis, was long considered to be due to the eating of bad maize. But in 1910 the recent research on this disease, still in progress, seemed to negative this theory (see PELLAGRA). Another disease, *ergotism*, in an epidemic form, has affected poor people in Russia and North Germany when obliged to subsist upon bread made of rye which has been attacked by the ergot fungus. The poison thus introduced into the system produces progressive degenerative changes in the brain and spinal cord, which are manifested by psychical disturbances, such as slowness of thought, weakness of memory, dulness of perception, sometimes delirium and incoherence; other symptoms are blunted sensibility, dilated pupils, muscular spasms, perhaps even epileptiform seizures and ataxy, and, lastly, stupor deepening into coma. Sausage disease, due to eating decayed meat and fish infected with *Bacillus botulinus*, is associated with symptoms which frequently terminate fatally, and it has been shown that the symptoms are due to a poison which has a very destructive effect upon the nerve cells (fig. 6).

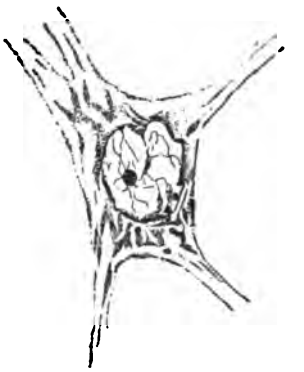

FIG. 6.—Cell illustrating swelling of nucleus and chromatolysis in acute toxaemia produced by poison of bacillus botulinus. Compare with the appearances presented by a normal cell, fig. 12.

II. *Normal and Abnormal Stimulation.* — The nervous system, in order to develop and manifest functional activity, requires suitable stimulation from without. Structure and function are mutually reciprocal and interdependent; for a structure which is not used will gradually lose its function, while its nutrition will also suffer, and in time atrophy may occur. Consciously and unconsciously, a continuous stream of impulses is pouring into the nervous system from without by the sensory channels, which are the avenues of experience and intelligence, and our somatic and psychical life depends upon the existence of such stimuli. The nervous system in the form of systems, groups and communities of neurones, each with special functions, yet all woven together in one harmonious whole, develops in a particular way in consequence of the awakening influence of these stimuli from without. Consequently nervous structures which are not used are liable to undergo regressive metamorphosis and atrophy; thus amputation of a limb in early life causes atrophy of the nervous structures which presided over the sensation and movement of the part. This is seen both in the grey and white matter of the spinal cord; there is also an atrophy of the psychomotor neurones of the brain presiding over the movements of the limb.

A healthy physical, intellectual and moral environment of the individual is an essential factor in the prevention and cure of psychoses and neuroses, because it tends to develop and strengthen body and mind, deliberation, judgment and the higher controlling functions of the brain. A function not used will gradually disappear, and become more and more difficult to evoke. This fact is of importance in functional neuroses and psychoses, *e.g.* hysterical paralysis, melancholia and delusional insanity, because the longer mental or bodily function is left in abeyance, the more likely is the defect to become permanently installed. The converse is also true; the longer a perverted function exists, the more unlikely it is to disappear. Thus auditory hallucinations, a very important and frequent symptom in the insane, commence with indistinct noises: these are followed by "voices," which eventually become so distinct and real that the greater part of the patient's psychical existence is concentrated upon, and determined by, this abnormal stimulus from within, indicating progressive strengthening and fixation of the perverted functions of the mind, and progressive weakening and dissolution of the normal functions.

Mental pain in the form of grief, worry, anxiety, fright, shock, violent emotions (pleasurable or painful), disappointed love, sexual excesses or perversions, and excessive brain work, frequently precede and determine, in persons with the insane or neuropathic taint, various forms (*a*) of psychoses, *e.g.* mania, melancholia, delusional insanity; (*b*) of neuroses, *e.g.* chorea, hysteria, epilepsy, hystero-epilepsy; (*c*) or organic brain disease, *e.g.* apoplexy, thrombosis, general paralysis.

Visceral reflex irritation affords many examples of neuroses and psychoses, the symptoms of which are set up by irritation of the viscera, *e.g.* intestinal worms. Teething and indigestible food are often the exciting cause in infants and young children of convulsions, spasms of the glottis and tetany. Various functional and organic

diseases of the female reproductive organs act as exciting causes in the production of hysteria, hystero-epilepsy, melancholia and mania; moreover, paroxysmal attacks in these diseases are more liable to occur at the menstrual period or menopause. The irritation of a carious tooth may produce spasmodic tic and trigeminal neuralgia. Wax in the ear may occasion vertigo and tinnitus; and errors of refraction in the eyes may be the cause of attacks of migraine, and even tend to excite epileptic fits in a person suffering from epilepsy. Numerous other examples of peripheral disturbance could be mentioned as exciting causes of nervous affection in neurotic individuals. Irritation of the terminals of the vagus in almost any part of its widespread visceral distribution may lead to vomiting. The characteristic pain of angina pectoris, which radiates down the inner side of the left arm, is explained by the fact that the cardiac branches of the sympathetic arise from the same segments of the spinal cord as the sensory branches of the ulnar nerve; consequently the pain is referred to the corresponding skin area supplied by this nerve. This is one example of a great number of *referred pains*.

III. *Injury or disease of enclosing or supporting structures* may lead to paralytic or irritative lesions of the nervous system, or the two may be combined. Blows or wounds of the head and spine may damage or destroy the nervous structures by shock or direct injury. Concussion of the brain or spinal cord may occur, as a result of injury, without any recognizable serious damage of the enclosing structures or even the central nervous system. Shock, due to concussion, can only be explained by a molecular or bio-chemical change in the nervous structures.

Direct injury or a fall fracturing the skull, driving the fragments into the brain, will cause direct destruction of the nervous tissue; but wounds and diseases of the enclosing and supporting structures, if producing simple non-infective inflammation, give rise only to such symptoms as accord with the nerve structure irritated or destroyed. Should, however, the wound or diseased structure become infected with micro-organisms, the disease spreads and becomes generalized likewise the symptoms. Of all the causes of infective inflammation, middle-ear disease, on account of its frequency and insidious onset, is the most important. It is very liable, when neglected, to be followed by a septic meningitis, encephalitis and brain abscess, the most frequent seat of which is in the adjacent temporal lobe, but it may be in other parts of the brain, *e.g.* the cerebellum and frontal lobe (Plate I. fig. 3). The peripheral nerves may be destroyed or irritated by direct injury, disease or new growth in adjacent tissues, or they may be involved in the callus thrown out round the seat of a fracture.

Diseases of the blood-vessels are among the most frequent causes of organic brain disease. Arteries or veins—more frequently the former—may become blocked or ruptured from various causes. The immediate effect is a disturbance or loss of consciousness, and the individual may be "struck down" (see APOPLEXY) and never regain consciousness (see COMA). Should the individual recover consciousness more or less permanent loss or disturbance of function will be the result. Paralysis of some form, especially hemiplegia, is the commonest result, but the loss or disturbance of function will depend upon the seat of the injury.

The cerebral arteries may be occluded by embolism; a portion of a clot or vegetation from a diseased valve of the left side of the heart may be detached, and escape into the circulation; and this is carried into one of the arteries of the brain, usually the middle cerebral, more often of the left side than the right. The area of brain tissue supplied by that artery is deprived of blood, and undergoes softening in consequence, resulting in paralysis of the opposite half of the body (hemiplegia) associated with aphasia when the paralysis affects the right side in a right-handed person (Plate I. figs. 5 and 9). When the embolus is infective, as it frequently is in ulcerative endocarditis, its lodgment in an artery of the brain, not only blocks the vessel but leads to an infective inflammation and softening of its coats, with the formation of an aneurism. The aneurism may suddenly rupture into the substance of the brain and produce apoplexy. In fact the majority of cases of apoplexy from cerebral haemorrhage recurring in young people are due to this cause. Softening may also arise from coagulation of the blood (thrombosis) in the arteries or veins. There are many causes which generally combine or conspire together to produce thrombosis, viz. a weak acting heart and altered conditions of the blood, and sometimes independently of vascular disease spontaneous coagulation in a vessel of the brain may occur. It is sometimes met with in the cachexia of certain grave diseases, viz. in phthisis and cancer, in typhus and pneumonia, after parturition and in marasmus at all periods of life, but especially in the very young and very old. But thickening, roughening and a degenerated condition of the cerebral arteries known as atheroma when associated with a weak acting heart is especially liable to give rise to thrombosis and softening, and this is a very common cause of apoplexy, paralysis and dementia in people who have passed middle life. General disease of the arteries of the body, associated especially with chronic Bright's disease and high arterial pressure, is frequently attended with the formation of minute miliary aneurisms upon the cerebral arteries, which may rupture and cause apoplexy. Haemorrhage into the brain from this cause is especially liable to occur in certain situations; one vessel in particular, supplying the basal ganglia, most frequently gives way, the effused blood tearing through the motor efferent fibres, which, proceeding from the cerebral cortex in the shape of a funnel, become aggregated together to form the neck between the two masses of grey matter—the optic thalamus and the corpus striatum (Plate II. fig. 6). The result is hemiplegia of the opposite side of the body. Disease of the arteries of the central nervous system, occurring in a person under forty, is generally due to syphilis, the virus of which produces an inflammation of the coats of the vessel, especially the inner (see Plate II. figs. 4, 9, 10). The thickening and narrowing of the lumen with loss of elasticity of the arteries of the brain generally, may suddenly or gradually set up conditions of cerebral anaemia and give rise to semi-comatose and comatose or even apoplectic states. Occlusion by the inflammatory proliferation or by the sudden clotting of blood in the diseased vessel may occur, the immediate effect of which may be an epileptic or apoplectic fit; the result is softening; and seeing that any or all the arteries of the brain may be affected successively, simultaneously, or at random, the symptoms may be manifold. They may be general or local, and not uncommonly are associated with inflammation of the membranes. The disease, under treatment, may abate, and the paralytic or mental phenomena partially or completely disappear, indicating the restoration, or partial restoration, of the circulation in the diseased arteries; sometimes with the lapse of treatment and sometimes without, new symptoms, such as paralysis of a fresh group of muscles or of the opposite side of the body, may manifest themselves, showing that the disease has attacked a fresh set of arteries. *Disseminated sclerosis* (*insular*) is another random morbid process, affecting especially the white matter, with certain characteristic symptoms of a progressive character, the pathology of which is not understood fully, but is probably due to some toxic cause. Islands of nervous tissue undergo a morbid change, commencing in

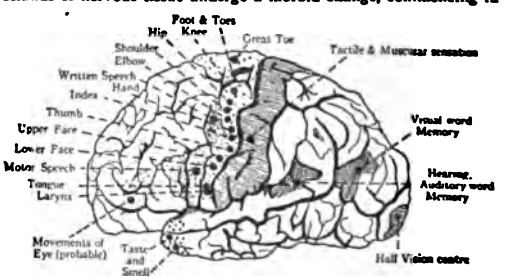

FIG. 7.—Diagram of left cerebral hemisphere, showing localization of function. The motor region is situated in front of the central sulcus, and is arranged in a series from "toe to larynx" downwards, corresponding in an inverse manner to the spinal series. Irritation of any part of this area will cause localized convulsive spasms, which may spread in a definite march to the whole motor area, as in Jacksonian epilepsy. Destructive lesions will cause paralysis. The centre for "taste and smell" is represented at the tip of the uncinate convolution. The centre for "half-vision" is only in small part represented, for the larger part is on the mesial surface. "Hearing" is represented occupying the posterior half of the first temporal convolution, but only a small part of the centre is seen, for the greater part lies above within the fissure of Sylvius. Included in this area, but in the *left* hemisphere only, is the centre for "auditory word memory"; destruction of this causes inability to understand the meaning of words uttered, although the patient is able to read aloud. Behind this, in the angular gyrus, is the centre for "visual word memory"; destruction of this causes loss of power of understanding of written or printed words—therefore inability to read. In front of the motor area is Broca's convolution, the centre of "motor speech"; destruction of this produces motor aphasia, or inability to articulate words. Above this is a centre which is connected with written speech. These four centres concerned with verbal and written language are connected by commissural fibres, and destruction of these connexions leads to various defects in verbal and written language. It will be understood from this diagram that diseases of the left hemisphere in right-handed persons are associated with results of more significance than similar affections of the right hemisphere.

the myelin sheath and ending in an increase of the supporting neuroglia tissue at the expense of the true nervous tissue.

Tumours and new growths in the central and peripheral nervous systems may be primary or secondary: the former arise in the supporting, enclosing or nutrient tissue elements; the latter are metastatic deposits from tumours originating elsewhere. Tumours may be single or multiple, the special symptoms occasioned depending upon the seat of the tumour and whether it destroys or only irritates the adjacent nervous tissue. Tumours situated within the cranial cavity cause general symptoms, namely, optic neuritis, severe headache and vomiting; these symptoms, which are caused by increased intracranial pressure, are more severe in rapidly-growing vascular tumours, even though small, than in large slow-growing tumours.

FIG. 8.—Diagram of section of the spinal cord in the upper cervical region, showing recent degeneration of the crossed pyramidal tract of the right side and direct pyramidal tract of the left side. The black dots indicate the degenerated fibres stained by the Marchi method. This degeneration is secondary to haemorrhage into the internal capsule of the left hemisphere, and it will be observed by the number of degenerated fibres that the greater bulk have crossed over to the right side of the spinal cord, thus agreeing with the fact that the paralysis is of the right half of the body.

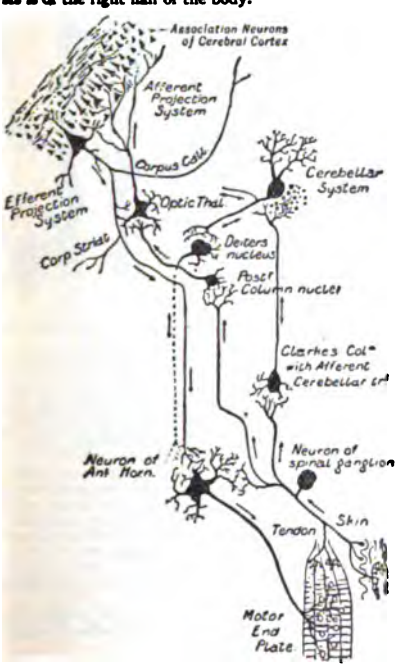

FIG. 9.—A diagram to indicate afferent, efferent and association systems of neurones. It will be observed that there are three nervous circles indicated by the arrows—spinal, cerebellar and cerebral. In every perfect co-ordinate movement impulses properly adjusted are flowing along these three systems of neurones. In systemic degenerations one or more of these systems may be affected, and the symptoms will depend partly upon the function which is lost or disturbed, and partly upon the disturbance of equilibrium of the three co-ordinated systems.

FIG. 10.—Diagram of spinal cord, fifth lumbar segment, from a case of advanced *tabes dorsalis*. The posterior column is shrunken, and but faintly stained, except in the anterior part; the shrinkage and the loss of stainability are due to the absence of fibres of the posterior roots, which normally form the greater part of this region of the cord. The fibres which are seen in the anterior part of the posterior column are derived from cells within the spinal cord, and belong to spinal association neurones.

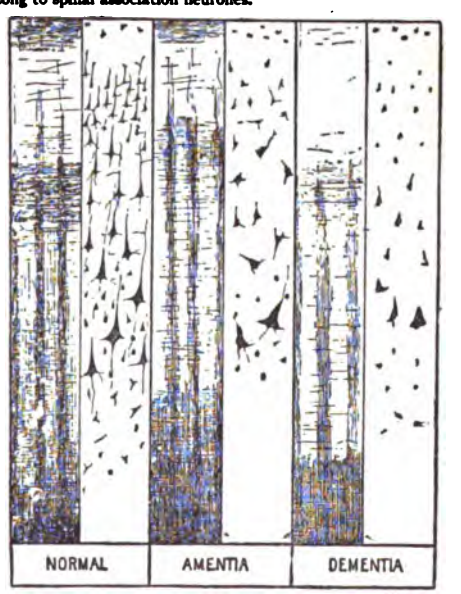

FIG. 11.—Diagram illustrating the relative number and wealth of cells and fibres in the cerebral cortex in the normal brain, in amentia, and dementia. The horizontal systems of fibres are association systems, and it will be observed that these are especially diminished in amentia, and still more in dementia, whereas the radial fibres are less affected. In the normal, there are five layers of cells arranged in columns (Meynert's); in the pathological conditions it will be observed that the pyramidal-shaped cells no longer have their apical processes pointing vertically upwards. The processes are broken off, the cells are distorted in shape and diminished in numbers, and the degree of dementia in a wasted brain is proportional to the atrophy and destruction of the small and medium-sized pyramids of the whole cerebral cortex, and the disappearance of the superficial layers of fibres. This is specially manifested in paralytic dementia and the dementia of chronic insanity.

Some tumours are highly vascular and a large thin-walled vessel may suddenly rupture and cause an apoplectic fit. If the growth is situated in a portion of the cortex having some special localizing function, *e.g.* the motor area (*vide* fig. 7), it may give rise to epileptiform convulsions, starting in a limb or definite group of muscles; but the irritation usually spreads to the whole motor area of the same side, and even extends to the opposite hemisphere, by an overflow of the discharge through the corpus callosum. In such case there is loss of consciousness. If, however, the tumour destroys the cerebral cortex of a particular region, it may give rise to a paralytic lesion, *e.g.* paralysis of the arm (*vide* Plate I., fig. 4).

Organic diseases of the blood-vessels, or of supporting and enclosing tissues, produce secondary degenerations of the nervous system. The symptoms, like the lesion, are obvious, coarse and obtrusive; frequently arising suddenly, they may in a short time terminate fatally, or tend towards partial or complete recovery. Various forms of motor and sensory loss and disturbance of function may arise, indicating destruction or disturbance of particular regions of the central nervous system; and degenerations in certain tracts and systems of fibres arise, corresponding in histological character with those observed when a nerve fibre is separated from its cell of origin by section (secondary degeneration of Waller and Türck) (*vide* fig. 8, with explanation). This form of degeneration must be distinguished from primary degeneration, which is due to an inherent nutritional defect of the nerve cell and all its processes (the neurone), in which a regressive metamorphosis occurs; it starts in the structures of the neurones latest developed (namely, the myelin sheath and the fine terminal twigs of the axis cylinder and dendrons), and proceeds back to the main branches and trunk, eventually destroying the trophic and genetic centre itself, the nerve cell. These *primary* degeneration processes are insidious in origin, progressive in character, and nearly always fatal in termination; they affect definite systems, groups and communities of neurones in a progressive manner, and, therefore, are associated with a progressive evolution of symptoms, related to the structures affected (*vide* figs. 9 and 10).

To cite some examples: (1) *Locomotor ataxy*, on the one hand, is a primary degeneration affecting the *afferent* system of neurones; it is characterized by muscular incoordination without wasting, inability to stand with the eyes shut, lightning pains in the limbs, absent knee-jerks, Argyll-Robertson pupils, and other symptoms pointing to a morbid process affecting especially the afferent sensory system of neurones. (2) *Progressive muscular atrophy*, on the other hand, is a disease of the *efferent* motor system of neurones of the brain and spinal cord, characterized by progressive wasting of groups of muscles innervated by groups of neurones which are undergoing degeneration. A fatal termination to this disease frequently arises from affection of the medulla oblongata, causing what is known as bulbar paralysis. Infantile paralysis is an acute inflammation of the anterior horns of the spinal cord, causing destruction of the spinal motor neurones of the anterior horn. It differs from the above chronic disease in its sudden onset and non-progressive character; it resembles it in producing paralysis of muscles without sensory disturbance. (3) *General paralysis of the insane* is a degeneration which begins in the association system of neurones of the cerebral cortex, but which may be, and frequently is, associated with degeneration of the afferent or efferent systems (fig. 9).

Neuroses and psychoses have not hitherto been satisfactorily explained by definite morphological changes in the brain (Plate I., fig. 1). We know little or nothing accurately about the morbid histology of insanity, except as regards the morphological changes met with in cases of amentia and dementia. The conditions of amentia, namely, idiocy and imbecility, are associated with arrest of development of the brain, as a whole or in part, the naked-eye evidence of which may be afforded by small size and simplicity of convolutions of the brain as a whole or in part (Plate I., figs. 2, 8 and 10); and the microscopical evidence by arrest of development, or imperfect development, of structures connected with the higher functions of the mind, namely, the association neurones in the superficial layers of the cerebral cortex (fig. 11). Conditions of dementia, primary or secondary, are associated with progressive decay and atrophy of the superficial layers of the grey matter of the cortex, and naked-eye evidence thereof is afforded by partial or general wasting of the cerebral hemispheres, accompanied with thickening of the pia-arachnoid membrane, atrophy of the convolutions, and with deepening and widening of the intervening sulci (Plate I., fig. 7).

The cerebro-spinal fluid fills up the space in the cranial cavity caused by the atrophy of the brain; consequently there is a great excess of this fluid. Before general paralysis was recognized as a disease some of the cases which died suddenly in a fit were doubtless termed serous apoplexy. This wasting so characteristic of general paralysis is especially due to atrophy of the cells and fibres of the superficial grey matter of the cortex, sections of which, examined microscopically, after suitable methods of staining have been employed, show great poverty, or complete loss, of three sets of delicate myelinated fibres, namely, tangential, super-radial and the inter-radial corresponding to the line of Baillarger. This degeneration

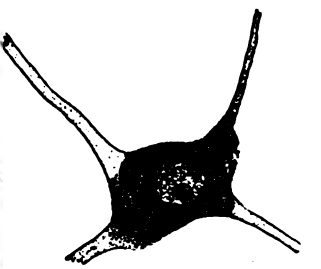

FIG. 13.

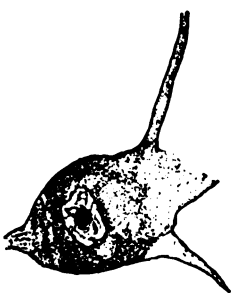

FIG. 14.

FIG. 15.

FIG. 16.

Motor Cells, drawn from Microphotographs of Preparations stained by Nissl method to show Microchemical Changes produced by various diseases.

FIG. 12.—Normal motor cell from cerebral cortex, showing a mosaic pattern of the cytoplasm due to a substance stainable by basic aniline dyes; this stainable substance exists also on the dendrons. By comparing the appearances of this cell with the other figures a just idea can be obtained of the morbid changes which result in various pathological conditions.

FIG. 13.—Cell from a case of hyper-pyrexia—disappearance of the mosaic pattern, substance uniformly stained; absence of the chromatic elements on the dendrons, due to a precipitation of cell-globulin by the heat.

FIG. 14.—Cell in an advanced stage of coagulation necrosis, complete absence of mosaic pattern; diffuse fine dust-like stain; breaking off of the processes; all caused by softening of the brain from vascular obstruction.

FIG. 15.—Another specimen from the same brain in a still more advanced stage of destruction, and showing a phagocyte attached to the cell and devouring the decayed structure.

FIG. 16.—A cell with enormously swollen nucleus, the result of hydration due to absorption of fluid after ligature of cerebral vessels. Such a cell will probably recover.

of the superficial association fibres of the cerebral cortex affects especially the frontal and central convolutions, and is the earliest and most constant microscopical change in progressive paralytic dementia; it is accompanied usually by meningeal and vascular changes, atrophy of the nerve cells, and proliferation of the neuroglia (fig. 11); especially characteristic is the perivascular infiltration with lymphocytes and plasma cells (see Plate II., fig. 7). It was indeed thought that this condition of the vessels was pathognomonic of general paralysis; it certainly is not, for it is found throughout the central nervous system in sleeping sickness and cerebro-spinal syphilis (Plate II., figs. 8 and 9). It sometimes occurs in the neighbourhood of cerebral tumours but it is not found in uraemia or lead encephalitis. Possibly new methods may enable us to show changes of structure in diseases such as epilepsy and delusional insanity, in which hitherto no naked eye or microscopical structural defects accounting for the symptoms have been certainly demonstrated.

In conditions of acute mania there is usually considerable vascular engorgement. We should, however, probably be more correct in assuming that insanity (especially those forms in which there is neither amentia or dementia) is due to alterations in the quality rather than the quantity of blood in the brain. The primary dementia of adolescence, which in 80% of the cases occurs before the age of 25, in which hereditary taint is most common, and which frequently is accompanied by, or terminates in, tuberculosis, can be explained by the effect of toxaemic conditions of the blood on cerebral neurones with an inborn low specific energy and metabolic activity. The histological changes found in the brain do not serve to explain the symptoms, and we must look to bio-chemical changes in the body acting upon an innately unstable brain to explain the problems of the disordered mind in this disease.

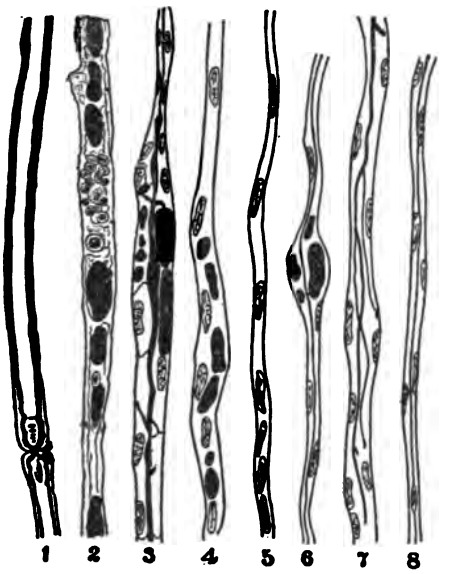

FIG. 17.—Diagram to illustrate various stages in degeneration and regeneration of medullated nerve fibres.

1. Normal medullated nerve with node of Ranvier.
2. Degenerated nerve, ten days after section, showing degenerated myelin stained black; disappearance of axis-cylinder.
3. Central end of cut nerve, showing at the top an axis-cylinder budding out, proliferated neurilemmal cells, and still some degenerated myelin in sheath.
4. Peripheral cut end of same, showing proliferated neurilemmal cells, still some degenerated myelin.
5. Complete absorption of degenerated myelin, proto-plasmic basis of new fibre formed out of neurilemmal cells.
6. A new fibre, with axis-cylinder.
7. Central end of cut nerve at junction, showing an axis-cylinder sprouting and forming a number of axis-cylinder processes, which grow into the peripheral end to form new channels of conduction.
8. Is a new regenerated fibre resembling a sympathetic fibre in having as yet no myelin sheath; as the nerve becomes excitable and stimulus passes, a myelin sheath is formed.

Microscopical Changes in Degeneration of the Neurone.—About 1850, Waller demonstrated that a nerve fibre underwent degeneration to its termination when separated from its cell of origin; hence the term "Wallerian degeneration." Embryological researches by Professor His showed that the axis-cylinder process (the essential conducting portion of the nerve fibre) is an outgrowth of the nerve cell. The cell, therefore, is the trophic and genetic centre of the nerve fibre. Acute alterations and death of the nerve cells may occur from toxic conditions of the blood; from high fever (107°-110° F.); arrest of the blood supply, as in thrombosis and embolism; or actual destruction by injury, haemorrhage or inflammation. These morbid processes produce, as a rule, bio-chemical as well as morphological changes in the nerve cell and its processes. Space will not allow of a full description, but some of these changes are indicated in figs. 18-22, with explanatory text. When a nerve cell dies, the nerve fibre undergoes secondary degeneration and death; that is to say, the whole neurone dies, and regeneration, at any rate in the higher vertebrates, does not take place. Restoration, or partial restoration, of function is due to other structures taking on the function, and the more specialized that function is, the less likely is restoration to take place. If, however, a peripheral nerve is divided, its component fibres are merely severed from their cells of origin. All that portion of the nerve which is in connexion with the nerve cells of origin practically undergoes no change. The peripheral portion undergoes degeneration, but from the central end of the nerve new axis cylinders again grow out and a new nerve is formed. With this regeneration comes restoration of function, which may be hastened by suturing the ends of the cut nerve. A similar regeneration, however, does not occur after section of fibres of the white matter of the central nervous system, and this may be due to the fact that the nerve fibres of the white matter of the cerebro-spinal axis possess no nucleated sheath of Schwann, which, by the light of recent investigations, is shown to play an important part in regeneration; in the writer's opinion, the neurilemmal sheath of the old fibre forms a new protoplasmic basis, into which the axis-cylinder from above grows, the passage of stimulus determining its function. Fig. 17, Nos. 1-8, with explanatory text, shows the changes which occur in degeneration and regeneration of a peripheral nerve after section, with loss of function; and subsequent union, with restoration of function. The writer, in conjunction with Professor Halliburton, has shown that the characteristic microscopical changes in the myelin sheath which occur in the process of degeneration are due to a splitting up of the complex phosphoretted substance "protagon" into glycero-phosphoric acid, choline and oleic acid by a process of hydration. The Marchi reaction, which has been found so useful for demonstrating degeneration of the central and peripheral nervous systems, is dependent upon the fact that the myelin sheath, after hardening in a solution of bichromate of potash, does not turn black when acted upon by osmic acid, whereas the simpler non-phosphoretted fatty product of degeneration is stained black. When the Marchi reaction of degeneration is fully developed, it has been ascertained that the nerve yields no phosphorus. The degeneration resulting from section of a nerve is termed *secondary*, to distinguish it from another, *primary*, due to slow

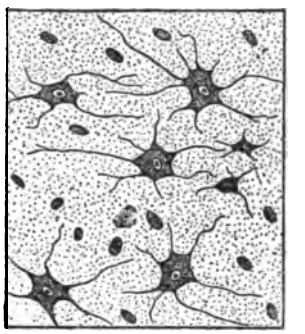

FIG. 18.—Diagram drawn from photomicrograph to show different forms of neuroglia cells in a patch of sclerosis secondary to degeneration and disappearance of the neurones. Observe the large branched cells of Deiters.

and progressive decay of the whole neurone, beginning usually at the terminal twigs and proceeding back towards the cell body with its contained nucleus. These primary degenerations involve systems of neurones, correlated by function rather than by anatomical situation. Examples are afforded by locomotor ataxy and progressive muscular atrophy, the former being a degeneration of the afferent sensory system of neurones, the latter of the motor efferent system. The cause of primary degenerations is probably a defect inherited or acquired in the "vita propria" of the neurones affected. They slowly atrophy and disappear, and their place is filled up by an overgrowth of the supporting neuroglia tissue (figs. 10 and 18). This overgrowth of dense tissue is termed sclerosis, and was erroneously considered to be the cause, instead of the effect, of the atrophy of the nervous tissue.

For further information the reader may consult the Croonian Lectures on the Degeneration of the Neurone, by F. W. Mott, published in the *Lancet* (1900); and the same writer's "Introduction to Neuropathology," in *Allbutt's System of Medicine*. Also Gower's *Handbook of the Nervous System*, von Monakow's *Gehirn Pathologie*, Ford-Robertson's *Pathology of Mental Diseases* and Mott's *Archives of Neurology*, vols. 1, 2, 3 and 4. (F. W. Mo.)

NEUROPTERA (Gr. νεῦρον, a nerve. and πτερόν, a wing), a term used in zoological classification for an order of the class *Hexapoda* (*q.v.*). No ordinal name used in the class has had so many varying meanings given to it by different authors. As first used by Linnaeus (1735) it included all insects with mandibulate jaws and two pairs of net-veined wings—dragon-flies, May-flies, stone-flies, lacewing-flies and caddis-flies—and it has been employed in the same wide sense by D. Sharp (*Cambridge Nat. Hist.* vol. v., 1895). But detailed study of these various groups of insects shows that beneath their common superficial resemblances lie important distinctions in structure, and essential differences in the course of the life-history. Some of the families —the stone-flies, for example—have the young insect much like the adult, growing its wings visibly outside the thoracic segments, and active at all stages of its life. The dragon-flies and May-flies are also active throughout their lives and possess external wing-rudiments, though the young insects differ rather strikingly from their parents. All such families—falling into the group Exopterygota as defined in the classification of the Hexapoda—were separated from the Neuroptera by W. E. Erichson (1839) and united with the Orthoptera, with which order some entomologists still associate them under the name of "Pseudo-neuroptera." The other groups of the old Linnean order (such as lacewing-flies and caddis-flies)—which are hatched as larvae markedly unlike the parent, develop wing-rudiments hidden under the larval cuticle, and only show the wings externally in a resting pupal stage, passing thus through a "complete" metamorphosis and falling into the sub-class Endopterygota—were retained in the order Neuroptera, which thus became much restricted in its extent. More recently the subdivision of the Linnean Neuroptera has been carried still further by the separation of the caddis-flies and scorpion-flies as distinct orders (Trichoptera and Mecaptera respectively), and by the withdrawal of the "Pseudo-neuroptera" from the Orthoptera—with whose typical families they have little in common—and their division into a number of small orders. Altogether, eight orders are recognized in the classification adopted here, the first five of these belonging to the sub-class Exopterygota and the last three to the Endopterygota (see HEXAPODA).

The multiplication of orders is attended with practical difficulties, and the distinctions between the various groups of the Linnean Neuroptera are without doubt less obvious than those between the Coleoptera (beetles) and the Diptera (two-winged flies) for example. But if classification is to express relationship, it is impossible to associate in the same order families whose kinship to insects of other orders is nearer than their kinship to each other. And no student can doubt that the stone-flies are akin to Orthoptera and the caddis-flies to the Lepidoptera, while dragon-flies and May-flies stand in an isolated position with regard to all other insects. In the present article. for the sake of convenience, all the insects which have been regarded by Linnaeus and others as "Neuroptera" are included, but they are distributed into the orders agreed upon by the majority of modern observers, and short characters of these orders and their principal families are given. For further details the reader should consult the special articles on these groups, to which cross-references will be found.

Sub-class EXOPTERYGOTA

Order *Plecoptera*.

This order was founded (1869) by F. Brauer—the name having been long previously suggested by H. Burmeister (1832)—to include the single family of the Perlidae or stone-flies. They resemble the Orthoptera more nearly than do any other group of the Linnean Neuroptera, having the anal area of the hind-wings folding fanwise beneath the costal area and the whole hind-wing covered by the fore-wing when the insect is at rest, though the forewing is not firmer in texture than the hind-wing, as is the case in the Orthoptera. In the opinion of J. H. Comstock and J. G. Needham the wing-neuration in this order is the most primitive to be found in the Hexapoda. The tenth abdominal segment carries a pair of jointed cerci which are often elongate, and the feelers are always long, while the jaws are usually feeble and membranous, though the typical parts of a mandibulate mouth are present—mandibles, maxillae with inner and outer lobes and palps, and second maxillae (labium) whose lacinae are not fused to form a ligula. Both head and trunk are somewhat flattened dorso-ventrally, giving the insects a very distinct and characteristic aspect. The stone-flies further resemble the Orthoptera in their numerous Malpighian excretory tubes, which vary in number from twenty to sixty. The reproductive organs, both ovaries and testes, become fused together in the middle of the body. A remarkable point in the Plecoptera is the presence in some forms (*Pteronarcys*) of small branching gills on the three thoracic and the front abdominal segments. These organs appear, however, from the observations of H. A. Hagen not to be functional in the adult insect—they are merely survivals from the aquatic nymphal stage.

Life-history and Habits.—The nymphs of the Perlidae are closely like their parents and breathe dissolved air by means of tracheal gills on the thoracic segments, for they all live in the water of streams. They feed upon weaker aquatic creatures, such as the larvae of May-flies.

The perfect insects, whose flight is feeble, are never found far from the water. A curious feature among them is the frequent reduction of the wings in the males of certain species, contrary to the usual condition among the Hexapoda, where if the sexes differ in the development of their wings it is the female which has them reduced. The Plecoptera are world-wide in their range and fossils referable to them have been described from rocks of Eocene, Miocene and Jurassic age, while C. Brongniart states that allied forms lived in the Carboniferous Period.

Order *Isoptera*.

The two families included in this order agree with the Plecoptera in the young insect resembling the parent, but they are all terrestrial

throughout life. The hind-wings have no folding anal area and the wings of both pairs, when present, are closely alike (see fig. 1) whence the name Isoptera (=equal winged) lately applied to the group by

G. Enderlein. The eleventh abdominal segment which carries the short jointed cerci (fig. 1, *b*, *c*) may remain in a reduced condition distinct from the tenth. There are only six or eight Malpighian tubes—contrasting with the large number of these excretory organs found in the Orthoptera and Plecoptera.

The *Embiidae* are feeble, somewhat soft-skinned insects with the prothorax small and the mesothorax and metathorax elongate. The feelers are long and simple, and the wings are very narrow, each with a sub-costal, a rädial, a median and a cubital nervure; the branches of the median and the cubital, however, as well as the anal nervures, are vestigial, and there are a few short cross-bars between

FIG. 2.—Head of termite. *a*, Front view. *b*, Hind view, showing jaws (note the distinct inner and outer lobes of the second maxillae). Magnified.

the radial and the median. Some Embiidae are entirely wingless in the adult state, and it has been suggested that this is always the condition in the female sex. According to the recent investigations of K. W. Verhoeff, the family contains only thirteen known species.

The Embiidae live in warm countries, and are very retiring in their habits, hiding under stones where they spin webs formed of silk produced by glands in the basal segments of the fore-feet.

The *Termitidae* (so-called "white ants") are the other family of Isoptera. They are relatively shorter and broader insects than the Embiidae with large prothorax and long wings, which have a transverse line of weakness at the base and are usually shed after the nuptial flight. The Termitidae are numerous in species in warm countries. The vast majority of individuals in a community consist of wingless forms—"workers" and "soldiers," which are undeveloped members of either sex. Their economy is fully described in a special article on TERMITES.

Order *Corrodentia*.

The insects included in this order differ from those of the two preceding orders in their more condensed abdomens which bear no cerci, while the number of Malpighian tubes is reduced to four. In the absence of cerci the Corrodentia are more specialized than the Isoptera and Plecoptera, but some of them show a more primitive character in the retention of vestigial maxillulae—the minute pair of jaws that are found behind the mandibles in the Aptera (*q.v.*). A large proportion of the Corrodentia are wingless. When wings are present the front pair are much larger than the hind pair, and the neuration is remarkable for the concrescence of the median with the

cubital trunk, and the zigzag course of many of the branches. All the insects of this order are of small size and the cuticle is imperfectly chitinized, so that the body as a whole is soft. The name Corrodentia was first used by H. Burmeister (1832) and has reference to the biting habits of the insects. Originally, however, the Corrodentia included the order which Enderlein has recently separated as Isoptera (see above). As at present restricted, the Corrodentia include two distinct sub-orders.

Copeognatha.—This sub-ordinal name has been applied by Enderlein to the "book-lice." These frail insects, the majority of which have wings of the type described above, are further characterized by the presence of minute but distinct maxillulae, while the inner lobe (lacinia) of the first maxilla is an elongate, hard structure (the "pick," fig. 3, *e*) and the outer lobe is convex and soft. The labial (second maxillary) palps are reduced to small, rounded prominences external to the still smaller prominences that represent the lobes (fig. 3, *c*). The feelers of these insects are elongate and thread-like, consisting of from a dozen to nearly thirty segments. The prothorax is very small.

The book-lice are familiar wingless insects, often found in houses running about among old papers and neglected biological collections. They belong to the family *Psocidae* which has a few score species—most of them winged—living out of doors on the bark of trees and among vegetable refuse. In some Psocidae the wings are in a vestigial state, and the fully winged species rarely if ever fly. H. A. Hagen observed that some genera possess wing-like outgrowths on the prothorax, comparable to those seen in certain insects of the Carboniferous Period. The Psocidae themselves have not been traced back beyond the Oligocene, in the amber of which period their remains are fairly numerous.

Mallophaga.—This term was first applied by C. L. Nitzsch (1818) to the degraded wingless parasites (fig. 4) commonly known as bird-lice or biting-lice, differing from the true lice (see HEMIPTERA, LOUSE) by their jaws adapted for biting (not for piercing or sucking). By their structure they are evidently allied to the Copeognatha. They are abundantly distinct, however, through the short feelers with only three to five segments and the conspicuous prothorax. The head is relatively very large, but the eyes are degraded and often absent. A remarkable feature is the frequent concrescence of mesothorax and metathorax and in some cases, even, their fusion with the anterior abdominal segments. The legs are stout and spiny, and well adapted for clinging to the hair or feathers of the host animal. It is usual to divide the Mallophaga into two families—the *Liotheidae*, possessing labial palps and two foot-claws, being fairly active insects, which are capable, on the death of their host, of seeking another, and the *Philopteridae*, without labial palps and with a single foot-claw modified for clasping (fig. 4) which never leave the host and perish themselves soon after its death.

After Osborn, *Ent. Bull.* 7 (*O.S.*), *U.S. Dept. Agric.*

FIG. 4.—Biting-louse (*Trichodectes scalaris*) of cattle.

Order *Ephemeroptera*.

This order includes the single family of the *Ephemeridae* or May-flies. The name, although quite recently proposed by A. E. Shipley, should be used rather than A. S. Packard's older term Plectoptera on account of the great liability of confusion between the latter and Plecoptera. The May-flies are remarkably primitive in certain of their characters, notably the elongate cerci, the paired, entirely mesodermal genital ducts, and the occurrence of an ecdysis after the acquisition of functional wings. On the other hand, the reduced feelers, the numerous Malpighian tubes (40), the large complex eyes, the vestigial condition of the jaws, the excessive size of the fore-wings as compared with the hind-wings and their complex neuration with an enormous number of cross-nervules are all specializations. So in some respects is the life-history, with a true larval preparatory stage, unlike the parent form, and living an aquatic life, breathing dissolved air by means of a paired series of abdominal tracheal gills. Except for its aquatic adaptations, however, the ephemerid larva is wonderfully thysanuran in character, and possesses conspicuous and distinct maxillulae. See special article on MAY-FLIES.

Order *Odonata*.

The distinctness of the dragon-flies from other insects included in Linnaeus's Neuroptera was long ago recognized by J. C. Fabricius, who proposed for them the ordinal name of Odonata (1775). They resemble the May-flies in their "hemimetabolous" life-history; the young insects are markedly unlike their parents, inhabiting fresh water and breathing dissolved air, either through tracheal gills at the tip of the abdomen, or by a branching system of air-tubes on the walls of the rectum into which water is periodically admitted. The winged insects resemble the May-flies in their short feelers and in the large number (50 to 60) of their Malpighian tubes, but differ most strikingly from those insects in their strong well-armoured bodies, their powerful jaws adapted for a predaceous manner of life, and the close similarity of the hind-wings to the fore-wings. All the wings are of firm, glassy texture, and very complex in their neuration; a remarkable and unique feature is that a branch of the radius (the radial sector) crosses the median nervure, while, by the development of multitudinous cross-nervules, the wing-area becomes divided into an immense number of small areolets. The tenth abdominal segment carries strong, unjointed cerci, while the presence of reproductive armature on the second abdominal segment

of the male is a character found in no other order of the Hexapoda. See special DRAGON-FLY.

Sub-class ENDOPTERYGOTA

Order *Neuroptera.*

The insects retained in the order Neuroptera as restricted by modern systematists are distinguished from the preceding orders by the presence of a resting pupal stage in the life-history, so that a "complete metamorphosis" is undergone. Structurally the Neuroptera are distinguished by elongate feelers, a large, free prothorax, a labium with the inner lobes of the second maxillae fused together to form a median ligula, membranous, net-veined wings without hairy covering, those of the two pairs being usually alike, the absence of abdominal cerci, and the presence of six or eight Malpighian tubes. The larvae are active and well-armoured, upon the whole of the "campodeiform" type, but destitute of cerci; they are predaceous in habit, usually with slender, sickle-shaped mandibles, wherewith they pierce various insects so as to suck their juices. The order contains nine families, most of which are wide in their geographical distribution. Fossil Neuroptera occur in the Lias and even in the Trias if the relationships of certain larvae have been correctly surmised.

The *Sialidae* or alder-flies (*q.v.*) differ from other Neuroptera in the jaws of the larva—which is aquatic, breathing by paired, jointed abdominal gills—resembling those of the imago, and being adapted for the mastication of solid food. Some American genera (Corydalis) which belong to this family are gigantic among insects and their males possess enormous mandibles. The *Raphidiidae* or snake-flies (*q.v.*) are remarkable for the long, narrow, tapering prothorax which gives the appearance of a constricted neck, while the female has a long ovipositor. Both these families are very sparingly represented in our fauna.

The *Myrmeleonidae* are large insects with short clubbed feelers on their prominent heads, and two pairs of closely similar net-veined wings, with regular oblong areolets at the tips. Their predaceous, suctorial larvae are the well-known ant-lions (*q.v.*). No members of this family inhabit our islands, though a few species occur in neighbouring parts of the continent. The same is the case with the allied *Ascalaphidae*, which are distinguished from the *Myrmeleonidae* by their elongate feelers—as long as the body—and by the irregular apical areolets of the wings. The curious *Nemopteridae* have slender feelers and very long strap-shaped hind-wings. The *Mantispidae* are remarkable among the Neuroptera for their elongate prothorax, raptorial fore-legs and hypermetamorphic life-history, the young campodeiform larva becoming transformed into a fat eruciform grub parasitic on young spiders or wasp-larvae (see MANTIS-FLY). The last-named two families are confined to warm regions of the earth. The lacewing-flies (*q.v.*), however, of which there are two families, the *Hemerobiidae* and *Chrysopidae*, whose larvae feed on Aphids, sucking their juices, are represented in our fauna. So are the tiny *Coniopterygidae*, which are covered with a white powdery secretion, and have very small hind-wings. Their larvae resemble those of the lacewings, attacking scale-insects and sucking their juices.

Order *Mecaptera.*

This small order was founded (1869) by F. Brauer—under the name of Panorpata—for the small family of the Panorpidae or scorpion-flies (*q.v.*). The name Mecaptera is due to Packard. They may be distinguished from the Neuroptera by the elongation of the head into a beak, the small prothorax, the narrow, elongate wings with predominantly longitudinal neuration, the presence of abdominal cerci and the eruciform larva. They are generally but sparingly distributed over the earth's surface and can be traced back in time to the early Jurassic epoch.

Order *Trichoptera.*

The caddis-flies (*q.v.*) constitute this order, the name of which (suggested by H. Burmeister) indicates the hairy covering of the wings. They are abundantly distinct from the Neuroptera and Mecaptera, through the absence of mandibles in the imago, the maxillae—both pairs of which possess the typical inner and outer lobes and jointed palps—forming a suctorial apparatus. The feelers are long, slender and many-jointed. While the fore-wings are elongate and narrow, the hind-wings are broad, with a folding anal area. At the base of each wing projects a dorsal lobe—the jugum—and the neuration is predominantly longitudinal, resembling so closely that of the lower Lepidoptera (*q.v.*) that a nearer relationship of the Trichoptera to that order than to any group of the old Linnean Neuroptera is certain. Fossil Trichoptera occur in rocks of Liassic age.

Frequently the whole of the Trichoptera are included in a single family, but most special students of the order recognize seven families. In all Trichoptera the maxillary palps of the female are five-segmented. The family *Phryganeidae* have males with four-segmented hairy palps; the larvae inhabit stagnant water and make cases of vegetable fragments. In the *Limnephilidae* the maxillary palp is three-segmented in the male, the larvae are variable in habit, many forming cases of snail-shells. The males of the *Sericostomatidae* have two or three segmented palps; their larvae inhabit running water and make cases of grains of sand, or of small stones. In the *Leptoceridae*, *Hydropsychidae*, *Rhyacophilidae* and *Hydroptilidae* the palps of the males have five segments like those of the females. The stone-built cases of the carnivorous Hydropsychid larvae are familiar objects in the water of swift streams.

BIBLIOGRAPHY.—For a general account of the various orders mentioned in the present article see D. Sharp, *Cambridge Natural History*, v. (London, 1895); L. C. Miall, *Nat. Hist. Aquatic Insects* (London, 1895); J. G. Needham, &c., *Aquatic Insects in New York State* (Albany, N.Y., 1903); F. Brauer, *Die Neuropteren Europas* (Wien, 1876); J. A. NEUSALZ, a town of Germany, in the Prussian province of Silesia, on the Oder, 20 m. by rail N.W. of Glogau. Pop. (1905) 13,002. It has three Evangelical churches, one of which belongs to the Herrnhut brotherhood, a Roman Catholic church and an orphanage. Its largest industry is, perhaps, the manufacture of thread; there are also in the town ironworks, breweries, shipbuilding yards and electrical works. Neusalz became a town in 1743.

See Bronisch, *Geschichte von Neusalz an der Oder* (Neusalz, 1893).

NEUSS, a town of Germany, in the Prussian Rhine province, lies 4 m. to the W. of Düsseldorf and 1½ m. from the W. bank of the Rhine, with which it is connected by the Erft canal. It lies at the junction of lines to Cologne, Viersen, Zevenaar (Holland), Düsseldorf, Düren and Rheydt. Pop. (1905) 30,494, of whom 95% were Catholics. The chief building in the town is the church of St Quirinus, a remarkably fine example of the transition from the Round to the Pointed style; and there are six other Roman Catholic churches, two Protestant churches and a gymnasium, which contains a collection of Roman antiquities. The town hall was built in the 17th and altered in the 18th century. The old fortifications are now laid out as a promenade encircling the town. Neuss produces oil and meal, and also manufactures woollen stuffs, chemicals and paper, bricks and iron-ware. Its markets for cereals are among the most important in Prussia, and it is also the centre of a brisk trade in cattle, coals, building materials and the products of its various manufactories.

Neuss, the *Novaesium* of the Romans, frequently mentioned by Tacitus, formerly lay close to the Rhine, and was the natural centre of the district of which Düsseldorf has become the chief town. Drusus, brother of the emperor Tiberius, threw a bridge across the Rhine here, and his name is preserved in the Drususstor, the lower half of which is of Roman masonry. In 1474–1475 Charles the Bold of Burgundy besieged the town in vain for eleven months, during which he lost 10,000 men; but it was taken and sacked by Alexander Farnese in 1586. Since 1887 extensive excavations have been made of the foundations of a huge Roman camp, and many valuable Roman treasures have been unearthed.

See C. Tücking, *Geschichte der Stadt Neuss* (Düsseldorf, 1891); F. Schmitz, *Der Neusser Krieg, 1474–1475* (Bonn, 1896); W. Effmann, *Die St Quirinus Kirche zu Neuss* (Düsseldorf, 1890); and Band xx. of the *Chroniken der deutschen Städte.*

NEUSTADT (Polish, *Prudnik*), a town of Germany, in the Prussian province of Silesia, on the river Prudnik, 60 m. by rail S.E. of Breslau. It has four Roman Catholic churches and one Evangelical. Pop. (1905) 20,187, the greater part of whom are

Roman Catholics. The chief industries are tanning, dyeing and the manufacture of damask, linen, woollen stuffs, leather and beer.

In 1745, 1760 and 1779 engagements between the Austrians and Prussians took place near Neustadt, which on the last occasion was bombarded and set on fire.

See Weltzel, *Geschichte der Stadt Neustadt* (Neustadt, 1870).

NEUSTADT-AN-DER-HAARDT, a town of Germany, in the Bavarian Palatinate, picturesquely situated under the eastern slope of the Haardt Mountains and at the mouth of the valley of the Speyerbach, 14 m. W. of Spires, and at the junction of railway lines to Worms, Weissenburg and Monsheim. Pop. (1905) 18,576. It has four churches, two Evangelical and two Roman Catholic. The Protestant abbey church, a fine Gothic edifice dating from the 14th century, contains the tombs of several of the counts palatine of the Rhine. The Roman Catholic Ludwigskirche is a modern Gothic structure. The chief industries of the town are cloth, paper, furniture, soap, starch and hats. It has also breweries and distilleries. A brisk trade is carried on in wood, grain, fruit and wine, all of which are extensively produced in the vicinity. Neustadt, which became a town in 1275, is one of the centres of the Rhenish "grape-cure," and thus attracts numerous visitors.

NEU-STETTIN, a town of Germany, in the Prussian province of Pomerania, on the small Streitzig lake, 90 m. by rail N.E. of Stettin, at the junction of railways to Belgard, Posen and Stolpmünde. Pop. (1905) 10,785. Its industries are iron-founding, dyeing, brewing and the manufacture of machinery, soap and matches. There is a considerable trade in cattle, grain and other agricultural produce, and in timber and spirits. Neu-Stettin was founded in 1313 by Wratislaus, duke of Pomerania, on the model of Stettin.

See Wilcke, *Chronik der Stadt Neu-Stettin* (Neu-Stettin, 1862); and F. W. Kasiski, *Beschreibung der vaterländischen Alterthümer in Neu-Stettin* (Danzig, 1881).

NEU-STRELITZ, a town of Germany, capital of the grand-duchy of Mecklenburg-Strelitz, situated between two small lakes, the Zierker See and the Glambecker See, 60 m. N. of Berlin, on the railway to Stralsund, at the junction of lines to Warnemünde and Buschhof. Pop. (1905) 11,656. It is built in the form of a star, the eight rays converging on a market-place adorned with a statue of the grand-duke George (d. 1860). The ducal residence is a handsome edifice in a pseudo-classical style, with a library of 75,000 volumes, and collections of coins and antiquities. Other buildings are the churches (two Evangelical and one Roman Catholic), the Carolinum (a large hospital), the town hall, the barracks, the gymnasium and the theatre. Its manufactures are iron-ware, machinery, pottery, beer and mineral waters. Its trade, chiefly in corn, meal and timber, is facilitated by the Zierker See and by a canal connecting the town with the Havel and the Elde.

About 1½ m. to the south lies Alt-Strelitz, the former capital of the duchy, a small town the inhabitants of which are employed in the manufacture of tobacco, leather and wax candles. Neu-Strelitz was not founded till 1726. In the vicinity is the château of Hohen-Zieritz, where Queen Louise of Prussia died in 1810.

NEUSTRIA, the old name given to the western kingdom of the Franks, as opposed to the eastern kingdom, Austrasia (*q.v.*). The most ancient form of the word is *Niustер*, from *niust*, which would make the word signify the "most recent" conquests of the Franks. The word Neustria does not appear as early as the *Historia Francorum* of Gregory of Tours, but is found for the first time in Fredegarius. The kingdom of Chilperic was retrospectively given this name, and in contemporary usage it was given to the kingdom of Clovis II., as opposed to that of Sigebert III., the two sons of Dagobert; and after that, the princes reigning in the West were called kings of Neustria, and those reigning in the East, kings of Austrasia. Under the new Carolingian dynasty, Pippin and Charlemagne restored the unity of the Frankish realm, and then the word Neustria was restricted to the district between the Loire and the Seine, together with part of the diocese of Rouen north of the Seine; while Austrasia comprised only the Frankish dominions beyond the Rhine, perhaps with the addition of the three cities of Mainz, Worms and Spires on the left bank. The districts between Neustria and Austrasia were called *Media Francia* or simply *Francia*. In 843 Brittany took from Neustria the countships of Rennes and Nantes; and gradually the term Neustria came to be restricted to the district which was later called Normandy. Dudo of Saint Quentin, who flourished about the year 1000, gives the name Neustria to the lands ceded to Rollo and his followers during the 10th century. In the year 1663, the Père de Moustier gave to his work on the churches and abbeys of Normandy the title of *Neustria pia*.

At the time of Charlemagne, Lombardy was divided into five provinces: Neustria, Austrasia, Aemilia, Littoraria maris and Tuscia. Austrasia was the name given to eastern Lombardy, and Neustria that given to western Lombardy, the part last occupied by the Lombards.

See F. Bourquelet, "Sens des mots France et Neustrie sous le régime mérovingien," in the *Bibliothèque de l'école des chartes*, xxvi. 566-574; Longnon, *Atlas historique de la France*, both atlas and text. (C. Pf.)

NEUTITSCHEIN (Czech *Nový Jičin*), a town of Austria, in Moravia, 75 m. N.E. of Brünn by rail. Pop. (1900) 11,891, chiefly German. It is situated on a spur of the Carpathians, and on the banks of the Titsch, an affluent of the Oder. It is the chief place in the Kuhländchen, a fertile valley peopled by German settlers, who rear cattle and cultivate flax. At Neutitschein manufactures of woollen cloth, flannel, hats, carriages and tobacco are carried on; and it is also the centre of a brisk trade. The town was founded in 1311. Neutitschein was in 1790 the headquarters of the Austrian field-marshal Loudon, who died here in the same year and is buried in the parish church.

NEUTRALITY, the state or condition of being neutral (Lat. *neuter*, neither of two), of not being on or inclined to one side or another, particularly, in international law, the condition of a state which abstains from taking part in a dispute between other states. Neutrality is the most progressive branch of modern International Law. It is also that branch of International Law in which the practice of self-restraint takes the place of the direct sanctions of domestic law most effectively. The rapid changes it is undergoing are in fact bringing the state-system of the modern world nearer to the realization of the dream of many great writers and thinkers, of a community of nations just as much governed by legal methods as any community of civilized men. While the right of war was simply the right of the stronger, there was no room for neutral rights, for, without going back to the time of the ancients, the so-called rights of war and conquest are nothing but survivals of the right of brute strength. No nation or community down to comparatively recent times was treated as having a right to what it could not keep. It is the growth of a law of neutrality, through the modern possibility of concerted action among neutral states, which is bringing about improvement, and, though the signs of our times are not always reassuring, we have taken a long stride forward since Molloy, in his *De Jure maritimo et navali* (1680), wrote: "As a neuter neither purchases friends nor frees himself from enemies, so commonly he proves a prey to the victor; hence it is held more advantage to hazard in a conquest with a companion than to remain in a state wherein he is in all probability of being ruined by the one or the other."

It was the great commercial communities, the Hansa in the north and Venice and the Mediterranean maritime republics in the south, which were first able to insist on some sort of regulation of the usages of war for their own protection. With the growth of intercourse among nations a further advance was made, by treaty stipulations entered into in time of peace, to provide rules for their guidance in the event of war, but it is only in our own time that the idea of a substantive neutral right has obtained recognition. To our own time belongs the final acceptance of the principle that the neutral flag protects an enemy's goods except contraband, the conception of neutralization of territory, the abolition of fictitious blockades, the practice of declarations of

neutrality, the detachment from the high sea and neutralization of the zone called territorial waters, and the Areopagus of nations called the European Concert, in which the right of neutrals is asserted as a brake upon the operation of the still venerated right of conquest. The rights of neutrals have received their most recent affirmation in several of the decisions of the Hague Peace Conferences.

International trade and intercourse have become so intricate that war can no longer be waged without causing the most serious loss to neutral nations, which, moreover, suffer from it without any of the possible contingent benefits it may procure for the immediate parties. So much is it so, that most great powers have found it necessary for their self-protection to enter into defensive alliances with others, the direct object of which is the preservation of European peace by the threat of making war so gigantic a venture that no state will again embark on it "with a light heart." The next step will probably be alliances between states which, by their nature or by their having reached the limit of their expansion, have nothing further to gain by war with each other, for the purpose of securing perpetual peace as between themselves.

Different attempts have been made to define neutrality, but the word defines itself, so far as a succinct definition serves any purpose. The subject covers too wide and varied an area of matter to be condensed into a short statement of any kind. Neutrality entails rights and duties on both the belligerent and the neutral sides. Theoretically, neutrality, to be complete, would require the neutral to abstain from everything which could even remotely be of assistance to either belligerent. To this obligation would theoretically correspond that the belligerent should carry on the war without doing anything which could even remotely disturb or interfere with the neutral state or the free activity of its citizens. Neither the one nor the other is found to be practicable. It is not even easy for the belligerent to observe absolutely the duty of doing no direct injury to neutral territory. A battle may be fought to the very edge of the neutral frontier, and shells may explode in any neutral town within the firing range of modern artillery. The present respect paid by belligerents to territorial waters is a palliative in the case of a seaboard frontier; but even the three-mile limit acknowledged by most countries would permit belligerent vessels with present range of artillery to fire landwards far into neutral territory. Compensation—it is true, would be due for any damage done, but this does not alter the fact that acts of war can produce direct consequences on neutral territory which have the character of carrying war into a neutral state. The neutral state, moreover, is obliged to incur heavy expenditure to protect its frontier from being traversed by either belligerent, and thus avoid itself being exposed to claims for compensation for an act which it would otherwise be powerless to prevent. In the case of a maritime war, the neutral state is also bound to exercise strict supervision to prevent its ports from being used by either belligerent for the purpose of increasing its military strength. In short, war cannot be carried on without heavy expense and inconvenience to neighbouring neutral states. The inconvenience to the intercourse of neutral citizens is still greater. Their ships are liable to be taken out of their course, and their cargoes to be discharged to the bottom of the hold in search of articles which are contraband according to circumstances over which they have no control, and they may be confiscated without recourse by judges appointed by one of the interested parties. Even their whole trade with specific ports of the one belligerent may be stopped by the ships of the other belligerent without indemnity. On the other hand, a great deal of vital assistance can be given by neutral citizens to the one or the other belligerent in money, or by supplies of arms, ammunition, food and other commodities, which it is not at present the duty of neutral states to interfere with.

Definition and scope.

The respective rights and duties of belligerent neutrals in current practice may be subdivided as follows:—

1. Belligerent duty to respect neutral territory and neutral territorial waters.

2. Neutral right of official representation and mediation; of intercourse of neutral citizens with citizens of either belligerent; of convoy, &c.

3. Belligerent right of blockade, angary, visit and search, capture and confiscation of contraband of war.

4. Neutral duties: (*absolute*) of abstention from any direct corporate assistance to either belligerent, of enforcement of respect by both belligerents for neutral territory; (*relative*) of prevention of any recruiting for either belligerent, or arming or equipping of vessels for their service; and (*contingent*) of allowing commercial access to the one or other belligerent without distinction, and of granting impartially to one or the other belligerent any rights, advantages or privileges, which, according to the usages recognized among nations, are not considered as an intervention in the struggle.

This subdivision, we believe, covers the whole ground of neutrality. We shall follow it in this article.

Belligerent Duty.—It is now universally recognized among European states that a belligerent army must make no use of its strength in the field to carry its operations into neutral territory or into neutral waters. Belligerent forces entering neutral territory are by the practice of nations bound to surrender their arms to the neutral state, and remain *hors de combat* till the close of the war. (Compare arts. 11 and 12 of the Hague Convention relating to the "Rights and Duties of Neutral Powers and persons in case of war on land" 18th of October 1907.)

Duty to respect neutral territory.

Through territorial waters belligerent vessels are allowed to pass freely as in time of peace. Nor does the usage of nations forbid a belligerent vessel from entering a neutral port. Motives of humanity have sanctioned this distinction between territorial and maritime warfare. The Admiralty Instructions (1893) set out the rights of belligerents as Great Britain views them as follows: "Subject to any limit which the neutral authorities may place upon the number of belligerent cruisers to be admitted into any one of their ports at the same time, the captain, by the comity of nations, may enter a neutral port with his ship for the purpose of taking shelter from the enemy or from the weather, or of obtaining provisions or repairs that may be pressingly necessary (I. section 592). He is bound to submit to any regulations which the local authorities may make respecting the place of anchorage, the limitation of the length of stay in the port, the interval to elapse after a hostile cruiser has left the port before his ship may leave in pursuit, &c. (I. section 593). He must abstain from any acts of hostility towards the subjects, cruisers, vessels or other property of the enemy which he may find in the neutral port (section 594). He must also abstain from increasing the number of his guns, from procuring military stores, and from augmenting his crew even by the enrolment of British subjects" (section 595).

Access to and duty to respect territorial waters and ports.

Nor may the commander of a British warship take a capture into a neutral port against the will of the local authorities (Holland, *Manual of Naval Prize Law*, 1888, section 299). This subject was one of those dealt with at the Hague Conference of 1907. (See art. 18 of the "Convention relating to the rights and duties of neutral powers in naval war.")

Neutral Rights.—Neutral powers have the right to remain, as far as possible, unaffected by the war operations, and, therefore, continue their diplomatic relations with the belligerent states. The immunities and exterritoriality of their diplomatic agents attach to them as in time of peace, subject only to necessity of war, which may entitle a belligerent to place restrictions on this intercourse. Thus, during the Franco-German War, on the surrounding of Paris, foreign diplomatists in the besieged city were refused by the German authorities all possibility of corresponding with their governments, except by letters left open for their inspection. Neutral legations may also undertake the representation of private interests of subjects of the one belligerent on the territory of the other. Thus in the Franco-German War of 1871 the Germans in France were placed under the protection of the United States legation, and the French in

Right of legation.

Germany under that of the British legation; in the war of 1898 between the United States and Spain, American interests in Spain were committed to the care of the British legation, and those of Spaniards in the United States to that of the Austro-Hungarian legation. By legations are understood both diplomatic and consular authorities. The protection granted is in the nature of mere mediation. It confers no rights on the belligerent subjects in question, nor does it give the neutral legation any right to protect a belligerent subject or his property against any ordinary rights of war.

Right of offering good offices and mediation.

Good offices, properly speaking, are a mild form of mediation or tentative mediation, *i.e.* mediation before it has been accepted by the parties. Article 3 of the Hague Convention for the pacific settlement of international disputes of October 18, 1907, however, provides that "powers, strangers to the dispute, have *the right* to offer good offices or mediation, even during the course of hostilities," and that "the exercise of this right can never be regarded by one or other of the parties in conflict as an unfriendly act." The Hague Convention puts an end to the doubt whether a neutral power can mediate without involving itself in some way with the one or the other side in the dispute. Mediation had already been provided for in several existing treaties, such as the Treaty of Paris (30th March 1856), which provides that "if any dissension should arise between the Sublime Porte and one or more of the other signatory powers and threaten the maintenance of their good relations, the Sublime Porte and each of these powers before resorting to force shall give an opportunity to the other contracting parties in order to prevent such extreme measures" (article 8); the Treaty of Yedo between the United States and Japan (29th July 1858) stipulating that in the case of difference between Japan or any other state, "the president of the United States, at the request of the Japanese government, will act as a friendly mediator in such matters of difference as may arise between the government of Japan and any other European power" (article 2); and the General Act of Berlin relating to West Africa (1885), which provides that "in the case of a serious dissension having arisen on the subject of, or within the territories" in question, between the signatory powers, they undertake, before taking up arms, to have recourse to the mediation of one or more of the friendly powers (article 12).

In the Venezuela-Guiana boundary question, the mediation of the United States government was declined by Great Britain, but its good offices were accepted. In the difficulty which arose between Germany and Spain in connexion with the hoisting of the German flag on one of the Carcline Islands, Spain did not consider arbitration consistent with the sovereign power she claimed to exercise over the island in question, but she accepted the mediation of the pope, and the matter was settled by protocols, signed at Rome (17th December 1885). These incidents show the uses of variety and gradation in the methods of diplomacy.

Rights of neutral subjects on belligerent soil.

Neutral subjects have the right to carry on trade and intercourse with belligerent subjects in so far as they do not interfere with the operations or necessities of war, and it is no violation of the neutral character that this trade or intercourse is of benefit to either side. This is subject always to the belligerent right to capture and confiscate contraband of war (see below). On the other hand, the property of subjects and citizens of neutral states follows the fortune of the belligerent state within whose territorial jurisdiction it is situated. It is liable to the same charges as that of native subjects and citizens, and in case of military contributions neutral subjects on belligerent soil can claim no protection or exemption (see below, *Angary*). They have also the same rights to all indemnities for loss as are granted to native subjects and citizens.

The position of neutral public ships and the relative assimilation to them of mail steamers has been the subject of some controversy. A public ship is a ship having an official character It includes not only warships, but also any ships affected to any specific and *exclusive* government purpose. Public ships in this sense are invested with an extra-territorial character, and the state to which they belong is directly responsible for their acts. They are therefore not liable to visit and search for contraband of war, and are exempt from territorial jurisdiction even in belligerent waters. As regards vessels which are engaged partly in private traffic and partly on public service, such as mail steamers and government packets, the position is necessarily different. Under the Japanese Prize Law, adopted in view of the Chino-Japanese campaign, any vessel carrying contraband of war, whose destination is hostile, may be detained, without exception being made for mail steamers. The United States proclamation of April 1898 in connexion with the Spanish War stated that mail steamers would only be stopped in case of grave suspicion of their carrying contraband or of their violating a blockade.

The rights of neutral public ships and mail steamers.

On the arrest of the German mail steamers "Bundesrath" and "General" during the South African War, the German government represented to the British government that "it was highly desirable" that steamers flying the German mail-flag should not be stopped, and the British government thereupon issued orders not to stop them on suspicion only (*Parliamentary Papers*, Africa, No. 1, 1900). This was a precedent of the greatest importance. It would have practically assimilated mail steamers to public ships. Yet the mere circumstance of carrying the mails does not manifestly *per se* change the character of the ship. Both this subject and the position of packets under state ownership, which may carry on trade and may consequently transport contraband, require deliberate adjustment by treaty. The convention between Great Britain and France respecting postal communications (30th August 1890) provides that "in the case of war between the two nations the packets of the two administrations shall continue their navigation, without impediment or molestation until a notification is made on the part of either of the two governments of the discontinuance of postal communications, in which case they shall be permitted to return freely to their respective ports" (article 9). The position of either as neutral is not dealt with. The tendency seems to be towards exemption, but in this case there should be official certification that the ships in question carry nothing in the nature of contraband.

Convoy.

Meanwhile the Hague Conference of 1907 has adopted rules under which postal correspondence of neutrals or belligerents is inviolable, whether it be official or private, or the carrying vessel be neutral or an enemy vessel, but in so far as mail ships are concerned they are not otherwise exempt from the application of the rules of war affecting merchant ships generally (see Convention on restrictions on the exercise of the right of capture in maritime war, October, 1907). Connected with the position of public ships is the question of the right of convoy. Neutral merchant ships travelling under the escort of a warship or warships of their own flag are held by some authorities to be exempt from visit and search. The Japanese Prize Law, which is largely based on English practice, following on this point the recommendations of the Institute of International Law (see *Règlement des prises maritimes*, Annuaire 1888, p. 221), provides that "when the commander of a neutral convoy declares that there is no contraband of war on board the vessels under convoy, and that all the papers are in order in these vessels, the vessels shall not be visited" (article 23).[1] The United States,

[1] At the outset of the Chino-Japanese War, Vice-Admiral Sir E. R. Fremantle sent a note to the Japanese admiral requesting him to "give orders to the ships under his command not to board, visit or interfere in any way with British merchant vessels, observing that the British admiral had directed all British ships under his orders to afford protection to such merchant vessels, and not to allow them to be molested in any way." Professor Takahashi, in his *International Law of the Chino-Japanese War*, relates that the Japanese admiral replied that "as the matters demanded by the British admiral belonged to the sphere of international diplomacy, and consequently were outside his official responsibility, they should be communicated directly to the Japanese Department of Foreign Affairs." "The idea of the British admiral," observes Professor Takahashi, "seemed to be not only to claim a right of convoy, which has never been recognized

in treaties with Mexico (5th April 1831), Venezuela (20th January 1836), Peru (6th Sept. 1870), Salvador (6th December 1870) and Italy (26th February 1871), have agreed to accept the commander's declaration as provided in the Japanese Prize Law. Wharton quotes in his *International Law Digest* a passage from a despatch of Mr Secretary Forsyth (18th May 1837) in which he states that "it is an ordinary duty of the naval force of a neutral during either civil or foreign wars to convoy merchant vessels of the nation to which it belongs to the ports of the belligerents. This, however, should not be done in contravention of belligerent rights as defined by the law of nations or by treaty." The Spanish Naval Instructions (24th April 1898) in the war with the United States granted unconditional exemption to convoyed neutral ships (article 11). The subject has now been dealt with by the Declaration of London (1908–1909), which requires the commander of a convoy to give a statement in writing as to the character of the vessels and cargoes (see CONVOY). A neutral merchant ship, travelling under *enemy's* convoy, places itself, with the assistance of the belligerent force, beyond the application of the belligerent right of visit and search, and thus commits a breach of neutrality.

Belligerent Rights.—Since the declaration of Paris providing that blockades in order to be binding must be effective, that is to say, must be maintained by a force sufficient really to prevent access to the enemy's coast, the tendency has been to give a precise form to all the obligations of the blockading belligerent. Thus it is now generally agreed that notification to the neutral should be sufficiently detailed to enable neutral vessels to estimate, with practical accuracy, the extent of their risks. French writers consider a general notification, though desirable, as insufficient, and hold an individual notification to each neutral ship which presents itself at the line of blockade as requisite. This theory was applied by France in the Franco-German War, and earlier by the Northern States in the American Civil War. The new Japanese Prize Law (1894) does not attempt to prescribe any such notification to each ship, but sets out that notice of blockade to each ship is either actual or constructive. "Actual" it describes as being when the master is shown to have had knowledge of the blockade, in whatever way he may have acquired such knowledge, whether by direct warning from a Japanese warship or from any other source; "constructive," when a notification of its existence has been made to the proper authorities of the state to which the vessel belongs, and sufficient time has elapsed for such authorities to communicate the notification to the subjects of that nation, whether or not they have in fact communicated it. No blockade, however, was attempted by the Japanese government, and the application of the rules was not put to the test. *Blockade.*

In the war with Spain the United States proclamation of the investment of Cuba stated that an efficient force would be posted, so as to prevent the entrance and exit of vessels from the blockaded ports, and that any neutral vessel approaching or attempting to leave any of them, "without notice or knowledge" of the establishment of the blockade, would be duly warned by the commander of the blockading forces, who would endorse on her register the fact and date of such warning, and where such endorsement was made. The words "without notice or knowledge" were explained fully in the instructions to blockading vessels (20th June 1898). "Neutral vessels," said these instructions, "are entitled to notification of a blockade before they can be made prize for its attempted violation." "The character of this notification is not material. It may be actual, as by a vessel of the blockading force, or constructive, as by a proclamation of the government maintaining the blockade, or by common notoriety. If a neutral vessel can be shown to have notice of the blockade in any way, she is good prize and should be sent in for adjudication; but should the formal notice not have been given, the rule of constructive knowledge arising from notoriety should be construed in a manner liberal to the neutral." Thus the United States government abandoned the system of individual notification inserted in the proclamation of 19th April 1861, which was only found practicable in the case of vessels which had presumably sailed without knowledge. In such cases it was provided by the more recent instructions that they should be boarded by an officer, who should enter the notice in the ship's log, such entry to include the name of the blockading vessel giving notice, the extent of the blockade, and the date and place, verified by his official signature. The vessel was then to be set free, with a warning that, should she again attempt to enter the same or any other blockaded port, she would be good prize. The Declaration of London (1908–1909) exhaustively treats of this subject and has regulated it with a leaning towards continental views (see BLOCKADE).

Angary, or *Droit d'Angarie*, is a contingent belligerent right, arising out of necessity of war, to dispose over, use and destroy, if need be, property belonging to neutral states.[1] During the Franco-German War imminent necessity was pleaded by the German government, as the justification of using force to seize and sink six British coal-ships in the Seine to prevent French gun-boats from running up the river and interfering with the tactics of the German army operating on its banks. The captains of the vessels refused to enter into any agreement with the commanding German general, and the vessels were then sunk by being fired upon. The British government raised no objection to the exercise of the right, and confined itself to demanding compensation for the owners, which the German government declared itself ready to pay. Count Bismarck evidently felt the use which might be made against Germany, as a neutral power, of such an extreme measure, and took care in the correspondence with the British government to emphasize the pressing character of the danger, which could not be otherwise parried. *Angary.*

A case given in the text-books as another one of angary during the same war was the temporary seizure and conversion to war purposes of Swiss and Austrian rolling-stock in Alsace, without any apparent military necessity. Ordinary private neutral property on belligerent soil, it must be remembered, follows the fate of private property generally. The only distinction between the right of angary and the right of assimilating private neutral property to private property generally on belligerent soil which seems based on reason is that, whereas private property of neutrals generally which has remained on belligerent soil is sedentary, or, so to speak, domiciled there, neutral vessels are mere visitors with a distinct external domicile. The writer thinks the assimilation of neutral railway carriages to neutral vessels in this respect not unreasonable.[2]

A neutral state in its corporate capacity, we have seen, must abstain from acts which can be of assistance to either belligerent, and it is bound to exercise reasonable diligence to prevent its territory being used as a base for belligerent operations. The duties of a neutral state as a state go no further. Commercial acts of its citizens, even the export of arms and munitions of war to a belligerent country, do not, in the present state of international usage, so long as both belligerents are free to profit by such acts alike, involve liability on the part of the neutral state. But relief from the obligation of repressing breaches of neutrality by contraband traffic of subjects has its counterpart in the right granted to belligerent warships of visit and search of neutral merchant vessels, and in the possible condemnation, according to circumstances, of the ship and confiscation of goods held to be contraband. *Contraband.*

[1] Angaria (from ἄγγαρος, a messenger), a post station. The French word *hangar* or shed is probably of the same origin.

[2] Treaties between the Zollverein and Spain (30th March 1868) and between Germany and Portugal (2nd March 1872) contain special provisions for the fixing of indemnities in case of any forced utilization by either state of private property of the citizens of the other.

by British prize courts, but also to extend it over all waters of the Far East, where British warships were not actually engaging in convoy. Soon afterwards the matter was settled without any difficulty. On 11th August the under-Secretary of the Japanese Foreign Office received a letter from the British Minister in Tôkyô stating that there must be some misunderstanding, and that the British government would never try to interfere with belligerent right."

Contraband is of two kinds—*absolute* contraband, such as arms of all kinds, machinery for manufacturing arms, ammunition, and any materials which are of direct application in naval or military armaments; and *conditional* contraband, consisting of articles which *are fit* for, but not necessarily of direct, application to hostile uses. The British Admiralty *Manual of Prize Law* (1888), following this distinction, enumerates as *absolutely contraband*: arms of all kinds and machinery for manufacturing arms; ammunition and materials for ammunition, including lead, sulphate of potash, muriate of potash, chlorate of potash and nitrate of soda; gunpowder and its materials, saltpetre and brimstone; also guncotton; military equipments and clothing; military stores, naval stores, such as masts, spars, rudders, and ship-timber, hemp and cordage, sailcloth, pitch and tar, copper fit for sheathing vessels, marine engines and the component parts thereof, including screw propellers, paddle wheels, cylinders, cranks, shafts, boilers, tubes for boilers, boiler plates and fire-bars, marine-cement and the material used in the manufacture thereof, blue lias and Portland cements, iron in any of the following forms—anchors, rivet iron, angle iron, round bars of iron of from ⅜ to ⅝ of an inch diameter, rivets, strips of iron, sheets, plate iron exceeding ¼ of an inch, and Low Moor and Bowling plates;—and as *conditionally contraband:* provisions and liquors fit for the consumption of army or navy, money, telegraphic materials, such as wire, porous cups, platina, sulphuric acid, materials for the construction of a railway, such as iron bars, sleepers and so forth, coal, hay, horses, rosin, tallow, timber.[1]

Coal.

The classing of coal as conditional contraband has given rise to much controversy. Great Britain has consistently held it to be so. During the war of 1870 the French and German warships were only allowed to take at English ports enough to return to a French or German port respectively. In 1885, during the Franco-Chinese campaign, after protest by the Chinese government, Great Britain applied the same rule at Hong-Kong and Singapore. During the Spanish-American War neither belligerent seems to have treated coal as contraband. In the case of the coal-ships which were prevented from landing their cargoes at Cuba, the prevention seems to have been connected with the blockade only. At the West African conference of 1884 Russia declared that she would "categorically refuse her consent to any articles in any treaty, convention or instrument whatever which would imply" the recognition of coal as contraband of war (*Parliamentary Papers*, Africa, No. 4, 1885). Coal, however, is so essential to the prosecution of war that it is impossible to avoid classing it as conditional contraband, so long as such contraband is recognized. The alternative, of course, would be to allow both belligerents freely to supply themselves at neutral ports, and neutral vessels freely to supply belligerent coaling stations.

Food-stuffs.

During the Franco-Chinese campaign of 1885 and the South African War there was controversy as to the legality of treating food-stuffs as conditional contraband. During the former the subject-matter was rice, and the circumstances were exceptional. The hostilities being at the outset reprisals, and not actual war, France at first exercised no right of search over British merchant ships. Great Britain, on her side, for the same reason did not object to French war vessels coaling, victualling and repairing at British ports. On China protesting against this indulgence to France, Great Britain, as above stated, put in force her practice of treating coal as contraband, and thereupon France exercised her corresponding belligerent right of searching British vessels. The closing of British coaling stations to French warships was a serious inconvenience to France, and she proclaimed "that in the circumstances in which war was being carried on" the cargoes of rice which were being shipped to the northern Chinese ports were contraband. By depriving the Chinese government of part of the annual tribute sent from the southern provinces in the form of rice she hoped to bring pressure on the Peking government. This was a manifest stretching of the sense of conditional contraband. Besides, no distinction was made as to destination. The British government protested, but no cases were brought into the French prize courts, and the legality of the measure has never been judicially examined.

The controversy during the South African War was confined to theory In practice no stoppage of food-stuffs seems to have taken place, though the fact that the whole able-bodied population of the enemy states formed the fighting force opposed to Great Britain made it clear that the free import of food supplies from abroad helped the farmer-soldiers to carry on warfare without the immediate care of raising food crops.

The two cases cited show the great difficulty of fixing the character of conditional contraband in a way to prevent arbitrary seizures. During the Russo-Japanese War (1904–1905) there was a warm controversy between the British and Russian governments on the scope of the belligerent right to declare certain articles contraband. The Conference of London (1908–9), by enumerating the articles which are absolute contraband, limiting those which may be declared contraband, and fixing certain articles which can in no case be declared contraband, has endeavoured to meet the difficulties which arise in practice (see CONTRABAND).

Continuous voyages.

Trade between neutrals has a prima facie right to go on, in spite of war, without molestation. But if the ultimate destination of goods, though shipped first to a neutral port, is enemy's territory, then, according to the "doctrine of continuous voyages," the goods may be treated as if they had been shipped to the enemy's territory direct. This doctrine, though Anglo-Saxon in its origin and development, has been put in force by an Italian court in the case of the *Doelwijk*, a Dutch vessel which was adjudged good prize on the ground that, although bound for Jibouti, a French colonial port, it was laden with a provision of arms of a model which had gone out of use, and which could only be intended for use by the Abyssinians, with whom Italy was at war. The subject has been fully discussed by the Institute of International Law, by whom the following rule has been adopted: "Destination to the enemy is presumed where the shipment is to one of the enemy's ports, or to a neutral port, if it is unquestionably proved by the facts that the neutral port was only a stage (*étape*) towards the enemy as the final destination of a single commercial operation."[2]

The question of the legality of the doctrine was raised by Chancellor von Bülow during the South African War in connexion with the stopping of German ships bound for Delagoa Bay, a neutral port. He contended that such vessels were quite,

[1] The Japanese Prize Law (21st August 1894) makes the following distinction: (1) Arms of all kinds, brimstone, dynamite, nitrate of potash, and all goods fit for the purpose of war exclusively the above-mentioned goods are contraband when they are on board a vessel which either has a hostile destination or calls at any port of the enemy. (2) Provisions and liquors, money, telegraphic materials, such as wire, platinum, sulphuric acid and zinc, porous cups, materials for the construction of a railway, as iron bars, sleepers, &c., coal, timber and so forth: the above-mentioned goods are contraband goods when the destination of the vessel is either the enemy's fleet at sea or a hostile port, used exclusively or mainly for naval or military equipment When it is clearly known that, though goods detailed in the above sections 1 and 2 are found on board a vessel, they are merely for her own use, they cannot be deemed contraband goods.

[2] The only person in that eminent assemblage who raised an objection to the principle of the doctrine was the distinguished French writer on maritime law, M. Desjardins, who declined to acknowledge that any theory of continuous voyages was, or could be, consistently with the existing law of neutrality, juridically known to International Law. He admitted, at the same time, that penalties of contraband would be incurred if the shipping to a neutral port were effected merely in order "to deceive the belligerent as to the real destination of the cargo." This was the French ruling in the *Frau Houwina* case (26th May 1855). He proposed to restrict the operation of the doctrine to this condition, but was opposed by three Italian professors of international law, Professors Fusinato, Catellani and Buzzati, on the ground that it would exclude, as it obviously wou'd do, the contingency of goods shipped to a neutral port, not for the purpose of defrauding the belligerent, but for that of being ultimately delivered to a belligerent not in possession of a seaport. The article as quoted in the text was also supported by the greatest German authority on International Maritime Law, Director Perels of the German admiralty.

at all times, outside belligerent jurisdiction, and that only the authorities of the neutral port were entitled to stop contraband on its way to a belligerent force. He did not, however, press the point, and only reserved the right of raising it at a future date.[1] It was fully discussed at the London Conference of 1908–1909. In order to effect a compromise between conflicting theories and practice, a distinction was made in the declaration between absolute and conditional contraband, the doctrine of continuous voyages not being applicable to conditional contraband when documented to be discharged at a neutral port, except where the enemy country has no seaboard (Declaration of London, arts. 30 to 36)

Unneutral Service.—Under this heading the London Conference of 1908–1909, concerning the laws of naval war, dealt with analogues of contraband, and neutral vessels assisting or in the service of the enemy. The articles adopted are as follows:—

A neutral vessel will be condemned and will, in a general way, receive the same treatment as a neutral vessel liable to condemnation for carriage of contraband: (1) If she is on a voyage specially undertaken with a view to the transport of individual passengers who are embodied in the armed forces of the enemy, or with a view to the transmission of intelligence in the interest of the enemy. (2) If, to the knowledge of either the owner, the charterer, or the master, she is transporting a military detachment of the enemy, or one or more persons who, in the course of the voyage, directly assist the operations of the enemy.

In the cases specified under the above heads, goods belonging to the owner of the vessel are likewise liable to condemnation.
