From Cassiciacum he wrote to Ambrose asking to be received as a convert, and at Easter, 387, the bishop himself baptized him with Alypius and Adeodatus. He now resigned his chair, but lingered some months at Milan, editing the Dialogues, and also writing the two unfinished books of *Soliloquia* (a word which he seems to have invented) in which he rigorously cross-examined his consciousness. These he condemned in his old age as too Platonic, echoing the theory of anamnesis and Porphyry's contempt for objects of sense. It was perhaps because he was already getting free from those Platonisms that he left them unfinished. Another writing of this date De Immortalitate *Animae,* which got into circulation against his will, he found even more objectionable on the same score. He then resolved to return to Africa, with Monica and some intimate friends, planning a new mode of life. Nothing more is heard of the projected marriage. He did not yet, however, abandon his literary studies, and he finished the six books De *Musica* in Africa.

On the way thither Monica died, waiting at Ostia for embarkation. In the Confessions Augustine unveiled his passionate grief, and the consolation that foliowed. Equally interesting is the story of his last conversation with her, in which he follows almost verbally the method of Plotinus (Ennead. V. 2) for entering on the Mystic Ascent. It may show what elements of Plotinian theory had most affected him.

Life in Africa. — Augustine settled with his friends on the small estate of his family at Tagaste, where they lived a common life of study and devotion. Within a year Adeodatus died, a brilliant boy of 17, whom his father made interlocutor in a dialogue De *Magistro,* the gist of which is that all knowledge comes directly or indirectly from God. After less than three years of this life, he happened to visit Hippo Regius, where his reputation had preceded him. Possidius, a disciple and friend of many years standing, narrates as from his own mouth what happened. The aged bishop Valerius addressed his flock assembled in the church, urging them to find a candidate for the priesthood; they laid hands on Augustine and brought him forward; the bishop thereupon ordained him priest in the tumultuous fashion of which several examples are recorded in that age. This was early in the year 391. His reputation continued to grow, chiefly because of his conduct of controversy with the Donatists, and Valerius, afraid of losing him to another church as bishop, wrote to Aurelius of Carthage as primate of Africa, suggesting that he should be consecrated bishop at once with right of succession to Hippo. Writing to Paulinus of Nola (Ep. 31) Augustine described his hesitation about this unusual procedure, but precedents were quoted, in Africa and elsewhere, and it was decided so to proceed. Early in the year 395 Megalio, the primate of Numidia, was at Hippo with some other bishops, and Augustine was consecrated. In the following year, on the death of Valerius, he became bishop of Hippo. Four years before his own death (Aug. 28, 430) he was asked to nominate his successor, but he would not then allow the same procedure, having learnt in the interval that it was forbidden by the Council of Nicaea. It is interesting evidence that the Canons of Nicaea were not yet current in Africa 70 years after their enactment.

The rule forbidding translations of bishops was strictly observed in Africa, and Augustine was therefore fixed for life, at 40 years of age, in that small seaport. We made it famous. During more than half his episcopate the most resounding voices in the Catholic Church were Latin voices. Chrysostom was gone. Cyril was not yet come to his own. Augustine and Jerome, the bishop of a provincial town in Africa and the monk at Bethlehem who would not minister in the priesthood which had been forced upon him, had the weight of a whole hierarchy. Both ruled by the pen. Augustine never went beyond the confines of Africa and Numidia; his voice was heard occasionally in a provincial council at Carthage, constantly from his apostolic chair at Hippo; his letters, weighty and powerful like those of St. Paul, went everywhere. The length of some was portentous; the number of them must have been immense. Two hundred and twenty, almost all dated during his episcopate, have been preserved and collected by the piety of subsequent ages to fill, with some 50 received by him, a large volume in folio. His sermons, usually brief, seem to have been preserved by shorthand writers; collected, they form running commentaries on considerable parts of the Bible, notably the Psalms and the fourth gospel. Of all these, thrown off in the day's work, he took little further notice. Of formal tractates and larger works he calculated towards the end of his life (*Ep.* 224) that he had written more than 230, many of which he "retracted" or criticized in a chronological catalogue of great importance. Something is known of his manner of working. The greater treatises were written at intervals, extending in the case of the 15 books De Trinitate over several years. Twelve of these were dragged from him and put into circulation before final revision, with consequences which made him hasten to complete the work. The 22 books De Civitate *Dei,* begun three years after the sack of Rome by Alaric in the year 410, were issued separately as written, and finished in 426. This mode of composition led to excessive digressions, and reflections on current events, many of which appear also in the epistles. Apart from these great works and the Confessions, almost all his writings bear the stamp of their occasion.

Literary Style. — Professor Souter's judgment on Augustine that "even if he be not the greatest of Latin writers, he is assuredly the greatest man that ever wrote Latin," may seem excessive. More critically we may say that this African of the 4th century might have been as Ciceronian as Jerome had he wished, and unlike Jerome he would not have pretended to be ashamed of it. Avowing the use of a more vulgar style in preaching, he elected to write the language current among the educated of his own day. It was a more flexible idiom than that of the great classics, and he was a consummate master of its possibilities. He was a great coiner of phrases, which sometimes controlled his thought too powerfully and more often did the same disservice to a reader. The famous ejaculation of the Confessions, "*Da* quod iubes, et *iube quod vis,*" became the starting point of the Pelagian controversy. Phrases torn from their context have been made dangerous catchwords. His simple but mystical description of baptism, "Accedit *verbum* ad *elementum* et fit *sacramentum,*" isolated and supplemented by the peripatetic distinction of matter and form, is the foundation of a whole chapter of theology. He was fastidious about words, disliking the ambiguous *persona* as used in theology; he employed it because it was customary, and because he could find none better, "non ut *illud diceretur,* sed *ne* taceretur." (De *Trin.* v. 9.) He was uneasy about Jerome's revision of the Old Latin text of Scripture, and his warnings were treated by that irascible scholar as impertinent; but, as Mr. Milne has shown, he soon became reconciled to it. His Dialogues are among the lightest and best of their rather heavy kind.

Theology. — In the space at our disposal it is impossible to give an adequate account of Augustine's contribution to theology.

It is the more difficult because he was not himself—except when writing De Trinitate, and then only at intervals—a systematic thinker. To find in his *Civitas Dei* an adumbration of the *respublica christiana* of the middle ages, would be equivalent to putting it there. The book contained valuable materials for the exponents of that polity, but for Augustine himself the empire under Theodosius, though it might by the advent of justice have ceased to be grande *latrocinium,* remained none the less civitas terrena. Though he could bring himself after long resistance to accept its aid against the African schismatics, and though he could twist a text of the gospel into a justification of that attempt to "compel them to come in," he remained unhappy in conscience. It was a hateful expedient, and one of the weak spots in his greatness was a tendency to fall back on expedients, alike in argument and in action. In consequence of all this, we have to seek most of his theology in occasional writings, and to sift it out of a mass of irrelevancies. It says much for the solidity of his habitual thought if we can arrive in this way at anything coherent. That can be done, but only in fragments. It may be said that Augustinianism is a close-knit system. It is; but Augustine was not an Augustinian. The close-knit system was formed out of elements gathered from his writings and put together without regard to other elements no less proper to his thought. Almost from the time of his conversion he was entangled in one or another of three great controversies. As priest and bishop he found himself at grips with Donatists. He had already, before leaving Rome for Africa, undertaken as a personal task the refutation of Manichaeism. The publication of his *Confessions* brought upon him a challenge from Pelagius which was not disposed of while he lived. Each dispute in which he engaged led him to certain theological conclusions.

The Donatists.—The Donatists had at first a fairly good case. They were the true inheritors of Cyprian's doctrine of the Church, which they reduced to absurdity by pressing it relentlessly to a logical conclusion. A faction, though amounting to a majority, of the African Church, they concluded that all the rest of the Church had fallen away to apostasy because not in communion with themselves. The schism was the stupidest, and the controversy about it the most wearisome, that has ever troubled the Christian Church, but Augustine drew from it some important points of doctrine. When he appeared on the scene, it had lasted for 70 years, and was become inveterate. He took up the argument of Optatus of Mileum, which he reduced to doggerel verse for the benefit of the unlearned. Optatus had boldly thrown over Cyprian's theory, and argued that separation did not necessarily amount to apostasy; he therefore insisted, with some rough humour, on calling the Donatists his brothers, to their great annoyance; he maintained that he himself and they were alike sons of the one Church, held the same faith, and possessed the same sacraments. Augustine shrank from dismissing so rudely the great African saint, and laboured at an accommodation. He met the difficulty about the sacraments by drawing a distinction between a sacrament and its effect, which has been fruitful in later theology. He argued that a sacrament is valid, whoever the minister may be, if administered in accordance with the institution of Christ, but the proper effect of the sacrament does not reach the soul of a recipient who interposes an obstacle of faithlessness, of heresy or of schism. Yet the proper effect is produced by the divine operation, even if it lie dormant, and the removal of the obstacle by the conversion of the recipient will release it for the work of grace. The more fundamental difficulty he treated with less subtlety, arguing that the whole Church throughout the world was properly called *Catholica,* while local churches were so called only because they were, broadly speaking, in communion with the whole. The whole Church, on this ground, condemned the Donatists as not Catholic, and acknowledged their opponents as Catholic. It was to beg the question; for the claim of the Donatists was that they, and they alone, were precisely the whole Church. But this dialectical weakness does not obscure the great addition made by Augustine to current conceptions of the Catholic Church. From the atomic episcopate of Cyprian and the earlier reliance on the traditions of apostolic sees he advanced, without putting these aside, to the conception of a world-wide society influencing all its parts and all its members. "*Consensio populorum* atque *gentium,*" he says, was one of the strands binding him; in the same connection (Contra *Ep.* Fund. 5) he makes the memorable statement, "I should not believe the gospel, did not the authority of the Catholic Church move me thereto." This authority should be strictly understood; it was not in the nature of dominion or jurisdiction, but was the true Latin auctoritas.

Manichaeism.—He first attacked Manichaeism on the side of its determinism in the dialogue De libero Arbitrio. The conduct of the argument is rather sophistical, depending on the difficulty of expressing in Latin the distinction which we can easily make in English between wish and will. The purpose is to affirm a valid experience of freedom and power. For Augustine what is given in experience is the basis of all certainty. On this ground he had further to combat the Manichaean dualism of light and darkness, good and evil, equally unalterable and eternal. The Platonic dualism of mind and matter, soul and body, was dangerously akin to this; he escaped from it by the way of the emanation-theory of Plotinus, in which all things that exist emanate from the eternal One, the source of all, partaking of existence in a measure diminishing with distance. But he was not satisfied. For the jejune idea of emanation he substituted the Hebraic conception of Creative Will, drawn from the Sapiential Books of the Old Testament. This gave him his monistic basis. But absolute transcendence of the First Cause would induce another absolute dualism of creator and creature. The argument drove him to the conception of a continuous Nature extending from Supreme Being—ab eo *qui summe* est—to the lowest grade of existence. The word natura became equivocal; there is the one continuous *cursus naturae,* and there are the several *naturae* of existing things. He could see subdivisions. The deacon Caelestinus, in difficulty with some Manichaeans, was instructed to see nature in triplicate: a nature mutable in time and space, which is body; a nature mutable in time but not in space, which is soul; and a nature wholly immutable, which is God. Augustine was certainly not immanentist in the sense of making the creature constituent of the Creator, but his whole thought was of God immanent in the world, *ordinator* as well as creator, controlling all things "*aut* faciendo aut *sinendo.*" And God is Love. Therefore all that is in nature is essentially good.

Where then is evil? Augustine was not the sort of optimist to explain it away as a lesser good. He had the beginnings of the scientific mind, an insatiable curiosity about the most trifling facts of nature, which he sometimes deplored as a distraction from things of greater moment. Hence a firm adhesion to ascertained fact was one of his characteristics. He knew evil as a fact of his own experience. But a positive fact? That would mean a return to dualism. Plotinus taught him that it was negative, a lack of something, a defect in that which is fundamentally good, due to remoteness from the Source. He accepted the description but not the explanation, for he had abandoned the emanation-theory. He found the cause in natures which are nearest in the scale of being to the Creator; men, whom we know, and others perhaps higher, whose existence we assume. These have received the splendid gift of reason and a limited freedom, so that they are capable of resisting control. Such lack of conformity to creative will is evil, and the only evil that he can find in the world, all other natures being constrained to obedience. *Mala voluntas* is the only malum. But the creature whose will is thus depraved remains naturally a good thing. Hence the affirmation which he unweariedly iterates: "Omnis natura, inquantum natura est, *bonum* est." Even evil actions, regarded merely as actions in abstraction from the directing will, are not in themselves evil. In a case of murder it is right to admire the strength and skill with which the fatal blow is delivered. The completeness of his monism is illustrated by his treatment of miracle. He took no account of "supernatural" causes. The word was not yet invented, and the idea was foreign to his mind. A miracle is simply an unusual event occurring in the course of nature, the immediate cause of which is unknown: it is done "*non* contra *naturam,* sed contra quam est nota natura."

Pelagianism.—It might seem impossible to accuse Augustine of reverting to Manichaean dualism, but the charge was made in his lifetime and has often been repeated. In his third great controversy he was constantly on the defensive. Pelagius opened the attack at Rome, scandalized by the words *"Da quod iubes et iube quod vis,"* which he took to involve a denial of human freedom and responsibility. Augustine heard of the criticism, but for some time took no public notice of it, though it was being freely discussed in correspondence. At last he wrote in general defence of his teaching the three books *"De peccatorum meritis et remissione,"* in which he avoided mention of Pelagius. Not until after the condemnation of Coelestius in 412 by a council at Carthage, from which he was wisely absent, did he come into the open with a book *De Natura et Gratia* in answer to one *De Natura* by Pelagius, whose zeal for human liberty and moral responsibility he warmly commended. The regions ecclesiastically dependent on Rome were the stronghold of the new teaching, and when Innocent I. in 417 confirmed the sentence on Coelestius, adding a milder censure of Pelagius, he thought the trouble was at an end. *"Causa finita est,"* he announced in a sermon at Hippo. For him it was only beginning. Within a year Zosimus, Innocent's successor, reversed the judgment. A very large African council protested, and the imperial power was once more unhappily invoked. Honorius compelled Zosimus to cancel the reversal, and to publish a more formal condemnation of the two leaders, which should be signed by all the bishops of the Roman province. Eighteen of them refused to sign, and were banished from Italy by imperial rescript.

From the broken ranks of the party a brilliant champion emerged. One of the banished bishops was Julian of Eclanum, a kinsman of Paulinus of Nola. Finding shelter in the East with Theodore of Mopsuestia, he opened a personal campaign against Augustine, who had beyond question laid himself open to criticism by his doctrine of sin. Maintaining always the essential goodness of every creature, *inquantum natura est,* he measured the effect of sin upon human nature by his own experience of impotence in the face of sinful habit, without considering how far that experience was exceptional. He found the same weakness confessed by St. Paul in circumstances quite unlike his own. It amounted to a paralysis of the will, leaving him at the mercy of instincts, summed up comprehensively as *concupiscence,* which ought to be kept under control. A curious study of child-psychology convinced Augustine that this weakness was congenital, and here again he could lean on St. Paul, though with less assurance. It was therefore inherited. Still with St. Paul he turned to the myth of Eden, regarded as an adequate though symbolical account of human origins, and the source of trouble was found in the sin of the first parents, causing a weakening of the will to do good, transmitted to all their offspring. Augustine attempted three explanations of this transmission, physiological identity of parent and offspring, solidarity of race, and a fouling of the act of generation by the presence of concupiscence. The result was that all humanity is a *massa perditionis,* in a state of moral death, out of which individuals are lifted to renewed life and liberty by a special favour or grace of God perfected in the sacrament of baptism. The *massa perditionis* must not be understood in the sense of the "total depravity" imagined by later Augustinians, for that was ruled out by his metaphysical requirement of a remnant of good in every creature. The doctrine of original sin was not invented by Augustine. It was in St. Paul, and more or less in all Christian teaching before him. What he added was the forensic idea of *reatus,* of guilt attaching even to a new-born child by reason of the depravation of nature. He argued this against Pelagius from the practice of infant baptism, allowed and even encouraged by the Church, since baptism was for the remission of sin. The answer of the Pelagians seems to be complete; remission of sin is not the only gift of grace in baptism.

Julian began with a complaint that the part assigned to concupiscence in this teaching involved a denial of the sanctity of marriage, which Augustine rebutted without much difficulty. He further alleged that it involved the Manichaean conception of the flesh as intrinsically evil, and that the *massa perditionis* was nothing else but the Manichaean Kingdom of Darkness. If Augustine had been content to ignore these allegations, it is probable that no harm would have been done, but he insisted on answering at great length every question that was raised, with the result that he was engaged for the remaining 12 years of his life in a constantly developing controversy, obstinately defending every doubtful position. It is generally agreed that he was dialectically no match for his opponent, who drove him from point to point, from exaggeration to exaggeration. Thus in the difficult doctrine of predestination the fact of God's apparently arbitrary election of individuals to receive the gift of grace was twisted into a conclusion that by similar election the gift is refused to many for whom it is desired: *"tam multos volentibus hominibus sed Deo nolente salvos non fieri."* (*Ep.* 217.) The proposition that fallen man cannot without the help of grace fulfil the purpose of God was stretched to mean that he cannot do anything well-pleasing to God. This extension is found elsewhere than in expressly controversial writings; in the earlier books *De Civitate Dei* Augustine could say that God gave the empire of the world to the Romans as a reward for their virtues; in the later he did not indeed say, as he has been accused of saying, that the virtues of unbelievers are *splendida vitia,* but he came very near doing so. (C.D. v. 15; xix. 25.)

It was during this time of stress that he emitted those extravagances, inconsistent as he himself knew (*Retract.* ii. 1) with the saner thought of his maturity, which have been made the core of the system known as Augustinianism. Four years after his death Vincent of Lerin wrote in the *Commonitorium* a travesty of these, as an example of the novelty which is heresy; but he did not venture to put to it the name of Augustine.

BIBLIOGRAPHY.—The Benedictine edition of the works of St. Augustine, in 11 vols. (1679–1700), reprinted in J. P. Migne's *Patrologia,* remains necessary for reference, except where superseded by the volumes now published in the Viennese *Corpus Scriptorum Ecclesiasticorum Latinorum. See* also *J. AUGUSTINE, ST. (died c. 613), founder of the Christian Church in southern England, and first archbishop of Canterbury, occupied a position of authority in the monastery of St. Andrew at Rome, when Gregory I. summoned him, probably in A.D. 595, to lead a mission to England. The apprehensions of Augustine's followers caused him to return to Rome, but the Pope furnished him with letters of commendation and encouraged him to proceed. He landed in Thanet in A.D. 597, and was favourably received by Aethelbert, king of Kent, who granted a dwelling-place for the monks in Canterbury, and allowed them liberty to preach. Augustine first made use of the ancient church of St. Martin, at Canterbury, which before his arrival had been the oratory of the Queen Berta and her confessor Liudhard. Aethelbert, upon his conversion, employed all his influence in support of the mission. In A.D. 597, Augustine was consecrated bishop by Vergilius at Arles, and in 601 received the pallium from Gregory and was given authority over the Celtic churches in Britain, as well as of all future bishops consecrated in English territory, including York, which was to be independent after Augustine's death. In A.D. 603 he consecrated Christ Church, Canterbury, and built the monastery of SS. Peter and Paul, afterwards known as St. Augustine's. At a conference with the British bishops at Augustine's Oak he endeavoured in vain to bring about a union between the Celtic and the Roman churches. In A.D. 604 he consecrated Mellitus and Justus to the sees of London and Rochester respectively. He died soon after-

wards, though the *Saxon Chronicle* records the date of his death as A.D. 614, and the *Annales Monasterienses* as A.D. 612.

See Bede, *Eccl. Hist.* (ed. by Plummer), i. 23–ii. 3.

AUGUSTINIAN CANONS, a religious order in the Roman Catholic Church, called also Austin Canons, Canons Regular, and in England Black Canons, because their cassock and mantle were black, though they wore a white surplice; elsewhere the colour of the habit varied considerably. The Lateran Synod of 1059 had urgently exhorted the clergy of every cathedral and collegiate church to live together and adopt some form of regularized common life.

The clergy of some cathedrals (in England, Carlisle), and of a great number of collegiate churches all over western Europe, responded to the appeal; and the need of a rule of life suited to the new regime was satisfied by the so-called Rule of St. Augustine, which dates from the 6th or 7th century (see AUGUSTINIANS). This Rule was widely adopted by the Canons Regular, who also began to bind themselves by the vows of poverty, obedience and chastity. In the 12th century this discipline became universal among them; and so arose the order of Augustinian Canons as a religious order in the strict sense of the word. They resembled the monks in so far as they lived in community and took religious vows; but their state of life remained essentially clerical, and as clerics their duty was to undertake the pastoral care and serve the parish churches in their patronage. They were bound to the choral celebration of the divine office, and in its general tenor their manner of life differed little from that of monks.

During the later middle ages the houses of these various congregations of Canons Regular spread all over Europe and became extraordinarily numerous. They underwent the natural and inevitable vicissitudes of all orders, having their periods of depression and degeneracy, and again of revival and reform. In the 15th century grave relaxation had crept into many monasteries of Augustinian Canons in north Germany, and the efforts at reform were only partially successful. The Reformation, the religious wars and the Revolution have swept away nearly all the Canons Regular, but some of their houses in Austria continued to exist. In England there were as many as 200 houses of Augustinian Canons, and 60 of them were among the "greater monasteries" suppressed in 1538–40.

See the *Catholic Encyclopedia,* art. "Austin Canons"; Gasquet, *English Monastic Life;* Heimbucher, *Orden und Congregationen* vol. i (1933), pp. 397–409.

AUGUSTINIAN HERMITS or **FRIARS,** a religious order in the Roman Catholic Church, sometimes (but improperly) called Black Friars (see FRIAR). In the first half of the 13th century there were in central Italy various small congregations of hermits living according to different rules. The need of co-ordinating and organizing these hermits induced the popes towards 1250 to unite into one body a number of these congregations, so as to form a single religious order, living according to the Rule of St. Augustine, and called the Order of Augustinian Hermits, or simply the Augustinian Order. Special constitutions were drawn up for its government, on the same lines as the Dominicans and other mendicants—a General elected by chapter, provincials to rule in the different countries, with assistants, definitors and visitors. For this reason, and because almost from the beginning the term "hermits" became a misnomer (for they abandoned the deserts and lived conventually in towns), they ranked among the friars, and became the fourth of the mendicant orders.

The reaction against the inevitable tendencies towards mitigation and relaxation led to a number of reforms that produced upwards of 20 different congregations within the order, each governed by a vicar-general, who was subject to the General of the order.

About 1500 a great attempt at a reform of this kind was set on foot among the Augustinian Hermits of northern Germany, and they were formed into a separate congregation independent of the general. It was from this congregation that Luther went forth, and great numbers of the German Augustinian Hermits, among them Wenceslaus Link the provincial, followed him and embraced the Reformation, so that the congregation was dissolved in 1526. The Reformation and later revolutions have destroyed most of the houses of Augustinian Hermits, so that now only about 100 exist in various parts of Europe and America; in Ireland they are relatively numerous, having survived the penal times. (See AUGUSTINIAN CANONS.)

AUGUSTINIANS, in the Roman Catholic Church, a generic name for religious orders that follow the so-called "Rule of St. Augustine." The chief of these orders are: Augustinian Canons (*q.v.*), Augustinian Hermits (*q.v.*) or Friars, Premonstratensians (*q.v.*), Trinitarians (*q.v.*), Gilbertines (see GILBERT OF SEMPRINGHAM, ST.).

St. Augustine never wrote a Rule, properly so called; but *Ep.* 211 (*al* 109) is a long letter of practical advice to a community of nuns, on their daily lifer and *Serm.* 355, 356 describe the common life he led along with his clerics in Hippo. When, in the second half of the 11th century, the clergy of a great number of collegiate churches were undertaking to live a substantially monastic form of life, it was natural that they should look back to this classical model for clerics living in community. And so attention was directed to St. Augustine's writings on community life; and out of them grew the "Rule of St. Augustine" followed by many congregations and orders founded then and later.

See E. A. Foran, *The Augustinians, from St Augustine to the Union, 1256* (London, *1938);* also *Lexikon für Theologie und Kirche,* Vol. *I,* cols. 812 sqq.

AUGUSTOW, a town of Poland, in the province of Bialystok, 50 mi. N. of the town of that name, on a canal connecting the Vistula with the Niemen. Pop. (1931) 12,156. It was founded in 1557 by Sigismund II (Augustus), and is laid out in a regular manner, with a market-place. It carries on a large trade in cattle and horses, manufactures linen and huckaback, and is a centre for the transport of timber from the Augustow forest. It was taken by the U.S.S.R. in 1939 and Germany in 1941.

AUGUSTUS, the title given by the Roman senate, on Jan. 17, 27 B.C., to Gaius Julius Caesar Octavianus (63 B.C.–A.D. 14), or, as he was originally designated, Gaius Octavius, in recognition of his eminent services to the state (*Mon. Anc.* 34), and borne by him as the first of the Roman emperors. The name is derived from the Latin *augeo,* increase (see Neumann in Pauly-Wissowa's *Realencyklopädie* s. v.), *i.e.,* venerable, majestic, Gr. Σεβαστός. The title was adopted by all the succeeding Caesars or emperors of Rome long after they had ceased to be connected by blood with the first Augustus.

Gaius Octavius was born in Rome on Sept. 23, 63 B.C., the year of Cicero's consulship and of Catiline's conspiracy. He came of a family of good standing, long settled at Velitrae (Velletri), but his father was the first of the family to obtain a curule magistracy at Rome and senatorial dignity. His mother, however, was Atia daughter of Julia, the wife of M. Atius Balbus and sister of Julius Caesar, and it was this connection with the great dictator which determined his career. In his fifth year (58 B.C.) his father died; about a year later his mother remarried, and the young Octavius passed under her care to that of his stepfather, L. Marcius Philippus. At the age of 12 (51 B.C.) he delivered the customary funeral panegyric on his grandmother Julia, his first public appearance. On Oct. 18, 48 (or ? 47) B.C. he assumed the "toga virilis" and was elected into the pontifical college, an exceptional honour which he no doubt owed to his great uncle, then dictator and master of Rome. In 46 B.C. he shared in the glory of Caesar's African triumph, and in 45 he was made a patrician by the senate and designated as one of Caesar's "masters of the horse" for the next year. In the autumn of 45 Caesar, who was planning his Parthian campaign, sent his nephew to study quietly at the Greek colony of Apollonia, in Illyria. Here the news of Caesar's murder reached him and he crossed to Italy. On landing he learnt that Caesar had made him his heir and adopted him into the Julian gens, whereby he acquired the designation of Gaius Julius Caesar Octavianus. The inheritance was a perilous one; his mother and others would have dissuaded him from accepting it, but he, confident in his abilities, declared at once that he would undertake its obligations and discharge the sums bequeathed by the dictator to the Roman

people. Mark Antony had possessed himself of Caesar's papers and effects and made light of his young nephew's pretensions. Brutus and Cassius paid him little regard and dispersed to their respective provinces. Cicero, much charmed at the attitude of Octavianus, hoped to make use of him and flattered him to the utmost, with the expectation, however, of getting rid of him as soon as he had served his purpose. Octavianus conducted himself with consummate adroitness, making use of all competitors for power, but assisting none. Considerable forces attached themselves to him. The senate, when it armed the consuls against Antonius, called upon him for assistance, and he took part in the campaign in which Antonius was defeated at Mutina (43 B.C.). The soldiers of Octavianus demanded the consulship for him, and the senate, though much alarmed, could not prevent his election. He now effected a coalition with Antonius and Lepidus, and on Nov. 27, 43 B.C. the three were formally appointed a triumvirate for five years for the reconstitution of the commonwealth. They divided the western provinces among them, the East being held for the republic by Brutus and Cassius. They drew up a list of proscribed citizens and caused the assassination of 300 senators and 2.000 knights. They further confiscated the territories of many cities throughout Italy and divided them among their soldiers. Cicero was murdered at the demand of Antonius. The remnant of the republican party took refuge either with Brutus and Cassius in the East or with Sextus Pompeius, who had made himself master of the seas.

Octavianus and Antonius crossed the Adriatic in 42 B.C. to reduce the last defenders of the republic. Brutus and Cassius were defeated and fell at the battle of Philippi. War soon broke out between the victors, the chief incident of which was the siege and capture by famine of Perusia and the alleged sacrifice of 300 of its defenders by the young Caesar at the altar of his uncle. But peace was again made between them (40 B.C.). Antonius married Octavia, his rival's sister, and took for himself the eastern half of the empire, leaving the west to Caesar. Lepidus was reduced to the single province of Africa. Meanwhile Sextus Pompeius made himself formidable by cutting off the supplies of grain from Rome. The triumvirs were obliged to concede to him the islands in the western Mediterranean. But Octavianus could not allow the capital to be kept in alarm for its daily sustenance. He picked a quarrel with Sextus and when his colleagues failed to support him, undertook to attack him alone. Antonius, indeed, came at last to his aid, in return for military assistance in the campaign he meditated in the East. But Octavianus was well served by the commander of his fleet, M. Vipsanius Agrippa. Sextus was completely routed and driven into Asia, where he perished soon afterwards (36 B.C.). Lepidus was an object of contempt to all parties, and Octavianus and Antonius remained to fight for supreme power.

The five years (36–31 B.C.) which preceded the decisive encounter between the two rivals were wasted by Antony in fruitless campaigns, and in a dalliance with Cleopatra which shocked Roman sentiment. By Octavian they were employed in strengthening his hold on the West, and his claim to be regarded as the one possible saviour of Rome and Roman civilization. His marriage with Livia (38 B.C.) placed by his side a sagacious counsellor and a loyal ally, whose services were probably as great as even those of his trusted friend Marcus Agrippa. With their help he set himself to win the confidence of a public still inclined to distrust the author of the proscriptions of 43 B.C. Brigandage was suppressed in Italy, and the safety of the Italian frontiers secured against the raids of Alpine tribes on the northwest and of Illyrians on the east, while Rome was purified and beautified, largely with the help of Agrippa (aedile in 33 B.C.). Meanwhile, indignation at Antony's un-Roman excesses and alarm at Cleopatra's rumoured schemes of founding a Greco-Oriental empire were rapidly increasing. In 32 B.C. Antony's repudiation of his wife Octavia, sister of Octavian, and the discovery of his will, with its clear proofs of Cleopatra's dangerous ascendancy, brought matters to a climax and war was declared, not indeed against Antony, but against Cleopatra.

The decisive battle was fought on Sept, 2, 31 B.C., at Actium on the Epirot coast and resulted in the almost total destruction of Antony's fleet and the surrender of his land forces. Not quite a year later (Aug. 1, 30 B.C.) followed the capture of Alexandria and the deaths, by their own hands, of Antony and Cleopatra. On Jan. 11, 29 B.C., the restoration of peace was marked by the closing of the temple of Janus for the first time for 200 years. In the summer Octavian returned to Italy, and in August celebrated a three days' triumph. He was welcomed, not as a successful combatant in a civil war, but as the man who had vindicated the sovereignty of Rome against its assailants, as the saviour of the republic and of his fellow-citizens, above all as the restorer of peace.

He was now, to quote his own words, "master of all things," and the Roman world looked to him for some permanent settlement of the distracted empire. His first task was the re-establishment of a regular and constitutional government, such as had not existed since Julius Caesar crossed the Rubicon 20 years before. To this task he devoted the next 18 months (Aug. 29–Jan. 27 B.C.). In the article on ROME: History (*q.v.*), his achievements are described in detail, and only a brief summary need be given here. The "principate," to give the new form of government its most appropriate name, was a compromise thoroughly characteristic of the combination of tenacity of purpose with cautious respect for forms and conventions which distinguished its author. The republic was restored; senate, magistrates, and assembly resumed their ancient functions; and the public life of Rome began to run once more in the familiar grooves. The triumvirate with its irregularities and excesses was at an end. The controlling authority, which Octavian himself wielded, could not indeed be safely dispensed with. But henceforward he was to exercise it under constitutional forms and limitations, and with the express sanction of the senate and people. Octavian was legally invested for a period of ten years with the government of the important frontier provinces, with the sole command of the military and naval forces of the state, and the exclusive control of its foreign relations. At home it was understood that he would year by year be elected consul and enjoy the powers and pre-eminence attached to the chief magistracy of the Roman state. Thus the republic was restored under the presidency of its "first citizen" (*princeps* civitatis).

In acknowledgment of this happy settlement and of his other services further honours were conferred upon Octavian. On Jan. 13, 27 B.C., the birthday of the restored republic, he was awarded the civic crown to be placed over the door of his house, in token that he had saved his fellow-citizens and restored the republic. Four days later (Jan. 17) the senate conferred upon him the cognomen of Augustus.

But it was not only the machinery of government in Rome that needed repair. Twenty years of civil war and confusion had disorganized the empire, and the strong hand of Augustus, as he must now be called, could alone restore confidence and order. Towards the end of 27 B.C. he left Rome for Gaul, and from that date until Oct. 19 B.C. he was mainly occupied with the re-organization of the provinces and of the provincial administration, first of all in the West and then in the East. It was during his stay in Asia (20 B.C.) that the Parthian king Phraates voluntarily restored the Roman prisoners and standards taken at Carrhae (52 B.C.), a welcome tribute to the respect inspired by Augustus and a happy augury for the future. In Oct. 19 B.C. he returned to Rome, and the senate ordered that the day of his return (Oct. 12) should thenceforward be observed as a public holiday. The period of ten years for which his *imperium* had been granted him was nearly ended, and though much remained to be done, very much had been accomplished. The pacification of northern Spain by the subjugation of the Astures and Cantabri, the settlement of the wide territories added to the empire by Julius Caesar in Gaul—the "New Gaul," or the "long-haired Gaul" (Gallia Comata) as it was called by way of distinction from the old province of Gallia Narbonensis (see GAUL)—and the re-establishment of Roman authority over the kings and princes of the Near East, were achievements which fully justified the acclamations of senate and people.

In 18 B.C. Augustus's *imperium* was renewed for five years, and his tried friend Marcus Agrippa, now his son-in-law, was associated with him as a colleague. From Oct. of 19 B.C. till the middle of 16 B.C. Augustus's main attention was given to Rome and to domestic reform, and to this period belong such measures as the Julian law "as to the marriage of the orders." In June of 17 B.C. the opening of the new and better age, which he had worked to bring about, was marked by the celebration in Rome of the Secular games. The chief actors in the ceremony were Augustus himself and his colleague Agrippa—while, as the extant record tells us, the processional hymn, chanted by youths and maidens first before the new temple of Apollo on the Palatine and then before the temple of Jupiter on the Capitol, was composed by Horace. The hymn, the well-known *Carmen Saeculare*, gives fervent expression to the prevalent emotions of joy and gratitude.

In the next year (16 B.C.), however, Augustus was suddenly called away from Rome to deal with a problem which engrossed much of his attention for the next 25 years. The defeat of Marcus Lollius, the legate commanding on the Rhine, by a horde of German invaders seems to have determined Augustus to take in hand the whole question of the frontiers of the empire towards the north and the effective protection of Gaul and Italy. The work was entrusted to Augustus's step-sons Tiberius and Drusus. The first step was the annexation of Noricum and Raetia (16–15 B.C.), which brought under Roman control the mountainous district through which the direct routes lay from North Italy to the upper waters of the Rhine and the Danube. East of Noricum, Tiberius reduced to order for the time the restless tribes of Pannonia and probably established a military post at Carnuntum on the Danube. To Drusus fell the more ambitious task of advancing the Roman frontier line from the Rhine to the Elbe, a work which occupied him until his death in Germany in 9 B.C. In 13 B.C. Augustus had returned to Rome; his return and the conclusion of his second period of rule were commemorated by the erection of one of the most beautiful monuments of the Augustan age, the Ara Pacis Augustae. His *imperium* was renewed, again for five years, and in 12 B.C., on the death of his former fellow-triumvir Lepidus, he was elected Pontifex Maximus. But this third period of his *imperium* brought with it losses which Augustus must have keenly felt. Only a few months after his re-appointment as Augustus's colleague, Marcus Agrippa, his trusted friend since boyhood, died. As was fully his due, his funeral oration was pronounced by Augustus, and he was buried in the mausoleum near the Tiber built by Augustus for himself and his family. Three years later his brilliant step-son Drusus died on his way back from a campaign in Germany, in which he had reached the Elbe. Finally in 8 B.C. he lost the comrade who next to Agrippa had been the most intimate friend and counsellor of his early manhood, Gaius Cilnius Maeccnas, the patron of Virgil and Horace.

For the moment Augustus turned, almost of necessity, to his surviving step-son. Tiberius was associated with him as Agrippa had been in the tribunician power, was married against his will to Julia, and sent to complete his brother Drusus's work in Germany (7–6 B.C.). But Tiberius was only his step-son, and, with all his great qualities, was never a very lovable man. On the other hand, the two sons of Agrippa and Julia, Gaius and Lucius, were of his own blood and evidently dear to him. Both had been adopted by Augustus (17 B.C.). In 6 B.C. Tiberius, who had just received the tribunician power, was transferred from Germany to the East, where the situation in Armenia demanded attention. His sudden withdrawal to Rhodes has been variously explained, but, in part at least, it was probably due to the plain indications which Augustus now gave of his wish that the young Caesars should be regarded as his heirs. The elder, Gaius, now 15 years old (5 B.C.), was formally introduced to the people as consul-designate by Augustus himself, who for this purpose resumed the consulship (12th) which he had dropped since 23 B.C., and was authorized to take part in the deliberations of the senate. Three years later (2 B.C.) Augustus, now consul for the 13th and last time, paid a similar compliment to the younger brother Lucius. In 1 B.C. Gaius was given *proconsular imperium* and sent to re-establish order in Armenia, and a few years afterwards (A.D. 2) Lucius was sent to Spain, apparently to take command of the legions there. But the fates were unkind; Lucius fell sick and died at Marseille on his way out, and in the next year (A.D. 3) Gaius, wounded by an obscure hand in Armenia, started reluctantly for home, only to die in Lycia. Tiberius alone was left, and Augustus, at once accepting facts, formally and finally declared him to be his colleague and destined successor (A.D. 4) and adopted him as his son.

The interest of the last ten years of Augustus's life centres in the events occurring on the northern frontier. The difficult task of bringing the German tribes between the Rhine and the Elbe under Roman rule, commenced by Drusus in 13 B.C., had on his death been continued by Tiberius (9–6 B.C.). During Tiberius's retirement in Rhodes no decisive progress was made, but in A.D. 4 operations on a large scale were resumed. From Velleius Paterculus, who himself served in the war, we learn that in the first campaign Roman authority was restored over the tribes between the Rhine and the Weser, and that the Roman forces, instead of returning as usual to their headquarters on the Rhine, went into winter-quarters near the source of the Lippe. In the next year (A.D. 5) the Elbe was reached by the troops, while the fleet, after a hazardous voyage, arrived at the mouth of the same river and sailed some way up it. Both feats are deservedly commemorated by Augustus himself in the Ancyran monument. To complete the conquest of Germany and to connect the frontier with the line of the Danube, it seemed that only one thing remained to be done, to break the power of the Marcomanni and their king Maroboduus. In the spring of A.D. 6 preparations were made for this final achievement; the territory of the Marcomanni (now Bohemia) was to be invaded simultaneously by two columns. One, starting apparently from the headquarters of the army of Upper Germany at Mainz, was to advance by way of the Black Forest and attack Maroboduus on the west; the other, led by Tiberius himself, was to start from the new military base at Carnuntum on the Danube and operate from the south-east.

But the attack was never delivered, for at that moment, in the rear of Tiberius, the whole of Pannonia and Dalmatia burst into a blaze of insurrection. The crisis is pronounced by Suetonius to have been more serious than any which had confronted Rome since the Hannibalic war, for it was not merely the loss of a province but the invasion of Italy that was threatened, and Augustus openly declared in the senate that the insurgents might be before Rome in ten days. He himself moved to Ariminum to be nearer the seat of war, recruiting was vigorously carried on in Rome and Italy, and legions were summoned from Moesia and even from Asia. In the end, and not including the Thracian cavalry of King Rhoemetalces, a force of 15 legions with an equal number of auxiliaries was employed. Even so the task of putting down the insurrection was difficult enough, and it was not until late in the summer of A.D. 9, after three years of fighting, that Germanicus, who had been sent to assist Tiberius, ended the war by the capture of Andetrium in Dalmatia.

Five days later the news reached Rome of the disaster to Varus and his legions, in the heart of what was to have been the new province of Germany beyond the Rhine. The disaster was avowedly due entirely to Varus's incapacity and vanity, and might no doubt have been repaired by leaders of the calibre of Tiberius and Germanicus. Augustus, however, was now seventy-two, the Dalmatian outbreak had severely tried his nerve, and now for the second time in three years the fates seemed to pronounce clearly against a further prosecution of his long-cherished scheme of a Roman Germany reaching to the Elbe.

All that was immediately necessary was done. Recruiting was pressed forward in Rome, and first Tiberius and then Germanicus were dispatched to the Rhine. But the German leaders were too prudent to risk defeat, and the Roman generals devoted their attention mainly to strengthening the line of the Rhine.

The defeat of Varus and the tacit abandonment of the plans of expansion begun 25 years before are almost the last events of importance in the long principate of Augustus. The last five

years of his life (A.D. 10–14) were untroubled by war or disaster. Augustus was ageing fast, and he was more and more disinclined to appear personally in the senate or in public. Yet in A.D. 13 he consented, reluctantly we are told, to yet one more renewal of his *imperium* for ten years, stipulating, however, that his stepson Tiberius, himself now over fifty, should be associated with him on equal terms in the administration of the empire. Early in the same year (Jan. 16, A.D. 13) the last triumph of his principate was celebrated. Tiberius was now in Rome, the command on the Rhine having been given to Germanicus, who went out to it immediately after his consulship (A.D. 12), and the time had come to celebrate the Dalmatian and Pannonian triumph, which the defeat of Varus had postponed. Augustus witnessed the triumphal procession, and Tiberius, as it turned from the Forum to ascend the Capitol, halted, descended from his triumphal car, and did reverence to his adopted father.

One last public appearance Augustus made in Rome. During A.D. 13 he and Tiberius conducted a census of Roman citizens, the third taken by his orders; the first having been in 28 B.C. at the very outset of his rule. The business of the census lasted over into the next year, but on May 11, A.D. 14, before a great crowd in the Campus Martius, Augustus took part in the solemn concluding ceremony of burying away out of sight the old age and inaugurating the new. The ceremony had been full of significance in 28 B.C., and now more than 40 years later it was given a pathetic interest by Augustus himself. When the tablets containing the vows to be offered for the welfare of the state during the next lustrum were handed to him he left the duty of reciting them to Tiberius, saying that he would not take vows which he was never destined to perform.

It was apparently at the end of June or early in July that Augustus left Rome on his last journey. Travelling by road to Astura (Torre Astura), at the southern point of the little bay of Antium, he sailed thence to Capri and to Naples. On his way, at Puteoli, the passengers and crew of a ship just come from Alexandria cheered the old man by their spontaneous homage, declaring, as they poured libations, that to him they owed life, safe passage on the seas, freedom, and fortune.

At Naples, in spite of increasing disease, he bravely sat out a gymnastic contest held in his honour, and then accompanied Tiberius as far as Beneventum on his way to Brundusium and Illyricum. On his return he was forced by illness to stop at Nola, his father's old home. Tiberius was hastily recalled and had a last confidential talk on affairs of state. Thenceforward, says Suetonius, he gave no more thought to such great affairs. He bade farewell to his friends, inquired after the health of Drusus's daughter, who was ill, and then quietly expired in the arms of the wife, who for more than 50 years had been his most intimate and trusted guide and counsellor, and to whom his last words were an exhortation to "live mindful of our wedded life." He died on Aug. 19, A.D. 14, in the same room in which his father had died before him and on the anniversary of his entrance upon his first consulship 57 years before (43 B.C.). The corpse was carried to Rome in slow procession along the Appian Way. On the day of the funeral it was borne to the Campus Martius on the shoulders of senators and there burnt. The ashes were reverently collected by Livia and placed in the mausoleum by the Tiber which her husband had built for himself and his family. The last act was the formal decree of the senate by which Augustus, like his father Julius before him, was added to the number of the gods recognized by the Roman state.

If we except writers like Voltaire, who could see in Augustus only the man who had destroyed the old republic and extinguished political liberty, the verdict of posterity on Augustus has varied just in proportion as his critics have fixed their attention, mainly, on the means by which he rose to power, or the use which he made of the power when acquired. The lines of argument followed respectively by friendly and hostile contemporaries immediately after his death (Tac. *Ann.* i. 9, 10) have been followed by later writers with little change But of late years our increasing mistrust of the current gossip about him and our increased knowledge of the magnitude of what he actually accomplished have conspicuously influenced the judgments passed upon him. We allow the faults and crimes of his early manhood, his cruelties and deceptions, his readiness to sacrifice everything that came between him and the end he had in view. On the other hand, a careful study of what he achieved between the years 38 B.C., when he married Livia, and his death in A.D. 14 is now held to give him a claim to rank, not merely as an astute and successful intriguer, or an accomplished political actor, but as one of the world's great men, a statesman who conceived and carried through a scheme of political reconstruction which kept the empire together, secured peace and tranquillity, and preserved civilization for more than two centuries. (H. F. P.)

AUGUSTUS I. (1526–1586), elector of Saxony, was the younger son of Henry, duke of Saxony, and consequently belonged to the Albertine branch of the Wettin family. Born at Freiburg on July 31 1526, and brought up as a Lutheran, he received a good education at the University of Leipzig. He acted as regent of Saxony in 1552 during the absence of the elector, his elder brother Maurice. Augustus was visiting Denmark when by Maurice's death in July 1553, he became elector of Saxony.

The first care of the new elector was to come to terms with John Frederick, head of the Ernestine branch of the Wettin family, and to strengthen his own hold upon the electoral position. By a treaty made at Naumburg in Feb. 1554, John Frederick recognized Augustus as elector of Saxony in return for the grant of Altenburg and other lands. The elector, however, was continually haunted by the fear that the Ernestines would attempt to deprive him of the electorate, and his policy both in Saxony and in Germany was coloured by this fear.

In imperial politics Augustus acted upon two main principles: to cultivate the friendship of the Habsburgs, and to maintain peace between the contending religious parties. To this policy may be traced his share in bringing about the religious peace of Augustus in 1555, his tortuous conduct at the diet of Augsburg 11 years later, and his reluctance to break entirely with the Calvinists. On one occasion only did he waver in his allegiance to the Habsburgs. In 1568 a marriage was arranged between John Casimir, son of the elector palatine, Frederick III., and Elizabeth, a daughter of Augustus, and for a time it seemed possible that the Saxon elector would support his son-in-law in his attempts to aid the revolting inhabitants of the Netherlands. Augustus also entered into communication with the Huguenots; but his aversion to foreign complications prevailed, and the incipient friendship with the elector palatine soon gave way to serious dislike.

The hostility between the Albertines and the Ernestines gave serious trouble to Augustus. A preacher named Matthias Flacius, who held an influential position in ducal Saxony, began to make personal attacks on Augustus, and to incite Duke John Frederick to make an effort to recover his position. Associated with Flacius was a knight, William of Grumbach, who made inroads into electoral Saxony. After some delay, Grumbach and his protector, John Frederick, were placed under the imperial ban, and Augustus was entrusted with its execution. His campaign in 1567 was short and successful. John Frederick surrendered, and passed his time in prison until his death in 1595; Grumbach was taken and executed; and the position of the elector was made quite secure.

The elector imposed a strict form of Lutheranism in his dominion, and tortured and imprisoned the "Crypto-Calvinists" who followed the teaching of Melanchthon. In 1576 he made a serious but unsuccessful attempt to unite the Protestants upon the basis of some articles drawn up at Torgau. The change in Saxony, however, made no difference to the attitude of Augustus on imperial questions, and he continued to support the Habsburgs.

As a ruler of Saxony, Augustus was economical and enlightened. He favoured trade by encouraging Flemish emigrants to settle in the country, by improving the roads, regulating the coinage and establishing the first posts. He was specially interested in benefiting agriculture, and added several fine buildings to the city of Dresden. His laws were numerous and comprehensive. The constitution of 1572 was his work, and by these laws the church, the universities and the police were regulated, the administration of justice was improved, and the raising of taxes was placed upon a better footing (see SAXONY).

In Oct. 1585 the electress Anna died, and a few weeks later Augustus married Agnes Hedwig, a daughter of Joachim Ernest, prince of Anhalt. He died at Dresden on Jan. 21 1586. By his first wife he had 15 children, but only four of these survived him, among whom was his successor, the elector Christian I. (1560–91). Augustus was a covetous, cruel and superstitious man, but these qualities were redeemed by his political caution and his wise methods of government. He wrote a small work on agriculture entitled *Künstlich* Obst- *und Gartenbüchlein.*

AUGUSTUS II. (1670–1733), "the Strong," king of Poland, second son of John George III., elector of Saxony, was born at Dresden May 12 1670. Upon the death of his brother, John George IV., in 1694, he became elector of Saxony as Frederick Augustus I., and in 1695 and 1696 led the imperial troops against the Turks, but without much success. When John Sobieski died in 1696, Augustus was a candidate for the Polish throne, and in order to further his chances became a Roman Catholic, a step which was strongly resented in Saxony. He secured his election and coronation in Sept. 1697, and his principal rival, F. L. de Bourbon, prince of Conti, abandoned the contest and returned to France.

Augustus continued the war against the Turks for a time, and made an alliance in 1699 with Russia and Denmark against Charles XII. of Sweden. The Poles would not assist, and at the head of the Saxons Augustus invaded Livonia, but he was defeated by Charles at Klissow in July 1702. Augustus was then deposed in Poland, and fled to Saxony. The alliance with Russia was renewed, and in reply Charles invaded Saxony in 1706, and compelled the elector to sign the Treaty of Altranstaedt in September of that year, to recognize Stanislaus Leszczynski as his successor in Poland, and to abandon the Russian alliance, During the War of the Spanish Succession, Augustus fought with the imperialists in the Netherlands, but after the defeat of Charles XII. at Poltowa in July 1709, he turned his attention to the recovery of Poland. Declaring the Treaty of Altranstaedt void and renewing his alliance with Russia and Denmark, he recovered the Polish Crown. He then attacked Swedish Pomerania. He was handicapped by the mutual jealousy of the Saxons and the Poles, and was compelled to promise to limit the number of his army in that country to 18,000 men.

Peace was made with Sweden in Dec. 1719 at Stockholm after the death of Charles XII., and Augustus was recognized as king of Poland. He spent his remaining years in futile plans to make Poland an hereditary monarchy, to weaken the power of the Saxon nobles, and to gain territory for his sons in various parts of Europe. He was a man of extravagant and luxurious tastes, and, although he greatly improved the city of Dresden, he cannot be called a good ruler. He sought to govern Saxony in an absolute fashion, and, in spite of his declaration that his conversion to Roman Catholicism was personal only, assisted the spread of the teachings of Rome. His wife was Christine Eberhardine, a member of the Hohenzollern family, who left him when he became a Roman Catholic, and died in 1727. Augustus died in Warsaw on Feb. 1 1733, leaving a son Frederick Augustus, who succeeded him in Poland and Saxony, and many illegitimate children, among whom was the famous general, Maurice of Saxony, known as Marshal Saxe (q.v.).

Foerster, Die *Höfe und Kabinette Europas im* achtzehnten Jahrhundert (Potsdam, 1839); Jarochowski, History of *Augustus II.* (Posen, 1856–74); C. W. Boettiger and T. Flathe, Geschichte des *Kurstaates* und Koenigreichs Sachsen (Gotha, 1867–73).

AUGUSTUS III., king of Poland (1696–1763) and, as FREDERICK AUGUSTUS II., elector of Saxony, the only legitimate son of Augustus II. ("the Strong"), was born at Dresden on Oct. 17 1696, and died there on Oct. 5 1763. He followed his father's example by joining the Roman Catholic Church in 1712. In Aug. 1719 he married Maria Josepha, daughter of the Emperor Joseph I., and became elector of Saxony on his father's death in Feb. 1733. He was then a candidate for the Polish crown; and having purchased the support of the Emperor Charles VI. by assenting to the Pragmatic Sanction, and that of the Tsarina Anne by recognizing the claim of Russia to Courland, he was elected king of Poland in Oct. 1733.

Aided by the Russians, his troops drove Stanislas Leszczynski from Poland; Augustus was crowned at Cracow in Jan. 1734 and was generally recognized as king at Warsaw in June 1736. On the death of Charles VI., in Oct. 1740, Augustus, as a son-in-law of the Emperor Joseph I., claimed a portion of the Habsburg territories. In 1742, however, he was induced to transfer his support to Maria Theresa, and his troops took part in the struggle against Frederick the Great during the Silesian wars, and again when the Seven Years' war began in 1756. Saxony was in that year attacked by the Prussians, and the Saxon army was forced to capitulate at Pirna in October. The elector fled to Warsaw, and made no attempt to recover Saxony from Frederick. When the treaty of Hubertsburg was concluded in Feb. 1763 he returned to Saxony.

He had five sons, of whom the eldest was Frederick Christian, who succeeded him; and five daughters, one of whom married Louis, the dauphin of France, and another Charles III., king of Spain. Augustus was content to leave Poland under the influence of Russia, and Saxony to the rule of his ministers. He took great interest in music and painting, and added to the collection of art treasures at Dresden.

BIBLIOGRAPHY.—*See* C. W. Boettiger and T. Flathe, Geschichte des Kurstaates und Konigreichs Sachsen (Gotha, 1867–73); R. Roepell, *Polen um die Mitte des 18. Jahrhunderts* (Gotha, 1876).

AUGUSTUSBAD, a watering-place of Germany, 10 m. E. from Dresden, close to Radeberg, in a pleasant valley. It has five saline chalybeate springs, used both for drinking and bathing.

AUKS, GUILLEMOTS or MURRES, and PUFFINS, northern oceanic birds of the family Alcidae, breed often in vast mixed communities on cliff ledges from Greenland, Iceland and Spitsbergen to the St. Lawrence, Maine, Norway and the British isles. As the legs are set far back, they stand upright. Most lay one large, blotched egg, pointed at one end so that it tends to roll in a circle, thus not falling from the ledge; the black guillemot (*Cepphus,* or *Uria,* grylle), length 14 in., lays two eggs; in summer it is black with a white patch on the wing; in winter the wings and tail are black while head and body are white. Other members of the family, black above and white below, have little seasonal change of colour. The puffin (*Fratercula arctica*), length 13 in., distinguished by a heavy, deep, scarlet and yellow bill, nests in a burrow or rock crevice. The common guillemot (U. troille), length 18 in., like the puffin, breeds south to Portugal; a subspecies is found in the north Pacific. Briinnich's murre (U. lomvia), length 18 in., is more northern, and has a pale line along the upper mandible. The razor-billed auk (*Alca* forda), has a deep, heavy bill; it sometimes wanders to the Great Lakes. The little auk (Alle alle), only 8 in. long, shares with the black guillemot the name "dovekie"; it is a source of wealth to the Eskimo, who

eat birds and eggs and make garments of the skins. When the young are grown all auks take to the ocean, spending 8 months on the stormy north Atlantic, south to the Azores.

The great auk *(Plautus,* or *Alca, impennis)*, 30 in. long, had lost the power of flight and was reduced to extinction by boat crews about 1844. A few skins and eggs have been preserved.

The cliffs along the Pacific coast of North America, Alaska and

the Aleutian islands are the home of 13 species of this family: the tufted puffin *(Lunda cirrhata),* the horned puffin *(Fratercula corniculata)*, six auklets, three murrelets and Pacific representatives of the black and common guillemot.

AULARD, FRANÇOIS VICTOR ALPHONSE (1849–1928), French historian, and one of the leading authorities on the revolutionary period in France, was born at Montbron in Charente on July 19, 1849. Having obtained the degree of doctor of letters in 1877 with a Latin thesis upon C. Asinius Pollio and a French one upon Giacomo Leopardi (whose works he subsequently translated into French), he made a study of parliamentary oratory during the French Revolution, and published two volumes upon *Les Orateurs de la constituante (1882)* and upon *Les Orateurs de la législative et de la convention* (1885). With these works, which were reprinted in 1905, he entered a field where he soon became an acknowledged master. Applying to the study of the French Revolution the rules of historical criticism which had produced such rich results in the study of ancient and mediaeval history, he devoted himself to research in the archives, and to the publication of many important contributions to the political, administrative and moral history of that marvellous period. As professor of the history of the French Revolution at the Sorbonne and president of the Société de l'Histoire de la Revolution, he formed the minds of students who in their turn have done valuable work. He died in Oct. 1928.

BIBLIOGRAPHY.—To him we owe the *Recueil des actes du comité de salut public* (vol. i., 1889; vol. xvi., 1904); *La Société des Jacobins; recueil de documents pour l'histoire du club des Jacobins de Paris* (1889–97); and *Paris pendant la réaction thermidorienne et sous le directoire, recueil de documents pour l'histoire de l'esprit public à Paris* (1898–1902), which was followed by an analogous collection for *Paris sous le consulat* (1903–04). For the Société de l'Histoire de la Révolution Française, which brought out under his supervision an important periodical publication called *La Rdvolution française,* he produced the *Registre des délibérations du consulat provisoire* (1894), and *L'État de la France en l'an VIII. et en l'an IX.* with the reports of the prefects (1897), besides editing various works or memoirs written by men of the Revolution, such as J. C. Bailleul, Chaumette, Fournier (called the American), Hérault de Séchelles, and Louvet de Couvrai.

He has also written a *Histoire politique de la Rdvolution française* (1901), and a number of articles which have been collected under the title *Études et leçons sur la Rdvolution frangaise* (1893–1908). His *Taine, historien de la Rdvolution frangaise* (1908) is, as it were, the "manifesto" of the new school of criticism applied to the political and social history of the Revolution *(Les Annales Re'volutionnaires,* June, 1908).

His later works include *La guerre actuelle commentée par l'histoire* (1916), and *Le Christianisme et la Révolution française* (1925; Eng. trans. by Lady Frazer, 1927). He edited the *Histoire politique de la Grande Guerre* (1924).

See A. Mathiez, "M. Aulard, historien et professeur," in the *Revue de la Rdvolution française* (July 1908).

AULIC COUNCIL (*Reichshofrat*), an organ of the Holy Roman empire, originally intended for executive work, but acting chiefly as a judicature, which worked from 1497 to 1806. In the early middle ages the emperor had already his *consiliarii;* but his council was a fluctuating body of personal advisers. In the 14th century there first arose an official council, with permanent and paid members, many of whom were legists. Its business was largely executive, and it formed something of a Ministry; but it had also to deal with petitions addressed to the king, and accordingly it acted as a supreme court of judicature. It was thus parallel to the king's Eouncil in mediaeval England; while by its side, during the 1 jth century, stood the *Kammergericht,* composed of the legal members of the council, in much the same way as the Star Chamber stood beside the English council. But the real history of the Aulic Council, as that term was understood in the later days of the empire, begins with Maximilian I. In 1497–98 he created a new *Hofrat* to deal with "all and every business which may flow in from the empire, Christendom at large, or the king's hereditary principalities." It was thus to be the supreme executive and judicial organ, discharging all business except that of finance and the drafting of documents. But it was difficult to work such a body for the empire and for the hereditary principalities; and under Ferdinand I. it became an organ for the empire alone, the hereditary principalities being removed from its cognizance. As such an imperial organ, its composition and powers were fixed by the treaty of Westphalia of 1648. (1) It consisted of about 20 members—a president, a vice-president, the vice-chancellor of the empire, and some 18 others. The council followed the person of the emperor, and was therefore stationed at Vienna; it was paid by the emperor, and he nominated its members. whose office terminated with his life. (2) Its powers were nominally both executive and judicial. *(a)* Its executive powers were small: it gradually lost everything except the formal business of investiture with imperial fiefs and the confirmation of charters, its other powers being taken over by the Geheimräte, who were already constituted as a definite body for dealing with imperial affairs by 1527. *(b)* In its judicial aspect, the Aulic Council, exercising the emperor's judicial powers on his behalf, had exclusive cognizance of matters relating to imperial fiefs, criminal charges against immediate vassals of the empire, and cases "reserved" for the emperor. In all other matters, the Aulic Council was a competitor for judicial work with the Imperial Chamber (q *v.).*

See R. Schrbder, *Lehrbuch der deutschen Recktsgeschichte* (Leipzig, 1904). (E. B.)

AULIE-ATA, a district and town in the Syr-darya province of the Russian S F.S.R. The area of the district is 75,331sq.km. and the population is *227,016.* The Talas river waters the district and it has been a fertile loess oasis known to pilgrims and armies from Central Mongolia for centuries. The chief products are rice, cotton, wheat, barley, millet, potatoes, silk and grapes. Cattle, camels, horses, sheep and goats are reared. The town, Lat. 42° 52' N., Long. 71° 23' E., alt. *5,700* ft., has prospered since the railway through it to **Alma** Ata was built. Population *24,682.*

AULIN, TOR (1866–1914), distinguished Swedish violinist, was born at Stockholm and acquired wide renown as one of the most accomplished executants of his time. He also composed and conducted.

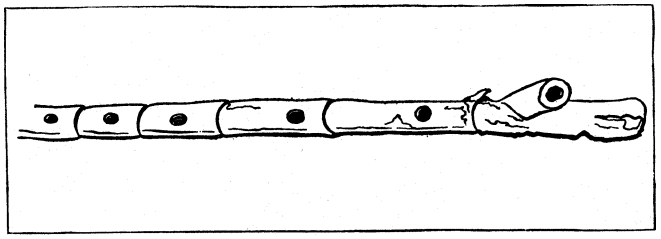
AULIS, an ancient town in Boeotia on the Euripus, on a rocky peninsula between two bays, near the modern village of Vathy, about 3m. S. of Chalcis. It was the traditional starting-place of the Greek fleet before the Trojan War, the scene of the sacrifice of Iphigenia.

AULNOY (or AUNOY), **MARIE CATHERINE LE JUMEL DE BARNEVILLE DE LA MOTTE,** BARONNE D' (*c.* 1650–1705), French author, was born at Barneville near Bourg-Achard (Eure). She married on March 8 1666, François de la Motte, a gentleman in the service of César, duc de Vendôme, who became Baron d'Aulnoy in 1654. With her mother, who by a second marriage had become marquise de Gudaigne, she instigated a prosecution for high treason against her husband. The conspiracy was exposed, and the two women saved themselves by a hasty flight to England. Thence they went (Feb. 1679) to Spain, but were eventually allowed to return to France in reward for secret services rendered to the government.

Mme. d'Aulnoy wrote fairy tales, *Contes nouvelles ou les Fées à la mode* (1698), in the manner of Charles Perrault. This collection (24 tales) included *L'Oiseau Bleu, Finette Cendron, La Chatte Blanche* and others. The originals of most of her admirable tales are to be found in the *Pentamerone* (1637) of Giovanni Battista Basile. Other works are: *L'Histoire d'Hippolyte, comte de Duglas* (1690), a romance in the style of Mme. de la Fayette, though much inferior to its model; *Mémoires de la cour d'Espagne* (1679–81); and a *Relation du voyage d'Espagne* (1690 or 1691) in the form of letters, edited in 1874–76 as *La Cour et la ville de Madrid* by Mme. B. Carey; *Histoire de Jean de Bourbon* (1692); *Me'moires sur la cour de France* (1692); *Mémoires de la cour d'Angleterre* (1695). Her historical writings are partly borrowed from existing records, to which she adds much that must be regarded as fiction, and some vivid descriptions of contemporary manners.

The *Diverting Works of the Countess d'Anois,* including some extremely untrustworthy "Memoirs of her own life," were printed in London in 1707. *The Fairy Tales of Madame d'Aulnoy,* with an introduction by Lady Thackeray Ritchie, appeared in **1892.** For biographical particulars *see* M. de Lescure's introduction to the *Contes des Ftes* **(1881).**

AULOS, in Greek antiquities, a class of woodwind instruments with single or double reed mouthpiece and either cylindrical or conical bore, thus corresponding to both oboe and clarinet. (Gr. αὐλός; Lat. *tibia;* Egyptian hieroglyphic, *Ma it;* mediaeval equivalents, *shalm, chalunteau, schalmei, hautbois.)* In its widest sense *aulos* was the generic term for instruments consisting of a tube in which the air column was set in vibration either directly by the lips of the performer, or through the medium of a mouthpiece containing a single or a double reed. Even the pipes of the pan-pipes were sometimes called *auloi* (αὐλοί). This is the prototype of the organ, which, by gradual assimilation of the principles of syrinx and bag-pipe, reached the stage at which it became known as the *Tyrrhenian aulos* (Pollux iv. 70) or the *kydraulos,* according to the method of compressing the wind supply *(see* ORGAN and SYRINX).



FROM MACAULAY FITZGIBBON, "THE STORY OF THE FLUTE"

THE AULOS, A PRIMITIVE KIND OF FLUTE USED BY THE GREEKS

At first the aulos had but three or four holes; to Diodorus of Thebes is due the credit of having increased this number (Pollux iv. 80). Pronomus, the musician, and teacher of Alcibiades (5th century B.C.), further improved the aulos by making it possible to play on one pair of instruments the three musical scales in use at his time, the Dorian, the Phrygian, and the Lydian, whereas previously a separate pair of pipes had been used for each scale (Pausanias ix. 12, 5; Athenaeus xiv. 31). The double reed was probably used at first, being the simplest form of mouthpiece. There is, however, no difficulty in accepting the probability that a single beating reed or clarinet mouthpiece was used by the Greeks since the ancient Egyptians used it with the as-it or arghoul (*q.v.*). Aristoxenus gives the full compass of a single pipe or pair of pipes as over three octaves. This, according to the tables of Alypius, would correspond to the full range of the Greek scales, and it is evident that the ancient Greeks obtained this full compass on the aulos by means of the harmonics. The aulos or tibia existed in a great number of varieties falling into two distinct classes, the single and the double pipes.

AUMALE, HENRI EUGENE PHILIPPE LOUIS D'ORLÉANS, DUC D' (1822–97), French prince and statesman, 5th son of Louis Philippe, Duke of Orleans, afterwards king of the French, and of Marie Amélie, princess of the Two Sicilies, was born in Paris, Jan. 16 1822. He inherited a large fortune from the Prince de Condé. Aumale entered the army at the age of 17, served in Algeria 1840–47, and was governor of the colony (1847–48). After the revolution of 1848 he went to England and occupied himself with military and historical studies.

Although his offer of service during the Franco-German War was declined, he resumed his place in the army in 1872 as general of division. He presided over the court martial which condemned Marshal Bazaine to death. In 1879 he became inspector general of the army. In the meantime he had been elected deputy for Oise to the Chamber. The act of exception of 1883 excluded him, with other members of ex-reigning families, from the army, and that of 1886 from exercising any public functions. Aumale protested, and was expelled, though he was permitted to return in 1889 on account of the bequest in his will of Chantilly with its art treasures to the Institute of France. The Duke was a member of the French Academy and the author of an unfinished *Histoire des princes de Condé.* He died at Zucco, Sicily, on May 7 1897.

See Georges Picot, *M. le duc d'Aumale* **(1898)**; Ernest **Daudet,** *Le duc d'Aumale* **(1898).**

AUMALE, a town of northern France, in the department of Seine-Inférieure, on the left bank of the Bresle, 47 mi NE. of Rouen. Pop. (1936) 1,972. The church is an interesting building of the 16th and 17th centuries and has a portal attributed to Jean Goujon. The town has glass and steel works.

The territory of Aumale in Normandy was granted to Odo of Champagne, brother-in-law of William the Conqueror, who founded the first line of counts of Aumale. Hawise, countess of Aumale, after the death of her first husband William de Mandeville, earl of Essex (d. 1189), was married to William de Forz, one of the commanders of the fleet under Richard I. during his crusade. He died in 1195, and his widow married Baldwin de Béthune, who became count of Aumale in her right. He died in 1213, and in 1214 William de Forz, son of Hawise by her second husband, was confirmed by King John in all his mother's lands. The territory of Aumale shared the fate of the rest of Normandy and was annexed to the French crown by King Philip Augustus; but the title of count of Aumale, derived from it, continued to be borne in England by William de Forz, and was passed on to his heirs in the form Albemarle (*q.v.*). Aumale itself was conferred by Philip Augustus as an appanage on his son Philip. It was subsequently granted by Louis VIII. to Simon, count of Dammartin, whose daughter, Jeanne, transferred it, together with the countship of Ponthieu, to the house of Castile, by her marriage with Ferdinand III. of Castile (1238). It remained in the possession of a branch of her descendants bearing the name of Ponthieu until it passed to the house of Harcourt on the marriage of Blanche of Ponthieu with John, count of Harcourt (1340). Marie d'Harcourt (d. 1476), heiress of Aumale, married Anthony of Lorraine, count of Vaudemont, and Aumale was created a duchy in the peerage of France for Claude and Francis of Lorraine in 1547. By the mar-

riage of Anne of Lorraine with the duke of Nemours in 1618 the. duchy of Aumale passed to the house of Savoy-Kernours. In 1686 Marie Jeanne Baptiste, duchess of Nemours and of Aumale and wife of Charles Emmanuel II., duke of Savoy, sold Aumale to Louis XIV., who gave it to his natural son, the duke of Maine. From him the dukedom devolved upon his brother, the count of Toulouse, and passed to the latter's son, the duke of Penthièvre, whose daughter married the duke of Orléans. Since the reign of Louis Philippe, king of the French, the title of duke of Aumale has been borne by a son of the duke of Orléans.

AUMERY: see AMBRY.

AUMONT, the name of a family which played an important part in French history. Jean d'Aumont, lieutenant-general to the king of France in the government of Burgundy, rendered important services to Louis XII. and Francis I. Another Jean d'Aumont (d. 1593), a marshal of France and knight of the Order of the Holy Ghost since its institution in 1578, fought against the Huguenots under the last of the Valois kings; but he was among the first to recognize Henry IV., and was appointed governor of Champagne and of Brittany where he had to fight the League.

His grandson Antoine (1601–69) was also a marshal of France (1651), governor of Paris (1662), duke and peer (1665). Louis Marie Augustin, duc d'Aumont (1709–82), was a celebrated collector of works of art. Louis Marie Céleste d'Aumont, duc de Piennes, afterwards duc d'Aumont (1762–1831), emigrated during the Revolution and served in the army of the Royalists, as also in the Swedish Army. During the Hundred Days he effected a descent upon Normandy in the Bourbon interest, and succeeded in capturing Bayeux and Caen.

AUNCEL, a balance formerly used in England; now, in dialectical use, a term for the weighing of meat by hand instead of by scales (from the Anglo-Fr. auncelle, a confused derivation from *l'auncelle,* Ital. *lancella,* a little balance).

AUNDH, a native State of India in the Deccan division of Bombay, ranking as one of the Satara Jagirs. Its area is 501sq.m.; its population was 76,507 in 1931, showing an increase of 18% in the decade. No tribute is paid. The chief, whose title is Pant Pratinidhi, is a Brahman. The State has suffered severely from plague. The town of Aundh is situated 26m. S E. of Satara. Pop. 3,741.

AUNGERVYLE, RICHARD (1287–1345), commonly known as RICHARD DE BURY, English bibliophile, writer and bishop, was born near Bury St. Edmunds, Suffolk, Jan. 24 1287, and educated at Oxford. He was made tutor to Prince Edward of Windsor (afterwards Edward III.), and was mixed up with the sordid intrigues which preceded the deposition of Edward II. On the accession of Edward III. his services were rewarded by rapid promotion. He was cofferer to the King, treasurer of the wardrobe and afterwards clerk of the privy seal. The King, moreover, repeatedly recommended him to the Pope, and twice sent him, in 1330 and 1333, as ambassador to the papal court, then in exile at Avignon. On the first of these visits he made the acquaintance of a fellow bibliophile in Petrarch, who records his impression (*Epist. Famil.,* lib. iii., Ep. 1) of the Englishman as "not ignorant of literature and . . . from his youth up curious beyond belief of hidden things." During his absence from England he was made (1333) dean of Wells. In September of the same year the see of Durham fell vacant, and the King overruled the choice of the monks, who had actually installed their sub-prior, Robert de Graystanes, in favour of Aungervyle. In Feb. 1334 he was made lord treasurer, an appointment he exchanged later in the year for that of lord chancellor. This charge he resigned in the next year, but he was repeatedly employed on the Icing's service abroad and in the defence of northern England.

Aungervyle sent far and wide in search of manuscripts, rescuing many treasures from the charge of ignorant and neglectful monks. "No dearness of price," he says, "ought to hinder a man from the buying of books, if he has the money demanded for them, unless it be to withstand the malice of the seller or to await a more favourable opportunity of buying." The record of his passion for books, his *Philobiblon,* was completed on his 58th birthday, and he died April 14 (May, according to Adam Murimuth) of that year, in great poverty. It seems likely that his collection was dispersed immediately after his death. But the traditional account is that the books were sent to the Durham Benedictines at Oxford, and that on the dissolution of the foundation by Henry VIII. they were divided among the libraries of Duke Humphrey of Gloucester, Balliol College, and Dr. George Owen. Only two of the volumes are known to be in existence.

BIBLIOGRAPHY.—The chief authority for the bishop's life is William de Chambre, printed in Wharton's Anglia Sacra (1691), and in Historiae Dunelmensis scriptores tres, Surtees Soc. (1839). It has often been asserted that the Philobiblon itself was not written by Richard de Bury at all, but by Robert Holkot. This assertion is supported by the fact that in seven of the extant mss. it is ascribed to Holkot in an introductory note. The original Latin text was printed at Cologne (1473), Spires (1483), Paris (1500), Oxford (1598 and 1599), etc. The best translation is that by Mr. E. C. Thomas, accompanying the Latin text, with full biographical and bibliographical introductions (1888). Other editions are in the Ktng's *Classics* (1902) and for the Grolier Club (New York, 1889, ed. A. F. West).

AUNIS was formerly a province (pays) of France, bounded on the north by Poitou, on the west by the Atlantic, and on the south and east by Saintonge. Its principal town was at first Chbtelaillon, and later La Rochelle; the latter city was founded in 1117 by Duke Guillaume X. of Aquitaine. Other towns are Saujon and St. Jean d'Angely. Aunis formed part of the diocese of Saintes until 1648. In that year it was joined to the former diocese of Maillezais (created in 1317), and the bishop's see was transferred to La Rochelle. For the administration of justice, Aunis came under the Parlement of Paris; it was subject to the jurisdiction of the *présidial* of La Rochelle. For military purposes, Aunis constituted a separate Government (gouuernement *général*) which included the islands of RC and Oléron and had its headquarters at La Rochelle.

Aunis (pagus Alnensis) possibly derives its name from its old capital Chbtelaillon (*castrum qui vocatur* Allionis). It very early became a feudal dependence of Poitou, and shared the political fortunes of that province. It now forms the north-western part of the department of Charente-Inférieure.

See L. Arcère, *Histoire* de la ville de la Rochelle et *du* pays *d'Aunis* (1756–57); Me'moires de la *Société* des Antiquaires de *l'Ouest* (1835 *seq.*); La Revue de Saintonge et *d'Aunis;* L. de Richemond, Documents *hist. inédits* sur *le département* de la *Charente-Inférieure* (1874).

AUNT SALLY, an English game popular at fairs, race-courses and summer resorts. It consists in throwing wooden or leather-covered balls at grotesquely dressed puppets, generally a female figure called "Aunt Sally," with the object of smashing a clay pipe, inserted either in the mouth or forehead of the puppet. In France the game is known as jeu de massacre.

AURA, formerly the supposed ethereal emanation from a volatile substance; applied later to the "electrical aura," or air-current caused by electrical discharge; in epilepsy (*q.v.*) to one of its premonitory symptoms; and in spiritualism (*q.v.*) to a light associated with the presence of spirit-forms. See AUREOLA; HYSTERIA.

AURAMINE, a yellow synthetic dye. There are several different methods of preparation. It crystallizes from water or alcohol in yellow scales, melts at 267° C, and carbonizes without previous fusion at 265°–280° C. It decomposes when heated as an aqueous solution, above 70° C, and when treated with acids. It dyes wool and silk direct, but cotton has to be nordanted previously. (See DYES, SYNTHETIC.)

AURANGABAD, a city of India, in the dominions of the nizam of Hyderabad, north-west division, situated 138m. from Poona, 207 from Bombay via Poona, and 270 from Hyderabad on the river Kaum. It gives its name to a district. It was founded in 1610 by Malik Ambar, an Abyssinian slave who had risen to great influence. Subsequently it became the capital of the Mogul conquests in south India. Aurangzeb, who erected here a mausoleum to his wife which has been compared to the Taj Mahal at Agra, made the city the seat of his government during his viceroyalty of the Deccan, and gave it the name of Aurangabad. It thus grew into the principal city of a province including nearly all the territory now the northern division of the presidency of Bombay, and was for long capital of the nizams after they became inde-

pendent of Delhi. They subsequently transferred their capital to Hyderabad, whereupon Aurangabad began to decline. In recent years the jungle has been cleared from the ruins of the citadel, mosque, etc., 2m. from the cantonment, and government offices have been built near the ruins. North of the city are Buddhist caves of the 7th century. Aurangabad is a railway station on the Hyderabad-Godavari line, 435m. from Bombay. In 1931 the population, with that of the military cantonments, was 36,870.

The district of Aurangabad has an area of 6,212 square miles. The population in 1931 was 944,793. It contains the famous caves of Ajanta, and also the battlefield of Assaye.

AURANGZEB (1618–1707), one of the greatest of the Mogul emperors of Hindustan, was the third son of Shah Jahan, and was born in Nov. 1618. His original name, Mohammed, was changed by his father, with whom he mas a favourite, into Aurangzeb, meaning ornament of the throne, and at a later time he assumed the additional titles of Mohi-eddin, reviver of religion, and Alam-gir, conqueror of the world. At a very early age, and throughout his whole life, he manifested profound religious feeling, perhaps instilled into him in the course of his education under some of the strictest Mohammedan doctors. He was early employed in the campaigns in Afghanistan where the Persians were fighting to recover Kandahar from the Uzbeg chief who had acknowledged the Mogul authority. The city surrendered to the Shah Abbás in 1648, and Aurangzeb's attempts to dislodge the Persians failed. The prince was then transferred to the army fighting on the southern frontier, where he had better success. In conjunction with the famous general, Mir Jumla, who had deserted from the king of Golconda, he seized and plundered the town of Hyderabad. His father's express orders prevented Aurangzeb from following up this success, and, not long after, the sudden and alarming illness of Shah Jahan turned his thoughts to the succession. Shah Jahan's eldest son, Dara, a brave and honourable prince, but disliked by the Mussulmans on account of his liberality of thought, at once seized the reins of government and established himself at Delhi. The second son. Shuja, governor of Bengal, a dissolute and sensual prince, raised an army to dispute the throne with Dara. Aurangzeb was too politic to put forward his claims openly. He made overtures to his younger brother Murad, governor of Gujarat, representing that he himself had no temporal ambition, and desired only to place a fit monarch on the throne, and then to devote himself to religious exercises and make the pilgrimage to Mecca. He therefore proposed to join Murad, who would thus have no difficulty in making himself master of the empire while the two elder brothers were divided. Murad at once accepted the offer. Their united armies then moved northward. Meanwhile Shah Jahan had recovered, and though Dara resigned the crown he had seized the other brothers pressed on. Shuja was defeated by Dara's son, but the imperial forces under Jaswant Singh were completely routed by the united armies of Aurangzeb and Murad. Dara in person took the field against his brothers, but was defeated. Aurangzeb then placed his father in confinement, in which he was kept for the remaining eight years of his life. Murad was assassinated, and Aurangzeb, with affected reluctance, ascended the throne in Aug. 1658. Dara, who again invaded Gujarat, was defeated and closely pursued, and was given up by the native chief with whom he had taken refuge. He was brought to Delhi and executed. Shuja was defeated and fled to Arakan, where he perished; Mohammed, Aurangzeb's eldest son, who had joined his uncle, was captured, thrown into the fortress of Gwalior, and died after seven years' confinement.

No similar contest disturbed Aurangzeb's long reign of 46 years which has been celebrated, though with doubtful justice, as the most brilliant period of the history of Hindustan. The empire certainly was wealthy, and extended from the Himalayas over the whole of northern and central India, for there were successively added to it the rich kingdoms of Bijapur and Golconda, but it was internally decaying and ready to crumble away before the first vigorous assault. Two causes principally had tended to weaken the Mogul power. The one was the intense bigotry and intolerant policy of Aurangzeb, which had alienated the Hindus and roused the fierce animosity of the haughty Rajputs. The other was the rise and rapid growth of the Mahratta power. Under their able leader, Sivaji, these daring freebooters plundered in every direction, nor could all Aurangzeb's efforts avail to subdue them. For the last 26 years of his life Aurangzeb was engaged in wars in the Deccan, and never set foot in his own capital. At the close of the long contest the Mogul power was weaker, the Mahratta stronger than at first. Still the personal ability and influence of the emperor were sufficient to keep his realms intact during his own life. His last years were embittered by remorse, by gloomy forebodings, and by constant suspicion, for he had always been in the habit of using espionage, and now only experienced its evil effects. He died March 3 1707, at Ahmadnagar, while engaged on an extensive but unfortunate expedition against the Mahrattas.

See S. Lane-Poole, *Aurangzib,* "Rulers of India" series (1893), and *History of the Moghul Emperors illustrated by their coins* (1892); Hosain Khan, *Letters of Aurangzeb* (Bombay, 1889).

AURAY, a town of France, in the department of Morbihan, 12 mi. W. of Vannes on the railway to Quimper Pop. (1936) 6,544. Coastal subsidence forming the island-studded Morbihan bay has submerged the lower valley of the Auray river and the tide reaches the town, giving it some coasting trade. The great stone monuments abounding near by are thought to indicate maritime intercourse already in prehistoric times. In the neighbourhood is the church of Ste. Anne d'Auray, famous for its pardon and one of the principal places of pilgrimage in Brittany. Auray is one of the chief centres in France for oyster breeding. There is an active coasting trade, the principal cargoes being mine-props for, and coal from, Great Britain. Auray also makes furniture, and trades in dairy produce and fruit.

AURELIA, VIA, ancient highroad of Italy, date unknown. It ran from Rome to the sea at Alsium, and thence along the west coast line of Italy, perhaps originally only as far as Cosa, but it was later extended to Vada Volaterrana, and in 109 B.C. to Genua and Dertona by means of the Via Aemilia, though a coast road as far as Genua at least must have existed long before. The name is applied in the Antonine Itinerary to these extensions, and even to the prolongation to Arles. Its line is in the main closely followed by the modern coast highroad.

See D. Anziani in *Mélanges de l'École Française* (1913), 174 *sqq.*

AURELPAN (LUCIUS DOMITIUS AURELIANUS) (Roman emperor, A.D. 270–275) was born of humble parents at Sirmium in Pannonia between A.D. 212 and 214. He had a distinguished military career, and on the death of the emperor Claudius II. Gothicus (270), Aurelian was proclaimed his successor, with the universal approval of the soldiers. His first task was to continue the war which had been begun by Claudius against the Goths. He drove them out of Moesia across the Danube, where he left them in possession of Dncia, which he did not think himself able to retain; the name was transferred to Moesia, which was then called Dacia Aureliani. The chronology, however, of Aurelian's reign is very confused, and the abandonment of Dacia is placed by some authorities towards its close. He next entered upon campaigns against the Juthungi, Alamanni, and other Germanic tribes, over whom, after a severe defeat which was said to have imperilled the very existence of the empire, he at length obtained a complete victory. Having thus secured the Rhine and Danube frontiers, he turned his energies towards the east, and in 271 set out on his expedition against Zenobia, queen of Palmyra (*q.v.*). At the same time he crushed two pretenders to the throne — Firmus and Tetricus. Firmus, a wealthy merchant of Seleucia, had proclaimed himself emperor of Egypt. Aurelian, who was at the time in Mesopotamia, hastened thither, and ordered him to be seized and put to death. Tetricus, who had been proclaimed emperor in the west after the death of Gallienus, and left undisturbed by Claudius II., still ruled over Gaul, Spain and Britain. A decisive battle was fought near the modern Châlons, in which Tetricus was defeated. The restoration of the unity of the empire was thus complete. In 274 a brilliant triumph, adorned by the persons of Zenobia and Tetricus, was celebrated at Rome.

Towards the end of 274, he started on an expedition against the Persians, halting in Thrace by the way. While on the march between Heracleia and Byzantium, at the beginning of the following year, hc was assassinated through the treachery of his secretary, Eros, who, in order to escape the discovery of his own irregularities, incited certain officers against the emperor by showing them a forged list, on which their names appeared as marked out for death.

Aurelian well deserved the title of restorer of the empire. He was a great soldier and a rigid but just disciplinarian, and in more favourable circumstances he would have been a great administrator. He was the first Roman emperor to wear the diadem, and assumed the title of Lord and God on medals. The restoration and enlargement of the walls of Rome, begun by him, was not completed till the reign of Probus.

BIBLIOGRAPHY.—The chief authority for the events of Aurelian's reign is his life by Vopiscus, one of the writers of the "Augustan History"; it is founded on Greek memoirs and certain journals deposited in the Ulpian library at Rome. See L. Homo, Le *Règne* de *l'empereur Aurélien* (1904), and Groag's art. in Pauly-Wissowa, Realencyklopadie, v. 1347 foll.

AURELIANUS, CAELIUS, a physician of Sicca in Numidia, who probably flourished in the 5th century A.D., although some place him two or even three centuries earlier. We possess a translation by Aurelianus of two works of Soranus of Ephesus (2nd century), the chief of the "methodist" school of medicine, on chronic and acute maladies — Tardae or *Chronicae* Passioizes, in five, and Celeres or Aczitae *Passiones* in three books. We also possess considerable fragments of his *Medicinales Responsiones,* also adapted from Soranus, a general treatise dealing with rules of health (*salutaria praecepta*) and the pathology of internal diseases (ed. Rose, *Anecdota Graeca* et Latiiza, ii., 1870). (Editions: Amman, 1709; Haller, 1774.)

AUREOLA, AUREOLE, the radiance of luminous cloud (fr. diminutive of Lat. *aura,* air), surrounding the figures of sacred personages in paintings. In the earliest periods of Christian art this splendour was confined to the figures of the persons of the Godhead, but it was afterwards extended to the Virgin Mary and to several of the saints. The luminous disk round the head is a *nimbus; nimbus* and aureole together constitute a glory. The *nimbus* in Christian art appeared first in the 5th century, but it was known still earlier in non-Christian art. Thus (though earlier Indian and Bactrian coins do not show it) it is found with the gods on some of the coins of the Indian kings Kanishka, Huvishka and Vasudeva, 58 B.C. to A.D. 41 (Gardner's Cat. of Coins of Greek aizd *Scythic* Kings of Bactria aizd *India,* Brit. Mus. 1886, plates 26–29). Its use has been traced through the Egyptians to the Greeks and Romans, representations of Trajan (arch of Constantine) and Antoninus Pius (reverse of a medal) being found with it.

AURÈS, a mountain mass in the south of the department of Constantine, Algeria (*q.v.*).

See M. W. Hilton Simpson, Among *the* Hill Folk of Algeria (1921).

AURIC, GEORGE (1899–), French composer, born Lodève, Hérault. With Honegger, Poulenc, and others, he first came under notice as one of a group of ultra-advanced composers calling themselves 'Les Six."

His earliest works showed the influence of Ravel and later of Satie, but more recently he has inclined to the methods of Stravinsky. He wrote the music for the Diaghilev ballet "Les Matelots."

AURICH, a town of Hanover, Germany. chief town of the district of East Friesland, on the Ems-Jade canal, 18 mi. N.W. of Emden. Pop. (1933) 6.544 It is built in the Dutch style and lies in a sandy but fertile plain, surrounded by promenades replacing the old fortifications.

The palace bf the counts of East Friesland is now government offices.

Close by is the *Upstallsboom,* the hill of oath and liberty where every year at Whitsuntide representatives of the seven Frisian coastlands used to assemble.

AURICLE, the external ear in animals. or an analogous part in plants, etc.

From a supposed resemblance to the ear of a dog, the term was applied to the upper cavities of the heart. The adjective "auricular" is more specially used in the phrase "auricular confession" (see CONFESSION), *i.e.,* private confession.

AURICULA (*Primula* auricula), an Alpine plant and a favourite spring flower. It thrives best in a cool soil and shady situation. The florists' varieties are grown in rich composts.

Auriculas are best germinated in a cold frame or cool greenhouse, in September or October, in a rich but light soil. They can be planted in the rock garden or border, preferably in mild climates, the following spring.

Auricuias may also be propagated by division, which is to be done in early spring. When seed has been saved from the finer sorts, the operation is one of considerable nicety, as it not infrequently happens that the best seedlings are at first exceedingly weak.

They generally flower in the second or third year, a few good sorts being all that can be expected from a large sowing. The summer heat in the United States makes the cultivation of auriculas rather difficult.

Auriculas prefer cool, moist sites and lacking this are best grown in a shaded, cool greenhouse.

AURICULAR CANAL, the tube leading from the external ear to the ear drum. It is about 1in. long and is lined by thin skin which is tightly bound to the cartilage and bone on which it rests. The outer one-third is formed by cartilage; the inner two-thirds by bone. The few short crisp hairs at the entrance of the canal serve as a barrier to dust and small insects. In the skin of the outer portion are glands which secrete a sticky yellow material called cerumen, or wax. This also serves to catch small particles. The cerumen sometimes becomes packed in, causing sudden deafness, and should then be removed by a physician. The short, straight, constricted tube, connecting the auricular with the ventricular portions of the embryonic heart is also known as the auricular canal.

AURIGA (the "charioteer" or "wagoner"), in astronomy, a constellation of the northern hemisphere. It was symbolized by the Greeks as an old man in a more or less sitting posture, with a goat and her kids in his left hand, and a bridle in his right. The ancient Greeks associated this constellation with many myths. Some assume it to be Erichthonius, son of Athena and Hephaestus, who was translated to the skies by Zeus on account of his invention of chariots or coaches. Others assume it to be Myrtilus, a son of Hermes and Clytie, and charioteer to Oenomaus, who was placed in the heavens by Hermes. The constellation contains Capella (*q.v.*).

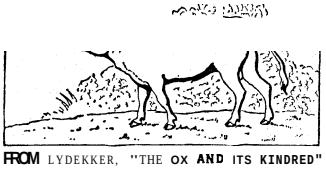
AURILLAC, central France, capital of the department of Cantal, 140m. N.N.E. of Toulouse, on the Orléans railway. Pop. (1936) 18,074. On the right bank of the Jordanne, it began with the 9th century abbey of St. Géraud. The Gothic abbey church was rebuilt in the 17th century. The 11th century castle stands on Roc Castanet. The abbey was a famous seat of mediaeval learning and this tradition was continued by a (17th century) college, now a museum and library. The chief manufactures are wooden shoes and umbrellas; and there is trade in cheese and in the cattle, horses, and mules reared in the neighbourhood. Aurillac is the seat of a prefect, and has tribunals of first instance and of commerce and a chamber of commerce.

AURIOL, VINCENT (1884–), French lawyer and politician, born at Revel, Haute Garonne, on Aug. 27, 1884. He became Socialist deputy for Haute Garonne; after the Party Congress of Tours (1920) which adhered to the Communist International, he remained with the minority which retained the name of Socialist Party (S.F.I.O.). Auriol was one of the authors of an international plan for the financial reconstruction of Europe and the settlement of the reparations question, which was adopted in 1921 by the German Socialists and the British Labour Party. He was president of the finance committee of the chamber, but resigned in July 1925. In 1934 he became leader of the opposition; and was minister of finance from 1936 to 1937; of justice, 1937; and for co-ordination of the services, 1938.

AURISPA, GIOVANNI (*c.* 1370–1459), Italian scholar, who did much to promote the revival of the study of Greek in

Italy, was born at Noto, in Sicily. In 1418 he visited Constantinople, where he remained for some years, perfecting his knowledge of Greek and searching for ancient mss. His efforts were rewarded by the acquisition of some 250 mss., with which he returned to Venice. Here he is said to have been obliged to pawn his treasure for 50 gold florins to provide for his immediate wants. Cosimo de' Medici, hearing of his embarrassment, redeemed the mss. and summoned the owner to Florence. Aurispa was secretary to Pope Eugenius IV., and afterwards to Nicholas V., who presented him to two lucrative abbacies. He died at Ferrara

AUROCHS, the name of the extinct wild ox of Europe (Bos *primigenius*), said by R. Lyddeker (11th edit. E.B.) and others to be the original stock whence the European domestic cattle was derived. It survived in the Jaktozowka forest in Poland until 1627 and an account, with woodcuts, appeared in Freiherr von Herberstein's *Moscovia,* published at Venice in 1550. The aurochs was of great size and black in colour, the British black Pembroke breed being said to resemble them closely, while the semi-wild park-cattle of Chillingham and elsewhere are an albino offshoot. Skulls and limb-bones of specimens standing 6 ft. at the shoulder have been found in the pleistocene gravels of the Thames valley.



FROM LYDEKKER, "THE OX AND ITS KINDRED"
AN AUROCHS (BOS PRIMIGENIUS)
After a picture copied from an oil painting on wood of A.D. 1500 and known as the Augsburg portrait

On the extinction of B. *primigenius,* the name "aurochs" was, in common parlance, transferred to the European bison (*q.v.*).

AURORA, the Roman goddess of the dawn, corresponding to the Greek Eos. According to Hesiod (Theog. 271) she was the daughter of the Titan Hyperion and Theia, and sister of Helios and Selene. By the Titan Astraeus, she was the mother of the winds Zephyrus, Notus, and Boreas, of Hesperus and the stars. Homer represents her as rising every morning from the couch of Tithonus (*q.v.*) and drawn out of the east in a chariot by the horses Lampus and Phaëthon to carry light to gods and men (Odyssey, xxiii. 253). From the roseate shafts of light which herald the dawn, she bears in Homer the epithet "rosy-fingered." The conception of a dawn-goddess is common in primitive religions, especially in the Vedic mythology, where the deity Usás is closely parallel to the Graeco-Roman. She is also represented as the lover of the hunter Orion (Odyssey, v. 121), the representative of the constellation that disappears at the flush of dawn, and of the youthful hunter Cephalus, by whom she was the mother of Phaethon (Apollodorus iii. 14. 3). In works of art Eos is represented as a young woman, fully clothed, walking fast with a youth in her arms; or rising from the sea in a chariot drawn by winged horses; sometimes, as the goddess who dispenses the dews of the morning, she has a pitcher in each hand. In the fresco-painting by Guido Reni in the Rospigliosi palace at Rome, Aurora is represented strewing flowers before the chariot of the sun. In Latin writings the word Aurora was used (*e.g.,* Virgil, Aen., viii. 686, vii. 606) for the East.

AURORA, a city of Kane county, Illinois, U.S.A., on the Fox river, 38 mi. W. of Chicago. It is on federal highways 30 and 34, state highways 31, 25 and 65; is served by the Burlington, Chicago and North Western. Chicago, Aurora and Elgin railways and for freight also by the Chicago, Milwaukee and St. Paul, and the Elgin, Joliet and Eastern railways; its area is 8·5 sq.mi. Its population in 1930 was 46.589, and was 47,170 in the 1940 federal census. About 15% are foreign-born.

Aurora is in the heart of the beautiful, productive Fox river valley. It has a high percentage of home ownership. The assessed valuation of property in 1940 was $26,955,729.

Aurora college, Marmion Military academy, Madonna high school and Jennings seminary are among its educational institutions. Shops of the Burlington railway, which was founded in Aurora in 1850, are there. It is an important industrial centre. The aggregate annual pay roll of its 154 manufacturing plants in 1940 was $11,511,800.

Among the leading products are road-building machinery, conveyors and loaders, steel cabinets, lockers and shelving, pumps and drills, pneumatic tools. doorway hardware, iron. brass and aluminium castings, clothing, corsets, toilet articles, brushes, typewriter supplies, advertising displays and automatic vending machines.

Aurora was settled in 1834 as a trading point and mill site. In 1837 the name Aurora was chosen and the city was chartered in 1857. It operates under the aldermanic form of government.

AURORA, a village of Cayuga county, N.Y., U.S.A., on Cayuga lake, 16 mi. south-west of Auburn, 26 mi. north of Ithaca. It is served by the Lehigh Valley railroad. It is beautifully situated in the heart of the Finger Lakes district. Its permanent population, which is stationary, was 372 in 1940 (federal census). It is, however, the seat of Wells college, a non-sectarian college for women, founded in 1868 by Henry Wells (1805–78). It has an annual enrolment of about 300, and its endowment amounted to $1,471,086 in 1940. Aurora was settled in 1789, chiefly from New England, and was incorporated in 1909.

AURORA BOREALIS: see AURORA POLARIS.

AURORA POLARIS, a phenomenon of the atmosphere, sometimes of great beauty, known in the northern hemisphere as the aurora borealis, in the southern hemisphere as the aurora australis. Confining our attention to the aurora borealis, about which we have far more information, we find that the number of auroras increases as we go further north to certain limits, and then decreases as the pole is approached. For Europe and Asia the latitude of maximum frequency is +70°, for America +60°. This means that while an aurora is very rarely seen in southern Europe, auroras may often be seen in the central United States.

There are many types of auroral phenomena, sometimes several types appearing simultaneously. These are known as arcs, rays, bands, curtains, draperies, coronas and diffuse glows. When the aurora is faint it is generally white; if fairly bright, yellowish; and when bright, many other colours, particularly red and green, appear. To the average American or European observer the most common forms are arcs and rays. The arc has its highest point on the magnetic meridian and frequently seems to reach to the horizon in the north-west and north-east. The under edge is more sharply defined, and as a consequence the sky below appears considerably darker than that above. When the arc is bright, the lower part will usually be red, the middle yellow and the upper part green. The arc may be visible alone, but frequently from it rays appear to spread out like the spokes of a fan. The auroral rays sometimes are stationary, simply appearing and disappearing without seeming to move. At other times there is a rapid cross motion and again they seem to shoot rapidly upward and then recede. These upward pulses are probably quite real, and may be due to progressive electric discharges.

Further north the direction of the dip needle approaches nearer to the observer's zenith and the corona effect is seen, with rays spreading in all directions from this central ring of light, and even reaching to the horizon. This is perhaps the most striking and beautiful of all types of auroras. The curtains and draperies seem to be luminous clouds of light, usually of irregular outlines, that hang vertically in the sky. These are rarely seen in lower latitudes. The colours in the same aurora frequently change rapidly, even in the same area of the sky, but on the average are said to be more brilliant in the arctic regions.

The height of an aurora may be determined by the usual method of making simultaneous observations on a certain luminous point therein from two stations whose distance apart is known. Such observations have been made with great success by photographing the aurora against a background of stars. By this method an upper limit of from 50 to 240m., and a lower limit of from 50 to 100m. have been fixed. These heights refer to auroras which occur in that portion of our atmosphere not illuminated by the sun. During the early part of the 20th century rays have been measured in some cases to heights of from 240 to 480 miles. On Sept 8. 1926, an unusual aurora was observed west of Norway. It appeared an arc to the eye, but the

photographs showed it was composed of a curtain of rays. These rays extended as high as 300m., but the diffuse form which ended the aurora reached the unexpected height of 600 miles. Calculation proved that this, as well as the rays in previous years which reached more than 240m. from the ground, were actually situated in that part of our upper atmosphere still illuminated by the sun. It seems proved therefore that sunlight has an ionizing action on the higher strata of our atmosphere, so that the illumination caused by the rays forming the aurora become visible at greater altitudes than when the light is withdrawn. These new heights for our atmosphere, which are derived from this work, open up most interesting questions as to how far it really does extend and what its physical properties must be at such great altitudes. The heights of meteors have long since proved that it was dense enough to cause them to become visible at least 120m. from the ground. Some phenomena of telescopic meteors may be explained by a height ten times as great, but other explanations of these phenomena are more probable. Thus auroral photographs give the first direct proof of such a great height for the atmosphere.

Trustworthy observers have, however, reported seeing the aurora between them and a mountain or cliff, or below clouds. This would mean an altitude of a mile or less. Also it is said to be accompanied by a crackling sound, like the rustling of silk. Such reports come from the far north where presumably the aurora would be nearer the ground. While difficult to explain, they have been made by so many observers that it is impossible arbitrarily to dismiss them as unreal.

In brightness different auroras vary immensely. Some are so faint as to be just visible, others exceed the light of the full moon, with all gradations between. A fairly good aurora might be compared to the Milky Way in brilliancy. On the whole they become more brilliant toward the Arctic Circle. The auroral spectrum has been carefully studied and large numbers of characteristic lines, particularly a bright green line, are observed. Indeed by photographing the night sky, when to the eye no aurora is visible, it is possible to obtain this line. The inference is that there is a permanent aurora. In the ordinary auroral spectrum many nitrogen lines appear, and recently the famous green line has been proved definitely to be due to oxygen. The line in question has a wave-length of 5,577.34 Angstrom units. The early hypothesis that this line was due to krypton had long been held improbable. Frozen nitrogen particles had also been suggested.

From observations extending over more than two centuries the numbers of auroras have been found to follow rather closely the numbers of sun-spots. These latter have a maximum approximately every 11 years. It is further found that more auroras appear in March and September, when the earth is more directly opposite the spot zones on the sun, than in June and December when such is not the case. On the earth it is found that whenever a brilliant aurora appears there is almost sure to be a magnetic storm, accompanied by heavy earth currents. These latter seriously disturb telegraph and cable lines, sometimes putting them out of commission for several hours. The magnetic storm is not necessarily confined to those areas over which the aurora is visible, but may extend over the rest of the earth as well. For the 19 great magnetic storms between 1875 and 1903, there was an average delay of 25 hours between the passage of the spots over the central meridian of the sun and the storm on the earth. Therefore we may infer with fair safety that the action, whatever its nature, was not propagated with the velocity of light. From what has been said it is clear that the appearance of an aurora must be closely connected with something that happens on the sun, and it is evident that the original outburst takes place on the sun and what is seen on the earth is a mere reflex action. That it is visible at all is due to the earth itself being an immense magnet surrounded by an atmosphere.

Since all bright shifting auroras are accompanied by magnetic storms, it seems certain that this type, and presumably all others, is caused by electric discharges of some kind. The current evidently must come from or be induced by the sun. Two theories have been advanced. One is that the cause lies in negative particles shot off by that body and caught in the magnetic field of the earth. The second is that alpha-particles, with a plus charge, come to us from radioactive substances in the sun. In some cases at least it has been possible to prove that only plus charges could explain the accompanying magnetic effects, but it has been pointed out that even were these particles to move with the velocity of light they could not penetrate the atmosphere to within a distance of 16m. from the earth's surface. (C. P. O.)

AURUNCI, the name given by the Romans to a tribe which in historical times occupied only a strip of coast on either side of the Mons Massicus between the Volturnus and the Liris, although it must, at an earlier period, have extended over a considerably wider area. Their own name for themselves in the 4th century B.C. was *Ausŏnes.* Greek writers applied the name Ausŏnia to Latium and Campania, while the Augustan poets used it as one of many synonyms for Italy. In history the tribe appears only for a brief space, from 340 to 295 B.C., and their struggle with the Romans ended in complete extermination. No record of their speech survives; but their geographical situation, and the frequency of the co-suffix in that strip of coast (besides *Aurunci* itself we have the names *Vescia, Mons Massicus, Marica, Glanica,* and *Caedicii*) *(see* R. S. Conway, *Italic Dialects,* p. 283 *et seq.)* rank them beyond doubt with their neighbours the Volsci (*q.v.*).

AUSABLE CHASM, a gorge of scenic and scientific interest situated in the north-eastern part of the State of New York, U.S.A. At this point, which is about midway in its course from the Adirondack mountains to Lake Champlain, the Ausable river has worn in hard sandstone a series of narrow zigzag chasms, the whole about 2m. long and in places 175ft. deep. The rocks forming the precipitous walls are of Potsdam formation and present an instructive display of fault lines and displacements.

AUSCULTATION, a term in medicine applied to the method of determining, by the sense of hearing, the condition of certain internal organs. Strictly, it should include audition of sounds produced within the body naturally and sounds induced artificially by the physician, but often the term percussion is applied to the last mentioned. In the beginning auscultation was direct only, the physician placing his ear over the heart or lungs, or, in percussion, tapping the part with his fingers. These methods are still followed but in the main some material is interposed between the listening ear or the percussing finger and the patient's body. In its modern sense auscultation dates from 1819 when Laennec invented the stethoscope. Some variations from the normal in heart or respiration sounds are associated with special morbid changes so constantly that diagnosis is certain.

The following are simple examples. When the normal heart sounds represented by "lūbb dfip" are replaced by "loove dfip" it is evidence that the mitral valve is not closing properly, if replaced by "lūbb" and a blowing sound in place of "dfip" the aortic valve is affected. When the normal slight rustle heard during inspiration and the almost silent expiration are replaced by crackling or snoring sounds there is evidence that the lung contains an abnormal fluid as in consumption or bronchitis. In cases of pneumonia, where the air in the lung is replaced by exuded and coagulated serum, a dull note replaces the normal resonant note on percussion. These examples might be extended indefinitely. One of the most striking instances of the value of auscultation is in the diagnosis of pregnancy. An adult woman's heart beats at the rate of some 75 per minute, a foetal heart beats at the rate of 120–140 per minute. (W. S. L.-B.)

AUSDEHNUNGSLEHRE: *see* **QUATERNIONS.**

AUSGLEICH, a German word meaning treaty, compact or compromise. It is specifically used to describe the compact, finally concluded in Feb. 1867, which regulated the relations between Austria and Hungary following upon the establishment of the dual monarchy. *(See* AUSTRIA-HUNGARY.)

AUSONIUS, DECIMUS MAGNUS (c. 310–395), Roman poet and rhetorician, was born at Burdigala (Bordeaux). He set up (in 334) a school of rhetoric in his native place, which was largely attended, his most famous pupil being Paulinus, afterwards bishop of Nola. After 30 years of this work, he was summoned by Valentinian to the imperial court, to undertake the education of Gratian, the heir-apparent. The prince had the

greatest regard for his tutor, and after his accession bestowed upon him the highest honours, culminating in the consulship (379). After the murder of Gratian (383), Ausonius retired to his estates near Burdigala. He appears to have been a (not very enthusiastic) convert to Christianity. He died about 395. Ausonius was rather a man of letters than a poet; his wide reading supplied him with material for a great variety of subjects, but his works exhibit no traces of a true poetic spirit; even his versification, though ingenious, is frequently defective.

His most important extant works are: in prose, *Gratiarum Actio,* an address of thanks to Gratian for his elevation to the consulship; *Periochae,* summaries of the books of the *Iliad* and *Odyssey;* and one or two *epistolae;* in verse, *Epigrammata,* including several free translations from the Greek Anthology; *Ephemeris,* the occupations of a day; *Parentalia* and *Commemoratio Professorum Burdigalensium,* on deceased relatives and literary friends; *Epitaphia,* chiefly on the Trojan heroes; *Caesares,* memorial verses on the Roman emperors from Julius Caesar to Elagabalus; *Ordo Nobilium Urbium,* short poems on famous cities; *Ludus Septem Sapientum,* speeches delivered by the Seven Sages of Greece; *Idyllia,* of which the best known are the *Mosella,* a descriptive poem on the Moselle, and the scandalous *Cento Nuptialis.* We may also mention *Cupido Cruciatus,* Cupid on the cross; *Technopaegion,* a literary trifle consisting of a collection of verses ending in monosyllables; *Eclogarum Liber,* on astronomical and astrological subjects; *Epistolae,* including letters to Paulinus and Symmachus; lastly, *Praefatiunculae,* three poetical epistles, one to the Emperor Theodosius.

There are no mss. containing the whole of Ausonius's works. Editio princeps (1472); editions by Scaliger (1575), Souchay (1730), Schenkl (1883), Peiper (1886); cf. Mosella, Böcking (1845), de la Ville de Mirmont (critical edition with translation, 1889), and De *Ausonii* Mosella (1892), Hosius (1894), English translation of works by H. G. E. White (Loeb series 1919).

(1921).

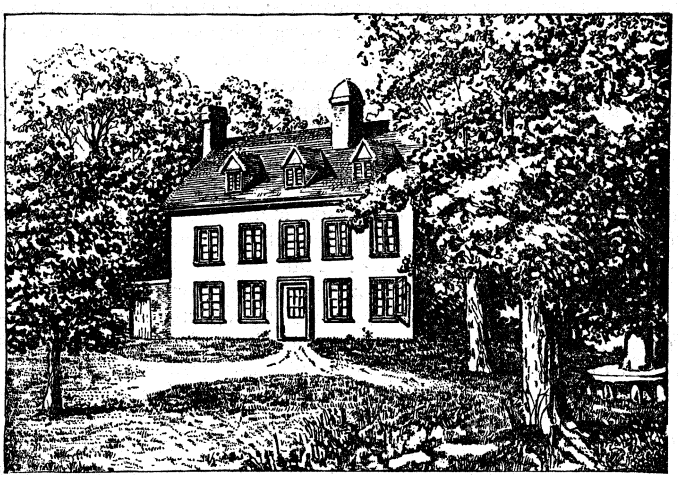
AUSSIG, same as USTÍ NAD LABEM (*q.v.*).

AUSTEN, JANE (1775–1817), English novelist, was born on Dec. 16, 1775, at the parsonage of Steventon, in Hampshire, a village of which her father, the Rev. George Austen, was rector. She was the youngest of seven children. Her mother was Cassandra Leigh, niece of Theophilus Leigh, a dry humorist, and for 50 years master of Balliol, Oxford. The life of no woman of genius could have been more uneventful than Miss Austen's. She did not marry, and she never left home except on short visits, chiefly to Bath. Her first 16 years were spent in the rectory at Steventon, where she began early to trifle with her pen, always jestingly, for family entertainment. In 1801 the Austens moved to Bath, where Mr. Austen died in 1805, leaving only Mrs. Austen, Jane and her sister Cassandra, to whom she was always deeply attached, to keep up the home; his sons were out in the world, the two in the navy, Francis William, and Charles, subsequently rising to admiral's rank. In 1805 the Austen ladies moved to Southampton, and in 1809 to Chawton, near Alton, in Hampshire, and there Jane Austen remained till 1817, the year of her death, which occurred at Winchester, on July 18, as a memorial window in the cathedral testifies.

During her placid life Miss Austen never allowed her literary work to interfere with her domestic duties: sewing much and admirably, keeping house, writing many letters and reading aloud. Though, however, her days were quiet and her area circumscribed, she saw enough of middle-class provincial society to find a basis on which her dramatic and humorous faculties might build, and such was her power of searching observation and her sympathetic imagination that there are not in English fiction more faithful representations of the life she knew than we possess in her novels. She had no predecessors in this genre. Miss Austen's "little bit (two inches wide) of ivory" on which she worked "with so fine a brush"—her own phrases—was her own invention.

Her best-known, if not her best work, *Pride and Prejudice,* was also her first. It was written between Oct. 1796 and Aug. 1797, although, such was the blindness of publishers, not issued until 1813, two years after *Sense and Sensibility,* which was written, on an old scenario called "Eleanor and Marianne," in 1797 and 1798. Miss Austen's inability to find a pcblisher for these stories, and for *Northanger Abbey,* written in 1798 (it is true that she sold that ms. in 1803 for £10 to Crosbie and Co., London, only,



THE BIRTHPLACE OF THE NOVELIST JANE AUSTEN. STEVENTON PARSONAGE, HAMPSHIRE

however, to see it locked away in a safe for some years, to be gladly resold to her later), seems to have damped her ardour; for there is no evidence that between 1798 and 1809 she wrote anything but the fragment called "The Watsons," after which year she began to revise her early work for the press. Her other three books belong to a later *date*—*Mansfield Park, Emma* and *Persuasion* being written between 1811 and 1816. The years of publication were *Sense and Sensibility,* 1811; *Pride and Prejudice,* 1813; *Mansfield Park,* 1814; and *Emma,* 1816—all in their author's lifetime. *Persuasion* and *Northanger Abbey* were published posthumously in 1818. All were anonymous, agreeably to their author's retiring disposition.

Although *Pride and Prejudice* is the novel which in the mind of the public is most intimately associated with Miss Austen's name, both *Mansfield Park* and *Emma* are finer achievements—at once riper and richer and more elaborate. But the fact that *Pride and Prejudice* is more single-minded, that the love story of Elizabeth Bennet and D'Arcy is not only of the book but *is* the book (whereas the love story of Emma and Mr. Knightley and Fanny Price and Edmund Bertram have parallel streams), has given *Pride and Prejudice* its popularity above the others among readers who are more interested by the course of romance than by the exposition of character. Entirely satisfactory as is *Pride and Prejudice* so far as it goes, it is, however, thin beside the niceness of analysis of motives in *Emma* and the wonderful management of two housefuls of young lovers that is exhibited in *Mansfield Park.*

It has been generally agreed by the best critics that Miss Austen has never been approached in her own domain. No one indeed has attempted any close rivalry. No other novelist has so concerned herself or himself with the trivial daily comedy of small provincial family life, disdaining equally the assistance offered by passion, crime and religion. Whatever Miss Austen may have thought privately of these favourite ingredients of fiction, she disregarded all alike when she took her pen in hand. Her interest was in life's little perplexities of emotion and conduct; her gaze was steadily ironical. The most untoward event in any of her books is Louisa's fall from the Cobb at Lyme Regis, in *Persuasion;* the most abandoned, Maria's elopement with Crawford, in *Mansfield Park.* In pure ironical humour Miss Austen's only peer among novelists is George Meredith, and indeed *Emma* may be said to be her *Egoist,* or the *Egoist* his *Emma.* But irony and fidelity to the fact alone would not have carried her down the ages. To these gifts she allied a perfect sense of

dramatic progression and an admirably lucid and flowing prose style which makes her stories the easiest reading.

Recognition came to Miss Austen slowly. It was not until quite recent times that to read her became a necessity of culture. But she is now firmly established as an English classic, standing far above Fanny Burney (Madame d'Arblay) and Maria Edgeworth, who in her day were the popular women novelists of real life while Mrs. Radcliffe and "Monk" Lewis, whose supernatural fancies *Northanger Abbey* was written in part to ridicule, are no longer anything but names. Although, however, she has become only lately a household word, Miss Austen had always her panegyrists among the best intellects—such as Coleridge, Tennyson, Macaulay, Scott, Sydney Smith, Disraeli and Archbishop Whately, the last of whom may be said to have been her discoverer. Macaulay, whose adoration of Miss Austen's genius was almost idolatrous, considered *Mansfield Park* her greatest feat; but many critics give the palm to *Emma.* Disraeli read *Pride and Prejudice* 17 times. Scott's testimony is often quoted: "That young lady had a talent for describing the involvements, feelings and characters of ordinary life which is to me the most wonderful I have ever met with. The big bow-wow I can do myself like anyone going; but the exquisite touch which renders commonplace things and characters interesting from the truth of the description and the sentiment is denied to me." (E. V. L.)

BIBLIOGRAPHY.—Works by Jane Austen, published posthumously, are: *Love and Freindship,* and other early works (1922); *Fragment of a Novel (known as Sanditon),* ed. *R. W.* Chapman (1925); *Plan of a Novel accordzng to Hints from Various Quarters. By Jane Austen With Opinions on Mansfield Park and Emma collected and transcribed by her* (1926); *The Watsons* (1927). Jane Austen's *Letters* have been collected by Lord Brabourne (1884); *see* also *Five Letters from Jane Austen to her niece Fanny Knight,* printed in facsimile (1924); and a selection edited by R. Brimley Johnson (1925). For *Lives* see the authorized biography by her nephew, J. E. Austen Leigh (1870, rep. 1926); S. F. Malden, *Jane Austen* (1889); Goldwin Smith, *Jane Austen* (1890); W. H. AUSTERLITZ (Czech *Slavkov*), a town in Moravia, 15 mi. E.S.E. of Brünn by rail Population 4,556, mostly Czech. It contains a magnificent palace belonging to the prince of Kaunitz-Rietberg, and a beautiful church.

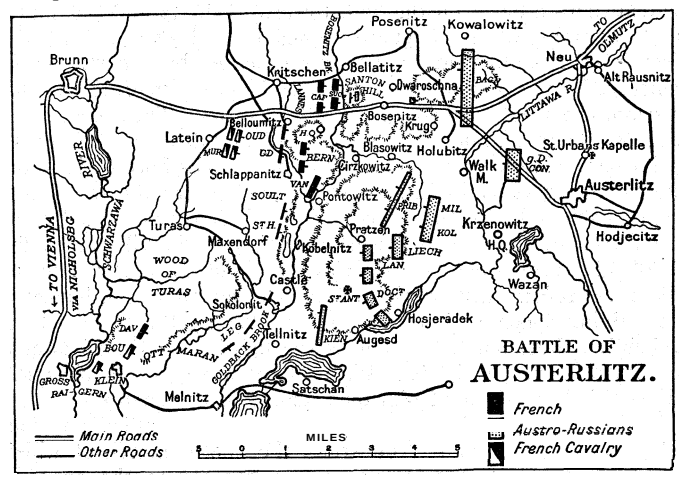
The great battle in which the French under Napoleon I. defeated the Austrians and Russians on Dec. 2, 1805, was fought in the country to the west of Austerlitz, the position of Napoleon's left wing being almost equidistant from Brunn and from Austerlitz. The wooded hills to the northward throw out to the south and south-west long spurs, between which are the low valleys of several rivers and brooks. The scene of the most important fighting was the Pratzen plateau. The famous "lakes" in the southern part of the field were artificial ponds, which have long since been drained. On the west or Brunn side of the Goldbach is another and lower ridge, which formed in the battle the first position of the French right and centre. On the other wing is the mass of hills from which the spurs and streams descend; here the Olmütz-Brünn road passes. The road from Brunn to Vienna, Napoleon's presumed line of retreat, runs in a southerly direction and near the village of Raigern (3m. west of Melitz) which is very close to the extreme right of the French position, a fact which had a great influence on the course of the battle. (The course of events that led to the action is described under NAPOLEONIC CAMPAIGNS.) Napoleon, falling back before the advance of the allied Austrians and Russians from Olmutz, bivouacked west of the Goldbach, whilst the allies, holding, near Austerlitz, the junction of the roads from Olmutz and from Hungary, formed up in the valleys east of the Pratzen heights. The cavalry of both sides remained inactive, Napoleon's by express order, the enemy's seemingly from mere negligence, since they had 177 squadrons at their disposal. Napoleon, having determined to fight, as usual called up every available battalion; the splendid III. corps of Davout only arrived upon the field after a heavy march, late on the night of Dec. 1. The plan of the allies was to attack Napoleon's right, and to cut him off from Vienna, and their advanced guard began, before dark on Dec. 1, to skirmish towards Tellnitz. At that moment Napoleon was in the midst of his troops, thousands of whom had made their bivouac-straw into torches in his honour. The glare of these seemed to the allies to betoken the familiar device of lighting fires previous to a retreat, and thus confirmed them in the impression which Napoleon's calculated timidity had given. Thus encouraged, those who desired an immediate battle soon gained the upper hand in the councils of the tsar and the emperor Francis. The attack orders for Dec. 2 (drawn up by the Austrian general, Weyrother, and explained by him to a council of superior officers, of whom some were hostile, the greater part indifferent, and the chief Russian member, General Kutusov, asleep) gave the five columns and the reserve, into which the Austro-Russian army was organized, the following tasks: the first and second (Russians) to move south-westward behind the Pratzen ridge towards Tellnitz and Sokolnitz; the third (Russian) to cross the southern end of the plateau and come into line on the right of the first two; the fourth (Austrians and Russians under Kolowrat), on the right of the third, to advance towards Kobelnitz. An Austrian advanced guard preceded the 1st and 2nd columns. Farther still on the right the 5th column (cavalry under Prince John of Liechtenstein) was to hold the northern part of the plateau south of the Brunn-Olmutz road; across the road itself was the corps of Prince Bagration, and in rear of Liechtenstein's corps was the reserve (Russians under the grand-duke Constantine). Thus, the farther the four main columns penetrated into the French right wing the wider would the gap become between Bagration and Kolowrat, and Liechtenstein's squadrons could not form a serious obstacle to a heavy attack of Napoleon's centre. The whole plan was based upon defective information and preconceived ideas; it has gone down to history as a classical example of bad generalship, and its author, Weyrother, who was perhaps nothing worse than a pedant, as a charlatan.



BATTLE OF AUSTERLITZ, SHOWING **DISPOSITION** OF CONTENDING ARMIES **AND.** ABBREVIATED, NAMES OF GENERALS COMMANDING **DIVISIONS**

On Dec. 2, 1805, Napoleon broke the Austro-Russian centre at Pratzen while Murat, operating on the left, cut the enemy's communication with Austerlitz

Napoleon, on the other hand, with the exact knowledge of the powers of his men, which was the secret of his generalship, entrusted nearly half of his line of battle to a division (Legrand's) of Soult's corps, which was to be supported by Davout, some of whose brigades had marched from Vienna, 90m. in 48 hours. But the ground which this thin line was to hold against three columns of the enemy was marshy and densely intersected by obstacles. and the III. corps was the best in the *Grande Armée,* while its leader was perhaps the ablest of all Napoleon's marshals. The rest of the army formed in the centre and left. "Whilst they march to turn my right," said Napoleon in the inspiriting proclamation which he issued on the eve of the battle, "they present

me their flank," and the great counterstroke was to be delivered against the Pratzen heights by the French centre. This was composed of Soult's corps, with Bernadotte's in second line. On the left, around the hill called by the French the Santon (which was fortified), was Lannes' corps, supported by the cavalry reserve under Murat. The general reserve consisted of the Guard and Oudinot's grenadiers.

The attack of the allies was begun by the first three columns, which moved down from their bivouacs behind the Pratzen plateau before dawn on the and, towards Tellnitz and Sokolnitz. The Austrian advanced guard engaged at daybreak, and the French in Tellnitz made a vigorous defense; both parties were reinforced, and Legrand drew upon himself, in fulfilling his mission, the whole weight of the allied attack. The contest was long and doubtful, but the Russians gradually drove back Legrand and a part of Davout's corps; numerous attacks both of infantry and cavalry were made, and by the successive arrival of reinforcements each side in turn received fresh impetus. Finally, at about 10 A.M., the allies were in possession of the villages on the Goldbach from Sokolnitz southwards, and Davout's line of battle had reformed more than a mile to rearward, still, however, maintaining touch with the French centre on the Goldbach at Kobelnitz. Between the two lines the fighting continued almost to the close of the battle. With 12,500 men of all arms the Marshal held in front of him over 40,000 of the enemy.

In the centre, the defective arrangements of the allied staff had delayed the 4th column (Kolowrat), the line of march of which was crossed by Liechtenstein's cavalry moving in the opposite direction. The objective of this column was Kobelnitz, and the two emperors and Kutusov accompanied it. The delay had, however, opened a gap between Kolowrat and the 3rd column on his left; and towards this gap, and the denuded Pratzen plateau, Napoleon sent forward St. Hilaire's division of Soult's corps for the decisive attack. Kutusov was pursuing this march to the southwest when he was surprised by the swift advance of Soult's men on the plateau itself. Napoleon had here double the force of the allies; Kutusov, however, displayed great energy, changed front to his right and called up his reserves. The French did not win the plateau without a severe struggle. St. Hilaire's (the right centre) division was fiercely engaged by Kolowrat's column, General Miloradovich opposed the left centre attack under Vandamme, but the French leaders were two of the best fighting generals in their army. The rearmost troops of the Russian 2nd column, not yet committed to the fight on the Goldbach, made a bold counter stroke against St. Hilaire's right flank, but were repulsed, and Soult turned to relieve the pressure on Davout by attacking Sokolnitz. The Russians in Sokolnitz surrendered, an opportune cavalry charge further discomfited the allied left, and the Pratzen plateau was now in full possession of the French. Even the Russian Guard failed to shake Vandamme's hold. In the meanwhile Lannes and Murat had been engaged in the defence of the Santon. Here the allied leaders displayed the greatest vigour, but they were unable to drive back the French. The cavalry charges in this quarter are celebrated in the history of the mounted arm; and Kellermann, the hero of Marengo, won fresh laurels against the cavalry of Liechtenstein's command. The French not only held their ground, but steadily advanced and eventually forced back the allies on Austerlitz, thereby barring their retreat on Olmiitz. The last serious attempt of the allies in the centre led to some of the hardest fighting of the day; the Russian Imperial Guard under the grand-duke Constantine pressed closely upon St. Hilaire and Vandamme on the plateau, and only gave way when the French Guard and the Grenadiers came into action. After the "Chevalier Guards" had been routed by Marshal Bessières and the Guard cavalry, the allies had no more hope of victory; orders had already been sent to Buxhowden, who commanded the three columns engaged against Davout, to retreat on Austerlitz. No further attempt was made on the plateau, which was held by the French from Pratzen to the Olmiitz road. The allied army was cut in two, and the last confused struggle of the three Russian columns on the Goldbach was one for liberty only. The fighting in Tellnitz was perhaps the hardest of the whole battle, but the inevitable retreat, every part of which was now under the fire of the French on the plateau, was terribly costly. Soult now barred the way to Austerlitz, and the allies turned southward towards Satschan. As they retreated, the ice of the Satschan pond was broken up by the French artillery, causing delay to the sorely harassed columns. In the twelve hours from 7 A.M. to nightfall, the 65,000 French troops had lost 6,800 men, or about 10%; the allies (82,500 engaged) had 12,200 killed and wounded, and left in the enemy's hands 15,000 prisoners (many wounded) and 133 guns.

AUSTIN, ALFRED (1835–1913), English poet-laureate, was born at Headingley, near Leeds, May 30, 1835, and died June 2, 1913 at Swinford Old Manor, near Ashford, Kent. He was educated at Stonyhurst, Oscott, and London University, from which he was graduated in 1853, and was called to the bar four years later. He made his first noteworthy appearance as a writer with a satire called *The Season*, which showed both wit and observation. Austin published several volumes of verse: *Savonarola* (1881), a tragedy; *Soliloquies* (1882); *Prince Lucifer* (1887); *England's Darling* (1896); *The Conversion of Winckelmann* (1897), etc. For several years he edited *The National Review*, and wrote leading articles for *The Standard*.

After Tennyson's death in 1892, no new poet-laureate was nominated for several years. Eventually, in 1896, Austin was appointed. His verses for official occasions did not escape adverse criticism; his hasty poem in praise of the Jameson raid in 1896 being a notable instance. The most effective characteristic of Austin's poetry, as of the best of his prose, is a genuine and intimate love of nature. His prose idylls, *The Garden that I love* and *In Veronica's Garden*, are full of a pleasant open-air flavour, which is also the outstanding feature of his *English Lyrics*.

See his *Autobiography* (1911).

AUSTIN, JOHN (1790–1859), English jurist, was born on March 3, 1790. His father was the owner of flour mills at Ipswich and in the neighbourhood, and was in good circumstances. John was the eldest of five brothers. One of his brothers, Charles (1799–1874), obtained great distinction at the bar. John Austin entered the army at a very early age, and remained in the service until 1812. He then read for the bar, was called in 1818, and joined the Norfolk circuit. He never had any large practice, and retired in 1825.

On the foundation of University College, London, in 1826, Austin was appointed to the chair of jurisprudence, but his lectures did not begin until 1828. In the meantime he visited Heidelberg and Bonn to study German methods of legal teaching. There he made stimulating contacts with Savigny, K. J. A. Mittermaier, Niebuhr, Brandis, Schlegel and others. His class at University College was never a large one, but included a number of brilliant men: Sir George Cornewall Lewis, Charles Buller, Charles Villiers, Sir Samuel Romilly, and his brother, Lord Romilly, Edward Strutt (afterwards Lord Belper), Sir William Erle and John Stuart Mill. All of these have left on record expressions of the profound admiration which the lectures excited in the minds of those who heard them. But in 1832 Austin resigned for financial reasons, as he could not afford to live in London. In that year he published his *Province of Jurisprudence determined*, being the first ten of his delivered lectures compressed into six.

In 1833 Austin became a member of the royal commission on the criminal law and procedure. It appears from some notes made at the time that Austin, though he thought it his duty to sign the report (1834), strongly objected to some passages which it contained. It appears from the nature of these objections that nothing would have satisfied him short of a complete recasting of the criminal law.

In 1834 Austin gave a few lectures on the "General Principles of Jurisprudence and International Law," at the Inner Temple. He then went to live with his wife (*née* Sarah Taylor) and only child Lucie (afterwards Lady Duff-Gordon), at Boulogne. The Austins were in Malta, where Austin was on a government inquiry, from 1837–38. After their return they lived a good deal abroad, and in 1844 they settled in Paris, where they remained

until driven out of France by the Revolution of 1848. They then took a house at Weybridge, and there Austin remained until his death in Dec. 1859.

In 1842 Austin published in the *Edinburgh Review* an attack upon Friedrich List's system of trade protection *(Das nationale System der politischen Oekonomie)*. His pamphlet "A Plea for the Constitution" (1859) was a reply to Lord Grey's essay on "Parliamentary Government," and expressed Austin's view that the consequences to be anticipated from parliamentary reform were all of them either impossible of realization or mischievous. He thought that political power was safest in the hands of those possessed of hereditary or acquired property; and that without property even intelligence and knowledge afforded no presumption of political capacity.

Austin's first published lectures were almost forgotten when Mr. (afterwards Sir Henry) Maine began to lecture on jurisprudence at the Inner Temple. Both in his private and public lectures Maine constantly urged upon his hearers the importance of Austin's analytical inquiries into the meaning of legal terms. He used to say that it was Austin's inquiries which had made a philosophy of law possible. Undoubtedly Maine's influence revived for a short time the interest in Austin's teaching. Maine was lecturing about the time of Austin's death, and in 1861 Mrs. Austin published a second edition of the *Province of Jurisprudence,* and this was followed by two volumes which contained other fragments (*Lectures on Jurisprudence; or the Philosophy of Positive Law).*

Austin proposed to distinguish law from morals; to explain the notions which have been entertained of duty, right, liberty, injury, punishment and redress; and their connection with, and relations to, sovereignty; to examine the distinction between rights *in rem* and rights *in personam,* and between rights *ex contractu* and rights *ex delicto;* and further to determine the meaning of such terms as right, obligation, injury, sanction, person, thing, act and forbearance.

The *Lectures on Jurisprudence* were reviewed by J. S. Mill in the *Edinburgh Review* of Oct. 1863, and this review is republished in Mill's *Dissertations and Discussions,* vol. iii., p. 206. Professor Jethro Brown published (1906) an edition of Austin's earlier lectures, in which they are stated in an abbreviated form. There is a sketch of his life by his widow in the preface to the *Lectures on Jurisprudence,* which she published after his death.

AUSTIN, MARY HUNTER (1868–1934), American novelist and essayist, was born at Carlinville (Ill.), on Sept. 9, 1868. After graduating at Blackburn university in 1888 she went to California to teach. Later she settled in New Mexico and became the friend and chronicler of the nearby Indian tribes. Her first book, *The Land of Little Rain,* a poetical description in prose of the desert and its denizens, was published in 1903 and brought her immediate renown. She published several novels with scenes in the west and in the artistic centres of New York, where she spent much time, and wrote for the magazines on feminism, social problems, and the art of writing; but her chief interest and best work have been in her interpretation of the American Indian and his contribution to American life.

Besides *The Land of Little Rain,* her most notable books are *The Basket Woman* (1904); *The Flock* (1906); *Lost Borders* (1909); *Woman of Genius* (1912); *The Arrow Maker,* a play produced in New York in 1911; *20 Jayne Street* (1926); *The American Rhythm,* interpretation and translations of Indian poetry; *A Small Town Man* (1922); and *The Land of Journey's Ending* (1924).

AUSTIN, STEPHEN FULLER (1793–1836), an American frontier colonizer and founder of the principal settlements of English-speaking people in Texas during the 1820's, while that country was still a part of Mexico, was the oldest son of Moses Austin (1761–1821) who had himself inaugurated the project for the colonization of Texas during the last year or two of his life and Maria Brown, of Quaker descent. Moses was caught in the financial panic of 1819 and left the lead-mining region of southeast Missouri, where he had settled, for Texas. Here he obtained a grant of land for colonization purposes (Jan. 1821) but died six months later, leaving his son to carry out the enterprise. Stephen F. Austin had been educated at Bacon academy, Colchester (Conn.), and at Transylvania university, Lexington (Ky.), and had served in the territorial legislature of Missouri from 1814 to 1819, when the slavery question was raised to a high pitch over the Tallmadge proposal to exclude slavery upon the admission of Missouri as a state. Involved in his father's business misfortunes, he joined a general migration into the new territory of Arkansas, and opened a farm at Long Prairie, on the Red river, as a step towards Texas; but proceeding to New Orleans he learned that the approaches to Texas from that city were better. There he began the study of law and assisted in editing the *Louisiana Advertiser,* until the middle of July, 1821, when, with all the vigour of a young man, he entered Texas and, during the following winter, planned a substantial settlement near the coast between the Brazos and the Colorado rivers. Meanwhile a successful revolution had occurred in Mexico, and it became necessary for him to go to Mexico City to secure the confirmation of his grants, and for some years henceforward he was one of the main factors in the struggle between two civilizations for the possession of Texas.

In the interest of the slaveholding element of Anglo-Americans Austin successfully defeated the efforts of Mexican statesmen, who were supported by British agents and diplomats, to keep negro slavery out of Texas; and in 1833, when he failed to induce the Mexican government to make Texas a separate state in the confederation, so that the American settlers might have that liberty and self-government which they considered indispensable, he wrote home recommending the organization of a state without waiting for the consent of the Mexican congress, he was thrown into prison. He was released in 1835, the Texas Revolution followed, and Austin secured the help of money and men from people in the United States. In the end he found himself and his colonies practically submerged by the flood of adventurers and immigrants; and the revolution was successful. Sam Houston defeated him in a campaign for the presidency; and Austin died on Dec. 7, 1836, while serving in the subordinate position of secretary of state. As a colonizer on an advancing frontier where there was a contest between two civilizations and where one had to restrain his own followers and conciliate the defence, Austin's work was of a high order, and it constitutes his chief title to fame.

The late Professor George P. Garrison (d. 1910) laid foundations for modern studies in the lives and times of the Austins, Moses and Stephen F., in his *Texas* (1903) and *Westward Extension, 1841-1850* (1906). He has been succeeded by Professor Eugene C. Barker. *See* Barker: *Life of Stephen F. Austin* (1925); his edition of "The Austin Papers, published in *Am. Hist. Ass. Reports* for 1919, 1922 (issued 1924, 1928), and in a concluding volume by the Univ. of Texas Press (1927); and his *Mexico and Texas, 1821–1835* (1928); also reviews in *Southwestern Political and Social Science Quarterly* (June, 1926), and in *American Historical Review* (Jan. 1927, and later). (T. P. MA.)

AUSTIN, a city of Minnesota, U.S.A., 90 mi. S. of Minneapolis and St. Paul, on the beautiful Red Cedar river; the county seat of Mower county. It is a division point of the Chicago, Milwaukee and St. Paul railway, and is served also by the Chicago Great Western. The population was 18,307, 1940 federal census. Austin is a market for the fine livestock and dairy products of this area. It has a packing plant which slaughters 2,000,000 head of livestock a year; three hatcheries; greenhouses, the largest in the west; railway shops and a number of smaller industries. The city owns and operates its water, natural gas, light and power plant, and has a sewage disposal plant (built in 1940). At the head of Main street is the Horace Austin state park, and the city maintains five other parks. Austin was settled in 1855, incorporated as a village in 1868, and chartered as a city in 1873.

AUSTIN, the capital of Texas, U.S A., and the county seat of Travis county, on the north and south banks of the Colorado river, in central Texas. It is on federal highways 79, 290 and 81 and state highways 2, 71, 20, 29, 165 and 43; and is served by Missouri-Kansas-Texas, Missouri Pacific and Southern Pacific railroads, and bus, motor freight and air transportation lines. The area of the city is 30·909 sq mi. Population (1930) 53,120, with 68.9% native white, 18·6% Negro, 12·5% others; 1940 by federal census was 87,930

The site of Austin was selected by a commission appointed in 1836 by the republic of Texas to find the most attractive spot within its boundaries for the seat of government. It lies at a

point where the Colorado river issues from a canyon, and is built on bluffs 40–120 ft. above the river. To the east stretch gently rolling plains, dotted with farms. The state capitol, a vast building of red Texas granite, roofed with copper plates, was built (1881–88) by Chicago capitalists in return for 3,000,000 ac. of public land. The state library (230,000 volumes) is rich in material on the history of the southwest. The governor's mansion (1853), on a hill overlooking the capitol, is a fine example of southern colonial architecture. The home built by France in 1841 for her minister to the republic of Texas still stands; and the city cherishes a live-oak tree with a spread of 126 ft., under which the Indians and the white men made their treaties. On high ground half a mile north of the capitol is the main campus (40 acres) of the University of Texas, set aside for this purpose in 1839 by the congress of the republic. Other large tracts within the city are occupied by the athletic field, the "new" campus, and the "little" campus, and the university owns 400 acres along the river, between the city and the dam. The university was established and endowed by acts of the state legislature in 1858, 1876, and 1881. and was opened to students in 1883. The total enrolment in all departments except extension, summer school and medical branch was 11,078 in 1939–40 (7.630 men and 3,448 women). The endowment of the university amounts to over $39,000,000. Its library contains over 660,000 volumes, including important special collections in English literature (the Wrenn, Stark and Aitken libraries), Texas and Latin-American history; an archives collection (3,000,000 documents) including the Spanish archives of Texas and a newspaper collection (17,000 volumes). The medical branch of the university is at Galveston; the College of Mines and Metallurgy is at El Paso. St. Edward's university, a Roman Catholic institution for men (founded 1881), is 2 mi. south of the city. The Austin Presbyterian Theological seminary was opened in 1902; Concordia Lutheran college in 1926. There are several privately supported schools for Negroes. Eleemosynary institutions include Texas State school for deaf; school for the blind; Deaf, Dumb and Blind institute (coloured); Austin State school; Austin State hospital. Confederate homes for veterans of Civil War and for women are there. The assessed valuation of property in 1940 was $68,327,345. National bank clearings in 1940 were $93,676,418.30. The 63 manufacturing plants produced products valued at $3,916,727 in 1935. The largest industries are manufactures of brick and tile, bedroom furniture, building stone, food products. An active farm area produces cotton, corn, vegetables and livestock.

Lake Austin, Lake Travis, Marble Falls lake, Inks lake and Buchanan lake all produce power under Lower Colorado River authority, and provide splendid recreational opportunities within 55 mi. of Austin.

Austin was first settled in 1838 under the name of Waterloo. Its name was changed the next year in honour of Stephen F. Austin, when it was selected as the capital of the republic of Texas. It was incorporated in 1839, and has been the seat of government ever since, except for a time in 1842–45, when, under the influence of General Sam Houston, the city of Houston was used as the capital. In 1909 a commission form of government was adopted, and in 1926 a city manager was installed.

AUSTIN MOTOR COMPANY LIMITED, English motor-car manufacturing company, was founded in 1905 by Mr. Herbert Austin, later 1st Baron (1866–1941), engineer and pioneer of motoring. When foreign cars were in the ascendant in the United Kingdom, the Austin Motor Company developed its works at Longbridge, near Birmingham, with the object of supplying British built cars for home and export. Like many other firms the Company was badly crippled by war reaction and the collapse in general trading which occurred in 1920, but careful management and a broad-minded policy soon led to recovery and it now (1928) employs directly some 12,000 and indirectly about 60,000 persons.

In addition to the construction of cars the company undertakes foundry work in various metals, stamping, forging, pressing, sheet metal working and machining, etc. Statistics show remarkably high earnings by the workers, expansion in the turnover during the last few years of some seven times, and a greatly increasing export market. The equipment has been brought up to date and is capable of dealing with huge amounts of material; large quantities are handled continuously, and the various components are quickly assembled and turned out as finished cars, ready for the service required of them.

(A. P. K.)

AUSTRALASIA, a term formerly applied somewhat loosely to all the land, mainly insular, extending eastwards and south-eastwards from the south-eastern portion of Asia and occupying approximately the south-western quadrant of the Pacific. In its widest sense it has been taken to include, besides Australia (with Tasmania) and New Zealand, the Malay Archipelago and the Philippines; Melanesia (New Guinea and the island groups lying east and south-east of it as far as and including New Caledonia and the Fiji islands); Micronesia (the island groups extending from Pelew island and the Ladrones east-south-eastwards to include the Marshall and Gilbert groups); Polynesia (the scattered groups of islands extending eastwards from the above groups to about longitude 130° E.). But the Hawaiian islands, and even Antarctica, have been included under the heading "Australasia."

AUSTRALIA is situated wholly in the southern hemisphere between longitudes 113° 9′ E. and 153° 39′ E. and latitudes 10° 41′ S. and 43° 39′ S. (mainland, 39° 8′ S.). With an area of nearly 3,000,000sq.m. (2,974,581sq m.; mainland alone, 2,948,366sq.m.) it is the smallest continent and the Iargest island on the globe, approximating in size to the United States of America (3,026,789 sq m.) and being rather more than three-fourths of the size of Europe and over one-fifth of the area of the British empire. (Tasmania [*q.v.*] and other adjacent islands are included in the above, but Papua [*q.v.*] and mandated territories are excluded.) With a coast-line of 12,210m.—giving a proportion of 1m. of coast to 244 sq m. land surface (mainland alone, 1:261sq.m.; cf. Europe, 1:75; England and Wales, 1:25)—Australia is a markedly closed land mass. This fact, in conjunction with its shape (max. east–west extension c. 2,400m., north–south 1,970m.) and latitudinal position, profoundly influences the climatic, and hence its general geographical, character.

Position and general spatial relationships are potent factors in Australian geography. Extensive water surfaces lend comparative isolation except towards the north. Regarded as a south-eastern detached extension of the Asiatic land mass, Australia cannot be entirely dissociated in respect of geographical destiny from Asia, and the same may be said if we view it, or its eastern margin, as a section of the western Pacific seaboard. With regard to the Pacific the position of Australia is pregnant. Along with New Zealand it dominates geographically the south-west Pacific quadrant. Similarly it commands the south-east Indian Ocean, to which water-triangle—more enclosed in geographical than in physical fact—it forms, as it were, the south-east apex.

With regard to position in the British empire Australia shares with New Zealand extreme remoteness from the mother country (London-Suez-Colombo-Fremantle, 9,537 nautical m.; Liverpool-Panama-Sydney, 12,222 nautical m.), but is linked to the British Isles by two sea-ways (the Suez and the Panama routes) which span the Eastern and Western Hemispheres respectively and traverse the two great land-masses of the globe. Both routes—but particularly the former—lie athwart important units of the empire and both have longer alternative sea-routes. The Australian continent, also forms one of the "corner-stones" of the Indian Ocean, much of the territory adjoining which is under British administration. Finally Australia is situated diagonally across the Pacific from Canada and the route joining these Dominions (Sydney-Vancouver, 6,848 nautical m.) intersects, or runs adjacent to, perhaps a majority of the most important routes traversing that ocean.

Geomorphology (see also under Geology).—Australia, as the lines of folding and faulting show, has been built up against and on a core of pre-Cambrian rocks which to-day are most in evidence in the south-west and west. Against this massif were successively pressed up a series of sediments in roughly parallel strips along the

north, east and south-east so that the land area continued to grow in the directions mentioned until, after the last great (Carboniferous) period of folding, it possessed at the end of the Palaeozoic period the whole of, and more than, its present extension.

Subsequently, three main types of episode have determined the broad features of the present land-mass:

(1) The continuance, or extension, of crustal sagging in central and eastern Australia accompanied by marine transgressions and the formation of lakes with the accumulation of sediments. Since Cretaceous times the present land surface—if we except the south marginal areas—has remained uninterruptedly above sea-level.

(2) The progressive elevation of the eastern and south-eastern marginal portions of the continent to form the elongated belts of highland now known as the Eastern Highlands and the South Australian Highlands. These highlands, therefore, though composed of ancient materials and possessing much denuded upper surfaces are geologically of late formation.

(3) (a) The outpouring of vast sheets of basalt over large areas in east and south-east Australia, in Tasmania, and, to a less extent, in south-west Australia. Beneath these basalt "floods" existing features were submerged, valleys were covered up (*cf.* the "deep leads") and the already worn-down landscape was even more levelled. (b) A series of comparatively localised glaciations, which affected notably the Kosciusko Plateau and Tasmania and were accompanied by climatic conditions which supported in Central Australia herds of giant herbivorous and carnivorous animals. (c) Oscillations of the coast-line, and perhaps of sea-level, resulting, for instance, in the severance, the re-junction, and again the parting of Tasmania from the mainland; the subsidence of large stretches of continental margins particularly along the north-east, central-south, and south-west with consequential flooding of surface features; and, most recent of all, an elevation of the land, relative to the sea, of about 1 jft. (in places as much as 200ft.) widely marked round the Australian coast-line.

The above historical facts are clearly reflected in the present character of the Australian land-mass. Rising, in places with surprising steepness, from the great abyssal furrow which accompanies and well-nigh rings it in, the continental platform bounded by the 100-fathom line (*i.e.*, including the continental shelf) appears in plan as a broad flat disc with two irregular prolongations—one at the south-east corner comprising Tasmania, the other, much larger and more irregular, at the north comprising New Guinea. An elevation of the land (or a lowering of the sea) of about 200ft. in the case of Tasmania, of only about 100ft. in the case of New Guinea, would reunite these islands to the mainland. Elsewhere the continental shelf is remarkably narrow, especially along the south-east and east. On the north-east, on the other hand, a 1,200m. long stretch of down-faulted, and perhaps still sinking, coast has left room for the growth of one of the most remarkable coral-reefs—and also one of the longest, though not the best sheltered, semi-enclosed maritime water-ways—(see BARRIER REEF).

In detail also the varying physiographic—and hence often economic—character of the coasts is the direct outcome of tectonic history. The recently submerged coast-lines in the south-east (including Tasmania) present a frowning front, but also, where commodious and branching river-valleys have been "drowned," some of the finest of natural harbours (Sydney harbour; the submerged valleys of the Tamar and the Derwent in Tasmania). Along the north-east (Queensland) coast also, where the collapse of the continental margin has broken diagonally across the folds, or again in parts of the north-west and north, subsidence has given a series of natural inlets, the potential value of which, however, is often diminished by the amplitude of the tides. (Spring tides [range]: Townsville, 8–12ft.; Broad Sound, 30ft.; north-west coast, varying between *c.* 21 and 36 ft) Elsewhere waves, currents and tides have had greater effect, and here (*e.g.*, along many stretches of the west and north-west, south-west and south coasts) rocky promontories alternate with sandy bays and spits, and tied islands and sand-dunes are the seaward front of a low and featureless interior. In three places (the Ninety-Mile Beaches of north-west Western Australia and south-east Victoria, and at Great Sandy island [Queensland]) the set of the currents has permitted great accumulations of sand, and in several considerable stretches (Gulf of Carpentaria [south coasts]; Great Australian Bight; Spencer gulf, etc.) recent elevation has resulted in either low shelving shores (south coast of Gulf of Carpentaria; Spencer gulf) or in an unbroken line of cliffs (Great Australian Bight).

The exceedingly closed nature of the continent—the paucity of large and effective sea inlets—has already been referred to. The 135th meridian of east longitude divides Australia roughly into two divisions as regards surface configuration: To the west lies the great plateau, to the east the lowlands, followed nearer the coast by the belt of highlands. Each of these divisions is broadly expressive of the physical genesis and growth of the continent.

The Western Plateau.—This division includes the whole of Western Australia, most of the Northern Territory, besides much of the west and north-west of South Australia. It constitutes one of the "primitive" continental blocks of the earth's crust ("shields") and consists fundamentally of a complex of very old and very hard rocks (see Geology, below). Around its edges from the north-west to the south-east, and again along its inland (eastern) boundary the older rocks dip below younger formations which form the greater part of the coastal lowlands. These lowlands, 60–70m. wide along the west but broadening to 100–200m. towards the north-west and south-east, slope up very gently inland to heights of 600–1,000 feet. Here they frequently terminate abruptly against a scarp which rises to about 1,200ft.—in places to 4,000ft.—and which is the faulted edge of the interior plateau, though, owing to its steepness and its dissection by streams, it has often the appearance of a mountain range (*e.g.*, Darling Ranges). Elsewhere the transition to the plateau is more gradual, and on the south-east and south a limestone platform, formerly a sea-floor, rises from an unbroken line of perpendicular cliffs of 200–400ft. and forms the remarkable Nullarbor Plains. The interior plateau has an average elevation of perhaps 1,500ft.: its surface features result from the age-long denudation of the materials and structures which characterize it. The primitive folds have been truncated, the broad granitic masses worn down to a comparatively uniform level. Crustal movements have slightly lowered some areas and raised others.

Coastward draining streams, where these have attained to any size and power as in the south-west, north-west and north, have dissected the outer margins of the plateau and have worked out a rugged if subdued relief. In the north-west and Kimberley Divisions in particular the dissection of the horizontal or gently inclined strata has given rise to a characteristic landscape of table-land, ridge and canyon (Mt. Hann, 2,800ft.). Everywhere continued erosion has differentiated hard from less hard rocks, and ridges, spines (often of quartzite), granite erosion scarps ("break-away~"),isolated rocks or groups of rocks (Ayers Rock and Mt. Olga in Central Australia), and occasionally larger and more mountainous masses (Stirling Range, 3,640ft.; Hammersley Range, Mt. Bruce, 4,024ft.; etc.) arrest the eye and sharply frame the horizon. But apart from these and the Macdonnell (Mt. Heughlin, 4,800ft.) and Musgrave Ranges (Mt. Woodruffe, *c.* 5,000ft.) in Central Australia, there are no "mountains" in the ordinary sense. Over far the greater part an immense peneplain, the major elevations of which are imperceptible swellings, the chief hollows wide salt-floored flats, extends with expressionless monotony. Here broad expanses of sandy or clayey plain, there mile upon mile of sand-ridge (*e.g.*, in an area comprising the centre, and east and north of the centre of Western Australia); here wide levels floored with limestone (travertine); there rougher but hardly less level surfaces of laterite, with granite and quartz outcrops. Long lines, either level or of low inclination, and sharp scarp faces may in this direction or that bound the horizon and mark the sky-line of ridge and range. But the prevailing impression is flatness, the prevailing sense that of space. Not the desert, for the most part, of popular imagination, for the surface is peopled with trees, scrub or at least heath. But a great wide silence-filled land, a land of age where loneliness dwells.

The Central Lowlands. — To the plateau of the west succeeds, from about long. 135° E., a belt of lowlands. They extend from the Gulf of Carpentaria to the eastern coast of South Australia and the Victorian highlands; from the dissected margins of the western platform and the Central Australian ranges, to the highland foothills in the east. On the eastern side their boundary is somewhat indefinite but coincides approximately with the 1,000ft. contour. Some 900m. across at their maximum breadth (at about 29° S. lat.), they narrow northwards and southwards to barely half that distance. They are crossed in two places by low swells or saddles (Barkly, Selwyn and Kynuna highlands in the north; Barrier-Grey Ranges farther south [all *c.* 1,000ft.]). Along their eastern margin a few inconsiderable projections from the Beall and McGregor "Ranges" in Queensland. Further south the platform around the upper Lachlan river (Cobar-Wyalong peneplain, 600–900ft.) reaches out westwards towards the Barrier Range, and in the south-east are the striking South Australian highlands (Mt. Lofty and Flinders Ranges). Having regard to the above surface inequalities the area may be divided into (i) the Northern (or Gulf), (ii) the Central (or Lake Eyre), (iii) the Eastern (Upper Darling or Warrego), (iv) the Southern (Murray river), lowlands respectively, where each division corresponds to a more or less distinct drainage area. (The Lake Frome basin may be regarded as a subdivision of [ii].) But the actual continuity of these lowlands is seldom interrupted save around the edges, and the division lines are far from distinct.

The area represents the zone of crustal weakness or sagging where great quantities of sediments were deposited on the floors of inland gulfs and lakes and, later, wide sheets of river gravels and alluvium. The ancient rocks of the west sink below these newer formations but the Barkly and Selwyn uplands, with the adjoining Cloncurry area, are a north-easterly extension of the great plateau. Similarly, the Cobar-Barrier Range "peneplain," affected by recent elevatory movements, forms a sill partly separating and partly submerged by the more recent deposits. The outcrop of these older rocks ("inliers") has significance in connection with the occurrence both of workable minerals and of artesian water. The south-eastern portion of the central lowlands is, from a physiographical point of view, one of the most interesting in Australia. Complementary to the elevation of the south-eastern margins of the continent was a subsidence of its more central portions. The older "grain" of the land and the continental "backbone" had run in an east-west direction (cf. Macdonnell, Musgrave, Gawler Ranges). Rivers comparable, perhaps, with the Murray had discharged along the south coast which then lay farther to the south. Subsidence in the northern parts, coupled with the elevation of the Mt. Lofty-Flinders Ranges, disrupted this order, dammed back the streams, and caused or hastened the formation of great "lakes." (The surface of Lake Eyre lies normally about 39ft. below sea-Ievel.) A belt of country anciently the site of a mountain system (strongly folded Cambrian and older sediments), but worn flat by long denudation, was raised by crustal warping, probably in sympathy with the movements further east, and formed the Mt. Lofty-Flinders Range (St. Mary's Peak, 3,900ft.; Mt. Lofty, 2,334ft.) which, with its main spur continued in the Barrier Range, encloses on three sides the Lake Frome basin.

On the west side St. Vincent's and Spencer gulfs — the latter continued northwards by the Lake Torrens "rift" valley — probably represent areas of subsidence along divergent lines of fracture, while Yorke's Peninsula is a block left upstanding between them. To these facts of physical history are due many of the distinctive geographical characteristics of the area (*e.g.,* drainage features; human settlement; lines of movement). More recent was the volcanic activity which affected the coastal strip from Kangaroo island to south-western Victoria (Mt. Shanck, Mt. Gambier: volcanic cones with associated lakes). For the rest, the general features of the lowlands admit of little in the way of description. Rolling or undulating in the north and east, towards the south and centre they mostly flatten into seemingly boundless expanses of plain. Clothed with scattered timber, scrub and grass, they here and there spread flat pavements of clay or broken stones ("gibber" plains of Central Australia) to distant and unbroken horizons. Where the climate is dry, or where perhaps it was once drier than now (*e.g.,* in the North), forms of arid erosion — sharp steep-sided scarps surmounted by long flat crest-lines ("table-top" hills) and other similar shapes — are etched in the "desert sandstone" and reveal higher land-surfaces now all but gone. Sand-ridge (brick-red moving dunes, or fixed mounds calcareous within and only outwardly coated with sand) occupies some few areas (*e.g.,* eastern Central Australia and parts of the South Australian "Mallee"). In still other parts areas of limestone ("kunkar"; travertine) and ironstone gravels occur, but the most extensive and most characteristic are the vast alluvial sheets — gravels, clays and loams for the most part, often very fine and very deep — washed down by streams from distant highlands and laid by innumerable floods over many hundreds of square miles.

The Eastern Highlands (Including Tasmania). — The eastern and south-eastern borders of Australia are mainly highland, though there is also included a certain proportion of mainly coastal lowlands. The highlands have been termed "cordillera," but they are a more or less continuous belt of plateaux rather than a mountain chain or series. This character they owe — as indeed does the belt as a whole — mainly to two processes in the physical history of the continent; viz., the recent elevation of its eastern borders and the perhaps complementary subsidence beneath the sea of a considerable marginal strip. The last major folding or mountain-building processes in Australia occurred towards the close of the Palaeozoic age (Carboniferous period). The structures then reared in the labile zone which comprises, but extends far beyond, the eastern margins of the continent, have since then been subjected to continuous denudation — so far, at least, as can be judged from the portions which remain above sea-level. It was thus an ancient and very reduced surface which was "warped up" to form the highland rim. The uplift, however, was irregular ("differential") and was accompanied by much slipping and faulting, so that there resulted a number of unevenly tilted blocks which in some parts are more closely coherent, in others separated by gaps of varying width, such gaps representing very often areas of down-faulting or block-subsidence ("Senkungsf elder").

The prevailing plateau character of the summits is further attributable to (a) volcanic activity, whereby extensive areas throughout the belt were covered with sheet-flows, the surface levelled, and former irregularities of topography submerged ("deep leads");[1] (b) denudation intensified by the uplift (*cf.* the "peneplains" of the western slopes; "valley in valley" formations), and, more locally, by glaciations also (*e.g.,* in the south-eastern part of Australia and in Tasmania). But the uplift naturally worked in the opposite sense also since it reinvigorated erosive agencies and processes in general. The displacements mentioned had the effect of shifting the watershed on the whole further inland (exceptions are certain areas in the south-east of the continent), and the collapse of the eastern margins in particular gave the eastward-flowing streams greater cutting power. Thus the deep fresh-cut valleys are as characteristic of the scenery as are the old worn summit-levels, and this has resulted here and there in striking precipice and gorge topography (*e.g.,* scarp of New England Plateau) and occasionally in dislccated courses of streams (*e.g.,* upper Barron river in north-east Queensland).

The highland belt falls into three fairly clear natural sections: the Northern Uplands; the Central and South-eastern Highlands (including Tasmania); the Southern Dividing Range. (See articles on various States.) (O. H. T. R.)

GEOLOGY

Australia is essentially the fragment of a great plateau land of Archaean rocks, the western portion of the continent constituting a Precambrian nucleus around which later sediments have been deposited and against which they have been folded. East of a line drawn through Cloncurry and Broken Hill the continent is built up of later deposits, with the exception of isolated areas of probably Precambrian rocks in the east Queensland zone extending

[1] The uplands composed of these volcanic rocks now form the watershed along considerable stretches of the highland belt.

from Cape York peninsula to the latitude of Gladstone. A very similar geographical disposition of the Precambrian is revealed in the architecture of Tasmania, where Precambrian rocks are confined to a region west of a line drawn through Beaconsfield and Louisa bay on the extreme south coast. The stratigraphy and structure of this old terrain is best known in the State of Western Australia, essentially an old Precambrian land that has remained above sea level throughout Palaeozoic and later times.

The succession of Precambrian rocks in this State, is as follows:—

Archaean	Warrawoona series	Older Greenstones—basic lavas, tuffs and sills.
		Yilgarn sediments—para-schists and gneisses.
		Newer Greenstones—peridotites, gabbros, dolerites, porphyrites.
	Older granites and gneisses.	
Lower Proterozoic	Mosquito Creek series—conglomerates, quartzites, phyllites.	
	Kurrawang series—arkoses, conglomerates, slates.	
	Stirling Range series—quartzites.	
	Newer Granites.	
Upper Proterozoic	Nullagine series—conglomerates, sandstones, dolomitic limestones, basic and acid lavas.	

In the southern and central provinces of the State the greenstones of the Warrawoona series consist of highly folded hornblende and chlorite schists arranged meridionally or along north-north-west lines. They are enclosed in granites and gneisses of igneous origin which without exception appear to be transgressive. The principal gold mining centres of the State are situated within these greenstone belts or at their contacts with the invading igneous rocks. This Archaean platform is continued eastward into South Australia where a complex of para-schists, amphibolites and igneous gneisses underlie the greater part of Eyre peninsula. In central Australia the dominant structure lines of the Archaean rocks are latitudinal as seen in the Macdonnell range gneisses.

The Mosquito Creek series and Kurrawang series developed in the Pilbarra and Coolgardie areas respectively are dominantly sedimentary systems which, though intensely folded, show discordant relations to the Archaean rocks on which they rest. They in turn are penetrated by a later series of granites and granodiorites (Newer Granites). In the Kimberley region of northern Western Australia a great group of sediments and igneous rocks overlain by the Nullagine series is of Precambrian age, but little is known of the structure of this region beyond the striking V-shaped trend lines of the series outcropping from King Sound to the Northern Territory border. In the Northern Territory the Precambrian series is constituted in its lower part of schists largely of tuffaceous character penetrated by granite intrusions. They form a well-defined belt extending from Darwin to the region of Pine Creek.

In Queensland, a large area around Cloncurry is built up of Precambrian rocks, the age being definitely established by the presence of Cambrian rocks resting on the eroded edges of the series. It is probable, however, that the rocks of the Hamilton-Coen, Charters Towers, Gilbert and Etheridge goldfields are also of Precambrian age. In New South Wales the only undoubted area of Precambrian rocks is that surrounding Broken Hill, while in Victoria the granites and gneisses in the bed of the Glenelg river near Harrow and Balmoral represent an eastern outpost of the Precambrian rocks of south-eastern South Australia.

In South Australia, the lower portions of the Adelaide series principally developed in the Mount Lofty ranges have been ascribed to the Nullagine series by David. These lower members of the Adelaide series include a folded series of ilmenitic conglomerates, quartzites, slates and limestones passing upwards into a well defined glacial horizon (Sturtian tillite). These rocks are devoid of recognizable fossils. In the Flinders ranges at Wooltana and at Mt. Arrowsmith to the north of Broken Hill the series contains a volcanic horizon which is correlated with the lava zones of the Nullagine series.

As far as can be determined no orogenic movement ushered in the Cambrian era. Rocks of Cambrian age occur principally in the Kimberley district (Western Australia), Northern Territory, Cloncurry area (Queensland) and in the Mt. Lofty and Flinders ranges of South Australia. The great lava flows of the Antrim basalt plateau are followed by a series of Cambrian sediments carrying *Salterella*, and a somewhat similar relation is revealed in the Northern Territory. In the Mt. Lofty ranges and Flinders ranges a continuous section from the unfossiliferous Adelaide series to the *Archaeocyathinae* limestones of Middle Cambrian age has not yet been discovered, but the evidence here, as in the Kimberley region, points to no great stratigraphical break. Some portion of the Adelaide series is therefore probably of Lower Cambrian age.

The prominent tillite horizon (Sturtian tillite) in the Adelaide series is found at intervals over a zone extending from south of Adelaide into the far north of South Australia and is also developed in the Broken Hill district. Owing to the difficulty in defining the base of the Cambrian, it is uncertain whether this ancient tillite is Lower Cambrian or Late Proterozoic in age. In Queensland a gently undulating or horizontal series of fossiliferous Cambrian sediments discovered west of Cloncurry indicates an extension of the Cambrian sea into western Queensland. In Tasmania, the only known Cambrian rocks are the *Dikellocephalus* sandstones of Railton.

Heathcotian Series.—Of uncertain stratigraphic position are the so-called Heathcotian series of Victoria, variously ascribed to Upper Cambrian or Lower Ordovician age. These rocks in the type area of Heathcote consist of shales and radiolarian cherts associated with spilitic lavas and tuffs. These beds are strongly folded and followed apparently without break by Lower Ordovician rocks. The beds themselves contain a mixed fauna including purely Cambrian forms together with others of a more Ordovician aspect. A similar difficulty is met with in correctly placing the "Cambro-Ordovician" series of Tasmania. These rocks developed in the western portion of the island include slates, and extensive masses of sheared keratophyric lavas, tuffs and intrusions of the Dundas and Read-Rosebery areas.

Two strongly contrasted types of deposits are present in Australia's Ordovician system. The first, a littoral facies, is developed in central Australia and is represented in the region of Tempe downs, the Krichauff range, etc., south of the Macdonnell ranges. An immense thickness of sandstones and fossiliferous limestones were deposited in a shallow sea probably extending as far east as the Cairns range in Queensland. The fauna includes such forms as *Orthis, Isoarca, Raphistoma, Orthoceras* and *Asaphus.*

In Victoria a more pelagic type of deposit is represented by the Lower Ordovician graptolitic slates practically confined to an area west of the meridian of Melbourne. These beds have been subdivided into four zones, those of Lancefield, Bendigo, Castlemaine and Darriwill, each characterized by a typical graptolitic fauna. The chief productive goldfields in the western portion of the State occur in these zones near their contacts with granodiorites. Upper Ordovician rocks are chiefly developed in the eastern portions of the State and extend northward into New South Wales. The crystalline schists of the Albury-Omeo districts and of the region around Cooma (New South Wales) are believed to be of Ordovician age as they appear to pass gradually into unaltered fossiliferous Ordovician rocks.

At the close of Ordovician times a strong folding set in, accompanied in places by igneous intrusions. In New South Wales a marked unconformity separates these rocks from the succeeding Silurian strata.

Silurian Age.—Rocks of the Silurian age are entirely confined to the eastern States of the continent. The western coastline extended from western Tasmania through central Victoria and New South Wales into Queensland. The only undoubted fossiliferous Silurian rocks of the latter State occur at Chillagoe in the north, but it seems probable that the lower members of the Brisbane schists and their northerly extension in the Amamoor and Gladstone series are of Silurian age, and possibly, too, the Coff's Harbour series of north-eastern New South Wales. Silurian strata

form the most widespread Palaeozoic formation of New South Wales.

In the Jenolan district, the famous caves are hollowed out of limestones rich in *Pentamerus*, and other Upper Silurian limestones occur at Wombeyan, Bathurst, Orange and Wellington. In Victoria the Silurian system is divisible into a Lower or Melbournian series, mainly of sandstones and shales and an Upper or Yeringian series. These rocks cover a large portion of central eastern Victoria and contain much of the gold of the mining fields of this part of the State (Walhalla, Wood's Point, Rushworth, etc.). In Tasmania the West Coast range conglomerate series, which contains pebbles of the Cambro-Ordovician porphyroid series, is of Silurian age and underlies a Silurian limestone horizon. Here, too, are placed the limestones of the Gordon river, and the slates and sandstones of the Queen river, Zeehan and Middlesex.

The close of Silurian times witnessed great orogenic movements followed by intrusions of granites probably throughout south-eastern Australia and Tasmania. Widespread volcanic activity ushered in the Devonian era in south-eastern Australia. In Victoria a great group of dacite lavas was poured out over a landscape of folded Ordovician and Silurian sediments. These rocks are exposed in the Dandenongs, at Lilydale, Healesville and Macedon. Probably of similar age are the Snowy river porphyries of north-east Victoria, and the acid lavas of the Murrumbidgee valley. The former attain a thickness of 2,000ft., the latter probably 6,000ft. In both areas Middle Devonian sediments and tuffs with a rich marine fauna follow the lavas.

In north-eastern New South Wales and Queensland a Devonian sea, formed probably at an earlier date, and argillaceous sediments, tuffs, radiolarian shales and coral limestones were deposited in the Tamworth-Barraba region (New South Wales). Igneous action, represented in flows and shallow intrusions of spilites, keratophyres and dolerites, is especially prominent in the Middle Devonian rocks of this region. In Queensland the upper portions of the Brisbane schist series and its equivalents were laid down in a Devonian sea. A period of pronounced orogenic movement closed the Middle Devonian epoch over southern and central New South Wales, and gently inclined Upper Devonian sediments rest unconformably on older sediments as at Cobar and in the Parkes-Forbes district. The Upper Devonian quartzites and shales reach a thickness of 10,000ft. at Mt. Lambie.

In the Kimberley district of Western Australia a series of conglomerates, grits and limestones occur on the Elvire river and in the Napier range. The fauna indicates an Upper Middle or Upper Devonian age.

At the close of the Devonian age, orogenic movement associated with granitic intrusions disturbed the area west of the Blue Mountains, but in north-eastern New South Wales there is little sign of any stratigraphic break between the Upper Devonian and Carboniferous sediments which are folded together. In this region Carboniferous strata attain a thickness of 17,000ft. and extend in a wide folded belt from Port Stephens northward into New England. The succession is as follows:—

Lower Carboniferous	Burindi series (5,000ft.), mudstones, limestones. tuffs and some lavas.	
Middle Carboniferous Upper Carboniferous	Kuttung series (9,500 ft.)	Basal Stage Volcanic Stage Glacial Stage
Upper Carboniferous	Lower Marine series, Lochinvar Stage to *Eurydesma* horizon (2,600 ft.)	

At the close of Burindi times earth movements in this region led to a reversion to widespread land conditions, the commencement being told by the development of a great thickness of conglomerates (Wallarobba Conglomerates), which are likened to a "Flysch facies" comparable with the Siwalik conglomerates of the Sub-Himalayas. Then followed the accumulation of an immense zone of lavas, tuffs and sills extending almost meridionally throughout the area. During these volcanic outbursts the first signs of glaciation that subsequently enveloped much of the whole southern portion of Australia appeared, glacial tills and seasonally banded varve rocks being intercalated between the tufaceous beds. In Queensland Carboniferous rocks are best represented in the Star series, and beds of similar age occur in the Drummond range, and at Rockhampton. Possibly they are also represented in the far north in the Herberton series and on the Pascoe river. The base of the great geosyncline in the Bowen area is constituted of a great pile of volcanic rocks which are probably to be correlated with the volcanic stage of the Kuttung of New South Wales. In the State of Victoria probably the Mansfield series with their fish beds, the Avon river sandstones with *Lepidodendron australe* and similar beds at Iguana Creek belong to Kuttung times. The glacial conditions which set in during the Middle Carboniferous intensified near the close when an ice sheet covered large areas of southern Australia. In Victoria and South Australia no marine beds of Permian age are known, but in Tasmania, New South Wales and Queensland widespread marine conditions obtained. In the type area of New South Wales the total thickness of Permian strata reached 15,000ft. Marine beds are grouped into a lower and upper series separated by the Greta coal measures (100–200ft). Equivalent measures occur in Tasmania and Queensland. The final regression of the Palaeozoic sea from eastern Australia is represented by a second series of fresh-water beds and coal measures. In New South Wales they include the Tomago coal measures (500–1,800 ft.) and the Newcastle coal measures (1,600ft.) of Upper Permian age. The Permian beds contain a characteristic flora represented principally in Glossopteris and Gangamopteris while the typical Carboniferous Rhacopteris-Lepidodendron flora had died out in the Carboniferous. Glacial conditions persisted into the Upper Marine and a thickness of 10,000ft. of strata separates the lower glacial beds of the Kuttung from the glacial conglomerates in the Muree beds of the Upper Marine stage.

This latter stage in the Kiama area contains a thick series of latite lavas. In Queensland Permian deposits are known as far north as the Little river, west of Cooktown, but they are especially well developed over a region extending southward from the Bowen river to the New South Wales border. In Western Australia deposits of this age containing glacial horizons are known in the Irwin, Collie areas, and in the Gascoyne and Kimberley districts; in the latter deposits can be traced into the Northern Territory.

Triassic **Rocks, etc.**—The Triassic rocks of Australia are confined to a belt of rocks in southern Queensland and New South Wales. They are essentially fresh-water deposits and were deposited in two lake areas, one covering in New South Wales part of the Permian coal basin extending from the Shoalhaven river to Newcastle and westward to Lithgow, the other covering the south-eastern region of Queensland extending westward to Carnarvon and southward to the Clarence river in New South Wales. The deposits of the former lake are represented in the Hawkesbury series, subdivided into three stages (*a*) Narrabeen stage (1,800ft.), sandstones and chocolate shales with tuffs; (b) Hawkesbury stage (1,000ft.)—massive sandstones; *(c)* Wianamatta stage (800ft.)—shales. This series contains at its top a bed rich in foraminifera and ostracoda, pointing to a brief marine incursion over the Blue Mountain region. In Queensland the deposits of the second lacustrine area are chiefly represented in the Ipswich and Bundamba series. The former series contains at its base an acid tuff horizon (Brisbane tuff). Portions of the Mesozoic freshwater series of southern and eastern Tasmania are probably of Triassic age though they extend into the Jurassic. These beds include the Knocklofty sandstones (1,000ft.) overlying conformably the Permian series. The Fingal coal measures (1,200ft.) are probably to be correlated with the Jurassic coal measures of Victoria.

The Jurassic period witnessed a much wider extension of the lacustrine conditions characteristic of the preceding era. In eastern Tasmania and southern Victoria productive coal measures occur in rocks of this system. In the latter state a great lake covered portions of south Gippsland, and the Otway ranges and conglomerates, felspathic sandstones, mudstones and thin coal seams were deposited. Similar rocks occur further west in the valley of the Wannon. A large Jurassic basin occupied much of southern Queensland and portions of northern New South Wales and north-eastern South Australia. The sediments deposited in this basin supply artesian water to the great artesian basin.

In Queensland the Jurassic system includes the Walloon series and the Tiaro series in the Maryborough district. The latter series has at its top an horizon of andesitic and rhyolitic lavas and tuffs. The Jurassic beds of Western Australia occur in a long belt near the western coast, near Geraldton and at Shark's Bay, at Cape Riche, east of Albany, and in the Kimberley district. The maximum thickness of these beds is not less than 3,000ft. They include conglomerates, sandstones, oolitic limestones and lignite beds. The marine sediments contain a rich fauna and the ammonite beds are referred to a middle Bajocian age. At the close of the Jurassic, central and eastern Tasmania witnessed the widespread intrusion of a series of quartz-dolerite sills reaching 2,000ft. in thickness. They are associated with the Permian and Lower Mesozoic unfolded sediments, and form the tiers of central Tasmania.

Cretaceous Era.—The Cretaceous era in Australia was a period of great marine transgressions and regressions. In Cape York Peninsula, plant beds of Lower Cretaceous age underlying a marine Cretaceous series probably represent a continuation of the lacustrine conditions of Walloon times. Then followed an extensive marine transgression by which much of central and western Queensland, north-western New South Wales and northern South Australia were covered by a shallow epicontinental sea extending from the Gulf of Carpentaria and flooding one-third of the area of Australia. Possibly this sea extended southward into the Australian Bight, for marine Cretaceous beds underlie the Tertiary basin of the Nullarbor plains.

The principal marine horizons of the Australian Cretaceous constitute the Rolling Downs formation (Lower Cretaceous).

Aptian—Roma series, Maryborough beds, Eucla beds (in part).

Albian—Tambo series, Point Charles bed, Eucla beds (in part).

In Western Australia the Upper Cretaceous Gingin Chalk series which extends in a coastal belt north of Perth to the Murchison river contains a rich foraminiferal fauna and is palaeontologically distinct.

The first marine transgression in east Australia gave rise to the Roma series (blue clays) and probably represented the flooding of the Walloon basin by the sea. A non-sequence follows, the interval indicating a regression of the sea from the whole area to be followed by a second transgression during which a series of limestones represented by the Tambo beds was laid down. Both these seas appear to have had outlets to the north and south (Gulf of Carpentaria and Australian Bight). At the close of the Albian the sea finally withdrew from central and eastern Australia. The post-Tambo series of beds in the artesian basin include part of the so-called Desert sandstone. They are fresh-water beds and referred to as the Winton series. These beds reach a thickness of at least 4,000ft. in the Patchewarra bore. Lacustrine conditions probably extended into Lower Tertiary times.

In the Janjukian epoch the sea encroached over the region of the Nullarbor plains and sediments reach a thickness of over 1,000ft. In the east a marine transgression covered the Murray basin extending into the western plains of New South Wales. The sediments are principally polyzoal limestones, calcareous sandstones and clays. The Kalimnan and Werrikooian are much more limited in their distribution. The former is typically developed in eastern Victoria, but is also represented by the oyster beds of the River Murray cliffs and beds along the coast of St. Vincent's Gulf. The latter is typically developed at Limestone Creek, Glenelg river (Victoria), but appears in the Mallee bores and near Adelaide.

Probably the oldest terrestrial Tertiary deposits in southern Australia are the brown coal deposits, sands, muds and limestones recognized from bores at Newport and Altona Bay, south-west of Melbourne. These underlie the Balcombian (Oligocene) marine beds already referred to. The brown coal beds of Victoria are probably the thickest yet recorded in the world. Among the deposits of the Janjukian may be mentioned the Morwell brown coal deposits, the lignites of Moorlands (South Australia), plant beds underlying and overlying the older basalts of Victoria and the buried river drifts or deep leads of New South Wales and Victoria.

The non-marine deposits of Kalimnan and Werrikooian age include the newer deep leads of south-eastern Australia, *e.g.*, Gulgong and Forest reef in New South Wales and Brandy Creek near Beaconsfield, Tasmania. The lacustrine deposits of Launceston and the Derwent basin are probably of Kalimnan age.

Throughout eastern Australia and Tasmania the Middle and Upper Tertiary was a period of intense volcanic activity. The volcanic series can generally be subdivided into three series termed (a) Older basalts, (b) Alkaline series, (c) Newer basalts, and as such are well recognized in Queensland, New South Wales and Victoria. The earliest lavas are of Balcombian and Janjukian age while the newest lavas range from the Pliocene probably into Pleistocene times. In Victoria the newer series of basalts cover an immense area west of the meridian of Melbourne. The alkaline series is represented in Queensland, New South Wales, Victoria and Tasmania and include alkaline trachytes, solvsbergites, pantellerites, tinguaites, melilite and nepheline basalts. The leucite lavas of New South Wales and the Kimberley district of Western Australia are probably to be referred here.

The latest events in the geological history of Australia include the widespread epirogenic movements in which the eastern margin of Australia was warped up to elevations of over 3,000ft. above the sea. The Kosciusko area rose to an elevation of 7,000ft. and in Pleistocene times was the site of an ice cap, as was also much of the highlands of Tasmania. After the main uplift there followed a period of marked rift faulting, the foundering of Bass Strait, and the formation of the rift valleys of Spencer and St. Vincent's Gulf. Earthquake shocks indicate that adjustment is still in progress in these regions.

Information on the geology of Australia is principally contained in the publications of the State Geological Surveys and State Royal Societies. Reference may also be made to the Federal *Handbook*, **B.A.A.S.** 1914, chapter vii. "The Geology of the Commonwealth," by Sir Edgeworth David; Transactions of *the* ***New*** *Zealand* Institute, 1923, "Palaeozoic and Mesozoic Seas in Australasia," by W. N. Benson; and articles in the reports of the Pan-Pacific Science Congress, Australia, 1923. (C. E. T.)

GENERAL PHYSICAL CHARACTERISTICS

Geological and climatic factors have given Australia a singularly uniform surface, which either lies directly upon worn-down ancient rock or has been formed by filling in and levelling up. Barely one-twentieth of the mainland is over 2,000ft. above sea level, though the proportion is greater in Tasmania. Marked temperature variation, torrential rainfall and, more locally, ice, have produced rubble, gravels, sand and dust. Dust-laden winds, ceaselessly scouring, etching and filing-down, have carried the finer materials far and wide, while in less arid areas and ages wide-ranging floods have spread alluvial floors. Wind and water-laid deposits cover much of the interior which, deprived by climatic and tectonic processes of a powerful drainage system, lies half-buried under the products of its own decay. Hence one of the paradoxes of Australian scenery—great expanses of flat or billowing surface sweeping up to, and often half engulfing, sharp upstanding rocky forms which rise, massive and deep-scarred, over against them.

In spite of sandridge areas, great parts of the interior possess soils sterilized by climate (*e.g.*, Lake Eyre basin). Widespread surface or sub-surface concretions (laterite, ironstones, limestones, salt and gypsum) are also due mainly to arid conditions. The coastal belt (v. inf. Rivers and *Drainage*) exhibits great variety but includes the rich and ample slopes and river flats of Queensland, New South Wales, east Victoria and Tasmania. Inland the dark sticky soils of the moister terraces, plains and river-courses (*e.g.*, Upper Darling basin) are succeeded on drier slopes and flats (*e.g.*, western plains of New South Wales) by the well-known red soils, and almost the whole Lower Darling-Murray basin is covered with varied alluvial deposits. The Cretaceous (Rolling Downs) soils of Queensland, the (Tertiary) limestone soils of South Australia and of the Nullarbor plains (dry red soil about 1ft. deep) are soils developed *in situ*.

Most varied are the soils of the eastern highlands and Tasmania, ranging from poor sands and grits derived from silicious sandstones and granites to rich red-to-black loams of limestone origin or admixture. The Palaeozoic rocks (slates, shales, etc) yield in places rather poor clays, but widespread volcanic deposits provide fertile black-grey-red soils (cf. Darling Downs [Queensland]; south and south-west Victoria; New England plateau: Kimberley

Division [Western Australia]; Tasmania, etc.). Light sandy-to-loamy soils are widely distributed in southern Australia (cf. the "sand-plains" of Western Australia and the "Mallee" soils of South Australia and Victoria). These soils have not been leached out and are rich in mineral plant foods. Contrary to early prepossessions, they are mostly capable of great improvement and are being extensively occupied.

Rivers and **Drainage.**—Owing to climatic conditions, flatness and the warped-up rim, 64% of the Australian surface has internal (basin) drainage and some 43% no regular surface drainage at all (cf. Europe: 24% and 5%; world as a whole: 33% and 23% respectively). Three broad types of surface drainage may be distinguished: (i.) coastal, (ii.) interior ("enclosed"), (iii.) semi-enclosed. (i.) Coastal *drainage* is on the whole well-developed. The streams are often more important than their length suggests. Along the south, except towards the east and west extremities, streams are rare or poorly developed; there are more on the north. The subsidence of the eastern margins and the displacement inland of the watershed (*supra*) has enabled many of the eastern streams to enlarge their basins, while the increase of gradient and cutting-power has enabled them to cut through the interposed "ranges." The coast-range in Queensland in particular has forced several streams to cut through it close to their mouths (cf. Burdekin gorge). Short steep gradients and abundant rainfall give a fairly strong and constant flow; "drowned" estuaries facilitate access from the sea to some, the formation of deltas and bars (*e.g.*, Burdekin and Shoalhaven) hinders it in the case of others. The north-east Queensland streams have the longest courses and the largest basins (*e.g.*, Fitzroy: c. 500m. long; basin c. 55,000sq.m.) but New South Wales and Tasmania also have some fine streams. Regarded as economic factors these eastern streams assist penetration, settlement and general economic development (irrigation, hydro-electric power, etc.), and to a much less extent, in their lower stretches only, navigation.

Comparable are the rivers of the north and north-west coasts of the continent (*e.g.*, Fitzroy [c. 400m.], Ord [c. 300m.] besides the Victoria, Daly, Roper and McArthur). Many are navigable for considerable stretches and have economic possibilities though all suffer from a markedly seasonal ("monsoon") régime. The south-west coastal portion of Western Australia is well drained by small but fairly constant streams (*e.g.* Swan river), but those farther north, the Ashburton, Fortescue and others, are courses only occasionally utilized by water. By far the greater part of the western plateau has no organized surface drainage, courses normally dry carrying off the water of occasional downpours.

(ii.) Further east the inner Northern Territory and the central lowlands have a drainage better defined but intermittent. Large shallow depressions (*e.g.*, Lakes Woods and De Burgh in Northern Territory; Lake Eyre in South Australia) receive flood waters from near or distant uplands and then become more or less extensive patches of water, swamp and mud. Descending from the uplands of Queensland or Central Australia by normal channels (cf. valleys and gorges of the Macdonnell Range), the streams survive upon the plains only after heavy rain and then are more in the nature of moving floods. Drying up, they leave behind them broad channels with water-holes, or sometimes (Finke, Neales, etc., in central Australia) shallow beds lined with sand beneath which water may linger or flow.

(iii.) The Murray-Darling would rank as one of the world's greatest drainage systems if its volume throughout were on the same scale as its mileage. As it is. the system is somewhat one-sided (there are practically no western affluents); the flow, even occasionally of the Murray, is liable to interruption; a proportion of the quasi-tributaries seldom or never reach the main streams, and an oceanic outlet adequate to a great river is absent. Above the main confluence at Wentworth the Darling and Murray systems are distinct but similar. Each drains an approximately semi-circular basin rimmed by the south Queensland and north New South Wales highlands and by the south New South Wales and Victorian highlands respectively. The head-streams usually emerge from long, tortuous, and often narrow and precipitous highland valleys. On the lowlands they converge, in comparatively straight lines, on centres respectively near Bourke (Darling) and east of Euston (Murray).

In the north are the Macquarie (590m.), Namoi (430m.), Bogan, and others; in the eastern system the Murrumbidgee (c. 1,000m.), Lachlan (c. 800m.), Goulbourn (280m.), Mitta Mitta (125m.), Loddon (150m.). Descending to the lowlands these streams mostly slacken, begin to meander and deposit, to build their beds above the level of the plains, to flood, form distributaries ("anabranches") and lagoon-like "billabongs," and in dry periods to shrink to a string of water-holes or dry up altogether. A good many streams (Macquarie, Paroo, Avoca, Wimmera, etc.) are usually lost in swamps or sands. The Darling itself may be dry as long as 18 months at a time, and even the Murray occasionally ceases to flow.

The lower course of the combined Murray-Darling is very flat (gradient c. 3in. per mile). The river here flows through a wide flood plain between high and often cliffy banks. Near its mouth it expands into Lakes Alexandrina (*q.v.*) and Albert and has an outlet, but at times no outflow, into Encounter bay over a shifting sand-bar carrying 7–12ft. of water. In their plains course nearly all the streams of the Murray-Darling system lose enormous volumes of water by evaporation, by seepage (especially by old silted-up and buried channels), and increasingly also by the demands of irrigation. Under the most favourable conditions navigation can reach Walgett on the Darling and Albury on the Murray. The longest single stream-course is the Condamine-Darling-hlurray (c. 3,800m.), but it is obvious from the conditions above described that this and similar figures have little practical significance.

Sheets of standing water are naturally rare in Australia. The lakes which adorn many maps of Western and South Australia are mostly either extensive saline flats ("Lakes" Amadeus, Disappointment, etc.) or mud-flats receiving occasional (Lakes Gairdner, Frome, Torrens) or periodic (Lakes Eyre, Woods) flood-waters. Periodic also are the swamps, "billabongs," gilgais, etc., formed in the drainage courses of the great streams (v. *sup*). The only true lakes are those found in southern South Australia, in Victoria (some of them of the volcanic "crater" type) and in the eastern highlands, including Tasmania. Even Lake George, the largest of these, is subject to considerable variations.

Minerals.—Over considerable parts of the continent the ancient rocks are hidden under later (Mesozoic — Recent) deposits. In these rocks the chief minerals are salt and gypsum, bauxite and phosphatic deposits, opals (*e.g.* in west New South Wales and Queensland), some of the softer coals, besides alluvial deposits of gold and tin (v. p. 725). Improved methods of prospecting and surveying (*e.g.*, by geo-physical methods) will probably reveal minerals in the older rocks which underlie these newer formations. Petroleum oil, though perhaps not entirely absent (*e.g.*, in the Northern Territory and the Kimberley Division of Western Australia), has so far not been found in any quantity.

Ancient rocks, broadly speaking, constitute the outer portions of the continent, the eastern highlands, including Tasmania, forming a marked marginal belt. These rocks are extensively mineralized with metallic ores such as gold, silver-lead, copper, tin and iron, besides coal, phosphatic rocks and other non-metallic deposits. Australian minerals are therefore on the whole well situated for exploitation. Some important deposits are situated on or near the coasts (coal in New South Wales; silver-lead and copper in Tasmania; iron in South Australia and Western Australia), though Broken Hill, Cobar and Cloncurry are well inland. The continental margins are, moreover, the usually better watered and forested. The flatness and openness of the country (e g, in Western Australia) have in places favoured prospecting further inland, but here the supplies of timber and water diminish, and Broken Hill has suffered from dearth of water. Transport has often presented difficulties and there are fields potentially valuable which are still commercially inaccessible. Australia owes a considerable proportion of its railway mileage to minerals. The wide distribution and convenient situation of workable coal, the availability in the east (notably in Tasmania) of water for power,

and the facilities for marine coastwise transport also assist development of mineral resources. (See *Mining* and Minerals, p. 724.)

Primary occurrences of minerals are those in ancient rocks which have been involved, often at considerable depths, in mountain-building and other tectonic processes, and have become impregnated with bodies of ore. Such are the rocks of most of the western plateau, of virtually the whole of the eastern highland belt (including Tasmania), and of the South Australian and Barrier ranges, in which gold, tin, silver-lead, zinc, copper, iron, phosphatic rocks and many others are found in lodes (vertical to horizontal), reefs (cf. saddle-reefs), "replacement" zones, stockworks, etc., generally at or near contact-planes between different formations where stresses have occurred.

In the west, the mineralized areas are chiefly the north-west to south-east belts of "greenstone" schists, etc. (*v.* Geology, p. 704, *et* seqq.) of pre-Cambrian age; in the east somewhat later rocks (notably Silurian slates, etc.) are the chief seats of occurrence. Elevation and long-continued denudation have brought these mineral bodies near to the surface and, in places, left whole masses of ore-bearing quartz, etc., projecting as hills or ridges. Weathering also, by reducing exposed portions of lodes, has frequently brought about concentrations of ore in the upper parts ("secondary enrichment," *e.g.*, Mount Morgan, Queensland). The distribution of the mining industry, mining methods and mining profits have been, and continue to be, fundamentally dependent upon the conditions described.

Derivative deposits occur in (a) sedimentary strata such as the auriferous Nullagine conglomerates of north-west Western Australia (cf. the Banket deposits of South Africa), iron-impregnated sandstones, etc. These strata are in places more or less horizontal, and dissection by streams has made the ores more accessible. Most common, however, and widespread are alluvial deposits — notably of gold and tin. These river-bed ("stream") deposits, with which may be associated the auriferous sea-sands, derived originally from primary sources, have been widely covered up (10–100ft.) by later deposits — basaltic flows and river alluvium. These occurrences have also lent to Australian mining some of its most distinctive features.

Coal. — The coal resources of Australia are distributed along the eastern highlands, in Tasmania, and also, to a less extent, in South and Western Australia. The deposits, which occur in rocks ranging from the Permo-Carboniferous to Tertiary age, have mostly been preserved in hollows and basins in the underlying older rocks. The elevation, down-faulting and dissection of the eastern highlands, however, has exposed the seams in many areas so that they are easily worked. This applies particularly to portions of the largest deposit, viz., that of the great New South Wales (Triassic) basin which, shaped roughly like a saucer with its deepest part near Sydney, has numerous seams exposed at the surface near, or actually upon, the coast (*e.g.*, near Bulli).

The coals occur in seams of varying thickness and range from anthracite to lignite and include coking, steam and gas varieties. Their abundance, variety, accessibility and ease of working is leading, with the growth of population and of industries, to increasing exploitation. All the States (*qq.v.*) have useful supplies — South Australia has perhaps the least — and several of them have relatively enormous reserves. The additional advantage of marginal or coastal position and of sea transport gives them especial commercial value.

Water-power. — The northern rivers have very variable régimes and the Murray-Darling system has in addition insufficient gradients over most of its area. The eastern highland belt has steep gradients (including falls) on the coastward side and strong and fairly constant stream-flows and here, in a belt stretching from Cairns in Queensland to Victoria, some 650,000–1,300,000h.p. are available for development. Tasmania has some 400,000 located h.p. The coal deposits of the eastern highland belt greatly enhance the value of the water-power there, since the two sources of power can be worked in conjunction.

Water **Supply.**—Around the margins a belt varying in width roughly from 100 to 200 miles — broadest towards the south-east and including Tasmania, interrupted in the central west and central south — has normally a sufficient rainfall and run-off. Here capital cities, country towns and rural areas have abundant supplies, based often on extensive reticulation schemes. The corresponding parts of northern Australia have also adequate available supplies. In the drier parts of the country one finds both superficial and underground supplies.

Superficial supplies are derived from rainfall and include, besides occasional river, lagoon, pool and spring supplies, run-off stored in gravel screes at the base of, *e.g.*, granite hills, sand-hill soaks (many "sand-hills" have clayey or tufaceous interiors) and other similar sources. Superficial supplies are apt to fail, but water-storage in reservoirs, dams, tanks, underground cisterns, etc., has made steady progress and is now widely established and the incidence of irregular, if spasmodically heavy, rainfalls is being mitigated.

Underground artesian supplies underlie nearly one-third of the surface of the continent (c. 950,000sq.m.). Virtually the whole of the great central lowlands, besides large areas at the head of the Great Australian Bight and along the west and north-west coasts are included. If, as seems possible or even probable, a proportion of this water is derived from the harder rocks which underlie the basins ("connate" or "included" water), and not by the underground percolation and gravitation of rainfall ("meteoric" water), there is a definite, if a still extended, limit to the supplies available. Certainly in recent years the yields, which in many cases were over 1,000,000gal., and in one case reached 2,333,000gal., per diem, have almost everywhere declined by amounts ranging from 3% to about 7% per annum.

These wells vary in depth from 6,000ft. to 10ft., averaging *c.* 2,000–1,500ft. They are relatively costly to bore, and failure to find water entails loss. In artesian wells proper the water overflows, in sub-artesian wells it rises but does not flow. The temperatures at point of issue range from 212° F to 72° F and the waters are in general too highly mineralized for human consumption or even for irrigation, but are excellent for watering stock (see Pastoral and *Agricultural Industries*, p. 727).

Shallow sub-surface waters are widely distributed through the softer surface strata — Tertiary marine limestones and sandstones, alluvial gravels, silts, etc.—that mantle so much of the continent. They may be only a few feet below the surface and are derived originally from rainfall percolating directly, or through the intermediate agency of rivers.

In wet seasons, especially in the south (see *Climate*, below) where the rain falls in the cool season (when evaporation is lowest), great quantities of water lie upon the ground as pools or floods, and a large proportion of this water must escape underground. These waters are thus permanently available and are also readily accessible, failure to strike supplies involving no great loss. Unfortunately many are saline. Nevertheless, when made available by means of windmills, etc., these supplies constitute an economic asset the value of which has perhaps been inadequately recognized, and large tracts of country (*e.g.*, in South Australia) have been, and can still be, permanently settled by their means.

In general, large-scale conservation and supply schemes, though important, are perhaps less important than the aggregate of individually small but widely, and increasingly densely, distributed supplies which serve as a permanent safeguard.

Climate. — An island set in large water-bodies, Australia has for the most part equable conditions, but it is large enough to experience in its interior considerable extremes. Its size permits climatic differentiation, especially as between north and south, in which direction it stretches over some 33" of latitude (c. 11°–44° S.). At the same time, it has the least average elevation of all the continents and also a closed outline, and this makes for uniformity, and gives climatic — and hence often economic — regions on a large and simple scale. The great extent, moreover, of land lying between the lats. of c. 20° and 30° s. — *i.e.*, roughly along the tropic of Capricorn, and in a transition zone between two major rain regions — gives Australia a large area of low rainfall, increased because the eastern highlands force precipitation on the eastern rim.

Temperature. — About 38% of Australia lies north of the tropic and the northern two-thirds (roughly) has mean monthly temperatures in Jan. and Feb., 80°–85° F; in June and July, 55°–75° F; the southern third, go°–65" and 55°–50° in the same months respectively. In the ranges of temperature the influence of the oceans is very apparent. Tasmania has naturally very equable conditions, but the coastal parts almost everywhere have a low average ann. range (15"–zo°). Along the north, this low range (15°–8°) implies monotonous heat; elsewhere it is perhaps an advantage. Inland, extremes of temperature become increasingly marked and variations of over 80° occur. Thus in Central Australia shade temperatures of 110°–113° by day may be followed by night temperatures near or at zero, though even so the variations are not comparable with those experienced in, *e.g.,* Asia or North America (171° and 153° respectively). The south-east parts (including Tasmania) are the coolest, owing largely to the presence of highlands; the hottest are the north-west, Wyndham (av. ann.: 84·6°) being one of the hottest places on the globe. Heat spells are also longest and fiercest inland in the north-west and north (100° on 50 to 60 consecutive days); on the southern and eastern coasts they are less trying (go°: Perth, zo; Adelaide, 14; Melbourne and Brisbane, 8; Sydney, 4; Hobart, 3 consecutive days). Over considerable areas the heat is relatively dry, bearable, and, to those accustomed to it, invigorating. The same applies to the interior also, Central Australia being particularly healthy. Ground frosts occur everywhere except along the north and west margins. But the hot winds of summer are trying, and uneven heating sometimes causes "bumpy" conditions for flying. Summer in the north coastal parts is enervating (70° wet bulk temperatures) from Mackay to Broome.

Rainfall. — Conditions are, as it were, delicately balanced and very small differences (*e.g.,* an inch or two of rain more or less) may vitally affect economic conditions. Snowfall is normally restricted to the south-east highlands and Tasmania, where it lies for several months. Insularity and world position give Australia a rainfall which, predominantly marginal, swings around the continent from north-west to south-west and back again, completing a sort of circular return tour more or less regularly with the procession of the seasons.

In the north the rains are monsoonal and brought by depressions ("tropical lows") passing eastwards and south-eastwards. These rains fall in the hot season (chiefly in the six months November to April) and usually die away rapidly inland (c. 18°S. lat.). In the south the rains come mainly with depressions ("antarctic lows") which, travelling east, cover Tasmania and a strip of varying depth of the mainland. Rains are deposited upon the eastern highlands (from about 30° S. northwards) by the south-east trade winds which come moisture-laden from the Pacific. These rains vary locally according to the disposition of the opposing heights but are mostly heavy.

More occasional and irregular, but often very heavy, falls are brought by tropical storms on the north-east coast, by the passage of "anti-cyclones" in the south, and by tropical lows moving down behind (west of) the eastern highlands. These last sometimes penetrate to Victoria and even to Tasmania (*e.g.,* June 12, 1912) and they are welcome refreshers of the great pastoral plains of the eastern States. Finally there is the strip stretching roughly east and west from the lower Darling and south-west Queensland to the west coast about Sharks Bay, which has an average breadth of c. 550m. It touches the head of the Bight but narrows towards the west coast and occupies *c.* 1,000,000 sq m. or about one-third of the continent. This is "arid" Australia, with an annual rainfall of 10in. or less, where the marginal rains described above tail off and come feebly, irregularly, or seldom. The true "axis of aridity" swings north and south with the seasons, and the margins are visited by occasional rains from now the north, now the east, now the south. At the opposite extreme stands Tasmania with an abundant all-the-year fall, especially on its exposed western highland flank.

Four main rainfall regions have thus been distinguished: (1) the northern, with summer rains averaging 60in. or less (reckoning inwards) annually; (2) the southern, with winter rains averaging from 40in. downwards; Tasmania 110–20in.; (3) the eastern, sharing partly in both the above, but having "independent" sources of its own, from 60–40in., confined mainly to the eastern highland flank and thereafter falling off inland; (4) the "arid," with 10in. or less. The wettest portion of Australia is on the north-east Queensland coast (144–165in. av. ann.), and the driest about Lake Eyre (less than 5in.). Reliability of rainfall decreases as temperature increases towards the north-west and north of the continent, the extreme north and one or two other areas forming exceptions. The economic value of the rainfall — the moisture normally available after evaporation has taken its toll — is greatest in the area of uniform rainfall along the south-west and south-east marginal parts. Elsewhere there are district wet and dry seasons and inwards the rains become more spasmodic and more concentrated so that special adaptations are necessary ("dry farming"; water and fodder conservation, etc.).

Torrential and irregular precipitation is rather typical particularly in the north and north-east in summer. Hail occurs along the south in winter and over the south-east in summer. These cause considerable damage especially through flood destruction. Recurrent droughts have earned excessive notoriety. Storms visit chiefly the north and east parts: cyclones ("willy-willies") the north-west in November to April; hurricanes the north-east in January to April; "Southerly bursters" the south-east chiefly in October to February. The arid interior is the home of restless dust-carrying winds which periodically sweep down to discomfort the south. Tasmania, somewhat exceptional, has a climate like that of England — mild, moist and invigorating. (X.)

FAUNA AND FLORA

Fauna. — The Triclad Turbellarian (Land Planarian) genus *Geoplana* is largely confined to Australia, New Zealand and South America, with some species in South Africa and in Japan. Among earthworms the Perichaetidae are represented by obviously ancient forms in Australia; they are also important in South America and a few occur in south-east Asia, Perichaeta itself abundantly, and a few in Africa but none in the more northerly lands. It is noteworthy that the earthworms of New Zealand, though related to some Australian ones, show only a few species and are related to those of South Georgia, the Falklands and south Argentine and Chile. Peripatus, again, an ancient type related both to the segmented worms and to the arthropods, has species found in Australia, while other species characterize New Zealand, Sumatra, South Africa, South America and the West Indies. They are all land animals without means of distribution over the water and they are all ancient types of life. Their distribution is that of relicts of an old widespread fauna, they are now found only in discontinuous areas of survival as a result of physiographical isolation.

Ceratodus, a Dipnoan fish, survives in the rivers of Queensland, the other living Dipnoans being African and South American though fossils are widespread. The Port Jackson shark (*Heterodontus*) is another survival, in this case of the elasmobranchs (sharks) of the Secondary period.

As regards crocodiles and lizards Australia, especially in the north-east, where the crocodiles occur, is clearly related to Asia. Among the tortoises the family Chelydidae is found in Australia and South America, and fossils have been found in Europe. Here, then, we seem to have evidence from fossils to support the general thesis concerning discontinuous areas of survival (Chelydidae), as well as to suggest that Australia and Asia have been connected within the period of earth history since the first evolution of lizards; crocodiles may get across a fair breadth of sea. The great Queensland crocodile has been known to reach a length of 30ft. The leathery turtle has been taken in some Australian coastal seas. Australia has many snakes, several venomous ones.

'The running birds are represented in Australia by the emu and the cassowary. The emu is a known fossil from New Zealand, which had, until recently, gigantic flightless birds The cassowary occurs in Papua and some neighbouring islands as well as in Australia. The other running birds that survive are the ostriches in Africa and rhea in South America. The gallinaceous birds are

interesting in the same way; some ancient types, the Megapodes or mound builders are Australian but one species is found in south-east Asia; their probable nearest relatives, the Cracidae, are South American. The lyre-birds (Menura), the bower-builders, and the honey-eaters are other features of Australia.

But it is the mammalian fauna of Australia that presents the greatest interest. The Mammalia bear their young alive after nutrition in the uterus for a period through a vascular organ called the placenta. The young, after birth, are fed by the mother from her mammary glands; they develop a juvenile, or so-called milk-dentition, which is replaced by the second or adult dentition. Two genera in Australia, Ornithorhynchus and Echidna are survivors of early types in which these features are barely indicated; they lay eggs, have no placenta, and no tooth change, but they give milk though without teats; they form the order Monotremata which has obvious kinship with reptiles as well as with mammals. Echidna also occurs in Papua. The Marsupialia or pouched mammals are the only other order of mammals, apart from bats and rodents and introductions by man (but see below), found living in Australia. A few members of this order live in America, north and south and some in the eastern East lndies and Papua (see ASIA: *Fauna*) while related fossils are widespread. But, among marsupials, some have several front teeth on each side of the lower jaw and these include many Australian forms, the American opossums and fossils in the northern land mass of the Old World. Others like the kangaroos have more specialized features, one of which is that there are but two front teeth (one each side) in the lower jaw, and, outside Australia, the only member of this sub-group is Coenolestes, in Ecuador, but fossil relatives have been found in southern South America. This has led to suggestions of land connections via the Antarctic at some time such as the early Tertiary period when apparently the earth's climates were far warmer on the whole than now. Play has been made in this connection also with the special richness of the Marsupial fauna of Tasmania. Other workers think that the idea of restriction of survivals to southern isolated lands is what is again illustrated here. Some of the Australian Marsupials (*e.g.,* the bandicoot) have been shown to possess degenerate traces of the processes of placental nutrition and of tooth change.

The dingo or wild dog is a remarkable feature in Australia and opinion concerning it has varied from time to time; it has been said to be a human introduction, *i.e.,* to be feral and not a real wild animal; bones, however, have been found which have been claimed to be of a date long before the arrival of man in Australia and the feral character has been denied on anatomical grounds as well. The wide distribution of *Canis* is a point to be borne in mind, as also the fact that it can swim. Bats and rodents have such special means of distribution that their occurrence in Australia raises no problem of the kind above discussed. The dingo appears to be increasing.

The native fauna has almost ceased to have economic significance in Australia. The kangaroo, once hunted for his skin, and the wombat are becoming rarities, though the native birds are abundant, interesting and often beautiful. The feral buffaloes of the north-west (*e.g.,* Melville Island) have been nearly exterminated. Ants and termites are a destructive pest, especially in the north. To the ranks of pests have been added the rabbit, fox, sparrow and starling, and even camels have been known to become feral in central Australia.

Vegetation and Flora.—The sand-ridge country of the west and north-west interior, the "gibber" and clay loam plains of the Lake Eyre basin, rock highlands and rock patches in various parts are bare over considerable areas or for considerable periods. The sand-ridges, with their included clay strips, have sparse and stunted scrub and "porcupine" grass; the clay plains of central Australia produce from their richness amazing growths of grass, herb and flower after rains—deceptive glories, suddenly appearing and as quickly vanishing. Over much of the arid interior the plant population is sparse, stunted and relatively depressing in appearance. Climatic influences obviously dominate vegetation in Australia, but geological factors play a part, and from Western Australia to Queensland pastoral, agricultural and other lands, granites, sandstones, "sand-plains," etc., are distinguished by types and names of plants, or plant associations. Between and outwards from the areas mentioned above, there extend vast plains, for the most part of seasonal grassland and permanent scrub, in which acacias of various sorts are common, particularly "mulga" scrub. The scrub thickens in brakes and patches and the seasonal river-courses are lined with larger trees (*e.g.,* River and Swamp gums). On the south side salt-bush, a valuable fodder plant, is widespread. The pastoral value of all this type of country is considerable and as yet little utilized (*e.g.,* Burt plains north of the Macdonnell range). It occupies a large oval extending from the central west coast to west Queensland and New South Wales, and from the central north nearly to the Bight and Gulf region of the south. Outwards it merges into another belt, or series of belts, of wooded grasslands. In the north-west, north and (inland) north-east, tropical savanna predominates. Here summer rains followed by a long dry season give a prevailingly open landscape with much fine grassland and varying proportions of woodland composed of rather small trees. In Queensland the term "brigalow scrub" is applied to the wood element. Considerable patches of real forest occur, notably in the rich alluvial valleys of the north-west and also towards the east Queensland highlands. On the south side—in the areas having *c.* 10–20in. average annual rainfall—the characteristic tree-scrub is "mallee," a eucalypt with a bunchy growth above ground and massive pancake-like base and root-crown. Mallee country, once called "desert," is now producing wheat over wide areas. The "brigalow" country of Queensland, etc., includes some of Australia's best pastoral lands, as do also the west plains of Queensland and New South Wales with their wide open stretches of grass and low scrub and tree-belts by water-courses and waterholes. There remain the outer margins of the continent, from north-east Queensland round t a the extremity of South Australia, with Tasmania and south-west Australia as well. Here are rainforests proper ranging from the tropical (almost equatorial) to the cool temperate type (Tasmania). Sometimes they are sharply marked off from the inland types, but more often they are more or less open in character, with grassy grounds and patches, merging gradually into the wooded grass-lands behind. This transition is marked on the west flanks of the highlands by a belt of timber more open and having smaller trees. The forests of north-east Queensland (the Queensland "brush") are luxuriantly grown, matted with lianas, and contain soft-wood trees. Southwards these pass into a eucalypt forest which reaches its finest development in Gippsland, the home of Australia's giant trees (Max. recorded: height, 326ft. 1in.; girth [6ft. from ground], 25ft. 7in.). The Gippsland forests, with their deep tree-fern valleys, are famous in Australia, and hardly less so are those of Tasmania (conifers and beeches), and of south-west Australia (jarrah, karri, tuart, etc.).

Australian vegetation as a whole has a marked individuality. One feature is the great predominance—at least in the southern parts—of eucalypts of which some 320 species are known. Another is the great range, in area and in species (c. 412), of acacias ("wattles") many of which give their names to well-known types of scrub (mulga, brigalow, myall, etc.), the golden wattle being the "unofficial floral emblem of Australia." Spinifex is widely known by name outside Australia, but the "Native (or Cypress) pine," "she-oaks," "black-boys," besides numerous flowering shrubs and plants, are more widely typical of the Australian "bush" Forest fires, all too frequent and destructive, and the practice of ring-barking, give many square miles a look gaunt, ghostly and forlorn, softened sometimes by shimmering heat and the blue distant haze. There is in Australian vegetation a reminiscence of age-long struggle, a savour of the rocks and climate, of survival, not without effort, from past ages into an exacting present. Economically Australian vegetation has possibilities not fully utilized (see Forestry, etc., below, p. 726, et seq.). Of all plant pests introduced, the prickly pear is the most menacing and costly. By 1922 it had covered an (estimated) area of 60,000–70,000 sq.m. (*cf.* England and Wales, area, 58,300 sq.m.), a space "twice the total area in Australia under all crops," and was spreading at the

rate of *c.* 230 sq.m. per annum in south Queensland and north New South Wales. It prefers the richest lands, often forms a solid impenetrable mass, is of little economic value, and is difficult to destroy by mechanical or chemical means. Recent experiments, however, with insect parasites justify hope that the pest may be controlled if not exterminated. Destruction of forests is introducing changes in hydrographic conditions. Problems of soil erosion and run-off are arising and need attention.

(O. H. T. R.)

Brief reference must be made to the phytogeographical interest of the Australian flora. The plants of north-east Australia include many trees, mostly of soft woods and lianas, which have relatives in Papua and Melanesia and they represent an intrusive flora which reached Australia ere Torres Strait divided it from Papua. This intrusive flora has exterminated the older indigenous one in the coastlands of the Gulf of Carpcntaria, of Queensland and of northern New South Wales but it has not been able to penetrate much beyond these limits, within which the annual rainfall is at least 30in. and in many places over 40in. The rest of Australia is largely characterized by types of plants which are often peculiar to the continent, or are related to plants of other southern lands and show every indication of being survivors of quite ancient elements of the world's flora. The eucalypts and the peculiar acacias have already been mentioned. The Proteaceae are hard-leaved plants found in Australia, New Zealand, Caledonia, southern South America and South Africa and they are believed to be survivors of an old element in the world's flora. Araucaria, a coniferous genus, is also important in both Australia and South America while Andansonia Gregorii in north-west Australia is closely related to the African baobab. These are all indications of the survival in Australia and other southern lands of types once more widely, perhaps generally, distributed in the great northerly lands but pressed out there by evolution of newer types and surviving in southern lands which have now for a long period been more or less isolated from the larger northern masses. (X.)

ETHNOLOGY

Physical Anthropology. — The Australian "black-fellow" is not black, but chocolate brown. He is below the average height of Englishmen, has strong wavy hair, well developed beard whiskers and moustache, usually jet black. Women wear the hair short. While the average index for Australian skulls is 71·5, the range in the living subject is from 80·5 to 66.6. The head is often high and ridged, with a retreating forehead. The eyebrow ridges are heavy, the nose has its root set deeply and is distinctly broad. There is much variation, which has been regarded as evidence of admixture or of the survival of intermediate and generalized characters of a really primitive nature. Blood tests reveal two distinct blood groups and there are grounds for thinking that in the very distant past at least two streams of immigrants met and fused — one of them being akin to elements surviving in the south of India, in Ceylon, the Malay Peninsula and in Indonesia.

Social Organization. — The tribe in Australia is a group distinguished from its neighbours by possessing a distinct language and a tribal name and by inhabiting a defined territory. Here and there groups of contiguous tribes are, or were, more or less loosely allied so that the present great number of separate tribes may be due to the gradual disruption of once larger communities. Of any real combination or cohesion there was no trace and the association may be modern and temporary. Each tribe consists of a number of exogamic totemic clans (see EXOGAMY and TOTEMISM), which, generally, are matrilineal in the east and patrilineal in the west. In all tribes marriage is between persons who stand in a certain relation of consanguinity. In one type the man marries a woman who is the daughter of his mother's brother (maternal uncle), while in the other type a man marries his mother's mother's brother's daughter's daughter, and the Australian system displays an intense recognition of actual relationship by consanguinity. Both types are found in proximity but type 2 (in which the marriage of first cousins is impossible) is more common. Each tribe, with rare exceptions, is primarily divided into two halves, moieties, which are again divisible into two or four sections. The primary division into moieties prohibits the marriage of brothers and sisters; the second division into sections prohibits the marriage of brothers and sisters and of parents and children, but allows that of first cousins, while the third division into sub-sections prohibits the marriage of first cousins as well. Ingenious arrangements exist by which, when male and female descent tribes come into contact, the position of the children can fit into the social system of either tribe. The status of headman, within certain limits, is hereditary in one or two cases; in the generality of tribes the old men exercise authority in virtue of their magical powers (see GERONTOCRACY).

The exogamic system, with variation in details, is universally bound up with the beliefs that every person is the re-incarnation of some former individual, and that the identity of the human ancestor or type merges into the totem animal. There are complicated initiation rites, circumcision, subincision (the penile urethra being laid open from the meatus to the junction with the scrotum), removal of teeth, head-biting, tossing the novice in the air, fire-ceremonies. There are rites for women analogous to the initiation rites of the men, but fewer in number and less elaborate. The purpose of the rites is to establish the authority of the elders, to inculcate self-restraint and manliness, and finally to bring about a progressive revelation of the tribal secrets.

Religion. — In the category of the sacred, the powerful, the worshipful, the aweful, the numinous, are included all the forces which sustain and stabilize Australian society; all the ideas, beliefs and practices which express the attitude of society in that level towards the material of religion. Beliefs as to the physical, psychical, physiological nature of man, as to the nature of the world in which and by which he lives, are preserved in the complicated myths, legends and ritual recorded by many observers. Man shares life with other creatures and is akin to them, and is therefore constrained to behave towards them as sharers of a common life. In the medley of beliefs there is great variation, with a common plan in which here and there appears the belief in a Creator Deity.

Sanctity, power, authority, reside in man and in objects fabricated or adorned or modified by man. The churinga especially form a class of sacred objects in wood or stone varying in length from six to seven feet to two or three inches and of various shapes. The term "Bull-roarer" is used of the smaller kind and there are two main forms of this article which have definite distribution and association with specific forms of initiation.

An important class-of rites are performed for the welfare of the totem, animal or plant, and are held customarily just when there is the promise of the approach of a good season. As a rule, the headman or director of ceremonies is required to partake ceremonially of the plant or animal, thus breaking the rule of sanctity partly to acquire its virtue for himself. Others not members of the same totemic group are then free to use the plant or animal. Co-operation of this nature throughout the group brings the constituent clans together, and has a social value by reason of its economic importance.

Mode of Life. — There is no agriculture, no domestication of animals, no permanent settlement. Wind screens of rough branches serve as shelters. The Australian is a hunter, fisher, food-collector. In the north, bark canoes and dug-outs are found while on the north-east of Queensland outrigger canoes are used. At the present day we find a practically complete series of stone tools from crude eolith forms to well-fashioned leaf-shaped spear heads and polished axes. The work varies according to the material available, the pressure of need, etc. Fragments of glass bottles are chipped, and telegraph insulators have been stolen for the purpose of making spear heads. The bow is not used. The boomerang (*q.v.*), the throwing stick, the digging stick, the shield, the club, and the tray, form the instruments of the chase and the daily toil for food. Clothing, as protection against the climate or as required by ideas of modesty, is unknown in many parts, but some use skins. Such articles as are worn are in intention decorative, due to special requirements, or to religious needs, and the materials are provided by nature and by the ani-

mals hunted. They are skilled trackers, keen observers of the habits of the creatures on which they subsist, and they possess an extensive knowledge of the properties of plants, using them to poison pools. The daily weapons are used as musical instruments to make a noise, while conch shells are also employed. Well-made string bags are fashioned of knitted twine, from fur or vegetable fibre, or finely split rattan, and in some parts are made to hold water or honey. Their art uses but few colours, and is mainly geometric, though plant and animal designs occur. Contrasting colours are often boldly used.

General.—So great is the variety of detail in every respect of the activities of the black-fellow over this great area that no universal statement can be made with safety. Thus there are at least six entirely different methods of treating the dead, each of which is found in other parts of the world; five or six distinct initiation ceremonies; and three distinct methods of fire-making. while the distinctiveness of art and craft work shows an endless capacity for variation and invention, within well defined and narrow limits imposed by the physical environment and the long isolation of the countrv from external contacts. There have been movements, combinations, dispersions, recombinations, variations, changes of interest and environment. changes of stress. Whatever helps to denote the group and to distinguish it effectively from other contiguous groups, has received emphasis, has disturbed the balance of ideas, of customs which—strange and complicated as they now are—represent undoubtedly the outcome of internal stresses and strains, as well as the contacts with external agencies, and are far, as the legends current among them indicate, from the earliest order. The range of variation is ultimately limited, but within those limits the Australian black-fellow has achieved much by his native ingenuity.

HISTORY

It is impossible to say who were the first discoverers of Australia, although there is evidence that the Chinese had some knowledge of the continent so far back as the 13th century. The Malays, also, would seem to have been acquainted with the northern coast; while Marco Polo, who visited the East at the close of the 13th century, makes reference to the reputed existence of a great southern continent. A map on which a large southern land is shown still exists, dedicated to Henry VIII. of England, and the tradition of a Terra Australis appears to have been current for a long period before it enters into authentic history.

THE DISCOVERY OF AUSTRALIA

In 1603 a French navigator named Binot Paulmyer, sieur de Gonneville, was blown out of his course, and landed on a large island which was claimed to be the great southern land of tradition, although Flinders and other authorities are inclined to think that it must have been Madagascar. Some French wrilers confidently put forward a claim that Guillaume le Testu, of Provence, sighted the continent in 1531. The Portuguese also advance claims to be the first discoverers of Australia, but so far the evidence cannot be said to establish their pretensions. As early as 1597 the Dutch historian, Wytfliet, describes the Terra Australis as the most southern of all lands, and proceeds to give some circumstantial particulars respecting its geographical relation to New Guinea, venturing the opinion that, were it thoroughly explored, it would be regarded as a fifth part of the world.

De Torres.—Early in the 17th century Philip III. of Spain sent out an expedition from Callao, in Peru, for the purpose of searching for a southern continent. The little fleet comprised three vessels, with the Portuguese pilot, De Quiros, as navigator, and De Torres as admiral or military commander. They left Callao on Dec. 21, 1605, and in the following year discovered the island, now known as Espiritu Santo, which De Quiros, under the impression that it was indeed the land of which he was in search, named La *Austrialia del Espiritu Santo*. Sickness and discontent led to a mutiny on De Quiros's vessel, and the crew, overpowering their officers during the night, forced the captain to navigate his ship to Mexico. Thus, abandoned by his consort, De Torres was compelled to bear up for the Philippines to refit, and sailed through the strait that bears his name; he may even have caught a glimpse of the northern coast of the Australian continent. His discovery was not, however, made known until 1792, when Dalrymple rescued his name from oblivion, bestowing it upon the passage which separates New Guinea from Australia. De Quiros returned to Spain and petitioned the king to despatch another expedition for the purpose of prosecuting the discovery of the Terra Australis. He was finally successful in his petitions, but died before accomplishing his work, and was buried in an unknown grave in Panama.

Dutch Discoverers.—The first Europeans to land in Australia were the Dutch. In 1606, the "Duyfken" or "Dove," sailing from Java, entered the Gulf of Carpentaria and reached Cape Keerweer. Some of the crew went ashore, but, attacked by natives, made no attempt to investigate the country. In the next fifty years, Dutch navigators explored the north and south-west coasts, leaving memorials of their boats in such names as Arnheim Land and Cape Leeuwin. Among them was Pelsaert, who, about 1640, described in unfavourable terms the inland country on the west, and, incidentally, wrote the first account of the kangaroo. By 1665 the Dutch possessed rough charts of the west coast, and gave to the mainland the name of New Holland.

In 1642 Abel Janszoon Tasman sailed from Batavia on Aug. 14. After a visit to the Mauritius, then a Dutch possession, Tasman bore away to the south-east, and on Nov. 24 sighted the western coast of the land which he named Van Diemen's Land, in honour of the governor of the Dutch East Indies. The honour was later transferred to the discoverer himself, and the island is now known as Tasmania. Tasman doubled the southern extremity of Van Diemen's Land and explored the east coast for some distance. The ceremony of hoisting a flag and taking possession of the country in the name of the Government of the Netherlands was actually performed, but the description of the wildness of the country, and of the fabulous giants by which Tasman's sailors believed it to be inhabited, deterred the Dutch from occupying the island, and by the international principle of "non-user" it left their hands.

Dampier.—The first English navigator to sight the Australian continent was William Dampier in 1688. He was supercargo of the "Cygnet," a trader whose crew had turned buccaneers. On his return to England he published an account of his voyage, which resulted in his being sent out in the "Roebuck" in 1699 to prosecute his discoveries further. To him we owe the exploration of the coast for about 600m.—from Shark's Bay to Dampier's Archipelago, and thence to Roebuck Bay. He appears to have landed in several places in search of water. His account of the country was quite as unfavourable as Pelsaert's. He described it as barren, and, but for the kangaroo, almost devoid of animals. In 1696 the East India Company fitted out an expedition with the object of searching on the western shores of New Holland for traces of a Dutch vessel lost twelve years previously. This expedition reached the island of Rottnest, which was thoroughly explored, and early the following year a landing party discovered and named the Swan river. The vessels then proceeded northward, making fairly accurate charts of the coast-line.

Cook.—The great voyage of Captain James Cook, in 1769–70, was primarily undertaken for the purpose of observing the transit of Venus, but he was also expressly commissioned to ascertain "whether the unexplored part of the southern hemisphere be only an immense mass of water, or contain another continent." H.M.S. "Endeavour,)' the vessel fitted out for the voyage, was a small craft of 370 tons, carrying twenty-two guns, and built originally for a collier, with a view rather to strength than to speed. The transit was successfully observed from the island of Tahiti. Cook then turned south and beat about the Pacific in search of the east coast of Australia. On Oct. 6, 1769, the coast of New Zealand was sighted, and two days later Cook cast anchor in Poverty Bay,

After voyaging westward for nearly three weeks, Cook, on April 19, 1770, sighted the eastern coast of Australia at a point which modern geographers identify with Cape Everard.

The "Endeavour" then coasted northward, and Botany Bay was discovered on April 28, 1770. As it appeared to offer a suitable anchorage, Cook entered the bay and dropped anchor. The ship brought-to opposite a group of natives who were cooking over a fire. Cook and his men were not a little astonished that these natives took no notice of them or their proceedings. But when a landing was attempted, two natives, each armed with a bundle of spears, presented themselves on a projecting rock and made threatening signs to the strangers. It is interesting to note that the ingenious wommera, or throw-stick, which is peculiar to Australia, was first observed on this occasion. As the men were evidently determined to oppose any attempt at landing, a musket was discharged between them, in the hope that they would be frightened by the noise. But it produced no effect. Cook examined the bay in the pinnace, and landed several times; but by no endeavour could he induce the natives to hold any friendly communication with him. From the great variety of new plants there obtained Botany Bay derives its name. Before leaving, Cook performed the ceremony of hoisting the Union Jack and thus took formal possession for the British Crown.

Cook then sailed northward. He saw and named Port Jackson, but forbore to enter the finest natural harbour in Australia. Broken Bay and other inlets, and several headlands, were also seen and named, but the vessel did not come to an anchor till Moreton Bay was reached, although the wind prevented Cook from entering this harbour. He next landed at Bustard and Keppel Bays and the Bay of Inlets. After sailing 1,300m. in safety, the "Endeavour" one night suddenly ran into shallow water and struck heavily. Only with great difficulty and with the loss of guns and other heavy gear was she floated off next evening. The land was soon made near the mouth of a small stream, which Cook called, after his ship, the Endeavour river. A headland close by he named Cape Tribulation. The ship was steered into the river, and there careened and thoroughly repaired. Cook, having completed the survey of the east coast, to which he gave the name of New South Wales, sighted and named Cape York, the northernmost point of Australia, and took final possession of his discoveries northward from 38" S. to 10½° S. on a spot which he named Possession Island. Thence he returned to England by way of Torres Straits and the Indian Ocean.

Cook's second voyage, undertaken in 1772, with the "Resolution" and the "Adventure," is of less importance. The vessels became separated, and both at different times visited New Zealand. Captain Tobias Furneaux, in the "Adventure," also found his way to Storm Bay in Tasmania. In 1777, Cook, while on his way to search for a north-east passage between the Atlantic and Pacific oceans, again reached the coast of Tasmania and of New Zealand.

Cook in 1770 believed that Tasmania was an island, but on his last voyage he seems to have changed his mind, and, until 1798, when Bass, accompanied by Flinders, discovered the strait which bears his name, Tasmania was considered part of the mainland.

In Jan. 1788 a British colony was founded at Botany Bay, and Australian history began.

INLAND EXPLORATION

For twenty-five years the colonists were acquainted only with the country along the coast extending northwards about 70m. from Sydney and about a like distance to the south. This narrow strip, not more than 50m. wide at its broadest part, was shut in to the west by the Blue Mountain range.

The Blue Mountains attain a height of between 3,000 and 4,000 ft. only, but they are intersected with precipitous ravines, 1,500ft. deep, which baffled every effort to reach the interior until, in 1813, Blaxland, Lawson, and Wentworth, after crossing the Nepean river at Emu Plains and ascending the Dividing Range, obtained a view of the grassy valley of the Fish river. A line of road was constructed across the mountains as far as the Macquarie river by the surveyor, Evans, and the town of Bathurst laid out. This marks the beginning of the occupation of the interior of the continent.

Some small expeditions were made from Bathurst, resulting in the discovery of the Lachlan, and in 1816 Lieutenant Oxley, R.N., accompanied by Evans and Allan Cunningham, the botanist, led an expedition to trace the course of the Lachlan in a westerly direction. The results were disappointing. In a circuitous journey of 800m. Oxley discovered that the Lachlan, east of 147° E., ended in swamps, and that, below Mt. Harris, the Macquarie did the same. He crossed the Arbuthnot Range and the Liverpool Plains; then, ascending the Peel and Cockburn rivers, at last reached the sea at Port Macquarie. Captain King in three voyages next explored the north-west coast, and Melville Island was settled for a short time. Then in 1823 Oxley reached Moreton Bay and Port Curtis (690m. north of Sydney) and found the river Brisbane. About the same time Hamilton Hume and Hovell set out from Lake George, crossed the Murrumbidgee, and, skirting the foothills of the Australian Alps, reached the river Hume. Crossing the Murray at Albury, the explorers followed the western shore of Port Philip and reached the coast near the future site of Geelong. In 1827 and the two following years, Cunningham explored both sides of the Liverpool Range, some of his discoveries, including Pandora's Pass and the Darling Downs, proving exceedingly valuable.

Desiring to trace the courses of the large rivers flowing west, Governor Sir Ralph Darling, in 1828, sent out an expedition under Captain Charles Sturt, who, turning westward from the Macquarie marshes, struck a large river, with many affluents, to which he gave the name of the Darling. The course of the Murrumbidgee, a deep and rapid river, was followed by the same explorer in 1831. He travelled on this occasion nearly 2,000m., and discovered that both the Murrumbidgee and the Darling finally joined another and larger river, the Murray. In 1833 Sir Thomas Mitchell, after establishing a depot at Fort Bourke, traced the Darling southwards for 300m. and confirmed Sturt's report that it joined the Murray about 142° E. Meantime, Eyre explored the country north and west of Adelaide, travelling in 1840 all the way along the barren sea-coast of the Great Australian Bight, from Spencer Gulf to King George Sound. He also explored the interior north of the head of Spencer Gulf. Sturt, however, in 1845 made his way from the Darling northward to the very centre of the continent, reaching about S. lat. 24° 25.

Leichhardt.—In 1844 Dr. Leichhardt set out in quest of an overland route from the military station of Port Victoria, on the coast of Arnheim Land, to Moreton Bay. He went first along the Dawson and the Mackenzie in Queensland. Thence he ascended the source of the Burdekin, and, crossing the table-land to the west, easily reached the Gulf of Carpentaria. Skirting its shores as fas as the Roper, he crossed Arnheim Land to the Alligator river, and arrived at Port Victoria, after a journey of 3,000m., accomplished within a year and three months. In 1847 Leichhardt attempted to cross the continent from east to west. His starting-point was the Fitzroy Downs, north of the river Condamine, in Queensland. But he had not proceeded far before he met his death, his last despatch dating from the Cogoon, April 3, 1848. In the same region, from 1845 to 1847, Sir Thomas Mitchell and E. B. Kennedy explored the northern tributaries of the Darling, and a river in S. lat. 24°, named the Barcoo or Victoria, which flows to the south-west. This river was more thoroughly examined by A. C. Gregory in 1858. Kennedy, while attempting to explore the peninsula of Cape York, from Rockingham Bay to Weymouth Bay, was killed by the natives in 1848.

Other valuable achievements include Captain Banister's discovery of the route from Swan river to King George Sound, and the journey of Robinson and G. H. Haydon in 1844, from Port Philip to Gipps' Land. In Western Australia the Arrowsmith, the Murchison, the Gascoyne, and the Ashburton rivers were explored, by Captain Grey, Roe, Governor Fitzgerald, R. Austin, and the brothers Gregory, whose discoveries have great importance from a geographical point of view.

Stuart.—The error of Eyre in believing that Lake Torrens, Lake Eyre, and Lake Gairdner were but one vast lake was discovered by Babbage and Major Warburton in 1858. In this and the year following, Stuart explored the same district more fully. He next attempted to win the reward of £10,000 offered by the South Australian legislature to the man who should first cross the continent from south to north. He started, in March 1860, from

Adelaide, passed the lakes and found fertile country till he crossed the Macdonnell Range. On April 23 he reached the most central marked point of Australia, now named Central Mount Stuart. He pushed on to S. lat. 18°, but then abandoned his task owing to illness. Next year he made a second attempt, but advanced only one degree further north than in 1860, a failure due to lack of water and to the density of the scrub.

Burke and Wills.—Meanwhile the colonists and the legislature of Victoria provided funds for an expedition from hfelbourne to the Gulf of Carpentaria. The leading men of the party were Robert O'Hara Burke, an officer of police, and William John Wills, of the Melbourne observatory. Leaving the main body of his party at Menindie on the Darling under a man named Wright, Burke, with seven men, five horses and sixteen camels, pushed on for Cooper's Creek at S. lat. 27° 40′, E. long. 140° 30′. Wright was to follow him to this proposed depot, but Burke, weary of waiting, left four men behind, and, accompanied by Wills, King, and Gray, on Dec. 16, 1860, with one horse and six camels, began to cross the desert. In spite of great difficulties, they passed the McKinlay range S. lat. 21° and 22°, and reached the Flinders river, where though they did not actually stand on the shore of the Gulf they met the tidal waters of the sea. In effect, they had succeeded, and on Feb. 23, 1861, they began the return journey. On April 16, Gray fell ill and died. Five days later, the others had repassed the desert and gained the depot. That very day the men in charge had left in despair to rejoin Wright, who at length moved to Cooper's Creek, but, incredible to relate, neglected to search for the missing explorers. Burke, Wills and King wandered about in the district till near the end of June. They subsisted miserably on the bounty of some natives and by feeding on the seeds of a plant called nardoo. At last both Wills and Burke died of starvation. King, the sole survivor, was saved by friendly blacks, and was found alive in Sept. by A. W. Howitt's party, which had been sent to discover Burke.

Four other parties were sent out that year from different Australian provinces. Three of them, respectively commanded by Walker, Landsborough and Norman, sailed to the north, the two last named landing on the shores of the Gulf of Carpentaria, while Walker marched inland from Rockhampton. The fourth party, under J. McKinlay, from Adelaide, made for the Barcoo (Cooper's Creek) by way of Lake Torrens. Landsborough crossed the continent from north to south, between Feb. and June 1862; and McKinlay, from south to north, before the end of Aug. in that year, New South Wales and Queensland, east of the 140th degree of longitude, were examined. The Barcoo, the Flinders, the Gilbert, the Gregory, and other rivers were also explored. These valuable discoveries were made in the attempt to relieve the lost explorers. The bodies of Burke and Wills were recovered and brought to Melbourne for a solemn public funeral.

Stuart, in 1862, made his third attempt to traverse the continent from Adelaide. He started in Jan. and on April 7 reached the point where he had turned back in 1861. He then pushed on, through a very thick forest, with scarcely any water, till he came to the streams which supply the Roper. Having crossed a table-land of sandstone which divides these streams from those running to the western shores of Arnheim Land, he passed in July down what is called the Adelaide river of north Australia, and came at length to the Indian Ocean. The electric telegraph connecting Australian cities with London follows the line thus explored.

A third part, at least, of the interior of the continent, from about 120° to 134° E. long., an extent of half a million square miles, still remained unexplored. On April 21, 1873, William Christie Gosse, with men and horses provided by the South Australian Government, started from the telegraph station 50m. south of Central Mount Stuart (S. lat. 22°, E. long. 134°) to strike into Western Australia. He passed the Reynolds range and Lake Amadeus, but was compelled to turn south, where he found well-watered grassy land, and having travelled above 600m. to 26° 32′ S. and 127° E., was forced to return. In the same year, Major Warburton, with thirty camels, provided by Mr. (afterwards Sir) T. Elder, of South Australia, left the telegraph line at Alice Springs (23° 40′ S., 133° 14′ E.), and succeeded in making his way to the De Grey river in Western Australia. Overland routes between all the widely separated Australian provinces had now been discovered. Hann, Warner, Tate and Taylor, in 1873, explored the country north of the Kirchner Range, Queensland. G. Elphinstone Dalrymple, with Hill and Johnstone, finished, in Dec. 1873, a coasting expedition in which they surveyed the inlets and navigable rivers of the Cape York Peninsula.

Forrest.—In 1874, John (afterwards Sir John) Forrest was despatched by the Perth Government to explore the immense tract of country out of which flow the rivers falling into the sea on the northern and western shores of Western Australia. Leaving Yewin, lat. 28° S., long. 116° E., Forrest travelled north-east to the Murchison river, and followed its course to the Robinson ranges; thence he advanced eastward along the 26th parallel. He safely reached the overland telegraph line at Peake station, and, after resting, journeyed south to Adelaide. Seventeen degrees of desert had been traversed in five months, a very wonderful achievement. In his report Forrest showed that pastoral settlement could not extend to the spinifex region; and the main object of subsequent explorers was to determine the extent of the desert in the direction of north and south. Ernest Giles in his third attempt crossed the Central Australian Desert. Through the generosity of Sir Thomas Elder, of Adelaide, Giles's expedition was equipped with camels. It started on May 23, 1875, from Port Augusta. Working westerly along the line of the 30th parallel, Giles reached Perth in about five months. After a short rest, he journeyed back, for the most part between the 24th and 2 jth parallels, and reached the overland telegraph line in about seven months. His report proved that the interior of Australia west of 132° E. long. is a sandy and waterless waste, entirely unfit for settlement.

Recent Explorers.—The list of explorers since 1875 is a long one; but most of the smaller expeditions concerned themselves with the search for gold. Amongst the more important explorations may be ranked those of Tietkins in 1889, of Lindsay in 1891, of Wells in 1896, of Hiibbe in 1896, and of the Hon. David Carnegie in 1896–97. Hiibbe, sent by the South Australian Government to discover some stock route to the gold-fields of Western Australia, journeyed safely from Oodnadatta to Coolgardie, but reported that no such stock route was practicable.

In July 1896, the Hon. David Carnegie equipped and led an expedition to find a stock route between Coolgardie and Kimberley. In eight months he had travelled 5,000m. No practicable route for stock was discovered, and the desert showed few, if any, traces of gold, the search for which and for unoccupied pasturage quickly diminished the areas, nowhere extensive, of unexplored Australia.

POLITICAL HISTORY

Early Colonization.—Of the six Australian states, New South Wales is the oldest; for in 1788 Port Jackson was founded as a penal station for criminals from England; and the settlement retained that character, more or less, during the subsequent fifty years, transportation being virtually suspended in 1839. The colony, however, from 1821 had made a fair start in free industrial progress. By this time, too, several of the other provinces had come into existence. Tasmania, occupied as early as 1803, had been an auxiliary penal station under New South Wales, but in 182 j it became a separate province. From this island, ten years later, parties crossed Bass Strait to Port Phillip, where, under New South Wales, a new settlement was soon established. Out of this grew, in 1851, the State of Victoria. In 1827 and 1829, an English company endeavoured to plant a settlement on the Swan river, and this, added to a small military station established in 1825 at King George Sound, constituted Western Australia, which, however, did not become autonomous till 1890. On the shores of St. Vincent's Gulf (discovered, with Spencer's Gulf, by Flinders in 1802) another joint-stock company, between the years 1835 and 1837, created South Australia, as an experiment in the Wakefield scheme of colonization. Finally, in 1859, Queensland was separated from New South Wales.

The first British governors at Sydney, from 1788, were naval or military officers in command of the garrison, the convicts, and the

few free settlers. In the twelve years' rule of General Macquarie, closing with 1821, the colony made a substantial advance. By means of bond labour, roads and bridges were constructed, and a route opened into the interior beyond the Blue Mountains. The population was 30,000, three-fourths of them convicts. Captain John McArthur in 1803 had introduced the rearing of fine wool sheep, and the community profited greatly thereby. During the next ten years, 1821–31, the colony increased, and eventually, in the administration of Sir Richard Bourke (1831–37), obtained political representation by means of a legislative council.

Melbourne, which began with a few huts on the banks of the Yarra-Yarra in 1835, was in 1840 a busy town of 6,000 inhabitants, the population of the whole district, with the towns of Geelong and Portland, reaching 12,850. Its import trade amounted to £204,000, and its exports to £138,000. At Melbourne there was a deputy governor, Mr. Latrobe, under Sir George Gipps at Sydney. Adelaide had its own governors, first Captain Hindmarsh, next Colonel Gawler, and then Captain George Grey. Western Australia progressed but slowly, with less than 4,000 inhabitants altogether, under Governors Stirling and Hutt.

Discovery of Gold.—In spite of a commercial crisis, from 1841 to 1843, caused by extravagant land speculations and inflated prices, Australia had made sound progress. The wool clip of 1852 amounted to 45,000,000lb.; and South Australia had opened valuable mines of copper. The population of New South Wales in 1851 was 190,000; that of Victoria, 77,000; and that of South Australia about the same. At Summerhill Creek, 20m. north of Bathurst, gold was discovered, in Feb. 1851, by E. Hargraves, a gold-miner from California. In Aug. it was found at Anderson's Creek, near Melbourne; a few weeks later the great Ballarat gold-field was opened; and then that of Bendigo to the north. Throughout Australasia all ordinary industry was left for the one exciting pursuit. The copper mines of South Australia were for the time deserted. Immigrants from Europe, and to some extent from North America and China, poured into Melbourne, where the arrivals in 1852 averaged 2,000 persons in a week. The population of Victoria was doubled in the first twelve months of the gold fever, and the value of imports and exports was multiplied tenfold between 1851 and 1853. ,The colony of Victoria was constituted a separate province in July 1851, and Latrobe was appointed governor.

General Problems.—At the beginning of 1860 all the states, except West Australia, had received the boon of responsible government. The main questions at issue were now the secular as opposed to the religious system of public instruction, protection as opposed to a revenue tariff, vote by ballot, adult suffrage, abolition of the convict system, and free selection of lands before survey. All these questions were settled within the next twenty years, with the exception of woman's suffrage. Of the states, the first to grant this was South Australia in 1894, and the last, Victoria in 1908. The Federal franchise was given to women from the outset.

Taking the states as a whole, agrarian legislation has been the most important subject of parliamentary debate. Such legislation seeks to ensure permanent settlement on the land, to encourage tillage, or tillage joined to stock-rearing, and to discourage large estates devoted chiefly to grazing. The land question is a difficult one and the laws are continually being amended. Since 1870 there have been five radical changes made in New South Wales. In Victoria the law has been altered five times, and in Queensland and South Australia seven times.

Immigration.—To prevent or regulate the immigration of coloured races has been the aim of much legislation in the states. The agitation against the influx of Chinese began very soon after the gold discoveries. The European miners objected strongly to their presence on the diggings. The allegations made concerning the Chinese really amounted to a charge of undue industry. The Chinese were hard-working and had the usual fortune attending those who work hard. They spent little on drink or with the storekeepers, and were, therefore, by no means popular. As early as 1860 there had been disturbances of a serious character, and the Chinese were chased off the goldfields of New South Wales, serious riots occurring at Lambing Flat, on the Burrangong goldfield. The Chinese difficulty, so far as the miners were concerned, was solved by the exhaustion of the alluvial deposits; but the mere proximity of China has always appeared a menace to Australia and, at the many conferences of representatives from the various states, the Chinese question invariably held a prominent place. The absence, however, of any Federal authority made common action difficult. In 1888 the last important conference on the Chinese question was held in Sydney and attended by delegates from all the states. The conference resolved that it was necessary to limit the number of Chinese immigrants in order to prevent their becoming an important element in the community. The states, thereupon, either enacted new laws in this sense or amended those existing. This prejudice against Chinese was extended to all Asiatics. But a large number of these were British subjects, and the Imperial Government would not sanction any direct restriction on the movement of British subjects within the Empire. Eventually the difficulty was overcome by the device of an educational test based on the provisions of an act in operation in Natal. It was provided that a person should be prohibited from landing in Australia who failed to write in any prescribed language fifty words dictated to him by the commonwealth officer supervising immigration. The agitation against the Chinese was promoted and kept alive almost entirely by the trades unions, and the restriction acts were the first legislative triumph of the Labour Party, although it was not at the time directly represented in parliament.

Bank Crisis.—In 1893 occurred the bank crisis. Its effects were felt most severely in Queensland, New South Wales, and Victoria, above all in Melbourne. The crisis was by no means a sudden crash, and even when the failures began they were spread over a period of sixteen weeks.

The first noticeable effect was a great scarcity of employment, since much capital was locked up in the banks that had failed. Wages and rents fell precipitately; building almost ceased; credit was greatly restricted, and all speculative enterprise came to an end. The consuming power of the population was greatly diminished, and in 1894 imports decreased by four and three-quarter millions. But good came out of evil. Trade was put on a sound basis, and the abuses of the credit system were abolished. Above all, agriculture everywhere expanded, and the mining industry revived. But for the low prices of staple products, the visible effects of the crisis would have passed away within a few years.

In 1902 occurred the great drought. The disaster was due, in part, to the improvidence of pastoralists, who had made no sort of provision for feeding stock in times of drought. But the lesson was learnt, and, as the year 1903 proved most bountiful, the effects of the disaster quickly passed away.

FEDERATION

In the report of the committee appointed in 1852 to prepare a constitution for New South Wales, the following passage occurs: "One of the most prominent legislative measures required by the colony, and the colonies of the Australian group generally, is the establishment at once of a general assembly, to make laws in relation to those intercolonial questions that have arisen or may hereafter arise among them. The questions which would claim the exercise of such a jurisdiction appear to be (1) intercolonial tariffs and the coasting trade; (2) railways, roads, canals, and other such works running through any two of the colonies; (3) beacons and lighthouses on the coast; (4) intercolonial gold regulations; (5) postage between the said colonies; (6) a general court of appeal from the courts of such colonies; (7) a power to legislate on all other subjects which may be submitted to them by addresses from the legislative councils and assemblies of the colonies, and to appropriate to any of the above-mentioned objects the necessary sums of money, to be raised by a percentage on the revenues of all the colonies interested." This wise recommendation received scant attention, and, though Federation at no time actually dropped out of sight, thirty-five years passed before any practical steps were taken towards its accomplishment. Meanwhile a sort of makeshift, was devised: the imperial parliament permitted the formation of a Federal council, to which any colony that felt inclined could send delegates. Of the seven colonies New South

Wales and New Zealand stood aloof. The council moreover was merely a deliberative body. It had no executive fupctions and possessed no control of funds or other means to give effect to its decisions. Little interest, therefore, was taken in its biennial meetings. In 1899, on the eve of Federation, the council sat for the last time. Major-General Edwards had, in 1889, reported on the defences of Australia. In view of this report, Sir Henry Parkes took such action as led to a conference in Melbourne of representatives from each of the seven colonies. This conference adopted certain resolutions which affirmed the desirability of an early union, under the Crown, of the Australasian colonies, on principles just to all, and provided that steps should be taken for the appointment of delegates to a national Australasian convention. Accordingly the various Australasian parliaments appointed delegates to attend a national convention which was held in Sydney on March 2, 1891. Sir Henry Parkes was elected president. He moved a series of resolutions embodying the principles necessary to establish, on an enduring foundation, the structure of a Federal Government. These resolutions were slightly altered by the conference, and were adopted in the following form: —

1. The powers and rights of existing colonies to remain intact, except as regards such powers as it may be necessary to hand over to the Federal Government.

2. No alteration to be made in states without the consent of the legislatures of such states, as well as of the Federal parliament.

3. Trade between the federated colonies to be absolutely free.

4. Power to impose customs and excise duties to be in the Federal Government and parliament.

5. Military and naval defence forces to be under one command.

6. The Federal Constitution to make provision to enable each state to make amendments in the constitution if necessary for the purposes of federation.

On March 31 Sir Samuel Griffith, chairman of the committee on constitutional machinery, brought up a draft Constitution Bill. This was carefully considered by the convention in committee of the whole and adopted on April g. The convention then formally dissolved. The bill, however, fell absolutely dead, though desire for federation still survived, especially in Victoria.

In 1894 an unofficial convention was held at Corowa, at which the cause of federation was strenuously advocated, but it was not until 1895 that the movement obtained new life. Mr. (afterwards Sir) G. H. Reid of New South Wales convened a meeting of premiers, in which all the colonies except New Zealand were represented, and it was agreed that each parliament should be asked to pass a bill enabling the people to choose ten representatives on a Federal convention; this convention was to frame a Federal Constitution which should be submitted to the people for approval by means of the referendum. During the year 1896 Enabling Acts were passed by the New South Wales, Victoria, Tasmania, South Australia and Western Australia, and delegates were elected by popular vote in all the colonies named except Western Australia, where the delegates were chosen by parliament. The convention met in Adelaide on March 22, 1897, and, after drafting a bill for the consideration of the various parliaments, adjourned till Sept. 2. The delegates reassembled in Sydney, and debated the bill in the light of suggestions made by the legislatures of the federating colonies. As it was announced that Queensland wished to join the proposed union, the convention again adjourned. The third session was opened in Melbourne on Jan. 20, 1898, but Queensland was still unrepresented. The draft bill was finally adopted on March 16 and remitted to the various colonies for submission to the people.

The constitution was warmly received by Victoria, South Australia and Tasmania, but in New South Wales great opposition was shown. The main points of objection were the financial provisions, equal representation in the Senate, and the difficulty of amending the constitution in a conflict with the smaller states. The statutory number of votes necessary for the acceptance of the bill was 80,000. The result of the referendum in New South U7ales showed 71,595 votes in favour and 66,228 against, and the bill was accordingly lost. In Victoria, Tasmania, and South Australia, on the other hand, it was accepted by triumphant majorities. Western Australia did not put it to the vote, as the Enabling Act of that colony only provided for joining a federation of which New South Wales should form a part. The general election in New South Wales, held six or seven weeks later, was fought on the Federal issue. The new parliament decided to send the premier, Mr. Reid, into conference, with a request that the other colonies should reconsider those provisions which were most generally objected to in New South Wales. The other colonies readily agreed to this course of procedure. A premiers' conference, at which Queensland was for the first time represented, met in Melbourne at the end of Jan. 1899. Something was conceded to the claims of New South Wales, but the main principles of the bill remained intact. The bill, as amended, was triumphantly carried in Victoria, South Australia and Tasmania. New South Wales and Queensland carried it also, and the way was now clear for a decision on the part of Western Australia. The Enabling Bill passed through its various stages, and the question was then adopted by referendum.

The colonial draft bill was submitted to the imperial government for legislation as an imperial act. Six delegates were sent to England to explain the measure. A bill was presented to the British parliament and speedily became law. Under this act, which was dated July 9, 1900, a proclamation was issued on Sept. 17 of the same year, declaring that, on and after Jan. 1, 1901, the people of New South Wales, Victoria, South Australia, Queensland, Tasmania, and Western Australia should be united in a Federal commonwealth under the name of the Commonwealth of Australia.

Provisions of the Act. — The six colonies entering the Commonwealth were denominated original states, and new states might be admitted, or might be formed by separation, or union of two or more states or parts of states; and territories (as distinguished from states) might be taken over and governed under the legislative power of the Commonwealth. The legislative power was to be vested in a Federal parliament, consisting of the sovereign (represented by a governor-general), a senate, and a house of representatives. The Senate was to consist of the same number of members (not less than six) for each state, the term of service being six years, but subject to an arrangement that half the number would retire every three years. The House of Representatives was to consist of members chosen in the different states in numbers proportioned to their population, but never fewer than five. The first House of Representatives was to contain seventy-five members. For elections to the Senate, writs would be issued in the name of the state governor, and for general elections of the House of Representatives in the name of the governor-general. The Senate would choose its own president, and the House of Representatives its speaker; each house would make its own rules of procedure; in each, one-third of the number of members would form a quorum; the members of each must take oath, or make affirmation of allegiance; and all alike would receive an allowance of £400 a year. The legislative powers of the parliament have a wide range, many matters being transferred to it from the colonial parliaments. The more important subjects with which it deals are trade, shipping and railways; taxation, bounties, the borrowing of money on the credit of the Commonwealth; the postal and telegraphic services; defence, census, and statistics; currency, coinage, banking, bankruptcy; weights and measures; copyright, patents, and trade-marks; marriage and divorce; immigration and emigration; conciliation and arbitration in industrial disputes. Bills imposing taxation or appropriating revenue must not originate in the Senate, and neither taxation bills nor bills appropriating revenue for the annual service of the Government may be amended in the Senate, but the Senate may return such bills to the House of Representatives with a request for their amendment. Appropriation laws must not deal with other matters. Taxation laws must deal with only one subject of taxation; but customs and excise duties may be dealt with together. Votes for the appropriation of the revenue shall not pass unless recommended by the governor-general. The constitution provides means for the settlement of disputes between the houses, and requires the assent of the sovereign to all laws. The executive power is vested in the governor-general, assisted by an executive council appointed by

himself. He has command of the army ana navy, and appoints Federal ministers and judges. The ministers are members of the executive council, and must be, or within three months of their appointment must become, members of the parliament. The judicial powers are vested in a high court and other Federal courts, and the Federal judges hold office for life or during good behaviour. The High Court has appellate jurisdiction in cases from other Federal courts and from the supreme courts of the states, and it has original jurisdiction in matters arising under laws made by the Federal parliament, in disputes between states, or residents in different states, and in matters affecting the representatives of foreign powers. Special provisions were made respecting appeals from the High Court to the sovereign in council. The constitution set forth elaborate arrangements for the administration of finance and trade during the transition period following the transference of departments to the Commonwealth. Within two years uniform customs duties were to be imposed; thereafter the parliament of the Commonwealth had exclusive power to impose customs and excise duties, or to grant bounties; and trade within the Commonwealth was to be absolutely free. Exceptions were made permitting the states to grant bounties on mining and (with the consent of the parliament) on exports of produce or manufacture, but Western Australia for a time was partially exempted from the prohibition to impose import duties.

The constitution, parliament and laws of each state, subject to the Federal Constitution, retained their authority; state rights were carefully safeguarded, and an inter-state commission was given powers of adjudication and of administration of the laws relating to trade, transport, and other matters. Provision was made for alteration of the constitution of the Commonwealth, but no alteration could be effected unless the question had been directly submitted to, and the change accepted by, the electorate in the states. The seat of government was to be within New South Wales, not less than 100 m. distant from Sydney, and of an area not less than 100 sq. m. Until other provision was made, the governor-general was to have a salary of £10,000, paid by the Commonwealth. Respecting the salaries of the governors of states, the constitution made no provision.

Lord Hopetoun (afterwards Lord Linlithgow) was chosen governor-general, and Mr. (afterwards Sir Edmund) Barton became prime minister. The first parliament under the constitution was elected on March 29 and 30, 1901, and was opened by the Prince of Wales on May 9 following.

The administration of Papua, which had been for some time in the hands of the Queensland Government, was transferred in 1906 to the Commonwealth, and a lieutenant-governor, assisted by an executive and a legislative council, appointed. Under the Treaty of Versailles (1919), Australia accepted the Mandate over German New Guinea and the adjacent islands (see NEW GUINEA; MANDATE).

In Oct. 1908 the Yass-Canberra district, near the town of Yass, N.S.W., was at length selected by both Federal houses to contain the future Federal capital, Canberra (*q.v.*). In 1913 the foundation stone was laid; in 1923 the Parliament House was begun; and on May 9, 1927 the Duke of York opened the first parliament which met in the capital.

THE LABOUR MOVEMENT

The free immigrant and the time-expired convict (who both objected to the competition of the bond labourer) were the pioneers of the Australian Labour movement. After transportation ceased, Labour strove mainly to secure shorter hours. The principle of an eight-hour day was conceded in several trades, and from 1873 to 1889, in spite of a steady fall in the cost of living, wages remained as high as ever. Thus the Labour unions, though as yet without political influence, had proved themselves effective.

After 1884 Labour troubles became frequent, especially in the mines of New South Wales. Work had become difficult to obtain, and some industries had been carried on without any profit. A strike of Newcastle miners, having lasted twenty-nine weeks, came to an end in Jan. 1890. On Sept. 6 the silver mines closed down, and a week later 40,000 men came out. The Great Strike had begun. There were riotous scenes in Sydney and on the coalfields. Towards the end of Oct. 20,000 shearers were called out, and many other trades concerned with the handling and shipping of wool joined in the strike. But early in Nov. the employers gained a decisive victory. The result was the entry of Labour into politics.

Parliamentary Labour Party.—Several attempts had been made by individuals belonging to the Labour Party to enter the New South Wales parliament, but it was not until 1891 that the occurrence of a general election gave the party the looked-for opportunity for concerted action. The results of the election came as a complete surprise; for the Labour Party captured 35 seats out of a House of 125 members. The old parties almost equally divided the remaining seats, and, as a fusion was impossible, the Labour representatives dominated the situation. It was not long, however, before Labour itself became divided on the fiscal question; and, when a Protectionist government came into power, about half the Labour members, by consistent support, enabled it to maintain office for about three years. The party as a political unit was thus destroyed. It was therefore determined to support only those Labour candidates who pledged themselves to vote as the majority of the party had decided. Under this "solidarity pledge," the Labour Party contested the general election of 1894. The result was the loss of 16 seats; but a signal triumph was won for solidarity: very few of those who refused to take the pledge were returned, and the adherents of the united party were able to accomplish more with their reduced number than under the old conditions.

The two features of the Labour Party in New South Wales are its detachment from other parties and the control of the caucus. The caucus, which is the natural corollary of this detachment, determines by majority the vote of the whole of the members of the party, independence of action being allowed on minor questions only. The party has refrained from formal alliance with the other great parties of the state. It supports the Government as the power alone capable of promoting legislation, but its support is given only so long as the measures of the Government are consistent with the Labour policy. This position the Labour Party has been able to maintain with great success, owing to the circumstance that the other parties have been almost equally balanced.

All the other states followed New South Wales in forming a parliamentary Labour Party. It may be noted that South Australia, in addition to the pledge of solidarity, requires that candidates shall have worked for their living at manual labour; and this qualification of being an actual worker was strongly insisted upon at the formation of the party and strictly adhered to, although the temptation to break away from it and accept as candidates persons of superior education and position has been very great.

On the formation of the Commonwealth a Labour Party was established in the Federal houses. It comprised one-third of the representation in the House of Representatives, and a still larger proportion in the Senate. The party was, however, formed on a broader basis than the state parties; for the solidarity pledge extended only to votes upon which depended the fate of a government. The conscription issue of 1916 broke up the Labour party. In 1927 it had not yet regained political power in the federal parliament, and had lost it in the states of South Australia and New South Wales.

LEGISLATION

Australian legislation in the closing years of the 19th century and the first decade of the 20th bore the most evident traces of the Labour Party's influence. In all the colonies every branch of domestic industry has been subjected to the control of specially constituted tribunals, which were empowered among other important functions to fix the minimum rate of wages to be paid to all grades of workmen. (See also the articles ARBITRATION; INDUSTRIAL RELATIONS; TRADE UNIONS.)

Victoria.—Victoria, in 1873, was the first state to pass factory laws. In 1884 a royal commission, appointed two years earlier to inquire into the conditions of employment in the colony and into certain allegations of "sweating" that had then recently been made, reported that: "The most effective mode of bringing about

industrial co-operation and mutual sympathy between employers and employed, and thus obviating labour conflicts in the future, is by the establishment of courts of conciliation in Victoria, whose procedure and awards shall have the sanction and authority of law." This report led to the passing of a number of acts which, proving ineffectual, were followed by the Factories and Shops Act of 1896, passed by the ministry of Mr. (afterwards Sir Alexander) Peacock. This measure, together with several subsequent amending acts, of which the most important became law in 1903, 1905, and 1907, forms a complete industrial code in which the principle of state regulation of wages is recognized and established. Its central enactment was to bring into existence (1) "Special Boards," consisting of an equal number of representafives of employers and workmen respectively in any trade, under the presidency of an independent chairman, and (2) a Court of Industrial Appeals. A special board may be formed at the request of any union of employers or workmen, or on the initiative of the Labour department. After hearing evidence, which may be given on oath, the special board issues a "determination," fixing the minimum rate of wages to be paid to various classes of workers of both sexes and different ages in the trade covered by the determination, including apprentices, and specifying the number of hours per week for which such wages are payable, with the rates for overtime when those hours are exceeded. The determination is then gazetted, and it becomes operative over a specified area, which varies in different cases, on a date fixed by the board. Either party, or the minister for Labour, may refer a determination to the court of industrial appeals, and, should a special board fail to make a determination, the court may itself be called upon to frame one. The general administration of the Factories and Shops Acts is vested in a chief inspector of factories, subject to the minister of Labour in matters of policy. Before the end of 1906 fifty-two separate trades in Victoria had obtained special boards, by whose determinations their operations were controlled.

South Australia.— A similar system was introduced into South Australia by an act passed in 1900 amending the Factory Act of 1894, which was the first legislation of the sort passed in this state. In 1912 an Industrial Court was founded which, unlike that of New South Wales, but like that of the Commonwealth, can call a compulsory conference in any industry in order to avert a strike. The system includes punishment for strikes and lockouts.

Slueensland.— In Queensland, where the earliest factory legislation dates from 1896, keen parliamentary conflict raged round the proposal in 1907 to introduce the special boards system for fixing wages. More than one change of Government occurred before the bill became law in April 1908.

New South Wales.—In New South Wales, whose example was followed by Western Australia, the machinery adopted for fixing the statutory rate of wages was of a somewhat different type—modelled on the Industrial Conciliation and Arbitration Act of New Zealand (1894). A similar measure, under the guidance of the attorney-general, the Hon. B. R. Wise, was carried after much opposition in New South Wales in 1901, to remain in force till June 30, 1908. By it an arbitration court was instituted, consisting of a president and assessors representing the employers' unions and the workers' unions respectively; in any trade in which a dispute occurs, any union of workmen or employers registered under the act is given the right to bring the matter before the arbitration court, and if the court makes an award, an application may be made to it to make the award a "common rule," which thereupon becomes binding over the trade affected, wherever the act applies. The award of the court is thus the equivalent of the determination of a special board in Victoria, and deals with the same questions, the most important of which are the minimum rates of wages and the number of working hours per week. The act contained stringent provisions forbidding strikes; but in this respect it failed to effect its purpose; several strikes in which there were direct refusals to obey awards occurred in the years following its enactment.

Western Australia,— In 1900 and 1902 acts were passed in Western Australia still more closely modelled on the New Zealand act. They reproduced the institution of district conciliation boards in addition to the arbitration court; but these boards were a failure here as they were in New Zealand, and after 1903 they fell into disuse. In Western Australia, too, the act failed to prevent strikes taking place. In 1907 a serious strike occurred in the timber trade, attended by all the usual accompaniments, except actual disorder, of an industrial conflict.

Federal Arbitration Act **of** 1904.—In all this legislation one of the most hotly contested points was whether the arbitration court should be given power to lay it down that workers who were members of a trade union should be employed in preference to non-unionists. This power was given to the tribunal in New South Wales, but was withheld in Western Australia. It was the same question that formed the chief subject of debate over the Federal Conciliation and Arbitration Act, which, after causing the defeat of more than one ministry, passed through the Commonwealth parliament in 1904. It was eventually compromised by giving the power, but only with safeguarding conditions, to the Federal arbitration court. This tribunal differs from similar courts in the states inasmuch as it consists of a single member, called the "president," an officer appointed by the governor-general from among the justices of the High Court of Australia. The president has the power to appoint assessors to advise him on technical points; considerable powers of devolution of authority for the purpose of inquiry and report are conferred upon the court, the main object of which is to secure settlement by conciliatory methods. The distinctive object of the Federal Act, as defined in the measure itself, is to provide machinery for dealing with industrial disputes extending beyond any one state, examples of which were furnished by the first two important cases submitted to the court—the one concerning the merchant marine of Australia, and the other the sheep shearers, both of which were heard in 1907. An additional duty was thrown on the Federal arbitration court by the Customs and Excise Tariff Acts of 1906, in which were embodied the principles known as the "New Protection." By the Customs Act the duty was raised on important agricultural implements, while, as a safeguard to the consumer, the maximum prices for the retail of the goods were fixed. In order to provide a similar protection for the artisans employed in the protected industries, an excise duty was imposed on the home-produced articles, which was to be remitted in favour of manufacturers who could show that they paid "fair and reasonable" wages, and complied with certain other conditions for the benefit of their workmen. The chief authority for determining whether these conditions are satisfied or not is the Federal arbitration court. In 1926 a special Federal arbitration court, entitled the Commonwealth Court of Conciliation and Arbitration was founded, consisting of three "judges" and a chief "judge."

The same period that saw this legislation adopted was also marked by the establishment of old age pensions in the three eastern states, and also in the Commonwealth. By the Federal Act, passed in the session of 1908, a pension of ten shillings a week was granted to persons of either sex over sixty-five years of age, or to persons over sixty who are incapacitated from earning a living. The Commonwealth legislation thus made provision for the aged poor in the three states which up to 1908 had not accepted the principle of old age pensions, and also for those who, owing to their having resided in more than one state, were debarred from receiving pension in any. The pension was raised, in 1919, to fifteen shillings a week, and, in 1925, to one pound.

Tariff.—An important work of the Commonwealth parliament was the passing of a uniform tariff to supersede the six separate tariffs in force at the establishment of the Commonwealth, but many other important measures were considered and some passed into law. During the first six years of federation there were five ministries; the tenure of office under the three-yearly system was naturally uncertain, and this uncertainty was reflected in the proposals of whatever ministry was in office. The great task of adjusting the financial business of the Commonwealth on a permanent basis was one of very great difficulty, as the apparent interests of the states and of the Commonwealth were opposed. Up till 1908 it had been generally assumed that the constitution required the treasurer of the Commonwealth to hand over to the states, month by month, whatever surplus funds remained in his hands.

But in July 1908 a Surplus Revenue Act was passed which was based on a different interpretation of the constitution. Under this act the appropriation of these surplus funds to certain trust purposes in the Federal treasury is held to be equivalent to payment to the states. The money thus obtained was appropriated in part to naval defence and harbours, and in part to the provision of old age pensions under the Federal Old Age Pension Act of 1908. The act was strongly opposed by the Government of Queensland, and the question was raised whether it was based on a true interpretation of the constitution. The chief external interest, however, of the new financial policy of the Commonwealth lay in its relation towards the empire as a whole. At the Imperial Conference in London in 1907 Mr. Deakin, the Commonwealth premier, was the leading advocate of colonial preference with a view to imperial commercial union; and, though no reciprocal arrangement was favoured by the Liberal cabinet, who temporarily spoke for the United Kingdom, the colonial representatives were all agreed in urging such a policy, and found the Opposition (the Unionist Party) in England prepared to adopt it as part of Mr. Chamberlain's tariff reform movement. The Australian ministry therefore, in drawing up the new Federal tariff, gave a substantial preference to British imports, and thus showed their willingness to go farther. Indeed by the Tariff Act of 1921 this favourable treatment of the United Kingdom was considerably extended. *(See* BRITISH EMPIRE.)

RECENT YEARS

The second decade in the history of the Commonwealth was a period of national development. The rapidity of this development was due to the World War, but many signs in Australian political history of the period 1910–28 suggest that war merely hastened what peace would have attained in the end. The construction of the transcontinental railway, the creation of the Australian navy, and the provision of compulsory military training in time of peace, were all products of the years before the War.

Pre-War Period. — The purely political history of this period was marked by several distinctive features. In the first place, there was the definite commitment of the people to certain political doctrines — notably Protection and the maintenance of the "White Australia" policy. In the second place, after 1907, now that questions of tariff had largely ceased to interest the voter, the Labour Party became an important influence in Federal politics. Indeed at the end of 1921, not only was it the sole force in opposition to the Federal Government but it actually held office in every state except Victoria.

The year 1910 saw the end of the third Deakin administration, and in February the House was dissolved. The elections which followed resulted in a substantial victory for the Labour Party under Mr. Fisher, who had previously been prime minister from Nov. 1908 to June 1909. He now returned to office with a working majority both in the Senate and in the House of Representatives. In May 1911 he submitted to a referendum certain amendments of the Federal Constitution, without which the Government could not carry out its avowed programme. These amendments sought to give the Commonwealth Parliament fuller powers to deal with questions of trade and commerce, with labour problems and with monopolies; but the proposals were defeated by about 250,000 votes.

Nevertheless, Labour carried on for two more years, and actually brought into effect important schemes for national defence. The credit for the inception of these schemes was due to the Deakin administration, which in 1909 had not only brought in a Bill enforcing military training on the young men of the Commonwealth, the first instance of compulsory service in an English-speaking community, but also decided to give practical effect to the sweeping recommendations of the Imperial Defence Committee. But Labour had offered no serious opposition to these measures, and when it succeeded to office it spared no effort in giving them the fullest possible effect. Among other legislation of this period was the grant of a "maternity bonus" of £5 on the birth of each child, and the transfer of the Northern Territory from South Australia to the Commonwealth. In 1926 the Federal Government offered to relieve Western Australia of the burden of the north-western part of her territory.

Australia During the World War. — In May 1913 another General Election was held in the Commonwealth. It had a singularly unsatisfactory result in so far as Mr. Deakin's successor, Mr. (afterwards Sir Joseph) Cook, obtained a majority in the House of Representatives but was unsuccessful in the Senate. In these precarious circumstances he managed to survive until July 30 1914 when a dissolution of both Houses was granted. Five days later, war broke out. There was an immediate outcry for the abandonment of the elections, but the writs were already out, and an attempt to arrange an allotment of seats and form a National Government signally failed. For nearly two months Mr. Cook and his colleagues conducted Australia's war effort, and it is to them that the credit for the initial organization of the Australian Imperial Force belongs.

The election took place on Sept. 17. Again Mr. Fisher triumphed, and he at once proved that Labour was no less ready and eager than its opponents to put every effort into the war. For more than a year Mr. Fisher remained at the head of affairs. Then, in Oct. 1915, he accepted the appointment of High Commissioner in London and was succeeded by the attorney-general, Mr. W. Morris Hughes.

For the next seven years the political history of the Commonwealth was dominated by the personality of Mr. Hughes. His services to Australia and to the Empire may have been somewhat over-estimated when he was in power, but there is little doubt that, in the reaction that followed his fall, they came dangerously near to being forgotten altogether.

In 1916 he travelled to Great Britain, where he achieved remarkable success by his hard-hitting speeches. But with his return to the Commonwealth there came an anticlimax. The tide of recruiting had begun to fall, the best of Australia's manhood had already left for the front, and the nation waited for Mr. Hughes to declare for the measures of conscription which he had advocated so whole-heartedly abroad. He hesitated, and finally decided to submit the question of conscription to a referendum. The referendum was held and conscription was decisively rejected by the people.

The immediate result was the break-up of the Labour Party. A second referendum and a second defeat made it impossible for Mr. Hughes to remain leader of a party which had officially rejected the most vital clause of his policy, and in 1917 he crossed the floor of the House and formed the Australian National War Government. The new Ministry was recruited mainly from the ranks of the former opposition and included only three of the prime minister's former colleagues. The Armistice came a year after the reshuffle and once again Mr. Hughes visited England. His vigorous assertion of Australian claims, both in London and at Versailles, re-established his popularity.

The War Effort. — The sacrifices of the nation are shown by the following figures: Australia sent 329,883 troops overseas. The casualties of this force reached the high proportionate total of 314,078, of which 59,302 were deaths from wounds or disease. Other casualties from wounds or gas totalled 166,819, and there were 87,957 cases of sickness. The financial drain of the War on a young nation of fewer than 6,000,000 inhabitants was appalling. It is estimated that the total war expenditure, in which pensions and allowances played a large part, was, up to June 30, 1927, nearly £660,000,000.

Australia made generous provision for ex-service men. Pensions payable for total disability ranged from £2 to £3 a week, with extra provision for a wife and all children under 16 years of age. Ex-soldiers and sailors were liberally helped to re-establish themselves in civil life, and the Commonwealth Government, co-operating with the state governments, provided farming lands, grants and loans for houses, working capital, etc. A scheme was also formed to provide education for war orphans and the children of incapacitated ex-soldiers.

Post-War Problems. — Labour had been badly beaten at a "khaki" election in 1919, and Mr. Hughes was branded as a traitor by his old associates. The Nationalists were divided, for the new

"Country Party" was disposed to flirt with Labour. There were personal considerations as well, and although Mr. Hughes paid a successful visit to the Imperial Conference of 1921 his success was coldly received by his own countrymen.

The eighth parliament of the Commonwealth came to an end at the close of 1922. The elections, held in December, were marked by the most violent personal bitterness, and, although Labour again suffered defeat, it was evident that no alliance of Nationalists and the Country Party was possible under the leadership of Mr. Hughes. An acceptable successor was found in Mr. Stanley Melbourne Bruce. His first task was to form a coalition with the strongly reinforced Country Party. Dr. Page, its leader, became Treasurer, and the administration was known as the Bruce-Page ministry. But Mr. Bruce was the real leader, and by the time he came to visit London for the Imperial Conference of 1923 his position was firmly established.

The chief business of the Conference was concerned with Imperial Preference. Mutual preference was agreed to between Great Britain and Australia. But the new Government of Mr. Ramsay MacDonald neither carried out these arrangements nor approved of a naval base at Singapore. Mr. Bruce replied by a new naval programme, a scheme to assist exporters, and a series of Bounty Bills to help the primary producer. A reciprocal trade treaty with Canada was also sanctioned.

A long series of shipping strikes culminated in the crisis of 1925. Shipping in Australian ports was held up and trade production seriously affected.

A general election was held in Nov. 1925, which resulted in the heavy defeat of the Labour Party in both Houses. Voting was compulsory under a penalty of £2.

The year 1927 was disturbed by two strikes of unusual magnitude. The strike of the sugar-cane workers in Queensland spread to the railway unions, and threatened a serious constitutional crisis, which was, however, averted by the firmness of the Queensland premier, Mr. McCormack. The strike of the waterside workers, at the end of the year, was even more serious. A bill imposing penalties for unjustified strikes and lock-outs was introduced in the Commonwealth Parliament.

In 1916 the Commonwealth Shipping Line had been floated by Mr. Hughes. Heavy reverses were experienced, and the Australian Government was compelled to advocate the disposal of the line. In Nov. 1927 Mr. Bruce defeated the Labour vote of censure on his policy, and on April 24. 1928, he announced the acceptance of the White Star Line's tender of £1,900,000. Mr. Bruce became prime minister in 1928, but was succeeded in 1929 by the Labour leader, Mr. J. H. Scullin. In January 1932 a government was formed by Mr. J. A. Lyons, leader of the United Australia Party. In August 1935, Sir Alexander Gore Arkwright Hore Ruthven succeeded Sir Isaac Isaacs as Governor General, and Australia, following Canada and South Africa decided to appoint a High Commissioner in London. In June 1935, a Joint Committee of Lords and Commons in London declined to entertain a petition from Western Australia dealing with the secession controversy. The British Committee held that such a petition should be presented by the Commonwealth as a whole.

CONSTITUTIONAL QUESTIONS

Experience has demonstrated the marked rigidity of the Australian Constitution. Between 1908 and 1927 only one amendment was carried in accordance with the procedure outlined in section 128. The situation foreseen by certain critics, in which proposed amendments would be carried by sweeping popular majorities, but lost to an opposition strong enough to control three small states, did not occur. The submission of proposed alterations to a referendum proved a sufficient barrier.

Proposed Amendments. — In 1910, simultaneously with the general election of April 13, electors were asked to decide on two constitutional amendments. By section 105 of the constitution the power of the Commonwealth to take over the debts of the states was limited to debts already existing at the date of the Commonwealth's establishment. By the amendment, state public debts incurred later could also be taken over. This amendment was accepted by a majority. The other proposal, although passed in Parliament, was rejected. It related to the allocation of the customs and excise revenue bet een the Commonwealth and the states. Under section 87, the Commonwealth's share was limited to one-fourth of its total. This arrangement was to continue for a period of ten years and thereafter until the Commonwealth Parliament otherwise provided. Parliament resolved, however, to diminish the proportion left to the states to an amount representing £1.5.0. for each unit of population — and to do so, not by statute, a course which was open under section 87, but by constitutional amendment, in order to give the states a somewhat more stable claim on the proportion left to them. At a slightly later date, an ordinary statute to the same effect was passed. The effect of this was greatly to enhance the financial importance of the Federal Government, while the corresponding reduction of the states' share in customs and excise revenue, by approximately 50%, initiated a period of considerable stringency in their finances.

A further unsuccessful effort to amend the constitution was made in 1911. On April 26 of that year, a referendum was submitted to the people the object of which was to give to the Commonwealth parliament power to deal with the following matters: —

(a) Trade and commerce, without any limitations, instead of "trade and commerce with other countries, and among the states."

(b) The control and regulation of corporations of all kinds, except those formed not for the acquisition of gain. (Only "foreign corporations and trading and financial corporations formed within the limits of the Commonwealth" came under the jurisdiction of the Federal parliament.)

(c) Labour and employment, including wages and conditions of labour and the settlement of industrial disputes generally, including disputes in relation to employment on state railways. (Conciliation and arbitration by the Commonwealth operate only in the case of any industrial dispute extending beyond the limits of any one state.)

(d) Combinations and monopolies in relation to the production, manufacture, or supply of goods or services.

This proposal was rejected by a majority and also by a majority in every state except Western Australia. On the same occasion and as an outcome of the same legislation, it was proposed to insert in the constitution the following sub-section: —

"When each House of Parliament, in the same session, has by resolution declared that the industry or business of producing, manufacturing, or supplying goods, or of supplying any specified services, is the subject of any monopoly, the Parliament shall have power to make laws for carrying on the industry or business by or under the control of the Commonwealth, and acquiring for that purpose on just terms any property used in connection with the industry or business."

This proposal was also rejected by closely similar voting. In 1913 the same proposed alterations of the constitution, with certain minor changes, were again submitted in the form of six separate amendments. They were again rejected, although on this occasion a majority for them was obtained in Queensland, South Australia and Western Australia, while New South Wales, Victoria and Tasmania were hostile. In 1919 proposals were again submitted to a referendum for extending the legislative powers of the Commonwealth relating to industrial disputes and the nationalization of monopolies. Both proposals were rejected. On this occasion South Australia was hostile, but Victoria gave a majority for the proposals, as did Queensland and Western Australia. In 1926 Mr. Bruce's Government desired to give further powers to the Commonwealth in regard to (a) Industry and Commerce and (b) Essential Services. The proposals were submitted in a referendum on Sept. 4, and both were rejected by a majority.

Decisions of the High Court. — Apart from action of a legislative character directly altering the nature of the constitution, there must be noted, within the period 1900 to 1925, certain constitutional changes due to the activity of the High Court. In connection with cases of overlapping of State and Federal powers, what amounted in the circumstances to a new principle, was enunciated by the majority of the Court in the following terms: —

"That section (sec. 109) which says 'When a law of a State is inconsistent with a law of the Commonwealth, the latter shall pre-

vail, and the former shall, to the extent of the inconsistency, be invalid,' gives supremacy, not to any particular class of Commonwealth acts, but to every Commonwealth act, over not merely State acts passed under concurrent powers but all State acts, though passed under an exclusive power, if any provisions of the two conflict; as they may." (The Amal. Soc. of Eng. *v.* the Adelaide S.S.Co.—28 C.L.R.129.)

This important determination has obviously affected the independence and dignity of the states. The total disbursement, *e.g.*, to be made to its railway or other industrial servants by any state, may now depend not on the decision of the taxpayers of the state, but on that of an organ of the Federal Government (the Court of Conciliation and Arbitration). This would appear to be a substantial derogation of the states' financial autonomy, which in other portions of the constitution is carefully safeguarded. The High Court also decided the true meaning of section 92 of the constitution, the important part of which is as follows:—

"On the imposition of uniform duties of customs, trade, commerce and intercourse among the States, whether by means of internal carriage or ocean navigation, shall be absolutely free."

The attempts of various states to maintain control over some commodity whose place of origin was within their territory met with varying degrees of success. In New South Wales the state had taken over the whole of the wheat in the state, and refused to sell it in other states except upon its own terms. The Court held that this constituted no violation of section 92. The ownership had passed to the King. If his advisers wished to export it to another state they were free to do so. Later a New South Wales statute purported to make public property of pigs. Here, however, the Legislature had provided that the ownership should pass only upon a proclamation, and that in the interim no holder should export except in certain conditions. This additional provision, as infringing the prohibition of section 92, was held to be invalid.

When a similar question arose in Queensland over the position created by a statute (modelled upon the New South Wales statute) in which the operative words were equivalent, the Court changed its attitude and. on fuller consideration, came to the conclusion that in the interval preceding the actual transfer of stock, or meat, to the King, an intermediate type of property interest, not previously known to the law, had been created, and that it was within the province of the state Legislatures to create such new forms of property. Confronted later with the somewhat different problem presented by the action of the Queensland parliament in endeavouring to make it unlawful for the trader to sell commodities within Queensland at anything above an officially proclaimed price, the Court held that so far as it sought to impose this prohibition upon traders of other states this act was invalid. (McArthur *v.* Queensland 28 C.L.R. 530.)

This decision also has affected the standing of the constituent states of the Commonwealth, by imposing a definite limitation upon their legislative powers. Whether the same limitation would apply to the legislation of the Commonwealth was, of course, not a matter to be decided. But the majority of the Court indicated clearly that they considered it would not. The net result of the judgment would thus appear to exclude a whole field of legislation from the jurisdiction of the states and leave it, subject to any further decision of the High Court, to the Commonwealth.

In June 1927 a conference between the Federal prime minister and the State premiers established the principle of a Loan Council under the Commonwealth to prevent unchecked and competitive borrowing by State Governments, a measure described by Mr. Bruce as "the most important financial measure submitted to the Commonwealth parliament since the Commonwealth was constituted."

Australia and the League of Nations.— From the inception of the League, Australia has sent delegations to the Assembly. In 1924 both parties in the Federal parliament were represented. Since 1922 a woman has always been sent as substitute delegate. Australia has also taken part in every conference of the International Labour Office. League of Nations unions exist in all the six states, and useful propaganda work has been done. The public opinion thus created has been of service in the good administration of the Mandated Territories. A chair of anthropology founded at Sydney university should help to train suitable administrative officers.

DEFENCE

The development of a self-reliant national spirit in Australia can be traced directly to the withdrawal of British troops in 1870 which caused Australians to face the question of defence without immediate help from elsewhere. The despatch from Sydney of a contingent of New South Wales troops amidst scenes of great enthusiasm to fight in the Sudan in 1885 marked a further step towards co-operation with Great Britain in emergencies. The occasion was marked by a prophetic speech by the prime minister (W. B. Dalley) "All statesmen who contemplate disturbing the world's peace will from this time not limit their calculations as far as England is concerned to her ironclads and to her armies. They will consider the rapidly increasing millions of colonial subjects." Further demonstrations, from all the six Australian colonies, occurred in Jan. 1895, and all sent contingents to the Boer War of 1899–1902, at which period we can date the birth of the Australian nation. In March 1901 the newly-formed Australian Federal Government took charge of defence questions and of the existing defence forces. These included:— from New South Wales, 9,338; Victoria, 6,335; Queensland, 4,028; South Australia, 2,932; West Australia, 2,096; Tasmania, 2,024; making a total of 26,753, excluding cadets, reserves, rifle clubs, etc. Universal service in time of war, for all able-bodied men between the ages of 18 and 60 years, was introduced in 1903–04; universal military training, made law for the first time in modern days for any English-speaking community, was in force in 1911. The necessary legislation had been passed in 1909 on the advice of Lord Kitchener. 412,953 Australians joined the military forces in the World War of 1914–18, and 331,781 of them served outside their own country, suffering 214,630 casualties including 56,132 deaths, and establishing for all time the fame of Australians as hard and skilled

fighters. The year 1921 saw another administrative advance, the establishment of a divisional organization, wherein the traditions and the laurels earned in Gallipoli, in Palestine and in France and Flanders can be maintained in perpetuity. Such has been the history of military developments in Australia since 1864, when other European nations began to acquire territory in Australasian waters, to the present day.

Present-day Army.—The military forces of the Commonwealth of Australia are composed of a permanent force and of a citizen force known as the militia. In time of war all men between the ages of 18 and 60 who are British subjects and have resided in Australia for 6 months or more are liable to serve in the latter, but in 1929 the provisions of the Defence Act making militia service compulsory in time of peace were suspended The militia is recruited from men between 18 and 40 years of age, who are engaged for periods of three years and may be re-engaged for successive periods of one year each until the age for retirement (48) is reached. The permanent force is recruited by voluntary enlistment for five years' continuous service, with re-engagements for periods of three years. Its principal function is to train the citizen force and cadet units, and to provide a skeleton force to man posts of strategic importance.

Strength and Organization.—The budget effective strength of the permanent force in 1937–1938 was 2,448 (subsequently in course of expansion to 7,500), of whom 261 were officers of the staff corps—*i.e.*, graduates of the Royal Military College. In this year the total strength of the military forces was rather over 37,000, but on the outbreak of the war in September 1939, the militia amounted to 78,000. The permanent force includes, besides the staff corps, certain coastal defence and anti-aircraft units, together with details of survey corps, army service corps, army ordnance corps, army medical and veterinary corps, and it is intended to form other field units. Apart from a few ordinary regular units who train throughout the year, it is organized for instruction and administration. The militia is organized to provide the peace nucleus of the field army, with line of communication and maintenance units, and part of the personnel for the coastal and anti-aircraft defences.

Following reports in 1938 by the inspector-general to the forces, the army was re-organized into four commands, Northern (Queensland), Eastern (New South Wales), Southern (Victoria, S. Australia, Tasmania), Western (W. Australia) and the independent garrison of Port Darwin, so that army headquarters now has to deal directly with only five subordinate headquarters. The higher direction of Australian defence policy is controlled by a council of defence, composed of the prime minister, the treasurer, the minister for external affairs, the minister for defence and the chiefs of staff of the three services. The administration is conducted by the defence department, while naval, military and air boards administer the respective services, and government factories are under the supervision of the munitions supply board. There is a defence committee exactly analogous with the chief of staff's sub-committee of the committee of imperial defence. The military board is composed of the minister for defence, the chief of the general staff, the adjutant-general, the quartermaster-general, the finance member and secretary.

Military Education.—The military college at Paddington, N S.W., trains both Australians and New Zealand cadets for four years, the Australians joining the permanent force. On receipt of commissions graduates are attached to a regular regiment or corps in Britain or India for a year's training. There is a school of artillery at Sydney, a small arms school at Randwich, N.S.W., and an Army Service Corps training school at Melbourne. There is a central training depot for the permanent force. The co-ordination between the British and Australian land forces is close: the Australian general staff is a branch of the imperial general staff, and Australian officers graduate at the staff and imperial defence colleges. But in manufacture of munitions Australia is self-supporting.

The only permanent fortifications in Australia are those defending certain harbours and anchorages considered to be of strategic value to the Australian and British navies.

Air Force.—The Royal Australian air force is not embodied in the army. It is administered by the Air Board, which has representatives at the Air Ministry in London; the Board consists of three air force members and a finance member. In 1938 the strength (budgetary effectives) of the R.A.A.F. was 2,472. but in that year and 1939 a program of expansion was adopted and plans were passed to promote the manufacture of aircraft in the Dominion: thus in December 1938 a supplementary appropriation increased air force expenditure from £12,512,000 to £16,444,000. On the outbreak of war in 1939 it was decided to send a detachment of 3,200 men to Europe.

M.* Stationery Office, **1922)**.

(G. G. A.; X.)

Navy.—Until the end of the 19th century the Australian Colonies relied upon the mother country for Naval Defence. From 1895, under the Australasian Defence Act an annual payment of £100,000 was made towards the expense of the squadron in Australasian waters and this contribution was increased to £200,000 in 1903, in which year the training of the Australian Naval Reserve Force was commenced. Later the Commonwealth Government decided to form an Australian navy for its own defence, and in 1909 the first units, three destroyers, were ordered in England. There followed the laying down of a battle-cruiser ("Australia") and two cruisers ("Sydney" and "Melbourne"), and with the arrival of these ships in Australian waters in 1913, the Royal Australian Navy came into being as a fleet unit. This squadron, controlled during peace by the Commonwealth Government, is in war time at the disposal of the British Admiralty, though it may not leave Australian waters without the concurrence of the Commonwealth Government.

In 1914, on the outbreak of war, the Australian fleet, to which two submarines had been added was first employed in the capture of the German Pacific Colonies, and afterwards, under the direction of the Admiralty, served in all parts of the world, its most notable achievement being the sinking of the "Emden" by H.M.A.S. "Sydney" in Nov. 1914. After the armistice all warship building was suspended and the personnel was reduced, by 25 per cent, to 3,500. As a result of the Washington Treaty the battle cruiser "Australia" was disposed of by sinking her and the number of ships in commission were reduced from 25 to 13. In 1925 the Commonwealth Government decided to bring their fleet up to date by building two 10,000 ton cruisers ("Australia" and "Canberra"), two submarines and a seaplane carrier. These ships, completed in 1928, brought. the strength of the Royal Australian Navy to 6 cruisers (2 modern) 12 destroyers (6 modern) a seaplane carrier, 3 submarines and 4 sloops. The chief naval base is at Sydney and at the Officers Training College at Jervis Bay and the Training Schools at Geelong the training is similar to that in the establishments in Great Britain. Australian Naval expenditure from 1922–28 averaged approximately £2,500,000.

(S. T. H. W.)

ECONOMIC AND INDUSTRIAL DEVELOPMENT

General Conditions of Settlement.—Regarding the continent as an area for settlement, size implies room, scope, variety. Its world position implies an element of remoteness and isolation, but with contacts, which are physically most direct, with south-east Asia and Pacific marginal lands. These are factors which must exert a permanent influence. If they are to be counteracted in any special human "interest" (*e.g.*, British empire), a definite effort is required—the more so as isolation in the case of Australia implies individuality, not to say, insularity.

An island with a long coast-line and hence a potentially well-developed coastal and maritime life, Australia is yet a continent with continental interests. The most influential characteristic of its surface is perhaps its flatness. Owing largely to this, minerals (including coal), sub-surface waters and easily-worked soils are widely available, while movement and transport—except where coastal highlands create obstacles—are facilitated. On the other hand surface-drainage and water-power possibilities are not bene-

fited, though the juxtaposition of lowlands and steep-rising, valley-seamed highlands favours irrigation works and also gives in places a welcome change of climate and scenery within a small space.

Climate is a strong determinant as regards settlement: in climatic conditions some of Australia's major problems are rooted. Here size implies variety: Australia has climates ranging from sub-equatorial to cool temperate. Flatness, or low relief, here works mostly adversely. Australia—unlike, *e.g.*, Africa—has comparatively little lofty land in the tropics where it might mitigate temperatures. Instead, the most mountainous parts are in temperate latitudes occupying space which would be more valuable were it low. The rims of the continent, again, catch much of the rain, especially on the east, and though there is strictly no "dead heart," the areas of maximum vitality are broadly peripheral. So far as heat alone is concerned, few parts of Australia seem unsuited for "whites," especially as "tropical" diseases are few. The dry heat of most of the continent, including the inner north, is not unhealthy, provided hygienic modes of living are observed. The hot, damp, coastal lowlands, on the other hand, present a different problem. Much of the richer (alluvial) soil of the north is thus situated and often, in addition, liable to floods.

Apart from questions of health, humidity broadly speaking determines economic productivity, mining excepted. The vegetation belts or areas (*v. supra*) serve as rough indices. They show a general progression from more intensive agricultural, forestry and industrial possibilities in the coastal parts to more extensive and mainly pastoral possibilities inland, the process of closer settlement having, in historical fact, gradually pushed the large holdings in many parts backwards into the interior. Over very large areas, and in a degree not paralleled in a country like England, an assured water-supply is the essential prerequisite of settlement and of economic stability. Useful soils in great variety abound but, while those situated in humid areas are, or were originally, mostly tree-clad, those having a lighter cover are in drier parts. Thus, where the change of environment for British peoples is least, the initial effort of settlement is often greatest: conversely, where little labour (in clearing) is required, the necessity for adaptation and for learning new methods (*e.g.*, dry farming) is greatest. Pests, animal and vegetable, are further to be reckoned with, and variability of climate, particularly of rainfall, introduces uncertainty. Production statistics in Australia, partly for this reason, often show considerable variations and are best considered over periods of years. In many respects, therefore, Australian conditions demand close and even rigid adaptation and in turn they stamp upon those who learn to conform a certain regional individuality.

Regional Character of **Settlement.**—What precisely that regional character is will depend largely on the type of people who settle there. The "aboriginal" population (c. 60,000) is now confined mainly to the north and north-west. They include (*e.g.*, in the north-west) some fine types. The Australian "black," in fact, is more intelligent, adaptable and capable of civilization than is usually believed. Of the remaining population, 6,629,839 (Census, June 30, 1933), a very large proportion has been derived from the British Isles, though the proportion of native-born Australians is rapidly growing. (Census 1933: born in Australia, British Isles and New Zealand together, 97.62%; other European countries, 1·43%; remainder, ·90%.) The settlement and development of Australia therefore depends, and will probably continue to depend, essentially upon the adaptability of British stock to Australian environmental conditions. In this connection the situation is on the whole favourable. The necessarily marginal and sub-oceanic character of much of Australia's life is particularly favourable to British inherited experience, especially in the more southerly latitudes. British peoples also possess a talent for executive and administrative government of the "committee" or "board" type. This has proved particularly useful in Australia where the physical difficulties facing centralized control are considerable and local self-government is essential. Further, some of Australia's chief problems—water-supply, irrigation, etc.—demand large-scale corporate action for their solution. This has been achieved (*e.g.*, by the various water-boards and conservation commissions) democratically and yet with reasonable efficiency. The same applies, broadly speaking, to the physically large-scale problems of political and social organization (*e.g.*, education). British settlers, moreover, adapt themselves to Australian environment and learn, if somewhat slowly, to cope with its often imperious dictates. On the other hand they have shown as yet little special ability, or will, to adapt themselves to damp tropical conditions. Hence, perhaps, the real threat of "alien," including southern European (*e.g.*, Italian), immigration which is felt as a menace in proportion as it may succeed under conditions which the dominant stock will not readily tolerate. On the whole the severity of Australian "controls" seems to have had few ill effects, though it has perhaps intensified individualism. It is leading to the development, not only of an Australian type, but of regional subtypes—a fact noticeable not only among human-kind, but amongst the sheep and cattle population also. At the same time. physical isolation contains germs of danger and is evoking special efforts to counteract it (*e.g.*, by the development both internally and externally of "wireless," aerial transport, etc.). Another phenomenon, due partly to the same cause, is the marked tendency towards concentration in cities. In this, not in itself wholly harmful, there may be traced the working of factors which are partly sociological but partly also economic and which make for the development of Australian civilization.

Compared with, say, the North American continent Australia bulks small in terms of absolute economic values. Measured by the physical scale and difficulty of its problems, by the small number of people and the relatively short time they have been engaged, the economic development and national productivity are impressive. Partly, no doubt, this is due to relative lateness of growth whereby the purely pioneering stage has been curtailed and the weapons and technique of 19th century civilization were available. But largely also the new and vitalizing environment, the challenge of great tasks and greater rewards, have liberated energy and widened the scope of its application, so that Australia, continentally and in its own individual way, reflects and epitomizes the processes and impulses which created, and which sustain, the British empire. The second major stage of Australian development is now closing or closed. The new era, born partly in the experiences of war and inspired more or less consciously by external examples and ideals (*e.g.*, of the United States), is marked by the large-scale application of science to the solution of national problems, whereby a people, vigorous and intelligent, is organizing its next great advance and is seeking, with virtual certainty of success, to enlarge, intensify and strengthen its hold over a somewhat baffling physical environment.

MINING AND MINERALS

The broader aspects of mineral occurrence in Australia have been referred to above. Although the value of production from the mineral industry is now much less than that of the agricultural and pastoral industries, it was the discovery of gold which first attracted settlement on a large scale, and hence laid the foundations of the country's present development. Pending a complete geological survey, it is as yet impossible to arrive at an accurate estimation of Australia's mineral wealth; but it can be safely stated that by comparison with, *e.g.*, the United States, a country of about the same area, the mineral resources are small. Further prospecting will almost certainly reveal new deposits, however, and in some cases, deposits known to exist have not as yet been worked. Until 1931 the mineral production of Australia had been in slow decline for many years. One of the main causes of the decline was the exhaustion of many ore-bodies which, although exceedingly rich, had in some cases been worked continuously since the middle of the nineteenth century. Other factors contributing to the decline of the industry were: high costs of production and transport, low prices, labour difficulties, inaccessibility of deposits and difficulties of exploitation.

With the enhanced prices of precious metals after 1931, the decline was arrested, and since that date production has increased (value of Australia's mineral production 1932—£15,583,391; 1937—£32,296,980). Gold was for the greater part responsible

for this increase, but the production of silver, zinc, lead, copper and coal also increased. It is noteworthy that since 1931 advanced geological methods and technical improvements have been employed in existing concessions. Mines regarded as unworkable or extinct have thus been reopened, and so the increased output of Australian mines must not be ascribed entirely to the discovery of fresh deposits. Between 1900 and 1930 Australian mining remained in a stationary position, the value of the annual output being about £23,500,000. In the meantime the development of other industries reduced the relative importance of mining in Australian economy, for whereas in 1910 mining represented 12·3% of the total annual production, in 1926 mining represented 6% and in 1936, 6.6%. New South Wales has for long been the chief producer of minerals (1937, £11,988,088). The other states are, in order of importance: West Australia (£9,171,372), Queensland (£4,392,492), South Australia (£2,502,795), Tasmania (£2,282,365), Victoria (£1,832,019), and Northern Territory (£127,849).

Gold.—The maximum recorded production of gold was £16,300,000 in 1903. From 1903 to 1930 production diminished (minimum 1929, £1,814,000) as a result of the exhaustion of many fields, and owing to the high commodity prices of the post-war era. Australia's share of the world production of gold fell from 24·4% (1910) to 2·6% (1930).

Currency devaluation in various countries after 1931 evoked a sharp rise in the production of gold and in 1938 Australia produced 1,570,000 fine oz. (4.2% of world production) compared with 467,742 oz. in 1930. Until 1898 Victoria was the chief producer but since that date West Australia has held the first place (maximum in 1903, £8,770,000; 1937, £8,689,000). Third in order of importance comes Queensland. The remaining states produced in aggregate less than £1,000,000 worth (9% output) in 1937. The greater part of the gold is obtained from reefs, especially in West Australia and Victoria, but in the Eastern Highlands alluvial washing is important (chiefly New-South Wales and Victoria), while some gold is obtained from the smelting of other ores, chiefly copper. Australia ranks fifth in order of gold production, coming after South Africa, Russia, Canada and the U. S. A.; and in 1936 33,000 workers were employed in the industry.

Silver-lead.—These minerals are found in close association, particularly in New South Wales. The peak of production was reached in 1918 (£6,100,000—*c.* 6% of the world's production) but owing to labour troubles and economic crises production fell off sharply. The 1936 figure (£4,900,000—3·8% of the world's production) represents a recovery since 1931. Broken Hill, in New South Wales, is the chief centre of production, and up to 1936 had contributed £163,000,000 to the wealth of Australia. The output of silver-lead from Broken Hill reached its maximum in 1923 (value £5,700,000), and in 1936 production was valued at £4,600,000, comprising over 75% of total Australian production. Mount Isa, in Queensland, discovered in 1923, produced a large quantity of the silver and all of the lead obtained in the state during 1936. In spite of early hopes this new field is by no means as important as Broken Hill (1936, Mount Isa £899,000, Broken Hill £3,820,000). The Magnet, Lyell and Zeehan mines of Tasmania produced £215,449 in 1936, and of this lead accounted for the greater proportion. About 12% of the silver (103,000 oz.) was obtained from copper ores. New discoveries of ore have been made near Franklin Harbour and Rapid Bay (South Australia), but as yet little attempt has been made to exploit them.

Zinc.—The greater part of Australian zinc is produced at Broken Hill, where since 1909 improved methods have allowed extraction of the metal from silver-lead ores (prod. 1936, £1,120,000). The remaining proportion of Australian zinc was produced at the Mount Isa mines (see above) and in Tasmania, where production recommenced in 1936 after a lapse of 5 years.

Tin and Copper.—Tin is derived from alluvial deposits and from lodes, veins, etc., usually in association with acid granites. New South Wales (Tingha area), Tasmania (Mount Bischoff), and Queensland (Herberton, Stanthorpe, etc.) are the chief producers. Output has fallen from £1,500,000 (1907) to £658,000 (1936). Owing to high production costs Australia is greatly affected by fluctuations in the price of tin, and so output varies from year to year according to world conditions. Copper mining is similarly subject to price fluctuations. The Queensland and New South Wales fields have ceased or restricted production, so that 70% of Australian production now comes from the Mount Lyell mines of Tasmania, which have the advantages of high grade ore and hydro-electric power. Copper production reached its maximum output in 1917 (£4,860,000) with 9,000 persons employed; in 1936 production was valued at £797,000, with 1,800 workers.

Iron.—The full extent of Australian iron-ore reserves is not as yet fully known, and a survey was being carried out in 1939. Deposits of large extent occur at Yampi Sound (West Australia) and at Iron Knob (South Australia), and a recent estimate placed the quantities available at 100 million tons and 150 million tons respectively. In view of the relative smallness of these reserves, the Commonwealth government in 1938 prohibited the export of iron-ore, in order to conserve resources which would otherwise have been exhausted within two generations. In 1936 over 95% (1,887,000 tons) of Australian ore was purchased from the Iron Knob field. New South Wales produced 4,500 tons of ore together with a small quantity of oxide, much of which was used in the gas, paper and chemical industries. The Yampi field has not yet entered the production stage, and the balance of Australian iron production was obtained as a by-product of the Mount Lyell (Tasmania) copper and silver mines.

Other Minerals.—Besides the above Australia contains a wide range of minerals both metallic and non-metallic, including gemstones (opals, etc.). Although many of these deposits are individually small, they are of considerable aggregate value. Production is dependent on prices, and during the last few years has been intermittent, especially since 1929. Australia possesses important deposits of tungsten, which remain to be exploited at the present time.

Coal.—In 1930 a Royal Commission estimated the actual and probable coal reserves as follows.—Bituminous: New South Wales 13,929,000,000 tons; Victoria 40,000,000; Queensland 2,238,000,000; Tasmania 244,000,000; sub-bituminous and brown coal: Victoria 37,000,000,000 tons; Queensland 67,000,000; South Australia 57,000,000; Western Australia 3,500,000,000. Total 57,075,000,000 tons, of which 16,451,000,000 are bituminous. The most important field is the Permo-Carboniferous basin of New South Wales. The situation of the coal deposits in close proximity to centres of population; the ease with which they can be worked; and in some cases the association of coal with other minerals (*e.g.* iron) have led to extensive exploitation, so that in addition to forming the basis for a metallurgical industry, and providing for home consumption, there is an export surplus.

In New South Wales, the coal-bearing strata occupy an area of *c.* 15,000 sq.mi., and extend some 160mi. along the coast on either side of Sydney, and about 150mi. inland from it. They form a saucer-like body, the productive rim of which outcrops towards the north, south and south-west. The three principal fields are situated on these outcrops: *viz.* the Greta seams between West Maitland and Cessnock, uhich extend for about 15mi. and form the most important coal mining district in Australia; the Illawarra (Southern) field round Bulli on the coast; and the Lithgow (Western) field, 9 jmi. from Sydney. The Maitland-Cessnock coal is excellent for gas making and household purposes, whilst the product of the other two fields is a very good steaming coal. A fourth field situated round Newcastle (Northern field) is now largely worked out. The production of coal from these fields reached a maximum of 11,500,000 tons in 1924, and after falling to 6,000,000 tons in 1931 reached 9,200,000 tons in 1936. Of the total quantity of coal won in New South Wales, the Northern field has produced about 68%, the Southern 21% and the Western 11%. The coal deposits of Queensland are scattered along the whole length of the eastern highlands, and include some anthracitic varieties, soft coal of Trias-Jurassic and Cretaceous age, and harder Permo-Carboniferous types. The Ipswich district (Trias-Jurassic) produces nearly half of the Queensland total, and other soft coal areas are Darling Downs (Trias-Jurassic) and Maryborough (Cretaceous). Attention is now being paid to the harder

varieties, the Bowen and Clermont districts being increasingly exploited. The 1936 output of about 1,000,000 tons was still below the peak production of 1929.

Victoria possesses fair quality coal of Jurassic age in South Gippsland. Production reached 400,000 tons in 1936. Of much more importance are the Morwell lignite deposits—78oft., the thickest known, which produced in 1936 over 3,000,000 tons of brown coal, all but 2,000 tons being produced by the state-owned open cut at Yallourn. The coal supplies the Melbourne district with light, power and fuel (briquettes).

Western Australia has scattered deposits of various geological ages, those at Collie and the Irwin river (Wilga) being Permo-Carboniferous. The Wilga field is unworked and the five collieries at Collie produced 560,000 tons (1936–37). Tasmania has some deposits of varying quality, chiefly in the north-east (production 1936, 130,000 tons). South Australia possesses lignite in certain regions (*e.g.*, Leigh Creek) but no exploitation has yet taken place, and she is dependent upon imported coal.

In spite of a recovery from economic depression the amount of coal mined in 1936 (11,370,000 tons; value £6,600,000) was still below the early post-war level of production (1924, 13,750,000 tons; value £11,600,000), and the change in value is a sufficient indication of altered conditions. There was formerly a considerable export trade in coal (1913, 2,000,000 tons) chiefly to the S. W. Pacific area, but owing to adverse conditions exports had diminished to 300,000 tons in 1936–37. The change-over to oil burning has also adversely affected the trade in bunker coal, which fell from 1,600,000 tons in 1913 to 600,000 in 1936–37. The remainder of the coal is consumed within Australia, but owing to the nearness of the coalfields to tide-water and the scarcity of land communications, a considerable amount of coal is moved by sea to the various states. The New South Wales fields supply almost all of the coal which moves by sea, either abroad or to other states, and Newcastle handles over 80% of this trade. In 1936–37 66% of New South Wales coal was consumed locally, 24% was exported to Australian ports, and 10% was exported abroad. The growth of metallurgical industries has resulted in an increased production of coke (1936, 893,000 tons New South Wales; 23,000 tons Queensland). With the development of Australian mining, imports of coal and coke (chiefly from Britain) are decreasing—yearly average of imports 1927–32, 190,000 tons; 1932–37, 14,000 tons. Deposits of oil shale exist in New South Wales and in Tasmania. Production commenced in 1939 at Newnes (N.S.W.), but the Tasmanian Oil Company ceased production in 1935, and it is doubtful whether oil-production will have any great development in Australia.

Metallurgical Industries.—Associated with ore-mining are concentrating and smelting processes, which often in themselves amount to considerable operations. In some instances, especially in Western Australia, difficulties of communications have led to the development of refining industries on the mining fields themselves, but the tendency is becoming increasingly common to carry out these activities at a few centres which have the advantages of cheap transport and abundant supplies of fuel, fluxes and raw material. Hence the greater part of the smelting industry is localized in New South Wales (at Port Kembla, Sydney and Newcastle) and handles ores from New Zealand and New Guinea as well as from the Commonwealth; ten factories (1937) in N.S.W. were smelting non-ferrous metals. Australian tin ores are smelted at Launceston, and the Electrolytic Zinc Co., of Risdon (Hobart) deals with ores from Broken Hill (N.S.W.), and Tasmania. Three other instances require special mention: (1) The smelting of Broken Hill silver-lead ore at Port Pirie (South Australia) 254mi. distant by rail, near the north-east extremity of Spencer's Gulf. The bulk of the ore is now sent direct to Port Pirie because fuel and fluxes are more cheaply available there. (2) The Broken Hill Proprietary Company began in 1915 to produce iron and steel at Pprt Waratah, near Newcastle (N.S.W.). The ore is obtained from Iron Knob (South Australia) 35mi. inland from Spencer's Gulf, where high-grade ore stands out as hills 400–600ft. high and is mined by open cut (1936 production, 1,887,000 tons). Limestone flux is derived from Melrose (north-west Tasmania), and coking coal from the Maitland (N.S.W.) field. An extension of the industry to South Australia is contemplated. The steel products formerly exported to South Africa are now absorbed by Australia herself, where the demand for steel products is increasing. (3) At Port Kembla the old established firm of Hoskins was joined by English companies to form the Australian Iron & Steel Co.; a large up-to-date plant has been erected at this port, which possesses outstanding geographical advantages for the assemblage, treatment and distribution of materials and products.

Australian production of iron and steel goods has been fostered by various bounty Acts, and by high tariffs, and is at present restricted to the state of New South Wales. In 1913 production was very small, but in 1937 900,000 tons of pig-iron, 1,000,000 tons of steel ingots and 800,000 tons of steel rails, bars, etc., were produced. This development has been accompanied by a corresponding growth in mechanical engineering—railway and other transport needs, agricultural implements and machinery—which is tending to make Australia independent of foreign supplies. In 1938 there were 1,037 engineering, and 437 smelting works in Australia, with an annual output valued at about £61,000,000.

Forestry.—Scientific forestry is of comparatively recent date in Australia, the establishment at Canberra (1926) by the Commonwealth Government of a national school of forestry marking an important stage in development. Although the greater part of the continent has some vegetation cover, latest estimates place the forest area at 19,500,000 acres (1·02% of the total area), a figure which is some 5,000,000 acres less than a former estimate (cf. Gt. Britain 5·4%, New Zealand 20·2%, United States 24·7%). By the end of 1937 16,900,000 acres had been preserved as State forests, and a further 8,000,000 acres of forest and bush had been placed under temporary reservation. In the past, land settlement has been the prime consideration; so that the more accessible areas have been cleared of timber, and a large proportion of the present forest reserves consists of mountainous slopes and highland ridges, especially in the Eastern States. Furthermore, unrestricted cutting for timber and fuel has depleted supplies, and recurring forest fires have caused considerable damage, particularly in New South Wales and Victoria. Wasteful methods have been employed in timber cutting and, although now reduced, losses during cutting have in the past amounted to as much as 60%. An annual consumption of 12cu.ft. per caput of wood for fuel is another factor of importance. Australian forests range from the tropical rain type (70in.-140in. average annual rainfall) in the north-east through sub-tropical to the temperate rain type. The 30in. isohyet can be taken as the limit of useful forest growth, and thus the forested areas occur only in certain coastal regions, and on parts of the Eastern Highlands, as well as over most of Tasmania. Indigenous softwoods are rare (less than 5% of the total) and occur chiefly in Queensland and northern New South Wales (bunya, hoop, Queensland Kauri and other pines, besides non-coniferous softwoods) and in Tasmania (huon, celery-top, King William pines). Both coniferous and broad-leaved types include valuable cabinet wood (*e.g.*, red cedar) and have been much exploited. In consequence, Australia finds it necessary to import a large quantity of her timber requirements: in 1936–37 timber products (including wood-pulp) were imported to the value of £2,257,000, and of this over 90% was for softwood (chiefly from Canada, Norway, Sweden and the United States). Efforts are being made to increase the home production of softwood by the cultivation of imported species (*e.g.*, the Monterey pine, *Pinus* insignis) (**v.** *inf.*). About 95% of the timber trees of Australia belong to the genus Eucalyptus, of which over 400 species are recognized. A belt of cypress trees is found along the south-eastern margins of the Eastern Highlands, and tropical cabinet woods occur in the north. The relatively large supplies, rapidity of growth, strength, durability, variety and freedom from insect growth render the hardwoods a valuable asset for constructional purposes, and thus they have been used somewhat unsparingly in Australia itself. Western Australian jarrah and karri have a wide reputation, and logs are exported chiefly to Gt. Britain, New Zealand, South Africa and China, to the value of about £1,000,000 annually. Attempts have been made to make Australia independent

of imported wood-pulp by the planting of the *Pinus insignis* in the south-east of the continent, and by the utilization of certain eucalyptic hardwoods. The efforts have met with some success, but Australia still imports (1936–37) over £400,000 worth of wood-pulp. Eucalypts, certain varieties in particular, yield valuable gums and oils. Eucalyptus oil has long been distilled, and in addition to the large quantities of the crude oil which are used in ore-concentration (flotation process) there is an export trade (from Victoria) to Great Britain and Germany which in 1936–37 reached £80,000. Other forest products include various tan-barks, which are obtained chiefly from various species of wattle. After the War of 1914–18, the wattle supplies became greatly depleted, and for a time Australia had to rely on importations from Natal, derived from plants originally introduced from Australia. Since 1928, however, Australian exports of tan-bark (chiefly to Europe) have exceeded imports, although the latter are still considerable (1936–37, imports £6,600; exports £8,400). Another important product is sandalwood, which is exported from Western Australia to China (1936–37, £106,000).

Trees and forests fulfil a more general function, that of checking erosion, regulating run-off and fixing loose earth, which in a country such as Australia is an exceedingly valuable one. Regulating legislation exists (*e.g.* as regards forest fires), but federal supervision is lacking, and much remains to be done through the medium of scientific forestry. It is estimated that under proper treatment the forest resources could supply the needs of a population of 22½ millions, but at the present time timber imports exceed exports by £1,200,000, and the total annual forest production is valued at only £7,300,000.

Fisheries. — Although Australia possesses a wide variety of fish and inland waters have been enriched by the introduction of new stocks, development in the fishing industry has been slow. Inland fishing is largely a sporting activity, and sea fishing, though continuous and even systematic in certain areas, has hitherto been insufficiently organized on a large scale. In an attempt to remedy these defects, governmental regulations have been framed restricting the exploitation of the fishing grounds, and subjecting all large catches to inspection. In certain instances (*e.g.* in New South Wales and Queensland) state governments have improved local conditions, and state trawling has been carried on since 1919. A fishery research vessel was put into commission in 1938, and a laboratory and research station was opened at Port Hacking (N. S. W.) in 1939 — indications that efforts are being made to develop the industry on a scale commensurate with natural resources. Two good fishing grounds are known, one c. 200 sq.m. in area lying south-east from Sydney Heads, the other c. 300 sq.m. situated to the north-east of Cape Howe. Here in 30–75 fathoms, over a floor open but with rocky patches, excellent results have been obtained first by the New South Wales government and later by private trawling enterprise. It is believed that the grounds south of Victoria (Bass Strait) and in the Great Australian bight will prove equally productive, and the shallow seas to the north of the continent offer further potentialities. Catches from the two previously mentioned grounds are sold chiefly in the Sydney, Melbourne, and South Queensland markets. Fishing of another type is carried on in the estuaries and bays of New South Wales and Victoria (Port Phillip). Oyster breeding is of some importance but is virtually restricted to New South Wales and Queensland. Difficulties of transport and marketing. and irregularity of supply have been serious obstacles to the development of the industry, and as a result per caput consumption is rather low (c. 13 lb. per annum; cf. Great Britain c. 42 lb.) In 1936–37 the total Australian catch was valued at £1,369,000 of which New South Wales produced £660,000, Victoria £204,000, and South Australia £200,000.

At various parts along the north and north-west coasts from Cape York to Shark's Bay and particularly along the Great Barrier Reef, pearl oysters, btche-de-mer (trepang), turtle, etc. are obtained. The boats engaged in this work numbered 221 in 1937 (Queensland 95, Western Australia 90) with *c.* 2.000 men. It is stipulated that wherever Asiatic labour is used the boat must be owned and managed by Europeans, and it is only on these conditions that permits to introduce Asiatic labour are granted. Pearl-shell (with pearls, trepang, etc. as by-products) was obtained to the value of £340,000 in 1937 (pearls £5,000, trepang £6,000), and turtle and trochus shell produced was valued at £52,000. Exports of pearl-shell in 1937–38 were valued at £345,580 The pearl oysters live at depths of 4–20 fathoms, but are mainly collected at 7–8 fathoms. In the west, Broome is the chief centre; on the east, Thursday Island in Torres Straits. During 1936–37 fish valued at £1,540,000 was imported into Australia, the greater part being tinned, and consisting chiefly of salmon (from Canada), herrings (from Great Britain), and sardines (from Norway). In view of the fact that in 1936–37 the value of imports exceeded the total value of Australian production by about £200,000, indications that the fishing industry is being systematically, if slowly, developed by the Commonwealth are encouraging; but the situation outlined above makes it very evident that there is a great deal still to be done before a really satisfactory result can be achieved.

PASTORAL AND AGRICULTURAL INDUSTRIES

Pastoralism is one of the oldest, historically most interesting, and economically most important industries in Australia. About 55% of the Commonwealth is estimated to be available for pastoral pursuits only (mining value apart), and although price levels have fallen greatly during the last decade, the value of production is approaching the former average of £110 million per annum (1936–37, £105 million) and the industry produces 23% of the national wealth, coming second only to manufacturing (38%). (With dairying and allied industries included the relative figures are £155 million and 33%). The importance of the industry in Australia's export trade is even more marked: the average annual exports (1927–37) are about £61 million—51% of total export values (with dairying included, £71 million and 60%). Agricultural exports (24%) are therefore second in importance. In this result climatic conditions play a large part. The climate of Australia is on the whole favourable to stock. At the same time regional and local climatic differences give rise to differentiations, *e.g.,* as between the cattle (meat), sheep and dairying industries (and cf. differentiation in breeds of sheep). Aridity sets severe limits; some 20% (*c.* 600,000 sq m) of the total area has at present little value, even as pastoral land, and in another 20% the conditions have proved more or less precarious. Droughts are an undoubted disadvantage; they recur irregularly, but on an average perhaps once in every 4 or 5 years. In one year (1894–95) one station on the Darling is said to have lost 90,000 out of 276,000 sheep. In the two years' drought which prevailed in Queensland (1926–28), 8 to 10 million sheep and 2 million cattle were lost — (total loss some £15–16 million). At the same time they are seldom universal; they interdict growth and enforce rest, and are followed by vigorous recuperative periods. They exercise a severely selective effect on vegetation and thus restrict the natural fodder to certain types. Economically they are perhaps no worse than the grasshoppers and locust visitations of Uruguay and the Argentine and perhaps less handicapping than the annual snows of Canada. Artesian and sub-artesian waters have increased and stabilized the carrying capacity over wide areas, while, as Government wells along the great overland stock-routes, they constitute essential links in lines of movement. Droughts are also being fought by conservation of water and of fodder (hay and ensilage), by improvement of transport, removal of stock to unaffected areas, and by avoiding overstocking in periods of plenty. Australia is well endowed with natural fodders many of which are highly nutritious and also either drought-resisting or capable of rapid growth upon the advent of rains. The value of Australian salt-bush as a dry area fodder has led to its cultivation in *e.g.,* the Union of South Africa. On the other hand native noxious plants (poison plants; burrs. etc.), though not very plentiful, exist and their numbers have been greatly augmented by imported varieties. More important, perhaps, is the selective action of the climate (v. sup.). Thus certain Australian fodders may be deficient in essential constituents (*e.g.,* phosphorus). Moreover the tendency of stock is to denude, to "eat out" the best fodder-plants, to spread pests, puddle clayey soils (cattle in particular), break up light ones, upset drainage,

start erosion, and generally to disarrange the natural balance and impoverish feeding grounds. Droughts and rabbits aid these processes. Moreover "artificial" fodders have not been used to the same extent as, for instance, in the United States or New Zealand. The use of these, however, is increasing and, in general, more attention is being paid to the conservation and improvement of pastures. Careful breeding is needed to maintain the standard of Australian flocks and herds. Here, also, regional differentiation comes into play and breeding stock from Tasmania, etc., mill be imported to New South Wales or Queensland. The pastoral industry in Australia has many scourges (blow-fly [sheep]; tick [cattle] ; pleuro-pneumonia, etc.). Dingoes still cause immense aggregate loss in the "back-blocks" and beyond: the loss in Queensland alone is estimated at some £100,000 per annum. They breed in the cattle country, where they are more or less ignored, and invade the sheep areas and even the outlying farm lands. They have even made certain areas impossible for sheep and have led to cattle being substituted for these. Though difficult to master they are perhaps slowly yielding to the advance of settlement. Not so the rabbit. Spreading like a flood over vast areas of country, rabbits eat up the pasture, ring-bark trees; devour seedlings, intensify the effects of drought and reduce the stock-carrying capacity of the Commonwealth by perhaps one-fifth. Vast sums have been spent in fencing, trapping, poisoning, etc. Extermination plans have lacked the large scale organization necessary for complete success, and although in operation for over 10 years, exports of frozen rabbits and their skins have recently tended to increase (1932–33 £1,000,000—1935–36 £2,000,000).

The general flatness of Australia greatly favours the pastoral industry. While in a sense size is essential to the industry, it also often implies great distances and involves special problems of movement and transportation. Drovers in the north charge for droving cattle per hundred miles. Where coastal highlands interpose steep gradients, the cattle industry is at a disadvantage as compared with the Argentine or New Zealand where a flatter terrain, a denser railway net, or shorter distances are present singly or in combination. The distance of Australia from its present chief markets in northwest Europe also entails special problems for the meat export trade, as well as for the dairying industry. Pastoralism in Australia is steadily following the general lines of evolution of this industry. On the one hand are the enormous pastoral holdings, millions of acres, unfenced save for the "home" paddocks, provided with natural water only and natural pasture; carrying flocks and herds numbering some hundreds of thousands but having a low average density both of animal and human population (*e.g.*, 4–5 head cattle, 25–100 sheep per square mile; on the northern cattle runs, one white man, assisted perhaps by aboriginal stock hands, per 500 square miles). Droughts are severely felt; distances to market are often great; much risk and speculation is entailed but occasional rich fortunes are made. At the other end — (omitting dairying) is stock-raising as an element in mixed farming. Here sheep — not cattle as yet to any extent — form an integral part of the rotation system. Individual holdings and flocks are small but the aggregate number of head that can be carried is great. Somewhere between these extremes lies the bulk of Australian pastoralism to-day. But size is relative and distinctions must be drawn. Cattle require more food and room than sheep (*v. inf.*). Much depends on the class of country, and also on position in relation to markets. Thus in North Queensland 20–35,000 acres of land are considered necessary, but nearer markets 10,000 acres suffice. But broadly speaking the tendency is to restrict areas, and to this end legislation in the various States has steadily tended. Along with this goes the effort to intensify methods and stabilize production and returns. Fencing, water and fodder conservation, pasture improvement, scientific breeding and management, disease and pest-elimination or control, improved transport, handling and marketing are all making gradual headway. Physical, economic and also some political difficulties remain, but the industry is steadily emerging from the old "gambling stage" (especially since the advent of cold storage), and gives promise.

Sheep, cattle and horses are the pillars of Australian pastoral wealth. Horse-breeding is associated to a considerable extent with the other branches of the pastoral industry and also with agriculture. Australian conditions suit horses, and by careful breeding fine types have been evolved suitable to varying localities and needs. Notable is the endurance of Australian horses under hot and dry conditions, as was proved in Egypt and Palestine in the World War and by their export to India for army remounts. This export has however declined from 18,000 (1901) to 4,000 (1937). Australian horses total about $1\frac{3}{4}$ million, of which New South Wales possesses 32%, Queensland 25% and Victoria 20%.

Sheep. — Sheep constitute by far the most important single element in the pastoral industry. In 1937 Australia (with 114 million) possessed the greatest number of any country in the world. The annual export of sheep products has averaged (5 years to 1937) about £54 million (total exports of pastoral industry over same period averaged £71 4 millions, inclusive of dairy products). Australia, possessing about one sixth of the world's sheep, produces about a quarter of the world's wool, and exports wool valued at about £55 million, *i.e.* about 80% of the total export values of the whole pastoral industry and 35–45% (value) of Australia's total exports. The chief sheep areas are disposed in a belt some 300 miles broad which runs from about central Queensland roughly parallel with the east and south coasts, but well inland, until it meets the coast in the south-west of Victoria. Other areas lie east and north of the South Australian "gulf" region, in Eyre's peninsula and in a belt extending from above Albany to Pilbara and into the Kimberleys in Western Australia. From the coastal regions sheep are largely excluded by humidity which induces footrot and other ailments, but also by agriculture and dairying. Sheep are increasingly kept in the drier farming areas where they afford a valuable safety element. Sheep in their turn tend to displace cattle. Thus the sheep belt, while it largely interpenetrates the wheat belt, is markedly antithetical to the cattle areas. On the whole sheep seem to do best where the average temperatures are about 65–75° and where the average annual rainfall is 20–35 in.; in such parts the average densities amount to 100–200 head per square mile. The distribution of sheep was in 1936 as follows: New South Wales 48%, Victoria 16%, Queensland 18%, South Australia 7%, Western Australia 8%, Tasmania 2%, of a total of 114 million head. Western Australia has suffered a setback owing to drought. Most important also is the differentiation and specialization within the industry. On the economic side the issue is between meat and wool, broadly between the merino (fine wool and carcase — c. 46 lb.) and cross-bred (coarse wool and carcase — c. 60 lb.). The production of cross-bred wool has in recent years fluctuated, but comprises about 15–20% of the wool marketed, the remainder being merino. There is a continuous demand for these fine wools, and since Australia is specially suited for producing them, output is maintained, and about half the world's supply of merino wool now comes from the Commonwealth, its supremacy being securely established. At the same time the cross-bred, with the all-round returns (wool, mutton, fat, lambs) fits better into the farming regime. The farming areas also have a damper climate which cross-breds can better stand. Merinos do better in large flocks on the open plains with natural pastures. Australians eat 70 lb. of mutton and lamb per caput per annum; the home market is therefore considerable--of 18 million head slaughtered in 1936 (480 million lb.), 70% was consumed locally. Hence the attempt to stabilize the "dual-purpose" animal; the evolution of a special type, the Corriedale; and the effort to secure in cross-breds maximum bulk combined with the finest possible quality wool. Australian wools are as a whole unrivalled, and have occasionally fetched remarkable prices. The average weight of fleece has been raised to *c.* 8 lb. (prize fleeces: 30–40 lb.) and, with the advent of the shearing machine, shearing and its attendant processes have reached a high degree of technical efficiency. Shearing, owing to the size of Australia and the range of the climate, goes on virtually the whole year. The sheep are sheared, dipped, branded; the wool is baled, loaded on wagons or, in the far interior, on camels, and transported often many hundreds of miles Motor transport, however, is becoming

increasingly common. Practically the whole of the Australian clip is now sold in Australia, the markets—which are held in all the capitals and in some other towns as well (*e.g.*, Albury; Geelong)—being visited by buyers from the great wool-consuming countries. Of the total clip Australia now retains about 7% for home consumption, and the remainder is exported (90% in the "greasy" unscoured state) chiefly to Great Britain (39%), Japan (17%), France (16%) and Belgium (15%). Of the total wool imports of the United Kingdom, Australian wool forms 37% in quantity and 44% in value. Compared with this export trade other branches of the industry (*e.g.* frozen lamb and mutton trade; trade in skins, etc.) are of much less importance. (Total value of lamb and mutton exports 1936–37, £5.1 million). More important is the Australian woollen manufacturing industry, which has grown considerably, especially since the World War (1914–18). In 1926 the 45 million lb. of wool supplied 50 woollen and tweed mills, situated mainly in the capitals and larger towns. In 1939 there were 90 mills (52 of which were in Victoria), as well as 297 hosiery and knitting mills. The value of the output reached £12·2 million in 1936–37.

Cattle.—Though Australia is a first-class natural cattle-country the cattle industry has never attained a position comparable with that of sheep and wool. The reasons are complex and difficult to define. A "pioneer" industry, it has held, dairying excepted, mainly to the outskirts of settlement and civilization. Here large areas of sheep land have been available, while the adaptability and mobility of cattle maintain them under conditions intolerable for sheep. Thus cattle in Australia show a notably wide distribution, from the cool districts of the south to the tropical north, from the coastal lands of the east (dairying) well into the dry interior. Only aridity seems to set limits, for cattle, to attain condition, require plentiful nourishing fodder and, ideally, should not have to walk more than 2½ miles to water—(they can, and do. go further). Thus (meat) cattle have been slowly forced back by wheat and sheep into remoter or rougher country and so far little attempt has been made to fit them, like sheep, into a mixed farming system. Hence Queensland has the greatest cattle population (5·9 million head out of a Commonwealth total of c. 13–14 million—44%. Cattle max. 1921: 14·4 million), and in this State meat cattle hold the field everywhere except in the south-east (dairying) parts and in the central and central-south sheep areas. So, too, the North Territory and north-west west Australia (notably Fitzroy and Victoria river basins and Barkly tableland) have a relatively large cattle population and in these areas are some of the greatest natural cattle areas of the world. Dairy cattle, in contrast, occupy fairly clearly marked areas (mainly coastal) in South-east Queensland and north-east and east New South Wales, and also in Victoria and Tasmania. (Reckoning in dairy cattle, New South Wales has one million head—33%: Victoria has ·9 million—30%. of Australia's cattle). In the remoter parts conditions are relatively primitive, though artesian bores have been provided in Western Queensland and on the Barkly tableland. At the same time white labour is costly and mustering, droving, etc., are expensive. Droughts have consequently been severely felt and their ravages are evidenced by the fluctuations in numbers of head (1894–1902: 12 million–7 million—42% loss) Nor has much money or attention been devoted to scientific breeding and the quality of animal and of meat has suffered. Long droving and rail distances, uneconomic methods of handling and transporting, high transportation costs also operate detrimentally in parts. Australia consumes nearly 81% of her total beef production (average for 3 years ending 1937—1,200 million lb., ann. per caput consumption: 140–160lb.—*cf.* United Kingdom 641b), but in respect of exports she is at a disadvantage as compared with her competitors—notably the Argentine. Until 1932 she could send practically none of her exports to the United Kingdom chilled, and chilled is preferred to frozen meat. The Australian meat-freezing industry, moreover, is carried on in many small and widely separated works and this increases costs and difficulties of transport. The Western Australian Government freezing works at Wyndham are among the most successful. Operating for 6 months (April–September. *i.e.*, during the dry season) they deal with some 25,000 head of cattle. employ 200–300 hands and maintain the pastoral industry in this region. Australian exports of meat have fluctuated considerably (average for period 1932–37: £2½ million); her hide exports are valued at (1937) £900,000 per annum. The bulk of these exports goes to the United Kingdom, the USA., and some European countries.

Dairying.—Dairying is geographically and economically fairly distinct from the cattle industry. It has made great progress in recent years and it has an assured market in the United Kingdom which can but improve, especially if certain transportation problems can be solved. The warm, "open-air" climate is in general favourable, but, though dairying is carried on inland in conjunction with mixed (wheat and sheep) farming, the tendency has been to concentrate in the areas of assured and plentiful rainfall and also near the great city markets and export facilities. Thus while the coastal parts of New South Wales (particularly in the north) and of south-east Queensland have shown marked increases of production, the inland areas in many cases have shown little or no advance. In Victoria also the chief dairying districts lie along the south coast. Thanks to stringent and efficient Government regulation and encouragement (both as regards production and marketing), to careful breeding and the adoption of scientific-and co-operative methods, the yield of milk and the output and export of high-grade butter—recently of cheese and concentrated milk also—has increased. The home consumption is very high (c. 30lb. butter and cheese per caput: cf. United Kingdom *c.* 25lb.) and production varies greatly with the season, but taking butter as a general index of the dairy industry as a whole, out of a total production varying between 396–469 million lb. (5 years 1932–37), Australian (net) exports amounted to 174–262 million lb. valued at £8–£10 million. More or less closely associated with dairying are pig-rearing, poultry and bee-keeping. Of these products the first-named are consumed almost entirely in Australia. The total value of dairying productions averaged, during the period 1932–37, £25 million, while exports during the same period have ranged from £9–£11 million. In 1936–37 Australia supplied 14% of the total butter imports of the United Kingdom; New Zealand (£15·3 million) and Denmark (£11·9 million) alone exceeding this figure.

Agriculture.—Agriculture has advanced to the third place amongst the major Australian industries (£75–90 million—c. 20% of total annual production of all industries), in spite of fluctuations of seasons. Teaching and research and Government agricultural departments have done much to solve local problems. The physical problems are those of adaptation to climate and soil; nearly 80% of the cultivated area is now regularly manured, largely by superphosphate manufdctured in Australia from rock imported largely from Nauru and the Gilbert and Ellice Islands (Fertilizer imports: *c.* £1 million of which c. 70%—rock phosphate, milled in some 100 factories.) Light soils, so wide-spread in Australia, are successfully worked by use of fertilizers, "dry" and mixed farming methods, etc. Mixed farming, fodder cultivation and conservation (ensilage, etc.) are also extending as a provision against droughts and will gradually introduce greater stability, and irrigation agriculture is being studied. Grading, transport and marketing are being improved, and co-operative methods are gaining ground (cf. wheat and cotton pools). This introduces another aspect of the question. The total area under cultivation has steadily expanded to c. 20 million acres (1% of the total area of the Commonwealth. Of their respective total areas Victoria has *c.* 8·5% under cultivation; New South Wales, 2·5%; Tasmania 1·6%; South Australia 1·5%), and the productivity has correspondingly advanced (v. sup.). The total number of population engaged in agriculture has however declined, especially during the last few years (1913, 211,000; 1923, 202,000; 1936–37, 190,000), and thus, with an extension in the cultivated area and increased efficiency in production, far fewer people are retained on the land. Australian farming still favours extensive methods. Wheat occupies *c.* 60% of the total cultivated area, the recent expansion of which is mainly due to increased wheat production: mixed farming, on the other hand, has made little corresponding progress.

Whereas in Europe hay is derived chiefly from meadow and other grasses, the drier climate and more variable rainfall of Australia necessitate its cultivation by plough. The 3 million acres normally under hay (15% of total cultivated area, annual yield 3–4 million tons) consist predominantly of wheat, oats and lucerne, while the same crops and some others are cut as green forage (½–1 million acres). Moreover, in bad seasons, or if prices fall, crops intended for grain will be cut for green forage or for hay, so that the dividing line between agriculture and pastoralism is fluctuating as well as indefinite. Australian agriculture exhibits broad differentiation into tropical, sub-tropical and temperate types, though each of these retains distinctly Australian features and there is more or less overlapping and interpenetration. (Vide individual States.)

Wheat. — In recent years, in spite of occasional adverse seasons and markets, the area under cultivation has advanced (1936–37) to c. 12·3 million acres representing c. 60% of the total cultivated area — (giving a yield of 12·9 bushels per acre) — and the total value of the crop to £30–40 million. As with sheep, wheat has been gradually forced away from the moister coastal areas — where rust works damage and where dairy and mixed farming are more profitable — and it now occupies a belt which follows roughly the direction of the coast-line from the Darling Downs (Queensland) along the west and south-west slopes of the New South Wales highlands, across central north and north-west Victoria to Yorke and Eyre's peninsulas (South Australia), in which State it impinges on the coast. It is resumed in south-west Australia where it forms an inland belt running south-east — north-west, also roughly parallel with the coast, but meeting it near Geraldton. Artificial manuring (superphosphates); the 3 year rotation grain-grazing-bare fallow, the latter associated in drier areas with moisture-conservation methods of tillage (dry-farming); improved types of wheat, the product of scientific breeding, have all contributed to the progress of wheat-growing. Winter rainfall (April to October) determines cultivation limits. By far the greater part of the wheat-belt, therefore, is bounded outwards by the 20 in., and inwards by the 10 in. winter rainfall line. Consequently New South Wales (c. 4 million acres; 48–78 million bushels), Victoria (3·2 million acres; 30–50 million bushels), South Australia (3.5 million acres; 27–45 million bushels), Western Australia (3·1 million acres; 20–40 million bushels), are the chief wheat-growing States. The areas of heaviest production are in South Australia (north from Adelaide) and in New South Wales (a strip c. 100 miles wide extending from Dubbo to Albury), but production in Western Australia is rapidly increasing (1937–38: 3 million acres; 36 million bushels). Yields in places (*e.g.*, South Australia; and in mixed farming practice) reach 30–40 bushels, but cultivation is generally extensive and yields vary greatly according to rainfall (e g., the Victorian farmer gets c. 1 bushel per acre for every 1 in. [winter] fall). The average yield is between 12 and 13 bushels per acre; the quality, however, is high and Australian hard wheats command good prices (5s.od. per bushel, 1937). The fact that the total production of wheat, in spite of bad seasons, has averaged 162 million bushels during the last 5 years (Max. 1932–33: 214 millions) indicates increasing skill and the elimination of risk. Of this total an annual average of nearly 54 million bushels (8·19 bushels per caput of population) is retained for seed or food, the remainder being exported. In the period 1932–33—1936–37 exports of wheat varied between 61.6 and 119·5 million bushels of which 33.9% (in the aggregate) went to the United Kingdom. This total includes small quantities of flour (the total exports of which in the season 1937–38 were valued at £6,052,321). As labour and transport conditions gradually improve, as farming becomes more intensive and markets expand, Australia, which has perhaps some, half million square miles of available wheat lands, will doubtless very largely increase her production of wheat.

Other Grains and Root Crops. — Besides a variety of minor grain and legume cultures oats (1.5 million acres: 16.6 million bushels) are produced chiefly in Victoria, all but c. 2 million bushels (oatmeal) being used as grain food for cattle. Barley (85% malting barley) cultivation is increasing in South Australia (65%) and Victoria (21%) and 2½–3 million bushels are exported annually. *Maize*, grown for grain mainly in the sugar areas (***v.*** *inf.*) gives good returns, but its cultivation (300,000 acres: 7.8 million bushels) has declined and quantities are now imported annually (South Africa). With improved methods and the development of the tropical north, production will probably expand. Interesting is the attempt to develop the Australian production of rice, the cultivation of which in the (Murray-Darling) irrigation areas, fostered by a customs duty, is expanding (1926–27: 5,100 acres; 1936–37: 23,000 acres). Root crops play a smaller part in Australian arable farming than they do in North-west Europe. Potatoes, for which the soils and climate of Victoria and Tasmania are admirably suited, have been neglected in recent years. Production varies (1936–37: 364,000 tons; £2 million) but with improved methods these figures could be considerably increased. Sugar-beet is grown to some extent in Victoria and efforts are being made to stimulate production, so far with no marked success.

Sugar, Cotton, Tobacco. — Sugar and cotton both require freedom from frost, considerable warmth and moisture for their growth; prefer rich soils; repay scientific cultivation (manuring, pest-control, etc.); demand much labour particularly at specific seasons. Both industries have secondary industries associated with them (crushing and refining; ginning) and are markedly dependent upon world-market conditions. In Australia, further, both represent a patriotic attempt to achieve national independence (cf. rice, and woollen manufacturing industry [v. sup.]), to vindicate the feasibility of the "white Australia" policy and the superiority of the "small" free owner-cultivator as against the coloured labour plantation system. They have thus greater significance than their actual status might imply, though perhaps not more than their undoubted prospects warrant.

Sugar is grown in areas scattered down the east coast of Queensland (notably Cairns, Mackay, Bundaberg) and in north coastal New South Wales (Grafton-Lismore). The climate is suitable, the alluvial soils rich, there is plenty of room for expansion, and this has, on the whole, been steady (1936–37; total acreage: 318,000 acres [90% in Queensland], of which 230,000 acres were actually producing). Cultivation has been increasing in New South Wales where the yield is higher (24·3 tons cane per acre; cf. Queensland 18·7 tons). The total annual production has averaged (10 years) c. 600,000 tons sugar (from 4.35 million tons cane. Max. production: 1936–37: 782,000 tons from over 4 million tons cane). Of this output c. 50% is consumed in Australia (111 lb. per caput) and the remainder is exported. The industry enjoys Commonwealth protection and support without which, since the abolition of coloured labour, it could not survive. Australia at present pays several millions yearly for its "white" sugar industry, and the keeping of the export sugar prices down to a competitive level involves considerable difficulties. These might be solved either by full preference in the United Kingdom or by a voluntary world limitation of output. Associated with this agricultural industry is the milling of cane (c. 36 mills, almost all in Queensland). Of the products, raw sugar, molasses, etc. (annual value c. £10 million) the raw-sugar is refined in 7 refineries (2 each in Queensland and Victoria; 1 each in South Australia, Western Australia and New South Wales).

Cotton can probably be grown along a coastal strip extending from Newcastle (New South Wales) to Bundaberg (Queensland) and in a belt stretching across the base of Cape York Peninsula through the Northern Territory to the Victoria River basin. Post-war conditions — particularly the Empire cotton-growing campaign — have stimulated production. The planters are small-holders using, often, family labour. The area planted (Queensland only) rose (1936) to 62,000 acres (19·2 million lb.) but the infant industry is sensitive to physical (climatic) and economic (world-market) conditions and there have been many fluctuations. Stringent Government control (seed, planting, ginning, etc) is exercised, and Government also assists both production and marketing and also the nascent cotton-manufacturing industry.

Tobacco of excellent quality can be grown in Australia, and **a** serious attempt to expand production has recently taken place;

as a result, although many fluctuations have occurred, output has risen from 1·6 million lb. (1926–30) to 6·5 million lb. (1931–35).

Vines and Fruit. — These represent one of the most valuable and interesting minor specializations of Australia, the production of which holds out great promise. Vines grow mainly in South Australia and Victoria (Commonwealth acreage, 1936–37: 120,000: South Australia 56,000; Victoria 41,000) where the climate is admirably suited to them. After considerable difficulties Australian wines, supported by a Commonwealth bounty, have gained a footing in external (mainly the United Kingdom and New Zealand) markets (Exports, 1936–37: £1,000,000). Of increasing value also has been the production and export of raisins and currants (chiefly from Victoria). The export trade depends largely upon the British market but the average annual (net) export is valued at £1·5 million.

Fruit-growing fairly accurately represents climatic conditions in Australia and ranges from bananas, pineapples, etc. in Queensland to apples, berry-fruits, etc. in Tasmania, but a larger denominator comprising both sub-tropical (oranges, lemons, peaches, apricots) and "northern" (pears, plums, cherries, etc.) fruits is common to all states according to local position and climate. The industry, subject largely to the capacity of British markets, is capable of great expansion, and improved methods of culture and marketing are now being achieved. The trade has expanded in both fresh and dried fruits (1936–37: f3.4 million; of which £1·3 million was for apples and £2 million for dried fruits).

Irrigation. — The extensive water-conservation works of Australia supply water either for domestic use in urban or rural (farming) districts, for stock (*e* g., north andnorth-west Victoria), or for irrigation purposes. The development of irrigation, an obvious consequence of the warm climate and erratic rainfall, is taking place chiefly along, and in connection with, the east highland belt from Queensland to Victoria. In Queensland the roomier valleys and larger streams of the east are encouraging large-scale developments (Dawson river scheme) on the coastward side but in New South Wales and Victoria the relief and drainage generally favour the inland flank. Exceptions are the irrigation areas of Victoria south of the Dividing Range (Werribee; Macallister), and perhaps also the South Australian (Lower Murray) areas. The highland and valley configuration give considerable catchment areas (Dawson river: 9,000 square miles; Murrumbidgee: 5,000 square miles; Lachlan: 3,200 square miles, above dam sites) and rainfall, though fluctuating, is adequate on the highlands (*e.g.*, Goulbourn, Victoria valley: 20–52 in.). The valleys, often long, deep and conveniently narrow at the mouth. afford dam and reservoir sites. The alluvial soil of the valley-floors and plains is mostly rich and the hot sunny climate suits fruit and other cultures. Transport distances and facilities, if not ideal, are not prohibitive (cf. Central Murray to Melbourne; Upper Murrumbidgee to Sydney; Lower Murray to Adelaide).

Thus there has grown up, upon the basis of early private undertakings, the characteristic conservation and irrigation and similar public commissions. Victoria has the superior physical position and, with some 519,000 acres actually occupied, takes precedence as an irrigation state; New South Wales has some 152,000 acres occupied; South Australia has large areas, and Queensland is developing one large (Dawson river) and some smaller schemes. The most noted dams are the Burrinjuck (Upper Murrumbidgee, New South Wales) which is designed to impound some 20 square miles and to water well over 1½ million acres. Besides the old and flourishing Mildura settlement, Victoria has extensive schemes along the Murray and its tributaries (Goulbourn system: c. 1 million acres), and in South Australia besides Renmark a series of irrigation and drainage works have lined the lower Murray for many miles with growing settlements. In the upper reaches the supply of water is by gravitation; lower down pumping is necessary. Besides vines (grapes, raisins, currants) and fruits and vegetables of various kinds, these irrigation areas are engaging in fodder (lucerne) growing and in dairying, in fruit-canning and other activities. Finance bulks largely in these schemes which also depend upon expansion of markets, since they produce far in excess of Australia's home demands. Closely connected with them is the extensive program for regulating and locking the Murray river (*q.v.*), and the great Hume reservoir which will open up a further extensive area.

MANUFACTURING INDUSTRY

Australia desires to employ her own nationals in working up her own raw materials. In 1911 368,000 people were engaged in industry, and 450,000 in 1929. During the economic crisis the number fell by over 25% to 336,000, but since 1932, employment has increased by about 8% per annum, and over 523,000 persons were employed in 1936–37, the highest total ever recorded. The (net) value of manufactured products, which in 1915 was f 59 million, had by 1936–37 risen to three times that figure, namely £177 million. In 1925–26 the figure was f143 million. In producing over 37% of the total, industry now occupies the leading position as a winner of national wealth. It is true that in Australia many very small concerns are classed as "factories," as are others which use no mechanical power. Thus (1936–37) there were some 20,000 factories (out of a total 25,600 = 82%), employing between them nearly $ of all the operatives in Australia, which individually had under 20 hands (average 5·8 hands). Similarly, 7% of all the factories use no mechanical power. On the other hand, there are about 895 factories employing an average of 280 hands each (250,000 operatives out of a total of 523,000 in Australia). Manufacturing is largely concentrated in or near the capital cities (*i.e.*, on or near the coasts), where markets, labour, fuel, transport facilities and raw materials are, if not cheap, more readily available. It is also mainly connected with primary production. Thus from pastoralism arise meat preserving (freezing, etc.); fell-mongering and wool-scouring, tarring, boot-making, soap- and candle-making, textile and clothing industries; from agriculture, flour, sugar (raw and refined), jam, biscuits, beer, etc.; from dairying, butter, cheese, bacon, etc.; from forestry, lumber (saw-milling), furniture; from mining, concentrates, pig-iron and steel, coke, gas, foundry and engineering products (agricultural implements); electric light and power. Somewhat more complex are vehicle construction (wagons, etc.; motors; cycles); railway and tram construction; electrical machinery, printing, etc.

Power is derived almost entirely from coal and applied through the medium of steam (31%) or, increasingly, electricity (64%). Gas, oil and water-power are naturally little in evidence. Hence New South Wales, with its resources in coal, raw materials and population is the leading industrial State. It has the most (364) large concerns, employs the greatest horse power (513,000) and number of hands (211,000) chiefly in the manufacturing of metallurgical, food and drink and (woollen) textile products (As long ago as 1928 a Sydney firm secured a large contract [£500,000] for the construction of high-power locomotives.) Its (net) output (£76 million) represents 43.5% of the total manufacturing output of Australia. Victoria is not far behind in natural advantages or in development (345 larger concerns; 429,000 horse power; 192,000 hands) but its chief industry is (woollen) textiles, food and metallurgical industries coming next. (Output: f 58 million [net] = 30% of total.) Australian industry works almost entirely for the home market (*i.e.*, not reckoning made-up dairy products — butter, cheese, bacon, etc.—as manufactures). Only about 5% of the goods manufactured are exported and these form only *c.* 4.5% of the total exports in value. The industry thus reflects in some degree the standard of wealth and comfort in the Commonwealth, for amongst the most important products are food and drink, textiles, furniture, heat and light, while the metallurgical industry, the most important of all, works for self-sufficiency in the basic requirements of practically all the other industries.

Foreign Trade.—Since the advent of Federation abolished inter-State customs, overseas trade alone comes into consideration. The total foreign trade of Australia during the 5 years 1932–33—1937–38 ranged from £135 million to £225 million per annum; (1937–38: f 225 million; Max 1924–25: £319 million), or an average of *c.* £30 per head per annum (1937–38: £34 17.0). The fall in the aggregate value of Australian trade is in part due to the drop in commodity prices after 1929 Of this trade by far the

greatest bulk is composed of exports of Australian products and imports for domestic consumption, since the transit (re-export) trade of Australia amounts to no more than some £2 million per annum.

From 1892 to 1919–20 Australian exports normally exceeded imports; until 1930 the reverse was normal. Since 1930 exports have again exceeded imports (in 1936–37 by £44,000,000). New South Wales and Victoria have approximately 42% and 29% respectively of the total trade, South Australia and Queensland having each some 10%.

Exports. — Exports have varied in value from £104 million (1930–31) to £157 million (1937–38) (Australian currency) compared with £134 million (1921) to £141 million (1929) in the pre-depression period. Of these totals about £2.5 million represents re-exports, and some £2–3 million per annum, not included above, represents ships' stores. During the decade 1926–27 to 1936–37 the pastoral industry provided (chiefly in the form of wool) over 51% of the value of the total exports; agriculture over 24% (mainly wheat and flour); mining, 10·3%; dairying. 8.9%; forestry and fisheries, 1·1%; manufacturing, 4%. Exports classed as primary produce thus amount to 96% in value, Australia exporting 46·8% (value) of all its primary products, and only 3.4% of its manufactured products. The above figures, however, since they represent values, include the effect of price changes, *i.e.* the lower values of Australian exports in recent years do not altogether denote a corresponding decrease in quantities (*e.g.,* index numbers of Melbourne prices have varied as follows [base = 1911, 1,000]: 1920, 2,055; 1929, 1,803; 1931, 1,428; 1937, 1,656). Thus-allowing for the effect of price-changes, the advance of £16 million in exports since 1929 represents a much greater "real" gain than the figures indicate. The greatest proportional advances have been made by agriculture and dairying.

The more important exports have been mentioned under the various industries (*v. sup.*). They go chiefly to the United Kingdom (1921–22: c. 45%; 1937–38: £73 millions = 52% of the value of the total exports). Wool, wheat and butter were the chief items. France takes c. 7% (1937–38: £9 6 million). Japan: *c.* 4% (£5·9 million). United States: *c.* 3% (£3.3 million). New Zealand: 6% (£7 million). Canada: 2% (£2 million).

Imports. — Imports mounted fairly steadily until 1926, after which there began a diminution which lasted until 1932 (1926–27: £165 million = £26 per caput; 1931–32: £45 million = £7 per caput; 1937–38: £114 million = £16 per caput). Of the total (value) the United Kingdom supplies a decreasing amount (1921–22: 51·4%; 1937–38: 41% = £46 million) — machinery, etc. (£16 million), textiles (£11 million), besides paper, chemicals, whisky and manufactured goods. The United States: 15% (1937–38) = £17 million, mainly motor cars and parts, oil, manufactured goods. Japan: 4·8% (£5 million) — textiles (chiefly silk), machinery, manufactured goods. Germany: 3.7% (£4 million) — machinery, chemicals. Dutch East Indies: 6·8% (£7.5 million) — petroleum and crude oil, tea. Canada: 7·2% (£8 million) — paper, motor chassis and parts, timber, machinery, tinned fish. New Zealand: 1·5% (£1.7 million) — gold, timber, hides and skins. Except for the year 1936–37, the percentage of imports from British countries declined during the period 1933–38. The proportion of imports from Canada increased; but that of India and New Zealand declined. The rise of the United States proportion has been the most notable feature in recent years, although this was tending in 1939 to decrease. German imports regained some of the ground which they lost (chiefly to America and Japan) after the War of 1914–18. Part of the trade now goes direct to Europe instead of to the United Kingdom for re-export to Australia; and the shift of trade can also be partly explained by the fact that Australia's needs are growing more complex, and cannot be satisfied from a single source. A symptom of this change is the growing trade with Pacific countries (Japan, East Indies, Canada, United States).

Between 1921 and 1926 Australia's trade with British countries declined from 63% to 54% In the year following the Ottawa conference of 1932, a new Customs Tariff Act came into operation, by which, although Australian products — manufactures in particular — were protected, preferences were accorded to British products. In 1936–37 trade with British countries comprised 57% of the total, and imports of British origin benefited to the extent of £7.9 million. Similarly exports to the United Kingdom benefited by £5.5 million under British preferential tariff rates. Imperial trade reciprocity, of fairly long standing in certain instances, has been repeatedly modified (notably after the Ottawa Conference of 1932) and is still comparatively experimental.

COMMUNICATIONS AND TRANSPORT

After Canada, Australia has the greatest length of railway per head of any country (4.08 m. per 1,000 pop.; cf. Canada 4.43; British Isles 0.47). But in relation to area, Australia has only 9.36 m. per 1,000 square m., a lower figure than any country except Brazil and Egypt (cf. Great Britain and Ireland: 223·57 m.). Hence the significance of the motor car, the "caterpillar" car, and other modern traction devices, and still more of the aeroplane and flying-boat. Shape helps to explain the separateness of the various systems, the close conjunction of railway with coastwise shipping transport, and the mathematical quality (circumferential as well as radial) of the system Flatness favours movement over very large parts, but along the east and south-east, and elsewhere where highlands run parallel to the coast, transport is impeded. Thus the main lines Melbourne-Sydney and Sydney-Brisbane were built behind and over the eastern highlands, the main net is also developing inland, and the south-east coasts generally have few important railways. Connected with relief also is the presence of excellent harbours at various points along the east, south-east and south-west coasts, in Tasmania, and in the north-west and north. Even with future large developments Australian routes will be largely circumferential — we may look forward to a hollow oval of lines running roughly parallel to the coasts, but with some "short cuts" (*e.g.,* Adelaide-Sydney; Brisbane-Darwin); many "radial" lines (*i.e.,* chiefly mineral and pastoral lines roughly at right angles to the coast); and at least one "diameter" (Adelaide-Darwin). In minor ways climate presents some problems such as heat, dust, water-supply (*e.g.,* non-saline water for locomotive boilers), floods (wash-aways), etc. Starting sporadically, as it were, and as the needs of each mining, each wool, wheat or farming area demanded, the separate State railway systems with various gauges have gradually become more widely integrated until they begin to show a truly continental character. State jealousies are gradually laid aside; and the motor-car and the aeroplane are contributing to this result.

Roads, **etc.**—Over considerable parts of Australia bullocks, horses, mules, donkeys, camels are used as beasts of draught or burden; bush-tracks and country roads are little more than trodden or wheel-marked lines subject, especially in the north, to interruption by floods. Roads outside the settled farming areas are mostly poor and labour costs too high to permit much improvement. But motor cars and lorries are now revolutionizing Australian inland transport, reducing days and distances — (the continent has been repeatedly crossed by car, once from Darwin to Adelaide in 6¾ days) — and making, life in the "out-back" increasingly possible. In the pastoral industry, in particular, motor-transport will probably play an increasing part, *e.g.,* moving stock or supplying fodder in droughts; wool transport, etc. Still more the aeroplane is quartering time and space, quadrupling mails in number and frequency; carrying stores, "spare parts," medicines, doctors; and in general, along with "wireless," extending the range of social and economic forces and unifying the continent. In recent years the number of motor vehicles has increased very rapidly; one person in about 8 owns a car and in 1937 imports reached £5.5 million in value (70,000 vehicles) of which £2.5 million represented imports from the United States of America and £3 million from the United Kingdom. With State-owned railways, however, motor omnibuses are not permitted to compete but only to act as "feeders" or extensions of them.

Waterways. — The Murray-Darling system provides in all some 4,200 navigable m.: the Murray is navigable for about 7 months (July to January), the Darling only very irregularly, and the whole system is badly handicapped for lack of a good ocean out-

let. The head of navigation on the Murray is Albury (goo m. above the South Australian border), and on the Darling, Walgett (1,758m from their confluence at Wentworth), while the Murrumbidgee is at best navigable to Narrandera. But Echuca is the limit of normal river traffic on the Murray, and for the 500mi. in South Australia Morgan is the traffic centre. The trade is mainly in pastoral products (wool, tallow, etc.) and some agricultural products downstream, and supplies and stores upstream, carried in the characteristic flat-bottomed, two-decker river steamers; but the trade has dwindled greatly as railways offer preferential rates. The future of the Murray-Darling as a water-way system is bound up with the schemes for large-scale regulation and development—locking, etc.—schemes destined to be but partly fulfilled for some time to come (see MURRAY RIVER). Of the northern rivers the Victoria, Daly and Roper are navigable for stretches of c. 100, 70 and 90mi. respectively, the last for craft drawing 14ft., but in the wet season they are often violent. Most of the streams on the east, south-east and south-west are useful only for short stretches near their mouths (which are sometimes sand-barred), but their "drowned" lower valleys often provide useful harbours.

Railways.— By 1937 the total length of railway lines in Australia open for general traffic stood at 27,896mi. In addition some 3,000mi. were privately owned, consisting mostly of "light" lines, built (under licence) by companies engaged in the lumbering, mining, sugar and other industries, though 800mi. of these lines were open for general traffic. The remainder were public property: Federal (Commonwealth) Government, c. 2,000mi., State Governments, c. 25,000mi. The total capital cost of the public lines was (1937) £336 million, or c. £49 per caput of population. The State railways had a net revenue of c. £11·9 million offset by interest charges. Australian railway construction has hitherto been financed largely from London, and in 1937 interest on railways loan expenditures (excluding Federal lines) amounted to £12·3 million. Loss on capital cost has thus been incurred. Costs both of construction and of "running" are high. Salaries have continuously increased, along with the cost of living, as a result of wage awards. At the same time Australia pays something for its progressiveness, and something for its physical handicaps. Railways have a "developmental" character. Profits may not be expected for some years after construction. The longest lines, moreover, those which reach out into the interior, often have the least (average) traffic—especially "outwards" freight—offer the lowest freight rates to encourage settlement, and thus show the highest working costs. And yet these lines are precisely those which are doing most to develop the continent. The Federal railways (*i.e.* the Trans-Australian, Central Australia, Federal Capital Territory, and North Australia). besides being truly "national," are predominantly of this character. (Trans-Australian lines: Kalgoorlie-Port Augusta and Port Pirie; Port Augusta-Alice Springs; Darwin-Birdum; and others.) The losses which such lines incur have been for the most part foreseen and have been deliberately incurred, either for national (development or defence) purposes, or in the expectation that they would ultimately vanish. And this has now come to pass: in 1927 the Federal railways for the first time showed a net profit (£27,213) though this was still offset by interest charges of £318,700. The (State) railways--especially in the east and south-east—suffer from physical (relief) factors and also from the fact that they are roughly paralleled by coastwise maritime routes, which are preferred not infrequently by passengers as well as for goods. These State railways are to a large extent centred on the capitals --which are also usually the chief ports—and hare developed as independent systems. Queensland possesses the longest mileage (1937: 6,567mi., 3ft. 6in. gauge) comprising 5 lines (with branches) penetrating to mineral (*e.g.*, Cloncurry) and pastoral (*e.g.*, Longreach) areas in the interior; a long coastal line (with branches) from Brisbane to Cairns; a more developed network in the south-east, besides some detached sections. New South Wales (6,124mi. of 4ft. 8½in. line) has a wide-spread net draining the wheat and pastoral Riverina, tapping the pastoral lands and rivers of the Central North and debouching on Sydney and Newcastle. A coastal line now runs north to Queensland and south for a shorter distance. One line now crosses the west plains to Broken Hill and one goes south to the Australian Alps. Victoria (4,721mi.; 5ft. gin.) has the densest net. It spreads fanwise north and west from Melbourne to the Murray, Wimmera and western districts, and also east along the coast into Gippsland. These are mainly farming (wheat, sheep, etc.) lines with Warrnambool and Portland as secondary (west) ports. Western Australia (4,357mi.: 3ft. 6in.) has a well developed grid paralleling the south-west coast and opening up the wheat, sheep, etc., areas inland from Northampton to Albany, besides several long "mineral" lines (Perth-Kalgoorlie; Geraldton-Meekatharra; Port Hedland-Marble Bar, etc) penetrating radially inwards. The South Australian system (2,529mi.: main lines, jft. gin.; others, 3ft. 6in.) centres mainly on Adelaide and is developed eastwards (lower Murray valley: fruit, etc., and Mallee: wheat) and northwards (wheat, etc.). More detached sections serve the south-east districts (Mount Gambier) and Eyre's peninsula, and long inland lines bring ores from Broken Hill to Port Pirie (Spencer's gulf) and open up Central Australia (Oodnadatta). Tasmania's system (651mi.: 3ft. 6in.) is developed mainly in the north with important branches to the west (mineral) district and south-east through the fertile agricultural valleys to Hobart. As these systems developed they were gradually linked at the State boundaries, and main lines connecting, first the east capitals and then also (1917) Perth, came into existence (Perth-Brisbane: 3,475mi.; 6 days, 1¾ hours, schedule time). Recently also the States have come to co-operate, for their mutual advantage, by cross-border systems (*e.g.*, Victoria and New South Wales across the Murray; Victoria and South Australia in the Mallee and Mount Gambier-Portland railways). To this end the Commonwealth (Federal) influence also steadily contributes, representing the wider national interests. Thus the gauge problem—3 breaks and changes on the Perth-Brisbane journey—is now being faced. Two important breaks in the transcontinental line have already been removed, and other proposals are under consideration.

Aviation.— The Civil Aviation Department (Commonwealth) has been active in encouraging research, construction, and in opening up commercial routes. In 1937, Australia had over 117,000mi. of approved regular service routes, with 256 landing grounds controlled by the Federal Government. All large towns are now linked by air, and a regular service is maintained with New Guinea and Great Britain. Certain of the air services are subsidized by the Government, and a scheme came into operation in 1938 by which first class mail is carried between London and the Dominions by flying-boats. Mail despatched from Australia is, however, surcharged. An air ambulance service was developed (1.928) at Cloncurry, in Queensland, for settlers in remote districts; and bases now exist at Wyndham, Port Hedland (Western Australia), and Broken Hill (New South Wales). In 1936–37 civil aviation machines covered over 8,000,000 miles, carrying 102,000 passengers, 822,000lb. of goods and 168,000lb. of mail, with a loss of 19 killed and 14 injured. Meteorological services are provided at main capital city aerodromes, and new first class stations have been provided on the Singapore and New Guinea routes. Radio aerodrome control came into operation in 1938 at the Brisbane, Sydney, Melbourne and Adelaide airports.

Posts, Telegraphs, **etc.**—Besides the normal inland postal services, which often operate over long distances, Australia has an extensive coastal packet service plying between the various ports of Australia and to outlying islands and Tasmania, as well as overseas mail services to Pacific ports, North America and Europe (Fremantle-London, via Suez; average time: 26½ days; Sydney-London via San Francisco: average 3j3 days). Mails are increasingly carried, especially to outlying settlements, by aeroplane (*v.sup.*). There were (1937) c. 346,000mi. of inland telephone lines (122,000 of which are used for telegraph also). and wireless telegraphy and broadcasting are becoming increasingly common and are a boon to remote parts. In spite of increased labour costs, superannuation and pensions, and reduced rates and charges, the posts, telegraphs and telephones of Australia, which are under Federal control, have been worked at a profit recently (1936: £3·3 million). Australia is connected by

cable with Europe (a) via South Africa by two routes, of which the shorter (Adelaide-Perth-Mauritius, etc.) is 15,919mi., (b) via Norfolk island, Suva, etc.–Vancouver Island. thence across Canada, etc., is 14,707mi., (c) Adelaide-Darwin-East Indies, East Asia and Siberia; 13,52jmi. Submarine cables also link Australia with New Zealand, New Caledonia and other adjacent islands. The number of cablegrams received and despatched had mounted (1936–37) to 1,439 million (New South Wales: 742,000; Victoria 477,000). In 1927 a '(beam" wireless service was established between England and Australia and wireless communication (including telephony) has since then been established between Australia and the more important centres of the Old and New Worlds.

Shipping.—Australian trade (passenger, mail and cargo) is carried in some 6.3 million tons (1936–37) of shipping, or slightly less than 1 ton per caput of population. The total volume has increased fairly steadily (1921–22: 4.56 million, 1929–30: 5·5 million tons), and the average tonnage of vessels from 2,910 tons to 3,823 tons (1936–37). Vessels trading overseas engage in interstate trade only under restricted conditions. The tonnage engaged solely in interstate traffic is 16–18 million, coastwise traffic being very well developed. The proportion of British-owned (oversea) cargo-carrying tonnage had until recently been in decline (1921–22: 86%, 1932–33: 66%, 1936–37: 73% carrying 72% of the total cargo). The foreign tonnage is engaged mainly in trading between Australia and its home ports (*e.g.* French: New Caledonia and France; Dutch: Holland and Dutch East Indies). The sale of the Commonwealth Line (1928) to private interests—the result of the failure of the experiment in (Federal) Government shipping—has reduced the amount of Australian tonnage (1937 = *c.* 5% of the total), which is now mainly engaged in Pacific and coastal trade. The total amount of cargo discharged and shipped amounted in 1937 to 14 million tons, of which 6.5 million tons is interstate cargo.

Ports.—The principal Australian ports are: Sydney (1936–37: 10·9 million tons entered): to London (Suez) 11,538 nautical miles, Naples, 9,438, Yokohama 4,316, Singapore 4,306, San Francisco 6.467, Vancouver 6,848, Panama 7,692, New York (Panama) 9,704, Auckland 1,264. Melbourne (8.1 million tons): to Sydney 576 nautical miles, Adelaide 499, Hobart 443. Adelaide (4.9 million tons): to Fremantle 1,353 nautical miles. Newcastle (N.S.W.) (4.8 million tons). Brisbane (4·5 million tons): to Sydney 474 nautical miles. Fremantle (3.5 million tons): to London (Suez) 9,537 nautical miles, Naples 7,437, Colombo 3,120, Cape Town 4,708. (For other ports see under the various States.)

Finance.—Under finance, Commonwealth and State finance have to be distinguished, though the relations between the two have been repeatedly modified (*v.* inf.). Commonwealth receipts have risen fairly steadily from £64 million (1921–22) to £89 million (1937–38), the chief sources being (1937–38) customs (£33 million), excise (£15 million), income tax (£9 million), and revenue from business undertakings (£17 million). Expenditure has risen to £85 million (1937–38): some of the items are—war pensions, etc. £19 million; pensions £16 million; posts, telegraphs, etc. £14 million; railways and new works £4.6 million; defence £6.3 million; Home and Territories Department £1 million. The total cost of the war of 1914–18 and subsequent war services (repatriation, gratuities, etc.) was estimated (1937–38) at £563 million. Of note also is expenditure on behalf of superannuation and pensions (old age, invalid, war) and maternity allowance (£4 per child). State revenues had risen (1937–38) to £126 million, derived chiefly as follows: public services (railways, water-supply, etc.) £54 million; taxation £37 million; land (sale or lease) £4 million; and also, from Commonwealth subsidies, £10 million. Expenditure is mainly on account of interest on debt, £39 million; railways, £34 million; educational, £11 million; medical and charitable, £13 million. The total public debt (Commonwealth and State together) had risen in 1936–37 to £1,419 million, = £207 13s. 11d. per caput. Loans, originally raised by the States, but from 1912 onwards by the Commonwealth also, mill in future be raised entirely by the Commonwealth—on behalf of itself or of the States—acting on the advice of the Australian Loan Council, virtually a committee of Federal and State treasurers. Loan moneys are mostly expended on development of communications (chiefly railways); on water supply and conservation; land purchase and settlement; vermin control (rabbit-proof fences, etc.); public buildings; and defence

Australians are taxed (1937–38) at £17 6s. od. per caput, the total amount paid in taxes being £118,741,000 (Commonwealth £69 million, State £49.69 million). The Financial Agreement Act of 1928 reorganized the relationship between Commonwealth and State finance; the outstanding arrangements being that the Commonwealth took over (from 1929) all State debts, contributes £7.5 million annually to interest charges, and also contributes towards the extinction of the debts in 58 years. Debts incurred after July 1927 are to be extinguished, by a similar arrangement, in 53 years.

Australia has two mints (Melbourne and Perth) issuing silver and bronze coin and gold bullion. Since 1931 no gold coins have been minted. The total issue of gold had amounted in 1937 to £462 million (bullion £58 million), and Treasury notes in circulation totalled £48 million. There was formerly a third mint at Sydney, but this was closed in 1926.

Banking in Australia is conducted by the Commonwealth Bank—virtually a central bank together with a savings bank business—and 16 joint stock banks, 3 of which are foreign institutions and exist mainly for the purposes of exchange. The banking business is highly profitable, and reveals a high degree of national thrift. The dividends declared in 1937 totalled *c.* £4 million, and averaged 7%. The profits of the Commonwealth Bank alone aggregate, since its inception in 1922, £14·5 million (1938). In 1938 the cheque paying banks held deposits to the value of £391·5 million (= £56 16s. od. per caput of population), against assets of £465 million; while the Commonwealth Bank holds assets of £65 million. State savings banks exist in Victoria. South Australia and Tasmania; former savings banks in other States having been merged in the Commonwealth Bank (Savings Dept.). Savings bank deposits amounted (1938) to £225 million = £34 18s. od. per caput of population, out of which the Commonwealth Savings Bank held £143 million. Of a special nature are the agricultural (rural) banks, conducted by the States, which grant credit to settlers, and in general exist to promote settlement and development.

POPULATION, IMMIGRATION AND SETTLEMENT

The total population of the Commonwealth of Australia, as returned by the Census taken on June 30, 1933, was 6,629,839. Of this total New South Wales, which includes only about 10·4% of the whole area of the Commonwealth, had the greatest portion, 39·23% (or 2,600,847 inhabitants); Victoria, with only about 3% of the territory of the country, had 27·45% of the population (or 1,820,261 inhabitants); while Northern Territory with over 17·5% of the entire area, had but ·07% of the population (or 4.860 inhabitants). The division by sex was approximately equal for the continent as a whole, but in the cities and the more closely settled parts there appeared a slight preponderance of females (e g., in New South Wales, Victoria and Tasmania) while in the more pioneering areas—notably in Queensland and Western Australia, the reverse holds. Aboriginals and half-castes are now reduced to some 75,000, mainly in the northern areas. They are now protected by the Governments, reserves have been created, and they are cared for by various missionary bodies, sometimes with encouraging results (*e.g.*, the mission stations in the north-west). It seems, however, still an open question to what extent they will survive civilization. Of the 49.849 other non-Europeans (including half-castes), 25,143 are Asiatics—mainly pearl-fishers and Chinese (c. 11,000) (laundry and joinery workers in the cities; market-gardeners and cooks on "out-back" stations). The great bulk of the population (c. 98%) is of British origin and born in Australia—(a rapidly increasing proportion)—the British Isles or New Zealand. Increase in population has been (1921–33) at the rate of 1·38% per annum, and is due partly to "natural" increase and partly to immigration. In the quarter century 1901–26, 80% of the total increase was "natural." A comparatively low birth-rate (22 per 1,000; cf. Great Britain: 20·3) is counterbalanced by a low death-rate (9.4 per 1,000, cf. England and

Wales: 11.6; Scotland: 13) with a resulting "natural" increase of 13·9 per 1,000 (England and Wales: 6.9; Scotland: 8·4). The remaining 20% has resulted from immigration which has recently varied very widely (see below).

With 2.23 people per square mile Australia is the most sparsely populated continent (cf. Europe: c. 127), but the densities vary greatly as between and within the different States. Victoria is the most densely populated (20·71 per sq. mile), Tasmania (8 68), New South Wales (8·41) having also fair densities (cf. South Australia: 1·53; Queensland: 1·41; Western Australia: 0·4j). Hitherto, in fact, for settlers from north-west Europe the southern and south-east portions of the continent have been found most habitable. Apart from mining settlements (which account for perhaps under 2% of the total population) some 40% of Australia, having less than 1 j in. average annual rainfall, is useful chiefly for pastoral purposes and is hence thinly peopled. In the tropical areas (40% of total) there are some 180,000 people, 100,000 of whom are in the east coastal parts of Queensland. Besides a smaller area in the south-west, a block of c. ½ million square miles (c. 17% of the continent) in the south-east holds 70% of the population and produces c. 75% of the total wealth, and to this area may be added south-east Queensland and north-east New South Wales which are also areas of relative concentration. Within the areas of greater density, again, the outstanding feature is the preponderance of urban population, viz., 64% of the total (New South Wales: 69.24%; Victoria: 65·39%; the lowest being Tasmania: 51·49%) due mainly to the growth of the capital cities. Thus 46·87% of Australian population is "metropolitan"; in Victoria and Southern Australia about 54%, in New South Wales and Western Australia over 47% of the population is in the respective capitals and the six Australian capitals together contain 46·87% of the whole Commonwealth population. (Sydney: [Dec. 31, 1939], 1,302,890 pop.; Melbourne: 1,046,750.) The situation is disturbing particularly because it is intensifying (cf. "metropolitan" population in 1911= 38%), but it is not entirely unnatural or portentous. The causes are complex: amongst them are probably: (1) the desire, strong under Australian conditions and operative particularly amongst the younger generation, for the opportunities and amenities of city life. (2) the same type of desire on the part of successful pioneers (farmers; pastoralists) to retire and enjoy their wealth and leisure in cities. (3) the profitableness of "extensive" methods of land utilization (*e.g.*, wheat farming; pastoralism: *v. sup.*) coupled with the isolation and lack of amenities often implied. (4) the growth of manufactures and commerce in the urban (coastal) centres. Droughts and the decline of mining are perhaps contributory and more or less occasional causes and the fiscal (protectionist) policy has also been blamed—with some reason, though it is probably an effect rather than a cause.

The result is reflected in the proportions of population engaged in various pursuits. Of the total "bread-winners" (1921: 2.3 million=~.43% of total population) some 31% work for wages or salaries. Again, in 1921, 31·2% of the "bread-winners" (725,800) were engaged in industry (1911: 28.4%); 25.8% (600,000) in primary production (1911: 30·4%); 15·3% in commerce (1911: 14·5%); domestic occupations, 9% = 210,000 (1911: 10% = 203,000); transport and communications: 9% (1911: 8%); professional, 8.7% = 202,000 (1911: 7.3% = 147,000). Thus nearly all occupations connected with urban life in Australia have received accessions, but the country occupations, and also domestic occupations, have relatively, and in the case of mining and, pastoralism, absolutely declined.

Immigration and its problems are closely related to these facts. Unemployment, most marked and most concentrated in the cities with their young and sensitive industrialism, affects public opinion—the city voter is normally in the majority. The immigrants themselves often come from urban conditions and in times of stress readily revert to these conditions. Unemployed persons sometimes refuse to take work outside the cities. The country has thus, in a sense, its apertures blocked and the inflow is carefully filtered. Alien immigration is strictly regulated—the main features of the "White Australia" policy are well known—and the objection to immigration of southern Europeans (Italians) and even of Maltese has recently become pronounced. Land tenure conditions may, at times and in places, have some effect, but the steady policy of all the Governments, through their highly elaborated and varying laws and regulations, is to encourage not only settlement but closer settlement on the land and, when the need has been felt, public opinion has not failed to compel the "discovery" of suitable settlement areas. The settler is regarded as an asset: given a good start in time he becomes a revenue-producer besides a citizen and a father of citizens. Thus the most generous treatment is usually accorded—land, implements and stock, scientific advice, seed, credit, easy repayment terms, special freights and such educational and general social amenities as are possible. Large estates are bought and thrown open to closer settlement. The following proportion of the States and Commonwealth were (1937) occupied by private individuals or corporations under various conditions—freehold or under lease or licence (mining, pastoral, timber, etc.): New South Wales: c. 92%; Queensland: 83%; Victoria: 70%; South Australia: 57%; Tasmania: 54%; North Territory: 56%; Western Australia: 38%; Commonwealth: 58%; and there have been considerable recent increases in Western Australia, South Australia and Queensland. The root causes influencing migration are deep-rooted and the various Government agreements to promote migration (*e.g.*, Joint Commonwealth and States Immigration Scheme [1920]; British and Commonwealth Governments Migration Agreement, 1925), while admirably and generously conceived, have hardly produced the anticipated results. Immigration reached a maximum in the period 1921–25, but after 1927 a decline set in, and the depression years after 1929 saw a net loss of population due to extensive emigration from the Commonwealth. During the decade 1930–40 there was a large increase in the proportion of immigrants from Southern Europe; but in spite of various settlement plans (notably group settlement and nomination schemes) permanent new arrivals in Australia have decreased very considerably (1927—60,000; 1937—16,000) and in the same period the number of persons entering with official "assistance" fell from 30,000 to 141. Recently there has been an attempt to encourage the migration of young people by such schemes as the "Big Brother" movement; the Fairbridge Farm Schools in Western Australia; and the South Australia apprentice scheme; and by the farm training of many young refugees from Central Europe.

SOCIAL CONDITIONS: GENERAL SUMMARY

In Australia a small community, British by descent and in tradition, has entered and is developing an area relatively large, unoccupied and sharply characterized—an area also in the nature of a frontier, isolated and yet confronting massive populations. Herein lies the key to Australian social conditions. In Australia British ways and traditions persist but are liberated, as it were, from certain inhibitions. British ideas and ideals prevail, but with perhaps more of the vehemence of youth. British economic and political methods continue, but modified by a new physical environment and the uncertainty and inexperience entailed. Democracy takes very concrete, and sometime novel, forms. The ingrained striving for independence and equality and the deep-seated desire for racial integrity and a high standard of social life involve difficult questions; but Australian life is based on sobriety, business ability and common sense.

Normal primary education is provided free by the States (1936: 10,307 schools; 906,221 scholars with an average attendance of 87.4%). Medical care of children is established and extraordinary efforts are made to cater for the sparsely-populated areas (*e.g.*, half-time schools; "travelling" schools; itinerant teachers; correspondence teaching; lending libraries). Secondary education and the training of teachers is now highly organized and liberal scholarships and bursaries are available. Agricultural education is well-established and progressive, and technical education in general is amply provided for. The educational systems are gradually being internally co-ordinated (New South Wales has led the way) to culminate in the university. There are six universities, those of Sydney, Melbourne and Adelaide being the oldest and best endowed. Good museums, libraries and galleries

(art, etc.) exist. Some £10 million of public money is spent annually on education in all its forms, and in addition there is the expenditure of private schools, which are numerous and usually good. Public hygiene stands at a high level. Legislation affecting food, drugs, milk, etc., is enforced; infant and child welfare is attended to as well as the control of infectious diseases. Public water-supply and sanitation are efficient in all the more settled areas, many of the former schemes being on a very large scale (cf. Western Australia's goldfields' supply; Southern Australian supply schemes). The Institute of Tropical Medicine (Townsville) is an illustration of the volume of trained thought focussed on national problems, a movement typified now by the manifold activities of the Council of Scientific and Industrial Research. These features are related to the largely urban character of that society. The high proportion of persons engaged in professional (including civil service) pursuits is one incidental corollary but the rise of industrialism in recent years is partly a cause and partly an effect of urban life. Australia has been called the "working man's paradise" and its government an "aristocracy of labour." Under adult suffrage labour wields great political power: the trade unions include (1937) some 856,000 members, matched, it is true, by some 169,600 persons organized in employers' associations. The "basic wage" principle, and the "44 hour week"—though in detail alterations and modifications continually occur-express the determination that every man, woman and child shall have a modicum of health and happiness. State pensions (old-age, invalid, maternity) and the child endowment practised in New South Wales—are regarded as part of a citizen's rights. Distinct from this are the extensive public and semi-public charities amounting to c. £8 million (1937). In a small and much-governed community—there are six State Legislatures besides that of the Commonwealth, with, in all, some 609 representatives—State interest and control is an accepted principle and the system of bounties, bonuses, protective tariffs, etc., is applied in the social no less than in the economic sphere. The State, in fact, being the people, thinks and cares for itself. Critics assert that Australians show a tendency to regard their public services too exclusively as citizen-supporting possessions and too little as business organizations subserving general utility.

If this is so, it is essential that the community as a whole should pay its way. Australia has a public debt of £1,275 million (1937–38) incurred by borrowing.

Compulsory arbitration is in force, but strikes during the period 1932–37 occasioned the loss of over 2 million working days and £1.7 million in wages (cf. 1926–30, *c.* 10 million days lost). The main causes of industrial wage disputes are wage questions and working conditions, and thus the relatively small number of strikes since 1931—loss of 2 million days between 1932–37=smallest loss in any 5 year period since 1912—is related to the fall of prices, which has enhanced the "real" value of wages.

At the same time some advantage has been taken of the Arbitration Court rulings: matters having become so confused that the Commonwealth Government has been compelled to take steps to simplify and regularize the situation.

At the same time the young Australian manufacturing industries are somewhat sensitive to economic conditions. The number of unemployed has fluctuated (1937–38) round about 40,000 per annum (=9·3% of total Union members) and those unemployed, along with their industries, are mainly in the cities. At the same time Australian national wealth, even though partly based on borrowed capital, is considerable, and this wealth is, on the whole, well distributed. But it is, after all, productive capacity which constitutes real wealth, especially viz-a-viz borrowed capital. The total production of Australians in 1936–37 was estimated at c. £456.7 million or £67.1 per caput, and, if the year 1911 be taken as basis of reference (=100), this represents a productive activity of 163. Thus, though fluctuations, and also serious crises are bound to arise, Australian economics are probably securely based. In common with other young countries she has undergone somewhat violent crises but the steady movement is towards the development of her resources, towards an influx and growth of population, and towards her conversion from a debtor to a creditor nation.

Some 20% of the Commonwealth is of little apparent value except possibly for sporadic mining. A further 50–55% is, apart from possible mining value, probably of permanent value for pastoralism only, while 21% is good–fair agricultural land, the drier parts suitable mainly for wheat-growing. Besides knowledge, therefore, a sense of responsibility is necessary if Australia is to be wisely developed. The "White Australia" policy—morally and economically justifiable on Australian pre-suppositions-demands determination and some self-denial if it is to be maintained in practice. The Australian will have none of the "tropical plantation" system which he, perhaps shrewdly, identifies with the interests of capitalism rather than with the interests of the coloured races. But neither could a Queensland sugar industry be maintained indefinitely unless paid for strictly out of Australia's own pocket. Unfortunately there has developed a differentiation—hardly an antithesis—in economic tendencies. On the one hand primary production, land settlement and development, with free trade or deflated protection: on the other industrial and manufacturing development with its concomitants protection and urban—or at least centralized life. On the one hand complete economic self-sufficiency; on the other fuller participation in world, and particularly imperial, economics. The advocate of the former points to increasing output and self-sufficiency and also complains of unemployment. The latter points out that $\frac{4}{5}$ of the wealth is produced on the land, that labour is scarce and dear, and immigration retarded. And certainly agriculture and pastoral development have in recent years not made the advances anticipated and the pastoralist has perhaps to complain of political quite as much as of economic or physical disabilities. Fortunately this seems but a phase. Manufacturing is a young growth in Australia and so far works mainly for the home market. If ever foreign competition has to be met in an overseas (export) market, it seems inevitable that costs of production will have to be abated, or greater efficiency achieved. Meanwhile the older industries—pastoralism and agriculture—though in a degree specializations, have long had to cope with world trade conditions. And if the manufacturing industry is to continue to expand, it will do so most easily with an expanded home market. Thus, it seems, things must adjust themselves, especially as Australia, even in manufacturing industry, will have in some degree to specialize. Fortunately indications are not wanting that these facts are becoming appreciated. Australia can hardly fail to prosper.

AUSTRALIAN LANGUAGES, the aboriginal dialects of Australian natives. There are two fundamental phonetic features which, as it seems, are to be found in all the Australian tongues: in the first place the lack of all fricatives (s, f, x) which occur only in the youngest languages and but seldom, though there are palatalizations of the dentals (ty, dy) that repeatedly pass over to affricates (ts, dz); in the second place the lack of a discrimination of voiced and voiceless consonants within the same language; thus there exists neither k nor g, neither t nor d, neither p nor b, but a sound intermediate between both, taken by some investigators as voiced (g, d, b), by others as voiceless (k, t, p).

Simplicity in the initial and final sounds is found with the youngest languages, whereas the oldest languages of Australia (in the north-west, north and south-east) show also double consonants as initials (kl, pl, tr, pr and others) and final sounds (lk, lt, rk, rt and others).

The characteristics of grammatical structure are very different according to the different groups. The most essential grouping is to be derived from a division into Northern and Southern languages. For a long time only the languages of south-west Australia and south Australia, Victoria, New South Wales and Queensland were known, those of north-west and north Australia becoming known much later.

Northern Languages. — The languages belonging to this group have no intrinsic relation to the Southern languages. Among themselves they show no relation of any sort in vocabulary and but little in grammar, so that there is, in a limited space, a great diversity of languages. The area of these languages begins in the west with Roebuck bay, goes eastwards thence in 19° to 21° of southern latitude on the course of the rivers Flinders and Leichhardt, is interrupted by a branch of the Southern languages, turns thence north to the 17th° and ends at the same degree on the east coast at about Cape Flattery. In the centre the Aranda penetrate beyond the 28th° of southern latitude.

Southern Languages. — The Southern languages are divided into three sub-groups: (1) an older West group comprising the north-west and the Northern Territory, with some languages of Cape York peninsula. It is characterized by grammar and vocabulary, also by vocalic, sonantic (r, l, nasals) and consonantic (also double consonantic) final sounds. To it belong: the Western language with the Ruby creek language; the King's sound l.; the Ord R. l.; the Katherine R. l.; the Woolmunga l.; the Larakiya, the Cobourg peninsula l.; the Karandi; the Walsh R. l.; (2) a younger Eastern group, comprising the southern centre and the east with exclusively purely vocalic final sounds. To it belong: Aranda with its dialects: Yaroinga, Underekebina, Aranda, Wychinga; Yelina; Walooker; Chingalee; Leeanuwa; Mingin; Cape York languages with dialects: Otati, Yaraikana, Gudang; Island dialects: Nggerikudi, Coen River dialect, Mapoon R. dialect; (3) the Central group, the youngest group with vocalic and consonantic (l, r, nasals) final sounds; due perhaps to a blending of the West and East groups. To it belong: Woolna; Caledon bay l.; Roper R. l.; Akoonkul (Akoonkun); Princess Charlotte bay language. Except for some fundamental features of the grammar the languages are radically dissimilar. They have in common the preposition of the genitive and possessive and the use of suffixes and postpositions. A dual occurs with the personal pronoun besides singular and plural. The Cape York group has a trial. In the first person plural (dual, trial) an inclusive form (comprising the person addressed) and an exclusive form are repeatedly distinguished. In the Island languages of the Cape York group the third person singular (and the first person) distinguishes special forms for masculine and feminine; the Daly river language also discriminates bet een animate and inanimate. The Southern languages comprise by far the greatest part of Australia. Aranda, which belongs to the Northern languages and in the centre penetrates deeply into the south, almost splits them into an East group and a West group.

These languages are connected by common traits in the personal pronoun and the more or less complete occurrence of the names of the following parts of the human body: da (wa), mouth; *tyalana*, tongue; *mura*, hand; *ngama*, breast; *dara*, thigh; *dina*, foot; *guna*, excrement. All these words are originally proper to the Central group of the Southern languages, the only one which has exclusively vocalic final sounds. Other common characteristics are: lack of r and l as initials, occurrence of the combination ld (lt) as medial sound and preposition of the affixless genitive. This group as the youngest among the Southern languages has penetrated from the north-east (146° to 150° of eastern longitude) as far as the south coast (134° to 138° of eastern longitude) and has driven the older, originally independent linguistic groups towards the east, and west, and south-east to the coasts, producing among them a series of its own peculiarities in different degrees. Thus the present unity of the Southern languages is but secondary and later.

The Southern languages are divided into the following groups which are ordinated here by their age in Australia:

(1) the Central group with the North Central group and the languages belonging to it: Kogei, Barcoo; Puruga, Goa, Cook District language; Mamburra, Wakelburra, Burdekin R. language and with the South Central group and the languages belonging to it: Parnkalla, Tyura, Meyu; Nulla, Dieri, Yarrawurka, Wonkamarra, Evelyn Creek l.; hfarowra, Kurnu; Karawalla-Tunberri, Ulaolinya-Wonkajerra, Kana; Kungerri-Birria l. The discrimination of a transitive and intransitive form with the personal pronoun and the substantive as a subject of the sentence is a special feature here.

(2) The South-west group: Yungar, Ngaiarda, Kardu, Kanyara, Yamaidyi, Padu and Luridya. The peculiarities of the Central. group are here only partly preserved.

(3) The languages of the east coast, an exclusively geographic complex of languages (independent of each other): Murrawari; Thangatti-Yukumbul; Pikumbul; Kumbainggerri; Minpung; Turubul; Wakka-Kabi; Bieli-Kuinmurburra; Halifax Bay language; Bulponarra-Kokoyimidir; Bundyil language (to the South of the gulf of Carpentaria). Everywhere we find singular, plural, dual, with the personal pronoun. Discrimination of transitive and intransitive forms, of inclusive and exclusive forms is originally unknown. With the Minyung (and Kumbainggeri?) are found a division of the nouns into animate and inanimate beings, the first subdivided into male, female and animal, the latter into things and places and concordance of the adjectival and pronominal suffixes with the class of the substantive.

(4) The Narrinyeri group, along the course of Murray river; but insignificantly influenced by the Central group. To it belong: South and North Narrinyeri; Bangerang, Dhudhuroa, Pallangamiddah, the three latter greatly blended with Kulin, Kurnai, Yuin, Kuri. Here r- and l- occur as initials, ld (lt) as a medial sound and double consonantic final sound. Originally the dual and probably the difference between transitive and intransitive forms with the personal pronoun were absent. Comparative forms with the adjective are found.

(5) The Wiradjuri-Kamilaroi group, a blend of languages of the east coast with those of the Yuin-Kuri and the North Central group, divides into a South group: Wiradyuri, Wongaibon, Ngeumba, Burrabinya, Wailwun, and a North group: Kamilaroi, Yualeai (Euahlayi), Ngoorie, Wirriwirri. Affixal forms of the possessive and subjective pronouns are found here.

(6) The Yuin-Kuri group is related to the Eastern languages and to the Central group and, in its grammatical structure, to the Victoria languages. It comprises the Yuin sub-group (Yuin, Ngunawal, Thurga, Dyirringan, Tharumba, Wodi-Wodi, Illawarra, Thurawal) and the Kuri sub-group (Kuri, Gundunggura, Dharruk, Port Jackson language, Darkinñung, Awabakal, Kutthung, Biripi). Suffixing of the possessive and the subjective pronoun is more strongly pronounced in this group, the second in age of the Southern languages.

(7) The Victoria languages are the oldest group of the Southern languages and are the least influenced by the Central group. They are divided into an Eastern sub-group consisting of the Kurnai and a Western sub-group, comprising the Piangil, Buandik, Kolijon and Kulin, with the dialects Ngenngenwurro, Wuddyawurru, Bunurong, Woiwurru, Taunguwurru. It is the only Australian group that places the (affixless) genitive after the word governed and the possessive with the noun and the subjective pronoun with the verb are therefore suffixed. The personal pronoun possesses everywhere singular, plural, dual, in some languages also trial. A characteristic of these languages is the discrimination of inclusive and exclusive in the first person plural of the personal pronoun. Discrimination of transitive and intransitive, however, is lacking.

Relations to Languages. — There is a possibility that relations of the Victoria languages to the Tasmanian tongues may be demonstrated; both groups have in common r- and l- as initials and use possessive suffixes. Single groups of the Australian languages may show connections with single groups of the Papuan languages or with substrata of the Melanesian languages; but as yet no relationship has been conclusively proved.

Bibliography.—Among older collections of material still worthy of consideration are D. Bruce, *Languages of the Aborigines of the Colony of Vtctoria with other Australian Dialects* (Melbourne, 1851); W. Ridley, *Kamilaroi and other Australian Languages* (Sydney, 1875); R. Brough-Smyth, *The Aborigines of Victoria* (2 vols., London, 1878); E. M. Curr, *The Australian Race: Its Origin, Language, Customs* (4 vols., Melbourne-London, 1886–87). The Literature on the Australian languages is treated by W. Schmidt, *Die Gliederung drr australischen Sprachen* (Vienna, 1914), originally published in *Anthropos,* vii.–xiv., 1912–1919. *See* also A. Trombetti, *Elementi di Glottologia* (pp. 63–83, 404–422 Bologna, 1922); A. L. Kroeber, "Relationship of the Australian Languages" (*Journ. Proc. Roy. Soc. N.S. Wales,* lvii., 1923, pp. 101–117); W. Schmidt, *Die Sprachfamilien und Sprachenkreise der Erde* (s. 155–160, Heidelberg, 1926). (W. Sc.)

AUSTRALIAN LITERATURE. It has been described as an ironical commentary on Australian literature that the first writer on the subject should have borne the name of Barron Field. It is true, however, that when Field (he will be remembered as Charles Lamb's friend who emigrated to Australia and became judge of the supreme court of New South Wales) gathered together his *First Fruits of Australian Poetry* (1819) English civilization in Australia was scarcely more than 50 years old. With the early settlers in the late 18th century literature was, naturally, a slow growth, and when it did break into bud it was, equally naturally, with English soil clinging to its roots. The highly polished models of the 18th century and those of the romantic revival seem to have suffered little or no sea-change in transportation. The early Anglo-Australian versifiers adopted them as a matter of course. It was left to later poets, such as Charles Harpur and Adam Lindsay Gordon, to give the bush a place in literature, to experiment with new rhythms

Poetry. — Throughout the short history of literature in Australia we find poetry predominating with history and topography coming after. Charles Harpur (1813–68) may be regarded as the first Australian poet of any distinction. He was strongly influenced in his earlier work by Wordsworth and Shelley, and is now chiefly remembered for his *Creek of the Four Graves,* in which we see the bush vividly pictured for the first time. Very different, both as a man and as a poet was the once famous Richard Henry Horne (1803–84), that wild young Londoner, friend of Elizabeth Barrett Browning, who ran away from home to enlist in the Mexican navy and arrived in Australia in middle age to seek his fortune digging for gold. His contemporaries hailed Horne, in their excitement over his four poetic plays (*The Death of Marlowe* is the best known), as a new Elizabethan, but it is probably only for his narrative poem *Orion* that he is remembered to-day. Sold first at a farthing a copy, this blank-verse story of the loves of Orion for Merope, Artemis and Eos, contains many passages of sustained beauty, as well as some of the flattest lines in English literature. It was largely thanks to Horne that Henry Kendall (1841–82) received recognition during his life-time. The son of one of the earliest missionaries to New Zealand (an exceptionally intelligent and inquisitive cleric who compiled the first grammar of the Maori language) Kendall, at the age of 28 resigned his position in the colonial secretary's office to devote himself entirely (and, alas! unsuccessfully) to literature. He was rescued from poverty by the kindness of his friends, and though he died at 41, he lived long enough to write a considerable bulk of poetry (largely narrative) which was to rank in the judgment of later Australian readers beside that of his unfortunate friend Adam Lindsay Gordon. Kendall's best poem is his "Araluen," a poignant elegy on his daughter, though his "Hy-Brasil," "Cooranbean" and "After Many Years" still occupy an important position in Australian literature. He was one of the earliest Australian poets to receive recognition from England where many of his poems were printed in the *Athenaeum.*

The most eminent figure in Australian literature is undoubtedly Adam Lindsay Gordon (*q.v.*), whose romantic career is by now almost too well known to need re-telling. Born in the Azores in 1833, he was educated in England, but at the age of 20 was packed off to Australia in disgrace. His early occupations there included those of police constable and steeplechaser. After a variegated career he married, inherited a fortune of £7,000 and began his short-lived career as a politician by being elected in 1864 to the South Australian parliament. He resigned his seat after a few years, became the manager of a livery stable at Ballarat (he won three steeplechases in one day) and took up free-lance journalism, writing among other things, racing tips in rhyme. In 1867, he published his first book of verse *Sea Spray and Smoke Drift,* this was followed by *Bush Ballads.* In 1870 after having impoverished himself by his claims to the estate of Esslemont in Scotland (he believed himself to be the head of his branch of the Gordon clan), he corrected the proofs of his *Bush Ballads* and shot himself. Before he died, Gordon instructed a friend to burn a trunk containing all his remaining mss., and the instructions, unfortunately, were obeyed to the letter. In his verse, Gordon was strongly influenced by Byron, and, later, by Swinburne. In spite of this, however, and in spite of a remarkable memory (he was able to quote whole pages of Horace, Macaulay, Browning, and, much to the annoyance of his fellow members in parliament, Lemprière's *Classical Dictionary),* Gordon struck an original note in poetry. In such famous poems as "The Sick Stockrider" and "How we beat the Favourite" he has recaptured the joy of his favourite sport of steeplechasing and given us something of its rhythm. And yet in such a poem as "Whisperings in Wattle Boughs," while still maintaining his Swinburnisms, he can write movingly of his regrets for England and for the life of his boyhood. Gordon has had many imitators in Australia, but none has surpassed him for his unerring rhythms, his infectious delight in physical achievements and in the open air. It was most probably his bad sight which prevented him from giving us those touches of observation with which lesser poets have delighted us.

Since Gordon's time poetry in Australia has flourished, though we still wait for its full flowering. James Brunton Stephens, the author of a long narrative poem, "Convict Once," and of *The Dominion of Australia,* a fine piece of patriotic literature, was a Scot who came to Australia in 1866. His humorous poems, such as "Universally Respected" and "To a Black Gin" have caused him to be described as the Bret Harte of Australia. Equally patriotic, but considerably more sensitive, was George Essex Evans (1863–1909), the author of *The Australian Symphony,* and *The*

Repentance of Magdalene Despair, who successfully experimented with new metres. The 'eighties and 'nineties saw a renaissance in Australian poetry, with such men as Barcroft Boake (1866–92), a poet of the bush, strongly influenced by Gordon (his best known poem is "A Vision out West"); Victor James Daley (1858–190*j*), who reflects something of the glamour of the Celtic Twilight in his *At Dawn and At Dusk* and *Wine and Roses;* Andrew Barton Paterson (1864–1941), famous as "Banjo" Paterson for swinging ballads and lyrics; Henry Lawson (1867–1922), regarded by some as the national poet of modern Australia: Bernard O'Dowd. more severely disciplined than any of his forerunners, whose "The Bush" (1912) is full of fine imagery; John Farrell (1851–1904) author of "How he died" and "Australia to England"; and George Gordon McCrae, friend of Lindsay Gordon, and poet of aboriginal legendry. Among others worthy of mention are:—Philip Joseph Holdsworth, Francis Adams, Robert Richardson, James Lister Cuthbertson, William Gay, Grace Jennings Carmichael, W. H. Ogilvie, E. J. Brady, Roderic Quinn, C. J. Dennis, author of *The Sentimental Bloke,* Hugh McCrae, and more recently Shaw Neilson author of *The Heart of Spring,* Mary Gilmore (*Hound of the Road*) and Leon Geilert. Such Australian poets, however, as Francis Adams, and later, W. J. Turner belong to English rather than Australian literature.

Fiction.—Although the novelists have not been so prolific as either the poets or the historians, they have done some excellent work. Most famous of all Australian novels is Marcus Clarke's *For the Term of his Natural Life,* that vivid and sinister story of life in one of the early penal sertlements. Clarke, who came to Australia as a boy, and had a varied career as worker in the bush, banker and librarian, wrote plays, short stories, two novels *(Heavy Odds* is vastly inferior to his masterpiece) and a large amount of journalism. Henry Kingsley (1830–76), brother of the more famous Charles, wrote in *Geoffrey Hamlyn* a fine novel about an immigrant which has become something of a classic. Much more robust was "Rolf Boldrewood" (Thomas Alexander Browne) who died in 191*j.* His *Robbery under Arms (1888)* is one of the most famous stories of bush-ranging. His other novels *The Squatter's Dream* (1890) and *The Miner's Right* (1890), still enjoy great popularity. George Lewis Becke ("Louis Becke"), who died in 1913, was the author of many short stories about the southern Pacific, the best of which are to be found in *By Reef and Palm* (1894). A much abler short story-writer was Henry Lawson *(wide supra),* whose bush tales, such as *While the Billy Boils, Joe Wilson and his Mates* and *Children of the Bush,* have won for him in the affection of Australian readers a place beside Bret Harte and Maxim Gorki. Another writer of fine short stories, though in a quieter vein, is Barbara Baynton, the author of *Bush Studies.* In *The Little Black Princess* and *We of the Never-Never (1912)* Mrs. Aeneas Gunn has shown herself to be a writer of delicate fancy with her accounts of life in the backwoods of northern Australia, while realism is well represented by C. A. Bean, whose *The Dreadnought of the Darling* is a fine piece of writing.

In the sphere of literary criticism, such books as A. T. Strong's volume of essays, *Peradventtare* (1912) and T. G. Tucker's critical edition of Shakespeare's *Sonnets* (1924) may be mentioned. Gilbert Murray, though an Australian by birth, belongs both as critic and poet to English rather than to Australian literature.

History **and** Topography.—Like poetry, historical and topographical works have been hardy growths in Australia. As long ago as *1819* we find *A Statistical, Historical and Political Description of New South Wales,* by that passionate man of adventure, pioneer and journalist, William Charles Wentworth (1793–1872). This remarkable compilation, the first of its kind in Australian literature, which contains the germs of much of the economic theory of later writers on immigration, was responsible (it has been said) for the great influx of immigrants into Australia in the years immediately following its publication. An even more romantic figure was Edward Gibbon Wakefield (1796–1862), a Londoner, one of the most vigorous and important writers on colonization, who, while imprisoned in Newgate gaol on a charge of abduction, published anonymously *Letters from Sydney* (1829) in which he put forward a new system of colonizing Australia. On his release Wakefield gathered round him an enthusiastic group of supporters and formed the National Colonization Society which led to the Government attempting to establish two important colonies in New South Wales and South Australia. In *1834* Wakefield published his *New British Province of South Australia.* Another early historian of importance was the Scottish missionary and journalist, John Dunmore Lang (1799–1878), whose *Historical and Statistical Account of New South Wales* and *Origin and Migrations of the Polynesian Nation (1834)* are still a source of information for historians. A generation later came George William Rusden (1819–1903), whose monumental *History of Australia* and *History of New Zealand* were both published in England in 1883, revised editions not being published in Australia till 1895 and *1897.*

In more recent years a number of outstanding historical and topographical works have appeared, notably Henry Gyles Turner's *A History of the Colony of Victoria* and *The First Decade of the Australian Commonwealth* (1911); B. R. Wise's *The Making of the Australian Commonwealth* (1913); R. L. Jacks's *Northnzost Australia* (1921); Baldwin Spencer's *Across Australia* (1912); *The Colonisation of Australia* (1915) by R. C. Mills; Prof. Ernest Scott's *A Short History of Australia* (1916); G. Arnold Woods's *The Discovery of Australia* (1922); and T. Dundabin's *The Making of Australasia* (1922). Works dealing with the Aborigines are numerous. Among the most important may be mentioned Dr. A. W. Howitt's *The Native Tribes of South-East Australia* (1904); E. M. Curr's *The Australian Race* (1886); A. R. Wallace's *Australasia* (1880); G. T. Bettany's *The Red, Brown and Black Men of Australia* (1890); and *Native Tribes of Central Australia* (1899) by B. Spencer and F. J. Gillen.

(H. L. Mo.)

AUSTRAL ISLANDS: *see* PACIFIC ISLANDS.

AUSTRALITE: *see* TEKTITE.

AUSTRASIA, the name given to the easternmost part of the Frankish kingdom. It usually had Metz for its capital, and the inhabitants of the kingdom were known as the *Austrasii.* Retrospectively, later historians have given this name to the kingdom of Theuderich I. (511–534), of his son Theudebert (534–548), and of his grandson Theudebald (548–555); then, after the death of Clotaire I., to the kingdom of Sigebert (561–575), and of his son Childebert (575–597). They have even tried to interpret the long struggle between Fredegond and Brunhilda as a rivalry between the two kings of Neustria and Austrasia. When these two words are at last found in the texts in their precise signification, Austrasia is applied to that part of the Frankish kingdom which Clotaire II. entrusted to his son Dagobert, subject to the guardianship of Pippin and Arnulf (623–629), and which Dagobert in his turn handed on to his son Sigebert (634–639), under the guardianship of Cunibert, bishop of Cologne, and Ansegisel, mayor of the palace. After the death of Dagobert, Austrasia and Neustria almost always had separate kings, with their own mayors of the palace, and then there arose a real rivalry between these two provinces, which ended in the triumph of Austrasia. The Austrasian mayors of the palace succeeded in enforcing their authority in the western as well as in the eastern part, and in re-establishing to their own advantage the unity of the Frankish kingdom. The mayor Pippin the Short was even powerful enough to take the title of king over the whole.

At the time of Charlemagne, the word Austrasia underwent a change of meaning and became synonymous with *Francia orientalis,* and was applied to the Frankish dominions beyond the Rhine (Franconia). This Franconia was in 843 included in the kingdom of Louis the German, and was then increased by the addition of the territories of Mainz, Spires, and Worms, on the right bank of the river.

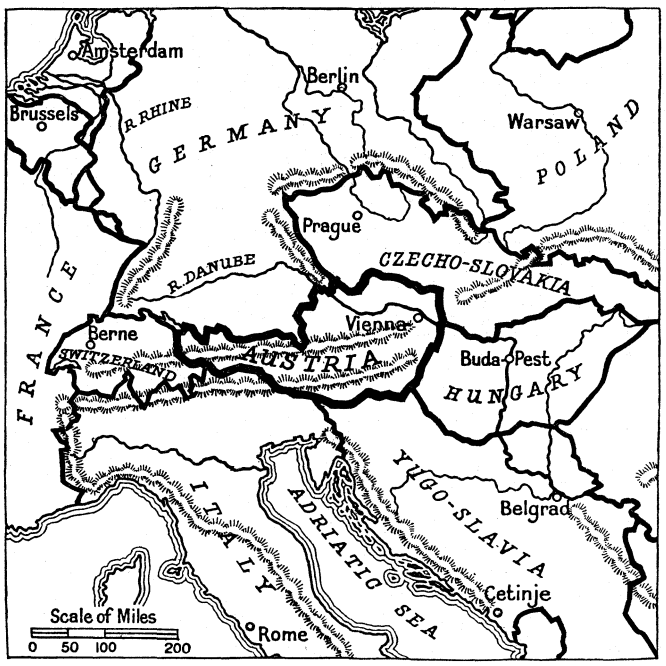
See A. Huguenin, *Histoire du royaume mérovingien d'Austrasie* (1857); Aug. Digot, *Nistoire du royaume d'Austrasie* (1863); L. Drapeyron, *Essai sur l'origine, le développement et les résultats de la lutte entre la Neustrie et l'Austrasie (1867);* Auguste Longnon, *Atlas historique,* 1st and 2nd parts. (C. PF.)

AUSTRIA, from Nov. *1918* to March 15, 1938, mas a Federal Republic formed from the predominantly German-speaking lands of the old Austrian empire. The new State thus returned in some measure to its original function as the Eastmark or frontier province, an outpost of Germanic speech and culture in the Slav and

Magyar worlds.

While danger threatened the mediaeval German empire from the East the frontier situation of the Eastmark contributed largely to its rise to greatness, and when the eyes of western Europe turned seawards a leading position was maintained by clever appreciation of political values.

The land routes to the Near East and beyond are recovering



BOUNDARIES OF THE AUSTRIAN REPUBLIC UNDER THE PEACE TREATY
Prior to the World War, Austria with Hungary, with an area of 240.456 sq. miles, was the largest of the European empires, excepting Russia. The union with Hungary was dissolved under the Peace Treaty, and its area reduced to 31,756 sq. miles. The republic dates from Nov. 12, 1918, the day after the abdication of the last emperor

something of their old importance

Austria, with its commanding situation astride several of the great European crossways, is the natural highway to the area of Southeastern Europe. Since its annexation to Germany by Chancellor Adolf Hitler in 1938 its economic and political importance in Germany's Drang *nach Osten* (push to the East) has been greatly enhanced.

Vienna, which used to be the cultural centre for the Lower Danube Valley and the Balkans, is spoken of by Germans as the Gateway to the East, as Hamburg and Bremen are the gateways to the sea.

Physical Structure. — The republic covered an area of 32.369 sq.m., *i.e.,* about equal to Scotland, and included much of the mountainous territory of the eastern Alps. From the Rhine valley, the western frontier of the country, these trend west-south-west, east-north-east to approximately 13° E., where the ranges commence to branch with loss in height and grandeur, and merge ultimately on the north and north-east into the accidented valley of the Danube and the open Vienna basin. On the east and south-east the ranges merge into the forested foothills overlooking the undulating countryland of western Hungary.

Northward, beyond the Danube, the former provinces of Upper and Lower Austria encroach upon the granite plateau that forms the southern flank of the Bohemian Massif, and the hilly plain of the lower Morava.

A remarkable feature of the Alpine system, significant in the human geography of Austria, is the zonal arrangement of its constituent formations; each zone shows a characteristic scenery and natural economy to nhich settlement has made a distinctive response.

Nevertheless, the excellent system of longitudinal and transverse valleys and low passes by which the highlands are broken has fostered currents of intercourse.

The central zone of the eastern Alps is a crystalline core of gneisses, schists and granites forming the highest ground In its western half it repeats, in subdued manner, the majestic features of the Swiss Alps, for large areas rise above the average height of the snowline (9,jooit.), *e.g.,* in the Silvretta Alps (Piz Bruin—10 88oft.). the Oetztal Alps (Wild Spitze—I2,309ft.) and the Hohe Tsuern (Gross Glockner—12,461ft.). Snowfields and glaciers *e.g.,* Pasterz, the finest example in the eastern Alps, stretching for 6m. down the slope of Gross Glockner, feed the streams of numerous radiating valleys that score the impervious rock, while there is ample evidence of heavier glaciation in the past. Below the zone of perpetual snow and ice, Alpine pastures clothe the rounded slopes giving place, below 7,000ft., to forests in which human effort has established vast clearings for pasture, cultivation and settlement. Isolated farms (*einzelhöfe*), hamlets and villages dot the sunny terraces, the gentler slopes and the valley floors; in suitable exposures even cereal cultivation is carried to a height of 4,000ft. Naturally, human activities increase in valleys leading to vital thoroughfares, such as the Brenner saddle, the most important route of the eastern Alps, lying at a level of 4 495ft., between the massive blocks of the Stubai and Zillertal Alps. For more than a hundred miles to the east no other carriage-way crosses the mighty watershed, but at the eastern limit of the Hohe Tauern the last snow peaks rise above the angle of the Mur valley, and the main range bifurcates north-east into the Niedere Tauern and south-west into the Gurktal Alps. Further branchings give rise to minor groups of heights, *e g.,* the Glein Alps, the Fischbach Alps and the Leitha mountains with progressive decrease of height accompanied by widening of valleys which often open out into sheltered, terraced basins, such as Klagenfurt, Judenburg and Graz, floored with thick deposits of fertile morainic and other débris. None of these mountains rises into the zone of snow; many are clothed almost to their summits by forest which everywhere dominates the landscape and plays an important rôle in the economic life of the highlands, while in clearings and above the tree belt rich, rain-nourished pastures supplement the varied agricultural activities of the valleys and basins. Valuable mineral deposits add to the natural wealth and impart an industrial stamp to the larger valleys, *e.g.,* the Mur-Murz depression; settlements are correspondingly more numerous and show a multiplicity of function generally absent in those of western Austria.

The central zone is flanked to the north by a broad limestone band that extends from the Rhine to the Vienna basin. This includes territory of two contrasted types; parallel ranges prevail to the west in the Allgauer and North Tirol Alps, but the Salzburg, Upper Austrian and Lower Austrian Alps are faulted and dissected into block masses. The prevalence of dolomite gives unity to the zone. Cold and barren surfaces broadening in the faulted regions to high plateaus, steep ruiniform slopes and poverty of surface drainage are the chief characteristics. On the tablelands, where water courses slowly, the stream channels are deeply incised (karrenfelder); in some cases the drainage becomes completely subterranean.

Though lower in the west than the corresponding crystalline blocks and losing height eastward, the rate of decrease is less than in the central zone so that the peaks of the latter are gradually overtopped by their limestone neighbours. Small plateau glaciers and snowfields are common and the most easterly Alpine glaciers are found in the Dachstein group (9,83oft.) of the Salzburg Alps. The precipitous slopes hinder the development of long ice streams, the old moraines with their rich meadowlands are a valuable economic asset in a limestone area; salt-bearing strata and timber are other desirable sources of wealth. The great chain of valleys, the Inn, Salzach and Enns, with initial subsequent and lower consequent reaches, forms a striking boundary between the central and northern Alps and makes both cross and through travel a comparatively easy matter.

From Innsbruck to the Mandling Pass on the upper Enns, and Salztbal on the Enns to the Semmering Pass, two lenticular belts of schist are intercalated between the crystalline and limestone zones, forming in the first the Kitzbühl Alps. and in the second the Eisenerz Alps, the eastern mass being celebrated for its deposits of iron ore.

North of the limestone Alps stretches the Flysch zone, a lower undulating region of sandstones, marls and schists that covers the northern half of Vorarlberg and reappears east of the Salzach as a narrow outcrop, culminating in the Wienerwald, where it plunges beneath the recent strata of the Vienna basin; except in Vorarlberg, where much clearing has occurred, it is a thinly-settled deciduous woodland. Between this and the Danube lies the true Alpine Foreland, a land of hill and plain carved out of Tertiary and Recent deposits, rising to its greatest height in the Hausruck (Göblberg—2,950ft.), a forested chain rich in lignite. The tributaries of the Danube have developed fine, terraced landscapes in the deep, fluvio-glacial debris. These are fertile and movement is easy; important development of agriculture has therefore resulted. Similar physical conditions are continued towards the north-east in the Morava-Danube angle. By contrast, the high granite plateau of Upper and Lower Austria is a region of forest and marsh, raw and inhospitable except where, as at Freistadt, outcrops of gneiss occasion depressions where farming is possible. Apart from such interruptions settlements hug the margin of the plateau along the line of the Danube.

Another limestone zone lies south of the Drava which acts as a dividing line between it and the crystalline Alps; only a portion of this lies within Austria, the Gailtal Alps, the northern flank of the Carnic Alps, separated from the former by the valley of the Gail, and the northern slopes of the Karawankas. From the source of the Drava the highlands stretch eastwards as a series of massive folds, with the customary progressive loss in height. Heavily forested and often with marshy valleys they do not encourage settlement, but are valuable for their lead and zinc ores. Both the Carnic Alps and Karawankas are deficient in easy passes, so that, although their situation relative to the Adriatic sea has necessitated the construction of important transverse routes, little local development has resulted.

Climate.— Variety is the keynote of Austrian climate. Uniformity is impossible in view of the strong contrasts in relief and only the most elevated areas are sufficiently unique and regular to be regarded as forming a distinct climatic region—the montane or Alpine type. Elsewhere the climatic conditions vary considerably within small distances according to the nature of the local topography, though the general characteristics in any particular area are due to its situation with reference to Atlantic, Continental and Mediterranean influences.

The whole of the region north of the central highland axis is under the influence of west and north-west winds, which convey modified Atlantic conditions along the line of the Danube and, by the north to south valleys, deep into the interior. The mean annual temperature ranges between 45" F and 48" F and no month has an average exceeding 68° F; the annual range, however, is high, 36° F, and marks the transition to the extremes of eastern Europe. Western influences are seen in the absence of a marked dry season but decrease in amount, and the nature of the general distribution of precipitation throughout the year are warnings of the growing strength of continental control; even at Innsbruck 43% of the annual fall occurs during the summer months. Farther east convectional overturnings of air above the Danubian lowlands are shown in violent summer storms. Snowfalls decrease westward often with important and serious effects upon the winter sowing of cereals. The climate of the northern valleys is appreciably modified by the *Föhn,* a warm wind particularly active in the valleys of the Rhine, Inn and Wipp. It raises the mean annual temperature and makes possible the growth of the vine in Vorarlberg and maize in North Tirol.

The climatic region of eastern Europe projects its influences up the valleys of the eastern borders, in Burgenland and east Styria. A decrease in total precipitation is accompanied by its greater incidence as summer storms and by a slight increase (2° F–4° F) in the difference of temperature between the hottest and coldest months. An important characteristic is the warm autumn.

A tendency towards a secondary maximum of precipitation during October in this region suggests a certain conflict with Mediterranean influences. These become more pronounced in the valleys that open south in Tirol where mild winters, and warm summers with temperatures often higher than 68" F, and maximum precipitation in spring and autumn prevail.

The greatest severities are experienced in the mountainous interior, in partially enclosed basins, *e.g.,* Klagenfurt, and in the deep, longitudinal valleys. The vertical fall of temperature is most rapid along the edges of the ranges and near isolated masses, a fact that is of importance in cultivation and settlement, which are further affected by a general retarding, often by several weeks, of vegetation. Against this must be placed the rapid growth of plants, under the stimulation of high air temperatures, where a suitable aspect occurs; the inevitable result is seen in the contrast between the desolate wastes and forests of the shaded slopes and the cleared and settled faces of the sunny sides. The enclosed basins and valleys are centres of extreme continentality, *e.g.,* the mean January temperature of Klagenfurt is less than that of Hammerfest, and winter severity is increased by the prevalence of temperature inversions with interesting consequences for cultivation and settlement, which avoid the valley floors thus escaping devastating frosts and obtaining a greater amount of sunshine than reaches the zone below the glacial shoulders.

The natural vegetation has been greatly altered by man. Where it exists undisturbed it is, like the climate, transitional in character. The mountain slopes bear the central Europe stamp; deciduous woods in which beech prevails flourish up to about 4,000 ft. and are succeeded by conifers, pine and larch, with a sub-Alpine ground flora. On the eastern and southern mountains oak-woods are common, *e.g.,* on the Wienerwald and the hills of East Styria while, except where planted, conifers are less abundant. The passage to Mediterranean latitudes is marked by the appearance in sheltered valleys of palm, lemon and olive groves.

The settled valleys customarily show a regular zonal arrangement of (1) cultivated land, (2) forests and (3) *almen* or "alp" pastures. The limiting heights of these belts vary with rainfall, aspect, soil and slope, being lowest in the east and in the limestone ranges but, generally speaking, the upper limit of tree growth lies about 800ft. below the snow line. Between is a region of high pasture whose richness varies with the rainfall and soil porosity.

Human Activities.— The population is mainly representative of the broad-headed Alpine race typically associated with the mountain axis of central Europe. Despite their mountainous character the east Alps have been settled from prehistoric time, as discoveries at Hallstatt, the lakes of Salzkammergut and elsewhere clearly prove. These early peoples with a culture based on agriculture were fortunate in their situation astride the amber route across the Brenner Pass, with easy access later to salt and iron and other metals, and they made many valuable contacts. Their language, Celtic in affinity, ultimately came under the influence of both Latin and Teutonic tongues. The latter proved the stronger and more absorptive and finally the mixture crystallized into High German, which to-day prevails everywhere except in a narrow belt along the south-eastern frontier. Here the Slavonic tongue has spread along the valleys of Styria and Carinthia, and beyond its present limits the persistence of forms of settlement and other old social characteristics associated with Slav-speaking people points to a deeper penetration in the past; in Burgenland, islands of Magyars introduce an Asiastic element, different in speech yet closely allied in outlook to their German-speaking neighbours.

It has been suggested in the opening paragraph that Austria is essentially rural in foundation. Of the population of 6,759,062, (Census of March 1934), less than one-half is urban, and only in Vienna and its surrounding lowland does industry predominate. But the situation is changing. Reorganization of factories and the traditional position of Vienna as the intermediary between western Europe and the Danubian countries and as a great financial centre are multiplying the activities of Austria and altering its original economic structure.

From 1918 to 1938 the growth of raw material for industrial purposes was negligible because the whole arable area had to be used for the production of foodstuffs, and energetic efforts were made by the Ministry of Agriculture and Forests to put more land under the plough, particularly in Burgenland, Lower Austria, Salzburg and Styria, and to increase the yields of individual crops.

Since annexation to Germany, more attention has been given to timber production and especially to the extraction of iron ore. This can easily be brought down by gravity to Linz on the Danube, where the Hermann Goering Iron company is developing a great iron and steel plant. The character and extent of the cultivation vary considerably from place to place, for 92·3% of the country ranks as mountainous while only 4·5% is true plain. About 10·5% of the total area is unproductive but the proportion of barren surface rises to 25% in the Hohe Tauern, and to 34% in the central Alps. Of the productive territory 40·9% is intensively cultivated as ploughland, meadowland, gardens and vineyards, while 59·1% is covered by forests and natural pasture. Broadly speaking two regions may be recognized, viz.: the difficult Alpine lands (Vorarlberg, Tirol, Salzburg. Carinthia and Styria), where the rigorous climate shortens the vegetable period, and the very fertile territories of the Danube (Upper and Lower Austria, Vienna basin) and Burgenland. The Alpine regions are rich in forests and rough pastures, and therefore stock raising is the basis of the farm for arable land decreases to insignificant amounts, *e.g.*, 5·9% and 3·5% of the productive surface in Tirol and Vorarlberg respectively; on the other hand timber supplements stock though not to such an extent as in the countries of Inner Austria. In the more fertile loess lands of the lower districts arable land averages between 40% and 50% of the productive area, and yields are higher in response to better soil and more advanced methods of farming.

Dependence upon imported foodstuffs has stimulated agriculture in the direction of cereal production. Rve takes the leading place, followed in order by oats, wheat, barley and maize, but the production of wheat and rye is still unsatisfactory for only some one-third and three-fourths respectively of the country's needs can be supplied. For barley and oats the proportion is two-thirds and four-fifths respectively, so that large quantities of cereals and bread-flours are regularly imported from Hungary, Yugoslavia, Italy and Czechoslovakia. Yet there is an all-round approach to the pre-war yield. Maize is restricted in occurrence and area; it disappears entirely in the exposed Salzburg and Upper Austria, but thrives in the warmer eastern lowlands where minor amounts of millet and buckwheat are also grown. The cultivation of potatoes now suffices to meet home requirements and is general, reaching its greatest intensity in the Danube lands and Burgenland, but sugar-beet, though increasing in area and yield, does not yet satisfy more than half the demand; it is almost confined to the Vienna basin. Fodder crops are important on the lower foreland, therefore cattle are more numerous per unit of area than in the highlands, where, despite the rich crops of Alpine hay, difficulties of transport and scarcity of arable land reduce their numbers.

Other crops of importance are hops and rape (Middle Styria and Upper Austria); flax on the marshy granite plateau of Upper and Lower Austria, and, with hemp, on the Styrian hill lands; chicory in Upper Austria; stone fruits, which are replacing the vine, thrive everywhere except in Tirol and Salzburg, *i.e.*, the apple countries; leguminous plants in Lower Austria; tobacco in Tirol and the vine, absent only in Salzburg, Tirol and Upper Austria, reaches its finest quality in the sheltered Rhine valley and the warm eastern basins, notably that of Wiener-Neustadt

Nature, small properties and methods of settlement often retard the adoption of advanced methods of agriculture, particularly in the mountainous districts where a rotation of crop and grass is the rule, while even in the better lowlands the three-field system of cultivation is still widespread.

Livestock. — Like cultivation, stockraising shows sympathetic reaction to many physical and social circumstances. The great Alpine expanses of natural pasture are the basis of a thriving stock-farming yet, for reasons stated above, it is on the forelands of the North and East that animals are most thickly concentrated; the mountainous centre and West raise cattle to export for breeding, the supply of milk and meat to Vienna is the object on the lowlands of the east, e.g , Lower Austria, which is responsible for 90% of the milk used in the capital. But the example of Switzerland, already followed in Vorarlberg, is spreading and, by the help of co-operative organizations, Austria is slowly developing the dairying industry and has already succeeded in reducing considerably the heavy post-war imports of condensed milk.

Much can also be done in the breeding of pigs which have increased in numbers. They are most common on the mixed farms of the lowlands, for in the highlands their place is taken by goats. whose milk, rich in fat, is an important element in the peasant dietary, while everywhere on small-holdings and near large centres of population goat-keeping increases. Sheep-rearing is also of importance in the highlands where the coarse wool required for clothing and domestic purposes is supplied by the hardy Alpine breed, whose excellent meat quality has developed a brisk export, particularly to Switzerland, though the main object at present is to improve the wool by crossing with German breeds.

Before the World War Austria was a noted exporter of horses but war losses, the steep decline of the army demand and the increasing use of motors in agriculture and transport have ruined many studs and caused others to concentrate upon quality. Still, breeding of all kinds continues everywhere with a bias towards the heavy type (Pinzgau breed) in Salzburg and North Styria, the lighter types in the foremost breeding countries of Carinthia and Upper Austria.

In addition to domestic animals certain districts, notably Upper Styria are well stocked with game, *e.g.*, deer and chamois.

NUMBERS OF LIVESTOCK

	1923.	1934.
Cattle including cows	2,162,385	2,348,600
Cows	1,074,865	1,209,900
Pigs	1,473,197	2,823,000
Goats	382,146	326,500
Sheep	597,413	263,400
Horses	282,651	261,200

Forestry. — The forests of Austria cover about 38% of the total, and 42% of the productive area, the latter figure being exceeded only in Finland and Sweden, and are an important national asset, for timber exports take first place in quantity and a high rank in value. Further, although the State controls a great portion of the forests and local authorities and large landowners most of the remainder, many peasants may claim, by interesting historic rights, supplies of free timber and more than 100,000 people are directly employed in forestry or sawmills.

Seventy-one per cent of the forest is coniferous in which pine predominates, 19% is deciduous and 10% mixed. The coniferous plays the most important rôle, particularly in the mountainous provinces of Carinthia, Styria, Salzburg and Tirol, and an annual output of timber approaching ten million cubic metres is the average; of this amount about six millions are available either for export or as the basis of wood and paper industries

Detailed study proves that Austria's basic industry, the exploitation of the land, is essentially sound and capable of great expansion by improved technical education of the rural population and the adoption, on a greater scale, of co-operative methods of farming.

Mineral Resources and Power. — Mining has a long and happy history but in modern times has undergone important

changes. Austria has always been noted for the variety of its mineral wealth, but the famous gold mines of the Hohe Tauern and the silver ores have ceded pride of place to those of iron, lead, zinc and copper. In the Eisenerz-Vordernberg range (Styria) lies one of the largest European deposits of iron-ore, exploited since the dawn of the iron age. It is quarried rather than mined so that production costs are low, and smaller accessible fields occur near Werfen (Salzburg); the annual output of iron-ore exceeded a million metric tons in 1936 and is rapidly increasing. In other ores variety, not quantity, is the rule. Copper is mined in Salzburg, Tirol and Lower Austria in the order of importance named. Lead and zinc are principally dug at Bleiberg (Carinthia), though minor amounts are obtained from the Tirol section of the northern limestone counterpart. In addition, small quantities of bauxite (Salzburg), graphite (Styria and Lower Austria), sulphur (Styria, Tirol and Salzburg) and manganese are of sufficient importance to figure in statistical returns.

The lower Triassic strata in the Salzkammergut region, at Hallein (Salzburg) and Hall (Tirol), are rich in salt layers famous from pre-historic times and still actively worked. Building-stone, marbles and rocks for cement are widely distributed.

The resources in fuel comprise small deposits of coal in Lower Austria and large quantities of lignite. The latter is fair in quality and is mixed everywhere, excepting the province of Salzburg, but the richest supplies lie in Styria, in the region of Graz and along the Mur-Murz valley. From these districts come nearly two-thirds of the annual output, the remaining third from Burgenland, Upper and Lower Austria, Carinthia and Tirol, in the order of importance detailed. Yet, even with the coal the home supply of fuel is scarcely 30% of the quantity needed and import of coal and coke is a heavy debit item on the annual balance sheet. Austria seeks to improve the trade balance and to obtain supplies of power by exploitation of its water resources. The existing water power may be set at about 3.7 million gross h.p. at low-water level, of which only 50% is considered worthy of development. This is more than sufficient to meet the requirements of the country and further, every province excepting Burgenland and Vorarlberg has more than 300,000 available h.p. So far not 20% of the available supply has been harnessed, but with the growing interest of foreign capital and an energetic State programme, development proceeds apace.

Manufacture.— In Austria modern production is still far below the pre-war scale, for many of the old markets are lost and post-war impoverishment has reduced purchasing capacity.

Most important are the metallurgical and engineering industries. Iron and steel manufacture, largely in the hands of the Alpine Montan-Gesellschaft, suffers from a shortage of suitable local fuel and depends upon imported coke but, nevertheless, is ample for home requirements. (Production, 1936, pig iron—248,000 metric tons; steel—424,000 metric tons.) Styria is responsible for 99% of the production. Upon these fundamentals have developed thriving engineering trades. These are concentrated in four districts, viz., the north Alpine Foreland centring on Steyr, the Mur-Murz valley, the Vienna-Wiener Neustadt region and the Klagenfurt basin. The first, distant from the raw materials, deals largely with small, valuable and highly-specialized articles, *e.g.*, cutlery, firearms, needles, screws, etc., or cycles and automobiles; the Mur-Murz valley handles heavy products such as locomotives and rolling stock, while machinery for agricultural and industrial purposes is naturally the output of Vienna and Wiener-Neustadt. Other metal industries include the working of copper in Salzburg and Tirol, lead in Carinthia, antimony in Burgenland and alloys such as German silver at Berndorf (Lower Austria). The rarer metals are handled in the capital where exists also an important manufacture of scientific and surgical instruments. Allied to the above trades is the electrical industry. Almost the whole output of electrical products of the old empire was concentrated in the present territory and recent developments towards electrification of the railways, utilization of water power and wireless have greatly enlarged the trade.

The working of timber and its derived products, *e.g.*, pulp, cellulose, furniture and musical instruments is second in importance. Wood products are widely manufactured both as factory and house industries. while the output of pulp, cellulose and paper exceeds the pre-war level. (Metric tons in **1936:** paper, 177,000; pulp, 52,000; cellulose, 253,000.) Paper products have suffered severely from import prohibitions and high tariffs devised by the new States and the situation for these is unsatisfactory. Saw mills and joineries, large and small, are widely scattered but the working of paper centres principally in the Wiener-Neustadt valley, in the valleys of the right bank tributaries of the Danube from the Traun to the Traisen and along the Mur, Drave and Inn valleys, while ornamental furniture and musical instruments are the specialities of the capital.

The textile industry is highly important, for it employs some 70,000 workers and is the basis of a number of finishing trades. In cotton-working, before the break-up of the empire, Bohemia specialized in weaving and the modern Austria concentrated upon spinning so that to-day, for the treatment of cotton, the country has a surplus of spindles but a deficiency of looms. This industry has grown up in three centres, viz., in the Wiener-Neustadt valley, aided by cheap labour and a large adjacent market, in the moist northern valleys, *e.g.*, of the Linz district, and, by spread from Switzerland, in Vorarlberg and North Tirol. Wool has never had great importance except for the working of coarse cloths (*Loden*) for home use, though Austria was able during the post-war inflation period to take advantage of the heavy world demand for fancy knitted goods. The position in finishing trades, *e.g.*, clothing, for which Vienna has always been famous, is not so hopeful owing to loss of overseas markets, luxury duties fixed by new countries and lack of capital. By contrast, the leather trade has exceeded its pre-war prosperity for the reputation of Vienna in fine goods has enabled it to meet foreign competition. Domestic supplies of the necessary raw materials, water power and the stimulation of war have fostered the vigorous chemical trade in all its varied aspects. The products range from soaps, perfumes and other delicate goods in Vienna to calcium carbide and aluminium in Vorarlberg and Tirol. Glass manufacture persists with difficulty on the flank of the Bohemian Massif, mainly by reason of its close association with the factories of Czechoslovakia.

The production of foods and drinks is largely dependent upon imported materials and is primarily intended to meet home consumption. Brewing is widespread with important concentration in the towns, distilling in Vienna, sugar manufacture in Lower Austria and Burgenland and the preparation of tobacco, a State monopoly, over the whole country.

Tourist traffic brings an ever-growing revenue in Tirol and Salzburg, though by reason of its later start and distance from western countries, it still lags behind that of Switzerland.

Communications.— Physical difficulties confront the construction and maintenance of roads and railways and therefore the network is not dense. Railway development has concentrated upon the important through routes, the northern longitudinal valleys carry the east to west traffic, the transverse bind north to south, while the slope unites both directions to the great focus of Vienna. There are more than 4,000m. of line, of which three-quarters are State-owned, and electrification, with the object **of** reducing costs and increasing the load and speed of trains, proceeds rapidly. Motor transport is still light but air services are growing in number. For these Vienna is an important junction on the Paris–Constantinople and Prague–Budapest through routes, and is also a terminus for subsidiary routes to Warsaw, Munich, Trieste and Venice. Water traffic, apart from a small canal from Klagenfurt to Lake Wörther, is restricted to the Danube. The traffic of Linz and Vienna, the two important river ports, has suffered severely in comparison with pre-war times. This is directly due to the decline of trade that has followed the break-up of the empire, whereby traffic policies and frontier formalities have replaced the original free trading conditions. Future recovery is bound up with a number of circumstances, *e.g.*, the revival of cereal exports from Rumania and the conclusion of satisfactory commercial treaties. The Danube must nevertheless continue to be an important artery of transport of increasing value with the development of the Rhine-Main-Danube deep-water canal.

In many ways the natural wealth of Austria is greater than that of Switzerland, a hopeful augury for the future, but, whereas Switzerland has elaborated its economic adjustment in an evolutionary manner through the centuries, Austria is faced with the more difficult problem of reorganization and re-equipment to meet a wholly new set of conditions.

Political Organization and Settlement. — The Federal republic comprised nine independent provinces, each of which had its own assembly *(Landtag)* for the control of regional affairs, the members being chosen by the provincial electorate. The assemblies sent deputies to a national higher chamber *(Bundesrat)* of 46 members, in proportion to the size of the populations they represented. This acted in an advisory capacity to a general chamber (*Nationalrat*) whose members were chosen by national election.

Province	Area Sq.m.	Population	Population per sq.m.	Percentage of total population
Vienna	107	1,861,856	17,400	27·78
Lower Austria	7,452	1,512,011	202·9	22·33
Upper Austria	4,626	906,025	195	13·35
Salzburg	2,762	248,188	89	3·64
Styria	6,323	1,016,585	160	15·00
Carinthia	3,680	407,529	110	6·01
Tirol	4,882	351,888	72	5·17
Vorarlberg	1,005	157,338	156	2·30
Burgenland	1,532	297,642	194	4·42

For the most part the provinces are inhabited by people of German speech, 97% of the total population, but dilution appears along the eastern border. Thus Vienna has about 80,000 Czechs, Carinthia some 40,000 Slovenes and Burgenland 42,000 Croats and 11,000 Magyars. The religious unity is almost as pronounced for 93.68% of the population are Roman Catholics; 3·11% and 2·93% are Protestant and Jewish respectively. Protestantism is strongest in Upper Carinthia, where the proportion rises to 6%, in the upper valleys of the Traun, Enns and Drava and in Vorarlberg, while the greatest numbers of Jews are found in Lower Austria and Vienna.

Naturally settlement is most dense in the fertile lowlands and in regions where industry supplements agriculture, *e.g.,* Vienna basin and the Rhine valley. The mountainous districts, particularly the inhospitable northern limestone zone, are thinly peopled; nearly 95% of the Austrian population lives permanently below 2,500ft. and over 50% below 1,000ft. The closing years of the nineteenth century were marked by a general valleyward drift of settlement in the highlands, quite independent of the seasonal pastoral movements, but post-war changes in social and economic conditions appear to have checked this.

A close relation exists between conditions of settlement and the possibilities of cultivation. In the highlands where terraces are narrow and slopes steep the isolated farmstead *(einzelhof)* built with due regard to suitable shelter, sunshine and soil, is common. Where terraces widen and slopes are softened by talus and alluvial fans the village becomes the typical unit, customarily after the characteristically German irregular grouping of houses *(haufendorf)* though, if the valley be a through route, a straggling arrangement along the line of movement appears *(strassendorf);* in all cases the fertile but dangerous marshy flood plain is avoided. Eastward in Burgenland and north of the Danube villages arranged regularly along the length of a ridge *(reihendorf)* suggest Frankish influences, while to the south-east typical Slav forms may be recognized. Apart from Vienna, only three towns, Graz, Linz and Innsbruck, exceed 50,000 in population and these, like the smaller towns, are fundamentally nodal points.

The structural forms and building materials of the individual house also vary considerably, the difference being partly physical and partly cultural in origin. For instance, the houses of Tirol and Salzburg, half wood, half stone, with verandas and flat stone-laden, wooden roofs are quite distinct from those of the eastern mountain zone where steep roofs of boards, shingles or straw thatch predominate.

Natural Divisions. — The spirit of unity that inspires the provinces of Austria is more the outcome of centuries of participation in a common history than of similar physical endowments. It has been shown that Austria may be divided into a number of longitudinal physical zones, most of which are distinctive in the possibilities they offer, yet so important are the transverse thoroughfares that they too have exercised a large measure of control upon the growth of the individual provinces, whose frontiers are in close relation to physical features. The exact nature of the relationship is analysed for each of the former provinces under its title where, too, are analysed the material and other contributions it has made to the national welfare.

DEFENCE

Army: I. Historical. — The *Landsknecht* infantry constituted the mainstay of the imperial armies in the 16th century. Maximilian I. and Charles V. are recorded to have marched and carried the "long pike" in their ranks. Maximilian also formed a corps of *Kyrisser,* who were the origin of the modern cuirassiers. It was not, however, until much later that the Austrian army came into existence as a permanent force. Rudolph II. formed a small standing force about 1600, but relied upon the "enlistment" system, like other sovereigns of the time, for the bulk of his armies. The Thirty Years' War produced the permanence of service which led in all the states of Europe to the rise of standing armies. In the empire it was Wallenstein who first raised a distinctly imperial army of soldiers owing no duty but to the sovereign; and it was the suspicion that he intended to use this army, which was raised largely at his own expense, to further his own ends, that led to his assassination. From that time the regiments belonged no longer to their colonels, but to the emperor; at the close of the Thirty Years' War Austria had 19 infantry, 6 cuirassier and 1 dragoon regiments. The almost continuous wars of Austria against France and the Turks (from 1495 to 1895 Austrian troops took part in 7,000 actions of all sorts) led to a continuous increase in her establishments. The wars of the time of Montecucculi and of Eugene were followed by that of the Polish Succession, the two Turkish wars, and the three great struggles against Frederick the Great. This, in conjunction with the fact that Austria took part in other Turkish campaigns subsequently, rendered this army the most formidable opponent of the forces of the French Revolution (1792). But the higher leading, organization and numbers of the emperor's forces were totally inadequate to the magnitude of the task of suppressing the Revolutionary forces, and though such victories as Neerwinden were sufficient proof of the efficiency and valour of the Austrians, they made no headway. In later campaigns, in which the enemy had acquired war experience, the tide turned against the Imperialists even on the field of battle. The archduke Charles's victories of 1796 were more than counterbalanced by Bonaparte's Italian campaign, and the temporary success of 1799 ended at Marengo and Hohenlinden. *(See* FRENCH REVOLUTIONARY WARS.)

The Austrians, during the short peace which preceded the war of 1805, suffered, in consequence of all this, from a feeling of distrust, not merely in their leaders, but also in the whole system upon which the army was raised, organized and trained. This was substantially the same as that of the Seven Years' War time.

MOUNTAIN VIEWS IN AUSTRIA

1. View of the Gesause valley of the river Enns, in Styria, through which passes the railway line connecting Vienna and Innsbruck
2. View of the crest of the Grossalockner mountain, in Tirol, showing the Pasterze glacier
3. Snow trail on the Kandigrat, in the Tirolese Alps
4. Kandersberg, in the Tirol, which is at the junction of three national boundary lines. The castle, sometimes called Castle Kanders, houses the district law-courts and is on German territory. Mount Mondin, shown in the backaround. is in Switzerland, and the valley below borders Italy
5. A corner of one of the many small lakes in the Salzkammergut district. in Upper Austria
6. Summer view of the hospice of St. Christoph, on the Arlberg Pass, 6,000 feet above sea level. Mounts Madaunspitze and Kuchenspitze are seen in the background, the latter peak rising to a height of 10,000 feet
7. Mitterndorf, in the Styrian Salzkammergut, one of the well-known winter resorts in Austria
8. Zell-am-See, Salzburg, with the Tirolese Alps in the distance
9. The Stelvio road, formerly partly in Austria, but after World War I in Italy; the pass is thk highest carriage road in Europe

Enlistment being voluntary and for long service, the numbers necessary to cope with the output of the French conscription could not be raised, and the inner history of the Austrian headquarters in the Ulm campaign shows that the dissensions of the general officers had gone far towards the disintegration of an army which at that time had the most esprit de corps and the highest military qualities of any army in Europe. But the disasters of 1805 swept away good and bad alike in the abolition of the old system. Already the archduke Charles had designed a "nation in arms" after the French model, and on this basis the reconstruction was begun, The conscription was put in force and the necessary numbers thus obtained; the administration was at the same time reformed and the organization and supply services brought into line with modern requirements. The war of 1800 surprised Austria in the midst of her reorganization, yet the new army fought with the greatest spirit, and the work went on steadily until, in 1813, the Austrian armies worthily represented the combination of discipline with the "nation in arms" principle. Their intervention in the War of Liberation was decisive, and Austria, in spite of her territorial losses of the past years, put into the field well-drilled armies far exceeding in numbers those which had appeared in the wars of the Revolution (see NAPOLEONIC CAMPAIGNS). After the fall of Napoleon, Austria's hold on Italy necessitated the maintenance of a large army of occupation. This army, and in particular its cavalry, was admittedly the best in Europe, and, having to be ready to march at a few days' notice, it was saved from the deadening influence of undisturbed peace which affected every other service in Europe from 1815 to 1850. But it was employed in dynastic wars, and the conscription was modified by substitution; thus, when the war of 1859 resulted unfavourably, the army began to lose confidence, precisely as had been the case in 1805. Once more, in 1866, an army animated by the purely professional spirit, which was itself weakened by distrust, met a "nation in arms," and in this case a nation well trained in peace and armed with a breech-loader. Bad staff work, and tactics which can only be described as those of pique, precipitated disaster (*see* SEVEN WEEKS' WAR).

The result of the war, and of the constitutional changes about this time, was the re-adoption of the principles of 1806–13, the abolition of conscription and long service in favour of universal service for a short term, and reform in the methods of command and staff work. It was said of the Prussian army that "discipline is—the officers." This was more true of the "K.K." army[1] than of any other in Europe; the great bond of union between the heterogeneous levies of recruits of many races was the spirit of the corps of officers, which retained the personal and professional characteristics of the army of 1848, whose peculiar tone was well conveyed in George Meredith's Vittoria.

Between 1866 and 1914 the principal action taken by the Austrian army was the occupation in 1878 of the Turkish provinces of Bosnia and Hercegovina, with the support of the Concert of Europe. These countries were added to Austrian territory in 1908. The seat of Government was established at Serajevo which became the scene of the sinister murder of June 1914, immediately preceding the World War. The military effort of Austria-Hungary in that conflict is described elsewhere. The total ration strength of the Austro-Hungarian army at the Armistice (Nov. 1918) may be put at about 2,229,500, with about 500,000 in reserve if the 1920 class is included. Of this army, about 1,353,000 were on the Italian Front, the rest distributed in the Western, Eastern (329,000), Balkan and Asia Minor theatres of war and on the lines of communication. There were nearly 3,900 field and 1,760 heavy guns on the Italian Front. The field army stationed there included 757 battalions (54½ divisions, etc.) and 26 squadrons (6 divisions, etc.), totalling 408,500 rifles and 3,900 sabres. It is not possible to distinguish the Austrian figures from the Austro-Hungarian totals.

II. Post-War Army.—Under the terms of the Treaty of St. Germain which followed the World War (Sept. 10, 1919), compulsory service was forbidden in the Austrian army. The functions of that army were limited to the maintenance of internal order and to the control of the frontiers. A maximum strength was laid down for the army staff and both a maximum and a minimum strength for all formations. All methods of "mobilization" were forbidden. The gendarmerie was limited to the number maintained in 1913, and no military training was permitted for this force. Officers in the army served for at least 20 years; not more than one-twentieth of the number to retire in any one year. Enlistment for other ranks was to be for at least 12 years, of which six years or more were to be spent with the colours. The importation of arms and munitions of war was forbidden. A maximum of arms to be retained was prescribed, none to be imported. No gun exceeding 105mm. calibre was allowed, except in the normal armament of fortresses. Only three field-pieces were allowed for every 1,000 men of other arms. Manufacture or importation of armoured cars, tanks, or "any similar machines suitable for use in war" was forbidden; also flame-throwers, poison gas, etc.

In May 1936, Austria, following Hitler's example in Germany, announced that she would no longer abide by these military restrictions imposed by the treaty. She therefore adopted conscription with a short term of service and proposed to raise her army from the treaty limit of 30,000 to 150,000.

Recruiting was by voluntary enlistment of men between the ages of 18 and 26, the maximum number raised in the different districts being limited as follows: Vienna District, 9,000; Lower Austria, 6,500; Burgenland, 1,500; Upper Austria, 4,000; Styria, 4,000; Carinthia, 1,700; Salzburg, 1,000; Tyrol, 1,700; Vorarlberg, 600. Total 30,000. (G. G. A.; X.)

Navy.—Since the rearrangement of boundaries following the World War, Austria has no seaboard and the former Austro-Hungarian fleet is no longer in existence. Four patrol-boats on the Danube were the only war vessels belonging to Austria.

ECONOMIC CONDITIONS IN AUSTRIA, 1918–38

The old Austro-Hungarian empire consisted of the great fertile plains of the Danube, the Theiss, and the Elbe, the ring of mountains which surrounded them, and to the north-east the uplands and plateau which lie beyond those mountains. Of this somewhat amorphous, but geologically united area, post-war Austria formed a rough sector which ran from the extreme western boundary to Vienna, the sector which was left after the frontiers of the other succession states had been determined. Geologically, this new Austria consisted of the major part of the eastern wing of the Alps and of a stretch of the Danube valley to the north-east. The valley is rich, but over two-thirds of the total area, which amounts to 32,369sq.m., is mountainous. In 1934, when the last census was taken, the population was 6,759,062, of which about 65% were living in the relatively low-lying districts of Upper and Lower Austria and in Vienna. In Vienna itself there were 1,861,856 persons. The mountainous nature of the territory and the large proportion of the population resident in the capital city are the two factors which mainly determine and must determine the essential economic characteristics of the country.

Until the autumn of 1922 when the League of Nations formulated its reconstruction scheme, Austria lived a precarious existence with the aid of relief loans, private charity and the sales of her depreciating paper currency to unduly optimistic speculators. The population of Vienna was unable to procure the bare necessities of life. The State budget, burdened by relief expenditure and the salaries of a staff far in excess of the requirements of the reduced territory, was in chronic deficit. Her inflated currency lost day by day in value and her industries divorced at once from their sources of raw material and their former markets, battled vainly in a sea of tempestuous prices. The relief credits which were granted by the Allies proved to be of no value—save as temporary palliatives, and in the autumn of 1922 it was decided by the Assembly of the League of Nations that measures of relief must be replaced by a definite scheme of reconstruction. It is not necessary here to record the details of the League of Nations plan of reform. It involved the formal re-affirmation of the independence and sovereignty of Austria, a moratorium from reparation lia-

[1]The phrase "K. und K." (*Kaiserlich und Königlich*) was applied to all services common to the Austrian and Hungarian armies; "K.-K." (*Kaiserlich-Königlich*) only in the strict sense to the troops of Austria, the Hungarian army being known as the "K.Ung." (Royal Hungarian) service.

bilities for a period of 20 years, the raising of a foreign government guaranteed loan of 880 million schillings[1] (net), a precise and elaborate scheme of budget reform, tho reorganization of the national bank, the definitive stabilization of the currency, and finally the appointment of a high commissioner to supervise the execution of the reforms proposed. After the repayment of certain relief credits, a sum of 6j3 million schillings became available from the loan for utilization by Austria as required. and to this was added in the autumn of 1927 a further sum of approximately 27 million schillings on account of the postponed Swiss block.

Agriculture and Forestry. — Agriculture in Austria is of that mixed type which results inevitably from the formation of the land — in the plains mainly arable, in the mountain districts mainly dairy and stock breeding with patches of arable in the valleys and occasional orchards and vineyards. The percentage distribution of the total area according to the use to which it is put is approximately as follows:

	%
Arable	23·9
Meadows	110
Mountain pastures	155
Gardens	1·0
Vineyards	06
Forest5	37 4
Unproductive	106
	100

The amount under plough is relatively small (in Hungary over 59% and in Rumania 41·6% of the area is arable); and the greater part of it is in Upper and Lower Austria and Burgenland, where it accounts for over 40% of the available area. Only about 4% of the Tirol is under plough Most of the agricultural land is divided into peasants' holdings which vary in size. Large estates probably do not account for more than about 6% of the total On the other hand the forests, which are an Important source of wealth and cover over a third of the territory, are mainly owned by large landed proprietors, the State, and to a lesser extent the local authorities The peasants have, however, in many districts certain ancient privileges permitting them to cut firexood, etc

Of the crops the most important are rye and oats The yield of the major crops in thousands of metric tons was as follows —

Crops	Metric tons (000's) Average 1909–13	1930–34	1935	1936	1937
Wheat	271	344	422	368	400
Rye	568	576	620	460	476
Barley	169	277	270	253	288
Oats	405	418	390	403	287
Maize	73	134	127	135	..
Potatoes	1,296	2,628	2,392	2,500	3,612
Sugar-beet	320	1,089	1,150	889	1,008

During the World War agriculture suffered severely from lack of labour and lack of fertilizers. and during the inflation period the peasant had little inducement to produce more than he required for his own needs. Inflation, however, relieved him of practically the whole of his mortgage debt, and although the high rates of interest which ruled in Austria until about 1926 made borrowing for land betterment or indeed on short term extremely difficult the ultimate gain to agriculture must not be overlooked.

In spite of the progress which has been achieved in recent years Austrian agriculture can only cover a relatively small proportion of the cereal requirements of the population. The relationship of production to consumption In 1926 was as follows:—

Production as Percentage of Total Quantities Available for Consumption

Wheat	Rye	Barley	Oats	Potatoes
33·0	80·7	63·8	84·6	90·6

Although the stockbreeding and dairy-farming of the Alpine districts are rapidly developing. Austria still imports considerable quantities of meat in addition to other foodstuffs This import is required almost wholly for the needs of Vienna.

Austria is thus largely dependent on foreign sources of food supply and that fact determines and must continue to determine her general economic structure. In 1926 about 37% of her gross imports consisted of live animals and articles of food and drink. These imports are mainly paid for by the export of manufactured goods and by the services of middlemen, although the largest single article of export is building timber.

Industry. — The old Austro-Hungarian empire was to an exceptional degree a self-contained economic unit. Its trade per head amounted to less than $1 5 and a large proportion of the raw materials of its industries was obtained within its frontiers. The Austrian republic of 1918–38 was at once essentially dependent on her export trade and relatively poor in raw materials. Her forests supplied the wood required for her paper mills She had more than enough iron ore for her steel and engineering works. and there are deposits of magnesite, salt and graphite. But she had to purchase abroad over three-quarters of her coal requirements and nearly all the raw materials for her textile industries The relative importance of her various industries may be very roughly gauged by the statistics of numbers employed in 1925:—

Industry	No.		Industry	No.	
Metallurgy and engineering	188,532	21 4	Hotels, etc.	35,659	4·0
			Paper	30,060	3·4
Building	140,541	15·9	Chemicals	26,778	3·0
Clothing and shoemaking	75,644	9 0	Printing, etc.	25,683	2·9
			Stone and		
Woodwork	70,946	8·0	earthenware	24,537	2·8
Textile,	67,476	7·7	Leather	13,166	1·5
Food	60,397	6 8	Rubber	5,660	0·6
Mining	52,998	6 0	Electrical supply	3,209	0·4

These particular industries employed labour in the proportions indicated largely owing to historical causes — only to a limited extent do they depend on existing natural advantages. They were grouped in part round their market and distributing centre. Vienna. in part round the Styrian ore-fields. and they were closely connected with what is now the German Protectorate of Bohemia and Moravia. Cotton yarn was spun in Austria and woven in Bohemia. and Bohemian piece goods were made up in Austrian clothing factories. The steel works in Styria employed Moravian coke and those in Moravia Styrian ore. Modern Austria found herself with an excess of spindles and a lack of looms. an excess of ore and lack of hard coal. The result of these conditions has been to stimulate the use of water power and create a certain shift in the relative importance of the different industries in favour of those such as paper for which the raw materials were available at home. of those such as hosiery and motor-cars which have enjoyed a general prosperity in post-war years, and more recently in favour of the typical Viennese luxury industries. The development of those industries for which data exist may he judged from the following figures:

AUSTRIAN PRODUCTION (Metric tons; 000's omitted)

	Hard coal	Lignite	Iron ore	Pig iron	Steel	Lead	Paper	Cellulose
1923	158	2,685	1,211	342	500			
1926	157	2,958	1,094	332	550			
1930	216	3,063	1,180	297	468	6 9		213
1931	228	2,982	512	145	323	6·1		216
1932	221	3,104	307	94	205	2 0	201	200
1933	239	3,014	267	88	226	4 6	201	222
1	251	2,851	467	134	309	5·6	199	239
1935	261	2,971	775	193	364	8·0	197	254
1936	244	2,897	1 024	248	418	8 7	177	253
1937	230	3,242	1 880	389	650	8 7	232	304

Trade and Commerce. — The foreign trade of Austria per head of population was remarkably high, amounting in 1924 to nearly $116, and in 192 j to $93. But it fell disastrously during the world depression, being only $23 in 1934, and $25 in 1936. Imports

[1] The schilling (=10,000 paper crowns=·73 gold franc) was introduced in the spring of 1925.

PEOPLE AND SCENES IN THE ALPINE REGIONS OF AUSTRIA

1. Peasants of the region of Salzburg in fête day costume, the man carrying a tobacco pipe
2. Austrian guides leading tourists up the Zugspitze, on the Austro-Bavarian frontier, the highest peak in the Northern Tirolese or Bavarian Alps
3. Two natives of a village in the Carinthian Alps, just below Salzburg and east of the Tirol, wearing the national costume for church on Easter Sunday
4. People of the Tirol, the most southerly province in Austria, who have bicycled to town from a mountain village for supplies. Bicycling is a favourite mode of travel in this province, where the roads are excellent
5. A wayside shrine on the top of the Arlberg Pass, one of the chief passes of the Silvretta and Rhätikon ranges, in the Austrian Alps. Beneath the carriage road a railway tunnel runs between Landeck and Bludenz. Valluga Spitze, 8,000 feet high, can be seen in the background of the picture
6. Sand beach by the Millstater See, an Alpine lake in one of the valleys of the Carinthian Alps, which is a favourite bathing place and holiday resort
7. An Austrian mountaineer in characteristic short jacket and feathered hat, carrying the rope and pick equipment necessary for mountain-climbing

have always considerably exceeded exports, causing an unfavourable balance of trade. This unfavourable balance has been partly met from the proceeds of large international loans to Austria, and partly by the services which Austrians perform for citizens (notably tourists) of other countries. The decline in Austrian foreign trade which became sharp with the world depression may be seen from the following figures:—

AUSTRIAN FOREIGN TRADE (000,000's omitted)

Year	Imports	Exports	Total	Balance
1929	$458*	$302	$760	$−156
1932	169	93	262	− 76
1933	131	88	219	− 43
1934	129	95	224	− 34
1935	134	101	235	− 33
1936	138	106	244	− 32
1937	162	136	298	− 26

*Throughout the table the gold dollar is of the old value before 1933.

International **Services.**—Vienna before the World War was much more than a political capital. It was the commercial and banking and cultural centre of the whole Austro-Hungarian empire. Although independent money markets have grown up in the other Succession States, and tariffs and the desire for economic self-dependence have greatly restricted the distribution of goods over the new frontiers, Vienna has maintained a large part of its former business. Its bankers and merchants are still the natural intermediaries between eastern and western Europe, and it is still a transit depot. Before the World War Viennese banks directly owned or controlled the main industrial undertakings of the country and they have gradually acquired since the Austrian currency was stabilized in 1922 an increasing interest in industries in the other Succession States.

Moreover, the importance of Vienna as an international mart to-day is not due only to the special skill and experience of her bankers and her merchants, but to the fact that Austria is a transit country (by river and by rail) between south-eastern and western Europe It has been estimated that in 1924 the earnings of middlemen on transit trade alone amounted to 216 million schillings, to which must be added receipts by railways on international traffic which exceeded 4; millions. Almost as important as a source of income is the expenditure of foreign tourists which in the same year was estimated at 200 million schillings.

Further, private citizens in Austria as well as the great Viennese banks had large interests in industries in Czechoslovakia, Hungary and other neighbouring states. and according to reliable estimates, despite the magnitude of her foreign borrowings, Austria received more in interest and dividends from abroad than she was liable to pay on the loans she had effected.

General Characteristics of Austrian Economy.—From what has already been said it is clear that Austrian economy is to an unusual degree mixed in character. According to the census returns of 1920, just under one-third of the gainfully employed persons were engaged in agriculture, almost exactly one-third in mining and industry, and just under one-third in other occupations, including transport, trade, domestic services, liberal professions, etc. It is at once an industrial area. a transit country. and a banking and commercial centre. Its mountainous districts afford a playground for foreign tourists. and Vienna is a centre of culture and of trade—in the retail shops of the Ring especially of luxury trade. It is in this mixed character of its economy and in the adaptability and artistic powers of its population that the potential strength of the country lies.

Commercial Policy.—Just as in the case of Austria, the other Succession States found themselves in 1919 each with a fragment of the total economic mechanism of the former Austro-Hungarian empire. Each accordingly endeavoured to supply the missing parts in its own machinery, and with that object in view protected itself from foreign competition by import prohibitions and high tariff walls. Austria therefore found herself hemmed in and cut off from her former markets. Until the end of 1922 she endeavoured to find an opening for her exports by the arrangement of commercial conventions providing for exemptions from foreign import prohibitions for defined import quotas, and from the beginning of 1923 by the conclusion of bilateral commercial treaties stipulating a reciprocal reduction in tariff rates.

In Jan. 1925 she introduced a new tariff, better adapted to her economic needs than the old Austro-Hungarian tariff of 1900 on which she had worked up to then. This tariff was substantially lower than those applied in any of the other Succession States. But the difficulties from which her trade suffered in common with that of other countries in central and eastern Europe in 1923, and the feeling that the concessions obtained by commercial treaty were inadequate, brought about a reversal of policy in 1926, and a series of amendments to the tariff law were introduced, by which the rates were substantially raised. They remained, however, lower than those of the majority of her neighbours.

Public **Finance.**—The state of the public finances of Austria before the introduction of the League of Nations reconstruction scheme is strikingly portrayed in the report of the financial committee of the league dated Sept. 1924. In the autumn of 1922 it is stated "Austria was undoubtedly one of the countries in Europe which seemed nearest to ruin. The State had no proper budget. All that could be said was that only one-third of the total expenditure seemed covered by normal revenue. The remaining funds required by the treasury were obtained from the printing-press of the bank of issue. Between Jan. and Aug. 1922, the currency fell from 1/1,000 of its pre-war value to 1/15,000. The monthly deficit had risen to about 40 million gold crowns. The complete financial chaos and total absence of any supervision over the administration of the various departments obviously made the task to be accomplished one of almost insuperable difficulty. The number of officials was out of all proportion to the size and importance of post-war Austria. Those who believed in the political stability and financial improvement of Austria dreaded the grave economic crisis which appeared to be imminent. Industry and commerce did not dare to re-adapt themselves to a sound currency system."

In accordance with the general scheme of reform which was initiated in Oct 1922, the Government was empowered to take any measures necessary for the establishment and maintenance of budgetary equilibrium by means of decrees. As early as 1924 the current outgoings and revenue were made to balance, and in 1925 actual revenue covered not only total current expenditure but the whole capital expenditure The progress achieved during the five years since the initiation of the scheme may be judged from the following figures:—

SCHILLINGS (000,000's omitted)

	1923 Closed accounts	1924 Closed accounts	1925 Closed accounts	1926 Estimates (voted)	1927 Estimates submitted to Parliament
Current account: Revenue	697.4	900·6	908·5	760.2	921.9
Expenditure	779·6	810·	741·4	724·3	877·6
Balance	−82·2	+90·6	+167·1	+35·9	+44·3
Investments:	76·—	103.6	90·6	157·7	179·8
Total balance of current and investment accounts	−158·2	−13·—	+76·5	−121·8	−135·5
Repayment of debt from the current account	24·4	65·5	68·4	53·5	55·6

In June 1926 the Council of the League of Nations decided that the financial stability of Austria could be considered assured within the meaning of the protocol. The purposes for which the proceeds of the international loan were used during the period of the operation of the scheme were as follows:—

	Schillings (000,000's omitted)
a. Repayment of credit granted during the inflation period	175·6
b. Security of the service of the loan for six months	51·5
c. Cover for investment expenditure	332·6
d. Cover for deficits on current account in 1922 and 1923 (about 13% of the total loan)	115·4
	675·1

The result of inflation was practically to eliminate the domestic debt, and the greater part of the existing public debt is foreign.

Public Debt, Schillings (000,000's omitted)

General Conclusions. — The economic press of central and western Europe has concerned itself largely in recent years with the problem whether Austria can exist economically without continued help from outside — with the so-called question of her *Lebensfähigkeit*. On this point an interesting comparison with Switzerland is made in the report of Messrs. Layton and Rist.

"It is natural," they state, "that in Vienna, which was recently the capital of a great empire, the idea should be prevalent that a tiny country can with difficulty exist in the present economic world. A comparison with Switzerland, however, suggests that this assumption is too hasty a one.

The geographical position of the two countries is in many respects similar. But it has often been observed that Switzerland's economic resources are more limited. In proportion to its population its cultivated area is smaller and its dependence upon foreign food supplies is greater than is the case with Austria. It possesses no coal resources, whereas Austria supplies nearly a quarter of her requirements from her own mines. While Austria is self-supporting in iron ore, Switzerland depends entirely for its supply upon foreign sources. As regards water-power, nature's most generous gift to Switzerland, Austria is almost as well equipped as that country and better than most other countries in Europe. The urban population of Switzerland is a larger percentage of the total population than is the case in Austria. The foreign assets of Austria are probably not lower per head than are those of Switzerland. Even the tourist earnings of Switzerland do not suffice to restore the balance, for the latter constitute less than 7% of the national income of the country. In spite of the fact that Switzerland is lacking in some of the most important raw materials, that country had in 1913 the highest average accumulated wealth per head of population of any political unit in Europe."

The problem indeed is not one of Austria's power to live, but of her probable degree of prosperity in the immediate future. The answer to that problem depends on the progress which is achieved in the surrounding countries and the importance which they attach to the development of their foreign trade by the free exchange of goods. **(A.** Lov.; X.)

HISTORY

Declaration of Austrian Republic. — (For Austrian history prior to 1918, *see* Austria-Hungary.) Nov. 12, 1918, the day after the last Habsburg emperor abdicated in Vienna, is also the day from which the new Austrian republic dates its birth. On Oct. 21 the assembly of all the German members of the Lower House (Abgeordnetenhaus) of the former Austrian parliament, basing their action on the Emperor Charles's manifesto issued on Oct. 16, had already determined to declare the German-Austrian portion of the Austrian territories, formerly under Habsburg rule, an independent state, and had constituted itself the Provisional National Assembly.

On Oct. 30 this Assembly assumed the supreme independent authority in those Austrian territories claimed by it to be predominantly German, and appointed a State Council **as** executive under the leadership of the three presidents of the Assembly. who then nominated secretaries of state as heads of the administrative departments simultaneously organized for German-Austria. But the revolutionary movement, which broke out in Vienna at this moment as a consequence of the general military breakdown of the Central Powers, led to the declaration of an independent German-Austrian republic on Nov. 12. This declaration, which was in accordance with the right of self-determination, was the result of revolutionary action, and expressly repudiated any legal descent from the broken-up empire. The law promulgated by the Provisional National Assembly on Nov. 12, 1918, explicitly declared in its first article "German-Austria is a democratic republic," and in its second "German-Austria is a component part of the German republic." Thus in the proclamation itself of the new state. there was adumbrated its cessation by a future treaty uniting it with the German Reich.

Ten days later, in a special law, on Nov. 22, 1918, the National Assembly defined its territory. It claimed the ancient hereditary Austrian lands (Crown lands), except the districts inhabited by the Yugoslav and Italian races, and also a large number of predominantly German districts in Moravia and Bohemia. Simultaneously with the constitution of the republic, administration was taken over in the separate provinces (the former Crown lands), of which it was composed. The provincial diets, resolving themselves into provisional assemblies, carried out corresponding changes, the presidents being entrusted with the conduct of the provisional administration and the executive power in their provinces. Thus the autonomous organization and provincial self-government, established by the constitution of the Austrian empire of Feb. 26, 1861, was perpetuated as a real popular self-government in the separate provinces, this time on a really democratic foundation.

Treaty of St. **Germain.**—The Treaty of St. Germain (*q.v.*) finally defined the frontiers and extent of the new republic. All districts occupied by the Czechs in 1919, even the German-speaking, nere allotted to Czechoslovakia. The frontier with Yugoslavia near Klagenfurt was drawn in accordance with the plebiscite (Oct. 10, 1920) ordered by the treaty; in south-east Carinthia it was essentially according to the ancient frontier of that province. The treaty also laid down that the republic was in future not to bear its own chosen name, but that of Austria. The principle already laid down in the Treaty of Versailles, that the Austrian republic must preserve her independence, and that union with Germany could only take place with the consent of the League of Nations, was also laid down in the dictated peace of St. Germain. But the treaty awarded a large part of the old German-settled territories in West Hungary to Austria; and Hungary was obliged by the Treaty of Trianon (*q.v*) to evacuate and transfer them. The execution of these decisions of the Paris treaties was not complete until well on into 1921, after meeting with much opposition from Hungary *(see* Burgenland).

Difficulties of the **New** State. — The law of Oct. 1, 1919, definitely and finally drew Austria's frontiers in accordance with the treaty. The carrying into effect of the onerous and complicated terms of the treaty became the chief task of Austria's foreign policy, which was prevented from following any independent line by weak economic conditions and ever-increasing financial difficulties. In 1919 and 1920, only credits from the United States, granted largely in kind, made it possible to maintain the town population, which had been reduced to destitution by the World War and the effects of the blockade. The most important agencies in relieving this extreme misery and suffering were the American relief organized by Mr. Herbert Hoover, which fed the children, and the work of the Society of Friends for the starving population of Vienna and other towns. Thus at that time the whole political life of the republic was absorbed in the efforts to assure the existence of the republic under the burdens imposed on it by the consequences of the War and by the division of the great and ancient empire into independent economic and political units, in the fulfilment of Austria's obligations, and in the task of maintaining public order in the face of internal and external dangers. The chancellor, Karl Renner (*q.v.*), who had been at the

head of the Government since the revolution, nevertheless succeeded in 1920 in establishing friendly relations with the Czechoslovak republic. Numerous problems arising out of the execution of the treaty were harmoniously solved in an agreement concluded with the Prague Government at Brno (Briinn), (June 7, 1920), and a supplementary agreement at Karlovy Vary (Carlsbad), (Aug. 23, 1920).

The Constituent Assembly. — The revolutionary decisions of Nov.–Dec. 1918 had provided for the summoning of a National Constituent Assembly, elected on the broadest democratic franchise and by proportional representation, which met at Vienna on hfarch 4, 1919. The result of the elections was again to divide political power between the three parties which together had carried through the revolution, but in considerably altered proportions. Of 159 deputies, 69 belonged to the Social Democratic party, 63 to the Christian Socialists, and 26 to the Pan-Germans (Nationalists). In accordance with the two laws of March 14, 1919, on the franchise and on the Government the Constituent Assembly retained for the time being the provisional constitution of the republic of 1918, but introduced fundamental changes. The Council of State (Staatsrat) and its three presidents were abolished.

The ministry, consisting of the state chancellor, the vice-chancellor and the secretaries of state, now received full executive and administrative powers, and was henceforward to be elected on nomination of the main committee of the National Assembly, the permanent link between legislative and executive, consisting of the president, two vice-presidents and eleven deputies. Several former functions of the Council of State were now transferred to the ministry; some of its prerogatives, such as the appointment of judges and higher officials, were, however, transferred to the president of the National Assembly acting in agreement with his vice-presidents. He became the representative of the republic abroad and treaties must be ratified by him. He represented the supreme power in the republic, although with strictly limited functions. The Constituent Assembly, elected for two years, was to be in continuous session for this period.

Centralized or Federal Government. — The central problem for the republic, as for imperial Austria, was the relation to the State of the historic provinces. From the first the idea of centralization had been most strongly emphasized by the Social Democrat leaders. Opposition in the provinces increased. In the laws of March 14, 1919, certain provisions were therefore inserted to meet the case of conflicts between the decisions of the provincial assemblies and the federal laws, the central authority being empowered to challenge such decisions before the new Constitutional Court.

Coalition and "Proportional" Governments. — On March 15, 1919, the Government was reconstituted by election from the National Assembly. The Social Democrats; as the strongest party, filled almost all the important posts — the ministries of the interior, of foreign affairs, and of war. The first chancellor. Dr. Renner, presided over the new ministry, and was appointed head of the peace delegation to Paris.

The Social Democratic Party found its main support in the trade unions and party organizations, which in Vienna and in all industrial districts included almost the whole of the working classes. The revolutionary feeling born of the War and the downfall of the monarchy was a strong auxiliary. Part of the official class and of the lower middle class also supported it. On the other hand, the Christian Socialist Party included all the agricultural class, and the overwhelming majority of the upper and middle classes in Vienna and the provincial towns. The Social Democrat leaders regarded the coalition, from which the first constitutional government was formed, as a union of workers and peasants, from which a complete democratic republic would emerge through the legislation to be passed by the National Assembly. The party, under the leadership of Dr. Renner, President Seitz and Dr. Otto Bauer (foreign minister), was able to preserve its unity by successfully combating those activities of its own Left wing, which had been inspired by the establishment of the Bolshevist republic in Russia and by the temporary success of Bolshevism in Hungary.

In the spring of 1919, when the Soviet republic in Hungary was exercising increasing pressure on Austrian Social Democracy, the situation became at times highly critical, but the policy and tactics of the Social Democrat leaders directed against Bolshevism were successful in restraining the population of Vienna. The armed police easily repressed the isolated attempts by the extremist elements to disturb by violence the quiet development of Austria's republican democracy, and despite the vast and ever-increasing difficulties, public order was preserved.

The gradual cooling of revolutionary sentiment in the masses did not therefore lead to any change in Social Democratic policy, which was directed to the maintenance and development of the democratic republic, nor to any reactionary movement against democracy by the Christian Socialists. This relative stability was further demonstrated by the united opposition from both the great parties in the country to the attempts made by the ex-emperor Charles, on March 13 and Oct. 26, 1921, to restore the dynasty by his return to Hungary. Nevertheless the second coalition, formed on Oct. 17, 1919, with Dr. Renner at its head, was felt to be an undesirable hindrance to normal political developments, while the agricultural and urban middle classes began to resist the predominance of socialistic ideas in government and administration. These tendencies emerged most clearly on the question of the new army organization.

The coalition was formally dissolved, and a "proportional" Government formed which accomplished its tasks of completing and introducing the new federal constitution (Oct. 1, 1920). On Oct. 17 new elections were held.

Dr. Mayr's Ministry. — As the Christian Socialists had gained nearly 200,000 votes from the Social Democrats, securing 82 seats in the National Council against 66 Social Democrats, 20 German nationalists, 6 Peasants' Party and 1 Workers' Party, a new ministry was formed under Dr. Michael Mayr, generally supported by the German Nationalists, the Social Democrats retiring into the opposition.

The constitutional problem of centralization or federation — the provinces, particularly the farmers, demanding the wider administrative and financial independence, while the German Nationalists and Christian Socialists of Vienna and the whole Social Democrat party urged the retention of the "Centralist" constitution — was solved by a compromise on the principle of an eventual administrative reform on federal lines, the execution of which was deferred for future legislation. The opposition of the Social Democrats was removed by the assurance that the city of Vienna, containing little less than one-third of the total population of the State, in whose city council Social Democracy had had an overwhelming majority since 1919, should be legally severed from the province of Lower Austria, and be declared an independent province (*Bundesland*). The city council thus became the Provincial Diet, and received all the legislative and administrative powers which the constitution gives to the provinces. It became a provincial government, and the burgomaster the governor of a province. Some minor modifications of the principle were conceded to the Christian Socialists.

Austria's internal policy was, from this time onward, dominated by the dangerous economic situation, above all by the rapid depreciation of the Austrian exchange consequent on continuous currency inflation to stop the gaps in the federal budget and provincial revenue. The yield of the taxes disappeared, and the capital levy of 1920 remained inoperative. The embarrassment of the Mayr government was heightened by the pressure of the popular movement, instigated by the Tirolese and other provincial governments, under the influence of the Conservatives and Nationalists in Bavaria, for union with Germany. The Government under pressure of French intervention opposed the movement when its strength was evidenced in plebiscites.

In the spring of 1921 the chancellor tried unsuccessfully to obtain financial help in London and America. The reviving industry needed credits and foreign currency to pay for imports of raw materials; the Government had immediate and similar needs, and the result was a further fall in the Austrian exchange.

The Schober, Seipel, and Ramek **Ministries.**—Unwilling to shoulder alone the inevitable unpopularity of Government, the Christian Socialists combined with the German Nationalists to elect a cabinet of officials, with J. Schober (*q.v.*), the police president of Vienna, as chancellor (June 21, 1921). The cost of living, however, continued to rise, especially in Vienna.

Schober resigned on May 31, 1922, in favour of an anti-Socialist coalition of Christian Socialists and German Nationalists under Monsignore Ignaz Seipel. Meanwhile, an English loan had been rapidly exhausted and the Austrian exchange was dropping headlong. Dr. Seipel determined to treat the collapse of Austria as a European problem, to be solved only by a broad policy of long date and adequate credits. He undertook diplomatic journeys to Prague, Berlin and Verona, and finally obtained the desired loan which stopped the financial collapse (see section, *Economic Conditions, 1918–38*). It was not popular as it imposed many sacrifices on the Government servants and others; but Seipel retained his majority in the 1923 elections which altered the party figures little. He resigned in November 1924 after an attempt on his life had injured his health. His successor, Dr. Rudolf Ramek, completed the Constitution, in agreement with the Socialists, further strengthening the federal principle. In December 1925 the League Council held Austria's budget to be permanently balanced, although at a level higher than anticipated, and transferred the remainder of the loan to the Government. In March 1926 the controller-general left Vienna.

In 1926 the Government's position was weakened by two scandals: the collapse of a bank with which various Christian Social leaders had been connected, and the discovery of irregularities in the conduct of the Austrian Post Office Savings Bank. In November 1926 Seipel again became chancellor.

Growth of the Private Armies.— Inter-party political tension was growing rapidly. Immediately after the War various provinces had formed local defence forces (Heimwehren), partly for defence against Austria's neighbours, but afterwards increasingly against Socialism. The Socialists, on losing control of the Army—which, in the first months, had been a "Red Party Guard"—had formed their own force, the "Republikanischer Schutzbund," while the National Socialists had small troops of their own. In January 1927 some of the last-named had in an affray killed a child and an old man. In July a Viennese jury acquitted the persons concerned. Radical elements utilized the popular anger for a mass demonstration in which the police were assailed and the Palace of Justice burned. The police then opened fire, and order was restored only after 89 persons had been killed. The Socialists proclaimed a general strike, but this was crushed in the provinces by the Heimwehr and called off after four days. The result was a great strengthening of anti-Socialist feeling in the provinces and an impetus to the Heimwehr organization. A Socialist proposal for general disarmament was rejected, and the situation as between the rival elements continued serious throughout 1928. On one occasion only heavy rain prevented probably a pitched battle in Wiener Neustadt between the Heimwehr and the Schutzbund. The chancellor now declared himself openly on the side of the Heimwehr, while the Socialists were further embittered by the election of the clerical W. Miklas as president of the republic. The tension increased in 1929 The Heimwehr passed to open threats. Although Seipel resigned on April 3rd, his successor, Dr. Ernst Streeruwitz, was powerless in the face of the Heimwehr, whose leaders, Steidle and Prince Starhemberg, openly defied the Constitution. To the political crisis was added a financial one, when in September the largest Austrian bank, the Bodenkreditanstalt, was found to be on the verge of failure. Seipel forced the resignation of Streeruwitz, but on September 26th Schober took office again and temporarily saved the situation. The Bodenkreditanstalt was merged in the Credit Anstalt, and a constitutional reform act was passed on December 7th, being accepted by the Socialists as less reactionary than anything to be anticipated from Seipel Vienna remained a federal province, but the president of the republic received increased powers. In foreign affairs Dr. Schober at first succeeded in relaxing the tension between Austria and Italy, and concluded a commercial treaty with Germany (April 12th, 1930) besides negotiating at The Hague Austria's release from her reparations obligations. He also managed for some months to hold the Heimwehr in check, but his measures so infuriated them that they successfully intrigued him out of office (September 25th). A Heimwehr Government under Vaugouin took charge and held elections in November; but these giving the Socialists 72 seats against 66 to the Clericals, 7 to the Heimwehr and 20 to Schober, the Clericals were forced to accept a coalition with Dr. Otto Ender as chancellor and Schober as vice chancellor and foreign minister.

The Austro-German Customs **Union.**—On March 20, 1931, it was stated that Austria had concluded a customs union with Germany. A storm of protest arose from France and her allies, who regarded this as tantamount to political union. The atmosphere of uncertainty was increased by the announcemect that the Credit Anstalt, now far the biggest Austrian bank, was in its turn threatened with failure. France insisted on political conditions in return for help, and although British intervention postponed the day, Schober was forced to resign and Austria had to renounce the customs union a day before The Hague Court, by a majority of one, declared the plan incompatible with Austria's international obligations. A new Government was now formed under Dr. Buresch, who was succeeded on May 20th, 1932, by Dr. Dollfuss. The Government had a majority of only one vote, but in August just secured the adoption of the Lausanne Protocol which gave Austria a new loan of £9,000,000 under humiliating conditions, including the renunciation for 20 years of a customs union with Germany, and strict financial control.

The Rise of National Socialism. —Meanwhile, the National Socialist movement had made sudden and rapid strides in Austria, and at the provincial elections the Nazis practically wiped out the Pan-Germans, also making gains at the expense of the Socialists and moderate Conservatives. The Nazi propaganda redoubled in vigour when Hitler came into power in Germany in 1933, with a policy which included the early absorption of Austria. The whole political alignment in Austria was now changed, for the Socialists at once renounced the idea of Anschluss so long as the Nazis remained in power, while the Jews, to a man, supported the Government in its anti-Nazi activities. On the other hand, many of the Heimwehr were Nazi in sympathies.

A temporary breakdown in the Austrian Constitution in March, 1933, gave Dollfuss a legal excuse to rule thereafter by arbitrary decree. He now found himself absorbed in a violent struggle with Germany, which attacked the Austrian Government with scurrilous broadcasts and leaflets, dropped by aeroplane, while a tax of 1,000 marks imposed on June 1st on all German visitors to Austria was designed to ruin her tourist traffic. A legion was formed of Nazi deserters and fugitives from Austria, and frequent acts of terrorism were perpetrated. The Bavarian minister of justice visiting Austria in the spring, attacked the Government violently Dollfuss took strong measures against the Nazis. He enjoyed much sympathy from France and Britain. He flew to Italy, and seems to have received a guarantee that Italy would defend Austria's "independence" if she would adopt the Fascist form, crush the Socialists and refrain from appealing to the League. Dollfuss now made definite terms with the Heimwehr (which had largely been reconstituted) making Emil Fey, a Heimwehr leader, vice-chancellor.

The Revolts of 1934.—The Socialists offered to co-operate with the Government, on moderate terms, against the Nazis, but Dollfuss rejected their offer.

When the Socialists resisted by force, they were crushed in a battle which broke out on February 12 and lasted for several days with heavy casualties. Many Socialists were thrown into concentration camps and the movement driven underground.

Nazi violence continued, and on July 25 a *coup d'état* was attempted. It failed, although Dollfuss was killed. Italy mobilized on the Brenner, Yugoslavia made counter-preparations. However, Dollfuss's successor, Kurt Schuschnigg, had a quieter time, particularly when Hitler sent Herr Franz von Papen to Austria to initiate a rapprochement. Schuschnigg, however, remained true to Dollfuss's pro-Italian policy. Meanwhile, a new Constitution was adopted, based on the corporate system. (J. RE.)

Union of Austria with Germany. — From the World War to the advent of Hitler as chancellor in Germany there was a strong feeling in both Germany and Austria that the two countries ought to be politically united. Historic sentiment favoured union. For nearly nine centuries they had been united, first in the Holy Roman Empire, and then in the German Confederation irom 181j to 1866. Bismarck, to be sure, had expelled Austria from the German Confederation in order to found a new German state under Prussian leadership. But after defeating Austria in 1866 he had the rare wisdom to treat her so generously that Austria quickly overlooked the defeat and became the friend, and in 1879 even the ally, of Germany. It was to bolster up and protect her Austrian ally that Germany entered the World War in 1914. But the Peace Treaties at the close of the War foolishly forbade the union. although informal plebiscites in Austria showed that probably 90% of the people at that time desired reunion with Germany.

With Hitler's seizure of power in 1933 the Austrian desire for union largely evaporated Austrian Socialists abhorred Hitler's destruction of the German Social Democratic Party and its trade unions. Austrian Roman Catholics rightly distrusted the Nazi promises given to the German Catholics in the Concordat of 1933. Austrian Jews were horror-stricken at the anti-Semitism across the border. And most easy-going Austrians disliked the brutal totalitarian regimentation taking place in the Nazi Third Reich. The only persons in Austria then favouring union with Germany were the Austrian Nazis. They were organized by Hitler as a division of the larger Nazi Party, and they were secretly encouraged with money and advice from Germany to work for union by undermining Austrian independence in defiance of the Peace Treaties. Under instigation from Germany they made the abortive revolt of 1934 which resulted in the assassination of Chancellor Dollfuss.

Dr. Kurt Schuschnigg, the successor of Dollfuss as Austrian chancellor, made an earnest and hopeful struggle to maintain Austrian independence for nearly four years. He greatly improved the country's economic and financial condition, so that Austria was able to balance her budget and to pay interest on her foreign loans. He dismissed some of his strongest potential rivals and became virtually dictator. The dangerous private armies were dissolved or forced to enter his o n loyal Fatherland Front. But he was guided by strongly clerical interests, and he made the mistake of not making concessions to secure the co-operation of the Socialists who had revolted and been suppressed in 1934.

Schuschnigg also had to meet continued danger from Germany, which kept on inciting Austrian Nazis to stir up disorders which might give Hitler a pretext for intervention. In the hope of ending this intolerable situation Schuschnigg consented to sign with Germany the agreement of July 11, 1936. The German Government "recognized the full sovereignty of Austria, including the question of National Socialism in Austria, which is to be regarded as exclusively an Austrian question, in which the German Government promises to exert no interference either directly or indirectly." Austria on her part would "respect the internal organization of Germany, and conduct her policy in general, and especially as regards Germany, in accord with the fundamental basis which corresponds with the fact that Austria acknowledges herself to be a German state." This agreement was followed by diplomatic conversations for the removal of friction on both sides. Schuschnigg promised an amnesty to political prisoners except those convicted for serious crimes. He also agreed at a future suitable time to take into the Austrian Government some representatives of the Austrian Nazi group, if he could find persons whom he could trust.

The agreement of July 11, 1936, unfortunately did not bring the internal quiet in Austria nor the good relations with Germany that had been hoped for. Schuschnigg delayed to take Kazis into his cabinet. The Nazis in turn continued to foment disorders and were arrested and sent to concentration camps. So, after a year and a half, Hitler's followers reverted to the "putsch" policy of 1934 when Dollfuss was assassinated. A plot was organized to kill the German military attaché in Vienna or even the German ambassador, Franz von Papen; the blame mould be laid on the Austrian Legitimists; and Hitler would then have a pretext for intervening. But in Jan. 1938, Schuschnigg's police nipped the plot in the bud and seized incriminating documents. To prevent their disclosure and to induce Schuschnigg to make concessions to the Nazis, the Austrian chancellor was persuaded to come to a meeting with Hitler at the latter's Bavarian mountain chalet.

At the Schuschnigg-Hitler conference at Berchtesgaden on Feb. 12, 1938, Hitler put strong pressure on his guest and intimated that German troops might force compliance. Alone and defenceless, Schuschnigg felt compelled, in order to prevent greater dangers to Austrian independence, to promise that he would urge concessions upon President Miklas. Great was the gloom among loyal Austrians when he returned to Vienna, for he seemed to have capitulated pretty completely to the demands of the German dictator who had at his call immense military forces and a population ten times that of Austria. On February 15 Schuschnigg and Miklas did in fact grant a general amnesty to the Austrian Nazis. suppressed the incriminating evidence, and took several Nazi sympathizers into the cabinet, including Arthur Seyss-Inquart.

Dr. Seyss-Inquart thus became minister of the Interior, which meant that he would have control of the Austrian police. Within a few hours of his appointment he hurried to Berlin to confer with Hitler and with Heinrich Himmler, the head of the Elite Guard and the secret police of Germany Upon his return he pretended to be loyal to Schuschnigg and Austrian independence, but winked at and tolerated wide-spread Nazi activities. It was apparently arranged between him and the Berlin leaders that German Nazi propaganda and money should be poured into Austria and that after some months, when these had done their work, Hitler would insist on a plebiscite in Austria to decide whether it should be united with Germany.

When Schuschnigg learned of this plan he decided to forestall it by holding a plebiscite at once. He announced by radio on March 9 that the vote would be held on Sunday, March 13. In accordance with the Austrian Constitution, only those who were twenty-four years of age could vote; this provision was unfavourable to the Nazis who had relatively more adherents among the young than the old. Certain other of Schuschnigg's plebiscite arrangements would also work against the Nazis, so Schuschnigg could reasonably count on getting a clear majority in favour of himself and Austrian independence. Hitler, at first nonplussed at Schuschnigg's manoeuvre, then acted quickly before Austria could get support from other countries. He moved troops to the Austrian frontier and on March 11 despatched two ultimatums to Vienna demanding the postponement of the plebiscite and the resignation of Schuschnigg.

Threatened by an overwhelming invasion of German troops and police, Schuschnigg, to avoid bloodshed, yielded. He resigned after ordering the Austrian troops to offer no resistance to the Germans who crossed the frontier on March 12 and occupied Vienna next day. Hitler came in with the troops, and on March 13 proclaimed the union of Austria with Germany. He thus united the land of his birth with the land of his adoption, and created a "Greater Germany" of nearly 75,000,000 population. On April 10 he held a vote throughout Greater Germany to ratify his action and to elect a new Reichstag for the enlarged state. In Old Germany he received a 99% endorsement, and in Austria a shade higher endorsement. This remarkable "yes" vote in Austria did not of course give a true picture: all Jews were disfranchised; the presence of German troops and police exercised an inevitable pressure; and terrorized Socialists, Communists, and Catholics conspicuously voted "yes" for fear of the consequences if they did not do so.

The German **"Ostmark."**—With Hitler's annexation of the land of his birth, the name "Austria" (Oesterreich) was replaced by that of "Ostmark" (East Mark), thus recalling the mediaeval period when Austria had stood as a defensive frontier against the Magyars, Slavs, and Turks.

Austria thus ceased to exist as a political entity The former Austrian territory was soon divided up into seven districts (*Gaue*) which follow fairly closely historic provincial lines. At the head of each district is a leader (Gauleiter) who is both the head of the Nazi Party in the district and also the chief Government official

of the district. The seven new Gaue, with the capital of each in parentheses, are as follows: (1) Upper Danube (Linz); (2) Lower Danube (Krems), these two replacing the former provinces of Upper and Lower Austria; (3) Vienna, which has been somewhat enlarged in order to be the "portal" to the south-east just as Hamburg was recently enlarged to be the "portal" to the north; (4) Styria (Graz); (5) Carinthia (Klagenfurt); (6) Salzburg (Salzburg), and (7) Tirol-Vornrlberg (Innsbruck). (See, for the character and history of each of these former Austrian provinces, the articles on AUSTRIA. UPPER; AUSTRIA, LOWER; STYRIA; CARINTHIA; SALZBURG: TIROL.)

Immediately after the annexation Hitler accomplished rapidly the political and economic co-ordination of Austria into "Greater Germany." Joseph Buerckel, an ardent Nazi who had had experience in organizing the Nazi vote at the time of the Saar plebiscite, was transferred from the Saar to Vienna, made commissioner for the Ostmark for a year, and was charged with preparing the plebiscite in new territory. In order to get the vote of the Roman Catholics, who form the great majority of the population, Buerckel had several conferences with Cardinal Innitzer, Archbishop of Vienna, and his brother bishops. He held out assurances to them of favourable treatment for the Catholic Church. The assurances were very welcome, since the Austrian Concordat of 1855, more favourable to the Catholics than the German Concordat of 1933, was declared to have automatically lapsed with Austria's extinction as a sovereign State. Cardinal Innitzer, being a native of the Sudeten territory and strongly German nationalist, and his brother prelates, apparently trusting in Buerckel's assurances, and without consulting the Pope, then issued the declaration desired by Buerckel. They stated that "as a result of their innermost convictions and of their own free will" they had joyfully decided to recognize National Socialism, and to vote "Yes" as a national duty, and that they expected all good Austrian Catholics to do likewise. Their statement was read from all the Austrian pulpits, and a copy of it was sent to Buerckel in a note that Cardinal Innitzer signed in his own hand with "Heil Hitler"—certainly the first time that a German bishop had used the Hitler greeting. These documents were published in facsimile very widely in the Austrian newspapers. The plebiscite resulted in a more than 99% endorsement of the annexation to Germany. Of course this did not register the real feeling of the people, because a great many persons, just as in the plebiscites in Germany, voted "Yes" out of fear of what might happen to them if they should show opposition to the Nazis.

Buerckel's assurances were not kept by the Gestapo (German secret police) and by the more radical German Nazis who poured into the Ostmark. Many of the Catholic religious orders were deprived of their buildings, and the residence of the Archbishop of Salzburg was seized for Nazi uses. In Jan. 1939, all Catholic property was inventoried, which was thought to be a preliminary step to its eventual confiscation. In July 1939, Cardinal Innitzer, who had previously been attacked and had the windows of his palace broken, was insulted with a shower of rotten eggs and cries of "murderer" while making a rural tour, because he did not intervene in 1934 to prevent the execution of two Nazis connected with an abortive "putsch" and the assassination of Chancellor Dollfuss.

The so-called "Nuremberg Laws" were introduced and resulted in even greater hardships and misery to the Austrian Jews than that already suffered by the Jews in Germany. Of the approximately 180,000 Austrian Jews who were members of Hebrew religious communities before the annexation, 99,672, or more than half, had emigrated from Austria in little over a year, according to figures published on May 15, 1939, by the official Nazi Central Bureau for Jewish Emigration. By a decree of the following July, emigration was made more difficult by an order that thereafter all emigrating Jews must pay half the cost of their steamship tickets in foreign currency supplied by their relatives or friends abroad. In addition to the Jews who are members of Hebrew religious conimunities, there is a large number of other Jews, many of them baptized, but exact figures as to how many have ernigrated and how many still remain in Austria have not been published. It is the Nazi hope to have all the Jews out of Austria within three years Already they have almost completely disappeared from the provinces, those that remain being mainly concentrated in Vienna where they can more easily escape notice.

In the economic field German efficiency and hard work replaced the easy-going life of the Austrians. In the early summer of 1938 many thousand Austrian unemployed were despatched in special trains to work on the triple line of fortifications, or "Westwall," against the French frontier. Within a month after annexation, as a symbol of the new employment which the Germans would bring to Austria, Hitler turned the sod near the frontier town of Wels for the new Austro-German highway which would connect Vienna with the super-highways of the old Reich. To add spectacular emphasis, as Hitler finished his speech at the spade ceremony, the crowd was thrilled to see a forest of birch and oak fall with a terrific roar along the path of the new road.

In his report at the end of a year Commissioner Buerckel claimed that 650,000 unemployed had been put back to work, the skilled in munition factories, and the majority at building new motor highways, bridges, streets, waterways, and houses. Ore-mining in Styria was expanded to supply the great Hermann Goering Iron Works under construction at Linz. Idle mines of gold, silver, lead, antimony, and other metals, abandoned previously as uneconomic in view of the world prices, began to be worked again to serve an economy wherein world prices were disregarded. The Austrian schilling was replaced by the German mark at the ratio of two marks for every three schillings, an arrangement favourable to Austria. The Austrian banks were co-ordinated under the Reichsbank, and some $60,000,000 in gold belonging to the Austrian National Bank was transferred to the Reich. Similarly the Austrian railway, tariff, and insurance systems were assimilated by those of Germany. The German rigid control over prices and wages and service in the army, Labour Front and other German organizations was introduced.

The administration of the Ostmark was given a definite form by a decree which went into effect on May 1, 1939. In each of the seven new Gaue, or districts which correspond closely with the former historic provinces of Austria, there is a supreme administrator known as the Reichsstatthalter. He is both the representative of the central government of Greater Germany and the head of the Gau administration. He is also the head of all the other special Reich administrations within his Gau (except the army, which has its own centralized organization) like the forestry, insurance, peasant, employment, etc., organizations. He naturally leaves these organizations to function according to their own rules. but he is kept informed of all their doings, and may, if he sees fit, step in and give orders. He is also the *Gauleiter,* or Leader of the Nazi Party, for his district. In his person the Party and the State are united in one supreme district head.

AUSTRIA, LOWER, or "Austria below the river Enns." formerly a province of Austria, in 1938 became the *Niederdonau Gau* of "Greater Germany." It is divided by the Danube into a northern more agricultural and a southern more industrial half, and each may be further subdivided into structural regions with distinct economic contrasts. The northern half falls naturally into two districts, almost equal in area, the "Waldviertel" and the "Weinviertel." The former coincides with the extension of the Bohemian and Moravian igneous plateau which here slopes gently from the Weinsberger Wald (3.478 ft.) to the Manhartsberg (1 758 ft.). Westward it resembles the parent mass of Upper

Austria, but towards the east lithological and climatic changes cause the forest to be confined to the deep, winding valleys, and the high tableland shows an increase of cultivation and a greater number of large villages while in the north-west corner small textile and glass factories raise the density of settlement. The long north-east-south-west scarp of the Manhartsberg falls quickly to the wide valleys and soft, swelling hills of the "Weinviertel." Here all sunny slopes are terraced with vineyards while a mantle of Tertiary sediments and loess, and ease of movement, combine to encourage cultivation and settlement. Only in the centre, nhere forested offshoots of the Alps, *e.g.*, the Leisser mountains (1,615ft.), form a connecting link with the Carpathians, is the network of fields and routes broken. East of these spurs the land sinks to the alluvial basin of Vienna and to the intensively cultivated valley of the Morava along which stretches a continuation of the Moravian sugar-beet belt.

South of the Danube three zones may be distinguished, viz.: (1) a narrow and hilly prolongation of the Alpine Foreland, (2) the north-eastern extension of the Flysch and Limestone Alps culminating in the Wienerwald, and (3) the southern half of the Vienna basin thrust as a wedge south-west beyond Wiener-Neustadt. The Foreland is more hilly than in Upper Austria but maintains its importance for stock-farming and offers little hindrance to communication. Rail and road avoid the river which between Grein and Ybbs and again between Melk and Krems (the "Wachau") follows a deep, tortuous course between steep walls of crystalline rock. Crowned by ruined castles and terraced with vineyards and orchards, these gorges are reminiscent of the Rhine but lack its volume of industry and traffic though water-power and communications have stimulated the former at Krems and Waidhofen. East of the Traisen, a right bank tributary of the Danube, the isolated farmsteads and small hamlets surrounded by orchards typical of the West Foreland are replaced by large nucleated villages of Germanic form as in the "Waldviertel" and "Weinviertel." The forested Alpine promontory thrusts a thinly-peopled zone between the Foreland and the busy Vienna basin where agriculture and industry mingle. Settlement is most dense in the western half of the basin, *i.e.*, in association with the great route to the Semmering Pass and along the tectonic thermal "fall line" of separation from the Alps, where rich vineyards cover the slopes and prosperous spas and factories, fed by local water-power, line the foot of the scarp. East and north the basin is floored with impermeable strata favouring maize, wheat and sugar-beet; southward permeable gravels cause a change to woodland. But the overwhelming aspect of human activity is industry; more than half of the manufacture of Austria is concentrated in Vienna (*q.v.*) and its basin, particularly between the capital and Wiener-Neustadt. Smaller centres have arisen where, as on the Foreland, local advantages of situation or resources of materials and power assure their prosperity; the paper. iron and cellulose factories of the Ybbs and Erlauf valleys and the cotton-spinning of St. Pölten are examples. Area, 9,091 sq mi.; pop. (1939), 1,699,302. (W. S. L.)

AUSTRIA, UPPER, or "Austria above the river Enns," formerly a province of Austria and now the Oberdonau *Gau* of Greater Germany, is situated in the north-west of the country, and divided by the Danube into two unequal parts. The smaller northern part is a portion of the S. flank of the Bohemian massif, a granite plateau sloping gently south-east from a height varying between 4,500ft. and 3,500ft. to a steep scarp overlooking the Danube. As its soil is thin and the climate raw and wet, forests and rough pasture prevail, though in the sheltered valleys and depressions hardy cereals, potatoes and flax are successfully grown. Communication is poor and only one important railway crosses the plateau, that from Linz through the Kerschbaum Gate to Budejovice. The southern part belongs to the Eastern Alps and falls naturally into two divisions, the Alpine Foreland and the limestone and Flysch zones forming the Outer Alps (see AUSTRIA) The former is a richly-cultivated region of arable slopes and pastoral valley floors to which Upper Austria owes much of its high agricultural reputation; of the productive surface, *i e*, 95% of the total area, 46·5% is arable. garden and vineyard, 35·2% is forest, 14·5% meadowland and 3·8% rough pasture. It is a land of long tradition in which prehistoric and Roman remains are scattered amongst large and imposing farms, prosperous towns and stately monasteries, and it contributes heavily to Austrian resources through its large cereal production, extensive orchards and advanced cattle-breeding. Between the fertile valleys of the Inn and Traun lies the Hausruck range with rich beds of lignite, which are associated with the small iron and textile manufactures of Linz and Steyr (*q.v.*). Brewing. milling, distilling (Linz) and leather factories (Wels) are important and handle all the local produce. The Outer Alps offer few opportunities to agriculture and settlement, but the magnificent scenery of the western lakeland of Salzkammergut (*q.v.*) and the numerous thermal springs, *e.g.*, at Ischl, attract a large tourist population. Further, their wealth of salt, timber and water has originated chemical, paper and small iron industries in the Traun and Enns valleys.

Population is most dense upon the Foreland where small, evenly-distributed market towns along the streams are the rule. These local centres, however, are dwarfed by Linz, Steyr and Wels, each largely the product of its situation. Linz, which with its industrial suburb of Kleinmiinchen has a population of 131,423, is the third largest town of Austria and capital of the province. Situated where the old Bohemian "Salt" road crossed the Danube, it has developed extensive trading interests and important river activities. Wels (26,656), another nodal point, is the recognized market for the cattle and cereals of the Foreland. while Steyr (31.165), situated at the junction of Foreland and Alps, is the natural centre of gravitation for the trade of the whole of the south-eastem highlands. A secondary group of small towns, *e g.*, Gmunden (10,909), Ischl (11,062) and Ebensee (8,533), thrives upon the exploitation of salt, water-power and scenery in the lakeland district, but the true heart of Upper Austria is that great thoroughfare of peoples and ideas — the Foreland and its waterway the Danube, towards which the life and interests of the province converge, and by which a large proportion of its heavy exports of salt, stone, timber, iron and paper finds outlet.

AUSTRIA-HUNGARY. Under this heading an account is given of the history of those territories in central and eastern Europe, since 1918 partitioned among Italy, Austria, Czechoslovakia, Poland, Hungary, Rumania and Yugoslavia, which were accumulated by the dynasties of Babenberg and Habsburg round the nucleus of the "Ostmark" established in A.D. 976. The generation which saw the dissolution of this empire in 1918 knew it as "Austria-Hungary"; but this title was of recent date, and represented (and inadequately) only one phase of this venerable but singularly unstable organism. To call the whole "Austria" is admittedly inexact; but an exact definition of the term is equivalent to an examination of its whole history. The word represents, at any rate. the spiritual idea of an eastern bulwark and defense of the German nation and of Christendom itself, in which Austria lived. In proportion as it became untrue to this task, or as the need for it disappeared, Austria withered, and at last perished. The following article will describe the rise of the original Ostmark and its development into a European power of the first magnitude, together nith the international or internal events affecting the countries which at various times composed the Austrian empire as a whole; the internal histories of these countries being given under the appropriate headings (see HUNGARY; POLAND; BOHEMIA; CROATIA-SLAVONIA, etc.).

Earliest History. — The territories later to be known as Austria were inhabited by man from a very early date. Remarkable relics of prehistoric civilizations have been found at Hallstatt (q *v.*) and elsewhere in Austria. About 400 B C, Celtic tribes, the most powerful of which were the Taurisci, later known as the Norici, and the Boii, invaded and occupied the eastern Alps, Bohemia and the Hungarian plain. The Romans directed their arms across the Alps in the first century B C., completing the conquest of the land south of the Danube nith the subjugation of the Norici in 15-14 B C Their efforts to subjugate the territory north of this linr from which the Celts had been rxpelled by an

invasion of Germanic tribes, notably the Marcomanni and Quadi, proved unavailing. The Danube was therefore fixed as the frontier of Roman occupation, and the territories south of it were organized in the three provinces of Raetia, Noricum and Pannonia. Vindobona, afterwards Vienna, was already a place of importance under the Romans. This era was closed by the great national migrations of the 5th century AD. In 432 the Huns settled in the plains of Pannonia, which were next occupied, after Attila's death (453) by the Ostro-goths. Hitherto Noricum had been ravaged by the barbarians on their forays into Italy, but not chosen by any for their home; but in 487 Odoacer, who was then master of Italy, abandoned his possessions north of the Alps and withdrew his garrisons, which were accompanied by the richer elements of the native population. The empire of the Heruli, which followed him, was short lived. The mountain lands west of the Enns were occupied by a Germanic tribe, the Bajuvari, the descendants of the earlier Marcomanni. The territory east of this line was occupied by the Lombards and, after their invasion of Italy in 568, by the Avars, who remained its overlords for three and a half centuries. Themselves numerically few, the Avars drove before them, or brought in their train, many Slavonic tribes, who gradually peopled the Alpine valleys as far west as Raetia and Istria: Austria thus became the ethnographical meeting point of the Germans and the Slavs. In 622, one Samo, said to be a Frankish merchant, united a number of Slavonic tribes on the western frontier of the Avars and led them to freedom. After his death in 668, the territories of Bohemia and Moravia in the north and Carantania in the south were semi-independent of the Avars.

The Germanic tribes, meanwhile, were laying the foundations of their later civilization. Shortly after settling in their new homes, the Bajuvari had acknowledged the supremacy of the Franks, while retaining a considerable degree of independence under their ducal house, the Aglolfingi; an independence which became very full on the death of the Frank king Dagobert in 638. In 738 they became an important power when Boruch, duke of Carantania, acknowledged their suzerainty and accepted the Christian faith in return for help against the Avars. The rise of Bavaria was unwelcome to the ambitious Frank kings, and after the Saxons and Lombards had been subjugated, they turned against Bavaria in 787–788. Tassilo, the Bavarian duke, appealed to the Avars for help; but he was deserted by his own subjects and forced to surrender to Charlemagne, who bestowed Bavaria on his brother-in-law, Gerold, and went on to destroy the Avars (791–797). Having thus pushed the frontiers of his empire far to the east, Charlcmagne organized the newly-won territory in two large Marks, the "Mark im Ostland" north of the Drave and the "Mark of Friuli" south of that river (811).

The territories remained part of the German Reich for 100 years. Their most powerful neighbour, with whom there were frequent wars, was the empire of Great Moravia, which was founded about 828 and defied all efforts made to subjugate it, but was also not dangerous to the existence of the Mark. In 894, however, a more dangerous enemy appeared in the Danube valley in the shape of the Magyars. In 906 this formidable nation destroyed the Moravian empire, and in 907 defeated the German forces gathered to resist them, slew Luitpold, the markgraf of the Ostmark, and overran his land. All trace of German civilization and colonization seems to have disappeared before them; for although the mountains of Carantania escaped their forays, these wild recesses had probably been little affected by the German rule.

After ravaging central Europe, the Magyars were defeated on the Unstrut by King Henry (933); but they were only definitively driven back into Hungary after the crushing defeat inflicted on them in 955 by King Otto the Great. Otto's step-son, Henry, was duke of Bavaria; and after the Battle of the Lech, Henry's son, Henry the Quarrelsome, organized a fresh Ostmark on the eastern frontiers of his duchy, and bestowed it on a member of his house. On the death of Otto the Great, however, Henry the Quarrelsome unsuccessfully disputed tho German throne with Otto II., who deprived him of his duchy in favour of Otto of Swabia, and bestowed the Ostmark on a partisan of his own, Luitpold or Leopold of Babenberg (976).

Austria Under the **Babenbergs.**—This year (976) is celebrated by tradition, and justly, as marking the true birth of Austria, for it was under the Babenbergs that it began its long and steady rise to power. The position of the first Babenbergs was, however, modest enough, Their frontiers extended only from the Enns to the fringes of the Wienerwald and from Retz to the valley of the Piesting. Even within these narrow limits many enclaves were under other jurisdiction than theirs, since during previous centuries gifts of land or office had been liberally made in this district. The most important of these were the properties of the bishopric of Passau, which included such places as Mautern, St. Pölten and Stockerau Other enclaves belonged to the bishopric of Regensburg or the Bavarian church, and to the great monasteries, of which Salzburg was the chief, and others, again, to lay families of Bavarian origin. Jurisdiction was exercised on many points, and claimed on more still throughout the whole Mark, by the great bishoprics of Salzburg, Aquileia and Passau, all of which lay outside its frontiers. Moreover the markgraf, like all vassals under the feudal system, held his Mark only in virtue of the office which he performed for the German king; he could at any time be deprived of it, and had no legal right to transmit it to his son. While the office was granted by the king, the land comprising the Ostmark was still regarded as pertaining to the dukes of Bavaria of which the markgrafs held three counties on their western frontiers.

On the other hand, the very dangers of Austria's exposed situation (the name Ostarrich is mentioned for the first time in 996 as its "popular appellation") proved a source of strength to its rulers. Unlike the holders of the northern marches, who were faced only by scattered, incoherent and heathen Slavonic tribes, they had as their neighbours the strong State of Bohemia, which had survived the collapse of the Moravian empire, and the new Magyar State, which showed an unexpected power of resistance, even in defeat, and consolidated its position by its timely conversion to Christianity. These two States barred the way to any premature expansion of Ostmark. A small advance of the eastern frontier was checked in 1031 by the defeat of King Conrad II. by Stephen of Hungary, to whom the contested strip of land was restored. It was recovered for Germany in 1043 by Henry III., and a new and independent Mark, the "Neumark Oesterreich," was set up between the old frontier and the Leitha. In 1063 these lands were incorporated into the older Ostmark, being the first important acquisitions made by the Babenbergs.

The necessity of keeping a strong defence on the eastern frontier against Bohemia, and more especially Hungary, obliged the German kings to grant the markgrafs of Austria exceptional privileges. Few exemptions were made from their authority in the Mark, and their hereditary right to the office, though not admitted in law, was in practice unquestioned from the first.

As markgrafs they held the further advantage of not being obliged to grant out the counties attached to their Mark in fee, but were allowed to hold them in person, or administer them through officials appointed by themselves. At a time when the rights and privileges of other fiefs were falling into decay, those of the Babenbergs remained undiminished; and meanwhile, as the other land-owning families in the district died out, they consolidated their position by securing the reversion of these estates, by purchase, marriage or investiture. Personally, too, they were bold, tenacious and hard-working, and able guardians of the marches. In a long series of forays with the Magyars they kept their frontiers intact, just as at home they held their own successfully in the constant struggle for power. In addition they earned the gratitude of a succession of German kings by their constant and loyal support.

The Duchies **of** Austria and Styria.—Of the earlier Babenbergs, only Leopold II. (1075–95) deserted the Emperor Henry IV. in the investiture struggle, and was deprived of his fief in consequence (1081). It was given to Vratislav II., duke of Bohemia, but soon after Leopold was reconciled with the emperor and received his fief back (1083). Leopold III. (1095–1136) supported Henry V. against his father, Henry IV., and was rewarded with the hand of the young king's sister Agnes, widow **of**

the Hohenstaufen Frederick and mother of the later king, Conrad III. Through this marriage the house of Babenberg became allied with the Hohenstaufens, while through his sisters Leopold was also connected with the dukes of Bohemia and Carinthia, the markgraf of Steyr, the prince of Znaim, and other influential families. He had, indeed, raised his house to such eminence that on the death of Henry V., his name was put forward for the German throne; but he declined this dangerous honour. and both he and his son and successor, Leopold IV. (1136–41), proved remarkably successful in holding aloof from the great feud between the Welfs and the Hohenstaufen which divided Germany. From it, indeed, they reaped only advantage; for Conrad III., the stepbrother of Leopold V., bestowed on him in 1138 the duchy of Bavaria, of which he had deprived the Welf, Henry the Proud. After Leopold's death, his brother, Henry "Jasomirgott," so called from his favourite oath, held the duchy from 1143 to 1154, when it was restored to the Welf, Henry the Lion, by Frederick Barbarossa. The Babenbergs were now strong enough to press for compensation; and at the Investiture of Regensburg (Sept. 17, 1156) Henry renounced all rights of Bavaria over Austria, which Frederick thereupon raised to the rank of a duchy, investing it in Henry and his wife Theodora as a hereditary fief, capable of transmission in the female line, in default of heirs male; while should the succession fail altogether, the duke received the right to nominate his successor. At the same time the dukes of Austria, being now the titular equals of those of Bavaria, incorporated in their domains the counties which they had formerly held from Bavaria, and thus extended their western frontier up to the present boundary east of Passau. The duke now held exclusive jurisdiction in his territories, and his duties towards the emperor were limited to appearing at any Diet held in Bavaria, and to contributing a contingent for the imperial army in any campaign waged in the countries bordering on Austria (*privilegium minus*).

These very notable privileges aroused the jealousy of the markgrafs of Steyr, the wealthy and powerful house of Chiemgau, who had succeeded to the fiefs of the perished dynasty of Eppensteiner in 1122, and had since been pursuing a policy of patient and successful acquisition which had made their dominions hardly less extensive than those of the Babenbergs. Ottakar III. of Steyr obtained for himself the ducal title in 1180; but being childless, he made a secret compact six years later with the Austrian duke, Leopold V., to whom he was related through his great-grandmother Elizabeth, daughter of Leopold II. of Austria, granting the latter his domains after his own death, subject to the king's approval. In 1192, Leopold V. duly entered into possession of this rich territory; and although on his death in 1194 the two duchies were partitioned between his two sons, on the death of the older, Frederick I., they were again united in the person of the younger son, Leopold VI. (1198). The union, like all the later unions with territories of any magnitude, was personal only; the Estates of each duchy retained their own especial and varying privileges and organization.

Leopold VI. acquired, by purchase or treaty, a number of smaller territories within or adjacent to his now stately domains. His son, Duke Frederick the Quarrelsome, was brought by his wife another important acquisition, whence he took the title of lord of Carniola. But he came near losing his whole domains, for after he had involved himself in disputes with his neighbours, his Estates and the emperor, he was placed under the ban, his domains invaded by the imperial armies, and his territory reduced at one time to the town of Wiener Neustadt and the adjacent castle of Starhemberg. Thanks to the disunity of his adversaries, he won back all he had lost, and negotiations were actually proceeding for the elevation of Austria and Styria into a single kingdom, and Carniola into a duchy, when he was killed in a battle against the Hungarians (June 15, 1246), and with him the male line of Babenberg became extinct.

The Interregnum. — On the extinction of the Babenbergs, the Emperor Frederick II. claimed their duchies as vacant fiefs of the empire, and entrusted them to the administration, first of Count Eberstein, later of Otto II., duke of Bavaria, in Austria, and of Count Meinhardt of Gorizia in Styria. Pope Innocent IV., on the contrary, espoused the cause of Frederick the Quarrelsome's surviving niece, Gertrude, wife of the markgraf of Moravia, and after his death, that of her second husband, Hermann, markgraf of Baden. When both Hermann and the emperor died in 1250, the Estates of Austria met at Triibensee in 1251, and elected Ottakar, son of Wenceslaus I., king of Bohemia, while those of Styria elected Bela IV., king of Hungary. Although the rivals swore peace at Ofen (Buda) in 1254, Ottakar expelled Bela in 1260 and reunited the two duchies, with which he was invested (though not in legal form) by the German king, Richard earl of Cornwall, in 1262. Ottakar, who had become king of Bohemia in 1253, ruled his domain wisely, being a particular patron of the towns, and added to it, in 1270, Carinthia, Carniola, and the Windisch Mark, by virtue of a compact made in 1268 with Ulrich III., duke of Carinthia, who died childless two years later. But his great power frightened the Electors of the Rhine, who saw the probability that the centre of gravity of central Europe would be shifted permanently to the east; and on the death of Richard in 1272, they rejected Ottakar's nominee and chose instead a man of great abilities but few possessions: Count Rudolph of Habsburg. Rudolph was crowned German king on Aug. 24, 1273.

The **Habsburgs** in Austria. — Rudolph's primary mission was to break the power of the king of Bohemia, and he probably aspired from the first to secure the Austrian duchies for his own house, whose possessions, in Switzerland and Alsace, were modest. He proceeded with caution. In 1274 he questioned Ottakar's claims to the duchies, and in 1276, having twice summoned him to appear before the Imperial Diet, placed him under the ban. In 1276 he led the imperial forces into Austria and defeated Ottakar, who renounced his claims to the three duchies, and did homage to Rudolph for Bohemia and Moravia. Attempting two years later to recover his possessions, he was defeated and slain. In 1281, Rudolph appointed Albert, his eldest son, governor of Austria and Styria, retaining Carinthia in his own hand. On Dec. 27, 1282, he raised his two sons, Albert and Rudolph, to the ranks of princes of the empire, and invested them with Austria, Styria, Carniola, the Windisch Mark and Carinthia. In the following year the dual sovereignty was abolished, Albert, with his descendants, receiving the lands. while Rudolph was compensated by a sum of money. Finally, in 1286, Carinthia was separated from the other provinces and bestowed on Count Meinhardt of Gorizia, who was also count of Tirol.

Development of the Estates. — The position of the first Habsburgs was in appearance much stronger than that of the Babenbergs, but in reality far less secure. The old feudal system under which the earlier dynasty had grown strong was in complete decay. The power of the German king had followed that of the Holy Roman emperor into practical extinction. Little by little the kings had been forced into making, first the higher fiefs, and then the lower, hereditary. The power of landed nobles had replaced the old hierarchy of service; and all that remained to the king was some small control over his weaker vassals, with the possibility of mediating in the quarrels of the stronger, together with the right of bestowing titles which were merely nominal. From 1438 until its abolition in 1804, the title of Holy Roman emperor was held, with one exception, only by the rulers of Austria; but it was a shadow whence the life had departed. Nor did the Habsburgs recover as dukes the authority which they had lost as kings. As the feudal system decayed, that of Estates came into being; the internal history of the next centuries is that of struggle of the great divisions of society to secure power and privilege for themselves and to defend them against attack from above and below. By the close of the 13th century this process was already well advanced in Austria. The belief of the privileged classes in their right to a voice in affairs was shown by the revolts with which Albert had to deal; the revolt of the burghers of Vienna in 1288, of the Styrian nobles in 1292, and of the Austrian nobles in 1295. Albert, who was a strong and a hard man, dealt with these risings successfully; but throughout the 14th and 15th centuries the power of the Estates steadily increased. This was due to two main causes: to family dissensions

among the Habsburgs themselves, and above all, to their chronic penury. Whatever the legal position, the fresh funds of which they were continually in need could be obtained only with the consent of the Estates, who made each application the occasion for exacting confirmation or extension of their privileges. By the beginning of the 15th century the process of evolution was complete. The Estates of the church, the landed nobility, the burghers, and (in the Tirol alone) the free peasants had acquired a definite status and organization, and a considerable control over public affairs. The power of the sovereign was correspondingly diminished, while the unprivileged classes were sinking into increasing misery. For most of the inhabitants of Austria, the later middle ages were a time of great wretchedness, full of class warfare, oppression and hatred, which found their outlet at last in the religious wars which filled much of the period. Nor was this all. The advance of the Turks cut away Vienna's eastern trade, besides threatening more directly the Austrian provinces themselves. The Black Death ravaged Austria in 1348, 1349, 1369 and 1381; the transition to the more general use of currency, instead of payment in kind, caused a prolonged economic crisis of the utmost severity; and the degeneration of the free peasantry into a class of oppressed and exploited serfs was disastrous, not only for themselves, but for the whole country.

Expansion of Austria Under the Early Habsburgs.—Over other German States Austria preserved, indeed, the advantage which had been hers under the Babenbergs. Less than ever was it possible now for the crowded States of the west to expand to any real extent; but the east remained a more promising field. The Habsburgs themselves chiefly retarded the growth of their own power by their unfortunate family policy; the system of primogeniture was unknown among them, and at first attempts were made to establish a common rule of two or more brothers. This proving impracticable, in 1355 Albert II. issued a family ordinance which admitted the right of all members of the family to rule. For over a century the Austrian lands were divided between different members of the family (for details *see* HABSBURG), and they were only reunited by Maximilian I. The quarrels between the brothers occupied much of their time, and meanwhile the title of German king, although held by Albert I. and his son Frederick, then passed for a century to the house of Luxembourg. The first real advance made by the Habsburgs was in 1335, when, as a result of a secret agreement made five years previously, Albert II. (1314–58) and Otto (1314–39) who were then ruling Austria and Styria in common, obtained definite possession of Carinthia, as of Carniola, which had been pawned to the count of Gorizia, and of south Tirol. The *privilegium de non evocando,* which was obtained by Duke Albert, gave the dukes of Austria further privileges in the empire; but these were too little for Otto's ambitious successor, ,Rudolph IV. (1339–65). Irritated by the omission of Austria in the Golden Bull of 1356 from the list of Electoral States, Rudolph produced a series of forged privileges, purporting to go back to Roman times, designed to give the duke of Austria a status superior to that of any other vassal of the empire. The Emperor Charles IV., while confirming in general fashion the rights of the Habsburgs, refused to acknowledge the forged *privilegium majus,* and the result was a breach between him and Rudolph, who, however, gained a solid success in 1363 when Margaret Maultasch, duchess of Tirol, made over her dominions to him and his brothers.

A dark period followed Rudolph's death. His succession was divided between his brothers Albert III. (1365–95) and Leopold III. (1365–86), and this partition led to a long and devastating dispute between the two lines which they founded. The disunion in the ruling house led to a formidable increase in the power of the nobles, and civil wars from which the Tirol and Vienna suffered particularly heavily. Leopold, indeed, secured the possessions of the counts of Gorizia in Istria and the Windisch Mark (1374) and of parts of Vorarlberg (1375), while in 1382 Trieste submitted voluntarily, to escape the encroachments of Venice: but his defeat at Sempach in 1386 presaged the loss of the Habsburg dominions in Switzerland. The glory of the dynasty, but not the prosperity of the lands, was suddenly restored in 1437 by the death of Sigismund of Luxembourg, king of Germany, Bohemia and Hungary, who bequeathed all three crowns to his son-in-law, Albert V. Albert, however, died two years later. His heir, Ladislaus Postumus, was born after his death, and his second cousin Frederick, of the Styrian line, acted as guardian both for Ladislaus and his first cousin, Sigismund of Tirol, who was also a minor.

Frederick III.—Frederick's prolonged reign was one of almost ceaseless strife with the Estates, his neighbours and his jealous family. In 1446 a revolt of the nobles of the Tirol forced him to release Sigismund from tutelage, and a similar and more serious movement broke out in Ladislaus' domains in 1451, headed by the wealthy adventurer Rudolph Eitzing and Ladislaus' uncle, Count Ulrich Cilli, and supported by strong parties among the Estates of Austria, Bohemia and Hungary. In 1452 this league besieged the emperor in Wiener Neustadt and forced him to release Ladislaus, who now became nominal ruler over his wide domains, while the actual power was wielded in Austria by Ulrich, and in Bohemia and Hungary by national regents in the persons of George Podiebrad and John Hunyadi respectively. When Ulrich was killed in 1456, the emperor succeeded to the wide estates of his house; but the death of Ladislaus in the following year opened up a period of strife and civil war between Frederick and his brother Albert, which was only ended by Albert's death in 1463. The Styrian and Austrian possessions were now at last reunited under Frederick; but Hungary and Bohemia, on the death of Ladislaus, had broken away and had elected national kings: George Podiebrad in Bohemia and Matthias Corvinus, the son of Hunyadi, in Hungary. The latter, a ruler of exceptional ability, actually drove Frederick from Vienna in 1485, established his own residence there, and incorporated large parts of Austria, Styria and Carinthia in the kingdom of Hungary.

Although treated with so little consideration in Austria, Frederick had enhanced its dignity by confirming, as emperor, the forged privileges put forward by Rudolph 100 years previously. Thus in 1453 Austria received the title of an archduchy, with many privileges within the empire, and was declared indivisible, the principle of primogeniture being introduced into the succession. The beneficiary of these innovations, Frederick's son and successor, Maximilian (1459–1519), was as brilliant a figure as his father had been a pathetic one, and inaugurated an entirely new era in Austrian history.

Maximilian I.—The rise of the duchy of Burgundy under Philip the Good and Charles the Bold had inspired Frederick with the idea of using this new power as a counterweight against the increasing unruliness of the princes of the empire. To this end, Maximilian had been married in 1477 to Maria, daughter and heiress of Charles the Bold, to whose lands in Burgundy, Flanders and Luxembourg he succeeded on the death of his father-in-law in 1482. The position of the Habsburgs on the two flanks of Germany was now commanding indeed; but it was also dangerous; and Maximilian's early years were spent in constant struggles in the west, not only with the Flemish Estates, but also with France, whose long hostility towards Austria dates from the Burgundian marriage. Fortunately he was able rapidly to consolidate his position in Austria. Elected German king in 1486, in 1490, on the death of Matthias Corvinus, he drove the Hungarians out of Austria and restored the old frontier, and in the same year his cousin, Sigismund of Tirol, abdicated in his favour. On the death of his father he was elected emperor, and united all the Austrian possessions in his own hand, later augmenting them slightly by the heritage of the counts of Gorizia, whose line became extinct (1500), some districts in north Tirol, the prize of the War of the Bavarian Succession (1505) and some small districts won by war from Venice (1516).

It was largely with the purpose of making his Austrian dominions into a compact and reliable base for his more ambitious plans elsewhere that Maximilian introduced the administrative reforms which were his abiding legacy to Austria proper. "Austria," as he found it, consisted of an agglomeration of provinces, united only in the person of their common sovereign, whose relations towards, and authority in, each were governed by the

varying rights of the several Estates. For this system—the outcome of mediaeval evolution—Maximilian attempted to introduce government by permanent State officials in the provinces, linked up to a central authority; while matters of common interest to several provinces should be discussed by deputies of each at a "brotherly union." To some degree, Maximilian was successful: but after his provincial "colleges" had been made a permanent institution in 1501, the Estates awoke to the threat to their particularism and privileges. Their suspicious hostility was aroused. At the Innsbruck Diet of 1518, Maximilian was forced to retract some of his reforms, and his successor reaped the fruit of the animosity he had aroused.

Yet the march of time was with the emperor; and the chief reason why Austria failed to develop into a compact German State was Maximilian's own preference for grandiose schemes to shed lustre on his house and justify his imperial title. Yet in these projects, in which he exhausted his dominions, he was seldom successful. His reforms in Germany were opposed by the Electors, who frustrated his plan to get the Tirol made into an Electorate. The Swiss Federation, after a long struggle, broke finally away from the empire. The Italian campaigns ended with minute territorial gains, and the deep hostility of Venice—an important matter in view of the advance of the Turks. France had become an implacable enemy, and the attempt to rouse Europe to a crusade against the Turks ended in failure. The transformation of Austria into a super-national world-power was due only to Maximilian's own marriage and that of his children and grandchildren. The marriage of his son Philip to Joan, infanta of Castille (1496) and of his daughter Margeret to John of Aragon (1497) made the Habsburgs heirs to the new power of Spain; while at the congress of Vienna (1 j1 j) Maximilian arranged marriages (which were consummated in 1521 and 1522 respectively) between his grandchildren, Maria and Ferdinand and Louis and Anna, the children and heirs of Vladislav III., king of Bohemia and Hungary. Thus when he died, on Jan. 12, 1519, Maximilian had already prepared the way for the great transformation which was to follow.

(C. A. M.)

AUSTRIA AS A GREAT POWER: 1519–1740

Ferdinand I. 1526-64.—Maximilian's grandson, Charles, king of Spain, 1516, emperor 1519, was also co-ruler of the Habsburg dominions in Eastern Germany, but relinquished them to his brother Ferdinand by the partitions of Worms (1521) and Brussels (1522). When Louis II., king of Bohemia and Hungary, died childless (1526), Ferdinand claimed the succession to the two kingdoms in the name of his wife Anna, Louis's sister, and his own. The Bohemian Estates denied the validity of his title, and claimed the right themselves to elect their king. On Oct. 23, 1526, they then unanimously elected Ferdinand king of Bohemia, while demanding from him considerable diminutions of his sovereign rights. Ferdinand admitted that the Estates had elected him of free will, but conceded only part of the limitations demanded. The Estates of the other lands of the Bohemian crown (Moravia, Silesia, Lusatia) recognized Ferdinand's title, through his wife. In Hungary the difficulties were greater. No alternative to election was recognized. The opposition elected John Zápolya, Voivode of Transylvania (Nov. 1526), while the Habsburg party elected Ferdinand (Dec. 1526); but he had to accept important restrictions on his sovereign rights. The diet of Croatia voted for Ferdinand, the Estates of Slavonia elected Zápolya. War broke out between the two candidates. Zipolya appealed for help to the Sultan Suleiman, who advanced and besieged Vienna in 1529. In 1538 peace was concluded at Grosswardein; Zápolya retained the title of king, with that part of Hungary then in his possession; but on his death the whole kingdom was to fall to Ferdinand. When, however, Zápolya died (1540) his councillors secured the sultan's recognition and support for his son, John Sigismund. War broke out afresh, and the Turks occupied a great part of Hungary. Ferdinand even had to undertake to pay the sultan an annual tribute for the remnant of Hungary left him (1547).

In the severe struggles in which Ferdinand's brother, Charles V., was involved with the Protestant princes of Germany and their allies abroad, Ferdinand did not directly intervene, although his sympathies were unfeignedly Catholic. Elected German king in 1530, he repeatedly advocated reconciliation between the two religious parties and attempted, although vainly, at the Council of Trent, to modify the demands of the Catholics. He was largely instrumental in the conclusion of the treaties of Passau (1552) and Augsburg (1 j55). In 1 j56 he was crowned emperor in succession to Charles V.

Ferdinand's reign was of great and lasting importance for the internal administrative history of the Austrian districts. He continued the centralizing policy of Maximilian I., and gradually established a number of administrative bodies common to all his lands, assisted by the circumstance that the constitutions of the lands of the Hungarian and Bohemian crowns did not bind him to consult the Estates in many important questions; *e.g.,* decision on war and peace, the raising and application of the regular income from the crown property and revenues, etc. He thus prepared the way for the efforts of his successors to rule their different kingdoms and lands on a common basis, and to create a real unity between them in foreign, military and financial respects. These central organs comprised the Privy Council (Geheimer Rat), created in 1527, for foreign affairs and general administration, the General Court Chancelry (*Allgemeine* Hofkanzlei) for execution of decisions taken by the Privy Council and the sovereign, the Court Council of War (Hofkriegsrat), established 1 j56 to deal with military recruiting, equipment and supplies and maintenance of fortresses and arsenals, and the Court Treasury (*Hof*-kammer), established 1527 as a central financial organ.

The development of the Habsburg power was severely hampered by the fact that in the German-Austrian provinces, where the hereditary title of the dynasty was unquestioned, the principle of primogeniture was sanctioned neither by law nor tradition. Ferdinand I. himself only owed his possession of these territories to the principle that all male members of the Habsburg dynasty had a claim to the government and revenues of all territories. Despite his better judgment, Ferdinand could not free himself from the traditional view. To avoid a partition of the hereditary provinces, in his will (1543) he appointed his eldest son, Maximilian, his successor in Hungary and Bohemia, and expressed the wish that his three sons should rule the German-Austrian territories without partition. Yet at last tradition proved too strong. In 1 j54 he decreed a partition of the Austrian dominions. Maximilian, as eldest, received the duchies of Upper and Lower Austria and certain other smaller territories; Ferdinand, Tirol and the "Vorlande"; Charles, Styria, including the county of Cilli, Carinthia, Carniola, Gorizia, Trieste and Austrian Istria. The revenues were to be divided as equally as possible between the three. On the extinction of the male line of any brother the survivors inherited his possessions. This partition came into force on Ferdinand's death (1564) The resultant weakening of the dynasty was only temporary, as Tirol and the "Vorlande" reverted to the Styrian line in 1595 (definitively, after a new partition, 166 j) and the Inner Austrian territories were united with the Duchy of Upper and Lower Austria in 1619.

Maximilian II. 1564–76.—War with Turkey again broke out towards the end of Ferdinand's reign. An eight years' truce (1562) left the Turks in possession of their recent conquests. On Ferdinand's death (1564) a new conflict broke out between his successor, Maximilian II. and the Turks, whose assistance the Prince of Transylvania had invoked. Sziget, heroically defended by Nicholas Zriny, defied Sultan Suleiman II.'s assaults, but after his death (1566) the fortress fell and Maximilian lost also his last strongholds beyond the middle Theiss and Unna. In 1568 a fresh eight years' truce (afterwards repeatedly renewed) was concluded.

Maximilian's attitude towards the religious question (see REFORMATION) seemed likely to affect decisively the destinies of both Austria and Germany. He had been educated in a more or less Protestant atmosphere. Charles V.'s plan to secure the imperial succession for his son Philip had brought Maximilian in oppo-

sition to the Spanish Habsburgs, and confirmed his conciliatory feelings towards the Protestants. Consequently, Protestantism spread widely through the old estates of Austria, particularly the nobles. However, the antagonism between the two Protestant creeds in Germany, consideration for dynastic tradition, his family connections with the Catholic dynasties of France and Spain, and also purely political motives combined to keep Maximilian, personally, true to Catholicism. He therefore accorded the Protestant nobles religious liberty only, but not a legal establishment of their church. Even so, on his death the Protestants formed an overwhelming majority in most of his lands.

Rudolph II. and the Counter-Reformation. — Under Rudolph II. (1576–1612), whose succession to the thrones of Germany, Bohemia and Hungary had been ensured in his father's lifetime, the Catholic reaction began. Rudolph refused to grant legal recognition of religious liberty, and issued severe edicts against the prevalent heresies. He was, however, too weak and indolent to carry through the measures he planned, and Protestantism made further progress, especially in the towns.

Rudolph's brother, Ernest, as governor of Upper and Lower Austria, was more successful in defending the Catholic faith against the repeated assaults of the Protestant preachers; especially after finding in Melchior Klesl (*q.v.*) an ardent advocate of the policy of Catholic restoration, who applied the religious edicts ruthlessly. Klesl's severity led to unrest in Upper Austria, which presently turned into a social struggle against the landed proprietors; this spread into Lower Austria and was suppressed with difficulty and only imperfectly. The counter-reformation proved most successful in Inner Austria. The Archduke Charles, needing the help of the Estates against the Turks, at first had to make concessions (Brucker Libell 1578), but the counter-reformation soon set in strongly, its headquarters being the Jesuit university of Graz. Charles's son Ferdinand succeeded his father as independent ruler in 1596 and carried on his work. Commissions appointed by him eradicated Protestantism among the townspeople and peasants. Obstinate heretics were forced to emigrate. In a few years the majority of the population was thus restored to Catholicism.

The success of the counter-reformation in Austria inspired the Government to attempt a similar reaction in Bohemia, hforavia and Hungary; but their efforts failed, especially after Stephen Bocskay (*q.v.*) became leader of the anti-Habsburg party. The towns and nobles of Upper Hungary joined him, as Archduke Matthew, as representative of his brother Rudolph, persecuted the Protestants and attempted to infringe the rights of the Hungarian diet. Bocskay allied himself with the Sultan; the imperial troops were repulsed and several towns conquered by the Turks. Simultaneously the discontented Protestant Estates in Austria formed a league in defence of their religious and political liberties, the unrest among the Bohemian Estates grew, and anti-Habsburg feeling increased among the evangelical Estates of the empire. The emperor's insanity had become increasingly obvious since 1598; his brother thought energetic action imperative to save the territory and repute of the dynasty. Rudolph proved obstinate in the main question, but empowered Matthew to treat with the Turks and Bocskay. By the treaty of Vienna (June 1606), Transylvania remained under the suzerainty of the Hungarian king, but Bocskay was recognized as prince and his dominions enlarged. The Hungarian Estates (magnates, nobles and free towns) and royal markets were guaranteed free practice of their religion. In Nov. 1606 the negotiations with the Turks were concluded at Szitvatorok. The territorial status *quo* was accepted, but the sultan for the first time recognized the emperor as his equal.

As the emperor, whose health had further deteriorated, refused to recognize his brothers' arrangements, the archdukes determined to recognize Matthew as head of the house (April 1607). Rudolph objected; a family quarrel broke out. After complex negotiations, the Hungarian, Austrian and Moravian Estates agreed with Matthew to maintain peace on the basis of the treaties concluded by him in 1606. Rudolph, however, refused to grant these demands. War seemed inevitable, but a compact was concluded at Lieben, Bohemia (June 1608), whereby Rudolph resigned Hungary, Moravia and Austria to Matthew and promised him the succession to the Bohemian crown, while Matthew renounced his share of the Tirol and the Vorlande in his brother's favour.

This dispute had greatly increased the power of the Estates, whose demands the two Habsburgs were obliged to concede. In March 1609 Matthew concluded a compact with the Estates of Hungary, Austria and Moravia; the guarantees given by Maximilian II. were taken as basis and extended in favour of the Protestants. In Sept. 1609 Rudolph signed a royal patent (*Majestätsbrief*), assuring liberty of conscience to all inhabitants of Bohemia, and granting certain further rights to the nobles, knights and free cities. Yet the discords between Matthew and Rudolph and between them and the Estates continued. The formation of the Protestant Union (1608) and Catholic League (1609) in the empire reacted on conditions in the Habsburg dominions. The great danger for the imperial power lay in the fact that each of these federations sought supporters abroad — the Union France, the League Spain and the pope. The fatal fraternal struggle in the Habsburg territories thus led to increased agitation among the Estates, reinforced in Bohemia by nationalist feeling. In Hungary Matthew, who had succeeded his brother as emperor in 1612, was involved in new struggles with Bethlen Gabor (*q.v.*) and the Turks, and, receiving insufficient support from the Estates, was forced to recognize Bethlen as Prince of Transylvania and prolong the peace of Szitvatorok for 20 years (1615). The danger of a combination of the Estates of Matthew's dominions against the crown was averted by increasing and irreconcilable differences between the Estates of Hungary, Bohemia and Austria. The internal conflicts in the Habsburg dominions, however, prevented Matthew from active intervention in European politics, to the detriment of his prestige in the empire and Europe.

The Thirty Years' War. — Fortunately for the dynasty, the succession question, which had grown acute on the extinction of the main line, was settled peaceably by agreement (1617), Archduke Ferdinand, the representative of the Inner Austrian line, being recognized as heir to the Austrian territories, Bohemia and Hungary; the other Austrian Habsburgs renounced their claims and a settlement was also concluded with the Spanish line. Ferdinand was recognized as king in 1617 by Bohemia, in 1618 by Hungary. His immediate and active prosecution of the counter-reformation and attacks on local self-government led to severe conflicts. A rising in Bohemia (1618) led to a war which lasted thirty years. The details of this war are found elsewhere (see THIRTY YEARS' WAR); here we need only state that the Bohemian diet in Aug. 1619 passed a new constitution, declared Bohemia an electoral kingdom, granted greater independence to the adjunct provinces, disclaimed the house of Habsburg, and elected as king Frederick V. of the Palatinate, who was duly crowned in Prague.

By his victory on the White Mountain (Nov. 8, 1620) Ferdinand forced his opponent to flee and became master of the situation. He acted against his enemies with extraordinary severity; their estates were confiscated; many were forced to emigrate; the Catholic religion was restored. Meanwhile Ferdinand seized the opportunity to establish an autocratic and centralized system and crush the excessive power of the Estates. To secure the future a radical alteration of the constitution was planned. The *Verneuerte Landesordnung* issued on March 10, 1627, as royal decree for the Bohemian lands greatly increased the sovereign's prerogatives. Elsewhere in the Habsburg dominions Catholicism and autocracy triumphed similarly. The interdependence of religious and economic motives was particularly obvious in the Peasant War of 1625.

While the Jesuitical and autocratic system was everywhere victorious over Protestantism and the power of the Estates west of the March and Leitha, the general situation, conditions in Germany, consideration for Bethlen Gabor, and fear of Turkish intervention prevented the imperial government from acting with equal vigour in Hungary. Here, too, Catholicism made great progress; yet the sovereign's position remained quite different in

Hungary and in the rest of his dominions. Henceforward the political individuality of the German and Bohemian provinces was repressed, while their relations to the dynasty were broadly uniform. The Hungarians, on the other hand, preserved their separate status.

The Thirty Years' War seemed at first likely to end in victory for the emperor and the complete triumph of Catholicism. The situation changed, however, when Gustavus Adolphus of Sweden entered the struggle (1630), and still more with the participation of France (1635). The war ceased to be a religious one, and became essentially a struggle between the two branches of the Habsburg dynasty and France for continental supremacy. It was still raging when Ferdinand died (1637).

Strangely enough, Ferdinand, who had done so much to strengthen the imperial power and centralize its authority, could not quite throw off the idea of a partition of his dominions. Although in a will dated 1621 he maintained the principle of primogeniture and decreed the indivisibility of the dominions united under him, soon after he abandoned the principle of indivisibility, and granted his brother Leopold Tirol and the Vorlande. This new Tirolean secundogeniture became extinct, however, in the male line in 1665, whereupon all Austrian lands were again united.

Momentous for the administration of the Habsburg possessions was the establishment by Ferdinand of a special "Austrian Chancelry," side by side with the imperial chancelry (1620). This organ became also the family chancelry for the German line of the Habsburgs, and dealt with "all matters aifecting the Austrian lands and secreta of the Archducal house." Gradually relations with foreign powers came to be regulated by the "Austrian Court Chancelry" under a "Court Chancellor." Thus the Austrian dominions were permanently distinguished from the imperial.

Ferdinand **III.** and **Leopold** 1.—Under Ferdinand III. (1637–57) peace with Sweden and France was concluded (1648), after long negotiations. Ratifications were exchanged at Münster on Oct. 24 (see WESTPHALIA, TREATY OF). The emperor had to abandon his father's imperialist and Catholicizing plans, to recognize freedom of religion arid conscience, at least de *facto*, for the empire, and allow the Estates of the empire extensive rights. including that of concluding treaties with foreign powers. France obtained a large part of the Habsburg Vorlande, Breisach, the counties of Upper and Lower Alsace, the Sundgau, the bailiwick in the ten imperial cities in Alsace. The position of the Habsburgs in the empire was shaken. While the value of the imperial crown for the Habsburg dynasty, even after this date, must not be underestimated, it is true that henceforward their European influence was due primarily to their sovereignty in those great territories out of which the Austro-Hungarian monarchy was evolved. In this respect the long 'rule of Leopold I. (1658–1705) was of decisive importance. The Danube monarchy was created under him, principally by his triumphs over the Turks, who had again penetrated to Vienna in 1683, and over the Hungarian malcontents, followed by the capture of Buda-Pest, the recognition by Hungary (Diet of Pressburg, 1687) of the male line of Habsburgs in primogeniture as Hungarian kings, and shortly afterwards the incorporation of Transylvania. Further decisive victories by the imperial armies under Prince Eugene of Savoy (*q.v.*) led to the peace of Karlowitz (1699). The Porte ceded to the emperor Transylvania, the districts north of the Maros and between the Theiss and Danube, and part of Slavonia.

The Balance of Power.——Leopold's successes were the more remarkable in that part of his forces were engaged simultaneously in severe battles with other powers, especially in his prolonged struggle to defend the rights of his crown and of the German nation against the attacks of Louis XIV. (see FRANCE; EUROPE) Attempts to conclude a peaceful arrangement nith Louis XIV on the partition of the Spanish territories of the Habsburg dynasty, whose ruler, Charles II was childless and weak. had no lasting success.

Louis's endeavours to secure a share of the booty increased the conflicts between him and the Emperor. A number of wars followed (see DEVOLUTION, WAR OF; GRAND ALLIANCE, WAR OF THE), in which France mas at first successful.

A change came with the intervention of William III. of Orange, king of England since Feb. 1689. In May 1689 the "Grand Alliance" was formed between the emperor and the States General, William III. as king of England, adhering. The allies gained, indeed, no decisive victory over Louis XIV., and were eventually parted by the skilful French diplomacy; yet the Peace of Ryswick (1697) was a defeat for France. The changed situation appeared more clearly when Louis XIV., disregarding his agreements with England and the States General, claimed (1700) the whole Spanish succession for his grandson, Philip of Anjou, on the strength of Charles II.'s will. The "Grand Alliance." concluded in 1701, won a succession of decisive victories under the brilliant commandership of Marlborough and Prince-Eugene. (See SPANISH SUCCESSION, WAR OF.)

But the change of régime in England, the quarrel between Queen Anne and the Whigs, and her growing dislike of Marlborough was disastrous for the allies' conduct of the war. The greatest change was, however, brought about by the death of Joseph I. (April 1; 11) and the succession of Charles VI. (1711–40). The same danger to the balance of power which had led the maritime powers to oppose the estahlishment of the Bourbons in France and Spain, now threatened them from the Habsburgs in Spain and Central Europe. England signed a separate treaty with France (Treaty of Utrecht, April 11, 1713); and the emperor had finally to submit to a compromise. On March 7, 1714, the Peace of Rastatt was signed. Charles finally renounced the territories in Alsace, but received Naples, Milan, Sardinia, the Tuscan sea-board and the Spanish Netherlands. The recognition by the emperor of the Bourbon Philip V. in Spain was not expressed in the treaty, but was implicit in it. When Philip, secretly supported by the duke of Savoy, attempted in 1717 to recover part of the Italian possessions, the emperor, in 1718, joined the alliance concluded in 1716 between England, Holland and France. The duke of Savoy was forced to cede Sicily to the emperor, receiving Sardinia in return. The support of the Saxon candidature in Poland (1733) led Charles VI. to war with France, Savoy and Spain. Charles, abandoned by the maritime powers, his allies, and supported too late by Russia, was defeated, and ceded Novara and Tortona to Savoy, the kingdoms of Naples and Sicily and the sea-board in Tuscany to Don Carlos, receiving in return the duchies of Parma and Piacenza (preliminary peace of Vienna with the king of France, Oct. 3, 1735; Peace of Vienna, Nov. 1738).

A war with Turkey (1736–39), in which Charles was allied with Russia, brought still graver losses: Bosnia, Serbia and the two Walachias. The Peace of Belgrade (Sept. 1739) defined the lower Unna, the Save, and the Danube as far as Orsova as the Austro-Turkish frontier.

Internal Reforms.—In the 92 years between the Peace of Westphalia and the death of Charles VI. (1740) the constant effort of the rulers of Austria had been to strengthen the monarchical power against the Estates and increase the influence of the central organs on the conduct of the state. Their continuous wars and consequent unrelieved financial distress, which forced them again and again to apply for funds to the provincial Estates, gravely impeded these autocratic and centralist ambitions. Nevertheless, they succeeded in diminishing the power of the Estates considerably in the German and Bohemian lands, and increasing the influence of the government over affairs throughout their dominions by re-organization of the central offices (formation of the Conference for Foreign Affairs *c.* 1660, establishment of the Permanent Conference, 1709, abolition of the Central Offices in Inner Austria and Tirol 1705, reorganization of the Austrian Court Chancelry 1 jog). The sovereigns and their advisers also adopted a definite commercial and industrial policy, and endeavoured, although unsuccessfully, to put order in the finances. The mercantile system was brilliantly represented in Austria; Charles VI. founded trading companies in Ostend and Trieste, established Commercial Courts in various provinces, and formed a Board of Trade (1718). Joseph I. founded the Vienna city bank (1706); Charles VI. established a central revenue office for the majority of the state revenues (1715).

Charles VI. and the Pragmatic Sanction. — The question of succession gave Charles VI. much anxiety. When Charles had appeared likely to become ruler of Spain, an agreement had been made between Leopold I. and his sons, Joseph and Charles, that Joseph should renounce the Spanish possessions and become sole ruler of the Austrian. As, however, Charles's prospects did not materialize, Leopold, in his will (April 1705), provided, Joseph consenting, that Charles, if the peace left him none of the Spanish possessions, should receive Tirol with the Swabian and other territories in the west. Still earlier (Sept. 12, 1703) the *Pactum Mutuae Successionis* had laid down regarding the succession that the principle of primogeniture should hold, the legitimate male line always taking precedence of the female both in Spain and Austria, and that should either branch become extinct in its male line, its possessions should fall to the nearest male member of the other line; the female line and their descendants always coming after the male line. Charles's daughters should retain their rights to the lands of both branches if all male members of the dynasty and Joseph's female descendants, which should always take precedence over those of Charles, died out. This pact, however, lost its importance when Joseph I. died in 1711 without male issue, Charles becoming heir to the Habsburg dominions. The weakness of all these arrangements was that they were binding only on the Habsburgs, being merely unilateral expressions of the sovereign's will, and not that of the territories, in particular of Hungary, whose Estates in 1687 had reserved to themselves the right of election in case of the extinction of the entire male line of Habsburgs. Charles VI. therefore attempted to regulate the succession. On April 19, 1713, acting on his own prerogative, he informed his privy councillors and dignitaries of his wish that his kingdoms and territories should pass undivided, first to his male heirs on the principle of primogeniture, and in default of male line to his daughters, and in default again of any legitimate descendants of himself, to the daughters of Joseph I. and their legitimate descendants, and after them to the descendants of his sisters and all other lines of the archducal house, according to the principle of primogeniture. This declaration was not issued until March 1720, after Charles VI.'s son, born 1716, had died in the same year, his only other children being two daughters, born in 1717 and 1718. The Estates of the German-Austrian territories accepted this settlement in 1720 and 1721, those of Transylvania and Hungary in 1722; the Hungarian Estates reserved their electoral right in case of extinction of the male line. Joseph I.'s daughters on marriage, and their husbands also, were obliged explicitly to renounce any claims to the Austrian lands so long as issue of Charles VI. lived. Charles VI. made tireless efforts to secure for this law international recognition and the guarantee of the European powers. His whole foreign policy up to the end of his reign was directed to this endeavour, to which he sacrificed important interests of his dominions. In fact, Spain, Russia, Prussia, England, Holland, the German empire, Denmark, France and Sardinia recognized the Pragmatic Sanction.

1740-1848

Maria Theresa; the Wars of the Austrian Succession. — On the death of Charles VI. (Oct. 1740) the male line of the Habsburgs became extinct. He was succeeded in Austria, Bohemia and Hungary by his daughter, Maria Theresa (1740–80) (b. 1717) who, in 1736 married Francis Stephen of Lorraine (which he exchanged against Tuscany in 1737). The Estates of her dominions recognized Maria Theresa's succession unreservedly, but Bavaria, Saxony and Spain laid claim to Habsburg territories, and Frederick II. of Prussia, claiming that old treaties entitled his house to parts of Silesia, declared war His first great victory at Mollwitz (1741), encouragrd France, Bavaria, Spain, Saxony and Sardinia to attack Maria Theresa, who, allied with the Maritime Powers, resisted with varying success. (See AUSTRIAN SUCCESSION, WAR OF.) At the Peace of Breslau (June 1742), concluded at England's advice, she ceded most of Silesia to Prussia. In 1743, hoping to compensate herself in Bavaria for this loss, she occupied that state, but Prussia intervened (1744), and the war was again victorious. The Treaty of Dresden (Dec. 1745) confirmed the provisions of the Treaty of Breslau without territorial alterations. Fortunately for Maria Theresa, the Elector Charles of Bavaria (as Emperor Charles VII.) died early in 1745; his son concluded peace in April and in September Maria Theresa's husband, Francis I., was crowned emperor (1745–65).

The other enemies prosecuted the war in the Spanish Netherlands and Italy. But despite successes, won chiefly by the French commander, Maurice of Saxony (*q.v.*) in the Spanish Netherlands in 1746–7, France inclined to peace, as Russia had been induced by the Maritime Powers to help Austria, and England prosecuted the war against France at sea with increasing success. By the treaty of Aix-la-Chapelle (Oct. 18, 1748) Austria ceded Parma, Piacenza and Guastalla to the Spanish Infante, Philip.

Despite her territorial losses in these wars, Austria's prestige had risen. She had shown unexpected vitality, and in some respects, notably the improved quality of her army and greater experience of her generals, was stronger than at the beginning of the struggle.

The period 1748–58 was occupied in preparations for carrying into effect Maria Theresa's determination to recover her lost possessions. The influence of Wenzel, Prince Kaunitz (*q.v.*) was predominant in convincing the cautious, hesitating empress that a reversal of Austria's foreign policy was necessary to the fulfilment of these ambitions. Increasing differences, mainly of commercial policy, with the Maritime Powers made the continuance of the old alliance impracticable, and Kaunitz, recognizing that Prussia, not France, was now Austria's chief enemy, persuaded Maria Theresa to ally herself with France. The Treaty of May 1, 1756, confirmed and extended in 1757, ended the long Bourbon-Habsburg rivalry. In the Seven Years' War (*q.v.*), France and Austria were ranged against England and Prussia. Despite the alliance with France and (later) Russia and some smaller powers, and the support of the empire, Maria Theresa failed to recover Silesia. The Peace of Hubertusberg (Feb. 15, 1763) restored the *status* quo ante *bellum*. Austro-Prussian rivalry, however, subsisted, and led to fresh conflicts when Joseph II., who succeeded his father as emperor in 1765, becoming simultaneously co-regent with his mother in the Habsburg dominions, planned on the death, without children of the Bavarian Elector (1777) to annex Bavaria as compensation for Silesia. Frederick II., however, advanced into Bohemia, and as Maria Theresa shrank from another campaign against Frederick, the Peace of Teschen was concluded (May 1779), whereby Austria received the Inn district, renouncing all other claims on Bavaria.

First Partition of Poland. — The efforts of Catherine of Russia to extend her influence over Poland put Maria Theresa in a difficult position. She would gladly have supported the Poles, but found no encouragement from England or France, while Prussia had become Russia's ally in 1764. Neither could Austria intervene on Turkey's side in the Russo-Turkish war, which commenced in 1768, as Kaunitz, particularly, wished, since Joseph II. in his meetings with Frederick (1769 and 1770, the latter attended by Kaunitz), failed to persuade Frederick to adopt a hostile attitude to Russia. Frederick considered a partition of Poland the best way to reconcile the interests of Prussia, Russia and Austria, and sought to win Catherine for this plan. At first unsuccessful, he eventually convinced her, and Maria Theresa, although her sense of justice revolted against the plan, had no alternative but to share the booty. By the Treaty of Aug. 5, 1772 Austria received Zips and the districts included under the names of Galicia and Lodomeria. To make these acquisitions directly contiguous with Transylvania, Joseph occupied the Bukovina, part of the Turkish principality of Moldavia, in 1774, which Turkey, incapable of recovering it, ceded to him in May 1775.

Maria Theresa's Internal Reforms. — Maria Theresa's internal reforms were momentous. Having asserted her right in the wars of succession to her father's dominions, she felt the necessity of giving these territories which had hitherto had little in common but the dynasty, an inner unity and firmer administration. While leaving the Estates intact, she reduced their rights and seldom convoked them. To unify the administration of the

German-Bohemian territories and introduce some harmony of principle into the existing offices, the Austrian State Council (Staatsrat) was established in 1760, at Kaunitz's suggestion, to report on all questions submitted to Maria Theresa. The Council covered the whole state and thus debated questions concerning Hungary, the Spanish Netherlands and the Italian possessions as well as the German-Bohemian territory. The *Directorium* in *publicis* et *cameralibus,* which was charged with the political and part of the financial administration of the German and Bohemian territories, was established in 1749, but proving unsatisfactory, was abolished in 1761; the political and financial administrations were again separated, the former entrusted to the German-Bohemian Court Chancellery, the latter distributed among three central organs, the chief being the Hofkammer (Court Chamber). A "Credit Deputation" was formed for the national debt of the German-Austrian territories. The *Kommerzienrat* (Commercial Council) was an independent body for the promotion of trade and industry. In 1760 a Commission of Studies was established to supervise education, which was now considered definitely the concern of the state. The Government now not only organized the primary schools and drew up the syllabus for the upper schools and lay faculties of the universities, but after 1774 also settled syllabuses and text books for the theological faculties and monastic schools.

The contemporary theories of state supremacy and anti-papal feeling (Febronianism), wide-spread in the monarchy, in ecclesiastical as well as lay circles, deeply influenced the Government's relations with the Catholic Church. Various measures were devised to strengthen the state in clerical questions. A new law forbade publication of papal bulls without the consent of the crown, and direct intercourse between the bishops and Rome; the privileges of the religious orders were curtailed. Maria Theresa herself was a devout Catholic, distinctly hostile towards the Jews, against whom she issued several severe decrees, including decrees of expulsion, a fate shared on occasions by the Protestants. Her government devoted particular attention to taxation. Negotiations with the Estates led to a considerable increase in the provincial contributions; the basis of the land tax was revised, the estates of nobles and the Church submitted to the regular taxation. The customs system was revised (1775), although still inadequately. Maria Theresa also claimed the codification of the law as her prerogative, wishing to replace the extraordinarily numerous systems current by a single, unified code. In 1768 a unified criminal code and procedure (the *Theresianische Halsgerichtsordnung*) was introduced for the German-Bohemian lands. Torture, retained here, was abolished in 1776. A civil code was completed in 1767, but not approved by the sovereign.

Joseph II. (1780–90).—Joseph II. became sole ruler on Maria Theresa's death (Nov. 29, 1780), and proceded vigorously to enforce his theories of enlightened despotism and *étatisme.* Above all, he airned at completest centralization, not only in the German and Bohemian provinces, but throughout his territories, regardless of historic rights and tradition. The Hungarian Estates were never convoked. Outside Hungary the rights of the Estates were reduced, the principal affairs entrusted to the provincial governments. The diets were at first convoked frequently, but only to grant the Government's financial requirements. The financial and political administrations were reorganized (1782) and Joseph refrained only at the urgent representation of the State Council from uniting the judicature with the executive. Directories of police were established in all large towns on the model of Vienna, to supervise the population, and the secret police began its work in Vienna. The city charters were reorganized on bureaucratic lines. His centralistic tendencies and desire to accelerate the administration induced Joseph in 1784 to introduce German as the administrative language in all his dominions, including Hungary. As regards the judicial system, he attempted to organize the courts with greater simplicity and uniformity, to concentrate judicial authority in the hands of the sovereign, and to create a competent magistrature. The civil procedure was organized in three stages: local courts, courts of appeal, supreme court. The criminal procedure was organized by the patent of 1787. Maria Theresa's unfinished codification was carried further. A "General Judicial Decree" (Allgemeine *Gerichtsordnung*) was issued 1781 for the German-Bohemian lands, simultaneously with a bankruptcy law. The civil code was not completed, but portions of it, notably marriage law, were regulated. On Jan. 1, 1787 the first part of the general legal code (private law) came into force for the German-Bohemian lands; 1788 the criminal procedure. Without consulting the Estates, Joseph re-modelled the systems of direct and indirect taxation in the direction of equal taxation for all classes (land tax Patent of 1785). In 1781 he issued his "subjects' patent" (*Untertanspatent*) for the protection of peasants, regulating relations between them and their masters, to the advantage of the former, in the German-Bohemian lands. Most important of all was the patent of Nov. 1, 1781, abolishing serfdom and giving all subjects the right of marriage, free movement and instruction in any handicraft in Bohemia, Moravia and Silesia, soon after in Galicia, and in Hungary in 1785. Corvées and other contributions were left to the land owner as "urgent rights," but were reduced by further patents.

Joseph's intervention in ecclesiastical conditions in his dominions was drastic. The Patent of Tolerance (Oct. 1781) granted extensive concessions to the non-Catholic Christian creeds, while the Jews were freed from many restrictions imposed on them from earlier centuries. Joseph maintained the absolute power of the State even in ecclesiastical matters and wished to exclude the pope from influence over internal ecclesiastical conditions in his domains. No papal bull might be published without previous permission from the Government. Appeals to Rome and the procural of dispensations were forbidden. In 1782 the abolition of all purely contemplative monasteries was decreed and their property confiscated by the State, which assumed control over the remaining monasteries. Theological instruction was completely taken over by the State and State general seminaries established. The Marriage Patent (1783) declared marriage a civil contract validated only by civil law. The pope's personal intervention with Joseph proved fruitless.

Both the revolutionary contents of these reforms and the autocratic severity of their execution elicited wide-spread resistance, particularly among influential circles. Hungary resented deeply the violation of the Estates' traditional rights and the attempts at Germanization, and Belgium the anti-Catholic measures. In both countries there were revolts which the emperor could possibly have repressed, had he not been engaged simultaneously on an ambitious foreign policy as impracticable as his internal reforms. His hope of exchanging Bavaria for the Spanish Netherlands had to be abandoned when Frederick II. of Prussia founded a League of Princes (1785). He was equally unlucky in his attempt to expand his territories eastwards, allied with Russia. Loudon's Turkish campaign of 1789 reversed the Austrian armies' ill-success in 1788 and Belgrade was captured, but the foreign and internal situation made it impossible to follow up the victories. Prussia, allied since 1788 with the Maritime Powers, concluded treaties with Turkey and Poland and armed. Russia, Austria's ally was weakened by an attack by Sweden, France by her revolution. Simultaneously open revolt broke out in the Austrian Netherlands against Joseph's ecclesiastical and administrative innovations. The discontent in Hungary also became formidable and the Galician nobles were preparing a movement with Prussia's connivance, and opposition to Joseph's methods was growing even in the Austrian and Bohemian territories. Further, the treasury was empty. Joseph had to recognize that his plans were premature. He revoked most of his reforms in Hungary and the Austrian Netherlands.

Leopold II. (1790–921.—On Feb. 20, 1790, Joseph died, leaving his brother, Leopold II., a dangerous situation at home and abroad. Leopold, who was far less talented than his brother, had been a liberal ruler as grand duke of Tuscany. In Austria, warned by his brother's failure, and intimidated by the Revolution in France, he reverted to the traditional conservative policy of Joseph's predecessors. His first efforts were to restore peace abroad and internal tranquillity. Abroad he was successful by renouncing all territorial acquisitions. On Aug. 27, 1790, he under-

took in the Convention of Reichenbach with Prussia to conclude an armistice with Turkey on the basis of the territorial *status quo ante bellum,* and to conclude peace with the mediation of Prussia and the Maritime Powers. The armistice was concluded Sept. 1790, the peace signed at Sistova, Aug. 5, 1791. The *status* quo *ante bellum* was, roughly, re-established.

Leopold's attitude towards the French Revolution was dictated by the wish to preserve peace and avoid implications in European entanglements. To restore internal tranquillity he revoked almost all Joseph's reforms. In Hungary he sanctioned a number of laws framed to guarantee the Hungarian constitution against further violations and safeguard the independence of the internal administration. Latin was introduced as the official language of administration in Hungary, the office of Palatine restored. Here and in the German-Bohemian territories, the diets were again convoked, and many of their demands granted. The central administration also reverted to Maria Theresa's system; their activities were reduced, the co-operation between different offices became less close. Leopold held most firmly to his brother's ecclesiastical policy The State retained control over schools; toleration, etc. was maintained intact. Although Leopold restored theological education to the bishops, abolished the General Seminary and re-instituted some of the monasteries, priests were still looked on as servants of the State.

The Napoleonic Wars.—By caution and reserve, Leopold escaped an armed conflict with France. His son Francis (II. as Roman Emperor, 1792–1806, I. as Emperor of Austria, 1804–35) was forced by France's declaration of war (April 20, 1792) into a war which lasted intermittently till 1815 (*see* NAPOLEONIC CAMPAIGNS). Disunity between the Prussian and Austrian statesmen and generals, mutual jealousy and ambition influenced the attitude of the two powers and were largely responsible for the unsuccessful course of the war in which, in 1793, England and Holland had united against France to be joined later by Spain; especially after Russia and Prussia had concluded the Treaty of Jan. 1793, whereby both powers annexed large districts of Poland, while Austria was only to receive Bavaria instead of Belgium, as compensation. In consequence of Prussia's conduct, Baron Thugut (*q.v.*), a convinced opponent of Prussia, and determined to allow her no important enlargement except against a corresponding increase for Austria. took over Austrian foreign policy (March 1793). He attained his object. On Jan. 3, 1795, the treaty on the third partition of Poland was concluded, after Russia had suppressed the Polish rebellion and taken Warsaw. Austria received West Galicia. Prussia having concluded the Treaty of Basle with France (April 1795) and Tuscany and Spain having followed her example, the chief burden of the war with France rested on Austria. Her commanders were victorious on the Rhine, but defeated by Bonaparte in Italy.

An armistice, followed by a preliminary peace (April 18) was concluded at Leoben, the definitive peace being signed on Oct. 17 at Campo Formio. Austria renounced Belgium, which was united to France, and the duchies of Milan and Mantua, incorporated in the new Cisalpine republic, but received a great part of the territory of the Venetian republic (whose independence was abolished by Bonaparte), including Venetian Istria and Dalmatia. The Emperor further consented that France should receive most of the left bank of the Rhine on concluding peace with the empire. At the cangrcss of Rastatt, opened Dec. 1797, France obtained the cession from the empire of the whole left bank of the Rhine. Before the indemnification due to the imperial estates concerned had been determined, war broke out again (Second Coalition War, 1798–1801). Austria at first won considerable successes in Germany and Switzerland, and, allied with Russia, in Italy; but their effect was nullified through the disunity of the commanders. The Tsar Paul, imputing egotistical motives to the Austrians, recalled his troops, and Austria was left (1800) alone to face the French, whose troops in Italy were now again commanded by Bonaparte, returned from Egypt. Bonaparte's victory at Marengo (*q.v.*) (June 14), and Moreau's at Hohenlinden (Dec. 3, 1800) forced Francis to conclude the treaty of Lunéville (Feb. g, 1801), in his own name and that of the empire. This treaty repeated in essence the provisions of Campo Formio and Rastatl.

The Austrian Empire, 1804.—The transformation of France into a hereditary monarchy under the emperor Napoleon I. (1804), caused Francis also to assume the title of hereditary emperor of Austria (Aug. 10, 1804), a title designed also to express the essential unity of the different Austrian territories. In 1805 Francis, principally in view of Napoleon's policy in Italy, joined the Anglo-Russian alliance against France, but after the crushing defeat suffered by his own and the Russian troops at Austerlitz (*q.v.*) on Dec. 2, he was forsaken by the Russians and forced to accept the humiliating peace of Presburg (Dec. 26, 1805). Austria was cut off from Germany and Italy, and forced to relinquish territories which had long been hers to Napoleon. Her position as head of the German empire was gone. The formal dissolution of the empire followed when 16 princes in southern and western Germany concluded the Rhenish league under the protectorate of Napoleon (July 1806). Under pressure and threats from Napoleon, Francis declared, on Aug. 6, 1806, that he considered the tie which had hitherto united him with the empire as broken, and renounced the dignity of Roman-German emperor.

Austria took no part in the Napoleonic wars of the following years; but the patriotic feelings of her inhabitants (and especially of the Germans) awoke. This movement was encouraged by the new foreign minister, Count Philip Stadion (*q.v.*), and assisted by the Archdukes Charles (*q.v.*) and John. Although here, and always, Francis remained cold and averse from any popular movement, he recognized the necessity of providing against future dangers. Austria's greatest difficulty, which seemed irreparable, was financial. The value of the paper currency sank continually; and a severe commercial crisis broke out in 1808. Nevertheless, Stadion accomplished sundry reforms, and the Archduke Charles attempted to raise the morale of the standing army, by the side of which he created a national force or *Landwehr,* to include all able-bodied men between 18 and 25. In 1809 Stadion and his supporters persuaded the emperor to undertake a fresh campaign against Napoleon. After initial reverses, the Austrian army, led by Charles, inflicted his first defeat on Napoleon at Aspern (May 21 and 22, 1809); but Austria's hopes were destroyed at Wagram (July 6). An armistice was concluded. After hesitating long between the rival parties of war and peace in his *entourage* Francis declared for the latter. Stadion fell, his successor, Count (later Prince) Clemens Wenzel Lothar Metternich (*q.v.*), undertook negotiations with Napoleon, which, after long parleying, led to the Peace of Schonbrunn (Oct. 14, 1809), which imposed on Austria the severest sacrifices, including the loss of Salzburg, the Inn district and West Galicia.

Metternich and the French Alliance.—An immediate resumption of hostilities was unthinkable; clever diplomacy was the essential, until the hour came to recover these losses. Metternich won over his sovereign for this policy. Austria courted Napoleon's friendship; his marriage to the emperor's daughter Marie Louise enabled Metternich in Paris to get alleviations for the payment of the indemnity, although these were insufficient to ward off the state bankruptcy in Austria admitted by the Patent of Feb. 20, 1811. The financial crisis, mistrust in Austria's forces, the deep conflicts between Austria and Russia, and the hope that a French alliance would bring compensation for past losses induced Metternich to recommend the emperor to conclude a treaty with Napoleon (March 14, 1812), whereby Austria undertook to supply 30.000 men for the Russian campaign, Napoleon promising his ally an indemnity and territorial gains should the campaign prove successful. Whether Metternich, convinced of Napoleon's invincibility, wished to link Austria's fate permanently with France, or only awaited a suitable moment to strike for freedom, is still undecided. Recent research tends to the latter assumption. It is certain that even after Napoleon's disastrous Russian campaign, Metternich still advocated caution for Austria. He concluded an armistice with Russia and armed, but would not join the Russo-Prussian alliance of March 1813. The French alliance was, however, denounced (April 6, 1813), and simultaneously Austria's armed neutrality proclaimed. Another step was taken when Napoleon,

after his victories at Liitzen and Bautzen (May 1813), concluded an armistice with his opponents (early June) to gain time for further armaments. Austria armed, concentrated large masses of troops in Bohemia and assumed the part of intermediary. As, however, Napoleon refused to accept the sacrifices suggested to him, involving the overthrow of his entire political system in central Europe, Austria declared her adherence to the Russo-Prussian alliance (Aug. 10, 1813) and soon after declared war. The battle of Leipzig (Oct. 16–18, 1813) brought Napoleon's defeat. As, however, he refused to make peace, the war continued until his abdication and the first Peace of Paris (May 30, 1814).

Treaty of Paris and Congress of Vienna. — This treaty laid down the Po, the Ticino and Lago Maggiore as Austria's frontier in Italy, whereupon the incorporation of Lombardy and Venice in the Austrian monarchy was proclaimed (July 12). On June 3 Bavaria restored Tirol, Vorarlberg, Salzburg and, later, the Hausruck and the Inn districts. The other questions were settled at the Congress of Vienna (Sept. 1814–July 1815). Austria received the "Illyrian provinces" ceded in 1805 and 1809, with Dalmatia and the Republic of Ragusa, the district of Tarnopol, Wieliczka and the Veltlin. The secundogeniture of the Habsburgs in Tuscany and the tertiogeniture in Modena were restored. Austria renounced all other territory lost since 1792. At Metternich's advice, Francis did not re-assume the title of Roman Emperor, since Metternich thought that a loose association of sovereign states under Austrian presidency, "powerful for defence, powerless for offence" would form a guarantee of the peace of central Europe and of Austrian preponderance, and in its councils Austrian diplomacy, backed by the weight of the Habsburg power outside Germany, would exercise more influence than any possible prestige derived from a venerable title that had become a byword for the union of unlimited pretensions with practical impotence. By renouncing Belgium and minor possessions in Western Germany, Metternich thought he was increasing the power of the Habsburgs, which now rested on a coherent territorial complex. He failed to see, however, that by this action, and by acquiescing in the establishment of Prussia in the Rhine provinces, Austria abdicated to Prussia her position as the bulwark against France.

Metternich's **Sway (1815–48).**—From 1815–48 Metternich controlled Austria's foreign policy. The great successes he had achieved against Napoleon, and the predominant position assumed by him, and thus by Austria, at the Congress of Vienna, induced Francis, although he sometimes disagreed with his minister's political views, to leave the conduct of foreign affairs almost entirely to him, especially as Metternich was an adept at clothing his advice in such a form as to enable Francis to look on the decisions he took as the outcome of his own initiative. The principles followed by Metternich have been described as "stability and legitimacy." Metternich wished to preserve the *status quo* formulated at the Congress of Vienna, because he saw no other certain way of insuring lasting peace in Europe, which he thought indispensable for her war-weary and exhausted states, particularly Austria. Sufficient measures should be taken against revolution from without, or any possible upheaval from within. This preservation of the existing order in the foreign and internal organization of the states of Europe was the essence of what Metternich called the "stability of things," and as progress and change in any direction seemed to him an unjustified attempt against the legitimate rights of existing authorities, he became the champion of "legitimacy." The alliance of Chaumont uniting the four powers, Austria, Russia, Prussia and England, renewed in Nov. 1815 and adhered to after 1818 by France, was to ensure the balance of power as restored in 1815. The great powers were to avoid conflicts with one another and prevent them between the other states, and between rulers and ruled within them, by their intervention, armed if necessary. He attempted to instill this principle into the congresses held on his initiative between 1818 and 1822, and on later occasions. Even the unrest which followed the French July revolution in many parts of Germany, and increased the power of the democratic parties where constitutions were already in force, failed to alter Metternich's conviction that his methods alone could be the salvation of all proper-thinking persons He found confirmation in the apparent success of this policy within the Austrian monarchy. The occasional meetings of the Estates were mere forms, and the Hungarian diet, which functioned again after 1825, was not yet troublesome. The police, under Count Leopold Sedlnitzki, were everywhere supreme. Paid or voluntary spies reported every utterance made at meetings; any person of importance was under regular supervision; all letters were opened. The draconic censorship suppressed any free literary activity. The government paid special attention to the upper schools, and saw that the instruction conformed with conservative principles.

Francis I.: Internal Stagnation. — Francis's influence in the inner affairs of Austria was much stronger than in foreign policy, which he left increasingly to Metternich. Convinced that a reorganization of the administration was necessary, and determined to create order, he began reforms, principally in the central government offices, soon after his accession. His first, ill-considered experiments, proved unsuccessful. Only in Aug. 1802, were the arrangements perfected, which then remained practically unchanged till 1848. The political administration of all the German and Bohemian hereditary provinces, Galicia and the Italian districts, was entrusted to the "United court chancelry" *(Vereinzgte Hofkanzlez)*, while the supreme judicial instance was revived for the judicature in those territories; the court chamber (*Hofkammer*) and *Banco-Deputation* took charge of all the state economic action throughout the monarchy. The State Council was replaced in Aug. 1801 by an advisory Ministry (Staats- *und Konferenzministerium*), over whose debates the emperor presided, as highest instance for all state affairs. This institution, however, proved unsatisfactory, as the other central authorities had no direct communication with one another, all matters submitted for imperial decision being sent to the imperial cabinet under a *chef de cabinet.* As Francis also preferred, rather than attending conferences, to discuss questions with individual members, or to call for written opinions from the councillors, the conferences became ever rarer. In 1808 this Ministry was abolished, and the Council of State restored. In 1814 a further "advisory council" *(Konferenzrat)* was established, where especially important questions were treated after discussion in the Council of State. Nevertheless, the administration remained most imperfect. Its conduct still lacked any uniformity. The jurisdiction of the departmental heads was strictly defined, and whatever lay outside this was reserved for imperial decision. Thus the emperor came gradually to represent alone any synthesis of the various administrative departments, while the officials, high or low, avoided any responsibility, and the minutest questions were handed up through all the stages of the bureaucratic hierarchy, to be shelved and forgotten in the imperial cabinet; for, industrious as he was, Francis could not permanently fulfil his self-imposed task. The re-organization of the provincial administration was equally unsuccessful. The introduction, on Jan. 1, 1812, of the general civil code, was beneficial for justice. Metternich recognized the dangers inherent in the slow, inconsistent working of the machine of state, and would have liked to introduce reforms, where compatible with his "system." But Francis, naturally mistrustful, shrank more and more from radical changes. He contented himself with meeting immediate necessities, buried himself in details, and thus as Metternich said, "Austria was administered, but not ruled."

Francis's ever-growing terror of popular movements made him averse from any tendency to give the people larger participation in political life. Thus Metternich's attempt in 1832 to persuade the emperor to grant a new constitution, to reconcile the "opposition between the monarchist principle and the democratic" failed. Accordingly, although the forms of the Estates remained unchanged, their activity was steadily reduced. The diets were allowed to enact no legislation; taxes were raised without consulting them; the rights of the Estates in the recovered provinces of Tirol and Carniola reduced. Even in Hungary, whose constitution was unaltered, Francis attempted, from 1813 to 1825, to rule without a diet, demanding subsidies and troops direct from the counties. Only when the counties refused compliance with their king's commands, was the diet again convoked (1825), and promised regular convocation every three years, and the sole right of approving taxes and recruits.

Fear of the influence of oppositional politicians and liberal writers on the popular mind was the cause of Francis's severe repression of all assaults on the existing organization of the state and society. Political prisoners were tortured, not out of vindictiveness, but in the expectation that the "criminal spirit of enlightenment" could thus be brought into the right path. All attempts to convince the emperor that these methods could never permanently improve public conditions — a view shared by Metternich — remained unsuccessful. Francis became ever deafer to such advice. In his will he warned his successor, Ferdinand I. (1835–48) to "displace nothing of the foundations of the edifice of state. Rule, and change nothing."

Ferdinand I. — The new sovereign, weak-minded and incapable of really ruling, followed his father's advice so far as to leave to Metternich the conduct of foreign affairs. He was, however, induced by court circles to establish the Conference of State (1836), as supreme administrative body. Its members were the Archdukes Louis and Francis Charles, Metternich and Count Francis Anton Kolowrat. The ever-increasing rivalry between the two last-named impeded business, and Archduke Louis's dislike of novelty thwarted any reforms proposed by the ministers, or at best delayed their execution. Nevertheless, Austria followed other civilized States, although hesitatingly, in building railways, improving communications, concluding commercial treaties, abolishing many customs barriers, etc.

Internal Unrest. — Elsewhere, however, the governmental tradition of passive waiting subsisted, even when signs of popular impatience multiplied. The meetings of the Estates began to be lively; those of Bohemia, Styria and Galicia advanced complaints and demands. The opposition to the central government was reinforced by the rapidly-growing nationalist movement among the non-German nationalities. In Bohemia the Czech nationalist elements united into a literary opposition; in the Yugoslav districts "Illyrianism" was the catch-word; in Hungary Count Stephen Szechényi inaugurated a national liberal opposition; in the Italian provinces dislike of the Austrian régime, despite the many administrative reforms introduced by Austria, grew boundless. Even where nationalist influences were absent, as in the German-Austrian districts, discontent increased. The Styrian Diet discussed the necessity of agrarian reform. The Estates of Lower Austria demanded greater participation in public affairs, publication of the budget, and abolition of corvées, and in Vienna, despite all threats of the police, the demand of the upper circles for greater liberty grew louder. The works of Anastasius Grün and Lenau's songs of liberty, Heine's and Börne's writings were read with enthusiasm. Liberal periodicals, smuggled in from Germany, were devoured. The impression made by Andrian von Werburg's anonymous pamphlet, "Austria and her Future" (1841) proved that many good Austrians agreed with him, that "the anarchy of a studied despotism was intolerable." The masses, less affected by the spiritual tyranny, were goaded by the severe economic depression. Peasants, artisans, traders and the growing number of industrial labourers, demanded reforms and grew increasingly embittered as they were forced to realize that no help would come from above. Riots occurred among the workmen and populace. Some of the responsible statesmen recognized the imperative necessity of timely reform; even some members of the imperial house, especially Archduke John, advocated sensible reforms, but Archduke Louis remained obdurately averse from change, and Metternich lacked energy to press his better judgment on his powerful opponents. Such was the situation when revolution broke out in France (Feb. 1848) and the universal discontent found a vent.

1848-1918

The Revolution of 1848. — The revolt against the system of government in Vienna commenced in Hungary, where Louis Kossuth (*q.v.*), for some years leader of the Radical party, made the "inaugural speech of the Austrian revolution," on March 3, in the Hungarian Diet. Prague followed. On March 13 there was a rising in Vienna, led by the students Views at Court were divided; the opposition (now of long standing) turned against Metternich; the Archduchess Sophie, mother of the late Emperor, Francis Joseph, also belonged to it. On the evening of the 13th the abdication of the chancellor was announced, to the general joy; it was hoped that his system would fall with him. As further concessions, the students were armed, the middle-class constabulary reinforced, committees convoked to consider what reforms should be introduced. On the following day the censorship was abolished and freedom of the press granted. On the 15th it was announced that deputies would shortly be summoned "to give the country a constitution." A few days later, a responsible ministry was appointed, at first under the aged Kolowrat, who was soon succeeded by Count Charles Louis Ficquelmont, later (May 4) by Francis Xavier Freiherr von Pillersdorf, an old opponent of the old system. All their hands were, however, tied, as the troops were in Italy, which had risen against Austrian rule. The Czechs, who seized the occasion to press their national demands, were promised a responsible central organ in Bohemia and equality of rights for Czech and German nationals (April 8). In Galicia the abolition of all dues and obligations arising out of the condition of servitude was promised. In Vienna, the National Guard, led by the Radicals and students' representatives was in charge, and established a Political Central Committee to safeguard the rights of the people. On April 25 the new constitution, on the model of the Belgian, was published. It broke completely with the past, granted liberty, introduced ministerial responsibility, a parliament of two chambers and juries. Nevertheless, the Government's conditions appeared insufficient to the democratic-feeling middle classes and students. They objected to the imposition of the constitution from above, and to the two-chamber system. The proletariat condemned the indirect franchise and the exclusion of workmen and servants from suffrage. When the Government decreed the dissolution of the Viennese Central Committee and the National Guard (May 13), riots followed (May 15). Pillersdorf yielded. The dissolution was revoked, and a revised suffrage and the convocation of a single-chambered diet promised. After fresh riots, the Government allowed the formation of a committee of safety and abolished the limitations on the suffrage. Meanwhile Ferdinand and his family had left Vienna for Innsbruck. Archduke John was appointed plenipotentiary regent during the Emperor's absence (June 1j). Under pressure from the Committee of Safety, he dismissed Pillersdorf and called the Liberal leader, Anton von Doblhoff, who included in his ministry Freiherr Johann Wessenberg and also democrats such as A. Bach and Ernst Schwarzer. This ministry was to create a "popular monarchy based on the legally expressed will of the people" in co-operation with the first Austrian diet, which was opened July 22, 1848. The 383 deputies from the German and Slavonic lands formed national groups, rather than stable political parties. The burning question was the liberation of the peasants who had sent 94 members to the diet. Hans Kudlich's motion to abolish serfdom and all rights and duties deduced therefrom (July 26) was debated; on Sept. 7, after excited debates and tenacious opposition from the Conservatives, a law was passed relieving the peasants of their burdens. The landowners were promised indemnification. Meanwhile the Government had gained successes in the provinces against the revolutionaries. A Czech rebellion which broke out in Prague in connection with the Slavonic Congress (June 12), was repressed by Prince Alfred Windischgratz. In Italy Radetzky defeated the Sardinian armies at Custozza (July 25). On August 5 Charles Albert evacuated Milan (see ITALIAN WARS). The court returned to Vienna (August 12), receiving an enthusiastic welcome which, however, soon cooled when conditions remained unimproved. In September there were workmen's riots in Vienna. Events in Hungary increased the unrest. The gap widened between the Radicals in the Hungarian diet under Kossuth and the Viennese Government. The former aimed at complete separation of Hungary from the monarchy; the latter at incorporating it with Austria as a province and abolishing all especial powers and rights possessed by the Hungarian nation. In Sept. 1848, the Viennese Government determined to act against the Hungarian opposition. Joseph Count Jellačić (*q.v.*), Ban of Croatia, who had been first dismissed from his post as a traitor, but later reinstated because he wished to break the Magyars and

establish a uniform Habsburg kingdom, led his troops against the Magyars. Complaints lodged in Vienna by deputies of the Hungarian diet found sympathy among the Viennese democrats, but could not be brought before the Austrian Reichstag on account of the opposition of its Slav majority. The flight of the Palatine and the murder of Count Lamberg made the breach irremediable. German-Austrian troops were ordered to march from Vienna against the hlagyars on Oct. 6th; some of them, incited by the people, mutinied and remained victors in the consequent fighting. The revolt spread; the minister of war, Count Latour, was murdered and the Arsenal stormed (Oct. 6). The proletariat and lower middle-classes now seized the power; the diet, municipality and students' committee had little authority. The court fled to Olmutz (Oct. 7), leaving behind them a manifesto sharply condemning the behaviour of the Viennese and adjuring all right-minded persons to combat the revolutionaries. Jellačić and Windischgratz marched on Vienna. Incompetently led, abandoned by the provinces, supported too late by the Magyars, the revolutionaries could not long hold the city against Windischgrätz's troops, especially as provisions soon ran short. On Oct. 31st Windischgratz entered Vienna, which surrendered to him. Some of the revolutionary leaders were executed; others imprisoned. The population accepted the dictates of the Government, now led by Prince Felix Schwarzenberg, ably supported by Francis Count Stadion, Bach and Karl Freiherr von Bruck.

Accession of Francis Joseph.—Parliament was convoked at Kremsier for Nov. 1j, there to work undisturbed by the discords of the capital. On Nov. 27 a proclamation announced that the continuation of Austria as a united State was necessary for Germany and Europe. On Dec. 2 Ferdinand abdicated, and his nephew, Francis Joseph (*q.v.*) (1848–1916) ascended the throne. In his inaugural proclamation he expressed the hope that he would succeed in uniting "all lands and races of the monarchy in one great body politic," while guaranteeing the peoples' rights to participate in the legislature. The deputies in Kremsier debated, indeed, on a new constitution and on "fundamental rights." The former aimed at establishing a modern, multi-national state after the wishes and with the consent of the nations of Austria proper; the "fundamental rights" were to include freedom of religion, press and speech, equality before the law, equal rights for all nationalities, juries, etc. The negotiations were still proceeding when Schwarzenberg, encouraged by the armies' successes in Italy and Hungary, dissolved the diet and published a constitution, dated March 4th, elaborated by Stadion. This was to be applicable also to the lands of the Hungarian crown. It was based on the Kremsier draft, but was less democratic. A number of juridical and administrative reforms followed. The arrangements for the extension of the agrarian reform was favourable to the peasantry.

Hungary answered the imposition of the constitution by convoking a Rump Parliament at Debreczin (April 14, 1848) which declared Hungary, with its *partes* adnexae, an independent State and the dynasty of Habsburg-Lorraine dethroned. Francis Joseph thereupon asked Tsar Nicolas I. for help, which was readily granted. The united Austrian and Russian forces proved too strong for the Hungarians. On Aug. 13, 1849, Arthur Gorgei (*q.v.*), with the main army, capitulated to Russia at Vilagos. Russia delivered the Hungarians to the discretion of the Viennese Government, which took severe reprisals. The Hungarian constitution was declared annulled, Hungary reduced to an Austrian crownland, its partes adnexae created independent crownlands (see HUNGARY).

Austria was completely successful in Italy without foreign assistance. Sardinia having again declared war (March 1849), Austria was victorious at Novara; in August Venice was retaken. Austria again ruled directly over the Lombard-Venetian kingdom; indirectly in Parma, Modena, Tuscany and the Romagna. These successes enabled Schwarzenberg to restore Austria's hegemony in Germany The struggle between Grossdeutsch and *Kleindeutsch* in Frankfurt is discussed elsewhere (*see* GERMANY: History). Here it suffices to remark that Schwarzenberg's ambition of a seventy-million state in Central Europe, including all peoples of the Austrian empire and Germany under Austrian leadership, was not realized. The plan of the majority of the Frankfurt Parliament, a German feudal state under Prussia, excluding Austria, was also frustrated through Frederick William IV.'s refusal of the crown. All other schemes to weaken Austria in Germany were thwarted by Schwarzenberg. Prussia dared not embark on war in support of her policy of unification, and submitted at Olmütz (Nov. 1850). The problem of Germany's future constitution remained, for the time, open; but soon after, the old German federal constitution and diet were restored.

The Period of Absolutism.—The ex-democrat Bach, Stadion's successor, and Freiherr Baron Max Carl Kubeck, a former Liberal, did their best to make Austria into a unified, but absolutist, state. In April 1851, the Reichsrat (Imperial Council), a consultative body nominated by the emperor, was established. Its leading figure was Kiibeck. at whose instance the constitution of March 4, 1849, was suspended on Dec. 31, 1851 together with the fundamental laws and jury system. Judicature and executive were then united in the lower instances. Even after Schwarzenberg's death (April 1852), the reaction continued, as exemplified in the penal law of 1852, the Law of the Right of Free Assembly and the Press regulations. In education, clerical influence predominated, though Count Leopold Thun admittedly introduced many reforms. Economic reforms were also not lacking. The internal customs barrier between Austria and Hungary was abolished (Nov. 1850). The customs tariff of Nov. 1851 replaced the system of prohibition by moderate protection. Bruck, the minister of commerce, tried to accomplish economic union with Germany, but Prussian opposition wrecked his proposed customs union, although he concluded a commercial and customs treaty with Prussia (Feb. 1853), whereby each party accorded the other certain benefits. The financial situation, however, continued gloomy; the deficit grew; while the system of espionage and police suspension reached its climax. hleanwhile the bishops, led in Austria by Cardinal Joseph Othmar Rauscher, one of Francis Joseph's tutors, convinced the court that the revolution had only been the consequence of national unbelief. Various decrees granted the clergy increased rights and influence; finally a concordat was concluded (Aug. 18, 1855) which ensured the Catholic Church and clergy a privileged position, entrusted education to the clergy, and contained an assurance to the Vatican that Austria would alter no confessional or inter-confessional laws without its previous consent. Further concessions to the Church followed, especially regarding marriage law.

The **Crimean War.**—Whether the autocratic régime evolved in the 1850s could prove permanent inevitably depended mainly on foreign policy. If Austria could maintain the position she had achieved in the early '50s in Germany and Europe, no revolt need be feared from the discontented peoples. This was, however, not the case. Francis Joseph's foreign policy was unfortunate. In the Crimean War (*q.v.*) (1854–56) his attitude was vacillating, and pleased no party. At the Congress of Paris (Feb. and hlarch, 1856) Austria paid for her vacillation. She had to renounce the acquisition of the Danube principalities, which she had occupied and hoped to incorporate, and withdraw her troops.

More unlucky still was the outcome of Austria's conflict with Sardinia in 1859 (see ITALIAN WARS). The Austrian troops were defeated, Lombardy was lost (Treaty of Villa-franca: Peace of Zürich). This great victory for the movement for Italian unity, led by the house of Savoy, was succeeded by the declaration of Parma, Modena, the Romagna and Tuscany that they wished to unite themselves with Sardinia. Austria retained only Venice.

Constitutional Experiments.—These reverses abroad necessitated abandoning the discredited absolutist system. Slowly and reluctantly Francis Joseph consented to change the constitution. In August 1859, the ministry of Count Johann Bernhard Rechberg and Count Agenor Goluchowski was formed. The first attempt at reorganization consisted in the convocation of a "reinforced Reichstag" (reinforced by comparison with that of 1851). It sat from May 31 to Sept. 28, 1860, but without result, agreement proving impossible between the "federalist" majority who wished to strengthen the "historical and political individuality of

the provinces," against the central authority, and the "centralist" minority who championed the unity of the empire. All parties condemned the previous methods of government. The attitude of Hungary, where discontent with the Bach system was general, turned the scale. Hungary's old constitution had been revoked, her traditions violated, Austrians ruled in the land. The numerous emigrants fanned the flames, demanding restoration of her independence, while the Conservatives urged an advantageous compromise with the emperor. Francis Joseph, who attached great importance to the warnings of this party, decided to meet the spirit of the times. The "October Diploma" (Oct. 20, 1860) divided the legislative power between the Crown and diets and a Reichsrat, to deal with legislative questions affecting all kingdoms and provinces of the State alike. The Reichsrat, however, enjoyed only an advisory vote in legislation, but taxation had to be submitted to it. The lands of the Hungarian Crown were promised a new constitution. For questions concerning Austria proper only, a smaller council (engerer Reichsrat), excluding the Hungarians, was to be competent.

The new constitution, in its attempt to reconcile provincial autonomy with Imperial unity, satisfied no parties. The German "centralists" thought themselves disregarded. The discontent among the Liberal middle classes of German Austria grew when the provincial statutes compiled by Goluchowski, the new "minister of State." gave small rights to the diets but large ones to the nobles and clergy. The Czechs welcomed the concessions to the lands of the Bohemian Crown, but like the Germans, they (the feudal nobility excepted) condemned the favours shown to the nobles and clergy. In Hungary, too. only the Conservatives were content, while the Liberals grumbled because the old rights of the Hungarian diet to pass taxation and vote recruits were transferred to the Vienna Reichsrat. Led by Franz Deák (q *v.*) they demanded unrestricted restoration of the 1848 laws.

The ill success of the *rapprochement* with the "federalists" brought a reaction towards "centralism." Goluchowski was dismissed, and replaced (Dec. 1860) by the Liberal Anton Ritter von Schmerling. In Feb. 1861. the ministry of Archduke Rainer (president) and Schmerling (minister of State) was formed. Rechberg remained minister for foreign affairs, Joseph Freiherr von Lasser, an excellent administrator, became minister of the interior. **A** new constitution, largely the work of Hans von Perthaler and Freiherr Tadaus von Lichtenfels, was issued on Feb. 26, 1861. The reinforced Reichsrat was replaced by a Staatsrat dnd a Reichsrat. The latter consisted of two houses: the Upper House (*Herrenhaus*) and the House of Deputies (*Abgeordnetehaus*). The Reichsrat was to represent the whole State; a "narrower Reichsrat," was to include only representatives of Austria proper and deal only with questions common to its various Crownlands. The competence of the provincial diets was restricted, the central parliament given the chief weight. In this parliament the electoral system was weighted to give the Germans the predominant position, and among them the great landed proprietors; franchise was indirect, members being deputed by the provincial diets, which were composed on the system of representation of interests. Schmerling hoped thus to establish a unified centralist State under German control at the expense of the provinces and other nationalities. But the constitution satisfied only the German Liberals; the advocates of absolutism in the army and bureaucracy and the supporters of feudalism and clericalism protested against its Liberal principles. The Slavonic provinces were violently opposed to it. The Bohemian diet condemned the electoral system and demanded that Francis Joseph be crowned king of Bohemia. The Poles, Slovenes and Italians also attacked the constitution as dangerous to nationalist ambitions. The elections to the Reichsrat were consequently widely boycotted.

The opposition was strongest in Hungary, where the diet rejected the constitution decisively. Deák still maintained that the Hungarian constitution was still legally valid, while the Government of Vienna declared it had been annulled by the revolution. The Hungarians now determined not to attend the Reichsrat. When the House of Deputies was opened (April 1861), the representatives of Hungary, Croatia, Transylvania and Venice were absent. The various German Liberal groups, known as the "Constitutional Party," dominated the assembly, which, the Hungarian representatives being absent, was taken as a "narrower Reichsrat." In 1863 the Czechs, disappointed in their expectations, withdrew from the parliament. The Reichsrat and Government made praiseworthy attempts to reconstruct the State finances. The deficit was not abolished, but considerable economies were introduced and trade improved.

The grant of constitutional conditions was acclaimed enthusiastically by the Liberal parties in Germany; the more so when the constitutional conflict broke out soon after in Prussia. Schmerling hoped to utilize this feeling to reform the Bund on "Grossdeutsch" lines, giving Austria the preponderance in Germany, and the German nation in Austria. He gained Francis Joseph for this plan, despite Rechberg's opposition. Francis Joseph convoked and opened a diet of Princes in Frankfurt (1863), but the reform was not effected, Bismarck (*q.v.*) having persuaded William I. of Prussia not to attend. The tension between Prussia and Austria grew, although they were reconciled once more (1864) over the Schleswig-Holstein question (*q.v.*).

Meanwhile Rechberg had resigned (Oct. 1864). His Schleswig-Holstein policy was unpopular among the Liberals of Austria and Germany and his failure to win concessions from Germany in the customs question entailed his fall. Schmerling soon followed. Francis Joseph, who disliked him personally, abandoned him as soon as he lost the support of the Constitution21 party; especially as the emperor had drawn closer to the Magyars after visiting Hungary (June 1865) and Debk's proposals offered hope of a compromise including the recognition of matters common to the whole State. Schmerling was replaced, at the instance of the influential Count hloritz Esterhazy, by Count Richard Belcredi, who aimed at restoring the old absolutism with a diet for each province, and maintenance of the Concordat. To this end the 17 provincial diets were convoked for November, and on Sept. 20, the Reichsrat was suspended by manifesto, the Government being empowered by Patent to conduct necessary business in the interim. The Government's new course was recognized and strongly approved by the diets of Bohemia, Galicia, Istria and Bukovina, while the diets of the German provinces protested, though unsuccessfully, against the suspension of the constitution. In Hungary a diet was opened by Francis Joseph in person (Dec. 186;). The speech from the throne recognized the validity of the 1848 laws. but demanded their prior revision on the lines of the October Diploma, while the Hungarians made any change conditional on prior reintroduction of the lams. Agreement was not quickly reached; but Debk prevented a rupture and obtained the appointment of 67 members (March 1, 1866) of a Parliamentary Commission of Compromise. In June a sub-committee presented a memorandum formulating conditions for the regulation of relations between Hungary and Austria. Deák and Julius Andrássy were the principal advocates of this compromise. (See HUNGARY.)

Negotiations were stiil proceeding when war broke out with Italy and Prussia. Austria, though victorious on land and sea against Italy (Custozza, Lissa) was decisively defeated by Prussia at Koniggratz (July 3, 1866) and forced to yield. The negotiations at Nikolsburg, terminating in the Peace of Prague (Aug. 1866), led to Austria's exit from the German federation and the cession of Venice to Italy; thus she lost for ever the hegemony in Germany and Italy conquered in 1815 and re-conquered in 1849–50.

The Hungarian Compromise. — The military disasters inevitably reacted on internal conditions. The policy of suspension was abandoned, for the disordered finances could not be reorganized nor the indispensable reforms achieved without restoration of the constitution. All parties agreed in this; but disagreed entirely on the next step. The "federalists" demanded equal rights for all nationalities; the extreme "centralists" a unified state under German leadership; others a compromise between these extremes. For some time Belcredi's plan of a feudal-conservative, federative State with an absolute monarch at the head. seemed most probable. But the opposition of the Hungarian moderates under Deák and Andrássy, and the German and Liberal parties in the German

and Slavonic provinces, was too strong. Belcredi was replaced as minister president (Feb. 7, 1867) by the Saxon statesman Ferdinand, Freiherr, later Count, Beust, who had succeeded Count Alexander Mensdorff-Pouilly as foreign minister in Oct. 1866. Beust convinced Francis Joseph of the necessity of satisfying the Hungarians and Germans, convoked the "Narrower Reichsrat" in Austria and simultaneously appointed a ministry in Hungary to conclude the negotiations for a compromise, already far advanced. A responsible ministry was appointed in Hungary in Feb. 17, 1867, with Julius Andrássy as president, with whom, and with Deák, the conditions of the compromise were agreed. Francis Joseph made peace with the dominant party in Hungary on a basis which left his dominions a remnant of unity and left him complete control of the armed forces. By this compromise which, after receiving the emperor's sanction, was issued in various rescripts, the Habsburg dominions received the name of the Austro-Hungarian monarchy. They fell into the Austrian and Hungarian halves, which were united only in the person of the sovereign and their common institutions, which included the ministries of foreign affairs, war and finance (the two last-named only for affairs of common interest) and the Austrian and Hungarian delegations composed of representatives of both halves of the empire, which were to debate on common affairs in Vienna and Budapest alternately.

These institutions were to be permanent, but the financial concessions and customs and commercial accord were to be revised every ten years. Austria was to bear 70%, Hungary 30% of the common expenditure. The coronation of Francis Joseph as king of Hungary (June 1867) was the outward token of his reconciliation with the Hungarians.

Austria After the Compromise. — In Austria proper the compromise was vigorously opposed by the Slavs; the Germans approved it, hoping now to be able to maintain permanently the supremacy in Austria; all Liberals acquiesced, as they now hoped to achieve a liberal constitution. Indeed, the Government met the wishes of the parliament convoked in May 1867 in this respect. while parliament approved the compromise with Hungary, also passing the Government's budget without important alterations. Thus the Government accepted four fundamental State laws elaborated by the Constitutional Committee of the House of Deputies on the general rights of citizens, the execution of governmental and executive power, the judicial power and the establishment of a Supreme Court (Dec. 21, 1867). The first of these laws ensured all citizens equality before the law and in the holding of public office, complete freedom of confession and conscience, and liberty of knowledge and teaching. All this meant a break with the past and abandonment of Rome and the Concordat. The Supreme Court was to decide in conflicts concerning competence and questions of public right. Ministerial responsibility was a further governmental concession to the form of constitutional government. As a sop to the German autonomists and Slav and clerical "federalists," all matters not falling within the competence of the Reichsrat, which was exactly defined, were assigned to the provincial diets — the opposite principle from that of 1861.

The Reichsrat having approved the Hungarian compromise, the first common ministers were appointed (Dec. 1867) and the first Delegations met in Jan. 1868. Meanwhile a new ministry had been formed in Austria (Dec. 1, 1867) composed of leaders of the Liberal majority of the House of Deputies with two aristocrats, and Prince Carlos Auersperg as president. Its first important act (March 1868) was to bring forward in the upper house a Liberal marriage law already passed by the lower house (Oct. 1867), restoring the civil marriage law suspended by the Concordat, and civil judicature in marriage questions. Two further laws, the relation between school and church and the regulation oi inter-confessional conditions, were passed by both houses. All three Liberal laws received the emperor's sanction on May 25, 1868. The State was recognized as enjoying supreme control and supervision over all education and instruction, and inter-confessional conditions regulated on the lines of equality of rights. The Government disregarded the sharp protests of the pope; recalcitrant bishops were punished.

Parliament also attacked administrative reform. The judicature was separated from the executive, the political service reorganized and the provinces divided into smaller units (*Bezirkshauptmannschaften*). Peasant entails, where still existing, were everywhere abolished in favour of free disposal, unless the provincial legislation prohibited the partition of peasant properties. Energetic measures were taken to improve the State finances; some, as the Ground Tax Law, were carried through, others were still incomplete when the ministry resigned. In 1868 a Military Service Law was passed, increasing the armed forces considerably; in 1869 a law introducing juries for political and press offences, and the Primary Schools Law.

The ecclesiastical and educational activities of the German Liberals were strongly opposed by the Clericals, and their centralizing tendencies by the Slavonic peoples. The national struggle, which henceforward, until the monarchy fell, absorbed unremittingly the best powers of all nationalities in Austria-Hungary, took open form after the institution of Dualism. Galicia was abandoned to the Poles, Polish introduced as the internal official language of most authorities, and other concessions granted which gave Galicia a separate status in Austria proper. Still the Poles were discontented; the Galician diet demanded a separate minister, responsible to the Galician diet, and entirely independent national administration and legislation. The Czechs aimed higher still. They denied the legality of the Reichsrat, and the 81 Czech deputies who abstained from the Bohemian diet, presented a declaration (Aug. 23) denying the competence of the Reichsrat to pass laws valid for Bohemia, and demanded the restoration of the unified kingdom of the crown of King Wenceslaus (Bohemia, Moravia and Silesia). The Czechs of Moravia proceeded on similar lines. Counter-measures by the German majority — rejection of the declaration and suspension of Belcredi's Language Law of January, 1866 — led to Czech excesses, which were repressed by force (Oct. 1868).

Differences between Beust and Auersperg had led meanwhile to Auersperg's dismissal (Sept. 26, 1868), and Taaffe, a childhood's friend of the emperor, became minister-president. Yet discord continued in Bohemia, in Carniola and in Trieste. In Dalmatia there was an open rebellion in 1869; the Bocchesi refused to enrol in the Austrian *Landwehr*. To meet all these centrifugal tendencies a strong and harmonious Government was needed; whereas, actually, the cabinet was divided; the majority advocated centralism and the methods hitherto adopted; the minority (Taaffe, Potocki and Berger), reconciliation with the nationalist opposition. Both parties submitted their opinions in a memorandum to the emperor (Dec. 1869). He decided for the majority; Taaffe and his supporters resigned. Hasner became minister-president.

To survive, the new cabinet had to make the Reichsrat independent of the provincial diets, the centre of the opposition. The two-thirds majority necessary to introduce direct election to the Reichsrat was, however, unobtainable. Giskra, the chief supporter of parliamentary reform, thereupon resigned (March 20, 1870). A few days later the Poles, Rumanians, Slovenes and Italians left the Parliament, which the Clericals had already forsaken The cabinet asked the emperor to dissolve those diets whose members had left the Reichsrat, and when he refused, resigned (April 1870). At Beust's suggestion, Francis Joseph invited Count Alfred Potocki to form a new cabinet. This was formed with difficulty and consisted principally of officials.

Potocki's efforts to reach a friendly compromise with the Czechs and Poles on the basis of the memorandum of December, 1869, to which he had been a signatory, broke down on the increasing demands of the two nations. As the Germans were hostile to the new ministry from the first, the latter dissolved the House of Deputies (May 1870) and all diets (the Bohemian not till late July), and convoked the new diets for late August, the Reichsrat for mid-September. The Government attempted to conciliate the national parties, but could not grant the extensive demands of the Czechs, who demanded recognition of the Bohemian State rights. The Czechs of both Bohemia and Moravia thereupon refused to attend the House of Deputies. In the new House

of Deputies the Constitutional Party and the Federals were evenly balanced; but new direct elections in Bohemia, over the head of the diet, gave the former the majority. It opposed the federalist ambitions of the Czechs, but also attacked the Government for attempting a coinpromise at the expense of the constitution. The ministry resigned (Nov. 24, 1870), but remained in office till Feb. 1871.

Two important events occurred during this ministry; the Franco-German War (*q.v.*) and the abolition of the Concordat. After 1866 an influential party in Austria still hoped to recover Austria's hegemony in Germany, and was prepared to try a new campaign with Prussia. Not only the military party under Archduke Albert (*q.v.*), but also politicians, notably Prince Richard Metternich, the Austrian ambassador in Paris, held this view. Beust, too, hoped for revenge; but in the negotiations with Napoleon III., which lasted till the outbreak of the Franco-German War, he watched over Austria's interests, which did not always coincide with Napoleon's. Francis Joseph was cautious, although he, too, cherished hopes of recovering Austria's hegemony in Germany. When the war broke out, the negotiations between Austria, France and Italy, were almost complete; but the peace party in Vienna, headed by the Hungarian minister-president, Julius Andrássy, prevailed at the decisive Crown Council (July 1870); it was resolved to remain neutral, provisionally. After the great military success of the Germans, this party definitely conquered; Austria remained a neutral spectator of the foundation of united Germany.

The abolition of the Concordat followed Pope Pius IX.'s declaration of the dogma of infallibility. In July 1870 the Government, urged by the minister of cults, Karl Stremayr, announced that the Concordat was not to be maintained, and that Beust had informed the pope of its formal abolition. Simultaneously, Stremayr was empowered to draft the necessary legislation for the Reichsrat.

On Feb. 5, 1871, the cabinet of Count Karl Albert Hohenwart-Schaffle took office, after long private negotiations, kept secret even from Beust, with the aim of adapting the constitution to the demands of the Slavs and satisfying the feudal and clerical parties. On April 25, 1871, the first of a series of bills for increasing considerably the legislative and administrative autonomy of the provinces was submitted to the Reichsrat; the provincial diets were to receive the right of initiative in legislation. As this bill was rejected by the House of Deputies, Hohenwart resorted to other expedients. To placate the Poles, he appointed a minister for Galicia, and in April introduced a bill giving Galicia great independence. In May he offered to allow the Czech opposition an equal measure of autonomy. The protests of the German majority of the House of Deputies were disregarded, as the emperor supported the Government's action. The Reichsrat was prorogued; the negotiations of the Czech opposition leaders, Heinrich, Count Clam-Martinitz and Francis Ladislaus Rieger, were carried further. The seven "constitutional" diets were dissolved and the Government, by manipulating the elections, got the two-thirds majority in the House of Deputies, necessary for constitutional alterations. The negotiations in Bohemia were now concluded. In an imperial Rescript issued Sept. 12, 1871, Francis Joseph offered to revive the rights of Bohemia with its coronation oath. Simultaneously, a bill was introduced guaranteeing Czechs and Germans equal rights in all questions, especially language, and the preservation of their national individuality. The diet was required to consider a settlement of Bohemia's constitutional status. Thereupon a committee drafted the "Eighteen Fundamental Articles." They recognized the compromise with Hungary, but demanded for Bohemia a status similar to Hungary's. All questions concerning Bohemia, and not common to Austria and Hungary, should be decided by the Bohemian diet. Austria should be dismembered into separate States, with a congress of delegates and a senate as common representation. On Oct. 10 these articles were submitted to the emperor, who refused his assent, as not only the German Liberal Ministers, including Beust, but Andrássy also declared Hohenwart's plan a menace to the unity of the empire. Attempts to induce the Czech leaders to decrease their demands failed. This sealed the fate of Hohenwart's ministry, which fell on Oct. 27, 1871. Beust was also dismissed (Nov. 8) and replaced by Julius Andrássy.

After a short provisional ministry, a new Liberal Government took office under Prince Adolph Auersperg, which after first assuring itself a constitutional majority in parliament, set about an electoral reform, with direct franchise, independent of the diets, for the house of deputies, whose membership was raised to 353. The bill was brought in in Feb. 1873. The high franchise qualification admitted only a limited circle of voters, the large landowners, chambers of industry and commerce, and towns, being favoured. The Liberal Government, co-operating with both houses of the Reichsrat, carried through several reforms. A new criminal procedure was introduced (1873) and a special court (*Verwaltungsgerichthof*) established (1875), to which any citizen might appeal for legal redress against encroachments by the administrative authorities. In Jan. 1874, the Government introduced its substitute for the provisions of the Concordat. An abortive attempt at marriage law reform was also made in 1875. Financially, the period of the Liberal régime is noteworthy for the financial crisis (May 1873), which necessitated state intervention. It was followed by a commercial crisis. The campaign for protective tariffs began. The Government's reputation was damaged by the implication of some of its members in the scandals attending the financial crisis of 1873. It was, moreover, weakened by disunity in its own camp, and was often openly opposed by its own partisans. At the same time, the Slavs renewed their attacks.

The result of the protracted negotiations with Hungary, skilfully led by Koloman Tisza, over the revision of the financial compromise of 1867, was most unsatisfactory to Austria. The two ministries agreed (1877), indeed, to renew the customs agreement for ten years and leave the quota of contributions unaltered; but in the bank question, the Dualist principle being introduced in the control of the Austro-Hungarian Bank, and in fixing the tariffs, Hungary exacted concessions which were approved by the Austrian Constitutional party only with the greatest reluctance.

The Eastern Question. — The Government had also to face a crisis in foreign policy. As foreign minister, Count Andrássy had, from the first, worked for permanently friendly relations with the new German empire, and Bismarck had met him half way. In Sept. 1872, the rulers of Germany, Austria and Russia had exchanged verbal declarations in Berlin, which in 1873 were set down in treaties directed towards the preservation of peace and, in particular, providing for common action in questions concerning the Near East. Andrássy's attitude was dictated rather by desire not to thwart Bismarck's plans, than by confidence in his Russian policy. When the Eastern crisis of 1875 broke out (see EASTERN QUESTION), Andrássy was put into a difficult position. Opinion in the monarchy was divided: the Hungarians were Turcophile, the Poles Russophobe; all the other Slavs were filled with pan-Slavonic enthusiasm; the Germans wanted peace. Andrássy favoured utilizing the occasion to extend the monarchy's power eastward, if possible by agreement with Russia. The two secret agreements of Reichstadt (July 1876) and Budapest (Jan. 1877), supplemented at Vienna (March 1877) were the outcome of this policy; they promised Austria-Hungary the annexation of Bosnia and the Hercegovina under certain conditions. After defeating Turkey, however, Russia, disregarding her engagements towards Austria, concluded the Treaty of San Stefano (March 1878), establishing a Greater Bulgaria, entirely dependent on Russia, with autonomy for Bosnia and the Hercegovina. Andrássy, supported by the emperor, and by England, determined to protest energetically against these conditions and prepared to support his decision, if necessary, by force. At the Congress of Berlin (June 13–July 13, 1878) Austria received a European mandate to occupy Bosnia and the Hercegovina, with the right to station garrisons in the Sanjak of Novi Pazar. Andrássy had originally intended to annex Bosnia and the Hercegovina, but the energetic resistance of the Turkish delegates, the anticipation of opposition from the Magyars to annexation, and the inevitability of conflicts between the two halves of the empire over the attribu-

tion of the provinces induced him to accept occupation; a convention concluded with the Sultan furthermore described the occupation as temporary only; the Sultan retained his sovereignty. The Austrian troops occupying Bosnia (July to Sept. 1878) met stubborn resistance, which was only overcome after severe fighting.

The Germans of Austria and the Magyars had disapproved of Andrássy's policy of occupation from the first. The considerable sacrifices in blood and money entailed by its execution increased their discontent. While, however, Tisza convinced the Magyars that the satisfaction of their own national ambitions depended on their retaining the favour of the court, the leaders of the Austrian Constitutional party attacked the Government vigorously, and thus estranging themselves from the emperor, who declared their opposition "factious," and accepted the resignation of Auersperg's cabinet (Oct. 1878), although leaving it in office pending appointment of its successor. The Constitutional party continued its opposition during this period, and by their impractical struggles drove the emperor into the camp of the Federalists and Ultramontanes, who had supported the occupation and agreed to all financial demands.

Formation **of** the Triple Alliance.—The increasing influence of the Slavs, Ultramontanes and feudal party in the German-Bohemian lands threatened to entail a change in the monarchy's foreign policy, which had been based on close and friendly relations with Germany. Andrássy, the chief exponent of this principle, therefore seized an opportunity to link Germany closer with the monarchy. Bismarck, who recognized the danger of the Germanophobe tendencies, which became very apparent after the Berlin Congress, of the dynasty in Russia, and feared a coalition between Russia, France and Austria-Hungary, took the initiative towards negotiations with Andrissy, which led on Oct. 7, 1879, to the conclusion of a secret treaty, whereby both States guaranteed one another mutual support in case of attack by Russia. Austria-Hungary was not, however, pledged to more than benevolent neutrality towards Germany in case of a Franco-German war. Only if Russia co-operated with the adversary of one contracting party was the other pledged to assist with its complete armed forces. The treaty, to which Bismarck only gained William I.'s consent with great difficulty, was a victory for Andrássy and for that party in Austria-Hungary which saw salvation in the continuance of closest relations with Germany. At first concluded for 5 years, later automatically prolonged, the treaty became inoperative only on the fall of the two monarchies. Soon after its conclusion, Andrássy resigned, but his two first successors, Baron Heinrich Haymerle (1881) and Count Gustav Ralnoky (1881–95) remained true to the fundamental principles of his policy. A series of treaties concluded in their terms of office before Bismarck's dismissal in March 1890, served to strengthen the Austro-German alliance, which was defensive and dimed at the preservation of peace, while safeguarding the interests of both contracting parties. Although Austro-Hungarian statesmen doubted the possibility of permanently reconciling the conflicting Balkan policies of their own State and Russia, a treaty was concluded through Bismarck's mediation (June 1881) between Russia, Austria-Hungary and Germany, which temporarily averted the threatened conflict between the two rivals. At about the same time Austria-Hungary drew Serbia into its sphere of influence. One year later (May 20, 1882) the first Triple Alliance treaty was signed, whereby Italy became an ally, although not a permanently reliable one, of the Central Powers. In 1883 Charles I., King of Rumania, adhered thereto. Austria-Hungary was then in the centre of this powerful international league, which not only safeguarded its foreign position, but also formed an effective protection against the growth of those currents which aimed at the unification of the nationalities other than German and Magyar in the monarchy with their co-nationals in the neighbouring foreign States. As allies of Austria-Hungary, the governments of Russia, Italy, Serbia and Rumania must try to curb—repress, they could not had they willed—the irredentist movements in their States. In 1884 the League of the Three Emperors was renewed. When it next expired (1887) the differences between Austria-Hungary and Russia, due chiefly to the changes in Bulgaria, had so increased as to make its renewal impossible. Bismarck, who, in view of the threat of a Franco-German war, wished to maintain tolerable relations with Russia, coilcluded a secret treaty with Russia, unknown to Austria-Hungary (June 1887), granting Russia important concessions, but not breaking his obligations towards Austria-Hungary. The same policy had determined the renewal of the Triple Alliance in Feb 1887; on the same principle, Bismarck sponsored the conclusion of the two treaties between England, Austria and Italy (March and Dec. 1887), which aimed at protecting the Mediterranean and Constantinople against possible Russian aggression. He endeavoured to prevent the outbreak of an Austro-Russian War, with conspicuous success in 1887 and 1888, when the danger of such a conflict was greatest. His pertinacious efforts to create a real reconciliation between Austria-Hungary and Russia through a partition of their spheres of interest in the Balkans were, however, unsuccessful.

Taaffe Minister-President, 1879.—The continuance of a Germanophile foreign policy was impeded by the changed situ ation in Austria proper in 1879. In August of that year Edouard Count Taaffe, the leading figure in Stremayr's provisional cabinet became head of the new ministry, which included Ultramontanes Poles and Czechs, and also German Liberals. The Germans, however, obstinately refused to come to a real compromise and left the cabinet (the last of them in June 1880) which thus became a ministry of the Right. The Czechs dropped their policy of abstention, and returned to the House of Deputies; then the Czechs, Poles and the Feudal Party formed the majority which offered the Government its support, which rewarded them with liberal concessions. Chief of these was the language decree of April 1880 for Bohemia, Moravia and Galicia, which established the bilingual system in communications of the courts and administration with the public; a measure which affected especially the officials in the solidly German linguistic districts of Eohemia. The German parties, the Clericals excepted, opposed this violently but fruitlessly. Their proposal that the Government should introduce a bill establishing German as the language of state, and regulating the use of the language locally current, was rejected. In 1882 Prague university was divided into two parts: Czech and German.

The two groups of the Constitutional party, the Liberals and the Progressives, united to defend the unity of the State, and their own nationality, and constituted themselves the "United Left" (1881). In 1882, however, the Clerical-Czech majority granted the vote to all payers of five guldens direct taxation in towns and markets. In the elections of 1885 the German parties lost ground and split again. The Government leaned even more on the Right, whose wishes it had to meet. The discontent of the Austrian Germans grew; but their influence was weakened by their own increasing disunity.

In 1832 a "German national league" had been founded on the basis of the "Linz programme," which proposed that Galicia and Dalmatia should be detached and Austria become a predominantly Germanic state, in closer connection with Germany. **A** few years later, however, this party split. The liberal thinking members were estranged by the increase of anti-Semitism, and the anti-Semites themselves divided, as a party of them, under Karl Lueger (*q.v.*), disapproved of the German nationalist tendencies. In 1887 the "Christian socialist league" was founded. Lueger, whose influence over the masses, especially the lower middle classes, was growing, approved Schonerer's anti-Semitism, but not the increasing German nationalist tendencies in his party.

The Labour Movement.——At the same time a strong movement was spreading among the industrial labourers. Excluded from the legislation and administration of the State, they sought to gain influence through their own organizations and street demonstrations. The severity and repression of the Government envenomed their discontent. The radicals among them, who advocated countering force by force, got the upper hand. Outrages were committed and led to very severe repressive legislation by the Government. In June 1886, the "Anarchist Bill," initiated in the House of Deputies, received imperial sanction. It

was not revoked until 1891, after the sagacious leadership of Victor Adler (*q.v.*), at the Hainfeld party meeting (Dec. 1888) had reconciled the moderates and radicals among the workmen. Meanwhile similar movements abroad had helped to show wide circles in parliament and outside, that the lower middle classes, who were suffering under the increasing pressure of capitalism, needed assistance. Various measures were passed for the benefit of artisans, a reform of industrial conditions undertaken, insurance against sickness and accidents introduced. The Government concluded the fresh compromise with Hungary (1887) without difficulties or basic alterations. It met the wishes of industrialists and peasants by raising tariffs. To improve the chaotic position of finances, new taxes were introduced, which were heavily felt by wide circles; yet the state revenues increased so much that in 1889 and 1890 the budget estimates showed no deficit, although several private railways had been taken over by the State, others built, and large sums voted for expanding the military forces.

Rise **of** the Young Czechs.—The successes of the Young Czech Party forced the Government to alter its attitude to national questions. In the elections to the diet of 1889 this party had almost annihilated the moderate Old Czech Party, and now commanded a majority in the Bohemian diet. The energetic opposition of the Germans to the extensive demands put forward by this party in the language question and that of Bohemian State rights induced Taaffe to attempt a compromise, which broke down, however, on the opposition of the Young Czechs. This failure induced Taaffe and the majority of the ministers to approach the German Liberals. Julian von Dunajewski, the finance minister, an enemy of the Germans, who thought the altered policy unnecessary, was out-voted, and resigned (Jan. 1889). His successor, Emil Steinbach, was an advocate of social reform, an enemy of the old Liberalism, and a Clerical sympathizer. The new elections to the House of Deputies did not bring the Government the expected gains for the moderate parties. Taaffe attempted, nevertheless, to unite them and form another government with their support. He failed, mainly owing to differences between the German Liberals and the Clericals, but relations between the three great parties, the United German Left, the Poles and the Hohenwart group, were tolerable, and Taaffe was able to remain in office. Fresh commercial treaties were now concluded with several states; certain tariffs were consequently reduced considerably. The financial situation improved. In 1892 the currency was regulated, the gold currency introduced, and a reform of direct taxation commenced.

Renewed attempts in 1891–93 to achieve a compromise in Bohemia again proved fruitless, neither party accepting the Government's proposals. When, in 1893, the Government attempted to delineate the judiciary districts in Bohemia on national lines, riots occurred, fostered by the Young Czechs; these provoked the Government to energetic measures, culminating in the proclamation of a state of siege in Prague and district (Sept. 1893). The Government believed that these and other disturbances could best be countered by wide extension of the franchise. For years past, franchise reform bills had occupied parliament's attention, some of them advocating general, equal and direct franchise. The growth of Social Democracy in Austria and the victories of the sister parties in Belgium and Germany helped to strengthen the movement in Austria towards enfranchising the workman. On Oct. 10, 1893, a bill was introduced in the House of Deputies, drafted by Steinbach and approved by Taaffe, abolishing the privileges of the electoral colleges of municipal and country districts, and granting the franchise to almost all men of 24 years. The party leaders had not been informed of this bill, which created great astonishment and still greater aversion among the overwhelming majority of deputies. The German Left, Poles and Conservatives, united against it. On Oct. 28, Parliament was adjourned; on the following day Taaffe tendered his resignation. On Nov. 11, 1893, he left office.

The new ministry, under Prince Alfred Windischgratz, rested on the three great parties in the House of Deputies, Liberals, Poles and Clericals, led by Ernst von Plener, Apolinar von Jaworski and Count Karl Hohenwart respectively. Permanent co-operation between such dissimilar interests and personalities was improbable from the first. They at first united in defence of the privileged basis of parliament; but dissension soon broke out between them, and even more between the three parties. Agreement proved impossible, either in the question of electoral reform, which had to be reopened in deference to public opinion, or in the language question. The breach came on a question trivial in itself: the Government's proposal to establish an upper school with instruction in German and Slovene, in Cilli. The German Left seceded from the coalition, whereupan the ministry resigned (June 1895). A provisional ministry, consisting mainly of high officials, under the Governor of Lower Austria, Count Erich Kielmansegg, carried on. Two important acts, long debated and widely demanded, the new civil procedure and the new income-tax law, were passed in this period.

Badeni's Ministry, 1895–1897.—In late Sept., 1895, the definitive ministry was appointed under the ex-governor of Galicia, Count Casimir Badeni. Badeni attempted at first to please all parties. The state of siege, proclaimed in Prague in 1893, was removed. In 1896 Badeni carried a franchise reform bill, which satisfied nearly all parties, except the advocates of general and equal franchise. All the old electoral categories were maintained, but a fifth curia was added, embracing almost anyone who had resided six months in one place and was not in domestic service; the membership of the House of Deputies was increased by 72. But the new elections (March 1897) strengthened the radical elements in all parties. The United German Left almost disappeared. The Germans fell into several mutually antagonistic groups; the majority put questions of nationality first, and had deserted the constitutional standpoint. The Right, too, had split. The Social Democrats secured 14 seats. Badeni was unable to secure a firm parliamentary majority, but got a temporary majority by concessions to the Clericals and thus, although he had offered his resignation, continued in charge. Francis Joseph now confirmed Lueger's election as burgomaster of Vienna, which he had long refused to sanction. To attract the Czechs, Badeni issued new language legislation under which, *inter alia,* all offices in Bohemia and Moravia were obliged to reply to the public in the language in which they had been addressed. After a short grace, all officials must prove their knowledge of both languages current. These proposals evoked violent opposition from the Germans, leading to uproar in parliament, obstruction and great public demonstrations. The attempt forcibly to break the Germans' parliamentary obstruction failed. When the movement reached a climax the emperor intervened and dismissed Badeni. A provisional ministry under Paul Freiherr von Gautsch (Nov. 28, 1897–March 1898) revoked Badeni's language laws and replaced them (March 1898) by others, dividing Bohemia into a Czech, a German and a mixed linguistic district. Neither Germans nor Bohemians were satisfied, and Gautsch resigned. Francis, Count Thun replaced him (March 1898). He attempted strong action, but was unsuccessful. The language controversy continued; peasant unrest broke out in Galicia; new taxation, a consequence of the new provisional compromise with Hungary, increased the discontent. At last the Government put through the increase of indirect taxation and renewal of the customs and commercial agreement with Hungary by application of paragraph 14 of the Constitution of 1867. This paragraph provided that in case of urgent necessity, legislation for which the assent of the Reichsrat was required might, if the Reichsrat was not in session, be proclaimed by the Emperor. It must be signed by the whole Ministry, and if not submitted to the Reichsrat within four months of its meeting, or if failing to receive the approval of both houses, it ceased to be valid. The Germans contended that the application of this clause to the Compromise was invalid, and demanded its repeal. Thun fell (Oct. 1899).

Clary and **Korber.**—His successor, Manfred, Count Clary-Aldringen, issued two language decrees for Bohemia and Moravia (Oct. 14, 1899), re-establishing the status *quo ante* of Badeni's bills pending completion of the projected legal settlement of the language question. The Germans consented; the Czechs, however. deeply indignant, began obstruction. Their attempt to carry the language struggle into the army offended the emperor, who was

determined to allow no tampering with the unity of the language in the army. The Czechs, however, continued their attacks upon the Government, and prevented it from passing an excise bill, which was a necessary part of the Hungarian Compromise. Unwilling to break his word towards Hungary, Clary resigned (Dec. 1899). After a short provisional ministry, Ernst von Korber became minister-president (Jan. 1900). His efforts to achieve a lasting compromise in the language question remained as fruitless as his predecessors'. The Czechs were bitterly hostile, the Poles and Italians discontented also. Nevertheless, Korber succeeded in his first years of office in abolishing obstruction and passing the votes on the budget, recruiting, and "other necessities of state" through parliament, by proposing large public works in which Czechs and Germans alike were interested, and passed the Compromise with Hungary (Jan. 1903) by the help of mutual concessions—a great success. Nevertheless, opposition increased in the Austrian parliament, and Korber, failing to induce parliament to vote the budgets for 1903, 1904 and 1905, was driven, like his predecessors, to apply "paragraph 14." Thus discontent grew and grew. The old opponents were reinforced by new; the Clericals, frightened by the progress of the *Los von Rom* movement against which Korber refused to take strong action, joined the opposition. In Dec. 1904 Korber resigned.

Struggle with Hungary.— Under Korber falls the struggle of the Hungarian party of independence *(see* HUNGARY) against the throne, manifested chiefly in the demand for the Magyar word of command in the Hungarian regiments (a preliminary to their complete Magyarization). The emperor, ordinarily very pliant to the Magyars' wishes, refused to yield an inch here, and declared (army order of Chlopy, Sept. 1903) his intention of maintaining the single language in the army. Stephen Tisza (*q.v.*) the Hungarian minister-president, proved unable to control the growing violence of the opposition. The Party of Independence was victorious in the new elections (early 1904). Tisza fell. Under his successor, Fejervari (June 1905), the parliamentary struggle in Hungary reached a climax. The Hungarian minister of the interior, Kristoffy, considered a plan of replacing the existing narrow franchise by universal franchise. The discussion of this question had some influence on the corresponding movement in Austria.

Suffrage Reform.—Gautsch, who had succeeded Körber on Jan. 1, 1905, certainly had no intention, at first, of a violent alteration in the constitution. His ambition was to reconcile the German-Czech differences, or at least to achieve a temporary compromise. In the former ambition he was successful in Moravia (autumn, 1905), in the latter in Bohemia. Meanwhile franchise reform was debated within and without the Reichsrat. Gautsch, who had originally declared that the introduction of general franchise in Austria must be preceded by a settlement of the national problem, gradually changed his attitude under the influence of public opinion, and particularly of the emperor's espousal of electoral reform, and on Feb. 23, 1906, laid sundry bills before the House of Deputies, aiming at the introduction of general, equal and direct voting. The details of these bills, however, were not unreservedly supported by any party. The opponents of general suffrage objected on principle, and the partition of mandates among the different nations caused insurmountable difficulties among the other deputies. Gautsch therefore resigned. His successor, Prince Conrad von Hohenlohe (March 1906), was equally unsuccessful in uniting the parliamentary parties by a new proposed compromise in the mandate question, and resigned in June.

His successor, Freiherr Max Vladimir Beck, managed by skilful tactics to secure an agreement regarding electoral reform (Oct. 1906). In early December the House of Deputies passed the bill. Fresh opposition was encountered in the upper house, but, before the end of 1906, the government's concession of the *numerus clausus* bought the passage of the bill for the general, equal and direct suffrage for parliamentary elections. It was sanctioned on Jan. 26, 1907, by Francis Joseph who hoped, by these concessions to modernity, to strengthen the dynasty, and to preserve the unity of his dominions, as expressed in the unified control of the common army and of foreign policy against the separatist ambitions of the Hungarian "'48" party. This seemed to him and his ministers the more urgent in that relations between the monarchy and foreign powers had become so threatening that an appeal to arms seemed not impossible.

Foreign Policy.— Austria-Hungary had held to the German alliance of Oct. 7, 1879, and renewed the Triple Alliance of 1882, in 1891 and 1902, for six and twelve years respectively, although confidence in Italy's sincerity grew ever less, and the irredentist movement in the Italian districts of Austria received both sympathy and active support in Italy itself. Relations with Russia had improved during the '90s after the critical period in the late '80s, although the conclusion of the Franco-Russian alliance (1891, Military Convention 1892, definite formulation 1893–94) directed largely against Germany and her allies, boded future danger. Count Agenor Goluchowski, who succeeded Kalnoky in May 1895, reached an understanding with Russia in 1897 on Balkan questions which, although not definitely reconciling to the divergent interests of the two Powers in the Balkans, yet enabled temporary cooperation on the basis of preservation of the *status quo*, and, in the event of unavoidable territorial changes, the understanding that these should go to enlarge the Christian Balkan states, while maintaining the balance of power. This compromise was the more welcome to Austria-Hungary as the treaty concluded with Serbia (1881) and renewed in 1889 was not renewed on expiration in 1895, neither was the agreement of 1887 with England and Italy *(see* above). Russia's increasing interest since the middle '90s in the Far East as a possible maritime outlet enabled Austria to cooperate with her in the Balkan unrest in Macedonia and elsewhere. The Mürzsteg programme (Oct. 1903), aimed at restoring order in Macedonia under Russian and Austrian supervision, on the lines of previous understandings. Permanent success was, indeed, impracticable, but the wish to maintain the best relations possible with Russia determined Austria-Hungary's benevolent attitude during the Russo-Japanese war. The secret treaty of 1883 with the king of Rumania was renewed (1892 and 1902) and, despite many differences, arising mainly over the oppression of the Rumanians in Transylvania, relations with Rumania remained good, largely thanks to her jealousy of Bulgaria and of the ambitious Prince of Bulgaria, Ferdinand of Coburg. In the conflicts which arose out of the Cretan rising (1896) and led to the Turco-Greek War, Goluchowski held aloof, swayed principally by the wish to preserve peace. Similarly he aimed at amicable settlement of the differences between Austria-Hungary and Italy in Albania, and achieved it by the agreements of 1897 and 1901. For the same reason he did not hesitate to recognize Peter Karageorgević, who ascended the Serbian throne after the murder of the last Obrenović (1903). He could not, however, prevent economic differences, due chiefly to Hungary's objections to the importation of Serbian live-stock, from occasioning repeated conflicts which resulted in a tariff war between the two States.

The Annexation of Bosnia and **the Hercegovina.**—Austria-Hungary's foreign policy changed when Baron, later Count, Aloys Lexa Aehrenthal (*q.v.*) succeeded Goluchowski (Oct. 1906). As ambassador in Petersburg, Aehrenthal had believed it possible to establish permanently good relations with Russia, especially when her attention was concentrated on the Far East. When, however, Russia, defeated by Japan, returned to her earlier policy, planned to reach the coveted outlet in Europe by seizing the Dardanelles, and to this purpose endeavoured to extend her influence in the Balkans, Aehrenthal saw the danger threatening Austria-Hungary. This danger became ever greater as the internal affairs of the Turkish empire became more critical. Aehrenthal wished to preserve this empire, but in the event of its final liquidation, he was firmly determined to safeguard Austria-Hungary's interests. It was necessary, above all, to secure permanent possession of Bosnia and Hercegovina. The Young Turks' revolution of July 1908, offered an immediate occasion to annex these territories. Without consulting the co-signatories of the Treaty of Berlin, Francis Joseph proclaimed the annexation (Oct. 6, 1908), at the same time announcing the withdrawal of the Austro-Hungarian troops from the Sanjak of Novi Pazar. Aehrenthal thought this move possible as he had previously made arrangements with the Russian foreign

minister, Isvolski, whereby Isvolski had promised his consent to the annexation in return for a promise of a free hand for Russia in the Dardanelles question. Aehrenthal's action evoked violent and widespread objection, and led to ominous complications, especially as Isvolski, whose Dardanelles plan had found no favour in France and England, now declared he had been deceived by Aehrenthal and never consented to the annexation. Encouraged by the attitude of certain Great Powers, Serbia protested against the annexation, demanded autonomy for the territories under the guarantee of the Great Powers, and a port on the Adriatic with a strip of territory to connect it with Serbia. As Aehrenthal did not consent, Serbia armed. Turkey, too, assumed a threatening attitude, and in Bulgaria the inclination to join Austria-Hungary's enemies grew, Aehrenthal, however, remained firm and reached his end, principally through Germany's intervention in Austria's favour. The differences with Turkey were composed (Feb. 1909), the signatories of Berlin recognized the annexation and Serbia had to submit and promise to further no more machinations against Austria-Hungary. It was a victory for Aehrenthal, but a Pyrrhic one, since it intensified the cleavage of Europe into two hostile camps, the Triple Alliance and the Triple Entente (see EUROPE).

One party in Austria, led by the chief of the general staff, Franz Conrad (later Count) Hotzendorf, even at this time favoured a decision by arms. After a violent conflict, however, Aehrenthal, supported by the emperor, who also advocated the maintenance of peace, carried his point. Aehrenthal attempted accordingly to improve relations with Russia and to settle amicably the fresh differences with Italy regarding Albania. In every way Aehrenthal worked for peace in 1910 and 1911. He attempted to reconcile the ever-recurrent differences between England and Germany. In the Moroccan question, indeed, he supported his ally, but carefully abstained from irritating the other side. He also prevented Austria-Hungary from intervening actively in the Italian-Turkish war of 1911, although the war party in Vienna wished to settle with the unreliable ally, Italy, as it had with Serbia in 1909.

The Balkan Question. — The Italian-Turkish War was followed by the Balkan War (Oct. 1912), in which the allied armies of Bulgaria, Serbia and Greece proved victorious. Count Leopold Berchtold, who succeeded Aehrenthal on his death (Feb. 1912), recognized the danger if the Balkan states, especially Serbia and Montenegro, were strengthened, but failed to prevent it. A strong party, again led by Conrad, once more urged armed intervention against the enemy in the Balkans, but again the peace party carried the day, especially as Austria's allies, Germany as well as Italy, were opposed to the war (1913). So Austria-Hungary had to watch the Balkan powers renew the war with Turkey and, despite unexpectedly stubborn resistance, again prove victorious. The outcome of the Second Balkan War (1913) brought another loss of prestige for Austria-Hungary. Serbia and Montenegro, especially the former, had extended their frontiers considerably, and henceforth, being no longer separated by the Sanjak of Novi Pazar, were in a position to join forces against the Habsburg monarchy when the time came. Bulgaria mas discontented with Austria's attitude, having expected active support in her war against the other Balkan states, while Rumania resented Berchtold's attempts to revise the Treaty of Bucharest in Bulgaria's favour. Anti-Austrian feeling made rapid headway every month. The agitation in Bucharest in favour of the Hungarian Rumanians became ever more active. Rumania drew closer to the Entente Powers, and although King Carol renewed the secret treaty with the Triple Alliance (Feb. 1913) and could not be persuaded definitely to break with the Central Powers, yet the pro-Entente party in the Rumanian government won the upper hand. So the danger increased that a new Balkan alliance under the aegis of Russia and France might be formed against Xustria-Hungary.

To hinder this encirclement became the principal endeavour of Viennese statesmen, who worked untiringly to compose Bulgaria's outstanding differences with Turkey and Rumania and, if possible, to win Greece to a closer adhesion to the Central Powers. All their efforts, however, were frustrated by the divergent interests and mutual distrust of the Balkan States, which were revealed during the negotiations conducted under the mediation of the Central Powers in the winter of 1913–14.

These failures were the more disappointing as the general situation during 1912–13 had become ever less favourable to the Central Powers. Relations with Italy were increasingly strained, although the Italian foreign minister, San Giuliano, maintained a correct attitude towards the Viennese Government, and although the Triple Alliance was renewed (for the last time) in Dec. 1912. But the attitude of the press and deputies with nationalist sympathies showed that influential circles were endeavouring to lead Italy into the Entente camp. Relations between England, France and Russia were also visibly growing ever closer, and all three powers were taking steps to increase their own military strength; while Germany and Austria-Hungary did likewise.

Internal Conditions 1907–14. — An early outbreak of a world war was not, however, expected in either capital, as relations between Germany and England began to imprcve, and a settlement of many outstanding points seemed promised. The Viennese statesmen, therefore, thought they might turn their attention to the Balkans, where conditions grew daily more intolerable, and seriously threatened the existence of the Danube monarchy, as the irredentist movement among the Slav inhabitants of the Monarchy had grown steadily, and was warmly encouraged by their co-nationals abroad. The Government was powerless. Despite the electoral reform, parliament was as disinclined as ever to allow proper government or a permanent settlement between the nationalities. The successive ministries between 1907 and 1914 were not parliamentary and did not express the majority of the house. Their successive programmes thus always aimed at an objective, non-party application of the Iaw and equal rights for all nationalities; but in order to gain a majority for necessary bills, they were obliged to negotiate with the parties, make them concessions, and take representatives of the different nations into their ministries. Their hopes thus to achieve a permanent national reconciliation proved unfounded. Centrifugal tendencies grew ever stronger. Fresh conflicts broke out between the Czechs and Germans in the Bohemian diet and in the House of Deputies, each in turn resorting to obstruction. Under Beck the Germans made work hopeless in the Bohemian diet, after riots had occurred in Prague and Laibach. The Czech ministers thereupon left the cabinet, and Beck, deserted by Germans and Czechs, resigned (Nov. 1908). His successor, Baron, later Count, Richard Bienerth, tried taking a representative of each of the three great parties, Germans, Czechs and Poles, as "provincial ministers." In vain. The Germans opposed any alteration in the Language Law of Bohemia unfavourable to themselves and resorted to obstruction when the ministry opened negotiations with the Czechs. At the same time discontent grew increasingly apparent among the Yugoslavs and Italians, while the Germans quarrelled among themselves. As the Christian Socialists, the chief support of the Government, lost heavily in the 1911 elections, Bienerth resigned (June 1911). His successor, Gautsch, was faced with the same difficulties. He failed to satisfy the extensive demands of the Czechs, but, by negotiating with them, aroused the suspicions of the Germans. He was succeeded (Nov. 1911) by Carl, Count Stiirgkh, who pursued the same policy with similar ill-success. In March, 1914, he adjourned parliament; thus the people were unrepresented when the War broke out in consequence of the murder of the Archduke Francis Ferdinand (*q.v.*) (June 28, 1914).

Southern Slav Agitation. — Following the example of the Magyars, Ruthenes, Czechs and Italians, who had urged their national claims with waxing energy, and endeavoured with increasing zeal, though with varying success, to loosen the bond which held them together, the Yugoslavs also had put forward their national demands. against the Germans and Magyars. Finding insufficientresponse from the central Government, especially against the increasing aggressiveness of the Magyars, they looked ever more towards their brothers in Serbia, and listened to the propagandists of the greater-Serbia idea. The danger increased when the Russophil Karageorgević dynasty succeeded the Obrenović in Serbia. Henceforth Belgrade became the centre of pan-Serb agitation against the Danubian monarchy, whose commanding

position in the Balkans was described as the only obstacle to the realization of the national desires of all southern Slavs. The Governments of Vienna and Budapest saw that this danger must be met, but still hesitated whether to use force or conciliation towards the southern Slavs. Time passed, and nothing was done. The southern Slav sore was allowed to fester on the body of the empire, and spread over it until it brought about its death.

Outbreak of ***World War*** I.—The murderers of Francis Ferdinand were citizens of the Habsburg monarchy, of Serbian nationality. Their act gave the supremacy in Vienna to the party under Conrad which had long advocated a bloody reckoning with the Serbs. Gradually they convinced the emperor and the advocates of a diplomatic settlement (who included Stephen Tisza, the Hungarian premier) that only force could effecta permanently satisfactory solution of the Serbian question. Accordingly, the Austro-Hungarian Government put forward demands in its ultimatum to Serbia (July 23, 1914) which it did not expect to see accepted. Although Serbia's answer was most conciliatory, the Vienna Government rejected it as insufficient. War was declared on July 28, after the efforts of the Great Powers, including Germany, to negotiate a settlement had failed. Equally fruitless remained the further attempts by these Powers to localize the war. World War I (*q.v.*) broke out.

At the outset of the war Austria-Hungary and Germany were joined by Turkey, and in Sept. 1915, after long hesitation, by Bulgaria. The Central Powers' efforts to gain further allies were fruitless; their two peace-time allies, indeed, Italy and Rumania, joined the increasing number of their enemies, the former in April 1915 (Treaty of London, April 26; declaration of war on Austria-Hungary, May 23, 1915), the latter on Aug. 27, 1916. In vain had the two Foreign Ministers, Berchtold (up to Jan. 1915) and Count Stephen Burian (Jan. 1915 to Dec. 1916) attempted by ever more extensive concessions to prevent Italy from entering the enemy's camp. Their t o-year long negotiations with Rumania were equally unsuccessful, chiefly owing to the refusal of the Hungarians, led by Tisza, to consent to the cession of Hungarian territory demanded by Rumania. The struggle against the increasing superiority of the enemy was carried on with varying success throughout the world. Austro-Hungarian troops were engaged chiefly against Russia and Italy. An Italian offensive was repelled after heavy fighting (1915) but attempts to win a decisive victory over Italy failed, although initial successes were often gained. Lasting success against the superior forces of the Russians was achieved only when the German army joined the Austro-Hungarian and Rumania's rapid defeat was chiefly its work.

In judging the achievements of the Austro-Hungarian army, the increasing unwillingness of many troops, especially the Czechs, to fight for interests directly opposed to their own, must not be overlooked. Further, there was the increasing shortage of foodstuffs in the monarchy, especially in the towns of Austria proper, and the enlistment of the youngest and oldest categories into the army brought into it subversive elements which corrupted the morale of the war-weary soldiers. Under these circumstances the party which advocated peace, even at the price of sacrifice, grew. Francis Joseph had never been disinclined for peace, but had insisted that it must be made in concert with his allies, especially Germany, and without serious territorial losses to himself. All efforts to reach a result on this basis broke down, however, on the irreconcilability of the peace conditions of the Central Powers with the demands of their enemies. The difficulty of these negotiations was increased by the discord between the allied Governments. Berlin wished Vienna to meet Italy's claims for Austrian territory generously, while Vienna wished Berlin to make concessions to France in Alsace-Lorraine. There was the further complication of the Polish question, after Congress Poland had been conquered, and Warsaw occupied by the Central Powers (Aug. 1916). None of the various proposals made by one or other of the Central Powers was fully accepted by both parties. Definite settlement was, therefore, postponed, but a proclamation issued to the Poles (Nov. 1916), in the vain hope of securing their active assistance in the war, promised the restoration of independent Poland as a hereditary constitutional monarchy.

Shortly before this, conversations had taken place between Austria and Germany, at Burian's suggestion, with the purpose of presenting the concrete peace conditions of the four allies to their enemies. No agreement had, however, been reached when Francis Joseph died on Nov. 21, 1916, after a reign of nearly 68 years. His successor, his grand-nephew Charles (*q.v.*), took over a perilous heritage. The military and economic resources of the monarchy mere beginning to fail. The blockade, the loss of supplies from Hungary and Galicia, and the diminution of home production consequent on shortage of human and animal labour made the food situation in Austria desperate, especially in the towns; the country districts shut themselves off, held up supplies and put up prices, in defiance of the law. Anti-dynastic feeling was spreading, especially in the non-German and non-Magyar territories. The young emperor's programme was to combat this feeling, to renew the splendour of the dynasty, to give his peoples the longed-for peace and to reconcile their mutual differences. The first step, he thought, was to end the war. The negotiations with Germany were pursued energetically; on Dec. 12, 1916, the peace offer of the Quadruple Alliance was made public. It was ill received by their enemies, who, in their answer, made claims which were brusquely rejected, especially by Germany, and led to the decision to continue the war by the employment of extreme measures, the most important and most promising of which was indicated to be unlimited submarine warfare.

Neither Count Ottokar Czernin, who had succeeded Burian (Dec. 1916), nor Charles shared the hope of the German statesmen, but they submitted to their allies' urgency. As, however, the submarine warfare failed to achieve the expected success, and the land warfare brought no decisive victory, while, by the revolution, the United States took the place of Russia against the Central Powers, Charles and Czernin were increasingly anxious for peace. All efforts to achieve it failed, however, although Charles, under the influence of his wife and her brother Sixtus of Parma, had taken steps in the spring of 1917 which, when revealed in 1918, evoked much indignation in Germany and forced Charles to make agreements with William II. which, if realized, would have made Austria-Hungary practically a vassal state of Germany. The Sixtus negotiations broke down on Italy's insistence on the claims admitted by her allies in the Treaty of London, which Charles refused to grant. Further negotiations in 1917 (Revertera-Armand and Mensdorff-Smuts) brought no result, as Czernin refused the offer of a separate peace.

World War I: Second Phase.—Successes in the East, leading to the Treaties of Brest-Litovsk with Russia (March 3, 1918), and the preliminary Peace of Buftea (March 6) with Rumania, though gratifying, did not blind the Government to the critical situation. They knew that the difficulties of filling up the depleted ranks, raising arms and ammunition, and provisioning troops and population, would increase monthly. Wholly convincing reports came in of the increasing war-weariness of the troops and the ever more openly expressed anti-dynastic sentiments of the non-German and non-Magyar nationalities. Even in Francis Joseph's lifetime the convocaticn of parliament, muzzled since 1914, had been considered, but Stiirgkh objected, fearing an ever stronger manifestation of national differences. Stürgkh's murder (Oct. 1916) was a demonstration against the absolutist régime. Yet his successor, Korber, also ruled without parliament. His efforts to curb centrifugal tendencies by concessions to the nationalities, while preserving the interests of the Germans of Austria, failed, and Charles dropped him the more willingly (Dec. 1916) as he disagreed with Korber over the conduct of the war, the Hungarian Compromise and the question of taking the oath to the constitution. Korber's successor, Count Richard Clam-Martinitz, after overcoming many difficulties, convoked the Reichsrat (May 1917). The Southern Slavs and Czechs immediately issued declarations incompatible with the unity of the empire, while the Germans resolutely opposed any reorganization of the monarchy on federative lines. Clam-Martinitz thereupon resigned (June 1917), but his successor, Ernst von Seidler, failed to accomplish the desired reconciliation of the nationalities, despite the emperor's action in amnestying the Slav leaders (Kramař and others) con-

demned in 1915, and promising huge social reforms and a reorganization of Austria on national lines. Seidler accordingly resigned (July 22, 1918).

His successor, Max Freiherr Hussarek, made fresh attempts to settle the internal differences, while preserving the unity of Austria, through granting extensive autonomy to the nationalities; but the military situation now made the idea of preserving the Habsburg monarchy, though in changed form, quite hopeless.

Czernin's efforts to secure peace on the basis of Wilson's Fourteen Points (*q.v.*) failed, as the Allies laid down conditions inacceptable to Germany, who now hoped for victory. All attempts of the Viennese Government, which had become ever more dependent on Berlin, or rather, on the military party predominant in Germany, especially since the revelation of Charles's separate negotiations with the western Powers, broke down on this resistance. Only when Germany's anticipated victory in the West did not materialize, the Allies advanced and Ludendorff, the leader of the military party, declared that the military spirit of the enemy could not be broken by arms (Aug. 1918), did Burian, who had replaced Czernin in April, find no opposition on principle in Germany; differences of method still remained, which induced Burian to disregard Germany's opposition and ask all belligerents to attend a peace conference. The only result of his efforts was to redouble the enemies' vigour. The recognition (Aug. 1918) by the Entente of the Czechs, who had formed legions and rendered the Entente great services, especially in the East, as a belligerent and allied Power, was momentous to the fate of Austria-Hungary. All Slavs of the monarchy now began to see that the break-up of Austria would give them more than its continued existence. They, therefore, now based their calculation on a break-up. The Austrian Social Democrats had adapted their programme in their party conference, and that party in Hungary which demanded complete independence with democratic reforms and immediate peace grew very strong.

Break-up of the Habsburg Monarchy. — On Sept. 15 the Bulgarian line broke; on Sept. 29 Bulgaria concluded an armistice, leaving Hungary exposed; Hungary demanded the recall of her own troops to defend their home. The Viennese ministers were powerless before the centrifugal demands of the Slavs and the insistence of the Magyars on Hungarian integrity. They determined to make important concessions to the Slavs. On Oct. 1 they announced that they recognized the rights of the nationalities to free self-determination, adopted the standpoint of national autonomy, championed Polish independence and announced the union of all the Southern Slavs of Austria by constitutional means. This step, however, contented no nationality. The Poles proclaimed their independence in Warsaw on Oct.7, the Ruthenians summoned their National Council for Oct. 19, and the Czech Government was formed in Paris on Oct. 14.

As a last attempt, the emperor issued a manifesto (Oct. 16) proclaiming that Austria should be transformed, in accordance with the will of her peoples, into a federal state, in which every race would be free to establish its own form of body politic on the territory occupied by it. For Hungary, the manifesto laid stress on the integrity of the Hungarian kingdom. But even this last attempt to preserve the monarchy, although with diminished territory and as a loose aggregation of separate territorial groups under the Habsburg-Lorraine dynasty, failed. In the course of the following weeks autonomous governments were formed in Prague, Laibach, Sarajevo, Trieste, Cracow and Lemberg. On Oct. 27 Heinrich Lammasch took over the government in Austria with the task of liquidating the central administration. Count Julius Andrássy, who had followed Burian as foreign minister (Oct. 24), recognized Wilson's claims regarding the rights of the nationalities, especially the Czechs, Slovaks and Yugoslavs He immediately opened negotiations for a separate peace, but these were as fruitless as the rest. On October 30 a national Hungarian government was formed in Budapest. As the troops, the Germans excepted, were leaving the front to return home, the Austro-Hungarian supreme command was forced to beg the Italians, who now advanced victoriously, for an armistice. which was granted on Nov. 3 under the severest conditions.

The process of dissolution ran its course in the old monarchy. On Nov. 11 the emperor renounced all share in the business of government in Austria, not, however, renouncing his crown, and the Lammasch government resigned. On the following day the Austrian National Assembly proclaimed a republic, which was at first intended to form a component part of the new German republic. On Nov. 16 the republican form was introduced in Hungary. The ancient Austro-Hungarian monarchy thereupon ceased to exist. See AUSTRIA; HUNGARY.

BIBLIOGRAPHY.—For the whole period: Bibliography, R. Charmatz *Wegweiser durch die Literatur der Oest. Geschichte,* etc. (1912) (chief works indicated); Dahlmann-Waitz, *Quellenkunde zur deutschen Geschichte,* 12th ed. (1912) (Austria included); F. v. Krones, *Grundriss der Oest. Geschichte mit besonderer Riicksicht auf Quellen und Literaturkunde* (1882); excellent bibliography in relevant chapters of the *Cambridge Modern History.* Accounts: There is no adequate history in English; the best account in German is, A. Huher, *Geschichte Oesterreichs* (Gotha, 1885–95), 3 vols. to 1648; continued by O. Redlich, vol. 6 to 1700; F. v. Krones, *Handbuch der Oest. Geschichte* (1876–79), 5 vols. (a useful handbook); F. M. Mayer, *Geschichte Oest. mit besonderer Riicksicht auf das Kulturleben* (3th ed.) useful for beginners; Meynert's and Mailath's works are out of date. Development of the State; the best work is Luschin v. Ebengreuth, *Oest. Reichsgeschichte,* 2 vols. (1895–96) and *Grundriss der Oest. Reichsgeschichte* (1899); also A. Bachman, *Lehrbuch der Oest. Reichsqeschichte* (1895–96); A. Huber, *Oest. Reichsgeschichte,* 2nd ed. issued by A. Dopsch (1901); E. Werunsky, *Oest. Reichs- und Rechtsgeschichte* (1897 *sqq.*).

Period 1526–1740, F. B. v. Bucholtz, *Geschichte der Regierung Ferd. I.,* 8 vols., (1831–38) old, many documents; W. Bauer, *Die Anfänge Ferd. I.* (1907), A. Gindely, *Rudolf II. und seine Zeit* (1600–12), 2 vols. (1868); L. v. Ranke, *Geschichte Wallensteins* (classic work); H. Hallwich, *Wallensteins Ende* (1879). H. v. Srbik, *Wallensteins Ende* (1920); A. F. Pribram, *Franz Paul v. Lisola und die Politik seiner Zeit, 1613–74* (1897), and *Oesterreich und Brandenburg,* 1685–1700, 2 vols. (1883–88); A. (A. F. P.)

AUSTRIAN LITERATURE. This literature has been closely bound up with that of the German people as a whole. Yet Austrian literature has preserved characteristics of its own, partly because of the outlying position of the country, partly because of the special position which the Habsburg provinces occupied in the empire, partly because of the close, albeit often hostile, relations of the Austrian Germans to so many other nations, and partly also owing to the Counter-Reformation. In consequence of the latter movement, Austria was, from the end of the 16th century, divided by religious differences from south-western, central and northern Germany and became the centre of a baroque culture peculiar to itself, though largely derived from Spanish and Italian sources. Catholicism has continued down to the present day to be one of the most important elements of specifically Austrian literature. Contributory factors are the different variations of the Bajuvaric, or, in the case of Vorarlberg, the Alemannic national character, and the various territorial and local traditions. Above all, the temperament and mentality of the people of Vienna, which received its definitive stamp in the era of the Counter-Reformation, have modified the Austrian development of German tendencies in general. The Viennese have a vivid perception of beauty as well as of sentiment and of fun; they love music, nature and everything spectacular; they are endowed with a subtle taste in art. On the other hand they take life as easily as possible, avoiding everything unpleasant. They dislike extremes, are prone to compromise and usually take little interest in metaphysical problems. Since 1914 this mentality has undergone some change, but it will be found faithfully expressed in a great part of pre-war and post-war Austrian literature.

Owing to the outlying position of Austria, literary movements have often been late in reaching it from Germany; and though there has from the earliest times down to the present day been a constant literary give-and-take between the south-east section of the German-speaking people and the bulk of the race, it has seldom happened, and only for short periods, that the Germans of the Danube and the Alps have taken the lead in literary matters. Until the Counter-Reformation at least, the general lines of literary development are the same in both lands.

The Austrian literature of the middle ages included the religious lyric and the religious epic (the latter particularly in Carinthia and Styria), as well as the lyric of chivalry. The last-named *genre* enjoyed the same patronage in the court of Vienna as in the Wartburg; its Austrian representatives include such masters of different styles as Walther von der Vogelweide (*q.v.*) and Nithart. In the development of the great national epic of the middle ages the principal part was played by Austria proper, Styria and Tirol; the courtly epic being but scantily developed. Towards the end of the middle ages Austrian literature began to take on a realistic and comic colouring; but the lyric of chivalry continued to be written far longer than elsewhere, and the life of the mediaeval epic was artificially prolonged by the Emperor Maximilian I. (d. 1519). It is to Maximilian that Austria owed its brief efflorescence of humanism, and the first, though transient, period of prosperity of the University of Vienna (founded in 1365). The university, however, derived most of its fame from the foreign scholars who taught there.

A long period of literary sterility followed, owing to constant religious conflicts and the difficulties of internal and foreign affairs. This was succeeded by the baroque period, which was specially characteristic of south Germany. The baroque style appeared simultaneously in literature, architecture, sculpture, painting and music. It was the time of the supremacy of the Jesuits, and of the rigid absolutism of the emperors, who stood in close relation to Spain. These factors help to account for the movement. There was also a marked Italian influence, affecting more particularly the popular drama. The latter *genre* now appeared for the first time in literary form, and continued its long and brilliant course until well into the 19th century.

About the middle of the 18th century the *Aufklärung* (enlightenment) movement gradually began to penetrate Austria. This movement tended to minimize the acute difference between north and south Germany which had existed since the Counter-Reformation. Its principal figure was Sonnenfels (1733–1817) who, though far less significant, may be compared with Lessing. The literature produced by his school was well intentioned though not of great permanent value. Another result of the movement was the creation (1776) of the famous *Burgtheater*. In the classical period, Collin (*q.v.*) stands in about the same relation to Schiller as Sonnenfels to Lessing.

The Romantic movement was introduced into Austria comparatively early by its initiators, the brothers Schlegel. Austrian literature now enjoyed its second period of brilliance, known as the *Vormärz*. The most famous names of the period are those of Bauernfeld, Raimund, Nestroy, Grun, Lenau, Stelzhamer, and—most famous of all—Grillparzer (d. 1872) and Stifter (d. 1868). The lifetime and work of the latter writers form a connecting link with the next era, the period of constitutional liberalism, in which the best-known names are those of Hebbel, Laube and Wilbrandt—all immigrants from Germany—and, among native authors, Kurnberger, Schindler, Hamerling, Ebner-Eschenbach, Saar, Rosegger, Anzengruber, David.

Modern Austrian Literature.—In order to get a correct perspective of the subject during the years between 1910 and 1926 one must bear in mind the chief phases through which German literature has passed in the same period, viz., (1) naturalism, not the uncompromising and aggressive naturalisin of Holz and Schlaf, but a mitigated and domesticated species; (2) neo-romanticism, which from about 1910 was also made to suit the average public; and finally (3) expressionism, a movement that is opposed to, and yet is linked up with its predecessors.

There are three distinct periods in modern Austrian literature. In the first period are to be found those authors who in the '80s and '90s laid the foundations of the Austrian "Moderne" on the basis of realistic or neo-romantic principles. These men have either completed their life-work or at least are not likely to reveal any new features, although their former leader, Hermann Bahr, was a perfect Proteus in versatility. There are, secondly, those writers who, bet een 1900 and the World War, represented various aspects or combinations of realism and romanticism; and lastly, the authors of the war and post-war period; most of them, but not all, influenced by expressionism.

Lyrics.—Leadership among the "old moderns" may be awarded to Hugo Hofmannsthal. He is pre-eminent in the school originated by the Rhinelander Stefan George in opposition to the crude naturalism of the early '90s. His style may best be conceived by thinking of him as a reincarnation of Swinburne. There is the same exuberance of language, the same gorgeous imagery, the same quest for subtle beauty and the same interest in complicated or abnormal psychical phenomena, but blended with an elegant weariness, an aristocratic aloofness from everyday matters.

The next group consists of lyric poets, more or less under the influence of Hofmannsthal: Wladimir Hartlieb, Hans Muller, Alfred Grunewald, Stefan Zweig, Otto Hauser, Felix Braun, Paul Wertheimer, Max Mell and the passionate Anton Wildgans. But the third group follows the banner of expressionism, and is characterized by deliberate disregard of the laws of logic and of metre, and an all-embracing love of the universe and of mankind as a part of it, reminiscent of Whitman and the French unanimists.

Albert Ehrenstein, Franz Werfel, Georg Trakl (d 1914), Karl Schossleitner, Friedrich Schreyvogl, the painter Uriel Birnbaum may be mentioned here; and there is a certain affinity in matter and thought between their poems and those of the powerful satirist, Karl Kraus, and of the labour poet, Alfons Petzold (d. 1923), although in age both belong to an earlier period, as well as Peter Altenberg (d. 1919), equally original in life and art, whose short "prose poems" sometimes possess an irresistible charm and a childlike wisdom. A somewhat similar form has been adopted by the eminent thinker Josef Popper-Lynkeus (d. 1921).

Independent of these groups are Richard Kralik, Karl F. Ginzkey, Richard Schaukal, the religious poetess Enrica Handel-Mazzetti, Erika Spann-Rheinsch, and the Tyrolese poets Arthur Wallpach, Karl Dallago, Heinrich Schullern, all belonging to the school of the old romantics rather than to the new.

The Novel.—Here, too. the "moderns" of the '90s have held their own with their juniors. In the forefront have been Arthur Schnitzler (1862–1931) and Jacob Wassermann (1873–1934). Both these writers mastered the technique of fiction, and never quite lost touch with naturalism. The novels of both deal especially with the modern life of great cities, Schnitzler devoting himself chiefly to personal problems, Wassermann, with no common imaginative power, to social questions, too. Among Schnitzler's rivals were: Bahr, Raoul Auernheimer, Felix Salten, Hans Müller, Paul Zifferer, Robert Musil and among the younger generation, Ernst Lothar; while Otto Stoessl's measured and thoughtful style is somewhat reminiscent of Wassermann.

The next group, which appeared about 1908, adopted an attitude of tacit or outspoken opposition to the Schnitzler school; the scenes of their novels are laid for the most part, not in Vienna, but in the provinces, and the leader of this "Kailyard" movement was Rudolf Hans Bartsch of Styria, an emotional writer with a fervid imagination and a florid, sometimes ecstatic style, a master in word painting of landscapes. He had numerous followers, who shared his power of giving speech to nature, and his sympathy with the life of the countryside and the provinces. These were Ginzkey, Karl H. Strobl, Franz Nabl, Robert Hohlbaum, Josef F. Perkonig, Gustav Renker, Hans Sterneder, Hans Hammerstein, Paula Grogger—and again a separate group of Tyrolese: Hans Hoffensthal (d. 1915), Dallago, Schullern, Albert Trentini.

The historical fiction of Austria, after having been boycotted by "thoroughgoing" naturalism, received a fresh impetus before the war from the philosophic writers, Erwin G. Rolbenheyer and Emil Lucka—both excelling in technique, vividness of style and depth of thought. It was also influenced by the devout Handel-Mazzetti and the learned Otto Hauser—and in their wake Alma J. Koenig, Hermann Graedener, Braun and Egmont Colerus have followed. Hohlbaum wrote successful novels giving, if considered as a series, the historical development of the German "Geist." The last generation of novelists, the writers of the war and post-war period, are characterized either by weary resignation, or by passionate negation or assertion of the life force. Spiritualism, occultism and religion have become fashionable again, and are trying to find expression in novels of terror and in Wellsian Utopias. Otto Soyka, Franz Spunda, Paul Busson (d. 1924), Franz Rebiczek and Rudolf J. Kreutz, a no-more-war novelist, may be included in this category. The eminent proswork of Kraus, begun as early as 1899, stands apart from the main stream.

Drama.—During the period under review the naturalism of the Schnitzler school and the new romantic or neo-baroque style of Hofmannsthal had to share the leadership with the primitive strength of the Tyrolese dramatist, Karl Schonherr Society comedy, gracefully discussing erotic problems, continued to be cultivated in the Schnitzler manner by Bahr, Salten, Müller, Wertheimer, Auernheimer, the Shaw apostle Siegfried Trebitsch and Kurt Frieberger; and, later, by Hofmannsthal too. On the other hand. Mell and Georg Terramare attempted to revive the mediaeval morality play, suggested by Hofmannsthal's arrangement of *Everyman* in 1912. Otherwise the neo-romantic drama shows only a scant harvest (Richard Beer-Hofmann, Braun, Zweig, Colerus). Next to Schönherr's super-realistic plays are to be mentioned the dramas of Wildgans, whose style indicates clearly the transition from unrelentingly cruel naturalism to ecstatic expressionism. This reaction, directed against the mere exact rendering of visual and acoustic phenomena as well as against the academic and somewhat anaemic ideals of the neo-romantics, was begun in the pre-war empire and eagerly followed in post-war Austria; it restored and enhanced the poet's ego and liberated the drama from all the conventions hitherto determining form and subject. The young dramatists Arnolt Bronnen, Franz Th. Csokor, Oskar M. Fontana, Hans Kaltneker (d. 1919), Walter Eidlitz, Otto Marbach, Friedrich Lichtnecker, Richard Billinger, Alexander Lernet-Holenia, are all followers of this school, in which Werfel shines by creative power.

The Vienna Burgtheater, which formerly gave the lead to theatrical and, in some degree, to dramatic art in Germany, had already been deprived of its hegemony before 1900, and now has a dangerous rival in Max Reinhardt's *Theater* in *Der Josefstadt*. The annual summer festivals in Salzburg are also due to Reinhardt's initiative.

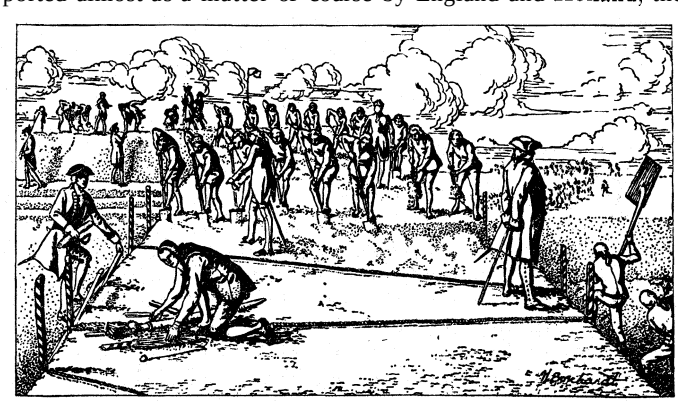
AUSTRIAN SUCCESSION, WAR OF THE (1740–1748). This war began with the invasion of Silesia by Frederick II. of Prussia in 1740, and was ended by the peace of Aix-la-Chapelle (Aachen) in 1748. After 1741 nearly all the powers of Europe were involved in the struggle, but the most enduring interest of the war lies in the struggle of Prussia and Austria for Silesia. South-west Germany, the Low Countries and Italy were, as usual, the battle-grounds of France and Austria. The constant allies of France and Prussia were Spain and Bavaria; various other powers at intervals joined them. The cause of Austria was supported almost as a matter of course by England and Holland, the traditional enemies of France. Of Austria's allies from time to time Sardinia and Saxony were the most important.



PRUSSIAN SOLDIERS CONSTRUCTING FORTIFICATIONS. FROM ADOLPHE MENZEL'S ILLUSTRATIONS TO FREDERICK THE GREAT'S "HISTOIRE DE MON TEMPS"

1. Frederick's Invasion of Silesia, 1740.—Prussia in 1740, was a small, compact and thoroughly organized power, with an army 100,000 strong. The only recent war service of this army had been in the desultory Rhine campaign of 1733–35. It was therefore regarded as one of the minor armies of Europe, and few thought that it could rival the forces of Austria and France. But it was drilled to a perfection not hitherto attained, and the Prussian infantry soldier was so well trained and equipped that he could fire five shots to the Austrian's three, though the cavalry and artillery were less efficient. But the initial advantage of Frederick's army was that it had, undisturbed by wars, developed the standing army theory to full effect. While the Austrians had to

wait for drafts to complete the field forces, Prussian regiments could take the field at once, and thus Frederick was able to overrun Silesia almost unopposed. His army was concentrated quietly upon the Oder, and without declaration of war, on Dec. 16, 1740, it crossed the frontier into Silesia. The Austrian generals could do no more than garrison a few fortresses, and with the small remnant of their available forces fell back to the mountain frontier of Bohemia and Moravia. The Prussian army was soon able to go into winter quarters, holding all Silesia and investing the strong places of Glogau, Brieg and Neisse.

2. **Silesian** Campaign of 1741.—In Feb. 1741 the Austrians collected a field army under Count Neipperg (1684–1774) and made preparations to reconquer Silesia. The Austrians in Neisse and Brieg still held out. Glogau, however, was stormed on the night of March 9, the Prussians, under Prince Leopold (the younger) of Anhalt-Dessau, executing their task in one hour with a mathematical precision which excited universal admiration. But the Austrian army in Moravia was now in the field, and Frederick's cantonments were dispersed over all Upper Silesia. It was a work of the greatest difficulty to collect the army, for the ground was deep in snow, and before it was completed Neisse was relieved and the Prussians cut off from their own country by the march of Neipperg from Neisse on Brieg; a few days of slow manoeuvring between these places ended in the battle of Mollwitz (April 10, 1741), the first pitched battle fought by Frederick and his army. The Prussian right wing of cavalry was speedily routed, but the day was retrieved by the magnificent discipline and tenacity of the infantry. The Austrian cavalry was shattered in repeated attempts to ride them down, and before the Prussian volleys the Austrian infantry, in spite of all that Neipperg and his officers could do, gradually melted away. After a stubborn contest the Prussians remained masters of the field. Frederick himself was far away. He had fought in the cavalry mêlée, but after this, when the battle seemed lost, he had been persuaded by Field-Marshal Schwerin to ride away. Schwerin thus, like Marshal Saxe at Fontenoy, remained behind to win the victory, and the king narrowly escaped being captured by wandering Austrian hussars. The immediate result of the battle was that the king secured Brieg, and Neipperg fell back to Neisse, where he maintained himself and engaged in a war of manoeuvre during the summer. But Europe realized suddenly that a new military power had arisen, and France sent Marshal Belleisle to Frederick's camp to negotiate an alliance. Thenceforward the "Silesian adventure" became the War of the Austrian Succession. The elector of Bavaria's candidature for the imperial dignity was to be supported by a French "auxiliary" army, and other French forces were sent to observe Hanover. Saxony was already watched by a Prussian army under Prince Leopold of Anhalt-Dessau, the "old Dessauer," who had trained the Prussian army to its present perfection. The task of Sweden was to prevent Russia from attacking Prussia, but her troops were defeated, on Sept. 3, 1741, at Wilmanstrand by a greatly superior Russian army, and in 1742 another great reverse was sustained in the capitulation of Helsingfors. In central Italy an army of Neapolitans and Spaniards was collected for the conquest of the Milanese.

3. **The** Allies in Bohemia.—The French duly joined the elector's forces on the Danube and advanced on Vienna; but the objective was suddenly changed, and after many counter-marches the allies advanced, in three widely separated corps, on Prague. A French corps moved via Amberg and Pilsen. The elector marched on Budweis, and the Saxons (who had now joined the allies) invaded Bohemia by the Elbe valley. The Austrians could at first offer little resistance, but before long a considerable force intervened at Tabor between the Danube and the allies, and Neipperg was now on the march from Neisse to join in the campaign. He had made with Frederick the curious agreement of Klein Schnellendorf (Oct. 9, 1741), by which Neisse was surrendered after a mock siege, and the Austrians undertook to leave Frederick unmolested in return for his releasing Neipperg's army for service elsewhere. At the same time the Hungarians, moved to enthusiasm by the personal appeal of Maria Theresa, had put into the field a *levée* en *masse*, or "insurrection," which furnished the regular army with an invaluable force of light troops. A fresh army was collected under Field-Marshal Khevenhiiller at Vienna, and the Austrians planned an offensive winter campaign against the Franco-Bavarian forces in Bohemia and the small Bavarian army that remained on the Danube to defend the electorate. The French in the meantime had stormed Prague on Nov. 26, the Grand-duke Francis, consort of Maria Theresa, who commanded the Austrians in Bohemia, moving too slowly to save the fortress The elector of Bavaria, who now styled himself archduke of Austria, was crowned king of Bohemia (Dec. 19, 1741) and elected to the imperial throne as Charles VII. (Jan. 24, 1742), but no active measures were undertaken. In Bohemia the month of December was occupied in mere skirmishes. On the Danube, Khevenhuller, the best general in the Austrian service, advanced on Dec. 27, swiftly drove back the allies, shut them up in Linz, and pressed on into Bavaria. Munich itself surrendered to the Austrians on the coronation day of Charles VII. At the close of this first act of the campaign the French, under the old Marshal de Broglie, maintained a precarious foothold in central Bohemia, menaced by the main army of the Austrians, and Rhevenhuller was ranging unopposed in Bavaria, while Frederick, in pursuance of his secret obligations, lay inactive in Silesia. In Italy the allied Neapolitans and Spaniards had advanced towards Modena, the duke of which state had allied himself with them, but the vigilant Austrian commander Count Traun had outmarched them, captured Modena and forced the duke to make a separate peace.

4. Campaign of **1742.**—Frederick had hoped by the truce to secure Silesia, for which alone he was fighting. But with the successes of Khevenhuller and the enthusiastic "insurrection" of Hungary, Maria Theresa's opposition became firmer, and she divulged the provisions of the truce, in order to compromise Frederick with his allies. The war recommenced. Frederick had not rested on his laurels; in the uneventful summer campaign of 1741 he had found time to begin that reorganization of his cavalry which was before long to make it even more efficient than his infantry. Charles VII., whose territories were overrun by the Austrians, asked him to create a diversion by invading Moravia. In Dec. 1741, therefore, Schwerin had crossed the border and captured Olmutz. Glatz also was invested, and the Prussian army was concentrated about Olmutz in Jan. 1742 A combined plan of operations was made by the French, Saxons and Prussians for the rescue of Linz. But Linz soon fell; Broglie on the Moldau, weakened by the departure of the Bavarians to oppose Khevenhuller, and of the Saxons to join forces with Frederick, was in no condition to take the offensive, and large forces under Prince Charles of Lorraine lay in his front from Budweis to Iglau. Frederick's march was made towards Iglau in the first place. Brunn was invested about the same time (February), but the direction of the march was changed, and instead of moving against Prince Charles, Frederick pushed on southwards by Znaim and Nikolsburg. The extreme outposts of the Prussians appeared before Vienna. But Frederick's advance was a mere foray, and Prince Charles. leaving a screen of troops in front of Broglie, marched to cut off the Prussians from Silesia, while the Hungarian levies poured into Upper Silesia by the Jablunka Pass. The Saxons, discontented and demoralized, soon marched off to their own country, and Frederick with his Prussians fell back by Zwittau and Leutomischl to Kuttenberg in Bohemia, uhere he was in touch with Broglie on the cine hand and (Glatz having now surrendered) with Silesia on the other. No defence of Olmutz was attempted, and the small Prussian corps remaining in Moravia fell back towards Upper Silesia Prince Charles, in pursuit of the king, marched by Iglau and Teutsch (Deutsch) Brod on Kuttenberg, and on May 17 was fought the battle of Chotusitz or Czaslau, in which after a severe struggle the king was victorious. His cavalry on this occasion retrieved its previous failure, and its conduct gave an earnest of its future glory not only by its charges on the battlefield, but its vigorous pursuit of the defeated Austrians. Almost at the same time Broglie fell upon a part of the Austrians left on the Moldau and won a small, but morally and politically important, success in the action of Sahay, near Budweis (May 24, 1742). Frederick did not propose another combinecl movement. His victory and

that of Broglie disposed Maria Theresa to cede Silesia in order to make good her position elsewhere, and the separate peace between Prussia and Austria, signed at Breslau on June 11, closed the First Silesian War. The War of the Austrian Succession continued.

5. **The French at** Prague. — The return of Prince Charles, released by the peace of Breslau, put an end to Broglie's offensive. The prince pushed back the French posts everywhere, and his army converged upon Prague, where, towards the end of June 1742, the French were to all intents and purposes surrounded. Broglie had made the best resistance possible with his inferior forces, and still displayed great activity, but his position was one of great peril. The French Government realized at last that it had given its general inadequate forces. The French army on the lower Rhine, hitherto in observation of Hanover and other possibly hostile states, was hurried into Franconia. Prince Charles at once raised the siege of Prague (Sept. 14), called up Khevenhuller with the greater part of the Austrian army on the Danube, and marched towards Amberg to meet the new opponent. Marshal Maillebois (1682–1762), its commander, then manoeuvred from Amberg towards the Eger valley, to gain touch with Broglie. Marshal Belle-Isle, the political head of French affairs in Germany and a very capable general, had accompanied Broglie throughout, and it seems that Belle-Isle and Broglie believed that Maillebois' mission was to regain a permanent foothold for the army in Bohemia; Mailiebois, on the contrary, conceived that his work was simply to disengage the army of Broglie from its dangerous position, and to cover its retreat. His operations were no more than a demonstration, and had so little effect that Broglie was sent for in haste to take over the command from him, Belle-Isle at the same time taking over charge of the army at Prague. Broglie's command was now on the Danube, east of Regensburg, and the imperial (chiefly Bavarian) army of Charles VII. under Seckendorf aided him to clear Bavaria of the Austrians. This was effected with ease, for Khevenhüller and most of his troops had gone to Bohemia. Prince Charles and Khevenhuller now took post between Linz and Passau, leaving a strong force to deal with Belle-Isle in Prague. This, under Prince Lobkowitz, was little superior in numbers or quality to the troops under Belle-Isle, under whom served Saxe and the best of the younger French generals, but its light cavalry swept the country clear of provisions. The French were quickly on the verge of starvation, winter had come, and the marshal resolved to retreat. On the night of Dec. 16, 1742, the army left Prague to be defended by a small garrison under Chevert, and took the route of Eger. The retreat (Dec. 16–26) was accounted a triumph of generalship, but the weather made it painful and costly. The brave Chevert displayed such confidence that the Austrians were glad to allow him freedom to join the main army. The cause of the new emperor was now sustained only in the valley of the Danube, where Broglie and Seckendorf opposed Prince Charles and Khevenhiiller, who were soon joined by the force lately opposing Belle-Isle.

In Italy, Traun held his own with ease against the Spaniards and Neapolitans. Naples was forced by a British squadron to withdraw her troops for home defense, and Spain, now too weak to advance in the Po valley, sent a second army to Italy via France. Sardinia had allied herself with Austria, and at the same time neither State was at war with France, and this led to curious complications, combats being fought in the Isère valley between the troops of Sardinia and of Spain, in which the French took no part.

6. **The Campaign of** 1743 opened disastrously for the emperor. The French and Bavarian armies were not working well together, and Broglie and Seckendorf had actually quarrelled. No connected resistance was offered to the converging march of Prince Charles's army along the Danube, Khevenhuller from Salzburg towards southern Bavaria, and Prince Lobkowitz (1685–1755) from Bohemia towards the Naab. The Bavarians suffered a severe reverse near Braunau (May 9, 1743), and now an Anglo-allied army commanded by King George II., which had been formed on the lower Rhine on the withdrawal of Maillebois, was advancing southward to the Main and Neckar country. A French army, under Marshal Noailles, was being collected on the middle Rhine to deal with this new force. But Broglie was now in full retreat, and the strong places of Bavaria surrendered one after the other to Prince Charles. The French and Bavarians had been driven almost to the Rhine when Noailles and the king came to battle. George, completely outmanoeuvred by his veteran antagonist, was in a position of the greatest danger between Aschaffenburg and Hanau in the defile formed by the Spessart Hills and the river Main. Noailles blocked the outlet and had posts all around, but the allied troops forced their way through and inflicted heavy losses on the French, and the battle of Dettingen is justly reckoned as a notable victory of the British arms (June 27). Both Broglie, who, worn out by age and exertions, was soon replaced by Marshal Coigny (1670–1759), and Noailles were now on the strict defensive behind the Rhine. Not a single French soldier remained in Germany, and Prince Charles prepared to force the passage of the great river in the Breisgau while the king of England moved forward via Mainz to co-operate by drawing upon himself the attention of both the French marshals. The Anglo-allied army took Worms, but, after several unsuccessful attempts to cross, Prince Charles went into winter quarters. The king followed his example, drawing in his troops to the northward, to deal, if necessary, with the army which the French were collecting on the frontier of Flanders. Austria, England, Holland and Sardinia were now allied. Saxony changed sides and Sweden and Russia neutralized each other (peace of Åbö, August 1743) Frederick was still quiescent; France, Spain and Bavaria alone continued actively the struggle against Maria Theresa.

In Italy, the Spaniards on the Panaro had achieved a Pyrrhic victory over Traun at Campo Santo (Feb. 8, 1743), but the next six months were wasted in inaction, and Lobkowitz, joining Traun with reinforcements from Germany, drove back the enemy to Rimini. The Spanish-Piedmontese war in the Alps continued without much result, the only incident of note being a combat at Casteldelfino won by the king of Sardinia in person.

7. **Campaign of** 1744. — With 1744 began the Second Silesian War. Frederick, disquieted by the universal success of the Austrian cause, secretly concluded a fresh alliance with Louis XV. France had posed hitherto as an auxiliary, her officers in Germany had worn the Bavarian cockade, and only with England was she officially at war. She now declared war direct upon Austria and Sardinia (April 1744). A corps was assembled at Dunkirk to support the cause of the Pretender in Great Britain, and Louis in person, with 90,000 men, prepared to invade the Austrian Netherlands, and took Menin and Ypres. His presumed opponent was the allied army previously under King George and composed of English, Dutch, Germans and Austrians. On the Rhine, Coigny was to make head against Prince Charles, and a fresh army under the prince de Conti was to assist the Spaniards in Piedmont and Lombardy. This plan was, however, at once dislocated by the advance of Charles, who, assisted by the veteran Traun, skilfully manoeuvred his army over the Rhine near Philipsburg (July 1), captured the lines of Weissenburg, and cut off the French marshal from Alsace. Coigny, however, cut his way through the enemy at Weissenburg and posted himself near Strasbourg. Louis XV. now abandoned the invasion of Flanders, and his army moved down to take a decisive part in the war in Alsace and Lorraine. At the same time Frederick crossed the Austrian frontier (August).

The attention and resources of Austria were fully occupied, and the Prussians were almost unopposed. One column passed through Saxony, another through Lusatia, while a third advanced from Silcsia. Prague, the objective, was reached on Sept. 2. Six days later the Austrian garrison was compelled to surrender, and the Prussians advanced to Budweis. Maria Theresa once again rose to the emergency, a new "insurrection" took the field in Hungary, and a corps of regulars was assembled to cover Vienna, while the diplomatists won over Saxony to the Austrian side. Prince Charles withdrew from Alsace, unmolested by the French, who had been thrown into confusion by the sudden and dangerous illness of Louis XV. at Metz. Only Seckendorf with the Bavarians pursued him. No move was made by the French, and Frederick thus found himself after all isolated and exposed to the combined attack of the Austrians and Saxons, Marshal Traun, summoned from the

Rhine, held the king in check in Bohemia, the Hungarian irregulars inflicted numerous minor reverses on the Prussians, and finally Prince Charles arrived with the main army. The campaign resembled that of 1742; the Prussian retreat was closely watched, and the rearguard pressed hard. Prague fell, and Frederick, completely outmanoeuvred by the united forces of Prince Charles and Traun, regained Silesia with heavy losses. At the same time, the Austrians gained no foothold in Silesia itself. On the Rhine, Louis, now recovered, had besieged and taken Freiburg, after which the forces left in the north were reinforced and besieged the strong places of Flanders. There was also a slight war of manoeuvre on the middle Rhine.

In 1744 the Italian war became for the first time serious. A grandiose plan of campaign was formed, and as usual the French and Spanish generals at the front were hampered by the orders of their respective governments. The object was to unite the army in Dauphiné with that on the lower Po. The adhesion of Genoa was secured, and a road thereby obtained into central Italy. But Lobkowitz had already taken the offensive and driven back the Spanish army of Count de Gages towards the Neapolitan frontier. The king of Naples at this juncture was compelled to assist the Spaniards at all hazards. A combined army was formed at Velletri, and defeated Lobkowitz there on Aug. 11. The crisis past, Lobkowitz then went to Piedmont to assist the king against Conti, the king of Naples returned home, and de Gages followed the Austrians with a weak force. The war in the Alps and the Apennines was keenly contested. Villefranche and Montalban were stormed by Conti on April 20, a desperate fight took place at Peyre-Longue on July 18, and the king of Sardinia was defeated in a great battle at Madonna del Olmo (Sept. 30) near Coni (Cuneo). Conti did not, however, succeed in taking this fortress, and had to retire into Dauphiné for his winter quarters. The two armies had, therefore, failed in their attempt to combine, and the Austro-Sardinians still lay between them.

8. Campaign of 1745.—The interest of the next campaign centres in the three greatest battles of the war—Hohenfriedberg, Kesselsdorf and Fontenoy. The first event of the year was the Quadruple Alliance of England, Austria, Holland and Saxony, concluded at Warsaw on Jan. 8. Twelve days previously, the death of Charles VII. submitted the imperial title to a new election, and his successor in Bavaria was not a candidate. The Bavarian army was again unfortunate; caught in its scattered winter quarters (action of Amberg, Jan. 7), it was driven from point to point, and the young elector had to abandon Munich once more. The peace of Fiissen followed on April 22, by which he secured his hereditary states on condition of supporting the candidature of the grand-duke Francis, consort of Maria Theresa. The "imperial" army ceased *ipso facto* to exist, and Frederick was again isolated. No help was to be expected from France, whose efforts this year were centred in the Flanders campaign. In effect, on May 10, before Frederick took the field, Louis XV. and Saxe had besieged Tournay, and inflicted upon the relieving army of the duke of Cumberland the great defeat of Fontenoy (*q.v.*). In Silesia the customary small war had been going on for some time, and the concentration of the Prussian army was not effected without severe fighting. At the end of May, Frederick, with about 65,000 men, lay in the camp of Frankenstein, between Glatz and Neisse, while behind the Riesengebirge about Landshut Prince Charles had 85,000 Austrians and Saxons. On June 4 mas fought the battle of Hohenfriedberg (*q.v.*) or Striegau, the greatest victory as yet of Frederick's career, and, of all his battles, excelled perhaps by Leuthen and Rossbach only. Prince Charles suffered a complete defeat and withdrew through the mountains as he had come. Frederick's pursuit was methodical, for the country was difficult and barren, and he did not know the extent to which the enemy was demoralized. The manoeuvres of both leaders on the upper Elbe occupied all the summer, while the political questions of the imperial election and of an understanding between Prussia and England were pending. The chief efforts of Austria were directed towards the valleys of the Main and Lahn and Frankfort, where the French and Austrian armies manoeuvred for a position from which to overawe the electoral body. Marshal Traun was successful, and the grand-duke became the Emperor Francis I. on Sept. 13. Frederick agreed with England to recognize the election a few days later, but Maria Theresa would not conform to the Treaty of Breslau without a further appeal to the fortune of war. Saxony joined in this last attempt. A new advance of Prince Charles quickly brought on the battle of Soor, fought on ground destined to be famous in the war of 1866. Frederick was at first in a position of great peril, but his army changed front in the face of the advancing enemy and by its boldness and tenacity won a remarkable victory (Sept. 30). But the campaign was not ended. An Austrian contingent from the Main joined the Saxons under Marshal Rutowski, and a combined movement was made in the direction of Berlin by Rutowski from Saxony and Prince Charles from Bohemia. The danger was very great. Frederick hurried up his forces from Silesia and marched as rapidly as possible on Dresden, winning the actions of Katholisch-Hennersdorf (Nov. 24) and Gorlitz (Nov. 25). Prince Charles was thereby forced back, and now a second Prussian army under the old Dessauer advanced up the Elbe from Magdeburg to meet Rutowski. The latter took up a strong position at Resselsdorf between Meissen and Dresden, but the veteran Leopold attacked him directly and without hesitation (Dec. 14). The Saxons and their allies were completely routed after a hard struggle, and Maria Theresa at last gave way. In the peace of Dresden (Dec. 25) Frederick recognized the imperial election, and retained Silesia, as at the peace of Breslau.

g. Operations in Italy, 1745–1747.—The campaign in Italy this year was also no mere war of posts. In March 1745 a secret treaty allied the Genoese republic with France, Spain and Naples. A change in the command of the Austrians favoured the first move of the allies. De Gages moved from Modene towards Lucca, the French and Spaniards in the Alps under Marshal Maillebois advanced through the Riviera to the Tanaro, and in the middle of July the two armies were at last concentrated between the Scrivia and the Tanaro, to the unusually large number of 80,000. A swift march on Piacenza drew the Austrian commander thither, and in his absence the allies fell upon and completely defeated the Sardinians at Bassignano (Sept. 27), a victory which was quickly followed by the capture of Alessandria, Valenza and Casale. Jomini calls the concentration of forces which effected the victory "le plus rémarquable de toute la guerre." But the complicated politics of Italy brought it about that Maillebois was ultimately unable to turn his victory to account. Indeed, early in 1746, Austrian troops, freed by the peace with Frederick, passed through Tirol into Italy; the Franco-Spanish winter quarters were brusquely attacked, and a French garrison of 6,000 men at Asti was forced to capitulate,. At the same time Count Browne with an Austrian corps struck at the allies on the lower Po, and cut off their communication with the main body in Piedmont. A series of minor actions thus completely destroyed the great concentration. The allies separated, Maillebois covering Liguria, the Spaniards marching against Browne. The latter was promptly and heavily reinforced, and all that the Spaniards could do was to entrench themselves at Piacenza; the Spanish Infant as supreme commander calling up hfaillcbois to his aid. The French, skilfully conducted and marching rapidly, joined forces once more, but their situation was critical, for only two marches behind them the army of the king of Sardinia was in pursuit, and before them lay the principal army of the Austrians. The pitched battle of Piacenza (June 16) was hard fought, and Maillebois had nearly achieved a victory when orders from the Infant compelled him to retire. That the army escaped at all was in the highest degree creditable to Maillebois and to his son and chief of staff, under whose leadership it eluded both the Austrians and the Sardinians, defeated an Austrian corps in the battle of Rottofreddo (Aug. 12), and made good its retreat on Genoa. It was, however, a mere remnant of the allied army which returned, and the Austrians were soon masters of north Italy, including Genoa (September). But they met with no success in their forays towards the Alps. Soon Genoa revolted from the oppressive rule of the victors, rose and drove out the Austrians (Dec. 5–11), and the French, now commanded by Belleisle, took the offensive (1747). Genoa held out against a second Austrian siege, and after the plan of campaign

had as usual been referred to Paris and Madrid, it was relieved, though a picked corps of the French army under the chevalier de Belleisle, brother of the marshal, was defeated in the almost impossible attempt (July 19) to storm the entrenched pass of Exiles (Col di Assietta), the chevalier, and with him the *élite* of the French nobility, being killed at the barricades. Before the steady advance of Marshal Belleisle the Austrians retired into Lombardy and a desultory campaign was waged up to the conclusion of peace.

In North America the most remarkable incident of what has been called "King George's War" was the capture of the French Canadian fortress of Louisburg by a British expedition (April 29–June 16, 1745), of which the military portion was furnished by the colonial militia under Col. (afterwards Lieut.-Gen. Sir William) Pepperell (1696–1759) of Maine. Louisburg was then regarded merely as a nest of privateers, and at the peace it was given up, but in the Seven Years' War it came within the domain of grand strategy, and its second capture was the preliminary step to the British conquest of Canada. For the war in India, *see* INDIA: *History*.

10. **Later** Campaigns. — The last three campaigns of the war in the Netherlands were illuminated by the now fully developed genius of Marshal Saxe. After Fontenoy the French carried all before them. The withdrawal of most of the English to aid in suppressing the 'Forty-five rebellion at home left their allies in a helpless position. In 1746 the Dutch and the Austrians were driven back towards the line of the Meuse, and most of the important fortresses were taken by the French. The battle of Roucoux (or Raucourt) near Liége, fought on Oct. 11 between the allies under Prince Charles of Lorraine and the French under Saxe, resulted in a victory for the latter. Holland itself was now in danger, and when in April 1747 Saxe's army, which had now conquered the Austrian Netherlands up to the Meuse, turned its attention to the United Provinces, the old fortresses on the frontier offered but slight resistance. The prince of Orange and the duke of Cumberland underwent a severe defeat at Lauffeld on July 2, 1747, and Saxe, after his victory, promptly and secretly despatched a corps under Lowendahl to besiege Bergen-op-Zoom. On Sept. 18 Bergen-op-Zoom was stormed by the French, and in the last year of the war Maestricht, attacked by the entire forces of Saxe and Lowendahl, surrendered on May 7, 1748. A large Russian army arrived on the Meuse to join the allies, but too late to be of use. The quarrel of Russia and Sweden had been settled by the peace of Abo in 1743, and in 1746 Russia had allied herself with Austria. Eventually a large army marched from Moscow to the Rhine, an event which was not without military significance, and in a manner preluded the great invasiops of 1813–14 and 1815. The general peace of Aix-la-Chapelle (Aachen) was signed on Oct. 18, 1748.

NAVAL OPERATIONS

The naval operations of this war are entangled with those of the Spanish War which broke out in 1739 in consequence of long-standing disputes between England and Spain in the West Indies. The British navy, after a long period of neglect during Walpole's administration, was in an unsatisfactory condition, and this, coupled with the lack of interest displayed by France and Spain in any but the continental aspects of the war, explains the languid nature of the movements at sea, for the greater part of the war at any rate.

It was believed in England that the Spanish colonies had only to be attacked to be captured, and a plan was laid for conducting combined operations against them from east and west. One force, under Admiral Vernon, was to attack them in the West Indies, while another, commanded by Commodore, afterwards Lord Anson was to fall upon the Pacific Coast. Delays and bad administration caused the failure of a hopeful scheme. In Nov. 1739 Vernon did succeed in capturing Porto Bello, but he had to wait a long time for the reinforcements necessary for an attack on Cartagena which was not carried out till March of the next year. The delay had given the Spanish admiral time to prepare, and Vernon was further handicapped by the near approach of a French force, the neutrality of which, in view of the growing hostility between England and France, could not be relied on, and by some impatience of, if not incapacity for, combined operations. He was thus unable to give his undivided attention to Cartagena, as he would have liked, with the result that the siege failed, and the war in the West Indies, except for isolated instances, died down till 1748. Anson also suffered from the effects of maladministration. His ships numbered six only and were ill-found. He left England in Sept. 1740 and returned in July 1744 with the "Centurion," carrying his broad pendant, alone. His other ships had either failed to round the Horn or had been lost, but he himself had harried the west coast of Spanish America, captured an immensely rich Spanish treasure-ship near the Philippines, and circumnavigated the globe.

In the meantime a Spanish fleet which was to conduct an army to Italy was fitting out at Cadiz whence it sailed and joined with a French squadron under M. de Court (Dec. 1741). This combined fleet was shortly faced by a British squadron which had failed to blockade the Spaniards in Cadiz, and which now hesitated to attack when the French admiral, though England and France were not yet at war, declared that he would support his Spanish allies, if necessity arose. The combined fleet eventually put into Toulon, where they were watched by a British squadron, while England and France gradually drifted into war, the declaration of which was actually anticipated by a collision between the fleets. As England regarded herself more and more as the ally of Austria, feeling against the French naturally increased, and the cutting of communications between Toulon and north Italy thus became a matter of more urgent necessity. So when M. de Court was ordered out of Toulon in Feb. 1744 to maintain these communications, the British admiral, Thomas Mathews, decided to attack him. The subsequent battle was most unsatisfactory from the British standpoint. Lestock, the second-in-command, who was on bad terms with Mathews, failed to engage the enemy, afterwards alleging that his commander's orders were contradictory and incomprehensible. After damaging the British, the Allies broke off the action, and such a storm of dissension broke out amongst the former that the vital issues in the Mediterranean became obscured by a multitude of courts martial.

In the same month the French tried to put into effect an invasion scheme which had been prepared in consultation with Jacobite leaders. Like many others, it failed, though on this occasion the omens were more than usually favourable. A French force of 20 sail actually got to sea before the British fleet in the channel was ready to meet it, but the winter gales militated against success, and the French admiral was without correct knowledge of his adversary's whereabouts. He came up nearly as far as the Downs, but finding himself faced by Admiral Norris, with a fleet of 25, he immediately retreated, and nothing further was heard of the military expedition waiting for his protection at Dunkirk.

At this time the British were joined by the Dutch (an accession to their naval strength that was welcome but not large) and

in 1745 Commodore Sir Peter Warren, with Sir William Pepperrell and an American volunteer force, conducted highly successful combined operations against Louisburg in Cape Breton Isle, capturing it, and thus threatening the French position in Canada. Unfortunately, as a set-off to this, in the East Indies Mahé de la Bourdonnais, making vigorous use of a small squadron to which the British opposed no very effective resistance, captured Madras (1746), and made the British position in India exceedingly uncomfortable, while in the same year a British combined naval and military expedition, which was to attempt the capture of the French East India Company's dockyard at L'Orient, failed to attain its object. In the closing years of the war, however, England made better use of her opportunities. A closer watch was kept on communications between France and her American possessions, which led to two successful sea-fights off Finisterre in 1747, which did something to atone for the earlier failures. In May Anson, with 14 ships, met a French convoy protected by a force of similar size, but including some inferior ships, under La' Jonquière. Most of the convoy escaped under cover of night, but Anson, chasing the protecting ships, accounted for them all. In October Admiral Sir Edward Hawke, who had first attracted notice by capturing the only prize at Toulon, now in command of 14 ships, came upon another French convoy, protected by Admiral L'Entenduère with nine battleships. The French admiral ordered the convoy to scatter, while he attempted to cover their retreat. Hawke, signalling the general chase, came up with him and sank or took six of his battleships. The merchant ships escaped, but arrived unprotected in the West Indies where the British were on the look-out for them, acting on information sent out by Hawke. Most of them were captured. These disasters convinced the French of their helplessness at sea, and they made no further effort.

The last naval operations of the war took place in the West Indies where the British and Spanish were trying to intercept one another's trade, while protecting their own, the former being particularly anxious to seize the richly-laden homewardbound convoys of the latter, and to break through their monopoly. In the course of such movements an English squadron under Sir Charles Knowles encountered a Spanish force under Admiral Regio in the Bahama Channel (Oct. 1748), and a somewhat indecisive action followed in which Knowles could claim the advantage. Had he been able to follow up this partial success with vigour, Spanish trade might have found itself in an unpleasant position, but he was prevented from this by the news that peace had been signed in Europe. England could claim to have established a definite superiority at sea, but unfortunately this was counter-balanced by France's conquests in India and her military successes in Flanders, while from Spain hardly anything had been taken. England handed over Louisburg in exchange for Madras, and the French evacuated the Netherlands.

This war was remarkable for privateering activity carried on at home and in more distant waters by all the naval belligerents. It may be true that the total number of captures by the French and Spanish exceeded those of the British who had not yet begun to enforce the use of convoy as strictly as they did later, but Voltaire's remark (that there were more British ships to capture) may also supply a reason for this state of affairs. Anyhow, it is certainly true that large numbers of French and Spanish were taken (especially after the battles of Finisterre) including a very fair total of French battleships, the capture of which led to a distinct improvement in ship-building in England after the war.

The War of the Austrian Succession should not be left without at least a reference to Anson's reforms. This administrative genius was appointed to the Admiralty on his return from his voyage round the world. The first-fruits of his efforts may be seen in the two battles of Finisterre. It was fitting that he should have been in command at one of them himself.

AUSTRIC LANGUAGES. Conformities in vocabulary, phonetics, word-formation (prefixing, infixing), in the (post-) position of the genitive in the inclusive and exclusive forms of the pronoun, and others, demonstrate the genetic relation of the Austronesian to the Austroasiatic Languages. By omitting the differentia specific to the two main divisions Schmidt termed them the "Austric Languages." They stretch from the Western Himalayas to Easter Island in the Pacific. A. Conrady would relate this widespread family of languages to the Indo-Chinese family and he adduces interesting evidence in support of his contention.

BIBLIOGRAPHY.—A. Conrady, *Eine merkwürdige Beziehung zwischen den austrischen und den indochinesischen Sprachen* (Festschrift fur E. Kuhn, Breslau, 1918); further "Neue austrisch-indochinesische Parallelen" (*Hirth Anniversary Volume,* London, 1920); W. Schmidt, *Anthropos, XII.–XIII. 1917–1918* and *Sprachjamilien und Sprachenkreise der Erde* (Heidelberg, 1926, pp. 147–148).

AUSTROASIATIC LANGUAGES. This family of languages must once have extended over nearly all Indo-China and the north-east of India.

Structure. — The phonetic system is very simple. It contains the three simple explosives with their spirants and nasals, besides a sort of cerebral. Final sounds may be vocalic and (one–)consonantic; also as medial sounds consonants—save muta cum liquida—are rather frequently inadmissible.

Suffixes—save in the Munda Languages and the Nicobarese—are completely missing. All the simple consonants except *n,* y, *r* may form suffixes the functions of which are, however, not yet fully ascertained. The prefix may be augmented by infixing a (secondary) nasal (n, *nt,* n) or a liquid *(r, l).* The (primary) infixes which even invade the stem of the word are characteristic: *n* for the forming of instrumental substantiva and abstracta and adjectiva—in the Nicobarese of a comparative; *p* and *m* for forming abstracts of the action—in Santali also of superlativa; *m* for the forming of substantives of the actor, of participles and adjectives.

All languages place the genitive after the word to be defined snd consequently use possessive suffixes. The Munda Languages now place the genitive before—but use possessive suffixes—due to their being influenced by the Dravida and Tibeto-Burman Languages surrounding them. The accusative of the objective substantive is placed after the verb.

Some of these languages have a plural and a dual in the personal pronoun; with some of the languages the plural seems to be an ancient trial. Munda, Nicobarese, Bahnar discriminate in the first person plural (dual) between inclusive and exclusive.

The grammar and syntax of these languages is of the utmost simplicity.

The main groups are

(1) Older Malacca Group: Semang, Sakai (Senoi).
(2) South-eastern Mixed Group: Cam, Rade, Djarai, Sedang, Raglai.
(3) South-eastern Flank Group (Mon-Khmer): Mon (Peguan); Khmer (Cambodgian); Bahnar; Moi-dialects; Bersisi, Jakun.
(4) Central Group: Nicobar; Wa, Palong, Riang; Khasi.
(5) North-western Flank Group (Munda): Eastern Group, Santali, Mundari, Bhumij, Birhar, Koda, Ho, Turi, Asuri, Koura; Western Group, Kurku, Kharia, Juang and the mixed languages Savara, Andaba.

Przyluski in *Les Langues du Monde* (Paris, 1924, pp. 385–403); W. Schmidt, *Die Sprachfamilien und Sprachenkreise der Erde* (Heidelberg, 1926, *pp.* 735–740).

AUSTRONESIAN LANGUAGES. The name "Malayo-Polynesian languages" was applied to this family of languages by W. von Humboldt in his work, *Ueber die Kawi-Sprache auf der Insel Java* (2 vols., Berlin, 1836, 1839). But when the affinity of the Melanesian languages was ascertained, W. Schmidt in his treatise *Die sprachlichen Verhältnisse Ozeaniens, . . .* in ihrer *Bedeutung für die Ethnologie* (Vienna, 1899, p. 32 ff.), applied the collective term "Austronesian languages" to the languages of this vast area. The Polynesian languages have arisen from a certain group of the Melanesian languages, those of the central Solomon islands among others. The Melanesian languages for

their part are descendants of the Indonesian languages, distinguishable from them on the one hand by phonetic decay, petrification of the pre- and in-fixes, and reduction of the syntax; on the other hand by innovations chiefly in a more copious formation of numeri with the personal pronoun. The rise of the Polynesian from the Melanesian languages continued and completed this process, especially by reduction of the phonetic system. Thus we are here dealing with a regressive development starting from the Indonesian languages through the Melanesian languages to the Polynesian languages—a development effected by the fact that the dark-skinned ulotrichous Melanesians were different from and much more primitive than the Indonesians.

General Characteristics.— All Austronesian languages use post-position of the genitive and are therefore in substance prefix languages, and use prepositions; suffixes are considerably rarer. Only on the Little Sunda islands and the Moluccas, on the coasts of New Guinea and in some languages of New Britain and the Solomon islands preposition of the genitive is found in consequence of a blending with the Papuan languages (formerly and now) native there. The first person plural (dual, trial) has an inclusive form (if the person addressed is included) and an exclusive form (if he is excluded). The Indonesian languages use in word-formation, declension and conjugation an amply developed system of pre- and in-fixes that is petrified almost everywhere in the Melanesian and Polynesian languages.

Indonesian Languages.— The Indonesian languages are divided into a greater western group and a smaller eastern group. The western group comprises the Malagasy and a northern division and a southern division. To the northern division belong: Formosan, Philippine languages (Tagalog, Bisaya, Ilokano, Igorot Biko, etc.), Chamorro (Marian islands), Pelew, Sangir (northeast Celebes). To the southern division belong: Malay, Batak, Nias, Madura-Bali, Makassar-Bugis, Mentawei-Engano; Java, Sunda, Dayak; Toradja, Bimba-Sumba. The eastern group contains the languages of the Little Sunda islands and the Moluccas: Sikka, Tettum, Kupong-Galoli (East Flores), Solor, Rotti, Kisser, Letti, Watubela, Aru, Kei, Ceram.

Melanesian Languages.— The Melanesian languages are divided into a southern group: New Caledonian, Loyalty islands, Aneityum, Eromanga; a central group: New Hebrides, Banks islands, Fiji, southern Solomons; a northern group: northern Solomons, New Britain, Admiralty islands, Santa Cruz; Micronesian languages: Caroline islands, Yap, Ponape, Gilbert islands, Marshall islands, Nauru; languages mixed with Papuan: Barriai. Kilenge, Mengen (New Britain), Mono, Uruava, Torau (South Bougainville), coast languages of New Guinea; transitory languages: South coast of New Guinea, central New Hebrides, central Solomon islands.

Polynesian Languages.— The Polynesian languages are divided into a western group with the languages of Fakaafo, Futuna, Samoa, Tonga, Uvea, Niue and an eastern group with the languages of New Zealand (Maori), Mangarewa, Marquesas islands, Rarotonga, Hawaii.

See W. Schmidt, *Die Sprachfamilien und Sprachenkreise der Erde* (Heidelberg, 1926, p. 144–146); S. H. Ray, *Comparative Studies in the Melanesian Island Languages* (Cambridge, *1926*).

AUTHENTIC, genuine (from Gr. *αὐθέντης*, one who does a thing himself), true or original. In music it is one of the terms used for the ecclesiastical modes. The title of *Authentics* was also used for Justinian's *Novellae.*

AUTHOR. In its widest sense the word means an originator; in practice it connotes a writer of original books or articles. The author's calling, as distinct from the scribe's, was recognized from very remote times in the community. There is a reference in the *Apocrypha* (II. Maccabees) to "the first author of the story," and Egyptian and Chinese literature takes the record an era farther back. The status of the author or, as Dr. Johnson has it, "the *first* writer of a book," in the sense of an originator or creative agent, is not always clear, as compared with the scribe's or copyist's, but his higher function and fuller responsibility are distinctly indicated. In China, towards the end of the 3rd century B.C., Huang-ti, "the Napoleon of China," not only ordered all books without exception to be destroyed, but all authors of books to be put to death. This was not, however, a reactionary step. It came of the intense conservatism of the scholars and authors who were the depositaries and the rigid maintainers of the ancient tradition. They had resisted Huang-ti's reforms, and he swept them away, and the caste of the *literati* perished with them. But the cult of the past was too ingrained to be destroyed. The Sacred Books were recovered from men's memories, and rewritten; and the name of Huang-ti became an author's byword in China. The story of this massacre in the 3rd century B.C. may have reached these shores and helped to foster the legend of Edward I.'s massacre of the Welsh bards, as recited in Gray's poem.

Among the Celtic peoples the official recognition of the bards was partly based on their service as rhyming chroniclers and keepers of the old tradition, or of the family or tribal records, quite apart from their more original function. As a class, jealous of their rights, they even sought legal powers in Wales to put down any irregular followers of their art, with a touch of the jealousy shown by Shakespeare's contemporary, who spoke of him as "an upstart crow beautified with our feathers." But the honour paid to the scholars and bards and even the scribes in ancient Britain and Ireland marks an implicit reverence for learning and a sense of a high tradition to be observed and reinforced by the old writers, as is shown in the title, The *Book of the Four Masters.*

The author's rights and his pride in his craft, with a suspicion of caste feeling in the background, were vigorously asserted on the Elizabethan stage. Ben Jonson's play *The Poetaster,* under the disguise of the Latin poets, and with his rival Dekker satirized as the literary cobbler Crispinus, turns from "poet apes" to the true authors whom "envy" wishes to put down. In this satire occurs what is probably the first use of the phrase "to damn the author."

In what is sometimes called the Augustan age of English literature, when poet or proseman had to resort to a titled patron for the backing needed to produce a book, he was apt to sink his corporate sense in his individual need and personal ambition. We catch echoes of this petitioner's suit and self-assertion in the prefaces and dedications of Dryden, in Swift and in Pope, in the allusions to my lord's ante-chamber and to Grub street (now Milton street by a strange conversion). Among the writers who mark the signs of a coming change were Daniel Defoe and Dr. Johnson. The change was when the patronal gave way to the popular support of the author.

That came with the enlarging of the audience, when at the end of the 18th century Burns's songs won a national hearing; when at the opening of the 19th century Walter Scott and Byron captured the fashionable public; when again the Waverley Novels prepared the way for the Victorian novelists, Dickens and Thackeray.

Dickens himself was a stout maintainer of the author's rights and legal sanctions. He was one of the first to insist on international copyright.

Dickens reminds us that the novel, which is not the highest form of the author's art, has done more than any other to win him both his market price and his public honour. But the full recognition was not won without a struggle, the evidences of which are to be traced in the corporate activity of such bodies as the Society of Authors (*q.v.*), the P.E.N. Club and the Royal Society of Literature. (E. RH.)

AUTHORS, SOCIETY OF. The Incorporated Society of Authors, Playwrights and Composers, founded in 1884, is a British institution which, embracing all authors as the term "author" is defined in the British Copyright Act, guards them in the protection of their property, and advises them of the various markets at their disposal. The details of a contract for publishing a book, for producing a play, for the sale of a serial, or for the purposes of cinema production, are exceedingly technical; the members are advised on all these things. The society also keeps itself informed as to the cost of production of books, etc., as this point is constantly arising. Of the various literary and dramatic agencies, the society has intimate knowledge, and advises upon their status and value. With representatives all over the world, the

society can protect its members in respect of infringements of copyright. In legal disputes, the society takes action in suitable cases at its own expense. This alone costs the society between £1,000 and £2,000 a year. In 1928 the society had 4,000 members.

In the United States the official national organization of authors, artists, dramatists and screen writers is known as The Authors' League of America, Inc. It was organized in 1912, to procure adequate copyright legislation, both international and domestic; to protect the rights and property of all those who create copyrightable material of whatever kind or nature; to advise and assist all such in the disposal of their productions and to obtain for them prompt remuneration therefor; to disseminate information among them as to their rights and remedies. Any author of any kind, dramatist, artist, composer or scenario writer of recognized position in his or her profession may be admitted to the league upon proper application duly approved by the membership committee. The term "recognized position in his or her profession" is intended to include all who regularly earn money in, and make a business of, such profession. Membership in 1939 was approximately 4,000.

AUTOBIOGRAPHY, as the suggestive nomenclature of Southey implies, is the biography of a person written by himself. Its motivations are various—among others self-scrutiny for self-edification; self-justification, as Cardinal Newman's beautifully written *Apologia pro Sua Vita* (1864); a nostalgic desire to linger over enchanting memories, as Selma Lagerlof's *Marbäcka* (1922); belief that one's experiences may be helpful to others, as Helen Keller's *The Story of My Life* (1903); an earnest attempt to orient self amid a world of confusion, as *The Education of Henry Adams* (1906); the urge for artistic expression; or the purely commercial desire to capitalize on fame or position.

Naturally the emphases and contents are equally varied although apparently in harmony with the age—in the epoch that saw Paganism crumbling before Christianity, spiritual struggles in the book by which the genre passed beyond embryonic stages. th *Confessions* of St. Augustine; in the lusty, beauty-loving, adventurous Renaissance the swash-buckling *Life of Benvenuto Cellini* with autobiographical glints in the dramatic narratives of explorers or the Platonic love revealed. for example, by Dante in the *Divine Comedy* and *Vita Nuova;* in Puritan England, John Bunyan's *Grace Abounding to the Worst of Sinners* and Milton's noble self-dedicatory sonnets; in the cynical 18th century, the shameless *Mémoires* of the Italian adventurer Casanova or the practical ascent of Benjamin Franklin. From that emotional pot-pourri, Romanticism, came one of the most influential of all autobiographies, the candid *Confessions* of Jean Jacques Rousseau, as well as Goethe's popular autobiographical romance *Die Leiden des jungen Werthers,* the romantic impulse being reflected, too, in the latter's *Aus Meinem Leben, Dichtung und Wahrheit.* In the 19th century some of the most distinguished autobiographies continued to be by men of letters, as Tolstoi, Dostoievski, or Ruskin, although the new science was mirrored in Thomas Huxley's brief self-description, the new political economy in J. S Mill's *Autobiography,* the changing spheres of women in the brilliant *Journal* of Maria Bashkirtseff, and military exploits in the *Personal Memoirs of U S. Grant* or the records revolving around Napoleon.

Perhaps nothing so dramatically illustrates the extraordinary diversity of modern life as the *mélange* of autobiography that has poured from the presses in the 20th century—by captains of industry, as Carnegie or Henry Ford; by men of letters, as Rudyard Kipling or Henry James; by artists in other fields, as Isadora Duncan, Paderewski, George Arliss, Eva Le Gallienne; by professional men. as Axel Munthe or A. E Hertzler in his popular *Horse and Buggy Doctor;* by social crusaders, as Jane Addams, Lillian Wald, Brand Whitlock, Kagahwa, and Lincoln Steffens. Aviation is reflected in C. A. Lindbergh's *We;* exploration in Byrd's *Little America;* nature study in W H. Hudson's *Far Away and Long Ago* or John Muir's *Story of My Boyhood and Youth.* Gandhi wrote *The Story of My Experiments with Truth,* and Hitler preluded his thrust for world dominion nith the fateful *Mein Kampf*

In the United States are several distinctive types—the immigrant autobiography such as Mary Antin's *The Promised Land;* that resulting from race problems, as Booker T. Washington's *Up from Slavery* (1901); or those inspired by the advancing frontier, as Hamlin Garland's colourful *Son of the Middle Border.*

Valuable social panoramas as these recent books present, no student can fail to feel, however, that their popularity has intensified the frailties inherent in the form. Reticences and obligations of position are cast aside; ghost writers are employed in a lucrative type of literary forgery. In time these excesses will bring about their own correction; but at present they seern to lend some justification to George Bernard Shaw's generalization, "All autobiographies are lies."

Meanwhile, among all nations, as long as the capacity for hero worship endures, as long as human beings desire to draw near to other souls, as long as they wish vicariously to broaden experience, the narrative of another's life at first-hand by himself will remain one of the most popular literary forms.

AUTOCEPHALOUS (from Gr. *αὐτός,* self, and *κεφαλή,* head), of independent headship, a term used of certain ecclesiastical functionaries and organizations.

AUTOCHTHONES, sons of the soil, the original inhabitants of a country as opposed to settlers (Gr. *αὐτός,* self, and *χθών,* earth; Lat. *terrigenae*). The idea that they were *autochthones* was *a* great source of pride to the Athenians, who wore golden grasshoppers (unless *tettiges* means pins for fastening it) in their hair in token that they were born from the soil and had always lived in Attica (Thucydides i. 6). So also, in Thebes, the race of *Spartoi* were believed to have sprung from a field sown with dragons' teeth *(see* ABORIGINES).

AUTOCLAVE, a strong closed vessel of metal in which liquids can be heated above their boiling points under pressure. Etymologically the word indicates a self-closing vessel (*αὐτός,* self, and *clavis,* key, or *clavus,* nail), in which the tightness of the joints is maintained by the internal pressure, but this characteristic is frequently wanting in the actual apparatus to which the name is applied. The prototype of the autoclave was the digester of Denis Papin, invented in 1681, which is still used in cooking, but the appliance finds a much wider range of employment in chemical industry, where it is utilized in various forms in the manufacture of candles, coal-tar colours, etc.

Frequently an agitator, passing through a stuffing-box, is fitted so that the contents may be stirred, and renewable linings are provided in cases where the substances under treatment exert a corrosive action on metal

AUTOCRACY, a term applied to that form of government which is absolute and vested in one single person (from Gr. *αὐτός,* self, and *κράτος,* power).

AUTO-DA-FE, more correctly AUTO-DE-FE (act of faith), the name of the ceremony during the course of which the sentences of the Spanish inquisition were read and executed. The ceremony comprised-a procession in which the members of the Holy Office, with its familiars and agents, the condemned persons and the penitents took part; a solemn mass; an oath of obedience to the inquisition, taken by the king and all the lay functionaries; a sermon by the Grand Inquisitor; and the reading of the sentences, either of condemnation or acquittal, delivered by the Holy Office. The handing over of impenitent persons, and those who had relapsed, to the secular power, and their punishment, did not usually take place on the occasion of an auto-da-fé, properly so called. The first great auto-da-fés were celebrated when Thomas de Torquemada was at the head of the Spanish inquisition (Seville 1482, Toledo 1486, etc.). The last, subsequent to the time of Charles III., were held in secret, and dealt with only a small number of sentences. *See* illustration on next page.

AUTOGAMY (from Gr. *αὐτός,* self, and *γαμία,* marriage), a botanical term for self-pollination. *(See* ANGIOSPERMS.)

AUTOGENY, AUTOGENOUS, spontaneous generation, self-produced. In "autogenous soldering" two pieces of metal are united by the melting of the opposing surfaces, without the use of a separate fusible alloy or solder as a cementing material. (*See* ABIOGENESIS.)

AUTOGIRO: see GYROPLANE.

AUTOGRAPHS. Autograph is a term applied by common usage either to a document signed by the person from whom it emanates, or to one written entirely by the hand of such person (which, however, is also more technically described as *holograph*), or simply to an independent signature. The object of the present article is to differentiate between collections of original manuscript

AUTO-DA-FÉ, AFTER A PAINTING OF ABOUT A.D. 1500 IN MADRID

A contemporary Picture showing the ceremony with which the sentences of the Inquisition were executed. The Grand Inquisitor enthroned with members of the Holy Office, presides, and the sentences of condemnation are carried out in his Presence. A stake with victims about to be burnt is shown at the right. (See descriptive article on page preceding.)

material, the values and interest of which may be, on the one hand, literary and historical, and on the other, mainly personal.

The series of original documents which were gathered in such a library as that of Sir Robert Cotton, now in the British Museum, found their way thither on account of their literary or historic interest, and not merely as specimens of the handwriting of distinguished men. Such a series also as that formed by Philippe de Béthune, Comte de Selles et Charost, and his son, in the reign of Louis XIV., consisting for the most part of original letters and papers, now in the Bibliothèque Nptionale, might have been regarded as the result of autograph collecting did we not know that it was brought together for historical purposes. Such collections are necessarily of the greatest importance and carry back their origin to the early years of national hislory, ever adding to their numbers as auxiliary to the public records

To turn to the other extreme and seek the origin of personal autograph collecting, we find, perhaps to our surprise, that that pursuit also has its claim to antiquity. We read that it was in Germany and the Low Countries that the practice appears to have originated, chiefly among students and other members of the universities, of collecting autograph inscriptions and signatures of friends in albums, *alba amicorum,* little oblong pocket volumes of which a considerable number has survived from the latter half of the 16th century. A fair collection is in the British Museum. In one of these little *alba* we discover an entry by the poet, John Milton, who doubtless fell a victim to an importunate member of a university.

The fate of the original manuscripts of the works of great authors is an interesting subject of study and there is none of greater interest than that of Shakespeare. We deplore the loss of all the original manuscripts of his plays and poems; and even of his authentic signatures there are only six that can be accounted for. It is no doubt a fact that he set no great store by his draft manuscripts, and there is sufficient literary evidence that in some instances at least he entrusted them to the "stationers" whom he employed to publish them. Of the signatures only five were known down to a quite recent date, two being subscribed to the purchase and mortgage deeds of a house in Elackfriars, London, in 1613, and three being attached to the three separate sheets of his will, in 1616. The sixth signature was discovered as recently as 1910 in the Public Record Office. It is attached to a deposition in a lawsuit in 1612. The literary importance of the signatures is that they are written in the Old English hand which Shakespeare was taught when a boy at school in Stratford, and that he employed the English hand down to the end of his life, having never learned to use the new Italian script which was coming into general use among the better educated classes in England. The most celebrated collection formed in England in recent years is that of the late Mr. Alfred Morrison, which still remains intact, and which is well known by means of the sumptuous catalogue, with its many facsimiles, compiled by the owner.

There are many published collections of facsimiles of autographs of different nations. Among those published in England the following may be *named:— British Autography,* by J. Thane (1788–1793, with supplement by Daniell, 1854); *Autographs of Royal, Noble, Learned and Remarkable Personages in English History,* by J. G. Nichols (1829); *Autographs of the Rings and Queens and Eminent Men of Great Britain,* by J. Netherclift (1835); *One Hundred Characteristic Autograph Letters,* by J. Netherclift and Son (1849); *Facsimiles of Original Documents of Eminent Literary Characters,* by C. J. Smith (1852); *The Autograph Miscellany, by* F. Netherclift (1855); *The Handbook of Autographs,* by *F. G.* Netherclift (1862); *The Autograph Souvenir,* by *F. G.* Netherclift and R. Sims (1865); *The Autographic Mirror* (1864–66); *The Autograph Album* by *L. B.* Phillips (1866). Facsimiles of autographs also *at* last appear in official publications, *Facsimiles of National mss. from William the Conqueror to Queen Anne* (Master of the Rolls) (1865–68); *Facsimiles of National mss. of Scotland* (Lord Clerk Register) (1867–71); *Facsimiles of National mss. of Ireland* (Public Record Office, Ireland) (1874–84); and *Facsimiles of Autographs* (British Museum publication), five series (1896–1900). (E. M. T.)

AUTOLYCUS, in Greek mythology, the father of Anticleia, mother of Odysseus. Later authors make Hermes his father. He lived at the foot of Mt. Parnassus, and was famous as a thief and swindler. On one occasion he met his match. Sisyphus, who had lost some cattle, suspected Autolycus of being the thief, but was unable to bring it home to him, since he possessed the power of changing everything that was touched by his hands. Sisyphus accordingly burned his name into the hoofs of his cattle and, during a visit to Autolycus, recognized his property. It is said that on this occasion Sisyphus seduced Autolycus's daughter Anticleia and that Odysseus was really the son of Sisyphus, not of Laertes, whom Anticleia afterwards married. The object of the story is to establish the close connection between Hermes, the god of theft and cunning, and the three persons— Sisyphus, Odysseus, Autolycus—who are the incarnate representations of these practices.

See *Odyssey,* xix. 394; Ovid, *Metam.* xi. 313; Apollodorus i. 112; ii. 63; Hyginus, *Fab.* 201.

AUTOLYCUS, of Pitane in Aeolia, Greek mathematician and astronomer, flourished about 310 B.C. His extant works are: *Peri Kinoumenēs Sphairas,* the oldest Greek mathematical treatise

AUTOMATIC MACHINES

VARIOUS TYPES OF AUTOMATIC MACHINERY

1. A bottle-filling machine. As the milk bottles emerge from the washing apparatus (left) they pass on a conveyor to the filling machine, where they are filled, capped and sealed automatically
2. Automatic screw machines for making complete screws, studs and other turned parts from bar stock
3. Combination bread slicer and wrapper. One operator standing in the same position can feed the slicer and receive the wrapped loaves from the delivery end of the wrapper
4. Automatic machine which wraps individual packages of cigarettes in cellophane with an easy-opening tape, then assembles the packages into groups of ten and places them in cartons
5. Adjustable automatic machine for packaging many differenr kinds of articles
6. High-speed machine for wrapping soap tablets and other similar articles

preserved to us entire, which contains some simple propositions on the motion of points on the sphere and its circular sections; and *Peri Epitolōn kai Duseōn,* which treats of the apparent rising and setting of the fixed stars. The former is interesting for the light it throws on the development of the geometry of the sphere even before Autolycus and Euclid. *(See* THEODOSIUS.)

AUTOLYSIS: *see* PATHOLOGY.

AUTOMATIC MACHINES, machines which function throughout their cycle of operation without the intervention of human effort. Special types are used in many industries for two main reasons; to reduce the necessity for manual labour and to secure uniformity of product. The rapidity with which automatic machines are developed and used depends largely on the cost and quantity of manual labour available. This is shown by the relatively slow introduction of special types of automatic machines into countries where labour is cheap, and the wide-spread use of such machinery where the wage rate is high, as in the United States. The great advantages of uniformity of parts lie in the saving of labour in assembling parts together and in repair work, and so is also closely related to the general wage level.

Machines can be designed and built to perform any operation normally done by hand. Some movements are difficult and require intricate and costly mechanisms. But given an output sufficiently large and labour costs high enough, the machine will be forthcoming. Unfortunately the designer and builder rarely profit to nearly the same extent as the user of the machine, unless the machines are leased, either on royalty or at a fixed charge per month or per year.

Automatic machines are now in use in nearly all industries, from the making of food products to the forming and machining of fairly heavy metal parts. Notable and interesting examples are to be found in the making of parts of watches and clocks (*q.v.*), cigarettes (*q.v.*) and in the wrapping of such products as chewing gum, soap and safety razor blades. Incidentally, the razor blades themselves are punched, ground, tempered and sharpened in machines that are almost entirely automatic. In some industries such as flour milling, automatic or semi-automatic machinery has almost entirely replaced human labour. Few men are to be seen, even in the flour mills producing hundreds of barrels of flour per day. Recent steel mills also have machinery so nearly automatic that many men are relieved of much of the back-breaking labour that was formerly necessary.

Classification.— The term automatic is rather elastic as applied to machinery and is, or should be, divided into two main classes, semi-automatic and full automatic. Nor is this distinction always definite. Full automatic machines are usually considered to be those to which the material is fed in bulk, as long bars, strips or reels of metal; or semi-finished material in quantities, as screw blanks or similar parts. The latter are generally dumped into some kind of a hopper to be fed to the machine for slotting, threading, turning or grinding in the case of metals; or tobacco and paper are fed into a machine to issue as finished cigarettes packed in boxes ready for shipment. Soap and hundreds of other products are handled in a similar manner. Semi-automatic machines require the material to be fed to or placed in the machine and removed from it, but all the mechanical operations are performed by the machine without further manual assistance.

The full automatic machines are much more intricate and require greater care in designing. This is largely because of the mechanism required to feed the material into the machine, to hold it firmly while the operations are being performed, and then release, or even eject the finished piece so as to make room for the next cycle of operations. When the work is to be performed on plain bars or rods that can be fed through the work spindles; in punch presses where the material can be fed through the machine in strips; in textile machines where the yarn or thread is continuous, the feeding mechanism is comparatively simple. But the problem is far from simple where the machine must pick up pieces of paper, as in an automatic job printing press, place them on the platen, and remove them at the proper time and pile them suitably; or pick up a safety razor blade, place it in the grinding machine correctly, so that the edges will be ground at the proper angle; pass it to another machine which automatically strops it and then finally to the machine that wraps it in waxed paper, without touching the sharpened edge in any way. In this sort of work, suction cups are frequently used to pick up flat pieces.

Another intricate problem is the sorting of screws, pins, etc., so as to insure their going into the machine in the correct position. These are usually dumped into a hopper which must sort them and direct them, singly, into the chute or slide that feeds them into the machine itself.

Special Types.— Automatic machines are usually made especially for different industries and frequently for different firms in the same industry. Some, such as the Jacquard loom, printing presses both of the job and web types, screw machines, etc., are of fairly wide application. But machines, such as those for bending wire into specially designed safety-pins, or for other purposes, are frequently designed and built solely for a single firm. In one such case, back in the old "hook and eye" days, one designer found it necessary to use a jet of air to blow the hooks away from the machine, as they would not fall rapidly enough of their own weight, to clear the machine. In this machine, a sheet of paper and a roll of wire were fed into it, the fasteners formed, fastened to a card, the cards stacked one dozen to a box, which was wrapped, sealed, and the distinctive name printed thereon, no one in the mean time touching the machine or a part of the product.

The same basic principles, however, are frequently applied to widely varying materials and purposes, but often in a strikingly similar manner. An excellent example of this similarity is to be found in the machines for making lead pipe bends or "traps" for plumbers, and those which turn out "elbow" macaroni for large food product manufacturers. Although there is a vast difference in the material used and in the size of the product, both machines are identical in principle. Both extrude a plastic material (lead or dough) in the same manner and control the flow of material in such a way that more is fed to the outside of the bend, forcing the extruded tube to assume the desired shape. When the curve is completed both materials are automatically cut off in the same way.

One of the most important points in designing automatic machinery is in securing the proper sequence of the different motions and the requisite time between the different movements. In "timing" the movements the designer must consider the time consumed in moving the work, the tools or the fingers into position, the actual time of the operation itself, and of moving the tools out of the way and replacing the completed work with a piece that is unfinished. Every movement of this cycle must be carefully laid out, both to avoid the loss of time and prevent the interference of various movements. Designers who have been brought up in this line of work follow the various steps from force of habit, but a novice will spend much time in studying out the next move.

Elements of Design.— Automatic machines are not confined to any size or class of work. And yet all may be said to operate on basically the same principles. *Levers, screws, gears* and *cams* properly arranged and connected in suitable combinations, are the heart of all automatic machinery. With suitable methods of stopping any movement at the proper time, and all parts interconnected so that each will perform its operation in proper sequence, machines are built that seem unbelievably human in their action.

As an example of how some of these various elements are combined in actual machines we show an outline of the movements of a type of riveting press used in the huge automobile frame-assembling plant of the A. O. Smith company in Milwaukee (for photographs of this plant *see* Plate I.), taken from the patent specifications. Starting with the electric motor *A* (fig. 1) we follow the drive through the pinion and gear to the worm B, which drives the disk C by means of the worm-wheel, in the direction of the arrow. The disk carries the crankpin *D* and the cam slot E. Crank D drives the connecting rod F and the crank-arm G, that rocks about the shaft H. To the right of *H* is another small crank I that moves the ram J of the press up and down for heading the rivets in the frame. Simultaneously the lower part, or anvil K, moves up and down so as to head the rivets and return to

the open position at the proper time. The movements of the anvil are effected by the cam slot *E* in which is a roller at L, in the end of lever M. This lever, being pivoted at N, moves the wedge (or cam) *O* under the plunger supporting the anvil *K*, and so raises and lowers it at the proper time under control of the cam slot *E*. By following the revolution of the disk *C*, it will be seen that before the riveting ram J gets far on its down stroke, the wedge *O* has raised the anvil *K* into the position shown. The cam holds the wedge in this position until the ram J has headed the rivet and then withdraws the wedge for a little more than half the revolution of the disk *C*. During this time, the ram J is being raised and the next frame is being set in position for riveting. This is only one of many mechanisms in this huge assembling machine, a description of which may be found below; but it shows one application of all the elements, if we consider the worm B as a screw, which it really is. Similar combinations of these four elements will be found in most of the modern types of automatic machines.

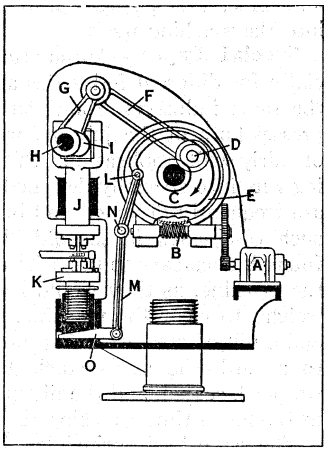

FIG 1.—RIVETING PRESS

Automobile Frame Assembly.—Let us follow the flow of steel through the A. O Smith company's plant on its two-hour journey, during which the heavy piles of strip steel are changed into enameled, precision motor car frames at the rate of one every 10 seconds. The strip steel, made to exacting specifications, is picked up from the cars by monorail cranes and shot through an automatic inspection machine *(see* Plate **I**, fig. 1) at the rate of 900 pieces per hour. Besides being straightened, the length, width, thickness and curvature of the strips is checked up and any piece found defective is automatically thrown out. The entire unit performs without human assistance and the passed blanks, in piles of predetermined size, are delivered to monorail cranes, which move them on to the pickling machine. Here the steel is received in special crates of five tons capacity, which are handled through the different baths by means of a crane operated with remote control. Following pickling, the strip stacks are again picked up by monorail cranes and over ingenious rail systems moved into the manufacturing building and deposited at the feed-ends of the two main assembly lines

Two types of parts going to make up a frame are side-rails and cross members. Due to their different peculiarities and lengths, they each have a separate system of machinery leading to the far end of, the building where one large unit takes care of the final assembly.

Let us first follow the side-rails. The pickled steel entirely handled by conveyors passes through the side bar press line *(see* Plate **I.**, fig. 2) with its four operations. First, the straight strip is *kicked up* in order to as nearly as possible follow the desired contour of the side-rail. Next, the numerous rivet holes, gauge-points and other openings are pierced, separate presses for right and left hand rails being required. Next there operates a single blanking press which trims the blanks, whereupon two more presses take care of the forming operation, *i.e.,* the folding up of flanges to obtain the conventional channel section. The feeding and unloading of each of these presses is done entirely automatically, and all the movements are timed and synchronized in a single unit, which does not require labour at any point. The side-rails are automatically deposited in crates, which move to the next unit by crane.

Before the side-rails can be assembled into a frame, there still remains a great deal of work to be done on them. A number of spring hangers, brackets and other attachments must be riveted on; but first the ends must be clipped *(see* Plate **I.**, fig. 3) off and certain holes drilled and reamed with extreme accuracy. This is done in the single large unit called the "side-bar parts assembly" *(see* Plate **I.**, fig. 4). Right and left hand bars are handled in pairs simultaneously, and loaded on to trucks automatically. The assembly is about 350ft. long, has 38 trucks and 19 stations, at each of which adjustable automatic machines are performing the various operations required. The finished side-bars are automatically removed from the trucks at the end and inspected before being delivered to the adjacent general assembly unit.

Going back to the point where the strip steel enters the manufacturing building, the steel intended for cross members is deposited by the monorail cranes at the loading ends of four crossbar finishing lines *(see* Plate **I**, fig. 5). Each of these is equipped with blanking, piercing and forming presses, very similar to, although smaller than, corresponding machines for the side-bar press line described above. Like them, the crossbar presses are fed automatically and all handling is done with automatic machinery.

Following the press-line is a continuation, which has a purpose similar to the above mentioned side bar parts assembly line. However, much less work has to be done on crossbars, requiring proportionally less space. At the end, the finished crossbars arrive at the general assembly unit in a manner similar to the side-bars.

The general assembly performs two important functions and does both automatically. It collects all the required parts for the frame, assembles them and puts in all the rivets *(see* Plate **I.**, fig. 6), finally *setting* each rivet by forming the rivet heads, as was described above. One conveyor system with trucks called the hand-loader line takes care of the first function. A so called *nailing machine* assembles the frame and puts in the rivets, while another conveying system equipped with other trucks handles the last function of riveting. All three sub-units are synchronized and operated with one single motor.

When the frame is stripped off its truck at the discharging end, it is delivered to the painting machine. On a conveyor, running the full length of the building, it travels back to storage. While on the way, it is carefully inspected and if any part is missing or defective, it is side-tracked, fixed up on a special repair line and then sent on its way again.

Arriving in the storage building *(see* Plate **I.**, fig. 7) it first has to pass through a washing machine where grease, dirt, etc., is thoroughly removed in a special automatic machine, using hot alkali solution. Clean and dry it is delivered to the *painting machine,* where, hung, one close to the other on an endless chain, the frames slowly pass through and special lacquer paint is sprayed on at the rate of 75gal. per minute; they pass through an oven which bakes the paint, then through a cooling chamber, emerging. after one to 1½ hours as a finished product *(see* Plate I., fig. 8).

A few examples of automatic machinery as used in other industries will give a good idea of the extent to which machinery is replacing human labour in nearly all lines of work. The folding of men's collars, for example. is done on a Sweet and Doyle machine that foids collars to the desired shape, after they have been cut from the cloth at the rate of 12 collars per minute in regular production.

Milk, now sold almost exclusively in bottles, is handled by machinery from the time it leaves the cow—some dairies even employing mechanical milking machines. The milk and cream are separated by centrifugal machines, both are cooled by mechanical refrigerators, and they are bottled in a machine known as the Elgin, which handles 12 bottles of milk simultaneously. The bottles are carried on a conveyor, stop long enough to be filled, and are then replaced by the next 12 bottles.

From here they travel on a conveyor to the capping machine, where the name of the dairy and the date of bottling is stamped on the cap.

The bottles are sealed at the rate of 50 per minute.

Cigars are made on a machine at the average rate of 480 per hour, the exact speed depending on several factors, such as the shape, size and quality of the cigar. This machine accomplishes all the manufacturing processes such as measuring and feeding the filler leaf into the machine, applying the binder, forming the "bunch," wrapping with the proper kind of tobacco and trimming to length.

Bread Baking.--Automatic machines have been designed which mix dough, cut it into uniform pieces and feed it into the

oven, through which it is carried in exactly the right time to be properly baked, being then received as a loaf from the oven, all without contact with human hands The loaf is then ready to be wrapped by automatic machinery. One machine of the latter type receives the loaf, slices it, and wraps it in properly-labelled wax paper or cellophane. A single operator, standing in one position, can feed the loaves into this machine and receive them from the delivery end.

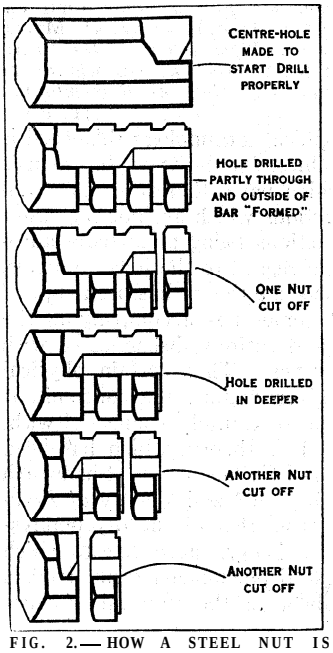

FIG. 2.—HOW A STEEL NUT IS MADE EVERY FIVE SECONDS ON A SIX-SPINDLE AUTOMATIC SCREW MACHINE

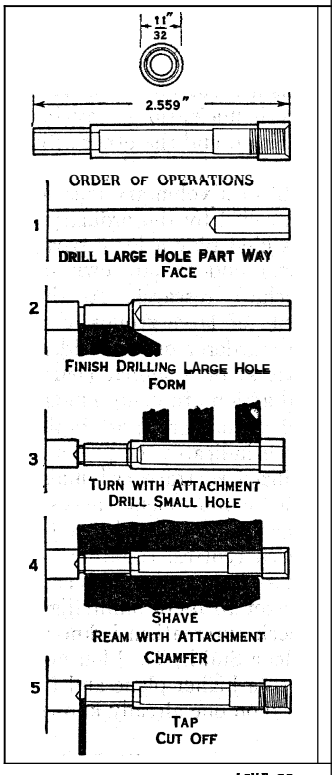
Machine Tools.—A good example of automatic mechanism as applied to a standard type of machine tool is seen in the Pratt and Whitney automatic lathe shown in Plate I., fig. 8. This is for what is known as second operation work, where a previous operation has been necessary to prepare jobs for this machine. The pieces to be turned are stacked in the vertical magazine at the back, this being done by hand, although it could be done automatically if the labour-costs warranted. At the proper time, the feed slide below the pile of work moves back so that the lowest piece in the slide can drop into the notches in front. The next forward movement of the slide carries the piece to the centre of the lathe and holds it while the tail canter forces it into position for driving from the live spindle. Next, the tools move into position for cutting and are fed forward the desired distance The piece is then released, and the tail stock centre recedes, the finished piece drops out of the way and the cycle is repeated.

A typical example of a multiple spindle automatic screw machine is a machine known as the National-Acme, five-spindle machine capable of handling $\frac{9}{16}$in. material through the work spindles. In this machine are five of these spindles and five tools at work, with a correspondingly large output. The indexing time is short, owing to a rapidly accelerating indexing movement. This machine is driven by a 5 h.p. motor running at 1,800 revolutions per minute and has a net weight of over **3,000** pounds The spindle speed can be varied from 1,050 to 2,885 revolutions per minute. The production range is from 355 to 2,880 pieces per hour, depending on the character of the work.



BY COURTESY OF THE NATIONAL ACME CO

FIG. 3.—SEQUENCE DRAWING SHOWING DIFFERENT STEPS IN TURNING OUT A TELEPHONE PLUG

An idea of the way in which the work is divided between the five spindles may be had by studying fig. 3. This shows the finished piece at the upper left with its principal dimensions. The other illustrations show the work performed at tach tool station. It should be remembered that all five of these operations are in process at the same time on material which is in each of the five work spindles. The first tool is a drill that goes in about $\frac{1}{3}$ of the length of the piece. The next station completes the large hole and at the same time a tool in the cross slide forms the neck at the end. The outside is next turned, using three tools so that only one-third the tool travel will be required. At the same time a high speed drilling attachment drills the small hole clear through the piece and leaves a centre beyond the cutting-off point. The outside is then finished with form or shaving tools in the cross slide,

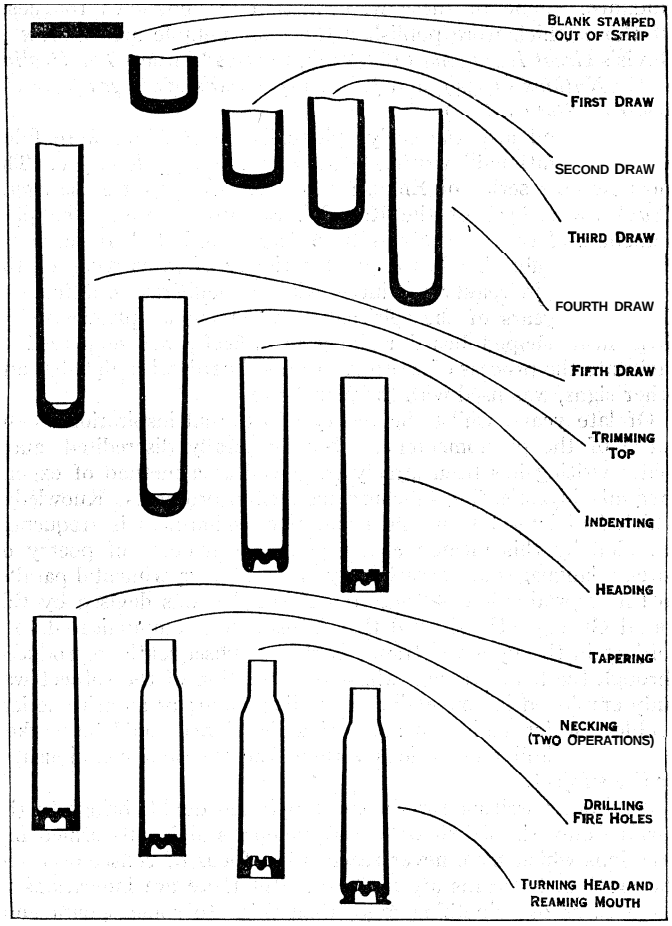


FIG. 4.—VARIOUS OPERATIONS IN MAKING A CARTRIDGE CASE

and the hole reamed to secure the desired size. The large hole is also chamfered. The last spindle taps the hole in the end and as soon as the tap has backed out the cutting-off tool comes in and separates the finished piece from the bar. The small drill has left a centre for starting the large drill on the next cycle of operations performed on the same bar of stock.

There are, of course, many more types of special automatic machines, but these will serve to show some of the developments and to bear out the statement that automatic machines can be designed and built for duplicating any human motion. In the machine-tool field there are comparatively few strictly automatic machines, if we consider this term as meaning those in which the work is fed to the machine without human assistance. Many machines are called automatic which perform their cycle automatically after the work has been put in place and the machine started by the operator. Such machines run their cycle and stop when it is completed. But they do not unload, reload and start again without attention from the operator as a strictly automatic machine should do (*See* MACHIKE-TOOLS.) (F. H. C.)

AUTOMATIC TRAIN (CONTROL: **see** RAILWAYS.

AUTOMATIC WRITING, the name given by students of psychical research to writing performed without the volition of the agent. The writing may also take place without any consciousness of the words written; but some automatists are aware of the word which they are actually writing, and perhaps of two or three words on either side, though there is rarely any clear perception of the meaning of the whole. Automatic writing may take place when the agent is in a state of trance, spontaneous or induced,

in hystero-epilepsy or other morbid states; or in a condition not distinguishable from normal wakefulness. Automatic writing has played an important part in the history of modern spiritualism. The phenomenon first appeared on a large scale in the early days (c. 1850–60) of the movement in America. Numerous writings are reported at that period, many of considerable length, which purported for the most part to have been produced under spirit guidance. Some of these were written in "unknown tongues." Of those which were published the most notable are Andrew J. Davis's Great Harmonia (1851–52), Charles Linton's *The* Healing of the *Nations* (1854), and J. Murray Spear's Messages from tlze *Superior* State (1852).

In England also the early spiritualist newspapers were filled with "inspirational" writing—Pages of *the* Paraclete, etc. The most notable series of English automatic writings are the Spirit Teachings (1894) of the Rev. W. Stainton Moses. The phenomenon, of course, lends itself to deception, but there seems no reason to doubt that in the great majority of cases recorded the writing was in reality produced without deliberate volition. In the earlier years of the spiritualist movement a "planchette," a little heart-shaped board running on wheels, was employed to facilitate the process of writing. A ouija board, with alphabet and other signs, was used with the planchette.

Of late years, whilst the theory of external inspiration as the cause of the phenomenon has been generally discredited, automatic writing has been largely employed as a method of experimentally investigating subconscious mental processes. Knowledge which had lapsed from the primary consciousness is frequently revealed by this means; *e.g.,* forgotten fragments of poetry or foreign languages are occasionally given. An experimental parallel to this reproduction of forgotten knowledge was devised by Edmund Gurney. He showed that information communicated to a subject in the hypnotic trance could be subsequently reproduced through the hand-writing, whilst the attention of the subject was fully employed in conversing or reading aloud; or an arithmetical problem which had been set during the trance could be worked out under similar conditions without the apparent consciousness of the subject.

Automatic writing for the most part, no doubt, brings to the surface only the débris of lapsed memories and half-formed impressions which have never reached the focus of consciousness—the stuff that dreams are made of. But there are indications in some cases of something more than this. In some spontaneous instances the writing produces anagrams, puns, nonsense verses and occasional blasphemies or obscenities; and otherwise exhibits characteristics markedly divergent from those of the normal consciousness. In the well-known case recorded by Th. Flournoy (*Des Indes à* la *planète* Mars) (1900) the automatist produced writing in an unknown character, which purported to be the Martian language. The writing generally resembles the ordinary handwriting of the agent, but there are sometimes marked differences, and the same automatist may employ two or three distinct handwritings. Occasionally imitations are produced of the handwriting of other persons, living or dead. Not infrequently the writing is reversed, so that it can be read only in a looking-glass (*Spiegel*schrift); the ability to produce such writing is often associated with the liability to spontaneous somnambulism. The hand and arm are often insensible in the act of writing. There are some cases on record in which the automatist has seemed to guide his hand not by sight, but by some special extension of the muscular sense (W. P. Carpenter, Mental *Physiology,* 4th ed. 1876, $128; W. James, Proceedings American S.P.R., 1885–89).

Automatic writing frequently exhibits indications of telepathy. The most remarkable series of automatic writings recorded in this connection are those executed by the American medium, Mrs. Piper, in a state of trance (Proceedings S.P.R.). These writings appear to exhibit remarkable telepathic powers, and are thought by some to indicate communication with the spirits of the dead.

The opportunities afforded by automatic writing for communication with subconscious strata of the personality have been made use of by Pierre Janet and others in cases of hystero-epilepsy, and other forms of dissociation of consciousness. A patient in an attack of hysterical convulsions, to whom oral appeals are made in vain, can sometimes be induced to answer in writing questions addressed to the hand, and thus to reveal the secret of the malady or to accept therapeutic suggestions.

AUTOMATISM. In philosophical terminology this word is used in two main senses: (1) in ethics, for the view that man is not responsible for his actions, which have, therefore, no moral value; (2) in psychology, for all actions which are not the result of conscious endeavour. Certain actions being admittedly automatic, Descartes maintained that, in regard to the lower animals, all action is purely mechanical. The same theory has been applied to man, with this difference that sometimes accompanying the mechanical phenomena of action, and entirely disconnected with it, are the phenomena of consciousness. Thus certain physical changes in the brain result in a given action; the concomitant mental desire or volition is in no sense causally connected with, or prior to, the physical change. This theory, which has been maintained by T. Huxley (Science and Culture, 1881), Shadworth Hodgson (Metaphysic of Experience, 1898 and Theory of Practice, 1870), must be distinguished from that of the psychophysical parallelism or the "double aspect theory," according to which both the mental state and the physical phenomena result from a so-called "mind stuff" or single substance, the material or cause of both.

Automatic acts are of two main kinds. Where the action goes on while the attention is focused on entirely different subjects (*e.g.,* in cycling), it is purely automatic. On the other hand, if the attention is fixed on the end or on any particular part of a given action, and the other component parts of the action are performed unconsciously, the automatism may be called relative.

Sensory Automatism is the term given by students of psychical research to a centrally initiated hallucination. Such hallucinations are commonly provoked by crystal-gazing (*q.v.*), but auditory hallucinations may be caused by the use of a shell (shell-hearing), and the other senses are occasionally affected.

Motor *Automatism,* on the other hand, is a non-reflex movement of a voluntary muscle, executed in the waking state but not controlled by the ordinary waking consciousness. Phenomena of this kind play a large part in primitive ceremonies of divination (*q.v.*) and in our own day furnish much of the material of psychical research. At the lowest level we have vague movements of large groups of muscles as in "bier-divination," where the murderer or his residence is inferred from the actions of the bearers; of a similar character but combined with more specialized action are many kinds of witch seeking. These more specialized actions are most typically seen in the Divining Rod (*q.v.*), which indicates the presence of water and is used among the uncivilized to trace criminals. At a higher stage still we have the delicate movements necessary for Automatic Writing (*q.v.*) or Drawing. A parallel case to automatic writing is the action of the speech centres, resulting in the production of all kinds of utterances from trance speeches in the ordinary language of the speaker to mere unintelligible babblings. An interesting form of speech automatism is known as Glossolalia; in the typical case of Helene Smith, Th. Flournoy has shown that these utterances may reach a higher plane and form a real language, which is, however, based on one already known to the speaker.

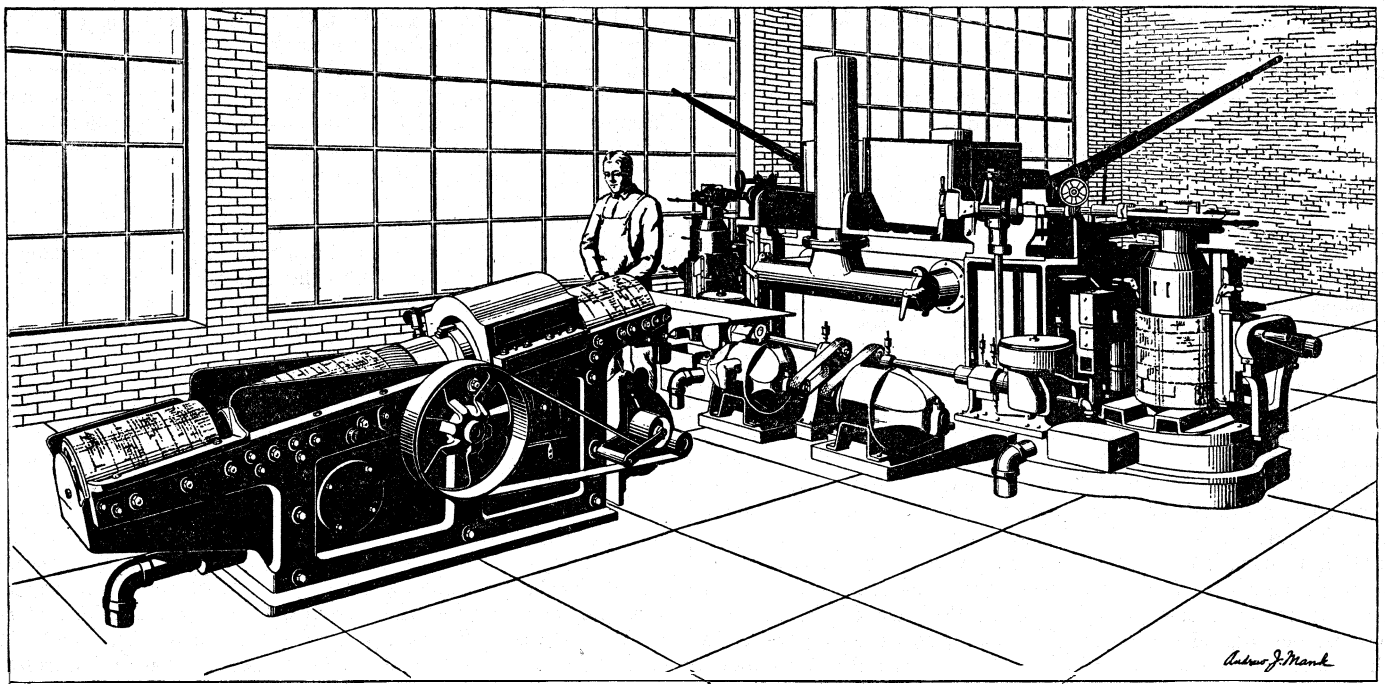
AUTOMATON, a self-moving machine, or one in which the principle of motion is contained within the mechanism itself (Gr. αὐτός, self, and μάω, seize). The word is generally applied to contrivances which simulate the motions of animal life. If the



BY COURTESY OF THE WOOD NEWSPAPER MACHINE CORP.

DOUBLE JUNIOR AUTOPLATE AND AUTOSHAVER IN A MODERN NEWSPAPER PLANT

Curved stereotype printing plates, which are required for high-speed rotary newspaper presses, are cast in a curved form with the autoplate machine, shown at the right. The autoshaver, on the left, trims and shaves the curved stereotype to fit the plate cylinder of the Press

human figure and actions be represented, the automaton has sometimes been called an *androides*. In 400 B.C. Archytas of Tarentum is said to have made a wooden pigeon that could fly, and during the middle ages numerous instances of the construction of automata are recorded. Regiomontanus is said to have made of iron a fly, which would flutter round the room and return to his hand, and also an eagle, which flew before the emperor Maximilian when he entered Nuremberg. The Swiss have always been celebrated for their mechanical ingenuity, and they construct most of the curious toys, such as flying and singing birds, which are frequently met with in industrial exhibitions. Kempelen's famous chess-player for many years astonished and puzzled Europe. This figure, however, was no true automaton, although the mechanical contrivances for concealing the real performer were exceedingly ingenious. J. N. Maskelyne (1875–80) exhibited his automata, Psycho (who played cards) and Zoe (who drew pictures), at the Egyptian hall, London. (*See* CONJURING.) In the 20th century a number of automatons have been invented which, operated by remote electrical or mechanical control, perform many of the actions of a human being. One of the most ingenious the "Voder," demonstrated in 1939 at Philadelphia, was a device with "vocal cords" of vacuum tubes that reproduced vowels, consonants, and monosyllables. The operator, who used a keyboard and foot-pedal, produced whole sentences of human speech from the mechanism

AUTOMOBILE: *see* MOTOR CAR.

AUTOMORPHISM, the conception and interpretation of other people's habits and ideas on the analogy of one's own. (*See* APPERCEPTION.)

AUTONOMY, in general, freedom from external restraint, self-government (Gr. *αὐτός*, self, and *νόμος*, law). In philosophy, the term (with its antithesis "heteronomy") was applied by Kant to that aspect of the rational will in which, qua rational, it is a law to itself, independently alike of any external authority, of the results of experience and of the impulses of pleasure and pain. In the sphere of morals, the ultimate and only authority which the mind can recognize is the law which emerges from the pure moral consciousness. This is the only sense in which moral freedom can be understood. (*See* ETHICS; KANT.) Though the term "autonomy" in its fullest sense implies entire freedom from causal necessity, it can also be used even in determinist theories for relative independence of particular conditions, theological or conventional.

AUTOPLASTY, the repair of diseased or injured parts by pieces taken from another part of the same body. The practice is based on the fact that tissues transplanted to other portions of the same body will either continue to grow or will supply a framework to support the reparative tissue. It is especially valuable where there has been extensive destruction of skin. Here usually small pieces of healthy skin are placed on the raw surface. These become islets of growth and gradually enlarge so as to merge and so cover the area. Occasionally in cosmetic work about the face flaps are used which are still left partially attached to their original sites so as to ensure the blood supply. Pieces of bone, particularly from the readily accessible shin-bone, are used to help support the spine when it has been weakened by tuberculosis.

AUTOPLATE, a machine for rapidly and automatically casting curved stereotype printing plates for rotary presses. Before the invention of this machine by Henry A. Wise Wood in 1900, curved stereotype plates were produced by manual processes. The autoplate produces plates mechanically at a great saving of time, casting three or four newspaper-page size plates a minute.

A sheet of flong, a specially-prepared papier maché is laid over the locked-up page form with moulding blankets over it. The form, usually comprising type and photo-engravings, is forced into the flong under heavy pressure, producing a stereotype mat or matrix—a mould of the form.

Newspapers generally use "dry" mats, a development which speeded up the moulding of stereotype mats and thus made for faster production of newspapers.

The moulded mat is placed in a dryer in which it is shaped to the curve of the printing cylinder, and dried. The dried mat is then placed in casting position, and a charge of moulten stereotype metal is forced against the mat in the mould cavity. forming a curved printing plate by a single stroke of the autoplate pump.

After a lapse of a few seconds for solidification, the "tail" or extension formed during casting is cut off and the plate ejected. The cast plate is then transferred by hand to the autoshaver, in which the inside surface of the plate is shaved accurately, the plate cooled and delivered ready to be clamped on the printing cylinder of the press. (*See* PRINTING.)

AUTOPSY (syn. post-mortem, necropsy), the examination of a dead body with the object of determining the cause of death. This examination may be for legal purposes (*see* **CORONER** and

MEDICAL JURISPRUDENCE) or for the extension of knowledge. When autopsy is ordered by a coroner for legal purposes the relatives have no option, but in most instances of patients dying in hospitals, the consent of the relatives is sought and their decision, if negative, is rigorously observed.

There is great difference amongst nationalities with regard to post-mortem examinations. In the United States, in Catholic countries, amongst Jews and Irish there is great aversion towards autopsies, with the result that the advance of medical knowledge is seriously handicapped. In the absence of autopsy a diagnosis of the cause of death is in large measure an opinion as distinguished from a fact. Even a physician of the highest skill often finds in the post-mortem room that his diagnosis of the patient's disease during life needs rectification. The knowledge he obtains thus he applies in future cases to the advantage of those patients.

The performance of an autopsy calls for special knowledge and skill on the part of the pathologist, and, besides inspection of the various organs, microscopical, bacteriological and chemical methods are employed where necessary and a detailed report on the case supplements the clinical notes in the hospital records. The extent to which advance of knowledge depends upon post-mortem examination is hardly realized. Thus the entire range of cancer research depends upon an accurate diagnosis of cancer, which can only be made microscopically and, in the case of the internal organs, depends either on surgical operation or on autopsy. In their absence the diagnosis is at best conjectural. When post-mortem examination has been carried out by a skilled pathologist there is no disfigurement, and the feelings of the relatives are considered to the fullest possible extent.

AUTOTOMY, the term applied to the self-mutilation practised by certain animals as a means of escape from their enemies. Thus many Crustacea (crabs, lobsters, etc.) will break off a limb if grasped thereby. Amongst vertebrates many lizards will shed the posterior part of their tail when this is held. A new part is grown again in a comparatively short time.

AUTRAN, JOSEPH (1813–77), French poet, was born at Marseilles on June 20, 1813, and died in that city on March 6, 1877. His best known work is La *Mer* (1835). remodelled in 1852 as *Les Poèmes de la mer*. Another important work is his *Vie rurale* (1856), a series of pictures of peasant life. Among his writings is a tragedy, La *Fille d'Eschyle*, played with great success at the Odéon in 1848. A definitive edition of his works was brought out between 1875 and 1881.

AUTUN, a town of east-central France, capital of an arrondissement in the department of Saône-et-Loire, 62 mi. S.W. of Dijon on the P.L.RI. railway to Nevers. Pop. (1936) 13,716. It stands on the slope of a hill above the river Arroux. Autun (Augustodunum) succeeded Bibracte as capital of the Aedui when Gaul was reorganized by Augustus. Under the Romans it had twice its present area, and was renowned for its schools of rhetoric. Roman remains include the ramparts and aqueducts, a theatre and amphitheatre, a square tower and a sepulchral pyramid in the neighbouring village of Coubard. The counts of Autun were dukes of Burgundy from 880 till 1276. The chapel of St. Nicolas (12th century) contains many local antiquities. The cathedral of St. Lazare, once the chapel attached to the residence of the dukes of Burgundy, is in the highest part of the town. Mainly 12th century, the Gothic central tower and the chapels were added in the 15th century by Nicolas Rolin, chancellor of Burgundy, born at Autun. The group of the Last Judgment sculptured on the tympanum above the west door, and the painting by Ingres representing the martyrdom of St. Symphorien, which took place at Autun in 179, are noteworthy. In the cathedral square stands the Renaissance fountain of St. Lazare. The hôtel Rolin (15th century) contains the collections of the "Aeduan literary and scientific society." Autun is the seat of a bishopric, of tribunals of first instance and of commerce. Oil is extracted from the local bituminous schist; leather manufacture, metal-founding, the making of umbrellas, marble-working, and furniture-making are carried on. Autun is the commercial centre for a large part of the Morvan, and trades in timber, grain, horses, and cattle.

AUTUNITE or **CALCO-URANITE,** a mineral which is one of the "uranium micas," differing from the more commonly occurring torbernite (*q.v.*) or cupro-uranite in containing calcium in place of copper. It is a hydrous uranium and calcium phosphate, $Ca(UO_2)_2(PO_4)_2+8(\text{or } 12)H_2O$. Though closely resembling the tetragonal torbernite in form, it crystallizes in the orthorhombic system and is optically biaxial. The crystals have the shape of thin plates with very nearly square outline. An important character is the perfect micaceous cleavage parallel to the basal plane, on which plane the lustre is pearly. The colour is sulphur-yellow, and this enables the mineral to be distinguished at a glance from the emerald-green torbernite. Hardness 2–23; specific gravity 3·05–3·19. Autunite is usually found with pitchblende and other uranium minerals.

AUVERGNE, formerly a province of France, corresponding to the departments of Cantal and Puy-de-Dôme, with the arrondissement of Brioude in Haute-Loire. It contains many mountains volcanic in origin (Plomb du Cantal, Puy de Dôme, Mont Dore), fertile valleys such as that of Limagne, vast pasture lands, and numerous medicinal springs. The population still retains strongly marked Celtic characteristics. In the time of Caesar the *Arverni* were a powerful confederation, the Arvernian Vercingetorix being the most famous of the Gallic chieftains who fought against the Romans. Under the empire *Arvernia* formed part of *Prima Aquitania*, and the district shared in the fortunes of Aquitaine during the Merovingian and Carolingian periods. Auvergne was the seat of a separate countship before the end of the 8th century; the first hereditary count was William the Pious (886). By the marriage of Eleanor of Aquitaine with Henry Plantagenet, the countship passed under the suzerainty of the kings of England, but at the same time it was divided, William VII., called the Young (1145–68), having been despoiled of a portion of his domain by his uncle (William VIII., called the Old, who was supported by Henry II. of England), so that he only retained the region bounded by the Allier and the Coux. It is this district that from the end of the 13th century was called the *Dauphiné d'Auvergne*. This family quarrel occasioned the intervention of Philip Augustus, king of France, who succeeded in possessing himself of a large part of the country, which was annexed to the royal domains under the name of *Terre d'Auvergne*. As the price of his concurrence with the king in this matter, the bishop of Clermont, Robert I. (1195–1227) was granted the lordship of the town of Clermont, which subsequently became a countship. Such was the origin of the four great historic lordships of Auvergne. The *Terre d'Auvergne* was first an appanage of Count Alphonse of Poitiers (1241–71), and in 1360 was erected into a duchy in the peerage of France (*duché pairie*) by King John II. in favour of his son John, through whose daughter the new title passed in 1416 to the house of Bourbon.

The last duke, the celebrated constable Charles of Bourbon, united the domains of the *Dauphiné* to those of the duchy, but all were confiscated by the crown in consequence of the sentence which punished the constable's treason in 1527. The countship, however, had passed in 1422 to the house of La Tour, and was not annexed to the domain until 1615. At the time of the revolution it formed a *gouvernement*, with two divisions: Upper Auvergne (Aurillac), and Lower Auvergne (Clermont).

BIBLIOGRAPHY.—*See* B. Gonot, *Catalogue des ouvrages imprimés et manuscrits concernant l'Auvergne* (1894) ; André Imberdis, *Histoire générale de l'Auvergne* (1867) ; J. B. M. Bielawski, *Histoire de la comté d'Auvergne et de sa capitale Vic-le-Comte* (1868).

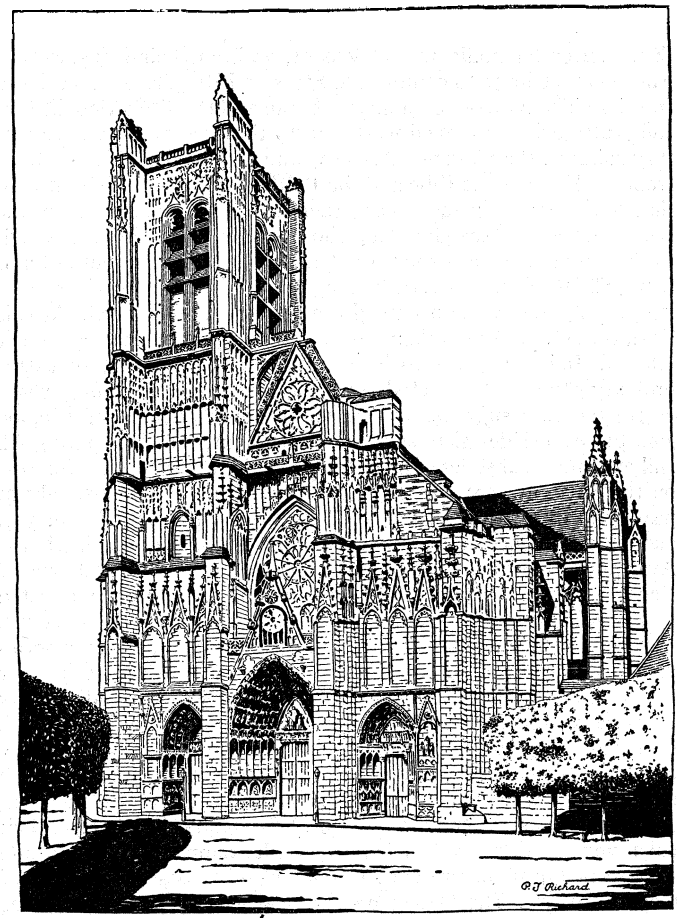
AUXENTIUS (fl. c. 370), of Cappadocia, an Arian theologian (*see* ARIUS).

When Constantine deposed the orthodox bishops who resisted, Auxentius was installed into the seat of Dionysius, bishop of Milan, and came to be regarded as the great opponent of the Nicene doctrine in the West.

When the orthodox emperor Valentinian ascended the throne, Auxentius was left undisturbed in his diocese, but his theological doctrines were publicly attacked by Hilary of Poitiers (*Liber contra Auxentium*, Benedictine edn.).

AUXERRE, central France, capital of the department of Yonne, 38 mi. S.S.E. of Sens on the P. L. M. railway, between Laroche and Nevers. Pop. (1936) 23,197. It stands on the left bank of the Yonne, which is crossed by bridges leading to suburbs.

Auxerre (Autessiodurum) became the seat of a bishop and a "civitas" in the 3rd century. Founded under the Merovingians, the abbey of St. Germain in the 9th century had become a seat of learning. The bishopric was suppressed in 1790. The countship of Auxerre was granted by King Robert I. to his son-in-law Renaud, count of Nevers. It passed by marriage to the house of Courtenay and thence to the families of Donzy, Châtillon, Bourbon and Burgundy. John IV. sold his countship to King Charles V. in 1370.



THE CATHEDRAL OF ST. ÉTIENNE IN AUXERRE, A FINE SPECIMEN OF FRENCH GOTHIC ARCHITECTURE. DATING FROM THE 13TH CENTURY

The town is irregularly built and the streets steep and narrow; its ancient fortifications have been replaced by boulevards. The former cathedral of St. Étienne, a majestic Gothic building (13th to 16th centuries) has three richly sculptured portals and a rose window, and a massive north-west tower; the south-west tower is unfinished. Beneath the choir (fine early Gothic) extends a crypt of the 11th century with 12th century mural decorations. The church has fine stained glass and many pictures. The ancient episcopal palace, now a prefecture, preserves a Romanesque gallery (12th century). The church of St. Eusèbe belongs to the 12th, 13th and 16th centuries. Of the abbey church of St. Germain (13th and 14th centuries) most of the nave has disappeared, so that its imposing Romanesque tower stands apart. Crypts of the 9th century contain the tombs of bishops of Auxerre. The abbey was once fortified and a high wall and cylindrical tower remain. The church of St. Pierre (16th and 17th centuries) has an elaborately ornamented west façade. The old law-court contains the museum and a library. The middle of the town has a gateway and belfry (15th century). Manufactures of ochre, from local quarries, and of iron goods are carried on. The canal of Nivernais reaches Auxerre, which has a busy port and hydroplane base and carries on boat-building. Trade is principally in the choice wine of the surrounding vineyards, and in ochre, metal goods, tanners' bark and coal. The town is the seat of a court of assizes, and has tribunals of first instance and of commerce.

AUXILIARY, that which gives aid or support (from Lat. *auxilium,* help); the term is used in grammar of a verb which completes the tense, mood or voice of another verb; in engineering, ***e.g.***, of the low steam power used to supplement the sail-power in sailing ships; in military use of foreign or allied troops, more properly of any troops not permanently maintained under arms. In the British army the term "Auxiliary Forces" was employed formerly to include the Militia, the Imperial Yeomanry and the Volunteers. So long as infantry was held to be the decisive arm, the term "auxiliary arms" was often used to mean the other arms, especially artillery, which assisted it in this rôle and gave fire-support to its assault.

AUXIMUM (mod. *Osimo*), ancient town, Picenum, on an isolated hill 8m. from the Adriatic, on the road from Ancona to Nuceria, a Roman fortress to protect settlements in Northern Picenum; the walls were built 174 B.C. of large squared blocks; they still exist. It was important in the civil wars and in imperial times, as inscriptions and the monuments of its forum (the present piazza) show. In the 6th century it is called by Procopius the chief town of Picenum, Ancona being spoken of as its harbour.

AUXONNE, town in the Côte-d'Or department, East France, 19 mi. E.S.E. of Dijon on the P.L.M. railway to Belfort. Pop. (1936) 3,727. It lies in the wide plain on the left bank of the Saône, whence its name (ad *Sonam*). The rnediaeval town was the centre of a county which passed to the dukes of Burgundy in the 13th century. The town received a charter in 1229, and had a mint founded by the dukes. In the 17th century Vauban restored the ramparts and stronghold, traces of which still remain, and built the arsenal now used as a market. Auxonne was invested by the allies in 1814 and surrendered to the Austrians in 1815. The church of Notre Dame (14th century) has two front towers (one unfinished) and a lofty spire surmounting a third tower over the crossing. The *Hôtel-de-Ville* (15th century) and some Renaissance houses are of interest. There are a tribunal of commerce and a communal college, but industries are unimportant though there is a large trade in market-garden and vegetable produce. There is also an aerodrome.

AVA, the ancient capital of the Burman empire, is on the Irrawaddy, on the opposite bank to Sagaing. Amarapura, another ancient capital, lies 5m. N.E. of Ava, and Mandalay, the present capital, 6m. N. The classical name of Ava is Yadanapura, "(the city of precious gems." It was founded by Thadomin Payā in A.D. 1364 as successor to Pagān, and the religious buildings of Pagān were, to a certain extent, reproduced here, although not on the same scale. It remained the seat of government for about four centuries with a succession of 30 kings. In 1783 a new capital, Amarapura (*q.v.*), was founded by Bodawpayā, but was deserted again in favour of Ava by King Baggidaw in 1823. On his deposition by King Tharawaddi in 1837, the capital reverted to Amarapura; but finally, in 1860, the last capital, Mandalay was occupied by King Mindōn. Traces of the great council chamber and various portions of the royal palace are still visible. but otherwise the secular buildings are completely destroyed; and most of the religious edifices are also dilapidated.

AVA: see KAVA.

AVADĀNA, the name given to collections of Buddhist tales purporting to be told by the Buddha in order to show the results of *karma.* They exist in a large number of Sanskrit (Nepalese) works of which the chief are the Avadānasataka (Century of Legends), and the Divyāvadāna (The Heavenly Legend). The older collections belong to Hīnayāna, and such compositions were continued in Mahāyāna schools They are not found in the Pāli, as a separate literary form, but the Canon contains a work called Apadāna, consisting of recitals in verse by elders, who tell how their good deeds in previous births have led to happiness. The Mahā-apadāna sutta ("great achievement"). in the Dīghanikāya gives an account of the last seven Buddhas. (See BUDDHA AND BUDDHISM)

AVAHI (ăv′ą-hĭ), a Malagasy lemur (*Avuhis laniger*) allied to the indri (q.v.), characterized by its woolly coat, and measuring about 28 in. in length, of which rather more than half is tail. The avahi is nocturnal, and is met with alone or in pairs. Very slow in its movements, it rarely descends to the ground, but, when it does, walks upright. It is found throughout the forests on the east coast of Madagascar, and also in a limited district on the northwest coast, the specimens from the latter locality being of smaller size and different colour. The eastern phase is generally rusty red above, with the inner sides of the limbs white; while the predominant hue in the western form is usually yellowish brown. See PRIMATES.

AVALANCHE (adopted from a French dialect form, *avalance,* descent), a mass of snow usually mingled with ice, soil, pebbles and boulders, which rushes down a mountain side destroying anything in its path. It often produces a strong wind which uproots trees on each side of its course. Above the snow line where the supply of snow exceeds the loss by evaporation the surplus, partly compacted to ice by pressure descends the mountain sides either slowly in the form of glaciers, or more swiftly in ice-falls or in avalanches. On steep slopes the foundation easily gives way, owing to the loosening effect of spring rains, the blowing of the *föhn* or from other causes and the whole mass slides downward. Thunder or even a loud shout is said to be sufficient to set the overloaded snow in motion when the mass is just poised, and Swiss guides often enjoin absolute silence when crossing dangerous spots.

AVALLON, a town of France, capital of an arrondissement in the department of Yonne, 34 mi. S.S.E. of Auxerre on a branch of the P.L.M. railway. Pop. (1936) 5,544.

Avallon (*Aballo*) was the seat of a viscounty in the mediaeval duchy of Burgundy. The church of St. Lazare (12th century) has two western portals sculptured in ornate Romanesque style; the tower on the left of the façade was rebuilt in the 17th century. The Tour de l'Horloge (15th century), pierced by a gateway through which passes the Grande Rue, contains a museum on its second floor. Remains of ancient fortifications, including seven flanking towers, are still to be seen. There is a statue of Vauban, the military engineer. The public institutions include the subprefecture, a tribunal of first instance, and a communal college. Trade is in wood, wine, leather, live-stock, grain, and wool.

AVALON (also written **AVALLON, AVOLLON, AVILION, AVELION),** in Welsh mythology the kingdom of the dead; in the Arthurian romances, the abode of heroes to which King Arthur was conveyed. In Welsh the name is Ynys yr Afallon, usually interpreted "Isle of Apples," but if the Celtic traditional derivation, a king over the dead named Avalloc (Welsh *Afallach*), is correct, the name comes from the Welsh *afal,* an apple, and is probably intended to symbolize the enjoyments of elysium. Perhaps owing to a confusion between Glasberg, the Teutonic kingdom of the dead, and the Anglo-Saxon Glaestingaburh, Glastonbury, the name "Isle of Avalon" was given to the ridge in Somersetshire culminating in Glastonbury Tor, while Glastonbury itself came to be called Avalon.

See *Studies in the Arthurian Legend,* by J. Rhys (Oxford, 1891); also ARTHUR; ARTHURIAN LEGEND; ATLANTIS.

AVALON, a seaside and sportsman's resort, situated on the southeast coast of Santa Catalina island, Calif., about 56 mi. S. of Los Angeles and 27 mi. by steamer from San Pedro and Long Beach on the mainland. The town is picturesquely built in a narrow valley and on the slopes of an amphitheatre of rugged hills surrounding a small, semicircular bay, which is the chief harbour of the island. The resident population, largely augmented at times by people whose permanent homes are across the channel, is engaged mainly in connection with the tourist trade. Each year the island is visited by thousands of tourists, including fishermen from all parts of the world, who are attracted by the climate, scenery and fishing grounds. Population in 1940, 1.637.

AVALON, formerly West Bellevue. a residential borough of Allegheny county, Pa., U.S.A.. 6 mi. N.W. of Pittsburgh, on the Ohio river and the Pennsylvania railroad. The population in 1940 was 6,155.

AVARS of Europe, sometimes called "pseudo-Avars," were probably a Turkish tribe, named Uigurs, who were subjected by the true Avars—a nation akin to the Huns, perhaps identical with the Yüan-Yüan, when the latter were driven out of Central Asia about A.D. 461. The Avar confederation dominated the Volga steppes till 555, when the Avars were defeated and almost annihilated by the Turks. The Uigurs, flying westward under Avar chiefs, took the name of Avar. In 555 they reached the country of the Alani, north of the Caucasus, whence they sent envoys to Constantinople, offering their services. The Emperor Justinian offered them Lower Pannonia for settlement, and, on their refusing this, paid them a tribute to combat the Slavs and Bulgars on his eastern frontier. The Avars overcame the Antae and the Bulgarian Utiguri and Kutriguri, and moved westward to the present Galicia, where they subdued the Slavonic Dubledy, and extended their suzerainty from the Volga to the Elbe and the Baltic. In 565 Justinian discontinued the tribute; the Avars then allied themselves with the Lombards against the Gepidae, who occupied the present Transylvania, bargaining for a share of the spoil and the conquered territory. The Gepidae were crushed in 567, and, the Lombards migrating to Italy, the Avars occupied the Danube-Theiss basin. At this time, the Avars were perhaps the greatest power in Europe. Their Khagan, Baian, appears to have been a military leader of extraordinary genius. He exacted from the Byzantine emperors, whom he treated with supreme arrogance, an annual tribute of 120,000 gold pieces, besides gifts such as an elephant, a bed of pure gold, and enormous subsidies. Baian took Sirmiurn, the Roman fortress on the Save, in 580; for the next 30 years he was alternately at peace and war with the Empire. He besieged Thessalonica in 597, and only pestilence in his ranks saved the city. After his death, the Avar power declined, although in 617 they ravaged the suburbs of Constantinople, carrying off 270,000 prisoners, and in 626, assisted by Slavs, Bulgars and Gepidae, and co-operating with the Persians, besieged the city itself. In 601, however, Priscus inflicted a series of defeats on them; in 603 the Slavs on their north-west frontier revolted, and later the kingdom of Moravia was formed; in 63j Bulgaria became independent; then the Croats. In the 7th and 8th centuries the Avars no longer troubled Byzantium, although they ravaged both Germany and Italy, sometimes in conjunction with the Lombards. In 791 Charlemagne attacked their western frontier on the Enns. After a bloody war of five years, Pippin took their chief ring and destroyed their power. The remnants of the nation were settled near the present Petronel, near the eastern frontier of modern Austria. Their Khagan swore fealty to the Franks, and was baptized. Two revolts, in 799 and 803, were suppressed, and soon after, the name of Avar vanished from history. The downfall of this once mighty nation was so complete and spectacular that it became proverbial among the Russians. The Avars were probably never more than a small ruling caste, and were absorbed by the Slavs: the theory that they were the ancestors of the mediaeval Vlachs and the modern Rumanians is untenable. On the other hand, the influence of their empire on the ethnographical distribution of modern Europe is immense, most of the western Slavs having either been driven to their present habitats before the advancing Avars, or settled by them to guard their frontiers. They lived in rings, or fenced enclosures, the largest of which was said to be 38 miles round. Here they kept their vast treasures; but they have left not a single monument.

See the account by Sir H. H. Howorth in the *Journal* of the Royal Asiatic Society (1889); also Prof. Bury's annotated edition of Gibbon's *Decline and Fall of the Roman Empire* (1909). (C. A. M.)

AVATAR, an "incarnation," especially the "descent" of a deity to save the world. Thus. the 10 *avatārs* of Vishnu were in the later epics, as (1) a fish, (2) a tortoise, (3) a boar, (4) a monster, half man, half lion, to destroy Hiranyakasipu, the infidel worshipper of Siva, (5) a dwarf, (6) Rāma, (7) Rāma, son of Jamadagni, (8) Krishna, (9) Buddha, and the 10th, yet to appear, will be, the Hindus believe, Kālki, in the form of a white-winged horse destined to destroy the earth.

See E. W. Hopkins, *Epic Mythology,* Strasbourg, 1915.

AVEBURY, JOHN LUBBOCK, 1ST BARON (1834–1913), English banker, politician and naturalist, was born in London

April 30, 1834, and died at Kingsgate Castle, Kent, May 28, 1913, the son of Sir John William Lubbock, 3rd baronet, himself a highly distinguished man of science. John Lubbock was sent to Eton in 1845, but three years later was taken into his father's bank, and at 22 became a partner. In 1865 he succeeded to the baronetcy. His love of science kept pace with his increasing participation in public affairs. He served on commissions upon coinage and other financial questions; and at the same time acted as president of the Entomological Society and of the Anthropological Institute.

Early in his career several banking reforms of great importance were due to his initiative, while such works as *Prehistoric Times* (1865), and The *Origin of Civilization* (1870), were proceeding from his pen. In 1870, and again in 1874, he was elected a member of parliament for Maidstone. He lost the seat at the election of 1880; but was at once elected member for London University, of which he had been vice-chancellor since 1872. He promoted various measures in Parliament, including the Bank Holidays Act 1871, and bills dealing with absconding debtors, shop hours regulations, public libraries, open spaces, and the preservation of ancient monuments, and he proved himself an indefatigable and influential member of the Unionist party. As a writer of popular scientific books Lord Avebury (he was raised to the peerage in 1900) had few rivals in his day. Many of his hooks ran into a great number of editions, and served a great educational purpose in arousing an interest in science among many young people who would have been repelled by the ordinary text book.

Among his works are: *The Origin and Metamorphoses of Insects* (1873), *British Wild Flowers* (1875), *Ants, Bees and Wasps* (1882), *Flowers, Fruits and Leaves* (1886), *The Pleasures of Life* (1887), *The Senses, Instincts and Intelligence of Animals* (1888), *The Beauties of Nature* (1892), *The Use of Life* (1894).

AVEBURY, village of Wiltshire, England, on the upper Kennet, among the Marlborough Downs, six miles W. of Marlborough. Population (1931) 561. The name is famous as that of a stone circle, perhaps the largest in the world, upon which the village, which, as Avreberie or Abury, dates at least from the time of Domesday, has encroached. The circle encloses an area of over 28 ac., and has an average diameter of 400 yards. It is surrounded by a deep ditch and an outside rampart of earth. The ditch, which has a marked "berm," is over 40ft. wide at the top; its depth varies, but measures in places 30ft., with a distance of 55·5ft. from floor of ditch to top of rampart. Within the larger circle were two smaller ones, probably consisting of double concentric rings of stones. The centres are marked in the one case by an "obelisk," in the other by three stones called "the cove." The monument was probably approached by avenues similar to that of Stonehenge. The stones are all native Sarsens, unhewn; and there appear to be no "foreign stones" such as are found at Stonehenge. They vary in size from 5 to 20 ft. in height above ground, and from 3 to 12 ft. in breadth. Scientific excavations, carried out in 1908 and subsequently, have suggested a Late Neolithic date for Avebury; but it cannot be proved not to have been constructed, at least in part, in the days when the use of metal was known in Britain. The fragments of pottery suggest a date contemporary with the Long Barrows. There are many barrows on the neighbouring downs, besides traces of a double oval of monoliths on Hackpen Hill, and the huge mound of Silbury Hill. Windmill Hill, with earth ramparts, nearby is proving of great interest, having probable cultural links with earthworks of the age of transition from stone to metal at Michelsberg and else here in central Europe.

AVEIA, an ancient town of the Vestini, on the Via Claudia Nova, 6m. S.E. of Aquila and N.E. of the modern village of Fossa, Italy. Some remains of ancient buildings still exist. Paintings in the church of Sta. Maria ad cryptas of the 12th to 15th centuries are important in the history of art.

AVEIRO, port and episcopal see, north-western Portgual, on the Lisbon-Oporto railway. Pop. (1930) 12,735. Aveiro is built on the southern shore of a marshy lagoon, containing many small islands, and measuring about 15m. from north to south, with an average breadth of about one mile. The Barra Nova, an artificial canal about 33ft. deep (built 1801–08), gives access to the ocean. The local industries include the preparation of sea-salt and the catching and curing of fish. There is also a brisk trade in mine, oil and fruit; while the Aveiro district contains copper and lead mines, besides much good pasture land.

Aveiro is probably the Roman Talabriga. In the 16th century it was the birthplace of João Affonso, one of the first navigators to visit Newfoundland; it soon became famous for its fleet of more than 60 vessels, which went thither yearly for dried codfish.

AVELLA (anc. ABELLA), city of Campania, Italy, province of Avellino, 23 mi. N.E. of Naples by rail. Population (1936) 4,260 (town); 4,305 (rommune). It is in fertile territory and its nuts and fruit were renowned in Roman days. About 2 mi. N.E. lies Avella Vecchia, the ancient Abella, regarded by the ancients as a Chalcidian colony. An important Oscan inscription relates to a treaty with Nola, regarding a joint temple of Hercules (2nd century B *c.).* It has remains of the walls of the citadel and of an amphitheatre, and lay on the road from Nola, perhaps joined here by a branch from Suessula.

AVELLANEDA, GERTRUDIS GÓMEZ DE (1814–1873), Spanish dramatist and poet, was born at Puerto Príncipe (Cuba) and removed in 1836 to Spain, where she published her first poems (1839) under the pseudonym of "La Peregrina." Her novels, such as *Sab* (1839) and *Guatimozín* (1846) are of no great importance. She obtained, however, a series of successes on the stage with *Alfonso Munio* (1844), a tragedy in the new romantic manner; with *Saúl* (1849), a biblical drama; and with *Baltasar* (1858). La Avellaneda has a grandiose tragical vision of life, a vigorous eloquence rooted in pietistic pessimism, a dramatic gift effective in isolated acts or scenes; but she is deficient in constructive power and in intellectual force, and her lyrics, though instinct with melancholy beauty, or the tenderness of resigned devotion. too often lack human passion and sympathy.

See E. B. Williams, *The Life and Dramatic Works of G. Gómez de Avellaneda* (Philadelphia, 1924).

AVELLANEDA, a city in the Argentine republic. pop. 139,572 in 1914, and estimated to be about 386,000 in 1942; a suburb of Buenos Aires, on the southern side of the Riachuelo which separates it from Buenos Aires proper. It is virtually a part of the capital but is organized as a separate municipality. Avellaneda is one of the new cities of the Argentine, owing its rapid development to the growth of Buenos Aires in recent years. It is chiefly industrial and commercial in character, and contains meat-packing plants, wool-washing establishments, textile mills and extensive markets for agricultural and stock products. Two railways (the Great Southern and the Midland) have been built into Avellaneda from Buenos Aires, and it is also reached by tramways and motor-bus lines. Several bridges span the Riachuelo, connecting Buenos Aires and Avellaneda.

AVELLINO, episcopal see, Campania, Italy, capital of province of Avellino, 1,150 ft. above sea-level, 28 mi. direct and 50 mi. by rail E.N.E. of Naples, at the foot of Mt. Vergine. Pop (19361 20,578 (town); 29,091 (commune). It is the junction for Benevento and Rocchetta S. Antonio. The name derives from the ancient Abellinum, ruins of which lie 2½ mi. N.E., close to Atripalda village, and consist of remains of city walls and an early imperial amphitheatre. Abellinum apparently was the chief place of a tribe, to which belonged also some independent communities among the Hirpinii and Apulians. It lay on the boundary of Campania and the territory of the Hirpinii, at the junction of the roads from Nola (perhaps also from Suessula) and Salernum to Beneventum. In the 9th or 10th century castle (now ruined) the antipope Anacletus II. crowned Count Roger II. king of Sicily and Apulia.

AVEMPACE (Abu Eakr Muhammad ibn Yahya, known as Ibn Bājja or Ibn Sa'igh; *i.e.,* son of the goldsmith, the name being corrupted by the Latins into Avempace, Avenpace or Aben Pace), the earliest and one of the most distinguished of the Arab philosophers of Spain. Little is known of the details of his life. He was born probably at Saragossa towards the close of the 11th century. According to Ibn Khāqān, a contemporary writer, he became a student of the exact sciences, and was also a musician and a poet.

But he was a philosopher as well, and apparently a sceptic. He is said to have rejected the Koran, to have denied the return to God, and to have regarded death as the end of existence.

But even in that orthodox age, he became vizier to the amir of Murcia. Afterwards he went to Valencia, then to Saragossa. After the fall of Saragossa (1119) he went to Seville, then to Xativa, where he is said to have returned to Islam to save his life. Finally he retired to the Almoravid court at Fez, where he was poisoned in 1138. Ibn 'Usaibi'a gives a list of 25 of his works, but few of these remain. He had a distinct influence upon Averroes (*see* ARABIAN PHILOSOPHY).

BIBLIOGRAPHY.—For his life, *see* M'G. de Slane's trans. of Ibn Khallikān's *Biographical Dictionary* (1842), vol. iii, p. 130 *et seq.*, and Ibn 'Usaibi 'a's biography translated in P. de Gayangos' edition of the *Iiistory of the Mohammedan Dynasties in Spain*, by al-Maqqari (1840), vol. ii, appendix, p. xii. List of extant works in C. Brockelmann's *Geschichte der arabischen Litteratur*, vol. i, p. 460. For his philosophy, *cf.* T. J. de Boer's *The History of Philosophy in Islām* (1903), ch. vi.

AVENARIUS, RICHARD HEINRICH LUDWIG (1843–1896), German philosopher, was born in Paris and died at Zürich, where he had been professor of philosophy for nearly 20 years. At Leipzig he was one of the founders of the *Akademisch-philosophische Verein*, and was the first editor of the *Vierteljahrsschrift fur wissenschaftliche Philosophie*. His chief works are *Philosophie als Denken der Welt gemäss dem Princip des kleinsten Kraftmasses* (1876) and the *Kritik der reinen Erfahrung* (1888–90). In these works he made an attempt to co-ordinate thought and action. Like Mach, he started from the principle of economy of thinking, and in the *Kritik* endeavoured to explain pure experience in relation to knowledge and environment. He discovers that statements dependent upon environment constitute pure experience. This philosophy, called Empiriocriticism, is not, however, a realistic, but an idealistic dualism, nor can it be called materialism.

BIBLIOGRAPHY.—*See* Wundt, *Philos. Stud.*, xiii (1897); and J. Petzoldt, *Einführung in d. Philos. d. reinen Erfahrung* (1900).

AVENGER OF BLOOD, the person. usually the nearest kinsman of the murdered man, whose duty it was to avenge his death by killing the murderer. In early societies, crimes of violence were regarded as injuries of a personal character to be punished by the sufferer or his kinsfolk. This right of vengeance in many countries was the subject of strict regulations and limitations. The law of sanctuary (*q.v.*) and the institution of blood-money, and the wergild offered the wrong-doer a mode of escaping from his enemies' revenge.

(*See* Westermarck, *Origin and Development of the Moral Ideas*, 1906, vol. i, ch. xx.)

AVENGERS or **VENDICATORI,** a secret society formed about 1186 in Sicily to avenge popular wrongs. The society was finally suppressed by King William II, who hanged the grand master and branded the members with hot irons.

AVENOL, JOSEPH LOUIS ANNE (1879–), French statesman, was the son of Ernest Avenol and Renée de Hansy. He was educated at the École des Sciences Politiques and the University of Paris. In 1905 he secured his first governmental appointment, as a member of the staff of the general inspector of finances in the French treasury. He advanced to the office of general inspector in 1910 and from 1916 to 1923 was a member of the French government's financial delegation in London. From 1920 to 1923 he mas on the financial committee of the League of Nations at Geneva.

He was deputy secretary general of the league from 1923 to 1932 and in the latter year became secretary general, which office he retained until his resignation in July 1940, shortly after the German conquest of France in World War II.

AVENS: *see* GEUM.

AVENTAIL or **AVANTAILLE** (O.Fr. *esventail*, presumably from a Latin word *exventaculum*, air-hole), the mouthpiece of an old-fashioned helmet, movable to admit the air.

AVENTINUS (1477–1534), whose real name was Johann Turmair, author of the *Annales Boiorum* in seven books, was born at Abensberg (Aventinum) July 4, 1477, and died at Regensburg Jan. 9, 1534. He studied at Ingolstadt, Vienna, Cracow and Paris, and from 1509–17 was tutor to two of the Bavarian princes. William IV, duke of Bavaria, encouraged him to write the *Annales* (first edition 1554), which give the history of Bavaria in conjunction with general history from the earliest times down to 1460. The work, written between 1517 and 1521, was later translated by its author into German as *Bayersche Chronik*. He took immense pains with the work and to some degree anticipated the modern scientific method of writing history. Throughout, the author shows a strong sympathy for the empire in its struggle with the papacy. Many important passages were omitted in the first edition, as they reflected on the Roman Catholics. A more complete edition was published at Basle in 1580 by Nicholas Cisner.

Although Aventinus did not definitely adopt the reformed faith, he sympathized with the reformers and their teachings, and showed a strong dislike for monasticism. On this account he was imprisoned for a short time in 1528, but was released through the intervention of friends. The remainder of his life was somewhat unsettled.

Aventinus, who has been called the "Bavarian Herodotus," wrote other books of minor importance, and a complete edition of his works was published at Munich (1881–86).

See T. Wiedemann, *Johann Turmair gen. Aventinus* (1858); W. Dittmar, *Aventin* (1862); J. von Döllinger, *Aventin und seine Zeit* (1877); S. Riezler, *Zum Schutee der neuesten Edition von Aventins Annalen* (1886); F. X. von Wegele, *Aventin* (1890).

AVENTURINE or **AVANTURINE,** a variety of quartz spangled with scales of mica or haematite. Most aventurine quartz is of yellow or brown colour, but a green variety containing scales of the chrome-mica, fuchsite, is also known. The name aventurine is also applied to certain iridescent felspars. The principal of these is the oligoclase occurring in gneiss at Tvedestrand in southern Norway. The brilliant spangled appearance of such felspars is due to microscopic enclosures, the colours in reflected light being the interference colours of thin films. In most cases the reflecting lamellae are haematite, oriented always after simple crystal forms causing "aventurization" on the planes 001 and 010. Aventurine felspar is also known as sunstone, but aventurization is not confined to oligoclase, occurring also in orthoclase and labradorite (*q.v.*).

AVENUE. Way of access, an approach to a country house, bordered by trees; it is now much used as a name for streets, with or without trees, *e.g.*, Fifth avenue, New York; Shaftesbury avenue, London.

AVENZOAR or **ABUMERON** (Abū Merwān 'Abdal-Malik ibn Zuhr) (d. 1162), Arabian physician, was born at Seville, where he exercised his profession with great reputation. He was a contemporary of Averroes, who, according to Leo Africanus, heard his lectures. and learned physic of him He belonged, in many respects, to the *Dogmatists* or *Rational School*, rather than to the *Empirics*. He was a great admirer of Galen; and in his writings, he protests emphatically against quackery and the superstitious remedies of the astrologers. His *Teisir* (Rectification of Health) mas translated into Hebrew (1280) and thence into Latin by Paravicius (Venice, 1490).

AVERAGE, a legal term (for mathematical meaning, *see* PROBABILITY AND ERROR), may be either *particular* or *general*. Particular average signifies damage or a partial loss sustained by ship, goods or freight through some accidental cause. According to s. 64 (1) of the Marine Insurance Act 1906, particular average is "a partial loss of the subject matter insured, caused by a peril insured against, and which is not a general average loss." It is borne by (or is "particular" to) the parties to whose property the misfortune occurs, unrelieved by any contribution from their co-adventurers. The loss may or may not be recoverable from their insurers (if any) according to the terms of the marine insurance policy (*see* MARINE INSURANCE). The essence of a particular average loss, however, lies in the fact that it is wholly accidental.

General average on the other hand consists of a voluntary sacrifice of part of the property at risk, or the incurring of an

expense, for the common safety of the adventure, and such sacrifice or expense is borne by the property saved. It is defined in s. 66 (2) of the Marine Insurance Act 1906 (the only statutory definition of general average) as follows: "There is a general average act where any extraordinary sacrifice or expenditure is voluntarily and reasonably made or incurred in time of peril for the purpose of preserving the property imperilled in the common adventure."

The equity of the underlying principle of general average has been recognized throughout the centuries, and every State possessing a maritime trade has adopted the rule that a loss caused by a sacrifice in time of peril at sea shall not be borne by one but by all. It will be appreciated, ho ever, that although nothing could be more simple than the fundamental principle of general average, its application to the adjustment of losses arising under modern conditions of maritime commerce is far from simple and has called into existence a profession of experts, known as average adjusters (*q.v.*). The complications of adjustment are added to by the fact that the law of no two countries in the world agrees as to what losses are to be treated as general average, or how such losses shall be borne. In actual practice, the settlement of general average losses and contribution is a matter usually dealt with by underwriters where the interests are insured. Liability to contribute, however, arises quite independently of insurance. Reference is made below to the movement for obtaining some measure of international uniformity in matters of general average.

Dealing with the subject from the point of view of English law, it will be convenient to treat it briefly under the following headings: 1. What losses and expenses are allowable as general average. 2. How much is allowable. 3. What interests contribute to the general average, and on what basis. 4. The question of security to be given for payment of the contributions.

Losses Allowable as General Average. — It will be seen from the definition in the Marine Insurance Act quoted above that a sacrifice to possess the quality of general average must have been made "for the purpose of preserving the property." It is not enough that it was necessary to enable the common adventure to be completed. General average according to English law only arises where the *safety* of the property at risk is at stake. It is not alone sufficient "that an expenditure should have been made to benefit both cargo owner and shipowner" (*per* Bowen, L.J., in *Svendsen* v. *Wallace*, 1883, 13 *Q.B.D.*, p. 84).

(1) Jettison is generally regarded as a typical case of general average and it was so regarded by the Rhodians according to whose law, "if goods are thrown overboard to lighten a ship, all shall make good by contribution that which has been given for all." The jettison of cargo carried on deck, however, is not treated as general average except where such carriage is the custom of the trade and is not contrary to the terms of the contract of affreightment. The reason for the exclusion of jettison of deck cargo from contribution is that a ship's deck is generally considered an improper place upon which to stow cargo. Damage to the ship incidental to a jettison is also allowable as general average, *e.g.*, the breaking of bulwarks or rails during the act of jettison.

(2) Damage done in extinguishing a fire is a very common case of general average and one that entails very complicated calculations in the adjustment of the loss. For many years it was the custom of average adjusters in England not to treat the loss caused by the use of steam, water or other means of quenching a fire as general average. As the result of a series of cases in the courts, however, it was established that any damage done in this way is properly allowable as general average. In practice, however, an exception is made to this rule — that no allowance is made for damage to cargo by water, etc., when the packages so affected were themselves on fire when the water was thrown upon them. This is justified by the argument that the particular packages were already doomed to destruction by fire and the water, therefore, could cause no additional loss to them. The damage done in scuttling or beaching a ship in order to extinguish a fire is also treated as general average.

The case of a fire on board a ship which is extinguished by the use of water or other agency illustrates clearly the distinction between general and particular average. The damage done by the fire itself is particular average, being entirely accidental; on the other hand the damage done by the water used to extinguish the fire is caused by a voluntary act, deliberately performed to avert the destruction of the ship and cargo, and forms, therefore, the subject of contribution by all interests on board saved by that act.

(3) When a ship is aground and in a state of peril, it is often found necessary to lighten her by discharging the cargo into lighters or other craft alongside. Such work can seldom be carried out without causing loss or damage to the cargo discharged, and in so far as the discharge is ordered for the general benefit and not merely to save the cargo itself, *e.g.*, when the ship has already become a total wreck, the cost of discharge and the resulting loss or damage is allowable as general average. Similarly, any loss caused by the discharge of cargo at a port into which the ship has put in distress is treated as general average, where the discharge is effected for the common safety or for the purpose of carrying out repairs to the ship necessary for the prosecution of the voyage.

(4) It may happen that owing to delay on the voyage due to bad weather or other circumstances a steamer's supply of fuel runs out. If the conditions are such as to threaten the common safety, the loss of cargo used as fuel in this emergency is treated as general average, provided that the original supply of ship's fuel was reasonably sufficient for the voyage.

(5) Where the shipowner is only entitled to freight upon the safe delivery of the cargo, the loss of cargo by, say, jettison causes of course a corresponding loss of freight, and in the event of the loss of cargo being allowable in general average the freight so lost is also made good in general average.

(6) A sacrifice of part of the ship, *e* g., the cutting away of a mast when the ship is on her beam-ends, or of her equipment or gear, *e.g.*, the jettison of ship's stores, etc., is treated as a general average loss when necessary for the common safety as much as a sacrifice of cargo. There is this distinction, however, between a sacrifice of cargo and of ship. In the case of the cargo, it should never be voluntarily exposed to peril, and if this be done for the general benefit, the ensuing loss or damage is, broadly speaking, always the subject of general average. The case of the ship, however, is not quite on the same footing. The shipowner is bound to give the services of his ship in exchange for the freight or hire received, and he is bound to give its services even under conditions of stress without claiming compensation for so doing. A ship is not built for fine weather only and even though she may suffer in a gale, and her equipment be severely damaged in bringing her safely through it, no claim can be made by the owners for compensation in general average. Where, however, any part of the ship or her equipment is put to an abnormal use for the purpose of avoiding an imminent peril, the case is different. The cargo is entitled to expect the full *use* of the ship, even under exceptional circumstances, but not that the ship or any part of her should be *abused* in the sense that it is put to a use for which it was never intended. A typical case of the former would be the loss of sails blown away in avoiding a lee shore; of the latter, the cutting up of spars to make a jury rudder. When a ship is aground and in a position of peril, damage caused to her engines in endeavouring to refloat her, as well as the coal used in the operation, is allowable in general average (*The Bona*, 1895, *P.*, p. 125). Damage to or loss of sails in similar circumstances is also the subject of general average.

The deliberate running of a ship ashore to avoid sinking or driving on to rocks or other emergency would seem at first sight to be a clear case of general average sacrifice. Both the main elements of general average appear to be present — the existence of imminent danger and the deliberate decision to incur a certain loss to avert a greater — but no decision has been given in the English courts on the point, although several cases have been decided in America, and the question is by no means free from doubt. The chief argument against the allowance of loss arising from voluntary stranding in general average is that in fact the element of sacrifice does not exist. At the moment of decision to put the vessel ashore she was apparently doomed to destruction by, say, sinking or by striking a reef. This fate is averted by manoeu-

vring her ashore at a place of comparative safety. The damage caused by this act, therefore, cannot be described as having been incurred for the benefit of all, for the mere selection of a better rather than a worse spot to take the ground is in fact a benefit conferred upon and not a sacrifice of the interest thereby damaged. If the grounding saved the ship from sinking in deep water, again no sacrifice is incurred, but merely a diminished loss. This argument, however, is not generally accepted and the better opinion seems to be that where the facts justify the view that there has been a deliberate decision to incur the certain loss which mould follow a voluntary stranding, the loss so incurred is properly allowable as general average. To argue that because a lesser loss has been incurred rather than a greater, no sacrifice has been made, is to deny the benefits of general average contribution to all whose property is sacrificed for the common benefit, for the very essence of the principle of general average is that a lesser loss is deliberately incurred to avoid a greater. Cargo jettisoned, or a mast cut away, to save the adventure from total loss during a hurricane are instances of comparatively minor losses voluntarily incurred to avert a greater, but they are regarded, quite properly, as typical cases of general average. In fact the greater the peril, the better grounds there are for regarding the means used to avert it as general average.

According to a series of American decisions, the principle is definitely recognized that loss through voluntary stranding is general average where it is clear that there was any act of volition at all, and this agrees with the law of most other countries. The practice of English average adjusters, however, is to the contrary, as will be seen from the wording of one of their rules of practice: "The custom of Lloyd's excludes from general average all damage to ship or cargo resulting from a voluntary stranding. This rule does not necessarily exclude such damage as is done by beaching or scuttling a burning vessel to extinguish the fire."

It has been held in England that damage sustained in resisting enemy attack is not general average, nor is the cost of replacing the munitions expended, nor the cost of medical attention to seamen wounded (Taylor v. **Curtis,** 1815, 4 Camp. 33;). It was held that there was no sacrifice, but that the seamen merely did their ordinary duty and nothing beyond it, and that no part of the property had been sacrificed for the general benefit. The same principle is extended to cases of damage to ship by carrying press of sail to escape an enemy, as well as to rockets or storm oil which are used in time of peril. They are carried for the special purpose and cannot be said to be sacrificed when used for that purpose.

Expenses Allowable as General Average. — Not only sacrifices of property, but expenditure incurred for the common benefit, is claimable as general average. The expenditure must, however, be extraordinary in nature to form the subject of general average contributiod. A mere enhancement of the ordinary cost of completing the voyage, though it may be due to extraordinary circumstances, does not entitle the shipowner to claim contribution from the cargo. The following are some of the main instances of general average expenditure:

(1) Salvage may be regarded as in some respects a typical case of a general average expenditure, as jettison of cargo may be regarded as a clear type of general average sacrifice. It consists of the reward payable for services rendered to a ship in distress by outside salvors and it is enforceable by a lien on ship and cargo. But the salvors may be specially engaged to proceed to the ship for the purpose of rendering assistance, or may answer the call of a ship in distress, or may even render unsolicited aid. In the first case the salvage payable is practically indistinguishable from general average expenditure, but in the two last cases, arising independently of contract, it differs from a purely general average expense, theoretically in that the salvors have a separate claim on ship and cargo enforceable at law and the shipowner has not incurred an expenditure for the common safety, and practically in that the basis for arriving at the amounts payable by ship and cargo respectively is not the same as that adopted for dividing a general average expenditure. For one thing the property saved by salvors, according to the rule of the court of admiralty, contributes to the award upon the values at the time when the salvors completed their work, whereas in general average contribution is usually assessed on the values at the end of the voyage, which may be materially different. In this respect the method of dividing salvage in England differs in a marked degree from that adopted in other countries, where it is the universal practice to treat salvage, whether under contract or not, as general average for all purposes, except perhaps where it consists of salving derelict property.

(2) The expenses of refloating a stranded or sunk ship frequently amount to a very considerable sum. The operations may extend over several weeks or even months, and as a rule involve general average sacrifice in the way of jettison or discharge of cargo into craft alongside as well as heavy expenditure for hire of tugs, labour, pumps and other salvage machinery. The expenditure is, ior the most part, clearly extraordinary and as such forms a claim in general average.

(3) When a vessel is forced to put into a port of refuge in consequence of damage received through heavy weather or other casualty, or as a result of a general average sacrifice, such as the cutting away of masts, the port charges and other expenses attendant on her entry into the port are recoverable in general average. So also is the cost of discharging the cargo in order to effect repairs to the ship. The treatment of the subsequent expenses, however, depends on the reason for the putting in to the port. If this act was in consequence of a general average sacrifice, all expenses at the port, including warehouse rent on the cargo discharged, reloading charges and outward port charges are allowable in general average. Should the vessel, however, have put in in consequence of accidental damage, the warehouse rent falls on the cargo itself and the cost of reloading and the outward charges are a charge on the freight (*Svendsen* v. *Wallace,* 11 Q B.D. 616; 10 App. Cas. 404). In this respect again the law of England differs from that of other countries, for it is the general rule elsewhere, with few exceptions, for all port of refuge expenses to be treated as general average whatever the cause of seeking the port. This rule extends also to the allowance of the wages and maintenance of the crew during the delay at the port, therein differing still iurther from the practice in this country, which regards such expense as a mere enhancement of the ordinary expense of the voyage, not extraordinary in nature, and as such not recoverable in general average.

Amounts Allowable. — The amount to be allowed in general average should be the loss which the owner of the property sacrificed has incurred by the sacrifice, or in the case of expenditure, the amount expended. In the case of a ship, the amount of compensation is, generally speaking, the cost of repairs, less certain deductions depending on the age of the ship, representing the improvement through the replacement of old material by new, generally known as "deductions new for old." Loss of cargo through sacrifice is made good on the basis of its value at the port of destination, less any charges saved through its loss, such as duty or landing charges. From all allowances, whether for ship or cargo, deduction has to be made of any loss, damage or charges which would inevitably have been sustained by the property sacrificed subsequent to the general average act. For example, should the whole of the cargo in a ship be damaged by sea-water after a jettison of cargo has taken place, deduction must be made from the allowance in general average for the jettison of the estimated depreciation which that cargo would have suffered had it remained on board. Otherwise an allowance of the sound value of the cargo jettisoned would confer a benefit on such cargo and it would be in a better position than the cargo which was left undisturbed.

It will be seen from the preceding paragraph that regard must be paid to the state of affairs existing at the termination of the adventure. The fact that a loss has been sustained by a general average sacrifice during the voyage is not enough to entitle the owner of the property sacrificed, or the shipowner who has incurred general average expenditure, to compensation. It is the rule in England and all other countries to consider the conditions upon the arrival of the vessel at her destination or, in the case of the voyage being broken up at an intermediate port, at that port. and generally speaking this rule applies both to cases of general average sacrifice and expenditure. Indeed, should the ship and

cargo be totally lost before the end of the voyage, no compensation is payable either for sacrifice or expenditure (*Chellew* v. *Royal Commission on the Sugar Supply,* 1921, 2 K.B. 627).

Interests Contributing to the General Average.—Having considered the main principles of general average and the method of arriving at the amounts to be allowed, it remains to consider what interests contribute to the general average and on what basis. As a general rule it may be laid down that the principle referred to in the preceding paragraph holds good not only for the method of calculating the amount to be allowed, but also for assessing the contributing values, viz., the condition of affairs at the place where the ship and cargo finally part company. Both ship and cargo contribute on their actual values there after deduction of any damage sustained, and this because these values are the actual values saved by the general average act. From the value of the cargo has also to be deducted the freight payable at destination, duty, landing charges, etc., so as to arrive at the net value saved. The freight at the risk of the shipowner also contributes, deducting therefrom the wages of the crew from the date of the general average act and the port and other charges incurred since that date for the purpose of earning the freight. To the values so arrived at has to be added any amount allowed in general average to the particular interest. This is done in order that there may be "equality of contribution as between those whose property has been sacrificed and those whose property has been preserved" (Lowndes, *Law of General Average,* 6th ed., p. 343). The same result could be arrived at by making a deduction from the amount allowed of the same percentage of contribution as falls on the property saved, but in practice, for reasons of convenience, the equalization is effected by the method described. A difficult question arises, upon which the law of England differs from others, when a ship is in ballast and under charter and a general average act is performed. It has been decided in Englsnd that contribution is due from the ship and the amount to be earned under the charter *(Carisbrook* S. *S. Co.* v. *London & Provincial Marine Ins. Co.,* 1901, *2* K.B. 861; 1902, *2* K.B. 651 C.A.), but this is not the rule in other countries, which regard the presence of cargo on board as an essential of general average. Ship, freight and cargo form the main contributing interests, but there are others which are at risk on a sea voyage, notably passengers' effects and luggage and mails. In theory, being saved by a general average act, they should contribute, but although they frequently represent a considerable sum of money, the practical difficulties of obtaining contributions are so great that, speaking generally, they are ignored.

Security for Payment **of** General Average Contribution.—"The shipowner has, at common law, a lien on the cargo while in his possession, or in that of his servants as a carrier, not only for the freight, but also for the cargo's share of general average" (Lowndes, *op. cit.,* p. 392). As, however, the shipowner is not in a position to demand payment of the exact amount due from the cargo at the time of delivery of the cargo, this lien is of practical value only to the extent of enabling the shipowner to enforce the giving of satisfactory security for eventual payment. The security usually required is either the signature of an agreement (known as an "average bond") to pay the proportion of general average as hereafter properly determined, or the payment of a reasonable cash deposit or very frequently both. The owner of goods sacrificed has no corresponding lien on the ship, or the rest of the cargo, for general average contribution, though if the shipowner demands a cash deposit from the cargo owner, the latter is entitled to set off the amount of any claim to which he is rightly entitled as against the ship in respect of any of his goods sacrificed or sold abroad (The *Norway;* in P.C., 1865. Br. & L. 410, 411). It is the duty of the shipowner, moreover, to take the necessary security from each cargo owner for the benefit of the owner of goods sacrificed *(Crooks* v. *Allan,* 1879; 5 *Q* B.D. 38; 49 L.J., Q.B., 201), and if he fails in this duty he is liable in damages to the cargo owner (*Nobels Explosives Co.* v. *Rea,* 1897, 2 Com. Cas. 293).

It mill have been observed from the above summary of the principles of general average that considerable differences exist between the law of England and of other countries. Not only this, but nearly every country differs in its view of what constitutes a general average sacrifice or loss and how it shall be borne, and the confusion which would have ensued had this state of things been allowed to persist would have been, and indeed was, extremely troublesome to the business community. There was always an uncertainty in the minds of underwriters and others as to what losses would or would not be allowed in general average, and on what values the ship, freight and cargo would be called upon to contribute. To remedy this confusion a movement to bring about international uniformity was commenced in 1860 and as a result of many conferences a group of rules was agreed upon for embodiment by reference in bills of lading or charter parties. These eventually took the form known as the "York-Antwerp Rules," from the cities at which the conferences of 1864 (at York) and of 1877 (at Antwerp) were held. The York-Antwerp Rules of 1877 were revised at a conference at Liverpool in 1890 and continued in almost universal use for 34 years, when they were again revised at the Stockholm Conference of the International Law Association held in 1924. The York-Antwerp Rules 1924 are used to such an extent that reference to different and differing codes of law on the subject of general average is almost unnecessary.

See **G.** R. Rudolf, *Yolk-Antwerp* ***Rules*** (1926), and the article MARINE INSURANCE (G. **R.** R)

AVERAGE ADJUSTER. The problems involved in giving effect to the ancient law of general average are very complex, and hardly less difficult are those arising out of the application of the law of marine insurance. The professional average adjuster undertakes the duties of applying these laws, subject to the business usages involved, to individual cases, and to determining the liabilities of the respective parties to a maritime adventure and to contracts of marine insurance. He embodies his findings in adjustments which may vary in bulk from a single sheet of foolscap to a volume of several thousand folios.

In the British Empire the adjuster has no official position. and the adjustments he prepares are subject, in case of dispute, to legal adjudication. Until the middle of the 19th century, adjusting was generally based upon the adjuster's individual interpretation of law and usage. With the increase in overseas trade which followed the termination of the Napoleonic wars, the necessity for uniform interpretation became evident, with the result that in 1872 the Average Adjusters Association was formed in Great Britain. The rules of practice of the association, in which have been embodied the original customs of Llcyds, have no legal sanction, but their value has been recognized by the law courts, and it is rarely that they have been overridden.

AVERESCU, ALEXANDRE (1859–1938), Rumanian general and politician, born March 9 1859, at Ismail (Bessarabia), was a volunteer in the war of independence against Turkey, 1877–78. After the war he remained in the army and studied at the high military school of Turin (Italy). He was minister of war in 1907 when he repelled the peasants' revolt. In 1913 he conducted the military operations in the war against Bulgaria as chief of the general staff. As commander of the 2nd and 3rd Armies, and later of the armies in the Dobruja, during the 1916 campaign, Gen. Averescu became enormously popular with his soldiers, a popularity which later on helped his political career.

In March 1918 he was asked by the king to form a cabinet and conducted the peace negotiations with the Central Powers. He was proclaimed president of the People's League, which later became the People's party, and thanks to the popularity of Gen. Averescu the party came into power in March 1920 with its president as prime minister. After holding office for a year and ten months he resigned, Dec. 17 1921, but remained president of the party. On the retirement of the Bratianu Government on March 27 1926, the king asked Averescu to form a government. He followed the general economic policy of his predecessors at home; and in foreign policy he initiated a rapprochement with Italy. He resigned in June 1927, and was thereafter active only periodically in Rumanian politics. On March 30, 1938, he was appointed a member of King Carol's permanent Crown Council. He died in Bucharest, Oct 2. 1938

AVERNUS, lake of Campania, Italy, about 1½m. N. of Baiae. It is an old volcanic crater, nearly 2m. in circumference, now, as in Roman times, filled with water. Its depth is 213ft., and its height above sea-level 3½ft.; it has no natural outlet. In ancient times it was surrounded by dense forests. It was represented as the entrance by which both Odysseus and Aeneas descended to the infernal regions, and as the abode of the Cimmerii. Its Greek name Ἄορνος, was explained to mean that no bird could fly across it. Hannibal made a pilgrimage to it in 214 B.C. Agrippa in 37 B.C. converted it into a naval harbour, the *Portus Iulius;* and joining it to Lacus Lucrinus by canal connecting with the sea, he reduced the distance to Cumae by boring a tunnel over ½m. in length, now called Grotta Pace, through the hill on the north-west side of Lake Avernus. The canal, however, soon became blocked owing to a gradual rise of the shore. Nero's works for his proposed canal from Baiae to the Tiber (A.D. 64) seem to have begun near Lake Avernus; indeed, according to one theory, the Grotta Pace would be a portion of this canal. On the east side of the lake are remains of baths, including a great octagonal brickwork hall known as the Temple of Apollo (1st century). The so-called Grotto of the Cumaean Sibyl, on the south side, is a rock-cut passage, ventilated by vertical apertures, possibly part of works connected with the naval harbour.

AVERROES (Abul-Walid Mohammed ibn-Ahmad Ibn-Mohammed ibn-Roshd) (1126–1198), the greatest Arabian philosopher in the West and the famous commentator on Aristotle, was born at Cordova. His early life was occupied in mastering theology, jurisprudence, mathematics, medicine and philosophy. Through Ibn-Tofail, he became acquainted with Yûsuf, a prince famous for his patronage of learning. Yûsuf helped to secure for him so many important posts, such as that of judge of Seville (1169) and later of Cordova, that Averroes complained that his frequent voyages into different parts of the empire on public business left him little time for study. Yûsuf's successor, al-Mansûr, at first equally well disposed towards Averroes, was incited, in 1195, by the growing popular distrust in speculative studies to intern the suspected philosopher at Elisâna, near Cordova. Later, Averroes was summoned to Morocco, where he died the year before al-Mansûr with whom (in 1199) the political power of the Mohammedans in the West came to an end, as did the Arabian culture of liberal science with Averroes.

Averroes left no school, and within the history of his own nation has little place. His historic fame came from the Christian Schoolmen, who admired and utilized his commentaries, sometimes judiciously and sometimes to excess. The latter group, in Paris known as the Latin Averroists, even went so far as to adopt his teaching that God eternally produces the intelligences by a process of emanation, that matter is an eternal potency, that the active intellect is one for all men, that there is no freedom or personal immortality, and that there may be contradiction between religion and philosophical truth.

The works of Averroes include treatises on jurisprudence, grammar, astronomy, medicine and philosophy, many of which still exist in manuscript. Some have been published in Arabic or in German translations (*cf.* Uberweg: *Grundriss der Geschichfe der Phil.* pt. 2, 1915, p. 364). By the end of the 12th century, the most important works were translated into Latin, and are found frequently in early printed editions of the works of Aristotle; they include the *Colliget,* a summary of medicine, the *Destructio Destructionis* (against Algazel), the *De Substantia Orbis,* two treatises on the union of the active intellect with man, and the commentaries on Aristotle, for whom Averroes had a profound admiration. The commentaries fall under three heads: the large ones, in which a paragraph from Aristotle is quoted and expounded at length; the medium commentaries, which are *résumés;* and finally the short paraphrases. The large commentaries exist only for the *Posterior Analytics, Physics, De Caelo, De Anima* and *Metaphysics.* On the *History of Animals,* no commentary at all exists, and paraphrases on Plato's *Republic* are substituted for the then inaccessible *Politics.* The best edition of the Latin translations of Averroes's works is that by Juntas (Venice. 1552).

AVERRUNCATOR, a long shears used in arboriculture for "averruncating" or pruning off the higher branches of trees.

AVERSA, episcopal see, Campania, Italy, province of Naples, 12½m. N. by rail from Naples, from which there is also an electric tramway. Population (1936) 26,538 (town); 36,960 (commune) Aversa was the first settlement granted to the Normans in 1027 for help to Duke Sergius of Naples against Pandulf IV. of Capua. The Benedictine abbey of S. Lorenzo preserves a portal of the 11th century. A large lunatic asylum was founded by Joachim Murat in 1813.

AVERY, SAMUEL (1865–1936), American chemist and educator, was born in Lamoille, Ill., on April 19, 1865. He graduated at Doane college, Crete, Neb., in 1887, and pursued graduate studies at the University of Nebraska. Later he studied at the University of Heidelberg, Germany, from which in 1896 he received the degree of doctor of philosophy. After teaching chemistry in various capacities in the University of Nebraska and in the Nebraskan Agricultural Experiment Station, he was made head professor of chemistry in the university in 1905. In 1908 he became acting chancellor and in 1909 chancellor of the University of Nebraska. He lectured extensively on educational subjects and wrote many bulletins and other papers, chiefly on subjects connected with organic chemistry His chemical researches embraced investigations on glutaric acids, arsenical insecticides, the constitution of Paris green, the extermination of prairie dogs, the action of lime and sulphur in cattle dips and the occurrence of prussic acid in sorghum and kaffir corn.

AVERY, SAMUEL PUTNAM (1822–1904), American art dealer and connoisseur, was born in New York city on March 7, 1822. He began life as an engraver on copper and executed much work for the leading publishers in his native city. Later he became a skilled wood-engraver and illustrated numerous books. In 1865 he established himself as an art dealer. He became identified with many scientific, artistic and educational associations and was a founder and trustee of the Metropolitan Museum of Art. In memory of his son, Henry Ogden Avery, a successful architect who died in 1880, he established the Avery architectural library at Columbia university. In 1893, in memory of a daughter, he established a library in the Teacher's college, Columbia university. He also presented a collection of some 17,000 prints to the New York public library. He died in New York city on Aug. 14, 1904. Eight years later, Avery hall, commemorating both father and son, was built at Columbia university. In this structure is housed the Avery library, a valuable collection of works on architecture and decorative art, containing in 1928 about 29,000 volumes.

AVESNES, capital of an arrondissement in the department of Nord, north France, on the Helpe, 28m. S.E. of Valenciennes by rail. Pop. (1936) 5,389. Avesnes was founded in the 11th century and formed a countship which in the 15th century passed to the house of Burgundy and afterwards to Habsburg. In 1477 it was destroyed by Louis XI. By the treaty of the Pyrénées (1659) it went to France. It was captured by the Prussians in 1815. The church of St. Nicholas is 16th century. The chief industry of the town is wool-spinning, and there is trade in wood. It is the seat of a sub-prefect and has a tribunal of first instance and a chamber of commerce.

AVEYRON, a department of the south part of the Massif Central, in south France, stretching from the Cevennes across the wild Causse noir, the Causse Ste. Affrique and the plateau of Larzac to include portions of the valleys of Tarn, Aveyron and Lot on the west side of the massif. It is bounded on the north by Cantal, east by Lozère, south-east by Gard and Hérault, south-west by Tarn, and west by Tarn-et-Garonne and Lot. Area 3,386 sq. miles. Pop. (1936) 314,682, a heavy decline since 1906.

Aveyron is specially rich in dolmens, evidencing a culture in this locality now increasingly attributed to the early ages of metal. Statue-menhirs are a feature of the culture, as are small metal beads. Vidal de la Blache thinks this culture flourished before the covering of woods, etc., was destroyed, as, since then, the high land of this department has become desert with bare limestone surfaces, sometimes in a chaos of blocks simulating a ruin, as at Montpellier-le-vieux on the Causse noir. The rivers make deep and beautiful gorges and valleys in the highland plateau much of which is well above the 2,000ft. level. The department verges on the volcanic country of Auvergne, and the volcanic mountains of Aubrac on the north-east boundary reach a height of 4,760 feet.

Aveyron has a rigorous climate in the highlands but conditions are mild in the sheltered valleys of the lower lands. The average annual rainfall oscillates about 800mm., but is far higher on the mountains of Aubrac. The mean temperature for winter (reduced to sea level) is about 41° but the actuality varies a great deal. The usual crops are grown on the poor soil, potatoes, some wheat, rye and oats, and so on, but vineyards occur in shelter as at Entraygues, S. Georges, Bouillac and Najac, and chestnuts in the south, between Aveyron and Tarn. Walnuts, plums, apples for cider and mulberries for silkworms are also grown to some extent. The main occupation is, however, that of keeping live stock cattle of the Aubrac breed, and sheep on the Larzac plateau, the latter supplying milk for the famous Roquefort cheeses ripened in caves near the town.

The west of the department is largely formed of archaean rocks, but a long basin of carboniferous and later rocks spreads westward with the carboniferous rocks exposed towards its western end and along the flanks. At the west end coal is worked near Aubin (pop. 1936, 3 961) and Decazeville; at the former surface coal has been in use since the 9th century, the latter is a new industrial town (pop. 1936, 11,154) with iron foundries and is named after the Duc Decazes who founded them in 1830. Coal is also dug near Rodez, and iron is mined in the department, also lead and zinc. Millau is another industrial centre (pop. 1936, 15,393) making gloves as a specialty. Wool weaving and a number of minor industries are maintained and there is a good deal of quarrying.

Rodez, the capital, Millau and Villefranche-de-Rouergue give their names to the three arrondissements into which the department is now divided. The department is a bishopric, with bishop's seat at Rodez, under the archbishop of Albi; it belongs to the 16th military region and to the academic or educational district of Toulouse, its court of appeal is Montpellier. It is served by the Orléans and the Midi railways.

The department corresponds nearly to the ancient Rouergue, the countship of which was united to that of Toulouse in the 11th century. Some "bastides" were founded in the 13th century and Villefranche and Sauveterre are good examples. Of monastic foundations, Conques in the north is one of the most famous in France, with a magnificent Romanesque abbey church containing a rich reliquary. Espalion, Najac and Sylvanès also have interesting mediaeval castles and churches.

AVEZZANO, a town in Italy, province of Aquila, 67m. E. of Rome by rail and 38m. S. of Aquila by road. Population (1936) 15,003 (town); 16,866 (commune). Its fine castle, built in 1490 by Gentile Virginio Orsini, was, with the rest of the town, much damaged by the disastrous earthquake of 1915, of which it was the epicentre. The Lago Fucino lies 1½m. to the east.

AVIANUS, a Latin writer of fables, placed by some critics in the age of the Antonines, by others as late as the 6th century AD. He appears to have lived in Rome and to have been a heathen. The 42 fables which bear his name are dedicated to a certain Theodosius. Nearly all the fables are to be found in Babrius, but Avianus appears to have used a Latin paraphrase as his source, and not the original Greek. His language and metre are correct and the fables became popular as a schoolbook. Imitations were frequent, such as the *Novus* Avianus of Alexander Neckam (12th century).

AVIARY, called by older writers "volary," a structure in which birds are kept in captivity. While the habit of keeping birds in cages dates from a very remote period, it is probable that structures worthy of being termed aviaries were first used by the ancient Romans, who called them ornithones. These consisted merely of four high walls and a roof, and were lighted with a few small windows, as the birds were considered to pine less if they could not see their free companions outside. Water was introduced by pipes, and conducted in narrow channels, and the birds were fed chiefly upon dried figs, carefully peeled, and chewed into a pulp by persons hired to do this.

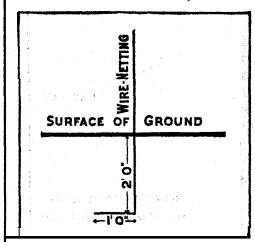

FIG. 1.—METHOD OF FIXING WIRE NETTING TO EXCLUDE VERMIN FROM AVIARY

The habit of keeping birds in aviaries for the sake of the pleasure they afford their owners and for the observation of their habits is, however, comparatively recent. The beginning of geographical research in the 15th century brought with it the desire to keep and study at home some of the beautiful birds the explorers came across, and hence it became the custom to erect aviaries for their reception. In the 16th century, in the early part of which the canary bird was introduced into Europe, aviaries were not uncommon in gardens of the wealthy, and Bacon refers to them in his essay on gardening (1597). Within recent years the method of keeping birds in large aviaries has received considerable attention.

An aviary may be of almost any size, from the large cage known, from its shape, as the "Crystal Palace aviary," to a structure as large as a church; and the term is sometimes applied to the room of a house with the windows covered with wire netting; but as a rule it is used for outdoor structures. composed principally of wire netting supported on a framework of iron or woodwork. For quite hardy birds little more than this is necessary, providing that protection is given in the form of growing trees and shrubs, rock-work or rough wooden shelters. For many delicate species, however, from tropical countries, warmth must be provided during the winter, and thus part at least of an aviary designed for these birds must be a wooden or brick house which can be shut up in cold weather and artificially warmed.

The ideal aviary, probably, is that which is constructed in two parts; viz., a well-built house for shelter in the winter, opening out into a large wire enclosure for use in the summer months. The doors between the two portions may be of wood or glazed. The sheltered portion is best built in brick or stone, as these materials are practically vermin-proof and the temperature in such a building is less variable than in a thin wooden structure. The floor should be of concrete or brick, and the house fitted with an efficient heating apparatus from which the heat is distributed by means of hot-water pipes or some other recognized method. Any arrangement which would permit the escape into the aviary of smoke or noxious fumes is to be strongly condemned. Such a house must be well lighted, preferably by skylights; but it is a mistake to have the whole roof glazed; at least half should be of wood, covered with slates or tiles. Artificial lighting, though not essential in most cases, is desirable during dull weather and short winter days, and electric light may be installed with great advantage; but some method of gradually dimming this is necessary to enable the birds to find their roosting places before the light is completely extinguished. Perches consisting of branches of trees with the bark adhering should be fixed up, and, if small birds are to be kept, bundles of bushy twigs should be securely fixed in corners under the roof.

The outer part, which will principally be used during the summer, though it will benefit most birds to be let out for a few hours on mild winter days also, should be as large as possible, and constructed entirely of wire netting stretched on a framework of wood

or iron. If the latter is selected, stout gas-piping is both stronger and more easily fitted together than solid iron rods. If the framework be of wood, this should be creosoted, preferably under pressure, or painted with three coats of good lead paint, the latter preservative also being used if iron is selected. The wire netting used may be of almost any sized mesh, according to the size of birds to be kept, but as a general rule the smallest mesh, such as half or five-eighths of an inch, should be used, as it is practically vermin-

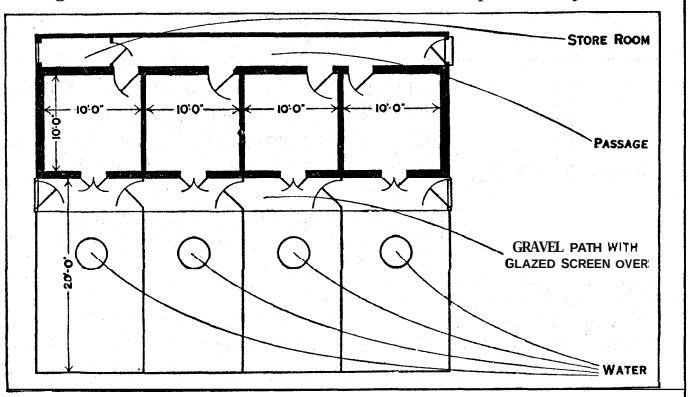

FIG. 2.— GROUND PLAN OF 4-COMPARTMENT AVIARY FOR LARGE BIRDS
Each compartment consists of an inner house 10 ft. square (shown in heavy outline) and an outer flight 20 ft. by 10 feet

proof, and allows of birds of any size being kept. Wire netting for aviaries should be of the best quality, and well galvanized.

Provision must be made for the entire exclusion of such vermin as rats, stoats and weasels, which, if they were to gain access, would commit great havoc amongst the birds. The simplest and a very effectual method of doing this is by sinking the wire netting some 2ft. into the ground all round the aviary, and then turning it outwards for a distance of another foot as shown in fig. 1.

The outer part of the aviary should be turfed and planted with evergreen and deciduous shrubs, and be provided with some means of supplying an abundance of pure water for the birds to drink and bathe in; and a gravel patch should not be forgotten.

Perhaps the most useful type of aviary is that built as above described, but with several compartments, and a passage at the back by which any compartment may be visited without the necessity of passing through and disturbing the birds in other compartments. Fig. 2 represents a ground plan of an aviary of this type divided into four compartments, each with an inner house 10ft. square, and an outer flight of double that area. The outer flights are intended to be turfed, and planted with shrubs, and the gravel path has a glazed roof above it by which it is kept dry in wet weather. Shallow water-basins are shown, which should be supplied by an underground pipe and a cock which can be turned on from outside the aviary; and they must be connected with a properly laid drain by means of a waste plug and an overflow pipe.

An aviary should always be built with a southern or south-eastern aspect, and, where possible, should be sheltered from the north, north-east and north-west by a belt of fir-trees, high wall or bank, to protect the birds from the biting winds from these quarters.

When parrots of any kind are to be kept, it is useless to try to grow any kind of vegetation except grass, and even this will be demolished unless the aviary is of considerable size. The larger parrots will, in fact, bite to pieces not only living trees but also the woodwork of their abode, and the only really suitable materials for the construction of an aviary for these birds are brick or stone and iron; and the wire netting used must be of the stoutest gauge or it will be torn to pieces by their strong bills.

The feeding of birds in aviaries is, obviously, a matter of the utmost importance, and, in order that they may have what is most suitable, the aviculturist should find out as much as possible of the wild life of the species he wishes to keep, or if little or nothing is known about their mode of living, as is often the case with rare forms, of nearly related species whose habits and food are probably much the same, and he should endeavour to provide food as nearly as possible resembling that which would be obtained by the birds when wild. It is often, however, impossible to supply precisely the same food as would be obtained by the birds had they their liberty, but a substitute which suits them well is generally obtainable. The majority of the parrot tribe subsist principally upon various nuts, seed and fruit, while some of the smaller parakeets or pnroquets appear to feed almost exclusively upon the seeds of various grasses. Almost all of these are comparatively easy to treat in captivity, the larger ones being fed on maize, sunflower-seed, hemp, dari, oats, canary-seed, nuts, and various ripe fruits, while the grass-parakeets thrive remarkably well on little besides canary-seed and green food, the most suitable of which is grass in flower, chickweed, groundsel and various seed-bearing weeds. But there is another large group of parrots, the *Loriidae* or brush-tongued parrots, some of the most interesting and brightly coloured of the tribe, which, when wild, subsist principally upon the pollen and nectar of flowers, notably species of *Eucalyptus*, the filamented tongues of these parrots being peculiarly adapted for obtaining this. In captivity these birds have been found to live well upon sweetened milk-sop, which is made by pouring boiling milk upon crumbled bread or biscuit. They frequently learn to eat seed like other parrots, but, if fed exclusively upon this, are apt, especially if deprived of abundance of exercise, to suffer from fits, which are usually fatal. Fruit is also readily eaten by the lories and lorikeets, and should always be supplied.

The foreign doves and pigeons form a numerous and beautiful group which are mostly hardy and easily kept and bred in captivity. They are for the most part grain-feeders and require only small corn and seeds, though the group of fruit-pigeons are fed in captivity upon soft fruits, berries, boiled potato and soaked grain.

The various finches and finch-like birds form an exceedingly large group and comprise perhaps the most popular of foreign aviary birds. The weaver-birds of Africa are mostly hardy and easily kept, their food consisting, for the most part, of canary-seed. The males are, as a rule, gorgeously attired in brilliant colours, some having long flowing tail-feathers during the nuptial season, while in the winter their showy dress is replaced by one of sparrow-like sombreness. The grass-finches of Australasia contain some of the most brilliantly coloured birds, the beautiful grass-finch, *Poëphila mirabilis*, being resplendent in crimson, green, mauve, blue and yellow. Most of these birds build their nests, and many rear their young, successfully in outdoor aviaries, their food consisting of canary and millet seeds, while flowering grasses provide them with an endless source of pleasure and wholesome food. The same treatment suits the African waxbills, many of which are extremely beautiful, the crimson-eared waxbill or "cordon-bleu" being one of the most lovely and most frequently imported. These little birds are somewhat delicate, especially when first imported, and during the winter months require artificial warmth.

There is a very large group of insectivorous and fruit-eating birds very suitable for aviculture, but their mode of living necessarily involves considerable care on the part of the aviculturist in the preparation of their food. Many birds are partially insectivorous, feeding upon insects, when these are plentiful, and upon various seeds at other times. Numbers of species again, which, when adult, feed almost entirely upon grain, feed their young, especially during the early stages of their existence, upon insects; while others are exclusively insect-eaters at all times of their lives. All these points must be considered by those who would succeed in keeping and breeding birds in aviaries.

It would be almost impossible to keep the purely insectivorous species, were it not for the fact that they can be gradually accustomed to feed on what is known as "insectivorous" or "insectile" food, a composition of which the principal ingredients generally consist of dried ants' cocoons, dried flies, dried powdered meat, preserved or fresh yolk of egg, and crumb of bread or biscuit. This is moistened with water or mixed with mashed boiled potato or beef dripping, and forms a diet upon which most of the insectivorous birds thrive. The various ingredients, or the food ready

made, can be obtained at certain bird-fanciers' shops. Although it is a good staple diet for these birds, the addition of mealworms, caterpillars, grubs, spiders and so forth is often a necessity, especially for purely insectivorous species.

The fruit-eating species, such as the tanagers and sugar-birds of the New World, require ripe fruit in abundance in addition to a staple diet such as that above described, while for such birds as feed largely upon earth-worms, shredded raw meat is added with advantage.

Many of the waders make very interesting aviary birds, and require a diet similar to that above recommended, with the addition of chopped raw meat, mealworms and any insects that can be obtained.

Birds of prey naturally require a meat diet, which is best given in the form of small, freshly killed mammals, and birds, the fur or feathers of which should not be removed, as they aid digestion.

The majority of wild birds, from whatever part of the world they may come, will breed successfully in suitable aviaries provided proper nesting sites are available. Large bundles of brushwood, fixed up in sheltered spots, will afford accommodation for many kinds of birds, while some will readily build in evergreen shrubs if these are grown in their enclosure. Small boxes and baskets, securely fastened to the wall or roof of the sheltered part of an aviary, will be appropriated by such species as naturally build in holes and crevices. Most of the parrots, when wild, lay their eggs in hollow trees, and occasionally in holes in rocks, or in ants' hills, making no nest, but merely scraping out a slight hollow in which to deposit the eggs. For these birds hollow logs, with small entrance holes near the top, or boxes, varying in size according to the size of the parrots should be supplied. In providing nesting accommodation for his birds the aviculturist must endeavour to imitate their natural surroundings and supply sites as nearly as possible similar to those which the birds would naturally select.

Aviculture is a delightful pastime, but it is also far more than this; it is of considerable scientific importance, for it admits of the living birds being studied in a way that would be quite impossible otherwise. There are hundreds of species of birds, from all parts of the world, the habits of which are almost unknown, but which may be kept without difficulty in suitable aviaries. Many of these birds cannot be studied satisfactorily in a wild state by reason of their shy nature and retiring habits, not to mention their rarity and the impossibility, so far as most people are concerned. of visiting their native haunts. In suitable large aviaries, however, their nesting habits, courtship, display, incubation, moult and so forth can be accurately observed and recorded. The keeping of birds in aviaries is therefore a practice worthy of every encouragement, so long as the aviaries are of sufficient size and suitable design to allow of the birds exhibiting their natural habits; for in a large aviary they will reveal the secrets of their nature as they never would do in a cage or small aviary. (D. S.-S.)

AVIATION ARTICLES: see AERONAUTICAL ARTICLES.

AVIATION, CIVIL. Civil aviation embraces all forms of flying other than that carried out by fighting forces and may be divided broadly into three branches. Before coming to details it will be useful to describe briefly the scope and nature of each branch. Though comparatively young, civil aviation has made sturdy growth and has developed along distinctive lines.

(1) Air Transport.—This has found a secure footing as an extra-rapid parallel to land and sea methods of transport and as an almost indispensable form of communication where ground services are difficult or non-existent; hence it has an enormous field of usefulness throughcut the world. In most countries air transport is organized by private enterprise, with the aid of Government subsidies.

(2) Other *Commercial* Uses of Aircraft.—These embrace air photographic survey, air photography for trade and advertising, forest fire protection and forest inventories, crop dusting for pest destruction, sky-writing, ambulance and medical duties, prospecting and geological survey, and charter hire.

(3) Flying Training, Private Flying and Air *Racing.*—Elementary training for military as well as civil pilots is in many countries carried on by civil organizations.

Throughout Europe civilian flying schools and the interest of civilians in aviation have been encouraged for many years by the governments of the various nations as measures of military preparedness.

In 1939, the United States for the first time followed this lead in establishing the civilian pilot training program. Even without such governmental assistance, the ownership and use of aeroplanes by individuals is rapidly on the increase and the steady development of light aeroplanes promises an expanding future for this type of aviation.

Air racing has a hold on the public imagination, and the great national and international events everywhere attract thousands oi spectators and world-wide attention.

AIR TRANSPORT

Historical.—Air transport is an entirely modern conception. In 1870, balloons were employed for the carriage of messages from Paris during the siege, a measure for evading the besieging army, which, in other circumstances, could not have claimed to be a practical method of carrying mails. Between 1909 and 1914 various demonstrations were made to prove the suitability of the aeroplane as a rapid conveyance for mail matter, and a considerable number of journeys by air were accomplished by private individuals; but none of these enterprises, though interesting and daring, could fairly be described as the real beginning of air transport.

That air transport would become a practical proposition was, however, recognized, and in 1910 a conference was held in Paris at which an international convention in regard to aerial navigation was drafted. The credit for the first genuine commercial air service lies with Germany; from March 1912 until Nov. 1913 the rigid airships "Victoria Louise," "Hansa" and "Sachsen" plied regularly between Berlin and Friedrichshafen, and in 881 flights. totalling 65,500m., carried 19,105 passengers without injury and in considerable comfort (see AIRSHIP).

The War of 1914–18 obviously interfered with the progress of commercial operations, but while European nations were engaged in the great conflict they, as well as the United States, were studying the feasibility of wider purposes of civil and commercial flying. with the result that shortly after the war a start was made by England, France and Holland on actual operations that have grown, with the progress of other nations, to regular, efficient transport systems that cover all continents and girdle the entire world.

The Cross-Channel **Air** Service.—On Aug. 25, 1919, Aircraft Transport and Travel Ltd. despatched the first aircraft to fly on a regular commercial service to Paris, and on Nov. 10, 1919, an aeroplane belonging to the same company carried the first regularly established air mail to the same destination. The British Handley-Page Transport Ltd. and the French Cie. Messageries Aériennes were quick to follow, and by Jan. 1, 1920, there were three British and two French companies operating on a regular time-table across the Channel. These operations were nearly all carried out by military aircraft, or by military aircraft modified to carry passengers in some degree of comfort. It was clear that air transport could not at once become self-supporting and would need some financial assistance from the State, until experience was gained and aircraft specially designed for commercial purposes were produced with the aid of that experience.

The French Government had already realized the vast possibilities of air transport and a costly and ambitious policy of financial assistance was inaugurated in 1919. This policy was inspired to some extent by its potential influence on the countries flown over, but its ultimate object was to attain rapid communication between Paris and the French colonies in Africa and Asia.

In England, on the other hand, there was not sufficient money allotted for even a very low standard of aerial defence, and air transport was therefore relegated to the background as an enterprise which the nation could not afford, although the British empire had more to gain from its development than any other country in the world. Lacking Government support, the pioneers, and

with them the public who had supported their new enterprises financially, walked towards inevitable ruin. The general financial crisis of the autumn of 1920 brought matters to a head, and Aircraft Transport and Travel Ltd. went into liquidation in December, whilst in Feb. 1921 Handley-Page Transport Ltd. suspended operations, leaving the French in unchallenged occupation of the cross-Channel routes. This disaster brought about a parliamentary and press agitation and, as a result, from March 1921 the cross-Channel services have been subsidized in varying degrees.

From March 1921 until March 31, 1922, two British companies continued limited operations between London and Paris under a system of Government financial support which guaranteed them a 10% profit on the receipts obtained for traffic carried. Whilst this temporary and admittedly extravagant measure was in force, the Londonderry Committee put forward a scheme which was accepted by the Government and operated from April to Sept. 1922. It comprised the provision of half the fleet of each company by the Government on a hire-purchase system, and a subsidy based partly on the load carried and partly on the gross earnings of the companies. Three companies, the Handley-Page Transport Ltd., the Instone Air Line Ltd , and Daimler Airways Ltd., operated to Paris, and one company, the Instone Air Line Ltd., flew to Brussels. It was very soon found that the hire-purchase scheme was impracticable. Moreover, the traffic available between London and Paris was not sufficient for five companies (three British and two French), and it was unsound that all three British companies should be subsidized. On Oct. 1, 1922, this scheme was modified on the basis of avoiding competition between British companies and extending British air transport into Europe as far as possible with the money available.

Meanwhile, owing to the various difficulties which had arisen and the apparent wastefulness of maintaining several separate organizations for a comparatively small volume of traffic, the Hambling Committee was assembled in Jan. 1923. This committee definitely recommended the amalgamation of the existing companies into a single national company with great freedom of action. They indicated that the company must be provided with a substantial capital, and be guaranteed a monopoly of subsidy for a term of years.

"Imperial Airways" Founded.—Thus, in March 1924, a national company, Imperial Airways Ltd., was brought into being with a guarantee of a total subsidy of £1,000,000 spread over a period of ten years on a tspering scale, for regular flying carried out within Europe, the contract with the Government permitting liberty of action as to the services actually operated.

At the commencement the subsidy was paid according to the mileage flown on the regular routes, irrespective of the type of aircraft employed.

As this method of payment held out no inducement to the company to use larger and more economical aircraft it was modified in Dec. 1925 so that "horse-power miles" instead of "machine miles" became the basis of payment.

The fruit of this alteration was that the company renewed its fleet with advanced type of craft, extended its routes, added Bight schedules and generally expanded its facilities Such improvement of service required more financing and Imperial Airways was therefore given a direct subsidy. In 1937 the company consummated an agreement with the government by which it undertook to carry all empire mail between England and those parts of the empire lying in Africa and Asia.

In 1939 plans were laid, at the government's suggestion, to merge Imperial Airways with the firm British Airways, Ltd into a new company to be known as British Overseas Airways corporation.

Empire Routes.—Cross-Channel service between London and Paris marked the beginning of British air transport in 1919, but within ten years in England as well as in other big countries of the world the conviction grew that air transport could only attain its full value over long routes, and accordingly the energies of Imperial Airways were more and more directed to the creation of great imperial routes to Africa and the East rather than toward establishment of comparatively short connections within Europe

British service had long been set up between London and Paris, Basle, Zurich, Brussels, Cologne and Ostend when, in 1926, the Government handed over to Imperial Airways a mail route from Cairo to Baghdad which had been established in 1921 by the Royal Air Force. This Egypt-Iraq stage was the start of a system of routes which in ten years brought every Dominion, excepting Canada, in aerial contact with London. From Cairo, the route was run back via Alexandria and Athens to, Brindisi, where railway connections with Paris were made until the British government could conclude arrangements with France and Italy for a direct air service across all of Europe. Meanwhile, the route was extended East from Baghdad to Basra (1926) and to Karachi (1929) via Koweit, Bahrein, Sharjah and Gwadar.

Karachi had been a major goal when the Eastern service was projected, but the line did not stop there. Instead, in a period of five or six years, it had crossed all of India, bisected the Gulf of Bengal and gone over Burma and thence down through the Malay Straits and into Brisbane—a route distance from London of 12,754 miles, which in 1936 was being negotiated on regular and frequent schedules in approximately ten days, as against the twenty days required by surface transportation. Connection of Singapore with Hongkong, via Penang, Saigon and Tourane, was projected for 1937, closing another of the final links in complete empire service. With probable connection from Hongkong with an American route to Manila, this link would mark the completion of flying routes around the earth.

Meanwhile, Imperial Airways surveyed a British route through Africa from the Mediterranean to the Cape of Good Hope. The survey was followed by demonstration flights, notably over the 1.400 miles between Khartoum and Kisumu, and on March 6, 1931, service was started on the Egyptian-South African route, first extending from Cairo to Kisumu in the Kenya Colony of East Africa, and by January of 1932 from Kisumu to Cape Town. The aerial conquest of Africa—almost 6,000 miles from Cairo to Cape Town—was as spectacular an achievement as the commercial pioneering across the lands of Asia to Australia and China. Distances over Africa and Asia were immense, even by air, and they extended across some of the most isolated stretches of wilderness on the globe. This isolation of far-flung operations, plus complications incidental to arrangements for flight over the countries of peoples indifferent to the white man's sense of progress, prohibited, at least at first, the advantages of complete radio-guided and beacon-lighted routes which played such an important part in the remarkable progress of the United States toward first place in the air transport nations of the world.

A glance at a map, however, will readily indicate the nature of the terrain and the vagaries of the weather encountered in flight over Europe. Asia, Africa and Australia. It is true that a rather complete knowledge of the world weather is now available and consistent flying has acquainted aeroplane crews with the sort of ground over which they fly, but weather changes come too

British Regular Air Transport

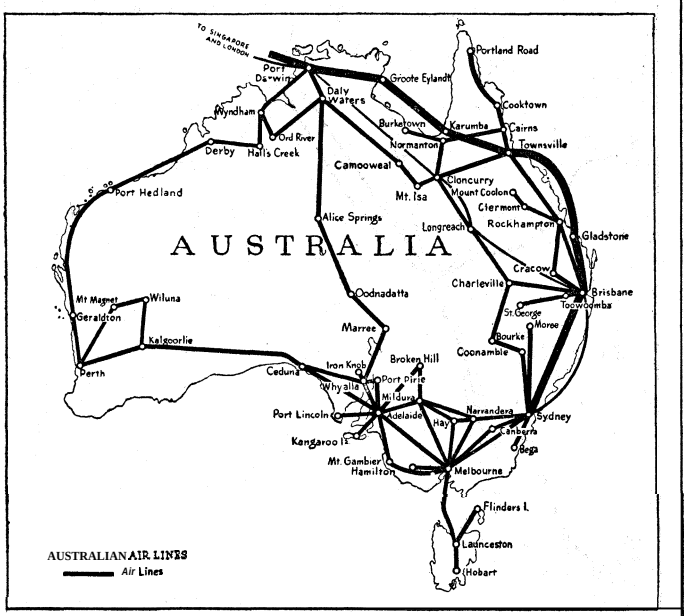
suddenly for timely and accurate predictions in far off places and knowledge of terrain is of comparatively little value until navigational and flying skill is brought into play. Hence it is that the extensive pioneering accomplished by British aviators and British equipment formed much of the basis upon which the success of the empire routes was built and has been maintained for many years. An excellent means of visualizing rapidly the many changes that have occurred in the history of British air transport is given in the table on page 802.

Australia. — In Australia air transport is firmly established, the saving in time effected by aircraft being measured by days or in some instances weeks. In 1938, 12 subsidized air routes were in operation totalling almost 22,000 mi., and, besides serving all parts of the continent, maintained links with New Guinea, Tasmania and Singapore.

Apart from conferring the benefits of more rapid communication upon the inhabitants of places lying on the regular routes, the Australian operating companies have done a most useful service



AUSTRALIAN AIR LINES

in undertaking special "taxi" flights to other places. The conveyance of doctors to patients and the carriage of sick people unfit for ordinary travel to hospitals has been especially valuable in assisting the settlement of remote areas. Stock breeders have also been saved large losses in times of drought, when the search for grazing grounds has been successfully carried out by air in a fraction of the time that would otherwise be consumed.

Canada. — For many years Canada's chief contribution to the development of air transportation consisted of extensive pioneering in the field of heavy freight-carrying largely in connection with mining operations in the northern part of the country. In 1939, Canadian air lines and established charter operators carried no less than 23,153,711 lb. of freight and mail. By that time, the Canadian government, working with the Canadian National railways, had established what was, in effect, a government-owned transcontinental air-line system running between Vancouver and Moncton via Winnipeg, Toronto and Montreal. A north-south spur was operated by this same Trans-Canada Air Lines between Lethbridge and Edmonton. Other companies, in 1940, were operating services from Edmonton and Vancouver which connected with American-Alaskan services in the Yukon; from Edmonton and Regina north through the mining districts to Aklavik and Coppermine on the shores of the Arctic ocean. Still another company was operating an extensive network of services to the north and east of Winnipeg.

United States. — Two American brothers, Wilbur and Orville Wright. were the first to fly a heavier-than-air machine and the scene of their accomplishment was naturally the United States. and while their country was the last of the bigger nations of the world to enter broadly into commercial aeronautics, it had outstripped the world in this branch of aviation well within ten years after it began such activity on a wide scale in 1926 and 1927.

The Wrights first flew in 1903, somewhat ahead of successful practical aeronautical experimentation in Europe, notably in France, and from the pioneer teaching in America and Europe a comparatively small group of pilots was evolved — this group, fast dying out, being popularly known in the United States as the "Early Birds," that is, usually, aviators who were trained prior to the World War of 1914–18 The "Early Birds" were itinerant and scattered all over the United States, but the entrance of tht United States into the World War in April of 1917 brought many of them into the army where they served either as commissioned or civilian instructors of the young men, who, after the Armistice, served as the nucleus of the personnel of American aviation when it began its remarkable advance.

The outcome of the World War of 1914–18 was still far from certain when the United States government, on May 15, 1918, inaugurated its first scheduled air-mail service between Washington and New York. At first undertaken as a means of affording cross-country experience to some of the nation's new military fliers, the service won the deep interest of the post office and was taken over by that department of the government on Aug. 12 of the same year. On Sept. 8, 1920, pilots pioneered the first transcontinental mail route between New York and San Francisco. This service mas equipped with old war aircraft powered with Liberty engines, the aircraft being modified only slightly to carry mail sacks in place of an observer. Despite such handicaps, the service set remarkable records for efficiency and regularity and in 1924 the first regular night flying service in the world was carried out between Chicago and Cheyenne. Aside from this contribution, the United States, in contrast to the governments of comparable European nations, gave little or no assistance to commercial aviation enterprise and even neglected to bring any form of air navigation regulations into force.

In February of 1925, however, a congressional bill was passed empowering the postmaster-general to make contracts for the carriage of domestic mail by private enterprise, and in May of 1926 the Air Commerce act came into law whereby air navigation was brought under federal control and a civil aviation branch was set up in the department of commerce to administer the regulations and take charge of route organization and navigational facilities generally. From that point progress has been very rapid. Lindbergh flew to Paris in May of 1927 and by July 1 of the same year 19 air-mail contracts had been awarded and 16 contractors were in active operation. One-half of the trans-continental service had been taken over by a contractor, and within several more months the remainder of the route passed to private operators. At this time the route mileage flown regularly with mails was 7,663 mi. and the distance flown daily (including night flying) was 16.382 mi.

The contrast obtaining with these figures approximately seven years later is impressive. In 1934 there mere 25 operators carrying passengers or mail or express, usually all three, and they had spun a network of lines over North and South America of more than 50,000 mi., a figure far in excess of the route mileage of any other nation in the world. Over this American route mileage, transport craft of various sizes and the fastest speeds were flying more than 133,000 m i daily, more than half of the U.S. continental portion of this distance being negotiated by night, thanks chiefly to an elaborate system of almost 19,000 mi of beacon-lighted radio-equipped airways built for the most part by government money. Other government money, given the air-line operators in the form of mail contracts, permitted the constant purchase of new, fast equipment, some of it includiiig sleeper planes which first went into use on the southern transcontinental route of American Airlines,

The progress of night flying and transport speeds were two of the outstanding features of the advance of American commercial aviation. In 1921, when transcontinental mail service was first

established, 60 hours were required for negotiation of the coast-to-coast distance; in five years this time was cut in half and by 1933 mail, passengers and express were being carried from the Pacific to the Atlantic on regular schedules of 15 hours.

The rather generous policy of government subsidy permitted in great measure the establishment of the transpacific service of Pan American Airways from San Francisco to China via Honolulu, Midway islands, Wake, Guam and Manila. This 8,000-mi. route is by far the longest over-water airways path in the world; it made possible the movement of mail, passengers and express across the Pacific in four days as against the weeks which had been required by some steamships.

A precipitous drop in some of the statistics for American aviation is noticeable in 1934 due to the cancellation by the government of commercial air-mail contracts on grounds of "collusion." But there being little substantiation of the charges, after three and a half months, the contracts were reinstated. Despite this episode, the growth of the business in the United States remained impressive, as shown in the table given herewith:

American Regular Air Transport
(Includes Domestic Air Lines Only)

Year	Miles Flown	Passenger Carried	Express (Pounds)	Mail (Pound-Miles)
1926	4,258,771	5,782	3,555	—
1927	5,779,863	8,661	45,859	—
1928	10,400,239	47,840	210,404	—
1929	22,380,020	159,751	249,634	—

EUROPEAN AIR TRANSPORT

France. — In this country civil aviation began to be developed immediately after the World War, and since 1919 large sums have been devoted each year to air transport development. In 1927, four air transport companies operating over 8,304 route miles, had connections between London, Paris, Berlin, Brussels, Bucharest and other large cities of Europe and North Africa.

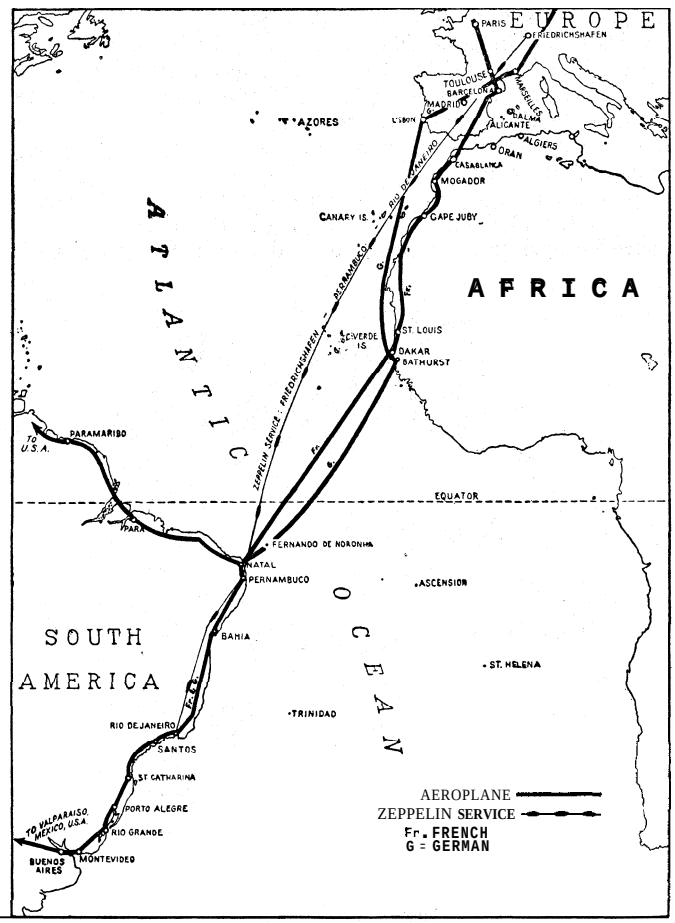
An outstanding success was achieved early by the line from France to Morocco over which mails have been transported since 1919. In 1933, all French air-line activities were merged into a single new company christened Air France of which one-third of the capital was held by the French government. Besides its long route to the orient, the most spectacular French operation is its service, established in 1936 across the south Atlantic. At the outbreak of hostilities in 1939, France stood ready to establish a service across the north Atlantic and, in fact, had actually completed several round-trip crossings with air mail.

Germany. — Germany entered the transport lists as soon as the conditions of peace permitted and, to encourage private enterprise, she offered a simple subsidy on a kilometric basis. During the earlier years the various air transport companies went through a process of grouping and regrouping until in 1924 German air transport was in the hands of two rival concerns, the Aero Lloyd and the Junkers company, both of which by rousing local interest had succeeded in establishing subsidiary companies in various parts of Germany.

The keen rivalry between these two groups developed after a time into harmful competition and duplication, and the government was forced to step in. The obvious solution was the formation of a single company, and on April 1, 1926, the Deutsche Lufthansa was brought into existence, and in a few years had established 14,000 mi. of routes radiating from Berlin to the principal cities of Europe with connections to Turkey, Persia and North Africa.

Side by side with its aeroplane services, Germany led all the world in a bold attempt to utilize the airship in air transport (see AIRSNIP). From 1934 to 1939, Germany maintained a highly successful air-mail service across the south Atlantic using mother ships and catapulted flying boats and had demonstrated itself ready to establish a similar service across the north Atlantic.

Other Countries. — Other European countries, particularly Russia and Holland, have spread their wings and flown far. Starting in 1919 with a service that first went between London, Paris and Copenhagen, Holland paralleled the activities of the British in



AIR LINES FROM EUROPE TO SOUTH AMERICA

establishing an air line to the east, terminating in Batavia. Russia, flying in all directions out of Moscow, eventually extended its service to Petropavlovsk, almost 6,000 mi. across bleak Eurasia.

The air service of the world in the two decades following the World War of 1914–18 progressed so steadily that by 1939 all continents were covered by extensive air-line networks, practically every major ocean route was paralleled by at least one air-line

Regular Air Services—The World

Year	Route Mileage (Approximate)	Miles Flown (Partly Estimated)
1919	3,200	1,022,000
1920	9,700	2,969,000
1921	12,400	5,831,000
1922	16,000	5,666,000
1923	16,100	6,570,000
1924	20,300	8,764,000
1925	34,000	13,011,000
1926	48,500	16,824,000
1927	54,700	22,242,000
1928	90,700	34,005,000

PLANES BUILT TO FLY AT HIGH ALTITUDES AND HIGH SPEEDS

1. American Boeing 307 Stratoliner, first commercial aeroplane designed to fly at altitudes up to 20,000 feet

2. Douglas DC-5 airliner flying with one motor cut out. Full-feathering propellers can be brought to a complete stop in flight within several seconds

3. Lockheed XC-35 substratosphere plane of the U.S. Army Air Corps — the first successful pressure-cabin aeroplane

service and even the Arctic regions had yielded to substantial experimentation looking toward the eventual establishment of transpolar air services.

Operations. — A high standard of operating efficiency has been reached all over the world. Almost 100% regularity in flying to a published timetable is claimed for certain European air lines operating during summer weather, and close to 100% is claimed for the main empire routes of Imperial Airways the year around. American international lines likewise approach 100% achievement of schedules. Domestic lines in the United States average over 95% in performance, an extremely creditable showing in view of the day-and-night high-speed nature of their flight assignments.

Bad weather has been responsible for most of the unscheduled landings by commercial transports, a rough percentage for the world being about 65% due to weather and 35% to mechanical failure. Schedule performance, however, is improving steadily everywhere with improved and new navigational communications and weather forecasting equipment and improvement in engines and craft design.

Cost of Operation.—Although some progress has been made toward economical operation, air transport has not yet arrived at a point at which it can be counted on to operate commercially without artificial financial assistance. There are two main reasons for the high cost of air transport as compared with other means of locomotion. First, an aeroplane expends a considerable proportion of its horse-power in climbing into the air and on maintaining itself at a safe height; in all other forms of transport the vehicle can remain at a fixed level on or in its particular element without expenditure of power. Secondly, in order to obtain as great a disposable load as possible for any given horse-power, the structure of both engine and aircraft must be extremely light. Consequently the air transport vehicle is costly to construct, and owing to its comparative fragility involves a high rate of maintenance. The cost of operation per hour depends largely on the horse-power employed; thus every effort is made, not only to increase the total weight per horse-power carried, but also to ensure that the greatest proportion of this total load is devoted to disposable load at the expense of structural weight. The large ground organizations required also add to air-line costs.

Improvement of Commercial Aircraft. — The problem of reducing the operating cost to cheaper commercial rates represents the most important question before the designers of commercial aircraft. Progress is being made on, broadly, two main lines — the reduction of maintenance costs and the increase of paying load per horse-power. Air-cooled engines have come into wide use; all-metal construction is generally replacing wood and

Regular Air Transport Services and Subsidies of the World in 1938

fabric. Each and all of these innovations appreciably reduce the cost of operation.

Various mechanical developments are being applied to increase the disposable load without adding to the weight and size of the aircraft itself. The greatest load which an aircraft can carry is that with which it can take off and land safely. Once at a safe height in the air, the normal aircraft has plenty of lifting power in hand. Considerable increase in horse-power is being obtained without serious additional weight by means of various systems of supercharging or "boosting" aircraft engines. Variable pitch propellers were perfected about 1934, permitting use of greater horse-power for take-offs with heavy loads and better speed at various flying altitudes.

Cleanliness of design of craft has been one of the most noteworthy advances in aeronautics. The trend, particularly in the United States, has been to ard monoplane construction of cantilever wing design, permitting elimination of outside structural bracing and other elements of "parasitic" resistance. With cleaner designs and improved engine performance speeds increased tremendously, some American transports regularly approaching cruising speeds of zoo miles per hour.

Steps were taken to achieve such speeds without increasing landing speeds. Particularly "wing flaps," usually attached to the lower trailing edge of the wing, were developed and brought the ratio of top speed to landing speed to about $3\frac{1}{2}$ to 1 by 1939.

The adoption of high-speed aircraft on European services lagged behind that in the United States although many European carriers, through the purchase of American equipment, soon established schedules at speeds comparable to the American standards. Just prior to the outbreak of hostilities in 1939, European-built transports were once more comparing favourably to similar American types.

Night Flying. — Due to the facilities provided by the various Governments, night flying has become increasingly popular. Beacons mark practically every important route in the United States and in Europe; beam radio is in wide use in America, and radio telephone has been generally adopted. More than half of the commercial flying in the United States is done at night, and transcontinental journeys of 2,500 and 3,000 miles from sunset to sunrise are common.

INTERNATIONAL AGREEMENTS

At the conclusion of the War when the whole world began to turn its attention to the possibilities of aviation as a commercial activity it was obvious that, if air transport was to accomplish even a small proportion of that which enthusiasts claimed for it, international regulations must be put into force as soon as possible, and the necessary steps were taken at the Peace Conference in Paris during 1919.

International Convention. — The Treaty of Versailles brought into being an International Convention for the Regulation of Aerial Navigation, in which all the Allies participated; under the terms of this Convention a permanent Commission for Air Navigation was to be set up and placed under the direction of the League of Nations. In Great Britain, except for a brief period during Easter Week 1919, post-War civil aviation did not commence officially until May 1, 1919. On Aug. 26, 1919, international civil flying from Great Britain was first started under temporary air navigation regulations.

By June 1922 the International Air Convention had been ratified by a sufficient number of signatory states to make the introduction of its regulations practicable. It was brought into force in Great Britain by the Air Navigation Order dated June 20, 1922. Accordingly, the first meeting of the International Commission for Air Navigation was opened in Paris on July 11, 1922 (see AERIAL LAW). It has been evident that international air navigation regulations were of vital importance, and during 1922, on ratification of the International Air Convention, to which reference has already been made, the International Commission for Air Navigation (known as the I.C.A.N. in England and as the C.I.N.A. on the continent of Europe) came into being. The following states are parties to the Convention and send representatives to this Commission: Belgium, Great Britain and Northern Ireland, Canada, Australia, South Africa, New Zealand, Irish Free State, India, Bulgaria, Chile, France, Greece, Italy, Japan, Argentine Republic, Finland, Iraq, Norway, Netherlands, Spain, Switzerland, Yugoslavia, Poland, Portugal, Rumania, Siam, Czechoslovakia, Uruguay, Sweden, and Denmark.

The general principles laid down by the Convention are as follows:

1. Innocent passage of commercial aircraft of the members over the territories of all.
2. Designation of customs aerodromes at suitable points at which aircraft must land.
3. Issue of licences to all members of the crew and airworthy certificates to all aircraft engaged in international commerce. The forms of these licences and certificates and the qualifications and tests to be demanded have been agreed upon by the Commission.
4. The establishment of a wireless and meteorological organization and a lighting system along air routes authorized by the nation over whose territory they lie.

The full Commission now meets twice every year, the place of meeting being decided on the invitation of one of the governments represented. The Commission has appointed standing subcommissions for the detailed study of operational, technical, medical and legal problems, and these meet at various dates between the meetings of the full Commission. Most European nations who are not members of the International Commission have drawn up regulations of their own, approximating those of the International Commission, and many of them have entered into agreements of various classes and duration with one another and with members of the International Commission in order to facilitate the operation of international air transport.

Since its creation the Commission has taken steps to modify Articles 5 and 34 of the Convention, which were unacceptable to certain ex-neutral and ex-enemy countries. These modifications came into force on Dec. 14, 1926, on the completion of ratification, and the way was opened for several other European nations to join the Convention. America, although a signatory to the Convention originally, has never deposited her ratification, but has established Federal legislation on the general lines of the Convention for the administration of inter-state air transport.

Each country through its national legislature gives effect to the International Air Convention and to the decisions of the International Commission. In Great Britain this is done by the Air Navigation Act, 1920, and by the air navigation orders and air navigation directions issued by the authorities from time to time thereunder.

OTHER COMMERCIAL USES OF AIRCRAFT

There are many kinds of work that can be done by aircraft more rapidly and at least as cheaply as by less up-to-date transport. The first steps were taken in Canada where aircraft have taken a constantly increasing share of the work of survey and forest fire protection. The United States uses the aeroplane as a destroyer of insect pests in the cotton fields, one machine in the air replacing 40 men on the ground. Russia attacks the plague of locusts by similar means. A company in British Guiana finds it worth while to keep a seaplane as an ambulance, whilst aeroplanes are employed for ambulance work in Australia.

Air Survey. — Aerial survey came into existence during the World War. The necessity of photographing trench-lines and hostile positions became more and more vital as operations progressed, and by 1918 military aerial photography had reached a high pitch of efficiency. It was only in a few cases, however, that it was necessary to employ aerial photography as a means of measuring distances on the ground; as a rule, comparatively accurate maps were available, and the photographs were required for filling in details of natural features, buildings, roads, etc., and for disclosing the dispositions of the enemy.

At the end of the war it was clear that aerial photography must provide a very valuable aid to ordinary survey, and from that date onwards aerial survey has been very successfully developed in various parts of the world.

Canada has been the pioneer of air surveying. Her vast and comparatively flat northern regions offered an ideal field for the young enterprise to prove its commercial value. Operations have for the most part been carried out by flying-boats working from the numerous lakes and waterways which intersect large expanses of unsurveyed forest land.

Two systems have been employed: vertical photography aided by certain points previously fixed by triangulation; and oblique photography along a line already traversed by means of ground survey.

Without doubt enough air survey work has been successfully carried out to demonstrate that this type of work has become a decided factor in the development of the British Empire. The most obvious demand for air survey is in regions where ordinary means of transport present serious obstacles to the ground surveyor. Such regions are often of immense value on account of their timber products, as in Canada, or mineral deposits, as in Rhodesia. The air photograph is also of real value to the geologist, the forestry officer, the railway engineer, the irrigation engineer, the draining engineer, the town-planning department, the department of agriculture, the archaeologist and the medical officer.

The point has long been reached where air survey can stand on its own legs, and it is only necessary now to obtain large contracts to maintain it as a really important and prosperous national industry. Practical experience has proved that under a great many conditions air survey saves a vast amount of time and a very appreciable amount of money as compared with ordinary methods.

In France, a law demanding accurate plans of all fair-sized municipalities led to much activity in the survey of towns. In Germany, forest survey has been carried out extensively and successfully, and great progress has been made in solving the scientific problems connected with stereoscopic plotting and the aerial photography of mountain tracts. The United States has followed Canada in aerial survey progress. Her operations have included oil surveys, coast-line and river surveys, the alignment of new roads and railways, municipal surveys and town-planning.

Modern Aerial Photography. — Aerial photography has an established place in various branches of commerce and advertising. In connection with engineering works, building contracts and land development, air photographs provide a valuable and comparatively inexpensive check on progress. For advertising purposes air photographs of factories, estates, hotels and seaside resorts are in constant demand. Municipal authorities have used aerial photography in drawing up plans for town improvements, river authorities have used them for studying currents and the siting of bridges, whilst traffic authorities have proved their value in investigating the baffling problems of road congestion.

Owing to the effects produced in a photograph by variations in the contour, colour and texture of a surface, air photographs often reveal features of interest to archaeologists. The riddle of the avenues at Stonehenge was solved by an air photograph that showed extraordinarily clearly the course of the ancient paths, of which no trace appeared to be visible on the ground. Similarly, under colonial conditions aerial photography is probably the cheapest and certainly the quickest method available for the investigation of schemes of development. Since extreme accuracy as to scale is immaterial, the technical difficulties of air survey do not arise.

Forest Fire Protection. — Experience in Canada has shown that in certain circumstances aircraft patrols are the most efficient method of controlling the fire hazard in forests. The greatest efficiency is reached in areas where population is sparse and ground forces cannot be fully organized.

During the forest fire season, constant air patrols have been maintained over important areas, and fires are reported by wireless to fire-fighting stations; in some cases, the fire-fighting parties and apparatus are actually carried to the site of the fire in aircraft. Enormous tracts of timber have been saved by this means. It has been recorded that 90% of the fires do not spread over more than 100 acres, owing largely to the fact that as soon as the fire is detected men are placed in a position to control it immediately.

The making of inventories and surveys of the forests is combined with fire protection, and in this way the patrols serve a double purpose. Until the introduction of air photography, survey in the forest regions was all but impossible owing to the difficulty and expense of ground operations. The use of aircraft, therefore, assists the conservation of the forest wealth not merely from destruction by fire but also from uneconomic exploitation.

Protection of Cotton and Other Crops. — The idea of utilizing aeroplanes as a means of spraying poison dust on cotton plants, fruit trees and crops generally in order to destroy insect pests was demonstrated in the United States as early as 1921. This method has been developed to a commercial stage and many thousands of acres are treated annually. The poison used is finely powdered calcium arsenate.

On large and favourably situated fields more than 500 acres per hour are treated. Under the most favourable conditions more than 1,000 acres per hour can be treated The method of applying the dust is a comparatively simple one. The "dust" is carried in a hopper on the aeroplane and discharged at an even rate under the control of the pilot. Each run of the aeroplane across the field dusts a strip up to 250 feet wide at a speed of 100 miles per hour. One slow aeroplane can dust 45 acres a minute, which is equal to the work of 40 cart dusting machines.

The principal advantage of aeroplane dusting is the speed at which it works. No sooner is an infestation of insects detected than the whole area, perhaps many thousand acres in extent, can be treated with poison in a few hours. To obtain the same result by the old method would necessitate the maintenance of a large force of men and dusting machines and would be economically unsound. A very substantial increase in yield is secured by effective "dusting" and the air method has been supplanting the old method wherever the territory is favourable for its use. The utility of air dusting is naturally greatest where the fields are large, flat and free from obstructions.

Ambulance and Medical Duties. — In undeveloped countries where methods of transport are elementary, and particularly in countries where tropical diseases are prevalent, great difficulty is experienced in counteracting outbreaks of disease and rendering medical attention to the sick.

Aircraft have already been the means of saving a number of lives by carrying medical assistance to people stricken down with sickness, or by transporting cases of dangerous illness to hospital when the hardships of ordinary travel would prove fatal. For instance, in one case when an epidemic of typhoid fever had been reported, the doctor by using aircraft, was able to reach the scene with supplies of antitoxin in the space of hours instead of the two or three days which would have been occupied by the ordinary means of transport. In British Guiana a seaplane was fitted up as an ambulance for the transport of fever patients from up-country plantations to the hospital at Georgetown; a journey which formerly took from 17 to 21 days can be made in less than two hours.

In Australia more and more use is being made of aircraft to assist doctors and nurses in reaching regions where ordinary methods of transport are primitive, if they exist at all; the result being that a man who would hesitate to take his family out of reach of medical aid knows that in case of need he can obtain help promptly.

Several aircraft constructors have built machines specially fitted out as ambulances and complete with surgical equipment.

Policing by Air. — Aircraft are considerably used for helping the officers of the law. Canada has important salmon fisheries on her west coast where policing by aircraft has been conducted in a very effective manner. The main offences against fishing regulations are fishing with two great length of net or nets of illegal mesh, fishing during the week-end closed season, fishing in restricted areas, and fishing without a licence. Numerous offenders have been detected and it soon became clear that the authorities were determined to have the laws strictly enforced. Denmark is another country to use aircraft in this manner, and the United States equips certain of her coastguard stations with seaplanes for

routine patrol duties.

Several countries have employed aircraft in order to check the movements of smugglers attempting to land prohibited goods, particularly drugs and liquor. In Canada successful and interesting results have been secured. The smuggling of drugs from ships when about to enter Vancouver harbour was well known to the Canadian Government. Members of the crew or passengers had devised a successful method of evading the customs examination by throwing overboard buoyed packages of drugs at selected spots where they were picked up by launches and landed secretly. Owing to the speed of these launches, it proved a difficult matter to catch them. In order to combat this illicit traffic certain incoming liners from the Orient were unexpectedly escorted by aircraft and the risks of detection were so increased that the smuggling stopped.

The aircraft were also used for customs "raids" on vessels suspected of carrying illicit cargo, a thorough examination being made before the goods could be disposed of. A similar use was made of aircraft in enforcing the former prohibition laws of the United States.

Passenger Transport. — There are still people who have not flown, and "joy-riding" concerns which offer "flips" at popular rates continue to operate. They form a large branch of civil aviation, and through their efficient operation and record of safety they have done a most valuable service by creating interest and confidence in flying.

Previous to 1929 the American "gipsy flier" was a figure of romance. Unhampered by any restrictions and with an enormous territory to rove in, some hundreds of these young men carried on the adventurous life of flying nomads, picking up a living from town to town and keeping their machines in the air more by faith than by the resources of engineering. Some of the foremost American pilots, however, emerged to renown from the "barnstorming" field.

Air Taxi Service. — There are many operators of aircraft who specialize in flights at short notice for urgent missions. The newspaper press and cinematograph industry make frequent use of aircraft for hastening the arrival in key cities of photographs and films of important events and place great reliance upon this form of rapid transport. There is an established seasonal traffic in newspapers to the nearer Continental seaside resorts, as only by using the air can English newspapers be delivered to these places on the morning of issue. Flights with belated passengers to Southampton and Cherbourg to catch outgoing liners have been common.

These are examples of the ordinary daily routine of an air taxi service. Frequently a business man will require a machine to take him on a fast tour round the European capitals, or even further afield. Planes have been chartered for business trips from London and Continental Europe to various points in the East, and travelers in America often resort to hired aircraft to carry them about the United States, in which country in 1934 more than thirty million miles of "taxi" flying was completed.

The "drive yourself" idea of renting motor cars was spreading rapidly in the field of fixed base flying operations. Hundreds of American operators found they could rent planes to amateur pilots for occasional flights or cross-country tours, and this business showed much promise of development.

Typical of the sightseeing service rendered by many companies in various parts of the world was that rendered by an American operator in Arizona who flew on a regular schedule over the Grand Canyon; another operstor featured the beautiful sight of New York from the air by night; other lines ran from the mainland to nearby island resorts.

Sportsmen make great use of chartered planes, particularly in trips to major competitive spectacles, such as championship prize fights, international boat racing such as the Harmsworth contest, big collegiate football contests, horse racing and other events of similar nature. The cost for this sort of charter when taken exclusively by a single group runs high, but wherever there are patrons there arr also operators ready to go anywhere on short notice.

Advertising. — Aircraft have proved effective in advertising. The writing of words in the sky is a British invention that has been used extensively. The aircraft used are fast single-seaters which are equipped with a chemical "smoke" generating apparatus of patented design from which a thick stream of white or coloured "smoke" is emitted as the pilot traces out the letters. The work calls for considerable skill on the part of the pilot. He has to keep his letters in line and equal in size over a group perhaps eight miles long, and unless he is quick the first letters will fade before the last are finished.

Aeroplanes and autogyros towing long lettered banners streaming out behind have also been used extensively in advertising, notably over great centres of population and over huge stadia where crowds gather for outdoor sporting events. Planes have also carried powerful amplifying equipment through which an announcer from the sky bawled out praises for commercial products, but this practice met with such public disfavor that it did not remain long in use.

CIVIL FLYING SCHOOLS; LIGHT AEROPLANE CLUBS; AIR RACING

Civil Flying Schools. — In maay countries the training of pilots both for military and commercial purposes has been entrusted to civil schools, partly for reasons of economy and partly to encourage the civil development of aviation.

In the United Kingdom a number of civilian schools or groups organized as flying clubs received governmental subsidies for the training of civilians. As the British program for aerial rearmament accelerated, this program of training was rapidly increased in scope. Until the actual outbreak of hostilities in Europe in 1939, it would be safe to say that the majority of British fliers began their flying careers by enrolment in such civilian training courses.

France went a step further by placing the whole of the ab *initio* training of military pilots in the hands of civil schools and by organizing "centres" at which any ex-Service pilot was entitled to make flights at frequent intervals in order to keep himself in training.

In Germany, prior to that country's denunciation of the Versailles Treaty as to armament limitations, flying training mas subject to certain restrictions owing to the fact that Germany was not permitted to possess a military air service. To summarize these restrictions as briefly as possible: training schools were not to be subsidized out of public funds; a limit was set on the number of officers serving in the Army who were permitted to qualify as pilots, and the Air Police Force, though its members could be given elementary flying training, were not to be equipped with aircraft.

In the absence of Government subsidies the training organizations were actively engaged in raising money by private subscription from public-spirited individuals and companies. The Deutsche Luftfahrt Verband (German Air League) was an energetic supporter of schemes for training, and a subsidiary body known as the "Deutsche Luftfahrt G.m.b.h." was formed to carry out training at three schools. Some pupils were assisted by the Air League to the extent of four-fifths of the cost of instruction.

The ascendancy of Adolph Hitler's Nazi party to governmental power in Germany was followed by denunciation of the Versailles pact and withdrawal from the League of Nations. These actions threw into confusion any statistics on Germany's flying status, although it readily was known that the country was conducting a wide aviation program involving in great part personnel trained from the generation following the World War of 1914–18.

Light Aeroplane Clubs and Private Flying. — The backbone of private flying is the man who keeps his own aircraft and flies it as another man drives his car Eut the movement is a very wide one, ranging from the member of a light aeroplane club, who takes a ten minute "hop," to the pilot who sets out to fly single handed across continents and oceans, and even around the worlrl

Light aeroplane clubs were formed in England in 1924–25, and

at the start of 1935 there were thirty such clubs approved to receive Government financial assistance, and twenty-three clubs receiving no assistance. Of the Government-assisted clubs, the membership during 1934 was 5,814 of whom 1,823 held pilots' "A" licences, the corresponding figures for 1933 being 4,931 and 1,569 respectively.

In the boom years of aviation following the Lindbergh flight to Paris, aviation "country clubs" were started in the United States and while several were operating with some success for a time the depression which set in in 1929 radically halted their activities, and most of the civilian flying instruction in this country was obtained at commercial schools, usually open in conjunction with other commercial operations, such as charter and "taxi" hire and maintenance work.

A grandly spectacular phase of private flying concerns those intrepid men and women pilots who for years braved uncharted air trails over which the commercial transport followed. In this category belong the names of Charles A. Lindbergh, Wiley Post and Harold Gatty, Frank M. Hawks, Roscoe Turner, Dieudonne Costes and Maurice Bellonte, James and Amy Johnson Mollison, Bert Hinkler, Hugo Eckener, Charles Kingsford-Smith, Wolfgang von Gronau, Russell N. Boardman and John Polando, Clyde Pangborn, Amelia Earhart, Paul Codos and Maurice Rossi, C. W. A. Scott and T. Campbell Black.

Lindbergh's New York-Paris flight was the greatest stimulus given aviation up to 1927; the first complete world aeroplane flight by Wiley Post and Harold Gatty and the subsequent solo journey around the globe by Post served as world-wide exploitation for flying; Hawks and Turner consistently and successfully hammered at the cross-country air records of the United States and Europe; the first Paris-New York flight by Costes and Bellonte redounded greatly to French aviation prestige; the Mollisons were consistent fliers to the East and across the North Atlantic. and Hinkler was a pioneer racer to the East and over the South Atlantic; Eckener took the dirigible Graf Zeppelin on voyages of spectacular demonstration at a time when lighter-than-air needed all the publicity it could get anywhere in the world; Kingsford-Smith's flight from San Francisco to Australia via Honolulu and the islands of the South Seas was a brilliant demonstration of navigation; von Gronau was applauded by the conservative elements in the business for his flights in a flying boat across the North Atlantic with stops at island bases; Boardman and Polando extended the world's distance record remarkably, as did Codos and Rossi; Pangborn spanned the Atlantic and was the first to fly from Japan to the United States; Earhart flew the Atlantic twice, once alone, and although lost on one of the final laps of a round-the-world flight, will stand forever as the greatest woman aviator of her time.

Air Racing—Many of these stars of aviation distinguished themselves in exhibition speed and distance flights, although some of them and others also came to the fore in national and international direct competition. The Scott-Black flight from London to Melbourne brought them victory in the Sir MacPherson Robertson international race in 1934, the most important aviation competition in the history of flight up to that time. They covered the 11,300 mile course in 2 days, 22 hours, 54 minutes, winning by a substantial margin over K. D. Parmentier and J. J. Moll, a Dutch team, and Turner and Pangborn, Americans, who finished second and third respectively.

In the United States the Vincent Bendix annual transcontinental contest attracts the ablest of American pilots and the fastest civilian planes. A great share of the credit for the remarkably fast times made across the 2,500 mile stretch from Los Angeles to New York belongs to Frank Hawks, who, in 1929 began a steady assault on the distance. Roscoe Turner followed with consistent performances, the two men and others bringing the record down to about ten hours by 1935.

An event of former international importance was the Schneider trophy races which drew the fastest aircraft that the leading nations of the world could build. This competition, however, ran to great expense and since 1931 no contest for the trophy has been staged, the prize last resting with England by virtue of a speed of 340.048 miles an hour established by Lieut. James N. Boothman. The Schneider competition gave way to separate efforts by some nations to hold the ultimate world speed record. England and Italy were particularly active in this regard, the record in 1934 going to Italy at 440 miles an hour, flown by Francesco Agello.

The British Empire has always been interested in the record between London and Cape Town and London and Australia. Times over these two courses have been broken as frequently as the American transcontinental mark, and although the American cross-country racers fly at a much higher speed, they do not have to negotiate the distances required on the flight to the East or to South Africa. The Scott-Black record from London to Melbourne was expected to stand unbroken for some time, although the record of Amy Johnson Mollison of 4 days, 6 hours, 54 minutes from London to Cape Town, established in 1932, quickly began to attract challengers and it was foregone that this time would be whittled down steadily.

The non-stop flight record has been coveted for many years by various countries. Most of the aeroplanes used on such flights have been specially constructed and usually are not considered in the class of "stock" craft, although record breaking planes and engine performance and reliability mean prestige for the country manufacturing the winner.

Record of important flights across the United States:

1911	C. P. Rodgers	New York-Pasadena	1st flight, 59 days
1912	Robert Fowler	Jacksonville-San Francisco	151 days
1922	James Doolittle	Jacksonville-San Diego	22 hours
1923	Kelly-Macready	New York-San Diego	26 hours
1924	Russell Maughan	New York-San Francisco	21
1928	Arthur Goebel	Los Angeles-New York	18 hours
1929	Frank M. Hawks	Los Angeles-New York	17 hours
1930		Los Angeles-New York	14 hours
1930	Lindberghs	Los Angeles-Nevv York	12 hours
1931	Doolittle	Los Angeles-New York	11 hours, 16 min.
1932	Doolittle	Los Angeles-New York	10 hours, 19 min.
1933	Roscoe Turner	Los Angeles-New York	10 hours, 5 min.
1934	Roscoe Turner	Los Angeles-New York	10 hours, 2 min.
1937	Howard Hughes	Los Angeles-New York	7 hours, 28 min.

List of record non-stop flights:

Date	Place	Aeroplane	Pilot	Distance
1908	France	Wright (U.S.)	W. Wright	77·5 mi.
1909	France	Farman (Fr.)	Farman	145 mi.
1910	France	Farman (Fr.)	Tabuteau	363 mi.
1911	France	Nieuport (Fr.)	Gobe	460 mi.
1912	France	Farman (Fr.)	Fourny	628 mi.
1919	St. Johns, Newf. to beland	Vickers (Br.)	Alcock and Brown	1,936 mi.
1922	San Diego, Cal. to Indianapolis, Ind.	Fokker (U.S.)	Kelly and Macready	2,060 mi.
1923	New York to San Diego, Cal.	Fokker (U.S.)	Kelly and Macready	2,516 mi.
1926	Paris to Djask, Persia	Breguet (Fr.)	Costes and Rignot	3,313 mi.
1927	New York to Paris	Ryan (U.S.)	Lindbergh	3,610 mi.
1927	New York to Germany	Bellanca (U.S.)	Chamberlin	3,911 mi.
1928	Rome to Brazil	Savoia (It.)	Ferrarin and Del Prete	4,466 mi.
1929	Paris to Coulart, China	Breguet (Fr.)	Costes and Bellonte	4,912 mi.
1931	New York to Istanbul, Turkey	Bellanca (U.S.)	Boardman and Polando	5,011 mi.
1933	Cranwell, Eng. to Walvis Bay, South Africa	Fairey (Br.)	Gayford and	5,308 mi.
1933	New York to Rayak, Syria	Bleriot (Fr.)	Codos and Rossi	5,653 mi.
1938	Ismailia, Egypt, to Port Darwin, Australia	Vickers (Br.)	R.A.F.	7,158 mi.

Air racing has been taken up with enthusiasm by the light aeroplane clubs and owners of private aircraft. Regular meetings are being held at which displays are combined with racing and the public are attracted in large numbers. The great crowds drawn to the British Hendon aerodrome to witness the air racing organized there before the War gave evidence of the interest that was subsequently to be aroused by well-organized meets. Under the changed conditions of to-day, with the light aeroplane bring-

ing aviation within the reach of thousands of people, it was ordained that air racing would grow into a big national sport. It has one outstanding advantage over other forms of racing in not requiring a special track. The principal British air race is the annual contest for the King's Cup which has been held each year over a different course since 1922. This race is a test not so much of speed as of piloting and general reliability.

The annual national air races in the United States run over a period of several days and draw hundreds of thousands of spectators. Almost every race brings out new types of design and improved engines which get gruelling tests in the Bendix transcontinental event, staged incidentally to the national air races program, and the Charles Thompson competition over a 100-mi. closed course. Although not held in 1939, the national air races have brought the United States several outstanding flying records.

As of Jan. 1, 1939, some of the most important records, according to *Aircraft* Yearbook, stood at:

OFFICIAL WORLD AIR RECORDS

(World records are defined as maximum performance regardless of the class or type of aircraft used)

MAXIMUM SPEED OVER A 3-KM. COURSE
Francesco Agello, Italy, Oct. 23, 1934
709·209 km.p.h. (440.681 m.p.h.)

DISTANCE, AIR-LINE ..... 11,520·421 km. (7,158·440 mi.)
Kellett, Gething Gaine, Combe, Burnett Gray, Great Britain, Nov. 5–7, 1938

DISTANCE, Closed circuit..... 11,651·011 km. (7,239·588 mi.)
Fujita, Takahashi and Sekine, Japan, May 13–15, 1938

ALTITUDE..... 22,066 m. (72,394·795 ft.)
Capt. Orvil A. Anderson and Capt. Albert W. Stevens, U. S. army air corps, United States, Nov. 11, 1935

OFFICIAL INTERNATIONAL AND NATIONAL RECORDS

(For aeroplanes only)

DISTANCE, CLOSED CIRCUIT

International record..... 11,651·011 km. (7,239.588 mi.)
Comdt. Yuzo Fujita and Fukujiro Takahashi, pilots; Chikakichi Sekine, mechanic; Japan, "Koken" monoplane, Kawasaki special engine of 700 h.p., May 13–15, 1938

National (U.S.) record..... 4,050 km. (2,516·5 j mi.)
Lts. Kelly and Macready, U. S. A., T-2 aeroplane, Liberty 375-h.p. engine, Dayton, Ohio, April 16–17, 1923

AIR-LINE DISTANCE

International record..... 11,520,421 km. (7,158·440 mi.)
Kellett, Gaine, Combe and Gray, Great Britain. Vickers Wellesley, Bristol Pegasus engine, from Ismailia. Egypt, to Darwin, Australia, Nov. 5–7, 1938

National (U.S.) record..... 8,065·736 km. (5,011·800 mi.)
Russell N. Boardman and John Polando, Bellanca monoplane, Wright J-6 300-h.p. engine, from Brooklyn, N.Y., to Istanbul, Turkey, July 28–30, 1931

DISTANCE, BROKEN LINE

International record..... 10,148 km. (6,295.662 mi.)
Col. Mikhail Gronov, Comdt. Andrei Youmuchev and Ing. Sergei Daniline, U.S.S.R., ANI-25 monoplane, AM-34 860-h.p. engine, from Moscow, U.S.S.R., to San Jacinto, Calif., July 13–15, 1937

National (U.S.) record..... None established

ALTITUDE

International record..... 17,083 m. (56,046·473 ft.)
Col. Mario Pezzi, Italy, Caproni 161 aeroplane, Piaggio XI R C engine at Montecelio, Oct. 22, 1938

National (U.S.) record..... 13,157 m. (43,165·880 ft.)
Lt. Apollo Soucek, Wright "Apache," Pratt and Whitney 450-h.p. engine, at Anacostia, D.C., June 4, 1930

MAXIMUM SPEED

International record..... Speed, 610·950 km.p.h. (379.626 m.p.h.)
Dr. Hermann Wurster, Germany, BF 113 R. monoplane, DB 600–950 PC 12-cylinder engine, Augsburg, Nov. 11, 1937

National (U.S.) record..... Speed, 567·115 km.p.h. (352·388 m.p.h.)
Howard R. Hughes, Hughes "Special" monoplane, Pratt and Whitney Wasp Junior 1,000-h.p. engine, Santa Ana, Calif., Sept. 13, 1935

Flying for Air Survey Photography (H.M. Stationery Office); Lieut. M. Hotine, R.E., *Simple Methods of Surveying from Air Photographs* (H.M. Stationery Office). (W.S.B.; H.P.K.; D. SE.)

Aeroplane Races in the United States. — The first aeroplane race in the United States took place in 1910 at Belmont Park, N.Y., when fliers from France, England and other lands went to the U.S. to compete for the Gordon Bennett cup—won in 1909 by Glenn Curtiss at Reims, France. From that time on until after the World War of 1914–18, aeroplane racing in America was rather desultory. There were numerous events, but the manner in which they were conducted made them local rather than national affairs.

The first real aeroplane race in America was held in 1920 for the trophy presented by Ralph Pulitzer. The event was staged at Mitchel field, N.Y., and won by Lieut. C. C. Moseley of the U.S. army air service. The average speed was 178 mi. an hour. In succeeding years greater speeds were attained, until the 1925 race when a speed of 248·975 mi. an hour was attained by Lieut. Cyrus Bettis.

The army and navy took great interest in the early Pulitzer races. In fact, these events played a very important role in developing the speed and efficiency of pursuit aircraft. It is perfectly justifiable to say that efficient performance of modern pursuit planes in army and navy aviation was developed in the gruelling grind to which motors were subjected in the Pulitzer trials. However, when the military air services developed fast tactical ships, they ceased building fast planes for racing purposes.

In April 1939 the record speed for aeroplanes was made by Fritz Wendel, in Germany, who flew for a short distance at the rate of 469 m.p.h. Wes Carroll and Clyde Schlieper, in 1939 in California, stayed in the air 726 hours, picking up fuel in cans.

Since 1920, in addition to the Pulitzer races, the National Aeronautic association has sponsored the national air races with the Pulitzer races as the main feature. At the outset, these races were primarily dependent upon the army, navy and marine corps for entries, with separate events for pursuit, observation, bombardment and light commercial planes. The military services are gradually withdrawing from participation in these races with the result that civilian and commercial entries have gradually taken an increasingly prominent part, a highly desirable development. In 1928, the national air races consisted chiefly of civilian events featuring weight-carrying, speed and light sport aeroplanes. Within the services there are several races exclusively for military planes, such as the Mitchell pursuit trophy, the Curtiss marine trophy, the Patrick attack trophy, the Liberty Engine Builders' trophy and Packard trophy for large aeroplanes. (L. J. M.; X.)

AVIATION, HAZARDS OF. Owing to technological advances in the design and construction of flying and ground equipment, to increasing experience and to steady improvements in flight technique, aviation hazards are decreasing at a rapid rate all over the world. On March 26, 1940, for example, the domestic airlines of the United States completed the first 12 months of their history completely free of accidents either fatal or resulting in serious injury to passengers or crew. During this period, these airlines flew 87,325,145 mi. and carried 2,030,000 passengers a distance of 814,906,250 passenger-miles. Insurance companies in both the United States and Europe now offer travel insurance at the same low rate as that offered to railroad passengers. While the safety of non-scheduled civilian flying was still below that of airline travel, substantial progress has been recorded. In 1939, non-scheduled civil flying in the United States resulted in one fatal accident for every 957,895 mi. flown compared with one fatal accident for every 406,463 mi. flown in 1934. During the first full year of the Civilian Pilot Training Program conducted by the Civil Aeronautics Authority, 10,000 students completed their primary training, flying some 26,600,000 mi. with only one fatal accident. (D. SE.)

AVIATION, MEDICAL ASPECTS OF. Medical studies on the effect of flight were first begun in 1783 when a chicken, a duck and a sheep were sent aloft in a smoke-filled balloon. They returned to earth unharmed, but a few months later a balloonist reported severe pains in his ears during an ascent. This is the first record of an ill effect of flying and as time went on other and more serious effects of flight were reported. Between 1875 and 1878 Paul Bert, a famous French physiologist, made a detailed study of the effect of high altitude and discovered that it was due principally to the decrease of atmospheric pressure with a consequent oxygen lack in the body.

Following the work of Paul Bert there were few further studies on the effect of flight until a few years prior to the outbreak of the World War of 1914–18. The Germans studied the special qualifications required of aeroplane pilots and drew up minimum standards as early as 1910 and by 1915 a special medical service for aviators functioned regularly in Germany. In France the first instructions relative to the examination of military pilots were issued in 1912 and a special service for aviators established in 1917. The first record in the United States of anything pertaining to aviation medicine appeared on Feb. 2, 1912 when the War Department published instructions concerning the physical examination of candidates for aviation duty.

The special medical examinations utilized in Europe in the first year of the World War of 1914–18 did not prove effective, however, as experience was to show. It was found, for example, during the first year of that conflict that of every 100 pilots killed. 2 died as the result of enemy action, 8 from defects in their machines, and go as a result of defects in the pilots themselves. These conditions attracted the attention of the highest medical authorities in each of the countries concerned and at that time there came into being a special branch of military medicine known as aviation medicine. Those who were trained and engaged in the practice of this new specialty became known as flight surgeons.

Between the years 1920–30 civil aviation was established in most of the civilized countries of the world and commercial airlines began carrying a large number of passengers. This introduced new problems in aviation medicine and required the services of specially trained physicians in civil as well as in military aviation. Aviation medicine has been generally recognized as a distinct specialty and may be defined as that branch of medical science which has to do with the selection and maintenance of aeroplane pilots and the prevention and treatment of the harmful effects of flying.

Pilot Selection. — Pilots are selected by means of a special physical examination in accordance with regulations laid down by government agencies. These regulations vary according to the class of licence sought, being fairly lenient for a student pilot's rating, but they become progressively more strict for private, commercial, airline and military ratings. The variation in the requirements for the various classes of licences is based on the fact that the lower ratings permit only the flying of light, simple aeroplanes in a local area and prohibit the carrying of passengers while the highest ratings contemplate the flying of large fast commercial passenger aeroplanes or military aircraft.

For the lower ratings the requirements specify that the candidate have average vision and intelligence and be free from any physical defect or any organic disease which might be considered as a possible cause of an aircraft accident. For the higher ratings the requirements are very detailed and exacting. Two to four years of college work may be required and in addition the candidate is subjected to an exhaustive mental examination to determine his aptitude for flying training. The physical examination is likewise very thorough and no one is accepted who has the slightest defect of any kind. The eye examination is especially strict as is that of the heart and nervous system.

Pilot Maintenance. — Graduate pilots who hold commercial or military ratings are under constant medical supervision. They are carefully re-examined by a flight surgeon at intervals of from 1 to 6 months and should a disqualifying defect be found, the pilot is grounded until the defect is remedied. The health of the pilot is carefully regulated by his medical supervisor who prescribes the necessary hygienic measures, exercise, diet and other modes of living designed to keep him at the peak of efficiency at all times. For the lesser ratings a re-examination every year or two is all that is required.

Accidents in Aviation. — In civil aviation the safety and comfort of the passenger are given primary consideration and as a consequence scheduled air travel is now as safe as any other form of public transportation. In military flying, on the other hand, accomplishment of the military mission is necessarily of first importance. Even in peace time military pilots must be trained to use their equipment under war time conditions and are required to obtain from their aeroplanes the maximum performance which their structural strength will permit. Acrobatics, gunnery and bombing practice must be carried out routinely as well as flying in dangerous weather conditions. Under such conditions military flying is, and probably always will be, a hazardous occupation.

The Harmful Effects of Flying. — In addition to aircraft accidents there are many other conditions peculiar to flight which may produce discomfort, illness and even death. The wind blast due to the speed of the aeraplane is greater than that of the fiercest tornado and is the source of great discomfort in open aircraft. The noise of the motor and propeller may be loud enough to cause deafness after a few years of flying. Vibration in aeroplanes is a prominent source of annoyance and fatigue.

Cold. — As one ascends to high altitude the temperature of the air drops approximately 2° C. for each 1,000 ft. until at 35,000 ft. and above the temperature remains constant at −55°. Thus during a rapid climb the military pilot is not only subjected to a very rapid change in temperature but is often exposed to a degree of cold which cannot be guarded against by even the heaviest winter flying clothing. This exposure not only leads to chilling and frost bite but may be the cause of subsequent respiratory diseases such as pleurisy and pneumonia.

Atmospheric Pressure Change. — Like the temperature, the pressure of the atmospheric air decreases with ascent. Thus at sea level the pressure is 14.7 lb. per sq.in. and is reduced to one-half at 18,000 ft., one-fourth at 34,000 ft. and to one-eighth at 48,000 feet. The most common effect of the change of atmospheric pressure with ascent and descent is pain in the ears and sinuses. The middle ear and the sinuses are air filled cavities in the skull connected to the outside by small openings into the throat and nose. If for any reason these openings are closed during ascent or descent, the air contained in the cavities will be at a higher or lower pressure than the surrounding atmosphere and either a positive or negative pressure will develop in them. When this occurs these structures are damaged and are the sources of great pain. The ear drum is sometimes ruptured during a rapid descent.

A' somewhat similar condition exists with reference to the stomach. This organ normally contains a quantity of gas and during ascent this gas expands in proportion to the decrease of atmospheric pressure. At altitudes of 25,000 to 30,000 ft. the stomach may become so distended that not only do severe abdominal cramps develop but the heart and lungs are crowded upward to the extent that their action is interfered with.

One of the most troublesome effects of decreased atmospheric pressure with ascent is the condition of oxygen lack in the body known as acute altitude sickness. This condition comes about, not because of a decrease of oxygen percentage in the air at high altitude, but because of a decrease of the oxygen pressure which is necessary to carry it into the blood and body tissues. There are few, if any, other conditions known to medicine which produce such profound changes in the body, or which may even produce death, without creating more pronounced subjective manifestations than those experienced in acute altitude sickness. At altitudes of 12,000 ft. or above individuals may react in one of two general ways. Some feel tired, depressed or sleepy and tend to fall asleep. Others will have the opposite reaction and become euphoric with outbursts of hilarity, uncontrolled laughter or pugnaciousness. At an altitude of about 25,000 ft. unconsciousness occurs. This comes on rather suddenly but not unpleasantly and usually without warning.

In contradistinction to the relatively mild or even total absence of subjective symptoms while at high altitude, the after effects of altitude sickness may be quite severe. Flying at 10,000 to 12,000 ft. for a period of 2 to 4 hours is usually followed by a dull headache and a sense of fatigue. Exposure to an altitude of 15,000 to 18,000 ft. for a period of 2 to 6 hours may be followed by a very severe intractable headache, nausea, vomiting, dizziness, mental confusion, muscular weakness, and even complete prostration. At higher altitudes these same effects may appear with shorter exposures until at about 22,000 ft. 15 or 20 minutes may be all that is required to produce them. The more severe the symptoms the longer they persist and as long as 48 to 72 hours may be required for complete recovery. Death from altitude sickness may occur from a prolonged exposure to 18,000 ft. altitude. Above that altitude the exposure period necessary to produce death is progressively shortened until at 25,000 ft. altitude death may occur any time after 25 to 30 minutes.

In addition to its effect on health, altitude sickness reduces both the mental and physical efficiency of the pilot and causes him to become dangerous in the air.

Altitude sickness may be prevented by the breathing of oxygen at high altitude. This method has been in routine use in the military services since the World War of 1914–18 and in 1938 civil airliners began carrying oxygen for passengers.

A marked decrease of atmospheric pressure, such as occurs during a rapid ascent to 20,000 to 30.000 ft. will produce a condition in the body similar to that seen in deep sea diving known as the "bends." In aviation this condition is known as aeroembolism. Aeroembolism is caused by the nitrogen dissolved in the body tissues and fluids coming out of solution and forming bubbles in the blood stream. These bubbles become lodged in the vessels and depending on their location, may produce itching of the skin, pain about the joints, edema of the lungs, or injury to the central nervous system with consequent paralysis or death. The treatment for this condition is descent to lower altitudes where the increased atmospheric pressure forces the bubbles back into solution in the blood. At about 44,000 ft. altitude, even while breathing pure oxygen, the atmospheric pressure is not sufficient to force the oxygen into the blood in the required amount and unconsciousness occurs. Thus the altitude to which one may go while breathing oxygen is definitely limited. Even were this not true, 63,000 ft. would be the absolute limit of human tolerance for at that altitude the atmospheric pressure is so low that the blood and other fluids of the body would boil due to the fact that liquids may be caused to boil either by increasing their temperature or by decreasing their superimposed atmospheric pressure. At body temperature blood will boil at a pressure of 47 mm. Hg which corresponds to that at 63,000 feet.

Airsickness. — Airsickness is caused by the irregular motion of the aeroplane in bumpy air over-stimulating the inner ear and causing dizziness, nausea, vomiting and prostration. It is identical with seasickness and occurs most frequently in passengers since candidates for flying training who are susceptible to attacks of airsickness are eliminated.

Treatment. — The prevention of accidents and the harmful effects of flight, rather than their treatment after they occur, is the principal function of aviation medicine. The careful selection and maintenance of pilots is an important part of this program of preventive medicine. The designer and builder of the aeroplane also contributes greatly to the safety of aviation as does the agency that trains the pilot and governs the operation of aircraft. In civil aviation the rate of ascent and descent is regulated as well as the altitude to which passengers may be carried. The closing. heating and soundproofing of aeroplanes have contributed greatly to the comfort of both pilots and passengers alike. In 1937 the first military aeroplane and in 1940 the first commercial aeroplane equipped with a pressure cabin was placed in service. A pressure cabin aeroplane is one having the cabin sealed air tight within which the atmospheric pressure is maintained at or near that at sea level when the aeroplane is flying at high altitude. This is accomplished by an air compressor which takes atmospheric air, compresses it, and forces it into the sealed cabin. A relief valve in the cabin, set to maintain the required cabin pressure, passes the air back to the outside atmosphere thus assuring adequate ventilation. By keeping the cabin pressure near that at sea level all of the harmful effects of flying due to the decrease of atmospheric pressure at high altitude, or during a change in altitude, are eliminated. The pressure cabin aeroplane is without doubt one of the greatest contributions ever made to the safety and comfort of civil flying. Its practicability in military aircraft is limited due to the fact that a single bullet hole through the cabin would cause it to lose its pressure. For flight above 40,000 ft. however, the pressure cabin aeroplane or a pressure suit is the only possible means of sustaining life.

BIBLIOGRAPHY.—Harry G. Armstrong, ***The Principles and Practice***

of Aviation Medicine (1939). (H. G. A.)

AVIATION INSURANCE: *see* AERIAL LAW.

AVICENNA (Abū 'Alī al-Husain ibn 'Abdallah ibn Sīnā) (979–1037), the greatest of Arabian philosophers in the East. and a physician in whom Arabian medicine reached its culmination.

Born in the province of Bukhārā of a family connected with public service, Avicenna at the age of ten was well acquainted with the Koran and Arabic classics. During the next six years he acquired a knowledge of philosophy, mathematics, astronomy. and medicine. His philosophical ability was such that he had memorized the *Metaphysics* of Aristotle, though its meaning remained obscure until he bought, by chance, the commentary of Alfarabi. At 17 his medical knowledge enabled him to cure the Samani ruler, Nūh ibn Mansûr, from a dangerous illness. His chief reward was an access to the royal library.

With the ending of the Samanid dynasty in 1004, Avicenna seems to have spent a short time in the service of the ruler of Khwarazm or Khiva, and then to have wandered about until he began his lecturing on logic and astronomy at Jurjân, near the Caspian. From there, he passed on to Rai and Karzwîn, and ultimately to Hamadbn, where he occupied the office of vizier to Shams Addaula. The soldiery, however, mutinied against their nominal sovereign, and demanded that the new vizier should be put to death. Addaula consented to his banishment, but Avicenna managed to hide himself until an attack of illness induced the amir to restore him to his post. When the ruler of Isfahan captured Hamadbn in 1024, Avicenna passed into his service as physician and general literary and scientific adviser. In this capacity he spent the remaining thirteen years of his life, combining hard work with frequent bouts of excessive pleasure. While marching with the army in a campaign against Hamadân, he was seized with severe colic, and died in June 1037, at the age of 58.

About 100 treatises are ascribed to Avicenna, and of these, the most influential was his *Canon of Medicine.* Although this work, like all other Arabic medical treatises, presents the doctrines of Galen and Hippocrates, modified by those of Aristotle, it was able to eclipse the *Summary* of Rhazes (d. *c.* 923), who, on account of his clinical observations, was one of the most original Mohammedan physicians, because of its greater method and its treatment of medical science as well as practical medicine. The *Canon* includes five books; the first and second treat of physiology, pathology, and hygiene, the third and fourth deal with the methods of treating disease, and the fifth describes the composition and preparation of remedies, and includes Avicenna's personal observations. It was badly translated into Latin by Gerard of Cremona (d. 1187), but the translation remained the standard text-book of medicine even until about 1650, when it was still used in the universities of Louvain and Montpellier. The best editions of this translation are those of Venice 1554, and Basle 1556. The Arabic text which was edited at Rome in 1593 has recently been re-edited in Egypt.

The second most influential work of Avicenna was his *al-Shifa* (the book of recovery), which includes long treatises on *Logic, Physics, Mathematics,* and *Metaphysics.* The *Logic,* part of the *Physics* (viz. *Sufficientia, De Caelo,* and *Lib. sex naturalium* or the *De Anima),* and the *Metaphysics* were translated into Latin by John of Spain and Gundissalinus, and passed through several editions, including that of Venice 1508. The *Metaphysics* has also been rendered into German in 1907 by M. Horten. The *al-Nadjat,* which is a résumé of the *al-Shifa,* has been recently translated into Latin by Mgr. Carame under the title, *Avicennae Metaphysices Compendium* (Roma, 1926). Both of these works show the influence of Alfarabi on his logic, the dynamism of his physics, the empirical tendency of his psychology, and his systematization of Aristotle coloured by a Neoplatonic theory of the production of the world *(see* ARABIAN PHILOSOPHY).

Of Avicenna's numerous other works, the *Kitab el-Jcharat. wa' tanbilzat* (the Book of Theorems) was edited in Arabic by M. Forget, 1892, and some of the mystical treatises by M. Mehren, 1892; the famous poem on the soul was translated into English by E. H. van Dyk (Verona, 1906).

Browne, *Arabian Medicine* (1921); C. Singer, *Short History of Medicine* (1928). For his philosophy, *see* Shahrastani (German trans.); K. Prantl, *Geschichte der Logik;* S. Munk, *Mélanges,* 352–366; Carra de Vaux, *Avicenne* (1900); Sauter, *Avicennas Bearbeitung der Aristotel Metaphysik* (Freiburg i. B. 1912); D. Saliba, *Etude sur la Métaphysique d'Avicenne* (1926).

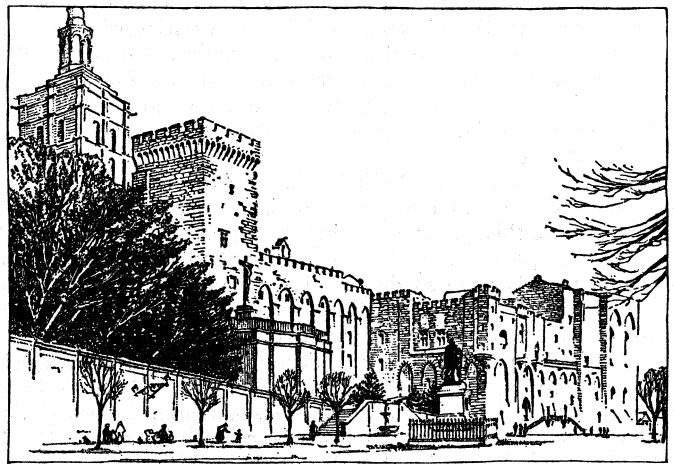
For the list of extant works, *see* C. Brockelmann's *Geschichte der arabischen Litteratur* (Weimar, 1898).

AVIENUS, RUFIUS FESTUS, a Roman aristocrat and poet, of Vulsinii in Etruria, who flourished during the second half of the 4th century A.D. He was probably proconsul of Africa (366) and of Achaia (372). Avienus was a pagan. He translated the Φαινόμενα of Aratus and paraphrased the Περιήγησις of Dionysius under the title of *Descriptio Orbis Terrarum,* both in hexameters, and compiled a description, in iambic trimeters, of the coasts of the Mediterranean, Caspian and Black seas in several books, of which only a fragment of the first is extant. He also epitomized Livy and Virgil's *Aeneid,* but these works are lost. Some minor poems are found under his name in anthologies.

Edition of complete works by N. E. Lemaire *(Poetae Latini Minores,* vol. v., 1819); of *Aratea* by Breysig (1882). French translation of complete works by Despois and Saviot *(Bibliothlque Latine-Française,* 1826).

AVIGLIANA, a town of Piedmont, Italy, 14 mi. W. by rail from Turin. Pop. (1936) 2,940 (town); 5,107 (commune). It has mediaeval buildings and a large dynamite factory.

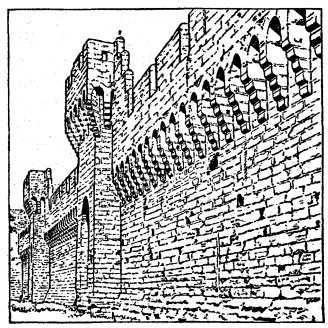
AVIGNON, capital of the department of Vaucluse, south-east France, 143 mi. S. of Lyons on the railway to Marseilles. Pop. (1936) 53,769. It lies on the left (east) bank of the Rhône where rising ground banks the river on both sides and gives defensible sites (Avignon on the east and Villeneuve-lès-Avignon on the west). There is also an island (Ile de la Barthelasse) in the river between them. A few miles below Avignon the Durance reaches the Rhône from the east, and the city is a nodal point for roads from this valley and the east side of the Rhône generally Villeneuve is similarly a focus of roads on the west. The division



PALACE OF THE POPES AT AVIGNON, WHERE THE PAPAL COURT RESIDED DURING ITS SO-CALLED BABYLONIAN EXILE
The palace, which took 30 years to complete, is a combination of castle, convent and fortress. It is now in part a national monument and in part a military barrack. The cathedral tower is to the left

of the river somewhat reduced the difficulty of crossing and helped to give the site its importance. The power of the Rhône is so great that a bridge could not be built in antiquity even by the Romans, but in 1177–85 St. Bénézet built one which was broken down and repaired at various times but was abandoned in 1680. As much of the bridge as was supported by the four arches nearest Avignon still stands and has on it the original Romanesque chapel (with 16th century portions above) dedicated, as usually happens on such sites, to St. Nicholas. Somewhat lower down the river a suspension bridge crosses from Avignon to Villeneuve. Avignon (Avenio) was an important site of the Gallic Cavares, and under the Romans a leading city

of Gallia Narbonensis. Severely harassed by barbarians and Saracens, it later belonged successively to the kings of Burgundy and of Arles and to the counts of Provence, of Toulouse, and of Forcalquier. At the end of the 12th century it became a republic, but in 1226 it was dismantled by Louis VIII. as punishment for its support of the Albigenses, and in 1251 was forced to submit to the counts of Toulouse and Provence. Pope Clement V. made it his residence, and from 1309–77 it was the papal seat. In 1348 the city was sold by Joanna, countess of Provence, to Clement VI. After Gregory XI. had migrated to Rome, two antipopes, Clement VII. and Benedict XIII., resided at Avignon, from which the latter was expelled in 1408. The town remained in the possession of the popes, who governed it by means of legates, till its annexation by the National Assembly in 1791, when conflicts between the adherents of the papacy and the republicans led to much bloodshed. The ramparts built by the popes (14th century) are very fine, with machicolated battlements, towers, and gateways, and they are surrounded by boulevards. The town is traversed by the Cours de la République, with the hôtel-de-ville on the Place Georges Clemenceau and the Place du Palais outside the enceinte in which, on a rocky hill, stand the cathedral and the palace of the popes. The Romanesque (13th century) cathedral (Notre Dame des Doms) contains the mausoleum of Pope John XXII., a masterpiece of 14th century Gothic work; the church has been much altered and is more or less dwarfed by the fortress palace of the popes begun in 1316 by John XXII. in the Gothic style and continued till 1370. It now belongs to the city. Among the minor Gothic churches of the town are St. Pierre, with graceful façade and richly carved doors, St. Didier, and St. Agricol. Avignon suffers severely in winter from the mistral winds. Jean Althen, a Persian, introduced in 1765 the culture of the madder plant which long formed the staple and is still an important branch of local trade. There are flour mills, oil-works, and leather works. Soap and chemicals are manufactured, and wine, teasels, and almonds traded, while the town is well-known for its sarsanet and other fabrics. Avignon was a bishopric in the 3rd century and became an archbishopric in 1475. It has tribunals of first instance and of commerce, a council of trade arbitrators, and a chamber of commerce.



BY COURTESY OF THE PARIS. LYONS, AND MEDITERRANEAN RAILWAY

THE WALLS OF AVIGNON, BUILT BY POPES OF THE 14TH CENTURY

AVILA, JUAN DE (1500–1569), Spanish saint, "Apostle of Andalusia," was born in Almodovar in the diocese of Toledo. He studied law at the University of Salamanca, and philosophy and theology at Alcala. He intended to do missionary work in Mexico, but in 1530, the archbishop of Seville persuaded him to turn his attentions to Andalusia. There his charity and humility and his fame as a good confessor attracted innumerable disciples including St. Theresa, St. John of God, and St. Francis Borgia. John was not beatified until Nov. 12, 1893.

His works were collected at Madrid in 1618, 1757, 1792 and 1805. The well-known *Audi Fili* was translated into English in 1620, and the *Spiritual Letters* in 1904. *See* Luis Muñoz, *Vida y virtudes del venerable varon J. de Avila* (1671); *L.* Oddi, *Life of the Blessed John of Avila (1898).*

ÁVILA, a province of central Spain, astride the Central Sierras from the Plaza de Almanzor (2,592 mi.), the culminating point of the Sierra de Gredos, to the Sierra de Malagón. Pop. (1939) 232,142; area 3,042 sq.mi.; density, 76.3 per sq.mi. South of the Sierra de Gredos, Ávila extends to the river Tiétar; it advances north for some distance across the plateau of Old Castile. On the level ground in the north, the centre of which is Arévalo, agriculture predominates, but the soils are poor, resting on outwash from the central Sierras. For the rest, Ávila is a province of sierras, mainly granitic, rising step-like from the plateau to the Sierra de Gredos, and separated from each other by longitudinal valleys which are, in some cases, dried-up lake-bottoms along lines of structural weakness. Of these the best known are the Barco de Ávila and the Valle de Amblés; the latter lies at the eastern end of an important structural line, giving a natural route from Plasencia to Avila. The head-waters of the rivers Alberche and Tiétar, flowing to the Tagus, and of the Tormes and Adaja, flowing to the Duero, occupy these longitudinal valleys. The raising of stock, especially of the merino sheep (of which the purest breeds surviving in Spain are found in the central Sierras) is the principal industry; the forests, mostly pine, are still in places important. The pastures and forests formed the basis of the life of the mediaeval communities, subdivided into *sexmos,* between which the area of the present province was divided. Nevertheless, 38% of the provincial area is under cultivation, and of this, wheat, grown with and without irrigation, occupies nearly one-fourth and is increasing its acreage, with rye, barley, oats and maize following in order of importance. Modern methods are widely adopted; production of cereals exceeds consumption, and a surplus is exported to other parts of Spain. The vine flourishes only in such areas as the Tiétar and Alberche valleys, which produce wines of some repute; olive cultivation is confined to a few sheltered localities (Arenas de San Pedro, Cebreros) with very high yield. Estates are generally large; there is often a shortage of labour, and harvesters are brought in from Galicia. The sierras formerly abounded in game, but the diminution of the ibex of the Sierra de Gredos led to the creation in 1905 of an ibex sanctuary. Avila, the capital (pop., 1940, 18,644), is the only large town. The province and capital were conquered by Francisco Franco's Nationalists early in the civil war of 1936–39.

BIBLIOGRAPHY.—G. W. Edwards, *Spain* (1926); Span. Lib, of Information, *Spain* (April, 1941).

ÁVILA (Rorn. *Abula, Avela,* etc.), capital of the province of that name; 54 mi. W. by N. of Madrid. Pop. (1940) 18,644. The old walled city, on the broad back of a ridge sloping west to the river Adaja, commands both the approach to the pass across the Central Sierras in the angle between the Sierra de Guadarrama and Sierra de Gredos, and the junction of two important roads, one downstream, coming from the south-west by Plasencia, the other upstream, converging on the cut made by the Adaja between the Sierra de Ávila and the Sierra Malagón.

The dark granite walls, into which the apse of the cathedral is built; the ancient churches (San Vicente, San Pedro, Santo Tomás and San Segundo) and the mediaeval town-houses of the nobility of Castile make *Ávila de los Caballeros* typical of "the spirit of the old knightly Catholic Castile." The convent and church of Santa Teresa (1515–82) occupy the site of the house in which the saint is said to have been born. Ávila came under nationalist control early in the 1936 civil war.

See O. Jürgens, *Die Spanische Städte* (Hamburg, 1926, bibl.); G. W. Edwards, *Spain* (1926).

AVILA Y ZUNIGA, LUIS DE (c. 1490–*c.* 1560), Spanish historian, was born at Placentia. He married a wealthy heiress of the family of Zuniga, whose name he added to his own. He rose rapidly in the favour of the emperor Charles V., served as ambassador to Rome, and was made grand commander of the order of the Knights of Alcantara. He accompanied the emperor to Africa in 1541, and having served during the war of the league of Schmalkalden, wrote a history of this war entitled *Commentarios de la guerra de Alemaña, hecha de Carlos V. en el año de 1546 y 1547.* This was first printed in 1548, and was translated into French, Dutch, German, Italian and Latin.

AVILÉS, a town of Spain, province of Oviedo; on the Bay of Avilés, a winding inlet of the Bay of Biscay, 24m. by rail W. of Gijón. Pop. (1930) 16,077. The bay, crossed by a fine bridge at its narrow landward extremity, is the headquarters of a fishing fleet, and a port of call for many coasting vessels. Coal from the Oviedo mines is exported coastwise.

AVIZANDUM, a Scots law term; the judge "makes avizandum with a cause," *i.e.,* takes time to consider his judgment.

AVLONA: *see* VALONA.

AVOCA or **QVOCA, VALE OF,** a mountain glen in south-east Wicklow, Ireland. The small rivers Avonmore and Avonbeg unite to form the Ovoca river, flowing south and south-east to the

Irish sea at Arklow. The vale's beauty was sung by Thomas Moore in his *Irish Melodies;* it is narrow and densely wooded, but is somewhat marred by the presence of lead and copper mines, and by the Great Southern railway, on which Ovoca station, midway in the vale, is 42¾ mi. south of Dublin. At Avondale, Charles Stewart Parnell was born.

AVOCADO, the fruit of *Persea americana* of the family Lauraceae, a tree native to the mainland of the western hemisphere from Mexico south to the Andine regions of Colombia and perhaps Venezuela. The common name is a sound-substitute for the Aztec *ahuacatl,* originating probably in Jamaica, where also the name *alligator pear* arose as a sound-substitute, plus reference to the pear-like shape and appearance of many varieties.

The avocado first became known to Europeans through a description published in 1519 by Martin Fernández de Enciso in his *Suma de Geografia.* Enciso had seen the fruit near Santa Marta, Colombia, as he coasted along those shores with one of the first Spanish expeditions to the mainland. In 1526 Gonzalo Oviedo described it in greater detail. Garcilaso de la Vega tells how it was carried from Ecuador to the warm valleys near Cusco by the Inca Tupac Yupanqui, shortly before the Spanish conquest. The common name in Peru and southward is *palta.* In most Spanish-speaking countries, *aguacate,* an adaptation of *ahuacatl,* is used; while in Brazil this becomes *abacate.*

The tree may be tall or spreading, with entire leaves commonly elliptic to obovate in form and 4 to 12 in. in length. The flowers, which are borne in dense racemes, are small, greenish, devoid of petals, with six perianth-lobes, nine stamens arranged in three series, and a one-celled ovary. The fruit is exceedingly variable in shape, size, and colour; some of the Mexican varieties are no larger than hens' eggs, while those of other races may attain three or four pounds in weight. The form varies from round to pear-shaped with a long slender neck, the colour from green to dark purple. The single large seed, with two cotyledons, is round to conical. Between it and the outer skin, which is sometimes no thicker than that of an apple, sometimes coarse and woody in texture, is the greenish or yellowish flesh, of buttery consistency and rich nutty flavour, containing in some varieties as much as 25% of oil, and eaten most commonly in salads, whence the name "salad fruit" which has been used to emphasize the peculiar characteristics of the avocado.

Thaugh it had been widely cultivated in tropical America since pre-Columbian days, it was not until 1900 that the avocado began to attract serious attention in the United States. About that time grafted varieties began to be planted in Florida. A similar development took place in California about 1910. From these beginnings an industry developed which produced more than 17,000 tons of fruit in 1941. An additional 3,000 to 5,000 tons were imported annually by the United States, mainly from Cuba, in the period 1930–40. Outside of tropical and subtropical America, avocados have been grown for many years in Hawaii; to a limited extent in the Malayan archipelago, India, and the south Pacific; and occasionally in the countries around the Mediterranean. Commercial cultivation of varieties from the United States has received attention in Australia, South Africa, and a few other regions.

Horticulturally, avocados are commonly divided into three races, recognized as early as 1653 by Fray Bernabe Cobo. These are the Mexican, the West Indian, and the Guatemalan. The first-named, considered by some botanists to be a distinct species, *Persea drinzyfolia,* is native to Mexico, and is characterized by the anise-like odour of the leaves, and by small (3 to 8 oz.) thin-skinned fruits of rich flavour and excellent quality. This is the hardiest race and therefore of value in regions too cold for the others, though it will not tolerate more frost than the orange. The Guatemalan race is native to the highlands of Central America; is slightly less frost-resistant than the Mexican; and produces fruits of medium to large size (8 to 32 oz.), characterized by thick woody skins and a ripening season different from that of the others. The West Indian race (it would more properly be termed South American) is the most tropical in character, and its cultivation in the United States is limited to southern Florida. Its fruits are frequently of large size and excellent quality. Natural crossing has taken place between these three races, resulting in numerous varieties of mixed character, some of them important commercially.

Avocados can be grown on a wide variety of soils, from the light sandy ones of central Florida to the heavy clays of southern California, but drainage must be perfect. A rich sandy loam or clay loam is perhaps best. Propagation of commercial sorts is by grafting or budding, though seedlings are more commonly grown in the tropics and are to be seen as dooryard trees in California and Florida. In the former state, the Mexican race is used as a root-stock; in Florida, the West Indian is more popular. For commercial orchards, grafted trees are spaced from 20x20 to 30x30 ft. Avocados will not tolerate severe drought, hence irrigation is used in many regions, especially those where there is lack of rainfall during the period when the trees are flowering and setting fruit. The tree is a gross feeder, requiring somewhat more plant food than Citrus; hence fertilizing is standard practice in most commercial orchards. Cultural attention varies in different regions; little pruning is required except that necessary to form a shapely tree and to remove dead or injured branches. Various insect pests and fungous diseases attack the groves in Florida and California, some of them requiring combative measures.

Yields vary with variety and environmental conditions; a fair expectation for most sorts is one to two crates of 40 lbs. each per tree per season, though five to ten times this amount may sometimes be realized. The ripening season of West Indian varieties in Florida is late summer and early autumn, but the Guatemalan varieties and hybrids extend the period to February or March. Since better prices are obtained in northern markets during the winter, the tendency is for commercial plantings to consist mainly of sorts maturing at that time of year. In California, Mexican varieties ripen in late autumn; Guatemalans and hybrids from early spring to late summer. Fruit is therefore available during most of the year. The majority of plantings made in California up to 1940 were of the *Fuerte* variety, which matures during an exceptionally long season, winter to late summer

(W. Po.)

THE AVOCET. A MIGRATORY WADING BIRD OF BLACK, WHITE AND CINNAMON PLUMAGE, THAT FREQUENTS MARSHES FOR FOOD

AVOCET (ăv'o-sĕt), a long-legged wading bird, conspicuously marked with black and white, the avocet *(Recurvirostra avosetta)* is remarkable for its long, slender bill, bent upwards at the distal end. The legs are long and the feet webbed. The bird inhabits Europe, Africa and central and south Asia, and formerly bred in England—its last breeding place being at Salthouse, in Norfolk, where the people made puddings of its eggs. These latter resemble those of the lapwing, as does the mode of nesting. The plumage of both sexes is black and white, and no courtship antics are performed. It obtains its food by working its bill from side to side in shallow pools, thus capturing small crustaceans and insect larvae. Two species, R. *americana* and *R. andina,* are found in America, R. *anzericana* reaching Saskatchewan, R. *andina* confined to the mountain lakes of Chile. A fourth species is found in Australia.

AVOGADRB, AMEDEO, CONTE DI QUAREGNA (1776–1856), Italian physicist, was born at Turin on June 9, 1776, and died there on July 9, 1856. He was for many years professor of higher physics in Turin university. He is chiefly remembered for his "Essai d'une manière de determiner les masses relatives des molecules élémentaires des corps, et les proportions selon lesquelles elles entrent dans les combinaisons" (*Journ. de Phys.,* 1811), in which he enunciated the hypothesis known by his name (Avogadro's law) that under the same conditions of temperature and pressure equal volumes of all gases contain the same number of smallest particles or molecules, whether those particles consist of single atoms or are composed of two or more atoms of the same or different kinds.

AVOGADRO'S CONSTANT is the number of molecules *(see* MOLECULE, CHEMICAL) in one gram-molecule, the molecular weight of the substance in grams. It is invariably the same, whatever the substance, its value being approximately 6.16×10^{23}, and it is denoted by the constant N. *Avogadro's Law* states that equal volumes of different gases at the same temperature and pressure contain the same number of molecules, *i.e.,* the volume of a gram-molecule is constant for all gases. This is correct only for perfect gases *(see* article GAS), but is approximately true for real gases *See* KINETIC THEORY OF MATTER; THERMODYNAMICS; and ELECTRON, THC.

AVOIDANCE, from "avoid" (O.Fr. *esvuidier* or *évider,* to empty out), the action of making empty, void or null, hence, in law, invalidation, annulment *(see* CONFESSION AND AVOIDANCE); also the becoming void or vacant, hence in ecclesiastical law a term signifying the vacancy of a benefice. In general use, the word means the action of keeping away from anything, shunning.

AVOIRDUPOIS or **AVERDUPOIS** (from the French *avoir de pois,* goods of weight), the name of a system of weights used in Great Britain and America for all commodities except the precious metals, gems and medicines. The foundation of the system is the grain. A cubic inch of water weighs 252.458 grains. Of this grain 7,000 now *(see* MEASURES AND WEIGHTS) make a pound avoirdupois. This pound is divided into 16 oz., and these ounces into 16 drachms.

Avoirdupois Weight

Drachm, 16=ounce,	16=pound,	14=stone,	2=quarter,	4=hundred,	20=ton.
27 3 grains	437'5	7,000	98,000	196,000 grs.	112 lb.	2,240 lb.

AVON, the name of several rivers in England and elsewhere. The word is Celtic, appearing in Welsh (very frequently) as *afon,*

in Manx as *aon,* and in Gaelic as *abhuinn* (pronounced *avain*), and is radically identical with the Sanskrit *ap,* water, and the Lat. aqua and *amnis.* The root appears more or less disguised in a vast number of river names all over the Celtic area in Europe. Thus, besides such forms as *Evan,* Aune, *Anne, Ive,* Auney, *Inney,* etc., in the British Islands; *Aff, Aven,* Avon, Aune appear in France; *Avenza* and *Avens* in Italy; *Avia* in Portugal, and *Avono* in Spain. The names Punjab, Doab, etc., also show the root. In England the following are the principal rivers of this name:—

(1) **The East or Hampshire Avon** rises in Wiltshire south of Marlborough and flows through the Vale of Pewsey. Traversing the eastern edge of Salisbury plain, it passes Amesbury, and reaches Salisbury after a very sinuous course. Here it receives on the east bank the Bourne and on the west the Wylye. In a wider fertile valley it skirts the New Forest on the west, receives the Stour, and 2½ mi. lower enters the English channel through the broad but narrow-mouthed Christchurch harbour. Length, excluding lesser sinuosities, about 60 mi. The total fall is over 500 ft.; that from Salisbury (35 mi. from the mouth) about 140 ft. The river is of no modern value for navigation, but may have been important in prehistoric times. It abounds in roach and there are valuable salmon fisheries. Drainage area, 1,132 sq.mi.

(2) **The Lower or Bristol Avon** rises on the eastern slope of the Cotswold hills in Gloucestershire, collecting streams south of Tetbury and east of Malmesbury. It flows east and south in a wide curve, through a broad valley past Chippenham and Melksham, turns abruptly west to Bradford-on-Avon, receives the Frome from the south and enters the narrow valley in which lie Bath and Bristol. Below Bristol the valley is known as the Clifton gorge, famous for its wooded cliffs and for the Clifton (*q.v.*) suspension bridge. The cliffs and woods have been disfigured by quarries, but many portions are now in the hands of the National Trust or other bodies. The Avon finally enters the estuary of the Severn at Avonmouth. From Bristol downward the river is one of the most important commercial waterways in England. The Kennet and Avon canal between Reading and the Avon (now disused) follows the river closely from Bradford to Bath, where it enters it by a descent of seven locks. Length of the river, excluding minor sinuosities, about 75 mi. The total fall is between 100 and 600 ft. Drainage area, 891 sq.mi.

(3) **The Upper Avon,** also called the Warwickshire, and sometimes the "Shakespeare" Avon from its associations with Stratford, is an eastern tributary of the Severn. It rises near Naseby in Northamptonshire, and, with a course of about 100 mi., joins the Severn immediately below Tewkesbury in Gloucestershire. After flowing southwest to Rugby, it runs west and southwest to Warwick, receiving the Leam on the east. Continuing southwest it goes past Evesham to Tewkesbury. The valley is broad, and especially after Warwick, through the Vale of Evesham, the scenery is very beautiful, the rich valley being flanked by the bold Cotswold hills on the south and by the wooded Arden district on the north. Famous beauty spots include Warwick castle, Stratford and Evesham. The river is locked, and carries some trade up to Evesham, 28 mi. from Tewkesbury; the locks from Evesham upward to Stratford (17 mi.) are decayed, but there are many reaches suitable for pleasure boats. Total fall of river, about 500 ft.; from Rugby about 230 ft.; and from Warwick 120 ft. Coarse fish abound. Other streams of this name in Great Britain are one from Dartmoor to the English channel; one in South Wales with its mouth at Aberavon in Glamorganshire; and, in Scotland, tributaries of the Clyde, Spey and Forth.

AVRANCHES, capital of an arrondissement in the department of Manche, northwest France, 87 mi. S. of Cherbourg on the Western railway. Pop. (1936) 7,115. It lies on the slopes and summits of a 341 ft. hill looking westward to the bay and rock of St. Michel. At the foot of the hill flows the tidal river Sée. The site was an important Roman military station, and in the middle ages Avranches was the chief place of a county of the duchy of Normandy.

It sustained several sieges, the most noteworthy of which, in 1591, was the result of its opposition to Henry IV. In 1639 it was the focus of the peasant revolt against the salt-tax, known as the revolt of the Nu-pieds. Avranches was from 511 to 1790 a bishop's see, held in the 17th century by Daniel Huet; and its cathedral, destroyed as insecure at the time of the first French revolution, was the finest in Normandy. Its site is now occupied by an open square, one stone remaining to mark the spot where Henry II of England received absolution for the murder of Thomas Becket. Avranches is the seat of a sub-prefect and has a tribunal of first instance. Leather-dressing and lacemaking and bleaching are also carried on, and horticulture flourishes in the environs. Trade is in cider, grain, butter, flowers and fruit, and there are salmon and other fisheries.

AVULSION (Lat. avulsio, a tearing off), the forcible separation of a considerable portion of land from the property of one owner and its deposit on the soil of another, caused by the mechanical action of water due to flood, change in the course of a river or the encroachment of the sea. The property thus separated belongs to the original owner, who is entitled to recover its possession. (See ACCRETION; ALLUVION.)

AVUNCULATE. The rights and duties enjoyed by the maternal uncle (Latin, avunculus) in many primitive societies throw light on the status of relatives in the social order. He may have specific duties at the initiation of his nephew (his sister's son) or take a leading part in his marriage rites or be responsible for his social training.

He may have, and in the case of matrilocal marriages seems to have always, responsibility for choosing the husband or approving the husband of the daughter of his sister. In many instances his position owes its importance to the matrilineal matrilocal system by which a woman's brother is necessarily her guardian (see MATRIARCHY). In matrilineal patrilocal societies he is still his sister's guardian, although on marriage she passes to residence in her husband's community. In many strictly patrilineal patrilocal societies the maternal uncle has a similar position and it is supposed that in most of these cases his privileges are a survival of an earlier, matrilineal order. In some of these societies the institution of cousin-marriage is found by which the maternal uncle's son has by custom a preferential right to his cousin, the daughter of his father's sister, or, more usually, the sister's son has a similar right to his maternal uncle's daughter. Cousin marriage has definite social and economic advantages and creates emphasis on the mutuality which all marriages produce and this fact indicates social conditions which enable the maternal uncle to claim and receive special authority in the social life over his sister's children. See R. H. Lowie, Primitive Society, 1921.

AVVAKUM (1620?–1681), Russian archpriest and author, famous as the leader of the conservative party in the Russian church in the 17th century, son of a village priest, was born at Grigorovo, near Nijni Novgorod. He became protopope or rector of a Moscow church, and a conservative reformer of the discipline of the church. He declined to accept the revision of the ritual of the Russian church according to Greek practice, proposed by Kikon (q v.) and was exiled to Siberia in 1653, where he joined the expedition of Pashkov in 1655, returning to Moscow in 1664 after the fall of Nikon. But the Synod of Moscow (1666–67), though it deposed Nikon, condemned Avvakum's doctrines, and he was compelled to take the tonsure and was sent to Pustozersk, in the extreme north of Russia. His autobiography (written *c.* 1673), was one of the most popular books of the Russian schismatics or old believers. He urged martyrdom on his followers and was himself burned at the stake in April 1681.

Avvakum was the first writer to use colloquial Russian for a literary purpose. Prince Mirsky says of his Life that it is "the only work of really intrinsic significance in the whole space separating the Old Russian Lay of *Igor* in the 12th century from the first expressions of modern poetry in the odes of Lomonosov and Derzhavin in the later 18th."

See Life of the *Archpriest* Avvakum, trans. by Jane Harrison and Hope Mirrlees (1924).

AWADIA, a Ga'aliin (Arab) sub-tribe in the Berber province. *See* H. A. MacMichael, History of the Arabs in the *Sudan* (1922).

AWAJI, an island of south Japan, 218 sq.mi. in extent. It lies (34° 20′ N., 134° 45′ E.), athwart and almost closes the eastern end of the island-studded Inland sea. Awaji ("the way to Awa") is the stepping-stone between Kyoto, the old capital of Japan, and Awa, the eastern end of Shikoku. It is said that the gods stepped from heaven upon Awaji; it is a rocky hilly island, displaying in miniature the features characteristic of all south Japan. (See JAPAN.)

AWAN, the name given to a dynasty of Babylonian rulers from its capital city. The designation mas later changed to Awak (in the district of Kazallu), but its exact location remains unknown. It probably stood east of the Tigris and was certainly not far from Susa.

AWARD, the decision of an arbitrator (See ARBITRATION.)

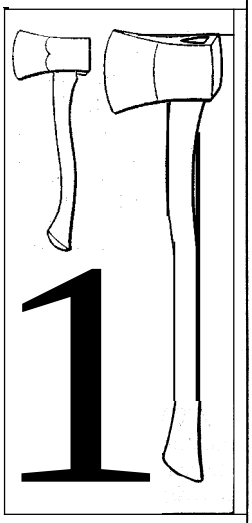
AWE, LOCH, the longest freshwater lake in Scotland, situated in mid-Argyllshire, 116 ft. above the sea, with an area of nearly 16 sq.mi. It is 23 mi. long northeast to southwest from Kilchurn castle to Ford, its breadth varying from one-third of a mile to 3 mi. at its upper end, where it takes the shape of a crescent, one arm of which runs towards Glen Orchy, the other to the point where the river Awe leaves the lake. The upper extremity is majestic, the lower half tame. Inishail Island contains ruins of a church and convent.

AWL (O.Eng. ael; at one time spelt *nawl* by a confusion with the indefinite article before it), a small hand-tool for piercing holes.

AWLAD HAMAYD: see BAKKARA.

AXE, a tool or weapon, taking various shapes, but, when not compounded with some distinguishing word (*e.g.,* in "pick-axe"), generally meaning an edged head fixed upon a handle for striking. A "hatchet" is a small sort of axe. In O.E. the word was aex.

In British politics. the word "axe" came, after World War I. to be applied to efforts to reduce public expenditure.



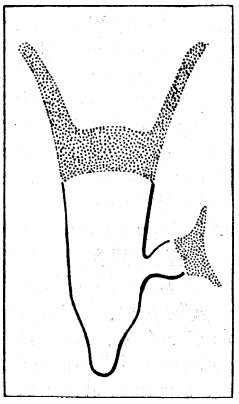
AN AXE AND HATCHETS
The axe, largest of the three, is mainly used for felling trees. Camper's hatchet at top, and carpenter's hatchet below, deal with small trees and undergrowth

AXHOLME, ISLE OF, a flat and formerly marshy tract in northwest Lincolnshire, about 18 mi. by 5 mi., and almost entirely under 100 ft. in elevation. The area is roughly 73.4 sq.mi. The rural district consists of 13 parishes with an area of 79.9 sq.mi. and a pop. (est. 1938) of 12,970.

In 1627 King Charles I, who was lord of the island, entered into a contract with Cornelius Vermuyden, a Dutchman, for reclaiming the meres and marshes and rendering them fit for tillage. This undertaking led to the introduction of a large number of Flemish workmen, who settled in the district, and, in spite of the violent measures adopted by the English peasantry to expel them, retained their ground in sufficient numbers to affect the physical appearance and the accent of the inhabitants to this day.

The principal towns are Epworth and Crowle. Joint light railways, L.M.S.R. and L.N.E.R., run north and south through the isle, connecting Goole with Haxey junction. The land is extremely fertile and produces heavy crops.

AXIAL GRADIENTS, a term applied to the regular decrease in the rate of protoplasmic activities, which is observed in organisms between one point of the body and another. The region where the rate is highest is the head-end of animals, and the growing point of plants; and from these points, the gradual decrease in rate of activities follows the axis of the organism. It is for this reason that the gradients are called "axial." The demonstration of axial gradients in the higher animals is made difficult by the high degree of specialization which they show; but it has been established that they exist in Protozoa, Coelentera, Platyhelmia, Annelida, larvae of Echinodermata, embryos of fish, tadpoles of frogs and embryos of birds. In addition, axial gradients have been demonstrated in a number of eggs. The methods of demonstration make use of the fact that the rate of activities of the protoplasm can be roughly measured by the rate of oxidation. The methods are the following: (1) direct susceptibility to toxic substances; (2) indirect susceptibility to toxic substances through acclimatization; (3) differential reduction of potassium permanganate to manganese dioxide in the tissues; (4) measurement of the output of carbon dioxide; (5) detection of difference of electric potential.



FROM "THE JOURNAL OF EXPERIMENTAL ZOOLOGY." BY PERMISSION OF THE WISTAR INSTITUTE OF ANATOMY AND BIOLOGY, PHILADELPHIA

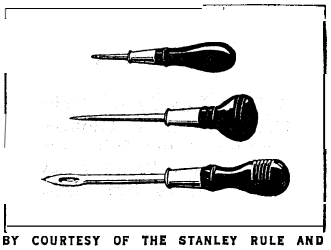
MEASUREMENT OF TISSUE GROWTH
The breaking down and building up processes of the tissues are not the same all over an organism. The Hydra, here shown, has been subjected to harmful conditions which affected the regions of the body where the rate of activities was highest. The damaged regions (dotted) include the mouth and tentacles of the little bud at the side

The importance of axial gradients lies in the fact that they are set up in previously homogeneous protoplasm by the action of external stimuli, and that, once set up, they constitute the prime differentiation of the organism during development, including especially polarity and symmetry. The relative rates of activity at different levels on the gradients determine the quality of the tissue which in development will differentiate at those levels. (See EXPERIMENTAL EMBRYOLOGY.)

BIBLIOGRAPHY.—Nearly all the important literature on axial gradients is contained or referred to in C. M. Child, Physiological Foundations *of* Behavior (1924). (*G.* R. DE B.)

AXILE or **AXIAL** (related to the axis), used technically in botany. An axile placentation is one in which the ovules are attached to the axis.

AXINITE, a mineral consisting of a complex aluminium and calcium boro-silicate; the calcium is partly replaced in varying amounts by ferrous iron and manganese, and the aluminium by ferric iron; the formula is $HCa_3BAl_2(SiO_4)_4$. The mineral was named (from ἀξίνη, an axe) on account of the characteristic thip wedge-like form of its anorthic crystals. The colour is usually clove-brown, but rarely it has a violet tinge. The best specimens are afforded by the beautifully developed transparent crystals, found at Le Bourg d'Oisans in Dauphiné. The specific gravity is 3.28. The hardness of $6\frac{1}{2}$–7, combined with the colour and transparency, renders axinite applicable for use as a gemstone, the Dauphiné crystals being occasionally cut for this purpose.



BY COURTESY OF THE STANLEY RULE AND LEVEL CO.

TYPES OF AWLS IN GENERAL USE
Top, The Brad awl; centre, Scratch awl; bottom, Belt awl

AXIOM, a statement admitted without proof, as that if two equal quantities are added respectively to two equal quantities, the sums will be equal. The Greek philosophers recognized the existence of first principles "the truth of which," as Aristotle said, "it is not possible to prove." These were called axioms, and also "the common [things]" (τά κοινά, ta koina) or "common opinions" (κοιναὶ δοξαι, *koinai* doxai). (See MATHEMATICS, FOUNDATIONS OF.)

AXIS, a word having the same meaning as axle, and also with many extensions of this primary meaning. It denotes the imaginary line about which a body or system of bodies rotates, or a line about which a body or action is symmetrically disposed. In geometry, and in geometrical crystallography, the term denotes a line which serves to aid the orientation of a figure. In anatomy, it is, among other uses, applied to the second cervical vertebra, and in botany it means the stem.

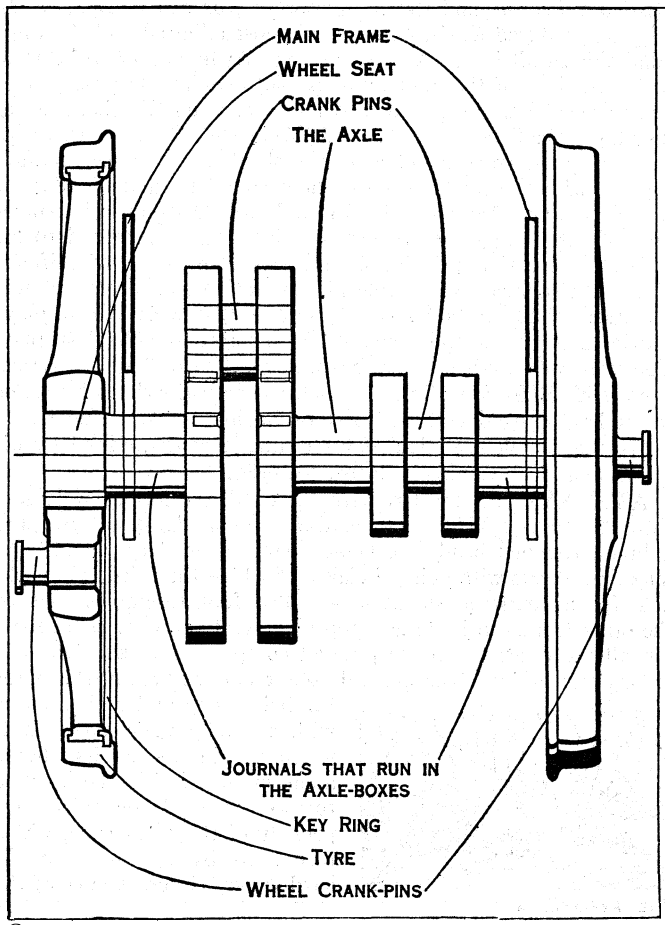
AXIS, MAGNETIC. The axis of a magnet is the line drawn from its south to its north pole. (See MAGNETISM.)

AXIS, OPTIC, the direction in a crystal along which the ordinary and extraordinary rays are propagated with the same velocity. (See LIGHT: *Polarization* and *Electromagnetic* Theory.)

AXLE, a pin or shaft on which a wheel turns, or a shaft revolving in bearings, and having wheels affixed. In carriages and carts the fixed bar is called the axle-tree, and the ends are the axles. In railway carriages, wagons, locomotives, tramcars, travelling cranes, and the like the axle runs in hearings, the length making contact therein being called the journal. Axles for steam and internal-combustion engines which require outside connecting-rods or coupling-rods have the journals between the wheels, but other rolling-stock and tramcars outside. (In M E. axel-tre is derived from O.Norw. oxull-tre, cognate with O.E. aexe or eaxe, and Lat. axis.)

An axle may be driven, as in the case of locomotives, tramcars, or cranes, either directly or through the intervention of gearing. or it may be idle in this respect. Motor-car axles comprise two main classes, the driven one at the back in two parts with differential gear, and mounted within a tube or secondary axle, and the front one consisting of a fixed bar, to which are pivoted the stub axles. Ball or roller bearings take the place of plain bearings in motor and certain other axles, but while roller bearings have been applied to some extent in railway carriages, the plain

axle-box still holds sway. The latter only requires bearing surface over the top half of the axle, hence merely a "keep" is fitted to the bottom half. The bearing surface is usually gunmetal, with white-metal liners cast in, and adequate arrangements for grease or oil lubrication have to be ensured. In view of the serious consequences likely to arise from broken axles on railways, only the best class of steel is employed, made and tested to stringent



CRANK AXLE FOR GREAT WESTERN RAILWAY. "KING" CLASS LOCOMOTIVE
Great care is taken in the making of locomotive crank axles to eliminate risk of fracture. In the one illustrated, the shaft portions are hollow, the webs of heat-treated slabs, and the whole shrunk together and locked with screws

specifications. The large numbers required entail the use of special lathes, turning both journals simultaneously. Finally a hardened steel roller in a holder is pressed with great force against each revolving journal, closing the pores of the metal, and leaving a highly-burnished and hard-wearing surface.

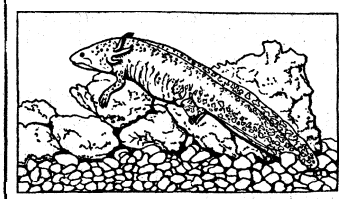
The failure of a locomotive crank-axle is even more serious than that of a carriage or wagon, consequently the manufacture demands the utmost care. In some cases a solid forging is supplanted in favour of the "marine type" built-up axle, made of heat-treated hollow axle, crank-pins, and web shrunk together, and locked with screws. Mr. C. B. Collett follows this method for Great Western engines, of the "King" class (see fig.). Wheels are forced on their axle seatings in hydraulic presses, the pressure required varying from 80 tons in the case of small wheels up to zoo tons or more for large locomotive driving wheels. For the final processes of turning the treads, the axles are put in the lathe with the wheels thus assembled. (F. H.)

AX-LES-THERMES, a watering place of south-west France, in the department of Ariège, at the confluence of the Ariège, with three tributaries, 26m. south south-east of Foix by rail. Pop. (1936) 1,114. Ax (aquae), a spa of ancient (Roman) origin, is well known for its warm sulphur springs, which vary greatly in temperature.

AXMINSTER, urban district, Devonshire, England, on the river Axe, 27m. E. by N. of Exeter by the Southern railway. Pop. (1938) 2,355. Area 2.0 sq mi. The situation of Axminster at the intersection of the two great ancient roads, Iknield Street and the Fosse Way, and also the numerous earthworks and hill-fortresses in the neighbourhood indicate a very early settlement. According to Domesday, Axminster was held by the king. In 1246 Reginald de Mohun, then lord of the manor, founded a Cistercian abbey at Newenham within the parish of Axminster, granting it a Saturday market and a fair on midsummer day, and the next year made over to the monks from Beaulieu the manor and hundred of Axminster. The abbey was dissolved in 1539. The midsummer fair established by Reginald de Mohun is still held. The minster. dedicated to St. Mary the Virgin, illustrates every style of architecture from Norman to Perpendicular.

Axminster was long celebrated for the admirable quality of its carpets, which were woven by hand, like tapestry. Their manufacture, which was established in 1755, was closed in 1835 and the machinery removed to Wilton, near Salisbury. but in 1936 the industry was again started in Axminster. Toothbrushes and nail brushes are also made there.

AXOLOTL, the aquatic larval form, which may become sexually mature, of the salamander Amblystoma tigrinum. This larva was for long held to be a species of perennibranchiate urodele (see AMPHIBIA); but in 1865, some axolotls in the Jardin des Plantes, Paris, metamorphosed into the salamander form. This phenomenon of larval sexual maturity is called neoteny (see METAMORPHOSIS). The axolotl, long known as an article of food in Mexico, inhabits the U.S.A. and the cooler parts of Mexico. In form it resembles the larva of the common newt but reaches a length of about a foot. A semi-albino variety is known. The adult A. tigrinum is dark brown in colour, with yellow spots, and differs little in appearance from European salamanders. In Lakes Chalco and Xochimilco, near Mexico City, the axolotl apparently never metamorphoses; these lakes contain abundant food and good shelter, while the surrounding country is dry and comparatively barren. Thus it is an advantage for the species to become mature in the aquatic



BY COURTESY OF THE N.Y. ZOOL. SOCIETY
AXOLOTL. THE AZTEC NAME FOR THE PERMANENT LARVAL FORM OF THE MEXICAN SALAMANDER

form. Further north, another subspecies occurs which inhabits smaller pools, and metamorphosis is much more readily induced, *e.g.,* by the drying of the pools. The permanently aquatic condition is in this species brought about by a suppression of the activity of the thyroid gland, the secretion of which is responsible for metamorphosis in Amphibia. Administration of thyroid will cause axolotls of any age to transform into the terrestrial form.

AXONE, the nerve fibre process of a neuron, which conducts away from the cell body (see DENDRITE; SYNAPSE). The axone is much longer than the dendrites, and also is frequently provided with a myelin sheath. Myelin is a fat-like material, white in colour; hence the white matter of the central nervous system is composed of axone fibres. The peripheral process of a bipolar or unipolar neuron is sometimes called a "sensory axone," though this is a seeming contradiction to the direction of conduction by which axone is defined. An axone may have collateral branches, and usually has a diffuse branching at the end of the fibre, called its terminal arborization.

AXUM: see AKSUM.

AXUMITE KINGDOM, THE. About the 1st century of the Christian era a new kingdom grew up at Aksum (*q.v.*), of which a king Zoscales is mentioned in the *Periplus Maris Erythraei*. Fragments of the history of this kingdom, of which there is no authentic chronicle, have been made out chiefly by the aid of inscriptions (see Littmann and Dittenberger cited in bibliography). To the Axumite King Aeizanes the emperor Constantius addressed a letter in A.D. 356.

Aeizanes and his successors style themselves kings of the Axumites, Homerites (Himyar), Raidan, the Ethiopians (Habašat), the Sabaeans, Silee, Tiamo, the Bugaites (Beğa) and Kasu.

This style implies considerable conquests in south Arabia, which, however, must have been lost to the Axumites by A.D. 378. They claim to rule the Kasu or Meroitic Ethiopians; an inscription records an expedition along the Atbara and the Nile to punish the Nuba and Kasu, and a fragment of a Greek inscription from Meroë was recognized by Sayce as commemorating a king of Axum. Except for these inscriptions Axumite history is a blank until in the 6th century the Axumite king appears sending an expedition to wreck the Jewish state then existing in south Arabia, and reducing that country to a state of vassalage: the king is styled in Ethiopian chronicles Caleb (Kaleb), in Greek and Arabic documents el-Esbaha. In the 7th century a successor to this king, named Abraha or Abraham, gave refuge to the persecuted followers of Mohammed at the beginning of his career (see ARABIA: History, ad *init.*). A few more names of kings occur on coins, which were struck in Greek characters till about AD. 700, after which time that language seems to have been displaced in favour of Ethiopic or Geez: the condition of the script and the coins renders them all difficult to identify with the names preserved in the native lists. For the period between the rise of Islam and the beginning of the modern history of Abyssinia there are a few notices in Arabic writers; so we have a notice of a war between Ethiopia and Nubia about 687 (C. C. Rossini in Giorn, *Soc.* Asiat. *Ital.* x. 141), and of a letter to George, King of Nubia, from the king of Abyssinia some time between 978 and 1003, when a Jewish queen Judith was oppressing the Christian population (I. Guidi, ibid. iii. 176, 7).

The Abyssinian chronicles attribute the foundation of the kingdom to Menelek (or Ibn el-Hakim), son of Solomon and the queen of Sheba. The Axumite or Menelek dynasty was driven from northern Abyssinia by Judith, but soon after another Christian dynasty, that of the Zagués, obtained power. In 1268 the reigning prince abdicated in favour of Yekūnō Amlāk, king of Shoa, a descendant of the monarch overthrown by Judith (see ABYSSISIA).

BIBLIOGRAPHY.—T. Mommsen, Provinces of the Roman Empire (1896); W. Dittenberger, *Orientis Graeci* Inscriptiones selectae, Nos. 199, 200; Littmann u. Kroncker, Vorbericht der deutschen *Aksum*-Expedition (1906), and Littmann's subsequent researches.

AY, AYE. The word "aye" meaning always (pronounced as in "day") is connected with Gr. ἀεί, always, and Lat. aevum, an age; it is often spelt "ay." "Aye," meaning Yes (pronounced like "eye"), is probably the same word etymologically, though differentiated by usage; the form "ay" for this is also common.

AYACUCHO, a city and department of central Peru, formerly known as Guamanga or Huamanga, renamed from the small plain of Ayacucho (*Quichua,* "corner of death"). This lies near the village of Quinua, in an elevated valley 11,600 ft. above sea-level, where a decisive battle was fought between General Sucre and the Spanish viceroy La Serna in 1824, which resulted in the defeat of the latter and the independence of Peru. The city of Ayacucho, capital of the department of that name and of the province of Guamanga, is situated on an elevated plateau, 9,200 ft. above sea level, between the western and central Cordilleras, on the main road between Lima and Cusco, 394 mi. from the former by way of Jauja. Pop. about 18,200. It has an agreeable, temperate climate, is regularly built, and has considerable commercial importance. It is the seat of a bishopric and of a superior court of justice. It is distinguished for the number of its churches and conventual establishments, although the latter have been closed The city was founded by Pizarro in 1539 and was known as Guamanga down to 1825. It has been the scene of many notable events in the history of Peru.

The department of Ayacucho extends across the great plateau of central Peru, between the departments of Huancavelica and Apurimac. Area, 18,185 sq.mi. Population (1940), 414,208. It is divided into seven provinces and covers a broken, mountainous region, partially barren in its higher elevations but traversed by deep, warm, fertile valleys.

AYAH, a Spanish word (aya) for children's nurse or maid, introduced by the Portuguese into India and adopted by the English to denote their native nurses.

AYALA, LOPEZ DE: see LOPEZ DE AYALA.

AYALA Y HERRERA, ADELARDO LOPEZ DE (1828–1879), Spanish writer and politician, was born at Guadalcanal and at a very early age began writing for the theatre. A four-act play in verse, *Un Hombre* de *Estado,* was accepted by the managers of the Teatro Español, and given on Jan. 25, 1851. Within a twelve-month Ayala became more widely known by his *Castigo* y *Perdon,* and by the humorous Los dos *Guzmanes.* In 1854 he produced Rioja, perhaps the most admired and the most admirable of all his works. About 1855 Ayala, who had been an active partisan of the moderates, passed over to the progressives and this political manoeuvre had its effect upon the character of his plays. On Feb. 20, 1856, his El Conde de *Castralla* was suppressed by the government after the third performance. Ayala's rupture with the moderates was now complete, and in 1857 he was elected as Liberal deputy for Badajoz. His political changes are difficult to follow or to explain. In 1871 he returned to his early Conservative principles, and was a member of Alfonso XII's first cabinet. Meanahile his reputation as a dramatist was increased by El *Tanto por* Ciento and El Tejado de *Vidrio,* plays satiric in intention and romantic in inspiration. His last play, Consuelo, mas given on March 30, 1878. The best of his lyrical work is his *Epístola* to Emilio Arrieta; if he had written lyrics, he might have ranked with the best of Spain's modern singers.

See the complete edition of his dramatic works, edited by his friend and rival Tamayo y Raus, 1881–85.

AYE-AYE, the most remarkable of all the Malagasy lemurs (*see* PRIMATES). The aye-aye, *Chiromys madagascariensis,* has a broad rounded head, short face, large eyes, large hands and long thin fingers with pointed claws, of which the third is remarkable for its extreme slenderness. The foot resembles that of the other lemurs in its large opposable great toe with a flat nail; but all the other toes have pointed compressed claws. The tail is long and bushy. The general colour is dark brown, the outer fur being long and rather loose, with a woolly under-coat. It is nocturnal in its habits, living alone or in pairs, in the bamboo forests. It feeds on juices, especially of the sugar-cane, which it obtains by tearing open the hard woody circumference of the stalk with its strong incisor teeth; but it also devours wood-boring caterpillars, which it obtains by first cutting down with its teeth upon their burrows, and then picking them out of their retreat with the claw of its attenuated middle finger. It constructs large ball-like nests of dried leaves, lodged in a fork of the branches of a large tree, and with the opening on one side.

THE AYE-AYE. A LITTLE ANIMAL ABOUT THE SIZE OF A CAT

AYLESBURY, municipal borough of Buckinghamshire. England, lying on a slight eminence in the fertile Vale of Aylesbury, which extends north of the Chilterns, and includes the upper Thame basin. Pop. (1931) 13.382; (1938) 14,490. Area 5 sq.mi. The town is on the L.N.E., Met. and G.W. Joint Ry. and is in the Aylesbury parliamentary division. There is little doubt that the rich neighbourhood was occupied in prehistoric times. In 1239 Henry III made a grant of an annual fair at the feast of St. Osith (June 3rd), which was confirmed by Henry VI. Queen Mary's charter of 1554 constituted Aylesbury a free borough and instituted a Wednesday market. Various privileges appear to have lapsed in the reign of Elizabeth, and it was only in 1917 that Aylesbury was made a municipal borough.

From the first, Aylesbury tended to become the chief ecclesiastical centre of the county. It is clear from Domesday that it possessed very valuable lands; and it is difficult to explain why it was not made the capital of the shire. (See BUCKINGHAMSHIRE.) The Franciscan Friars were established here in the 14th century. The Church of St. Mary is primarily Early English but has numerous later additions. The old streets of the town are mostly narrow and irregular, but growth is taking place on town-planning lines. Lace making and straw plaiting are carried on in the district, and important industries are printing and

milk products. The rearing of ducks is less extensive than formerly.

AYLESFORD, HENEAGE FINCH, 1ST EARL OF (1649?–1719), son of Heneage Finch, earl of Nottingham, was educated at Westminster school and at Christ Church, Oxford. In 1679, during the chancellorship of his father, he was appointed solicitor-general, being returned to parliament for Oxford university, and in 1685 for Guildford. In 1682 he represented the Crown in the attack upon the corporation of London, and the next year in the prosecution of Lord Russell, when, according to Burnet, "and in several other trials afterwards, he showed more of a vicious eloquence in turning matters with some subtlety against the prisoners than of strict or sincere reasoning."[1] In 1684, in the trial of Algernon Sidney, he argued that the unpublished treatise of the accused was an overt act, and supported the opinion of Jeffreys that *scribere est agere*.[2] The same year he was counsel for James in his successful action against Titus Oates for libel, and in 1685 prosecuted Oates for the Crown for perjury. Finch, however, though a Tory and a Crown lawyer, was a staunch churchman, and on his refusal in 1686 to defend the royal dispensing power he was summarily dismissed by James. He was the leading counsel in June 1688 for the seven bishops. He sat again for Oxford university in the Convention Parliament, which constituency he represented in all the following assemblies, except that of 1698, till his elevation to the peerage.

He was one of the few nho in the House of Commons opposed the famous vote that James had broken the contract between king and people and left the throne vacant. He held no office during William's reign, and is described by Macky as "always a great opposer" of the administration. In 1689 he joined in voting for the reversal of Lord Russell's attainder, and endeavoured to defend his conduct in the trial, but was refused a hearing by the House. In 1703 he was created baron of Guernsey and a privy councillor, and after the accession of George I on Oct. 19, 1714, earl of Aylesford. He died on July 22, 1719.

The 2nd earl died in 1757, and since this date the earldom has been held by his direct descendants, six of whom in succession have borne the Christian name of Meneage.

Many of his legal arguments are printed in *State Trials (see* esp. viii. 694, 1,087, ix. 625, 880, 996, x. 126, 319, 405, 1,199, xii. 183, 353, 365). Wood attributes to him on the faith of common rumour the authorship of *An Antidote against Poison . . . Remarks upon a Paper printed by Lady (Rachel) Russel* (1683), ascribed in *State Trials* (ix. 710) to Sir Bartholomew Shower; but *see* the latter's allusion to it on p. 753.

AYLESFORD, a town of Kent, England, 3½ mi. N.W. of Maidstone on the Southern railway. Pop. (1931) 3,636. Several remains of antiquity exist in the neighbourhood, among them a dolmen called Kit's Coty House, about a mile N.E. from the village, and the Countless Stones. To the west are the remains of a Carmelite friary founded in 1242, said to have been the first house of Carmelites established in England. In the vicinity is Preston Hall, which in 1921 became a hospital for disabled ex-service men and the headquarters of "British Legion Village."

AYLESHAM, the first of eight mining villages in the Kent coalfield, 7 mi. S.W. of Sandwich, England. The first section of the village, which is in Nonington parish and has a station on the S Ry., was planned on original lines and was completed in 1928, when the population was about 2.000. The centre of the town, reserved as a shopping square, lies at the head of a small valley whence wide roads follow the contours of the valley. Pop. of Nonington (1931) 3,808.

AYLLON, LUCAS VASQUEZ DE (*c.* 1475–1526), Spanish adventurer and colonizer in south-eastern North America, was born probably in Toledo, Spain, about 1475. He accompanied Nicolas Ovando to Hispaniola (Santo Domingo) in 1502, engaged with profit in various commercial enterprises, and became interested in a plan for the extension of the Spanish settlements to the North American mainland. In 1521, he sent Francisco Gordillo on an exploring expedition which touched on the coast of the Florida peninsula at about 33° 30' at the mouth of a river which Gordillo named the St. John Baptist, and after coasting northward for some distance along a region known among the Indians as Chicora, returned to Hispaniola with a cargo of Indian slaves. Gordillo's report of the region, and the stories of one of the Indians, were so favourable, that Ayllon in 1523 obtained from Charles V. a charter for lands extending 800 leagues to the north, which named him *adelantado* and governor of the region, and included the right to plant colonies, instructions to seek for the strait to the Spice Islands, and provisions for the spiritual and temporal welfare of the natives. In 1525 he sent out another reconnoitering expedition, under Pedro de Quexos, which explored the coast for about 250 leagues. In July, 1526, he himself set forth with 500 colonists, including women and priests, about 100 African slaves and 89 horses. He landed near Cape Fear, in 33° 40′, on a river which he called the Jordan, where he stopped long enough to replace a wrecked vessel—considered the first instance of ship-building on the North American continent—and to send scouting parties to explore the coast and the immediate interior. Then moving farther along the coast, he began the construction of a town which he called San Miguel de Guadalupe, and which some writers hold was on the exact site of the later Jamestown, Virginia. More probably, as Lowery contends, it was near the mouth of the Peedee river in South Carolina. The importation of African slaves here was undoubtedly the first instance of the sort in what was to be the United States. The colony was ill fated. Fever carried off many of the colonists. On Oct. 18, 1526, Ayllon himself died of it. Dissensions immediately broke out among the colonists. Some of the slaves rebelled and escaped into the forest, and the Indians grew hostile and audacious. In December the town was abandoned, and the remnant of the colonists embarked for Hispaniola. Less than 150 arrived safely. They took Ayllon's body with them, but on the way, it was consigned to "the sepulchre of the ocean-sea, where have been and shall be put other captains and governors."

See J. G. Shea, *History of the Catholic Church in the United States*, vcl. i. (1886); W. Lowery, *The Spanish settlements Within the Present Limits of the United States* (1901); H. E. Bolton and T. M. Marshall, *The Colonization of North America, 1492–1783* (1920); and H. E. Bolton, *The Spanish Borderland* (1921).

AYLMER, JOHN (1521–94), bishop of London, was born in 1521 at Aylmer Hall, Tivetshall St. Mary, Norfolk. About 1541 he was made chaplain to the duke of Suffolk, and tutor to his daughter, Lady Jane Grey. His first preferment was to the archdeaconry of Stow, in the diocese of Lincoln, but his opposition in convocation to the doctrine of transubstantiation led to his deprivation.

From exile in Switzerland he wrote a reply to John Knox's famous *Blast against the Monstrous Regiment of Women*, under the title of *An Harborowe far Faithfull and Trewe Subjects, etc.*, and assisted John Foxe in translating the *Acts of the Martyrs* into Latin. On the accession of Elizabeth he returned to England. He was a member of the famous convocation of 1562, which reformed and settled the doctrine and discipline of the Church of England.

In 1576 he was consecrated bishop of London, and thereafter made himself notorious by his harsh treatment of all who differed from him on ecclesiastical questions, whether Puritan or Papist. He is frequently assailed in the famous *Marprelate Tracts*, and is characterized as "Morrell," the bad shepherd, in Spenser's *Shepheard's Calendar* (July). He died in June, 1594. His life was written by John Strype (1701).

AYMARAN, an important linguistic stock of South American Indians. The term has really no proper application to the tribes of this group, having arisen through an unfortunate blunder. It has, however. become too well fixed to make any change possible. The various tribes of the stock, of which the most important were the Collas, Lupacas and Pacasas, occupied originally the greater part of the high plateaux forming the closed basin of lakes Titicaca and Poopo and the "salars" of Coipasa and Uyuni in Bolivia and southern Peru. From the existence of

[1] *Hist. of His Own Times*, i. 556. Swift has appended a note, "an arrant rascal," but Finch's great offence with the dean was probably his advancement by George I. rather than his conduct of state trials as here described.

[2] *Ibid.*, 572, and Speaker Onslow's note.

Aymara place-names and small groups of Aymara-speaking peoples further north in Peru, it is not improbable that tribes belonging to this stock had once a much greater northern extension, and were forced southward by the advancing Quichua (*q.v.*). Archaeological evidence in some measure confirms this suggestion, since the pre-Inca Andean culture far to the north at Chavin on the upper Marañon shows undoubted relationship to that of Tiahuanaco near lake Titicaca, generally regarded as of Aymaran origin.

The Aymaran tribes had, at the time of the Spanish conquest, long been subjugated by the Inca, whose ruling class may itself have been of Aymaran origin. The considerable remains of the older Aymara culture still await adequate archaeological investigation. Physically the modern Aymara are short and mainly brachycephalic or round-headed. The prehistoric population was, however, apparently dolichocephalic or long-beaded, the change being probably due to long intermixture with the brachycephalic Quichua.

See for general discussion Sir Clements Markham, The Incas *of* Peru (1910), also E. W. Middendorf, Die Aymara Sprache (Leipzig, 1891); *G.* Rouma, "Les Indiens Quitchouas et Aimaras des Hautes Plateaux de la Bolivie," *Bull. Mem. Soc.* Anthropologie de *Bruxelles,* vol. xxxii. pp. 281–391; **A.** Chervin, Anthropologie *Bolivienne* (Paris, 1907).

AYMER or **AETHELMAR, OF VALENCE** (d. 1260), bishop of Winchester, was a half-brother of Henry III., being the son of John's widow by her second marriage with Hugo of Lusignan. In 1250, Henry III., the King, by putting strong pressure upon the electors, succeeded in obtaining the see of Winchester for Aymer. Aymer was illiterate, ignorant of the English language, and wholly secular in his mode of life, and his appointment aroused justifiable indignation. At the Parliament of Oxford (1258) he and his brothers repudiated the new Constitution prepared by the barons. He was pursued to Winchester, besieged in Wolvesey castle, and finally compelled to surrender and leave the kingdom. He had never been consecrated; accordingly in 1259 the chapter of Winchester proceeded to a new election.

Bibliography.—See W. Stubbs, Constitutional History, vol. ii. (1896); *G.* W. Prothero, *Simon* de Montfort (1877); W. H. Blaauw, Barons' War (1871).

AYR, royal, municipal and police burgh and seaport, and county town, Ayrshire, Scotland, at the mouth of the river Ayr, 41½m. S.S.W. of Glasgow by the L M S railway. Pop. (1931) 36,784. Ayr proper lies on the south bank of the river, which is crossed by three bridges, besides the railway viaduct — the Victoria Bridge (1898) and the famous "Twa Brigs" of Burns. The Auld Brig is said to date from the reign of Alexander III. (d. 1286). The new Brig was built in 1788. The prophecy of Burns came true in 1877, when the newer bridge yielded to floods and had to be rebuilt (1879); the older has been restored, and is closed to wheeled traffic. The town buildings, surmounted by a fine spire, contain assembly and reading rooms. Of the schools the most notable is the Academy, for which new buildings were completed in 1911. This in 1764 superseded the grammar school of the burgh, which existed in the 13th century. The Gothic Wallace tower in High street replaces an old building of the same name taken down in 1835, from which were transferred the clock and bells of the Dungeon steeple. A niche in front is filled by a statue of the Scottish hero by James Thom (1802–so), a self-taught sculptor. There are statues of the 13th earl of Eglinton, General Smith Neill and Sir James Ferguson in the fine Wellington square, one of Wallace in Newmarket street, and one of Burns outside the railway station. In the suburbs is a racecourse where the Western meeting is held in September of every year. Fisheries and shipbuilding are carried on, and there are several foundries and engineering establishments. There is a large export and import mineral traffic. The harbour, with wet and slip dock, occupies both sides of the river from the new bridge to the sea, and is protected on the south by a pier, and on the north by a breakwater with a dry dock. There are esplanades south and north of the harbour. The town is under a provost and council, and, with Irvine, Ardrossan, Prestwick, Saltcoats and Troon returns one member to parliament.

In 1873 the municipal boundary was extended north to include Newton-upon-Ayr and Wallace town, formerly separate. Newton is a burgh of barony with charter said to have been granted by Robert Bruce in favour of 48 inhabitants who had distinguished themselves at Bannockburn. The suburb now manufactures chemicals, boots and shoes, carpets and lace and there are large breweries. It has a harbour and dock. About 3m. north of Ayr, Prestwick, a popular watering-place is the headquarters of a flourishing golf club. The pleasant suburb of Alloway is 23m. to the south. The "auld clay biggin" in which Robert Burng was born on the 25th of January, 1759, has been repaired and is the property of the Burns's Monument trustees. In the kitchen is the box bed in which the poet was born, and many of the articles of furniture belonged to his family. Adjoining the cottage is a museum of Burnsiana. The "auld haunted kirk," though roofless, is otherwise in a fair state of preservation. In the churchyard is the grave of William Burness, the poet's father. Not far distant, on a conspicuous position close by the banks of the Doon, stands the Grecian monument to Burns, in the grounds of which is the grotto containing Thom's figures of Tam o'Shanter and Souter Johnnie.

At the close of the 12th century, Ayr was made a royal residence, and soon a royal burgh, by William the Lion. During the wars of Scottish independence the town was the scene of many of Wallace's exploits. In 1315 the Scottish parliament met in the church of St. John to confirm the succession of Edward Bruce to the throne. The liberality of William the Lion bestowed an extensive grant of lands; while in addition to the well-endowed church of St. John, it had two monasteries. When Scotland was overrun by Cromwell, Ayr was the site of one of the forts he built to command the country.

AYRER, JAKOB (?–1605), German dramatist, of whose life little is known. He seems to have come to Nuremberg as a boy and worked his way up to the position of imperial notary. He died at Nuremberg on March 26, 1605. Ayrer left some 60 or 70 plays which were printed at Nuremberg under the title *Opus Theatricum* in 1618. This collection contains 30 tragedies and comedies and 36 Fastnachtsspiele (Shrovetide plays) and *Singspiele.* As a dramatist, Ayrer is virtually the successor of Hans Sachs, but he came under the influence of the so-called *Englische Komödianten,* that is, troops of English actors, who, at the close of the 16th century and during the 17th, repeatedly visited the continent, bringing with them the repertory of the Elizabethan theatre. From those actors Ayrer learned how to enliven his dramas with sensational incidents and spectacular effects, and from them he borrowed the character of the clown. His plays are cast in a more ambitious mould than those of Hans Sachs. He chose in many cases complicated historical subjects which served for a cycle of three, four, or even five pieces. The *Heldenbuch,* for instance, has three dramas on Hugdietrich, Otnit and Wolfdietrich. Ayrer was not in any way a great writer, but his work marks a forward stage in the practice of the drama.

Bibliography.—*Ayrers Dramen,* ed. by A. von Keller, have been published by the Stuttgart Lit. Verein (1864–65). See also L. Tieck, Deutsches Theater (1817); **A.** Cohn, Shakespeare in Germany (1885), which contains a translation of the two plays mentioned above; J. Tittmann, *Schauspiele* des sechzehnten Jahrhunderts (1888); W. Wodick, Jacob Ayrers *Dramen* in ihrer Verhaltnis *zur* einheimischen *Literatur* und *zum* Schauspiel der englischen Komddianten (1912).

AYRSMIRE, south-western county of Scotland, bounded on the north by Renfrewshire, on the east by Lanarkshire and Dumfriesshire, on the south-east by Kirkcudbrightshire, on the south by Wigtownshire, and on the west by the Firth of Clyde. It includes off its coast the conspicuous rock of Ailsa Craig, 10m. W. of Girvan; Lady Island, 3m. S.W. of Troon; and Horse Island, off Ardrossan. Its area is 1,142sq.m., its coast-line being 70m. long. In former times the shire was divided into the districts of Cunninghame (north of the Irvine), Kyle (between the Irvine and the Doon), and Carrick (south of the Doon), and these terms are still occasionally used.

The county boundary runs almost wholly over high ground. The uplands of the south (Black Craig, 2,298ft.) extend over a larger area within Ayrshire than those of the north. They belong to the Silurian system of the southern uplands of Scotland, in

which, as elsewhere, there are numerous intrusions of volcanic and igneous rocks, notably about Loch Doon, where a large granite mass is associated with fine wild scenery. The hills of the north are mainly of Old Red Sandstone, or of igneous rocks of Carboniferous age. The boundary uplands embrace an undulating lowland bordering the coast with younger palaeozoic rocks, affording fertile soils, and including a wide extent of the coal measures which are one of the foundations of the industrial wealth of central Scotland. There are also, especially in the centre of the lowland, red sandstone tracts which have been extensively quarried. The rivers of the county are short and unnavigable, but the tranquil beauty outside the industrial districts of Doon, Afton, Cessnock and Lugar, has been made famous in the poems of Robert Burns. The chief river is the Ayr. It rises at Glenbuck, on the border of Lanarkshire, and after a course of some 38m. falls into the Firth of Clyde at the county town which, with the county, is named from it. The largest of many lochs is Loch Doon, 5½m. long, the source of the river of the same name. From Loch Finlas, about 20m. south-east of Ayr, the town derives its water-supply. The Nith rises just in Ayrshire.

History.— Traces of Roman occupation are found in Ayrshire. At the time of Agricola's campaigns the country was held by the Damnonii, and their town of Vandogara has been identified with a site at Loudoun Hill near Darvel, where a serious encounter with the Scots took place. On the withdrawal of the Romans, Ayrshire formed part of the kingdom of Strathclyde and ultimately passed under the sway of the Northumbrian kings. Save for occasional intertribal troubles, the annals are silent until the battle of Largs in 1263, when the pretensions of Haakon of Norway to the sovereignty of the Isles were crushed by the Scots under Alexander III. A generation later William Wallace surprised the English garrison at Ardrossan, and burned the barns of Ayr in which the forces of Edward I. were lodged. Robert Bruce is alleged to have been born at Turnberry Castle, some 12m. S.W. of Ayr and he held the title of Earl of Carrick (now borne by the prince of Wales).

In 1307 he defeated the English at Loudoun Hill. Cromwell demolished the castle of Ardrossan and is said to have utilized the stones in rearing a fort at Ayr. Between 1660 and 1688 the sympathies of the county were almost wholly with the Covenanters, who suffered one of their heaviest reverses at Airds Moss—a morass btween the Ayr and Lugar—their leader, Richard Cameron, being killed (July 20, 1680). The county was dragooned and the Highland host ravaged. The Hanoverian succession excited no active hostility if it evoked no enthusiasm. The castles of Loch Doon, Turnberry, Dundonald, Portencross, Ardrossan and Dunure are to be noticed, and there are ruins of celebrated abbeys at Kilwinning and Crossraguel, and of Alloway's haunted church, famous for their associations.

Population and **Administration.**—The population was 299,254 in 1921, and 285,182 in 1931, when Gaelic and English were spoken by 1,160 persons, and Gaelic only by four. The pop. of the chief towns in 1931 were: Ardrossan (6,888), Auchinleck (6,624)) Ayr (36,784), Beith (5,977), Dalry (6,827), Galston (4,601), Girvan (5,292), Irvine (12,032), Kilbirnie (8,193), Kilmarnock (38,099), Kilwinning (5,324), Saltcoats (10,173), Troon (8,544). The county, with Bute, returns three members to parliament, for the North Ayrshire and Bute, Kilmarnock and South Ayrshire divisions respectively. Ayr, the county town, and Irvine are royal burghs and belong to the Ayr group of parliamentary burghs. The county forms a sheriffdom, and there are resident sheriffs-substitute at Ayr and Kilmarnock.

Agriculture.—With fertile if rather heavy soil, and the near neighbourhood of large towns, agriculture is specialized. Potatoes are extensively grown, the coast-lands supplying the markets of Scotland and the north of England. Of other roots, turnips and swedes are most widely cultivated, heavy crops being obtained by early sowing and rich manuring. Oats form the bulk of the cereal crop, but wheat and barley are also grown. High farming has developed the land enormously. Dairying has received particular attention.

Cheddar cheese of first-rate quality is made in Ayrshire, the manufacture having been set on foot by an adviser from Somerset in 1855. The Ayrshire cows are famous for the quantity and excellence of their milk. Great numbers of cattle, sheep and pigs are raised for the market, and Ayrshire horses are in high repute, but have decreased in numbers in recent years.

Other **Industries.**—Ayrshire has the second largest Scottish coalfield. There is a large output also of iron ore, pig iron and fire-clay. The chief coal mining centres are Ayr, Dalmellington, Patna, Irvine, Stevenston, Beith, Kilwinning, Dalry, Dreghorn, Kilmarnock, Galston, Hurlford, Muirkirk, and New Cumnock. Ironstone occurs chiefly at Patna, Dalry, Dreghorn and Beith and there are blast furnaces at Cumnock, Stevenston, Dalmellington, and many other places. A valuable whetstone has been worked at Bridge of Stair on the Ayr—the Water-of-Ayr stone. At Catrine are cotton factories and bleachfields, and at Ayr and Kilmarnock extensive engineering works, and carpet, blanket and woollens, boot and shoe factories; cotton, linen thread, shoes, lace, woollens and other fabrics and hosiery are also made at Dalry, Kilbirnie, Kilmaurs, Beith and Stewarton. Irvine has important chemical works. Near Stevenston, works have been erected in the sandhills for the making of dynamite and other explosives. There are large factories for lace and muslin at Galston, Newmilns and Darvel, and at Beith cabinet-making and tanning are considerable industries. Shipbuilding is conducted at Troon, Ayr, Irvine and Fairlie, which is famous for its yachts. The leading ports are Ardrossan, Ayr, Girvan, Irvine and Troon.

Communications.— The L.M.S. railway serves the industrial towns, ports and seaside resorts. Its trunk line via Girvan to Stranraer commands the shortest sea passage to Belfast and the north of Ireland, and its main line via Kilmarnock communicates with Dumfries and Carlisle and so with England. For passenger steamer traffic to the other parts of the Firth of Clyde, Arran, Ireland, etc. Ardrossan is the principal port.

AYRTON, HERTHA (1854–1923), English scientist, was born at Portsea, April 25 1854, the daughter of Levi Marks, a clockmaker and jeweller, and was brought up in London by her aunt, Mrs. Alphonse Hartog. At her aunt's house she met Madame Bodichon, one of the founders of Girton College, who introduced her to George Eliot and many distinguished people. She went up to Girton in 1876, and when she returned studied science in London, and married (May 6 1885) Prof. W. E. Ayrton, whose pupil she had been.

The work on the electric arc, which made her famous, began in 1883. She read various papers on the subject before learned societies, and her book, The Electric *Arc*, appeared in 1902. In 1903 Prof. Ayrton was asked by the Admiralty to elucidate some of the problems connected with the electric searchlight. The four reports sent in (1904–08) were largely, and the last one entirely, the work of Mrs. Ayrton. She continued to work on the problem after her husband's death in 1908, continuing at the same time her researches on ripple-forming vortices in water. Her discoveries in this connexion she utilized practically in the invention of the Ayrton anti-gas fan, for the repulsion of noxious gases in war. The first instalment of these fans was sent out to the front in France in May 1916. She was then asked by the War Office to investigate the ventilation of gun emplacements. Up to the end of her life she was experimenting with the transmission of coal gas to obviate the necessity of separate gas-works in each district. She died Aug. 26 1923.

Mrs. Ayrton was a militant suffragist before the World War. She had a host of friends in London and Paris; James Darmesteter was an intimate friend of hers before her marriage, and she had a lifelong friendship with Mme. Curie.

See Evelyn Sharp, *Hertha Ayrton* (1926).

AYRTON, WILLIAM EDWARD (1847–1908), English physicist, was born in London on Sept. 14 1847. He was educated at University College, London, and in 1868 went out to Bengal in the service of the Indian Government telegraph department. He taught physics at Tokyo and in London and in 1884 became professor of electrical engineering at South Kensington. He published, both alone and jointly with others, a large number of papers on physical, and in particular electrical, subjects, and his name was especially associated, together with that of Professor

John Perry, with the invention of a long series of electrical measuring instruments. He died in London on Nov. 8 1908.

AYSCOUGH, SAMUEL (1745–1804), English librarian and index-maker, was born at Nottingham. In 1782 Ayscough published a two-volume catalogue of the then undescribed manuscripts in the British Museum. About 1785 he was appointed assistant librarian at the museum, and soon afterwards took holy orders.

His first official work was a third share in the British Museum catalogue of 1787, and he subsequently catalogued the ancient rolls and charters, 16,000 in all. In 1789 he produced the first two volumes of the index to the *Gentleman's Magazine*, and in 1790 the first index-concordance to Shakespeare. He died at the British Museum on Oct. 30 1804.

AYSCUE (erroneously ASKEW or AYSCOUGH), **SIR GEORGE** (d. 1671), British admiral, came of an old Lincolnshire family. He took part in the first Dutch War. The indecisive battle off Plymouth (Aug. 16 1652) cost him his command, though an annuity was assigned him. The later years of the Commonwealth he spent in Sweden, Cromwell having despatched him thither as naval adviser. At the Restoration he became one of the commissioners of the navy, but on the outbreak of the second Dutch War in 1664 he once more hoisted his flag as rear-admiral of the Blue and took part in the battle of Lowestoft (June 3 1665). In the great Four Days' Battle (June 11–14 1666) he served with Monk as admiral of the White. His flagship, the "Prince Royal," was taken on the third day, and he himself remained a prisoner in Holland till the peace. Lely's portrait of Sir George Ayscue is in the Painted Hall at Greenwich.

AYSEN, a province of southern Chile, created in 1928 from parts of the provinces of Chiloé and Llanquihué and of the territory of Magallanes. It includes most of the Chonos archipelago, the peninsula of Taitao, the large island of Wellington, with many smaller islands, and a strip of coast some 600m. in length by about 50m. in width. The area is but partially explored. It consists almost entirely of mountains, rising 2,000 to 6,000ft. abruptly from the sea and deeply dissected into valleys and fiords. The islands are the southward continuation of the Chilean coast range, here submerged until only the summits of the higher peaks stand above the sea. There is very little level land. This is a district of heavy, all-year rains and uniformly cool but not cold temperatures. Snow frequently falls in winter and lies perpetually upon the tops of many of the mountains. From these snow fields many rivers are formed and in some places glaciers descend to or nearly to the sea. Among the rivers the larger are the Aysen, from which the territory receives its name, the Rayas, the Cisnes, the Corcovado, the Huemules, the Palena, the Yelcho and the Baker. The presence of English names throughout the region is due to the part played by British navigators in exploring the coasts and islands. The most notable of the British expeditions to this area was that which Fitzroy and King (accompanied by the young naturalist, Charles Darwin) carried out in the "Adventure" and the "Beagle" (1826–36). The best description of this territory still to be found is in the narrative of that expedition. The whole of Aysen is densely forested up to the snow line. Most of the trees at a low level are broad-leaved evergreens, several varieties of beech predominating. Coniferous trees are also found. The timber has not been of great value to Chile until recent years, but there are now a number of saw-mills at work and lumbering is the leading industry. The province is sparsely inhabited. The official census figures for 1940 place the population at 17,014. Most of these are Indians, other settlements consisting of small lumbering or fishing colonies. Aysen, the capital, on the river of the same name, is the largest town, though it has less than three thousand people.

AYTOUN or **AYTON, SIR ROBERT** (1570–1638), Scottish poet, son of Andrew Aytoun of Kinaldie, Fifeshire, was born in 1570. He was educated at the university of St. Xndrews. On the accession of James VI. to the English throne he wrote in Paris a Latin panegyric, which brought him into immediate favour at court. He was knighted in 1612. He held various lucrative offices, and was private secretary to the queens of James I. and Charles I. He died in London, and was buried in Westminster Abbey on Feb. 28 1638. Aytoun was one of the earliest Scots to use the southern standard as a literary medium.

Aytoun's Latin poems are printed in *Delitiae Poetarum Scotorum* (Amsterdam, 1637), i. pp. 40–75. His English poems are preserved in a ms. in the British Museum (*Add. mss.* 10,308), which was prepared by his nephew, Sir John Aytoun. Both were collected by Charles Rogers in *The Poems of Sir Robert Aytoun* (London, privately printed, 1871). This edition is unsatisfactory, though it is better than the first issue by the same editor in 1844. Additional poems are included which cannot be ascribed to Aytoun, and which in some cases have been identified as the work of others. The poem, "I do confess thou'rt smooth and fair," may be suspected, and the old version of "Auld Lang Syne" and "Sweet Empress" are certainly not Aytoun's.

Some of the English poems are printed in Watson's *Collection* (1706–11) and in the *Bannatyne Miscellany*, i. p. 299 (1827). There is a memoir of Aytoun in Rogers's edition, and another by Grosart in the *Dict. of Nat. Biog.* Particulars of his public career will be found in the printed *Calendars* of *State Papers* and *Register of the Privy Council* of the period.

AYTOUN, WILLIAM EDMONSTOUNE (1813–1865), Scottish poet and humorist, only son of Roger Aytoun, a writer to the signet, and of the same stock as Sir Robert Aytoun. He was educated at Edinburgh academy and university, and at Aschaffenburg, Germany. He became a writer to the signet in 1835 and was called to the Scottish bar in 1840. On his own confession, however, although he "followed the law, he could never overtake it." A preliminary volume of poems entitled *Poland, Homer, and other Poems* had appeared in 1832. His first contribution to *Blackwood's Magazine* appeared in 1836, and from 1839 onwards until his death he remained on the staff of the paper. His acquaintance with Mr. (afterwards Sir) Theodore Martin began in 1841. They collaborated in a series of humorous and satirical papers in which appeared from time to time the verses afterwards republished separately as *The Bon Gaultier Ballads* (1855). These are of striking interest as providing a model for later writers of humorous verse, and in particular for W. S. Gilbert (q.v.), in the *Bab Ballads*. Aytoun excels in parody, and *Montgomery, a Poem* deserves to be as well known as Macaulay's celebrated castigation of the fashionable poet. Indeed the lines:—

> Calm as Great Paul at Ephesus was seen
> To rend his robes in agonies serene

might have been among those selected by Macaulay to be pilloried in the *Edinburgh Review*. He is equally successful with parodies of Tennyson and Thomas Moore. Perhaps the best known in the collection is *The Massacre of the Macpherson*, which has continued to figure in many anthologies and song-books. In 1845 Aytoun was appointed professor of rhetoric and *belles lettres* at Edinburgh university. His services to the Tory Party, especially in the cause of protection, were recognized by his appointment in 1852 as sheriff of Orkney and Zetland. Among his other writings are: *Lays of the Scottish Cavaliers* (1848; also Burleigh Library ed. 1896); *Firmilian, a Spasmodic Tragedy* (1852), in which he ridicules the writings of Philip James Bailey, Sydney Dobell and Alexander Smith (qq.v.); *Bothwell, a Poem* (1854); *Collection of the Ballads of Scotland* (1858); and *Norman Sinclair*, a novel (1861).

In conjunction with Sir Theodore Martin he published a translation of the *Poems and Ballads of Goethe* (1858). Aytoun died at Blackhills near Elgin on Aug. 4 1865.

See *Memoir* of *W. E. Aytoun* (1867) by Sir Theodore Martin, with an appendix containing some of his prose essays. The poems of Aytoun were republished by H. Milford in the Oxford edition (1921).

(E. I. J.)

AYUB KHAN (1855–1914), Afghan prince, son of Sher Ali (formerly amir of Afghanistan) and cousin of Abdur Rahman, was born about 1855. During his father's reign little is recorded of him, but after Sher Ali's expulsion from Kabul by the English, and his death in Jan. 1879, Ayub took possession of Herat. In 1880 he invaded Afghanistan with the intention of asserting his

claims to the sovereignty, and in particular of gaining possession of Kandahar, still in the occupation of the British. He encountered the British force commanded by General Burrows at Maiwand (July 27) and was able to gain one of the very few pitched battles that have been won by Asiatic leaders over an army under European direction. His triumph, however, was short-lived; while he hesitated to assault Kandahar he was attacked and defeated (Sept. 20, 1880) by Sir Frederick (afterwards Lord) Roberts, at the close of the latter's memorable march from Kabul, and utterly discomfited. He made his way back to Herat, where he remained for some time unmolested.

In the summer of 1881, he again invaded Afghanistan, and on the anniversary of the battle of Maiwand defeated Abdur Rahman's lieutenants, mainly through the defection of a Durani regiment. Kandahar fell into his hands, but Abdur Rahman now took the field in person, totally defeated Ayub, and expelled him from Herat. He took refuge in Persia, and received an allowance from the Persian Government.

In 1887, internal troubles in Afghanistan tempted him to make another effort to seize the throne. Defeated and driven into exile, he wandered for some time about Persia, and in November gave himself up to the British agent at Meshed. He was sent to India to live as a state prisoner and died at Lahore on April 6, 1914.

AYUNTAMIENTO, the Spanish name for the district over which a town council has administrative authority; it is used also for a town-council or a town-hall. It is derived from the Lat. *adiungere,* and originally meant "meeting." The ayuntamiento consisted of the official members, and of regidores or regulators, who were chosen in varying proportions from the *hidalgos* or nobles and the *pecheros* or commoners. This distinction has now been abolished, and the powers and the constitution of ayuntamientos have been much altered.

AYUTMIA (Siamese KRUNG-KAO), for more than four centuries the capital of Siam, is on the northern main line of the state railways, 42 mi. from Bangkok. It was destroyed by the Burmese in 1555 and again in 1765, after which it ceased to be the capital. Historically it is the most interesting spot in Siam; the island site of the city has ruins of innumerable palaces, pagodas, churches and fortifications, while there is a rich local archaeological museum.

The bulk of the population (about 50,000) lives in floating houses along the edges of a network of river creeks and channels. The only trade consists in the exchange of great quantities of paddy (through Bangkok) for cloth and other goods needed by the peasants.

Ayuthia is the chief town of one of the richest agricultural provincial divisions of Siam (pop. of province in 1937, 326,218), the seat of a high commissioner, and the headquarters of a division of the army. The government offices occupy spacious buildings once a royal retreat; the government is that of an ordinary provincial division (*Monton*). Outside the town is an ancient masonry enclosure, periodically used for the capture of elephants.

AYVALIK, a seaport town on the west coast of Turkey (vilayet of Karasi), opposite the island of Mitylene. Population, 16,744.

It stands near the site of the Aeolian Heraclea, on rising ground at the end of a bay which is separated from the Gulf of Adramyttium, and protected from the prevailing winds by the Moschonisi islands (*Hecatonnesoi*). It was formerly an exclusively Greek town, but the Greek population was "exchanged" for Muslim immigrants in 1924. The town was formerly known as Aivali.

AZAÏS, PIERRE HYACINTHE (1766–1845), French philosopher, was born at Sorèze and died at Paris. The son of the musician P. H. Azaïs (1743–96), he spent his early years as a teacher and a village organist. In 1809 he published his Des Compensations *dans les destinées humaines* (5th ed. 1846), which pleased Napoleon so much that he made its author professor at St. Cyr.

The Restoration government at first suspected him as a Bonapartist, but at length granted him a pension. From that time he occupied himself in lecturing and the publication of philosophical works.

In the *Compensations* he sought to prove that, on the whole, happiness and misery are equally balanced, and therefore, that men should accept the government which is given them rather than risk the horrors of revolution.

His other works are: *Système universel* (1812); Du *Sort* de *l'homme* (1820); *Cours* de philosophie (1824), reproduced as Explication *universelle* (1826–28); Jeunesse, *maturité,* religion, philosophie (1837), De la *phrénologie, du magnétisme, et* ae la *folie* (1843).

AZALEA, a genus of popular hardy or greenhouse shrubs, belonging to the heath family (Ericaceae), related closely to *Rhododendron,* but kept distinct by most gardeners. The beautiful varieties now in cultivation have been bred from a few originals, natives of the hilly regions of Asia and the United States. They are perhaps unequalled as indoor decorative plants. These are usually increased by grafting the half-ripened shoots on the stronger-growing kinds, the shoots of the stock and the grafts being in a similarly half-ripened condition, and the plants being placed in a moist heat of 65°. They require a rich and fibrous peat soil, with a mixture of sand to prevent its getting waterlogged. The best time to pot azaleas is three or four weeks after the blooming is over. To produce handsome plants, they must while young be cut back as required. Specimens that have grown stringy may be cut back just before growth commences. The lowest temperature for them during the winter is about 35°, and during their season of growth from 55° to 65° at night, and 75° by day, the atmosphere being at the same time well charged with moisture.

The following are some well-known North American species: **A.** arborescens, a deciduous shrub 10–20 ft. high; ***A.*** calendulacea, a beautiful deciduous shrub 2–6 ft. high, with yellow, red, orange and copper-coloured flowers, and **A.** *nudiflora,* the pinkster flower, a shrub, 3–4 ft. high, which hybridizes freely with ***A.*** *calendulacea.*

The Ghent azalea (***A.*** *gandavensis*), the Korean azalea (***A.*** yedoensis) and the Kurume azalea (***A.*** obtusa) have been the parents of hundreds of named horticultural forms, which, with the North American species, are among the finest hardy shrubs in cultivation. (N. TR.)

AZAMGARH, a city and district of British India, in the Gorakhpur division of the United Provinces. The town is situated on the river Tons. Pop. (1931), 18.046.

The area of the district is 2,212 sq.mi., and its population in 1931 was 1,571,577. It is bounded on the north by the river Gogra, which is flanked by a low-lying tract, varying considerably in width; south of this, however, the ground takes a slight rise. The slope of the land is from northwest to southeast, but the general drainage is very inadequate. The soil is fertile, and very highly cultivated, bearing magnificent crops of rice and sugarcane. The district was ceded to the East India company in 1801 by the wazirs of Lucknow.

AẒĀN, the call to public worship proclaimed by the Muezzin (crier) from the mosque in all Muhammadan countries (Arabic *adhān* "announcement"). In small mosques the Muezzin stands at the door or at the side of the building; in large ones he takes up his position in a minaret. The call translated runs: "God is most great!" (four times), "I testify there is no god but God!" (twice), "I testify that Muhammad is the apostle of God!" (twice), "Come to prayer!" (twice), "Come to salvation!" (twice), "God is most great!" (twice), "There is no god but God!" To the morning Aẓān are added the words, "Prayer is better than sleep!" (twice). The devout Muslim has to make a set response to each phrase of the Muezzin. At first these are mere repetitions of Aẓān but to the cry "Come to prayer!" the listener must answer, "I have no power nor strength but from God the most High and Great." To that of "Come to salvation!" the formal response is, "What God willeth will be: what He willeth not will not be." The recital of the Aẓān must be listened to with the utmost reverence. The passers in the streets must stand still. all those at work must cease from their labours, and those in bed must sit up.

The Muezzin, who is a paid servant of the mosque, must stand with his face towards Mecca and with the points of his forefingers in his ears while reciting Aẓān. He is specially chosen for

good character, and Aẓān must not be recited by any one unclean, by a drunkard, by the insane or by a woman. The summons to prayers was at first simply "Come to prayer!" Muhammad, anxious to invest the call with the dignity of a ceremony, took counsel of his followers. Some suggested the Jewish trumpet, others the Christian bell, but according to legend the matter was finally settled by a dream:— "While the matter was under discussion, 'Abdallāh, a Khazrajite, dreamed that he met a man clad in green raiment, carrying a bell, 'Abdallāh sought to buy it, saying that it would do well for bringing together the assembly of the faithful. 'I will show thee a better way,' replied the stranger; 'let a crier cry aloud "God is most great, etc."' On awaking, 'Abdallāh went to Muhammad and told him his dream," and the Aẓān was thereupon instituted.

AZANDE, THE, are the least unknown of the comparatively short-statured (medium breadth of head) group of the Southern Sudan population (see SUDAN: Anglo-Egyptian Sudan), but whether the Azande proper stand in any close relationship to other tribes of the Bahr el-Ghazal attributed to this group is quite uncertain, though a number of the latter have undoubtedly been subjected to their influence. Schweinfurth wrote of the Azande as attaining the lowest grade of brachycephaly; measurements (unpublished) taken by E. E. Evans-Pritchard in the Sudan give an average cephalic index of 79, with a stature of about 6 jin. but Czekanowski's long series (*Forschungen im Nil-Kongo-Zwischengebiet*, vol. 4, Anthropologie, Leipzig, 1922) of Azande measurements from the Congo suggest an average cephalic index of 77 to 78 and a stature varying from group to group up to 69in., the higher figures no doubt being due to admixture. The Azande are expert agriculturists. The lower incisors are not removed, but a central v-shaped notch is filed between the upper central incisors.

The Azande, unlike other tribes of the Sudan (with the possible exception of the Shilluk), may be fairly regarded as a nation, for they are really a federation of tribes, each with its territorial sections, having a supreme head or sultan belonging to a special ruling class. This class, the Avongara, is often, but with doubtful accuracy, stated to be the descendants of one Gura, apparently the ruler of a dominant people who some 200 years ago began a process of conquering and absorbing the neighbouring tribes which has lasted to the present day. The territory of the Azande has been estimated at 48,000sq m. and their numbers at from two to four millions, the small portion falling within Sudan territory being divided into two districts, Yei and Meridi, each administered by a paramount chief. Evans-Pritchard's unpublished notes indicate that the Azande are patrilineal and patrilocal, with descent of property and rank in the male line. There is a clan organization described as totemic, but all chiefs (gbia or *vongara*) belong to one class, constituting the Avongara, to whom both endogamous and exogamous marriage is permitted. The political organization consists of a paramount chief ruling over a group or tribe, whose territory is defined by river boundaries. Under him are his brothers and sons, who administer provinces directly from provincial centres, these provincial governors appointing commoners to act as deputies (abakumba). The Azande live in homesteads widely scattered in bush-clearings, consisting—where the housefather is polygamous—of a number of huts, surrounded by cultivation, each occupied by a wife and her children.

A supreme being named Mboli is recognized, but his relation to the everyday affairs of man is by no means clear, though it is certain that offerings are made to him during periods of drought. The ancestral spirits possess a shrine in every homestead, and to them conduct is explained and offerings made. (C. G. S.)

See C. R. Lagae, Les Azande ou *Niam-Niam* (1926).

AZARA, DON JOSE NICHOLAS DE (1731–1804), Spanish diplomat, was born in 1731 at Barbunales, Aragon, and was appointed in 1765 Spanish agent and procurator-general, and in 1785 ambassador at Rome, During the 13 years of his residence there he distinguished himself as a collector of Italian antiquities and as a patron of art. He was afterwards Spanish ambassador in Paris. In that post it was his misfortune to be forced by his government to conduct the negotiations which led to the treaty of San Ildefonso. Azara died, worn out, in Paris in 1804. His end was undoubtedly embittered by his discovery of the ills which the French alliance must produce for Spain.

His younger brother, DON FELIX DE AZARA (1746–1811), spent 20 years in South America as a commissioner for delimiting the boundary between the Spanish and Portuguese territories. He made many observations on the natural history of the country, which, together with an account of the discovery and history of Paraguay and Rio de la Plata, were incorporated in his principal work, Voyage *dans l'Amérique méridionale depuis* 1781 *jusqu'en 1801,* published at Paris in 1809 in French from his ms. by C. A. Walckenaer.

Several sympathetic notices of Azara will be found in Thiers, *Consulat* et Empire. See also *Reinado* de Carlos IV. by Gen. J. Gomez de Arteche, in the *Historia* General de *España,* published by the R. Acad. de la Historia, Madrid, 1892, etc. There is a Notice *historique* sur le Chevalier *d'Azara* by Bourgoing (1804).

AZARIAH, the name of several persons mentioned in the Old Testament. The most important are: (1) King of Judah, son of Amaziah by his wife Jecholiah (II. Kings xv. 1, 2), also called Uzziah (*q.v.*); (2) One of the companions in captivity of the prophet Daniel, called Abednego by Nebuchadrezzar, by whom with two companions he was cast into a "burning fiery furnace" for refusing to worship the golden image set up by that monarch (Dan. i. 6, iii. 8–30).

AZAY-LE-RIDEAU, a town of France, department of Indre-et-Loire, on the Indre, 16 mi. S.W. of Tours by rail. Population (1936) 1,204. The town has a fine Renaissance chateau. well restored.

AZCARATE, GUMERSINDO (1840–1917), Spanish politician, was born at León, Spain, Jan. 13 1840. Educated at the universities of Oviedo and Madrid, in 1868 he was appointed assistant professor of comparative jurisprudence at the University of Madrid, and four years later became professor. In 1875 he resigned rather than submit to the famous Orovio decree limiting the liberty of the chair. He was, however, reinstated six years later and became one of the group headed by Francisco Giner, to which Spain owes most of its up-to-date educational institutions. From 1868 he represented, almost continuously, León, in the Cortes, as a moderate Republican. He had learned by painful experience that the attempt to set up a republic in a country where there was no genuine Republican party could result only in anarchy and military dictatorship. He, therefore, expressed his approval of the reformist evolution toward monarchism initiated by Melquiados Alvárez, but, upon his defeat as a deputy, he proved the strength of his principles by refusing a seat as senator for life. After the Barcelona outbreak of 1909, he kept apart from the violent section of his party. His position was less that of a leader than of a man whose personal character gave a certain dignity to the anti-dynastic parties. He died at Madrid Dec. 14 1917.

AZEGLIO, MASSIMO TAPARELLI, MARQUIS D' (1798–1866), Italian statesman and author, was born at Turin of a noble Piedmontese family. In Rome, where his father was special envoy to the Vatican, he acquired a love of art and music and became an artist, to the horror of his narrow-minded and aristocratic family. From 1831 to 1843 he lived in Milan, where he married a daughter of Manzoni, and turned to literature. His writings, whether novels or pamphlets, aimed at exposing the evils of foreign domination in Italy and awakening the national consciousness.

D'Azeglio fought in the first war of independence, and was twice expelled from Tuscany. He formed the first cabinet under Victor Emmanuel II., concluded peace, and remained in office for three years. D'Azeglio conducted the affairs of the country with tact and ability, improving its diplomatic relations, and opposing the claims of the Roman Curia. He invited Count Cavour, then a rising young politician, to enter the ministry in 1850. Cavour and Farini, also a member of the cabinet, made certain declarations in the Chamber (May 1852) which led the ministry in the direc-

tion of an alliance with Rattazzi and the Left. Of this d'Azeglio disapproved, and therefore resigned office, but on the king's request he formed a new ministry, excluding both Cavour and Farini. In October, however, he retired into private life, suggesting Cavour to the king as his successor. For the next four years he lived modestly at Turin, devoting himself once more to art, although Cavour always consulted him on matters of moment. In 1855 he was appointed director of the Turin art gallery. In 1859 he was given various political missions, including one to Paris and London to prepare the basis for a general congress of the powers on the Italian question. When war between Piedmont and Austria appeared inevitable, he returned to Italy, and was sent as royal commissioner by Cavour to Romagna, whence the papal troops had been expelled. After the peace of Villafranca, d'Azeglio was recalled with orders to withdraw the Piedmontese garrisons; but he saw the danger of allowing the papal troops to reoccupy the province, and after a severe inner struggle left Bologna without the troops. The king approved of his action, and said that his orders had not been accurately expressed; thus Romagna was saved. Early in 1860 Cavour appointed him governor of Milan, evacuated by the Austrians after the battle of Magenta. But, disapproving of the government's policy with regard to Garibaldi's Sicilian expedition and the occupation by Piedmont of the kingdom of Naples as inopportune, he resigned office.

The death of his two brothers in 1862 and of Cavour in 1861 caused d'Azeglio great grief, and he subsequently led a comparatively retired life. As deputy and as writer, he occupied himself chiefly with the Roman question and the relations of Piedmont (now the kingdom of Italy) with Mazzini and the other revolutionists. In his opinion Italy was to be unified by means of the Franco-Piedmontese army alone, all connection with the conspirators being eschewed, while the pope should enjoy nominal sovereignty over Rome, with full spiritual independence, the capital of Italy being established elsewhere, but the Romans being Italian citizens (see his letters to E. Rendu and his pamphlet Le *questioni* urgenti). He strongly disapproved of the convention of 1864 between the Italian government and the pope. D'Azeglio died at his villa of Cannero on Jan. 15, 1866, leaving his autobiographical memoirs, *I Miei* Ricordi, unfinished. Massimo d'Azeglio was a very attractive personality, as well as an absolutely honest patriot, and a characteristic example of the best type of Piedmontese aristocrat. He was cautious and conservative; in his general ideas on the liberation of Italy he was wrong, and to some extent he was an amateur in politics, but of his sincerity there is no doubt. As an author his political writings are trenchant and clear, but his novels, *Ettore* Fieramosca (1833) and *Niccolò* dei *Lapi* (1841), are somewhat heavy and old-fashioned, and are interesting only if one reads the political allusions between the lines.

See L. Carpi, *Il Risorgimento Italiano,* vol. i. pp. 288 *seq.* and Constance d'Azeglio, *Souvenirs historiques* (1884).

AZERBAIJAN, the north-western province of Persia. It is separated on the north from the Soviet Republics of Azerbaijan and Armenia by the river Aras (Araxes); on the east it abuts on the Talish country and the Caspian sea; on the west it is bounded by Asiatic Turkey, and on, the south are the provinces of Kurdistan, Karus, Khamseh and Gilan. The area is estimated at 32,000sq.m. The population, roughly 1½ millions, comprises various races, *e.g.,* Persians proper, Turks, Kurds, Syrians and Armenians.

Physically, Azerbaijan is a high plateau bordered all around by higher mountain crests. Sahend mountain (12,000ft.), the extinct volcano Savalan (15,792ft.) west of Ardabil, and Ararat (17,000ft.) in the north-west, are the highest elevations in the province. The central depression (about 4,000ft.) is the Urmia lake, the most extensive basin of Persia, into which numerous watercourses drain from the surrounding highlands. In general the country is superior in fertility to most provinces of Persia and consists of a regular succession of undulating eminences, partially cultivated and opening into extensive plains. The orchards and gardens which surround many villages yield fruits of almost every description and great quantities, dried, are exported to Russia, the chief centre of the industry and of general trade being Tabriz. There is a lack of forest and timber trees. Lead, copper, sulphur, orpiment and lignite have been found within the confines of the province, and indications of petroleum have been reported. A kind of variegated and translucent marble, known as Maragha or Tabriz marble, is quarried and much used in Persia in the construction of monumental buildings, tanks, baths, etc. The climate is subject to extremes and the cold of winter is severely felt for want of fuel, the only substitute being dried cow-dung. Water from the innumerable streams is abundant. The natives of Azerbaijan make excellent soldiers and a large part of the Persian army is recruited from them.

The revenue of the province from all sources amounted in 1926–27 to 32,870,059 krans. Communicatcns within the province are comparatively good. A railway, 80m. in length, operated at a profit by the Persian Government, runs from Tabriz to Julfa on the Araxes, where it connects with the Caucasian system; a branch (30m.) from Sofia runs to Sharafkhaneh on Lake Urmia. This railway is worked in conjunction with a line of motor boats and barges on the lake and the freight business carried on is large and increasing. There are some 40m. of railway in the extreme north-west corner of the province, also the property of the Persian Government, but in bad repair. A constructed road suitable for heavy motor traffic runs from Tabriz to Julfa (80m.) parallel to the railway, and another runs from Julfa to Khoi. Roads passable by automobiles and light wheel traffic also run from Tabriz to Astara on the Caspian sea and to Kazvin. Tabriz, the chief town of Azerbaijan, has a local telephone service.

AZIMUTH (from the Arabic), in astronomy, the angular distance from the north or south point of the horizon to the foot of the vertical circle through a heavenly body. The azimuth of a horizontal direction is its deviation from the north or south.

AZO (c. 1150–1230), Italian jurist, was born at Bologna, studied under Joannes Bassianus, and became professor of civil law at Bologna. Azo occupied a very important position among the glossators, and his *Summa* Codicis and Apparatus ad codicim, which were collected by his pupil, Alessandro de Santo Aegidio, and completed by the additions of Hugolinus and Odofredus, formed a methodical exposition of Roman law, and were of such weight before the tribunals that it used to be said, "Chi non ha Azzo, non vada a palazzo." Azo numbered among his pupils Accursius and Jacobus Balduinus. He died about 1230.

Azo, whose name is sometimes written Azzo and Azzolenus, and who is occasionally described as Azo Soldanus, from the surname of his father, and as Azzo Porcius, is to be distinguished from two other famous Italians of the same name; viz., Azo Lambertaccius, a canonist of the 13th century, professor of canon law at the University of Bologna, author of Qzcestiones **in** *jus canonicum,* and Azo de Ramenghis, a canonist of the 14th century, also a professor of canon law at Bologna, and author of *Repetitiones super libro* Decretorum.

AZO-COMPOUNDS, an important group of organic substances which may be prepared by the reduction of nitro-compounds in alkaline solution (using zinc dust and alkali, or a solution of an alkaline stannite as a reducing agent); by oxidation of hydrazo-compounds; or by condensation of a nitroso-compound and an amine, since the substances have the general formula R·N:N·R′, where R is an aryl radical and R' a substituted alkyl or an aryl radical. The essential difference between. these substances and diazo-compounds (*q.v.*) is that in the azo-compounds the group —N:N— is attached by both its valencies to different carbon atoms.

Azomethane $CH_3{\cdot}N{:}N{\cdot}CH_3$, the simplest azo-compound, is produced by oxidizing diinethylhydrazine (hydrazomethane) with chromic acid (J. Thiele, 1909). It is a colourless gas, condensing to a pale yellow liquid (b.p. 1·5° C).

The aromatic azo-compounds are intensely coloured, but are not capable of being used as dye-stuffs unless they contain salt-forming acid or basic groups (see DYES, SYNTHETIC). By oxidizing agents they are converted into azoxy-compounds, and by reducing agents into hydrazo-compounds or amines.

Azobenzene $C_6H_5N:NC_6H_5$, discovered by E. Mitscherlich in 1834, may be prepared by reducing nitrobenzene in alcoholic solution with zinc dust and caustic soda; by the condensation of nitrosobenzene with aniline in hot glacial acetic acid solution or by the oxidation of aniline with sodium hypobromite. It crystallizes from alcohol in orange red plates which melt at 68° C. and boil at 293° C. It does not react with acids or alkalis, but on reduction with zinc dust in acetic acid solution yields aniline.

Amino-azo-compounds of the benzene series are prepared by the molecular rearrangement of the diazoamines (see DIAZO-COMPOUNDS) when these are warmed with the parent base and its hydrochloride. They are usually yellowish brown or red in colour, the presence of more amino-groups leading to browner shades, whilst the introduction of alkylated amino-groups gives redder shades. They usually crystallize well and are readily reduced. When heated with aniline and aniline hydrochloride they yield indulines (q v.). Amino-azobenzene $C_6H_5{\cdot}N_2{\cdot}C_6H_4NH_2$, crystallizes in yellow plates or needles and melts at 126° C. Its constitution is determined by the fact that by reduction with stannous chloride it yields aniline and para-phenylenediamine. Diamino-azobenzene (chrysoidine), $C_6H_5{\cdot}N_2{\cdot}C_6H_3(NH_2)_2$, first prepared by O. Witt (1877), is obtained by coupling phenyldiazonium chloride with meta-phenylenediamine. It crystallizes in red octahedra and dyes silk and wool yellow. Bismarck brown (phenylene brown, vesuvine, Manchester brown), which contains the triamino-azobenzene. $NH_2{\cdot}C_6H_4{\cdot}N_2{\cdot}C_6H_3(NH_2)_2$ and a more complex disazo dye (E. Tauber and F. Walder, 1900) is prepared by the action of nitrous acid on meta-phenylenediamine. It forms brown crystals which are readily soluble in hot water, and it dyes mordanted cotton a dark brown. Alkylated amino-azobenzenes are also known, and are formed by the coupling of diazonium salts with alkylated amines provided they contain a free para position with respect to the amino-group.

Methyl orange (helianthin, gold orange, Mandarin orange), $(CH_3)_2N{\cdot}C_6H_4{\cdot}N_2{\cdot}C_6H_4SO_3Na$, is the sodium salt of para-dimethylaminobenzene-azobenzene sulphonic acid. It is an orange crystalline powder which is soluble in water, forming a yellow solution. The free acid is intensely red in colour. Methyl orange is used largely as an indicator. Its constitution follows from the fact that on reduction by stannous chloride in hydrochloric acid solution it yields sulphanilic acid and para-aminodimethylaniline.

Methyl red $N(CH_3)_2{\cdot}C_6H_4{\cdot}N_2{\cdot}C_6H_4{\cdot}CO_2Na$, the sodium salt of *o*—carboxybenzene-azo-dimethylaniline, is prepared by coupling diazotized anthranilic acid (benzene diazonium carboxylate) (see DIAZO-COMPOUNDS) with dimethylaniline. It is a useful indicator in acidimetry and alkalimetry.

Hydroxyazo-compounds.—The hydroxyazo-compounds are prepared by adding a solution of a diazonium salt to a cold slightly alkaline solution of phenol. The diazo-group takes up the para position with regard to the hydroxyl group, and if this be prevented it then goes into the ortho position. It never goes directly into the meta position.

The constitution of the hyroxyazo-compounds has attracted much attention, some chemists holding that they are true azophenols of the type $R{\cdot}N_2{\cdot}R{\cdot}OH$, while others look upon them as having a quinonoid structure, *i.e.,* as being quinone hydrazones of the type $R{\cdot}NH{\cdot}N:R:O$. The first to study the problem on the purely chemical side was Th. Zincke (1883–87) who found that the products obtained by coupling a diazonium salt with a-naphthol and by condensing phenylhydrazine with a-naphthoquinone, were identical; whilst R. Meldola (1889) who acetylated the azophenols, and split the acetyl products by reduction in acid solution obtained evidence of enolic structure. K. Auwers (1896–1900), examined the question from the physico-chemical standpoint by determining the freezing-point depressions, the result being that the para-hydroxyazo-compounds gave abnormal depressions; and the ortho-hydroxyazo compounds gave normal tlepressions; Auwers then concluded that the para compounds are phenolic and the ortho compounds are quinone hydrazones or act as such. A. Hantzsch (1899) considered that the hydroxyazo-compounds are to be classed as pseudo-acids, possessing in the free condition the configuration of quinone hydrazones, their salts, however, being of the normal phenolic type. J. T. Hewitt, 1900, nitrated para-hydroxyazobenzene with dilute nitric acid and found that it gave a benzene-azo-ortho-nitrophenol, whereas quinones are not attacked by dilute nitric acid. He also found by bromination experiments that the presence of mineral acid gives the azo-compound a pseudo-quinonoid character, which it does not possess if by addition of sodium acetate, the mineral acid be removed from the sphere of the reaction.

Para-hydroxyazobenzene (benzene-azo-phenol)—$C_6H_5N:N(1){\cdot}C_6H_4{\cdot}OH(4)$, is prepared by coupling diazotized aniline with phenol in alkaline solution. It is an orange-red crystalline compound which melts at 154° C. Ortho-hydroxyazobenzene, $C_6H_5N:N(1){\cdot}C_6H_4{\cdot}OH(2)$, was obtained in small quantity by E. Bamberger (1900) simultaneously with the para compound. from which it may be separated by its volatility in steam. It crystallizes in orange-red needles which melt at 82·5–83° C. Meta-hydroxyazobenzene $C_6H_5N:N(1){\cdot}C_6H_4{\cdot}OH(3)$ melting at 112–114° C. was obtained in 1903 by P. Jacobson by condensing ortho-anisidine with benzene diazonium chloride, the resulting compound then being diazotized and reduced by alcohol to benzene-azo-meta-anisole, from which meta-oxyazobenzene was obtained by hydrolysis with aluminium chloride.

Azoxy-compounds, $R{\cdot}\overline{N{\cdot}O{\cdot}N}{\cdot}R'$, are usually yellow or red crystalline solids which result from the reduction of nitro- or nitroso-compounds by heating them with alcoholic potash (preferably using methyl alcohol). They may also be obtained by the oxidation of azo-compounds. When reduced (in acid solution) they yield amines: distillation with reduced iron gives azo-compounds and warming with arnmonium sulphide gives hydrazo-compounds. Concentrated sulphuric acid converts azoxybenzene into hydroxyazobenzene (O. Wallach, 1880). Azoxybenzene $(C_6H_5N)_2O$ crystallizes from alcohol in yellow needles, which melt at 36° C. On distillation it yields aniline and azobenzene. Azoxybenzene is also found among the electro-reduction products of nitrobenzene, when the reduction is carried out in alcoholic-alkaline solution.

Mixed *azo-compounds* are those in which the azo-group ·N:N· is united with an aromatic radical on the one hand, and with a radical of the aliphatic series on the other. The most easily obtained mixed azo-compounds are those formed by the union of a diazonium salt with the potassium or sodium salt of a nitroparaffin (V. Meyer, 1876):

$$C_6H_5N_2{\cdot}NO_3 + CH_3{\cdot}CH(NO_2)K = KNO_3 + C_6H_5N_2{\cdot}CH(NO_2)CH_3.$$

Benzene-azo-nitro-ethane

Those not containing a nitro-group may be prepared by the oxidation of the corresponding mixed hydrazo-compounds with mercuric oxide. E. Bamberger (1898) has shown that the nitroalkyl derivatives behave as though they possess the constitution of hydrazones, for on heating with dilute alkalis they split more or less readily into alkaline nitrite and an acid hydrazide:

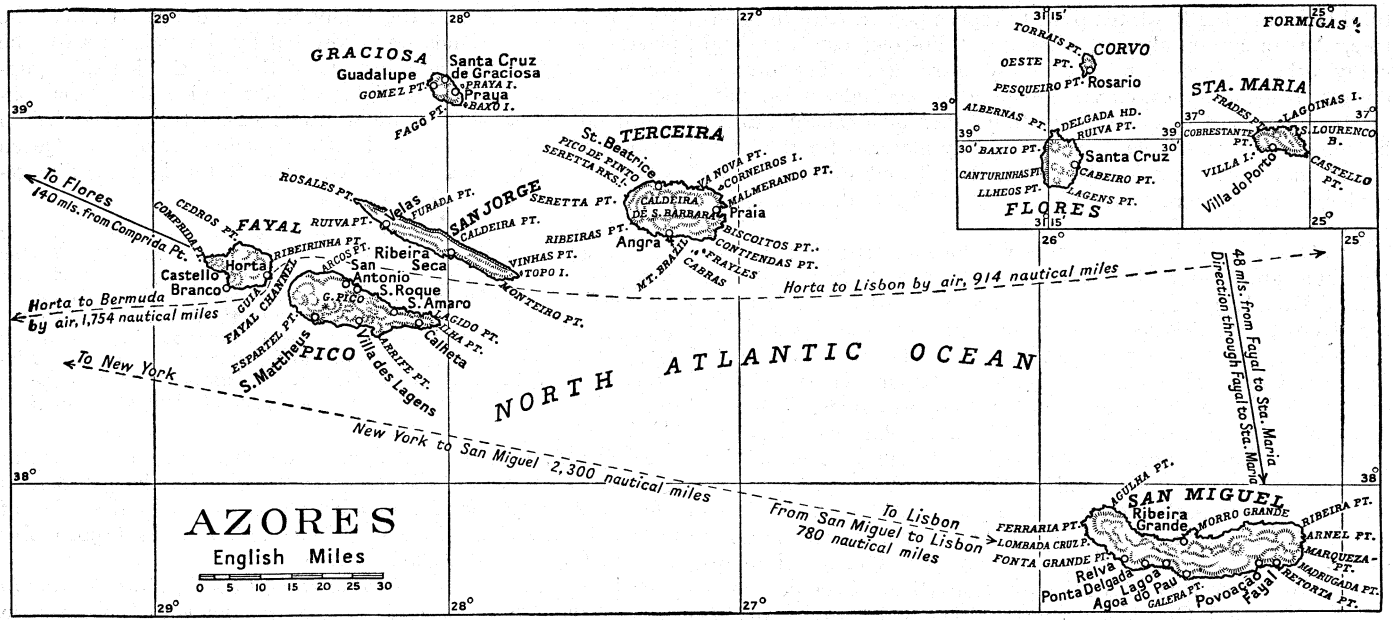
$$C_6H_5NH{\cdot}N:C(NO_2)CH_2 + NaOH = NaNO_2 + C_6H_5NH{\cdot}NH{\cdot}CO{\cdot}CH_3.$$

Benzene-azomethane, $C_6H_5{\cdot}N_2{\cdot}CH_3$, is a yellow oil which boils at 150° C. and is readily volatile in steam. Benzene-azoethane, $C_6H_5{\cdot}N_2{\cdot}C_2H_5$ is a yellow oil which boils at about 180° C with more or less decomposition. On standing with 60% sulphuric acid for some time, it is converted into the isomeric acetaldehyde-phenyihydrazone, $C_6H_5NH{\cdot}N:CH{\cdot}CH_3$.

Phenyl-azocarboxylic acid, $C_6H_5{\cdot}N_2{\cdot}COOH$, is obtained in the form of its potassium salt when phenylsemicarbazide is oxidized with potassium permanganate in alkaline solution (J. Thiele, 1895). It crystallizes in orange-red needles and is decomposed by water. (G. T. M.)

AZOIMIDE or **HYDRAZOIC ACID,** N_3H, a compound of nitrogen and hydrogen, first isolated in 1890 by Th Curtius, corresponding with diazoimino-benzene. $C_6H_5N_3$ (P. Griess, 1866), is prepared by adding amrnonia to diazobenzene perbromide.

Curtius found that either benzoylglycollic acid or ethyl benzoate gave benzoylhydrazine with hydrazine hydrate. Benzoyl-



THE AZORES. SHOWING IN THE MAIN MAP THE POSITION OF THE WESTERN GROUP AND SAN MIGUEL OF THE EASTERN GROUP. AND. IN THE TOP RIGHT INSET. THE CENTRAL GROUP AND SANTA MARIA OF THE EASTERN GROUP

The Azores stretch over a distance of 400 mi. and consist of 9 islands divided into three groups. Punic coins found at Corvo (in the central group) point to the Carthaginians having sailed here in their expeditions westward, but the first permanent foreign colonization was made by the Portuguese in 1421. As an intermediate landing stage between the Old and New Worlds, the economic development of the Azores received fresh impetus from the progress in commercial aviation; regular service was inaugurated in 1939

hydrazine gave a nitroso compound with nitrous acid, which changed spontaneously into benzoylazoimide by loss of water:

$$C_6H_5CO{\cdot}NH{\cdot}NH_2+HONO=H_2O+C_6H_5CO{\cdot}N(NO){\cdot}NH_2.$$

$$C_6H_5CO{\cdot}N(NO){\cdot}NH_2=H_2O+C_6H_5CO{\cdot}N_3$$

The resulting benzoylazoimide was easily hydrolysed by boiling with alcoholic soda, when the addition of ether, precipitating sodium hydrazoate, was in a crystalline condition.

An improved method of preparation is based on the use of hippuric acid, which reacts with hydrazine hydrate to form hippurylhydrazine, $C_6H_5{\cdot}CO{\cdot}NH{\cdot}CH_2{\cdot}CO{\cdot}NH{\cdot}NH_2$, and this substance is converted by nitrous acid into diazohippuramide, $C_6H_5{\cdot}CO{\cdot}NH{\cdot}CH_2{\cdot}CO{\cdot}NH{\cdot}N_2{\cdot}OH$, which is hydrolysed by the action of caustic alkalis with the production of salts of hydrazoic acid. To obtain the free acid it is best to hydrolyse the diazohippuramide with dilute soda, the resulting liquid being distilled with dilute sulphuric acid. The pure acid may be obtained by fractional distillation as a colourless liquid with a penetrating odour causing throbbing of the temples; it boils at 30°C., and is extremely explosive.' It is soluble in water, and the solution dissolves many metals (zinc, iron, etc.) with liberation of hydrogen and formation of salts (termed azoimides, azides or hydrazoates). The salts are explosive and readily interact with the alkyl iodides. In its properties hydrazoic acid shows some analogy with the halogen acids, since it forms difficultly soluble lead, silver and mercurous salts. The metallic salts all crystallize in the anhydrous condition and decompose on heating, leaving a residue of the pure metal. The acid is a "weak" acid, being ionized only to a very slight extent in dilute aqueous solution. Lead azide, PbN_6, is a powerful detonator employed in the military services instead of mercury fulminate. (See EXPLOSIVES.)

E. Noelting and E. Grandmougin (1891) obtained azoimide from 2:4—dinitraniline, $C_6H_3(NO_2)_2{\cdot}NH_2$, and from *ortho-* and para-nitro-anilines by converting either of these nitrated bases successively into diazomin salt, diazoperbromide and diazoimine, $NO_2\,C_6H_4{\cdot}N_3$, the last compound was hydrolysed by alcoholic potash and the resulting potassium azide KN_3, distilled with dilute sulphuric acid.

J. Wislicenus (1892) prepared sodium azide by passing nitrous oxide over heated sodamide. The acid can also be obtained by the action of nitrous acid on hydrazine sulphate; by the oxidation of hydrazine by hydrogen peroxide and sulphuric acid (A. W. Browne, 1905).

Ammonium azoimide, $N_3{\cdot}NH_4$, or N_4H_4, and *hydrazine* azoimide, N_5H_5, are soluble, explosive salts.

Chloroazoimide, $Cl{\cdot}N_3$, obtained by F. Raschig (1908), is a highly explosive colourless gas prepared by acidifying a mixture of sodium azide and hypochlorite with acetic or boric acid.

See Thorpe, Dictionary of Applied *Chemistry,* Azoimide, p. 496 (1921).

AZORES or **WESTERN ISLANDS,** an archipelago in the Atlantic Ocean, belonging to Portugal. Area, 888 sq.mi.; pop. (1940) 284,755. The islands extend from north-west to south-east, between 36° 55′ and 39° 55′ N., and between 25° and 31° 16′ W. They are divided into three widely severed groups, rising from a depth of more than 2½m. The south-eastern group consists of St. Michael's (São Miguel) and St. Mary (Santa Maria), with Formigas; the central, of Fayal (Faial), Pico, St. George (São Jorge), Terceira and Graciosa; the north-western, of Flores and Corvo. The nearest continental land is Cape da Roca in Portugal, which lies 800m. east of St. Michael's. Thus the Azores are further from the mainland than any group of Atlantic islands. In general characteristics all the component islands are very similar, rising steeply from scree-lined shores to heights reaching 7,613ft. (in Pico). Their volcanic nature is obvious, and has been shown by the numerous earthquakes and basaltic eruptions since their discovery. In 1522, the town of Villa Franca, at that time capital of St. Michael's, was buried during a violent convulsion.

Climate.— The climate is particularly temperate. The range of the thermometer is from 45" F, the lowest known extreme, or 48°, the ordinary lowest extreme of January, to 8z°, the ordinary. or 86°, the highest known extreme of July, near the level of the sea. Winds from the west and south-west render the navigation of the coasts very dangerous.

Fauna and **Flora.**—The mammalia of the Azores are limited to the rabbit, weasel, ferret, rat (brown and black), mouse and bat, in addition to domestic animals. The game includes the woodcock, red partridge (introduced in the 16th century), quail and snipe. There are valuable fisheries of tunny, mullet and bonito. The porpoise, dolphin and whale are also common. Whale-fishing is a profitable industry, with its headquarters at Fayal, whence the sperm-oil is exported.

The general character of the flora is decidedly European. Vegetation in most of the islands is remarkably rich, especially in grasses, mosses and ferns, heath, juniper and a variety of shrubs. Of tall-growing trees there was, till the 19th century, an almost

total lack; but the Bordeaux pine, European poplar, African palm-tree, Australian eucalyptus, chestnut, tulip-tree, elm, oak and many others, were then successfully introduced. The orange, apricot, banana, lemon, citron, Japanese medlar and pomegranate are the common fruits. A kind of fern *(Dicksonia culcita),* called by the natives *cebellinho,* furnishes a silky material for the stuffing of mattresses and is exported to Brazil and Portugal. The principal seaports are Angra (pop. 1930, 10,642), Ponta Delgada (18,022) and Horta (7,663).

Trade.—The trade of the Azores was long a Portuguese monopoly, but later, prior to World War II, it was shared by the United Kingdom and Germany; textiles imported from Portugal; coal from Great Britain; sugar from Germany, Madeira and the United States; stationery, hardware, chemicals, paints, oils, etc., from the United Kingdom and Germany. Exports consist chiefly of fruit, wine, natural mineral waters and provisions. Trade in pineapples is important. In addition to regular mail services, there are cables to Portugal, Ireland (Waterville), England and the continent, to America and to the Cape Verde Islands. In 1939 regular transatlantic air service via the Azores was inaugurated. The most important island is St. Michael's, with an area of 297 sq.mi.; the pop. in 1930 was 127,162. Graciosa is noteworthy for its scenery. Its chief towns are Santa Cruz de Graciosa (2,237) and Guadalupe (2,647). The chief towns of St. George are Ribeira Seca (4,091) and Velas (2,058). The inhabitants of the islands are mostly of Portuguese origin, with a well-marked strain of Moorish and Flemish blood. Negroes, mulattoes, English, Scottish and Irish immigrants are present in considerable numbers, especially in Fayal and St. Michael's. The predominant religion is the Roman Catholic, and the Azores constitute part of the ecclesiastical province of Lisbon. For purposes of military administration two line regiments of infantry and two battalions of garrison artillery are stationed in the islands.

History.—It does not appear that the Greeks and Romans had knowledge of the Azores, but from the number of their coins discovered in Corvo it has been supposed that the islands must have been visited by the Carthaginians. Arabian geographers, in the 12th and 14th centuries, describe nine islands in the Western ocean, other than the Canaries, which may be the Azores, and mention is made of hawks or buzzards, from which the present name is derived (Port. *Acor,* a hawk). Other authorities believe that references and maps earlier than 1432 describe the mythical St. Brendan Isles, since these records are incorrect as to distances, have the archipelago running north and south instead of east and west, and note no identifying physical features. Likewise, European ships before this time were incapable of so long a voyage. In 1432 Van der Berg—according to the usual account—was driven on the islands, and the news interested the court. The navigator, Gonzalo Velho Cabral—not to be confounded with his greater namesake, Pedro Alvarez Cabral—was sent to prosecute the discovery. Another version relates that Prince Henry the Navigator of Portugal had in his possession a map showing the islands, and that he sent out Cabral through confidence in its accuracy. Cabral reached the island, which he named *Santa Maria,* in 1432, and in 1444 took possession of St. Michael's. The other islands were all discovered by 1457. Colonization had meanwhile been going on prosperously; and in 1466 Fayal was presented by Alphonso V to his aunt, Isabella, the duchess of Burgundy. An influx of Flemish settlers followed, and the islands became known for a time as the Flemish Islands. From 1580 to 1640 they were subject, like the rest of the Portuguese kingdom, to Spain. At that time the Azores were the grand rendezvous for the fleets on their voyage home from the Indies; and hence they became a theatre of that maritime warfare which was carried on by the English under Queen Elizabeth against the Peninsular powers. One such expedition, which took place in 1591, led to the famous sea-fight off Flores, between the English ship "Revenge," commanded by Sir Richard Grenville, and a Spanish fleet of 53 vessels. Under the active administration of the marquis de Pombal (1699–1782), considerable efforts were made for the improvement of the Azores, but the stupid and bigoted government which followed rather tended to destroy these benefits. Towards the beginning of the 19th century, the possession of the islands was contested by the claimants for the crown of Portugal. The adherents of the constitution, who supported against Miguel the rights of Maria (II) da Gloria, obtained possession of Terceira in 1829, where they succeeded in maintaining themselves, and after various struggles, Queen Maria's authority was established over all the islands. She resided at Angra from 1830 to 1833.

AZORÍN (1874–), Spanish novelist and critic. Born at Monovar (Alicante), José Martinez Ruiz, under the pseudonym which has completely eclipsed his name, has written stories of ancient Castile in El *Alma Castellana (1600–1800)* (1900), *Los Pueblos* (1904), and *Castilla* (1912).

After the three novels La *Voluntad* (1902), *Antonio Azorín* (1903), and *Las Confesiones de un pequeño filósofo* (1904), in which are set down the self-revelations of an ordinary hero, Azorin turned to criticism, and *Al Margen de los Clásicos* (1911), *Rivas y Larra* (1916), *De Granada a Castelar* (1922) reveal him as an independent judge with a fine sense of relative values.

AZOTE: *see* NITROGEN.

AZOTH, the name given by the alchemists to mercury, and by Paracelsus to his universal remedy.

AZOTUS: *see* ASHDOD.

AZOV, a town on the left bank of the river Don, 20 mi, from its mouth, in the north Caucasian area of the R.S.F.S.R. (47° 5′ N., 39° 22′ E.). It was formerly a port, but the harbour is now silted and trade has been diverted to Taganrog and Rostov-on-Don. The chief occupation of the town is fishing. Population 19,266.

The ancient Tanais lay 10 mi. north and the Genoese factory, Tana, was here.

Formerly Azov was of military importance; it was captured by Peter the Great in 1696, restored to the Turks in 1711 and finally became Russian in 1739.

AZOV, SEA OF, an inland sea of southern Europe, communicating with the Black sea by the strait of Yenikale, or Kerch, the ancient *Bosporus Cimmerius.* To the Romans it was known as the *Palus Maeotis.* In prehistoric times a connection with the Caspian sea existed, but present conditions have obtained through the Manych depression since early historical times. It lies between 45° and 47° N. and between 35° and 39" E., its length from southwest to northeast being 370 km., and its greatest breadth 170 kilometres. The area runs to 42,000 square kilometres. It generally freezes from the end of November to the middle of April. The Don is its largest and, indeed, its only very important affluent. Near the mouth of that river the depth of the sea varies from 0.3 to 1.0 mi., and the greatest depth does not exceed 13 metres. Northeast and east winds, in July and August as well as in December, drive the water away from the very shallow gulf of Taganrog and the water level falls 2 metres or more so that ships are liable to ground. On the other hand strong southwesterly winds raise the level in the gulf of Taganrog by 1–1.5 metres. Its Turkish name, Baluk-deniz, means fish-sea. The long sandspit of Arabat on the west separates off the salter lagoons and marshes known as the Sivash or Putrid sea. On the shores of the sea of Azov stand Taganrog, Berdyansk, Mariupol and Genichesk, which export wheat, while Rostov, 45 km. upstream, is the important port for the most fertile part of Russia.

AZTEC. This most famous of native American peoples, known also as Mexica, belonged to the Nahua-speaking division of the great Uto-Aztecan family. Their traditions carry them back to an origin from an island cave in Aztlan, the situation of which has been sought in northern Mexico or beyond, but vainly, this portion of the legends being mythical, and Aztlan meaning only "Aztec place." Equally apocryphal are the legendary statements

BY COURTESY OF THE MEXICAN CHAMBER OF COMMERCE

AZTEC CALENDAR STONE. NATIONAL MUSEUM. MEXICO CITY

The surprisingly accurate chronological table of the ancient Aztecs. The stone is three feet thick and the disk part is twelve feet in diameter. It reveals an advanced knowledge of astronomy that is in sharp contrast with the barbarous practices and rituals of the Aztecs

that the Aztec ancestors some centuries before 1492 were nomadic hunters; nearly the whole range of Uto-Aztecan territory is shown by archaeological discoveries to have kno n maize agriculture several thousand years ago. These traditions are unconscious fabrications exalting the later rise of the Aztec by contrast with humble beginnings.

When the Aztec first emerge into semi-history about 1100 A.D., the Toltec power in and about the valley of Mexico was disintegrating, and the Aztec appear as one of a number of Nahua-speaking communities and peoples — the Tlazcalteca, Huexotzinca, Tlahuica, Chalca, Xochimilca, Tepaneca — attempting to obtain a lodgment in the area, or to strengthen themselves in it. The places at which according to their records the Aztec lived in this period and which can be accepted as more or less authentic, are all in the valley of Mexico or within a hundred miles to the northwest. In 1325 they effected a settlement on a marshy island near the western edge of the brackish lake of Tezcoco, named Tenochtitlan, a sister community settling at Tlatelulco a mile north.

This event marks an epoch, in that the Mexica were never again dislodged. They were at this time a small and weak town or village community, probably with limited farmlands and depending considerably on fishing and trade. They were at times subject and tributary to near-by towns, such as Culhuacan and later Tepanec Coyoacan and Atzcapotzalco, which survive as suburbs of Mexico City. After about 50 years they had become strong enough, under the patronage of Culhuacan, to reckon Acamapichtli as their first "king." Fifty years later, however, the third of the line, Chimalpopoca, was captured and killed in Atzcapotzalco.

At this point, however, the tide turned, and the new Aztec ruler, Itzcoatl, joined a revolt in 1427, which soon permanently broke the Atzcapotzalcan and Tepanec power. The lead in this war was probably taken by Tezcoco, a large town across the lake, where Toltec and immigrant "Chichimec" or semi-barbarian elements had fused, At any rate, Tenochtitlan or Mexico ("Mexica place"), Tezcoco and Tlacopan (a Tepanec town, now Tacuba), formed an offensive-defensive alliance, which preserved to each member autonomy and the right to independent conquests, but provided for the division of tribute from joint undertakings in the ratio of 2:2:1. This league, which was organized on a model no doubt long familiar in the region, prospered, but the Aztec, perhaps as the youngest and most vigorous community, became the most aggressive and soon forged ahead. When Cortez arrived the league was still in existence, but the overwhelming majority of conquests, including all at a distance, had been made by the Mexica alone, and their influence was strong in the internal affairs of Tezcoco. The whole duration of the league and of the empire growing out of it was only 90 years.

The Aztec conquests were slow at first, and confined to Mexico valley. Xochimilco, Chalco, and other towns offered a bitter and prolonged resistance. Some communities paid voluntary tribute and were regarded as allies; those that resisted or were beaten after rebelling had the captives taken away for sacrifice. Almost always conquered towns were rebuilt by the survivors, and often flourished, being left in possession of their lands, from which they paid tribute in kind. Confiscation of farmlands to the chiefly lineages of Mexico, resulting in so-called crown domains, was a custom that seems to have grown slowly, not becoming extensive, apparently, until the latter part of the 15th century.

The first conquests outside the valley of Mexico occurred under the second ruler after the throwing off of Atzcapotzalcan overlordship, Montezuma I. (1440–69), the most successful of the Aztec lords. Under him and his successors rapid progress was made in the building up of a foreign vassalage, which was still growing, though slowly and evidently near its apogee under Montezuma II., when Cortez landed near Vera Cruz in 1519. This realm was known and feared in Yucatan and Guatemala, collected tribute as far as the isthmus of Tehuantepec, and included as more or less subject populations the Otomi, Totonac, Zapotec, Mixtec, various Nahua-speaking groups, and others in the central highlands and on both Atlantic and Pacific coasts. It extended, however, only a short distance west of Mexico City, to Toluca, the Tarasca of Michoacan defeating an Aztec invasion decisively and remaining unconquered to the end.

The "empire" also included formally allied cities like Tezcoco, and others like Cholula, which were friendly, acting under Mexican direction when Cortez came, but apparently not paying tribute. It included also, territorially, the Tlaxcalteca and Huexotzinca of Tlaxcala, independent and confirmedly hostile populations, who met the Aztec almost annually in border battles, from which each side retired to sacrifice its prisoners before the temples. The populations about Oaxaca appear to have been held in precarious or intermittent subjection. Characteristic is the fact that as late as 1475, when the period of foreign domination was already well under way, the sister city of Tlatelulco "revolted."

Obviously, the Aztec empire paid no heed to territorial continuity; and quite evidently, too, it was not an empire or state in our sense but a loosely knit aggregation of units related to the dominating community in varying ways. It also embraced only a small fraction of the modern republic of Mexico. Baudelier, therefore, was largely right when he denied (*Peabody* Mus. Rep., vol. ii. 1876–79) that Montezuma II. was an emperor or even king in our sense; although he overshot the mark in trying to construe the Aztec social, economic and political status as essentially equivalent to those of a leaderless, clan-organized tribe of the United States. Aztec society grew out of a relatively primitive condition; but it had been made over.

When Tenochtitlan was founded in 1325, the population may have numbered a thousand or two; in 1519 it was probably a hundred thousand. In the interval, wealth and a species of luxury grew; the temple pyramids rose successively higher; the number of victims mounted; learning and specialization of professions increased; aqueducts, causeways, and public buildings were constructed. The whole basis of culture was, however, already provided in the civilization current in the area and shared in by hundreds of towns, large and small, according to the degree of their prosperity. Most of this civilization was already possessed by the

Toltecs. It altered in detail and appearance, so that objects of Toltec and Aztec period can usually be distinguished without difficulty. As yet, however, not a single important invention or major element of Mexican culture can be designated as having originated in the post-Toltecan period. Of what is called Aztec civilization, the bulk was carried by peoples other than the Mexica: this community came to be the administrator, legatee, dominator and disseminator of the culture. Even the Aztec realm is likely to have had a predecessor among the Toltec of Tula or Teotihuacan; and, like theirs, it would probably have crumbled in a century or two and another have arisen in its stead after a period of disintegration had the Caucasian not appeared on the scene.

Cortez conquered the Aztecs not only because of the awe, wonder and fear which he inspired and through superior organization, discipline, armament, intrepidity and ruthlessness, but because the great majority of peoples in the Aztec sphere either carefully watched the conflict from apart or allowed Cortez to impress them into his service; or, like the Tlaxcalans, aided him actively. The Mexica put up a heroic battle at the last; but it was the stand of a desperate people, outgeneralled, with the fruits of two centuries of national upbuilding already lost, and fighting almost hopelessly for self-preservation. With Tenochtitlan finally conquered, the whole empire and large surrounding districts lay completely pacified under Spanish rule.

The Spaniards carried and established Aztec place names over most of Mexico and Central America. Their speech absorbed an appreciable stock of Nahua words, which remain part of the language of the country, and some of which have become international: coyote, axolotl, ocelot, tomato, metate, chocolate. There are to-day nearly a million Indians in Mexico speaking Aztec-Nahua.

AZTEC RUIN, an American ruin of a prehistoric building of the pueblo type, situated in the valley of the San Juan river near the town of Aztec, New Mexico. It is a large structure covering 4·6ac. and containing about 500 rooms. Of this building the first storey is standing, and in 24 of the rooms the original ceilings have been preserved. Many second-storey rooms remain and also parts of third-storey rooms. Where still intact, the ceilings are upheld by large wooden beams which were cut and dressed with stone tools. The sandstone walls, still reasonably perpendicular, have dressed faces. These ceilings and walls are interesting examples of carpentry and masonry done in the Stone age. The Aztec ruin is the most striking and best preserved of a large group of ruins that serve as an index to the ancient cultures that flourished in the San Juan valley. Excavations have brought to light objects indicating that portions of the Aztec ruin are of the same age as the ruins of Chaco Canyon (*q.v.*). In 1923 the American Museum of Natural History, which has conducted systematic explorations of the building, presented the plot of land containing it to the United States, and immediately thereafter it was established as a national monument. The town of Aztec is reached by rail and is also on the route of the national park-to-park highway. *See* NATIONAL PARKS AND MONUMENTS.

AZUAGA, western Spain, province of Badajoz. Population 16,577. Azuaga is the livestock market of the broad upland pastures watered by the Matachel, a tributary of the Guadiana, and by the Bembézar. a tributary of the Guadalquivir.

AZUAY, a province of Ecuador, 3,872 sq.mi., est. pop. (1942) 254,147, bounded north by the province of Caiiar, east by Oriente, south by Loja, and west by El Oro and Guayas. It was formerly called Cuenca, and formed part of the department of Azuay, which also included the province of Loja. Azuay is an elevated mountainous district with a great variety of climates and proddcts. Among the products are silver, quicksilver, wheat, Indian corn, barley, cattle, wool, cinchona and straw hats. The capital is Cuenca.

AZUNI, DOMENICO ALBERTO (1749–182j), Italian jurist, was born at Sassari, in Sardinia, in 1749, and died at Cagliari, where he was consular judge and director of the university library. He studied law at Sassari and Turin, and in 1782 was made judge of the consulate at Nice. In 1786–88 he published his *Dizionario Universale Ragionato della Giurisprudenza Mercantile.* In 1795 appeared his systematic work on the maritime law of Europe, *Sistema Universale dei Principii del Diritto Maritimo dell' Europa,* which he afterwards recast and translated into French.

AZURARA, GOMES EANNES DE (?–1474), the second notable Portuguese chronicler in order of date. He adopted the career of letters in middle life. He probably entered the royal library as assistant to Fernão Lopes (*q.v.*) during the reign of King Duarte (1433–38), and he had sole charge of it in 1452. His *Chronicle of the Siege and Capture of Ceuta,* a supplement to the *Chronicle of King John I.,* by Lopes, dates from 1450, and three years later he completed the first draft of the *Chronicle of the Discovery and Conquest of Guinea,* our authority for the early Portuguese voyages of discovery down the African coast and in the ocean, more especially for those undertaken under the auspices of Prince Henry the Navigator. It contains some account of the life work of that prince, and has a biographical as well as a geographical interest. On June 6 1454, Azurara became chief keeper of the archives and royal chronicler in succession to Fernão Lopes. In 1456 King Alphonso V. commissioned him to write the history of Ceuta, "the land-gate of the East," under the governorship of D. Pedro de Menezes, from its capture in 1415 until 1437, and he had it ready in 1463. A year afterwards the king charged him with a history of the deeds of D. Duarte de Menezes, captain of Alcacer, and, proceeding to Africa, he spent a twelvemonth in the town collecting materials and studying the scenes of the events he was to describe, and in 1468 he completed the chronicle. Azurara was laborious, accurate and conscientious, though his position did not allow him to tell the whole truth about his hero, Prince Henry.

His works include: (1) *Chronica dsl Rei D. Joam. I. Terceira parte em que se contem a tomada de Ceuta* (1644); (2) *Chronica do Descobrimento e Conquista de Guiné* (1841; Eng. version issued by the Hakluyt Society, 1896–99); (3) *Chronica do Conde D. Pedro (de Menezes),* printed in the *Ineditos de Historia Portugueza,* vol. ii. (1792); (4) *Chronica do Conde Duarte de Menezes,* printed in the *Ineditos,* vol. iii. (1793). The preface to the English version of the *Chronicle of Guinea* contains a full account of the life and writings of Azurara and cites all the authorities.

AZURE, the lapis lazuli, a blue stone (Arab. *al-lazward,* the initial "l" having dropped), hence the colour blue, described in heraldry (q *v.*) as "azure." The word is also applied to the clear blue of a cloudless sky The pigment ultramarine blue was originally produced from powdered lapis lazuli.

AZURITE or **CHESSYLITE,** a basic copper carbonate $2CuCO_3{\cdot}Cu(OH)_2$. Its vivid blue colour contrasts strikingly with the emerald-green malachite, which usually accompanies it. It was known to Pliny as *caeruleum.* The name chessylite is taken from Chessy, near Lyon, where many fine crystals belonging to the monoclinic system have been found. Hardness 3·5-4, sp. gr. 3.8.

Azurite occurs with malachite in the oxidized portions of copper lodes, being due to alteration of copper sulphides by meteoric waters. It is often formed also by reaction between copper-bearing solutions and limestone. It is a common mineral in nearly all copper mines.

AZYMITES, a name given by the Orthodox Eastern to the Western or Latin Church, because of the latter's use of unleavened bread in the eucharist, a practice which arose in the 9th century. (Gr. ἀ-, privative, ζύμη, leaven). The Orthodox Church strenuously maintains its point, arguing that the example of Jesus and the early church alike testify against the use of unleavened bread in this connection.

B THIS letter, corresponding to Semitic *beth* and Greek *beta,* has retained the second place in the alphabet from the earliest times. Its form in the writing of the Moabite Stone, dating from the 9th century B.C., was  . Early Greek forms were  and  . The usual Greek form was or B, and in Latin these two latter forms appear unchanged, giving the modern B. An uncial form occurs in the 6th century A.D. strangely resembling the early Greek forms from the island of Thera, but there can scarcely be a direct connection, the two similar forms having developed independently.

Our minuscule form *b* is a descendant of Latin cursive  . In this form the upper loop is extremely elongated and has almost disappeared. The early Irish form was  , the Carolingian (9th or 10th centuries) . As early as the 2nd century A.D. we find a form , in which the upper loop of the letter has disappeared in the speed of writing.

CLASSICAL LATIN AND ONWARDS		

THE DEVELOPMENT OF THE LETTER B FROM ITS EARLIEST TO ITS PRESENT FORM COVERS A PERIOD OF SOME 3.100 YEARS. THE "THERAEAN" FORM IS FROM THE ISLAND OF THERA

The sound represented by the letter is the voiced labial stop. It stood for this sound in the Semitic languages, and in Greek and Latin. From the 2nd century A.D. onwards the sound in Latin tended to become a bilabial spirant, for we find confusion in spelling between b and *u.* The letter however, did not fall into disuse and was used by the Romance languages to represent the voiced labial stop, which was redeveloped by them. In English the sound was always present, an original Indo-European **bh* being represented by it.

In music, B is the second note of the musical alphabet and the 7th degree of the "natural scale" of C. In Germany, however, the alphabetical name for this note is, not B, but H, while B stands for B flat, a fact which it is important to remember in dealing with German music, German writings on music, and so on. Thus in German nomenclature Schubert's "Unfinished" symphony is not in B minor but in H moll (minor), while Brahms's second pianoforte concerto stands as being, not in B flat, but in B.

BAADER, FRANZ XAVER VON (1765–1841), German theologian, born at Munich, on March 27, 1765, studied medicine at Ingolstadt and Vienna, and later became a mining engineer. While in England (1792–96) he was introduced to the mysticism of Boehme and the empiricism of Hume, Hartley and Godwin. On his return to Hamburg he became acquainted with Jacobi and with Schelling. Between Baader and Schelling there was mutual influence until Baader's denunciation of modern philosophy in a letter (c. 1822) to Alexander I. of Russia entirely alienated Schelling.

Meanwhile Baader continued to apply himself to his profession of engineer, gaining a prize of 12,000 gulden (about £1,000) for his new method of employing Glauber's salts instead of potash in the making of glass. From 1817–20 he held the post of superintendent of the Bavarian mines. He retired in 1820, and in 1822 published his *Fermenta Cognitionis,* in which he combats modern philosophy and recommends the study of Boehme. In 1826 he was appointed professor of philosophy and speculative theology at the new university of Munich. Some of the lectures were published under the title, *Spekulative Dogmatik* (1827). In 1838 he ceased to lecture owing to a ministerial order prohibiting laymen from lecturing on philosophy and theology.

The facts that Baader left no systematic works and that he usually expressed himself in obscure aphorisms or mystical symbols make it difficult to summarize his philosophy. He believes that reason must be supplemented by faith and church tradition and that it must clarify the truths given by authority and revelation. But in his attempt to correlate the two realms he approaches the mysticism of Eckhart, Paracelsus and Boehme. Human knowledge is never mere *scientia,* it is invariably *con-scientia*—a knowing with a consciousness of God whose knowledge compenetrates ours. God is not to be conceived as mere abstract Being, but as an everlasting process of activity which is distinguishable under two aspects—the immanent or esoteric, and the emanent or exoteric. As regards ethics, Baader rejects the Kantian or any autonomic system of morals. Not obedience to a moral law, but realization in ourselves of the divine life is the true ethical end. But because man has alienated himself from God no ethical theory which neglects the facts of sin and redemption (and the necessity of prayer and the sacraments) is satisfactory. The history of man and of humanity is the history of the redeeming love of God. Man in his social relations is under two great institutions. One is temporal, natural and limited—the state; the other is eternal, cosmopolitan and universal—the

church. In the state two things are requisite: first, common submission to the ruler, which can be secured or given only when the state is Christian, for God alone is the true ruler of men; and, secondly, inequality of rank, without which there can be no organization. A despotism of mere power and liberalism, which naturally produces socialism, is equaliy objectionable. The ideal state is a civil community ruled by a universal or Catholic church, the principles of which are equally distinct from mere passive pietism, or faith which will know nothing, and from the Protestant doctrine, which is the very radicalism of reason.

Baader ranks among the greatest speculative theologians of modern catholicism, and his influence has extended itself even beyond the precincts of his own church. Among those whom he influenced were R. Rothe, Julius Muller and Hans L. Markensen.

His works were published by a number of his adherents—F. Hoffmann, J. Hamberger, E. v. Schaden, Lutterbeck, von Osten-Sacken and Schluter—Baader's *sammtliche Werke* (16 vols., 1851–60). Valuable introductions by the editors are prefixed to the several volumes. *See* F. Hoffmann, *Vorhalle zur spekulativen Lehre Baader's* (1836); *Grundzüge der Societats-Philosophie Franz Baader's* (1837); *Philosophische Schriften* (3 vols., 1868–72); *Die Weltalter* (1868); *Biographie und Briefwechsel* (Leipzig, 1857); J. BAAL, the name of a god, is properly a Semitic word signifying lord or owner. The word is used more generally as a noun of relation, *e.g.* a *ba'al* of hair, "a hairy man" (2 Kings i. 8), b. of wings, "a winged creature," and in the plural, b. of arrows, "archers" (Gen. xlix. 23), b. of oath, "conspirators" (Neh. vi. 18).

In the Old Testament it is regularly written with the article, *i.e.* "*the* Baal"; and the baals of different tribes or sanctuaries were not necessarily conceived as identical, so that we find frequent mention of Baalim, or rather "the Baalim" in the plural. That the Israelites even applied the title of Baal to Yahweh himself is indicated by the occurrence of such names as Jerubbaal (Gideon), Eshbaal (one of Saul's sons) and Beeliada (a son of David, 1 Chron. xiv. 7). The last name appears in 2 Sam. v. 16 as Eliada, showing that El (God) was regarded as equivalent to Baal; cf. also the name Be'aliah, "Yahweh is *baal* or lord," which survives in 1 Chron. xii. 5. However, when the name Baal was exclusively appropriated to idolatrous worship (cf. Hos. ii. 16 seq.), abhorrence for the unholy word was marked by writing *bosheth* (shameful thing) for *baal* in compound proper names and thus we get the forms Ishbosheth, Mephibosheth.

The innumerable baals could be distinguished by the addition of the name of a place or of some special attribute. Accordingly, the baals are not to be regarded necessarily as local variations of one and the same god, like the many Virgins or Madonnas of Catholic lands, but as distinct *numina.* The Baal, as the head of each worshipping group, is the source of all the gifts of nature (cf. Hos. ii. 8 seq., Ezek. xvi. 19); as the god of fertility all the produce of the soil is his, and his adherents bring to him their tribute of first-fruits. He is the presiding genius, patron or cause of all growth and fertility, and baalism, originating, probably, in the observation of the fertilizing effect of rains and streams upon the receptive and reproductive soil, became gross nature-worship. Joined with the baals there are naturally found corresponding female figures known as Ashtāroth, embodiments of Ashtōreth (see ASTARTE; ISHTAR). In accordance with primitive ideas which assume that it is possible to control or aid the powers of nature by the practice of "sympathetic magic" (see MAGIC), the cult of the baals and Ashtāroth was characterized by gross sensuality and licentiousness. The fragmentary allusions to the cult of Baal Peor (Num. xxv., Hos. ix. 10, Ps. cvi. 28 seq.) exemplify the typical species of Dionysiac orgies that prevailed On the summits of hills and mountains flourished the cult of the givers of increase, and "under every green tree" were practised the cults believed to secure abundance of crops. Human sacrifice (Jer. xix. 5), the burning of incense (Jer. vii. 9), violent and ecstatic exercises, ceremonial acts of bowing and kissing, the preparing of sacred mystic cakes, appear among the offences denounced by the Israelite prophets, and show that the cult of Baal (and Astarte) included the characteristic features of heathen worship which recur in various parts of the Semitic world, although attached to other names.

A Baal of the heavens appears to have been known among the Hittites in the time of Rameses II.; and considerably later, at the beginning of the 7th century, it was the title of one of the gods of Phoenicia. In Babylonia, from a very early period, Baal became a definite individual deity (Bel), and was identified with the planet Jupiter. This development is a mark of superior culture and may have been spread through Babylonian influence. Both Baal and Astarte were venerated in Egypt at Thebes and Memphis in the 19th dynasty, and the former, through the influence of the Aramaeans who borrowed the Babylonian spelling Bel, ultimately became known as the Greek Bēlos who was identified with Zeus. Of the worship of the Tyrian Baal, who is also called Melkart (king of the city), and is often identified with the Greek Heracles, but sometimes with the Olympian Zeus, we have many accounts in ancient writers, from Herodotus downwards. He had a magnificent temple to which gifts streamed from all countries, especially at the great feasts. The solar character of this deity appears especially in the annual feast of his awakening after the winter solstice (Joseph, contra *Apionem* i. 18). At Tyre, as among the Hebrews, Baal had his symbolical pillars, one of gold and one of smaragdus, which, transported by phantasy to the farthest west, are still familiar to us as the Pillars of Hercules. His name occurs as an element in Carthaginian proper names (Hannibal, Hasdrubal, etc.), and a tablet found at Marseilles still survives to inform us of the charges made by the priests of the temple of Baal for offering sacrifices.

The history of Baalism among the Israelites is obscured by the difficulty of determining whether the false worship which the prophets stigmatize is the heathen worship of Yahweh under a conception, and often with rites, which treated him as a local nature god; or, whether Baalism was concciously recognized to be distinct from Yahwism from the first. The earliest certain reaction against Baalism is ascribed to the reign of Ahab, whose marriage with Jezebel gave the impulse to the introduction of a particular form of the cult. In honour of his wife's god, the king, following the example of Solomon, erected a temple to the Tyrian Baal. This, however, did not prevent him from remaining a follower of Yahweh, whose prophets he still consulted, and whose protection he still cherished when he named his sons Ahaziah and Jehoram ("Yah [weh] holds," "Y. is high"). The antagonism of Elijah was not against Baalism in general, but against the introduction of a rival deity. But by the time of Hosea (ii. 16 seq.) a further advance was marked, and the use of the term "Baal" was felt to be dangerous to true religion. Thus there gradually grew up a tendency to avoid the term, and in accordance with the idea of Ex. xxiii. 13, it was replaced by the contemptuous *bōsheth,* "shame" (see above). However, the books of Deuteronomy and Jeremiah (cf. also Zeph. i. 4) afford complete testimony for the prevalence of Baalism as late as the exile, but prove that the clearest distinction was then drawn between the pure worship of Yahweh the god of Israel and the inveterate and debased cults of the gods of the land. (See further HEBREW RELIGION; PROPHET.)

BIBLIOGRAPHY.—W. Robertson Smith, *Relig. Semites,* 3rd ed. pp. 93–113 and the additional notes pp. 532–536 with the references. On *Beltane* fires and other apparent points of connection with Baal it may suffice to refer to Aug. Fick, *Vergleich. Worterbuch,* who derives the element *bel* from an old Celtic root meaning shining, etc.

(W. R. S.; S. A. C.)

BAALBEK, a town of the Beka' (Coele Syria), known to the ancients as Heliopolis, altitude 3,850ft., on the watershed separating the Lītānī (Leontes) and the 'Asī (Orontes), hard against one of the lower ridges of the Antilebanon: the population is

about 3,000, consisting of Christians, Mohammedans and Mutawilis in approximately equal numbers. Baalbek is the principal town in the eastern district of the State of the Great Lebanon (French mandated territory until 1941, when Lebanon became an independent republic) and is the see of an Uniate Greek bishop. A river, which rises at Ras el-'Ain, one mile E., provides an abundant supply of good water and drives a number of mills. Since 1902 Baalbek has been connected by railway with Damascus and Beirut via Rayāk, and since 1907 with Aleppo. Portions only of the wall, 2 mi. in circumference, which formerly enclosed the town, are still visible, but the main feature of interest is furnished by the vast and stately temple ruins of the Roman period.

History.—Baalbek in classical times was a centre whence roads radiated to Homs, Tripoli, Juneh, Beirut, Damascus, Sidon and Tiberias. The name has given rise to conjecture. Derivations have been suggested from Baal-Melek (Hoflmann), and Baal-Beka' (Puchstein, Kittel) and identifications with Baal-Gad (Josh. xi. 17.—Thomson), Tunip of the Tell-Amarna letters (Halévy, Winckler). A recent identification is with Kar-(H)adad mentioned in a list of cities taken by Tiglath-Pileser III. in 738 B.C. (Dussaud). No doubt it was early a seat of Baal worship and as the Greeks identified Baal with Hēlios they called the city Heliopolis. Augustus (31 B.C.–A.D. 14) made it into a Roman colony (Julia Augusta Felix) and furnished it with a garrison, and about the close of the second century Septimius Severus bestowed upon it the *ius Italicum,* a boon granted to favoured provincial cities. Antoninus Pius (138–161) initiated the building of a sanctuary to Jupiter Heliopolitanus (Hadad?) whose completion engaged the attention of his successors down to Caracalla (211–217). Before Antoninus' time the gods of Baalbek were already famous and Trajan did not disdain to consult the oracle there. Two other temples were erected later, one to Bacchus (or Atargatis?) and the other to Venus (or Fortuna?). Local representations of Jupiter Heliopolitanus depicted him as beardless, with scaly drapery, a whip in his right hand and lightning and ears of grain in his left, therein exhibiting a marked resemblance to the Babyionian conception of Adad. It has been a generally accepted view that Constantine (324–337) or Theodosius (379–395) converted the Great Court of the larger temple into a church, but on fresh evidence a date as late as the 6th century has been claimed for the erection of the Christian basilica (Thiersch). The Arabs under Abu Ubaida took possession of the town in 635 and converted the temple area into a citadel. Baalbek was the scene of fighting between 'Ali and Mu'āwiya, rivals for the caliphate, in 659. El-Welīd (705–71j) is credited with removing the gilded dome of brass from a church in Baalbek (the Basilica?) to set over the rock in Abd el-Malik's mosque (Dome of the Rock) in Jerusalem. The city wall was demolished by Marwān II. (744–748) to chasten the inhabitants for joining an insurrection. According to the Arab historian Makrīzī (15th century), whose family and name were of Baalbek although he himself was born in Cairo, during the Carmathian occupation (10th century) the town suffered a massacre of its inhabitants at the hands of these fanatics. Damascus swayed largely Baalbek's fortunes in the 12th century. In 1110 it was besieged and taken by Tughtakin, emir of Damascus, who suspected its governor of dealings with the crusaders (1110). The crusaders, indeed, raided within sight of its walls, but never took the city. Zengi, emir of Mosul, after a siege secured the surrender of its citadel on promising to spare the lives of the defenders (1139). He kept his promise by flaying the governor alive. The earthquakes which desolated Syria in the 12th century (1139, 1157, 1170) took heavy toll at Baalbek. In 1175 it surrendered to Saladin. The year 1260 marked the arrival of the Mongol Hulagu to enter in and destroy. Yet it arose from its ashes under the rule of the mameluke sultans and to the reign of the enlightened Kalawun (1277–90) its fine Muslim architecture in mosque and fortress must be mainly attributed. The town was sacked by Timur in 1400. An Arab writer of the end of the 15th century describes Baalbek as a "city possessing a strong fortress with columns erected by Solomon, mosques, schools. fine streets, baths, gardens. rivers. all which it mould take too long to describe." In 1j17 it passed with the rest of Syria into the possession of the Turks, whose hold, however, on the Lebanon district continued ineffective, leaving Baalbek in actuality in the hands of the Mutawilis until in the latter half of the 18th century the "Butcher" pasha of Acre (Jezzār) laid it waste. Ibrāhīm Pasha, the adopted son of Mohammed 'Ali of Egypt, occupied it in 1832. Baalbek returned to Turkish possession in 1840, and following the settlement of the Lebanon after the massacres there in 1860 it attracted tourists. In 1941 it came under British and Fighting French control.

Ruins.— The ruins for which Baalbek is world famous are vast and cover an enormous area. European attention was first directed to them in the 16th century by Baumgarten (1507) and Belon du Mans (1553). The destruction of the mighty temple, one of the grandest architectural achievements of all time, was accomplished apparently by a succession of earthquakes, the havoc wrought at Baalbek by that of 1759 being within European ken. From 1898 to 1905 a German expedition under Prof. O. Puchstein investigated the site. (1) *The Acropolis* is situated to the west of the present town. Within its area are included the ruins of two temples with their extensions in side galleries and annexes *(exedrae).* The temples were erected on an artificial terrace formed by an understructure of vaults varying in height from 24ft. to 42ft. above the surrounding terrain. Part of the wall of enclosure on the north-west is formed of enormous blocks of stone. Three of these, built into the wall 20ft. from the ground and most accurately masoned, are each roughly 62ft.×14ft.×11ft. In each block there is said to be sufficient stone to build a square house with 60ft. frontage, 40ft. height and walls 1ft. thick. A companion stone somewhat larger, shaped but not entirely detached from its bed, can still be seen in the quarry on the outskirts of Baalbek to the south-west. Historians of Byzantine times called them *Trilithon* and the name passed to the acropolis. The original main approach to the temple area was on the east by a stairway joyd. wide, which was destroyed to make way for the moat of the Arab fortress. The German expedition reconstructed a part of it (190j). (2) *Propylaea.* At the head of the stairway was a vestibule, 150ft.×36ft. flanked by square towers, with a frontage of 12 columns. of which the bases alone are left. Three of them bear inscriptions to Antoninus Pius, Julia and Caracalla respectively. (3) *Forecourt.* Three gateways in a richly ornamented screen provided entry to a hexagonal-shaped forecourt about 180ft. in diameter with a peristyle. It was flanked north and south by rectangular *exedrae* with four columns of red granite at each entrance. (4) *Great Court.* Through a majestic doorway of three bays (the northern alone remains) entrance was sought to the Great Court, which was roughly 340ft. square or with *exedrae* 450 feet. In it was the altar. The court was surrounded by a peristyle of 84 columns, furnishing access to richly ornamented *exedrae.* (5) *Basilica.* On the site of the Great Court there was erected by the Christians during the 4th or, as is now suggested, the 6th century a *basilica* comprising three naves, the central one being of double width It was built at first facing west and the apses were built into the first landing of the flight of steps leading to the Jupiter temple. Later, when oriented east, a new apse was erected. In the course of excavation half of the imposing altar of sacrifices was discovered and on the north side of the court a long basin (*piscina*) used for lustration. A corresponding one on the south side was destroyed in later times to make way for liturgical baths. This installation was connected at some time or other by means of a passage with the mosque in the south-west corner of the acropolis. (6) *Temple of Jupiter.* An imposing stairway, later disturbed by the apses of the basilica,, led to the temple dedicated to Jupiter-Hadad, or rather to the "gods of Heliopolis." Its shrine (*cella*), 290ft. by 60ft., was surrounded by a peristyle of 19 columns (Corinthian capitals) on each flank and ten on each front. Of these six only are left standing (south side). The columns are 62ft. high and 7½ft. in diameter, each consisting of three blocks bound together with bronze cramp pins. (7) *The Bacchus or Atargatis Temple* Some 40yd. to the south. on a different substructure and less high. stands a temple much smaller but better preserved and equally of Corinthian style. Commonly attributed to Bacchus it has

recently been attributed to Atargatis (Demeter) by Thiersch. The vestibule contains a row of six fluted colunins. Of the 46 columns, each 52ft. high, forming the peristyle, 19 still stand. A wonderful doorway with jambs and lintels elaborately ornamented with bacchantes, satyrs and genii and with vine leaves and stems, leads to the *cella* (87ft.×75ft.), whose walls still stand at half their original height. The sanctuary (*adytum*) at the west end is approached from the *cella* by a short flight of steps. On the south-east of this temple is an Arab bastion of which two out of three storeys remain. Some 300yd. from the acropolis in the midst of the town is a round temple of the late imperial age attributed to Venus (or Fortuna?). Its transformation into a Greek chapel dedicated to St. Barbara (whose place of martyrdom, however, was the Egyptian Heliopolis) ensured its preservation. To the north of the town is a ruined mosque, formerly the church of St. John, and also fragments of the façade of a Roman theatre.

BAARN, a town in the Netherlands, 5 mi. by rail east of Hilversum. Pop. (1940) 13,248. It is a favourite summer resort of people from Amsterdam. The Baarnsche Bosch, or wood, stretches southward to Soestdyk, where there is a royal country seat, originally acquired by the State in 1795. In 1816 the estate was presented by the nation to the prince of Orange (afterward Ring William II) in recognition of his services at the battle of Quatre Bras. Until the invasion of the Netherlands in 1940, the estate was the residence of Princess Juliana.

BAB, an Arabic word meaning "gate," used largely in place-names in the Near East, as Báb-el-Mandeb (*q.v.*). The word was brought into greater prominence in the phrase "The Bib" as a designation for Mirza Ali Muhammad ibn Radhik, founder of Bábiism (*q.v.*), on account of his taking the name *Báb-ud-Din* (Gate of the Faith) before spreading his teachings.

BABADAG, a Rumanian town in the department of Tulcea. on the main metalled road from Constanza to Tulcea. In 1930 it had a population of 4,607. It is normally a centre for distribution of agricultural produce of the northern Dobruja. It lies upon a railway line under construction at the time of World War II for connecting Tulcea with Mejidia, thus linking up the main Constanza-Bucharest line with Bessarabia at Ismail and ensuring traffic across the Danube. The town is Turkish in origin, having been founded by Bayezid I in the fourteenth century. It served as Turkish headquarters during nineteenth century campaigns against Russia.

BABBAGE, CHARLES (1792–1871), English mathematician and mechanician, was born at Teignmouth, Devonshire. He was educated at a private school and at St. Peter's college, Cambridge. In the years 1815–17 he contributed three papers on the "Calculus of Functions" to the *Philosophical Transactions,* and in 1816 was made a fellow of the Royal Society. With Sir John Herschel and George Peacock he sought to raise the standard of mathematical instruction in England, and especially endeavoured to supersede the Newtonian by the Leibnitzian notation in the infinitesimal calculus. Babbage's attention seems to have been very early drawn to the number and importance of the errors introduced into astronomical and other calculations through inaccuracies in the computation of tables. He contributed to the Royal Society some notices on the relations between notation and mechanism; and in 1822, in a letter to Sir H. Davy, on the application of machinery to the calculation and printing of mathematical tables, he discussed the principles of a calculating machine, to the construction oi which he devoted many years of his life. Government was induced to grant its aid, and he travelled in Europe, examining different systems of machinery; and some of the results of his investigations were published in the cdmirable little work, *Economy of Machinery and Manufactures* (1832). The great calculating machine was never completed; the constructor apparently desired to adopt a new principle when the first specimen was nearly complete, to make it not a difference but an analytical machine, and the government declined to accept the further risk (see CALCULATING MACHINES). From 1828 to 1839 Babbage was Lucasian professor of mathematics at Cambridge. He contributed largely to several scientific periodicals, and was instrumental in founding the Astronomical (1820) and Statistical (1834) Societies. He only once endeavoured to enter public life when, in 1832, he stood unsuccessfully for the borough of Finsbury. During the later years of his life he resided in London, devoting himself to the construction of machines capable of performing arithmetical and even algebraical calculations.

His *Passages from the Life of a Philosopher* (1864) throws considerable light upon his somewhat peculiar character. He wrote *Tables of Logarithms* (1826); *Comparative View of the Various Institutions for the Assurance of Lives* (1826); *Decline of Science in England* (1830); *Ninth Bridgewater Treatise* (1837); *Tlze Exposition of 1851* (1851).

See *Monthly Notices, Royal Astronomical Society,* vol. 32.

BABBITT, IRVING (1865–1933), American scholar, was born in Dayton, O., on Aug. 2, 1865. After graduating at Harvard in 1889 he continued his studies in Paris and in 1893–94 was instructor in Romance languages at Williams college. In 1894 he went to Harvard in the same capacity and was made professor of French literature in 1912. His attention became centred on an analysis of the theories of the classicists, neo-classicists and romantics, and while this was chiefly applied to problems of literary criticism he extended it also to art and politics. His general conclusion was that the romantics, whom he considered chiefly inspired by Rousseau, exaggeraled the two elements of liberty and sympathy and that in the name of these articles of faith they brought about an undesirable confusion of genres. The romantic exaltation of the ego, according to him, injected into the 19th century a spirit of revolt which denied the worth of what he considered fundamental laws and injured artistic and social thought.

Among his publications are: *The New Laokoön* (1910); *The Masters of Modern French Criticism* (1912); *Rousseau and Romaszticism* (1919) and *Democracy and Leadership* (1924).

BABBITT, ISAAC (1799–1862), American inventor, was born in Taunton, Mass., on July 26, 1799. He was trained to be a goldsmith and thus had some opportunity to experiment with metals, in which work he succeeded in making the first britannia ware produced in the United States (1824). Ten years later he went to Boston and while employed there by the South Boston Iron Co., in 1839, he made one of the types of alloy now known as Babbitt metals. They are hard compositions of tin with antimony and copper, and are used for bearings. For this invention he received a gold medal from the Massachusetts Charitable Mechanics' Association and an award of $20,000 from Congress. He became a manufacturer of this metal and of soap. He died in Somerville, Mass., on May 26, 1862.

BABBITT'S METAL, an alloy, invented by Isaac Babbitt, for the special purposes of machine bearings. A typical anti-friction alloy of this type contains 25 parts of tin, 2 parts of antimony and 0·5 part of copper. According to the British Admiralty specification for an anti-friction alloy in marine engines the metal should contain 2 to 7% of copper and 8 to 9% of antimony, the remainder being tin Babbitt metal contains two inter-metallic compounds SbSn and Cu_3Sn; these comparatively hard constituents are set in a soft plastic matrix containing the excess of tin. Alloys consisting of hard and soft constituents are of special value as anti-friction materials. (*See* ANTI-FRICTION METALS.)

BABBLER, the general name applied to members of a large Old World family of birds (Timeliidae), sometimes united with the thrush family (Turdidae). The best known are the Chinese robin (*Liothrix lutea*), the coach-whip bird (*Psophodes*) and the crow-tits (*Paradoxornithinae*).

BABEL, the native name of Babylon (*q.v.*). The name has become associated with the Tower of Babel. According to the narrative in Genesis, mankind after the flood attempted to build a tower whose top would reach unto heaven. They were, however, prevented through their speech being confounded, and the etymology of the name traditionally is found in the Hebrew verb *bālal* to confound. The original of the tower of Babel has been found in the temple of E-Sagila at Babylon but local and Jewish tradition associated it with the stage-tower of Borsippa. It is possible, however, that many of the stage-towers of Mesopotamia may have become confused in the story, which is widely scattered over the world. Versions have been recorded from near the Zambezi and also from Ashanti; among some of the Tibeto-Burman peoples of Assam the story of a tower and confusion of speech is found. Similar tales are found in Mexico, especially with reference to the great pyramid of Cholula, but these stories may be due to culture contact after the introduction of Christianity, as is the case with other Mexican legends.

BIBLIOGRAPHY.—Sir James Frazer, Folklore in *the Old* Testament (contains references to all the literature).

BABEL, TOWER OF, according to Gen. xi. a structure which was erected in the plain (or valley) of Shinar and here the confusion of tongues is said to have taken place. The name "Babel," however, gives a totally different interpretation of the structure for it is derived from *bab,* a gate, and *ilu,* god. The "confusion" of tongues would be correctly indicated by *balal,* a Semitic word meaning "to confuse."

The myth on which the building of the Tower of Babel rests is to the effect that at the time when all men formed a single unit and began their wanderings over the earth they arrived at the plain of Shinar and conceived the idea of a structure which would enable them to reach to Heaven. The gods were alarmed at this suggested intrusion and, descending to the earth, struck terror to the hearts of men by confounding their speech so that no man could understand his neighbour. From this time men wandered steadily abroad and founded independent colonies.

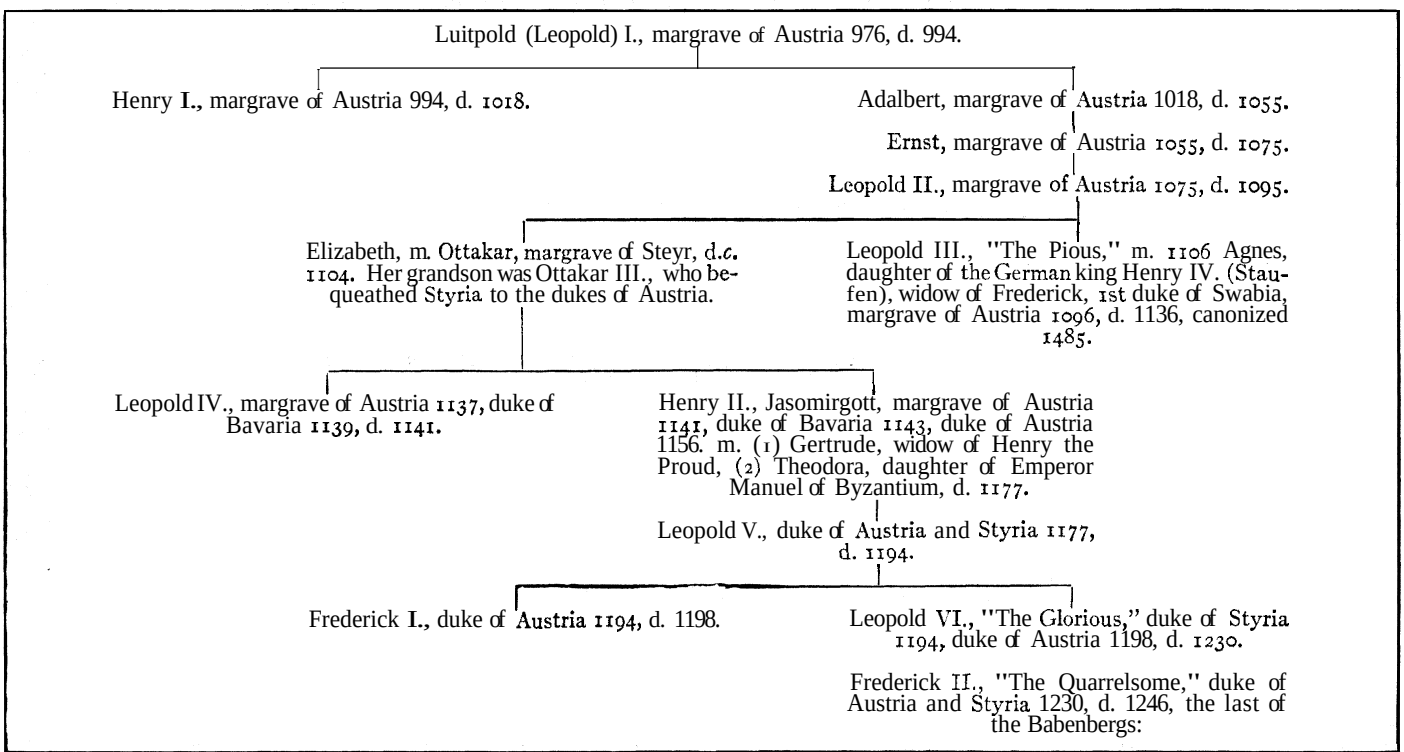
The Tower of Babel is generally identified with *E-temen-an-ki,* the tower north of the Marduk temple *E-sagila,* but it is not known when or by whom it was built. The site of the tower is now but a hole in the ground and is the modern *Es-sahan.*

BAB-EL-MANDEB (Arabic for "The Gate of Tears"—so called from the dangers attending its navigation), a strait between Arabia and Africa connecting the Red sea with the Indian ocean, is 20 mi. across and is divided into two channels by the island of Perim. The western channel is 16 mi. across with 170 fathoms and the eastern 2 mi. with 16 fathoms. Near the African coast is a group of small islands called the "Seven Brothers." The eastern channel has a surface current inwards and the western a strong undercurrent outwards.

BABENBERG, the name of a Franconian family which held the duchy of Austria in the middle ages. Its earliest known ancestor was one Poppo, count in Grapfeld in the 9th century. His son, Henry, margrave and duke in Franconia, fell fighting against the Normans in 886; another son, Poppo, was margrave in Thuringia from 880 to 892, when he was deposed by the German king Arnulf, who favoured the Babenberg's rivals, the Conradines. Henry's three sons, who held the castle of Babenberg on the upper Main, carried on the "Babenberg feud" against the Conradines, till two of them were killed, and the third, Adalbert, on refusing a summons from the regent Hatto I. to appear before the imperial court, was besieged in his castle of Theres, surrendered in 906 and was beheaded.

A Luitpold or Leopold of Babenberg, count in the Donnegau, presumed to be of the above family, was in 976 appointed margrave of the new Ostmark founded that year, which was the nucleus of the later Austria. The history of the family now becomes that of Austria (*q.v.*); the accompanying table shows only the genealogical relationships of the family, which are of some importance for the understanding of German and Austrian history. The Babenbergers were a race of administrators of ability well above the average. The most remarkable of them, personally, was Leopold the Pious.

GENEALOGICAL TABLE OF THE HOUSE OF BABENBERG



BABER, BABAR (1483–1530), a famous conqueror of India and founder of the Mogul dynasty in India. His name was Zahir ud-din Mohammed and he was given the surname of Baber ("tiger"); he was a descendant of Timur and son of Omar Sheik. king of Ferghana. Baber succeeded his father in 1495. In 1497 he successfully fought for Samarkand but, through a rebellion among his nobles, he lost it together with his own kingdom. He continued fighting and regained both territories, but in 1501 he was driven from Samarkand by Shaibani Khan, ruler of the Uzbegs.

In 1504 he crossed the Hindu Kush and after a siege captured Kabul. In the next year he united with Hussain Mirza of Herat against Shaibani; Hussain, however, died and the expedition was abandoned. He returned to Kabul in time to quell a formidable rebellion, but two years later a revolt among some of the leading Moguls drove him from his city. His courage struck the army of his opponents with such dismay that they again returned to their allegiance and Baber regained his kingdom. Once again, in 1510 after the death of Shaibani, he endeavoured to obtain possession of his native country. He received considerable aid from Shah Ismael of Persia, and in 1511 made a triumphal entry into Samarkand. But in 1514 he was utterly defeated by the Uzbegs and with difficulty reached Kabul.

He seems now to have resigned all hopes of recovering Ferghana, and as he at the same time dreaded an invasion of the Uzbegs from the west, his attention was more and more drawn towards India. Several preliminary incursions had been made when in 1521 an opportunity presented itself for a more extended expedition. Ibrahim, emperor of Delhi, was detested even by his Afghan nobles, several of whom called upon Baber for assistance. He at once assembled his forces, 12,000 strong, with some pieces of artillery and marched into India. Ibrahim, with 100,000 soldiers and numerous elephants, advanced against him. The great battle was fought at Panipat on April 21 1526, when Ibrahim was slain and his army routed. Baber took possession of Agra.

A still more formidable enemy awaited him; the Rana Sanga of Mewar collected the enormous force of 210,000 men, with which he moved against the invaders. On all sides there was danger and revolt, even Baber's own soldiers, worn out with the heat of this new climate, longed for Kabul. By vigorous measures and inspiriting speeches he restored their courage, though his own heart was nearly failing him, and in his distress he abjured the use of wine, to which he had been addicted. At Kanwaha, on March 10 1527, he won a great victory and made himself absolute master of northern India. The remaining years of his life he spent in arranging the affairs and revenues of his new empire and in improving his capital, Agra. He died Dec. 26 1530 in his 48th year.

See his *Memoirs*, written by himself, translated into English by Leyden and Erskine (1826); abridged in Caldecott, *Life of Baber* (1844). Also *see* Lane-Poole, *Baber*, "Rulers of India" series (1899).

BABEUF, FRANÇOIS NOEL (1760–1797), known as GRACCHUS BABEUF, French political agitator, was born at St. Quentin on Nov. 23 1760. Until the outbreak of the Revolution he was a domestic servant, and from 1785 occupied the invidious office of *commissaire à terrier*, his function being to assist the nobles and priests in the assertion of their feudal rights as against the unfortunate peasants. The first germ of his future socialism is contained in a letter of March 21 1787, addressed to the secretary of the Academy of Arras. In 1789 he drew up the first article of the *cahier* of the electors of the *bailliage* of Roye, demanding the abolition of feudal rights. During the earlier period of the Revolution he served in various minor posts in Paris and in the provinces. In 1794 he settled in Paris, and on Sept. 3 published the first number of his *Journal de la liberté de la presse*, afterwards *Le Tribun du peuple*. The execution of Robespierre had ended the Terror, and Babeuf—now self-styled "Gracchus" Babeuf—defended the men of Thermidor and attacked the fallen terrorists with his usual violence. But he also attacked, from the point of view of his own socialistic theories, the economic outcome of the Revolution. This was an attitude which had few supporters, even to the Jacobin club, and in October Babeuf was arrested and sent to prison at Arras. Here he came under the influence of certain terrorist prisoners, notably of Lebois, editor of the *Journal de l'égalité*. He emerged from prison a confirmed terrorist and convinced that his Utopia, fully proclaimed to the world in No. 33 of his *Tribun*, could only be realized through the restoration of the constitution of 1793. The universal misery due to the fall in the value of the *assignats* gained him a hearing He gathered round him a small circle of his immediate followers known as the *Société des Égaux*, soon merged with the rump of the Jacobins, who met at the Pantheon. After the club of the Pantheon was closed by Bonaparte, on Feb. 27 1796; his aggressive activity redoubled. In Ventôse and Germinal he published, under the *nom de plume* of "Lalande. soldat de la patrie," a new paper, the *Éclaireur du peuple, ou le défenseur de vingt-cinq millions d'opprimés;* in March of the same year the attempt of the Directory to replace the *assignats* (q.v.) by a new issue of *mandats* created fresh dissatisfaction after the breakdown of the hopes first raised. On April 4 it was reported to the Government that 500,000 people in Paris were in need of relief. From the 11th Paris was placarded with posters headed *Analyse de la doctrine de Baboeuf, tribun du peuple*, of which the opening sentence ran: "Nature has given to every man the right to the enjoyment of an equal share in all property," and which ended with a call to restore the constitution of 1793. Babeuf's song *Mourant de faim, mourant de froid* (Dying of hunger, dying of cold), set to a popular air, began to be sung in the cafés, with immense applause; and reports were current that the disaffected troops in the camp of Grenelle were ready to join an *émeute* against the Government. The Directory thought it time to act; the *bureau central* had accumulated through its agents, notably the ex-captain Georges Grisel, who had been initiated into Babeuf's society, complete evidence of a conspiracy for an armed rising fixed for Floréal 22, year IV. (May 11 1796), in which Jacobins and socialists were combined. On May 10 Babeuf was arrested with many of his associates, among whom were A. Darthé and P. M. Buonarroti, the ex-members of the Convention, Robert Lindet, J. A. B. Amar, M. G. A. Vadier and Jean Baptiste Drouet.

The *coup* was perfectly successful. The last number of the *Tribun* appeared on April 24, but Lebois in the *Ami du peuple* tried to incite the soldiers to revolt, and for a while there were rumours of a military rising. The trial of Babeuf and his accomplices was fixed to take place before the newly constituted high court of justice at Vendôme. On Fructidor 10 and 11 (Aug. 27–28), when the prisoners were removed from Paris, there were tentative efforts at a riot with a view to rescue, but these were easily suppressed. The attempt of five or six hundred Jacobins (Sept. 7) to rouse the soldiers at Grenelle met with no better success. On Prairial 7 (April 26 1797) Babeuf and Darthé were condemned to death; some of the prisoners, including Buonarroti, were exiled; the rest, including Vadier and his fellow conventionals, were acquitted. Drouet had succeeded in making his escape, according to Barras, with the connivance of the Directory. Babeuf and Darthé were executed at Vendôme on Prairial 8 (1797).

Historically, Babeuf's importance lies in the fact that he was the first to propound socialism as a practical policy, and the father of the movements which played so conspicuous a part in the revolutions of 1848 and 1871.

BÁBÍISM, the religion of the Báb (The Gate), initiated by his proclamation at Shiraz, Persia, on May 23, 1844.

The traditions of Islam had preserved throughout the Mohammedan world a popular conviction that in the "year sixty" would arise the Qa'im, the Messiah, destined to establish the final and complete victory of Islam upon earth. Though the prophecies foretelling this event were interpreted differently by the two branches into which Islam had become divided, the shiah and sunni sects, all Mohammedans agreed that Mohammed was the "Seal of the Prophets"—the final divine revelation—and that the mission of the Qá'im (or Imām Mihdi) must therefore be na other than the purification of the religion of the Qur'ān and its acceptance by mankind.

It was with this expectancy, so closely parallelling that held by the Jews before the coming of Christ, that the Báb became identified in the eyes of the clergy and people during the early days of his mission. Had he confined his aim and effort to the

reform of morals and worship within the framework of traditional Mohammedanism, the Báb might not have aroused the implacable hatred of the ecclesiastics nor awakened the fear of the government itself. It was his action in revealing a new Holy Book, and in abrogating the religious laws of the Qur'ān, which led to the charges that he was the destroyer of religion and the source of rebellion against the state.

The Báb made acceptance of his spiritual station the touchstone of true faith in God, and by his followers he was given the complete devotion due to a Prophet.

The Báb's own words, however, made it clear that while his authority was equal to that of Mohammed, he was likewise the herald of a succeeding and greater Manifestation, "He Whom God Would Manifest," by whose teaching and spiritual power the diverse religions of mankind would be fulfilled in one universal Faith. "I have revealed myself for His Manifestation, and have caused my Book, the Bayán, to descend upon you for no other purpose except to establish the truth of His Cause."

The civilization of Persia at that period was one of ignorance and superstition, a church-state combining materialism and tyranny to suppress the masses of the people. The spirit of pure religion, however, had in leaders like Aḥmad-i-Aḥsá'í and Siyyid Kázim-i-Rashtí, fostered the hope that ancient prophecy would come to realization, and spread to all parts of Islam their teachings that the appearance of the Promised One was imminent. The Báb's first disciples were known as "Letters of the Living," seventeen men and one woman, the famous martyr Tahirih, all of whom were led intuitively to recognize the truth of the Bib's claim. The Báb's charge to these disciples, as he sent them forth to spread the gospel of the new age, restored to religion a consecration and purity the church-state could not evoke nor even recall: "O my beloved friends! You are the bearers of the name of God in this Day. You have been chosen as the repositories of His mystery. It behooves each one of you to manifest the attributes of God, and to exemplify by your deeds and words the signs of His righteousness, His power and glory. The very members of your body must bear witness to the loftiness of your purpose, the integrity of your life, the reality of your faith, and the exalted character of your devotion. . . . Such must be the purity of your character and the degree of your renunciation, that the people of the earth may through you recognize and be drawn closer to the heavenly Father who is the Source of purity and grace. . . . The days when idle worship was deemed sufficient are ended. The time has come when naught but the purest motive, supported by deeds of stainless purity, can ascend to the throne of the Most High and be acceptable unto Him. . . . I am preparing you for the advent of a mighty Day. . . . Scatter throughout the length and breadth of this land, and, with steadfast feet and sanctified hearts, prepare the way for His coming."

None of these disciples survived the storm of opposition which gathered when the full implication of the Bib's religion became understood, and the Báb himself was executed by a regiment of soldiers in the public square of Tabriz on July 9, 1850, under orders given by the Vizier when the Bib's doom had been pronounced by leaders of Islam.

The history of religion records no persecution more savage than that inflicted upon the Babis. The total slain by mobs under severest torture with civil and ecclesiastical sanction is believed to have exceeded twenty thousand men, women and children. The influence of the Bib himself upon those who saw and heard him, even his guards and jailors, was one of overwhelming spiritual radiance and beauty.

After the martyrdom of the Báb a few of his followers sought to maintain a permanent "Bábi" movement, and this sect became known as Ezelis, from their leader, Subhi-Ezel. The majority, however, true to the fundamental character of the Báb's mission, became Bahá'ís.

The cycle of the Bib's religion was the period of nineteen years. from 1844 to 1863, when Bahá'u'lláh was accepted as the Manifestation heralded by the Báb. The Báb's physical remains, secretly buried and hidden in Persia, were in 1909 transported to Haifa, Palestine, and by 'Abdu'l-Bahá laid away in the shrine he had prepared on Mount Carmel. The Bib and Bahá'u'lláh are held by the Bahá'ís to be the co-founders of their faith. *(See* BÁHÁ'Í FAITH.)

BABINGTON, ANTHONY (1561–1586), English conspirator, son of Henry Babington of Dethick in Derbyshire, and of Mary, daughter of George, Lord Darcy, was born in October 1561, and was brought up secretly a Roman Catholic. As a youth he served at Sheffield as page to Mary queen of Scots, for whom he early felt an ardent devotion. In 1580 he came to London, attended the court of Elizabeth, and joined the secret society formed that year supporting the Jesuit missionaries. In 1582, after the execution of Father Campion, he withdrew to Dethick, and later went abroad. He became associated at Paris with Mary's supporters who were planning her release with the help of Spain, and on his return he was entrusted with letters for her. In April 1586 he became, with the priest John Ballard, leader of a plot to murder Elizabeth and her ministers, and organize a general Roman Catholic rising in England and liberate Mary. The conspiracy included, in its general purpose of destroying the government, a large number of Roman Catholics, and had ramifications all over the country. Philip II. of Spain promised to assist with an expedition directly the assassination of the queen was effected. Babington entered into a long correspondence with Mary, which was intercepted by the spies of Walsingham. On Aug. 4 Ballard was seized and betrayed his comrades, probably under torture. Babington then applied for a passport abroad, for the ostensible purpose of spying upon the refugees, but in reality to organize the foreign expedition and secure his own safety. The passport being delayed, he offered to reveal to Walsingham a dangerous conspiracy, but the latter sent no reply, and meanwhile the ports were closed.

One night while supping with Walsingham's servant, he observed a memorandum of the minister's concerning himself, fled to St. John's Wood, where he was joined by some of his companions, and after disguising himself succeeded in reaching Harrow, where he was sheltered by a recent convert to Romanism Towards the end of August he was discovered and imprisoned in the Tower.

On Sept. 13–14 he was tried with Ballard and five others by a special commission, when he confessed his guilt, but strove to place all the blame upon Ballard. All were condemned to death for high treason On the 19th he wrote to Elizabeth praying for mercy, and the same day offered £1,000 for procuring his pardon; and on the 20th, having disclosed the cipher used in the correspondence between himself and Mary, he was executed in Lincoln's Inn Fields. The detection of the plot led to Mary's own destruction.

There is no positive documentary proof in Mary's own hand that she had knowledge of the intended assassination of Elizabeth, but her circumstances, together with the tenour of her correspondence with Babington, place her complicity beyond all reasonable doubt.

BABINGTON, CHURCHILL (1821–1889), English classical scholar and archaeologist, was born at Roecliffe, in Leicestershire, on March 11, 1821, and studied at St. John's college, Cambridge. He died at Cockfield, Suffolk, of which place he was vicar, on Jan. 12, 1889. From 1865 to 1880 he held the Disney professorship of archaeology at Cambridge. In his lectures, illustrated from his own collections of coins and vases, he dealt chiefly with Greek and Roman pottery and numismatics. He brought out the *editio princeps* of the speeches of Hypereides *Against Demosthenes* (1850), *On Behalf of Lycophron and Euxenippus* (1853), and his *Funeral Oration* (1858). It was by his edition of these speeches from the papyri discovered at Thebes (Egypt) in 1847 and 1856 that Babington's fame as a Greek scholar was made. In addition to contributing to various classical and scientific journals,

he catalogued the classical mss. in the university library and the Greek and English coins in the Fitzwilliam Museum, for which he did great service.

BABIRUSA, the wild swine of Celebes and Buru (*Babirusa alfurus).* The skin is nearly naked, and very rough and rugged. The peculiarity of this genus is the development of the canines, or tusks, of the male. These teeth are ever-growing, long, slender and curved, and without enamel. Those of the upper jaw are directed upwards from their bases, so that they never enter the mouth, but pierce the skin of the face; they curve backwards, downwards, and finally often forwards again, almost or quite touching the forehead. Wallace remarks that "it is difficult to understand what can be the use of these horn-like teeth. It is conceivable that these tusks were once useful, and were then worn down as fast as they grew, but that changed conditions of life have rendered them unnecessary, and they now develop into a monstrous form. . . . In old animals they reach an enormous size, and are generally broken off as if by fighting." *See* SWINE; PECORA.

BABOON, properly the designation of the long-muzzled, medium-tailed Egyptian monkey, *Papio anubis;* in a wider sense applied to all the members of the genus *Papio* now confined to Africa and Arabia, although in past times extending into India. Baboons are large terrestrial monkeys with short or medium-sized tails, and long naked dog-like muzzles, in the truncated extremity of which are pierced the nostrils. They frequent barren rocky districts in large droves, and are exceedingly fierce and dangerous to approach. They have large cheek-pouches, large naked callosities, often brightly coloured, on the buttocks, and short thick limbs, adapted to walking. Their diet includes everything eatable they can capture or kill. The representative of the genus is the yellow baboon (*P. cynocephalus*), distinguished by its small size and grooved muzzle. It ranges from Abyssinia to the Zambezi. The anubis baboons were tamed by the ancient Egyptians. *(See* PRIMATES; CHACMA; DRILL; GELADA and MANDRILL.)

THE ASHY GREY ARABIAN BABOON ATTAINS A HEIGHT OF 4 FT. IT WAS WORSHIPPED BY THE EGYPTIANS AS ANUBIS

BABRIUS, author of a collection of fables written in Greek. He is supposed to have been a Roman, living in the East, probably in Syria, where the fables seem first to have gained popularity. The address to "a son of King Alexander" has caused much speculation. The Alexander referred to may have been Alexander Severus (A.D. 222–235). There is no mention of Babrius in ancient writers before the beginning of the 3rd century A.D., and his language and style seem to show that he belonged to that period. The first critic who made Babrius more than a mere name was Richard Bentley, in his *Dissertation on the Fables of Aesop.* In an examination of these prose fables, which had been handed down from the time of Maximus Planudes, Bentley discovered traces of versification, and was able to extract a number of verses which he assigned to Babrius. Tyrwhitt *(De Babrio,* 1776) and other scholars followed up these researches. In 1842 M. Minas, a Greek, the discoverer of the *Philosophoumena* of Hippolytus, came upon a ms. of Babrius, now in the British Museum, in the convent of St. Laura on Mt. Athos. This ms. contained 123 fables, arranged alphabetically, but breaking off at the letter O. The fables are written in choliambic, *i.e.,* limping iambic verse, having a spondee as the last foot. The style is extremely good. Their genuineness was generally admitted by scholars. In 1857 Minas professed to have discovered at Mt. Athos another ms. containing 94 fables and a preface. but this was soon proved to be a forgery. Six more fables were brought to light by P. Knöll from a Vatican ms. (ed. by A. Eberhard, *Analecta Babriana,* 1879).

There are translations in English by Davies (1860) and in French by Levèque (1890), and in many other languages.

BABU, a native Indian clerk. The word is really a term of respect attached to a proper name, like "Mr." and *Babu-ji* is still used in many parts of India, meaning "sir"; but without the suffix the word is generally used contemptuously as signifying a semi-literate native with a veneer of European education.

BABY BLUE-EYES (*Nemophila insignis),* a small North American plant of the water-leaf family, *Hydrophyllaceae,* one of the most popular wild flowers of California, native to moist places in valleys and mountains. It is a low usually diffuse annual, with stems about 6 in. long, minutely hairy divided leaves and bell-shaped light to deep blue flowers, ½ in. to 1½ in. across, often veined with purple and dotted toward the centre. Cultivated as a border or rock garden plant, it blossoms from early spring to late summer. *(See* NEMOPHILA.)

BABY BOND, in the United States a bond having a face or par value of $100 or less. Such bonds enable small investors to diversify their risks to an extent impossible with bonds of the usual $1,000 denomination. *(See* BOND.)

BABY FARMING, a term meaning generally the taking in of infants to nurse for payment, but usually with an implication of improper treatment. Previous to the year 1871 the abuse of the practice of baby farming in England had grown to an alarming extent. The evil was, no doubt, largely connected with the question of illegitimacy, for there was a widespread existence of baby-farms where children were received without question on payment of a lump sum. Such children were nearly all illegitimate, and in these cases it was to the pecuniary advantage of the baby-farmer to hasten the death of the child. It had become also the practice for factory operatives and mill-hands to place out their children by the day, and since in many cases the children were looked upon as a burden and a drain on their parents' resources, too particular enquiry was not always made as to the mode in which the children were cared for. The form was gone through too of paying a ridiculously insufficient sum for the maintenance of the child.

In 1871 the House of Commons found it necessary to appoint a select committee "to enquire as to the best means of preventing the destruction of the lives of infants put out to nurse for hire by their parents." The practical result of this investigation was the Infant Life Protection Act, 1872, which provided for the compulsory registration of all houses in which more than one child under the age of one year was received for a longer period than twenty-four hours. In 1896 a select committee of the House of Lords sat and reported on the working of chis act. In consequence of this report the act of 1872 was repealed and superseded by the Infant Life Protection Act, 1897, which did away with the system of registration and substituted for it one of notice to a supervising authority. By the act all persons retaining or receiving for hire or reward more than one infant under the age of five, or adopting an infant under two years for a lump sum, paid down, and not exceeding £20, had to give written notice of the fact to the local authority within 48 hours. The local authorities, in this case, the boards of guardians, except in London, where the London County Council is the authority, were empowered to appoint inspectors, and required to arrange for the periodical inspection of infants so taken in, while they could also fix the number of infants who might be retained. The act of 1897 was repealed and amended by the Children Act, 1908, which codified the law relating to children, and added many new provisions. This act is dealt with in the article CHILDREN—PROTECTIVE LAWS.

Decrease of Baby Farming.— The following figures supplied by the British National Society for the Prevention of Cruelty to

Children, show how far less prevalent baby farming is becoming than formerly. In 1918, the society dealt with 29 cases of baby farming, involving 48 children. In 1927 the figures were nine and 13 respectively, with an average of 13 cases and 28 children for a period of ten years.

In Australia all the states have passed legislation with the object of supervising and ameliorating the conditions of infant life. The Government departments control the boarding out to suitable persons of the wards of the state. In South Australia there is a State Children's Council, which, under the State Children Act of 1895, has large powers with respect to the oversight of infants under two years boarded out by their mother. "Foster-mothers," as the women who take in infants as boarders are called, must be licensed, while the number of children authorized to be kept by the foster-mother is fixed by licence; every licensed foster-mother must keep a register containing the name, age and place of birth of every child received by her, the names, addresses and description of the parents or of any person other than the parents from or to whom the child was received or delivered over, the date of receipt or delivery over, particulars of any accident to or illness of the child, and the name of the medical practitioner (if any) by whom attended. In New South Wales the Child Welfare Act, 1923, covers the conditions under which children are boarded out. In Victoria the Infant Life Protection Act, 1915, provides for similar conditions. Provision is also made for the medical care of boarded-out children and it is the duty of the medical officer so appointed to attend these children, when required, at the expense of the State.

In New Zealand the "Children's Protection Act, 1890," the "Adoption of Children Act, 1895," and the "Infant Life Protection Act, 1907" were consolidated and incorporated in the "Infants' Act, 1908." The "Child Welfare Act, 1925," has also helped to give the matter an appropriate and efficient status, more especially by providing for child welfare officers, whose duty it is to assist and guide unmarried mothers, either by placing the child in a suitable foster home or by advising the mother about affiliation proceedings, or helping her to find employment. (J. HA.)

BABYLON, one of the most famous cities of antiquity, is situated on the Hilla branch of the Euphrates just north of the modern town of Hilla. The rise of Babylon to importance seems to have taken place comparatively late in Sumerian history. Up to the present no mention of the town has been discovered in tablets of the pre-Sargonic period, but Sargon is said to have built sanctuaries there. Little is known of the history of Babylonia before the fall of the kingdom of Agade and Babylon itself first appears as the head of an independent kingdom under Sumu-abu at the end of the third millennium B.C. In the struggle which followed between various small cities Babylon was successful and under Hammurabi she became the capital of "Babylonia," ultimately attaining the position of the most important city in western Asia. Her geographical surroundings no doubt contributed considerably to this result. In earlier times the Euphrates flowed past Kish and so long as this city was the centre of a well watered district it possessed a singularly favoured site; but during the third millennium B.C. the Euphrates deserted Kish, and Babylon, only a few miles to the west but beside the new course of the stream, succeeded the old city.

Such minor changes in the river explain the position of the actual city of Babylon but do not account for the very wide influence which she afterwards attained. In this region there is only a narrow strip of land between the Tigris and the Euphrates. Under primitive conditions Mesopotamia was naturally divided into three parts, the upper Tigris fertile belt, which later developed into the kingdom of Assyria, the middle land to which Kish and, later, Babylon held the key and the lower region at the head of the Persian gulf. By the time that Babylon had succeeded to Kish, growth of organization had led the way to empires of wider extent than the comparatively small city-states of earlier times and Babylon, as queen of the central region, succeeded to suzerainty over the whole of Mesopotamia, holding as she did the narrow way between the north and south: for then, as now, the only practical road through Mesopotamia lies along the river valleys.

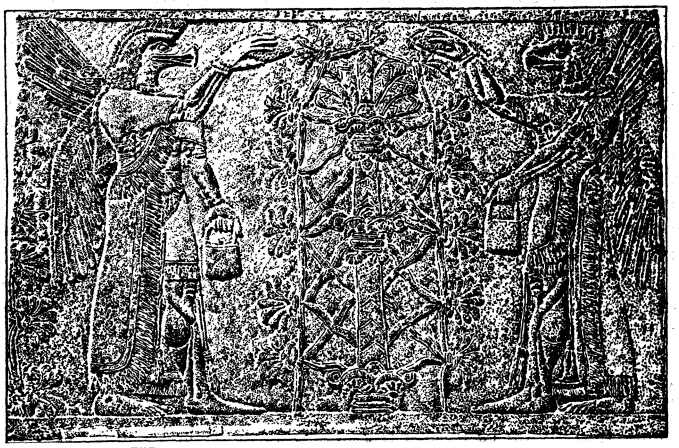
Advantageous as is Babylon's geographical position, other factors helped to make her a dominant city for a long period. Throughout the whole history of Mesopotamia, ancient as well as modern, religion has played an important part in giving prestige and power to a city. In Mesopotamia from the time of Hammurabi onwards the worship of Marduk was specially associated with Babylon. The priesthood acquired considerable power, and even the kings of Assyria found it politic to receive what was practically a coronation rite in Babylon. The priests did not fail to take advantage of the murder of Sennacherib and to proclaim that this misfortune was due to the failure of that prince to submit to Marduk; further it is not without significance that, as Langdon has shown, there was "consistent reference to the great temple of Marduk on the very bricks employed in the reconstruction of older and far more famous sanctuaries throughout Babylonia." Although this is ascribed by Langdon to local Babylonian pride, it is possible that behind this pride there lay the definite policy of a priesthood anxious under all circumstances to glorify the temples under its own control.

We have then in Babylon three factors at work, first geographical, second political and third spiritual. Geographically, owing to the circumstance of a change in the water supply Babylon succeeded to her previously powerful neighbour Kish. Secondly, while the neck of land between the rivers holds the key to power in Mesopotamia, political happenings at a very critical period enabled Babylon to obtain the first place amongst the other cities in the same region. Thirdly even after political power had passed from Babylon the spiritual power which her priesthood had obtained in the time of her political greatness continued to uphold the prestige of the city.

Although the history of Babylon is practically the history of Mesopotamia yet certain details are necessary to understand the topography of the city as described by classical writers and revealed by modern excavators. There are well defined periods. Old Babylon, the capital of Hammurabi and his successors, was almost entirely destroyed by Sennacherib who levelled the city to the ground in 689 B.C. Esarhaddon built a new town on the same site but his elder son, who succeeded to Babylonia, revolted against Assyria. Babylon suffered the horrors of a siege and was eventually captured by Assur-bani-pal. The fall of the Assyrian empire which followed was considered, at least by the pious upholders of Babylon's spiritual supremacy, as an act of divine vengeance on the king who like his predecessor Sennacherib did not offer royal homage to Marduk. In the period which followed Nabopolassar and his son Nebuchadrezzar built the city whose remains have survived until to-day; and it was at this time that Babylon, like Baghdad under the Caliphs and Peking under Kublai Khan, attained its greatest fame. But the end was not far off. The walls were destroyed by sieges, and Xerxes, after his capture of the city, still further continued the reduction of such defensive works as remained; but the murder of Alexander in the palace of Nebuchadrezzar, and even cuneiform texts under the Seleucids, show that much of the old town remained. In 275 B.C. the inhabitants were removed to the new city of Seleucia and with that event the history of Babylon ends. Although the rivalry of Persian religion had done much to destroy the prestige of the old temples, and although the place was depopulated, sacrifices were still performed there in the second century B.C.

In spite of the statements of classical writers and the work of the German excavators the topography of Babylon is still far from clear. The earliest Greek writer on the city is Herodotus, whose account, somewhat confused in places, is probably that of an eye-witness, though Sayce thinks he never visited Babylon. Herodotus describes the town as standing on a broad plain and forming an exact square, each side measuring 120 stades, which, if the length of a stade be estimated at 200 yards, is equal to 14 miles. Other classical writers give lesser estimates, Ctesias for instance suggests that the total periphery of the walls was 360 stades, 42 miles. Various attempts have been made to correlate these statements with the remains which can be observed. Some writers have preferred to ignore the literary evidence and to suppose that they represent an exaggeration of the truth, excavations having

shown that the actual walls of the city have an extent of only about $2\frac{1}{4}$ miles. Other explanations have been offered. First it is suggested that Herodotus included in his wall the neighbouring town of Borsippa, which lay on the east bank of the river. Langdon on the other hand relying both on a cuneiform text and on personal observation of the site concludes that the great line of walls which run from Kish to the Euphrates north of Babylon are part of the defences of the city erected by Nebuchadrezzar and



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

BABYLONIAN STONE RELIEF IN THE BRITISH MUSEUM, SHOWING TWO BIRD-HEADED DEITIES PLUCKING FRUIT FROM THE SACRED TREE

are therefore rightly included by Herodotus in his estimate of the length of the wall. When the plain is viewed from the top of the great mound of Babil, these ancient defences even now form a conspicuous feature in the landscape on a clear day and might easily be confused with the true city walls by one who wrote afterwards largely from memory. While it is possible to trace the actual extent of the walls from their ruins and to compare them with the measurements given by ancient writers the actual height cannot of course be restored and here it is clear that the statements of ancient authorities which give them a height of 300 ft. or over are impossible and that no exact estimate can be made on the basis of existent data.

Herodotus appears to have been guilty of a further confusion or possibly an omission. He states that there was an outer and inner wall. If the outer wall is correctly identified with Nebuchadrezzar's defences, the inner wall may possibly be the equivalent of the mall called by the excavators the outer wall, of which the ruins stand to-day a few hundred yards west of the canal outside the city. Inside these walls are yet other walls, which were either ignored by Herodotus or are his inner walls, in which case he has made an entirely wrong estimate of the outer walls. The actual plan of the city is equally difficult to reconcile with Herodotus' account. There appear to be three different series of mounds. To the north lies the mound of Babil, which has been considered by some writers as being the site of a palace of Nebuchadrezzar and possibly of the hanging gardens. No mention is made of these gardens by Herodotus and the identification rests on the presence of ancient irrigation works only.

About $1\frac{1}{2}$ m. south of Babil lies the mound of Al Qasr Excavations have shown that this mound contained the palace of Nebuchadrezzar, which was built nest to the former palace of Nabopolassar and to the east of the "Gate of Ishtar" from which a raised processional way led southwards. The east side of the mound also contained another small temple. To the south of the Qasr mound lie a series of ruins which include what appears to have been the most densely populated part of the city in ancient times, a great stage tower, and—though the identification has been questioned—the remains of E-sagila, the great temple of Marduk. This is said to have been in the centre of Babylon and to have been destroyed by Xerxes. Unfortunately here our description by Herodotus does not give any assistance as if Xerxes did destroy it Herodotus could not have seen it and he may therefore have confused the temple with some other temple of Marduk, possibly that at Borsippa.

In spite, then, of considerable excavations and of the frequent mention of Babylon both in ciassical writers and in cuneiform texts the actual topography of the city is still not clearly known, and many points still await investigation.

BABYLONIA AND ASSYRIA. Geographically as well as ethnologically and historically, the whole district enclosed between the two great rivers of western Asia. the Tigris and Euphrates, forms but one country. a fact recognized by the earliest authorities. It naturally falls into two divisions, the northern being more or less mountainous, while the southern is flat and marshy. In the earliest times of which we have any record, the northern portion was included in Mesopotamia (*q.v.*); it was definitely marked off as Assyria only after the rise of the Assyrian monarchy. With the exception of Assur, the original capital, the chief cities of the country, Nineveh, Calah and Arbela, were all on the left bank of the Tigris. The great Mesopotamian plain, the modern El-Jezireh, is about 250 miles in length, interrupted only by a single limestone range, rising abruptly out of the plain, and branching off from the Zagros mountains under the names of *Sarazūr, Hamrin* and *Sinjar*. The numerous remains of old habitations show how thickly this level tract must once have been peopled North of the plateau rises a well-watered and undulating belt of country, into which run low ranges of limestone hills, sometimes arid, sometimes covered with dwarf-oak, and often shutting in, between their northern and north-eastern flank and the main mountain-line from which they detach themselves, rich plains and fertile valleys. Behind them tower the massive ridges of the Niphates and Zagros ranges, where the Tigris and Euphrates take their rise, and which cut off Assyria from Armenia and Kurdistan.

The name Assyria itself was derived from that of the city of Assur (*q.v.*) or Asur, now Qal'at Sherqat (Kaleh Shergat), which stood on the right bank of the Tigris, midway between the Greater and the Lesser Zab.

In contrast with the arid plateau of Mesopotamia stretched the rich alluvial plain of Chaldaea, formed by the deposits of the two great rivers by which it was enclosed. The soil was extremely fertile, and teemed with an industrious population. Eastward rose the mountains of Elam, southward were the sea-marshes and the Kaldā or Chaldaeans and other Aramaic tribes, while on the west the civilization of Babylonia encroached beyond the banks of the Euphrates, upon the territory of the Semitic nomads (or Suti). Here stood Ur (*Mugheir,* more correctly *Muqayyar*) the earliest capital of the country; and Babylon, with its suburb, Borsippa (*Birs Nimrūd*), as well as the two Sipparas (the Sepharvaim of Scripture, now *Abu Habba*), occupied both the Arabian and Chaldaean sides of the river (see BABYLON). The Arakhtu, or "river of Babylon," flowed past the southern side of the city, and to the south-west of it on the Arabian bank lay the great inland freshwater sea of *Nejef,* surrounded by red sandstone cliffs of considerable height, 40 m. in length and 35 in breadth in the widest part.

The primitive seaport of the country, Eridu, the seat of the worship of Ea the culture-god, was a little south of Ur (at *Abu Shahrain* or *Nowāwis* on the west side of the Euphrates) It is now about 130 m. distant from the sea; as about 46 m of land have been formed by the silting up of the shore since the foundation of Spasinus Charax (*Muhamrah*) in the time of Alexander the Great, or some 115 ft. a year, the city would have been in existence at least 6,000 years ago.

The alluvial plain of Babylonia was called Edin, the Eden of Gen. ii., though the name was properly restricted to "the plain" on the western bank of the river where the Bedouins pastured the flocks of their Babylonian masters. A more comprehensive name of southern Babylonia was Kengi, "the land," or Kengi Sumer, "the land of Sumer," for which Sumer alone came afterwards to be used. Sumer has been supposed to be the original of the Biblical Shinar; hut Shinar represented northern rather than southern Babylonia, and was probably the Sankhar of the Tell

el-Amarna tablets. Opposed to Kengi and Sumer were Urra (Uri) and Akkad or northern Babylonia.

The country was thickly studded with towns, the sites of which are still represented by mounds, though the identification of most of them is still doubtful. The latest to be identified are Bismya, between Nippur and Erech, which American excavations have proved to be the site of Udab (also called Adab and Usab) and the neighbouring Fāra, the site of the ancient Kisurra. The dense population was due to the elaborate irrigation of the Babylonian plain which had originally reclaimed it from a pestiferous and uninhabitable swamp and had made it the most fertile country in the world. The science of irrigation and engineering seems to have been first created in Babylonia, which was covered by a network of canals, all skilfully planned and regulated. The three chief of them carried off the waters of the Euphrates to the Tigris above Babylon—the Zabzallat canal (or Nahr Sarsar) running from Faluja to Ctesiphon, the Kutha canal from Sippara to Madain, passing Tell Ibrahim or Kutha on the way, and the King's canal or Ar-Malcha between the other two. Thanks to this system of irrigation the cultivation of the soil was highly advanced in Babylonia. According to Herodotus (i. 193) wheat commonly returned two hundred-fold to the sower, and occasionally three hundred-fold. Pliny (H. N. xviii. 17) states that it was cut twice, and afterwards was good keep for sheep, and Berossus remarked that wheat, sesame, barley, ochrys, palms, apples and many kinds of shelled fruit grew wild, as wheat does in the neighbourhood of Anah. (A. H. S., A. N. J. W.)

ARCHAEOLOGY

In the history of the civilization of Babylonia there are broad archaeological differences between the following periods (1) the prehistoric age, a period without written historical records, before 3500 B.C.; (2) the early Sumerian period, from before 3000 B.C. to about 2500 B.C., of which there is a continuous tradition, occasionally verified and corrected by historical documents; (3) the Agade period, about 2500 B.C. to 2400 B.C.; (4) the dynasty of Gutium and the 3rd dynasty of Ur, about 2400–2150 B.C.; (5) from the dynasties of Isin and Larsa to the end of the 1st dynasty of Babylon, about 2150–1740 B.C.; (6) the Kassite dynasty from about 1740–1150 B.C.; (7) the period of Assyrian domination and the new Babylonian empire, lasting do n to the capture of Babylon of Cyrus in 539 B.C.; (8) the Achaemenian period, down to the victory of Alexander over Darius Codomannus; (9) the Seleucid age, merging into the Parthian.

PREHISTORIC PERIOD

No flint weapons or other remains of a palaeolithic or true neolithic culture have been found in Babylonia or Assyria, and it is doubtful whether the river valleys were ever inhabited by men unacquainted with the use of metal. The earliest settlements are marked by the use of painted pottery with elaborate geometric designs and of flint weapons of the kind called "chalcolithic," showing the difference of metal types. Painted hand-made pottery has been found in a connection that proves it to be earlier than the historic 1st dynasty of Ur by a not inconsiderable interval at Tall al 'Ubaid, near the city of Ur. At Susa there have been found two distinct classes of this pottery, the one of fine clay, porous and therefore unsuitable for domestic use, in a restricted number of shapes, and always confined to graves, with a decoration that marks the end of a long development; the other is thick, in ordinary use, and markedly different in decoration. Three views are held as to the Susa pottery, (1) that the second style developed out of the first, (2) that there was a gap between them, and that the second marks the advent of a different race, (3) that the two styles were at least in part contemporary, and that their difference depends upon the object in view. On other sites, at Bender Bushire, Jamdat Nasr (near Kish), Samarra, Nineveh, Qal'at Shirqāt, painted pottery has been found belonging to an early period, but it cannot be proved that it is in all cases contemporary. The differences to be noted may, however, be due to local differences. In general it may be said that everywhere in these two countries a painted pottery age preceded the advent of a Sumerian civilization of the second period.

Painted pottery did not go out of use suddenly in Babylonia; the last stages are marked by a decrease in the amount of decoration, and it is then found together with a pottery occasionally plain, sometimes decorated with incised patterns. In this last period writing was already known, since tablets have been found with such pottery; the system of numeration used on these tablets is not the sexagesimal, which was characteristic of the Sumerians, though the writing seems closely related with Sumerian.

Besides pottery and flints there are some very roughly made figurines of human beings and animals from the painted pottery period; some jars with handles given the resemblance of human faces, found at Susa and Jamdat Nasr, seem to belong to the end of the period, when plain pottery was more generally used.

The analogy of this painted pottery of Babylonia and Assyria to the early painted wares of Persia, Beluchistan, the Indus valley and even of China has been discussed but no conclusions are as yet agreed upon. The common use of obsidian points to close connections with Armenia. Sumerian traditions of a time before the Flood may perhaps refer to this civilization. Variant lists of ten kings were given and assigned to the towns of Eridu, Bad-tibira, Larak, Sippar and Shuruppak, while Larsa is included in one list; the tradition was already well known by 2200 B.C., and is repeated with some differences partly due to textual corruptions, by Berosus, about 300 B.C. Berosus also related stories about certain creatures which had the bodies and heads of fishes, with human forms below; these seem to correspond to "the seven wise ones" who, according to Babylonian mythology, instructed man in the use of herbs and in prophylactic measures against disease.

EARLY SUMERIAN PERIOD

Bas-reliefs.—According to the dynastic lists of Sumerian kings, the 1st dynasty after the Flood ruled at Kish, and from excavations there some early works of art have been recovered. Fragments of frieze, consisting of white limestone bas-reliefs on a background of date, show a king slaughtering his enemies. and men engaged in tending cattle and dairy work. These reliefs appear to be earlier than the series found at Tall al'Ubaid, 4m. W. of Ur, which are certainly dated to the time of the 1st dynasty of Ur, the 3rd dynasty after the Flood; but the series from there, consisting of shell (*tridacna* squamosa) and limestone bas-reliefs on a background of a bituminous mixture, are in exactly the same technique and serve to show the earliest form of this kind of work. There are differences in the human forms represented; *e.g.*, at Kish the men wear beards, and apparently wigs; at al'Ubaid they are clean shaven. Other peculiarities, such as the milking of the cows from the rear, have been variously explained as due to the clumsiness of the representation or to tribal customs. Almost contemporary with these inlaid reliefs are the stone bas-reliefs on a cylindrical object and on a square plaque from Ur; the latter is notable because it shows a chariot, apparently made of wicker and of wood, covered with an animal skin, drawn either by lions or by composite monsters. The men's dress is also interesting in that it shows the earliest form of the flounced skirt, a single flounce only appearing, and in the centre is a cod-piece resembling a Highlander's sporran. These reliefs immediately precede in point of time the series of plaques with bas-reliefs from Lagash representing Ur-Nina, an early governor of that city, carrying the brick-basket that marks the founder of a temple, facing his family. The last stage in the development of the bas-relief in this period is represented by the "Stele of the Vultures" from Lagash, showing the king, Eannatum, leading his phalanx of warriors, armed with lances, shields and helmets, out to battle, attacking the foe, overwhelming his enemies with a net, and burying the dead, in various registers of a stele with a round top. Minor but sometimes excellent bas-reliefs are to be found on large stone mace-heads and stone vases; on the former, animal and human subjects are both common; on the latter, animal subjects are generally preferred. In some cases the relief becomes actually carving in the round; thus, in a vase supported by a hero struggling with bulls surmounted by birds, parts of the male figure stand free from the background.

Drawings. — Closely associated with the bas-reliefs are shell plaques with incised engravings. The shell is sometimes mother-of-pearl, the incised lines were always originally filled with a red paint. This art is also represented on a stone plaque from Lagash with an inscription of Ur-Enlil. The scenes represented seem to be invariably religious in intention; animals in vegetation, men pouring libations before deities wearing floral crowns, all have some reference to myth or ritual. Some of the shell plaques have been found at Ur in a position which suggests that they formed part of a gaming-board: the perfect example of such a board actually found has only geometrical patterns, or eyes, on the individual plaques. A fine example of engraving is to be found on the silver vase of Entemena representing the bird Im-dugud seizing lions.

Metal-work. — Bas-reliefs were also at this period made of beaten copper; one example is from al 'Ubaid, and the decoration consists of a row of recumbent bulls. The heads are turned outwards, in the round, and affixed separately. They were most probably cast, but some authorities think they were beaten work also. A large example shows a bird holding stags, which had antlers socketed into the head.

Sculpture in the Round. — Metal figures in the round were also made by the same process on bitumen mixtures. Bulls, lions and other animals were built on to wooden frames; in some cases the figures were simply protomae, in others the animal stood quite free. The heads were sometimes inlaid with jasper tongues, teeth, and shell and lapis lazuli eyes; a golden horn seems to show that various metals were sometimes employed. The carving of stone in the round was far less developed. In the majority of instances the human figure is represented. The earliest type is a cross-legged, naked, seated figure; the body is little more than a hulk, the head is disproportionate to the size of the face. Immediately after this must be ranked clumsy seated figures, of women fully robed so that only the head and feet are separately carved, or of men, sometimes cross-legged, with the upper body naked. The last stage, which belongs to the period 2600–2500 B.C., was that of the standing figure; the males wear a full flounced skirt, sometimes decorated with an animal tail apparently used as a dagger-sheath, the women are clothed in various styles, sometimes hooded but never veiled. Various explanations of the manner in which these flounced dresses were put on, and as to the material, have been advanced. It may be that the basis of the cloth was some woven stuff and raw wool twisted into separate hanks was sewn in rows on the cloth. Another view is that a dressed sheepskin was combed, and the wool twisted into the required shape. The statuettes never exceed four feet in height, and seem always to have been placed in temples, to secure the favour of the god. The earliest are cut out of tufa or other volcanic and slightly porous stones, the latest are in hard limestone and diorite, a development probably due to improvement in tools. The eyes and eyebrows were often inlaid. The proportions of the figure are always squat, and the modelling of the naked body is not attempted. The animal heads in stone very closely resemble the metal heads, and were doubtless imitated from them.

Architecture. — The development of architecture within this period covered many centuries. The earliest building appears to have been simply with wet clay. The use of reeds, which allows of large constructions with rounded tops, was at an early date combined with the use of wooden beams; this wattle building was then used in combination with brick construction. The origin of the form of brick common amongst the Sumerians from 3000 B.C. onwards, a plano-convex shape, is not known; the walls so built, well mortared with mud, do not present the unusual appearance that might be expected. Plain brick constructions, in which burnt brick was used for facing walls and foundations, and sun-dried bricks for the interior and upper walls, are found as early as the 1st dynasty of Ur. The most marked feature of the walls is the panelling, and it has been plausibly supposed that this derived from wood constructions. Foundations were, as was always necessary in this country, built upwards. First a terrace of hard mud was laid out and built to a not inconsiderable height; this was faced with burnt brick, and in certain cases the bottom courses were of stone, if available. On this platform the building was marked out and foundation walls of sun-dried brick wider than required built up about two or three feet, and surrounded with stamped mud; on this foundation the building was constructed according to plan. The complete plan of an early building has not yet been recovered, but the external decoration of a small temple at al 'Ubaid has been found. Stone staircases led up to the terrace. The entrance was guarded by copper protomae of bulls. Before the doorway stood round wooden columns, covered either with beaten copper or with white, red and black tesserae wired on to a bitumen covering of the pillars. The wall was decorated in some way with primitive rosettes in white, red and black; the excavator considers that these objects represented flowers and stood free from the wall. There were three rows of friezes fastened by staples, and animal figures in the round may have stood before the wall. A large relief of special significance may have surmounted the entrance.

Sumerian influence may be found in the early temple of Ishtar at the city of Ashur, which has been excavated sufficiently to show a forecourt and a cult-room. The type of these early, and rather small buildings probably anticipated the universal scheme in the later periods. Whether inferences as to the general arrangement of the cult room, which in this case had the statue at the narrow end, the entrance on the wide side, are permissible, is not certain.

Pottery and Stone Vessels. — In this period the only decoration on the plain buff terra-cotta vessels is incised geometrical patterns, or twisted bands, *appliqué*. Occasionally small painted circles occur. The distinguishing feature of certain pots is the spout; when used in temples, these were for libations. The large store-pot for water, of porous clay, was already known. All the pots were turned on a primitive wheel, and are generally carelessly made; from this time forward in Babylonia there are but few variations in the shapes, which were dictated by particular uses and adhere to simple forms. The stone pots were often carved, frequently pointed like inverted cones, and generally dedicated as temple furniture.

Burial Customs. — The most various methods of interment were practised, but it has proved impossible to distinguish the various forms by any broad principles. The characteristic feature is the selection of burial grounds outside the city walls. Inhumation was universal; various attempts have been made to prove cremation, but in all the instances the burning may have been accidentally caused by some rite of purification, and there is no sufficient evidence to establish a general custom. Sometimes the body was interred in a pit, sometimes it was surrounded with matting; occasionally a clay coffin or larnax of a circular or oval shape was used. The body was generally laid on the side, most often in a contracted position to save space, but in various attitudes. Very rarely brick graves were built, in which case the body was laid at full length; the distinction probably marks a difference in social position. The poorest were buried with a few pots and their personal adornments, beads, paint; the wealthy, or those connected with the royal family, took with them to their graves their most prized possessions, gaming-boards of shell inlay, gold daggers of filigree work, and other weapons. There is no proof of a cult of the dead.

A single instance of a royal burial has shown that more elaborate burials were known. A king who must belong to the 1st dynasty of Ur, or to a period not far removed from it, was buried in a coffin in a tomb with two chambers, an outer and an inner. Immediate dependents, or members of the royal family, were placed in the outer tomb, with fairly rich furniture. The inner tomb was found rifled; it consisted of a limestone structure, with a corbelled vault resting on timbers. Some idea of the richness of the burial may be obtained from a burial near; a man of the same period, wearing a golden headdress on which hair, ears and a "chignon" are represented, lay surrounded by his weapons, and by a multiplicity of vessels, mostly in gold, silver and electrum. The purpose of the headdress is obscure, for it is not clear whether it was worn in life or not; if worn in life, the manner in which it was worn is not certain. The burial is a

RELIEFS AND CYLINDER SEALS

1. Copper relief of Im-gig, from Tell el Ubaid, early Sumerian period
2. Stone relief in two registers, from Ur, early Sumerian period
3. Stele of Naram Sin and his army, from Susa
4. Ivory sides of an Assyrian toilet box, 9th century, from Nimrud
5. Assur-nasir-pal's lion hunt, 9th century, from Nimrud
6. Dying lioness, Assur-bani-pal's lion hunt, 9th century, Nineveh
7. Struggle of mythical heroes, early Surnerian period
8. Warriors of Agade dynasty
9. Goddesses, third Ur dynasty
10. Darius' lion hunt. The inscription reads "Darius the King"

further proof of the wealth of the early period. An important feature is the appearance of the monkey among other amulets in the shape of rams and frogs. The monkey was not native to the country, and must have been known by importation from elsewhere, either Egypt or India.

Seals.—At the time of the 1st dynasty of Ur two forms of seal were equally common—the square or rectangular stamp seal, and the cylinder seal. There is one example of a scaraboid shape, of gold. The stamp seals are engraved with a simple device, such as a scorpion. A peculiar form of the stamp seal is probably not to be considered a seal at all; small models of animals, such as bulls or rams, have sometimes a device on the flat bottom, but these are prophylactic amulets. It has been suggested that the stamp seals are North Syrian in origin, and their use in Sumer is due to northern influence; but the devices used are all connected with astral symbolism and the like, and are connected with Sumerian religious conceptions. The cylinder seal also is purely Sumerian; it took its form as a bead, and the engraver first chose subjects which gave the bead special magical qualities. The variety of the stones used, the general excellence of the workmanship, and the range of subjects and decorative motives are surprising. The commonest theme is the struggle of a mythical hero with animals; the purpose of the theme was to drive away the demons of sickness, though the connection is obscure. The earliest appear to be the large shell, limestone or marble seals; these must belong to some period before 3000 B.C. After that date a long thin shape, frequently carved in two registers, always with scenes that have a direct reference to myths known from later poems, became popular. There is no proof that such seals were at this time used by legal compulsion on commercial documents; they seem to have been used for jar sealings. The name of the owner, and sometimes the god he served, may be found inscribed on some of them.

Weapons and Tools.—War was a constant occupation, and a great variety of weapons was used. Flint arrow-heads prove the use of the bow, though Eannatum's phalanx is only armed with the lance; throw-sticks and maces occur at the same time as axes, daggers with double and single blades, and scimitars. The gold weapons found in graves were perhaps only ceremonial. Of agricultural implements the only extant specimens are clay sickles, to which possibly saw-edged flints were attached by means of bitumen, and hooks, possibly used to lift scrub for cutting fuel. The important feature of the weapons consists in the advanced metal working. Thus the typical early Sumerian battle axe, which might have a perpendicular or horizontal (adze) blade, was socketed on to the handle, not grafted in, though the simpler type in various patterns (similar to the Egyptian axes of the time) was used at all periods.

Amulets and Jewellery.—The lavish wealth of the time is amply illustrated by the profusion of gold and semi-precious stones used for personal adornment, especially at Ur. Gold figures of rams, frogs and apes were worn for prophylactic purposes; a small golden bull is decorated with a beard to represent the divine power. Lapis lazuli, perhaps from the far east (Hindu Kush), and carnelian were common. A larger form of amulet, common in graves, was the model boat, made of stone, wood or even bitumen; to these the devils were consigned, that they might be carried away.

Trade and Foreign Relations.—Seals bearing Indian hieroglyphs of a kind found on early seals at Harappa and Mohenjo Daro in the Indus valley have turned up at Susa, Kish and elsewhere; the designs on these seals are closely connected with Sumerian stamp seals of about 3000 B.C. The trade route which brought, together with these seals, Indian merchandise from the Indus valley may have been by sea; it may also have been by land, as Sumerian objects have been found at Astrabad, and the painted pottery of Sistan resembles prehistoric Sumerian pottery. Egypt was in close trade relationship with Babylonia during the later portion of the pre-dynastic civilization. The great wealth of Ur, and probably of Kish, points to even more extensive trade relations, and it is to be assumed that metals were obtained not only from the Zagros range but also from Cilicia.

Business Documents.—The large number of documents from Lagash at this period deal with the temple offerings and prove that the administration of the town centred about the temple; the priests not only controlled the temple funds and lands, but seem to have been engaged in all business undertakings.

THE AGADE PERIOD

The men who spoke a Semitic language now called Akkadian had long been present in Babylonia, as menials and foreign settlers, before a general rising in the northern cities in the district afterwards called Akkad gave them power. The dynasty founded at Xgade by Sargon did not come into the country as foreigners; there was no clear breach with Sumerian civilization, but certain differences are doubtless due to adaptations by a people of foreign speech. The archaeological evidence proves this very clearly.

Bas-reliefs.—Some badly broken bas-reliefs from Susa, from monuments erected at this time, prove that the "Stele of Vultures" was copied faithfully. But there was a notable development in the treatment of the human figure. One fragment, from Lagash, shows battle scenes in different registers; in them, the men are much slimmer, the muscles and fleshy contours are carefully shown, and the drapery does not obscure the form beneath. To this extent the famous Stele of Victory set up by Naram-Sin is typical of the finest Babylonian work of the period. Foreign influences were clearly at work. Egyptian has been plausibly suggested. The remarkable feature of the stele is the composition; as the king and his warriors ascend the lower spurs of a hill in the Zagros, throwing their enemies down, a lofty peak rises sheer above them. The prototype of this stele was a rock-carving recently found at Darband-i-Gawr, "The Pagan's Pass," in the Qara Dagh, near Sulaimaniah, the territory of Lullubu in Agade times. Another feature of the bas-relief was the rendering of the human face; on the stele of Naram-Sin from the Diarbakr district the heavily bearded face of the king is shown in profile, and the type was faithfully reproduced in the renderings of gods and kings for centuries afterwards. Rock-carving was not uncommon at this time; Anubanini, a king of the Lullubu had a bas-relief carved on a sheer rockface south of Hulwan. Yet another convention became fixed from this time on; gods and divine beings were given horns, the number varying according to rank. Naram-Sin is given horns on the Stele of Victory because between the cutting of the rock-sculpture and of the stele he assumed divinity, a custom peculiar to this dynasty and subsequently copied by the dynasties of Larsa, Ur and Isin. Bas-reliefs on stone vessels depict heroes or gods fighting monsters, and this period may mark the development of the common types of composite creatures.

Sculpture in the Round.—Free figures display a development from the roughly cut and inadequately observed head of Manishtusu to the correctly proportioned and finely cut head of a man from Adab; the technique of inlaid eyes and eyebrows was derived from the preceding era. Similarly in the body there is a range between the continuance of the old lumpish treatment of the flounced skirt, and the fragment of another statue of Manishtusu in which the folds of the garment falling from the shoulder do not obscure the form of the waist, hips and thighs.

No buildings of any extent certainly belonging to this period have yet been discovered. There was a change in the form of the brick which became rectangular, rather large. From this time onwards the timber needed for roofing was obtained, generally by military expeditions, from the Lebanon, cedar being the most favoured. Foreign architecture was also studied; a description, with dimensions, of a typical hissar of Asia Minor is given in a text of Naram-Sin. Brick stamps were commonly used, whereas the written inscription was previously customary.

Seals.—The same features that characterize the best bas-reliefs may be found in the seals, very elaborate treatment of human and animal bodies, balanced spacing and symmetrical opposition. Extremely hard stones, including crystal quartz, were chosen, and the sides of the cylinders are generally concave, a feature hard to understand if the seals were intended to give a flat impression. The crystal quartz cylinders were filled in the centre with a variegated paint which shone through the translucent stone.

Trade and Foreign Relations.—Sea-trade was very active; the quays at Ur and Agade were frequented by the ships of Magan, a country of uncertain location reached by sailing down the Persian Gulf. This trade included the important traffic in copper and in the hard stone requisite for building. Tradition recorded campaigns of Sargon and Naram-Sin to Asia Minor, and there is no reason to doubt the historic fact; other campaigns down the Persian Gulf and across some part of the Mediterranean are not equally credible, but the king of Magan was certainly met in battle by Naram-Sin. To the east, continual strife with the Zagros tribesmen led to the establishment of Akkadian rule over an extensive area, and these efforts were probably directed towards keeping open the trade routes. In the north, Assyria and the Subaraeans alternately rebelled and succumbed.

DYNASTIES OF GUTIUM AND UR

The dynasty of Agade was suppressed by the hill men of Gutium, but no archaeological evidence of the foreign domination can be adduced. Gudea, the *iššakku,* "tenant farmer," or governor of Lagash, and his immediate successor lived under this foreign domination, and an independent dynasty controlled Erech; the Sumerian cities in the south recovered the prosperity and liberty previously lost. The culminating point was reached under the 3rd dynasty of Ur when the kings of the south country established an empire which included Elam and the Zagros range in the east, Assyria and Mesopotamia in the north, and Syria up to the Cilician gates in the west. This was a Sumerian reaction, not so much against the men of Semitic speech in Babylonia, as against a foreign domination from the east; Akkadians permeated the south during this period, the last rulers of the 3rd dynasty of Ur bore Akkadian names, the civilization is derived from that of the Agade period. But the result of the transfer of the seat of power to Sumer was that, owing to the empire established in this, the most flourishing period of Babylonian history, a more definite Sumerian impress was given to the outlying provinces than could otherwise have been the case.

Architecture.—The Sumerian city of this period always included within its walls a "temple" which was actually a complex of buildings, containing the temple of the city god, another of his consort, another perhaps used as the joint habitation of the two; within each temple might be found the "shrines" of different gods, and a "shrine" might contain small "chapels," screened off for lesser deities. Within such temple-complexes dwelt the priests, among whom were the governor, the city judges, the scribes and chief administrative officials. No such temenos can be planned as yet for this period, but it is probable that the plan drawn on the slab held by the statue of Gudea from Lagash was intended for the wall of such a part of his city. The walls of a temenos were in effect the inner fortifications of a city; gateways receded for defensive purposes, the walls had towers and battlements. The city without these walls stood on a lower level; it is as yet impossible to give details as to the general plan of cities, and the remains of dwelling houses of this period at Eridu are simple brick-constructions, interesting because they show windows and a painted black and white decoration. Within the temple complexes narrow streets led past the houses of the gods and of the priests. The larger buildings consist always of a main court with rooms opening off it, sometimes supplemented by a smaller court similarly arranged. The whole precinct was dominated by a temple tower or ziggurat, which might consist of seven, four, or only three stages. Steps up one side gave access to the top stage, which was a small cella, wherein the god was supposed to lie at night with the priestess he had chosen, according to Herodotus' account. The oldest and best extant tower of this kind is that at Ur; it was originally built by Ur-Nammu, the founder of the 3rd Ur dynasty. In later times the four stages were coloured, the lowest stage black, with bitumen, the second white, with gypsum, the third red, the colour of the brick, the fourth sky-blue, the result of glazing. Kings continually boast that they "raised" such structures "like heaven," and it may be that the temple tower corresponded to the conception of heaven's stages, varied between three, four and seven. *(See* RELIGION.)

An important development of the period was the brick-built column. A group of these, curiously close together at Lagash, is definitely dated to the time of Gudea by the French excavators; the row of similar columns at Kish attributed to an early period by the excavators may also belong to about this date. These brick-built columns do not recur in Babylonian architecture, so far as is yet known, until Seleucid and Parthian times, when instances have been found at Babylon and at Kish.

Door constructions depended upon the use of a hard stone—or. in the case of private houses, a burnt brick,—securely wedged in a brick box some distance below the threshold. In a hollow there turned the metal shoe of the wooden post, and the door itself consisted of two wings securely fastened on to this. The question of building in storeys is still doubtful; the evidence alleged from Ur in proof of an upper storey and a gallery, resembling the modern dwelling house of Iraq, is of doubtful value. Roofs seem to have been invariably of timber and mud.

Drainage was extensive and well conceived, at least inside the temple areas. Piping of pieces with bell-mouths, pierced cylindrical drums, and even brick pits of great depth were in use. Within the temples some of these drains unquestionably served ritual purposes.

Bas-relief.—The most favoured method was a return to carving in straight registers, and no attempt to copy Naram-Sin's stele has yet been found. The style of carving is rigid, but careful in detail and effective in grouping. A daring experiment, found on a bas-relief of Gudea, and repeated on the great stele of Ur-Nammu, was the representation of flying figures, bearing the blessing of the holy-water flowing from pots. The dairy scenes of earlier times are repeated; but the themes of the king setting out to build, of builders at work, of priests sacrificing or beating drums to drive off evil influences, are first treated on the Ur-Nammu stele. A remarkable anticipation of a later device may be found on the Gudea vase, in which two serpents twined round a post are watched on either side by bird-headed winged monsters who hold magical staves. The constant appearance of astrological and astronomical symbols in bas-reliefs on pots is noteworthy as marking the increased importance of star-worship.

Sculpture in the Round.—The complete seated figure of Gudea from Lagash retains the squat proportions of the early Sumerian style; the new kind of cloak, much like a cblamys, is less clumsy than the flounced skirt, but there is no attempt at modelling. But the head preserves the correct proportion of the Agade period. A standing figure of the same city governor betrays the same characteristics from the front, but the back view shows very careful modelling in broad masses, to render the natural contours of the human figure. A headless statuette of his son, Ur-Ningirsu, shows a slimmer figure. There are a number of broken figures, all repeating these characteristics, and the male heads of this period often repeat the rather plump conventionalized features of Gudea; but the modelling of the nostrils and mouth is finely done, and in some cases it is difficult to distinguish male stone and clay heads of this period from work done under Greek influence. The best heads are those of women, one from Lagash, one from the city of Ashur, two from Ur; these are portraits of individuals, modified perhaps by the current conception of beauty. In one case the inset eyes are still extant. It has been well said of one of these heads that it is a "spiritual sister" of certain early Athenian female heads of the 6th century. Babylonian sculpture never reached this level again. Casting in metal was also exceedingly good; a copper figure of a city governor, standing rigidly like Gudea, shows an ability to render drapery and follow the line of the human form beneath, together with a sense of proportion, which renders it the best male statuette yet found in Sumer. This art had an influence in the north. A statue dedicated by Puzur-Ishtar, son of Tura-Dagan, governor of Mari, a city west of the Euphrates below the Khabur, is carved in this style; the only variant feature consists in the elaborately curled beard, a custom of the Assyrians.

Seals.—The length of the cylinders in this period was considerably shortened, the execution rather less detailed, and, in conformity with current taste, the postures more rigid than in the

Agade times. The most favoured theme was the introduction of a human suppliant, conventionally rendered, to a god or goddess. The inscriptions are very formal; of the type "God . . ., X son of Y, thy servant," but in certain cases are longer and include the reigning king's name and titles. A great variety of coloured stones was employed.

Foundation Deposits.—The custom of placing small copper figures, the bottom of which is shaped as a peg, in foundations, had commenced in the time of Ur-Nina of Lagash in the early Sumerian period; these were accompanied by small stone tablets in the form of a plano-convex brick, and were placed in a burnt-brick box in the four corners of temple walls. At an earlier date the stone tablets were so placed without the copper figure. In some cases at a later date these copper figures bore a clay brick on their heads. In the Gudea—3rd Ur dynasty period the top of the copper nail is shaped into the head and bust of a man carrying a pointed oval object, perhaps representing a brick. The bottom of these nails is generally inscribed. A peculiar feature at Lagash was that the nail was left separate, held by a half-kneeling, half-running figure of a god, marked by the horned headdress. The phallic interpretation of these figures is quite erroneous. This custom of placing figures in the foundation lasted into the next period and then apparently ceased; it was a Sumerian practice not adopted by the Amorite 1st dynasty of Babylon. In one case the foundation deposit consisted of round-topped stelae bearing inscriptions of Pur-Sin. A rather different kind of deposit consisted in the insertion of small clay cones into the inner core of walls, with the object of perpetuating the name of the builder.

Law and Commercial Custom.—A marked feature of the period was the development of a law code, drawn up probably by Shulgi, the second king of the 3rd Ur dynasty, which was the basis of the Hammurabi code. This code entailed a regularization of business and scribal custom; tablets, to receive legal recognition, had to be sealed, were then inscribed and wrapped in envelopes, also sealed and inscribed with the same text. The observance of this practice in Cappadocia is a proof that the kings imposed their laws upon distant provinces. Commercial documents relating to sales, adoptions and other private business appear beside the records of temple administration. This was a great formative period in the development of social life and in the progress of civilisation.

Trade and Foreign Relations.—Gudea secured his materials by very extensive trade relations; timber came from the Lebanon, gold dust (*i.e.*, alluvial gold) from the Taurus, diorite and other stones from the Zagros, copper from the Median plateau and from Magan. The kings of the 3rd Ur dynasty were, however, engaged in constant warfare along these trade routes without apparently increasing their available sources of supply by contact with a wider area. The inference, justified by historical considerations, seems to be that the incursion of various new peoples into districts along the trade routes tended to shut the inlets into Babylonia, so that these were only partially kept open by an extension of direct authority. The widespread trade of the early Sumerian period was no more.

Provincial Administration.—The kings of Ur were satisfied to appoint the city governors in various districts; they did not attempt to alter the administration of the area they governed by national institutions. Some of the governors were pluralists, and towards the end of the dynasty one alone held nearly all the districts east of the Tigris. Submission was secured by the annual appearance of these governors bringing tribute. The effect of the system seems to have been beneficial; the governors indulged in building schemes within their own cities, and such a provincial capital as the city of Ashur flourished and received an abiding impress from this period. A curious feature of later nomenclature may be traced to this epoch, which illustrates its importance; temples devoted to the worship of the same god in different cities had the same Sumerian name, a custom doubtless due to direct derivation only probable under Shulgi, and walls, gateways, statues were also given Sumerian names, doubtless because the custom was derived from the era of Sumerian governors.

DYNASTIES OF ISIN, LARSA, AND BABYLON

From about 2300 B.C. men called "Amorites" that is "Westerners," were occupied in menial work in Babylonia. They bear names of various types, and may not all have been of western origin; but a new Semitic dialect appears in certain names, and this is a western tongue, more closely connected with Hebrew than with Akkadian. Then an invasion of Akkad from the district of Mari, west of the Euphrates and north of Babylonia, made an Amorite king of Isin; an alliance of Isin with Elam brought about the fall of Ur. Thereafter came a long period of confusion during which various Amorite dynasties struggled with one another; the principal cities involved were Isin, Larsa, Kazallu, Kish and Babylon. Finally the struggle was reduced to a clear issue between a family of Elamite origin, which ruled at Larsa, and the dynasty of Babylon, and in this Hammurabi was finally successful over his enemies, but the supremacy of Babylon did not last more than 50 years. The provinces continually rebelled, and the dynasty was ended by a Hittite raid.

The political history of the time is sufficient explanation of the poverty of archaeological evidence. The great cities were captured and recaptured, and little now remains of the small antiquities. The building operations were confined to restoration of old buildings. The earliest known true arch in Babylonia dates to this period, in a dwelling house at Ur; the fact is probably accidental. The style of fortifications is to be seen from an extant sally port, with the wide broad stairway known to the Assyrians as *mušlalu*. Larger truncated clay cones with more elaborate descriptions of the occasion of the building and the glory of the king, with the inscription repeated on a large circular base, were inserted in the walls. An example of the hollow barrel cylinder used as a foundation deposit, with a long inscription, dates from the Larsa dynasty. The sculpture in the round, while retaining the characteristics of the style of the previous age, shows a decline in artistic ability; a typical instance, the statuette of the goddess Bau, who rides the celestial waters seated on two ducks (?) which symbolize certain stars, is clumsily cut and ill-proportioned. The best bas-relief is that on Hammurabi's stele of laws, showing the king receiving commands from the sun-god, who holds the measuring rod and perhaps the measuring line that symbolize justice; the style is immediately derived from the Gudea reliefs, the faces of king and god exactly resemble Naram-Sin. An interesting stone vase, in the shape of a dog with a small vessel on his back, bearing an inscription of Sumu-ilu, may be paralleled by a coloured terra-cotta vase of later date from Asia Minor. There was a notable change in the burial customs, perhaps due to the Amorites; the dead were frequently buried beneath the floors of houses, either in clay coffins, or in brick corbel-vaulted tombs frequently re-used.

Seals.—A marked change may be found in the designs, and the source of this change is fortunately known. On tablet-envelopes from a site near Caesarea (Mazaca), which date from about 2150 B.C. onwards, two styles of seal impressions are to be found, those which closely resemble the Ur seals, and those in which the field is crowded with symbols; the cutting is more linear and not so elegant, and a series of amuletic figures previously not placed on seals, such as apes, dwarfs, naked goddesses, are commorily introduced. This second type, commonly called "Syro-Hittite" by modern scholars, was introduced into Babylonia by the Amorite dynasties. A large proportion of these seals are of haematite, the cylinder remains the same length as the Ur seals but the diameter is much reduced. The god Amurru, a form of Adad the weather-god, is on many; he stands with one arm a-kimbo, holding a club, and is worshipped-by his consort, who stands with both arms bent upwards. The inscriptions are of the same type as previously.

Literature.—The large output of literary work was a feature of the period. There is a presumption that some of the Iong poems, of which the earliest known copies are dated, were written then, and the evidence of language is in favour of the hypothesis. The Atrahasis version of the Flood story, the Gilgamesh epic, the Creation poem are the finest specimens of verse writing; they were intended for recitation, sometimes as part of a ritual at

festivals, sometimes doubtless simply for pleasure. A consummate mastery of prose is exhibited by the wording of Hammurabi's code of laws, which was itself in debt to Libit-Ishtar's previous code, derived from the Sumerian laws. Scientific study of geometry and mathematics resulted in elaborate calculations of areas and cubic contents beyond the needs of practical affairs. Large collections of omens, derived in part from earlier writings in the temples, were arranged, recording observations from the mixing of oil and water, from the inspection of sheep's entrails, and from the casual behaviour of birds and animals. It is difficult to estimate the total production of the time, but the creative literary effort involved was clearly very considerable and the work was by no means devoid of literary merit.

THE KASSITE DYNASTY

The Hittite raid upon Babylonia left the country leaderless, and gave the Rassite tribesmen who had served Babylonian kings as soldiers in considerable numbers the opportunity to place one of their number on the vacant throne. Thereafter a new political position resulted which has a considerable bearing on the archaeological evidence. The land of Assyria had, until the decline of Babylon, been no more than a province of Babylonia, both politically and culturally. Shamshi-Adad I., about 1840 B.C., created a considerable kingdom of Assyria, but there is no proof of an independent development of civilization in the north until after the advent of Kassite kings at Babylon; from that event, about 1740 B.C., Assyria went its own way, an independent kingdom of Mitanni, centring round the Khabur valley, threw off the Babylonian overlordship, and the Babylonians ceased to exercise any great influence directly upon these lands. The relations of the Kassite kings with the peoples of the east was, on the other hand, very close, and the Elamite and Babylonian civilizations were once again as closely connected as they had been in the earliest times.

The remains of the Kassite period are very rare, and the discovery of a site which will throw light on the civilization of the time is an urgent need. A royal inscription makes it clear that there were some interesting developments in the internal decoration of the temples; Agum-kakrime put figures representing the brood of Tiamat, the dragon of Chaos, on a wall of the temple of Marduk in Babylon, probably in low relief, thus anticipating the work of later times. The building of Kassite kings as yet found are inconsiderable restorations; the most noteworthy is the only extant standing round arch, at Ur.

Bas-reliefs are to be found on the stone "boundary-stones," so called by the Babylonians because they were inscribed with charters granting land to royal retainers and others for services rendered; these stones are ornamented with divine symbols intended to protect the stone from damage by ill-disposed persons. The symbols may in certain cases be astrological, but are for the most part cult objects associated with certain deities. There are occasional instances of representations of the gods, the king, or the persons concerned in the charter, sometimes of merit. Some suppose that these stones, the tops of which are roughly rounded, were intended to represent phalli; there is no proof of this assumption. The original document was on clay, and the purpose of these stone copies is not certainly known. Some have been found apparently in open fields, others were as clearly dedicated in temples. The custom of setting up these "boundary-stones" was continued in later times, and the best examples are from the period that followed the fall of the Kassites. In later times the stone occasionally took the form of a large tablet. Glazed pottery was first made during this period, and opaque glass beads were fairly common.

Seals.—Haematite ceased to be popular, and coloured stones, often variegated, were employed; the cylinders are longer and generally larger in diameter than those of the preceding age. The inscriptions often take the form of prayers to a god. The themes are generally very simple; a seated deity, a goddess or two goddesses beside the inscription, with arms raised in adoration, rows of prophylactic creatures; *e.g.*, frogs. A symbol constantly employed is the Rassite cross, either of the kind called Maltese,  or in a simpler form  . The glyptic art of Babylonia throughout this period was very clearly distinguished from that of the rest of western Asia.

ASSYRIA IN THE EARLY PERIOD

The land of Assyria may originally have been inhabited by the Subaraeans, a race which at a later time occupied parts of Mesopotamia, the hill country north of Assyria, and the valleys of the Zagros range as far south as Kirkuk. The Assyrians, themselves a mixed race with close affinities to the people of North Syria, speaking a language very closely related to Akkadian but with marked peculiarities, probably entered the Tigris valley before the time of Sargon of Agade. They brought with them a calendar of their own, and a yearly eponymous office, the *limu* or *limmu*. Their conquest brought about a breach in the continuity of civilization at the city of Ashur; after the Sumerian domination in the early Sumerian period, there is a new city which shows no sign of influence from the south. The Agade kings and their successors reimposed their rule on the Assyrians, and Babylonian domination continued until the time of the Amorite dynasty. Very few remains of the second millennium are extant, but they are sufficient to prove that Assyrian art and civilization developed in a distinctive national manner. The formative age was that of Ashur-uballit. This king ascended to the throne when Assyria was subject to the kings of Mitanni; when he died, his territory included Mitanni, the Tur 'Abdin, and a large tract south-east of Ashur. This was due to his organization of the state on a military basis. Certain features of Assyrian civilization were due to this military organization; the prominence of certain war-gods, Shulmanu, Enurta, or of the warlike aspects of Ishtar, may be so explained.

Bas-reliefs.—Two bas-reliefs, one in terra-cotta, the other in stone, dating from the middle of the second millennium, show the distinct Assyrian style. The stone object is a basis for a cult object, and the relief represents a king or priest between two figures surmounted with rayed disks, holding staves surmounted by similar disks. The subject is derived from Babylonian themes, the execution is peculiar to Assyria. On a narrow relief below the main scene, men and horses are shown climbing over mountains; the battle scenes of later times faithfully follow this model, and the relief is of great importance because it proves that the frieze style was already formed by the 13th century B.C. The terra-cotta relief apparently depicts Ashur as a tree-god, accompanied by two smaller, unidentified figures. The Assyrian national god was always closely associated with tree-worship, a feature which connects his worship with Syrian and Mediterranean cults; on the other hand, the same myth of Creation was related about Ashur of the Assyrians as about Marduk of Babylon.

Painting.—Painting in various techniques was practised in the time of Tukulti-Enurta I., about 1250 B.C.; tiles were decorated in blue, red and white with geometrical patterns, palmettes, and conventional religious subjects, such as two goats arranged heraldically beside a sacred tree. It is probable that this art arose from Egyptian and Mediterranean influences, due to the lively international trade and political intercourse of the 15th century *B.C.*, the "Amarna age." Glazed terra-cotta pots were common, and some specimens seem to have been imported from Cyprus and Crete.

Seals.—Assyrian seals share the characteristics of the "Syro-Hittite" style rather than the Babylonian. Tablets from the Assyrian provincial town of Arrapkha (Kirkuk) show impressions from short thin cylinders, the themes generally introducing monsters or sacred trees and certain amuletic devices. But in another particularly attractive style, on a longer larger type of cylinder, the ground was more spaciously treated, and hunting scenes, animals bounding across rocks, arid so forth, were cut in shallow intaglio.

Social Life.—Though the Hammurabi code was studied at an early date in Assyria, the Assyrian kings drew up a set of laws of their own, which reflect a social life rather different from Babylonia. Women, unless public or sacred prostitutes, were closely veiled; married women in some cases stayed in their

PAINTED AND ENGRAVED WORKMANSHIP OF BABYLONIA AND ASSYRIA

1. Gold dagger with handle of lapis lazuli, sheath of gold and drawn wire. Early Sumerian period
2. Painted cup from Necropolis at Susa, of "first" style
3. Painted bowl from Susa, of "first" style; 4. Painted vase from Susa, of "second" style
5. Silver vase of Entemena, engraved with symbolic representation of lion-headed eagle seizing lions, and a row of bulls. Early Sumerian period
6. Limestone mace-head showing members of royal family of Lagash in procession. Inscription records the didicatisn of a temple to the city-god
7. Painted and glazed jar from the city of Ashur, of the 9th century B.C.
8. Painted and glazed orthostat from Ashur, 9th century
9. Babylonian stone amulet from Carchemlsh, 7th century. A female demon, Lamashtu, who suckles wild animals, is carried away by a horse
13. Stone head of the demon of sickness, Panzuzu, who was associated with the West Wind. The amulet is pierced for suspension and was worn on the principle that evil averts evil. Sixth or seventh century

father's house and did not enter the husband's family. The king's court consisted of an officialdom partly borrowed from Babylonian models, partly peculiar to Assyria. The dichotomy to be observed in the institutions can be seen in names within the same family; Semitic and non-Semitic names were used inditierently in *a* manner which suggests intermarriage of the Assyrian-speaking people with Subaraeans.

The Assyrian kingdom was powerful throughout the 11th and 12th centuries; occasionally Babylonian kings were able to reverse the position, the most striking instance being Nebuchadrezzar I. about 1150 B.C. An Assyrian revival culminated in the successful campaigns of Tiglathpileser I. about 1090–1060 B.C.; this king was, however, actively engaged in repelling Aramaean tribes, and from about 1050–950 B.C. the invasion of Syria and northern Babylonia by this people exhausted Babylonia and Assyria.

LATER ASSYRIAN EMPIRE

After the Assyrian kingdom had recovered from the strain imposed by the Aramaean invasion of the southern and eastern lands, Assur-nasir-pal II and Shalmaneser III founded the future Assyrian empire by conquests east, north and west in the 9th century. Art and literature were cultivated, and political developments created the prototype of all oriental monarchies. The use of iron, which had been casually known at the beginning of the second millennium or earlier, had become regular from the end of the 12th century; bronze had almost entirely replaced copper for decorative use. It is rarely possible to mistake an Assyrian object throughout the remainder of their history.

Architecture. — The planning of new cities, the complete reconstruction of old sites, was commonly undertaken. Sometimes this entailed considerable engineering feats, such as the sinking of piles in the Tigris, in order to secure more ground. Sites were made into rectangular shapes, or a series of rectangular shapes, as is illustrated by Khorsabad, Sargon's city. A notable feature was the laying out of parks and plantations for the use of citizens. City walls were of great breadth, and strongly fortified; towers were placed at intervals of about 100ft., and at Ashur, Shalmaneser III. built an inner wall (from his time a permanent feature of defensive fortifications) 65ft. away from the outer wall, 23ft. thick, in such a manner that it completely commanded the outer wall. Walls were sometimes built on stone foundations, consisting of large rectangular limestone blocks. The battlements were an inverted T shape, and were frequently decorated with attached rosettes. Columns with capitals of the most varied kinds were used, and some were fluted; occasionally they stood upon a base resting on the back of a colossal lion or bull. Gateways were generally formed by colossal monsters or lions, which would support very heavy lintels and superstructures. Various words for architectural ornament are used in the description of the buildings, but these cannot yet be certainly interpreted; apart from the frieze of sculptured stone blocks, *askuppu,* there was a "belt" of decoration, *nibikhu,* and some rectangular form called *pasqi,* "bridles." It is possible that there was external as well as internal ornament. Assyrian architecture was considerably influenced in the construction of porticos by the Hittite constructions, called *bit hilani* by the Amorites, that were common in North Syria.

Bas-relief. — Assyrian kings decorated the interior walls of their palaces with bas-reliefs cut from a soft alabaster obtained in great quantities near Mosul. There are two series from Assur-nasir-pal's palace at Calah, the modern Nimrud, the one devoted to representations of a sacred ritual in which the king took part, perhaps at the New Year. The second depicts scenes from his campaigns. The first series is larger and more coarsely cut than the second; and the importance of such religious subjects diminished greatly, so that later kings invariably preferred battle scenes. The bas-reliefs of Shalmaneser III. also vary in quality; those on the "black obelisk" are small panels, and the mason was engaged on an unusually small surface which has restricted his style; but the *repoussé* reliefs on the bronze bands from the gates found at Balawat, giving a panorama of the expeditions in Armenia and Syria, are masterly. Round-topped stelae with representations of the king adoring the symbols of the great gods. the sun, the moon, and the evening star, before which an altar was generally placed, were fashionable in the 9th and 8th centuries. The bas-reliefs of Tiglathpileser III. are generally poorly executed, but display the details of military costume; the theme of animals grazing was also introduced in his time. In the reign of Sennacherib, an attempt to link up the walls of a room into a single scene led to compositions such as the siege of Lachish, or the conveyance of colossal bulls, otherwise unexampled. The perfection of the art was reached in the reign of Assur-bani-pal; close study of animal forms, variety in the treatment of the human figure to avoid the doll-like appearance common previously, and a broader spacing make most of the reliefs from his palace, *e.g.,* the lion hunt, the Arabian war, the royal feast, superior to any other Assyrian work. An interesting example of a sculptor's terra-cotta model for a bas-relief, very finely finished, throws some light on the technique.

Sculpture in the Round. — Few sculptures in the round are extant. The finest is a statuette representing Assur-nasir-pal II. bareheaded, holding a nail-studded crook (?) and a mace, with the arms tight to the side and the feet together; there is no attempt to represent the folds of the drapery or the modelling of the figure beneath. The stark simplicity is more probably due to the intention of the artist than to inability. A colossal statue, perhaps intended for Shalmaneser III., for many years *in situ* at Nimrud, reproduces the conventional modelling of the face. Seated statues of Shalmaneser III. and of the god Nabu recall in their lumpish treatment the Gudea statues and mark no advance in technique. Animal heads, on the other hand, were treated realistically; *a* white limestone head of a lion and an ivory head of a bull, both perhaps protomae, are examples of the finest work in this kind ever produced.

Metal Work. — The best extant metal work of the late Assyrian period has been found at Wan, the ancient capital of the kingdom of Urartu, on the shore of Lake Wan. Realistic bronze bulls' heads, a figure of a god in the Assyrian style, couching sphinxes with inlaid human heads (now lost), a snake monster with inlaid black and white roundels, and a model of a wall with a gateway, apertures for archers, towers and battlements, may be cited as typical; the finest individual object is a round shield, quartered, with *repousse'* figures of animals. Some authorities would see in Armenia the centre from which such work was inspired elsewhere, and the commencement of a style continued in Achaemenian Persia. The subject is, from the archaeological point of view, very complicated; a part of the same, or a similar, model of a wall was found at Nimrud, and the Assyrian style of the objects is not to be doubted. The treasure of bronze bowls from Nimrud can be more readily assigned to a source free from pure Assyrian influence; the subjects are treated in a mixed Egyptian and Western Asiatic style only possible in Phoenicia. Metal casting underwent an improvement of some kind in the time of Sennacherib, and colossal figures were made for his palace at Nineveh.

Ivories. — The hoard from Nimrud, which dates probably from the late 8th century, includes a number of ivory plaques from the sides of toilet boxes, and feet from small pieces of furniture; there are also a number of beads in a peculiar style. Some of these pieces are purely Assyrian in theme and treatment; others are as clearly Phoenician. A certain number remain that cannot easily be assigned. The trade in these ivory boxes was very extensive; good examples have been found at Ur.

Stone Vessels. — The ornamentation of the handles of stone vases and the decoration of the sides of votive cups was common. Handles generally take the form of animal heads; battle-scenes or religious subjects of the conventional kind were cut in bas-relief on the cups. Some flat libation vessels are decorated with ducks' or swans' heads, and other vessels are copies of the Egyptian types of the period.

Glass. — There is one glass vessel extant bearing the inscription of Sargon II ; it must therefore have been made in the second half of the 8th century The glass is of a distinctive, very heavy kind, and a few other specimens probably belong to the Assyrian era. There was a work called "the Gate of the Furnace" in Ass-

ur-bani-pal's library giving instructions for the making of glaze and glass. Opaque glass beads were not uncommon.

Painting and Glazing.—In the 10th century, before kings were rich enough to provide sufficient stone for the great friezes, painted bricks or orthostats decorated their palaces. The scenes are treated in the same manner as the reliefs, the colours applied are conventional and were not closely connected with the natural object. Various techniques were employed. It should be remembered that some of the stone friezes when excavated retained traces of the original colour, and in some instances the paint employed would seem to have been similar to that used on the bricks.

Painted and Glazed Pottery.—The native glazed ware is roughly made, and the manner of glazing resembles that of the late Kassite age in Babylonia. A number of ornate pots with palmette and geometrical decoration are more carefully made for royal use; the ornament is in part derived from Egypt. Occasionally animal figures, especially goats, and sacred trees, are introduced. This ware is the finest yet known in Babylonia and Assyria, and may be partly derived from Hittite work, but the designs are not closely related.

Prophylactic Figures and Plaques.—From the earliest times a great profusion of terra-cotta figurines and plaques are found in Babylonian and Assyrian temples. Their purpose is obscure and their artistic value generally small. Some of them, such as masks of the demon of sickness, Pazuzu, must have been used as amulets on houses, for they are pierced for suspension. In the late Assyrian age ritual texts inform us of the use to which a whole series typical of this period were put under the floors of certain rooms in temples to drive away pestilence and sickness of various kinds. Such figures and plaques were made of terra-cotta or of copper, and were buried in brick boxes beneath the threshold, or at stated positions in relation to the sick man's bed. Human figures carrying holy-water pots, or metal staves, and wearing metal belts and miniature daggers, others with a fish-skin over head and back; monsters with human forms, animal or bird heads and bovine hind-quarters, snakes, doves, dogs, dragons. apes, boats, priests and lion-headed men carrying daggers aloft are the common types. Such types reappear on friezes more especially in 9th century Assyria and in earlier examples from Mesopotamia and Syria, and all are derived from Babylonian mythology; but as these figures are characteristic of the Assyrian age, it is probable that the ritual development involved dates from this period. An extant text also describes the postures in which certain gods and semi-divine figures should stand, and as numerous terra-cottas; *e.g.*, of the goddess suckling a child, or of the monsters called Lakhmu and Lakhamu, correspond to this description, it may be that these also were considered apotropaic.

Amulets.—Assyrian amulets frequently take the form of an oblong tablet of stone, with a projection pierced for threading on to a necklace. These are inscribed with incantations generally addressed to the gods, or demons of sickness. Those most common are addressed to Lamashtu, a female monster who wanders the streets at night rendering maidens sterile and men impotent; these are generally carved with a relief showing the monster, suckling dogs or hyenas, being carried away by a boat across the river, the potency of the representation being due to a course of reasoning common in "sympathetic magic." A much favoured amulet at all times was the head of Pazuzu, a demon of sickness associated with the south-west wind; this bearded, lined face was made in bronze, in stone, in semi-precious stones such as lapis lazuli and carnelian, and in clay, and was worn round the neck, on the principle that sickness would avoid the place where he already was. Every kind of bead had an amuletic significance, though not all of their potent functions are yet known. One ritual lays down the rules for threading various kinds of stone on particular threads to avoid Lamashtu, to secure child-birth, or the like. The pomegranate shape was thought to promote sexual strength, and special significance must have attached to the pot-shape, and to the "eyes" of banded agate.

Seals.—The cylinder continued to be the only seal in use until the 7th century, when another type was introduced, the cone shape, with rounded top, pierced, perhaps for fastening on to rings. The free style and linear treatment of the earlier cutting was abandoned, and a formal style, of great precision and a minute delicacy recalling the Agade seals. Religious subjects, such as the worship of gods or the sacred tree, and amuletic themes, predominate, but hunting scenes with no religious reference were favoured, and in them there is the same excellence in the treatment of the human form as marks the friezes. Only one seal extant shows a battle scene, and that appears to have been cut in commemoration of the campaign against the Aribi under Ashur-banipal. The use of the drill, towards the end of the 9th century, did not have any disastrous effects until the close of the Assyrian era, but the commencement of the decline of the art, owing to the schematization of forms into circles with narrow channels connecting them must be dated to the 7th century.

Tools, Weapons, Armour.—Owing to the perishable character of iron the remains are very scanty, and bronze objects preponderate. The tools are generally of simple types; chisels, saws. knives and sickles. Chains, and meshed chain work were discovered at Nimrud, and the excavators thought the latter was part of some chain-armour, which is hardly probable. The weapons show a considerable diversity in shapes, and it is not certain that this diversity is due to a difference in period; arrow-heads sometimes have tangs, sometimes not, the straight dagger and the scimitar were both used, the hafting of lanceheads was particularly varied. Of metal articles used for dress, pins and fibulae of a simple kind were common. Harness from Sennacherib's stables shows the common forms of bits and cheek-pieces. For furniture, a bronze facing on iron was popular. The arms and legs of chairs mere ornamented, and the lion's or bull's head or claw or hoof was commonly used on them. On buildings, metal heads were used as gargoyles or as a roof decoration.

Burial Customs.—The habit introduced by the Amorites into Babylonia of burying the dead beneath the floors of houses was practised throughout Assyrian history and may account for the constant spread of city sites. The tombs of Assur-nasir-pal II and of Shamshi-Adad V, in oblong stone coffins, in well built cellars, yielded no objects of importance; this may be due to tomb robbery, but probably no considerable tomb furniture was customary in Assyria. Assur-bani-pal speaks of the sacred rites performed for ancestors, and says that he restored customs long neglected; the rites intended were perhaps no more than a symbolical breaking of bread and libation of water.

Foundation Deposits.—The inscriptions buried in foundations were made upon (1) cones of the Babylonian type, sometimes with large painted knobs intended to protrude from the wall; (2) upon rectangular stone slabs, buried in the corners of the buildings; (3) on small rectangular tablets of metal, gold, silver, copper and lead; (4) on hollow terra-cotta barrel cylinders, inscribed across the length; (5) on prisms, with five to ten sides, inscribed across the narrow faces, in columns. At the foundation of all buildings some fat, oil and other vegetable products were dedicated.

Libraries—Tablets in Babylonia were commonly kept in stone jars, and the first library arranged on a systematic principle seems to have been formed in the reign of Assur-bani-pal, though the collection of tablets began in the reign of Sargon. The tablets were arranged on shelves; where a work required several tablets, index lists enumerating the first lines formed, with the help of the catch-lines given on each numbered section, a reference index, and tabs hanging down on straws gave the general title of each work. There were two libraries, one in the temple of Nabu and the other in the palace. The system probably grew up slowly, and some of the tablets found in the city of Ashur seem to have belonged to such a library system.

Army—The organization of the army depended on a division into "bands," "fifties" and "tens," and was raised apparently by a census taken in provincial districts from time to time according to estates; an example of such a census for the district of Harran is extant. Originally the army was simply a militia, called out when required either for military purposes or the labours of the *corvée* on royal buildings; but from the time of Tiglathpileser III. onwards the formation of a standing army ("the royal troops,"

"the turtan's troops" and so forth) can be traced. Conquered provinces were immediately required to provide contingents; mercenaries were not employed, as in Egypt. The priests had a part to play; a Babylonian army of the time had a soothsayer to march before it. The liability to serve was not confined to one class, and all who were liable might provide substitutes. For men of the poorest class, there were regulations providing for the support of their dependents for a reasonable period after their capture. In the second millennium, armies consisted simply of chariotry and infantry; in the 9th century cavalry was added as an independent arm, and from the 8th century a body of specially trained men acted as pioneers, for road building, mining under besieged fortresses, and so forth. Siege engines were first introduced in the 11th century; heavy battering rams on wheeled carriages, scaling ladders, and ramps were regularly used, and the Assyrians were unusually successful in this kind of warfare. River-crossing was effected by building bridges of boats. Permanent ring-camps were constructed and used as bases for different columns. The armour of the period was simple; the helmet was a pointed conical shape, to which in the age of Assur-bani-pal a crest, borrowed from the peoples of Asia Minor, was added, round shields were carried in action, and strong reed constructions used for cover in siege operations.

Administration. — An elaborate court ceremonial surrounded the Assyrian king, whereas the administration of the old Babylonian kings had been simple and direct; it became difficult for the suppliant to reach the king, the privilege of every subject, because the monarch was surrounded by powerful officials in whose hands all executive power lay. The principal official in the second millennium had been the *ummanu,* the royal clerk or scribe who communicated the king's orders in writing. From the 9th century onwards the chief officer appears to have been the turtan, the commander of the army, whose functions in the 8th century had to be duplicated, for there was a *turtan* of the right and a turtan of the left. The king's chamberlain, *sukkallu,* perhaps fulfilled the old duties of the *ummanu,* and corresponded to a Persian vizier. Another military and civil officer, the *rab šariš* or *rab šutriš,* "the chief of those at the king's head" (as he reclined on a couch at his audiences), appears in the biblical account of Sennacherib's siege of Hezekiah, and was perhaps in charge of the king's personal attendants. A treasurer, *rab danibe,* sealed the gold and silver received and could veto the issue of it in certain cases. The provincial governors, *šaknu* or urasu, were under the empire assisted by subordinate district officers, the *bel pakhati;* the raising of military levies, the finding of men for the *corvée* and the exaction of taxes was the work of the *zabil kuduri.* The Assyrians made notable developments in methods of government, the full extent of which have not yet been appreciated.

Education. — The only account of the attainments of an Assyrian youth is the panegyric of his own accomplishments by Assur-bani-pal, but that forms a compendium of the ideal attributes of the most cultured man of his time. "I, Assur-bani-pal, understood the wisdom of Nabu; all the art of tablet writing of every kind of clerk, I acquired their understanding. I learnt to shoot the bow, ride horses, and chariots, and to hold the reins." And again, "Marduk, the wise one of the gods, presented me with information and understanding as a gift. Nabu the scribe, granted me all the understanding of his wisdom as a present. Enurta and Nergal made me virile and strong, of incomparable force. I understood the craft of the wise Adapa, the hidden secrets of all the scribal art; in heavenly and earthly buildings I read and pondered, in the meetings of clerks I was present, I watched the omens (taken from the liver of sacrificial victims), I explained the heaven with the learned priests, recited the complicated multiplications and divisions which are not immediately apparent. The beautiful writings in Sumerian that are obscure, in Akkadian that are difficult to bear in mind, it was my joy to repeat. . . . I mounted colts, rode them with prudence so that they were not violent; I drew the bow; sped the arrow, the sign of the warrior. I flung the quivering javelins like short lances. I held the reins like a charioteer, so that I made all the wheels revolve (a reference to the mechanical difficulties caused by friction). I directed the 'weaving' of reed shields and breastworks like a pioneer. I had the learning that all clerks of every kind possess when iheir time of maturity comes. At the same time I learnt what is proper for lordship, I went my royal ways." On the methods of training little light has yet been thrown.

Antiquarian Interest — A marked feature of the time was an interest in the history and literature of the past. Texts concerning the exploits of Sargon of Agade were collected, and explanations of the geography of his time, not always trustworthy, drawn up; a map to illustrate them was drawn in Babylon in the 8th or 7th century. At Ur the Assyrian governor in his restoration of the town came across some early Sumerian texts, which were translated into the language of the time and exhibited in the temple.

Social Life. — The policy of transporting large bodies of population from their native district to other provinces, and the extensive settlement of new cities in Assyria itself, always followed by Assyrian kings, led to a cosmopolitan social life, not only in Nineveh but in the other great cities of the empire. Egyptian prisoners brought with them the manners and objects of their own country. Aramaeans were numerous, and official letters or commercial notes were sometimes written in the Aramaic alphabet. Marriages of Assyrian princesses with Scythian chiefs were arranged. The general result was that a uniform level of civilization was spread over western Asia at this time. The increase of the proportion of slaves to free must have been very marked; though the status of the slave was no different from that of chattels, in relative well-being the slave was in a better position often than the poor Assyrian, and freemen not uncommonly sold themselves or their children into slavery. The position of the women was peculiar; though closely secluded, they might in individual cases be prominent in public affairs. For a number of years Assyria was ruled by a queen-regent, Sammuramat, from whose name the Semiramis of Greek stories may derive. Ladies of the noble class were occasionally empowered to act as provincial governors, *šakintu;* and court intrigues of the usual oriental kind centred about the harem. An important feature of civil life was due to the guild organizations of various classes of craftsmen, for these lived in special quarters of the cities.

NEW BABYLONIAN EMPIRE

When the Assyrian capital fell after a long war conducted by the Medes, Babylonians and Scythians in 612 B.C., and the last Assyrian resistance at Harran failed in 606 B.C., the Chaldaean dynasty founded at Babylon in 625 by Kabopolassar was firmly established. The Chaldaean race first appeared in Babylonia during the troubles caused by the Aramaean invasion; in religion, personal names, and social custom they cannot be distinguished from the older Babylonians, save that they were divided into great tribal stems, with many subdivisions, like the Aramaeans. The new dynasty involved no breach of continuity, but the rise of the Median empire involved new world conditions which can be vaguely traced in archaeological discoveries.

Architecture. — Babylon. which had been partially rebuilt, after the sack by Sennacherib, under Assyrian rule was set out on new lines by Nabopolassar and Nebuchadrezzar II. The massive buildings of this last period are all that have yet been recovered of the central area of the city. The principal feature was the sacred processional way leading through this area and out by the "Ishtar Gate"; along this way, at the New Year festival, every year the image of Marduk was conveyed, ritual acts in a mime taking place at each of the sacred buildings, until the god could be placed on a boat that conveyed him to the festival house, which lay west of the Euphrates, north of the city. The main part of this way was laid with limestone and breccia slabs. The great ziggurat of Babylon dominated the whole site, and it may be that the "hanging gardens" told of by the Greek writers were connected with its stages; the excavators however believe that a vaulted building with an installation for raising water in another part of the temenos was the substructure of the "hanging gardens." This is the first proven example of the vault, apart from the early corbelled vaults of tombs, though some believe that it may be

traced in the remains of much earlier periods. Drainage was conducted by very large brick conduits, to which there were manholes sufficient to allow clearance. Though the kings of this period, especially Nabonidus, always claimed that they restored buildings according to the original plan, there is proof at Ur that they altered the nature of buildings in a way which shows a change in religious worship.

Fortifications were built upon a larger plan than ever before: Nebuchadrezzar constructed a defensive wall and moats eastwards from the Euphrates which extended to Opis on the Tigris, and parts of the internal system show the character of these walls. At Ur the temenos wall was extended by a platform sufficiently large to allow two chariots to pass. The whole temenos was actually referred to as a "fortress building." The extensive use of glaze, semi-precious stones and metal for external decoration is attested by the inscriptions, and good examples of glazing may be found on every new Babylonian site. The town-site at Babylon, Merkes, gives the impression that the period was poor compared with the richer houses of the early period at Ur. Some curious burials of the period have been found; an anthropoid sarcophagus at Babylon, and a copper coffin from Ur, riveted in modern fashion, are rare exceptions from the ordinary terra-cotta and plain stone sepulchres.

Bas-relief.—The art of the large stone bas-relief is not represented by any extant examples, and it is even doubtful whether palace rooms were so decorated. There were, however, independent developments. The figures of bulls and certain monsters on the Ishtar gate are in low relief, made of bricks each cast in a separate mould and designed for a special place. This elaborate technique seems to have been invented at this period, and was subsequently imitated by the Persians. Another kind of relief is mentioned in the inscriptions but not exampled by any extant instance; on black-and-white figure-drawings, done with gypsum and bitumen, gold or other metal overlays were applied within the outlines; these overlays must have been beaten. A few small metal plaques with figures in low and very delicate relief belong to this period.

Sculpture in the Round is represented by a few small stone heads of women, perhaps intended for temple votaries. The poverty in bas-relief and sculpture may not be altogether accidental; the increased use of glazing, and the use of coloured designs, few of which are now preserved, may have affected public taste and caused the stone relief and sculpture to go out of fashion. It is hardly conceivable that the lack of stone was due to any difficulty in obtaining it, for Nebuchadrezzar, Neriglissar and Nabonidus all had free access to Syria. That there was a general decline in taste and artistic ability is rendered probable by the seals.

Seals.—The seals in common use were small in diameter and length, generally of poor stones, and are cut with the drill in a sketchy and generally unfinished manner. The cone seal was reduced to a narrow irregular octagon, also badly cut as a rule. The commonest theme was a priest worshipping before a low altar on which stand the emblems of Marduk, a lance-head, and of Nabu, a wedge-shaped object; to these other symbols are occasionally added. The priest is generally separated from the altar by a low fence or rail. Not all cylinders were intended for common use; some were preserved in temples, and two such belonging to a temple store carved in lapis lazuli depict the gods Marduk and Adad. These are the best examples of New Babylonian seal-carving, and the figures are closely connected with the art of the "boundary-stones," they do not approach the Agade, Third Ur or Assyrian seals in merit.

Religious **Struggles.**—Nebuchadrezzar and his successors were engaged in a desperate rivalry with the Medes, and later with the Persians; in addition to continual political strife, new religious ideas were causing a ferment in the whole world of the time, and some effects of this unrest can be found in Babylonia. Some no longer tolerated the images erected to obscene cults; thus the men of Erech at the beginning of the 8th century had pulled down a shrine of Ishtar in which there was a figure of the goddess with a team of seven lions, a goddess whose cult is known to have been licentious. Nabonidus engaged in a reconstruction of temples and committed certain acts at the New Year festival which the priests did not hesitate to denounce later as impious. The evidence is not sufficient to allow of any clear ideas being formed upon the exact nature of these religious troubles.

Social Life.—As Assyria had been made a cosmopolitan centre, so Babylonia became the home of many separate and isolated communities. The Jews brought from Palestine by Nebuchadrezzar rose to important positions, and were concerned in large commercial undertakings. Isolated Greeks came to Babylon in search of military adventure. Aramaeans used their own alphabetic script increasingly. A marked feature of the period was the growth of large business houses, confined often to a single family, or rather clan, which must have controlled the fortunes of individual cities; the Egibi family at Sippar, the Murashu family at Nippur, both laid the foundations of their fortune at this period. The administration of temple lands was in the hands of increasingly powerful officials.

PERSIAN DOMINATION

When Cyrus entered Babylon in 539 B.C. he posed as the deliverer of the land and the chosen of its gods; his son Cambyses fulfilled the duties of every Babylonian king at the New Year festival of 538 B.C. Rebuilding of the temples at Erech and Ur was undertaken as a sign of the king's piety. As time passed the country was left increasingly to the administration of the governor of the satrapy called Ebir-nari, "Beyond the river," and on the death of Cambyses, Babylonia, like many other provinces, rebelled against the Persians and had to be reconquered by Darius. The province thereafter gave repeated trouble, but remained fairly prosperous, and was made to pay a very large sum into the royal treasury yearly. Towards the end of the Persian domination an outbreak of Zoroastrian fanaticism seems to have led to the destruction of many of the great temples. The zikkurat at Babylon was a mass of debris when Alexander first saw it, though it had been in a good state when Herodotus wrote; the zikkurat at Borsippa must have been burnt about this time; the temple at Ur everywhere shows marks of incendiary destruction, after which the site was deserted, save for stray fugitives. There is every sign that Persian rule in Babylonia was unpopular from the time of Darius I., and that by the time of Darius III. the land had suffered from a religious persecution. There are some signs of a change of burial customs, long rectangular brick tombs in which the body was laid at full length, and the face sometimes covered with a gold mask, or the mouth, eyes and nose covered by thin gold strips may belong to this or a later period. The most typical, and only numerous, objects are the seals and tablets.

Seals.—In shape and cutting the seals closely resemble those of the late Assyrian period; the treatment of the themes alone is typical. The theme of the hero struggling with animals is adopted and becomes the king killing lions; the hunt of Sagittarius becomes the royal lion-hunt. Or sometimes the hero is converted into the ludicrous Bes, possibly with the intention of ridiculing the pagan religion. Contemporary scenes might also be treated, a custom already observed in Assyria; a seal shows a Persian soldier killing a Greek, a memorial perhaps of Darius' war. The treatment of the human body on some of these seals is unsurpassed in any gem-cutting; without the extreme detail favoured by the Assyrians, the forms are indicated with truth and delicacy. The cone seals have themes peculiar to them; the bird-man is a constant subject, as is also the king holding two animals, in the old heroic style. These seals are also very finely cut.

SELEUCID ERA

Alexander the Great ordered the clearance of the temple site at Babylon, and this was effected in part in the reign of his posthumous son. Seleucus I. and Antiochus I. paid particular attention to Babylonia, and seem to have aimed at a general restoration of the old religion. Cities were founded for the Macedonian and Greek colonists, and the ruin caused at Babylon by an incursion of Antigonus Monophthalmus led to the removal of most of the civilian population to Seleucia by order of Antiochus;

this need not have been due to any deliberate wish of the Macedonians to be rid of the ancient capital, as often represented. Rebuilding of the shrine of Nabu at Borsippa was undertaken at Antiochus' command; and the priests of Erech were given facilities for collecting the secret ritual texts, which had been scattered in Persian times, from Susa and elsewhere. A historical school, gathered round a central personality known in Greek as Berossos, was active in compiling chronicles of the long centuries of Babylonian history, that these might be translated into Greek for the instruction of their new rulers. The schools of priests who were engaged in astronomical studies were particularly active at this time, and scientific observation and prognostication was the most important advance in this direction. In the south, business documents continued to be written in cuneiform; the latest known cuneiform text contains astronomical observations for the year 9–8 B.C. Even cylinder seals have been found in use so late as the 3rd century, clearly marked with the Seleucid anchor, and the form survived as an exceptional usage into Parthian times; but it had ceased to be commonly used, and the tablets are sealed with oval ring-bezels bearing typically Greek devices. As the survival of Babylonian religion was one marked feature of the period, the complete disappearance of all native art was another. Stone and bronze statuettes, terra-cotta figurines and plaques, and the pottery and glass ware of the time, betray no survival of native handiwork. All is provincial, classical output, generally tasteless. And as the centuries passed, and Rome occupied the position the Hellenistic kingdoms once had done, until the Parthians drove the mistress of the world out of the Tigris valley, the output became worse, the last remnant of the old Babylonian civilization, the cuneiform tablets, cease to be found, and darkness settled upon the land for several centuries.

GENERAL FEATURES

The civilization which has been described in its historical aspect from the archaeological remains, was based upon an agricultural settlement of the lower valleys of the Tigris and Euphrates, only possible for a people acquainted with the method of irrigation necessary for that land. The problem presented is different from that in the Nile valley, where the annual inundation is welcome. The Tigris, swollen by the molten snows of the northern and eastern hills, floods at the end of March or beginning of April, and an overflow of its banks can do great damage to the surrounding country in the Baghdad region and southwards. The Euphrates floods about the time the Tigris is subsiding as a rule; the damage in this case is not due so much to the violence of the stream as to the deposit of salt left on the surface by any temporary flood. To be successful, irrigation must be preceded by a drainage system. The problem was at any rate in part solved by the avoidance of floods; canal systems sufficient to take the largest possible overflow were devised, and carried out sometimes, apparently by diverting the course of the Euphrates just north of Babylon. These canals were invariably built by forced labour, the royal corvée; and from the earliest to the latest times "Irrigator" was a proud title for any king. The derivative, smaller canals, were fed by simple machines; the *shadûf* still employed was in common use; there is some evidence for the existence of the water-wheel in the new Babylonian era. Some part of the history of the canal system is known; Lagash and Umma were once connected by water with the Tigris, the "Royal Canal" and the "Pallacottas" which lasted throughout the ages until mediaeval centuries were in existence before the time of Nebuchadrezzar II. The rise and fall of the towns was closely connected with the opening and silting up of canals. This silting up, which raises the bed and banks of the river by too considerable a height above the plain, is only avoided by annual cleaning, and that was secured by making the townships and landowners along the banks responsible. Such a dynasty as that which included Hammurabi, by an energetic personal administration, secured good order in this respect; the invasion of the Aramaean tribesmen in the 10th century caused a considerable lapse, with the result that the marsh land was increased. The Chaldaeans, the inhabitants of the marshes, occupied a far more extensive territory in the 7th century than their congeners, the Sea-Land dynasty of Hammurabi's time.

The canals carried commerce in the mean boats required for river traffic. In the earliest days craft had sailed up the Persian Gulf to Ur and even so far north as Agade, somewhere near Babylon, to unload at the brick-built, bitumen-faced quays beside these cities. But the constant recession of the gulf rendered this impossible after the time of the 3rd dynasty of Ur, and thereafter no more is heard of such traffic. The ordinary river boat is a canoe type, propelled by poles, with a high prow fore and aft. On the Tigris, a circular basket, constructed of wood and skin, of some depth, is coated with bitumen, and will serve to carry large animals, when adequately guided, down stream; this is the type now called a *quffah*. On the Euphrates, the raft is used above 'Anah, the modern kelek. The Assyrians on their military campaigns generally carried skins, which were inflated and used by the individual soldier; but Sennacherib, who undertook a great campaign in the marshes and the gulf, brought Phoenician ships with a bank of oars across to the Euphrates. Constant campaigning on the Mediterranean coast brought acquaintance with Mediterranean ships, and there is a representation on a 7th century frieze of a Phoenician ship with a ram.

The other principal feature of this civilization was that it depended upon trade to an exceptional degree. The wealth manifested by the early Sumerian remains can only have been so obtained; and the existence of the great city communities always afterwards proves that the trade was very considerable. It is not, therefore, surprising to find that the Babylonian system of minas, shekels and grains was very widely employed, and has had an influence upon distant lands. Only the actual form taken by the weights can be dealt with here. In Babylonia the commonest type of weight took the form of a duck, with its head turned back, modelled in low relief on the back; these were made in all sizes, in all kinds of stone. Another common form was a barrel cylinder, with flattened ends, a type also used in Egypt; these were generally made of haematite, but other hard stones were also employed. A more unusual form was a stele-shape, with rounded top, rather thick; an instance, dating from at least the second millennium, was found at Ur; Nebuchadrezzar's copy of Shulgi's weight and Darius' weight have also this shape. The Assyrians commonly used the duck-weight; but the royal weights of Sargon, found in the gateway of the palace of Khorsabad, take the form of bronze lions, or lionesses, and stone examples of this kind are known; this lion type was also used in Egypt. The use of the duck-weight and the cylindrical shape is interesting; they were suspended by wire to the end of a beam, as instances are known in which the wires are still intact. By no means all weights were inscribed: sometimes the weight is written in full, sometimes only a number of lines are marked, the unit not being given. In the case of Sargon's weights, there are both Assyrian and Aramaic inscriptions.

Exchange Methods.—The question of the mode of exchange is often complicated. In some cases barter of the simplest kind can be proved, even in the later periods; while even in the earliest, some instances of barter are regulated by a reference to weights of metal, which may not actually have been used in the transaction. On the other hand, there can now be no doubt that the numerous instances of purchase with gold, silver and copper should not be considered as "contracts for" these metals, but as exampling the use of these metals as a means of exchange, and this use can be traced from at least the third millennium to the first. In Babylonia only the three metals were so employed; in Assyria from the end of the third millennium to the end of the second, lead was also so employed, and State fines of delinquents were estimated in terms of lead. The form in which metal was used is doubtful. In early Sumerian times quantities of thin gold ribbon have been shown to have existed, and it is possible that the small amounts of this metal noted, fractions of a shekel being common, were passed over in this form. In Assyria, stamped lumps of lead dating from the 13th century have been found in the temple of Ishtar; such lumps would correspond to Chinese "cash," and would fulfil the description of lead minas and shekels in the documents as "sealed."

On various sites small "twists" of metal, of irregular shape but folded in such a manner as to allow of stringing, have been found in positions which seem to prohibit the view that they are merely waste pieces; such pieces also may have been used for exchange.

Money. — In the time of Sennacherib, however, Assyrian money was, and had for some time been, cast in small pieces. The half-shekel, or *zuzu,* was the denomination specially chosen. The form of these cast pieces is not stated in the inscription which mentions them; but such a piece must have been thin, and thin round pieces of metal, cast in moulds that had "runners," have been found in buildings and burials dating from a very early period. Such roundels may originally have been used as ornament; but it is difficult to think of the late Assyrian cast half-shekels in any other form. It is interesting to note that the word *zuzu* survived into the Christian era as the name of a very small coin.

The distinctive feature of the Babylonian weights was their dependence upon the sexagesimal system. The origin of that system has been much disputed; its use is obvious. The chief point about its origin is whether it depended upon a combination of two other systems, a decimal and a duodecimal, or (more probably) of a system dependent upon five with one based on six, or whether it was independent of the five (or ten) unit. Probability points to the former alternative, for the ner unit, 600, can hardly be explained on the second alternative. The obvious advantage of the system, the ready expression of most fractions, gave rise to a system of notation which closely approximates in use to the decimal point. Thus the number 4.275 could be expressed as  ; *i.e.,* 1 sar 1 ner 1 soss 10+5, or 3,600+600+60+15; the value of the number thus depending on the unit implied.

Staples Cultivated. — The staples of Babylonian commerce in the late period were wheat, emmer, barley, dates, sesame and woven stuffs. It has frequently been asserted that wheat was indigenous in the country, and an example of a species of wheat has been found in remains of the early Sumerian period at Kish; but the distinctive word for wheat does not begin to appear frequently until the end of the third millennium, and before 2000 B.C. barley and emmer were the only cereals in common use. The rich yield of wheat in Herodotus' time made Babylonia the wealthiest satropy in the Persian empire. The cultivation of the date depended on a knowledge of fructification, by grafting the spathe of the male tree into the female spathe. This operation entails climbing the tree with a rope, and the method of fructification was hence called "riding," *rukbu.* Weaving depended. from 2500 B.C., on the import of fax, which must have been obtained from the north, probably from the Khabur district. Cotton, the cultivation of which was introduced into Assyria by Sennacherib from some unknown district, is first mentioned by name, *quṭanu,* in the Persian epoch. Apiculture, of some importance owing to the use of honey and wax, was introduced into Sukhi, a land west of the Euphrates, just north of Babylonia, in the 8th century.

BABYLONIAN CULTURAL INFLUENCE

The evidence of Babylonian influence on other nations is more apparent in religion and in literature than in archaeological remains. Some of the themes of pre-dynastic and early dynastic art in Egypt were clearly borrowed from Sumer, and there is evidence of early Sumerian civilization in Syria in objects found there. At a later date, perhaps not earlier than the middle of the second millennium, the themes of Hittite and north Syrian art were derived from Babylonian mythology, but a direct derivation of the artistic style cannot be proved except in the case of seals. In the first millennium all the Assyrian provinces, especially southern Syria, were affected by the dominant race; a curious hybrid art arose in Phoenicia from a mixture of Egyptian and Assyrian elements. The art of Persia was at first quite dependent on Assyria, and the Lydians were also affected, to judge by the monument of Cyrus at Ephesus. This is all, or nearly all, that can be stated with certainty on this subject. But further discovery may prove a wider range of influence through trade. Isolated cylinder seals of Syrian or Babylonian origin have been found in Crete, and some believe that the use of clay tablets in that island must have originated by borrowing from Babylonia or Asia Minor. Another difficult question is that of glass manufacture. When Thothmes III. collected tribute from Assyria and some Assyrian provinces, he took "genuine lapis" and "Babylonian lapis lazuli"; if this latter was, as seems probable, a manufactured product, it is difficult to see what it can be other than an opaque glass. In that case Babylonia had an important influence on the early glass trade. In short, though the cultural influence of Babylonia was far more restricted than was at one time thought, it played an important part in the development of early civilization and should never be neglected.

ANCIENT SITES

At the end of the 18th century the abbé Beauchamps encouraged some native diggers at Babylon, who frequented the site to obtain mortar, to keep certain antiquities, and obtained some himself. Some of these passed into the possession of C. J. Rich, the British resident at Baghdad, whose report on the antiquities of the country was the direct inspiration of Botta and Layard, the first European excavators. The principal aim of these pioneers at first was to discover the site of Nineveh; they did not sufficiently rely upon Rich's well-grounded judgment that the Assyrian capital must lie under the twin mounds of Quyunjiq and Nabi Yunis. Botta, with the aid of funds from the French government, turned from Quyunjiq, owing to Turkish restraints, to Khorsabad, the ancient Dur-Sharrukin, which Sargon II. of Assyria built, and claimed that this was Nineveh; Layard, digging for Stratford Canning, thought that Nimrud, the ancient Calah, the Assyrian capital in the 9th century, was the same city, though he retained a firman for Quyunjiq.

Since these earliest expeditions in 1841–45 revealed the richness of the land in every kind of antiquity, many sites have been excavated, more have been located, and some are well known from native diggings. At various intervals Quyunjiq has been worked upon, and the excavations still in progress have only touched a small part of the site of Nineveh. That city existed in prehistoric times, but the most important finds, the palace sculptures and the library tablets, belong to the 7th century B.C. Khorsabad is a small site, excavated by Botta and Place; the remains belong exclusively to the 8th century, and are important because they reveal the most complete evidence for the architecture of the Assyrian period known. Nimrud was very thoroughly plundered of large objects, but at the time of its excavation little was understood of the subject, and much may yet be unearthed there; the city was rebuilt and much enhanced in importance in the 9th century, but it existed at the end of the second millennium. Other sites identified are Sharif Ḵhan, the ancient Tarbisi; Irbil, once Arbela, the only old Assyrian town still of importance when Alexander conquered Darius III.; Shemamokh, once called Alshe; and Sadawa, formerly Kakzi.

The earliest capital of the kingdom, the city of Ashur, near the village called Qal'at Shirqāt has been thoroughly excavated by a German expedition, and from it remains of every period have been recovered, down to the early centuries of the Christian era, when the poverty-stricken villagers still kept old Assyrian names. Archaeological finds there can be compared with the history of the time revealed in inscriptions, and the two sources of evidence combine to form a true picture. The thorough investigation of any Assyrian site is always rewarded with a wealth of exact historical information.

Some light on lands east of Tigris has been obtained from the district of Kirkuk, where two small sites have been attacked, one representing the important city of Arrapkha. This was the centre of a Subaraean population in the 14th century, and the personal names show that only a few Assyrians lived in the city. The place was generally an Assyrian province, but managed occasionally to secure independence; Assyrian legal customs and the Assyrian language had been adopted. The work was commenced by native diggers, and is being continued on scientific lines by American excavators.

Antiquities of the Assyrian period have also been found at Wan and Toprak Kaleh in Armenia and at various sites in Syria and Palestine

In Babylonia, Rassam obtained an important series of collections of tablets from Sippar of Shamash, now Abu Habbah, and from Babylon itself. Many years later a German expedition spent many years uncovering the deeply buried remains of Nebuchadrezzar's city at the last named site; except in the town quarter no remains much earlier than the 8th–7th century have appeared, and it would seem that the earlier levels are now sunk beneath the water level. A certain number of tablets and other antiquities have been obtained from time to time at Borsippa, now called Birs Nimrud, and considerable attention has been paid to the ruined ziggurat there. The remains from Sippar, where Rassam's work has been continued by a French expedition, are of very various dates, from the time of the 1st dynasty of Bdbylon to the Seleucid era; there was an important astronomical school there in the later centuries. Slightly north-east of Babylon Tall al 'Ckhaimir marks the position of Kish, where a French expedition commenced work in the first decade of the 20th century which has been carried on by a combined British and American expedition; adjoining Kish lies the city called Khursag-kalamma. Both places were inhabited at the earliest period, and have yielded information concerning the centuries previous to the 1st dynasty of Babylon. The other important site in northern Babylonia, the ancient Akkad, scientifically examined is Nippur, the modern Nuffar, where an American expedition recovered a great store of very early documents, and a series of ,dedications and building inscriptions of kings from the earliest to late Assyrian times prove the long continuance of the temple there as a central shrine for all Sumer and Akkad.

The southern country, Sumer, was first made known by the excavations of Captain Taylor and W. K. Loftus in 1854–55; they discovered the sites of Ur (Tall al Muqayyar), Eridu (Abu Shahrain) and Erech (Warka). The two first named cities have been partly revealed by subsequent British excavations, and a combined British and American expedition now at work at Ur has revealed historical monuments earlier than any previously known. But the nature of the early Sumerian civilization was first discovered owing to the French expedition to Tall Loh, the ancient Lagash at the end of the 19th century; subsequent discoveries have to be grouped around the important group of early city governors there, whose genealogies can be traced through many centuries.

The nature of other sites has been determined by hasty trial trenches: Dur-Kurigalzu lay at 'Aqarquf, immediately west of Baghdad; Kuthah at Tall Ibrahim. Shuruppak, the city of the Babylonian Noah, is known to be Farah, where there are extensive early cemeteries, Kisurra is Tall Surghul, Kutalla is Tall Sifr, perhaps one of the towns called Sippar u-as situated at Dair. Native diggings have resulted in great collections of tablets and antiquities of all ages from Erech reaching European and American museums. Erech was, according to Sumerian tradition, a royal city before the Flood: it was a flourishing centre of industry in the Seleucid era. and no city promises more interesting results in Babylonia than this. Larsa, the modern Sankarah, has also been extensively plundered by native workers: the school of scribes active there between 2200 and 2000 B C. is now well known to have produced an extensive and important series of editions of older texts.

At sites outside Babylonia but closely connected with it, in Susa, one of the Achaemenian capitals, perhaps the earliest known painted pottery has been discovered; apart from the important objects throwing light upon the history of Elam, some of the most important Babylonian monuments such as Naram-Sin's stele of victory and Hammurabi's Code of Laws have been found there by the great French expedition in Persia. It is, perhaps, the site with the most complete historical sequence of "strata" yet known in this region. North-west of Babylonia a promising commencement has been made at the site called Tall 'Asharah, which conceals Tirqa, or Sirqu, the ancient capital of the small kingdom of Khana; this place lies a little south of Dair-az-Zur, and owing to its strategic position played an important part in the political history both of Babylonia and Assyria.

Of the cities which arose in Seleucid and Parthian times there are imposing remains to be seen at Seleucia, Ctesiphon and Hatrah. No scientific work has yet been done upon sites of the "classical" period except Hatrah, and much good would result from more attention to the possibilities of these sites. An early parchment inscribed with a Greek text recordrng a business transaction has been found at a village in the Zagros range. Scientific excavations at the ancient Doura, the modern Tall-as-Salihiyyah, on the Euphrates, 20 odd miles south of Dair-az-Zur, have revealed important paintings of the Roman period. which anticipate the Byzantine style, and some early parchments, one dated to 159 B C., in Greek. Occasionally broken inscriptions coming from Babylonia are published, but statements as to their provenance are generally suspect.

HISTORY

In the earliest period of which we have any knowledge Babylonia was divided into several independent states, the limits of which were defined by canals and boundary stones. Its culture may be traced back to two main centres, Eridu. which had once been a seaport, in the south and Nippur in the north.

We may call the early civilization of Babylonia Sumerian. The race who first developed it spoke an agglutinative language, and to them was due the invention of the pictorial hieroglyphs which became the running-hand or cuneiform characters of later days, as well as the foundation of the chief cities of the country and the elements of its civilization

Arrival of the Semites.—When the Semites first entered the Edin or plain of Babylonia is uncertain, but it must have been at a remote period. The cuneiform system of writing was still in process of growth when it was borrowed and adapted by the new comers. It is in the north that mention of the Semites first occurs on the monuments.

The earliest monuments that can be approximately dated come from Lagash (Tello). We hear of a "king of Rengi," as well as of a certain Me-silim, king of Kis, who had dealings with Lugal-suggur, high-priest of Lagash, and the high-priest of a neighbouring town A dynasty was later founded at Lagash by the high-priests and the dynasty of Ur-Ninā was set up.

The campaigns of E-anna-du, grandson of Cr-Nina, extended beyond the confines of Babylonia. He overran a part of Elam and took the city of **Az** on the Persian Gulf. Temples and palaces were repaired or erected at Lagash and elsewhere, the town of Ninā—which probably gave its name to the later Ninā or Nineveh—was rebuilt, and canals and reservoirs were excavated. He was succeeded by his brother En-anna-tum I His son and successor Entemena restored the prestige of Lagash.

The eighth successor of Ur-Ninā was Uru-duggina, who was overthrown and his city captured by Lugal-zaggisi, the high-priest of Gis-ukh. Lugal-zaggisi was the founder of the first empire in Asia of which we know. He made Erech his capital and called himself king of Kengi.

Sargon's Semitic Empire.—The next empire founded in western Asia was the Semitic Empire of Sargon of Akkad whose date is believed to be about 2550 B.C. He was the son of Itti-Bel, and a legend related how he had been born in concealment and set adrift in an ark of bulrushes on the waters of the Euphrates Here he had been rescued and brought up by "Akki the husbandman"; but the day arrived at length when his true origin became known, the crown of Babylonia was set upon his head and he entered upon a career of foreign conquest. Four times he invaded Syria and Palestine, and spent three years in thoroughly subduing the countries of "the west," and in uniting them with Babylonia "into a single empire." Elam and the northern part of Mesopotamia (q *v*) were also subjugated, and rebellions were put down both in Kazalla and in Babylonia itself.

Sargon's son and successor, Naram-Sin, followed up the successes of his father by marching into Magan, whose king he took captive. He assumed the imperial title of "king of the four zones," and, like his father, was addressed as a god. He is even called "the god of Agadē" (Akkad).

Bingani-sar-ali was the son of Naram-Sin, but we do not yet know whether he followed his father on the throne. Another son was high-priest of the city of Tutu. The fall of Sargon's Empire seems to have been as sudden as its rise and the seat of supreme power in Babylonia was shifted southward to Ur:

This dynasty of Ur was Semitic, not Sumerian, notwithstanding the name of Dungi. Dungi was followed by Bur-Sin, Gimil-Sin, and Ibi-Sin, and their power extended to the Mediterranean.

After the fall of the dynasty, Babylonia passed under foreign influence. Sumuabi ("Shem is my father"), from southern Arabia (or perhaps Canaan), made himself master of northern Babylonia, while Elamite invaders occupied the south. After a reign of 14 years Sumuabi was succeeded by his son Sumu-la-ilu, in the fifth year of whose reign the fortress of Babylon was built, and the city became for the first time a capital. The Elamite supremacy was at last shaken oti by Hammurabi who was the Amraphel of Gen. xiv. 1, and who, in the thirtieth year of his reign (in 2037? B.C.), overthrew the Elamite forces in a decisive battle and drove them out of Babylonia. The next two years were occupied in adding Larsa and Yamutbal to his dominion, and in forming Babylonia into a single monarchy, the head of which was Babylon. A great literary revival followed the recovery of Babylonian independence, and the rule of Babylon was obeyed as far as the shores of the Mediterranean. Constant intercourse was kept up between Babylonia and the west, Babylonian officials and troops passing to Syria and Canaan, while "Amorite" colonists were established in Babylonia for the purposes of trade.

One of the most important works of this "First Dynasty of Babylon," as it was called by the native historians, was the compilation of a code of laws (*see* BABYLONIAN LAW). This dynasty was followed by another of 11 Sumerian kings, who are sdid to have reigned for 368 years, a number which must be much exaggerated. As yet the name of only one of them has been found in a contemporaneous document. They were overthrown and Babylonia was conquered by Kassites or Kossaeans from the mountains of Elam, with whom Samsu-iluna had already come into conflict in his 9th year. The Kassite dynasty was founded by Kandis, Gandis or Gaddas (about 1743 B.C.), and lasted for 576¾ years. Under this foreign dominion, which offers a striking analogy to the contemporary rule of the Hyksos in Egypt, Babylonia lost its empire over western Asia, Syria and Palestine became independent, and the high-priests of Assur made themselves kings of Assyria.

Rise of **Assyria.**—Under Hammurabi a Samsi-Hadad (or Samsi-Raman) seems to have been vassal-prince at Assur. The foundation of the monarchy was ascribed to Zulilu, who is described as living after Bel-kapkapi or Belkabi (1900 B.C.), the ancestor of Shalmaneser I. Assyria grew in power at the expense of Babylonia, and a time came when the Kassite king of Babylonia was glad to marry the daughter of Assur-yuballidh of Assyria, whose letters to Amenophis (Amen-hotep) IV. of Egypt have been found at Tell el-Amarna. The marriage, however, led to disastrous results, as the Kassite faction at court murdered the king and placed a pretender on the throne. Assur-yuballidh promptly marched into Babylonia and avenged his son-in-law, making Burna-buryas of the royal line king in his stead. Burna-buryas, who reigned 22 years, carried on a correspondence with Amenophis IV. of Egypt. After his death, the Assyrians, who were still nominally the vassals of Babylonia, threw oti all disguise, and Shalmaneser I. (1300 B.C.), the great-great-grandson of Assur-yuballidh, openly claimed the supremacy in western Asia. Shalmaneser was the founder of Calah, and his annals, which have recently been discovered at Assur, show how widely extended the Assyrian empire already was. Campaign after campaign was carried on against the Hittites and the wild tribes of the north-west, and Assyrian colonists mere settled in Cappadocia. His son Tukulti-In-aristi conquered Eabylon, putting its king Bitilyasu to death, and thereby made Assyria the mistress of the oriental world. Assyria had taken the place of Babylonia.

For 7 years Tukulti-In-aristi ruled at Babylon with the old imperial title of "king of Sumer and Akkad." Then the Babylonians revolted. The Assyrian king was murdered by his son, Assur-nasir-pal I., and Hadad-nadin-akhi made king of Babylonia. But it was not until several years later, in the reign of the Assyrian king Tukulti-Assur, that a reconciliation was effected between the two rival kingdoms. The next Assyrian monarch, Bel-kudur-uzur, was the last of the old royal line. He seems to have been slain fighting against the Babylonians, who were still under the rule of Hadad-nadin-akhi, and a new dynasty was established at Assur by In-aristi-pileser, who claimed to be a descendant of the ancient prince Erba-Raman. His fourth successor was Tiglath-pileser I., one of the great conquerors of Assyria, who carried his arms towards Armenia on the north and Cappadocia on the west; he hunted wild bulls in the Lebanon and was presented with a crocodile by the Egyptian king. In 1107 B.C., however, he sustained a temporary defeat at the hands of Merodach-nadin-akhi (Marduk-nadin-akhē) of Babylonia, where the Kassite dynasty had succumbed to Elamite attacks and a new dynasty reigned.

Of the immediate successors of Tiglath-pileser I. we know little, and it is with Assur-nasir-pal II (884–859 B.C.) that our knowledge of Assyrian history begins once more to be fairly full. His son Shalmaneser III. had a long reign of 35 years, during which the Assyrian capital was converted into a sort of armed camp. The last few years of his life were disturbed by the rebellion of his eldest son, which \%ell-nighproved fatal. Assur, Arbela and other places joined the pretender, and the revolt was with difficulty put down by Samsi-Raman (or Samsi-Hadad), Shalmaneser's second son, who soon afterwards succeeded him (824 B.C.). In 804 B.C. Damascus was captured by his successor Hadad-nirari IV., to whom tribute was paid by Samaria.

With Nabu-nazir, the Nabonassar of classical writers, the so-called Canon of Ptolemy begins. When he ascended the throne of Babylon in 747 B.C. Assyria was in the throes of a revolution. Civil war and pestilence were devastating the country, and its northern provinces had been wrested from it by Ararat. In 746 B.C. Calah joined the rebels, and on the 13th of Iyyar in the following year, Pulu or Pul, who took the name of Tiglath-pileser III., seized the crown and inaugurated a new and vigorous policy.

Second Assyrian Empire.—Under Tiglath-pileser III. arose the second Assyrian empire, which differed from the first in its greater consolidation. After terrorizing Armenia and the Medes and breaking the power of the Hittites, Tiglath-pileser III. seized the Phoenician seaport and the highroads of commerce to the Mediterranean and then made himself master of Babylonia. In 729 B.C. the summit of his ambition was attained, and he was invested with the sovereignty of Asia in the holy city of Babylon. Two years later, in Tebet 727 B.C., he died, but his successor Ululā. who took the name of Shalmaneser V., continued the policy he had begun. Shalmaneser died suddenly in Tebet 722 B.C., while pressing the siege of Samaria, and the seizure of the throne by another general, Sargon, on the 12th of the month, gave the Babylonians an opportunity to revolt. In Nisan the Kaldā prince, Merodach (Marduk)-baladan, entered Babylon and was there crowned legitimate king. For twelve years he successfully resisted the Assyrians; but the failure of his allies in the west to act in concert with him, and the overthrow of the Elamites, eventually compelled him to fly to southern Babylonia. Sargon was now accepted as king by the Babylonian priests and his claim to be the successor of Sargon of Akkad acknowledged up to the time of his murder in 705 B.C. His son Sennacherib, who succeeded him on the 12th of Ab, did not possess the military or administrative abilities of his father, and the success of his reign was not commensurate with his vanity. He was never crowned at Babylon, which was in a perpetual state of revolt until, in 691 B.C., he shocked the religious and political conscience of Asia by razing the holy city of Babylon to the ground. His campaign against Hezekiah of Judah was as much a failure as his policy in Babylonia, and in his murder by his sons on the 20th of Tebet 681 B.C. both Babylonians and Jews saw the judgment of heaven.

Esar-haddon, who succeeded him, was commanding the army in a campaign against Ararat at the time of the murder; forty-two days later the murderers fled from Nineveh and took refuge at the court of Ararat. But the Armenian army was utterly defeated near Malatia on the 12th of Iyyar, and at the end of the day Esar-haddon was saluted by his soldiers as king. He thereupon returned to Nineveh and on the 8th of Sivan formally ascended the throne. Under him Babylon became the second capital of the Empire.

Esar-haddon's policy was successful and Babylonia remained contentedly quiet throughout his reign. In February (674 B.C.) the Assyrians entered upon their invasion of Egypt (see also EGYPT: History), and in Nisan (or March) 670 B.C. an expedition on an unusually large scale set out from Nineveh. The Egyptian frontier was crossed on the 3rd of Tammuz (June), and Tirhaka, at the head of the Egyptian forces, was driven to Memphis after fifteen days of continuous fighting. On the 22nd of the month Memphis was entered by the victorious army and Tirhaka fled to the south. Two years later (668 B.C.) Egypt revolted, and while on the march to reduce it, Esar-haddon fell ill and died (on the 10th of Marchesvan or October). Assur-bani-pal succeeded him as king of Assyria and its empire, while his brother, Samas-sum-yukin, was made viceroy of Babylonia. The arrangement was evidently intended to flatter the Babylonians by giving them once more the semblance of independence. But it failed to work. Samas-sum-yukin became more Babylonian than his subjects; the viceroy claimed to be the successor of the monarchs whose empire had once stretched to the Mediterranean; even the Sumerian language was revived as the official tongue, and a revolt broke out which shook the Assyrian empire to its foundations. After several years of struggle, during which Egypt recovered its independence, Babylon was starved into surrender, and the rebel viceroy and his supporters were put to death. Next followed the contest with Elam, in spite of the efforts of Assur-bani-pal to ward it off. Assyria, however, was aided by civil war in Elam itself; the country was wasted with fire and sword, and its capital Susa or Shushan levelled with the ground. But the long struggle left Assyria maimed and exhausted, and she was ill prepared to face the hordes of Scythians — or Manda, as they were called by the Babylonians — who now began to harass the frontiers. A Scythian power had grown up in the old kingdom of Ellip, to the east of Assyria, where Ecbatana was built by a "Manda" prince; Asia Minor was infested by the Scythian tribe of Cimmerians, and the death of the Scythian leader Dugdammē (the Lygdamis of Strabo i. 3, 16) was regarded by Assur-bani-pal as a special mark of divine favour.

Scythian Influence.—When Assur-bani-pal died, his empire was fast breaking up. Under his successor, Assur-etil-ilani, the Scythians penetrated into Assyria and made their way as far as the borders of Egypt. Calah was burned, though the strong walls of Nineveh protected the relics of the Assyrian army which had taken refuge behind them; and when the raiders had passed on to other fields of booty, a new palace was erected among the ruins of the neighbouring city. The last king of Assyria was probably the brother of Assur-etil-ilani, Sin-sar-iskun (Sin-sarra-uzur), who seems to have been the Sarakos (Saracus) of Berossus. He was still reigning in Babylonia in his seventieth year. Nabopolassar, now viceroy of Babylonia, fought against Sin-sar-iskun and the Scythian king of Ecbatana, the Cyaxares of the Greeks, came to the help of the Babylonians. Nineveh was captured and destroyed by the Scythian army, along with those cities of northern Babylonia which had sided with Babylonia, and the Assyrian empire was at an end.

The seat of empire was now transferred to Babylonia. Nabopolassar was followed by his son Nebuchadrezzar II., whose reign of 43 years made Babylon once more the mistress of the civilized world. Only a small fragment of his annals has been discovered relating to his invasion of Egypt in 567 B.C., and referring to "Phut of the Ionians." Of the reign of the last Babylonian king, Nabonidos, however, and the conquest of Babylonia by Cyrus, we now have a fair amount of information. This is chiefly derived from a chronological tablet containing the annals of Nabonidos, which is supplemented by an inscription of Nabonidos, in which he recounts his restoration of the temple of the Moon-god at Harran, as well as by a proclamation of Cyrus issued shortly after his formal recognition as king of Babylonia. It was in the sixth year of Nabonidos (549 B.C.)—or perhaps in 553 — that Cyrus, "king of Anshan" in Elam, revolted against his suzerain Astyages, king of "the Manda" or Scythians, at Ecbatana. The army of Astyages betrayed him to his enemy, and Cyrus (*q.v.*) established himself at Ecbatana, thus putting an end to the empire of the Scythians, which the Greek writers called that of the Medes, through a confusion of Madā or "Medes" with Manda. Three years later we find that Cyrus has become king of Persia and is engaged in a campaign in the north of Mesopotamia. Meanwhile Nabonidos has established a camp at Sippara, near the northern frontier of his kingdom, his son — probably the Belshazzar of other inscriptions — being in command of the army. In 538 B.C. Cyrus invaded Babylonia. A battle was fought at Opis in the month of June, in which the Babylonians were defeated, and immediately afterwards Sippara surrendered to the invader. Nabonidos fled to Babylon, whither he was pursued by Gobryas, the governor of Kurdistan, and on the 16th of Tammuz, two days after the capture of Sippara, "the soldiers of Cyrus entered Babylon without fighting." Nabonidos was dragged out of his hiding-place, and Kurdish guards were placed at the gates of the great temple of Bel, where the services continued without intermission. Cyrus did not arrive till the 3rd of Marchesvan (October), Gobryas having acted for him in his absence. Gobryas was now made governor of the province of Babylon, and soon afterwards the son of Nabonidos, according to the most probable reading, died. (See MESOPOTAMIA; 'IRAQ; CYRUS; DARIUS and PERSIA: History.) (A. H. S ; A. N. J. W.)

BABYLONIAN AND ASSYRIAN RELIGION. Babylonia and Assyria are general geographical and racial terms which designate the eastern branch and habitat of the Semitic peoples, but their religion was essentially Sumerian, and consequently the religion of this earlier non-Semitic people, who founded the mighty civilization of ancient Mesopotamia, must be outlined first. The period of their entry into the valleys of the Tigris and Euphrates is still beyond the scope of exact historical research, but great cities and cults were already in existence before 3500 B.C., and there is quite clear evidence that they moved into the area from the eastern side of the Euphrates. Their legends regard the lost city D&rin Ashnunak 23 miles E.N.E. of Baghdad, modern *Asmar,* as the place from which the cult of Anu the heaven god, Innini the heaven goddess and her brother the dying god Tammuz, were transplanted to the great city Erech on the southern reach of the Euphrates. When we reach firm historical footing by means of inscriptions about 3300 B.C., the Sumerian religion has already an elaborate pantheon and an intricate theological system. The earlier stages of their religious evolution are obscure; although a number of inscriptions from the pictographic period exist, they mention no deities, and refer to no religious ideas. In this immense theological structure, which dominated the religions of Western Asia until the last century B.C., and profoundly influenced both the Old and New Testament, no trace remains of an earlier stage of animism and magic ceremonies.

Sumerian Pantheon. — From the earliest period onward four principal deities were at the head of the Sumerian pantheon, Anu (Semiticized form of *An),* the heaven god, father of all the successive series of deities, who is closely associated with the virgin heaven goddess Innini, the Semitic Ishtar, at Erech (see ANU). Enlil the earth god, and his consort Ninlil had their temple and cult at Nippur (see BEL). The water god (Ea, Enki) and his consort Damkina were worshipped at Eridu at the mouth of the Euphrates on the shore of the Persian gulf. Corresponding to this trinity, who divided the universe among themselves, is the unmarried mother goddess Nintud, goddess of engendering, often called Makh, "the supreme goddess," and known to the Babylonians and Assyrians as the *Bêlit ilāni,* "Queen of the gods." The theological lists assign to her as many as 41 names, which describe various aspects of her divine activity. Of these the following should be specially noted: *Ninkhursag,* "queen of the mountain," by which the Sumerians meant "queen of the earth"; in Babylonian theology this means land of the departed; *Aruru,* goddess of

childbirth; *Mama,* the goddess who created man from clay. There is a tendency to associate her with Enlil, the earth god, as her husband, but her virginal character is consistently maintained. The principal seat of her cult was Kêsh, an unidentified city near Erech, and the famous northern capital Kish was also one of the principal centres of her worship. Special temples were erected to her in every important city, or at least a chapel was consecrated to her in the great temple of the local deity. Innini, the virgin heaven goddess, is only a specialized aspect of the earth mother, particularly as the sister of the dying god Tammuz (*q.v.*). To understand the deeper aspects of this religion a complete study of the character of the mother goddess under her various titles is necessary. She consistently represents divine mercy and compassion as opposed to the severe and wrathful characters of the male deities. When men sin the gods punish with terrible vengeance, but the mother goddess ever intercedes for them. The religious scenes on seals in all periods represent her standing in prayer beside humans, and interceding with a god on their behalf. To the very end of Babylonian religion, Nintud, Aruru, Innini, Ishtar may be correctly described as the *mater dolorosa*, the "Weeping Mother."

Equally primitive, so far as the sources enable Sumerologists to trace the origins, are the two planetary deities Zu-en or Sin, the moon god, and Babhar or Utu, the sun god. Of these two the moon god, whose name means "lord of wisdom," was the more important, possibly through the fame and importance of the city of his principal cult, Ur on the lower Euphrates (see SIN). Larsa, between Ur and Erech, was the centre of the older temple of the sun god, but an equally important centre in the north (Accad) was Sippar on the Euphrates. Larsa is the Ellasar of Genesis xiv. and both of these figure among the five or six antediluvian cities, with Eridu, Badtibirra (Pantibiblus), Larak and Shuruppak. (See SHAMASH.) It must be assumed, therefore, that both Larsa and Sippar are of Sumerian origin, but it is difficult to account for the existence of two principal centres for the worship of the sun god Babbar=Shamash (Accadian). There is a very definite geographical principle in the distribution of the principal Sumerian cults; each is confined to one great city, and the important temple of that city was built to the deity of that place. In these great temples the chapel for the god's consort always joined the central chapel of the deity himself, and smaller temples for other deities often stood in various parts of the city. For example at Nippur there were temples for the mother goddess Ninkhursag, for Sin the moon god, Ninurta the war god, Enki the water god and many others, beside the spacious temple Ekur of Enlil the earth god and his consort Ninlil.

These six great deities form as it were the framework of the immense Sumerian pantheon of nearly 4,000 deities. But this scheme has another essential element, namely the sons of the earth god and the water god. The heaven god Anu appears to have been an abstract principle in their theology, and little attention was paid to his worship outside his city Erech, and even here his cult was less important than that of his daughter Innini-Ishtar. There were only two important schools of theological thought, those of Eridu and Nippur; from Eridu and the water cult come most of the incantation rituals of the magicians, and this school taught the theory that man had been created by the water god, whereas the Nippurians tell how the mother goddess made him from clay.

Attached to the pantheon of the earth god Enlil are the two important deities Ninurta, the war god, formerly read Ninib, and Nusku the fire god; the two sons of the water god are best known under their later names, Marduk of Babylon and Nabû of Barsippa, both of whom are originally connected with the water cult; but for the later developments of their cults the articles under their names must be consulted. There was also a fire god, Gibil, attached to the Enki (water god) pantheon. Of special importance in the pantheon is the consort of the war-god, the goddess Bau, which is more especially her name as consort of Ninurta (under the title Zamama), war god of Western Kish, and Gula, one of the many forms of the great earth goddess Makh-Ninkhursag. (For her connection with the cult of the dying god *see* TAMMUZ.)

All of these deities have many names describing the deification of certain aspects of nature under their control. Of special importance and most primitive is the grain goddess Ashnan, also called Nidaba or Nisaba, worshipped as a type of the earth goddess and specially connected with the rituals of purification. There is a special goddess of wine, Ninkasi, and of the expiatory rituals, Ninkhabursildu. The place of the thunder and rain god in the old Sumerian pantheon is not clear. He was called Immer there, but is of little importance until the later Semitic period at Assur (see ADAD).

The theologians divided the pantheon into two great groups, the Igigi or 600 gods of the upper world and sky, and the Anunnaki or 300 gods of the lower world, or gods of the land of the dead. Nergal (*q.v.*) and Ereshkigal are the two supreme deities of the land of the dead, and most prominent of the Anunnaki group. The centre of the cult of the god Nergal was Cutha, the most northern of all the great city cult centres; but the cult of Ereshkigal does not appear to have been specially confined to any city. That is true of all the cults of the unmarried goddesses, for whose worship the provision was made everywhere, and every man had access to the divine protection of the great mother goddess.

Acceptance of the Sumerian Pantheon by the Semites.— The Semitic race entered into Mesopotamia at a period so remote that it is impossible either to fix definitely the stage of evolution which the Sumerian religion had reached at that time, or to say what deities the Semites brought with them. In any case the South Arabian *Athtar,* god of the planet Venus, was identified with the Sumerian virgin goddess of Venus Ninsianna or Innini, and consequently became a female deity in Babylonia and Assyria, under the name Ishtar. It may be assumed that they also worshipped the sun god Shamash, who was at once identified with the corresponding Sumerian sun-god, Utu or Babbar. Although about 2750 B.C., the Semites of northern Sumer finally became masters of Sumer and founded a great empire at Accad near Sippar, there is almost no trace of genuinely Semitic character in their religion. Only two of the important gods are ever designated by their Semitic names, Shamash and Nabû, god of wisdom, and they usually write these by their Sumerian ideographs. This is also true of the entire subsequent history of Semitic Babylonia and only slightly less true of the later Assyria. The religion and the religious language, the temple liturgies, the theology, the official names of the various orders of the priesthood are Sumerian, and the advent of the Semitic empire of Accad marks no change whatsoever in the history of their religion. The only serious disturbance in the theological structure of the pantheon was caused by the sudden rise to power of the Ainoritic dynasty of Babylon under Sumu-âbu, founder of the great line of kings which numbers among them the famous Hammurabi and Ammizaduga But the Semitic language of Mesopotamia was always designated as Accadian, even the Assyrian scholars described their language as Accadian, and the designation of it as Babylonian or Assyrian is not exactly correct From the period of the First Babylonian dynasty (2169–1870 B.C.), a new element enters into the conception of the pantheon. Henceforth the hitherto unimportant local god of Babylon, Marduk, son of Enki the water-god, assumes a very predominant rôle in the theological works of that city; and since it became the capital of Sumer and Accad and remained so until the end of their civilization, the views of the great priesthood of Babylon naturally prevailed to more or less extent throughout the land, and especially in Assyria. To Marduk they attributed many powers, originally attributed to older and more important Sumerian deities; Ninurta, the son of Enlil and original protagonist of the conflict between the gods of order and the dragons of chaos, suffered severe reduction of power in favour of Marduk, who became not only the champion of the gods and conqueror of the dragon Tiamat (see CREATION, EPIC OF), but the creator of the universe as well. He becomes, henceforth, the principal deity of the rituals of expiation, acting as agent for his father Enki, and also in the late period he even assumed the sacred rôle of Tammuz the dying god, and became the subject of a myth and ritual of death and resurrection. There is a distinct

tendency toward henotheisin and even monotheism in regard to Marduk. But this elevation of the god of the capital was never recognized in the ancient Sumerian cities, such as Erech, Nippur, Larsa, Ur and Kish, which also continued to be great cities and theological centres as long as Babylon itself *(see* MARDUK).

The Temple Liturgies.— The principal feature of the temple services consisted in singing long liturgies, invariably in the Sumerian language even throughout the entire Semitic period, although they are latterly provided with interlinear translations in Accadian for the use of Babylonian and Assyrian laymen. In the early Sumerian period the temple song service consisted of single songs called *ershemma,* or song to the flute, or *kishub,* song of prostration; but the schoolmen of classical times of the great Sumerian revival under the last dynasty of Ur and the kings of Larsa and Isin, finally evolved long and intricate liturgies for all the great deities, those to Enlil and the mother goddess prevailing in number. These consist of a large number of old *ershemmas* and *kishubs,* arranged so as to exhibit the theological ideas concerning the deity and always of most penitential and mournful character. Each liturgy contains a hymn to the "Word of Wrath" of the god to whom the liturgy is sung, except in the case of liturgies to the mother goddess. There is also a long section called the *Titular Litany,* which mentions the Sumerian names of all the principal deities of the pantheon, each followed by a mournful refrain. The last section is a penitential psalm imploring the deity for mercy and peace. These long musical compositions were sung by the priesthood of psalmists, usually to the accompaniment of the instrument *balag,* probably a harp or lyre, although some render the word by tambour or drum.

The liturgical calendars for each great city prescribe the names of the liturgies to be sung on certain days of each of the twelve or thirteen months, as *regular* religious duties of the priesthood known as the *gala,* Accadian *kalû,* priests or psalmists. Then liturgies concerned the universal sorrows of mankind and the dire vengeance of the gods with special reference to some calamity which befell the city in the past. Sometimes more than one full service is prescribed for certain days. The liturgies were also employed in services to avoid the consequences of evil omens; in such ceremonies the rubrics indicate the places in the magic ceremonies when the liturgies must be sung, and the same is true of ceremonies for the consecration of buildings and even for consecration of sacred objects, such as the leather head of a drum. There is nothing apotropaic in the sense of magic in these musical services. They are arid hymns of praise to gods intermingled with pessimistic descriptions of human sufferings portraying the abject misery of life.

The Private Penitential Psalms.— The psalmists were also engaged in another activity of Sumero-Accadian religious life, which more directly affected the lives of individuals. A comparatively small group of liturgical Sumerian prayers has been preserved, which consists of psalms of private penance. They existed in the older Sumerian period, but only one of them has been found. Information concerning this aspect of the religion is obtainable from the literature of the Babylonian and Assyrian clay tablets, and here they are provided with an interlinear translation in Accadian. These are psalms of praise, confession and intercession, said in Sumerian by an official psalmist for a penitent, and they are entirely free from magic ceremonies of any kind. Occasionally these private penitential psalms consist in "part song" between priest and penitent, in which case it must be supposed that the layman belonged to the educated class and understood the liturgical non-Semitic language. The persistent use of Sumerian in all forms of strictly formal worship among the Semitic peoples of Babylonia and Assyria is a remarkable precedent to the use of Latin in the Western Catholic Church.

The Rituals of Expiation.— The Sumerians and the Semites, who accepted so literally the religion of the older race, attributed most of their misfortunes to the malevolence of the demons. Demonology is a very important aspect of their religion, and although the tribe of devils is usually counted as seven, yet the texts name many more. The seven devils are portrayed as semi-human monsters with animal heads (lion, panther, dog, sheep, ram, bird and serpent), and then there is the horrible winged monster of the devastating south-wind, and *Lamashtu,* the terrible female demoness who plagued women in childbirth. To them were attributed the diseases, plagues and general afflictions of man. But they were the creations of the gods themselves. *Lamashtu* is described as the daughter of Anu, and the chief of devils *utukku limnu* is the offspring of Anu. *Namtaru,* the demon of fate, is the beloved son of Enlil. They are also said to have been created in hell, and cause desolation on high and misery on earth. "Bitter poison of the gods are they."

They were in possession of the "curse," personified as *Mamit,* by which they obtained power over every man that sinned either by touching things *tabu,* by committing any ethical sin, or by any religious disobedience. The devils troubled sinners only, and if a man fell into the power of a demon, it proved clearly enough that he had sinned. His salvation depended upon the intervention of the powerful priesthood, known as the *ashipu* or magicians. Every man received at the age of puberty an official name, and by it was placed under the protection of a god, who was henceforth described as "the god of the man so and so." This protecting god dwelled in the man's body in some mysterious way, but any ceremonial or ethical sin caused the inner protecting spirit to leave the man, who at once became the prey of a devil. He was then said to be possessed by a devil, which usually manifested itself by some disease. Power over this demon had been given to the holy priests of the water cult of Eridu, who proceeded to curse the devil and enumerate a long list of demons and sins in hope of finding the "name" of the demon who had occupied the man's body and of the transgression which the man had committed. The incantations against the devils consist of endless descriptions of machinations of the demons, magic rituals and curses in the

GREEN STONE LIBATION VASE OF ANCIENT BABYLONIA AND ASSYRIA
Libation, or the pouring of wine on a sacrificial victim in honour of a deity, was an important feature in the religious ceremonies of Babylonia and Assyria

names of the gods. The rituals in which troubles are caused by ethical sins are particularly set forth in two great series called "Fire Rituals," the *Shurpû* series in nine tablets and the *Maqlû* series in eight tablets. They differ from the old Sumerian *Utukku* series, or incantations against the seven devils, in being almost exclusively Accadian, and referring principally to ethical and ceremonial sins or to sins committed by a man's father or one of his ancestors, while the devils are hardly mentioned. On the other hand the *Utukku* series do not examine into the causes of the trouble, but devote themselves to mythological matters. often containing hymns of great literary merit.

This priesthood of magicians obtained power over the demons by the curse in the name of the gods, also called Mamit, and by endless symbolic magic, such as tying coloured bands to the man's bed and breaking them in sign that the bonds of the devils were also broken. The most characteristic ceremony consisted in applying water, dough, herbs or salt to the body. By means of magic formulae the demon spirit was supposed to pass into these elements which were then wiped away. The Accadian verb employed for this act of covering and wiping away is *kuppuru*, the cognate of the Hebrew word for "atone," and thus constitutes a very vital element in the history of the Hebrew idea.

Closely allied to the purely magical rituals is the elaborate system of medicine, always intimately connected with incantation. But the doctors *asû* are not consecrated priests, at least they were not of the same standing as the two great orders of psalmists and magicians and the prophets or diviners discussed below. There was, at any rate in the late period, a very serious attempt to study scientific methods in medicine, and it has been recently proved by extensive publication of Babylonian and Assyrian medical texts that they possessed a very profound knowledge of the medicinal values of herbal preparations and mineral products. Their textbooks on the antidotes for poisons, especially serpent and scorpion bites, are traceable to the twenty-first century, and those on the same subject in the eighth and succeeding centuries show no advance on the earlier texts. It is probable that the science was already considerably advanced among the Sumerians in the age of Dungi of Ur. There are textbooks for the treatment of the eyes, teeth, head, intestines, poisons, muscles and ulcers, but incantations are inserted to aid the treatment, and sometimes mythical hymns on the origins of the disease.

Most famous is the legend of the worm which was supposed to be the cause of toothache.

Divination. — The third great order of priests are the *barû* or diviners, whose profession is said to have been founded by the antediluvian king Enmenduranna of Sippar. A legend states that all human knowledge had been written upon tablets before the Flood and buried at Sippar; the prophets who could divine future events were par excellence the possessors of all wisdom and their secrets must not be read by the profane. There is little reference to direct oracles from the gods corresponding to the Delphic oracles of Greece. A group of oracles of the late Assyrian period delivered to Asarhaddon, the king, by the Ishtar of Arbela by the mouths of prophets and prophetesses on political matters exists; but the historic method of obtaining knowledge of the will of the gods was by elaborate systems of divination, which are traceable to the early Sumerian period. The cuneiform tablets on these subjects are seemingly inexhaustible and form a great science in themselves.

Liver Divination (*Hepatoscopy*) (*q.v.*).—Divination by means of the sheep's liver is the oldest known method of forecasting events and is traceable to the age of Sargon of Accad, from whose reign a group of liver divinations has survived. The reason for assuming that the will and plans of the gods were revealed by various marks on the shriveling surface of a sheep's liver and by various physiological peculiarities of each liver, is not easy to define. Sumerian and Semite supposed that the function of the mind was performed by the liver, but there is no evident explanation for the choice of a sheep. In case of the other leading method of divination, by astrology (*q.v.*), it is clear that the planets and constellations, having been identified with various deities, would reveal the will of the gods by their positions and astronomical phenomena. Planets were, however, often called "sheep which are far away," and there is clearly some cause to be sought here for the assumption that the divine mind was revealed in the livers of sheep consecrated to sacrifice, a theory which dominated the schools of diviners throughout all antiquity. Nothing of any importance could be undertaken without obtaining the consent of the gods of divination, Shamash and Adad, by this means. The technical anatomical knowledge of the liver and abdominal organs was, therefore, accurate and detailed, as we know from several clay models of the liver designed for teaching hepatoscopy. The rules were derived in the simple and practical manner of keeping a record from generation to generation of events which actually occurred after certain signs were seen on the liver. Consequently a good many historical references occur in the textbooks on this subject of the utmost value for the historian.

Astrology (*q.v.*).—Equally important and vast are the works of the *barû* priests on divination by the planets and constellations and atmospheric conditions. This method of divination which is probably even more primitive than the rival system of hepatoscopy, is undoubtedly of Sumerian origin, and led to an astonishingly accurate knowledge of astronomy. Mars having been identified with the terrible god of the lower world, Nergal, was eminently a star of evil omen, but not always. The war god Ninurta was identified with Saturn, Ishtar with Venus, Nabû with Mercury, Marduk with Jupiter; and the entire firmanent of fixed stars was divided into a central band along the ecliptic assigned to Anu, and a parallel southern and northern band assigned to Enki and Enlil respectively. Each zodiacal constellation was identified with a deity, and all the other northern and southern constellations were carefully assigned to some god or goddess. Special attention was paid to the motions of the planets and their periods accurately fixed, and the tables for the phases and eclipses of the moon worked out with such care that eclipses could be prophesied. The standard work of the astrologers was known as the series, "When Anu, Enlil and Enki, the great gods, in their wisdom created the great decrees of heaven and earth," which numbers as many as 65 or more large tablets; and there are several series of purely astronomical works. The principles of forecasting are again derived from records of coincidences recorded from generation to generation and traceable to the remote age of Sargon of Accad.

Other Methods of Divination. — Oneiromancy or divination from dreams is well represented in the works of the *barû* priests, and there are several examples of necromancy. There are two famous examples of the latter; the soul of Nebuchadnezzar appeared to his second successor Nabunidus in a dream to interpret a previous astrological observation; and in the most important work on Babylonian pessimism the ancient Sumerian ruler of Lagash appeared in a dream to Tabi-utul-Enlil the Righteous Sufferer to interpret two previous dreams. It was not uncommon for astrological omens to be seen in dreams, and one of great importance to Nabunidus and his son Belshazzar was seen by a courtier. In dreams, great attention was paid to the direction of moving objects; the right was always lucky and the left unlucky; the principle of analogy is also widely employed to interpret the accidents of dreams. For example, if a man dreamed that he was discoursing with others and kept looking at the earth, it was interpreted that men would speak lies about him. This is based upon the fact that mendacity is associated with lack of frank behaviour. Lecanomancy is represented by two large texts which gives omens from the behaviour of drops of oil in a basin of water.

Every trivial phenomenon of nature was seized upon as an indication of future events. The actions of dogs, horses, serpents, birds and fish, and above all the appearances of misbirths both human and animal, are studied with incredible detail. In the history of man, there is no such stupendous system of beliefs in manifestation of the divine will in trivial accidents as in Sumer, Babylonia and Assyria. There is an emphasis upon the animistic spirit in nature by which the *barû* priesthood completely dominated the actions of those peoples for 4,000 years, but it is in accord with their theory of knowledge and absolute abandonment to "Fate." The great series of tablets, numbering more than 106, concerning the ominous character of ordinary affairs of life, was known under the title, "If a city is set upon a hill they that dwell therein will not be happy."

Sumero-Babylonian Philosophy. — The theories of knowledge and the origin of the universe are not separable from religion, and it is not possible to speak of their metaphysics and ethics in the Greek sense. Water is the first principle of all things, and the gods themselves descended from the primeval water. Consequently all their philosophic thought centres about the water god of Eridu and his sons Nabû and Marduk. The creative principle residing in water is called *mummu*, "word, creative form," and

the deities of the water cult are identified with this creative word or logos. This idea of "creative form" is often described as "*band*," and the water deities are described as the "*band* of all things." The original meaning of *mummu* is undoubtedly "spoken word" of the water god, and the creation of all things depends upon the activity of this "word." The reality of anything is its "form," Sumerian *khur*, Accadian *utsurtu*, "design," and rests upon the idea that it is the divine concept of an object, which must be first conceived in the divine mind of the water god and then given tangible form by the creative *mummu*. The form of things is designated by the "name," as "basin, lion, tree, child," and nothing can be known except by revelation, the peculiar prerogative of the *barû* priesthood. This doctrine of revelation and mystic monopoly of wisdom led straight to a priest-ridden orthodoxy. In practice a philosophy of this kind naturally led to a thorough fatalism, and the god of fate, Namtaru, is usually regarded as one of the seven devils. Occasionally the mother goddess Ishtar is designated by the Accadian word for fate, *shinztu*.

This theory of fatalism was not challenged by the philosophers, but a number of satires on the priesthood of divination prove that many did not believe in efficacy of omens, and it may be assumed that they also challenged the orthodox belief in the manifestation of divine plans by the most trivial accidents of nature. No important human plan could be executed until the diviners determined the will of god about it. But an important school of critics arose in Babylonia to deny this and claim the scope of man's will in the philosophical system. They did not go so far as to deny the theory of fatalism as a general principle. More serious, however, was their attack on the ethical side. The problem of suffering was investigated in several works, particularly in the so-called "Babylonian Job," and the "Dialogue of Pessimism." They argued that if the gods control all things and are just, why should the righteous suffer? and a few thinkers carried their conclusions to absolute pessimism, denying that providence is just and that piety results in any rewards at all. The effect of this movement is seen in the rise of a belief in rewards after death and the invention of two legends which declared that man had been originally created sinless and given every opportunity to remain in a state of bliss. This he lost by his own ignorance or by the deception practised on him by a god, who wished to retain mankind in a servile state to serve the gods. It is clear from the religious texts of the very latest period, that the school of pessimists never had much effect on the beliefs and religious rituals of the masses. But there is no record of persecutions for heterodoxy in Babylonia. The priesthood never retorted by violence, but only with apologetic works.

Participation of Laymen in the Religion.—The distinction between priest and layman is characteristic of this religion. The extremely few prayers of a strictly private nature are really royal hymns of praise to the gods. This distinction is particularly noticeable in the conservation of Sumerian in all public temple worship. The layman participated principally in the expiatory rituals known as the "House of Washing," "House of Baptism," and especially the *Enuru* series, which consisted in ceremonies for expelling demons and averting evil omens by magic rituals of the *ashipu* priests, interspersed by prayers said by the layman in his own Accadian language. These are called "Prayers of the Lifting of the Hand," and contain the highest expression of religious fervour in the religion. No examples of this kind of literature have been found in Sumerian; and it must be supposed that the prayers of these series which approximate most nearly to the Hebrew Psalms belong exclusively to the later (Semitic) evolution of the religion.

The Festivals.—The only important yearly festival in all periods was the New Year celebration, which occurred among the Sumerians apparently at the autumn equinox, and was so placed in the calendar (*q.v.*) by the Babylonians of the old southern city Erech to the very end of their history. It was known by the Sumerian word *zag-muk* "beginning of the year," and its occurrence at the autumn equinox is supposed to indicate an original system of beginning the new year at that time, although there is no sure indication of this in the oldest Sumerian records. From about 2400 onward the Sumerian month calendar clearly begins in Nisan shortly after the spring equinox, and this is the time fixed for the festival at Babylon, and in Assyria. The festival lasted eleven days, from the day of the first new moon after the spring equinox, and at Babylon consisted in a pantomime representing the creation of the world by Marduk and the episodes of the conflict between the gods and the dragons of Chaos. On this ritual the Epic of Creation (*q.v.*) was based. At this festival, whether as performed at Babylon, Erech or Assur, the old capital of Assyria, an essential feature is a procession to a building outside the city, known as the "house of the *akîtu*." The king must be present, at any rate, at the function in the capital, and being divested of all insignia of royal power by the high priest, he is momentarily reduced to the rank of a layman and openly humiliated. He then receives anew the royal authority at the hands of Marduk's priest. Thus the divine right to rule was yearly renewed; and so firmly fixed in the minds of the later dynasties of Assyria was this belief in Marduk as the source of all kingly power, that even the kings of that land, who then ruled all Western Asia, yearly renewed their royal warrant at the festival of Babylon. In the southern cities such as Ur and Erech, the Nisan festival was also in use, and consequently two new year festivals were held there. In these cities the ceremonies make no reference to Marduk and the local Babylonian Epic of Creation. There is evidence for this same kind of festival, characterized by a procession to the "house of the *akîtu*" in honour of the local deity of every city, at other times of the year, and the old Sumerian calendar contains references to festivals of various deities in nearly every month. (S. L.)

BABYLONIAN CAPTIVITY, the name generally given to the deportation of the Jews to Babylon by Nebuchadrezzar. Three separate occasions are mentioned (Jer. lii. 28–30). The first was in the time of Jehoiachin in 597 B.C. After 11 years a fresh rising of the Judaeans occurred; the city was razed to the ground, and a further deportation ensued. Finally, five years later, Jeremiah records a third captivity. The various captivities form the material of several of the psalms.

BABYLONIAN LAW. That the Sumerians, the earliest inhabitants of Babylonia, had long lived under the rule of State-law is to be inferred not only from the great antiquity of their settled dwelling in cities, but from the survival of certain very early documents concerned with sales of land and slaves. The inscriptions of Urukagina, king of Lagash (about 2600 B.C.), relate his efforts to impose respect for earlier customs and to curb the rapacity of priests and officials in oppressing the poor with illegal extortions. There is a direct reference to legal proceedings in Gudea's account (about 2400 B.C.) of a solemn occasion at Lagash, when the business of the courts was suspended, and distraint was not permitted. That no actual laws have survived from these early periods is doubtless due simply to the omission. probably deliberate, to cast them into writing. Like other sciences in Babylonia, law was jealously guarded in the oral tradition of the learned, but there is no need to suppose that it did not already exist in a developed form. As it is, the first actual records of proceedings in court belong to the Third Dynasty of Ur (about 2200 B.C.). They all begin with the phrase "judgment rendered," and are concerned generally with disputes arising out of sales, inheritances, gifts, or divorce. The courts were presided over by two or more *mashkim* ("watchers"), among whom were sometimes to be found the city governor or a royal delegate. When the claim had been made "in the king's name" and rebutted, the case was settled by an oath taken either by one of the parties or by a witness. Shortly after this specimens of actual Sumerian laws begin to appear, doubtless older than the earliest copies which belong to about 2000 B.C. To the same period must also be ascribed the collection of legal phrases and extracts from ancient codes called *ana ittishu*, which has preserved the seven "Sumerian Family Laws"; these concern the relations of adoptive parents and sons, divorce, and the hire of a slave whose services are afterwards lost. Upon three tablets (about 2000 B.C.) are inscribed some 25 laws in the Sumerian language, taken from a larger collection. No less than six of these laws concern family relations; three of them correspond closely with provisions in Hammurabi's Code, the rest do not appear there., Four more deal with slavery; it is decreed that the master of a runaway may claim another slave or 25 shekels of silver from anyone harbouring him. There are also provisions concerning adoption, injuries caused to pregnant women, liability of ox-herds for damage to their charges, the care of gardens, the obligations of neighbours, and false accusation. In general, these laws have much in common with the Code, and well illustrate the selective rather than creative character of Hammurabi's work.

THE CODE OF HAMMURABI

It is the great Code of Hammurabi, discovered at Susa in 1902, which is to us, as it was to the Babylonians, the completest and most perfect monument of their law. Fragments of copies found in Ashur-bani-pal's library at Nineveh, and others of new-Babylonian date, prove that it was known to later ages from its opening words as "When the exalted Anu," and was studied for 1,500 years after its first composition. Of its relations with, and influence upon, the law of Israel much has been written which cannot be considered here. As to its own sources, something has already been said. Compiled from a mass of existing Sumerian law under which highly civilized cities had certainly lived for many centuries, it was probably issued in two versions, Sumerian and Semitic, though only the latter survives. What degree of actual novelty it possessed cannot now be estimated; perhaps it contained hardly anything that could not be found elsewhere, but its great distinction was that the articles were chosen with a view to universal application, not to the customs of any single city, but so as to "establish justice in Sumer and Akkad" In spite of a few primitive remains relating to family solidarity, district responsibility, trial by ordeal, and the *lex talionis*, the Code has advanced far beyond tribal custom, and recognizes no blood-feud, private retribution, or marriage by capture. The king is already the source of justice; the judges are strictly supervised, and appeal to the king is allowed. The whole land is covered with feudal holdings, masters of the levy, and police. There is a regular postal-system. The position of women is free and dignified.

Classes.—The Code contemplates the whole population an falling into three classes, called *awelu, muskinu,* and *ardu.* The first was the designation of the highest class, probably confined to officers of the court or the temple, though their qualifications are nowhere stated. They had aristocratic privileges and liabilities, and the right to exact retaliation for corporal injuries, but they also bore the burden of heavier punishment for crimes and inisdemeanours, with higher fees and fines to pay. The term became in time a mere courtesy-title, and indeed the class receives no illustration from the contracts. Even in the Code itself, when status is not concerned, the term simply means "a man, anyone." Below these persons of quality stood the *muskinu,* whose precise character is even more difficult to define, but it is not probable that they formed the bulk of the ordinary population. The word came in time to mean "a beggar," and with that meaning has passed through Aramaic and Hebrew into many modern languages, but this is certainly not what is meant in the Code; he was free, but had to accept monetary compensation for corporal injuries, paid smaller fees and fines, and owed less valuable offerings to the gods. The *ardu* was a slave, his master's chattel, and belonged to a numerous class. He could acquire property, and even hold other slaves. His master fed and clothed him, paid his doctor's fees. but took all compensation for injury done to him. His master usually gave him a slave-girl as wife (the children were then born slaves), often set him up in a house or business, and simply took a yearly rent. Otherwise he might marry a freewoman (the children were then free), who might bring him a dower which his master could not touch; at his death one half of his property passed to his master. Runaway slaves, if caught, had to be returned, for which a reward of two shekels, about one-tenth of the average value, was prescribed. To obtain, harbour, or smuggle away a slave was a capital offence. Slaves were indicated outwardly by a special identification mark on the head.

Property.—Complete private ownership of land is recognized by the Code, but all land was sold subject to its fixed charges. At least in later practice it was possible for the king to free land from these charges by charter, and the provinces or estates of faithful servants often enjoyed the royal bounty. Among these charges was that of providing men for the army and for the corvée, or statute labour, and a definite area had to find a certain number of men. Perhaps the greater part of the normal levy was supplied from the king's own estates, which were of vast extent. Upon part of these was settled a large population of officials and craftsmen, but particularly soldiers, mostly in occupation of a small holding granted for their maintenance in return for service. These fiefs were usually hereditary, and, in the case of soldiers, inalienable. When ordered out these soldiers could nominate a son, if of age, to hold the benefice and carry on the duty. If there was no son capable, the king put in a *locum tenens,* but granted one-third to the wife to maintain herself and children. Recruitment for the corvée was less regularly effected; it was customary to call for workmen and leave their selection to the local authorities. It seems that rent-paying tenants were exempt, and so were shepherds in charge of flocks. If a soldier was captured by the enemy, and had not sufficient property of his own to pay a ransom, this might be found by a merchant, who could claim reimbursement from the temple of the prisoner's city, or even from the palace itself; the man's holding could not be sold for this purpose.

The temples, besides special gifts, often of great value, and regular income derived from estates and other property, received vast amounts of *naturalia* from sacrifices. Many families had rights to exercise the priesthood on certain days of the year, and the perquisites attached to these offices made the right a negotiable commodity, which could be pledged, rented, or shared within the family, but not alienated. The contracts reveal that the temples were resorted to for loans, particularly of seed-corn, or of ready money to pay harvesters. It is clear that the temples,

in particular those dedicated to Ishtar. contained a large female population, mostly devoted to religious prostitution, the profits of which accrued to the temple. Despite this, such women enjoyed many privileges, but it was incompatible with their dignity to keep or to enter a tavern where the lower forms of vice were practised.

The Code recognizes many ways of disposing of property—sale, lease, barter, gift, dedication, deposit, loan, pledge, all of which were matters of contract. No claim is admitted unless substantiated by documents or the oath of witnesses. A buyer had to convince himself of the seller's title. If he bought, or received on deposit, from a minor or slave without power of attorney he would be executed as a thief; if the goods were stolen, he was liable to death for receiving them, unless he could prove obtaining them by bona-fide purchase, in which case he must restore the goods, but had his remedy against the seller, from whose estate, if dead, he might claim five-fold. When a slave was bought abroad the buyer had to satisfy himself that he had not been stolen or captured from Babylonia, for then he would have to restore his purchase without compensation. A defect of title or undisclosed liability would invalidate the sale.

Land might be farmed by the owner himself, by an employee, or by a tenant. The husbandman was bound to carry out the proper cultivation, raise an average crop, and leave the field in good tilth, In case the crop failed the Code fixed a statutory return. If land was let at a fixed rent, accidental loss fell on the tenant. If let on share-profit, landlord and tenant shared the loss in proportion to their agreed shares of the profit. Waste-land might be taken over for reclamation rent-free for the first three years. If the work was neglected the Code directed the tenant to hand over in good tilth and fixed a statutory rent. The metayer system was in vogue especially on temple lands. The landlord found land, labour, animals, implements, seed, rations, and fodder; the rent was as contracted. Theft or mal-versation of the material supplied was visited with fines or muti-lation. The conduct of irrigation is regulated with a view to pre-venting damage from a flood due to negligence. Houses were let usually for the year, rent being paid in advance half-yearly. The tenant was bound to keep the house in repair, but might use his own wooden fittings. Land was let on lease for house-building for eight or ten years, the tenant being rent-free, after which the building reverted to the landlord.

Despite the multitude of slaves, hired labour was often needed, especially at harvest. Boys were sometimes sent out to work by their parents. The period of hiring might be for a year or for a few days only, and the rates of wages were fixed. Cattle were hired for ploughing, working irrigation-machines, carting, and threshing, at a fixed tariff. Oxen and sheep were committed to a herdsman, who gave a receipt for them and took them out to pasture. He was responsible for all care, must replace losses due to neglect, and attend to the breeding. Damages caused by beasts under his control had to be restored four or even 12-fold.

Payment in kind was as common as payment in cash. It was enacted that a debtor must be allowed to pay in produce according to a statutory scale. Debt was secured on the debtor's person. Distraint on a debtor's corn was forbidden, and the seizure of a working ox was fined. A debtor being seized for debt could nominate his wife, child, or slave to work off the debt; the wife or child could not be detained for more than three years. Death occurring through the creditor's neglect, he became liable to full compensation. In the matter of pledges, the Code enacted that the debtor should take the crop of a field himself and pay the creditor from it. If the crop failed, liability was held over for that year. The debtor's whole property might be pledged as security for payment, and personal guarantees were often given that the guarantor would be liable in case of default.

Exact rules controlled the caravan traffic. The travelling agent had to give a detailed receipt for all goods; nothing could be claimed that was not in the inventory. If no profit was made he was bound to return double the value he had received; if only a small profit, he had to make up the deficiency, but was not responsible for loss by robbery or extortion. On his return he obtained a receipt, and profits were divided, usually equally. These caravans undertook carriage, with five-fold responsibility for loss, freights being generally paid in advance. Warehousing charges were one-sixtieth of the value, the accepter taking all risks and repaying double any deficiencies. Ships were hired at a fixed tariff according to their cargo capacity, inclusive of the crew's wages. Prices for shipbuilding were fixed, and were subject to one year's guarantee of seaworthiness. Boats under way were held responsible for collision with those at moorings, and the skippers of sunken craft refloated had to pay half their value as damages. Sale of intoxicants was subject to fixed prices, and the ale-wife must not suffer her premises to be used for disorderly or illegal purposes.

The contracts show that payment through a banker, or by written draft against deposit, was familiar. Bonds to pay were treated as negotiable. Interest was rarely charged on advances of seed by the temples or wealthy landowners, but in these cases the borrowers may have been tenants. Ordinary business borrowing was effected at about 30%.

The Family. — Marriage was by purchase, arranged between the respective parents, the bridegroom's father providing the bride-price, and the bride's father her dowry. If the bride's father, after accepting presents, refused his daughter he had to return the presents doubled. The dowry might be real property, but was generally personal effects or household furniture. It remained the wife's for life, descending to her children, if any; otherwise returning to her family, when the husband could deduct the bride-price. Every lawful marriage had to be sanctioned by a contract, which usually stated the consequences to either party of repudiating the other. The couple formed a unit, especially for debt, the man being responsible for his wife's debts, even those contracted before marriage, but he could use her as a *mancipium*. The Code allows the proviso that a wife shall not be seized for her husband's pre-nuptial debts, in which case he also could not be sued for hers; in any case, both were responsible for post-nuptial debts. A man might make, by deed of gift, a settle-ment on his wife of a life-interest in part of his property, or even allow her to bequeath it to a favourite son.

A man might divorce his wife at will, but he had to restore the dowry, and she held the custody of her children. Suitable alimony had to be provided, which the wife shared equally with the children. If she had no children, he returned the dowry and paid her a sum equivalent to the bride-price, or a mina of silver, if there had been none. If she had been a bad wife, however, he might divorce her while keeping the children and the dowry, or he might reduce her to bare maintenance as a slave in his house. She on her part might sue him for cruelty or neg-lect, and might obtain a judicial separation, taking her dowry. If it was proved that the fault was upon her side she was to be drowned. If left in her husband's absence without maintenance she might cohabit with another man but must go back to her husband on his return, but if she had maintenance cohabitation would be adultery. When widowed, the wife took her husband's place and brought up the family, ultimately taking a child's share in the estate when the family grew up. She could remarry only by judicial consent, and subject to strict precautions that the first husband's estate should remain in trust for his children.

A childless wife might give her husband a maid to bear him children, who were reckoned hers. If the wife did this, the husband was not allowed a concubine; if not, he might take one. A concubine was free and a wife, though of inferior rank to the first. She could be divorced only on the same conditions as the first wife. Yet a third class of mothers were slave-girls. Their children by their masters were born free; the mother could not be sold, and was free on her master's death. Such children could be legitimized by the father's acknowledgment before wit-nesses. In that case they ranked equally in sharing the paternal estate, but if they were not adopted the wife's children shared alone. If a free woman married a slave the children were free, and at his death the wife took her dowry with half of their joint savings to share with her children; the other half went to the slave's master.

A father had complete control over his children until their marriage, to dispose of their labour, and even of their persons for his profit. Mothers had the same right in the absence of the father, and so had even elder brothers when both parents were dead. Daughters were entirely in their father's power to give in marriage, or as the votary of a god, or as a concubine. Priestesses had full disposal of their property, but other daughters enjoyed only a life-interest in their dowry, which afterwards went to their children, or back to their family if there were no children. A father might, however, execute a deed granting his daughter power to leave her property to a favourite brother or sister. A daughter's estate was usually managed by her brothers, but if dissatisfied she could appoint a steward. If she married, her husband managed it. The son also seems to have received his share on marriage, but did not always then leave his father's house; he might bring his wife there.

Foundlings were commonly adopted, particularly by childless persons, and several laws regulated this practice. Such a son could not be reclaimed by his natural parents when reared to maturity by an adoptive father, unless the latter had early sought to return him. It was forbidden to cut off a son once adopted when subsequently children of a man's own were born; the youth had a right to one-third of the personal property which would have fallen to him as heir, but the father was not bound to break up his real estate. Children adopted by eunuchs or temple-women (persons incapable of having natural children) were bound to them by absolute ties. No claim to recover possession of them could be entertained, and any attempt on the child's part to renounce the relation, or rejoin his natural parents, was visited with mutilation of the eye or tongue. A son adopted by a craftsman could be reclaimed only if he had not been taught the trade. From the contracts it appears that adoption was often effected by agreement between the adopters and the natural parents, specifying what was to be the child's patrimony, and the punishment for any attempt of either party to renounce the relation. Adoption is, in certain contracts from outside Babylonia, very largely a matter of form, covering various economic arrangements between the two parties.

All legitimate children shared equally in the father's estate at death. When there were two mothers all children at one time shared equally, but later the first family took two-thirds. Children shared their mother's, but not their stepmother's, property. If a son was to be disinherited the Code required judicial consent, granted only for repeated unfilial conduct.

For adultery both parties were liable to drowning, but if the aggrieved husband pardoned his wife the king might do as much for the paramour. Incest was visited with death or exile according to its heinousness; seduction was punished by fines; sodomy is not mentioned in the Code.

Criminal Law.—In the criminal law the ruling principle was the *lex talionis*. A primitive idea of exact justice prescribed the punishment of an offending member, as the cutting off of a hand that struck a father or stole a trust, the loss of an eye that pried into forbidden secrets. False accusation on a capital count was punished with death, and perjury in a matter of damages was visited with a penalty of the amount claimed. Death was freely awarded for various forms of theft, brigandage, disorder, shirking of State service, and criminal negligence. A specified form of the death penalty, such as gibbeting, burning, or drowning is inflicted on the perpetrator of certain crimes. A curious extension of the *talio* is the death of a creditor's son for his father having caused the death of a debtor's son while holding him as a *mancipium;* of a builder's son for a house being so carelessly built as to cause the death of the owner's son; of a daughter whose father was responsible for the death of another man's daughter.

Exile was inflicted for incest, disinheritance for repeated unfilial conduct. Branding was the penalty for slander on a married woman or a priestess. The corrupt judge was permanently deprived of office, the extravagant wife and unfilial children were enslaved. Imprisonment is not recognized by the Code. The commonest penalty, of course, was a fine. This is awarded for corporal injuries to a *muskinu* or slave, for damages to property, and breach of contract. The restoration of goods improperly acquired or negligently damaged was usually accompanied by a fine.

The importance of intention was recognized. If the defendant swore that he had committed manslaughter unintentionally, he was only fined according to the rank of the deceased. The Code does not specify the punishment of wilful murder, but it was doubtless death. The owner of an ox which gored a man in the street was responsible only if the beast was known to be vicious. Accidents, or anything beyond due provision, were not generally imputed as offences. Poverty excused bigamy on the part of a deserted wife. On the other hand, carelessness and neglect were severely punished. The unskilful surgeon's mistakes might cost him the loss of his hands, or heavy fines; the veterinary surgeon and the builder of houses or ships had equally good reason to see that their work was irreproachable. Suspicion, in all cases, was not enough. The criminal must be taken in the act; the thief found actually in possession of the stolen goods.

Courts.—In civil actions the plaintiff preferred his own plea, without the assistance of professional advocates. The judge heard the plea and called the other parties and witnesses before him. The usual procedure seems to have involved a preliminary hearing before one or two judges, who took the depositions of the parties and witnesses and sent them on to a larger tribunal. This was composed generally of priests or of civil officials. In course of time the latter came to predominate, and the priests fell more and more into the position of administering the oath before the gods. In matters beyond the knowledge of men ordeal by water was used, and judgment was given according as the parties sank or swam in the river. But where the defendant alone had knowledge of the matter, his oath was sufficient, if he would take it; such was the solemnity of this proceeding that perjury seems not to have been feared. But great stress was laid on the production of written evidence. In order to inform themselves of the facts, the court might go to view property in dispute. The verdict pronounced by the court seems not to have had in itself binding force until a document had been drawn up embodying the settlement and recording the agreement of the parties to accept it; infringement of this undertaking was punishable. If a cause was heard by the king himself, it appears that his decision was final, and imposed itself without mutual agreement or appeal.

THE ASSYRIAN LAWS

Three tablets have recently been discovered in the ruins of the ancient city of Ashur which are inscribed with about 90 articles from a collection of laws promulgated in about the 13th century B.C. In form the enactments refer to particular sets of circumstances rather than to universal principles. This gives them the appearance of being a collection of actual decisions of judges which have passed into law; so marked is this character, that the suggestion has even been made that these texts are rather a legal commentary than actual laws. It is more likely, however, that they reveal a written law in the making, which has not yet attained the maturity of Hammurabi's Code, though several centuries later in date. It must be recollected that the Assyrians were not of the same origin as the Babylonians, and had other traditions which would certainly make theinselves felt in legal custom.

The matters covered by the surviving laws are marriage, property, security, and offences, but a good deal may be gathered from them concerning the nature and the procedure of the courts. Space does not permit any comparison of their provisions with those of the Code.

A betrothal ceremony was the preliminary of marriage; in this the man anointed the woman, offered her various gifts, and in particular paid a bride-price to the woman, not her father, as was the Babylonian custom. In case of divorce the wife kept this money, and therefore the husband was not likely to divorce her inconsiderately. Assyrian custom recognized two forms of marriage, according as the wife went to her husband's house, or

stayed in her father's house and received her husband there. If she came to her husband, she brought a dowry and certain gifts from both families. This property was entailed to her sons, and could not be shared by the husband's brothers. If she remained at home she received a sum of money from the husband; this he resumed at her death or divorce. A widow, on remarriage, came into absolute possession of her husband's gifts if she continued to live at her home, while he had a similar right to hers if she came to live with him. Before leaving home on service the husband had to make suitable provision for his wife. If not, she might put any children there were out to work but might not remarry for five years. Should the husband return after that time and find her the wife of another he could do nothing, except in special circumstances. In case of special hardship the wife's period of waiting was reduced to two years, during which time she was to be assisted at the public expense, but if the husband returned he was obliged to reimburse such expenses. A wife's son by a former marriage had no part or lot in the second husband's estate. Wives owed absolute fidelity to their partners, and were severely punished even for indiscreet conduct, for continual gadding to the houses of gossips, for compromising business expeditions, or for appearing unveiled in the streets. For adultery the penalty was death, but the husband might be satisfied with mutilation or even forgiveness; in either case, the paramour shared her fate, though he could not be punished if he could prove ignorance of her being married. A bawd procuring a married woman was liable to the same penalty as befell the guilty pair; a married woman entrapped in a bawdy-house might escape punishment by immediate denunciation of the conspirators. The Mosaic law of levirate marriage is not directly affirmed, but certain particular cases are considered which obviously imply this custom. The wife who remained at home is (like the other kind) bound to marry the deceased husband's brother. A betrothed maiden must marry a brother of the man who was engaged to her if he died or disappeared; if there was no marriageable brother, the father must take her.

The surviving laws of property relate chiefly to real estate. Several articles are devoted to ensuring respect for landmarks and the equitable division of water for irrigation. A man might become the owner of an orchard by planting it, with the consent of the former owner, but had to find for him another plot of equal area. Clandestine use of land by a stranger was punished and the produce confiscated. When a father died his property might be divided among his sons, but sometimes this was not done; the land remained a whole and was cultivated in common by the brothers. In that case the eldest had the right to two shares of the harvest. Out of the common estate, however, each brother might lawfully extract the valuables which it was the custom to bestow upon his affianced wife. Within a family of brothers thus holding an undivided property there is, however, not an undivided responsibility for offences. When a sale of real property was contemplated it was important that the purchaser should not afterwards be confronted with genuine or bogus claims from third parties, and it was therefore required that he should make public announcement of his proposed acquisition by the town-crier, three times within the previous month. No claims lodged after this time were admitted.

As security for debt the creditor could attach the person of the debtor or one of his children. In either case the pledge must work for him until the value of the debt was paid off, but the creditor was strictly forbidden to sell the pledge into slavery. Any person who bought such a pledge was liable to lose his money. The only right of disposal that the creditor had was that of giving in marriage a girl whom he had received as a pledge; he might receive an agreed price for her from a suitor. The consent of her father was necessary, but in conditions of necessity could hardly be denied. If the father was dead, the girl's brothers could refuse consent to the marriage, but only if they were prepared to pay off the debt within a month. This disposal of girls in marriage sometimes led to complicated situations when it was found that other claims, besides those of the disposing creditor, lay against the father. A creditor who had ill-treated his pledge before selling her to a husband was held to have forfeited by such conduct any rights in her when once she had passed out of his control.

Theft is particularly regarded in the instances where the thief was a married woman. She who stole anything from the house when the husband was dead or sick was guilty of death, and so was the receiver. Thefts to the value of more than five minas of lead from the house of a stranger made a woman liable to be detained by the householder pending redress. Other thefts might be atoned for by the thief submitting himself to private retribution. Gross slander of immoral or unnatural conduct against man or woman was savagely punished by cudgelling, forced labour, a fine, and castration. Adultery and rape were alike capital offences, and the penalty could be inflicted privately by the aggrieved family, which had the option, however, of contenting itself with a milder satisfaction, or even of forgiveness. Indecent assault was avenged by the mutilation of the hands or face, by fines and beating, and assault leading to abortion by beating, forced labour, and a fine.

The source of justice was the king or his officers, sometimes assisted by the chief men of the locality. But a prominent feature of the Assyrian law is the wide allowance it gives to private retribution. Within the family the father is usually free to take such disciplinary measures, even of great severity, as seem good to him. Public sentences were carried out by an executioner who was ordered not to exceed the written instructions given to him. In general, the savagery of the corporal punishments prescribed or allowed is a disagreeable feature of the Assyrian lam; although the Code of Hammurabi is not sparing in denunciations of death it has none of the cruel and arbitrary woundings so freely awarded by Assyrian justice.

Two other matters involved by these laws are of interest; first, that in this period the ordinary medium of exchange is lead, not silver, financial penalties being always reckoned in this metal. Second is the use of the ordeal by water, which was also practised in Babylonia. In a criminal charge, if witnesses or other mode of proof were not available, the accused was thrown into the river, and was declared innocent if he floated. In a dispute, when both parties had taken oaths in a contradictory sense, the ordeal was used to decide between them.

THE HITTITE LAWS

So long ago as 1907 excavations near the Turkish village of Boghaz Keui, about 90m. east of Angora, lighted upon a great collection of clay tablets inscribed in cuneiform with a multitude of histcrical, religious, and political documents drawn up either in Babylonian or in one of several native languages, and dating from the 14th or early 13th century before the Christian era. Among these tablets were found two large and several smaller pieces which proved to contain laws written in the chief native language of the kingdom. Most of the difficulties of this language have lately been overcome, and the contents of the Hittite laws are now disclosed. Though belonging to a different culture, they were framed by a society closely in touch with Mesopotamia, and at a time shortly before the rise of Assyria to importance, so that some notice of them is indispensable.

The most striking peculiarity of the Hittite laws is their overt references to revision. In several cases it is said that "formerly" such-and-such was the practice, but "now" it has been altered. Occasionally it is custom which is thus modified, but more often it is an earlier recension of the law, as when the restitution for theft of cattle is reduced, or the considerations which determine whether there has been misappropriation of property are simplified. In general, the revised state of the law exhibits much milder provisions than the former.

The existing laws by no means cover all, or even the most important, relations with which a code might be expected to concern itself. Indeed there is no specific reference to such subjects as marriage, sale, heredity, or contract; the state of custom with respect to these is indicated only by directions aimed at avoiding disputes in connection with them. The chief purpose of these laws seems to be the maintenance of order, and there-

fore a good deal of their contents is occupied by exhaustive tariffs of fines or restorations after theft, and even of the fixed prices for land, animals, metals, food, and clothing. It is known that the Hittite rule extended at this period over many peoples different in race, language, and customs, for which the law consequently does not attempt to prescribe as it might in the case of a homogeneous population. The almost exclusively agricultural character of the subjects is revealed by the prominence of such topics in the laws; there is only one mention of merchants and only a few of craftsmen.

Property was completely private. In order to be formally recognized, a piece of real estate had to be solemnly put under the protection of the gods, and any new acquisition of the property required a further sacrifice. Several enactments are devoted to the conduct of fiefs granted to soldiers (and also to priests and weavers) by the king as maintenance. In the soldier's absence at the wars a civilian was detailed to cultivate his farm and furnish the dues which were attached to it. Should the soldier die the civilian could enlist in his place. Conversely, if the civilian died, the soldier could take up the fief and its dues, and put in a manager of his own. Sometimes the soldier took a partner, working the land and sharing in the produce. In the event of a quarrel and dissolution of partnership the associate was entitled to a definite, though smaller, share of the property.

The population was divided into free and slaves only. Marriage between two free persons was preceded by the giving of betrothal presents to the girl. If she changed her mind these had to be repaid; if the man did so he lost his money. The two kinds of marriage, according as the woman remains at home or goes to live with her husband, are recognized by Hittite as by Assyrian law. When the marriage was between slaves, or mixed, no betrothal presents were given. But if a slave made these gifts to a free woman, by accepting them she became a slave too. The levirate marriage was customary with the Hittites; a brother (or, if none, a father) must marry the deceased brother's wife. The husband had power of life and death over an adulterous wife, and the father might disinherit a son, but it was required that the son's misconduct should have been repeated. A picturesque custom was observed in these cases; the mother put the son's clothing outside the house to signify his banishment. If he was to be received back, the son carried out certain articles of furniture, which the mother then took back to their place.

That the person of a debtor might be taken as security for a debt is to be gathered from the rule that a third party might effect the release of such a one at the New Year by furnishing a substitute. As to other matters of contract the only indications are the very exhaustive tariffs for sale of animals (mules were dearest), skins, and garments, and for hire of animals, utensils, and craftsmen.

Most of the Hittite code is concerned with penal regulations, governing such offences as murder, assault, abortion, incest, sodomy, kidnapping, theft, and damage. Private revenge is allowed only in the case of an adulterous wife. The public penalties were death, forced labour, imprisonment, and facial mutilation, but the *lex talionis* is not in force. Death is inflicted only in the very moderate number of eight instances, forced labour for misappropriation of property, mutilation only upon slaves guilty of theft or arson. In general the sanctions are distinctly less severe than in either the Babylonian or the Assyrian laws.

(C. J. G.)

BACĂU, a town of Rumania, capital of department of same name. Pop. (1930), about 31,260, including many Jews. Bacău lies in the foothills of the Carpathians, on the river Bistrița, 5 miles above its junction with the Pruth, and on the main Czernowitz-Ploești line. A branch railway runs to Piatra, in the Carpathians. Bacău is a modern town and important commercial centre with manufactures of paper, cloth and clothing, timber and petroleum. There is a chamber of commerce and industry at Bacău.

BACCARAT, a gambling card-game (origin of name unknown), supposed to have been introduced into France from Italy during the reign of Charles VIII. (c. 1490). There are two varieties of the game: *baccarat banque* and *baccarat chemin* de *fer.* The most usual form at the present time is *chemin de fer* which is played a great deal in France, not only in clubs and private houses, but also at casinos all over the country. It is also played at the casino at Monte Carlo. Six full packs of cards are used. They are shuffled by the croupier and by any of the players who may wish to do so. Any number of people may play, but the ordinary *chemin de fer* table has 12 seats, one for the croupier in the middle and the others numbered from 1 to 11.

After the cards are shuffled, the croupier puts them into a "shoe" which is a special sort of box from which the cards can easily be drawn one at a time. The shoe is then passed to the player on the right of the croupier, that is, in No. 1 seat, who becomes banker for the time being. The other players are called *punters.* The banker places on the table in front of him the sum which he wishes to stake, and the player on his right has the first chance of calling *Banco,* which means that he plays for the entire stake. If the next player does not wish to go *Banco* anyone else at the table can do so in their regular turn. When the banker wins, his stake becomes doubled and again anybody at the table can call *Banco,* but the player who lost the last coup has the first right, which he claims by saying *suivi.* If nobody calls *Banco,* which happens sometimes, especially when the banker has won several coups, any of the punters at the table can stake what they like up to the amount that is in the bank. The banker continues, if he wishes to, until he loses a coup, when the deal passes automatically to the player on his right, but a banker can retire and take in his winnings at any time, before he has dealt a card, on saying *la banque passe.*

The banker deals one card to the punter and one to himself, then a second one to his opponent and another to himself, all face downwards. The object is to get as near to nine as possible, but not over it. Court cards and tens count nothing, other cards count their face value. The punter looks at his two cards and, if they count eight or nine he puts them on the table face upwards. A seven and a two would be nine, or a king and a nine, as court cards do not count; a five and a three, making eight, would also be a natural and must be shown at once. If he has not got a natural the punter can ask for another card, which the banker is bound to give unless he has a natural himself. The banker does not look at his own hand until the punter either asks for another card by saying *Carte,* or refuses by saying *Non.* The banker then exposes his two cards on the table. If he has a natural he wins the coup, if not, he deals another card to the punter, face upwards, and can then decide whether to take another card himself or not. The rules about taking a card are clearly defined. If a player holds either six or seven he does not draw; if he hold five it is *à volonté,* he can do as he pleases; if he holds less than five he always takes a card. This is where the banker gets his advantage. He can decide about taking a card after he has seen the card given to his opponent. For instance, if he has given a court card, counting nothing, he will stand on a four. If he has given a seven he will draw on a six in the faint hope of getting a two or a three. Ties neither win nor lose and fresh cards are dealt. When a banker passes his bank and takes his profit, the bank is offered round the table by the croupier, and anyone at the table can take

it and carry it on by putting up the same amount that was in the bank. If anybody is willing to take it, the bank is put up to auction by the croupier and the highest bidder takes it.

Baccarat Banque is rarely played nowadays except when there is very high gambling at Deauville or at Monte Carlo. Three packs of cards, thoroughly shuffled, are used. One player holds the bank against all the others. He puts in a certain named sum or sometimes declares *Banque* Ouverte, which means that anyone can stake whatever he likes. There are two tableaux, the right and the left. The banker deals one card to the right, one to the left and one to himself, then another to the right, another to the left and another to himself, all face downwards. He then looks at his cards, and if he has not a natural, that is eight or nine, he says J'en *donne,* and offers a card to the tableau on his right, and then to the one on his left. The duty of accepting or refusing the card devolves upon each player at the table in turn, provided that he has a stake in front of him. When he loses a coup, it passes to the player next to him. Baccarat in any form is illegal in England, but it is very popular in France.

BACCELLI, GUIDO (1830–1916), Italian physician and politician, was born at Rome, and after graduating in medicine at the university became assistant professor of medical jurisprudence in 1856, and some years later professor of clinical medicine. He devoted himself particularly to the study of malaria, his researches giving an impetus to the reclamation of the Roman Campagna. In 1873 he was elected deputy for a division of Rome, which he represented until his death. He was Minister of Education in various cabinets from 1879–99, and of Agriculture under Zanardelli (1901–03); from 1889 to 1893 he was vice-president of the Chamber. A keen classical scholar, he took an active interest in archaeological matters, although in some of his projects, such as the famous *Passeggiata Archeologica* in Rome, he showed more enthusiasm than judgment. His labours for the isolation of the Pantheon and the creation of the Museum of Ancient Art and of the Modern Art Gallery in Rome deserved and met with more general approval. He died in Rome Jan. 11 1916.

BACCHANALIA, the Latin name for the wild and mystic festivals of Bacchus (Dionysus [*q.v.*]). They were introduced into Rome from lower Italy by way of Etruria, and were held in secret, attended by women only, on three days in the year (Ovid, *Fasti* vi. 503). Subsequently, admission to the rites was extended to men and celebrations took place five times a month. The evil reputation of these festivals, at which the grossest debaucheries took place, and all kinds of crimes and political conspiracies were supposed to be planned, led in 186 B.C. to a decree of the senate—the so-called *Senatus consultum* de *Bacchanalibus*, inscribed on a bronze tablet discovered in Calabria (1640), now at Vienna—which prohibited the Bacchanalia throughout Italy, except in certain special cases. But, in spite of the severe punishment inflicted upon those implicated in the criminal practices disclosed, Bacchanalia were not suppressed in the south of Italy for a very long time.

BACCHIADAE, the name of the chief oligarchic family in ancient Corinth (*q.v.*).

BACCHYLPDES, Greek lyric poet, was born at Iulis, in the island of Ceos. His father's name was probably Meidon; his mother was a sister of Simonides, himself a native of Iulis. Eusebius says that Bacchylides "flourished" (ἤκμαζεν) in 01. 78. 2 (467 B.C.). As the term ἤκμαζεν commonly refers to about the 40th year we may suppose that Bacchylides was born circa 507 B.C. He would thus have been some 49 years younger than Simonides, and some 15 years younger than Pindar.

Bacchylides, like Simonides and Pindar, visited the court of Hieron I. of Syracuse (478–467). Ode iii. (468 B.C.) was possibly written at Syracuse, as verses 1 j and 16 suggest. He there pays a high compliment to Hieron's taste in poetry (ver. 3 ff.). A scholium on Pyth. ii. go (166) avers that Hieron preferred the Odes of Bacchylides to those of Pindar. The Alexandrian scholars interpreted a number of passages in Pindar as hostile allusions to Bacchylides or Simonides. If the scholiasts are right, it would appear that Pindar regarded the younger of the two Cean poets as a jealous rival (see 01. ii. 91–110). Yet it would be rash to assume that this tradition rested merely on surmise. It is tolerably certain that the three poets were visitors at Hieron's court at about the same time: Pindar and Bacchylides wrote odes of the same kind in his honour; and there was a tradition that he preferred the younger poet. It is noteworthy that, whereas in 476 and 470 both he and Bacchylides celebrated Hieron's victories, in 468 (the most important occasion of all) Bacchylides alone was commissioned to do so; although in that year Pindar composed an ode (Olymp. vi.) for another Syracusan victor at the same festival. Nor is it difficult to conceive that a despot such as Hieron may have found the genial Ionian a more agreeable courtier than Pindar, an aristocrat of the Boeoto-Aeolic type. But, whatever may have been the true bearing of Pindar's occasional innuendoes, it is at any rate pleasant to find that in the extant work of Bacchylides there is not the faintest semblance of hostile allusion to any rival.

Plutarch (de *Exilio*, p. 605 c) names Bacchylides in a list of writers, who after they had been banished from their native cities, were active and successful in literature. The passage implies that Peloponnesus was the region where the poet's genius ripened and where he did the work which established his fame. This points to a residence of considerable length; and it may be noted that some of the poems illustrate their author's intimate knowledge of Peloponnesus (*e.g.*, Odes viii., x., and dithyramb xix.).

The Alexandrian scholars included Bacchylides in their "canon" of the nine lyric poets. The Alexandrian grammarian Didymus (circa 30 B.C.) wrote a commentary on the epinikian odes of Bacchylides. Horace studied his works and imitated him (according to Porphyrion) in Odes, i. 15, where Nereus predicts the destruction of Troy. Quotations from Bacchylides, or references to him, occur in Dionysius of Halicarnassus, Strabo, Plutarch, Stobaeus, Athenaeus, Aulus Gellius, Zenobius, Hephaestion, Clement of Alexandria, and various grammarians or scholiasts. Ammianus Marcellinus (xxv. 4) says that the emperor Julian enjoyed reading Bacchylides. It is clear, then, that this poet continued to be popular during at least the first four centuries of our era. The only definite estimate of him by an ancient critic occurs in the treatise Περὶ Ὕψους ("On the Sublime") ascribed to Cassius Longinus (circ. A.D. 260), but more probably due to some writer of the first century of our era. In chapter xxxiii. of that treatise, the author asks whether we ought to prefer "greatness" in literature, with some attendant faults, to flawless merit on a lower level, and of course replies in the affirmative. In lyric poetry, he asks, who would be Bacchylides rather than Pindar? Yet Bacchylides is "faultless, with a style of perfect elegance and finish." In short, the essayist regards Bacchylides as a thoroughly finished poet of the second class, who never commits glaring faults, but never reaches the loftier heights.

The first and most general quality of style in Bacchylides is his perfect simplicity and clearness. Where the text is not corrupt, there are few sentences which are not lucid in meaning and simple in structure. This lucidity is partly due, no doubt, to the fact that he seldom attempts imagery of the bolder kind, and never has thoughts of a subtle or complex order. Yet it would be very unjust to regard such clearness as merely a compensatory merit of lyric mediocrity, or to ignore its intimate connection with the man's native grace of mind, with the artist's feeling for expression, with the poet's delicate skill.

Another prominent trait in the style of Bacchylides is his love of picturesque detail. This characteristic marks the fragment by which, before the discovery of the 1896 ms., he was best known—a passage, from one of his paeans, on the blessings of peace (fr. 13, Bergk; 3, Jebb); and it frequently appears in the Odes, especially in the mythical narratives. Observation and elegance do more for him than grasp or piercing insight; but his work is often of very high excellence in its own kind. In his

treatment of simile Bacchylides is intent on the decorative value of the details themselves. There are occasional flashes of brilliancy in his imagery, when it is lit up by his keen sense of beauty or splendour in external nature. A radiance, "as of fire," streams from the forms of the Nereids (xvi. 103 ff.). An athlete shines out among his fellows like "the bright moon of the mid-month night" among the stars (viii. 27 ff.). The sudden gleam of hope which comes to the Trojans by the withdrawal of Achilles is like a ray of sunshine "from beneath the edge of a storm-cloud" (xii. 105 ff.). The shades of the departed, as seen by Heracles on the banks of the Cocytus, are compared to the countless leaves fluttering in the wind on "the gleaming headlands of Ida" (v. 65 ff.)—an image not unworthy of Dante or of Milton.

Among the minor features of this poet's style the most remarkable is his use of epithets. A god or goddess nearly always receives some ornamental epithet; sometimes, indeed, two or even three (*e.g.* v. 98 f.). Such a trait is in unison with the epic manner, the straightforward narrative, which we find in some of the larger poems (as in v., x., and xvi.). On the other hand the copious use of such ornament has the disadvantage that it sometimes gives a tinge of conventionality to his work.

The poems contained in the ms. of Bacchylides found (see below) in 1896 are of two classes: I. Odes of Victory or epinikia; II. Dithyrambs. Simonides (b. *c.* 556 B.C.) was the earliest recorded writer of epinikia. His odes of this class are now represented only by a few very small fragments, some 20 lines in all. Two of these fragments, belonging to the description of a chariot-race, warrant the belief that Simonides, in his epinikia, differed from Pindar in dwelling more on the incidents of the particular victory. The same characteristic is found in the epinikia of Bacchylides. His fifth ode, and Pindar's first Olympian, alike celebrate the victory of the horse Pherenicus; but, while Pindar's reference to the race itself is slight and general (vv. 20–22), Bacchylides describes the running of the winner much more vividly and fully (vv. 37–49).

The ms. contains 14 epinikia, or 13 if Blass be right in supposing that Odes vi. and vii., as numbered by Kenyon in the editio princeps, are part of a single ode (for Lachon of Ceos). Four (or on the view just stated, three) of the odes relate to the Olympian festival; two to the Pythian; three to the Isthmian, three to the Nemean; and one to a Thessalian festival called the Πετραῖα. This comes last. The order in which the ms. arranges the other epinikia seems to bc casual; at least it does not follow (1) the alphabetical sequence of the victor's names or of the names of their cities; nor (2) chronological sequence; nor (3) classification by contests; nor (4) classification by festivals—except that the four great festivals precede the Petraea. The first ode, celebrating a victory of the Cean Argeios at the Isthmus, may possibly have been placed there for a biographical reason, viz., because the poet treated in it the early legends of his native island.

A mythical narrative, connected in some way with the victor or his city, usually occupies the central part of the Pindaric ode. Pindar's habit is to select certain moments or scenes of a legend, which he depicts with great force and vividness. Bacchylides, on the other hand, has a gentle flow of simple epic narrative; he relies on the interest of the story as a whole, rather than on his power of presenting situations. Another element, always present in the longer odes of victory, is that which may be called the "gnomic." Here, again, there is a contrast between the two poets. Pindar packs his γνῶμαι, his maxims or moral sentiments, into terse and sometimes obscure epigrams. The moralizing of Bacchylides is rather an utterance of quiet meditation sometimes recalling the strain of Ionian gnomic elegy.

The epinikia of Bacchylides are followed in the ms. by six compositions which the Alexandrians classed under the general name of διθύραμβοι (dithyrambs), using the word in a wide sense, as denoting simply a lyric poem occupied with a mythical narrative. The six dithyrambs of Bacchylides are arranged in (approximately) alphabetical order: Ἀντηνορίδαι, Ἡρακλῆς, Ἱππεῖς ἢ Θησεύς, Θησεύς, Ἰώ, Ἴδας. The principal feature, best exemplified by the first and third, is necessarily epic narrative—often adorned with touches of picturesque detail, and animated by short speeches in the epic manner.

Several other classes of composition are represented by those fragments of Bacchylides, preserved in ancient literature, which were known before the discovery of the new ms. (1) ὕμνοι. Among these we hear of the ἀποπεμπτικοί, hymns speeding some god on his way at the season when he passed from one haunt to another. (2) παιᾶνες, represented by the well-known fragment on the blessings of peace. (3) προσόδια, choral odes sung during processions to temples. (4) ὑπορχήματα, lively dance-songs for religious festivals. (5) ἐρωτικά, represented by five fragments of a class akin to σκόλια, drinking-songs. Under this head come some lively and humorous verses on the power of wine, imitated by Horace (Odes, iii. 21. 13–20). It may be conjectured that the facile grace and bright fancy of Bacchylides were seen to especial advantage in light compositions of this kind. (6) The elegiacs of Bacchylides are represented by two ἐπιγράμματα ἀναθηματικά, each of four lines, in the Palatine Anthology. The first (*Anth.* vi. 313) is an inscription for an offering commemorative of a victory gained by a chorus with a poem written by Bacchylides. The second (*Anth.* vi. 53) is an inscription for a shrine to Zephyrus. Its authenticity has been questioned.

The papyrus containing the odes of Bacchylides was found in Egypt by natives, and reached the British Museum in the autumn of 1896. It was then in about zoo pieces. By the skill and industry of Mr. F. G. Kenyon, the editor of the editio *princeps* (1897), the ms. was reconstructed from these lacerated members.

EDITIONS—F. G. Kenyon, Ed. princeps (1897); F. Blass, 3rd ed. (1904), re-ed. (Suers 1912); H. Jurenka (1898); N. Festa, text, translation and notes (1898). For a very full account of the life and works of Bacchylides, and a discussion of the ms. see the edition by Sir Richard Jebb (1905), with introduction, notes, translation, and bibliography; text only (1906). See also T. Zanghieri, Studi *su Bacchilide, Bibliografia Bacchilidea, 1897–1905* (1905).

BACCIO D'AGNOLO (c. 1460–1543), Florentine wood-carver, sculptor and architect. He started as a wood-carver, and between 1491 and 1502 did much of the decorative carving in the church of Santa Maria Novella and the Palazzo Vecchio in Florence. At the beginning of the 16th century he was engaged with Simon Pollajuolo in restoring the Palazzo Vecchio, and in 1506 he was commissioned to complete the drum of the cupola of the metropolitan church of Santa Maria del Fiore. The latter work, however, was interrupted on account of adverse criticisms from Michelangelo, and it remained unexecuted. Baccio d'Agnolo also planned the Villa Borghese and the Bartolini palace, with other fine palaces and villas. The Bartolini palace was the first house to be given frontispieces of columns to the door and windows, previously confined to churches; and he was ridiculed by the Florentines for his innovation. He designed the campanile of the church of Santo Spirito. His studio was the resort of the most celebrated artists of the day, Michelangelo, Sansovino, the brothers Sangallo and the young Raphael. He died in 1543, leaving three sons, all architects, the best-known being Giuliano.

BACH, JOHANN SEBASTIAN (1685–17jo), German musical composer. The Bach family was of importance in the history of music for nearly 200 years. Four branches of it were known at the beginning of the 16th century, and in 1561 we hear of Hans Bach of Wechmar who is believed to be the father of Veit Each (born about 1j55). The family genealogy, drawn up by J. Sebastian Bach himself and completed by his son Philipp Emanuel, describes Veit Bach as the founder of the family, a baker and a miller, "whose zither must have sounded very pretty among the clattering of the mill-wheels." His son, Hans Bach, "der Spielmann," is the first professional musician of the family.

Of Hans's large family the second son, Christoph, was the grandfather of Sebastian Each. Another son, Heinrich of Arnstadt, had two sons, Johann Rfichael and Johann Christoph, who are among the greatest of J. S. Bach's forerunners, Johann Christoph being probably the author of the splendid motet, *Ich lasse* dich *nicht* ("I wrestle and pray"), formerly ascribed to Sebastian Bach. Another descendent of Veit Bach, Johann Ludwig, was admired more than any other ancestor by Sebastian, who copied 12 of his church cantatas and sometimes added work of his own to them.

The Bach family never left Thuringia until the sons of Sebastian went into a wider world. Through all the misery of the peasantry during the period of the Thirty Years' War this clan maintained its position and produced musicians who, however local their fame, were among the greatest in Europe. So numerous and so eminent were they that in Erfurt musicians were known as "Bachs," even when there were no longer any members of the family in the town. Sebastian Bach thus inherited the artistic tradition of a united family aloof from all the musical fermentation which in the rest of Europe had destroyed polyphonic music throughout the 17th century.

LIFE

Early **Days.**—Johann Sebastian Bach was baptized at Eisenach on March 23, 1685. His parents died in his 10th year, and his elder brother, Johann Christoph, organist at Ohrdruf, took charge of him and taught him music. The elder brother is said to have been jealous of Sebastian's talent, and to have forbidden him access to a manuscript volume of works by Froberger, Buxtehude, and other great organists. Every night for six months Sebastian got up, put his hand through the lattice of the bookcase, and copied the volume out by moonlight, unfortunately to the permanent damage of his eyesight—as is shown by all the extant portraits of him at a later age and by the blindness of his last year. When he had finished, his brother discovered the copy and took it away from him.

In 1700 Sebastian, now 15 and thrown on his own resources by the death of his brother, went to Luneburg, where his unbroken soprano voice obtained for him an appointment at the school of St. Michael as chorister. We know little about his teachers, but we have abundant evidence of his own incessant study of earlier and contemporary composers, such as Frescobaldi (*c.* 1587), Caspar Kerl (1628–93), Buxtehude, Froberger, Muffat the elder, Pachelbel and probably Johann Joseph Fux (1660–1741), afterwards the author of the *Gradus ad Parnassum* (1725) on which Haydn trained himself a generation later.

A prettier legend than that of his brother's forbidden organ-volume tells how, on his return from one of the many holiday expeditions which Bach made to Hamburg on foot to hear the great organist Reinken, he sat outside an inn longing for the dinner which he could not afford, when two herring-heads were flung out of the window, and he found in each of them a ducat with which he promptly paid his way, not home, but back to Hamburg.

At Hamburg, also, Keiser was laying the foundations of German opera on a splendid scale which must have fired Bach's imagination, though it never directly influenced his style. On the other hand Keiser's church music was of immense importance in his development. In Celle the famous *Hofkapelle* brought the influence of French music to bear upon Bach's art, an influence which inspired nearly all his works in suite-form and to which his autograph copies of Couperin's music bear testimony. Indeed, there is no branch of music, from Palestrina onwards, conceivably accessible in Bach's time, of which we do not find specimens carefully copied in his own handwriting. Again, when Bach, at the age of 19, became organist at Arnstadt, he found Liibeck within easy distance, and there, in Oct. 1705, he went to hear Buxtehude, whose organ works show so close an affinity to Bach's style that only their lack of coherence as wholes reveals to the attentive listener that this noble music is more primitive than Bach's.

First Appointments.—Enthusiasm for Buxtehude caused Bach to outstay his leave by three months, and this, together with his habit of astonishing the congregation by the way he harmonized the chorales, got him into trouble. But he was already too great an ornament to be lightly dismissed; and though his answers to the complaints of the authorities (recorded in the archives of the church) were spirited rather than satisfactory, and the *consistorium* had to make what scandal they could about his allowing a "stranger-maiden" to sing privately in the church, Bach was able to maintain his position at Arnstadt until he obtained the organistship of St. Blasius in Mülhausen in 1707. Here he married his cousin, easily identified with the "stranger-maiden" of Arnstadt; and here he wrote his first great church cantatas, *Aus der Tiefe* and *Gottes Zeit. Gott ist mein Konig* he had written two years earlier.

In 1708 Bach went to Weimar where his successes were crowned by his appointment, in 1714, at the age of 29, as *Hofkonzertmeister* to the duke of Weimar. Here he found ample scope for sacred music, and the great cantata *Ich hatte viel Bekümmerniss* was probably the first work of his new office. In 1717 Bach visited Dresden in the course of a concert tour, and was induced to challenge the arrogant French organist, J. Louis Marchand. The two champions heard (or overheard) each other's playing. A musical tournament was arranged at court, but on the appointed day the only news of the French champion was that he had left Dresden by the earliest coach. This triumph was followed by Bach's appointment as *Kapellmeister* to the duke of Cöthen, a post which he held from 1717 to 1723. The Cöthen period is that of Bach's central instrumental works, such as the first book of *Das Wohltemperirte Klavier,* the solo violin and violoncello sonatas, the Brandenburg concertos, and the French and English suites.

Removal to **Leipzig.**—In 1723, finding his position at Cöthen uninspiring for choral music, he removed to Leipzig, where he became cantor of the Thomasschule, being still able to retain his post as visiting *Kapellmeister* at Cöthen, besides a similar position at Weissenfels. His wife had died in 1720, leaving seven children, of whom Friedemann and Philipp Emanuel had a great future before them. (For his sons *see* BACH, K.P.E., below.) In Dec. 1721 Bach married again, and for the beautiful soprano voice of his second wife he wrote many of his most inspired arias. She was a great help to him with all his work, and her musical handwriting soon became almost indistinguishable from his own. In 1729 Bach heard that Handel was for a second time visiting Halle on his way back to London from Italy. A former attempt of Bach's to meet Handel had failed; illness now prevented his travelling, and his son could not persuade Handel to visit Leipzig; so the two never met. Bach so admired Handel that he made a manuscript copy of his *Passion nach Brockes;* a fact of great significance. The poem of Brockes, a dreadful example of the literary taste of its day, purported to be a combination of the four Gospel narratives. It had been set by every German composer of the time, but it was transformed by Bach with real literary skill as the groundwork of the nonscriptural numbers in his Passion according to St. John.

Closing Years.—All Bach's most colossal achievements, such as the Passion according to St. Matthew and the B Minor Mass (*see* **ORATORIO** and MASS) date from his cantorship at Leipzig. His position there was important and congenial, and his temperament was equal to the strain of many a "breeze" with town councillors who would have preferred a less independent cantor and a more ecclesiastical style of music. But graver troubles were not to be avoided in any large family living on the wages of learning in those insanitary days. Of his seven children by his first wife only three survived him. By his second wife he had 13 children, of whom he lost four of the six sons. His post was more dignified than lucrative; and the inventory of his possessions, made after his death, tells a tale of thrift.

His eldest son, Friedemann, delighted him with the growth of a wonderful talent, which showed him to be, as the more famous son, Philipp Emanuel said, more nearly capable of replacirig his father than all the rest of the family together. Yet he gave his father much anxiety by a growing wildness which was destined to lead to an unproductive career and a squalid old age. The total eclipse of his own polyphonic art Bach faced with equanimity, saying of the new styles which in the hands of his sons Philipp Emanuel and Johann Christoph were soon to eclipse it for the next century, "The art has advanced to great heights: the old style of music no longer pleases our modern ears." Philipp Emanuel made a good career and was appointed court-composer to the king of Prussia. This led, in 1747, to Sebastian's being summoned to visit Frederick the Great at Potsdam, an incident which Bach always regarded as the culmination of his career, much as Dr. Johnson regarded his interview with George III.

Bach had to play on the newly invented pianofortes of Silbermann, of which the king had bought 15, and also to try the organs of the churches of Potsdam. Frederick, whose musical reputation rested on a genuine if narrow basis, gave him a splendid theme on which to extemporize; and on that theme Bach afterwards wrote *Das musikalische Opfer*. Two years afterwards his sight began to fail, and before long he shared the fate of Handel in becoming totally blind. (The same surgeon operated unsuccessfully on both composers.)

Bach died of apoplexy on July 28, 1750. His loss was deplored as that of one of the greatest organists and clavier players of his time. Of his compositions little was known outside the circle of his family and pupils. At his death his ms. works were divided amongst his sons, and many of them have, to the irreparable loss of the art, been irrecoverably lost; indeed, only a small proportion of his greater works was recovered when, after the lapse of nearly a century, the renascence of polyphony reversed the judgments of his immediate posterity. (X.; D. F. T.)

WORK AND INFLUENCE

Rediscovery. — The rediscovery of Bach's choral music dates from the boyhood of Mendelssohn, who at 12 years of age read the autograph of the Matthew Passion in the Royal Library at Berlin, and never rested until he had given a private performance of it, the first since Bach's death. In England the revival began still earlier by the performances and publications of Wesley and Crotch. In 1850, a century after his death, a society was started for the correct publication of all Bach's remaining works. Robert Franz, the song-writer, arranged some of Bach's finest works for modem performance; a valuable service, so long as the scholarship of the rediscovered art was in its infancy, but now superseded by the realization of Bach's own methods. The Porson of Bach-scholarship, however, is Wilhelm Rust, grandson of an interesting composer of that name, who wrote polyphonic suites and fantasias early in the 19th century. During the 14 years of his editorship of the *Bach-Gesellschaft* he displayed a steadily increasing insight into Bach's style, sometimes restoring harmonies of priceless value from incomplete texts, by means of research and reasoning which he sums up in a modest footnote that reads as something self-evident. Until Albert Schweitzer mastered Bach's art in its entirety, Rust's prefaces to the *Bach-Gesellschaft* volumes were by far the most valuable contributions to the criticism of the 18th-century music ever written, Spitta's biography not excepted.

Universal **Influence.**—Bach's influence in the history of music was powerful long before it was recognized by the musical world in general. In his lifetime his art-forms were already considered obsolete, and useful only as subjects of academic study. And yet; however much its purpose and significance may have been disguised and obscured by corrupt traditions and ignorance of its idioms, whenever any fragment of it gained the inner ear of a true composer the effect on the history of music was immediate and profound. Indeed, the recognized Each-revival that began with Mendelssohn is obviously connected with the "Romantic" movement in music. But Bach as "the first of the Romantics" is no larger a part of the real Bach than Shakespeare the sonneteer is of Shakespeare the dramatist.

The full influence of his whole work has hardly yet begun to show itself. Schumann died before the first editors of the *Bach-Gesellschaft* began to find more beauty than extravagance in Bach's ordinary musical language *(see*, for example, Hauptmann's letters, *The Letters of a Leipzig Cantor*, trans. by *A.* D. Coleridge, 1892), or, indeed, to grasp the main features of his designs. *(See* the wild conjectures of the editor of the Four Short Masses as to the "displacing" of structure in the kyrie of the G minor Mass [*B.-G., Jaltr.* viii. preface, with Rust's answer in the preface to *Jahr.* xxiii.]). The labours of the *Baclz-Gesellschaft* occupied more than 50 years, during which about four-fifths of Bach's choral works were published for the first time. In centuries no musician but a specialist will know this mass of work as every musician comes to know his Beethoven. Nor will anthologies hasten the attainment of such knowledge where the whole body of work so constantly attains that excellence for which the anthologist seeks. Except for practical difficulties (as when Bach writes for obsolete instruments) the only reason why some cantatas are better known than others is that a beginning must be made somewhere. Indeed, a cantata was once selected, on the ground of its popularity, for a choral competition in a small English country town the year before it was performed as a novelty in Berlin.

Mozart, Beethoven and Chopin. — Hence, the influence of Bach's art as an understood whole lies even yet in the future. In the past his influence was hardly suspected except by the great composers themselves; and, to any one contemplating the art of the generation after him, it might have seemed that both he and Handel had worked in vain. Yet his was the most subtle and universal force in the development of music, even when his musical language seemed hopelessly forgotten. Mozart, when rapidly advancing to the height of his mastery, had but to read Baron von Swieten's manuscript copies of the motets and of the *Wohltemperirte Klavier*, and his style, quite apart from his immediate essays in the old art-forms, and apart also from the influence of his study of Handel, developed a new polyphonic richness and depth of harmony which steadily increased until his untimely death.

Beethoven studied all the accessible works of Bach profoundly, and frequently quoted them in his sketch-books, often with a direct bearing on his own works. His rendering of the *Wohltemperirte Klavier* is said to be recorded in the marks of expression and *tempo* given in Czerny's edition; and if that record is true, Beethoven must have been completely in the dark as to Bach's meaning in many important respects. But art is full of such illustrations of the way in which great minds influence each other in spite of every barrier which diversity of language and time can set. Beethoven's great Thirty-Three Variations on a Waltz by Diabelli were actually described in the publisher's puff as worthy of their kinship with the Goldberg Variations of Bach; and that kinship is revealed in its truest light by a comparison between Beethoven's 31st variation and Bach's 25th; for here, just where the resemblance is most obvious, each composer utters his most intimate expression of feeling.

In the same way, Chopin is nowhere more characteristic than where he shows his love of the *Wohltemperirte Klavier* in his Études and Preludes. It was Schumann who, in a series of maxims for young musicians, said "Make *Das Wohltemperirte Klavier* your daily bread."

Mendelssohn, Wagner and **Brahms.**—In a more external, but no less significant way, the Passion according to St. Matthew made its mark on Mendelssohn from the time when he discovered it at the age of 12, and suggested to him many features in the general design of oratorios, by means of which he rescued that branch of art from the operatic influences that had ruined Beethoven's *Mount of Olives*. Without the renascence of Bach, Wagner's *Leitmotive* would less readily have attained that close polyphony which secures for his music a flow as continuous as that of the drama itself; and intimately connected with this is the whole subject of Wagner's harmonization, which, in many of its boldest characteristics was foreshadowed by Bach. A close study of the texture of Brahms's work shows that he develops Bach's and Beethoven's artistic devices *pari passu*, and that the result is a complete unification of that opposition between polyphony and form which in the infancy of the sonata (as in every transitional stage in musical history) threatened to wreck the art as a false antithesis wrecks a philosophy. Perhaps the only great composers who escaped the direct influence of Bach are Gluck and Berlioz. Even Gluck, whose art could owe nothing essential to Bach, echoed in every detail of harmony and figure no fewer than 12 bars of the gigue of Bach's B flat clavier partita in the aria "Je t'implore et je tremble" in *Iphigénie en Tauride*, a parallel far beyond the possibility of casual coincidence. The deep and all-pervading indirect influence of Bach no one could escape, for whatever in later music is not traceable to Sebastian Bach is traceable to his sons, who were encouraged by their father to cultivate those infant art-forms which were so soon to dazzle the world into the belief that his own work was obsolete.

A **Seeker** of **Truth.**—Bach's place in music is thus far higher than that of a reformer, or of an inventor of new forms. He is a spectator of all musical time and existence, to whom it is not of the smallest importance whether a thing be new or old, so long as it is true. It is doubtful whether even the forms most peculiar to him (such as the arpeggio prelude) are of his invention. Yet he left no form as he found it—not even that most conventional of all, the da capo aria. On the other hand, with every form he touched he said the last word. All the material that could be assimilated into a mature art he vitalized in his own way, and he had no imitators. The language of music changed at his death, and his influence became all-pervading just because he was not the prophet of the new art, but an unbiassed seeker of truth. Whether so great a man becomes "progressive" or "reactionary" depends on the artistic resources of his time. He will always work at the kind of art that is most coinplete and consistent in all its aspects The same spirit of truthfulness that makes Sebastian Bach hold himself aloof from the progressive art which he encouraged in his sons, drives Beethoven to invent new forms and new means of expression with every work he writes. Gluck abolished the da capo aria, because it was unfit for dramatic music. Bach retained and developed it, because he did not intend to write dramatic music. Mature musical art in Bach's time could not be dramatic, except in the loose sense in which enthusiasts apply the term to sunsets, cathedrals, and all kinds of impressive effect whatever. Dramatic expression, properly so called, can be attained in music only by the full development of resources that do not blend with those of Bach's art at all. Meanwhile there are many things unsuitable for the stage which are nevertheless valuable as pure music, and the da capo aria was one. We may regret with Schweitzer, that Bach allowed it to oust more German lyric forms.

Some of His Methods.—Under ARIA, CHORALE, CONTRAPUNTAL FORMS, CONCERTO, FUGUE and INSTRUMENTATION, will be found reference to Bach's handling of various art-forms. Here we may attempt to illustrate his methods in respect of such forms and characteristics as cannot be classified under those headings.

Treatment of the Toccata.—The toccatas of Buxtehude and his predecessors show how an effective musical scheme may be suggested by running over the keyboard of an organ as if to try the touch *(toccare)*, then bursting out into sustained and full harmony, and at last settling down to a fugue. But before Bach, no one seemed able to keep the fugue in motion long enough to make a convincing climax. It soon collapsed, and the process of quasi-extemporization began again, to culminate in a new fugue which often gave the whole work a deceptive suggestion of organic unity by having as its subject a variation of the subject of the first fugue. But in Bach's hands the toccata becomes one of the noblest and most plastic of forms. The introductory runs may be disjointed and exaggerated to grotesqueness, until the gaps between them gradually fill out, and they build themselves up into grand piles of musical architecture, as in the organ toccata in C; or they may be worked out on an enormous scale in long and smooth canonic passages with a definite theme, as in the greatest of all toccatas, that in F for organ, which is most artistically followed by a fugue unusually quiet for its size.

In one instance, the toccata at the beginning of the E minor clavier partita, the introductory runs, though retaining much of the extempore character from which the form derives its name, take shape in an organized and rounded-off group of contrasted themes. The fugue follows without change of time, and is developed in so leisurely a manner that it is fully as long as a normal fugue on a large scale by the time it reaches what sounds like its central episode. At this point some of the introductory matter quietly enters, and leads to a recapitulation of the whole introduction in the key now reached. The obvious sequel would be a counter-development of the fugue, at least as long as what has gone before, as in the clavier-toccata in C minor; but Bach does not choose to weary the hearer and weaken the impression of breadth he has already made here. Instead, he expands this restatement of the introduction, and makes its harmonies deliberately return to the fundamental key, and thus in an astonishingly short time the toccata is finished with the utmost effect of climax and satisfaction.

If such is Bach's treatment of a highly specialized art-form, an art which treats all forms and means of expression on this plane of thought will obviously demand an analysis of each individual work. School generalities are useless here. Fortunately, however, Bach gives us actual demonstrations of his general principles by frequently rearranging his own works. He almost seems to regard adaptability to fresh environment as the test of his art; and we cannot do better than review the evidence thus given to us—evidence hardly less significant than that of Beethoven's sketch-books.

Transplantations and Self-Criticism.—when a work of art is successfully transplanted to a fresh environment, we must distinguish between alterations produced by the environment and alterations that imply the composer's dissatisfaction with the original version. And here are traps for the unwary. Let us begin with the birthday cantata *Was mir behagt ist nur die muntre Jagd,* one of Bach's lightest occasional pieces, and see what became of its contents when they were distributed among two church cantatas, the great *Also hat Gott die Welt geliebt* and the cheerful *Man singet mit Freuden.*

In the birthday cantata the fine bass aria "Ein Fiirst ist seines Landes Pan" seems ill-proportioned with its breakneck return to the tonic and its perfunctory close. But the words assert that "a land without a Prince lacks its better part." So Bach is not thus to be caught napping! Nevertheless, his chief concern in adapting this aria for its place as "Du bist geboren mir zu Gute" in *Also hat Gott,* was to remedy a defect no longer justified by the words. On the other hand the use of the delightful ritornello for violoncello from the little aria, "Weil die wollenreichen Heerden," in the birthday cantata, and the restoration of the rejected long instrumental fugato that was to follow, were obviously brought about by the conception of the entirely new material for the voice in the famous aria, "Mein glaubiges Herze." And when the last chorus of *Was mir behagt* became the first chorus of *Man singet mit Freuden,* it was expanded to the proportions necessary for a triumphant opening (as distinguished from a cheerful finale) by the adroit insertion of new material between every joint in the design. This material, being new, could not produce the effect of diffuseness that would result from the expansion of old material already complete in its simplest form, and thus this instance does not imply criticism of the original idea.

Pure self-criticism is shown in the Passion according to St. John, which was twice revised, and each time reduced to a smaller scale by the omission of some of its finest numbers. The final result was a work of perfect proportions; and of the rejected numbers one (a magnificent aria with chorale) remained unused, two were replaced by finer substitutes, another took shape as part of one of the most perfect and remarkable of the church cantatas, *Du wahrer Gott,* while the greatest of the figured chorales was transferred to the Passion according to St. Matthew, of which it now crowns the first part.

Instrumental **Transcriptions.**—Such instances of self-criticisms have been paralleled by other composers; but there is no parallel in music to Bach's power of reproducing already perfect works in different media. The bare fact that a composer has transcribed his own work irom one medium to another is neither unusual nor instructive; the article on Handel will show that Handel did this as often as Bach, and sometimes with significant results. But Handel, is seldom, if ever, dissatisfied with a makeshift, while Bach always aims at, and often attains, a perfect effect of originality in the new form. The possibility of this depends on the identity of all his ritornello forms, including those of choruses. *(See* ARIA, CONCERTO, and also INSTRUMENTATION.) His power of adding parts to schemes already complete in harmony and counterpoint reveals many principles in his purely musical aesthetics; and the cases in which he adapts the same music to different words wiil help us to define his range of expression.

The *catalogue raisonné* at the end of this article shows that nearly all Bach's clavier concertos are arrangements of works for

violin. Here the new problem, solved with varying success or perfunctoriness, is to provide independent and apparently necessary material for the left hnnd of the cembalo player.

The greatest marvels begin with such transformations as that of the prelude of the E major partita for unaccompanied violin into the sinionia for organ obbligato accompanied by full orchestra (including three trumpets and a pair of drums) at the beginning of the church cantata, *Wir danken dir, Gott*. The original version is perhaps the most complete and natural of all the violin solos, for its arpeggios produce full harmony without recourse to the *tour de force* of playing on all four strings at once, which cannot be achieved with accurate rhythm. Yet in the sinfonia its proportions seem to reveal themselves for the first time. Not a bar is displaced and not a note of the new accompaniment is unnecessary. The whole is almost entirely without themes; for even this, the largest of all arpeggio preludes, consists essentially of the gradual unfolding of a scheme of harmony in which rhythmic and melodic organization is reduced to a minimum. Only in the first line does the incisive initial figure persist a little longer in the new accompaniment than in the original solo, but on the last page it reappears and pervades the whole orchestra, even the drums thundering out its rhythm at the climax where the holding notes of the trumpet span the torrent of harmony like a rainbow.

Deeper still is the thought that underlies the transformation of two movements of the great violin concerto in D minor (unfortunately lost except in its splendid arrangement for clavier) into parts of the church cantata *Wir müssen durch viel Trübsal in das Reich Gottes eingehen.* In both movements the violin is replaced by the organ an octave lower, the orchestral accompaniment remaining where it was. This treatment, with the addition of new and plaintive parts for wind instruments, turns the already very long and sombre first movement into an impressive idealization of the "much tribulation" that lies between us and the kingdom of heaven. The slow movement is still more solemn, and is arranged in the same way as regards the instruments; but from the first note to the last a four-part chorus sings, to the words of the title, a mass of quite new material (except for the bass and for numerous imitations of the solo-part), treated with every variety of vocal colouring and a grandeur of conception which is not dwarfed even by the Passion according to St. Matthew.

Adaptations and Transformation. — The four short masses, the Christmas Oratorio and the B minor mass, contain every variety of adaptation from earlier work. The four short masses are indeed obviously compiled for use in a church where the orchestra was small. Only four movements in the whole collection are not traceable to other extant works; and they were probably, like all the rest, from church cantatas.

The adaptations are not always significant; no attempt, for example, is made in the G minor mass to conceal how unfit for a "Kyrie eleison" is the tremendous denunciatory chorus, "Herr, deine Augen sehen nach dem Glauben." But the F major and G major Masses are very instructive; and the A major Mass, except for the damage done to the instrumentation, is a work that no one would conceive to be not original. The Kyrie is one of Bach's most individual utterances and could surely never have fitted any other text; but we should say the same of the Gloria if we did not possess the church cantata, *Halt im Gedächtniss.* The Gloria begins with a triumphant polyphonic chorus accompanied by a spirited symphony for strings. At the words "et in terra pax" the time changes, and two flutes softly accompany a single solemn melody in the altos. At the "laudamus te" the material of the beginning returns, and is interrupted again by the calm slow movement, this time in another key and for another voice, at the words "adoramus te." Twice the "laudamus" and "adoramus" alternate in a finely proportioned design; at last the words "gratias agimus tibi propter magnam gloriam tuam" are set for the full chorus to the music of the slow movement, the strings join with the flutes, and this most appropriate setting of those words is finished. And yet it is quite impossible to regard this as superseding the last chorus of *Halt im Gediichtniss.* Not one bar or harmony of the framework differs; yet the two versions are two independent works of art.

In the cantata the beginning is for instruments only; when the slow movement (here adequately scored for a flute and two *oboi d'amore)* begins, the basses, permanently separated from the rest of the chorus, sing "Peace be unto you." The other voices then sing the triumph of the faithful helped by the Saviour in their battle against the world. The slow movement is, of course, set for bass alone throughout, and at the last recurrence of the allegro the bass continues to sing "Friede sei mit euch" through the rest of the chorus, as if leading the chorus of humanity through strife to the kingdom of heaven; and then the single voice of peace remains to the end. Hardly a bar of the chorus material is on the same themes in the two versions.

The study of the sources of the Christmas Oratorio will complete the evidence on which we support our estimate of Bach's methods and range of expression. It is certain that the occasional cantatas, from which all except the chorale tune numbers and those set to words from the Bible were taken, date from shortly before the oratorio; and that Bach, being incapable of putting inferior work even into birthday odes, rescued his music from oblivion by having the verses for the oratorio built on the same rhythms as those of the odes in order that he might use those occasional works as a sketch *(see* B. *G., Jahr.* xxxiv. preface).

Be this as it may, the alterations are confined to details even where an aria is transposed a fourth or fifth; but the effect of them is startling. Pleasure (Wollust) sings a lovely soprano aria to allure Hercules from the paths of virtue, to which Hercules replies indignantly with an aria in a spirited staccato style. We may be shocked to find that Wollust's aria became the Virgin's cradle-song, while Hercules' reply became the alto aria in which Zion is bidden to "prepare for the Bridegroom." But this does not prove that Bach's music lacks definite characterization: on the contrary, these two arias are the best demonstration of his precise range of musical expression.

It never entered his conception of art that Wollust should be represented by a Wagnerian Venusberg-music; the obvious way to represent Pleasure was by writing pleasant music; and, with Bach's ideas of pleasance, the step from this to the solemn beauty of the sacred cradle-song was a mere matter of change of colour and *tempo.* The key is lowered from B flat to G, the strings are veiled with the tender reed tone of a group of oboe d'amore, the soprano becomes an alto whose notes are, as it were, surrounded with a nimbus by being doubled in the upper octave by a flute; and the aria becomes worthy of its new purpose, not by losing a grossness which it never possessed, but by gaining the richness which distinguishes the perfect work from the boldly executed draft.

In the aria of Hercules the change is in manner, while the character is essentially the same. Both Hercules and the faithful Christian of the oratorio are renouncing pomps and vanities for the claims of a higher life; in the one case indignantly, in the other case inspired "mit zartlichem Triebe." A change to a legato style, the substitution of a single oboe d'amore for tutti violins, the addition of delicate ornaments indicative of a slower pace, and the noble stream of melody preserves its identity while changing its aspect. Certain rolling basses that originally symbolized the serpents strangled by the infant Hercules in his cradle, now mean no more than arpeggio accompaniments. A cathedral reacts on the impressiveness of the rites performed within it, and nature reacts on a poet's thoughts, in the same ways as Bach's melodies react on their texts. They are greater than any possible mood of the moment, not because of any vagueness that pious evasiveness calls reserve, but because of their vital individuality. In their proper directions their changes are limitless; elsewhere change is inconceivable. No amount of *Umarbeitung* could, for instance, turn the aria of Hercules into the Virgin's cradle-song, or Wollust's aria into the exhortation of Zion to prepare for the Bridegroom. Bach's designs are not masks, but living types.

One of the best modern books on Bach is Pirro's *L'Esthétique de Jean-Sebastian Bach.* It is an account of the system of musical symbolism which Bach took over and developed from what he regarded as classical tradition. The only defect in the book is its title, which should have been *La Vocabulaire de J. S.*

Bach. The aesthetic system of Bach is a very different thing: it concerns his art-forms as wholes, and is remarkably independent of the vocabulary of musical symbols which he shares with the music of two previous centuries, and which makes him automatically set the word "high" to a high note even when the text merely mentions the High Priest.

An All-Embracing Art.—Within these limits, that is, short of dramatic expression in just so far as "the end of drama is not character but action," there is nothing good that Bach's art does not express. He has plenty of humour, in terms of an art which is always literal; an art in which jests are jests and serious things are treated with familiar directness, and all, whether in jest or earnest, is primarily beautiful.

In Der *Streit zwischen* Phoebus *und Pan,* Bach answers the critics who censured him for his pedantry and provincial ignorance of the grand Italian operatic style, by making effective use of that style in Pan's prize aria ("Zum Tanze, zum Sprunge, so wack-ack-ack-ackelt das Herz"), nobly representing his own style in Phoebus' aria, and promptly caricaturing it in the second part of Pan's ("Wenn der Ton zu muhsam klingt"). Midas votes for Pan—"denn nach meinen beiden Ohren singt er unvergleichlich schon." At the word "Ohren" the violins gave a pianissimo "hee-haw" which is as apt and as musical as Mendelssohn's clown theme in the overture to the Midsummer Night's Dream; and in the ensuing dialogue the prophecy is verified. As with many other great artists. Bach's playfulness occasionally showed itself inconveniently where little things shock little minds. The hilarious aria "Ermuntre dich," in the church cantata, "Schmucke dich, o liebe Seele," is one instance, and the quaint representation of the words "dimisit inanes" in the Magnificat is another.

This great work, one of the most terse and profound things Bach ever wrote, contains, among many other subtle inspirations one conception with which we may fitly end our survey, for it strongly suggests Bach himself and the destiny of all that work which he finished so lovingly, with no prospect of its becoming more than a family heirloom and a salutary tradition in his Leipzig choir-school. In the Magnificat he sets the words "quia respexit humilitatem ancillae suae" to a devout soprano solo accompanied by his favourite oboe d'amore. With the next sentence "ecce enim beatam me dicent" the tone brightens to a quiet joy, but Bach takes advantage of the syntax of the Latin in a way that defies translation, and the sentence is finished by the chorus. "Omnes generationes" seem indeed to pass before us in the crowded fugue which rises in perpetual stretto, the incessant entries of its subject now mounting the whole scale, each part a step higher than the last, and now collecting in unison with a climax of closeness and volume overwhelming in its impression of time and multitude.

SUMMARY OF BACH'S WORKS

Chronological sequence is not the primary interest in a catalogue of Bach's works. The changes in his style, though clear and evolutionary, are best appreciated after the bulk of the work has been digested. To describe them beforehand does not aid the student enough to make it worth while to expand this summary by an attempt to apportion its contents among the Arnstadt-Miilhausen period, the Weimar period, the Cöthen period (chiefly remarkable for instrumental music and comparatively uninteresting in its easy-going choral music), and the last period (1733–50) in which, while the choral works become at once more numerous and more terse (*e.g., Jesu,* der *du meine* Seele) the instrumental music, though never diffuse, shows an increasing preference for designs on a large scale. (Compare, for example, the second book of the *Wohltemperirte Klavier,* 1744, with the first, 1722.)

I. CHURCH MUSIC

A. With **Orchestra.**—190 church cantatas: besides several which are only known from fragmentary sets of parts. Of the 190, 40 are for solo voices, about 60 (including some solo cantatas) are more or less founded on chorales, and the rest, though almost invariably containing a chorale (for congregational singing). are practically short oratorios and frequently so entitled by Bach himself.

Three wedding cantatas; the Easter Oratorio (exactly like the above-mentioned oratorio-cantatas; and the Christmas Oratorio (six similar cantatas forming a connected design for performance on six separate days).

The Passions according to St. Matthew and St. John.

Funeral ode for the Duchess Eberhardine, now known to be arranged from portions of the lost Passion according to St. Mark.

Four short masses (*i.e.,* Kyrie and Gloria only) mainly compiled from church cantatas.

Mass in B minor; Magnificat in D; and a few other ecclesiastical Latin choruses.

B. Without Orchestra.—Five motets a capella (but the treatment of the bass shows that these were intended to be partly supported by the organ). A sixth motet has an obbligato figured-bass accompaniment.

A few early choruses, mostly turned to account in later works.

A large collection of plain chorales, including several original melodies.

II. SECULAR VOCAL MUSIC

Der *Streit zwischen Phoebus* und *Pan* and Der *zufrieden*-gestellte *Aeolus;* each entitled *Dramma* per *Musica,* but showing no more essential connection with the stage than Handel's Acis *and Galatea.*

Seven solo and seven choral cantatas, of which the latter three were almost entirely absorbed into the Christmas Oratorio and the B minor Mass. Of the solo cantatas two are Italian (one of these being Bach's only developed work for voice and clavier) and two are burlesque.

Several tunes with clavier bass, almost foreshadowing the song-style of the 19th century.

III. INSTRUMENTAL MUSIC

A. Orchestral.—Seven clavier concertos arranged from violin concertos and other sources. That in A major is evidently for oboe d'amore and was performed in a restored version for that instrument at Edinburgh in 1925.

Three concertos for two claviers (two being arranged from concertos for two violins).

Two concertos for three claviers.

The six Brandenburg concertos, for various combinations

Two violin concertos, and a colossal torso of a concerted violin movement forming the prelude to a lost church cantata.

One concerto for two violins.

Four orchestral suites. (The symphony in F in the same volume of the B.G. is only an earlier version of the first Brandenburg concerto.)

B. Chamber Music.—Three sonatas for clavier and flute (one doubtful); a suite (very doubtful) and six sonatas for clavier and violin, three for clavier and viola da gamba; two trios with figured bass; two flute-sonatas and a violin suite with figured bass; six sonatas (*i.e.* three sonatas and three partitas) for violin alone; six suites for violoncello alone.

C. Clavier and Organ **Music.**—Bach's own collections are:—

1. Das *Wohltemperirte Klavier* for clavichord (though neither expressly nor exclusively for that instrument): two books each containing 24 preludes and fugues, one in each major and minor key; with the object of stimulating tuning by "equal temperament" instead of sacrificing the euphony of remoter keys to that of the more usual ones.

2. *Klavier-Übung* (chiefly for harpsichord) in four books comprising: (i.) 15 two-part inventions and 15 three-part symphonies. (ii.) Six partitas. (iii.) The Goldberg variations, four duets, and an important collection of organ choral-preludes, with the "St. Anne" prelude and fugue in E flat. (iv.) The Italian concerto and French overture.

3. The six "French" and six "English" suites.

The other clavier works fill two Jahrgange of the B.G.

Bach's collections of organ music are (besides that included in the third part of the *Klavier-Übung*):—(1) Six sonatas (prob-

ably for pedal-harpsichord). (2) Four groups of six organ preludes and fugues. (3) *Das Orgelbüchlein,* a collection of short choral-preludes carefully planned—all the blank pages of the autograph being headed with the titles of the chorales intended for thein—but not half executed. (The projected whole would have been a larger volume than *Das Wohltemperirte Klavier.) (4)* 18 larger chorale-preludes, including Bach's last composition. (5) The six "Schiibler" chorales, all arranged from movements of cantatas.

Besides these there are the three great independent toccatas and the passacaglia. The remaining choral-preludes fill one *Jalzrgang* and the other organ works two more.

D. Schematic.— Two important instrumental works remain to be mentioned, viz., *Das Musikalische Opfer,* the volume of compositions (two great fugues, various puzzle-canons, and a splendid trio for flute, violin and figured bass) on the theme given to Bach by Frederick the Great; and *Die Kunst der Fuge,* a progressive series of fugues on one and the same subject, written in open score as if entirely abstract studies, but all (except two completely invertible fugues) in admirable clavier style and of great musical value.

IV. LOST WORKS

A. **Choral.**—J. N. Forkel's statement that Bach wrote five *Jahrgiinge* of church cantatas (*i.e.,* enough to provide one for each Sunday and holy day for five years) would indicate that some 80 are lost, but there is reason to believe that this is an exaggeration. Not more than six or seven cantatas are known to be lost, by the evidence of fragments, textbooks, etc.

Forkel says that Bach wrote five Passions. Besides the great Matthew and John Passions, there is one according to St. Luke in Bach's handwriting, but it is so worthless that the only possible plea for its authenticity is that nothing but personal interest could have induced Bach to make a copy of it.

The movements of the St. Mark Passion preserved in the Trauer-Ode are larger than anything in the St. John Passion; but the text-book has been found and proves to be on a very restricted scale.

Was there a *genuine* Lucas Passion? If so, Forkel's report of five Passions would be explained. Several lost secular works are partly preserved in those portions of the Christmas Oratorio of which the sources are not definitely known, but which, like the other duplicated numbers, are fair copies in the autograph.

B. Instrumental.— Three violin concertos and one for violin and oboe known only from the wonderful clavier versions.

Part of the first movement of the A major sonata for clavier and flute which was written in the spare staves at the bottom of a larger score. Some of these have been cut off.

V. ARRANGEMENTS OF WORKS BY OTHER COMPOSERS

Arrangements for harpsichord alone of 16 concertos, generally described as by Vivaldi, but including several by other composers.

Four Vivaldi concertos arranged for organ.

Many of these arrangements contain much original matter, such as entirely new slow movements, large cadenzas, etc.

Concerto in A minor for four claviers and orchestra, from Vivaldi's B minor concerto for four violins. This, though the most faithful to its original, is the richest and most Bach-like of all these arrangements, and is well worth performing in public.

Two sonatas from the *Hortus Musicus* of Reinken, arranged for clavier. (The ends of the slow movements are pure Bach.)

Finishing touches to cantatas by his uncle Johann Ludwig Bach. Also a very characteristic complete "Christe eleison" inserted in a Kyrie of Johann Ludwig's.

VI. DOUBTFUL AND SPURIOUS WORKS

Bach's autographs give the name of the composer on the outside sheet only. He was constantly making copies of all that interested him; and where the outside sheet is lost, only the music itself can tell us whether it is his or not. The above-mentioned Passion according to St. Luke is the chief case in point. The little music-books which he and his second wife wrote for their children are full of pieces in the most various styles, and the editors of the *Bach-Gesellschaft* have not completely identified them, even Couperin's well-known "Les Bergeries" escaping their scrutiny. A sonata for two claviers by Bach's eldest son, Wilhelm Friedemann, was detected by the editors after its inclusion in *Jahrgang* xliv. The second of the three sonatas for clavier and flute is extremely suggestive of Bach's sons, but Philipp Emanuel ascribes it to his father. However, he might easily have docketed it wrongly while arranging copies of his father's works. It has a twin brother (*B.* G. ix. Anhang. ii.) for which he has not vouched.

Four absurd church cantatas are printed for conscience sake in *Jahrgang* xliii. More important than these, because not so obviously ridiculous, is the well-known eight-part motet, *Lob, Ehr' und Weisheit* (blessing and glory and wisdom). It is poor, plausible stuff by a contemporary of Bach's named Wagner.

The beautiful motet, *Ich lasse dich nicht,* has long been known to be by one of Bach's uncles (Johann Christoph).

EDITIONS

Almost the only works of Bach published during his lifetime were the instrumental collections, most of which he engraved himself. Of the church cantatas only one, *Gott ist mein König,* (written when he was 19, but a very great work), was published in his lifetime.

Of modern editions that of the *Bach-Gesellschaft* is, of course, the only complete one. It is, inevitably, of very unequal merit. Its first editors could not realize their own ignorance of Bach's language; their immediate admiration of his larger choruses seemed to them proof of their competence to retain or dismiss details of ornamentation, figured bass, variants between score and parts, etc., without always stopping to see what light these might shed on questions of tempo and style—especially in the arias and recitatives, which they regarded as archaic almost in direct proportion to the depth of thought really displayed in them. In the 9th *Jahrgang* Wilhelm Rust introduced scholarly methods, with the happiest results. The *Wohltemperirte Klavier (Jahrgang* xiv.) was edited by Kroll, who had already made his text accessible in the Edition Peters (which till then had only Czerny's—an amazing result of corrupt tradition, still widely accepted). Kroll's and Rust's volumes are far the best in the *B.G.* On Rust's death the standard deteriorated for several years. The last ten volumes, however, are again satisfactory, and in *Jahrgang* xliv., the French and English suites are re-edited. Part of the B minor mass was also worked over again; and Kroll's text of the *Wohltemperirte Klavier* was supplemented by the evidence of the British Museum autograph.

The Steingraber edition of the clavier works, edited by Dr. Hans Bischoff, is incomparably the best, giving all the variants in footnotes and clearly distinguishing the extremely intelligent *nuances* and phrasing signs of the editor from the rare but significant indications of Bach himself. Nor does this wealth of scholarship interfere with the presentation of a straightforward, single text; though in addition there is every necessary explanation of the ornaments and kindred matters. There is still a great dearth of editions that distinguish Bach's text from the editor's taste—the publications of the *Neue Bachgesellschaft* by no means excepted. The Associated Board Edition of *Das Wohltemperirte Klavier* provides a pure text and analytical commentary.

The older vocal scores of cantatas in the Edition Peters are, though unfortunately but a selection, far better than the complete series issued by Breitkopf and Härtel in conformity with the *Bach-Gesellschaft* and therefore accepted as authoritative *(see* INSTRUMENTATION). The English vocal scores published by Novello are generally very good though covering but small ground. The Novello score of the Christmas Oratorio contains a fine analytic preface by Sir George Macfarren on lines by no means yet superseded. (D. F. T.)

BACH, KARL PHILIPB EMANUEL (1714–1788), German musician and composer, the third son of Johann Sebastian Bach, was born at Weimar on March 14, 1714. When he was ten years old he entered the Thomasschule at Leipzig, of which in 1723 his father had become cantor, and continued his education as a student of jurisprudence at the universities of Leipzig (1731) and of Frankfurt-on-the-Oder (1735). In 1738 he took his degree, but at once abandoned all prospects of a legal career and determined to devote himself to music. A few months later he obtained an appointment in the service of the crown prince of Prussia, on whose accession in 1740 he became a member of the royal household. During his residence at Berlin he wrote a fine setting of the *Magnificat* (1749), in which he shows more traces than usual of his father's influence, an Easter cantata (1756), several symphonies and concerted works, at least three volumes of *songs*—*Geistliche Oden und Lieder,* to words by Gellert (1758), *Oden rnit Melodien* (1762) and *Sing-Oden* (1766)—and a few secular cantatas and other *pièces d'occasion.* But his main work was concentrated on the clavier, for which he composed, at this time, nearly zoo sonatas and other solos, including the set *mit veranderten Reprisen* (1760–68) and a few of those *für Kenner und Lieblzaber.* Meanwhile he placed himself in the forefront of European critics by his *Versuch über die wahre Art das Clavier zu spielen.* In 1768 he succeeded Georg Philipp Telemann as Kapellmeister at Hamburg, and in consequence of his new office began to turn his attention more towards church music. Next year he produced his oratorio *Die Israeliten in der Wüste,* and between 1769 and 1788 added over 20 settings of the Passion, a second oratorio *Die Auferstehung und Himmelfahrt Jesu* (1777), and some 70 cantatas, litanies, motets and other liturgical pieces. At the same time his genius for instrumental composition was further stimulated by the career of Haydn, to whom he sent a letter of high appreciation, and the climax of his art was reached in the six volumes of sonatas *fur Kenner und Lieblzaber,* to which he devoted the best work of his last ten years. He died at Hamburg on Dec. 14, 1788.

Through the latter half of the 18th century the reputation of K. P. E. Bach stood very high. Mozart said of him, "He is the father, we are the children"; the best part of Haydn's training was derived from a study of his work; Beethoven expressed for his genius the most cordial admiration and regard. This position he owes mainly to his clavier sonatas, which mark an important epoch in the history of musical form. The content of his work, though full of invention, lies within a somewhat narrow emotional range, but it is not less sincere in thought than polished and felicitous in phrase. Again he was probably the first composer of eminence who made free use of harmonic colour for its own sake, apart from the movement of contrapuntal parts, and in this way also he takes rank among the most important pioneers of the school of Vienna. His name has now fallen into undue neglect. but no student of music can afford to disregard his *Sonaten für Kenner und Liebhaber,* his oratorio *Die Israeliten in der Wüste,* and the two concertos (in G major and D major) which have been republished by Dr. Hugo Riemann.

A list of his voluminous compositions may be found in Eitner's *Quellen Lerikon* and in Wotquenne's *Thematisches Verzeichniss* (Leipzig, 1905), and a critical account of them is given in Bitter's *C. P. E. und W. F. Bach und deren Brüder* (2 vols., Berlin, 1868), and in Otto Vrieslander's *Philipp Emanuel Bach* (Munich, 1923).

Four more of Johann Sebastian Bach's sons grew to manhood and became musicians. The eldest of them, WILHELM FRIEDEMANN BACH (1710–1784), was by common repute the most gifted; a famous organist, a famous improviser and a complete master of counterpoint. But, unlike the rest of the family, he was a man of idle and dissolute habits, whose career was little more than a series of wasted opportunities. His compositions, very few of which were printed, include many church cantatas and instrumental works, of which the most notable are the fugues, polonaises and fantasias for clavier, an organ concerto and an interesting sextet for strings, clarinet and horns. This last work, which is included among his compositions by Bitter, is assigned by some scholars to Johann Christian Bach. Further particulars may be found in Khant's *Verzeichniss.*

The fourth son, JOHANN GOTTFRIED BERNHARD BACH (1715–1739), was, like his elder brothers, born at Weimar and educated at Leipzig. From 1735 to 1738 he held successively the organistships at Miihlhausen and Sangerhausen; in 1738 he threw up his appointment and went to study law at Jena; in 1739 he died, aged 24.

JOHANN CHRISTOPH FRIEDRICH BACH (1732–1795), the ninth son, was born at Leipzig, studied at the Thomasschule and the university, and in 1750 was appointed Kapellmeister at Bhckeburg. He was an industrious composer, especially of church music and opera, whose work reflects no discredit on the family name.

JOHANN CHRISTIAN BACH (1735–1782), the eleventh son, was born at Leipzig, and on the death of his father in 1750 became the pupil of his brother Emanuel at Berlin. In 1754 he went to Italy, where he studied under Padre Martini, and from 1760 to 1 j62 held the post of organist at Milan cathedral, for which he wrote two Masses. a *Requiem,* a *Te Deum* and other works. Having also gained some reputation as a composer of opera, he was in 1762 invited to London and there spent the rest of his life. For 20 years he was the most popular musician in England; his dramatic works, produced at the King's theatre, were received with great cordiality; he was appointed music master to the queen, and his concerts, given in partnership with Abel at the Hanover Square rooms, soon became the most fashionable of public entertainments. He is of some historical interest as the first composer who preferred the pianoforte to the older keyed-instruments.

A full account of J. C. Bach's career is given in the fourth volume of Burney's *History of Music,* while a complete thematic catalogue of his works is to be included in the authoritative study of the composer which Dr. C. Sanford Terry has in hand (1928). (W. H. H.)

BACHARACH, YAIR (1639–1702), German rabbi, was the author of *Hawwoth I'air,* a colleclion of *Responsa,* and other works.

BACHARACH, town, Rhenish Prussia, Germany, on left bank of Rhine, 3om. above Coblenz. Pop. (1933), 1,853. The ruins of town walls and St. Werner's (Gothic, 13th century) church are well-known. St. Peter's is an interesting late Romanesque (early 13th century) basilica. The castle of Stahleck above the town belonged, with those of Fiirstenberg and Stahlberg, to the counts palatine. Bacharach was a famous wine-staple till the 16th century and is still an important market for Rhenish wine.

BACHAUMONT, LOUIS PETIT DE (1690–1771), French littérateur, was of noble family and was brought up at the court of Versailles. He passed his whole life in Paris as the centre of the *salon* of Madame Doublet de Persan (1677–1771), where criticism of art and literature took the form of malicious gossip. A sort of register of news was kept in a journal of the *salon,* which dealt largely in scandals and contained accounts of books suppressed by the censor. Bachaumont's name is commonly connected with the first volumes of this register, which was published anonymously under the title *Mémoires secrets pour servir à l'histoire de la République des Lettres,* but his exact share in the authorship is a matter of controversy. It was continued by Pidansat de Mairobert (1707–79) and others, until it reached 36 volumes (1774–79). It is of some value as a historical source, especially for prohibited literature. Extracts were published by P. Lacroix in one volume, 1859. An incomplete edition (4 vols.) was undertaken in 1830 by Ravenal.

See, in addition to the memoirs of the time, the *Correspondance littéraire* of Grimm, Diderot, d'Alembert and others (new ed., 1878, 17 vols.); Ch. Aubertin, *L'Esprit public au XVIII^e siècle* (1872).

BACH CHOIR. There are several bodies bearing this name. The London body so known was founded in 1875, primarily for the purpose of studying Bach's Mass in B minor, of which many performances have been given, the earliest under the direction of Otto Goldschmidt, the first conductor of the choir. Later the scope of the choir was enlarged to include the works of other

composers and schools, while the subsequent conductors of the choir have been C. V. Stanford (1885–1902), H. Walford Davies (1902–07), H. P. Allen (1907–20), R. Vaughan Williams (1920–28) and Gustav Holst (1928), but latterly the choir has had no permanent conductor.

An earlier body established in London with the same objects was the Bach Society, founded in 1849 by Sterndale Bennett.

An American Bach choir was formed at Bethlehem (Pa.), in 1900 by Mrs. Ruth Porter Doster in conjunction with John Frederick Wolle, under whose direction many of the master's most important choral works have been performed in the course of a series of festivals.

BACME, ALEXANDER DALLAS (1806–1867), American physicist, great-grandson of Benjamin Franklin, was born at Philadelphia, Pa., July 19, 1806. After graduating at the United States Military Academy at West Point in 1825, and holding an assistant professorship there, he was for a year or two a lieutenant in the corps of engineers engaged on coast fortifications. He was professor of natural philosophy and chemistry in the University of Pennsylvania in 1828–41 and president of the trustees of Girard college in 1836. He visited Europe to examine European systems of education, and on his return published a very valuable report. In 1843, he was appointed superintendent of the U.S. coast survey. By means of the liberal aid which he succeeded in obtaining from Congress, he carried out a singularly comprehensive plan with great ability and most satisfactory results. By a skilful division of labour, and by the erection of numerous observing stations, the mapping out of the whole coast proceeded simultaneously under the supervision of Bache, and by this method a vast mass of magnetic and meteorological observations was collected. He died at Newport, R.I., Feb. 17, 1867.

BACHE, FRANCIS EDWARD (1833–1858), English musical composer, was born in Birmingham on Sept. 14, 1833. The pupil of Alfred Mellon for violin and Sterndale Bennett for composition, he afterwards went to Leipzig in 1853 and studied with Hauptmann and Plaidy. Considering the early age at which he died, his compositions are fairly numerous, the best being a trio for piano and strings, which in its day was highly esteemed. He died of consumption at Birmingham on Aug. 24, 1858. His younger brother, WALTER BACHE (1842–1888), was born in Birmingham on June 10, 1842, and followed him to the Leipzig Conservatorium, where he became an excellent pianist. From 1862 to 1865 he studied with Liszt in Rome, and for many years devoted himself to the task of winning popularity for his master's works in England. At his annual concerts in London nearly all Liszt's larger works were heard for the first time in England. He was professor of the pianoforte at the Royal Academy of Music for some years and was instrumental in founding the Liszt scholarship. He died in London on March 26, 1888.

See Constance Bache, Brother Muricians (1901).

BACME, FRANKLIN (1792–1864), American chemist, was born in Philadelphia, Pa., on Oct. 25, 1792, and graduated from the University of Pennsylvania in 1810. He served in the Army during the War of 1812, when he was appointed surgeon's mate and later surgeon. He was given his degree as doctor of medicine from the University of Pennsylvania in 1814. He began practice in Philadelphia in 1816 and published a treatise on chemistry in 1819. In 1833 he published, in conjunction with Dr. G. B. Wood, the first edition of The Dispensatory of the *United* States *of* America, which became the standard authority on drugs with physicians and pharmacists. He died in Philadelphia on March 19, 1864.

See G. B. Wood, Memoir of Franklin Bache (Philadelphia, 1865).

BACHE, HARTMAN (1797–1872), American engineer and army officer, was born in Philadelphia, Pa., in 1797. He graduated at West Point in 1818 and entered the engineer corps of the army, retiring as a brevet brigadier-general in 1867. He made numerous topographical and hydrographic surveys but is particularly remembered for his achievements as an engineer. He directed the construction of the Delaware breakwater and the Brandywine lighthouse and was successful in applying the iron screw pile in marine foundation work. He died in Philadelphia on Oct. 8, 1872.

BACHELLER, IRVING ADDISON (1859–), American novelist, was born in Pierpont, N.Y., on Sept. 26, 1859. He graduated at St. Lawrence university, Canton, N.Y., in 1882 and entered journalism, serving from 1898 to 1900 as an editor of the New York World. He became known as a writer of fiction and among his numerous productions in this field Eben *Holden* (1900) and D'ri and I (1901) were well received as popular interpretations of American character.

His writings include also Darrel of the Blessed Isles (1903), *Vergilius* (1904), *Silas* Strong (1906), The Hand Made Gentleman (1909), The Master (1910), Keeping Up *with Lizzie* (1911), Charge It (1912), The Turning of Griggsby (1913), The Light in the Clearing (1917), Keeping Up with William (1918), A Man for the Ages (1919), The Prodigal Village (1920), In the Days of Poor Richard (1922), The Scudders (1923), and Father Abraham (1925).

BACHELOR, a word commonly used to describe a man who has not been married; in various connections it implies subordination or inferiority of rank. It is derived from Med. Lat. *baccalarius,* with its late and rare variant *baccalaris—cf.* Ital. baccalare—through O.Fr. bacheler, in the most general sense of the word, a young man. The word, however, as it possesses several widely distinct applications, has passed through many meanings, and its ultimate origin is still involved in a certain amount of obscurity. It came to be applied to various categories of persons as follows: (1) Ecclesiastics of an inferior grade, *e.g.,* young monks or even recently appointed canons (Severtius, de *episcopis Lugdunensibus,* p. 377, in du Cange). (2) Those belonging to the lowest stage of knighthood. Knights bachelors were either poor vassals who could not afford to take the field under their own banner, or knights too young to support the responsibility and dignity of knights bannerets (see KNIGHTHOOD and CHIVALRY). (3) Those holding the preliminary degree of a university, enabling them to proceed to that of master (magister) which alone entitled them to teach. In this sense the word *baccalarius* or *baccalaureus* first appears at the University of Paris in the 13th century, in the system of degrees established under the auspices of Pope Gregory IX., as applied to scholars still in statu *pupillari.* Thus there were two classes of baccalarii: the baccalarii *cursores, i.e.,* theological candidates passed for admission to the divinity course, and the baccalarii *dispositi,* who, having completed this course, were entitled to proceed to the higher degrees. In modern universities the significance of the degree of bachelor, in relation to the others, varies; *e.g.,* at Oxford and Cambridge the bachelor can proceed to his mastership by simply retaining his name on the books and paying certain fees; at other universities a further examination is still necessary. But in no case is the bachelor a full member of the university. The degree of bachelor (of arts, etc.) is borne by women also. (4) The younger or inferior members of a trade gild or city company, otherwise known as "yeomen" (now obsolete). (5) Unmarried men, since these presumably have their fortunes yet to make and are not full citizens.

Penalization of Bachelors.—Bachelors, in the sense of unmarried men, have in many countries been subjected to penal laws. At Sparta, citizens who remained unmarried after a certain age suffered various penalties. They were not allowed to witness the gymnastic exercises of the maidens; and during winter they were compelled to march naked round the market-place, singing a song composed against themselves and expressing the justice of their punishment. The usual respect of the young to the old was not paid to bachelors (Plut. *Lyc.* 15). At Athens there was no definite legislation on this matter; but certain minor laws are evidently dictated by a spirit akin to the Spartan doctrine (see Schomann, Gr. Alterth. i. 548). At Rome, though there appear traces of some earlier legislation in the matter, the first clearly known law is that called the Lex Julia, passed about 18 B.C. It does not appear to have ever come into full operation; and in A.D. 9 it was incorporated with the Lex Papia et Poppaea, the two laws being frequently cited as one, Lex Julia et Papia Poppaea. This law, while restricting marriages between the several classes of the people, laid heavy penalties on unmarried persons, gave certain privileges to those citizens who had several children, and finally imposed lighter penalties on married persons who were

childless. Isolated instances of such penalties occur during the middle ages; e.g., by a charter of liberties granted by Matilda I, countess of Nevers, to Auxerre in 1223 an annual tax of five *solidi* is imposed on any man *qui non habet* uxorem et est bachelarius. In Britain there has been no direct legislation bearing on bachelors; but, occasionally, taxes have been made to bear more heavily on them than on others. Instances of this are the acts of 169j (6 and 7 Will. III.) which taxed bachelors to pay for the war with France; the income tax of 1798 also differentiated against bachelors. Since 1908 the British income-tax law, by giving special abatements to men of family, has in effect taxed bachelors. (See INCOME TAX: IN PRACTICE.)

BACH-GESELLSCHAFT. This German organization was formed in 1850, for the purpose of publishing a complete critical edition of J. S. Bach's works in celebration of the first centenary of his death, July 28, 1850, and the 46 volumes which it issued in the course of its 50 years' existence—it was dissolved in 1900—stand as an enduring evidence of its labours. Among that of several editors the work of W. Rust, a Bach scholar of unsurpassed learning and insight, who was responsible for 14 of the volumes, was especially noteworthy.

BACHIAN (Dutch, Batjan), a mountainous island of the Moluccas. It lies in the Molucca sea, close to the southwest coast of Halmaheira, and is in Ternate division, Netherlands Indies. It is 52 mi. long, with a mean width of 23 mi.; the northern part is volcanic; the centre is lower, with an isthmus; the greatest heights are in the south (Labuan Mt., reaching 6,000 ft.). There are no active volcanoes, but sulphurous springs exist, while in the south there are ancient and non-volcanic rocks. West of Bachian are Great Tawali, 19 mi. long and 15 wide, Mandioli, 17 mi. by 9 mi. and several smaller islands. The area of the whole group is just under 1,000 sq mi. Gold, copper, and coal exist in small quantities, but a company formed to exploit them later abandoned operations. Bachian's fauna includes a large black crested baboon, (*Cynopithecus nigrescens*), which exists elsewhere in the archipelago only in Celebes, Sulu, and Buru; Bachian is the most eastern point on the globe inhabited by any of the apes (*Quadrumana*). Other mammals are an eastern opossum, (Cuscus *ornatus*), a little flying opossum, (*Belideus ariel*), a civet cat, (*Viverra zebetha*), and several bats. Among the many birds is a bird of paradise, discovered by Wallace and named after him *Semioptera Wallacei*, or "Wallace's Standard Wing." Other birds are a red lory, (*Lorius garrulus*), little lorikeet, (Charmosyna *placentis*), green parrot, with red bill and head, (*Geoffroyus cyanicollis*), golden-capped sunbird, (*Nectarinea auriceps*), racquet-tailed kingfisher, (*Tanysiptera isis*), a rare goat-sucker, (*Batrachostomous crinifrons*) and a large and handsome fruit pigeon, with metallic green and rufous plumage. Among butterflies, Bachian possesses the fine blue *Papilio Ulysses*, and the beautiful "bird-winged butterfly." Wallace described Bachian as "an island that would perhaps repay the researches of a botanist better than any other in the whole archipelago." It has fine trees including screw-pines, a great variety of surface and soil, a number of small streams, some navigable for small boats for some distance, and its products include sago palm, coco-nut palm, clove, nutmeg and excellent Moluccas damar (from forests).

The population of Bachian in 1930 was 7,553, partly people from Ternate and Tidore engaged in collecting forest products, and Javanese and others, working on the plantations of the Bachian Exploitation company. The Bachianese are supposed to have come originally from Halmaheira, with whose people they have strong affinities. They cultivate the land on a small scale, fish, and make baskets. Other inhabitants include the Serani, or Christian descendants of the Portuguese, Macassarese, Malays, Halmaheira men, and a few Chinese and Arab traders. Bachian, at the foot of high mountains, is the capital and a port trading in damar, spices, cobra, timber, and mother-of-pearl. The little fort—Barneveld—was built by the Portuguese, and captured from them by the Dutch in 1609; Bachian, hitherto independent, was placed under the suzerainty of the sultan of Ternate; when the Dutch superseded him, in 1683, they made it subject to themselves. The sultan of Bachian still retained authority. Japan occupied the island in 1942.

BIBLIOGRAPHY.—A. R. Wallace, *The Malay Archipelago*, (10th ed., 1890). (E. E. L.; X.)

BACWMAN, JOHN (1790–1874), **U.S.** naturalist and minister, was born in Rhinebeck, New York. He became a Lutheran minister in 1813 and founded both the Lutheran Synod of South Carolina, of which he was first president, and the state's Lutheran Theological seminary. But he is most famous for his work with the naturalist, John James Audubon.

Bachman wrote most of the Audubon-illustrated Viviparous *Quadrupeds* of hTortk America and assisted Audubon in the preparation of his book on American birds. He was also the author of numerous other works, both on nature and on religion.

BACILLARIOPHYCEAE or **DIATOMS.** The diatoms are microscopic unicellular or colonial algae, and are specially distinguished by the complex structure of their cell-walls, which are usually strongly impregnated with silica. The majority are exceedingly minute, and one with a length of 1/200 in. (0.127 mm.) is well beyond the medium size. The first forms were discovered by O. F. Miiller towards the close of the 18th century. With the perfection of modern microscopes and microscopic methods, the study of these minute plants has been prosecuted with great vigour and over 5,500 species of diatoms have been described, while about 1,200 species are known to occur in the fresh waters and on the coasts of Great Britain and Ireland.

Occurrence and Distribution.—The conditions necessary ior the growth of diatoms are moisture and light, and wherever these coexist, these forms will almost invariably be found. They occur abundantly in cultivated soils, and mixed with other forms on the surface of moist rocks; in pools and other small pieces of water they form a brownish stratum on the surface of the mud, or cover the stems and leaves of water plants or floating twigs with a furry investment. Marine forms are usually attached to seaweeds, and many are found in the stomachs of molluscs, holothurians, ascidians, and other denizens of the ocean. Both in fresh waters and in the sea, moreover, there are myriads of free-floating diatoms, which at times indeed make up the main bulk of the plankton.

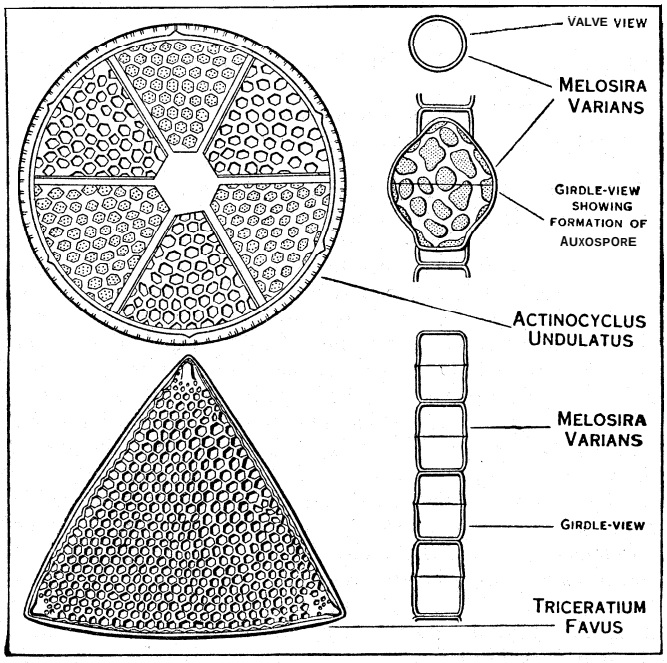

FIG. 1.—FRUSTULES (CELL WALLS) OF CENTRIC DIATOMS

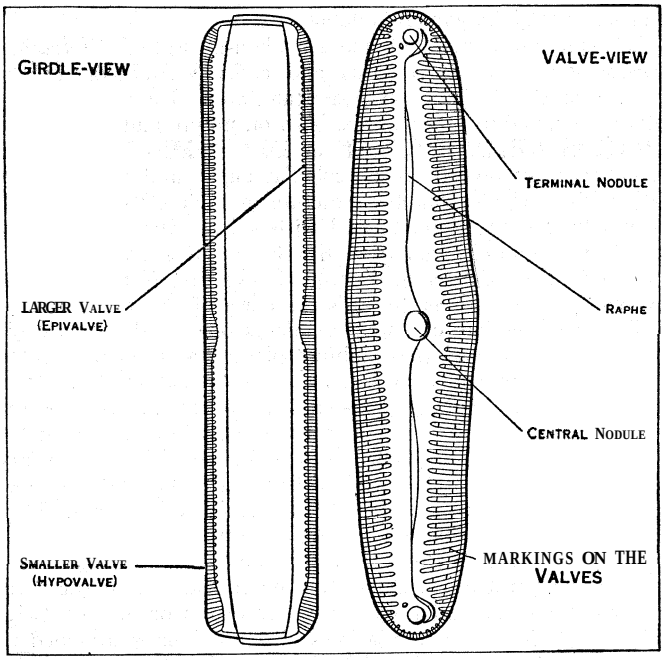
Diatoms are most abundant in cold latitudes, having a general preference for cold water, and exist in prodigious numbers in the Arctic and Antarctic oceans. The fresh-water species are almost always distinct from those found in salt or brackish water.

Large numbers of fossil diatoms are known. Since the siliceous wall is practically imperishable, it persists after the death of the

individual, so that where diatoms occur abundantly there is an unceasing rain of their minute valves on to the bottom of sea or lake as the case may be. In this way extensive deposits of *diatomaceous* earth may arise, and such are not only being formed at the present but have been produced abundantly in the past. Deposits of diatomaceous earth have been discovered in various parts of the earth; some of fresh-water, others of marine origin. Most deposits are a few feet in thickness but some are much thicker.



PROM WEST, "ALGAE" BY PERMISSION OF THE CAMBRIDGE UNIVERSITY PRESS
FIG. 2.— SIDE (GIRDLE) AND TOP (VALVE) VIEWS OF THE CELL WALL (FRUSTULE) OF A PENNATE DIATOM

The thickest deposits thus far discovered are in the Santa Maria oil fields, California.

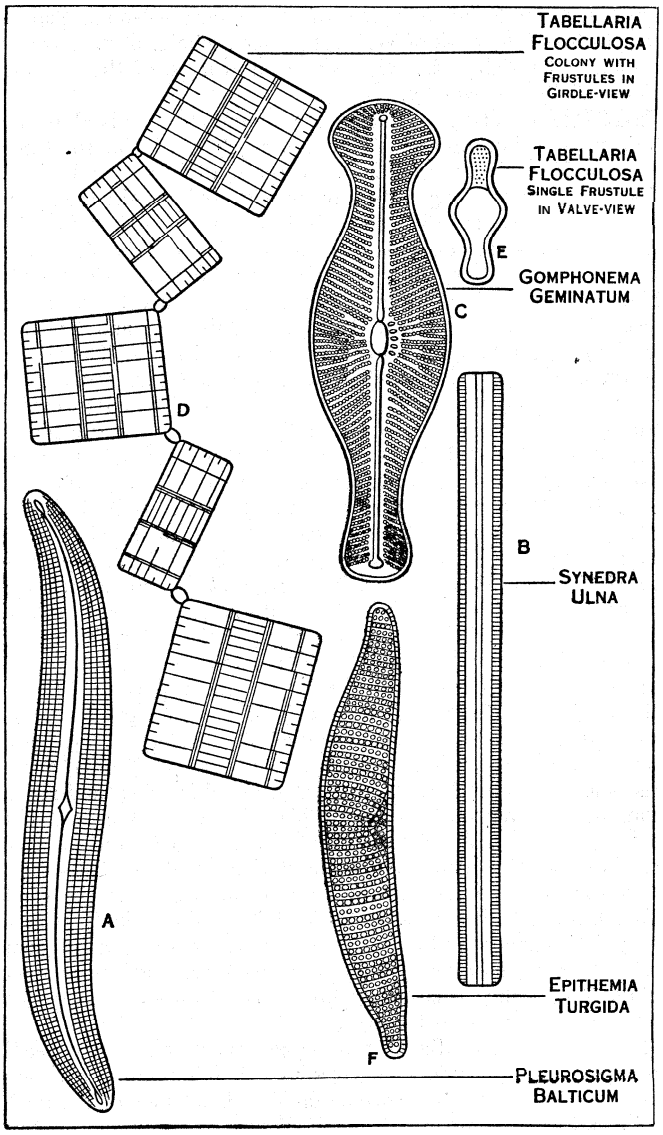
Oil wells drilled in this region show, after correction for dip, that there is a subterranean deposit about 3,000 ft. in thickness.

Most of the fossil deposits are in Tertiary rocks, although there are records of diatoms in the Trias.

Uses.—The industrial uses of diatomaceous earth are varied. Commercial production in the United States for the years 1936–38 was approximately 280,000 tons per annum and the average value for the three-year period was $4,300,000. The enormous quantity produced annually is more easily visualized when one realizes that a single ton has a volume of 65–260 cu.ft. Most of the diatomaceous earth sold in the United States comes from California and Oregon where the deposits are worked as open quarries.

One extensive industrial use is in the filtration of liquids, especially those of sugar refineries. Another major use is in the insulation of boilers, blast furnaces, and other places where high temperatures are maintained. At temperatures higher than 1000° F. diatomaceous earth is a more efficient insulator than asbestos or magnesia because it is more resistant to shrinkage and does not fail at red heat. The oldest and best-known commercial use is that of a very mild abrasive in metal polishes and tooth paste. The amount used in polishes has increased greatly in recent years with the utilization of diatomaceous dust as the base of polishes for automobiles finished in artificial lacquers.

Structure.— In spite of the immense number of diverse forms included in it, the class as a whole exhibits a remarkable uniformity of structure. The individual cells of diatoms are called *frustules,* and their wall consists of two similar halves (fig. 2), each composed of a slightly convex *valve* to whose incurved edges is attached at right angles a broad hoop-like connecting band. The two connecting bands together form the girdle. One half is slightly smaller than the other, the smaller fitting into the larger much as a box fits into its cover (fig. 2) and, according as one visualizes a circular, oval, or otherwise shaped box, one obtains a mental picture of the varied forms assumed by the frustules of diatoms; the sides of the box correspond to the connecting bands. As the protoplasmic contents increase in volume, the siliceous valves are pushed apart and the connecting bands become broader. Diatoms are usually described from two aspects, one in which the surface of the valve is exposed, the valve-view (fig. 2); and one in which the girdle is exposed, the girdle-view (fig. 2). The valve-view exhibits great variety of form; the girdle-view is much more uniform and commonly rectangular. The valves may be circular (fig. 1), triangular (fig. 1), or oval in outline. Some are linear. as *Synedra* ulna (fig. 3); others (Eunotia), more or less crescentic; others again are wedge-shaped (Podosphenia, *Gomphonema*, fig. 3); but the prevailing forms are boat-shaped (naviculoid), as in the genus *Navicula* (fig. 2), which embraces upwards of 1,000 species.

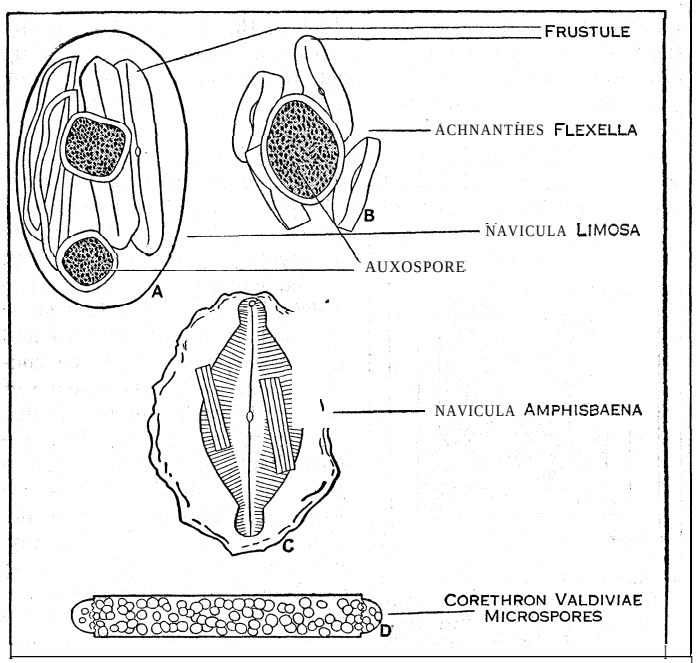


C AND D FROM SMITH, "BRITISH DIATOMACEAE"
FIG. 3.—TOP (VALVE) AND SIDE (GIRDLE) VIEWS OF THE CELL WALL (FRUSTULE) OF VARIOUS PENNATE DIATOMS

Many diatoms are free-floating, but some (*Gomphonema*) are attached to foreign bodies by simple or branched gelatinous stalks. The frustules of some are connected to form ribbon-shaped colonies (*Fragilaria*) or zigzag chains (fig. 3D). In a few genera numerous individuals are enclosed in a tube-like gelatinous envelope.

The valves are thin and transparent and generally ornamented with a variety of markings. The latter often appear as fine lines

(striae) on the face of the valve, and the best lenses show them in many cases to consist of a series of separate dots (punctae) which correspond to small cavities within the siliceous wall. The valves of certain marine genera exhibit a beautiful areolated structure due to the presence of larger chambers within the wall (fig. 1). A good many diatoms, especially those of the naviculoid type, have thickenings at the centre and at each extremity of the valve, known as nodules (fig. 2). These possess a complex structure and are generally connected by a long narrow cleft, the raphe (fig. 2), which appears as a straight or slightly undulating line in the valve-view.



FROM WEST, "ALGAE"

FIG. 4.— (A-C) AUXOSPORES AND EMPTY FRUSTULES OF THE CELLS FROM WHICH THEY WERE FORMED. (D) MICROSPORES BEFORE LIBERATION FROM A FRUSTULE

Some diatoms, while possessing nodules, lack a raphe, although in these cases the narrow area between the two rows of striae often simulates one (pseudoraphe).

The contents of diatom cells are very similar to those of other algae. Beneath the wall there is a lining cytoplasmic layer enclosing the cell-sap, and connected either by two broad bands or by a number of anastomosing strands with the central cytoplasm in which the nucleus is embedded.

The chromatophores are either one or two of large size, or numerous small lobed disks (fig. 1).

The former often include a variable number of glistening pyrenoids.

The characteristic brown colour is due to diatomin, a pigment resembling that of the brown algae and masking the chlorophyll.

The cells often contain abundant oil.

Many diatoms, but only those which possess a true raphe in their valves (*Navicula,* etc.), are able to move through the water, sometimes with considerable rapidity. The movements are doubtless in all cases related to the presence of the raphe, which in all probability contains streaming cytoplasm connected with that in the interior of the cell by a complex system of canals within the nodules. Some believe that the movements depend upon an 'extrusion of mucilage from the region of the raphe. In *Cocconeis,* whose disk-shaped frustules are found attached in enormous numbers to *Cladophora* and other fresh-water plants, only the valve in contact with the substratum possesses a raphe.

Reproduction.—The ordinary mode of multiplication is by cell-division, which usually occurs at night. The cell contents divide into two masses and the halves of the cell-wall commence to separate; thereupon fresh valves, which are at first very delicate, are secreted on the surfaces of the new protoplasmic masses opposite to the valves of the parent. The new valves are situated within the girdle of the original frustule, but as their own connecting bands develop, those of the parent separate. Each of the new individuals thus has one valve derived from the parent, and one that is newly formed and more or less parallel to it. This process of division is repeated at frequent intervals, and it has been calculated that from a single frustule 1,000,000,000 new individuals may arise in the course of a month.

The individual diatom, owing to the rigidity of the siliceous wall, is ordinarily incapable of any increase in length and, since the new valves are always formed within the girdle of the old ones, it would follow that one of the two cells in every succeeding cell generation is reduced in length by the thickness of the girdle.

This is not, however, strictly true, as daughter cells are sometimes formed which are larger than the parent cell, so that the reduction in size is not always proportional to the number of divisions.

The progressive diminution in size does not continue indefinitely because a small cell may produce a special rejuvenescent cell (*auxospore*), of considerably larger dimensions. In centric diatoms the auxospores are always formed singly within a cell (fig. 1, *Melosira*) and are asexual in nature. In pennate diatoms the auxospore is a zygote formed by union of two nonflagellate gametes. Two small cells become surrounded by a common gelatinous envelope and the valves of the cell walls spread apart. In some species the protoplast of each cell functions as a gamete and there is a formation of a single auxospore (figs. 4B, 4C). In other species each cell produces two gametes and there is a formation of two auxospores (Fig. 4A).

Marine centric diatoms may have the cell contents dividing to form 8, 16, 32, 64, or 128 flagellated microspores. This method of reproduction is rather frequent among plankton diatoms but as yet it is not definitely established whether the microspores are zoospores or gametes.

Classification.— The Bacillariophyceae are one of the three classes of the Chrysophyta (see ALGAE). The class is divided into two orders, Centrales and Pennales.

Valves of Centrales (fig. 1) have an ornamentation that is radial or concentric about a central point. The cells usually contain many chromatophores, are immobile, form microspores, and produce auxospores asexually.

The order includes about 100 genera and 2,400 species, the great majority of which are marine.

Valves of Pennales have an ornamentation that is bilaterally symmetrical or asymmetrical. The cells usually have but one or two chromatophores, never form microspores, and form auxospores by a fusion of two gametes. Species with a raphe move spontaneously. The order includes about 70 genera and 2,900 species.

The number of fresh-water species is somewhat smaller than the number of marine species.

BIBLIOGRAPHY.—For a general account of diatoms see F. E. Fritsch, *The Structure and Reproduction of the Algae* (Cambridge, 1935). There are numerous systematic works for the determination of diatoms, *e.g.* A. Schmidt, *Atlas der Diatomaceenkunde* (Leipzig, 1874 and onwards); H. van Heurck, *Synopsis des Diatomées de Belgique* (Antwerp, 1880–85); H. von Schonfeldt, "Bacillariales" in A. Pascher, *Süsswasserflora Deutschlands, dsterreichs, und der Schweiz* (Jena, 1913); C. S. Boyer, "Synopsis of the North American Diatomaceae" in *Puoc. Acad. Nat. Sci.,* Philadelphia, Vol. 78 (1927). (G. M. S.)

BACILLUS, a member of the group of rod-shaped forms constituting one variety of the non-chlorophyllaceous vegetable micro-organisms known as bacteria.

Certain bacilli cause disease in man and animals, *e.g.,* tuberculosis, diphtheria, plague; but the majority are non-pathogenic, though they occasion various putrefactive and other changes in vegetable and animal materials.

Loosely and incorrectly the term "bacilli" is sometimes used to denote bacteria in general.

(See BACTERIOLOGY; BACTERIA AND DISEASE.)

BACK, SIR GEORGE (1796–1878) British sailor, was born Nov. 6, 1796, at Stockport in Cheshire, and died in London on June 23, 1878. At the age of 12 he was a midshipman on the "Arethusa" and was captured by the French at Deba, in the Spanish campaign of 1809. On his return to England in 1814, after a long imprisonment in France, Back served on the "Akbar" against the French in North America. In 1818 he sailed with Buchan on a voyage to Spitsbergen, after which he joined Franklin's expedition to the Coppermine river in North America (1819–22), and to the Mackenzie river (1825–27). In 1833 Back offered to lead an expedition to the Arctic regions in search of Captain Ross, of whom there had been no news since 1829. The expedition wintered at Fort Reliance, near the Great Slave lake, where, in April 1834, news of the arrival of Ross in England reached Back; but the party proceeded to explore the Great Fish river (also known as the Back river), tracing it to its mouth in the polar sea. On his return in Oct. 1835, Back received the medal of the Royal Geographical Society. In 1836 he set forth on a new Polar expedition in the "Terror" intending to explore the remainder of the coastline of North America, but for four months the ship was icebound in Frozen channel, and he could not return until Sept. 1837. Ill-health, the result of continual strain, prevented Back's further activity and he retired on half-pay. In 1838 he was made a baronet. He wrote a Narrative of *the* Arctic Land Expedition to the *mouth* of *the* Great Fish River . . . *1833–35* (1836), and also, Narrative of *an expedition in H.M.S.* Terror . . . *in 1836–37* (1838).

BACK-BOND or BACK-LETTER, in Scots law, a deed qualifying the terms of another deed, or declaratory of the purposes for which another deed has been granted. Thus an ex facie absolute disposition, qualified by a back-bond expressing the limited nature of the right actually held by the person to whom the disposition is made, would constitute what in England is termed a deed of trust. This qualifying secondary instrument is not uncommon in other countries, *e.g.*, Argentina, C.C. 1030.

BACKBONE: see SKELETON; ANATOMY: *The* Back.

BACK-CHOIR or **RETRO-CHOIR,** a space behind the high altar in the choir of a church, in which there is, or was, a small altar standing back to back with the other.

BACKERGUNGE, a district of British India in the Dacca division of Bengal. It forms part of the joint delta of the Ganges and the Brahmaputra, and its area is 3,523sq.m. The general aspect of the district is that of a flat even country, dotted with clusters of bamboos and betel-nut trees, and intersected by a network of dark-coloured and sluggish streams. The level of the country is low, lying as it does on the fringe of the Gangetic delta; and the rivers, streams and water-courses are so numerous that there are few villages which cannot be reached by boat at any season of the year. Towards the north-west nothing is to be seen for miles but tracts of unreclaimed swamps and rice lands, with a few huts scattered here and there and raised on mounds of earth. In the. south of the district, along the coast of the Bay of Bengal, lie the forest tracts of the Sundarbans, now partially reclaimed, which extend over nearly 900 square miles. The islands on the sea-front are exposed to devastation by cyclonic storm-waves.

The principal rivers of the district are the Mcghna, the Arial Khan and the Madhumati or Baleswar, with their numerous offshoots. The Meghna represents the channel by which accumulated waters of the Brahmaputra and Ganges reach the sea. It flows along the eastern boundary for about 100m. till it debouches into the Bay of Bengal. During the latter part of its course this noble river expands into a large estuary containing many islands, the principal of which is that of Dakshin Shahbazpur. The channel between this island and the mainland was formerly 25m. wide, but it has contracted owing to accretions on either side till its width has been reduced to barely 5 miles. Most of the rivers in the district are subject to tidal action, and nearly all of them are navigable at high tide by country boats of all sizes. The rise of the tide is very considerable in the estuary of the Meghna, and a strong "bore" or tidal wave runs up it at spring tides.

The population was returned in 1931 at 2,939,050. Seven-tenths are Mohammedans, among whom the Farazi sect is numerous. There is a Buddhist section consisting of Maghs, as the Arakanese are called in Bengal, who first settled in Backergunge about 1800, and have made themselves very useful in the clearing of the Sundarbans. The soil is fertile, being annually enriched by the silt brought down by the rivers, and yields abundant harvests of rice, while the produce of coconut and betel-nut trees is a valuable source of income. Jhalakati is an important centre of trade, especially in betel-nuts. The climate is one of the healthiest in Eastern Bengal, owing to the flushing of the rivers and creeks by the tides, while the strong south-west monsoon, which comes up directly from the Bay of Bengal keeps the atmosphere cool.

Barisal, the headquarters station, has a population of 35,716

BACKGAMMON, a game played with draughtsmen and a special board, depending on the throw of dice. It is said to have been invented about the 10th century (Strutt). A similar game (*Ludus* duodecim *scriptorum,* the "twelve-line game") was known to the Romans, and Plato (*Republic,* bk. x.) alludes to a game in which dice were thrown and men were placed after due consideration. The etymology of the word "backgammon" is disputed; it is probably Saxon—baec, back, gamen, game, *i.e.,* a game in which the players are liable to be sent back. Other derivations are, Dan. bakke, tray, *gammen,* game (Wedgwood); and Welsh *bach,* little, *cammaun,* battle (Henry). Chaucer alludes to a game of "tables," played with three dice, in which "men" were moved from the opponent's "tables," the game (*ludus Anglicorum*) being described in the Harleian mss. (1527). The French name for backgammon is trictrac, imitative of the rattle of the dice.

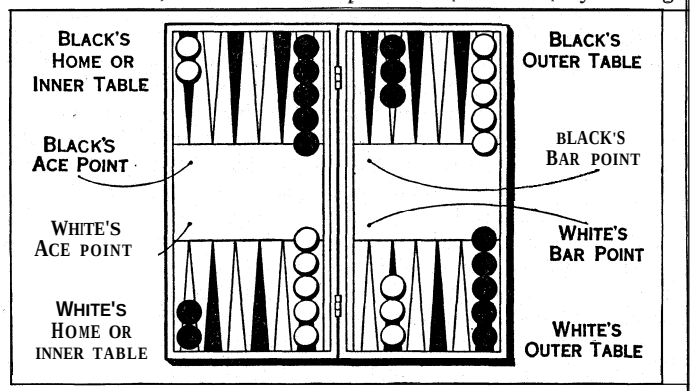
A GAME OF BACKGAMMON OR "TABLES" IN MEDIAEVAL ENGLAND From the Louterell Psalter. one of the earliest of illustrated books, first printed in 1499, in England, by Wynkyn de Worde

Backgammon is played by two persons. The "board" (see diagram) is divided into four "tables," each table being marked with six "points" coloured differently. The inner and outer tables sre separated from each other by a projecting Bar. The board (in the ordinary form of the game) is furnished with 15 white and 15 black men, "set" or arranged as in the diagram. It is usual to make the inner table the one nearest to the light. Two dice-boxes are required, one for each player, and a pair of dice, which are used by both players. The dice are marked with numbers on their six sides, from one to six, number one being called "ace"; two, "deuce"; three, "trey." Formerly the four was called "quatre" (pronounced "cater"); the five, "cinque" (pronounced either "sank" or "sink"); and the six, "sice."

For the right to start each player throws one or two dice; the one who throws the higher number has the right of playing first; and he may either adopt the numbers thrown or he may throw again, using both dice.

The men are moved on from point to point, according to the throws of the dice made by the players alternately. White moves from black's inner table to black's outer, and from this to white's outer table, and so on to white's inner table; and all black's moves must be in the contrary direction. A player may move any of his men a number of points corresponding to the numbers thrown by him, provided the point to which the move would bring him is not blocked by two or more of his adversary's men being on it. The whole throw may be taken with one man, or two men may be moved, one the exact number of points on one die, the other the number on the other die. If doublets are thrown (*e.g.,* two sixes), four moves of that number (*e.g.,* four moves of six points) may be made, either all by one man or separately by more. Thus, suppose white throws five, six, he may move one of his men from the left-hand corner of the black's inner table to the left-hand corner of black's outer table for six; he may, again, move the

same man five points farther on, when his move is completed; or he may move any other man five points. But white cannot move a man for five from the black's ace-point, because the six-point in that table is blocked. Any part of the throw which cannot be moved is of no effect, but it is compulsory for a player to move the whole throw unless blocked. Thus if the men were differently placed, and white could move a six and, having done so, could not move a five, his move is completed. If, however, by moving



A MODERN BACKGAMMON BOARD WITH PIECES IN POSITION AT THE BEGINNING OF PLAY

In addition to this special board, two dice are required to play the game

the five first, he can afterwards move a six, he must make the move in that manner. When a player so moves as to place two men on the same point he is said to "make a point."

When there is only a single man on a point, it is called a "blot." When a blot is left, the man there may be taken up (technically the blot may be "hit") by the adversary if he throws a number which will enable him to place a man on that point. The man hit is placed on the bar, and has to begin again by entering the adversary's home table again at the next throw should it result in a number that corresponds to an unblocked point. The points in the home tables count for this purpose as 1, 2, 3, 4, 5, 6, beginning from the ace-point. A player is not allowed to move any other man while he has one to enter. It is, therefore, an advantage to have made all the points in your own board, so that your adversary, if you take a man up, cannot enter; and you can then continue throwing until a point is opened.

The game proceeds until one of the players gets all his men into his inner table or *home.* Then he begins to take his men off the board or to bear them, *i.e.,* to remove a man from any point that corresponds in number with his throw. If such a point is unoccupied, a move must be made, if there is room for it, and a move may be taken, instead of bearing a man, at any time; but, when six is empty, if six is thrown a man may be borne from five and so on. If, after a player has commenced throwing off his men, he should be hit on a blot, he must enter on his adversary's inner table and must bring the man taken up into his own inner table before he can bear further.

Whoever first takes off all his men wins the game:—a single game (a "hit") if his adversary has begun bearing; a double game (a "gammon") if the adversary has not borne a man; and a triple game (a "backgammon") if, at the time the winner bears his last man, his adversary, not having borne a man, has one in the winner's inner table, or has a man up. When a series of games is played, the winner of a hit has the first throw in the succeeding game; but if a gammon is won the players each throw a single die to determine the first move of the next game.

In order to play backgammon well, it is necessary to know all the chances on two dice and to apply them in various ways. The number of different throws that can be made is thirty-six. By taking all the combinations of these throws which include given numbers, it is easily discovered where blots may be left with the least probability of being hit. For example, to find the chance of being hit where a blot can only be taken up by an ace, the adversary may throw two aces, or ace in combination with any other number up to six. and he may throw each of these in two different ways, so that there are in all eleven ways in which an ace may be thrown. This, deducted from 36 (the total number of throws), leaves 25; so that it is 25 to 11 against being hit on an ace. It is very important to bear in mind the chance of being hit on any number. The following table gives the odds against being hit on any number within the reach of one or two dice:—

It is	25	to	11,	or about	9 to 4,	against being hit on	1
,,	24	,,	12,	or	2 ,, 1,	,,	2
,,	22	,,	14,	or about	3 ,, 2,	,,	3
,,	21	,,	15,	or	7 ,, 5,	,,	4
,,	21	,	15,	,,	7 ,, 5,	,,	5
,,	9	,	17,	,,	9½ ,, 8½,	,,	6
,,	30	,,	6,	,,	5 ,, 1,	,,	7
,,	30	,,	6,	,,	5 ,, 1,	,,	8
,,	31	,,	5,	or about	6 ,, 1,	,,	9
,,	33	,,	3,	or	11 ,, 1,	,,	10
,,	34	,,	2,	,,	17 ,, 1,	,,	11
,,	33	,,	3,	,,	11 ,, 1,	,,	12

The table shows that if a blot must be left within the reach of one die, the nearer it is left to the adversary's man the less probability there is of its being hit. Also, that it is long odds against being hit on a blot which is only to be reached with double dice, and that, in that case (on any number from 7 to 11), the farther off the blot is the less chance there is of its being hit.

The table assumes that the board is open for every possible throw. If part of the throw is blocked by an intervening point being held by adverse men, the chance of being hit is less.

Two principles, then, have to be considered in moving the men:—(I) To make points where there is the best chance of obstructing the opponent. (2) When obliged to leave blots, to choose the position in which they are least likely to be hit.

The best points to secure are the five-point in your own inner table and the five-point in your adversary's inner table. The next best is your own bar-point; and the next best the four in your own inner table.

When your adversary is bearing his men, and you have two men in his table, say, on his ace-point, and several men in the outer table it is to your advantage to leave one man on the ace-point, because it prevents his bearing his men to the greatest advantage, and gives you the chance of his leaving a blot. But if you find that you can probably save the gammon by bringing both your men out of his table, do not wait for a blot. Eight points is the average throw.

The laws of backgammon (as given by Hoyle) are as follow:—

1. When a man is touched by the caster it must be played if possible; if impossible no penalty. 2. A man is not played till it is placed upon a point and quitted. 3. If a player omits a man from the board there is no penalty. 4. If he bears any number of men before he has entered a man taken up, men so borne must be entered again. 5. If he has mistaken his throw and played it, and his adversary has thrown, it is not in the choice of either of the players to alter it, unless they both agree to do so. 6. If one or both dice are "cocked," *i.e.,* do not lie fairly and squarely on the table, a fresh throw is imperative.

Russian Backgammon varies from the above game in that the men, instead of being set as in the diagram, are entered in the same table by throws of the dice, and both players move in the same direction round to the opposite table. There are various rules for this game. By some a player is not obliged to enter all his men before he moves any; he can take up blots at any time on entering, but while he has a man up, he must enter it before entering any more or moving any of those already entered. If he cannot enter the man that is up, he loses the benefit of the throw.

A player who throws doublets must play or enter not only the number thrown, but also doublets of the number corresponding to the opposite side of the dice; thus, if he throws sixes, he must first enter or move the sixes, as the case may be, and then aces, and he also has another throw. Some rules allow him to play either doublets first, but he must always complete one set before playing the other. If a player cannot play the whole of his throw, his adversary is sometimes allowed to play the unplayed portion, in which cases the caster is sometimes allowed to come in and complete his moves, if he can, and in the event of his having thrown deuce-ace or doublets to throw again. If he throws

doublets a second time, he moves and throws again, and so on. The privilege is sometimes restricted by not allowing this advantage to the first doublets thrown by each player. It is sometimes extended by allowing the thrower of the deuce-ace to choose any doublets he likes on the opposite side of the dice, and to throw again. The restriction with regard to the first doublets thrown does not apply to deuce-ace, nor does throwing it remove the restriction with regard to first doublets. A player must first be able to complete the doublets thrown. If the player cannot move the whole throw he cannot take the corresponding doublets, and he is not allowed another throw if he cannot move all the points to which he is entitled.

BACKHUYSEN or BAKHUISEN, **LUDOLF** (1631–1708), Butch painter, was born on Dec. 18 1631, at Emden, Hanover, and died at Amsterdam on Nov. 17 1708. He studied under Allart van Everdingen and Hendrik Dubbels, and soon became celebrated for his sea-pieces. His numerous compositions are nearly all variations of one subject, and in a style peculiarly his own, marked by intense realism. In his later years Backhuysen employed his time in etching and calligraphy.

BACKNANG, an agricultural market town in the *Land* of Württemberg, 18 mi. N.E. of Stuttgart. Pop. (1939) 11,547. It has an interesting 12th century church, and important tanneries and leather factories.

BACKSCRATCHER, a long slender rod of wood, whalebone, tortoiseshell, horn or cane, with a carved hand, usually of ivory, mounted at the extremity. Its name suggests the primary use of the implement, but little is known of its history, and it was unquestionably also employed as a kind of rake to keep in order the huge "heads" of powdered hair worn by women during the 18th and early 19th centuries. The backscratcher varies in length from 12 to zoin., and the more elaborate examples, which were occasionally hung from the waist, are silver-mounted, and in rare instances the ivory fingers bear carved rings. The hand is sometimes outstretched, and sometimes the fingers are flexed; the modelling is frequently good, the fingers delicately formed and the nails well defined; the hand was sometimes replaced by a rake or a bird's claw. It was indifferently dexter or sinister, but the Chinese variety usually bears a right hand The backscratcher has become scarce, and is sought after by the modern collector.

BACK'S RIVER, a river in Mackenzie and Keewatin districts, Canada, rising in Sussex lake, a small body of water in 108° 20′ W. and 64° 25′ N., and flowing with a very tortuous course north-east to an inlet of the Arctic ocean, passing through several large lake-expansions—Pelly, Garry, MacDougall and Franklin.

BACKWARDATION, a technical term employed on the London Stock Exchange to express the amount charged for the loan of stock from one account to the other, and paid to the purchaser by the seller on a bear account (see BEAR), in order to allow the seller to defer the delivery of the stock. The seller, having sold for delivery on a certain date, stocks or shares which probably he does not possess, in the hope that he may be able, before the day fixed for delivery, to buy them at a cheaper price and so earn a profit, finds on settling day that the prices have not gone down according to his expectation, and therefore pays the purchaser an agreed amount of interest (backwardation) for the privilege of deferring the delivery, either in order to procure the stock, or else in the hope that there will be a shrinkage in the price which will enable him to gain a profit. (See also STOCK EXCHANGE)

BACKWARD CHILDREN. By backwardness is commonly meant the effects of delayed progress or development in the growing child. Backwardness may be either physical or mental. It is, however, chiefly in mental backwardness that scientific interest has centred Apart from exceptional cases of a medical or pathological nature such as cretinism or deferred puberty, physical immaturity has mainly been studied because of its apparent influence on the expansion of the mind. Quite recently efforts have been made to find a precise measure of physical backwardness—based, for example, on height, weight, or X-ray photographs of the structure of the bones. But these have been largely undertaken to compare anatomical growth and physiological development with advance in mental capacity.

Definition.—Mental backwardness may be of two kinds: inborn or acquired. In the one, the child is born with less than the average measure of intelligence. In the other, through ill health, absence from school or poor home circumstances, he fails to make normal progress in knowledge or learning. The proper treatment of both forms is one of the most urgent problems for the parent, teacher and education authority. The development of the child's mind is now usually measured in terms of a mental or educational ratio; that is, the proportion of the child's mental age, or of his educational attainments expressed in terms of equivalent years, to his physical age by the calendar. Not every child who falls a fraction below the general average is in need of special school provision. The following is the definition most generally accepted: a backward child is one who is so deeply retarded in mental development or attainments that by the middle of his school career he is unable to profit by the instruction given even in the class below that which is normal for his age. In terms of the mental ratio this means that a backward child is one who is retarded by 15% of his chronological age, and therefore has a mental ratio of less than 85%. A child who is backward by more than 305% of his actual age, whose mental ratio therefore is below 70%, is commonly regarded as mentally defective. In Great Britain the milder cases of retarded development have received an official recognition, since the definition of the mentally defective given in the Act of 1921 speaks of them as children who, "not being imbecile and not being merely dull and backward, are defective, that is to say, by reason of mental or physical defect, are incapable of receiving proper benefit from the instruction in the ordinary public elementary school."

Numbers.—Several surveys have been carried out to determine the number of children who are backward in this sense. It appears that in most large cities and in most industrial areas they amount to about 10% of the school population. From one district to another, however, the figures vary widely. In good neighbourhoods the proportion may be as low as 1% or 2%. In slums and in rural areas where the best elements in the population have been drained away to neighbouring towns, it may rise to 20% or 25%. In the whole of England and Wales it has been calculated the total number of dull and backward children between the ages of seven and 14 amounts approximately to 265,000.

Causes.—To discover the causes of educational backwardness, intensive investigations have been made of numerous typical instances. Psychological tests, supplemented by thorough case-histories for each child, are the methods mainly used.

(a) *Psychological.*—Of all the causes thus laid bare the commonest proves to be inborn inferiority in general intelligence. It appears that the unintelligent are always backward; but the backward are not necessarily unintelligent. Among other psychological factors are to be noted, first, special mental disabilities such as bad memory, unstable attention, poor auditory or visual imagery, incapacity for verbal or abstract symbols as distinct from practical or manual work, and, secondly, various temperamental troubles, issuing in emotional apathy, emotional instability, emotional conflicts, petty moral or disciplinary difficulties, lack of interest in school work, antagonism to a particular teacher or subject, worry about conditions at home and the like.

(b) *Physical.*—Physical handicaps seem almost as common. They include such specific conditions as defective vision. defective hearing, defective speech, lefthandedness and disturbances of the nervous system, and more general conditions such as malnutrition and lowered vitality from many different causes—rickets, rheumatism, recurrent catarrh, enlarged tonsils and adenoids, a run of infectious ailments, and the like. In either case the factors are nearly all of a remediable type, and are often so slight as to escape attention and treatment unless an intensive study is made of each individual. Grave incurable disease is far more rare.

The foregoing causes arise within the child himself. Other factors are extrinsic; and require not only an examination of the pupil, but a careful enquiry into his past history and home circumstances. The following are the chief :—

(c) Defects Within the School Organization Itself.—Among these may be included bad teaching, uninspiring or ill-adapted methods of instruction, too slow or too rapid promotion, and, above all, a sudden break in teaching methods, such as too often occurs when the child is transferred from the infants' to the senior department or from one school to another. Irregular attendance is responsible for about one case in ten.

(d) Social or Environment Handicaps.—Poverty and its manifold concomitants—insufficient or inappropriate food, overcrowding, want of sleep, lack of facilities for healthy recreation, lack of culture in the home, lack of parental sympathy with the school and its work—these have an effect which is indirect rather than direct, and is harder to estimate than is popularly supposed.

It will thus be seen that educational backwardness may be divided into two main causal types: those due to some inherent disability operating from birth, and those due to some accidental circumstance operating after the child is born. The former are sometimes called (in a somewhat technical sense) the "dull"; and the latter (in a somewhat specialized sense) the merely "backward." The distinction makes a world of difference in regard to treatment and outlook. In the one case the backwardness is irreparable; in the other, it is, in theory at any rate, curable.

Treatment.— It is now generally agreed that the backward child needs special provision along lines so-mewhat similar to those already accorded to the mentally deficient. Special classes or schools should be instituted, intermediate in type between the special school for the mentally defective and the ordinary standards for the normal. In special classes such as these, the great features will be small size and an easily graded syllabus. There will be less formal and academic work, more concrete practical and manual work, and, above all, individual attention to specific difficulties of each particular child. Throughout, success will be attained, not by a little extra coaching or drill, but by discovering, and attempting to remedy, the fundamental causes. To this end the efforts of the teacher in the classroom must be supplemented by special medical inspection and treatment, and by an effective social service directed towards the removal of handicaps in the home.

BACOLOD, a municipality, capital of the province of Negros Occidental, and port on the western side of the island of Negros opposite the small island of Guimaras, in the Philippine Islands. Pop. (1939), 57,474, of whom 30,070 were males and 102 whites. Good automobile roads lead to other parts of the province and as a result Bacolod is an important centre for the sugar-industry. Its population nearly trebled between 1918 and 1939. It is a chartered city with 8 barrios (wards), an administrative centre and a meteorological station. It is also a port of entry, but large vessels cannot enter the harbour because of shallow water. The vernacular is a dialect of Bisaya. Bacolod is one of the most prosperous municipalities of the Philippines, but its prosperity ebbs and flows with the price of sugar.

(C. S. L.)

BACON, FRANCIS, BARON VERULAM, VISCOUNT ST. ALBANS (1561–1626), English philosopher, statesman and essayist, lord chancellor of England, was born at York House in the Strand, London, on Jan. 22, 1561. He was the youngest son of Sir Nicholas Bacon (*q.v.*), the lord keeper. His mother was a sister-in-law of Sir William Cecil, afterwards Lord Burghley. In April 1573 he was entered at Trinity college, Cambridge, where he applied himself diligently to the several sciences as then taught. Years later, he himself defined the quality of his mind and the nature of his real aspirations in the De *interpretatione naturae prooemium*:—

> I found that I was fitted for nothing so well as for the study of truth; as having a mind nimble and versatile enough to catch the resemblances of things (which is the chief point), and at the same time steady enough to fix and distinguish their subtler differences; as being gifted by nature with desire to seek, patience to doubt, fondness to meditate, slowness to assert, readiness to consider, carefulness to dispose and set in order; and as being a man that neither affects what is new nor admits what is old, and that hates every kind of imposture. So I thought my nature had a kind of familiarity and relation with Truth.

On June 27, 1576, Francis and his brother Anthony were entered at Gray's Inn, and a few months later he was sent abroad with Sir Amyas Paulet, English ambassador at Paris. He took up residence at Gray's Inn in 1579, and was admitted an outer barrister in 1582. In 1580 he applied, unsuccessfully, through his uncle, Burghley, the lord treasurer, for some post at court. In 1584 he took his seat in parliament for Melcombe Regis in Dorsetshire.

At the close of 1591 Bacon was acting as the confidential adviser of the earl of Essex, Elizabeth's favourite. In Feb. 1593 parliament was called, and Bacon took his seat for Middlesex. Bacon's opposition to the proposal to levy a double subsidy to meet the state necessities, though prompted by the desire to serve the queen, gave her deep and well-nigh ineradicable offence. He was accused of seeking popularity, and was for a time excluded from the court.

Essex at this time presented Bacon with a piece of land near Twickenham, and used his influence to procure for him the office of master of the rolls. Before anything came of this application, the Cadiz expedition had resulted in a brilliant success, and Essex became the idol of the army and the people. Bacon saw clearly that such a reputation would assuredly alienate the affections of the queen from his patron. He therefore addressed a letter to the earl, urging him to seek and secure the favour of the queen alone. His advice proved ineffectual.

Bacon, in the meantime, had increased his reputation by the publication in 1597 of his Essays, together with the Colours of Good and Evil and the *Meditationes* Sacrae.

The disgrace of Essex, after the unfortunate incidents of his campaign in Ireland in 1599, gave Bacon an opportunity of obtaining again the royal favour. The trial of Essex took place (June 1600) before a body of her majesty's councillors, and Bacon had an unimportant part in the accusation. Strangely enough Essex does not seem to have been hurt by his action in this matter, and shortly after his release he was again on friendly terms with his old client. Bacon did not then know that Essex had formed the desperate project of seizing the queen's person and compelling her to dismiss from her council his enemies, Raleigh, Cobham, and Cecil. The plot was, however, forced on prematurely and the rash attempt to rouse the city of London (Feb. 8, 1601) proved a complete fiasco. The leaders were arrested that night and thrown into prison.

Essex was tried along with the young earl of Southampton. Bacon, as one of her majesty's counsel, was present on the occasion and at times intervened in the course of the trial, to recall to the minds of those present the real question at issue. It seems to have been thought that had it not been for Bacon's speeches Essex might have escaped, or, at all events, have been afterwards pardoned. But this view of the matter depends on the supposition that Essex was guilty only of a rash outbreak. That this was not the case was well known to the queen and her council. After the execution of Essex it was thought necessary that some account of the facts should be circulated, to remove the prejudice against the queen's action in the matter. This was entrusted to Bacon, who drew up a Declaration of the Practices *and* Treasons attempted and committed by Robert, late Earl of Essex, his first draft being extensively altered and corrected by the queen and council. The ill-feeling against Bacon was not wholly removed, and some years later, in 1604, he published, in the form of a letter to Mountjoy, an Apology for his action in the case.

Though Bacon was to some extent trusted by Elizabeth, he seems to have seen that he had no chance of advancement. Her death in 1603, followed by the undisputed succession of James, gave him hopes which were not immediately realized. He procured, through his cousin Cecil, the dignity of knighthood, and was shortly afterwards formally installed as learned counsel. He was also appointed one of the commission to treat of the conditions necessary for the Union. The success of that body must be attributed mainly to his influence. During the recess he published his *Advancement of Learning*, dedicated to the king.

In the second parliament there was little scope for the exercise of Bacon's powers. In the course of this session Bacon married Alice Barnham, daughter of a London alderman.

Bacon's services were rewarded in June 1607 by the office of Solicitor. In Oct. 1608 he became treasurer of Gray's Inn. Meantime he had not forgotten his cherished project of reorganizing natural science. A survey of the ground had been made in the *Advancement*, and some short pieces not published at the time were probably written in the subsequent two or three years. Towards the close of 1607, he sent to his friends a small tract entitled *Cogitata et Visa*, probably the first draft of what we have under that title. In 1609 he wrote the panegyric, *In felicem memoriam Elizabethae*, and the learned and ingenious work, *De Sapientia Veterum;* and completed what seems to have been the *Redargutio Philosophiarum*, or treatise on the "idols of the theatre." In 1613 Bacon proposed to the king that Coke should be removed from the court of common pleas and transferred to the king's bench. The vacancy caused by Coke's promotion was then filled by Hobart, and Bacon stepped into the place of attorney general.

Bacon's services to the king had been most important; and as he had, at the same time, acquired great favour with Sir George Villiers, the king's new favourite, his prospects looked brighter than before. On March 7, 1617, the great seal was bestowed upon Bacon, with the title of lord keeper. On Jan. 7, 1618, he became lord chancellor; in July of the same year he was made Baron Verulam and in Jan. 1621 created Viscount St. Albans. His fame, too, had been increased by the publication in 1620 of his most celebrated work, the *Novum Organum*.

In Nov. 1620, when a new parliament was summoned to meet, Bacon earnestly pressed that the most obnoxious patents should be given up. This prudent advice was unfortunately rejected, and the session was not far advanced when the question of patents was brought up. It was even proposed to proceed against the referees (Bacon and Montagu), who had certified that there was no objection to them in point of law. This proposal, however, was allowed to drop, while the king and Buckingham agreed to give up the monopolies.

It is probable that this charge was dropped because a more powerful weapon had in the meantime been placed in the hands of Bacon's enemies. This was the accusation of bribery and corrupt dealings in Chancery suits, an accusation apparently wholly unexpected by Bacon, but, nevertheless, the cause of his downfall. The charges against him rapidly accumulated, and Bacon gave up all idea of defence and sent in a general confession to the Lords. On May 3, after considerable discussion, the Lords decided upon the sentence, which was, that he should undergo a fine of £40,000; that he should be imprisoned in the Tower during the king's pleasure; that he should for ever be incapable of any office in the State; and that he should never sit in parliament, or come within the verge of the court. This sentence was only partially executed. The fine was in effect remitted by the king; imprisonment in the Tower lasted for about four days; a general pardon was made out, and was passed probably in Nov. 1621. Bacon also received permission to come within the verge of the court, but he never sat again in parliament.

On the whole it appears that Bacon's own account of this painful episode is substantially correct. He confesses *(Letters and Life*, vii. 235–236) that he had received bribes from suitors *pendente lite*. Yet he affirms that his intention was never swayed by a bribe; and in several cases his judgment appears to have been given against the party bestowing the bribe.

Bacon was well aware that the practice was in itself indefensible. So far, then, as the mere taking bribes is concerned, he would permit no defence, and his own judgment on his action contains as severe a condemnation as has ever been passed upon him. Wet in the face of this he does not hesitate to call himself "the justest chancellor that hath been in the five changes since Sir Nicholas Bacon's time" *(Letters and Life*, vii. 560), and this on the plea that his intentions had always been pure and had never been affected by the presents received.

The remaining five years of his life were spent in work far more valuable to the world than anything he had accomplished in his high office. In March 1622 he presented to Prince Charles his *History of Henry VII*. In Nov. 1622 appeared the *Historia Ventorum;* in Jan. 1622/3 the *Historia Vitae et Mortis;* and in Oct. of the same year, the *De Augmentis Scientiarum*, a Latin translation, with many additions, of the *Advancement*. Finally, in Dec. 1624, he published his *Apothegms*, and *Translations of some of the Psalms*, dedicated to George Herbert; and, in 1625, a third and enlarged edition of the *Essays*.

His life now drew rapidly to a close. In March 1636, when driving one day near Highgate, he was taken with a desire to discover whether snow would delay the process of putrefaction. He stopped his carriage, purchased a fowl, and with his own hands assisted to stuff it with snow. He was seized with a sudden chill, and was conveyed to Lord Arundel's house, near at hand. The cold and chill had brought on bronchitis, and he died on April 9, 1626.

BACON'S WORKS AND PHILOSOPHY

Putting aside the letters and occasional writings, we may conveniently distribute the other works into three classes, *Professional, Literary, Philosophical*.

The professional works include the *Reading on the Statute of Uses*, the *Maxims of Law*, and the treatise (possibly spurious) on the *Use of the Law*. Bacon's legal writings exhibit a richness and ethical fulness that more than compensate for their lack of dry legal detail. Bacon was indeed a lawyer of the first order, with a keen scientific insight into the bearings of isolated facts and a power of generalization which admirably fitted him for the self-imposed task, unfortunately never completed, of digesting or codifying the chaotic mass of the English law.

Of the literary works the most valuable are the *Essays*, which are widely read and universally admired. The matter is of the familiar, practical kind, that "comes home to men's bosoms." The short, pithy sayings have become popular mottoes and household words. The short tract, *Colours of Good and Evil*, which with the *Meditationes Sacrae* originally accompanied the Essays, was afterwards incorporated with the *De Augmentis*. Along with these works may be classed the curiously learned piece, *De Sapientia Veterum*. The *Apophthegms*, though hardly deserving Macaulay's praise of being the best collection of jests in the world, contain a number of those significant anecdotes which Bacon used with such effect in his other writings. Of his historical works, besides a few fragments of the projected history of Britain, there remains the *History of Henry VII.*, a valuable work, giving a clear and animated narrative of the reign, and characterizing Henry with great skill. The series of the literary works is completed by the minor treatises on theological or ecclesiastical questions, including the *Meditationes Sacrae* and the *Confession of Faith*.

Philosophical Works.—Bacon's philosophical works may be classified under three heads: *(a)* Writings originally intended to form parts of the *Instauratio*, but which were afterwards superseded or thrown aside; *(b)* Works connected with the *Instauratio*, but not directly included in its plan; *(c)* Writings which actually formed part of the *Instauratio Magna*.

(a) The most valuable in this class are: (1) *The Advancement of Learning*, which is completely worked up into the *De Augmentis*, and takes its place as the first part of the *Instauratio*. (2) *Valeus Terminus*, composed probably about 1603, which contains a brief and somewhat obscure outline of the first two parts in the *Instauratio*. (3) *Temporis Artus Masculus*, another curious fragment, remarkable for its style, which is arrogant and offen-

sive, in this respect unlike any other writing of Bacon's. (4) *Redargutio Philosophorum,* composed probably about 1608 or 1609, and containing in pretty full detail much of what afterwards appears in connection with the Idola *Theatri* in book i. of the *Novum* Organum. (5) Cogitata et Visa, perhaps the most important of the minor philosophical writings, and containing the substance of the first book of the *Organum.* (6) The Descriptio *Globi* Intellectualis goes over in detail the general classification of the sciences. (7) The brief tract De *Interpretatione* Naturae *Sententiae Duoecim* is evidently a first sketch of part of the Novum Organum. (8) A few smaller pieces, such as the *Inquisitio* de Motu, the Calor et Frigus, the *Historia* Soni et *Auditus,* and the Phaenomena Universi, are early specimens of his Natural History, and exhibit the first tentative applications of the new method.

(b) The second group consists of treatises on subjects connected with the Instauratio, but not forming part of it. The most interesting is the philosophical romance, the New Atlantis, a description of an ideal state in which the principles of the new philosophy are carried out by political machinery and under state guidance. The work was to have been completed by the addition of a second part, treating of the laws of a model commonwealth, which was never written. Another important tract is the De *Principiis* atque Originibus *secundum* Fabulas *Cupidinis* et Caeli, where, under the disguise of two old mythological stories, he (in the manner of the *Sapientia* Veterum) finds the deepest truths.

Deserving of attention are also the *Cogitationes* de Natura *Rerum,* probably written early, perhaps in 1605, and the treatise on the theory of the tides, De *Fluxu* et *Refluxu Maris,* written about 1616.

(c) Consisted in the *Instauratio,* in its final form of six divisions.

(1) Partitiones *Scientiarum.*—The famous classification on which this survey of the sciences proceeds is based upon an analysis of the faculties and objects of human knowledge. This division is represented by the De Augmentis *Scientiarum.*[1]

(2) Interpretatio *Naturae.*—The new method, by which the mind of man is to be trained and directed in its progress towards the renovation of science. This division is represented, though only imperfectly, by the *Novum Organum,* particularly book ii.

(3) *Historia* Naturalis et *Experimentalis.*—The new method is valueless, because inapplicable, unless supplied with materials duly collected and presented—in fact, unless there be formed a competent natural history of the *Phaenomena* Universi. A short introductory sketch of the requisites of such a natural history is given in the tract Parasceve, appended to the *Novum* Organum. The principal works intended to form portions of the history, and either published by himself or left in manuscript, are *Historia Ventorum, Historia* Vitae et *Mortis, Historia* Densi et *Rari,* and the collection of facts and observations entitled Sylva Sylvarum..

(4) Scala Intellectus.—For practical purposes, Bacon interposed two divisions between the preliminaries and the philosophy itself. The first was intended to consist of types or examples of investigations conducted by the new method. Of this division there seems to be only one small fragment, the *Filum Labyrinthi.*

(5) Prodromi (forerunners of the new philosophy) was to contain certain speculations not formed by the new method but by the unassisted use of his understanding. There is extant a short preface to this division of the work, and some of the miscellaneous treatises, such as De *Principiis,* De *Fluxu* et *Refluxu,* Cogitationes de *Natura Rerum,* may have been prepared for inclusion under this head.

(6) The new philosophy, which is the work for future ages and the result of the new method.

Bacon's grand motive in his attempt to found the sciences anew was the conviction that the knowledge man possessed was of little service to him. Sovereignty over nature, which can be founded on knowledge alone, had been lost, and instead we have nothing but vain notions and blind experiments. To restore the original commerce between man and nature, and to re-establish the *imperium hominis,* is the object of all science. Failure had been due to many causes, but chiefly to the want of appreciation of the nature of philosophy and its real aim. The true philosophy is not the science of things divine and human; it is not the search after truth but is something altogether practical, nor is it of great matter what abstract notions one may entertain concerning the ultimate nature and the principles of things. Nevertheless, by following the new aim we shall also arrive at a true knowledge of the universe in which we are, for truth and utility are in ultimate aspect the same; "works themselves are of greater value as pledges of truth than as contributing to the comforts of life." Such was the conception of philosophy with which Bacon started, and in which he felt himself to be thoroughly original.

As his object was new, so the method he intended to employ differed, as he conceived, from all previous modes of investigation. He seems always to have felt that the first part of the new scheme must be a destructive criticism of all other methods. Opposition was to be expected, not only from previous philosophies, but especially from the human mind itself.

Before proceeding to unfold his method, Bacon found it necessary to discuss the obstacles to progress. As an insurance against error in collection of facts Bacon warned men against his four famous Idola, or false notions of things, erroneous ways of looking at nature. There were the Idola Tribus, the idols of the tribe, fallacies inherent in human kind in general, and notably man's proneness to suppose in nature greater order than is actually there. There were Idola *Specus,* idols of the cave, errors inherent in our individual constitution, our private and particular prejudices, as we may term them. There were the Idola *Fori,* idols of the marketplace, errors arising from the influence of mere words over our minds. There were the Idola Theafri, the idols of the theatre, errors arising from received systems of thought. But did not Bacon himself fail to discern a fifth set of idols, which we may term the Idola Academiae, the idols of the schools, the fallacy of supposing that a blind though learned rule can take the place of judgment? It was this fifth idol that prevented Bacon from entering into the promised land of which but a Pisgah view was granted to him.

To discover exactly Bacon's view of the characteristics and objects of natural philosophy it is necessary to examine the place it holds in the general scheme furnished in the *Advancement* or De *Augmentis.* All human knowledge, it is there laid down, may be referred either to man's memory or to his imagination or to his reason. Corresponding to memory is history, either natural or civil; corresponding to imagination is poesy; and corresponding to reason is philosophy. Natural philosophy is again divided into theoretical and practical, according as the end is contemplation or works. Theoretical natural philosophy has to deal with natural substances and qualities, and is subdivided into physics and metaphysics. The principal objects of physics are concrete substances, or abstract though physical qualities. The research into abstract qualities, the fundamental problem of physics, comes near to the metaphysical study of *forms.* Natural philosophy is, therefore, in ultimate resort, the study of *forms,* and consequently the fundamental problem of philosophy in general is the discovery of these forms.

A study of the various passages in the *Novum* Organum in which the definition of forms is attempted seems to show that Bacon's forms are no ideas or abstractions, but highly general physical properties. Further, it is hinted that these general qualities may be looked upon as the modes of action of simple bodies. Thus, by a knowledge of forms, Bacon believed that man's practical control of Nature would be enormously increased. For example, so long as we possess only certain practical recipes for the production of heat, these can only be applied when the requisite conditions are available. But, armed with the knowledge of what heat consists of, *i.e.,* the form of heat is violent, irregular, motion of particles, we can produce heat by any method which will induce such motion.

[1] The division of the sciences adopted in the great French *Encyclopédie* was founded upon this classification of Bacon's. See Diderot's Prospectus (Oeuvres, iii.) and d'Alembert's *Discours* (Oeuvres i.). The scheme should be compared with later attempts of the same nature by Ampère, Cournot, Comte, and Herbert Spencer.

This fruitful conception, however, Bacon does not work out; and though he uses the word *cause*, and identifies *form* with *formal cause*, yet it is perfectly apparent that the modern notions of cause as dynamical, and of nature as in a process of flow or development, are foreign to him, and that in his view nature was regarded in a purely statical aspect.

Francis Bacon, in common with his 13th century predecessor, Roger Bacon, held that the sciences are organically connected. At the basis of all he placed a body of general truth, common to all the sciences, which he called the *Prinza Philosophia*.

Following this summary philosophy come the sciences proper, rising like a pyramid in successive stages, the lowest stage being occupied by natural history or experience, the second by physics, the third, which is next the peak of unity, by metaphysics. The knowledge of the peak, or of the one law which binds nature together, is perhaps denied to man. Nature presented itself to Bacon's mind as a huge congeries of phenomena, the manifestations of some simple and primitive qualities, which were hidden from us by the complexity of things themselves. The world was a vast labyrinth, the clue to which, the *filum labyrinthi*, is the new method of *induction*. But the new method could not be applied until facts had been observed and collected.

Concealed among the facts presented to sense are the causes or *forms*, and the problem therefore is so to analyse experience that we shall with certainty and mechanical ease arrive at a true conclusion. For this purpose Bacon proposed to draw up three "tables of comparative instances." We must have before us instances in which any given nature is present, instances in which it is absent, and instances in which the nature is present in different degrees. To make clear the nature of these "tables" let us take for example the case of heat. We wish to discover the *form* of heat, *i.e.* the condition which is present or absent when heat is present or absent, and which increases or decreases as heat increases or decreases. To do this we begin with a process of elimination of all those inessential conditions which are not found always and only in conjunction with the phenomenon of heat. Bacon, for instance, excludes the property of rarity, since metals like gold are of very great density, even though heated. Thus, by a process of elimination, we should arrive at the true *form* of heat. But as it is exceedingly difficult to make our exclusive table at all exhaustive, Bacon proposes that we pause when a certain stage is reached, and a tentative survey be made of the state of the enquiry. This survey, which he calls the "first vintage" is probably Bacon's nearest approximation to our modern conception of the formation of a scientific hypotheses, the department in which Bacon's chief weakness lay. It is evident that if the tables were complete, and our notions of the respective phenomena clear, the process of exclusion would infallibly lead to the detection of the cause or *form*. But it is just as evident that these conditions can never be adequately fulfilled.

Such was the method devised by Bacon, and to which he ascribed the qualities of absolute certainty and mechanical simplicity. But even supposing that this method were accurate and completely unfolded, it is evident that it could only be made applicable and produce fruit when the phenomena of the universe have been very completely tabulated and arranged.

CRITICISM OF BACON'S PHILOSOPHY

It has been pointed out, and with perfect justice, that science in its progress has not followed the Baconian method. The reason of this is not far to seek.

The process of scientific discovery is essentially an act of judgment. Facts, phenomena, are infinite in number. We cannot choose them all, as Bacon would have had us do, and then pass them through a mill of logic and elicit a result. Still less dare we choose at random. The process of choosing facts is an act of judgment on the part of the man of science. His choice is doubtless limited by his knowledge of his art. He exercises his judgment to choose things which bear a certain relation to each other. But no knowledge of the nature of reasoning, however profound, nor even knowledge of his science, however complete, will make a man a scientific discoverer. The scientific man has, in fact, to practise two distinct mental processes, the making of the discovery and the demonstration of its truth. Essentially the two processes are distinct, and the one might be largely developed while the other was in a state of relative arrest.

This distinction between the act and demonstration of discovery was consistently missed during the middle ages. Mediaeval thought is further distinguished from our own by the persistent conviction in those ages that a wide measure of truth could be elicited from a very small series of observations by the extensive use of ratiocination. The latter error Bacon clearly discerned, and his discernment entitles him to rank as the herald of modern science. His claim that a direct appeal to nature was the only way to truth at once raised the functions of the observer while it tended to depress the vast mediaeval claims for ratiocination.

On the other point, in which our thought is separated from that of the middle ages, Bacon remained in darkness. He succeeded indeed in emphasizing the importance of the operation of collection of facts, but he failed to perceive how deeply the act of judgment must be involved in the effective collection of facts.

We may now turn to consider whether, in fact, the knowledge of his time would have enabled him to come to any other conclusions than those which he reached. What, we may enquire, were the actual, concrete, scientific achievements of his day, on which he might have tested his method? We may perhaps exonerate Bacon for having effectively ignored the astronomical ideas of his day. Copernicus (*q.v.*) (1473–1543), though he initiated a great movement, made no important observational contribution in his work, the first edition of which appeared in 1543. It was not till 1630, when Bacon had been in his grave for four years, that Galileo (1564–1642) gave the Copernican theory its formal observational justification, though Bacon had had news of Galileo's activities as early as 1616 from his friend, Sir Tobie Matthew (1577–1655), then travelling in Italy. Bacon missed, however, the *New Astronomy* (1609) of Kepler (*q.v.*) (1571–1630) which laid the foundation of modern astronomical views, set forth for the first time the laws of planetary motion, and developed a tenable theory of tides, a subject in which Bacon was specially interested.

Biology was less advanced than astronomical science, but there was one biological work of first-class importance from which Bacon might have learned of the distinction between the act of discovery and the demonstration of discovery. It had been written at Padua in 1543 by the Belgian, Andreas Vesalius (1514–64), and bore the title *On the Fabric of the Human Body*. It placed the study of anatomy at once on a scientific basis, and contained an enormous number of first-hand observations. But besides this, there were two men at home who were admirable exponents of the experimental method, and whom Bacon might have watched at work. One was William Gilbert (*q.v.*) (1544–1603) physician to Bacon's two royal masters, Elizabeth and James I., and founder of the science of electricity. Gilbert's great book *On the Magnet* was published in 1600. Now Gilbert so clearly perceived the character of the scientific process that he adopted in his book a special typographical method of marking and distinguishing his actual observations. Had Bacon followed these observations, he might have watched the practice of the art of discovery at the hand of a master. At Gilbert's house in London there used to foregather a society of men interested in the secrets of Nature. This may be regarded as the earliest scientific association in England, and perhaps the earliest in Europe. The inspiration of Bacon's philosophy and the magic of his pen produced in the generation that followed him the "secret college," which grew into the "Royal Society." It was an irony of fate that Bacon was no member of that secret college that was meeting at his very door.

The only other contemporary Englishman who was a first class exponent of the experimental method was William Harvey (1578–1657). Harvey was lecturing in London on the circulation of the blood as early as 1616, though he did not publish his discovery until 1628. Among his patients was Lord Chancellor Bacon. Yet Bacon not only knew nothing of Harvey's work, but failed to make any impression on the fine practical mind of the great

physiologist. Harvey would not allow him to be a great philosopher, though he esteemed him much for his wit and style. Speaking of Bacon, Harvey told Aubrey: "He writes philosophy (*i.e.* Science) like a lord chancellor." This shrewd saying may well contain the root of the matter.

It may be that it was just Bacon's legal powers and legal training that shut him out from a real appreciation of the scientific process. Often in history a legal bias has corrupted scientific method by giving a false conception of natural law. No less often has the legal form fixed the gaze of the investigator on the prospect of a scientific verdict so that he fails to focus exactly the details of scientific method.

We must glance at the influence of Bacon on posterity. It is significant that he has made himself more felt in the department of the moral and metaphysical sciences than in the physical. Furthermore, we observe that while many who have written about science have done him homage—and notable among them Voltaire and d'Alembert and the other contributors to the *Encyclopédie* by whom he was regarded as "*le* plus *grand, le* plus *universal,* et *le* plus *éloquent* des *philosophes*"—while men of science such as Leibnitz, Huygens, and above all Robert Boyle, have had him in good regard, yet there is not the least evidence that these or any other eminent scientific men have ever followed his method. Yet despite Bacon's failure in the field of the practical application of his method, the world certainly owes to him some developments of high importance. These we may sum up as threefold:—

1. He did in fact set forth clearly the widening intellectual breach which separated the men of his day from the middle ages. He perceived the vices of the scholastic method, and in the clearness of his vision and explanation he stands above his contemporaries, men such as Campanella (*q.v.*) (1548–1639) and Giordano Bruno (*q.v.*) (1548–1600), who, like him, were striving towards a new form of intellectual activity.

2. English writers of the later 17th century concur in ascribing to the impetus of Bacon's writings the foundation of the Royal Society. Thomas Sprat (1635–1713), Bishop of Rochester, the first historian of the Society, assures us of this, as does Oldenburg (1615–77), the most energetic of its early secretaries. The opinion is confirmed by Boyle (1627–91) and by many other of the earlv members.

3. It is perhaps in the department of psychological speculation that the influence of Bacon has been most marked. The basic principle of Locke's essay "Concerning Human Understanding" (1690), that all ideas are the product of sensation and of reflection, is implicit in the first aphorism of Bacon's Novum *Organum,* "Man, who is the servant and interpreter of nature, can act and understand no further than he has observed, either in operation or in contemplation, of the method and order of nature." The whole atmosphere of Locke's work is taken from, or at least is characteristic of, the *Novum Organum.* Through the "practical" tendency of his philosophy, and through Locke, Bacon was the father alike of English psychological speculation and of the empirical method in the department of ethics. Whatever his positive achievements may have been, we may thus accord to him his own claim that he "rang the bell which called the wits together."

BIBLIOGRAPHY.—*Editions:* The classical edition is that of R. L. Ellis, J. Spedding, and D. D. Heath, vols. i.–iii., philosophical writings; iv.–v., translations; vi.–vii., literary and professional works (1st ed., 1857; 2nd ed., 1870). A useful reprint (in one vol.) of the philosophical works (with a few not strictly philosophical), based on the first Ellis-Spedding edition, was published by J. M. Robertson (1905); besides the original introductions, it contains a useful summary by the editor of the various problems of Bacon's life and thought. Numerous cheap editions have' been published, *e.g.* in the "World's Classics" (1901), and "New Universal Library" series (1905) Sidney Lee, *English Works of Francis Bacon,* (1905), The State papers of James's reign contain a remarkable series of papers by Bacon (1612–13) indicating his view of the proper relations between king and parliament.

Of particular works there are numerous editions in all the chief languages. The following are the most important: T. Fowler, *Novum Organum,* with notes, full introduction on Bacon's philosophy in all its relations, and a most valuable bibliography (1878 and 1889). The *Essays* have been edited more than 30 times since 1870; the following editions may be mentioned: W. Aldis Wright (1862); Archbishop Whately, 6th ed. (1864); E. A. Abbott (1879); John Buchan (1879); F. Storr and Gibson (1886); A. S. West (1897); W. Evans (1897); R. Wilson (1924). A facsimile reprint of the 1st edition was published in New York (1904). *Advancement of Learning:* W. Aldis Wright (1866; 5th ed., 1900); F. G. Selby (1892–95); H. Morley (1905); with the *New Atlantis,* in the "World's Classics" series, intro. by Prof. T. Case (1906); and with the *Essays* and the *Colours of Good and Evil,* lib. of Eng. cl. (1920). *Wisdom of the Ancients and New Atlantis* in "Cassell's Kational Library" (1886–1903). A. B. Gough, *New Atlantis* (1915); *New Atlantis,* ed. with More's *Utopia,* with an intro., notes, and glos. by H. Gotein (1925).

Biography: J. Spedding, *The Life and Letters of Lord Bacon* (1861); *Life and Times of Francis Bacon* (1878); also Dr. Rawley's *Lije* in the Ellis-Spedding editions, and J. M. Robertson's reprint (above); W. Hepworth Dixon, *Personal History of Lord Bacon* (1861); *Story of Lord Bacon's Life* (1862); John Campbell, *Lives of the Chancellors,* vol. ii. (1845); P. Woodward, *Early Lije of Lord Bacon* (1902); *T.* Fowler, *Francis Bacon,* in "English Philos." series (1881); R. W. Church's *Bacon,* in "Men of Letters" series (1884).

Philosophy: Beside the introductions in the Ellis-Spedding and T. Fowler editions, and general histories of philosophy, *see* Kuno Fischer, *Fr. Bacon* (1856, 2nd ed., 1875, Eng. trans. by John Oxenford, 1857); *Francis Bacon und seine Schule Entwicklungs-geschiclzte der Erfahrungs-philosophie* in vol. v. of *Jubilaums-Ausgabe* of his *Geschichte der neueren Philosophie* (1904); Ch. de Rémusat, *Bacon, sa vie . . . et son influence* (1857 and 1877); G. L. Craik, *Lord Bacon, his Writings and his Philosophy* (1846–47 and 1860); A. Dorner, *De Baconis Philosophia* (186; and 1886); J. v. Liebig, *Uber F.B. v. Verulam* (1863); Ad. Lasson, *Uber B. v. Verulam's wissenschafteliche Principien* (1860); *E.* H. Bohmer, *Uber F.B. v. Verulam* (Erlangen, 1864); Ch. Adam, *Philos. de Francis Bacon* (1890); Barthélmy St. Hilaire, *Etude sur Francis Bacon* (1890); R. W. Church, *op. cit.* H. Heussler, *F. Bacon und seine geschichtliche Stellung* (Breslau, 1880); H. Hoffding, *History of Modern Philosophy,* Eng. trans. (1900); J. M. Robertson, *Short History of Freethought* (1906); Sidney Lee, *Great Englishmen of the 16th Century* (1904); W. Sorley, "The Beginnings of English Philosophy" in vol. iv. of *Camb. History of Mod. Lit.* (1904); Emil Wolti, *Francis Bacon und seine Quellen* (1910); Israel Levine, *Francis Bacon, Viscount St. Albans* (1925); *A.* Levi, *Il Pensiero di Francesco Bacone considerato in relazione con le filosofie della natura del Rinascimento,* etc. (1925); Charles D. Broad, *The Philosophy of Francis Bacon* (1926), a paper read at the Bacon tercentenary in Cambridge; A. E. Taylor, *Francis Bacon,* etc. (1927), a paper read before the British Academy. For the relations between Bacon and Ben Jonson see *The Tale of the Shakespeare Epitaphs by Francis Bacon* (1888); for Bacon's poetical gifts *see* an article in the *Fortnightly Review* (March, 1905).

For Bacon-Shakespeare controversy *see* SHAKESPEARE. (C. SI.)

BACON, HENRY (1866–1924), American architect, was born at Watseka, Ill., Nov. 28 1866. In 1884 he entered the University of Illinois to study architecture. From 1888 to 1897 he was with McKim, Meade & White, in New York, except the years 1889–91, which he spent in Europe as Rotch Travelling Scholar. From 1897 to 1903 he was a member of the firm of Brite & Bacon, in New York. After that time he worked independently. He designed the Court of the Four Seasons at the Panama-Pacific Expositions; the Union Square Savings Bank, New York city; the Public Library, Paterson, N.J.; the Waterbury General hospital, Waterbury, Conn., and the Whittemore memorial bridge, Naugatuck, Connecticut. Of numerous monuments, some designed in collaboration with various sculptors, the following should be mentioned: the Lafayette monument, Brooklyn, N.Y.; the Lincoln monument, Lincoln, Neb.; the Longfellow monument, Cambridge, Mass.; the Republic monument and the Centennial monument, Chicago, Ill.; the President Harrison monument, Indianapolis, Ind.; the Civil War memorial and World War memorial, Yale University, and the Parnell monument, Dublin, Ireland. In 1920 the Lincoln memorial, at Washington, D.C., designed by him, was completed at a cost of more than $2,500,000. He died Feb. 16 1924, in New York city.

BACON, JOHN (1740–1799), British sculptor, was born in Southwark on Nov. 24 1740, the son of Thomas Bacon, a clothworker, and apprenticed at 14 in Crispe's porcelain manufactory at Lambeth. Here he was at first employed in painting the small ornamental pieces of china, but soon became modeller to the works. During his apprenticeship he improved the method of working statues in artificial stone, an art which he afterwards carried to perfection. Bacon first attempted working in marble about the year 1763, and improved the method of transferring the form of the model to the marble (technically "getting out

the points") by the invention of a more perfect instrument for the purpose. This instrument was more exact, took a correct measurement in every direction, was contained in a small compass, and could be used upon either the model or the marble. In the year 1769 he won the first gold medal for sculpture given by the Royal Academy, his work being a bas-relief representing the escape of Aeneas from Troy. In 1770 he exhibited a figure of Mars, which gained him the gold medal of the Society of Arts and his election as A.R.A. He was then engaged to execute a bust of George III., intended for Christ Church, Oxford. He died on Aug. 4 1799, and was buried in Whitfield's Tabernacle. His work may be studied in St. Paul's cathedral, London, Christ Church and Pembroke college, Oxford, the Abbey church, Bath, and Bristol cathedral. Perhaps his best works are to be found among the monuments in Westminster Abbey.

See Richard Cecil, *Memoirs of John Bacon, R.A.* (1801); and also Vol. i. of R. Cecil's works, ed. J. Pratt (1811).

BACON, LEONARD (1802–1881), American Congregational preacher and writer, was born at Detroit, Mich., on Feb. 19, 1802, the son of David Bacon (1771–1817), missionary among the Indians in Michigan and founder of the town of Tallmadge, O. The son graduated at Yale in 1820 and at the Andover Theological seminary in 1823, and from 1825 until his death on Dec. 24, 1881, was minister in the First Church (Congregational) in New Haven, although he gave up the active pastorate in 1866, He was, from 1826 to 1838, an editor of the *Christian Spectator;* was one of the founders of the *New Englander* (later the *Yale Review),* and with Dr. R. S. Storrs, H. C. Bowen and others, of the *Independent* (1848), of which he was an editor until 1863; and was acting professor of didactic theology in the theological department of Yale university from 1866 to 1871, and lecturer on church polity and American church history from 1871 until his death. Because of his prominence he was sometimes popularly referred to as "the Congregational pope of New England." An advocate of liberal orthodoxy himself, in all the heated theological controversies of the day he used his influence to bring about harmony, and in the councils of the Congregational churches he manifested great ability both as a debater and as a parliamentarian. In all matters concerning the welfare of his community or the nation, moreover, he took a deep and constant interest, and was particularly identified with the temperance and anti-slavery movements, in which, as in most other controversies, he took a moderate course. His *Slavery Discussed in Occasional Essays from 1833 to 1846* (1846) exercised considerable influence upon Abraham Lincoln. Bacon was early attracted to the study of the ecclesiastical history of New England and was frequently called upon to deliver commemorative addresses, such as are contained in his *Thirteen Historical Discourses* (1839). The most important of his historical works, however, is his *Genesis of the New England Churches* (1874). He published *A Manual for Young Church Members* (1833); edited, with a biography, the *Select Practical Writings of Richard Baxter* (1831); and was the author of a number of hymns.

Leonard Bacon's sister, DELIA BACON (1811–1859), born in Tallmadge, O., on Feb. 2, 1811, was a teacher in schools in Connecticut, New Jersey and New York, and then, until about 1852, conducted in various eastern cities classes for women in history and literature. She wrote *Tales of the Puritans* (1831), *The Bride of Fort Edward* (1839), and *The Philosophy of the Plays of Shakespeare Unfolded* (1857). The latter work was intended to prove that the plays attributed to Shakespeare were written by a coterie of men, including Francis Bacon, Sir Walter Raleigh and Edmund Spenser, for the purpose of inculcating a philosophic system, for which they felt that they themselves could not afford to assume the responsibility. Her devotion to this one idea, as Hawthorne says, "had thrown her off her balance," and while she was in England she lost her mind entirely. She died in Hartford, Conn., on Sept. 2, 1859.

For Leonard Bacon *see* the commemorative volume issued by his congregation (New Haven, 1882) and Williston Walker's *Ten New England Leaders* (1901). A nephew, Theodore Bacon, issued *Delia Bacon: A Sketch* (1888), and Nathaniel Hawthorne included "Recollections of a Gifted Woman" in *Our Old Home* (1863). (W. W.)

BACON, NATHANIEL (c. 1647–1676), a Virginian colonial politician and soldier, was born at Friston Hall in Suffolk, England. He graduated at Cambridge when about 21 years of age, but had interrupted his studies in 1663 to join a party which made an extended trip through the Netherlands, Germany, Italy and France. He later studied at the Inns of Court in London. In 1674 he married Elizabeth, the daughter of Sir Edward Duke, and sailed for Virginia late in the same year. There Bacon acquired several estates, one where Richmond now stands, and another where he made his home, on the Jarnes river, about 40m. above Jamestown. Having high social standing, ample financial means and a keen intelligence, he was soon appointed a member of the governor's council, in which he acquired the first-hand knowledge of Governor Berkeley's policy and character which induced him to undertake "Bacon's Rebellion." The report of the royal commission sent to Virginia after the rebellion describes him as "indifferent tall but slender, black-haired, and of an ominous, pensive, melancholy aspect; of a pestilent and prevalent logical discourse tending to atheism in most companies, not given to much talk, or to make sudden replies; of a most imperious and dangerous hidden pride of heart, despising the wisest of his neighbours for their ignorance and very ambitious and arrogant." This is manifestly the official portrait of an outlaw and is widely at variance with the report of his admirers, who represented him as of genial manners and, although himself an aristocrat, of democratic political convictions, which made him popular with all who disapproved of the absolutism of Governor Berkeley. It is increasingly apparent that the part played by Bacon in the formation of an American national consciousness was a great one; and the circumstances attending the rebellion make it evident that this part could be played only by a man of very distinctive personality. Bacon died during a campaign, probably of malaria, on Oct. 1, 1676.

See Gordon McCabe, "The Family of Nathaniel Bacon, the 'Rebel,' " in *Virginia Magazine of Hist. and Biog.* 1907–08.

BACON, SIR NICHOLAS (1509–1579), lord keeper of the great seal of England during the reign of Queen Elizabeth, was the second son of Robert Bacon of Drinkstone, Suffolk, and was born at Chislehurst. He was educated at Corpus Christi college, Cambridge, graduating B.A. in 1527, and afterwards spent some time in Paris. Having returned to England and entered Gray's Inn, he was called to the bar in 1533, and four years later began his public life as solicitor of the court of augmentations. In 1546 he was made attorney of the court of wards and liveries; in 1550 became a bencher and in 1552 treasurer of Gray's Inn. Although his sympathies were with the Protestants, he retained his office in the court of wards during Mary's reign, but an order was issued to prevent his leaving England. The important period in Bacon's life began with the accession of Elizabeth in 1558. Owing largely to his long and close friendship with Sir William Cecil, afterwards Lord Burghley, his brother-in-law, he was appointed lord keeper of the great seal in December of that year, and was soon afterwards made a privy councillor and a knight. In March 1559, Bacon was appointed to preside, with Heath, archbishop of York, over a conference between the Protestants and Catholics at Westminster; and Elizabeth left the management of religious affairs largely in his and Cecil's hands. In 1559 he was authorized to exercise the full jurisdiction of lord chancellor. In 1564 he fell temporarily into the royal disfavour and was dismissed from court, because Elizabeth suspected him of a share in a pamphlet, "A Declaration of the Succession of the Crowne Imperiall of Ingland," written by John Hales (*q.v.*), and favouring the claim of Lady Catherine Grey to the English throne. Bacon's innocence was admitted. He was restored to favour and replied to a writing by Sir Anthony Browne, who had again asserted the rights of the house of Suffolk, to which Lady Catherine belonged. He thoroughly distrusted Mary queen of Scots; objected to the proposal to marry her to the duke of Norfolk, and warned Elizabeth that serious consequences for England would follow her restoration. He died in London on Feb. 20, 1579, and was buried in St. Paul's cathedral, his death calling forth many tributes to his memory He was twice married and by his first wife, Jane, had three sons and

three daughters. His second wife was Anne (d. 1610), daughter of Sir Anthony Cooke, by whom he had two sons. Bacon's eldest son, Nicholas (*c.* 1540–1624), was member of parliament for the county of Suffolk and in 1611 was created premier baronet of England. His second and third sons, Nathaniel (c. 1550–1622) and Edward (c. 1550–1618), also took some part in public life. His sons by his second wife were Anthony (1558–1601), a diplomatist of some repute, and the illustrious Francis Bacon (*q.v.*).

See G. Whetstone, "Remembraunce of the life of Sir N. Bacon," in the *Frondes Caducae* (1816); J. A. Froude, *History of England, passim* (1881 f.).

BACON, ROBERT (1860–1919), American banker, was born in Boston (Mass.), on July 5, 1860. He graduated from Harvard in 1880, and the following year entered the banking business in Boston. In 1894 he joined the house of J. P. Morgan and Company in New York. He was assistant secretary of State, 1905–09, and then for a short time secretary of State. Ambassador to France from 1909–12, he was commissioned major in the U S. Reserves in 1917, being assigned to the staff of Gen. Pershing in France. He returned to America with the rank of colonel in 1918, and died in New York city on May 29, 1919.

BACON, ROGER (*c.* 1214–1294), English philosopher and man of science. known to his successors as *doctor mirabilis,* was born near Ilchester in the county of Somerset. About 1230, he seems to have been at Oxford, though not, as tradition asserts, at Merton or at Brasenose, neither of which had then been founded. After taking the degree of M.A., he went to Paris probably before 1236. There he also received the M.A., but there is no evidence for supposing that he ever became a doctor of divinity.

At Paris, where he remained (perhaps not uninterruptedly) until shortly after 1251, Bacon lectured on the pseudo-Aristotelian treatise *De Plantis* and wrote his *Quaestiones* on *Aristotle's Physics* and *Metaphysics*—writings which bear the impress of an immature but vigorous mind. About 1247, his scientific and philological interests began to awaken and it was probably during the years 1256–66, when ill-health required him to retire from academic activities, that he produced the *De Speculis, De Mirabili Potestate Artis et Naturae,* the *Metaphysica,* the *De Multiplicatione Specierum,* and certainly the *De Computo Naturali* which from internal evidence dates from 1263–64. On June 22, 1266, Guy de Foulques, who before his election as Pope Clement IV. had heard of Bacon's writings, wrote a second time to Bacon requesting him to send immediately a copy of his works, regardless of any forbidding Franciscan constitution (this is the first intimation that we have of Bacon being a Franciscan). Bacon's elation over the papal interest led him to begin the *Communia Naturalium* a proposed exhaustive account of the various branches of knowledge. He soon realized the size of the task which he had undertaken, and in Jan. 1267, laid aside the *Communia Naturalium* for the less pretentious encyclopaedia, the *Opus Maius.* In 1268, this latter work, together with the older *De Multiplicatione Specierum,* the *Opus Minus,* an alchemical treatise, and possibly the *Opus Tertium,* was despatched to the Pope. Bacon then proceeded with the *Communia Naturalium* and also produced his introduction to the pseudo-Aristotelian *Secretum Secretorum,* the Greek and fragmentary Hebrew grammars, and about 1272, the incomplete *Compendium Studii Philosophiae.*

In 12 jj, appeared Bishop Tempier's condemnation of 219 erroneous theories circulating in Paris. This seems to have stirred those in high office, for in the same year, we find Jerome de Ascoli, the Minister-General of the Franciscans, calling many of the Order to give an account of themselves, and among these was Bacon, summoned, according to the *Chronicle of the Twenty-four Generals,* because of certain suspected novelties. What these novelties were, we are not told. Certainly in the light of what we know about Grosseteste's interests, they could not have been of a scientific nature; and contrary to the common opinion, there seems to be nothing unique in the astrology or alchemy of Bacon. Again, his attack on the moral and intellectual standards of the Church could hardly have been the crux, for this was expressly written for the Pope, and moreover, the glorification of the Church was always Bacon's chief concern in promoting the study of languages, of mathematics, optics, geography and chronology Judging from his works, there can be little doubt that one of the main reasons for his condemnation was his obnoxious attack on his contemporaries — Franciscans, as well as Dominicans and seculars. Thus he refers to Richard of Cornwall as "an absolute fool," to Alexander of Hales, whom he admits was one of the great promoters of the Order, as "ignorant of natural philosophy and metaphysics," to Albert the Great, or St. Thomas as a "teacher yet unschooled" and one whose works are full of "puerile vanity and voluminous superfluity," to William of Moerbecke as an ignorant man undermining philosophy by his false translations, to the Dominicans of Paris as the greatest corruptors of the biblical text, and lastly, to the seculars as neglecting theology and philosophy, and relying on the Orders. Such remarks were bound to bring him into disfavour, but whether or not they were the accusations laid against him, we know that his works were condemned and he himself imprisoned from 1277 to 1292 when the Minister-General died. On his release, Bacon began the *Compendium Studii Theologiae,* but owing to his death in the same year that work was never finished.

No doubt the condemnation of Bacon's works is responsible for the lack of any marked influence on his immediate successors; however, as Prof. Duhem (see *infra)* says, there are resemblances between his astronomy and that of the Franciscan, Bernard of Verdun, and between his perspective and that of Pecham and William of Saint-Cloud. About 1315, William of Herbert, a Franciscan master at Oxford, was able to secure some of his manuscripts for the friary at Hereford, and about the same time, Peter Dubois, a pupil of Siger de Brabant, became interested in his experimental and mathematical teaching. By the end of the century, Franciscan chroniclers placed Bacon among the famous natural philosophers of the Order, and by the 15th century, disputants quoted him in the schools at Oxford, while an official letter of the university mentioned him among the "modern Oxonians" who had kept untarnished the brightness of Oxford's fame.

In estimating the importance of Bacon, it is well to state at once that it is foolish to regard him as a meteor, a rebel against the whole spirit of scholasticism, or an assertor of the freedom of thought. He is essentially the product of his day. During his residence in Paris, the famous teachers were Alexander of Hales who was attempting to correlate the old Augustinianism with the newly introduced philosophy of Aristotle, William of Auvergne, a great admirer of Aristotle and Avicebron, John de Garlandia, the zealous grammarian, Albert the Great whom Bacon refers to as "the first master of philosophy" and whose interests in science were considerable, Petrus Peregrinus of Maricourt, a mathematician, and Bonaventure. When he returned to Oxford, Grosseteste, Adam Marsh (de Marisco) and Thomas of York, had already established the claims of science and the freedom of thought. That Bacon simply took up the Oxford tradition is borne out by the late appearance of his scientific and philological interests, interests formed only in the works written after he had become a Franciscan and after he had access to the writings of the aforesaid men whom he calls "maiores clerici de mundo et perfecti in scientia divina et humana," and whom he ranks among the "anglicani qui satis inter alios homines sunt et fuerunt studiosi," contrasting them with the "capita vulgi philosophancium Parisius."

Between Bacon and Grosseteste, there are many striking similarities, especially in their theories of the value of philological and linguistic studies, of calendar reform, of meteorology, of the propagation of force, of optics, and of the importance of mathematics and experiment in natural science. In some of these spheres, however, Bacon makes a great advance on Grosseteste. Thus as far as the study of languages is concerned, apart from insisting on the necessity of linguistic science for the adequate comprehension of Scripture and philosophy, Bacon produced a Greek grammar, started a Hebrew one, and made a continual attack on the corrupt text of the Bible and the bad translations of Aristotle. As for optics, he had the advantage of enriching

the theories of Grosseteste with those of Alkindi and Alhazen, advancing beyond all of them in his study of parabolic mirrors and in his theory of the agent's propagation of species as a force which is nothing other than the momentarily modified medium between the agent and the patient. His concern for mathematics and experiment, often regarded as his crowning glory, is not as remarkable as one might be led to suppose. It is true that he insists that the man who knows not matheinatics cannot know other sciences, but his mathematical interest seems to be less in abstract than in applied mathematics. As far as experiment is concerned, Bacon may speak of it as the lord of all sciences, the door to knowledge, and the criterion of truth, but Mr. Thorndike *(Kist. of Magic and Experimental Science)* has shown that Bacon's advances beyond the contemporary practical experiments made by artisans and alchemists, were largely of an imaginary kind consisting chiefly in testing the results of speculation by practical utility rather than in induction through regulated and purposive observation. Perhaps the really outstanding manifestation of Bacon's scientific bent lies in that extraordinary foresight which led him to see the magnifying properties of convex lenses, the inherent power in gunpowder, and the possibility of flying machines and mechanically propelled boats, or of circumnavigating the globe.

Nevertheless, this same ability, which shows itself in other spheres as a knack of correlating the sciences, of grasping the unity in history or of seizing upon the causes of human error, was Bacon's weak point as far as philosophy was concerned. United with his energetic but imperious temperament, it shows itself as a confidence in his own peculiar capacity to interpret Aristotle rightly, as a tendency to dismiss theories with which he disagrees and as an inability to consider calmly the implications and value of his own philosophical innovations. Thus, after proclaiming that the individual is the most real thing in the universe, he dismisses the problem of individuation as stupid; again, he posits in things both a *materia prima universalis* together with a *forma universalis* and a *materia prima singularis* together with a *forma singularis* with elaborate sub-divisions under each of them, and by denying that they are differentiations *secundum modum loquendi* leaves us with two unrelated sets of entities in things. Bacon's most valuable philosophical contributions are his adoption of the Augustinian theory of *rationes seminales,* his analysis of the process of becoming, his rejection of the monistic doctrine of the numerical unity of matter in all things, his discussion as to whether generated forms appear instantaneously and as to what happens to the forms of elements which combine to produce mixtures, his assertion of a *forma corporeitatis* in man intended to preserve the independence of the rational soul, his emphasis on the activity of the soul in knowing, his support of the Divine illurnination theory (he regards the active intellect not as a part of the soul but as God or an angel), his belief in innate exemplars for a knowledge of all spiritual beings including God, the angels and our own soul, and his views on the similarity between the knowledge of the angels and that of separated souls, and the divine knowledge of creatures.

BIBLIOGRAPHY.—A full bibliography of the works of Bacon is to be found in A. G. Little's *Roger Bacon Commemoration Essays* (Oxford, 1914). Nearly all of them are now in print, the most important being: *Opus Majus* ed. J. H. Bridges, (Oxford, 1897) with a third vol. containing a revision of the first three parts (1900); (The *Multiplicatione Specierum* is printed at the end of Vol. ii. of the *Opus Majus*); *Opus Majus* translation by R. B. Burke (Philadelphia, 1928); *Opus Minus* ed. J. S. Brewer (1859); *Opus Tertium* ed. J. S. Brewer (1859) further fragments of this work, which like the *Opus Minus* is an introd. and supp. to the *Opus Majus,* were edited by Duhem *Un Fragment inédit de l'opus Tertium* (Quaracchi, 1909) and by A. G. Little in Vol. iv. of the *Brit. Soc. of Franciscan Studies* (Aberdeen, 1912); *Compendium Studii Philosophiae* ed. J. S. Brewer (1859); *Compendium Studii Theologiae* ed. H. Rashdall in Vol. iii. of the *Brit. Soc. of Franciscan Studies; The Greek Grammar of R. Bacon and a Fragment of his Hebrew Grammar* (ed. E. S. Nolan and S. A. Hirsch), (Cambridge, 1902). Mr. R. Steele has edited the following writings: *Metaphysica, Communia Naturalium* (3 fasc.); *Secretum Secretorum cum Glossis et Notulis Fratris Rogeri, Compotus Fratris Rogeri, Quaestiones super undecimum prime philosophie Aristotrlis* (Met. xii.). The best general work on Bacon is A. G. Little, *Roger Bacon Commemoration Essays* (Oxford, 1914). *See* also E. Charles, *Roger Bacon, sa vie, ses ouvrages, ses doctrines etc.* (1861); K. Werner, *Die Psych . . . des Roger Bacon* and *Dte Kosmologie . . . des Roger Bacon* (Vienna, 1879); S. Vogl, *Die Physik des Roger Bacon* (Erlangen, 1906); Krembs, *R. Ward *Old English Drama* (Oxford, 1878). (D. E. SH.)

BACON. The smoked meat product which is prepared from the sides, belly or back of hogs. A variety of bacon known as "bacon squares," which is used chiefly in cooking (as a garnish or flavouring agent), is prepared from the jowls. In the British trade, bacon ordinarily consists of the entire side or half of the hog, or the half with only the shoulder end removed. In the United States, bacon for the domestic trade consists of the smaller cuts previously mentioned.

In the days before modern methods of food preservation were introduced salt was universally used for preserving meat not required for immediate consumption. When farming practice did not include the provision of more than very limited supplies of winter keep for stock, farmers every autumn killed off all but a small number of their cattle, sheep and pigs and salted down the flesh for their meat supply until the following spring. Pigs were cut up, put in tubs of brine for a time and afterwards smoked in the open chimney. The principle of curing bacon is practically the same to-day although it is now carried out almost entirely at factories on a large scale. The "sides" (*i.e.,* one half the pig divided along the backbone without the head) are placed in large tanks containing a strong solution of salt. Salt is also thoroughly rubbed into them by hand, or brine is injected by means of a syringe. Hams are often cured separately and sugar or molasses are sometimes used as well as salt in the process. The details of treatment vary and the precise method of curing is often regarded as more or less of a trade secret on which a reputation for special quality and flavour is based.

The methods of cutting a side of bacon vary in different countries and in different districts, which give the name of the "cut." The most general is the "Wiltshire" cut. After chopping the carcass along the backbone and removing the head, feet, tail, vertebrae and shoulder-blades, the whole of the remaining side, including the ham, or gammon, and shoulder, is termed a "Wiltshire side." A very large proportion of the bacon cured in Great Britain, the whole of the supplies received from Denmark and other continental countries, a large proportion of the supplies from Canada and the Irish Free State, and part of the supplies from America are placed on the British market in this form.

Trade in Bacon.—According to the returns collected by the International Agricultural Institute the number of pigs in the world is about 140 millions, being about one-third the number of cattle or sheep. The returns are incomplete, an important omission being the number kept in China, which is unknown. As the importation of pigs from China was one of the chief factors in developing the present breeds of pigs in Europe and America the absence of statistical information from that country is regrettable. On the basis of available statistics about 54% of the world's pig stock is in North America and 40% in Europe. The numbers kept, and their distribution are affected by racial and religious considerations. Even the most precise statistics of the number of pigs would give little information as to the production of bacon. It may be surmised that much the largest proportion of the flesh of swine is consumed as pork and not converted into bacon. This is certainly the case in the United States which has the largest

stock of pigs of any country for which information is available. In England with its comparatively small stock, the total annual output of "pigmeat" is about 250,000 tons but how much of this is consumed as pork and how much as bacon is a matter of conjecture. As articles of commerce, however, the two commodities are distinct and consequently in dealing with international trade it is easy to discriminate.

Practically the whole of the international trade in bacon is with Great Britain as an importing country and other countries as exporters. Up to the middle of the 19th century the British Isles were self-supporting, and were indeed exporters of pig meat. In **1840** the imports of bacon and hams were **6,181** cwts., and the exports **27,832** cwts. in addition to 29,532 cwts. of pork imported and **80,440** cwts. exported. Practically all the imports of "bacon and hams" consisted of hams from Germany and all the pork was salted. Most of the exports went to India or the British West Indies. Since that time the importation of bacon and hams has steadily increased, with a slight falling off in the period 1864–70, due probably to the American Civil War. The United States began to send bacon and hams to the British Isles in **1846** and from that time to the end of the century dominated the trade. In 1854 the proportion of total imports received from that source was 90% and in 1880 reached **92%.** Thereafter there was a decline. In 1900 the proportion had fallen to **75%** and in 1910 to **43%.**

The reason for the relative decline in the British supplies from the United States was the appearance of competitors for the British trade. Both Canada and Denmark began about 1870 to send bacon and hams to the British market, but for a long time they were able to make very little progress. In 1870 Canada had secured only 1·3% and Denmark only 0·5% of the total trade Both had to meet the competition of a well-established rival. In a report published in **1926** by the Ministry of Agriculture on the marketing of pigs it is stated: "It is possible that the growth of the pig meat-packing industry about this time, which made it less profitable than formerly to export pig meat from America in the form of bacon and hams, assisted Canada and Denmark to penetrate a market almost monopolized by America. Canadian bacon and hams competed directly with American because of their similarity in quality, which accounts for the fact that until the War, Canada was unsuccessful in establishing a firm hold on the British market. The Danes on the other hand, created and supplied a new and important demand for a high quality, mild-cured, lean bacon; to only a slight extent did Danish bacon actually displace American. In fact, aided largely by the War, American bacon retained its hold on the north of England until the last few years, Danish bacon finding its principal market in London and the South." The relative position of the chief suppliers of bacon and hams to the British market just before the War was as shown in the table below. The total British imports in 1913 were, 5,712,885 cwts. and of this total each of the countries supplied the proportion indicated:—

United States	44·9%
Denmark	40·9
Canada	5·9
Russia	3·7
Sweden	0·1

In **1926** the quantity received from each of the principal sources of supply was as follows:—

It is noteworthy that while Denmark has increased its quota to 42%, and Canada to 11% the proportion from the United States has fallen to 25%.

Bacon Factories.— Although the private curing of bacon and hams still lingers in farmhouses, either because of their remoteness or of the tenacity of tradition the product is mainly, if not exclusively, for domestic consumption. The trade is based on the factory system. A bacon factory is an establishment equipped with the necessary plant and organization for slaughtering, dressing, curing, smoking and distributing pigs sent in by neighbouring farmers. The most striking instance of the development of a large trade in bacon based on the factory system is furnished by Denmark. There are at the present time **46** co-operative and 16 private bacon factories in that country. The first co-operative factory was built in 1887 when there were 770,000 pigs in Denmark. In 1927 there were 3,729,000 pigs and the co-operative bacon factories took about 85% of the annual output. The approximate membership of the co-operative societies which own factories is 140,000.

There are many bacon factories, some of them very large, in Great Britain but practically all of them are privately owned. The only part of the British Isles where co-operative factories have been established in any appreciable number is in Southern Ireland, now the Irish Free State. In England attempts have been made to establish co-operative bacon factories in different districts, but with only partial success. In a report published in **1925** by the Ministry of Agriculture some particulars were given of the co-operative bacon factories then existing in England:—

The first of these to be established was the St. Edmundsbury factory in Suffolk which was started in 1910. Two years later the Herts and Beds factory was started at Hitchin. The others were established since the War, and one ceased operations after a short period. But the difficulties encountered and the reasons for the comparative failure to establish bacon factories on a co-operative basis belong to the story of agricultural co-operation in Great Britain. (R. H. R.)

UNITED STATES

Curing.—In commercial practice in the United States, the cuts which are to be made into bacon, after a thorough chilling, are placed in a sweet pickle solution consisting of a carefully prepared mixture of salt brine, a sweetening agent, such as sugar or molasses, and a small quantity of nitrate or nitrite of soda. The salt protects the product and imparts an agreeable flavour; the sugar tends to soften the harshness of the salt and probably serves as a basis of fermentative changes which contribute an agreeable flavour. The nitrate or nitrite makes permanent the natural colour of the meat.

The basis of all pickles used in meat curing is a salt solution. The first step is to make up a salt solution of **saturation** salometer strength, *i.e.*, a saturated solution, which is then diluted to whatever strength may be desired for the various cures. Pure water and a good clean grade of salt are used. This pickle ordinarily is filtered through sponges to remove any suspended matter and is often filtered through a filter press and canvas cloth before being used on the meat.

The sugar and nitrate or nitrite, in the proportion desired by the packer and approved by practice and the regulations of the United States Bureau of Animal Industry, are dissolved in water and boiled for about five minutes. After boiling, the solution is added to the pickle and carefully mixed. The temperature of the finished pickle should be brought down to 36° F. and should be maintained there during the entire process of curing. The curing is done in vats of wood or concrete. The wooden vats, in

general, hold 1,400 pounds of product. The concrete vats are built for carrying capacities over 1,400 pounds. Formerly, considerable curing was done in tierces of standard size halding about 350 pounds of meat.

From 20 to 30 days are required to cure bacon properly, depending on the weight of the bacon and the method of cure. The rooms in which the curing is done must be kept at a steady temperature of 38° F. Bacon cuts are usually cured in a pickle of approximately 68° salometer strength. They are left in cure according to a ratio of approximately 2½ days to the pound. Thus, a ten-pound cut will be left in the cure for approximately 25 days. Bacon cuts in sweet pickle cure are overhauled at intervals during the curing period. Overhauling involves the transierring of cuts from one curing vat to another to make sure that all surfaces of the meat are exposed to the curing solution.

During recent years, a somewhat different method of cure has developed, known as the dry cure. Instead of using a sweet pickle, the meats are packed closely in water-tight containers, with a slight sprinkle of salt, sugar and nitrate or nitrite of soda between the pieces, and left to cure for roughly, 25 to 35 days. After curing, the meats are soaked in water to remove the surplus surface salt and a portion of the salt absorbed by the meat itself, and then thoroughly washed in water at 110° F. with the aid of brushes. After washing, the product is dried on the skin side by scraping with a bell-shaped scraping device. The product is then branded; that is, the trade mark of the packer is applied on the skin with indelible vegetable ink, sometimes with the use of heated iron dies.

Smoking, Chilling and Packing.— After being smoked for from 20 to 26 hours, depending on the weight of the cut and the intensity of smoke desired, the bacon is ready for the consumer. The temperature of the smokehouse varies from 100° to 125° F. Smoke from burning hardwood sawdust is used. Artificial smoke is prohibited by the regulations of the Bureau of Animal Industry. In the smoking process, as applied by some packers, a flexible cloth container, known as a stockinet, is applied to the bacon. The stockinet gives the bacon a smooth and neat appearance. Curing and smoking constitute a highly scientific process and one which demands careful handling and close attention. For example, the temperature of the curing solution is kept fairly constant and the initial strength of the curing solution is carefully controlled.

After smoking, the bacon is chilled to approximately 55° F. It is then wrapped: first in grease proof paper, then in a rag ham paper and finally in an attractively coloured and printed parchment paper covering, for sale in whole pieces or for slicing in the retail meat shop. The wrapping serves to some extent as a protective covering and helps insure arrival at the market in a clean and attractive condition. Sometimes bacon cuts are marketed without this wrapping, particularly when the product is consumed near the point of production. The bacon also may be sliced in the packing plant and packed in glass jars, paper cartons, or wrapped in a transparent wrapper in quantities suitable for small families. The packing and other operations are carried on under highly sanitary conditions. Through the use of gloves, forceps, etc., the product is often "not touched by human hands."

Food Value: Production Figures.— The chief value of bacon as a food lies in its store of readily available energy or calories. A pound of bacon will contain about 3,000 calories, which is about three times as much as the average person will consume in an entire meal. This high energy content is due to the large proportion of fat present. The fat in the bacon is very readily and completely digested. The protein in bacon is of a very high quality and high digestibility. The lean part of the bacon contains appreciable quantities of vitamin B and the fat part usually supplies modest amounts of vitamin A. The lean part also furnishes some mineral elements, especially phosphorus and iron. Of course, the quantities of these minerals and vitamin B in a pound of bacon are not very great, and depend upon the relative amount of lean present. **A** 250-pound hog will yield only from 12 to 15 per cent of its weight in ruts suitable for bacon.

Figures or: the production of bacon in the United Statrs are not available. Ho ever, according to the latest census reports (1925), the annual production of smoked pork, which includes, in addition to bacon, smoked hams, shoulders and butts, approximates 1,236,000,000 pounds, valued at the plant at $336,122,000. Bacon always has been an important item in exports of meat from the United States.[W] During 1919 exports of American bacon exceeded 1,230,000,000 pounds. Exports declined gradually after this time. In 1927, they approximated 105,649,020 pounds. (0. G. M.)

BACONIAN METHOD is the method of "interpreting nature" (or studying natural phenomena) formulated by Francis Bacon (*q.v.*). It was intended to replace the method of citing the views of "authorities" or of having recourse to fanciful guesses. It insisted on dismissing prejudices and preconceptions of all kinds, and on the close and methodical observation of the facts concerned. It was essentially an empirical method, and consisted of three main steps: first comes a description of the facts; next, a tabulation or classification of them into three classes showing (i.) instances of the presence of the characteristic or quality, etc., under investigation, (ii.) instances of its absence, and (iii.) instances of its presence in varying degrees; thirdly, the rejection or elimination of whatever appears, in the light of these tables, not to be connected with the phenomenon under investigation, and the determination of what is connected with it. In their essence Bacon may be credited with the recognition of the methods of agreement, the joint method, and the method of concomitant variations. (See SCIENTIFIC METHOD.) But he exaggerated the mechanical element in scientific investigation when he assumed that by following his method anybody might make sound scientific discoveries, much in the same way as anybody might, with the help of a pair of compasses, construct an almost perfect circle.

BACONTHORPE (BACON, BACO, BACCONIUS), **JOHN** (d. 1346), known as "the resolute doctor," a learned Carmelite monk, was born at Baconsthorpe in Norfolk. He seems to have been the grandnephew of Roger Bacon (Brit. Mus. Add ms. 19. 116). Brought up in the Carmelite monastery of Blakeney, near Walsingham, he studied at Oxford and Paris, and in 1329 was chosen 12th provincial of the English Carmelites. He appears to have anticipated Wycliffe in advocating the subordination of the clergy to the king. In 1333 he was sent for to Rome, where, we are told, he first maintained the pope's authority in cases of divorce; but this opinion he retracted. He died in London in 1346. His work, the Commentary on the Sentences by Peter the Lombard, was published at Venice, 1527. While it rejects the doctrine of monopsychism, it contends that the arguments of Thomas Aquinas against Averroes are not conclusive. It excuses Averroes whenever possible, hence, nearly three centuries later, it was still studied at Padua, the last home of Averroism.

See K. Prantl, *Ges.* d. *Logik,* iii. **318.**

BACSANYI, JANOS (1763–184j), Hungarian poet, founded a patriotic paper, the *Magyar* Museum, at Raschau in 1788 with the assistance of Baróti and Razinczy. The paper was suppressed in 1792, and in 1794 Bacsányi was imprisoned for a share in the conspiracy of Bishop Martinovich. He spent two years in the Spielberg. His life was uneventful until 1809 when he translated Napoleon's proclamation in Vienna. He fled to Paris, was surrendered in 1814, but was allowed to live on parole at Linz. His first work, a patriotic poem, "The Valour of the Magyars" appeared in 1785. He died at Linz, May 12, 1845.

BACTERIA AND DISEASE. Bacteria are minute one-celled organisms consisting of spherical, oblong, or cylindrical cells, widely distributed in air, water and soil. The action of bacteria as pathogenic agents is in great part merely an instance of their general action as producers of chemical change, yet bacteriology as a whole has become so extensive, and has so important a bearing on subjects widely different from one another, that division of it has become essential. The science will accordingly be treated in this section from the pathological standpoint only. It will be considered under the two following heads, viz., (1) the methods employed in the study; (2) the modes of action of bacteria and the effects produced by them. The facts and theories with regard to immunity against bacterial disease are dealt with in a separate article (*see* IMMUNITY).

Historical Summary. — The demonstration by Pasteur that definite diseases could be produced by bacteria, proved a great stimulus to research in the etiology of infective conditions, and the result was a rapid advance in knowledge. An all-important factor in this remarkable progress was the introduction by Koch of solid culture media, of the "plate-method," etc., an account of which he published in 1881. By means of these the modes of cultivation, and especially of separation, of bacteria were greatly simplified. Various modifications have since been made, but the routine methods in bacteriological procedure still employed are in great part those given by Koch. By 1876 the anthrax bacillus had been obtained in pure culture by Koch, and some other pathogenic bacteria had been observed in the tissues, but it was in the decade 1880–90 that the most important discoveries were made in this field. Thus the organisms of suppuration, tubercle, glanders, diphtheria, typhoid fever, cholera, tetanus, and others were identified, and their relationship to the individual diseases established. In the last decade of the 19th century the chief discoveries were of the bacilli of influenza (1892), of plague (1894) and of dysentery (1898). Immunity against diseases caused by bacteria has been the subject of systematic research from 1880 onwards. The modes by which bacteria produce their effects also became a subject of study, and attention was naturally turned to their toxic products. The earlier work, notably that of Brieger, chiefly concerned ptomaines (vide *infra*), but no great advance resulted. A new field of inquiry was, however, opened up when by filtration a bacterium-free toxic fluid was obtained which produced the important symptoms of the disease — in the case of diphtheria by Roux and Yersin (1888), and in the case of tetanus a little later by various observers. Research was thus directed towards ascertaining the nature of the toxic bodies in such a fluid, and Brieger and Fraenkel (1890) found that they were proteids, to which they gave the name "toxalbumins." Though subsequent researches have on the whole confirmed these results, it is still a matter of dispute whether these proteids are the true toxins or merely contain the toxic bodies precipitated along with them.

Immunity against toxins also became a subject of investigation, and the result was the discovery of the antitoxic action of the serum of animals immunized against tetanus toxin by Behring and Kitazato (1890), and by Tizzoni and Cattani. A similar result was also obtained in the case of diphtheria, and diphtheria antitoxin was introduced as a therapeutic agent in 1894. The technique of serum preparation has become since that time greatly elaborated and improved. The laws of passive immunity were shown to hold also in the case of immunity against living organisms by Pfeiffer (1894), and various anti-bacterial sera have been introduced. Of these the anti-streptococcic serum of Marmorek and anti-plague serum are the best known. The principles of protective inoculation have been developed and practically applied on a large scale, notably by Haffkine in the case of cholera (1893) and plague (1896), and more recently by Wright and Semple in the case of typhoid fever. One other discovery of great importance may be mentioned, viz. the agglutinative action of the serum of a patient suffering from a bacterial disease, first described in typhoid fever independently by Widal and by Grünbaum in 1896. Thus a new aid was added to medical science, viz. serum diagnosis of disease.

During the present century one of the most important discoveries was that of *Spirochaeta pallida* (or *Treponema pallidum*) in syphilis by Schaudinn and Hoffman in 1905. Other important discoveries which have been made in the course of recent years are as follows: —

Acute Infectious Jaundice or **Weil's** Disease. — This disease, which came into some prominence as a war disease, especially on the Western Front, was found by Inada and Ido (1914) to be due to a motile spirochaetal organism Leptospira *icterohaemorrhagiae*. In certain localities it appears to be a parasite in the kidneys of wild rats, and infection of food and water by the urine of such rats is the most likely mode of transmission. A similar organism has recently been found to be the cause of a disease in young dogs called *The* Yellows.

Yellow **Fever.**—Noguchi after 1918 brought forward excellent evidence that another Leptospira (L. icteroides) is responsible for yellow fever (*q.v.*), and the employment of therapeutic serum, prepared by immunizing horses with this *leptospira*, has very favourably influenced the course of the disease. Also good reports have been received of the use of prophylactic vaccines in lowering the incidence.

Tularaemia.—McCoy (1911) in the course of examining ground squirrels in California for evidence of plague infection discovered another plague-like disease in these rodents which was not due to B. *pestis*. In the following year, he and Chapin isolated the specific organism and it was given the name of B. *tularense* from Tulare co. in California where the epidemic in the ground squirrels was prevalent. During the years preceding the demonstration of the organism, cases of severe lymphangitis in man apparently following insect bites had been observed in the state of Utah. Since the discovery of the parasite several human cases of infection have occurred in some of the American states. The disease is rarely fatal but a very protracted convalescence is the rule. The mode of infection in the field is almost certainly by the bite of the horse-fly (*Chrysops discalis*) which has fed on infected ground squirrels or jack rabbits. In the laboratory, also, workers engaged on research into this disease have been attacked, *e.g.*, at the Washington Hygiene Laboratories and at the Lister Institute, London.

Melioidosis.—This disease was first described in 1913 by Whitmore as a "glanders-like disease" occurring in Rangoon, and indeed the clinical relationship to glanders, both in man and in horses, is very close. Their morbid anatomy also is very similar. It runs a more acute course, however, than glanders, and is usually fatal.

Rat-bite Fever. — This is a prolonged, febrile disease, of which inflammation of the lymphatics and a well-marked rash on the skin, together with wasting, are prominent symptoms. The course of the disease is very irregular and the fever intermittent. A spirochaete has been described and is generally accepted as the causal micro-organism.

Gas Gangrene. — During the World War the occurrence of large numbers of infections of wounds led to a close study of the bacteria responsible for them. The anaerobic bacilli in particular were investigated anew, and much confusion in their classification and nomenclature cleared up. To three species especially, B. *perfringens* (B. welclzii), Vibrion septique (B. oedematis maligni) and B. *oedematiens*, most of the cases of gas gangrene were found to be due. From these three species, moreover, toxins and antitoxins were prepared which were found to be of service clinically.

Methods of Study. — The methods employed in studying the relation of bacteria to disease are in principle comparatively simple, but experience and great care are necessary in applying them and in interpreting results. In any given disease there are three chief steps, viz. (1) the discovery of a bacterium in the affected tissues by means of the microscope; (2) the obtaining of the bacterium in pure culture; and (3) the production of the disease by inoculation with a pure culture. By means of microscopic examination more than one organism may sometimes be observed in the tissues, but one single organism by its constant presence and special relations to the tissue changes can usually be selected as the probable cause of the disease, and attempts towards its cultivation can then be made. Such microscopic examination requires the use of the finest lenses and the application of various staining methods. In these latter the basic aniline dyes in solution are almost exclusively used, on account of their special affinity for the bacterial protoplasm.

Sometimes a simple watery solution of the dye is sufficient, but very often the best result is obtained by increasing the staining power, *e.g.*, by addition of weak alkali, application of heat, etc., and by using some substance which acts as a mordant and tends to fix the stain to the bacteria. Excess of stain is afterwards removed from the tissues by the use of decolorizing agents, such as acids of varying strength and concentration, alcohol. etc. Different bacteria behave very differently to stains; some take

them up rapidly, others slowly, some resist decolorization, others are easily decolorized. Sometimes the stain can be removed from the tissues, leaving the bacteria alone coloured. *(See* CYTOLOGY.)

Dark Ground Illumination. — Much use has been made of this method of studying bacteria, whether in the live or fixed state. Its chief practical applications have been in the demonstration of slender objects such as the *Spirochaeta pallida* in material from syphilitic sores (see VENEREAL DISEASES), the detection of motility and the enumeration of bacteria in emulsions such as vaccines. To obtain the dark ground effect, the microscope requires to be fitted with a special form of condenser, and a powerful source of illumination is necessary. The rays from the source of light after reflection at the substage mirror can enter only the peripheral portion of the condenser and, owing to their obliquity, are then either wholly reflected from the upper surface of the cover-glass or, according to the type of condenser, refracted beyond the range of the objective lens. Should, however, small objects come in the way, such as bacilli possessing a different refractility from that of the fluid, the rays are dispersed by them, and are able to enter the objective. Bacilli then appear as white spots on a dark background.

Cultivation. — In cultivating bacteria outside the body various media to serve as food material must be prepared and sterilized by heat. The general principle in their preparation is to supply the nutriment for bacterial growth in a form as nearly similar as possible to that of the natural habitat of the organisms —in the case of pathogenic bacteria, the natural fluids of the body. The media are used either in a fluid or solid condition, the latter being obtained by coagulation, or the addition of a gelatinizing agent, and are placed in glass tubes or flasks plugged with cotton-wool. To mention examples, blood serum solidified at a suitable temperature is a highly suitable medium, and various media are made with extract of meat as a basis, with the addition of gelatine or agar as solidifying agents and of non-coagulable proteids (commercial "peptone") to make up for proteids lost by coagulation in the preparation. The reaction of the media must in every case be carefully attended to, a neutral or slightly alkaline reaction being, as a rule, most suitable; for delicate work it may be necessary to standardize the reaction by tritration methods. The media from the store-flasks are placed in glass test-tubes or small flasks, protected from contamination by cotton-wool plugs, and are sterilized by heat. For most purposes the solid media are to be preferred, since bacterial growth appears as a discrete mass and accidental contamination can be readily recognized. Cultures are made by transferring by means of a sterile platinum wire a little of the material containing the bacteria to the medium. The tubes, after being thus inoculated, are kept at suitable temperatures, usually either at 37° C., the temperature of the body, or at about 20° C., a warm summer temperature, until growth appears. For maintaining constant temperature, incubators (*q.v.*) with regulating apparatus are used. Subsequent cultures ("subcultures") may be made by inoculating fresh tubes, and in this way growth may be maintained often for an indefinite period. The simplest case is that in which only one variety of bacterium is present, and a "pure culture" may then be obtained at once. When, however, several species are present together, means must be adopted for separating them. For this purpose the most important is the *plate-method* of Koch. In this method the bacteria are distributed in a gelatine or agar medium liquefied by heat, and the medium is then poured out on sterile glass plates or in shallow glass dishes, and allowed to solidify. Each bacterium capable of growth gives rise to a colony visible to the naked eye, and if the colonies are sufficiently apart, an inoculation can be made from any one to a tube of culture-medium, and a pure culture obtained. Of course, in applying the method means must be adopted for suitably diluting the bacterial mixture. Another important method consists in inoculating an animal with some fluid containing the various bacteria. A pathogenic bacterium present may invade the body, and may be obtained in pure culture from the internal organs. This method applies especially to pathogenic bacteria whose growth on culture media is slow, *e.g.*, the tubercle bacillus. (See also below.)

Isolation and Cultivation of Single Bacterial Cells. — For the cultivation of "pure line" strains of micro-organisms it is essential to start from a single microbe. In Barber's method (1904) a single bacillus in an appropriately diluted emulsion is picked up into an extremely fine capillary pipette working on a special holder under microscopic control. In the method adopted by Burri, dilutions of the culture are mixed with india ink and drops of these are laid on gelatine or agar plates. Under the microscope these drops are examined, and if one is found containing a single bacillus it is marked and allowed to grow into colony form, or the single organism may be removed directly to a nutrient medium.

A recent method, elaborated by Barnard, depends on the fact that ultraviolet light destroys bacteria. A single bacillus is marked down, and between it and the entering rays a minute droplet of mercury is placed under microscopic control. The bacillus is thus protected, while the surrounding organisms are killed. It can then be dealt with culturally.

Methods of Culture. — Numerous improvements in cultural methods have been introduced of late years, such as the addition of egg to a nutrient basis of agar, or the use of solid, inspissated mixed white and yolk of egg, especially for the growth of tubercle bacilli. A medium composed of broth and serum, covered with liquid paraffin, and containing a piece of sterile, unheated rabbit's kidney was introduced by Noguchi for the growth of spirochaetes, and has been recommended for other organisms of difficult culture.

Anaërobiosis.—Anaërobic culture methods have been improved by the introduction of various patterns of jars to contain Petri dishes or test-tubes; the object of these is to facilitate the removal of all, or a part, of the oxygen with an air pump, and replace it with hydrogen or other indifferent gas. The removal of the oxygen is also attained by using the catalytic action of spongy platinum (or palladium) to produce slow combination of oxygen with hydrogen. After removing the greater part of the air with a pump and replacing it with hydrogen, the jar is closed and the catalyst contained in a small wire-gauze cage heated by an electric current. The remaining oxygen then combines with hydrogen and this action keeps the platinum hot until the oxygen is used up.

The full description of a particular bacterium implies an account not only of its microscopical characters, but also of its growth characters in various culture media, its biological properties, and the effects produced in animals by inoculation. To demonstrate readily its action on various substances, certain media have been devised. For example, various sugars — lactose, glucose, saccharose, etc.—are added to test the fermentative action of the bacterium on these substances; litmus is added to show changes in reaction, specially standardized media being used for estimating such changes; peptone solution is commonly employed for testing whether or not the bacterium forms indol; sterilized milk is used as a culture medium to determine whether or not it is curdled by the growth. Sometimes a bacterium can be readily recognized from one or two characters, but not infrequently a whole series of tests must be made before the species is determined. As our knowledge has advanced it has become abundantly evident that the so-called pathogenic bacteria are not organisms with special features, but that each is a member of a group of organisms possessing closely allied characters. From the point of view of evolution we may suppose that certain races of a group of bacteria have gradually acquired the power of invading the tissues of the body and producing disease. In the acquisition of pathogenic properties some of their original characters have become changed, but in many instances this has taken place only to a slight degree, and, furthermore, some of these changes are not of a permanent character. In the case of bacteria we can only judge of organisms being of different species by the stability of the characters which distinguish them, and numerous examples might be given where their characters become modified by comparatively slight change in their environment. The cultural as well as the microscopical characters of a pathogenic organism may be closely similar to other non-pathogenic members of the same group, and it thus comes to be a matter of ex-

treme difficulty in certain cases to state what criterion should be used in differentiating varieties. The tests which are applied for this purpose at present are chiefly of two kinds. In the first place, such organisms may be differentiated by the chemical change produced by them in various culture media. Thus a very important, and usually very reliable, method of distinguishing between allied races and species of bacteria is that founded on their fermentative action (production of acid or acid and gas) on various carbohydrates and alcohols. Secondly the various serum reactions to be described below have been called into requisition.

Inoculation. — In testing the effects of bacteria by inoculation the smaller rodents, rabbits, guinea-pigs, and mice, are usually employed. One great drawback in certain cases is that such animals are not susceptible to a given bacterium, or that the disease is different in character from that in the human subject. In some cases, *e.g.*, Malta fever and relapsing fever, monkeys have been used with success, but in others, *e.g.*, leprosy, none of the lower animals has been found to be susceptible. Discretion must therefore be exercised in interpreting negative results in the lower animals. For purposes of inoculation young vigorous cultures must be used. The bacteria are mixed with some indifferent fluid, or a fluid culture is employed. The injections are made by means of a hypodermic syringe into the subcutaneous tissue, a vein, one of the serous sacs, or more rarely into some special part of the body. The animal, after injection, must be kept in favourable surroundings, and any resulting symptoms noted. It may die, or may be killed at any time desired, and then a post-morten examination is made, the conditions of the organs, etc., being observed and noted.

Separation of Toxins. — Though the causal relationship of a bacterium to a disease may be completely established by the methods given, another very important part of bacteriology is concerned with the poisons or toxins formed by bacteria. These toxins may become free in the culture fluid, and the living bacteria may then be got rid of by filtering the fluid. The effects of the filtrate are then tested by the methods employed in pharmacology. In other instances the toxins are retained to a large extent within the bacteria, and in this case the dead bacteria are injected as a suspension in fluid. Methods have been introduced for the purpose of breaking up the bodies of bacteria and setting free the intracellular toxins. For this purpose Koch ground up tubercle bacilli in an agate mortar and treated them with distilled water until practically no deposit remained. Rowland and Macfadyen for the same purpose introduced the method of grinding the bacilli in liquid air. At this temperature the bacterial bodies are extremely brittle, and are thus readily broken up. Toxic substances have also been separated by corresponding methods from the bodies of those who have died of certain diseases, and the action of such substances on animals is in some cases an important point in the pathology of the disease.

Bacteria as Agents of Disease. — The fact that in anthrax, one of the first diseases to be fully studied, numerous bacilli are present in the blood of infected animals, gave origin to the idea that the organisms might produce their effect by using up the oxygen of the blood. Such action is now known to be quite subsidiary. And although effects may sometimes be produced in a mechanical manner by bacteria plugging capillaries of important organs, *e.g.*, brain and kidneys, it is now accepted that all the important results of bacteria in the tissues are due to poisonous bodies or toxins formed by them. Here, just as in the general subject of fermentation, we must inquire whether the bacteria form the substances in question directly or by means of non-living ferments or enzymes. With regard to toxin formation the following general statements may be made: In certain instances, *e.g.*, in the case of the tetanus and diphtheria bacilli, the production of soluble toxins can be readily demonstrated by filtering a culture in bouillon germ-free by means of a porcelain filter, and then injecting some of the filtrate into an animal. In this way the characteristic features of the disease can be reproduced. Such toxins being set free in the culture medium are often known as *extracellular*. In many cases, however, the filtrate, when injected, produces comparatively little effect, whilst toxic action is observed when the bacteria in a dead condition are used; this is the case with the organisms of tubercle, cholera, typhoid and many others. The toxins are here manifestly contained within the bodies of the bacteria. *i.e.*, are intracellular, though they may become free on disintegration of the bacteria. The distinction between the two varieties, though convenient, must not be pushed too far, as we know little regarding their mode of formation. Although the formation of toxins with characteristic action can be shown by the above methods, yet in some cases little or no toxic action can be demonstrated. This, for example, is the case with the anthrax bacillus; although the effect of this organism in the living body indicates the production of toxins which diffuse for a distance around the bacteria. This and similar facts have suggested that some toxins are only produced in the living body. A considerable amount of work has been done in connection with this subject, and many observers have found that fluids taken from the living body in which the organisms have been growing, contain toxic substances, to which the name of aggressins has been applied. Fluid containing these aggressins greatly increases the toxic effect of the corresponding bacteria, and may produce death at an earlier stage than ever occurs with the bacteria alone. They also appear to have in certain cases a paralyzing action on phagocytes. Not only are the general symptoms of poisoning in bacterial disease due to toxic substances, but also the tissue changes, many of them of inflammatory nature, in the neighbourhood of the bacteria. Thus diphtheria toxin produces inflammatory oedema which may be followed by necrosis; dead tubercle bacilli give rise to a tubercle-like nodule, etc. Furthermore, a bacillus may give rise to more than one toxic body, either as stages in one process of change or as distinct products.

Nature of Toxins. — Regarding the chemical nature of toxins less is known than regarding their physiological action. In spite of an enormous amount of work on the subject, no important bacterial toxin has as yet been obtained in a pure condition, and, though many of them are probably of proteid nature, even this cannot be asserted with absolute certainty. Brieger, in his earlier work, found that alkaloids were formed by bacteria in a variety of conditions, and that some of them were poisonous. These alkaloids he called *ptomaines*. The methods used in the investigations were, however, open to objection, and it is now recognized that although organic bases may sometimes be formed, and may be toxic, the important toxins are not of that nature. A later research by Brieger along with Fraenkel pointed to the extracellular toxins of diphtheria, tetanus and other diseases being of proteid nature, and various other observers have arrived at a like conclusion. The general result of such research has been to show that the toxic bodies are, like proteids, precipitable by alcohol and various salts; they are soluble in water, are somewhat easily dialysable, and are relatively unstable both to light and heat. Attempts to get a pure toxin by repeated precipitation and solution have resulted in the production of a whitish amorphous powder with highly toxic properties. Such a powder gives a proteid reaction, and is no doubt largely composed of albumoses, hence the name *toxalbumoses* has been applied. The question has, however, been raised whether the toxin is really itself a proteid, or whether it is not merely carried down with the precipitate.

These facts show the great difficulty of the problem, which is probably insoluble by present methods of analysis; the only test, in fact, for the existence of a toxin is its physiological effect. It may also be mentioned that many toxins have now been obtained by growing the particular organism in a proteid-free medium, a fact which shows that if the toxin is a proteid it may be formed synthetically by the bacterium as well as by modification of proteid already present. With regard to the nature of intracellular toxins, there is even greater difficulty in the investigation and still less is known. Many of them probably also of proteid nature, are much more resistant to heat; thus the intracellular toxins of the tubercle bacillus retain certain of their effects even after exposure to 100° C. Like the extracellular toxins they may be of

remarkable potency; for example, fever is produced in the human subject by the injection into the blood of an extremely minute quantity of dead typhoid bacilli.

Enzymes.—We cannot as yet speak definitely with regard to the part played by enzymes in these toxic processes. Certain toxins resemble enzyrnes in their conditions of precipitation and relative instability, and the fact that in most cases a considerable period intervenes between the time of injection and the occurrence of symptoms has been adduced in support of the view that enzymes are present. In diphtheria Sidney Martin obtained toxic albumoses in the spleen, which he considered were due to the digestive action of an enzyme formed by the bacillus in the membrane and absorbed into the circulation. According to this view, then, a part at least of the directly toxic substance is produced in the living body by enzymes present in the so-called toxin obtained from the bacterial culture. Recent researches go to show that enzymes play a greater part in fermentation by living ferments than was formerly supposed, and by analogy it is likely that they are also concerned in the processes of disease. The trend of modern work on this subject is to show that specific enzymes are probably necessary for the first stage in the attack on substances of different chemical or stereochemical constitution, but that the immediate products of this attack are frequently of the same character. These then become changed under the influence of a system of enzymes which is common to a considerable number of different organisms, yielding final products of a similar nature, but in differing proportions.

Thus, B. *coli* acts both on mannitol and glucose, probably by the aid of two distinct enzymes, but yields the same final products from both substances, in different proportions, corresponding to the difference in composition of the two compounds. On the other hand B. *lactis aerogenes*, which attacks the same two compounds and produces from them all the products yielded by B. *coli*, in addition converts a part of one of the intermediate compounds (probably acetaldehyde) into butylene glycol, which is not produced by B. *coli* and the formation of which is presumably due to the influence of a specific enzyme.

Bacterial Infection.— A bacterial infection when analysed is seen to be of the nature of an intoxication. There is, however, another all-important factor concerned, viz., the multiplication of the living organisms in the tissues; this is essential to, and regulates, the supply of toxins. It is important that these two essential factors should be kept clearly in view, since the means of defence against any disease may depend upon the power either of neutralizing toxins or of killing the organisms producing them. It is to be noted that there is no fixed relation between toxin production and bacterial multiplication in the body, some of the organisms most active as toxin producers having comparatively little power of invading the tissues.

The Production of **Disease.**—We shall now consider how bacteria may behave when they have gained entrance to the body, what effects may be produced, and what circumstances may modify the disease in any particular case. The extreme instance of bacterial invasion is found in some of the septicaemias in the lower animals, *e.g.*, anthrax septicaemia in guinea-pigs, pneumococcus septicaemia in rabbits. In such diseases the bacteria, when introduced into the subcutaneous tissue, rapidly gain entrance to the blood stream and multiply freely in it, and by means of their toxins cause symptoms of general poisoning. A widespread toxic action is indicated by the lesions found—cloudy swelling, which may be followed by fatty degeneration, in internal organs, capillary haemorrhages, etc. In septicaemia in the human subject, often due to streptococci, the process is similar, but the organisms are found especially in the capillaries of the internal organs and may not be detectable in the peripheral circulation during life. In another class of disease, the organisms first produce some well-marked local lesion, from which secondary extension takes place by the lymph or blood stream to other parts of the body, where corresponding lesions are formed. In still another class of diseases the bacteria are restricted to some particular part of the body, and the symptoms are due to toxins which are absorbed from it. Thus in cholera the bacteria are practically confined to the intestine, in diphtheria to the region of the false membrane, in tetanus to some wound.

Tissue Changes.— The effects produced by bacteria may be considered under the following heads: (1) tissue changes produced in the vicinity of the bacteria, either at the primary or secondary foci; (2) tissue changes produced at a distance by absorption of their toxins; (3) symptoms. The changes in the vicinity of bacteria are to be regarded partly as the *direct result* of the action of toxins on living cells, and partly as indicating a *reaction* on the part of the tissues. (Many such changes are usually grouped together under the heading of "inflammation" of varying degree—acute, subacute and chronic.) Degeneration and death of cells, haemorrhages, serous and fibrinous exudations, leucocyte emigration, proliferation of connective tissue and other cells, may be mentioned as some of the fundamental changes. Acute inflammation of various types, suppuration, granulation-tissue formation, etc., represent some of the complex resulting processes. The changes produced at a distance by distribution of toxins may be very manifold—cloudy swelling and fatty degeneration, serous effusions, capillary haemorrhages, various degenerations of muscle, hyaline degeneration of small blood-vessels, and, in certain chronic diseases, waxy degeneration, all of which may be widespread, are examples of the effects of toxins, rapid or slow in action.

Symptoms.— The lesions mentioned are in many instances necessarily accompanied by functional disturbances or clinical symptoms, varying according to site, and to the nature and degree of the affection. In addition, however, there occur in bacterial diseases symptoms to which the correlated structural changes have not yet been demonstrated. Amongst these the most important is fever with increased protein metabolism, attended with disturbances of the circulatory and respiratory systems. Nervous symptoms, somnolence, coma, spasms, convulsions and paralysis are of common occurrence. All such phenomena, however, are likewise due to the disturbance of the molecular constitution of living cells. Alterations in metabolism are found to be associated with some of these, but with others no corresponding physical change can be demonstrated. The action of toxins on various glands, producing diminished or increased functional activity, has a close analogy to that of certain drugs. In short, if we place aside the outstanding exception of tumour growth, we may say that practically all the important phenomena met with in disease may be experimentally produced by the injection of bacteria or of their toxins.

Susceptibility.— The result of the entrance of a virulent bacterium into the tissues of an animal is not a disease with hard and fast characters, but varies greatly with circumstances. With regard to the subject of infection the chief factor is susceptibility; with regard to the bacterium virulence is all-important. Susceptibility, as is well recognized, varies much under natural conditions in diiferent species, in different races of the same species, and amongst individuals of the same race. It also varies with the period of life, young subjects being more susceptible to certain diseases, *e.g.*, diphtheria, than adults. Further, there is the very important factor of acquired susceptibility. It has been experimentally shown that conditions such as fatigue, starvation, exposure to cold, etc., lower the general resisting powers and increase the susceptibility to bacterial infection. So also the local powers of resistance may be lowered by injury or depressed vitality. In this way conditions formerly believed to be the causes of disease are now recognized as playing their part in predisposing to the action of the true causal agent, viz. the bacterium. In health the blood and internal tissues are bacterium-free; after death they offer a most suitable pabulum for various bacteria; but between these two extremes lie states of varying liability to infection. It is also probable that in a state of health organisms do gain entrance to the blood from time to time and are rapidly killed off. The circumstances which alter the virulence of bacteria will be referred to again in connection with immunity, but it may be stated here that, as a general rule, the virulence of an organism towards an animal is increased by sojourn in the tissues of that animal. The increase of virulence becomes especially marked

when the organism is inoculated from animal to animal in series, the method of passage. This is chiefly to be regarded as an adaptation to surroundings, though the fact that the less virulent members of the bacterial species will be liable to be killed off also plays a part. Conversely, the virulence tends to diminish on cultivation on artificial media outside the body.

Antibodies. — During the production of active immunity (*see* IMMUNITY) certain substances appear in the blood serum of the animal treated, to which the name of antibodies is given, and these have been the subject of extensive study. It is by means of them that immunity (passive) can be transferred to a fresh animal. The development of antibodies is, however, not peculiar to bacteria, but occurs also when alien cells of various kinds, proteins, ferments, etc., are injected. In fact, organic molecules can be divided into two classes according as they give rise to them or fail to do so. Amongst the latter, the vegetable poisons of known constitution, alkaloids, glucosides, etc., are to be placed. The molecules which lead to the production of antibodies. are usually known as antigens, and each antigen has a specific combining affinity for its corresponding antibody, fitting it as a lock does a key. The antigens, as already indicated, may occur in bacteria, cells, etc., or they may occur free in a fluid. Antibodies may be arranged into three main groups. In the first group, the antibody simply combines with the antigen, without, so far as we know, producing any change in it. The antitoxins are examples of this variety. In the second group, the antibody, in addition to combining with the antigen, produces some recognizable physical change in it; the precipitins and agglutinins may be mentioned as examples. In the third group, the antibody, after it has combined with the antigen, leads to the union of a third body called complement (alexine or cytase of French writers), which is present in normal serum. As a result of the union of the three substances, a dissolving or digestive action is often to be observed. This is the mode of action in the case of a haemolytic or bacteriolytic serum. So far as bacterial immunity is concerned, the anti-serum exerts its action either on the toxin or on the bacterium itself; that is, its action is either antitoxic or anti-bacterial.

Antitoxic Serum. — The antitoxic serum when injected before the toxin confers immunity (passive) against it; when injected after the toxin it has within certain limits a curative action, though in this case its dose requires to be large. The antitoxic property is developed in a susceptible animal by successive and gradually increasing doses of the toxin. In the earlier experiments on smaller animals the potency of the toxin was modified for the first injections, but in preparing antitoxin for therapeutical purposes the toxin is used in its unaltered condition, the horse being the animal usually employed. The injections are made subcutaneously and afterwards intravenously; and, while the dose must be gradually increased, care must be taken that this is not done too quickly, otherwise the antitoxic power of the serum may fall and the health of the animal suffer. The serum of the animal is tested from time to time against a known amount of toxin, *i.e.,* is standardized. The unit of antitoxin is the amount requisite to antagonize 100 times the minimum lethal dose of a particular toxin to a guinea-pig of 250 grm. weight, the indication that the toxin has been antagonized being that a fatal result does not follow within five days after the injection. In the case of diphtheria the antitoxic power of the serum may reach 800 units per cubic centimetre, or even more.

Action of Antitoxin. — Two important questions must next be considered, viz., how does the antitoxin act? and how is it formed within the body? It is now accepted that antitoxin acts on toxin directly, *i.e.,* chemically or physically; the chief grounds for this view are as follows: (a) The action of antitoxin on toxin, as tested by neutralization effects, takes place more quickly in concentrated than in weak solutions, and more quickly at a warm (within certain limits) than at a cold temperature. (b) Antitoxin acts more powerfully when injected along with the toxin than when injected at the same time in another part of the body; if its action were on the tissue-cells one would expect that the site of injection would be immaterial. (c) The law of multiples is obeyed, the amount necessary to neutralize five times the lethal dose being determined, 20 times that amount will neutralize a hundred times the lethal dose. In the case of physiological antagonism of drugs this relationship does not hold. (d) In certain instances the toxin can be made to pass through a gelatine membrane, whereas the antitoxin cannot, its molecules being of larger size. If, however, toxin be mixed with antitoxin for some time, it can no longer be passed through, presumably because it has become combined with the antitoxin. (e) When a toxin has some action which can be demonstrated in a test-tube experiment, for example, a dissolving action on red corpuscles, this action may be annulled by previously adding the antitoxin to toxin; in such a case the intervention of the living tissues is excluded.

Since antitoxin has a direct action on toxin, theoretically this may take place in one of two ways. It may produce a disintegration of the toxin molecule, or it may combine with it to produce a body whose combining affinities are satisfied. The latter view, first advocated by Ehrlich, may now be regarded as established.

Formation of Antitoxin. — The origin of antitoxin is of course merely a part of the general question regarding the production of anti-substances in general, as these all combine in the same way with their homologous substances and have the same character of specificity. As, however, most of the work has been done with regard to antitoxin production we may consider here the theoretical aspect of the subject. There are three chief possibilities: (a) that the antitoxin is a modification of the toxin; (b) that it is a substance normally present, but produced in excess under stimulation of the toxin; (c) that it is an entirely new product. The first of these, which would imply a process of a very remarkable nature, is disproved by what is observed after bleeding an animal whose blood contains antitoxin. In such a case it has been shown that, without the introduction of fresh toxin, new antitoxin appears, and therefore must be produced by the living tissues. The second theory is the more probable a *priori,* and if established removes the necessity for the third. It was strongly supported by Ehrlich, who, in his so-called "side-chain" (Seitenkette) theory, explained antitoxin production as an instance of regeneration.

It may be added that in the case of all anti-substances, which are produced by a corresponding reaction, we have examples of the existence of traces of them in the blood serum under normal conditions. We are, accordingly, justified in definitely concluding that their appearance in large amount in the blood, as the result of active immunization, represents an increased production of molecules which are already present in the body.

Anti-bacterial Serum. — In preparing anti-bacterial sera the lines of procedure correspond to those followed in the case of antitoxins, but the bacteria themselves in the living or dead condition or their maceration products are always used in injections. Sometimes dead bacteria, living virulent bacteria, and living supervirulent bacteria, are used in succession, the object being to arrive ultimately at a high dosage, though the details vary in different instances. The serum of an animal thus actively immunized has powerful protective properties towards another animal, the amount necessary for protection being sometimes almost inconceivably small. As a rule it has no action on the corresponding toxin, *i.e.,* is not antitoxic. In addition to the protective action, such a serum may possess activities which can be demonstrated outside the body. Of these the most important are (a) bacteriolytic or lysogenic action, (b) agglutinative action, and (c) opsonic action.

(a) Lysogenic Action. — The first of these, lysogenic or bacteriolytic action, consists in the production of a change in the corresponding bacterium whereby it becomes granular, swells up and ultimately may undergo dissolution. It has been established that in lysogenesis there are two substances concerned, one specially developed or developed in excess, and the other present in normal serum. The former (*Immunkörper* of Ehrlich, substance *sensibilisatrice* of Bordet) is the more stable, resisting a temperature of 60° C., and though giving the specific character to the reaction cannot act alone. The latter (complement) is ferment-like and much more labile than the former, being readily

destroyed at 60° C. Furthermore, lysogenic action is not confined to the case of bacteria but obtains also with other organized structures, *e.g.,* red corpuscles (Bordet, Ehrlich and Morgenroth), leucocytes and spermatozoa (Metchnikoff). That is to say, if an animal be treated with injections of these bodies, its serum acquires the power of producing more disintegrative effect in them.

The development of the immune body with specific combining affinity thus presents an analogy to antitoxin production, the difference being that in lysogenesis another substance is necessary to complete the process. It can be shown that in many cases when bacteria are injected the serum of the treated animal has no bacteriolytic effect, and still an immune body is present, which leads to the fixation of complement; in this case bacteriolysis does not occur, because the organism is not susceptible to the action of the complement. In all cases the important action is the binding of complement to the bacterium by means of the corresponding immune body; whether or not death of the bacterium occurs, will depend upon its susceptibility to the action of the particular complement, the latter acting like a toxin or digestive ferment. In the process of immunization complement does not increase in amount; accordingly the immune serum comes to contain immune body much in excess of the necessary amount of complement.

An important point with regard to the therapeutic application of an anti-bacterial serum is that when the serum is kept in vitro the complement rapidly disappears, and accordingly the complement necessary for the production of the bactericidal action must be supplied by the blood of the patient treated. This latter complement may not suit the immune body, that is, may not be fixed to the bacterium by means of it, or if the latter event does occur, may fail to bring about the death of the bacteria. These circumstances serve, in part at least, to explain the fact that the success attending the use of anti-bacterial sera has been much inferior to that in the case of antitoxic sera.

Bacteriolysis may result from other processes than that just described. Thus it may be produced by the action of "lysozyme" (see ANTISEPTICS AND ASEPSIS) or by that of "bacteriophage." This represents a newly observed phenomenon, first described by F. W. Twort (1915) and F. d'Hérelle (1918). The former observed a lytic change accompanied by translucency of some colonies in certain cultures of *Staphylococcus* and found that this lysis could be communicated to other normal colonies by an extract of the affected culture which had been passed through a Berkefeld filter, and was itself free from bacteria. D'Hérelle, starting with a Berkefeld filtrate from the faeces of dysentery convalescents, was able by adding a drop of this to a culture of B. *dysenteriae* (Shiga) to produce lysis of the bacteria. A drop of the resulting solution after filtration could be used to repeat the phenomenon in a fresh culture, and in this way a renewal of the active principle could be brought about indefinitely. This principle d'Hérelle called the bacteriophage (*Bacteriophagum intestinale*), and he maintains that it is an ultramicroscopic, living organism, which is parasitic in the bacteria and reproduces itself. The solution containing the principle is often active in a dilution of 1 in 100 million, and five c.c. of broth containing bacteriophage in this dilution, if inoculated with the sensitive culture, will reproduce in 24 hours in the incubator a clear solution containing the bacteriophage in the original strength, which again is still active when similarly diluted.

If a tube of suitable diluted phage, inoculated with B. *dysenteriae*, is incubated for three hours, and a loop of it then inoculated on agar, confluent growth of the bacteria may be obtained with a number of small, round, clear areas where no growth of bacteria has occurred. These spaces d'Hérelle called *tâches* vierges and considered them to represent colonies of the bacteriophage which had devoured the bacteria. Other bacteria are attacked besides B. *dysenteriae, e.g.,* B. *typhosus,* B. *paratyphosus* and B. coli. Most strains of bacteriophage are specific for certain kinds of bacteria, or even for certain strains of these species. Thus some varieties of bacteriophage will act on "rough" variants of B. *dysenteriae* and on some strains of *B.* coli, but not on the corresponding normal or "smooth" cultures.

After the action of the bacteriophage on a broth culture and the resulting clearing of the original turbidity, it is usual for some bacteria to remain alive which, when cultured on agar, are found to be considerably altered in the appearance of their colonies. Their agglutinability by salts is also changed. These colonies are often resistant to the bacteriophage. There is no doubt that bacteriophage may be present in small quantities in cultures, but remain unnoticed, and it has been suggested that many variations, occurring apparently spontaneously, are in reality brought about by the presence of unrecognized bacteriophage. D'Hérelle has advocated the use of bacteriophage in the prevention and treatment of infective disease, but its value for this purpose is not widely recognized.

The question of the nature of the bacteriophage has stimulated a very large amount of research on account of its theoretical importance. If the more generally accepted view ascribing the properties of the bacteriophage to a non-living enzyme or catalyst were proved, the fact that it appears to infect and multiply in a culture of bacteria might by analogy throw light on some infective diseases associated with ultramicroscopic viruses affecting the higher forms of life. The characteristics which make it less probable that the bacteriophage is a living entity are its ready filtrability through a porcelain filter, its resistance to heat (60° to 65° C.), its resistance to acetone and chloroform and its inability to multiply in the absence of a living bacterial culture.

(b) Agglutination. — Another property which may be possessed by anti-bacterial serum is that of agglutination. By this is meant the aggregation into clumps of the bacteria uniformly distributed in an indifferent fluid; if the bacterium is motile its movement is arrested during the process. The process is of course observed by means of the microscope, but the clumps soon settle in the fluid and ultimately form a sediment, leaving the upper part clear. This change, visible to the naked eye, is called *sedimentation.* Charrin and Roger first showed in the case of B. *pyocyaneus* that when a small quantity of the homologous serum (*i.e.,* the serum of an animal immunized against the bacterium) was added to a fluid culture of this bacillus, growth formed a sediment instead of a uniform turbidity. Gruber and Durham showed that sedimentation occurred when a small quantity of the homologous serum was added to an emulsion of the bacterium in a small test-tube, and found that this obtained in all cases where Pfeiffer's lysogenic action could be demonstrated. Shortly afterwards Widal and also Griinbaum showed that the serum of patients suffering from typhoid fever, even at an early stage of the disease, agglutinates; the typhoid bacillus — a fact which laid the foundation of serum diagnosis. A similar phenomenon has been demonstrated in the case of Malta fever, cholera, plague, infection with B. coli, "meat-poisoning" due to Gärtner's bacillus, and various other infections. As regards the mode of action of agglutinins, Gruber and Durham considered that it consists in a change in the envelopes of the bacteria, by which they swell up and become adhesive. The view has various facts in its support, but Kruse and Nicolle have found that if a bacterial culture be filtered germ-free, an agglutinating serum still produces some change in it, so that particles suspended in it become gathered into clumps. Duclaux, for this reason, considers that agglutinins are coagulative ferments.

The phenomenon of agglutination depends essentially on the union of molecules in the bacteria — the agglutinogens — with the corresponding agglutinins, and is often highly specific. Nevertheless group agglutination occurs and recent work has been devoted largely to dividing apparently identical groups into sub-groups by absorption experiments with specially prepared agglutinating sera. In this way the salmonella, the meningococcal and the dysentery groups have been subdivided into distinct strains. It should also be stated that agglutinins are used up in the process of agglutination, apparently combining with some element of the bacterial structure. In view of all the facts it must be admitted that the agglutinins and immune bodies are the result of corresponding reactive processes, and are probably related to one another. The development of all antagonistic substances which confer the special character on antimicrobic sera, as well as anti-

toxins, may be expressed as the formation of bodies with specific combining affinity for the organic substance introduced into the system—toxin, bacterium, red corpuscle, etc., as the case may be.

The facts which have emerged during the recent extensive study of agglutination have given rise to the hypothesis that each bacterium contains a mosaic of antigens, some of which are highly specific and peculiar to each subspecies, some are common to the whole species or group and others appear to be entirely unrelated as regards phylogeny and occur in very diverse bacteria (*e.g.*, Forssmann's nonspecific antigens). It is probable that the identification and classification of bacteria by their antigens have their limits, though the data are often extremely valuable.

(c) Opsonic Action.—By opsonic action is meant the effect which a serum has on bacteria in making them more susceptible to phagocytosis by the white corpuscles of the blood (*q.v.*). Such an effect may be demonstrated outside the body by making a suitable mixture of (a) a suspension of the particular bacterium, (b) the serum to be tested, and (c) leucocytes of a normal animal or person. The mixture is placed in a thin capillary tube and incubated at 37° C. for half an hour; a film preparation is then made from it on a glass slide, stained by a suitable method and then examined microscopically. The number of bacteria contained within a number of, say 50, leucocytes can be counted and the average taken. In estimating the opsonic power of the serum in cases of disease a control with normal serum is made at the same time and under precisely the same conditions. The average number of bacteria contained within leucocytes in the case tested, divided by the number given by the normal serum, is called the phagocytic index. Wright and Douglas showed that under these conditions phagocytosis might occur when a small quantity of normal serum was present, whereas it was absent when normal salt solution was substituted for the serum; the serum thus contained substances which made the organisms susceptible to the action of the phagocytosis. They further showed that this substance acted by combining with the organisms and apparently producing some alteration in them; on the other hand it had no direct action on the leucocytes. This opsonin of normal serum is very labile, being rapidly destroyed at 55° C. Various observers had previously found that the serum of an animal immunized against a particular bacterium had a special action in bringing about phagocytosis of that organism, and it had been found that this property was retained when the serum was heated at 55° C. It is now generally admitted that at least two distinct classes of substances are concerned in opsonic action, that thermostable immune opsonins are developed as a result of active immunization and these possess the specific properties of antisubstances in general, that is, act only on the corresponding bacterium. On the contrary the labile opsonins of normal serum have a comparatively general action on different organisms. It is quite evident that the specific immune-opsonins may play a very important part in the phenomena of immunity, as by their means the organisms are taken up more actively by the phagocytic cells. The opsonic action of the serum has been employed by Sir **A.** Wright and his co-workers to control the treatment of bacterial infections by vaccines.

Complement Fixation.—This is the name given to a procedure by which the presence of antisubstances to bacteria can be recognized in the blood serum of animals. In principle it rests on the discovery by Bordet and Gengou that when a bacteriolytic serum containing bacteriolysin and a suspension of the corresponding bacteria are allowed to interact in the presence of fresh serum, a constituent of the latter (alexin or complement) joins the combination of bacteria and antisubstance, and remains fixed to it, this union resulting in the death and solution of the bacteria. To render this fixation of complement obvious even where lysis of the bacteria is not visible, another system which also needs complement for its consummation is added to the mixture, and the occurrence or not of the first reaction is determined by the completion or the non-completion of the second reaction.

The most commonly used antigen-antibody system for the second system is a mixture of a suspension in salt solution of the red-blood corpuscles of the sheep and of a serum which is known to be lytic for them but does not contain active complement. This latter desideratum can be assured by previously heating the haemolytic serum to 56° C. for 30 minutes. If there is free complement at liberty to join the red corpuscles and antiserum, the red cells break up, and the haemoglobin is set free as a clear solution in the surrounding medium. The colour and transparency of the solution is a readily observed indicator of the presence of free complement and, to some extent, of its amount. This by inference allows an estimate to be made of the reagents present in the first system. If no appropriate bacterial substance or no antisubstance is present, then no complement will be fixed in the first reaction, and consequently it will still be available for haemolysis.

National Collection of Type Cultures.—This collection of living cultures from all spheres of bacteriological activity was founded in 1920 at the Lister Institute, London, under the auspices of the Medical Research Council. It has been of great service to microbiologists in all parts of the world, over 2,000 strains being maintained in 1925. The second edition of the catalogue appeared in 1925 and can be procured from H.M. Stationery Office, London.

BIBLIOGRAPHY.—The chief journals devoted to medical bacteriology and immunology are:—*Jour. Pathology and Bact.; Brit. Jour. Exp. Path.; Jour. Bact.* (Chicago); *Jour. Inf. Dis.* (Baltimore); *Jour. Exp. Medicine; Jour. Immun.* (Baltimore); *Zeit. f. Bact.*, Abt. 1 (Jena); *Zeitsch. f. Hyg.*, etc. (Leipzig); *Archiv. f. Hyg.; Zeitsch. f. Immunitätsf.*, etc. (Jena); *Ann. de l'Instit. Pasteur.*

The larger reference books are those of R. Kraus and C. Levaditi, *Handbuch der Immunitätsforschung und experimentellen Therapie* (Jena, 1914); and W. Kolle and H. Hetsch, *Die experimentelle Bakteriologie*, etc. (1922). Smaller text-books are E. O. Jordan, *Text-Book of General Bacteriology* (Philadelphia, 1915); J. A. Kolmer, *A Practical Text-Book of Infection, Immunity and Specific Therapy* (1915); R. Muir and J. Ritchie, *Manual of Bacteriology*, 7th ed. (1919); R. T. Hewlett, *Pathology* (1922); etc. (R.M.; J.C.G.L.; J.A.A.)

BACTERIOLOGY. The common idea of bacteria in the minds of most people is that of a hidden and sinister scourge lying in wait for mankind. This popular conception is born of the fact that attention was first focused upon bacteria through the discovery, some 70 years ago, of the relationship of bacteria to disease in man, and that in its infancy the study of bacteriology was a branch of medical science. Relatively few people assign to bacteria the important position in the world of living things that they rightly occupy, for it is only a few of the bacteria known today that have developed in such a way that they can live in the human body, and for every one of this kind there are scores of others which are perfectly harmless and, far from being regarded as the enemies of mankind, must be numbered among his best friends. It is, in fact, no exaggeration to say that upon the activities of bacteria the very existence of man depends; nay more, that without bacteria there could be no other living thing in the world; for every animal and plant owes its existence to the fertility of the soil and this in turn depends upon the activity of the micro-organisms which inhabit the soil in almost inconceivable numbers. It is one of the main objects of this article to show how true is this statement; there will be found in it only passing reference to the organisms which produce disease in man and animals; for information on these see PATHOLOGY and IMMUNITY.

The Beginnings of Bacteriology.—It is quite clear that in such an article as this any attempt at a comprehensive survey of the history of the subject would be out of place. It is well, however, to select a few dates so that the reader, if he is not already aware of it, may realize that, in comparison with other sciences, bacteriology is young. Before going farther it would be well to have a definite idea of the nature of bacteria; they are the smallest living creatures known; it is difficult to realize how small they are; some idea, however, may be gained when it is stated that one of the full-stops in this print would cover about a quarter of a million average-sized bacteria. Because of their minute size they are often termed micro-organisms. Indeed, some bacteria are so tiny that the highest magnification it is possible to reach with the microscopes of to-day is insufficient to reveal them to the eye. They are only known by the results they produce and they are termed ultra-microscopic organisms or filter-passers.

Bacteria are all unicellular and consist of masses of protoplasm (*see* CYTOLOGY), which at one time were believed to be naked masses as are some of the Protozoa. They were on this account first placed in the animal kingdom; but by colouring the organisms with aniline dyes it can be shown that most of the bacteria are

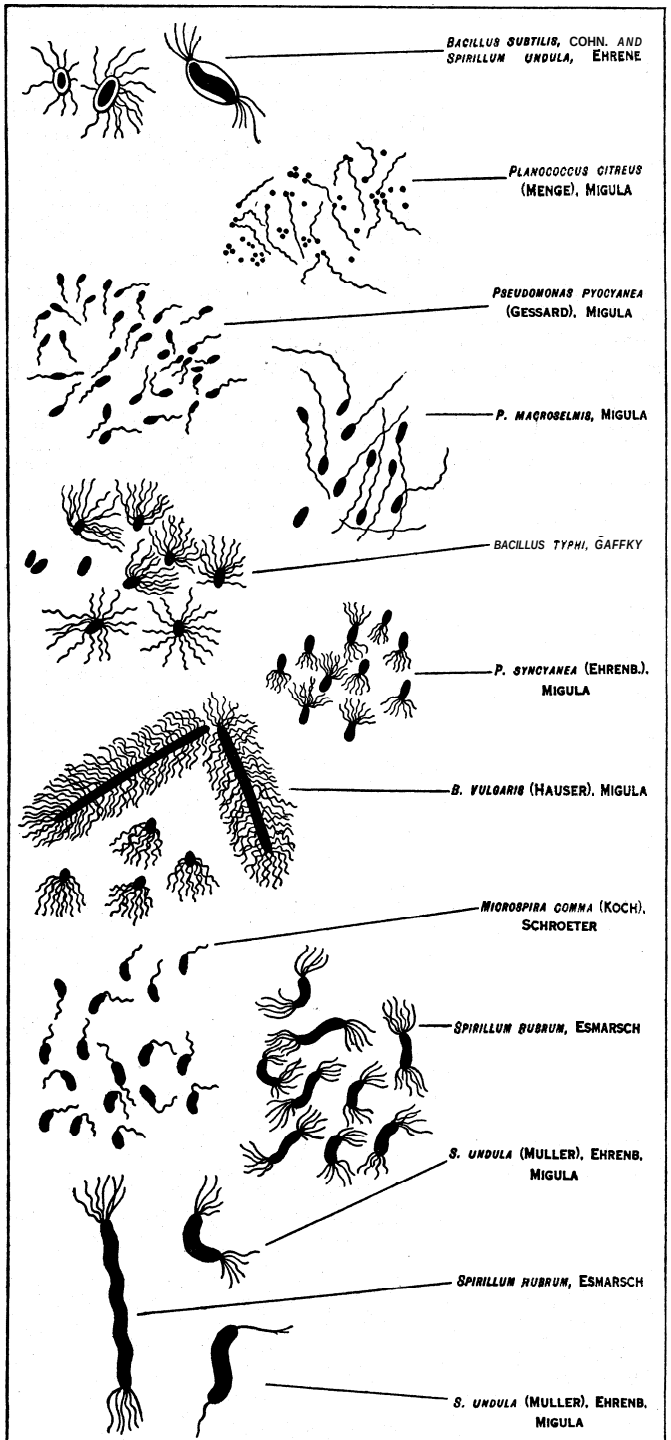

FIG. 1.— VARIOUS TYPES OF BACTERIA CAPABLE OF FREE MOVEMENT

surrounded by a cell-wall and are more correctly to be regarded as plants. They differ from the higher plants in being devoid of green colouring matter, in which respect they appear to be closely related to the Fungi. As to the contents of the protoplasm very little is known on account of the minute size of the cell. It is certain, however, that in the make-up of their protoplasm much variability exists as between one kind and another. This is indicated by their capacity to produce markedly different chemical changes which go far to distinguish one species from another. The denser part of the protoplasm, the nucleus of the cell, believed to play such an important rôle in controlling the heredity of higher plants and animals, is not known definitely to exist in the bacterial cell. The generally held view is that in the bacteria it is represented by a rudimentary form in which particles of nuclear matter, nucleoproteins, are distributed uniformly throughout the protoplasm in the form of granules or so-called chromidia. Recently, however, by the aid of microphotograph~and using the ultra-violet end of the spectrum, J. Barnard has obtained pictures of bacteria showing much more complicated structures than can be seen either by white light or in a stained preparation, and showing also granules which suggest strongly the presence of definite nuclear bodies. Nuclei have been observed in stained specimens of *Bacillus gammari,* B. *gigas* and *B. Bütschlii.* These organisms are so comparatively large as to make it at least a little doubtful whether they are correctly included among the bacteria.

Bacteria multiply as do other organisms, but they differ from most others in the absence of sexual reproduction; at any rate none has as yet been observed. It is well known that the fusion of sex nuclei tends to maintain constancy of a species. Absence of this feature may possibly account for the ease with which bacterial species tend to break up into races or strains. The characteristics of a species remain fixed only under rather narrowly prescribed conditions of cultivation. Departures from these conditions often produce profound changes in the shape, size and chemical behaviour of an organism—so much so that adaptation to environment may give rise to a strain of an organism which bears but little resemblance to the original form from which it developed. All of which tends to show that the nuclei, if present, do not function quite as do the sex nuclei of higher plants.

The shape of bacteria is simple, being modelled on three main types, the spherical or *coccus* form, the rod or *bacillus* type and the spirally twisted *spirillum;* many bacteria are provided also with thin whip-like appendages, projections of the protoplasm called flagella, which by lashing in the surrounding fluid propel the organisms with considerable rapidity. Some of the shapes assumed by the cells are shown in fig. 1.

The general advances which have been made of late years in the study of bacteria are clearly brought to mind when we reflect that in the middle of the 19th century these organisms were only known to a few experts and in a few forms as curiosities of the microscope, chiefly interesting for their minuteness and motility. The beginnings of bacteriology ran parallel with the development of the microscope. The first compound microscope was introduced by H. Jansen in 1590. This instrument gave only small magnification and it is doubtful whether **A.** Kircher, who wrote in 1659 of "minute living worms in putrid meat, milk, vinegar, etc.," had seen anything smaller than Protozoa or possibly the larvae of insects. The first to see micro-organisms was probably the Dutch naturalist **A.** van Leeuwenhoek who in 1683 sent a paper to the Royal Society in London in which he described some "Animalculae," as they were then called, in water, saliva and dental tartar. These had been seen with a simple lens magnifying some 100-150 diameters. The organisms (fig. 2) seem to correspond with some of the very large forms of bacteria such as *Bacillus buccalis maximus* and *Spirillum sputigenum.* In 1762 **M.** A. Plenciz propounded a theory of infectious disease, namely, that a special organism is associated with each disease and that the organisms are capable of reproduction outside the body and can be carried from place to place by the air. In this enlightened view, Plenciz was well in advance of his time, for little was known of these minute creatures before 1860. Great assistance came with the introduction of the oil-immersion lens by Dollond in 1844 but, though by the use of this instrument the magnification of 1,000 diameters became possible, the definition at this magnification was very imperfect till the light was focused on the object by means of the

BACTERIA RELATED TO FOOD, DISEASE AND AGRICULTURE

1. *Azotobacter agilis,* a rapidly motile form of soil bacteria which fixes nitrogen of the air to other forms, making it available to green plants
2. *Clostridium* pastorianum, an anaerobic bacterium. Such forms live on food in the absence of a good oxygen supply, leaving in their path substances which are very toxic to animals
3. Cellulose ferment, found in all soils and at the bottom of ponds, lakes, rivers and canals, where the bacteria are concerned with the destruction of woody tissues under anaerobic conditions
4. Bacillus proteus, common in the digestive tracts of animals, where it works in conjunction with other forms of bacteria in dissolving and disintegrating proteins and other forms of nitrogenous compounds
5. Bacillus *atrosepticus,* the organism causing blackleg or black rot of the potato. This disease causes yellowing and wilting of the plant
6. Spirillum sp.—a sample of a group of organisms having more or less of a spiral form

substage condenser. E. Abbé introduced his condenser in *1870* and C. Zeiss completed the microscopic equipment with his apochromatic lenses in *1880*. It is clear that bacteria were recognized before they were distinctly seen; O. F. Miiller knew several important forms in 1773, while F. Ehrenberg in *1830* had advanced to the commencement of a scientific separation and grouping of them, and in *1838* had proposed at least *16* species, distributing them into four groups or genera. Our modern more accurate knowledge of the forms of bacteria, however, dates from F. J. Cohn's brilliant researches, the chief results of which were published at various periods between *1853* and *1872*. Cohn's classification of bacteria, published in *1872* and extended in 1875, has in fact dominated the study of these organisms almost ever since. He based his classification on what may be considered the constancy of forms which he called species and genera. As to the constancy of form, however, Cohn maintained certain reservations which have been ignored by some of his followers. The fact that Schizomycetes produce spores appears to have been discovered by Cohn in *18;7*, though it was expressed dubiously in *1872*. In *1876*, however, Cohn had seen the spores germinate, and Robert Koch. O. Brefeld, P. van Tieghem, A. de Bary and others confirmed the discovery.

The supposed constancy of forms in Cohn's species and genera received a shock when E. R. Lankester in 1873 pointed out rhat 'his *Bacterium rubescens* (since named *Beggiatoa roseo-persicina*, Zopf) passes through phases which would have been described by most observers, influenced by the current doctrine, as so many separate species or even genera — that in fact forms known as *Bacterium*, *Micrococcus*, *Bacillus*, *Leptothrix*, etc., occur as stages in one life-history. J. Lister put forth similar ideas about the same time, and T. Billroth came forward in 1874 with the extravagant view that the various bacteria are only different states of one and the same organism which he called *Cocco-bacteria septica*. From that time the question of the pleomorphism (mutability of shape) of the bacteria has been hotly discussed: and quite recently pleomorphism exhibited in cultures of *Azotobacter chroococcum* has led *F*. Lohnis to the belief that all soil organisms are modifications of this one species. (F. Lohnis and N. R. Smith 1923.) It is now generally agreed that, while a certain number of forms may show different types of cell during the various phases of their life-history, yet the majority of forms are uniform, showing only one type of cell throughout their life. The question of species in the bacteria is essentially the same as in other groups of plants. Before a form can be placed in a satisfactory classificatory position its whole life-history must be studied, so that all the phases may be known. In the meantime, while various observers were building up our knowledge of the morphology of bacteria, others were laying the foundation of what is known of the relations of the organisms to fermentation and disease — that ancient will-o'-the-wisp, spontaneous generation, being revived by the way. When L. Pasteur in *1857* showed that lactic fermentation depends on the presence of an organism, it was already known from the researches of T. Schwann *(1837)* and H. L. F. v. Helmholtz *(1843)* that fermentation and putrefaction are intimately connected with the presence of organisms derived from the air, and that the preservation of putrescible substances depends on this principle. In *1862* Pasteur placed it beyond reasonable doubt that the ammoniacal fermentation of urea is due to the action of a minute bacterium. In *1864* this was confirmed by van Tieghem, and in *1874* by Cohn, who named the organism *Micrococcus ureae*. Pasteur and Cohn also pointed out that putrefaction is but a special case of fermentation, and before *1872* the doctrines of Pasteur were established with respect to bacteria. Meanwhile two branches of enquiry had arisen from the above. In the first place, the disputed question of spontaneous generation received fresh impetus from the difficulty of keeping such minute organisms as bacteria from reaching and developing in organic infusions; and, secondly, the long-suspected analogies between the phenomena of fermentation and those of certain diseases again made themselves felt as both became better understood Needham in 1745 had declared that heated infusions of organic matter were not deprived of living beings; Abbé Spallanzani (1777) had replied that more careful heating and other precautions prevent the appearance of organisms in the fluid. Various experiments by Schwann, Helmholtz, M. Schultze, K. Schroeder, Th. v. Dusch and others led to the refutation, step by step, of the belief that the more minute organisms, and particularly bacteria, arose *de novo* in the special cases quoted. Nevertheless, instances were adduced where the most careful heating of yolk of egg, milk, hay-infusions, etc., had failed — the boiled infusions, etc., turning putrid and swarming with bacteria after a few hours.

In *1862* Pasteur repeated and extended such experiments, and paved the way for a complete explanation of the anomalies; Cohn in *1872* published confirmatory results; and it became clear that no putrefaction can take place without bacteria or some other living organism. In the hands of O. Brefeld, A. de Bary, J. Tyndall, J. Lister and others, the various links in the chain of evidence grew stronger and stronger, and every case adduced as one of spontaneous generation fell to the ground when examined. No case of so-called spontaneous generation has withstood rigid investigation; but the discussion contributed to more exact ideas as to the ubiquity, minuteness and high powers of resistance to physical agents of the spores of bacteria, and led to more exact ideas of antiseptic treatment. Methods were also improved, and the application of some of them to surgery by J. Lister, Robert Koch and others has yielded results of the highest value.

The methods of bacteriological technique which are employed to-day had their beginnings as recently as 1870–1885 with the introduction of the use of stains by C. Weigert in 1871 and the discovery by Robert Koch *(1881)* of the method of separating mixtures of organisms on plates of nutrient media solidified with gelatine and agar. Following closely on the introduction of this technique came the separation of pure cultures of many bacteria. In *1882* F. Loeffler and F. Schulze discovered the cause of glanders; in *1883* Koch isolated the organism of Asiatic cholera and the same year E. Rlebs found that of diphtheria. In 1885, A. Nicolaier observed the Tetanus bacillus in pus produced by inoculating mice and rabbits with soil. It was left, however, to the famous Japanese Ritasato to discover the way in which these organisms could be cultivated. In *1889* he showed that previous failures in this connection had been due to a lack of appreciation of the necessary conditions, namely, that complete absence of oxygen was essential. A very important discovery came in 1880 when Pasteur first showed that *Bacillus anthracis* cultivated in chicken broth at a temperature of 42°–43° C., lost its virulence after a few generations and ceased to kill even the mouse; this remarkable finding which was destined to lay the foundation of serum-therapy (treatment of disease by serum inoculation), like so many other great discoveries, resulted from an accident; the temperature regulation of the incubator being faulty the cultures were submitted to 42° C., instead of 37° C. More remarkable still, animals inoculated with such "attenuated" bacilli proved to be curiously resistant to the deadly effects of subsequent inoculations with the non-attenuated form. In other words, animals vaccinated with the cultivated bacillus showed immunity from disease when re-inoculated with the deadly wild form. The questions as to the causes and nature of the changes in the bacillus and in the host, as to the extent of immunity enjoyed by the latter, etc., are of the greatest interest and importance.

MULTIPLICATION OF BACTERIA

Mode of Reproduction. — When a bacterial cell is about to divide, the material of the cell is gradually increased till its volume is practically doubled, spherical forms become oval and rod forms stretch to nearly double their length, the cell then becomes constricted at the middle and the constriction deepens till finally the contents are held in two compartments separated by a wall formed at the line of constriction. The two new cells remain adhering for some time and, sooner or later, they separate and form two new individuals or daughter cells which are the exact counterpart of the mother cell and of each other. Bacteria in view of this method of growth are by some spoken of as the fission fungi and are designated by the Greek word *Schizomycetes*.

For many bacterial species fission reuresents the only form of

reproduction. Some species are better favoured, however, in the possession of an alternative process, that of sporulation or multiplication by spores. Spores are formed in some organisms only when the conditions for growth by the method of fission described above have become unsatisfactory, it may be drought, or excessive heat or cold, or the presence of some poisonous chemical substance, in others sporulation follows in a regular sequence in time according to the temperature to which they are exposed. The first visible sign of spore formation is the appearance of a light spot in the body of the organism viewed under the microscope in the unstained condition. This is due to a change in the refraction of the light rays by some newly formed substance or physical state. This differentiated portion of the contents of the cell increases in size and soon appears as a rounded, or more usually oval, body enclosed by a wall, at first thin but quickly becoming thicker until at maturity the spore coat is of considerable thickness. Having formed its spore the rest of the cell disappears and sometimes it is only with difficulty that any trace of it can be found These spores are highly resistant to heat and drought and serve to tide the organism over a period of stress, so much so that sporulating organisms have been known to remain alive and viable for longer than ten years and in all probability they can exist very much longer, while organisms capable of multiplication only by the method of simple division are usually dead in 12 months and sometimes much less than that. When more suitable conditions return, germination of the spore takes place in one of two ways, either-the spore wall softens, thins down, becomes plastic and the cell reverts to the ordinary type, or the wall of the spore thins and breaks down at a certain spot either at the end or the middle of the cell. Through the ruptured wall the contents emerge, leaving behind the empty spore shell, and assume the typical active form.

FIG. 3.— CHROMATIN GRANULES IN "BACILLUS MEGATHERIUM." ,,,,, CARRY THE HEREDITARY CHARACTERISTICS

Sterilization.— Methods of sterilization have to be chosen in full appreciation of the high resistance to heat of the bacterial spore cell. The ordinary cells are destroyed at temperatures of 50° to 60° C., hence a single boiling of a fluid or even Pasteurization (application of heat of 60° C.) is sufficient to destroy them or most of them. The spores, however, require very prolonged heating at these temperatures for their destruction and in order to produce sterility of a liquid in a reasonably short space of time temperatures above 120° C., obtained by steam under pressure, are employed. Dry spores withstand even higher temperatures; but 150°, maintained for 20 minutes? will usually destroy them.

Rate **of Multiplication.**—Given suitable conditions for growth the rate of multiplication of bacteria is very rapid; whenever experiments have been conducted to determine this rate, under conditions purposely made most favourable, it has been found that a division of the cell is repeated every 20 or 30 minutes.

Rate of Growth **of** *Bacillus mycoïdes* at different temperatures.

39–40°	00

A little consideration of what this means will bring out the importance of bacteria in everyday household affairs.

Assuming that conditions are conducive to a rate of one division every 30 minutes, a single individual cell will have produced four cells at the expiry of the first hour, 16 at the end of two hours, 64 at three hours. At the end of eight hours these 64 will have become approximately 64,000, and at the end of 15 hours there will be roughly 1,000,000,000. It can be calculated that these would occupy a space of 1cu.mm. Such a mass of bacteria, easily visible to the naked eye, is called a colony and it may here be said that it is no unusual thing in bacteriological practice to obtain colonies of this size as the result of one night's growth. Returning to our calculation the cubic millimetre will have reached the proportion of 65c.c. in 23 hours or enough solid bacteria to fill an egg cup, and at the end of 3j hours the progeny of this single cell will occupy a space of 1,000 cubic metres. F. Lohnis, who was responsible for this calculation, states it would require a goods train of 100 wagons to transport this mass of bacteria. In practice these conditions are not met with in nature or at any rate not for long, but that such conditions may actually arise temporarily is shown by experiments in which milk ster ilized by long heating was inoculated and incubated at the temperature at which it leaves the cow, that is, about 36° C. In the foregoing table it will be seen that the increase in number at 36° C. corresponds very closely to the figure calculated for a doubling every 30 minutes. Even at the temperature of rather cool air, 12·5° C.. the rate of growth is sufficiently astonishing and emphasizes the difficulties to be overcome in maintaining a clean milk supply. Conditions for bacterial growth, fortunately for man's position in the world, never remain favourable for such unrestricted growth very long. In order to produce any mass of bacteria there must be an equivalent weight of suitable food material. Besides shortage of food there are other factors; running parallel with increase in numbers comes an accumulation of substances, the by-products of bacterial activity, which, unless removed, and in nature they seldom are removed, militate against bacterial growth. It is very noticeable when cultivating bacteria in the laboratory upon plates of nutrient media that growth which in the initial stages of incubation is extremely rapid, so that a visible colony may appear in six to ten hours, gradually becomes less rapid and usually comes to a complete standstill after 30 or 36 hours. Many of the by-products of bacterial growth are acid in character and acids generally are unfavourable to growth. The result of such an accumulation of acids is seen every day in the souring and later the curdling of milk caused by bacterial conversion of milk sugar into lactic acid. The effect of this accumulation of acids in milk is shown in experiments following the course of bacterial growth in milk at 30° C., during the whole of 24 hours. Beginning with a milk containing 370,000 organisms per c.c., at the end of six hours there were 226 million, and at 12 hours 8,070 million, at 18 hours 32,243 million. That 32,000 million organisms may be yresent in a cubic centimetre, *i.e.*, in less than a third of a teaspoonful, helps one to realize the extreme smallness of bacteria. After this time the injurious effect of the accumulation of acid made its appearance, growth was not merely stopped but many of the organisms were actually killed and at 24 hours the number of living organisms had been reduced to 2,286 million.

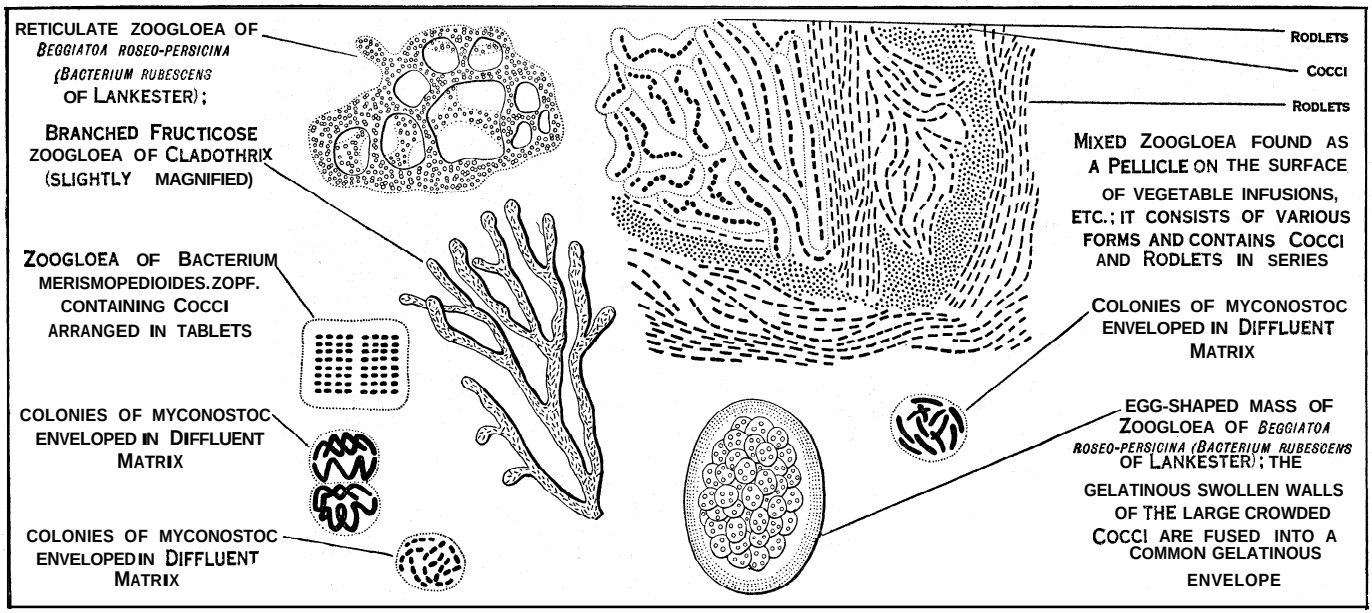
FIG. 4.— VARIOUS POSITIONS OF SPORES IN THE BACTERIAL CELLS

CONDITIONS AFFECTING THE GROWTH OF BACTERIA

Food Requirements.— The supply of food is obviously the most important condition. It has been seen that milk can support the life of bacteria at or near its optimum height, it is in fact as admirable a food for the majority of bacteria as it is for human beings. From this it might appear that bacteria should be considered as animals rather than plants if it were not for the fact that the food of plants is in chemical essence the same as that of animals. Every living cell be it plant or animal requires certain food ingredients the chief of which are sugars or other carbohydrates, proteins or other nitrogenous substances, phosphates,



AFTER KOPF

FIG. 5. — VARIOUS TYPES OF ZOOGLOEA. OR COLONIES OF BACTERIA EMBEDDED IN A JELLY-LIKE SUBSTANCE FORMED BY THE SWELLING OF THE CELL MEMBRANES THROUGH ABSORPTION OF WATER. THIS DEVELOPMENT OCCURS REGULARLY IN MOST SPECIES

sulphates, chlorides, calcium, magnesium, potassium, sodium and traces of other materials. The only real difference between plants and animals is in the power of the plant to utilize energy from the sun by which it is able to build up its necessary carbo-hydrates from the carbon dioxide of the atmosphere. Bacteria are non-green plants and in consequence are unable to invoke the aid of the sun in this direction and are therefore, with two exceptions, dependent upon some other source of carbon. The exceptions are the nitrifying bacteria and certain sulphur bacteria which obtain the necessary energy for the assimilation of carbon dioxide by the oxidation of ammonia and sulphides respectively. One kind of bacterium is known, *Bacillus oligocarbophilus*, which can obtain its carbon from carbon monoxide, and one other *Bacillus methanicus* can make use of marsh gas for this purpose. All other kinds require some sugar or other material like the higher alcohols which can readily be converted into sugar in order to build up their body substance. Most bacteria require a source of nitrogen in combination with organic matter; this requirement is met in milk and in beef extract by the proteins in which these materials are rich, but in using beef extract as an artificial culture medium it has become usual to add a certain amount of peptone as this is an easily digestible ingredient and gives the organisms every encouragement to make rapid initial growth. The nitrifying bacteria, on the other hand. can make no use of such combined forms of nitrogen but are able to build up their own protein from such simple molecules as ammonia and nitrous acid. Other organisms, the so-called nitrogen-fixers, can even make use of elemental nitrogen which they assimilate from the air. The requirements of bacteria in phosphorus, sulphur and other inorganic ingredients is so small that the amount necessary for bacterial development is almost universally present in nature. When these have to be incorporated in artificial culture media they are usually supplied in the form of potassium and sodium phosphates, calcium and magnesium sulphates and sodium chloride with traces of ferric chloride.

Moisture. — Experiments on soil have shown that there is no growth of bacteria when the water content is 2 to 3%, but bacteria become active at 4 to 5% and reach their optimum, depending on the character of the soil, at 25 to 40%, in fact, at approximately one-half the water-holding capacity of the soil.

The importance of moisture for bacterial growth will be clearly seen if it is realized that bacteria have no mouth parts and that all their food must be imbibed in a soluble form by the process of diffusion through the cell wall; without sufficient moisture therefore the inflow of food and the outflow of excreta becomes impossible. A very small percentage of water, however, is capable of preventing death of organisms by desiccation. That which is held hygroscopically by substances in the air-dry condition is as a rule sufficient; for instance, a fluid suspension of bacteria can be dried down on cotton wool or on filter paper and the bacteria will remain alive for upwards of 12 months, whereas the same suspension dried down on glass may be dead in 24 hours. As stated earlier the spores of bacteria are considerably more resistant to drying than are the vegetative cells.

Temperature.—For every organism there are certain cardinal points of temperature; there is first the minimum point below which growth is impossible; this varies with individuals, but for the majority it lies between 5° and 6° C.; some marine bacteria and certain soil types are active below 0° C., but this is exceptional. The optimum, depending largely on the usual habitat of the organism, is around 2j° C. for soil organisms and about 37° C. for animal parasites. The maximum, above which again no growth is possible, for many organisms lies between 38° C. and 48° C. Death of the organism does not as a rule occur at the maximum temperature for growth, but at a point some ten or 1j degrees higher. The actual death temperature can only be considered in relation to time, a low temperature acting for a long time will produce the same effect as a high temperature applied for a short time. A thermal death point standard has been chosen arbitrarily by bacteriologists and represents the lowest temperature which, when applied for exactly ten minutes, will destroy every individual in a fluid suspension of the organism. Temperatures below the minimum prevent bacterial growth but there appears to be no equivalent thermal death point at low temperatures. It is known that typhoid and other disease germs survive quite a long inclusion in ice, and instances are known where typhoid epidemics have been spread by the vendor of ice cream. J. MacFadyan and S. Rowland found that organisms frozen in liquid air and even in liquid hydrogen at −252° C. were still capable of development when restored to normal incubation temperature.

Thermophilic **Bacteria.**—Everyone knows that if hay be stacked in too moist a condition it is liable to ferment, begin to steam and finally become so hot that it bursts into flame; but it was only with the advance of bacteriological knowledge that the explanation of this phenomenon was found. There has been discovered in soil and manure heaps a group of bacteria whose relations to temperature are entirely different from those stated above. These bacteria are all of the sporing kind and seldom in the ordinary way of things do they get a chance to germinate, for their minimum temperature for growth is a point above the maxi-

mum for most organisms and even above the thermal death point of many; *e.g.*, *Bacterium ludwigii* has its minimum at 50° C., reaches its optimum at 55° C.–57° C. and its maximum at 80° C. Fermentation in the haystack is started by moulds, yeasts and bacteria, and heat is thereby developed which enables these thermophilic organisms to become active carrying the temperature to 80° C. Chemical oxidation then becomes so rapid that the spontaneous ignition point of the gases is reached and the stack bursts into flame. The writer well remembers seeing potatoes in a storage clamp cooked to that desirable floury condition by the action of thermophilic bacteria. The source of heat in this case was derived from the rotting of the potatoes in the lower region of the clamp, though the potatoes above this region were sound but cooked, for the temperature registered on a thermometer with its bulb nine inches below the surface of the clamp was 70° C. and steam was rising to a height of 10 or 12ft. above the clamp.

FIG. 6.— GERMINATION OF SPORES
A. *Bacillus subtilis*, equatorial spore formation
B. *Bacillus anthracis*, germination by simple fission, the spontaneous division of an organism into two organisms
C. *Clostrydium butryicum*, polar germination

Relation to Oxygen.— It is remarkable to find in organisms, which under the microscope appear exactly alike, such differences in thermal behaviour as between the thermophilic and the ordinarv forms of bacteria. It must in fact be a very peculiar form of protoplasm which will remain alive at 80° C. No less remarkable perhaps are the differences which bacteria of various kinds exhibit in their relation to oxygen. All races of human beings, and in fact all other animals, make use of oxygen in the same way, yet with bacteria some are known to be aerobic, *i.e.*, they function only in presence of air while for others precisely the reverse holds and the smallest quantity of oxygen prevents their growth; others again, and in this class fall the majority, can tolerate both conditions. These are spoken of among bacteriologists as *facultative anaerobes*. The fact that many bacteria can exist in the anaerobic condition often renders food in hermetically sealed tins unfit for human consumption. Tie decomposition of organicmatter is entirely different in presence or in absence of oxygen. In the former case the process is that of decay in which the breakdown is ultimately complete, the carbon being oxidized to carbon dioxide, the hydrogen to water, the phosphorus and sulphur to phosphates and sulphates, while the nitrogen may be given off as ammonia or may be oxidized to the form of nitrates. In the latter case the decomposition is putrefactive, the result being only a partial breakdown of the organic matter with the accompaniment of very offensive smells and the formation of poisonous substances, the ptomaines, such as putrescene and cadaverine. Ptomaine poisoning is usually the result of anaërobic bacterial action; *Bacillus botulinus*, the bacillus which is the cause of botulism, is perhaps the worst offender.

The Influence of Light.— The development of bacteria is favoured by darkness, many bacteria which are actively motile in the dark become sluggish when moved into the light and in direct sunlight bacteria exposed in thin layers, as for instance on the surface of an agar plate culture, rapidly die; some organisms under these conditions survive only for ten or 15 minutes. Experiments on the bacterial formation of nitrate in ammonia solution exposed in shallow dishes to the two conditions showed the relative speed of action in the dark to that in the light to be as 86 to 19. It is common knowledge that sunlight is regarded as one of the most powerful agencies in the destruction of pathogenic germs. The part of sunlight which possesses this lethal effect is that at the ultra-violet end of the spectrum. Experiments with ultra-violet light from a Cooper-Hewitt mercury-vapour lamp, of the type now used for treating rheumatism, have shown that *Bacillus coli* exposed at a distance of one foot from the lamp survives the action of the light for only three minutes.

The Effect of Antiseptics.— In order that bacteria may be cultivated, substances of antiseptic nature must be absent. Antiseptic surgery has now given place to aseptic surgery wherein the hands of the surgeon and nurses and every instrument used are sterilized before and during the operation. Antiseptics still have considerable use in industry and in the household, where carbolic acid and chloride of lime are extensively used. Chlorine is a very powerful antiseptic and in the form of sodium hypochlorite is used at the waterworks of large towns to reduce the number of bacteria in the water-supply. It is interesting to note that, whereas, in the main, antiseptics behave similarly towards all organisms, differences exist as between one organism and another in the concentration of poison which they can withstand; e.g., *Bacillus typhosus* will not grow in bouillon containing as little as one part of formalin in 15,000, while *Bacillus coli*, an organism in many respects closely related to it, develops vigorously in a concentration of one part in 3,000. Moreover there have been isolated from soil some organisms which are not only insensitive to the poisonous action of phenol and toluene but can actually utilize these substances as their source of carbon.

The Reaction of the Culture Medium.— The reaction of the culture medium, that is, the amount of free acid or free alkali present in it, is of the greatest importance for bacterial development. A culture medium which is neither acid nor alkaline is said to be neutral and is best adapted to the growth of many kinds of bacteria. There are numerous organisms that are favoured in their growth by a faintly acid medium and others again that prefer the medium to be slightly alkaline. It seems rather to depend upon the way in which they have been brought up; *i.e.*, upon the reaction of the medium in which the organisms normally exist. Many of the common inhabitants of milk, a medium that as we have seen readily becomes acid, grow better in artificial culture media whose H. ion concentration is on the acid side of neutrality, whereas as a rule the animal parasites, whose normal habitat (blood) is slightly alkaline, make better initial growth on media whose H. ion concentration is on the alkaline side of neutrality. In a few instances bacteria will develop vigorously in distinctly acid media; a common example of this kind is the familiar "mother of vinegar," which gelatinous material when examined by the microscope is revealed as a colony of bacteria adhering so closely together that they are difficult to separate.

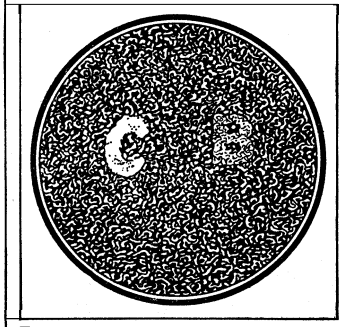

FIG. 7.— RESULTS OF AN EXPERIMENT IN WHICH A PLATE-CULTURE OF BACILLUS WAS EXPOSED FOR 4 HRS. BEHIND A STENCIL IN WHICH THE LETTERS C AND B WERE CUT
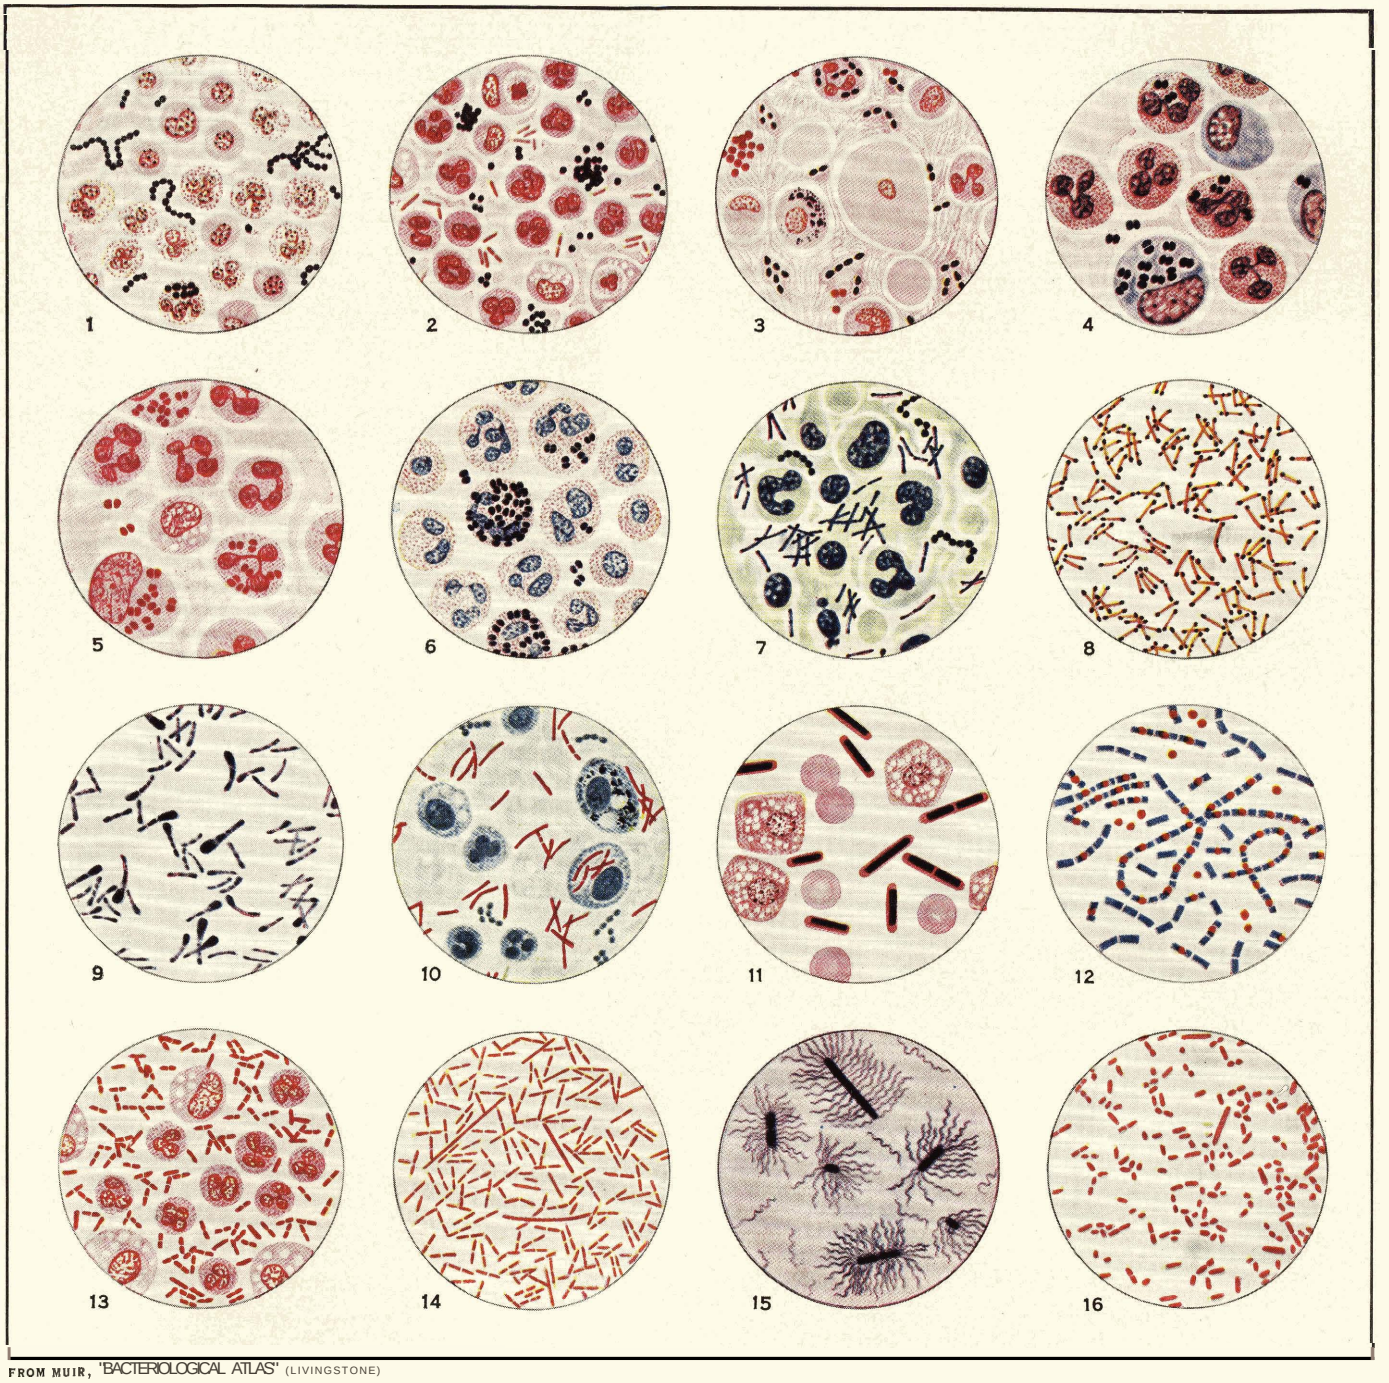
The light traversed a screen of water before passing through C, and one of aesculin, which filters out the blue and violet rays, before passing the B. The plate was then incubated. It shows that the bacteria on the C-shaped area were all killed, whereas they developed elsewhere. B is just visible to the right and covered with an opaque growth

Zoogloea.—Such a mass is termed a zoogloea and forms a remarkable phenomenon in the life-history of certain bacteria. A zoogloea may occur as a membrane on the surface of the medium, or as irregular clumps or branched masses (sometimes several inches across) submerged in it. Such growths represent a resting condition, the various elements being glued together, as it were, by their enormously thickened and mucilaginous cell-walls. Such thickened cell-walls are called capsules and the organisms in which this thickening occurs are said to be capsulated. Under favourable conditions the elements in the zoogloea again become active, move out of the matrix and distribute themselves in the surrounding medium to grow and multiply as before. If the zoogloea is formed on a solid substratum it may become firm and horny; the subsequent immersion in water softens it and the organisms become active as described.



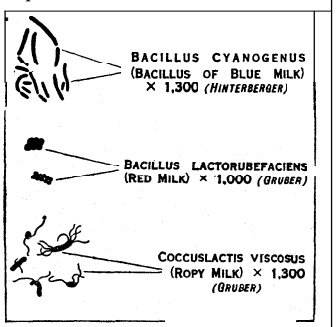
FROM MUIR, 'BACTERIOLOGICAL ATLAS' (LIVINGSTONE)

DISEASE-PRODUCING BACTERIA VIEWED THROUGH THE MICROSCOPE

1. Streptococcus pyogenes in pus. X (magnified) 1,500. Stain: Gram, neutral red. This is one of the common species of streptococsi. It is a very common pus-forming organism and is often associated in "mixed infections" or "secondary infections." S erysipelatis causes the long-known skin disease, erysipelas. (See also fig. 10)
2. Staphylococcus pyogenes aureus (dark spheres) and Bacillus pyocyaneus (pink rods) in pus. X 1,500. Stain: Gram, neutral red. Staphylococci are commonly found in boils, abscesses, carbuncles and other suppurative processes in man. S pyogenes aureus is characterized by the golden-yellow pigment formed in pus. Bacillus pyocyaneus is found in man associated with streptococci and staphylococci. It may also be found in pure culture in some cases of pneumonia
3. Pneumococcus (encapsuled dark ellipses) and Micrococcus catarrhalis (red spheres in clumps) in sputum. X 1,500. Stain: Gram, neutral red. The majority of pneumonia cases are caused by pneumococci
4. Meningococcus (encapsuled diplococci) from cerebro-spinal fluid in epidemic cerebro-spinal meningitis. X 1,500. Stain: Leishman
5. Same stained Gram, neutral red. The diplococci are mainly intracellular
6. Gonococcus from pus in gonorrhoea. X 1,500. Stain: Methylene blue, eosin. The diplococci are mainly intracellular
7. Bacillus diphtheriae (rods) and a few chains of streptococci from a smear of the throat lesion in diphtheria. X 1,500. Stain: Thionin blue
8. Bacillus diphtheriae from 12 hours' culture on Löffler's serum medium. X 1,500. Stain: Neisser's method with methylene blue and Bismarck brown. Note the bipolar staining of the metachromatic granules
9. Bacillus diphtheriae: involution forms. From a 5-day agar culture. X 1,500. Such are often found in the throat lesion. Stain: Thionin blue
13. Bacillus tubarculoeis (human type). From sputum in a case of pulmonary tuberculosis. X 1,500. Stain: Ziehl-Neelsen's method, methylene blue. A few streptococci (blue) are seen
11. Bacillus anthracis from liver of a diseased guinea-pig (experimental anthrax). X 1,500. Stain: Muir's method to show Gram-positive reaction and capsule staining. (See also fig. 15, Plate II)
12. Bacillus anthracis from 3 days' agar culture to show spores (red) within the bacilli. X 1,500. Stain: Ziehl-Neelsen's method with 0.5 per cent. sulphuric acid methylene blue
13. Bacillus coli from case of cystitis. X 1,500. Stain: Gram, neutral red. This bacillus is widely distributed in nature and has been isolated from air, water and soil. It occurs abundantly in the intestinal tract of man and derives its name "coli" from the fact that it is found most abundantly in the colon. Though these organisms may be present in large quantities without causing specific disease, they sometimes invade the gall-bladder and bile-ducts, causing cholangitis and cholecystitis, and produce lesions of the urinary tracts, causing cystitis
14. Bacillus typhosus from young agar culture. X 1,500. Stain: Gram, neutral red. This intestinal tract organism causes typhoid fever
15. Same to show flagella: 12 hours' agar culture. X 1,500. Stain: Muir's method
16. Bacillus dysenteriae (Shiga): young agar culture. X 1,500. Stain: Gram. neutral red. This is one of a group of four or more organisms of the intestinal tract causing dysentery in man

BACTERIA IN AIR AND WATER

That bacteria have existed from very early periods is clear from their presence in fossils; the researches of B. Renault and P. van Tieghem have shown that large numbers of bacteria existed in Carboniferous and Devonian times. To-day they are universally present in still ponds and ditches, in running streams and rivers, in the sea, especially in drains, rubbish and manure heaps, in the soil and wherever organic matter is allowed to stand for a short time. Any liquid (blood, urine, milk, beer, etc.) containing organic matter, or any solid food-stuff (meat, bread, potatoes, etc.,) allowed to stand exposed to the air soon swarms with bacteria if sufficient moisture is present and the temperature is not abnormally cold. Though they occur all the world over in the air their distribution is by no means equal in all parts. As might be conjectured they are most numerous in the air of towns, but even here the number of living germs is not so great as one would expect considering the enormous number of dust particles. Every mote in the air doubtless carries its quantum of bacteria, but the conditions of rapid drying and the exposure to ultra-violet light are responsible for the death of the majority of organisms that are raised by the mind from the earth's surface. The air of the country is relatively pure as compared with that of the towns and in forest areas the presence of bacteria in the atmosphere is usually hard to demonstrate. the leaves of trees seeming to act as efficient bacterial filters. The atmosphere of the ocean becomes more and more free from organisms the farther one goes out from the coast. Notwithstanding the large number of bacteria in the atmosphere the breath of individuals is practically germ-free. This means that the micro-organisms are retained in the nose, mouth and throat; the number thus retained must be very great. It is obvious then that other things being equal the danger from infection is greatest among town dwellers and those whose life is spent in ill-ventilated factories and least among sailors and dwellers on the mountain-side. The danger of infection from breathing disease germs is, however, not great in proportion to the numbers of such germs which are respired, since it can be shown that of the disease germs that fall upon an exposed plate of culture media, though many remain viable, only a few of these retain their virulent property. It can, however, be shown that the organisms of the common cold can be received on a plate of media held at a distance of seven feet from a person who sneezes openly. The explosive force of coughing and even speaking and whispering carries disease germs to some considerable distance.



LIPMAN, "BACTERIA IN RELATION TO ..." (MACMILLAN CO.)

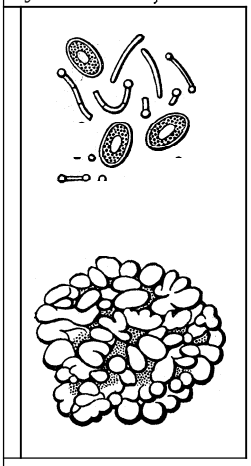
FIG. 8.—BACTERIA PRODUCING FAULTS IN MILK

BACTERIA IN MILK AND DAIRY PRODUCE

It has been stated already that milk is a perfect food for the development of bacteria. Without bacteria or other micro-organisms milk undergoes no change which can be detected by the senses and it may be kept in its original state almost indefinitely. The length of time during which milk will remain wholesome depends very largely upon its initial bacterial content. Appreciation of this fact has led the progressive dairyman to adopt methods to secure milk as free from bacteria as is consistent with its economical production; by steam sterilization of all vessels used, by washing the udders and cleaning the cows, by sterilizing the hands of all milkers, and by absolute cleanliness of the byre, the production of "Certified" milk guaranteed to contain fewer than 30,000 organisms per cu.cm. has been rendered possible.

Milk that has become sour is considered undesirable for drinking purposes in this country, but in different parts of Europe and Asia natural beverages are prepared by submitting milk to conditions which favour the development of certain acid-producing bacteria. The Bulgars, for instance, drink a great deal of milk soured by E. Metchnikoff's organism *Bacillus bulgaricus.* In other parts alcoholic beverages, kefir, kumiss, matzoon, etc., are brewed in the homes by the combined action of various yeasts with *Bacillus acidi lactici* and other acid-producing bacteria.

Butter-making.—Much use is made of the acid-forming bacteria in the preparation of cream for butter-making. It is possible to produce butter from fresh cream and in some of the European countries there is a strong demand for such butter. The keeping qualities of this fresh cream butter, however, are very poor and it therefore must be consumed within a short time of its production. This defect is to a large extent disposed of by allowing cream to sour before it is churned. In this bacterial "ripening" of cream the globules of fat are altered in that the protein envelope of the fat is practically digested by the bacteria and the enclosed fat is more readily coalesced to form butter. Further, since acids prevent the development of most bacteria, the high degree of acidity reached at the time of churning eliminates many of the bacterial kinds responsible for the rapid spoiling of butter made from fresh cream. In ordinary farm practice the cream is allowed to ripen in an almost uncontrolled manner by any organisms falling from the air into the cream accumulated from day to day until the quantity is sufficient for the churn. In this way the butter produced varies considerably in flavour and texture in accordance with the character of the bacterial flora. In modern dairy practice, on the other hand, the ripening process is scientifically controlled; mixed cultures of organisms (starters) chosen for their power to produce quickly a high degree of acidity and to enhance the flavour of the final product are employed. The temperature of the inoculated cream is kept practically constant so that when it enters the churn bacterially and chemically it is in a uniform condition. The result is a uniform butter free from undesirable taints and possessed of excellent keeping qualities. Such butter will be good for two or three weeks but sooner or later undesirable flavours will develop. Chief among these is the familiar rancidity produced by the conversion of lactic acid into butyric acid by *Bacillus butyricus* and a number of other organisms. Mottled, putrid, bitter and tallowy butter are faults that can usually be traced, sometimes with considerable difficulty, to certain contaminating bacteria and these are not always in the ripened cream but are introduced into the butter with the wash water. Even creameries with an established reputation for excellent butter are sometimes faced with the problem of eradicating some micro-organism causing rapid deterioration of their product. Similar faults arise in milk through certain bacteria gaining the upper hand and producing taints and colours; for example, blue milk, red milk, ropy milk and bitter milk.



FROM LIPMAN, "BACTERIA IN RELATION TO COUNTRY LIFE"

FIG. 9.—KEFIR GRAINS AND MICRO-ORGANISMS OF KEFIR

Cheese-ripening.— The starting material for all cheeses is practically the same, namely a curd produced by the action of rennet upon milk. The differences which characterize the various cheeses arise during the ripening process and are the result of the temperature and moisture conditions under which the curd is maintained during the ripening process. For the manufacture of hard cheese the curd is pressed to greater or less degree and more or less fat is retained in the curd according to the kind of cheese it is desired to produce. For the manufacture of soft cheeses the curd is merely drained or submitted to slight pressure only. The curd for hard cheese comes from the press in a hard, partly dry form whereas for a soft cheese the curd is left very wet. The latter condition is much more favourable to the growth of organisms, one therefore finds that soft cheeses ripen much more quickly than hard cheeses. The whole story of the ripening of cheese has not yet been revealed, but it is known that it is not entirely due to bacterial action. Some of the softening which the curd undergoes is a chemical process slowly developed under the influence of enzymes (catalytic agents

or chemical stimuli). These agents probably play a much larger part in hard than in soft cheese, but the flavours and texture which distinguish the different cheeses are undoubtedly the result of the growth of organisms, bacteria, yeasts and moulds. Most of the bacteria in cheese ripening are of the acid-forming type and these are not all equally suitable for the purpose. Artificial cultures or "cheese starters" are therefore sometimes employed, though their

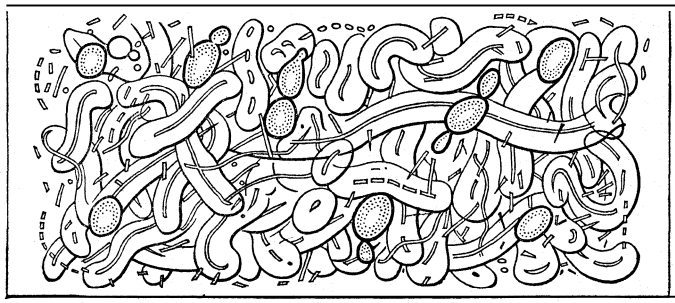


FIG. 10.—GINGER-BEER PLANT. SHOWING YEAST (SACCHAROMYCES PYRIFORMIS) ENTANGLED IN THE MESHES OF THE BACTERIUM (B. VERMIFORME)

use is by no means so general as is the use of "butter starters." The famous Edam cheese of Holland is started by adding to the milk to be curdled some slimy milk formed by a pure culture of the "ropy-milk" organism. From the nature of the case it will readily be seen that bacteria of the wrong kind may dominate the situation and may seriously affect the flavour and appearance of the cheese. Many faults may arise in this way; chief among these is a gassy condition, caused by *Bacillus lactis aërogenes;* other faults are sweet flavour, putrefaction, and variously coloured spots. These last are sometimes due to yeasts and sometimes to moulds.

BACTERIA IN RELATION TO SOIL FERTILITY

During the middle ages and the early part of the present era the fertility of soil was the subject of much speculation; varied and fantastic, and very wide of the truth were the views regarding the food requirements of plants. These views however were without their influence upon the methods of farming practice. These methods have throughout the ages been slowly evolved by experience, and even the science of the past century, apart from the introduction of artificial manures, has done little to change them. The composition of soil and its condition of cultivation have remained constant so long that gradually certain combinations or associations of micro-organisms specially adapted to the soil habitat have established themselves. Thus soil has come to have a special microscopic flora and fauna which vary only slightly in different localities and at difierent times of the year. These associations consist of certain well-defined groups of organisms each with its characteristic function to perform and such variations as exist show themselves in the relative ascendancy of one group over others as indicated by the prevalence, permanent or temporary, of the specific function which attaches to that group.

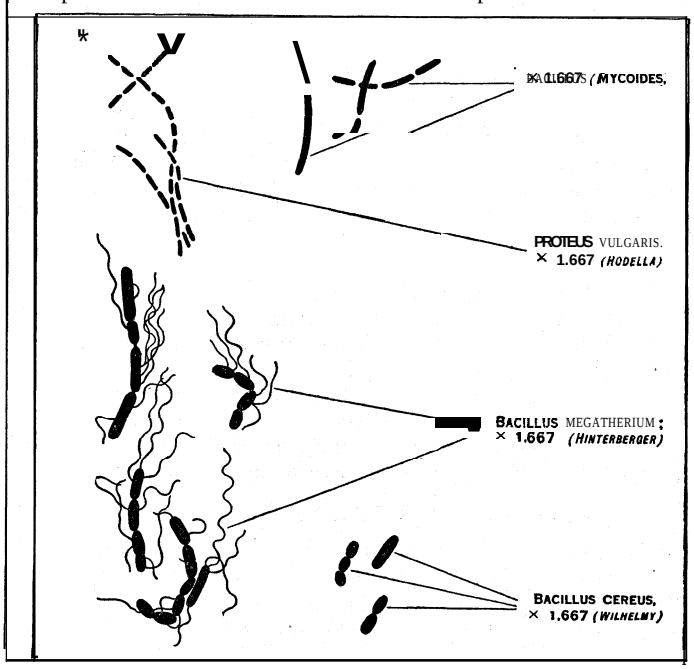
The combined efforts of all these groups result in the complete breakdown of organic remains of plants and animals and of inorganic rock particles and in the elaboration from them of simple substances which may act as plant food; in other words, they result in the fertility of the soil.

The soil population is so complex, and the functions of one group are so closely associated with the activities of others, that the bacteriologist can often do no better than study the working of the soil as a whole under artificially imposed changes in the soil conditions. Variations in the access of air, in the amount of moisture, in the temperature and in the H. ion concentration of the soil have led to considerable knowledge of the biological activities of loose well-aerated and dry soils (sandy soils and sandy loams) as compared with closely packed and relatively wet soils (heavy loams, clays and peaty loams). On the other hand, individual species isolated from soil have been studied in pure culture, and the chemical phenomena that they exhibit under these conditions have led to much enlightenment of the changes brought about in the soil by the group of organisms to which they belong.

Carbohydrate and Cellulose Fermentations. — The organic matter in the soil, the dark brown substance which distinguishes the fertile surface layers from the light coloured infertile sub-soil, is termed "humus" and consists of plant and animal remains in all stages of decomposition.

Starches and Sugars. — The most easily decomposed part of plants are rapidly fermented by yeasts, moulds and bacteria, and being themselves free from nitrogen their removal leaves the remaining humus relatively richer in nitrogen, and since these fermentations are oxidation processes they occur with greatest rapidity in well aerated soils and in the upper layers of the soil. The humus is therefore found to be progressively richer in nitrogen as one passes from depth to depth. Moreover, the rapidity of action of these oxidizing organisms is so great in sandy soils and in hot climates that the maintenance of sufficient organic matter in such soils is a matter of considerable difficulty. The fermentation of cellulose is but little slower than that of starch; many anaerobic bacteria are known to be capable of destroying cellulose and until recently anaerobic organisms alone had been shown to possess this power. It is, however, clear that the cellulose of buried plant material is rapidly attacked in open soils and that such parts lose their identity even more rapidly in well aerated than they do in badly aerated soils. Some oxidative processes of decay are obviously at work and recently it has been shown that English soils contain two organisms at least, *Spirochaete cytophaga* and *Microspira agar liquefaciens,* which under aerobic conditions in laboratory cultures have been found to destroy the cellulose of filter-paper in so short a time as three weeks. Some part of the cellulose is converted into a mucilaginous material which is incapable of further oxidation, and which has its counterpart in the mucilaginous nature of well rotted farmyard manure.

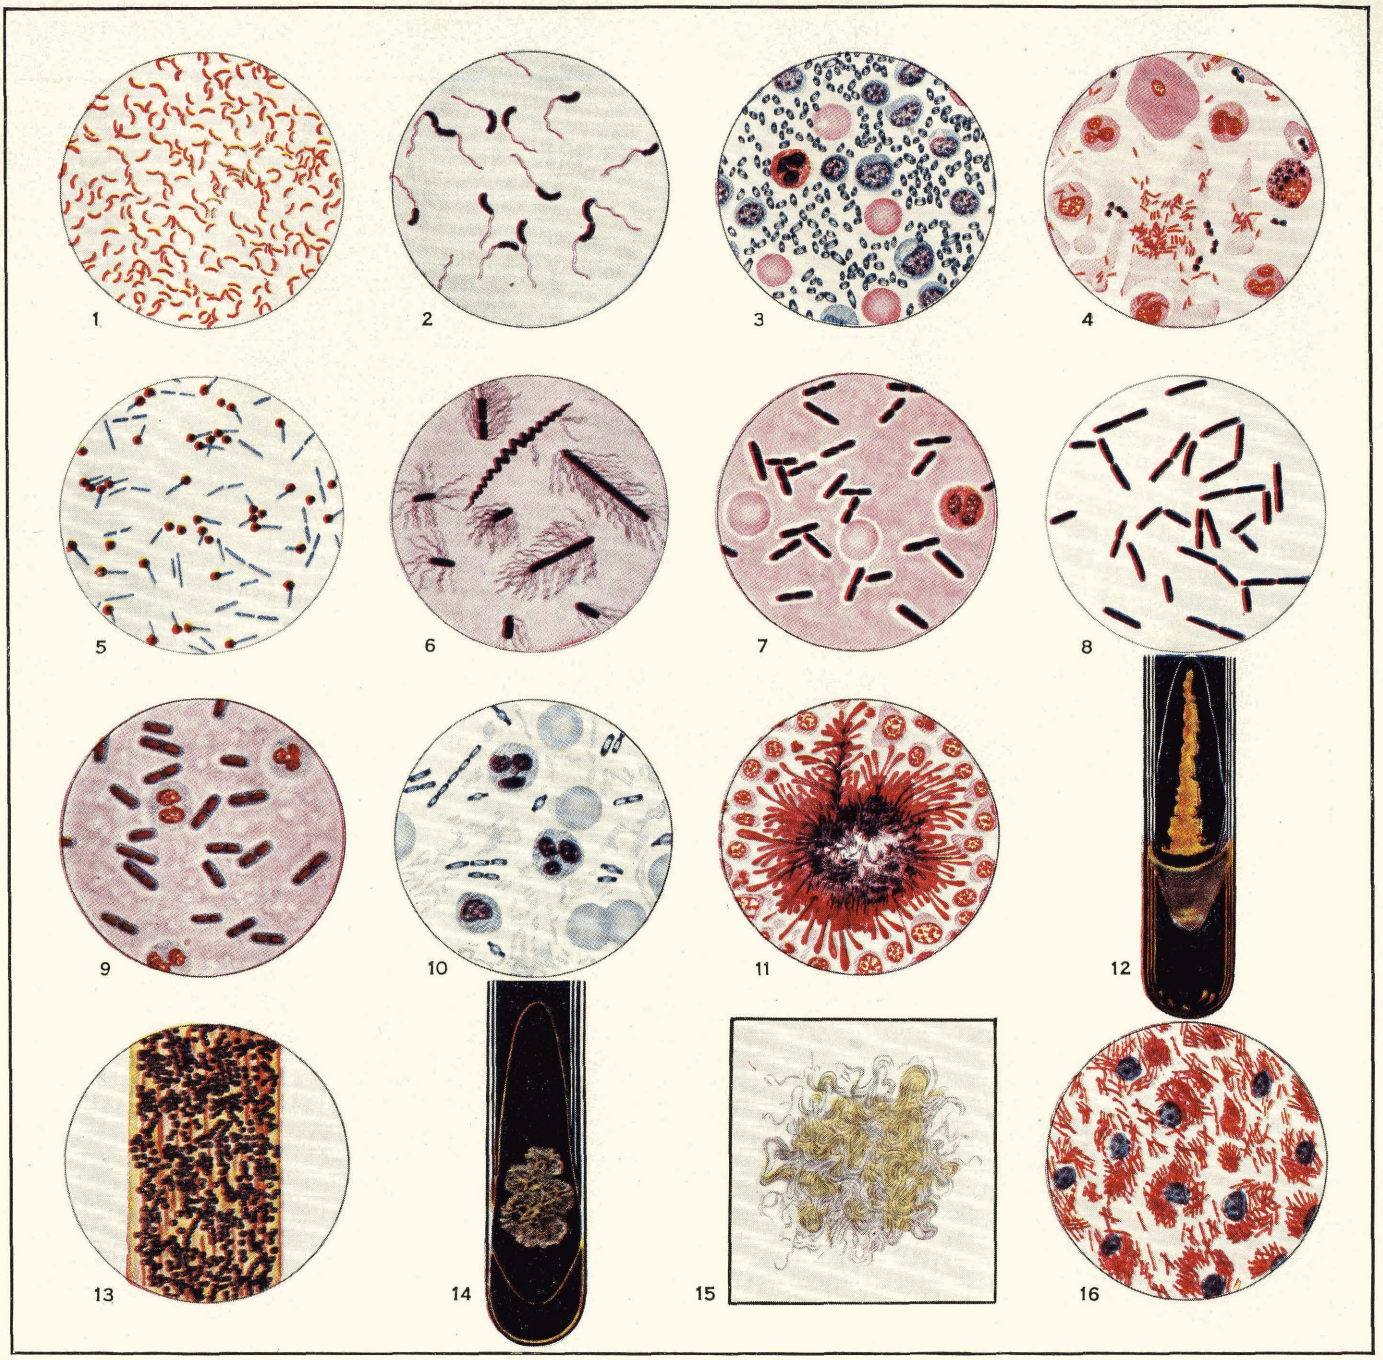
Ammonification.—Under this term is included a number of complicated and little understood chemical phenomena which result in the breakdown of the nitrogenous matter of the humus and its conversion into ammonia. The nitrogen of plant and animal remains is for the most part locked up in very large molecules, the proteins, and as such is not available as food for plants. Many bacteria are known to be capable of attacking the protein molecule with ease; by virtue of an enzyme which is exuded from them, the proteins of gelatine that form the basis of the medium on which the bacteria are cultivated are digested and liquefaction



FROM LIPMAN, "BACTERIA IN RELATION TO COUNTRY LIFE" (MACMILLAN CO.)

FIG. 11.—TYPES OF BACTERIA CAPABLE OF PRODUCING AMMONIA

Plants take up most of their nitrogen in the form of nitrates, which are simple substances compared with the humus from which they are drawn. There are three steps: 1. production of ammonia, 2. changing ammonia to nitrites. 3. changing nitrites to nitrates. Each step is usually carried out by a different kind of bacteria



(1-11) FROM MUIR, "BACTERIOLOGICAL ATLAS" (LIVINGSTONE), (12, 14, 15) FROM LEHMAN-NEUMANN, "BACTERIOLOGISCHE DIAGNOSTIK" (LEHMAN)

DISEASE-PRODUCING BACTERIA VIEWED THROUGH THE MICROSCOPE

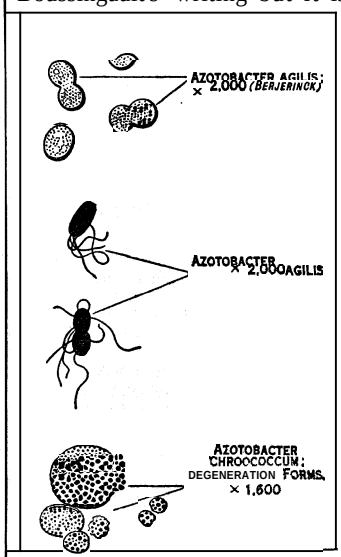
1. **Vibrio cholerae** asiaticae: 24 hours' agar culture. X magnified 1,500. Stain: Carbol fuchsin. Formerly known as "Comma bacillus," causing cholera
2. Same as fig. 1, to show flagella: 12 hours' agar culture. X 1,500. Stain: Muir's method
3. **Bacillus pestis from bubo in case of Oriental plague.** X 1,500. Stain: Methylene blue, eosin
4. Bacillus **influenzae** (Pfeiffer) from sputum in case of **influenzal** pneumonia. X 1,500. Stain: Gram, neutral red. Note presence of a few **pneumococci** in pairs (dark). (See also fig. 3, Plate III)
5. Bacillus tetani showing bacilli and terminal spores ("drum-sticks") from 3 days' **glucose** agar stab culture. X 1,200. **Stain: Ziehl-Neelsen,** decolourized with 5 per cent. **sulphuric** acid, washed (water) mordanted with saturated watery potash-alum, washed (water) methylene blue. This is the blood-poisoning (lockjaw) organism which grows best with a very low oxygen supply. For this reason the bacilli develop in deep, dirty wounds, though these may be relatively as small as pin pricks
6. Same as fig. 5, to show flagella: 12 hours' anaerobic agar culture. Stain: Muir's method. X 1,200. The wavy mass at top is a cluster of shed flagella
7. Bacillus Welchii **(perfrigens)** from a case of gas gangrene. X 1,500. Stain: Gram, neutral red
8. Same as fig. 7, from young agar culture grown **anaerobically.** X 1,500. Stain: Gram
9. Same as fig. 7. X 1,500. Stain: Muir's method to show capsule
10. **Vibrio septica from subcutaneous tissue in case of malignant oedema** with gas gangrene. X 1,200. Stain: Methylene blue. Note numerous spore-bearing bacilli singly or in chains
11. **Streptothrix actinomyces** ("ray fungus") from lesion in **tongue** of cow. X 800. Stain: Gram. eosin. Note that the **mycelial** filaments are **Gram-positive,** the clubs are Gram-negative. Around the colony mononuclear cells predominate
12. Naked-eye **culture** of **Staphylococcus** pyogenes aureus on gelatine slope: at the bottom the gelatine is liquefied. (See fig. 2, Plate III)
13. **Microsporon Audonini.** Hair from scalp in case of ringworm. **X 800.** Stain: Adamson's modification of Gram's method. The violet spheres are spores of the fungus on the surface of the hair
14. Naked-eye culture of bacillus tuberculosis of stycerm agar. (See fig. **10,** Plate III)
15. Impression of minute colony of Bacillus anthracis. X about 20. Unstained. Note the "Medusa locks" arrangement of the filament of bacilli. The demonstration by Robert Koch in 1876 of the causal relation between anthrax (splenic fever) and a specific bacillus marks the beginning of modern bacteriology. See **"Life** of Pasteur," New York, 1902. (See fig. **11,** Plate III)
16. Bacillus lepraea in tissue. From subcutaneous nodule in case of leprosy. **X** 1,500. Stain: Carbol fuchsin, methylene blue

of the medium follows. E. Marchal (1893) showed that of 31 species of organisms isolated from soil no less than 17 liquefied gelatine and a great many others have since been added. All these have the power of converting humus proteins into simple soluble nitrogenous compounds, amino acids, many go farther than this and produce ammonia. Besides these there are in soil many organisms which, though not so vigorous as the above, have the power of peptonizing the protein molecule much in the same way as digestion of protein takes place in the human stomach. All these organisms, since they are associated with the ultimate conversion of protein into ammonia, are included in the group of ammonifiers. Another group which is also included here, and which deserves special notice on account of the importance of its particular function, is a small group of urea bacteria, organisms which bring about the conversion to ammonium carbonate of the large quantity of nitrogen eliminated by animals in the form of urea. So rapidly do they effect this conversion and so common are they in the air that urine always smells of ammonia within a short time of its leaving the animal's body.

Nitrification. — Now, while it is possible for plants to assimilate ammonia, the chief form in which nitrogen is taken up by plants is that of nitrate and it has been recognized for a long time that ammonium carbonate is readily converted into nitrate, but it was not till near the end of the 19th century that this was definitely shown to be a biological problem. In 1877 two Dutchmen, J. H. Schloessing and C. A. Muntz, showed that the process came to an immediate stop when the soil was heated or was treated with chloroform. Although this pointed to a living agent, and experiments which followed indicated this to be bacterial, for some time all attempts to isolate these bacteria failed. Among the foremost workers were R. Warington in England and S. Winogradski in Russia. These two independently and almost simultaneously found the cause of their frequent disappointments lay in the fact that the nitrifying bacteria would not grow on ordinary nutrient media. It was Winogradski who first published his results; he cultivated the organisms in a solution of ammonium sulphate containing potassium phosphate and a small quantity of basic magnesium carbonate. In this medium nitrification occurred vigorously and from it he inoculated plates of gelatinous silica impregnated with these salts and isolated two kinds of bacteria. He found that neither of these organisms produced nitrate from ammonia. But having no trace of any other organisms, Winogradski thought to try a double inoculation of the ammonia solution and found that both organisms were required, and that the process took place in two stages.

The first stage in the oxidation of ammonia is brought about by a class included by Winogradski in the genus Nitrosomonas. They produce nitrite only, pure cultures can carry nitrification no farther. In the stages of culture an incubation period of five or six days at 25° C. occurs during which the organisms are found in a aoogloeal state attached to the particles of magnesium carbonate, and during this period little or no oxidation takes place. After this the zoogloea loosens and free-swimming organisms are found, and the first stage in the oxidation at once sets in. The other group which oxidizes nitrites to nitrates but which is powerless to oxidize ammonium salts is included in the genus Nitrobacter. These are smaller than the nitrite formers and are non-motile. With the conversion of ammonia to nitrite thus explained the complete return of the nitrogen contained in dead plants and animals to a form in which it is readily available for the building up of young plants again is completely accounted for. When one considers that in the process of cropping the greater part of the nitrogen taken up by the plant is lost to the land, only the small amount present in the roots and the stubble remaining, it is obvious that this wastage of nitrogen must in some way be made good or the soil would soon become exhausted and would no longer support the growth of plants. The farmer makes up a large part of this wastage by the application of dressings of farmyard manure and of sulphate of ammonia, etc. Forest land, however, never receives dressings of fertilizers, yet one knows that forests have continued to produce trees with unabated vigour for many centuries. Moreover it is well recognized that one way of enriching land is to allow it for a time to remain fallow, that is, bare of vegetation, and it can easily be shown by analysis that such fallow land gains in nitrogen content,.

Nitrogen Fixation. — "Vegetable earth contains not only dead organic matter but living organisms. The mycoderms have only an ephemeral existence and they leave their detritus in the soil which in turn may give rise to ammonia and nitric acid." Thus wrote J. B. J. D. Boussingault in 1858 and though he was not aware of the fact the statement contains the explanation of the gain of nitrogen in fallow land. There are in the soil certain organisms, the most notable of which are *Azotobacter chroococcum* and Clostridium *pastorianum*, which, in the absence of other forms of nitrogen, can utilize the nitrogen gas dissolved in the soil solution. These organisms were not discovered till 35 years after Boussingault's writing but it is now known that the enrichment of the soil is due to their assimilation of nitrogen from the air and the storage of it in their own bodies till such time as they are absorbed by the Protozoa. On the death of the protozoa the combined nitrogen becomes food for the plant through the agency of the ammonifiers and nitrifiers. Till recently it was believed that the nitrogen-fixers required to have nitrogen presented to them in the gaseous form. It is now recognized that they do not differ from other forms of life in taking the path of least resistance. They fix nitrogen not because they must but because they are able to do so. If it is possible for them to acquire their necessary nitrogen with smaller expenditure of energy no nitrogen will be fixed. In the presence of much ammonia and relatively little carbohydrate material; as when too heavy dressings of rich nitrogenous fertilizers like dried blood or cow dung are made, these organisms will multiply very rapidly, and will actually go into competition with the plant for the available supply of ammonia, and the plants temporarily will actually suffer nitrogen starvation.



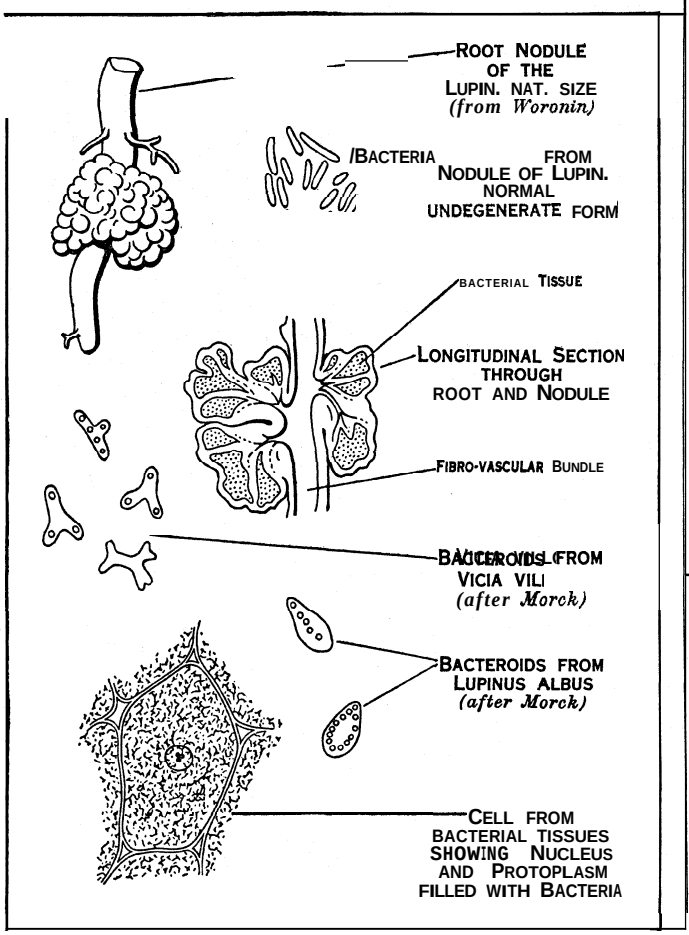
FROM LIPMAN, "BACTERIA IN RELATION TO COUNTRY LIFE"

FIG. 12. — TYPES OF BACTERIA, LIVING **INDEPENDENTLY IN SOIL, HAVING THE POWER TO EXTRACT** NITROGEN FROM THE AIR AND TURN IT **INTO** PLANT FOOD

Nitrogen Fixation by Symbiotic Organisms. — A further way in which the soil is enriched is through the growth of plants of the family *Leguminosae* (including peas, beans, clover, etc.).

By analysis it was shown by Schulz-Lupitz in 1887 that the way in which these plants enrich the soil is by increasing the nitrogen-content. The only possible source for this increase was the atmospheric nitrogen. It had been, however, an axiom with botanists that the green plants were unable to use the nitrogen of the air. The apparent contradiction was explained by the experiments of H. Hellriegel and H. Wilfarth in 1888. They showed that, when grown on sterilized sand with the addition of mineral salts, the *Leguminosae* were no more able to use the atmospheric nitrogen than other plants such as oats and barley. Both kinds of plants required the addition of nitrates to the soil. But if a little water in which arable soil has been shaken up was added to the sand, then the leguminous plants flourished in the absence of nitrates and showed an increase in nitrogenous material. They had clearly made use of the nitrogen in the air. When these plants were examined they had small swellings or nodules on their roots, while those grown in sterile sand without soil-extract had no nodules. Now these peculiar nodules are characteristic of the roots of leguminous plants grown in ordinary soil. The experiments above mentioned made clear the nature and activity of these nodules. They are the result of infection (if the soil extract was boiled before addition to the sand no nodules were produced), and their presence enabled the plant to absorb the nitrogen of the air.

The work of recent investigators has made clear the whole process. In ordinary arable soil there exists motile rod-like bacteria. *Bacterium radicicola.* These enter the root-hairs of leguminous plants, and passing down the hair in the form of a long, slimy (zoogloea) thread, penetrate the tissues of the root. As a result the tissues become hypertrophied, producing the well-known nodule. In the cells of the nodule the bacteria multiply and develop,



FROM "VORLESUNGEN UEBER BAKTERIEN," BY PERMISSION OF GUSTAV FISCHER

FIG. 13.— THE ROOTS OF LEGUMINOUS PLANTS. AS BEANS, PEAS, ETC., SUPPORT BACTERIAL GROWTHS CALLED NODULES OR TUBERCLES

drawing material from their host. Many of the bacteria exhibit curious involution forms ("bacteroids"), which are finally broken down and their products absorbed by the plant. The nitrogen of the air is absorbed by the nodules, being built up into the bacterial cell and later handed on to the host-plant. It appears from the observations of Mazé that the bacterium can even absorb free nitrogen when grown in cultures outside the plant. We have a very interesting case of symbiosis, the green plant always keeps the upper hand, restricting the bacteria to the nodules and later absorbing them for its own use. Different genera require different races of the bacterium for the production of nodules.

Another case of symbiotic nitrogen fixation is met in certain members of the plant families *Rubiaceae* and *Myrsinaceae.* Here the bacteria invade the leaf tissue through a large stomata1 opening which seems to have evolved specially for this purpose, they become established in spherical glands which are conspicuous as blisters on the surface of the leaves. These glands were previously regarded as protein glands, but through the researches of H. Miehe, A. Zimmerman and F. C. von Faber it is now known that what were formerly regarded as protein crystals are in truth bacteroids of a species of bacteria, *Pseudomonas rubiacearum,* which, like *Pseudomonas radicicola,* has the power of fixing atmospheric nitrogen.

Sulphur Bacteria.— There are in soil certain organisms which bring about a sulphur cycle similar to that of nitrogen. F. Cohn long ago showed that certain glistening particles in the cells of *Beggiatoa* consist of sulphur and S. Winogradski and M. W. Beigerinck have shown that a whole series of sulphur bacteria exist. In the process of decay the sulphur contained in protein is for a large part converted into hydrogen sulphide and in its presence sulphur bacteria thrive; they oxidize the molecule into sulphuric acid, at the same time storing up some of the sulphur in their own bodies, so that, if the hydrogen sulphide in the soil runs short, they have this reserve of sulphur, and so long as it lasts the organisms remain alive but death by starvation occurs when the last traces of sulphur are gone. The sulphuric acid formed finds its use in the soil in rendering soluble the insoluble calcium phosphate (apatite, bones, fish meal, etc.)

Beigerinck has shown that *Spirillum desulphuricans,* a definite anaerobic form, attacks and reduces sulphates, thus undoing the work of the sulphur bacteria. This phenomenon has its parallel in the action of certain de-nitrifying bacteria in reversing the operations of the nitrifying bacteria.

Iron Bacteria.— This group of organisms is present in all soils and especially abundant in regions bordering on iron-stone deposits; ponds in such regions may show a bright rust colour due to the presence of these bacteria for they are characterized by the possession of a thick sheath-like envelope in which ferric hydroxide, a substance akin to iron rust, is deposited. They are all thread-like forms, some species being flattened filaments having the appearance under the microscope of twisted ribbons. It is doubtful whether they are in any way useful but, on the other hand, they may prove extremely troublesome in the maintenance of the water supply for large towns for, given suitable conditions, they grow with extreme rapidity and the cells, when they die, leave behind minute tubes of iron oxide, and these have been known to choke completely the service pipes. Berlin had trouble of this kind in 1877 and the whole of the water mains had to be renewed. But perhaps the most striking calamity on record befell Rotterdam in 1887. The reservoirs first became contaminated by growths of mussels, polyzoa and sponges with which the walls of the reservoirs became thickly encrusted. These, however, did little harm, they produced a certain amount of increase of organic matter through their excreta, but by their habit of feeding they reduced the bacterial content of the water and they were consequently allowed to remain. The trouble came when the organic matter increased to such an extent that iron bacteria had their chance and all this mass of molluscs became coated with a $\frac{1}{4}$ to $\frac{1}{2}$-inch covering of filamentous iron bacteria. These found their way into the service mains and made the water quite undrinkable.

FIG. 14.— TYPES OF FRUCTIFYING BACTERIA

THE DISPOSAL OF SEWAGE

The disposal of the sewage of large cities is one of the most difficult problems with which the engineer is faced. Sewage contains, beside the waste products of human beings, the waste products of factories and the whole of the water used in the city in its multifarious daily operations. The bulk of sewage to be dealt with amounts to approximately thirty gallons per head of the population. In small communities the matter is simple since the relatively small amount of material can be run into streams without serious pollution or can be applied to the land, where the nitrogenous matter is decomposed and follows the cycle of changes described above. The land thus fertilized can be turned to good account in the cultivation of cabbages and other crops for the feeding of cattle. In tropical countries, where bacterial action is hastened by high temperatures, the sewage of even large towns

may be similarly disposed of, but in the more temperate climates similar rapidity of bacterial action has to be induced by special engineering methods. In all these methods the soil organisms are brought into play. In the majority of town syslems the sedimentation tank, the septic tank and coke or sand filter beds figure in the process. The greater part of the solid matter settles in the first tank the turbid liquid passing over into the second tank from which a rather less turbid and less evil-smelling liquid passes on to the filter beds.

In both tanks the action of bacteria is for the most part anaerobic, under which the breakdown of the excretal matter is very rapid, but the destruction is only partial, resulting in simple soluble nitrogenous substances possessed of the evil smells one associates with the process of putrefaction. This putrefying matter is sprinkled on to beds of coke some twenty to fifty feet wide and four to five feet deep through which it rapidly percolates. In its passage it is so much exposed to air that the aerobic processes of ammonification and nitrification follow with extreme rapidity. In many systems the time of passage through the filters is as short as 20 or 2 j minutes, after which the noxious substances have been converted almost entirely into nitrates and so forth, perfectly innocuous matter. These form an effluent that can be run into the river without fear of causing pollution of the stream.

Activated Sludge Process.—The purification of sewage by the aerobic bacteria which it normally contains is so slow, requiring many days for completion, that sewage disposal by this means alone has long been regarded as impracticable. A method of hastening the process was, however, discovered in 1913, and since 1916 the activated sludge process has actually been in successful operation. When sewage is well aerated the suspended matter gradually disappears, being acted upon by aerobic bacteria, and gives place to a granular brown mass which rapidly settles, leaving a clear solution of the inorganic salts, such as chlorides and nitrates, with only quite small amounts of soluble organic matter. It was discovered that the brown sediment added to a fresh supply of sewage and aerated by a blast of very fine air bubbles considerably hastened the oxidation process. On repetition each increase in the amount of sediment in relation to the volume of sewage is accompanied by an increase in the rate of oxidation, so that, when the relative amount of sediment approaches 30% of the total volume, oxidation is complete in the space of a few hours. This brown sediment forms the so-called activated sludge and consists very largely of a mass of living organisms, bacteria and protozoa.

In practice two tanks are employed: (1) the aeration tank in which the sewage and activated sludge are blown with air delivered in tiny bubbles by being forced through porous porcelain; (2) the settling tank in which the sludge is deposited and from which an effluent that requires no filtration is run away. Any excess of sludge over and above that required to maintain the necessary quantity of 25% to 30% in the aeration tank is spread out to dry by evaporation and forms a valuable fertilizer.

THE AFFINITIES OF THE BACTERIA

So far but little mention has been made of the classification of bacteria, the reader will find this adequately given in any textbook. All that need be said here is that the system or systems of classification adopted are based on no sure foundation, there being among bacteria, in contrast with other plants and animals, no clear indications as to the sequence in which various groups or families have arisen in the course of evolution. Similarly the affinities of bacteria with other forms of life are quite obscure; on the one hand they bear certain likeness to the protozoa, one group, the *Spirochoetes,* which used to be classed as bacteria has even been transferred to the protozoa, mainly on the ground of their character of dividing longitudinally as do the protozoa instead of transversely, the method universally present in the bacteria; on the other hand, as stated earlier, bacteria seem to possess affinity to the fungi, both being non-chlorophyll-containing plants. Whether the bacteria have evolved by degeneration from some more elaborate form of fungus, or whether they are to be regarded as the primitive form from which other forms of life have developed, are questions which have formed the basis of much discussion.

One group of bacteria which Thaxter has named the Myxobacteria shows very close relationship to a certain group of fungi, the Myxomycetes or slime fungi. The slime fungi are masses of naked protoplasm, or plasmodia, which at a stage in their life-history form cyst-like bodies in which the whole of the protoplasm changes into the form of spores. The Myxobacteria behave in a very similar way, equally elaborate spore-containing cysts are formed and in fact the characters of the group are those of the Myxomycetes except that a bacterial zoogloea takes the place of the plasmodial mass of the slime fungi. This group then seems to form one end of a bridge connecting the bacteria with the fungi and it is in fact the sole indication of any such affinity which up to the present has been discovered. (S. G. P.)

BACTERIOLOGY IN INDUSTRY. The industrial aspect of bacteriology which, in the early days of the science, exercised an almost dominating influence on the workers devoting their energies to the study of the microscopic world was gradually lost sight of when Pasteur, and the other early pioneers with him, turned their attention from the study of fermentations to that of putrefaction and of infectious diseases. For many years the bacteriological problems connected with industry were allowed to drift and few efforts were made to utilize the unique catalytic properties of bacteria, or to stem the destruction caused by these organisms in industries based on the handling of decomposable raw materials. To-day the industrial aspect of bacteriology is again receiving some attention, though unfortunately not always by the best qualified investigators; but much remains to be done to bring this branch of bacteriology on a level with the better-known sections—medical bacteriology, plant pathology and soil bacteriology.

A division of the subject under discussion into one part, dealing with the application of bacterial activity to industry, and another, outlining the destruction caused by bacteria in industrial undertakings, cannot, of course, be a very clear cut division. **A** number of problems of economic importance thereby remain unconsidered, for instance, the formation of peat, coal, shale oil and natural gas. However, the clearer view of the subject thereby obtained fully iustifies the adoption of this division.

INDUSTRIAL APPLICATION OF BACTERIAL ACTIVITIES

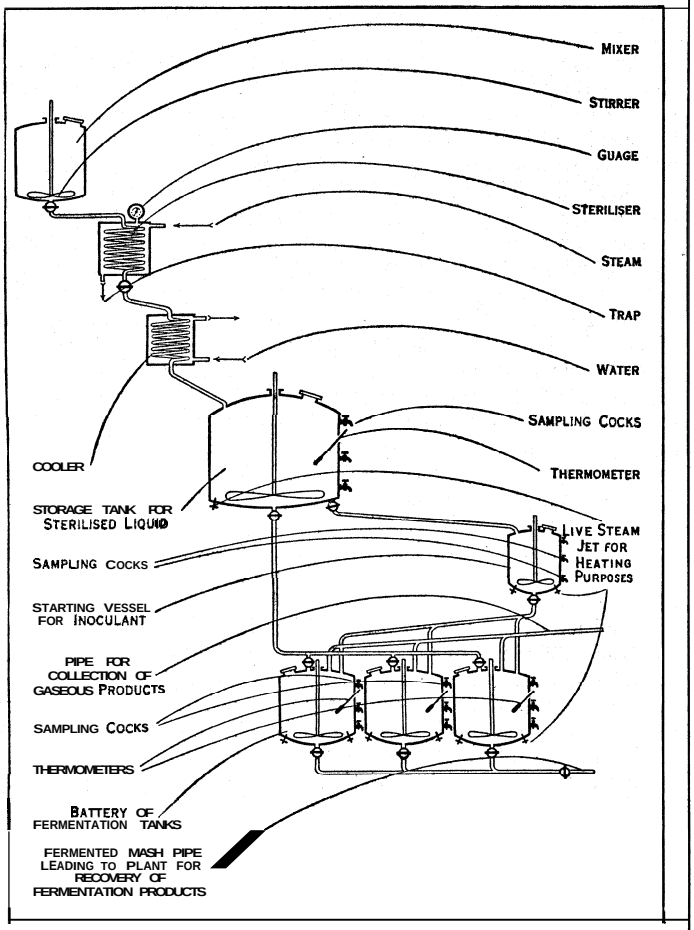
Baking.—The proper regulation of the fermentation which takes place during the raising of the dough is one of the most important problems of bread making. To-day this fermentation is artificially induced, in the making of the wheaten loaf, by the addition of suitable types of yeast—bakers' yeast—and by shortening the time of dough raising, the varied *microflora* of the flour is purposely prevented from taking part in the process. In those types of bread where the dough fermentation is induced by the addition of barms, the normal flora of the flour still plays an active role. The use of barms however is restricted to-day almost exclusively to the making of rye bread.

Bacterial Decomposition of Pectin.—The bacterial fermentation by which the pectinous middle lamellae of plant tissues are decomposed have long been industrially exploited for the retting of fibre plants. The best-known example is that of the retting of flax. In recent years this process has been greatly improved, particularly through the elimination of the putrefactive side reactions which prevailed in the earlier methods. The most important recent retting processes are those of Ochmann conducted in running water at low temperatures and in the presence of oxygen, the Rossi process, carried out at blood temperature in the presence of oxygen, and the Carbone process worked at blood temperature in the absence of oxygen.

Bacterial Decomposition of Starch and Sugars.—Leaving out of consideration the old established industries of brewing and wine making, there is a very large number of other processes by which the starch and sugar decomposing enzymes of bacteria—and of yeast—can be utilized for the production of industrially important products.

Glycerine and Lactic Acid.—The production of glycerine by yeast through the breakdown of sugars is based on Neuberg's and on Connstein's observations that sodium sulphite and certain other

alkaline salts, when added to a fermenting sugar solution, interfere with the normal course of the reaction and cause glycerine and acetaldehyde to accumulate in the fermenting liquid at the expense of alcohol and carbon dioxide. On a technical scale yields of 25% of glycerine, calculated on the sugar fermented, have been obtained.



A PLANT FOR THE ASEPTIC PRODUCTION OF LACTIC ACID AND MANY TYPES OF FERMENTATION UNDER SEMI-CONTINUOUS CONDITIONS

By employing certain bacteria, known as lactic acid bacteria, sugar solutions can be made to undergo another type of fermentation which results in the accumulation of very high yields of lactic acid. The fermentation has been industrially exploited since the middle of the 19th century, but only comparatively recently have efforts been made to conduct it under aseptic conditions, so as to avoid undesirable secondary fermentations which frequently seriously reduce the yields, and in the presence of pure cultures of the most suitable bacteria.

A diagram of a plant suitable for the aseptic production of lactic acid, and of many other types of fermentations, under semi-continuous conditions, is shown above.

Butyric Acid.—Like lactic acid butyric acid has been prepared industrially since the middle of the 19th century by the fermentation of sugars. The process has not yet been carefully investigated from the point of view of the most efficient procedure to be adopted. The responsible bacteria, which in most cases require the complete absence of oxygen—air—to develop, occur widespread in nature, particularly in the soil and on substances coming in contact with soil, for instance, milk and flour.

Citric Acid.—The conversion of sugars into citric acid can be performed by certain lower fungi, notably by species of *Aspergillus,* but this fermentation process has not yet met with economic success owing to insufficient knowledge of the most suitable conditions for the conversion. In recent years it has been shown that an adjustment of the reaction of the sugar solution to one of a fairly high acidity facilitates the production. There is little doubt that the application of this fact should make it possible to produce citric acid by fermentation at a price capable of competing with the product obtained from lemons.

Gluconic Acid.—Gluconic acid, an oxidation product of glucose, is produced by those lower fungi which form citric acid, and by certain bacteria. It has been suggested as a substitute for vinegar for domestic purposes, and has the advantage over vinegar of possessing a higher nutritive value. So far its industrial production by fermentation has not been attempted.

Alcohols.—During the World War the demand for acetone far exceeded the available supplies and new sources for the production of this solvent had to be devised. The foresight of the British Government made it possible to evolve a fermentation process in which certain bacteria, related to the butyric acid bacteria, were utilized for the conversion of starch into a mixture of butyl alcohol and acetone. With the increasing demand for butyl alcohol, which is used as a base in many dopes and varnishes, this fermentation process has become well established.

Apart from the use of sugars, such as molasses, for the production of power alcohol, recent investigations have shown that certain sugars, pentoses, which cannot be fermented by yeast, can be converted by bacteria into a mixture of ethyl alcohol and acetone. These sugars occur as a condensation product in a very large number of plants and are available in many parts of the world, notably in tropical and sub-tropical countries, in the waste products from agricultural industries. A fermentation process has recently been developed for the production of power alcohol from pentoses, and it is claimed that as much as zo imperial gallons of this liquid fuel has been obtained in this way from one ton of waste.

Many other fermentation processes, involving in these cases the breaking down of hemicelluloses and of cellulose, are of considerable industrial importance, the preparation of synthetic farmyard manure, for instance, and the production of natural indigo, but space does not permit.to discuss them in detail. They have been dealt with in considerable detail by Thaysen and Bunker.

Bacterial Decomposition of Organic Nitrogen Compounds.—Apart from the dairy industry, which may perhaps be most conveniently classed under the above heading, though the activity of bacteria in milk involves both its sugar and its casein content, the bacterial decomposition of organic nitrogen compounds may quite conceivably become of economic importance in the future in other directions—in the degumming of natural silk, for instance, and in the synthesis of nitrogen compounds which are costly to prepare by chemical means. Ehrlich has drawn attention to such cases, among them the preparation of an important part of the essential oil of roses.

It has been suggested that certain sulphur bacteria might be used for converting naturally occurring zinc minerals into zinc sulphate under conditions which would render the zinc more easily recoverable, and recently observations have been recorded that the inert gas argon had been detected in yeast during the fermentation of sugars.

The Destructive Activity of Bacteria in Industry.—However desirable the utilization of bacteria may be, it is still more important, sometimes even essential, to arrest and to prevent their activity in many industries. In the textile industries, for instance, damage involving millions of pounds yearly is caused through the destruction and milde ing of fibres and fabrics. In the wood industries equally serious losses occur through the action of micro-organisms, chiefly of fungi. In the sugar industries the freshly pressed juice is often inverted by bacteria and the crystallization of the sugar rendered difficult. In dairying, and in many other industries too numerous to enumerate, serious destruction by bacteria is frequently recorded.

BACTRIA (Bactriana), the ancient name of the country between the range of the Hindu Kush (Paropamisus) and the

Oxus (Amu Darya), with the capital Bactra (now Balkh); in the Persian inscriptions, Bākhtri. It is a mountainous country with a moderate climate. Water is abundant and the land is very fertile. Bactria was the home of one of the Iranian tribes (see PERSIA: *Ancient* History). The name is sometimes used, erroneously, to describe the whole of eastern Iran, and the Zend language was for some time called "Old Bactrian," from Zoroaster's living and teaching in Bactria. Falsely, too, was Bactria called the cradle of the Indo-European race. Iranian tradition has done much, with the help of the imagination of later students, to give Old Bactria an empire of great extent, whose kings won great victories over the Turanians. This is but a reflex of the great Achaemenid Sassanian empire of the Iranians. It is quite uncertain whether the Aryans came from central Asia in the same way as afterwards the Indo-Scythians, the Turks and others, or from some part of Europe, where now many scholars look for the home of the Indo-Europeans. The Bactrians and their neighbours were ruled by petty kings, one of whom was Vishtaspa, Zoroaster's protector. Ctesias in his history of the Assyrian empire (Diodor. Sic. ii. 6 ff.) narrates a war waged by Ninus and Semiramis against the king of Bactria, but his whole history is nothing but a fantastic fiction. From the Assyrian inscriptions we know that the Assyrians never entered the eastern parts of Iran.

Whether Bactria formed part of the Median empire is uncertain, but it was subjugated by Cyrus and from then formed one of the satrapies of the Persian empire. When Alexander had defeated Darius III., his murderer, Bessus, the satrap of Bactria, tried to organize a national resistance in the east. But Bactria was conquered by Alexander without much difficulty; it was only farther in the north, beyond the Oxus, in Sogdiana, that he met with strong resistance. Bactria became a province of the Macedonian empire, and soon came under the rule of Seleucus, king of Asia *(see* SELEUCID DYNASTY and HELLENISM). The Macedonians (and especially Seleucus I. and his son Antiochus I.) founded a great many Greek towns in eastern Iran, and the Greek language became for some time dominant there. The many difficulties against which the Seleucid kings had to fight, and the attacks of Ptolemy II., gave to Diodotus, satrap of Bactria, the opportunity of making himself independent (about 2 j j B.C.) and of conquering Sogdiana. He was the founder of the Graeco-Bactrian kingdom. Diodotus and his homonymous successor were able to maintain themselves against the attacks of the Seleucids; and when Antiochus III. "the Great" had defeated the next king, the usurper Euthydemus, he nevertheless acknowledged him as independent sovereign; he saw that his empire would be unable permanently to maintain these remote provinces and to protect the Greek settlers against the invasions of the eastern barbarians. After his defeat by the Romans (190 B.C.) the Bactrian king Euthydemus and his son Demetrius crossed the Hindu Kush and began the conquest of eastern Iran and the Indus valley. For a short time they wielded great power; a great Greek empire seemed to have arisen far in the East. But this empire was torn by internal dissensions and continual usurpations. When Demetrius advanced far into India one of his generals, Eucratides, made himself king of Bactria; and soon in every province there arose new usurpers, who proclaimed themselves kings and fought one against the other. Most of them we know only by their coins, a great many of which are found in Afghanistan and India. By these wars the dominant position of the Greeks was undermined even more quickly than would otherwise have been the case. After Demetrius and Eucratides, the kings abandoned the Attic standard of coinage and introduced a native standard; at the same time the native language came into use by the side of the Greek. On the coins struck in India the well-known Indian alphabet (called Brahmi by the Indians, the older form of the Devanagari) is used; on the coins struck in Afghanistan and in the Punjab the Kharoshṭhi alphabet. Politically, the Graeco-Bactrian kingdom, "the empire of 1,000 cities" as a Greek historian calls it, was an ephemeral creation of short duration; but for the development of eastern civilization it has been a factor of the greatest permanent importance. By it Greek art has been introduced into India; in the Gandhava sculptures from the Kabul valley and on the coins of the later kings we see how Greek art was adopted by the Indians and the forms of Greek gods and heroes applied to the representation of Buddhist saints and divinities. From here the Graeco-Buddhist art spread into central Asia; and its influence has changed the whole art of eastern Asia and determinated the further development of the art of China and Japan.

The weakness of the Graeco-Bactrian kingdoms was shown by their sudden and complete overthrow. In the west the Arsacid empire had risen, and Mithradates I. and Phraates II. began to conquer some of their western districts, especially Areia (Herat). But in the north a new race appeared, Mongolian tribes, called Scythians by the Greeks, among which the Tochari, identical with the Yue-chi (*q.v.*) of the Chinese, were the most important. In 159 B.C., according to Chinese sources, they entered Sogdiana, in 139 they conquered Bactria, and during the next generation they had made an end to the Greek rule in eastern Iran. Only in India the Greek conquerors (Menander, Apollodotus) maintained themselves some time longer. But in the middle of the 1st century B.C. the whole of eastern Iran and western India belonged to the great "Indo-Scythian" empire. The ruling dynasty had the name Kushan (Kushana), by which they are called on their coins and in the Persian sources. The most famous of these kings is Kanishka (*c.* 123–153), the great protector of Buddhism. The principal seat of the Tochari and the Kushan dynasty seems to have been Bactria; but they always maintained the eastern parts of modern Afghanistan and Baluchistan, while the western regions (Aria, *i.e.*, Herat, Seistan and part of the Helmund valley) were conquered by the Arsacids. In the 3rd century the Kushan dynasty began to decay; about A.D. 320 the Gupta empire was founded in India. Thus the Kushanas were reduced to eastern Iran, where they had to fight against the Sassanids. In the 5th century a new people came from the east, the Ephthalites (*q.v.*) or "white Huns," who subjected Bactria (about 450); and they were followed by the Turks, who first appear in history about A.D. 560 and subjugated the country north of the Oxus. Most of the small principalities of the Tochari or Kushan became subject to them. But when the Sassanian empire was overthrown by the Arabs the conquerors immediately advanced eastwards, and in a few years Bactria and the whole Iran to the banks of the Jaxartes had submitted to the rule of the caliph and of Islam. *(See* PERSIA.)

(ED. M.)

BACUP, municipal borough, Lancashire, England, on the river Irwell, 22m. N. by E. from Manchester, on the L.M.S. railway. Population (1931) 20,606. It is finely situated in a narrow valley, surrounded by wild, high-lying moorland. It is wholly of modern growth, although a prominent hill-top camp on the moorland near by suggests that there is a long history of settlement in the region. Cotton-spinning, power-loom weaving and metal-working are the chief of numerous manufacturing industries, and there are collieries in the vicinity. There is a mechanics institute and library as well as finely laid out recreation grounds. As usual

in Lancashire co-operation is strongly developed and the co-operative institution at Bacup has a free library for its members. The borough was incorporated in 1882 and the corporation consists of a mayor, six aldermen and 17 councillors. Bacup is in the Rossendale parliamentary division of Lancashire. Area of municipal borough 9.6 sq.mi.

BAD (=bath), a title often prefixed to names of German towns which are health resorts. The articles on these are given under the names of the towns apart from the title bad.

BADAGA, (1) **a** term applied to Telugu people who invaded the Tamil country from Vijayanagara in the latter middle ages and especially in the 16th century (Tamil vadugan, "northerner"); *(2)* an agricultural tribe of the Nilgiris in southern India, which may have occupied those hills before A.D. 1200, as Badagas still worship carved cromlechs in them. But traditionally they migrated there from Mysore between that year and 1600. In type they are akin to the pastoral Todas (*q.v.*), but they speak a corrupt Kanarese. They pay tribute to the Todas, influenced perhaps by fear of Toda sorcery. A highly composite body with several clans and a variety of customs, they are now mainly Lingayats (*q.v.*), and Shaivas.

See E. Thurston, *Castes and Tribes* of *Southern* ***India,*** i., Madras (1909), which gives full extracts from earlier writers; H. Yule and A. G. Burnell, *Hobson-Jobson,* ed. W. Crooke, (1903).

BADAJOZ, a frontier province of western Spain, formed in 1833 of districts taken from the province of Estremadura (*q.v.*). Pop. (1939) 755,558; area, 8,451 sq.mi.; density 89.4 per sq.mi. Badajoz is thus the largest province of the whole kingdom. It extends from the foothills of the Sierras de San Pedro, Montbnchez and Guadalupe, in the north, to the heart of the Sierra Morena in the south, and is crossed from east to west near its northern border by the river Guadiana. La Serena, the largest of the celebrated Estremaduran winter pasture grounds, lies in the east of the province, which is mainly pastoral. The only really productive soils are found in the *Tierra* de Barros, a region lying to the west of La *Serena.* The rainfall is scanty in average years, and the torrential rivers do not lend themselves to irrigation. The fertility of the soil varies widely, some zones, such as the Tierra de Barros, being famous for their high cereal yield. About two million acres are devoted to rough pasture, woodland and scrub. Cereals are grown to some extent, however, in every district, though with a low average yield; as in other pastoral provinces, the tendency has betn to break up natural pasture for indifferent ploughland; about 3,000,000 ac. are ordinarily under cultivation, principally for wheat and barley. Vine growing is important in certain zones, and the advance of phylloxera was checked by replanting with American stocks and on fresh ground. The olive is widely cultivated; the yield is large but the quality poor. Agricultural property is mostly in large holdings; rural communications are bad, hindering the development of mineral resources.

Badajoz is aniong the provinces best supplied with livestock of all kinds, but especially with sheep, goats and swine. Its acorn-fed swine are celebrated for their hams and bacon. Horned cattle are raised chiefly on the richer pastures on the banks of the Guadiana. Badajoz produces lead, copper and slate, but not in important quantities. Manufactures are woollen and cotton textiles, beer, soaps, oils, cork and leather. Commercial interests are more important than industrial, because of transit trade with Portugal. Education is backward. Many areas are comparatively inaccessible. The Madrid-Lisbon railway passes through Villanueva de la Serena, Mérida and Badajoz; at Mérida it joins the north-south lines from Cbceres south to Zafra, where the railways from Huelva and Seville unite. The capital is Badajoz (*q.v.*) (pop. 1940, 51,720); other cities, (1930 pop.) are Almendralejo (17,597), Azuaga (16,577), Don Benito (21,196), Jerez de los Caballeros (15,021), Mérida (19,354), Villanueva de la Serena (15,351) (*qq.v.*), and Villafranca de los Barros (13,521).

A Nationalist army fought northward through Badajoz to join a northern army during the civil war of 1936–39, capturing the city of Badajoz Aug. 14, 1936, and cutting the route to Portugal. The fall of Badajoz prepared the way for a concerted advance on Madrid from the north and west.

BADAJOZ, capital of the Spanish province of that name and the see of a bishop. Pop. (1940) 51,720. Badajoz overlooks the Guadiana from a slight eminence, crowned by the ruins of a Moorish castle. A bastioned wall with moat and outworks and forts on the surrounding heights gives an appearance of great strength. The river, which flows between the castle hill and the fort of San Cristóbal, is crossed by a granite bridge, built 1460, repaired 1597 and rebuilt 1833. The aspect of Badajoz recalls its stormy history; even the cathedral, built in 1258, resembles a fortress, with massive embattled walls. Badajoz was the birthplace of the statesman Manuel Godoy, duke of Alcudia (1767–1851), and of the painter Luis Morales "the divine" (1509–86). Two pictures by Morales, unfortunately retouched in modern times, are in the cathedral. Owing to its position the city enjoys a considerable transit trade with Portugal; its principal industries are the manufacture of foodstuffs of various kinds, alcoholic and other drinks, basket work, blankets and wax. Badajoz first rose to importance under Moorish rule, becoming in 1031 the capital of a small Moorish kingdom, which retained a fitful independence until 1229, when it was captured by Alphonso IX of Leon. During the Peninsular War Badajoz was unsuccessfully attacked by the French in 1808 and 1809; but on March 10, 1811, the Spanish commander was bribed into surrendering to the French. A British army endeavoured to retake it, and on May 16 defeated a relieving force at Albuera, but the siege was abandoned in June. For the operations preceding and following the siege of Badajoz in 1812, see PENINSULAR WAR. Its fortifications in 1812 were of great strength, while the high ground overlooking the town was covered by the forts of Pardaleras, Picurina and San Cristobal. In 1811 Wellington and Beresford had each attacked Badajoz unsuccessfully from the north; Wellington now chose the southeast corner, between the bastions of Trinidad and Santa Maria, for his point of attack. But first it was necessary to capture Ft. Picurina, which covered this angle; after one day's bombardment, 600 men of the 3rd division stormed Picurina, unbreached, losing half their number but capturing 200 prisoners. Batteries and parallels were dug and on March 30 fire was opened on the fortress; by April 5, 1812, breaches had been made in both bastions and in curtain between. The Light and 4th divisions mere detailed to storm the breaches while Picton's 3rd division escaladed the castle at the northeast corner of the town, and Leith's 5th division the San Vincente bastion at the northwest. At first the assault upon the breaches was a terrible and bloody failure. For two hours the gallant soldiers of the Light and 4th divisions struggled, stormed and died in vain. At midnight the survivors were recalled, leaving 2,000 dead and dying behind them. Picton's attempt to escalade the unbreached castle had also been beaten off with heavy loss. Failure stared Wellington in the face. But after Picton's attack had died away, a small group of his officers and men with two ladders found a quiet way up on to the walls of the castle while its defenders were listening to the battle at the breaches; reinforcements dashed up, and in a few minutes the castle was in the hands of the British. Almost simultaneously, Leith gained a footing in the San Vincente bastion, a late start having lulled its garrison into a state of false security. Sweeping along the battlements and through the deserted streets of the town, he took the defenders of the breaches in rear; at the same time the Light and 4th divisions dashed forward again and the town was won. The French commander, Phillipon, retired across the river to Ft. Cristobal and there surrendered. Again, as at Ciudad Rodrigo, the glory of the assault was dimmed by the excesses of the storming troops, who for three days were completely out of hand. The British losses were very heavy, amounting to 5,000, three-quarters of them in the assault; the French garrison of 5,000 were either killed or captured with 140 guns.

The fall of Badajoz to the Nationalists of Francisco Franco Aug. 14, 1936, during the Spanish Civil War was followed by a massacre in which hundreds were slain.

BADAKSHAN, including Wakhan, a province on the northeast frontier of Afghanistan, adjoining Russian territory. Its northeastern boundaries were decided by the Anglo-Russian agreement of 1873, which expressly acknowledged "Badakshan with its

dependent district Wakhan" as "fully belonging to the amir of Kabul," and limited it to the left or southern bank of the Oxus. On the west, Badakshan is bounded by a line which crosses the Turkestan plains southwards from the junction of the Kunduz and Oxus rivers till it touches the eastern water-divide of the Tash-kurghan river (here called the Koh-i-Chungar), and then runs south-east, crossing the Sarkhab affluent of the Khanabad (Kunduz), till it strikes the Hindu Kush. The southern boundary is carried along the crest of the Hindu Kush as far as the Khawak pass, leading from Eadakshan into the Panjshir valley. Eeyond this it is indefinite. The southern limits of Badakshan become definite again at the Dorah pass. The Dorah connects Zebak and Ishkashim at the elbow, or bend, of the Oxus with the Lutku valley leading to Chitral. From the Dorah eastwards the crest of the Hindu Kush again becomes the boundary till it effects a junction with the Muztagh and Sarikol ranges, which shut off China from Russia and India. Skirting round the head of the Tagdumbash Pamir, it finally merges into the Pamir boundary, and turns westwards, following the course of the Oxus, to the junction of that river and the Khanabad (Kunduz). So far as the northern boundary follows the Oxus stream, under the northern slopes of the Hindu Kush, it is separated only by the length of these slopes (some 8 or 10 m.) from the southern boundary along the crest. Eefore the boundary settlement of 1873 the small states of Roshan and Shignan extended to the left bank of the Oxus, and the province of Darwaz, on the other hand, extended to the right bank. Now, however, the Darwaz extension northwards is exchanged for the Russian Pamir extension westwards, and the river throughout is the boundary between Russian and Afghan territory; the political boundaries of those provinces and those of Wakhan being no longer coincident with their geographical limits.

The following are the chief provincial subdivisions of Badakshan, omitting Roshan and Shignan:—On the west Rustak, Kataghan, Ghori, Narin and Anderab; on the north Darwaz, Ragh and Shiwa; on the east Charan, Ishkashim, Zebak and Wakhan; and in the centre Faizabad, Farkhar, Minjan and Kishm. There are other minor subdivisions.

The Kokcha river traverses Badakshan from south-east to north-west, and, with the Kunduz, drains all the northern slopes of the Hindu Kush west of the Dorah pass. Some of its sources are near Zebak, close to the great bend of the Oxus northwards, so that it cuts off all the mountainous area included within that bend from the rest of Badakshan.

Its chief affluent is the Minjan, which Sir George Robertson found to be a considerable stream where it approaches the Hindu Kush close under the Dorah. Like the Kunduz, it probably drains the northern slopes of the Hindu Kush by deep lateral valleys, more or less parallel to the crest, reaching westwards towards the Khawak pass. From the Oxus (1,000 ft.) to Faizabad (4,000 ft.) and Zebak (8,500 ft.) the course of the Kokcha offers a high road across Badakshan; between Zebak and Ishkashim, at the Oxus bend, there is but an insignificant pass of 9,500 ft.; and from Ishkashim by the Panja, through the Pamirs, is the continuation of what must once have been a much-traversed trade-route connecting Afghan Turkestan with Kashgar and China. North of the Kokcha, within the Oxus bend, is the mountainous district of Darwaz, of which the physiography belongs rather to the Pamir type than to that of the Hindu Kush.

A very remarkable meridional range extends for 100 m. northwards from the Hindu Kush (it is across this range that the route from Zebak to Ishkashim lies), which determines the great bend of the Oxus river northwards from Ishkashim, and narrows the valley of that river into the formation of a trough as far as the next bend westwards at Kala Wamar. The western slopes of this range drain to the Oxus north-westwards, by the Kokcha and the Ragh, or else they twist their streams into the Shiwa, which runs due north across Darwaz. Here again we find the main routes which traverse the country following the rivers closely.

The principal domestic animal is the yak. There are also large flocks of sheep, cows, goats, ponies, fine dogs and Bactrian camels. The more important wild animals are a large wild sheep (*Ovis poli*), foxes, wolves, jackals, bears, boars, deer and leopards; amongst birds, there are partridges, pheasants, ravens, jays, sparrows, larks, a famous breed of hawks, etc.

Eadakshan proper is peopled by Tajiks, Turks and Arabs, who speak the Persian and Turki languages, and profess the orthodox doctrines of the Mohammedan law adopted by the Sunnite sect; while the mountainous districts are inhabited by Tajiks, professing the Shi'ite creed and speaking distinct dialects in different districts.

History.—Badakshan, part of the Greek Bactria, was visited by Hsüan Tsang in 630 and 644. The Arabian geographers of the 10th century speak of its mines of ruby and lapis lazuli, and of the commerce and large towns of Waksh and Khotl, regions in part corresponding with Badakshan. In 1272–73 Marco Polo and his companions stayed for a time in Badakshan. During this and the following centuries the country was governed by kings who claimed to be descendants of Alexander the Great. The last was Shah Mohammed, who died in the middle of the 15th century, leaving only his married daughters to represent the royal line. Early in the middle of the 16th century the Usbegs obtained possession but were soon expelled, and then the country was generally governed by descendants of the old royal dynasty by the female line. About the middle of the 18th century the present dynasty of Mirs established its footing in the place of the old one which had become extinct. In 1763 the country was invaded and ravaged by the ruler of Kabul. During the first three decades of the 19th century it was overrun and depopulated by Kohan Beg and his son Murad Beg, chiefs of the Kataghan Usbegs of Kunduz. When Murad Beg died, the power passed into the hands of another Usbeg, Mohammed Amir Khan. In 1859 the Kataghan Usbegs were expelled; and Mir Jahander Shah, the representative of the modern royal line, was reinstated at Faizabad under the supremacy of the Afghans. In 1867 he was expelled by Abdur Rahman and replaced by Mir Mohammed Shah, and other representatives of the same family.

BADALOCCHIO, SISTO, surnamed ROSA (1581–1647), Italian painter and engraver, was born at Parma and died at Bologna. He was of the school of Annibale Carracci. His principal engravings are the series known as Raphael's Eible, executed by him in conjunction with Lanfranco, another pupil of Carracci. The best of his paintings, which are few in number, are at Parma.

BADALONA, a town of north-eastern Spain, in the province of Barcelona; 6m. N.E. of the city of Barcelona, at the mouth of the small river Besós. Pop (1930), 44,291. Badalona is an industrial suburb of Earcelona, to which it is joined by railroad, tramways and roads; it manufactures chemicals, glass and several other commodities, and has a small harbour, chiefly important for its fishing and boat building trades. It is interesting for its Roman remains and other historical associations.

See Cayetano Soler, *Badalona histórica* (Barcelona, *1898)*; Solá y Seriol, *Memorias histdricas* de *Badalona* (Barcelona, 1879).

BADBY, JOHN (d. 1410), one of the early Lollard martyrs, was a tailor (or perhaps a blacksmith) in the west Midlands. He was burned at Smithfield for his denial of transubstantiation.

BADDELEY, ROBERT (*c.* 1732–1794), English actor, is said to have been first a cook to Samuel Foote, and then a valet, before he appeared on the stage. In 1761, described as "of Drury Lane theatre," he was seen at the theatre in Smock Alley, Dublin, as Gomez in Dryden's *Spanish Friar.* Two years later he was a regular member of the Drury Lane company in London, where he had a great success in the low comedy and servants' parts. He remained at this theatre and the Haymarket until his death. He was the original Moses in *The School for Scandal.* Baddeley died on Nov. 20, 1794. He bequeathed property to found a home for infirm actors, and also £3 per annum to provide wine and cake in the green-room of Drury Lane theatre on Twelfth Night. The ceremony of the Baddeley cake has remained a regular institution.

His wife SOPHIA BADDELEY (1745–86), an actress and singer, was born in London, the daughter of a sergeant-trumpeter named Snow. At the age of 18 she ran away with Baddeley, then acting at Drury Lane, and made her first appearance on the stage there on April 27 1765, as Ophelia. Later, as a singer, she obtained engagements at Ranelagh and Vauxhall.

See *Memoirs of Mistress Sophia Baddeley,* by Mrs. Elizabeth Steele (1781).

BADEN, a spa in Lower Austria, 17m. south of Vienna, beautifully situated at the foot of the Wiener Wald, where it is pierced by the romantic Helenental. The warm springs (72° F–97° F), from which its name and existence are derived, possess radioactive properties and have a high content of sulphate of lime. They are 14 in number, rising for the most part at the foot of the Calvarienberg (1,070ft.), a mass of dolomitic limestone, and are used for bathing. Most of the baths are in the old town where, too, are found the Rathaus, the parish church, a fine example of late Gothic architecture, dating from the end of the 15th century, and many fine monuments. West of the old town lie several fine parks and the Rollett museum, rich in local prehistoric and Roman finds. Evidences of a continuous settlement since early times are also to be seen in the old town, and Baden appears to have maintained its present function through the ages. Pop. (1939) 25,701.

See J. Schwarz, *Die Heilquellen von Baden bei Wien* (1900).

BADEN, a Land lying in the south-west corner of Germany, bounded on the north by Bavaria and Hesse; on the west by the Rhine with France and the Bavarian palatinate beyond; on the south by Switzerland; and on the east by Württemberg and part of Bavaria. The country consists of the eastern half of the fertile Rhine valley and of the adjoining mountains, especially the Schwarzwald (see BLACK **FOREST**) which fills the great angle made by the river between Schaffhausen and Strasbourg. The highest areas are south of the deep Kinzig valley which opens on to that of the Rhine south-east of Strasbourg. The Feldberg, the highest summit of the southern Schwarzwald, reaches nearly 5,000 feet. Westwards the hills are faulted steeply over the plain, which is broken only by the conspicuous Kaiserstuhl (1,800ft), a volcanic group north-west of Freiburg. To the north and north-east, beyond the Neckar, is the Odenwald range; while between that river and the northern end of the Black Forest the State includes a belt of lower land stretching from Pforzheim to Heidelberg. The greater part of Baden thus belongs to the basin of the Rhine, which receives upwards of 20 tributaries from its highlands. A part, however, of the eastern slope of the Black Forest belongs to the basin of the Danube, which there takes its rise in a number of mountain streams.

There are great physical contrasts within the *Land,* eg., the Rhine valley is the warmest district in Germany but the higher parts of the Black Forest record the greatest degrees of cold experienced in the south. The mean temperature of the Rhine valley is approximately 50° and that of the high table-land, 43°. Many minerals are found in small quantities, but little is worked save salt and building stone. Cultivable land including forests occupies 94% of the total area. Mineral springs are very numerous and famous, those of Baden-Baden, Badenweiler, Antogast, Griesbach, Freiersbach and Petersthal being the most frequented. In the valleys the soil is particularly fertile, yielding rye, wheat, barley, potatoes, hemp, hops, beetroot, turnips, chicory and tobacco. Cattle are reared in large quantities, and sheep, horses, pigs and goats. The culture of the vine increases; the wines are characterized by a mildness of flavour. Fruit-growing and bee-keeping are widespread. Forests, in which the predominant trees are fir, pine and chestnut, cover 39% of the total area; they have profoundly influenced life in the hills, and form a source of considerable wealth.

At the beginning of the 19th century Baden was only a margravate, with an area little exceeding 1,300 sq.mi., and a population of 210,000. Area and population progressively increased until the respective figures amounted in 1939 to 5,817 sq.mi. and 2,518,103 inhabitants. The religious division in 1933 was 1,408,j32 Roman Catholics, 943,540 Protestants, and 20,617 Jews.

District	Chief tonns	Pop. (1939)
(1) Mannheim	Mannheim	283,801
	Heidelberg	87,327
(2) Karlsruhe	Karlsruhe	189,8jo
	Pforzheim	78784
(3) Freiburg-im-Breisgau	Freiburg	111,860
(4) Konstanz	Konstanz	38,469

The capital of the Land is Karlsruhe, and important towns other than the above are Rastatt, Baden-Baden, Bruchsal Durlach, Oifenburg and Lahr. The population is greatest in the north and in the neighbourhood of the Swiss town of Basle.

The principal manufactures are machinery, cotton tissues, silk ribbons, paper, cigars, leather, clocks, jewellery, musical instruments, wood-work, brushes and chemicals. Beet sugar is also largely manufactured. The inhabitants of the Black Forest have long been celebrated for their dexterity in the manufacture of wooden ornaments, toys and musical instruments. The railways of Baden reach a total length of 2,110·6km., and transit trade is an important element. Mannheim is the great Rhine emporium, the chief manufacturing town and the seat of administrative government for the northern portion of the country.

Education is free and compulsory: schools are under State authority. There are two universities, the Protestant at Heidelberg and the Roman Catholic at Freiburg and a commercial high school at Mannheim, a technical high school and an academy of arts. The Roman Catholic Church has an archbishop at Freiburg; the Protestant Church is governed by a synod.

The constitution of the original republic of Baden was made by the National Assembly and is dated March 21, 1919. By it all privileges of birth, religion and caste were abolished. There was only one chamber (Landtag), the members of which were elected for four years. The suffrage was granted to all males and females over 20 years of age. The cabinet included four ministers and two State councillors; the president (officially "State President") was elected by the *Landtag.* Chief administrative authority after 1933 was in the hands of the nazi district leader (Gauleiter) and federal governor (Reichsstatthalter), Robert Wagner. (X.)

History.— The history of Baden as a state began in 1112 when Hermann, grandson of Bertold, duke of Carinthia and count of Zahringen, assumed the title of margrave of Baden. Ninety years later his descendants divided up their territories and formed two houses: Baden-Baden and Baden-Hochberg. A century later a new house of Baden-Sausenberg came into being as an offshoot of that of Baden-Hochberg. This latter line failed in 1418, and that of Baden-Sausenberg in 1503, when the whole of Baden passed under the rule of the margrave Christopher I, of Baden-Baden. This prince combined in 1512 with the Elector Palatine, duke of Wiirttemberg, bishop of Würzburg, and in 1515 with Frederick the Wise of Saxony, to set up a counter-alliance to the Swabian League, an action that was instrumental in preventing any effective organization of the Empire as a single unit. Christopher was also a promoter of discord within his own family by partitioning his estates between his three sons. Throughout the 16th century Baden suffered severely from the internecine warfare of its rulers, and the Reformation only served to add religious bitterness to territorial rivalries. The Thirty Years' War further accentuated these disputes and it was not until after the signature in 1648 of the Treaty of Westphalia that the family feuds finally disappeared. Nor was it until the Baden-Baden line failed in 1771, and their land passed to Charles Frederick of Baden-Durlach, that Baden came to play a conspicuous part in German history.

During his long reign (1749–1811) Charles Frederick quadrupled the territory of his state and proved himself a wise and humane ruler. Nor was he slow to seize the unequalled opportunity for territorial aggrandizement presented to him by the Napoleonic Wars. Siding first with the Austrians, and subsequently with Napoleon, he obtained benefits from both his allies. In 1806 he became a member of the Confederation of the Rhine, and adopted the style of a grand-duke. The treaties of Pressburg (1805) and Vienna (1809) brought him very substantial gains. On his death in 1811 he was succeeded by his grandson, Charles, who was married to Stephanie de Beauharnais, the adopted daughter of Napoleon I. As astute as his grandfather, Charles lost no time in transferring his allegiance from the French to the Allied side when once Napoleon's fortunes seemed finally on the wane. Baden had joined the Germanic confederation in 1815, but the vexed question of the succession to the grand-duchy was left unsettled by the Congress of Vienna. A treaty of April 16, 1816, between Austria and Bavaria had guaranteed the succession to Maximilian I., king of Bavaria, in

the event of the extinction of the Zähringen line. A year later Charles issued a pragmatic sanction (*Hausgesetz*) in which he declared that the succession should pass to the issue of a morganatic marriage between Charles Frederick and Luise Geyer von Geyersberg (created Countess Hochberg). The subsequent dispute between Baden and Bavaria over the succession question was finally settled in favour of the Hochbergs by the treaty of Frankfurt of July 10, 1819. One outcome of this dispute was of far-reaching importance. In order to gain popular support for the Hochberg claims Charles in 1818 had granted Baden a liberal constitution by which two chambers were set up with power over legislation and taxation. This experiment in constitutional government was watched with deep interest by all the German states, and its eventual failure was hailed with joy in reactionary circles all over Germany.

The July Revolution of 1830 left Baden undisturbed under the liberal rule of Leopold, the first grand-duke of the Hochberg line. But with the first news of the Paris revolution in 1848 the storm burst and the people demanded that a number of resolutions passed in the previous year by a Radical demonstration at Offenburg should be at once enacted. At first the Government obtained some measure of success against the insurgents, who had taken up arms, but in 1849 the storm burst again with redoubled fury. The promulgation of a new constitution on the Frankfurt model had pleased neither the Radicals nor the Conservatives, and the former again sought the arbitrament of arms. The army rose in revolt, and the grand-duke and his government sought safety in flight. Finally, in June, the aid of Prussia having been sought and obtained by the grand-duke, a Prussian army invaded Baden under the command of the future emperor William I. With its coming the revolution was doomed, and by August all show of resistance was at an end. The new diet passed a series of reactionary decrees with the object of strengthening the hands of the government, and the grand-duke returned to his capital. As the price for her assistance Prussia obtained the adhesion of Baden to the League of the Three Kings.

With the crushing of the revolution Baden entered upon a long period of uneventful prosperity that only terminated with World War I. In the war of 1866 her army fought on the side of Austria, although the sympathy of her ruler, the grand-duke Frederick, who was a son-in-law of the emperor William, was definitely on the side of Prussia. Indeed his was the voice that in 1871 first hailed the king of Prussia as German emperor in the Hall of Mirrors at Versailles. The only event of real interest in the history of Baden after the revolution was the battle that raged there as elsewhere in Germany between Clericals and Liberals for the control of education. In Baden this fight was not ended until 1880 when a reconciliation was effected with the Holy See and the archbishopric of Freiburg, which had been vacant since 1868, was once again filled up. The grand-duke Frederick, who had ruled Baden with wisdom and moderation for half a century and been an authoritative voice in the counsels of the Empire, died in Sept. 1907, and was succeeded by his son, the grand-duke Frederick 31.

World War I brought revolution in its train to Baden; and the dynasty that had ruled for 800 years gave place (Nov. 1918) to a democratic republic. A new constitution established (May 1919) a single legislative chamber with a cabinet responsible to and chosen by that chamber. Further the chamber selected from the cabinet the minister-president, who acted in the dual capacity of prime minister and president of the state. Baden was drawn into the Ruhr conflict of 1923–25 when French troops occupied the towns of Offenburg, Karlsruhe and Mannheim and seized their transportation facilities and customs houses. Though the University of Heidelberg, both students and faculty, accepted and expounded nazi ideology with enthusiasm after 1933, the Roman Catholic population and priests of southern Baden offered more opposition to nazification than most other parts of Germany.

BADEN or **BADEN-BADEN** (to distinguish it from other places of the name), fashionable watering-place, Germany, in the *Land* of Baden, 23 mi. S. by W. of Karlsruhe. Situated 600 ft. high in the Black forest, the surroundings are laid out in gardens and pleasure-grounds which attract numerous visitors. Resident population (1939) 36,056. The springs of Baden were known to the Romans. The name *Aurelia Aquensis* was given to it in honour of Aurelius Severus. In 1847 remains of Roman vapour baths were discovered just below the New Castle. The margraves resided at Baden from the 14th to the 17th centuries, first in the Old Castle, the ruins of which exist above the town, but after 1479 in the New Castle, situated nearer the town, and remarkable for its subterranean dungeons. During the Thirty Years' War Baden suffered severely. Since the early 19th century the Government has greatly fostered the growth of the town. The 29 hot springs, varying from 115° to 153°F, flow from the castle rock at the rate of 90 gallons per minute, and the water supplies the various baths. There are two chief bathing-establishments. The town proper is on the right bank of the Oos, but the principal resorts of visitors are on the left. Baden was bombed by British planes in World War II. The city's large hotels were used as hospitals for wounded German soldiers during the war.

BADEN, a town in the Swiss canton of Aargau, on the left bank of the river Limmat, 14m. N.W. of Ziirich The much frequented hot sulphur springs, mentioned by Tacitus, were fashionable in the 15th and 16th centuries. They are efficacious in cases of gouty and rheumatic affections, and attracted 6,400 visitors, chiefly Swiss, in 1920. They are approached from the old town by a fine boulevard. Many Roman remains have been found in the gardens of the Kursaal. The town is very picturesque, with its steep and narrow streets, and its one surviving gateway; it is dominated on the west by the ruined castle of Stein, formerly a stronghold of the Habsburgs. In 1415 Baden (with the Aargau) was conquered by the Eight Swiss confederates, whose bailiff inhabited the other castle, on the right bank of the Limmat, which defends the ancient bridge. The delegates of the confederates met at Baden, from 1426 to about 1712, so that during that period Baden was virtually the capital of Switzerland. The diet sat in the old town hall or *ratkaus*. Baden was the capital of the canton of Baden from 1798 to 1803, when the canton of Aargau was created. To the north-west of the baths a new industrial quarter, with large electrical engineering works, has sprung up. In 1941 the permanent population of the town of Baden was 10,313 (German-speaking, mainly Catholic, with many Jews). The whole agglomeration of Baden had 20,871 inhabitants in 1930.

One mile south of Baden, on the Limmat, is the famous Cistercian monastery of Wettingen (1227–1841—the monks are now at Mehrerau near Bregenz), with splendid old painted glass in the cloisters and magnificent early 17th-century carved stalls in the choir of the church. Six miles west of Baden is Brugg (4,415 inhabitants) in a fine position on the Aar. Near by are remains of the Roman colony of *Vindonissa* (Windisch), and the monastery (founded 1310) of Königsfelden, formerly the burial-place of the early Habsburgs, still retaining much fine painted glass.

See Barth. Fricker, *Geschichte der Stadt und Bader zu Baden* (Aarau, 1880); also Henri Mercier, *La Ville et les Bains de Bade* (Lausanne, 1922).

BADENI, KASIMPR, COUNT (1846–1909) Austrian statesman, was born Oct. 14, 1846, at Surochow in Galicia. He entered the civil service from which he resigned in 1886, but two years later was appointed governor *(Statthalter)* of Galicia. In Sept. 1895 he was appointed Austrian prime minister and his attitude was at first satisfactory to the German-Austrians. In 1897, however, in order to gain the support of the Czechs for the new *Ausgleich* with Hungary, he made certain important concessions

in respect of the use of the Czech language in Bohemia. This was done by ordinance, without parliamentary sanction, and met with violent opposition from the German deputies, some of whom were imprisoned. This led to Badeni's downfall on Nov. 28, 1897. He died at Radziechow, near Lemberg, July 9, 1909.

BADENOCH, a district of south-east Inverness-shire, Scotland, bounded on the north by the Monadhliath mountains, on the east by the Cairngorms and Braemar, on the south by Atholl and the Grampians, and on the west by Lochaber. *See* INVERNESS-SHIRE.

BADEN-POWELL, ROBERT STEPHENSON SMYTH BADEN-POWELL, 1st Baron (1857–1941), born in London, Feb. 22, 1857, sixth son of Professor Baden-Powell of Oxford. He was educated at Charterhouse, and in 1876 joined the 13th Hussars regiment, with which he served in India. Afghanistan, and South Africa. In 1895 he was appointed to command the native levies in Ashanti, and was chief staff officer in the campaign of 1896–97 in Matabeleland. After his famous defence of Mafeking (1899–1900) Baden-Powell was promoted major-general, becoming lieutenant-general in 1908. He organized the South African constabulary (1900–03) and in 1908 founded the organization of Boy Scouts (*q.v.*), which led, in 1910, to his founding the Girl Guides (*q.v.*) with the co-operation of his sister, Miss Agnes Baden-Powell, movements which have spread in most civilized countries. He retired from the army in 1910. His honours include the G.C.M.G., G.C.V.O., and K.C.B. He was created a baronet in 1922, and a baron in 1929 In 1937 he was awarded the O M.

His works include *The Matahele Campaign* (1896); *Quick Training for War* (1914); *My Adventures as a Spy* (1915); *Pigsticking* (rev. ed. 1924); *Paddle Your Own Canoe* (1939); and many books for scouts. He exhibited sculptures at the Royal Academy exhibition of 1907. *See* J. S. Fletcher, *Baden-Powell of Mafeking* (1900); R. J. Bremner Smith, *Col.* R. S. *S. Baden-Powell* (1900); *W.* F. Aitken, *The Chief Scout, Sir Robert Baden-Powell* (1912).

BADENWEILER, watering place in the *Land* of Baden, Germany, 28m. N. by E. of Basle at the western foot of the Black Forest, sheltered by the Blauen (3,820ft.). The 11th century castle, formerly belonging to the margraves of Baden, was destroyed by the French in the 18th century. The warm mineral springs and the picturesque surroundings attract numerous visitors. In 1784 well-preserved Roman baths were discovered here. Resident population (1933) 1,207.

BADGE, a distinctive emblem, originally worn by knights and their followers in battle as a mark of identification. Badges are now worn as a sign of membership of a society, or of the holding of an office, etc.

The heraldic badge is of great antiquity, the Plantagenet "broom," for instance, appearing on the seal of Richard I.; in the 14th and 15th centuries badges were borne on horse-trappings, bed-hangings, etc. (See HERALDRY.)

The fourth Lateran Council (1215) laid down a regulation by which Jews were compelled to wear a distinguishing badge on their outer garment or gaberdine (*q.v.*). It was worn on the breast and usually consisted of a circular piece of cloth. In France its colour was originally yellow, and later red and white; in England it was formed by two white or yellow bands, and in Edward I.'s reign it was made in the shape of the Tables of the Law. (See the Jewish Encyclopaedia, *s.v.* "Costume.")

BADGER, the name for any member of the Musteline subfamily *Melinae* or the genus *Meles* (*see* CARNIVORA). A feature of the genus is the way in which the lower jaw is locked into a long cavity of the cranium, thus enabling the animal to maintain its hold with great tenacity. The common badger (M. *taxus*) is 25–29 in. long, with a tail of about 8 in.; in colour it is grey above and black below, with a white head, on either side of which is a black stripe. It is nowhere abundant, but is generally distributed over Europe and Asia. Nocturnal in habits, it feeds on roots, fruits, eggs, small quadrupeds and insects. Allied species occur in various parts of Asia. The American badger (*Taxidea americana*) ranges over most of the United States of America. All these resemble *M. taxus* in habits. Badger hair is used for shaving-brushes and trimmings.

The old "sports" of badger-drawing and badger-baiting were prohibited in Great Britain about the middle of the 19th century. "To badger" (*i.e.,* to worry) is a metaphorical derivative, in use since 1794.

BADGER. A term of uncertain derivation (possibly derived from bagger, in allusion to the hawker's bag) for a dealer in food, such as corn or victuals (more expressly fish, butter or cheese), which he has purchased in one place and brought for sale to another place; an itinerant dealer, corresponding to the modern hawker or huckster. An English statute of 1552 which summarized, and prescribed penalties against, the offences of engrossing, forestalling and regrating, specially exempted badgers from these penalties, but required them to be licensed by three justices of the peace for the county in which they dwelt. A statute of 1562–63, after declaring that many people took up the trade of badgering "seeking only to live easily and to leave their honest labour," enacted that badgers should be licensed for a year only, should be householders of three years' standing in the county in which they were licensed, and should enter into recognizances not to engross or forestall. An act of 1844 abolished the offence of badgering, and repealed the statutes passed in relation to it.

BADGES, GOOD CONDUCT: see STRIPE.

BADGHIS, a district of north-west Afghanistan, between the Murghab and Hari Rud rivers, extending as far north as the edge of the desert of Sarakhs. It includes the Chul formations of the Russo-Afghan boundary surveyed in 1885. Since that date it has been largely settled by the amir with purely Afghan tribes.

BADWAM, CHARLES (1813–1884), English classical scholar, was born at Ludlow, in Shropshire, England. His father, Charles Badham, translator of Juvenal and an excellent classical scholar, was regius professor of physic at Glasgow; his mother was a cousin of Thomas Campbell, the poet. When about seven years old, Badham was sent to Switzerland, where he became a pupil of Pestalozzi. He was educated at Eton and Oxford, afterwards travelling in Italy to study ancient manuscripts, in particular those of the Vatican library. It was here that he began a life-long friendship with G. C. Cobet. He was headmaster at Louth and then at Edgbaston, and in 1866 went to Australia to be professor of classics and logic at Sydney university. Dr. Badham's classical attainments were recognized by the most famous European critics.

Badham published editions of Euripides, *Helena* and *Iphigenia in Tauris* (1851), *Ion* (1851); Plato's *Philebus* (1855, 1878), *Laches* and *Euthydemus* (1865), *Phaedrus* (1851), *Symposium* (1866) and *De Platonis Epistolis* (1866). He also contributed to *Mnemosyne* (Cobet's journal) and other classical periodicals. His *Adhortatio ad Discipulos Academiae Sydniensis* (1869) contains a number of emendations of Thucydides and other classical authors. He also published an article on "The Text of Shakespere" in *Cambridge Essays* (1856); *Criticism applied to Shakespere* (1846); *Thoughts on Classzcal and Commercial Education* (1864). *A* collected edition of his *Speeches and Lectures delivered in Australia* (Sydney, 1890) contains a memoir by Thomas Butler.

BADIA Y LEBEICH (1766–1818): see ALI BEY.

BADIUS, JODOCUS or **JOSSE** (1462–1535), sometimes called BADIUS ASCENSIUS from the village of Asche, near Brussels, where he was born, an eminent printer at Paris, whose establishment was celebrated under the name of *Prelum Ascensianum.* He was himself a scholar of considerable repute, had studied at Brussels and Ferrara, and before settling in Paris had taught Greek for several years at Lyons. He illustrated with notes several of the classics which he printed, and was the author of numerous pieces, amongst which are a life of Thomas à Kempis, and a satire on the follies of women, entitled *Navicula Stultarum Mulierum.*

See P. Renouard, *Bibliographie des impressions et des oeuvres de Josse Badius Ascensius* (1908).

BAD LANDS, a term originally applied to certain areas in western South Dakota which, because of their extreme roughness and inhospitability to man, were called Maka Sicha (*maka,* bad; *sicha,* lands) by the Dakota Indians, *Mauvaises* Terres by the French Canadian trappers of the region, and later "bad lands" by the white settlers. More recently the term has come to have only a topographic significance and is applied to regions sharing characteristics of the type area—the White river region of South Dakota. Other areas of bad lands occur in Korth Dakota, Nebraska, Montana, Wyoming, Colorado. New Mexico, Arizona, Utah

BAD LANDS

VIEWS OF ROCK FORMATIONS IN THE REGION KNOWN AS THE "BAD LANDS" OF SOUTH DAKOTA

The roughness of the district and its general inhospitality to man have given the White river region of South Dakota the name of the "bad lands." The area is covered with deep gullies, precipitous wails and fantastic rock formations which jut forth irregularly. These are largely the result of the erosive work of surface running water, although underground streams, wind erosion and other agencies are thought by some to have played a minor part in the shaping of some of the forms

and other Western States and in various regions of other continents, notably South America and Asia.

The South Dakota bad lands are still known as the most picturesque and rugged areas of their kind in the world. They are variously known as the White River Bad Lands, the Big Bad Lands or even the Bad Lands.

Typical bad lands are areas intimately dissected by running water into innumerable, winding, narrow, steep-sided gullies separated by narrow, serrate divides. They are found fringing the outer valley walls of some master stream to which the gullies are tributary or in a zone bordering table-lands that lie a few hundred feet above the general level of the surrounding country. The width of the dissected area varies considerably but seldom exceeds a few miles. In depth, the gullies usually vary from a few tens of feet to a few hundred feet. Gradients of stream courses in the valley bottoms are normally high, increasing toward their sources, where they may become nearly, if not quite, vertical. On the side-walls there are many alternations of steep slopes, projecting ledges and more gentle slopes. Divides between gullies are narrow, tortuous in direction and are interspersed with pinnacles and sags. Isolated peaks, pillars and pulpit rocks capped by more resistant portions of rock abound. The coalescing of gullies frequently leaves isolated flat-topped buttes, pyramidal or conical-shaped hills or wedge-shaped short ridges.

Viewed from the valley of the master stream to which the dissecting gullies are tributary, the fringe of bad lands appears against the sky-line much as a sawtooth mountain range appears from a greater distance. From the upland area one may approach the bad lands over level country with no hint of their presence until the head of a ravine is reached, when the whole intricate maze of gullies, ridges and peaks is seen suddenly.

Origin.—Bad lands are chiefly the result of the erosive work of running water. Erosion by the wind, the dissolving action of underground water and other agencies may play a part in the shaping of some forms, *e.g.*, by the etching out of the less resistant portions of rock, but these are merely incidental to the cutting of gullies.

For the formation of bad lands three factors seem to be the determinants: (1) the nature of the underlying rock material; (2) the gradient or slope of the land surface; (3) the climate of the region.

The most favourable rock material is a fine-grained, poorly cemented one of low permeability to water, such as clay or soft shale with perhaps some friable, fine sandstone or volcanic ash. When moistened, many of these clays expand and when dried may curl up in flakes and spring loose from the underlying mass or they may swell into spongy masses and dry in loose, incoherent aggregates resembling cauliflower heads. Such material is readily removed by slope wash during successive rains. The fineness of the material facilitates rapid transportation so that the chances for accumulation or deposition are small so long as water is flowing over the surface.

Stratified clays and shales are often alternately interbedded with sandstones, conglomerates, limestones or other more resistant layers. Shales, furthermore, often contain hard spherical concretions that may offer greater resistance to removal. Erosion of such material results in isolated resistant masses such as concretions or conglomerate boulders and gives rise to pillars of clay capped by these harder rocks. Pulpit rocks, toadstool rocks and like forms capped by slabs of sandstone or limestone are formed in a similar manner.

In bad lands the down cutting action of streams dominates over the side cutting. In order that this may take place the gradient of stream valleys must be steep. In many cases steep gradients are made possible by the rapid excavation of a large valley by a master stream which heads in some region of more abundant rainfall and which erodes its valley more rapidly than the tributaries from the bad lands areas where there is less rainfall.

The climate of regions of bad lands is mostly arid or semi-arid. Daily as well as yearly variations in temperature are great. Humidity is low. Rainfall is likely to be concentrated in heavy showers within short intervals alternating with longer periods of drought. During the sudden downpours of rain, slopes are washed clean of the fine clays loosened during the preceding period of moistening and drying, and any small vegetation that may have gained a foothold is quickly swept away. The great concentration of water from the bare side slopes rushes down the gullies, removing material from the bottom, and deepens the trenches.

Life.—In the bad lands proper there is little vegetation of any kind partly because of the deficiency of rainfall, but largely because of the difficulty plants have in maintaining a foothold under the severe conditions of erosion. Animal life in the bad lands is likewise scarce because of the meagre supply of plant food. A few birds, an occasional rabbit, gopher, prairie-dog, mouse, snake or coyote are likely inhabitants of such a region.

Fossils.—The rock formations of bad lands probably contain fossils in not greater abundance than the rocks of other regions, but the bare slopes and the rapid erosion make fossil-finding in these areas easier. Among the fossils found are those of the horse, camel, rhinoceros, dog, cat, tapir, deer, rodent, insect eater, turtle, crocodile, eggs of birds and the remains of many animals now extinct.

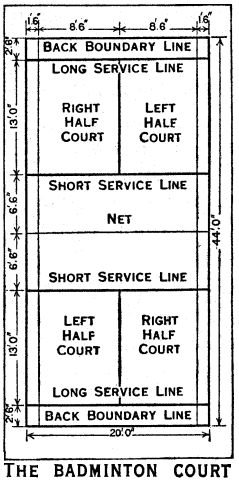
BADLESMERE, BARTHOLOMEW, BARON (1275–1322), English nobleman, was the son and heir of Gunselm de Badlesmere (d. 1301), and fought in the English army both in France and Scotland during the later years of the reign of Edward I. In 1307 he became governor of Bristol castle, and afterwards steward of his household to Edward II. He conspired with some other noblemen to gain supreme influence in the royal council. Although very hostile to Earl Thomas of Lancaster, Badlesmere helped to make peace between the king and the earl in 1318, and was a member of the middle party which detested alike Edward's minions, like the Despensers, and his violent enemies like Lancaster. The king's conduct, however, drew him to the side of the earl, and he had already joined Edward's enemies when, in Oct. 1321, his wife, Margaret de Clare, refused to admit Queen Isabella to her husband's castle at Leeds in Kent. The king captured the castle, seized and imprisoned Lady Badlesmere, and civil war began. After the defeat of Lancaster at Boroughbridge, Badlesmere was taken and hanged at Canterbury on April 14, 1322. His son and heir, Giles, died without children in 1338.

BADMINTON or **GREAT BADMINTON,** village in the Cotswold Hills, Gloucestershire, England, 100 mi. W. of London by the Great Western railway (direct line to south Wales). Here is Badminton House, the seat of the dukes of Beaufort, standing in a park some ten miles in circumference. The manor of Badminton was acquired in 1608 from Nicholas Boteler (to whose family it had belonged for several centuries) by Thomas, Viscount Somerset (d. 1650 or 1651), 3rd son of Edward, 4th earl of Worcester, and was given by his daughter and heiress Elizabeth to Henry Somerset, 3rd marquess of Worcester and 1st duke of Beaufort (1629–99), who built the present mansion (1482) on the site of the old manor house. Population of parish (1931) 356

BADMINTON, a game played with rackets and shuttlecocks, its name being taken from the duke of Beaufort's seat in Gloucestershire, England. The game appears to have been first played in England about 1873, but before that time it was played in India, where it is still popular to some extent. The Badminton Association in England was founded in 1895, and its laws were framed from a code of rules drawn up in 1887 for the Bath Badminton Club and based on the original Poona (1876) rules. These rules apply to the game as played in America and in practically every other country where Badminton is played. In clubs controlled by the Badminton Association only the covered court game is recognized. The All-England championships for gentlemen's doubles, ladies' doubles, and mixed doubles were instituted in 1899, and for gentlemen's singles and ladies' singles in 1900; and the first International Match between England and Ireland was played in 1903. Badminton may be played by daylight or by

artificial light, either with **two** players on each side (the four-handed or double game) or with one player on each side (the two-handed or single game). The game consists entirely of volleying and is extremely fast, a single at Badminton being admitted to require more staying power than a single at lawn tennis. There is much scope for judgment and skill; *e.g.*, in "dropping" (hitting the shuttle gently just over the net) and in "smashing" (hitting the shuttle with a hard downward stroke). The measurements of the Badminton court are shown on the accompanying plan.

Diagram of *Court.*—In the two-handed game, the width of the court is reduced to 17ft. and the long service lines are dispensed with, the back boundary lines being used as the long service lines, and the lines dividing the half courts being produced to meet the back boundary lines. The net posts are placed either on the side boundary lines or at any distance not exceeding 2ft. outside the said lines; thus in the four-handed game, the distance between the posts is from 20 to 24ft., and in the two-handed game, from 17 to 27ft. *N.B.*—With the exception of the net line, the dotted lines on the court apply only to the court for the two-handed game.



THE BADMINTON COURT
For the four-handed game the court is full-sized; for the two-handed, it is 3 ft. narrower as indicated

The Badminton hall should, if possible, be not less than 25ft. in height above the middle of the net. Along the net line is stretched a net join. deep and from 17 to 24ft. long, according to the position of the posts, and edged on the top with white tape 3in. wide. The top of the net should be 5ft. from the ground at the centre and 5ft. 1in. at the posts. The shuttlecock (or shuttle) has from 14 to 16 feathers from $2\frac{1}{2}$ to $2\frac{3}{4}$in. long, and weighs from 73 to 85 grains. The racket (which is of no specified size, shape or weight) is strung with strong fine gut and weighs as a rule between 5 and 6oz.

The game is for 15 or, rarely, for 21 aces, except in ladies' singles, when it is for 11 aces; and a rubber is the best of three games. Where 21 aces are played (as only occurs in handicap contests) matches are decided by a single game. The right to choose ends or to serve first in the first game of the rubber is decided by tossing. If the side which wins the toss chooses first service, the other side chooses ends, and vice versa; but the side which wins the toss may call upon the other side to make first choice. The sides change ends at the beginning of the second game, and again at the beginning of the third game, if a third game is necessary. In the third game the sides change ends when the side which is leading reaches eight in a game of 15 aces, and 6 in a game of 11 aces, or, in handicap games, when the score of either side reaches half the number of aces required to win the game. In matches of one game (21 aces) the sides change ends when the side which is leading has scored 11 aces. The side winning a game serves first in the next game, and, in the four-handed game, either player on the side that has won the last game may take first service in the next game.

The single-handed and double-handed game consists of 15 aces; when the score is "13 all" the side which first reaches 13 has the option of "setting" the game to 5, and when the score is "14 all" the side which first reaches 14 has the option of "setting" the game to 3; *i.e.*, the side which first scores 5 or 3 aces, according as the game has been "set" at "13 all" or "14 all" wins. In ladies' singles, when the score is "9 all" the side first reaching g may "set" the game to 5, and when the score is "10 all" the side which first reaches 10 may "set" the game to 3. In three-handed or in four-handed games, the game consists of 21 aces, the first "set" is at "19 all"; second set is at "20 all." There is no "setting" in handicap games.

In the four-handed game the player who serves first stands in his right-hand half court and serves to the player who is standing in the opposite right-hand half court, the other players meanwhile standing anywhere on their side of the net. As soon as the shuttle is hit by the server's racket, all the players may stand anywhere on their side of the net. If the player served to returns the shuttle —*i.e.*, hits it into any part of his opponents' court before it touches the ground—it has to be returned by one of the "in" (serving) side, and then by one of the "out" (non-serving) side, and so on, until a "fault" is made or the shuttle ceases to be "in play." (The shuttle is "in play" from the time it is struck by the server's racket until it touches the ground, or touches the net without going over, or until a "fault" is made.) If the "in" side makes a "fault," the server loses his "hand" (serve), and the player served to becomes the server; but no score accrues. If the "out" side makes a "fault," the "in" side scores an ace, and the players on the "in" side change half courts, the server then serving from his left half court to the player in the opposite left half court, who has not yet been served to. Only the player served to may take the service, and only the "in" side can score an ace. The first service in each innings is made from the right-hand half court. The side that starts a game has only one "hand" in its first innings; in every subsequent innings each player on each side has a "hand," the partners serving consecutively. While a side remains "in," service is made alternately from each half court into the half court diagonally opposite, the change of half courts taking place whenever an ace is scored. If, in play, the shuttle strikes the net but still goes over, the stroke is good; but if this happens in service and the service is otherwise good, it is a "let"; *i.e.*, the stroke does not count, and the server must serve again, even if the shuttle has been struck by the player served to, in which case it is assumed that the shuttle would have fallen into the proper half court. It is a "let," too, if the server, in attempting to serve, misses the shuttle altogether. It is a good stroke, in service or in play, if the shuttle falls on a line, or, in play, if it is followed over the net with the striker's racket, or passes outside either of the net-posts and then drops inside any of the boundary lines of the opposite court. *Mutatis* mutandis, the above remarks apply to the two-handed game, the main points of difference being that, in the two-handed game, both sides change half courts after each ace is scored and the same player takes consecutive serves. whereas in the double game only the serving side changes half courts at an added ace and a player may not take two consecutive serves in the same game. Furthermore, since 1921, it has been laid down that in the two-handed game the players shall serve from and receive service in the right-hand half courts only when the server's score is 0, or when he has scored an even number of aces in the game, the service being delivered from and received in the left-hand half courts when the server has scored an odd number of aces.

It is a "fault" (a) if the service is overhand; *i.e.*, if the shuttle when struck is higher than the server's waist; (b) if, in serving, the shuttle does not fall into the half court diagonally opposite that from which service is made; (c) if the service falls short of the service line or outside the boundary lines; (d) unless both the server's feet are in his own court; a foot on a line is held to be out of court; (e) if either in service or in play the shuttlecock falls outside the bounds of the court; (f) if the shuttlecock in service or play, passes through or under the net, or hangs in the net, or touches the roof or side walls of the hall or the person or dress of any player, or anything except the bat of the striker, or the top of the net; (g) if the shuttle is struck twice successively by the same player, or if it is struck by a player and his partner; (h) if the shuttle be struck before it crosses to the striker's side of the net; (i) if the striker touch the net or its supports with his racket or otherwise.

The development of Badminton in Great Britain and Ireland since 1910 is evidenced by the increase in the number of clubs affiliated with its central organization, the Badminton Association. In 1910 only 302 clubs were so affiliated, including Scottish clubs, while at the end of 1927 the number totalled nearly 700 in England alone. A further total of over 360 clubs belonged to the Irish, Scottish and Welsh Badminton Unions.

The World War necessarily checked the progress of the game, but since 1918 it has steadily gained in popularity, and with the aid of exhibition matches, which for some seasons have been held all over England, a better knowledge of the possibilities of Badminton has been acquired. Another symptom of the game's

advance is the increase in the number of county associations, the chief object of which is the promotion of inter-county matches and competitions.

BIBLIOGRAPHY.—The most important books that have been written on the game are: S. M. Massey, *Badminton* (1911); Sir G. A. Thomas, Bt., *The Art of Badmiaton* (1923); G. S. B. Mack, *Badminton* (1925); Mrs. R. C. Tragett, *Badminton for Beginners* (1926).

For full information as to the Laws of Badminton, the reader is referred to The Badminton Association's Annual Handbook (London). *The Badminton Gazette*, established in Nov. 1907, is the official organ of the Association, and appears monthly throughout the season. Also *see* Spalding's *Lawn Sports* for official rules and full details of the game.

BADNUR, a town of British India, the headquarters of the district of Betul in the Central Provinces, pop. about 7,000. Not far from Badnur is Kherla, the former residence of the Gond rajahs, where there is an old fort, now in ruins.

BADOGLIO, PIETRO (1871–), Italian general, was born at Grazzano Monferrato, Sept. 28, 1871. In the Italo-Turkish War he served in Tripoli on the staff. During World War I he planned and carried out the successful attack on Monte Sabotino which preceded the fall of Gorizia in Aug. 1916, and commanded the 27th corps at the battle of Caporetto. From Feb. 1918, he acted as sole sub-chief-of-staff under Diaz. He conducted the armistice preliminaries at Villa Giusti and signed the armistice on behalf of Italy. Appointed to the rank of army general, he was chief of the general staff until 1921. He was ambassador to Brazil, 1923–25, and governor-general of Libya, 1929–33. On Nov. 28, 1935, he was appointed commander-in-chief of operations in Abyssinia. From May to June 1936 he was viceroy of Abyssinia The title of duke of Addis Ababa was conferred on him. In June 1940 he was made chief of staff of the Italian army but he resigned in December of that year after the Italian armies were defeated in Greece, a campaign he had reputedly opposed. When Premier Benito Mussolini resigned July 25, 1943, Badoglio was made premier in his place. Less than two months later, on Sept. 8, Badoglio and King Victor Emmanuel agreed to Italy's unconditional surrender to the United Nations.

BAD OLDESLOE, a spa in the southeast of the Prussian province of Schleswig-Holstein, on the Trave, and a junction on the railway from Liibeck to Hamburg. Pop. (1933), 7.859.

BADRINATH, a village and celebrated temple in British India, in the Garhwal district of the United Provinces. It is situated among mountains rising to a height of 23,000 ft., and the altitude of the great temple itself is 10,294 ft. It is about 40 or 50 ft. in height, built in the form of a cone, with a small cupola, on the top of which is a gilt ball and spire, and contains the shrine of Badrinath, dedicated to an incarnation of Vishnu. The principal idol is of black stone and is 3 ft. in height. Badrinath is a favourite resort of pilgrims from all parts of India; and the long and toilsome route by which it is reached enhances the merits of the pilgrimage.

BADULLA, the administrative capital of the province of Uva, Ceylon, 54 mi. southeast of Kandy, and the terminus of the mountain railway. It was in Kandyan times the home of a prince who ruled Uva as a principality. Badulla stands 2,222 ft. above sea-level; the average annual rainfall is 78½ in.; the average temperature, 73°. The population of the town is 9,849; of the Uva Province (1931) 303,419. The town which is almost encircled by a river, the Badulla-Oya, and over-shadowed by the Naminacooly Kande range of mountains (highest peak 6,680 ft.) is very picturesquely situated. It is the centre of a thriving tea and rubber planting district.

BAEDEKER, KARL (1801–1859), German publisher, was born at Essen, Nov. 3, 1801. His father had a printing establishment and bookshop there, and Karl followed the same business independently in Coblenz. Here he began to issue the first of the series of guide-books with which his name is associated. They followed the model of the English series instituted by John Murray, but developed in the course of years so as to cover the greater part of the civilized world, and later were issued in English and French as well as German. Baedeker's son Fritz carried on the business, which in 1872 was transferred to Leipzig. Baedeker's success was due to systematic personal hard work. He is said to have been in the habit of travelling incognito and noting the minutest particulars of management in the hotels he visited. The firm maintained a tradition of employing good scholars and geographers in the preparation of its guide books.

BAEKELAND, LEO HENDRIK (1863–), the inventor of bakelite, was born in Ghent, Belgium. In 1889, he went to the United States, where he became active as research chemist, particularly in the manufacture of photographic materials, a subject in which he had been interested since student days at Ghent. In 1893 he founded the Nepera Chemical company, in Yonkers, N.Y., for the manufacture of photographic papers. The most successful was Velox paper, which utilized a special colloidal chloride of silver relatively unsensitive to yellowish and greenish light, but much more sensitive to blue and violet rays. Hence, it could be exposed and developed rapidly and conveniently. Baekeland then devoted himself to chemical research, developing the apparatus used in commercial production of caustic soda and chlorine by passing electric current through a solution of brine.

In 1906, he undertook a new line of research which resulted in his invention of Bakelite materials, synthetic phenol resinoids obtained by action of phenols upon aldehydes. Baekeland's product resembled shellac or amber in colour and form, but was otherwise so totally different that it formed the basis for an entirely new industry. Here was a super-resin which nature had not furnished; it had been built to specification in the research laboratory. This invention should probably be considered Baekeland's leading work, so broadly useful have resinoids become in nearly every phase of human activity. They have been used for electrical purposes and endless other industrial applications where natural resins, rubber or celluloid are unsuited. These applications range from radio and wireless telegraphy and other electrical devices to gears, grindstones, aeroplane propellers, self-lubricating bearings, jewellery and ornamental articles.

Baekeland founded (1910) and was first president of the General Bakelite company, which later became the Bakelite corporation. He was honorary professor of chemical engineering at Columbia university from 1917. For his achievements he was decorated by the governments of Belgium and France and received numerous awards and honorary degrees in Europe and the United States.

BAEL FRUIT (Aegle Marmelos). Aegle is a genus of the family Rutaceae, containing three species, two in tropical Asia and one in west tropical Africa. The plants are trees bearing strong spines, with alternate, compound leaves each with three leaflets and panicles of sweet-scented white flowers. Aegle *Marmelos*, the bael- or bel-fruit tree (also known as Bengal quince). is found wild or cultivated throughout India. The tree is valued for its fruit, which is oblong to pyriform in shape, 2 to 5 in. in diameter and has a grey or yellow rind and a sweet, thick orange-coloured pulp. The unripe fruit is cut up in slices, sun-dried and used as a remedy for dysentery; the ripe fruit is described as sweet, aromatic and cooling. The wood is yellowish-white and hard but not durable.

BAENA, a town of southern Spain, in the province of Córdova. Population 21,289. Baena is picturesquely situated near the river Marbella, on the slope of a hill crowned with a castle. which formerly belonged to the famous captain Gonzalo de Córdova. Farming and horse-breeding are the chief local industries The nearest railway station is Luque (pop. 5,750), 4 mi. southeast on the Jaén-Lucena line. The site of the Roman town (Baniana or Biniana) can still be traced.

BAER, KARL ERNST VON (1792–1876), German biologist, was born at Piep, Estonia, on Feb. 29, 1792. His father, a small landowner, sent him to school at Reval, which he left in his 18th year to study medicine at Dorpat university. The lectures of K. F. Burdach (1776–1847) suggested research in the wider field of life-history, and as at that time Germany offered more facilities for and greater encouragement to scientific work. von Baer went to Wiirzburg, where J. I. J. Dollinger (1770–1841), father of the Catholic theologian, was professor of anatomy. He collaborated with C. H. Pander (1794–1865) in researches on the evolution of the chick, the results of which were first published

in Burdach's treatise on physiology. Continuing his investigations alone von Baer extended them to the evolution of organisms generally, and after a sojourn at Berlin he was invited by his old teacher Burdach, who hsd become professor of anatomy at Königsberg, to join him as prosector and chief of the new zoological museum (1817). Von Baer's discovery of the human ovum is the subject of his *Epistola* de Ovo *Mammalium* et *Hominis* Genesi (Leipzig, 1827), and in the following year he published the first part of his History of the Development of *Animals* (*Ueber* die *Entwickelungsgeschichte* der Thiere), the second part following in 1837. In this work he demonstrated that the Graafian follicles in the ovary are not the actual eggs, but that they contain the true ovum. He next showed that in all vertebrates the primary stage of cleavage of the fertilized egg is followed by modification into leaf-like germ-layers (skin, muscular, vascular and mucous) whence arise the several organs of the body by differentiation. He further discovered the gelatinous, cylindrical cord, known as the notochord which passes along the body of the embryo of vertebrates, in the lower types of which it is limited to the entire inner skeleton, while in the higher the backbone and skull are developed round it. In his *History* of Development he suggests, "Are not all animals in the beginning of their development essentially alike, and is there not a primary form common to all?" (i. p. 223). Notwithstanding this, the "telic" idea, with the archetypal theory which it involved, possessed von Baer to the end of his life, and explains his inability to accept the theory of unbroken descent with modification when it was propounded by Charles Darwin and A. R. Wallace in 1858. The influence of von Baer's discoveries has been far-reaching and abiding. Not only was he the pioneer in that branch of biological science to which Francis Balfour, gathering up the labours of many fellow-workers, gave coherence in his *Comparative* Embryology (1881), but the impetus to T. H. Huxley's researches on the structure of the medusae came from him (Life, i. 163), and Herbert Spencer found in von Baer's "law of development" the "law of all development" (Essays, i. 30). In 1834 von Baer was appointed librarian of the Academy of Sciences of St. Petersburg (Leningrad). In 1835 he published his Development of Fishes, and as the result of collection of all available information concerning the fauna and flora of the Polar regions of the empire, he was appointed leader of an Arctic expedition in 1837. The remainder of his active life was occupied in divers fields of research, geological as well as biological, an outcome of the latter being his fine monograph on the fishes of the Baltic and Caspian seas. One of the last works from his prolific pen was an interesting autobiography published at the expense of the Estonian nobles on the celebration of the jubilee of his doctorate in 1864. Three years afterwards he received the Copley medal. He died at Dorpat on Nov. 28, 1876.

BAER, WILLIAM JACOB (1860–1941), U.S. painter, was born on Jan. 29, 1860, in Cincinnati, Ohio. He studied at Munich in 1880–84. He had much to do with the revival in America of the art of miniature-painting, to which he turned in 1892, and was the first president of the Society of Painters in Miniature, New York. Among his miniatures are "The Golden Hour," "Daphne," "In Arcadia" and "Madonna with the Auburn Hair." He died Sept. 21, 1941.

BAETYLUS (bē'tę-lus), a Greek word of Semitic origin (=bethel) denoting a sacred stone. Numerous holy or fetish stones existed in antiquity, and were generally attached to the cult of some particular god, and looked upon as his abiding-place or symbol. A famous example is the holy stone at Delphi (Pausan. x. 24), said to have been the one which Cronus (*q.v.*) swallowed. Another famous stone was that of Cybele, at Pessinus. See GREAT MOTHER OF THE GODS. In some cases an attempt was made to give a more regular form to the original shapeless stone. See HERMAE.

See Bosigk, *De Baetyliis (1854)*; and the exhaustive article by F. Lenormant in Daremberg and Saglio's *Dictionnaire* des *Antiquités.*

BAEUER, JOHANN FRIEDRICH WILHELM ADOLF VON (1835–1917), German chemist, was born at Berlin on Oct. 31, 1835, his father being Johann Jacob von Baeyer (1794–1885), chief of the Berlin Geodetical Institute from 1870. He studied chemistry under R. W. Bunsen and F. A. Kekulé, and in 1858 took his degree as Ph.D. at Berlin, becoming privatdocent a few years afterwards and assistant professor in 1866. Five years later he was appointed professor of chemistry at Strassbourg, and in 1875 he migrated in the same capacity to Munich. He devoted himself mainly to investigations in organic chemistry, and in particular to synthetical studies by the aid of "condensation" reactions. The Royal Society of London awarded him the Davy medal in 1881 for his researches on indigo, the nature and composition of which he did more to elucidate than any other single chemist, and which he also succeeded in preparing artificially, though his methods were not found commercially practicable. To celebrate his seventieth birthday his scientific papers were collected and published in two volumes (*Gesammelte* Werke, Brunswick, 1905), and the names of the headings under which they are grouped give some idea of the range and extent of his chemical work:—(I) organic arsenic compounds, (2) uric acid group, (3) indigo, (4) papers arising from indigo researches, (5) pyrrol and pyridine bases, (6) experiments on the elimination of water and on condensation, (7) the phthaleins, (8) the hydro-aromatic compounds, (9) the terpenes, (10) nitroso compounds, (11) furfurol, (12) acetylene compounds and "strain" (*Spannungs*) theory, (13) peroxides, (14) basic properties of oxygen, (15) dibenzalacetone and triphenylamine, (16) various researches on the aromatic and (17) the aliphatic series. Baeyer died at Munich on Sept. 5, 1917.

BAÉZA, a town of southern Spain, in the province of Jaén; in the Loma de Ubeda, a mountain range between the river Guadalquivir on the south and its tributary the Guadalimar on the north. Population 15,326. Its chief buildings are those of the university (founded in 1533, and now occupied by the Institute of Secondary Education), the cathedral and the Franciscan monastery. Its fortifications, now in ruins, were of great strength. The town has little trade except in farm-produce; but its red dye, made from the native cochineal, was formerly celebrated. In the middle ages Baéza was a flourishing Moorish city, said to contain 50,000 inhabitants; but it was sacked in 1239 by Ferdinand III. of Castile, who in 1248 transferred its bishopric to Jaén. It was the birthplace of the sculptor and painter, Gaspar Becarra.

BAFFIN, WILLIAM (1584–1622), English navigator and discoverer. The earliest mention of his name occurs in 1612, in connection with an expedition in search of a North-West Passage, under the orders of Captain James Hall, whom he accompanied as chief pilot. Captain Hall was murdered in a fight with the natives on the west coast of Greenland, and during the two following years Baffin served in the Spitsbergen whale-fishery, at that time controlled by the Muscovy Company. In 1615 he entered the service of the company for the discovery of the North-West Passage, and accompanied Captain Robert Bylot as pilot of the little ship "Discovery," and now carefully examined Hudson Strait. The accuracy of Baffin's tidal and astronomical observations on this voyage was confirmed in a remarkable manner by Sir Edward Parry, when passing over the same ground two centuries later (1821). In the following year Baffin again sailed as pilot of the "Discovery," and passing up Davis Strait discovered the fine bay to the north which now bears his name, together with the magnificent series of straits which radiate from its head and were named by him Lancaster, Smith and Jones Sounds, in honour of the generous patrons of his voyages. Onthisvoyagehehadsailed over 300m. farther north than his predecessor Davis, and for 236 years his farthest north (about lat. 77°45′) remained unsurpassed in that sea. All hopes, however, seemed now ended of discovering a passage to India by this route, and in course of time even Baffin's discoveries came to be doubted until they were re-discovered by Captain Ross in 1818. Baffin next took service with the East India Company, and in 1617–19 performed a voyage to Surat in British India, and on his return received the special recognition of the company for certain valuable surveys of the Red Sea and Persian Gulf which he had made in the course of the voyage. Early in 1620 he again sailed to the East, and in the Anglo-Persian attack on Kishm in the Persian Gulf, preparatory to the reduction

of Ormuz, he received his death-wound, and died on Jan. 23, 1622. Baffin made numerous scientific and magnetic observations, for one of which (the determination of longitude at sea by lunar observation) the honour is claimed of being the first of its kind on record.

BAFFIN BAY and **BAFFIN LAND,** an Arctic sea and island named after the explorer William Baffin. The former extends from about 69° to 78° N.. and forms part of the long strait separating Greenland from Baffin Land. The latter is a barren tract included in Franklin district, Canada. Area, 236,000 square miles. (See CANADIAN ARCTIC ISLANDS.) Pop. (1941) 2,052.

BAGA, a coarse-featured people related to the Nalu and Landuman who practise scarification. They lire on the coast of French Guinea between Cape Verga and Konakri in independent villages by unhealthy swamps. There are traces of totemism. Marriage is obligatory between (i.) the husband's brothers and his wife's sisters, and (ii) the younger brother or nephew and the widow. Polygamy is allowed The first wife has superior standing in the community. Inheritance passes in the maternal line; family ownership of property is combined with individual possession of personalty. They practise husbandry and aboriculture (rice, banana, cabbage-palm, kola), most of the labour falling on the women. The dead are exposed, before being buried in sacred groves, and some of their grain and parts of their personal possessions are collected in their houses which are then burnt. They are animists. *See* Arcin, La *Guinée Française* (1907).

BAGAMOYO, seaport, Tanganyika Territory, East Africa, in 6° 27′ S., 38° 55′ E. Pop. (1921) 5,200. As the mainland port nearest Zanzibar, 26m. distant, Bagamoyo became the starting-point for caravans to the great lakes, and thus an entrepôt of trade for the interior of the continent. Of the explorers who began their journeys inland from Bagamoyo the most illustrious were Sir Richard Eurton, J. H. Speke, J. A. Grant and Sir H M. Stanley. Having only an open roadstead it was superseded to a large extent in the last quarter of the 19th century by the development of the port of Dar es Salaam, 36m. south. It retained, however, a considerabie coastal trade. The Mission *du Sacré Coeur* has a large establishment here and the town is the seat of a Roman Catholic bishopric. Bagamoyo is the centre of an administrative division which had in 1921 a population of 57,000.

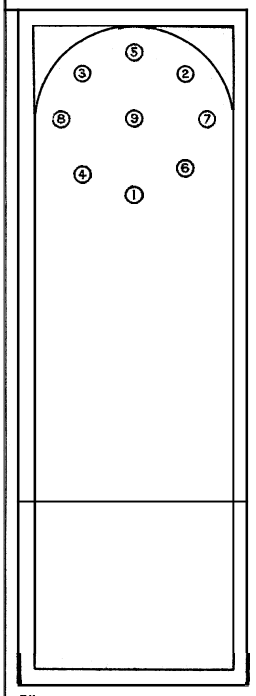
BAGASSE (ba-găs′), the name given to the fibrous residue resulting from the crushing of sugar-cane and the expression of its juices. Originally the term was applied in Provence, France, to refuse from olive-oil mills, hence anything worthless. The word was also used to describe a disreputable woman, and it appears in English as "baggage." The root of bagasse is the Anglo-Saxon baeg, referring to the olive skin as a bag.

Sugar-cane bagasse, known also as pumice, megasse and cane straw, comprising refuse of the milling and extracting operations, averages about 12% by weight of insoluble matter. Bagasse is not returned to the soil for in the extraction of the cane juices substantially all of the soluble minerals are carried off in solution leaving only the tough fibres which are very resistant to decay. Experiments to develop the use of bagasse as ensilage, as direct food or as a carrier for molasses, have been unsuccessful. Its use for a fuel, however, was worked out by developing special types of furnaces, and in most sugar-producing countries it furnishes the fuel for the sugar grinding.

Many attempts have been made to produce from bagasse a fibre suitable for paper making but hitherto the processes have been too costly or did not produce an entirely satisfactory paper, though in Hawaii small quantities of mulch paper are manufactured from it.

In 1921 the manufacture was begun in Louisiana of a bagasse fibre insulating board.

BAGATELLE, primarily a thing of trifling importance (Fr. from Ital. bagatella, bagata, a trifle). The name, though French, is given to a game which is probably of English origin, though its connection with the shovel-board of Cotton's Complete Gamester is very doubtful. Strutt does not mention it. The game is very likely a modification of billiards, and is played on an oblong board or table varying in size from 6ft. by 1½ft. to 10ft. by 3ft. The bed of the table is generally made of slate, although, in the smaller sizes, wood covered with green cloth is often used. The sides are cushioned with india-rubber. The head is semi-circular and fitted with nine numbered cups set into the bed, their numbers showing the amount scored by putting a ball into them. An ordinary billiard-cue and nine balls, one black, four red, and four white, are used. The black ball is placed upon a spot about 4in. in front of hole 1, and about 18in. from the player's end of the board. A line (the baulk) is drawn across it, behind which is another spot for the player's ball. (These measurements of course differ according to the size of the table.) Some modern tables have pockets as well as cups.



BY COURTESY OF MESSRS. THURSTON AND CO., LTD.

THE BAGATELLE BOARD
Scoring depends on making cannons, and in getting the balls into the numbered CUPS

Bagatelle Proper.—The black ball having been placed on the upper spot, the players "string" for the lead, the winner being that player who plays his ball into the highest hole. Any number may play, either separately, or in sides. Each player in turn plays all eight balls up the table. no score being allowed until a ball has touched the black ball, the object being to play as many balls as possible into the holes, the black ball counting double. Balls missing the black at the beginning, those rolling back across the baulkline, and those forced off the table are "dead" for that round and removed. The game is decided by the aggregate score made in an agreed number of rounds.

Sans **Egal.**—This is a French form of the game. Two players take part, one using the red and one the white balls. After "stringing" for lead, the leader plays at the black, forfeiting a ball if he misses. His opponent then plays at the black if it has not been touched, otherwise any way he likes, and each then plays alternately, the object being to hole the black and his own balls, the winner being the one who scores the highest number of points. If a player holes one of his opponent's balls it is scored for his opponent. The game is decided by a certain number of rounds, or by points, usually 21 or 31. In other matters the rules of bagatelle apply.

The Cannon Game.—This is usually considered the best and most scientific of bagatelle varieties. Tables without cups are sometimes used. As in billiards three balls are required, the white. spot-white and black, the last being spotted and the non-striker's ball placed midway between holes 1 and 9. The object of the game is to make cannons (caroms), balls played into holes, at the same time counting the number of the holes, but if a ball falls into a hole during a play in which no cannon is made the score counts for the adversary. If the striker's ball is holed he plays from baulk; if an object-ball, it is spotted as at the beginning of the game. A cannon counts two; missing the white object-ball scores 1 to the adversary; missing the black, 5 to the adversary. If there are pockets, the striker scores 2 for holing the white object-ball and 3 for holing the black, but a cannon must be made by the same stroke; otherwise the score counts for the adversary.

Mississippi.—This variation is played with a bridge pierced with nine or more arches, according to the size of the table, the arches being numbered from 1 upwards. All nine balls are usually played, though the black is sometimes omitted, each player having a round, the object being to send the balls through the arches. This may not be done directly, but the balls must strike a cushion first, the black, if used, counting double the arch made. If a ball is played through an arch, without first striking a cushion, the score goes to the adversary, but another ball, lying in front of the bridge, may be sent through by the cue-ball if the latter has struck

a cushion. If a ball falls into a cup the striker scores the value of the cup as well as of the arch.

In music, Bagatelle is a name sometimes given to a short instrumental piece of a light character. Beethoven wrote a number of such pieces for the pianolorte which were so entitled.

BAGÉ, a town end municipality of the State of Rio Grande do Sul, Brazil, about 176 mi. by rail W.N.W. of the city of Rio Grande do Sul. Pop. of the municipality (1940) 59,686; of the town 30,000. It is situated in a hilly region 774 ft. above sea level, and is the commercial centre of a large district on the Uruguayan border in which pastoral occupations are predominant. This region is the watershed for southern Rio Grande do Sul, from which streams flow east and south-east to the Atlantic coast, and north-west and south-west to the Uruguay river. The town dates from colonial times, and has always been considered a place of military importance because of its nearness to the Uruguayan frontier, only 25m. distant. It was captured by the Argentine general Lavalle in 1827, and figured conspicuously in most of the civil wars of Argentina. It is also much frequented by Uruguayan revolutionists.

BAGEHOT, WALTER (baj'ŏt) (1826-IS;^), English economist, editor of the *Economist* newspaper from 1860 to his death, was born at Langport, Somerset, his father being a banker at that place. His life was comparatively uneventful, as he early gave up to literature the energies which might have gained him a large fortune in business or a great position in the political world. He took his degree at the London University in 1848, and was called to the bar in 1852, but from an early date he joined his father in the banking business of Stuckey and Co. in the west of England, and during a great part of his life, while he was editor of the *Economist,* he managed the London agency of the bank, lending its surplus money in "Lombard Street," and otherwise attending to its London affairs. He became also an underwriter at Lloyd's, taking no part, however, in the active detailed business, which was done for him by proxy by a person or persons acting on his behalf.

Bagehot's connection with the *Economist* began in 1858, about which time he married a daughter of the first editor, the Right Hon. James Wilson, at that time secretary of the Treasury, and aiterwards secretary of finance in India. Partly through this connection he was brought into the inside of the political life of the time. He was an intimate friend of Sir George Cornewall Lewis, and was afterwards in constant communication with many of the political chiefs, especially with Gladstone, Robert Lowe and Grant Duff, and with the permanent heads of the great departments of state. In the City in the same way he was intimate with the governor and directors of the Bank of England, and with leading magnates in the banking and commercial world; while his connection with the Political Economy Club brought him into contact in another way with both City and politics. His active life in business and politics, however. was not of so absorbing a kind as to prevent his real devotion to literature, but the literature largely grew out of his activities, and of no one can it be said more truly than of Bagehot that the atmosphere in which he lived gave tone and colour and direction to his studies, one thing of course acting and reacting on another. The special note of his books, apart from his remarkable gift of conversational epigrammatic style, which gives a peculiar zest to the writing, is the quality of scientific, dispassionate description of matters which were hardly thought of previously as subjects of scientific study. This is specially the case with the two books which perhaps brought him the most reputation, *The English Constitutzon* (1867), and *Lombard Street* (1873). They are both books of observation and description. The English constitution is described, not from law books as a lawyer would describe it, but from the actual working. as Bagehot himself had witnessed it, in his contact with ministers and the heads of government departments, and with the life of the society in which the politicians moved The true springs and method of action are consequently described with a vivid freshness which gives the book a wonderful charm. and makes it really a new departure in the study of politics It is the same with *Lombard Street.* The money market is there pictured as it really was in 1850–70, and as Bagehot saw it with philosophic eyes.

Lombard Street was based on a series of articles which Bagehot wrote in 1858 in the *Economist,* though it was not published till the early '70s, after it had been twice rewritten and revised with infinite labour and care. *Lombard Street,* like *The English Constitution* in political studies, is thus a new departure in economic and financial studies, applying the same sort of keen observation which Adam Smith used in the analysis of business generally to the special business of banking and finance in the complex modern world. It is, perhaps, not going too far to say that the whole theory of a one-reserve system of banking and how to work it, and of the practical means of fixing an "apprehension minimum" below which the reserve should not fall, originated in *Lombard Street* and the articles which were the foundation of it; and the subsequent conduct of banking in England and throughout the world has been infinitely better and safer in consequence. A like note is also struck in *Physics and Politics* (1869), which is a description of the evolution of communities of men. The materials here are derived mainly from books, the surface to be observed being so extensive, but the attitude is precisely the same, that of a scientific observer. To a certain extent the *Physics and Politics* had even a more remarkable influence on opinion, at least on foreign opinion, than *The English Constitution* or *Lombard Street.* It "caught on" as a development of the theory of evolution in a new direction, and Darwin himself was greatly interested, while one of the pleasures of Bagehot's later years was to receive a translation of the book into the Russian language. In *Literary Studies* (1879) and *Economic Studies* (1880), published after his death, there is more scope than in the books already mentioned for other characteristics besides those of the scientific observer; but observation always comes to the front. as in the account of Ricardo, whom Bagehot describes as often, when he is most theoretical, really describing what a first-rate man of business would do and think in actual transactions. The observation, of course, is that of a type of business man in the City to which Ricardo as well as Bagehot belonged, though Ricardo could hardly look at it from the outside as Bagchot was able to do.

Bagehot had great City, political and literary influence, to which all his activities contributed, and much of his influence was las'ing. In politics and economics especially, his habit of scientific observation affected the tone of discussion, and both the English constitution and the money market have been better understood generally because he wrote and talked and diffused his ideas in every possible way. He was unsuccessful in two or three attempts to enter parliament, but he had the influence of far more than an ordinary member, as director of the *Economist* and as the adviser behind the scenes of the ministers and permanent heads of departments who consulted him. His death occurred at Langport very suddenly.

See the "Life" prefixed by R. H. Hutton to his edition of the *Literary Studies* (1905); the introduction by Hartley Withers to *Lombard Street* (ed., with notes, by A. W. Wright, 1915); and the biography by Mrs. Russell Barrington in her *Works* and ***Life*** of *Walter Bagehot* (1915). (R. Gi)

BAGGAGEMASTER, in the United States the official responsible for the transportation of passenger baggage and mail on railways, steamship lines and other systems of public conveyance. In England the army officer in charge of brigade or divisional baggage in the field is called the baggagemaster. This position in the United States calls for a common school education, a physical examination that includes hearing, eyesight and colour discrimination and general experience within the transporting system. At one of the New York city terminals the baggagemaster controls the handling of $3\frac{1}{4}$ million pieces of baggage annually and 2,000 tons of mail daily. He supervises the work of the parcel rooms and the movement of the daily newspapers—in all involving a force of 500 people. The keeping of records represents one of the most important phases of the work of the baggagemaster. On file in his office on various types of cards and sheets are recorded the name of the express company or hotel from which the baggage is received, the name and address

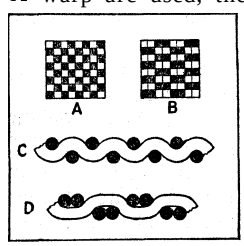
of sender, the check number, weight, size, day and hour of arrival, description of the type and condition of casing, destination and general remarks. A declaration of value, required by law, is also kept on file. For further protective purposes, in cases where delivery is made from a taxicab the number of the cab is noted; if a transfer company not well known to the agent acts as intermediary the driver's licence is recorded. The amount of personal baggage handled by railroads has been reduced to a marked extent because of the tendency of the travelling public to carry less and less persona1 baggage, the decrease in the amount of display goods carried by commercial travellers and trend of urban holiday-makers to establish permanent summer homes rather than carry back and forth with them large numbers of trunks containing household furnishings According to the census of 1940 there were approximately 5,959 baggagemasters and baggagemen per million population in the United States.

BAGGĀRA (Cattlemen), African "Arabs" of Semitic origin, great cattle owners and breeders, found west of the White Nile between the Shilluk territory and Dar Nuba, principally in Kordofan. They intermarried little with the Nuba. The date of their arrival in the Sudan is uncertain. They move from pasture to pasture, as food becomes deficient, and employ oxen as saddle and pack animals, carry no shield, but use a long, full-bladed spear, while many possess firearms. They were resolute fighters and slave-traders and were the first, as they were certainly the most fervent, supporters of the mahdi in 1882. They constituted his real fighting force, and to their fanatical courage his victories were due. The mahdi's successor, the khalifa Abdullah, was a Baggāra, and throughout his rule the tribe held the first place in his favour. As hunters of big game, they attack even elephants with sword and spear. The men are types of physical beauty, with fine heads, erect athletic bodies and sinewy limbs. There is little that is Semitic in their appearance. Their skins vary in colour from a dark red-brown to a deep black; but their features are regular and free of negro characteristics. In mental power they are much superior to the indigenous races around them. They have a passion for fine clothes and ornaments, tricking themselves out with glass trinkets, rings and articles of ivory and horn. Their mode of hair-dressing (mop-fashion) earned them, in common with the Hadendoa, the name of "Fuzzy-wuzzies" among the British soldiers in the campaigns of 1884–98. The women wear lumps of amber, bosses of silver, large earrings and nose rings.

See H. A. MacMichael, *History of the Arabs of the Sudan* (1922).

BAGGESEN, JENS IMMANUEL (1764–1826), Danish poet, was born at Korsor. His parents were very poor, and before he was 12 he was sent to copy documents at the office of the clerk of the district. He was a melancholy, feeble child, and before this he had attempted suicide more than once. By dint of indomitable perseverance he found his way in 1782 to the University of Copenhagen. His *Comical Tales* (1792) in verse took the town by storm, and the struggling young poet found himself a popular favourite at twenty-one. He left Denmark in pique at the failure of his opera, *Holge* Danske (1789), and spent the next years in Germany, France and Switzerland, returning for a short period in 1790, when he published his fine descriptive poem, the *Labyrinth*. The next 20 years were spent in incessant restless wanderings over the north of Europe, Paris latterly becoming his nominal home. He continued to publish volumes alternately in Danish and German. Of the latter the most important was the idyllic epos in hexameters called *Parthenais* (1803). In 1806 he returned to Copenhagen to find the young Öhlenschläger installed as the popular poet of the day. Until 1820 he resided in Copenhagen, engaged in constant literary feuds. He then left Denmark for the last time and went back to his beloved Paris, where he lost his second wife and youngest child in 1822, and after the miseries of an imprisonment for debt fell at last into a state of hopeless melancholy madness. He died Oct. 3, 1826, in the hospital at Hamburg on his way back to Denmark. Danish literature owes Baggesen a great debt for the firmness, polish and form which he introduced into it—his style being always finished and elegant. With all his faults he stands as the greatest figure between Holberg and Öhlenschläger. Of all his poems, however, the loveliest and best is a little simple song, "There was a time when I was very little," which every Dane, high or low, knows by heart, and which is matchless in its simplicity and pathos.

BAGGING AND BAGS. The textile stuff used for making bags was originally Baltic hemp, while in the beginning of the 19th century Sunn hemp or India hemp was also employed. Modern requirements call for so many different types of bagging that many kinds of fibres are used for this purpose. Most bagging is now made from yarns of the jute fibre. The cloth is, in general, woven with the plain weave, and the warp threads run in pairs, but large quantities of bags are made from cloths with single warp threads. In both cases the weave used for the cloth is thst shown at A in the figure, but when double threads of warp are used, the arrangement is equivalent to the weave shown at B. The interlacings of the two sets of warp and weft for single and double warp are shown respectively at C and D, the black marks indicating the warp threads, and the white or blanks showing the weft. The particular style of bagging depends, naturally, upon the kind of material it is intended to hold. The coarsest type of bagging is perhaps that known as "cotton bagging," which derives its name from the fact that it is used in the manufacture of bags for transporting raw cotton. It is a heavy fabric 42in. wide, and weighs from 2 to 2½lb. per yard. A similar, but rather finer make, is used for Sea Island and other fine cotton, and for any species of fibrous material; but for grain, spices, sugar, flour, coffee, manure, etc., the threads of warp and weft must lie closer, and the warp is usually single. For transporting such substances as sugar it is not uncommon to line the bag with paper, which excludes foreign matter and minimizes the loss. Although there are large quantities of seamless bags woven in the loom, the greater part of the cloth is woven in the ordinary way. It is then cut up into the required sizes by hand and by special machines, and afterwards sewn by chain-stitch or straight-stitch bag sewing machines. *(See* SACKING AND SACK MANUFACTURE.)



THE WEAVE OF BAGGING CLOTH

BAGHAL, a small native state in the Punjab, India. It is one of the Simla Hill states and has an area of 124sq.m. Pop. (1931) 26,352. The revenue amounts to £3,300 per annum.

BAGHDAD. The foremost city of Mesopotamia and the capital of modern Iraq is situated in lat. 33° 20′ N. and long. 44° 24′ E. on the Tigris at the point where that river and the Euphrates approach their closest approximation — to 25 miles. The city was originally built on the west bank of the river, but for over 1,000 years the greater part of the town has been on the E. bank. Today there is, however, a large and growing suburb, including a railway station on the west side, the two banks being connected by a bridge of boats. Baghdad is described by a traveller who visited it in 1583 as being "a towne not very grente but very populous and of greate trafficke of strangers for that is the way to Persia, Turkie and Arabia, and from thence doe goe Caravans for these and other places." Though the town has grown since that description was written, in other respects the words are still true and caravans, today by motor car and aeroplane, still run to Persia (Iran) and "Turkie"

Baghdad lies at a central point in the Middle East and there has been from Sumerian times an important town either on this very spot or close at hand. In early Sumerian times the ancient capital lay at Kish on the Euphrates and when that river changed its course Babylon succeeded to Kish. In later times Ctesiphon and subsequently Seleucia on the west bank of the Tigris opposite Ctesiphon succeeded to the supremacy. Baghdad itself, although on a site which has been occupied since very early times and still preserves the name which it has held for at least 4.000 years, did not rise to the position of a city of the first rank until the foundation of the Arab town on the west bank in the latter half of the 8th century A.D. Since that time the Abode of Peace although it has enjoyed very varying fortunes has always been the most

important city of Mesopotamia. Various factors have contributed to these changes, geographical, political and, as always in Mesopotamia, religious. Baghdad forms the meeting point of the land-routes of S.W. Asia. Uatil the discovery by the seafaring nations of Western Europe of a sea route to the Far East, Baghdad was the nodal point in the caravan routes between East and West. It commanded the two waterways of the Tigris and Euphrates and was close to the limit of navigation upwards of the former stream. It was the natural centre for the roads through the upland country to the north, for the ways through the gap of Khurasan, and for the practicable routes across the desert both to the Mediterranean and to the Holy Cities of Islam. Its commercial position was therefore unrivalled. The more stable condition of the Tigris, which is less given to moving its course than the Euphrates, makes the site, in spite of the constant danger from floods, more favourable to the continued existence of a city than the alternative Kish or Babylon.

So long as Mesopotamia remained a fertile land of gardens, whose fruitfulness could excite the wonder of all who visited her, Baghdad was truly the abode of peace and plenty. At the height of her fame during the early years of the 9th century Baghdad was the home of wealthy merchants and learned scholars who flourished under the shadow of an enlightened Caliphate. Under Mamun, the successor of Harun-al-Raschid it rose to be the centre of Islam at a time when Islam represented the highest civilization of the West. Renowned for learning, famous for silks, and for gorgeous tiled buildings, Baghdad became the city of the Arabian Nights and seemed certain, so favoured was its geographical situation, to enjoy a long period of prosperity. But political circumstances were destined to prevent the realization of this dream. For nearly two generations in the middle of the 9th century the city was deserted in favour of Samarra and, when the central power did return to Baghdad, the Commanders of the Faithful had degenerated to the position of mere shadow kings in the hands of the Turkish bodyguard which their predecessors had founded. Mesopotamia however still remained the fruitful country which it had been in antiquity, and Baghdad, though shorn of her former splendours, was still an important centre to which merchants and pilgrims resorted.

The real downfall of Baghdad did not come till 1258 when Hulaku the Mongol and his hordes overran Mesopotamia. They destroyed the Arab civilization and, by systematically breaking down the irrigation system, converted what had formerly been an agricultural land into a waste of steppe suited only to pastoral nomadism. A period of political instability ensued. Both these factors contributed to the downfall of Baghdad. She depended for her position on a continuation of a prosperous trade which in an unsettled and devastated country was impossible. Further a new situation had arisen. From the coming of the Mongols until the 20th century apart from short intervals Baghdad was never an independent capital. She was dependent first on the Mongol Emperor of Persia, then she became the southern capital of a smaller Mongol state. At the beginning of the 11th century she fell under Turkoman domination and a century later became part of the Persian kingdom. A prey to the warring factions of Turks and Persians the city was more than once put to the sword but relapsed into comparative obscurity after its final capture by the Sultan Murad IV. An independent Pashalik, attacked by Nadir Shah, and then once more at the beginning of the 19th century restored to full Turkish control, Baghdad remained a remote town far from the centres of political importance but often the unfortunate victim of political ambition. But the ancient fame and commercial possibilities of the country led at the end of the 19th century to the idea of a Baghdad railway, to connect Central Europe with the Middle East. Finally, in the readjustment of frontiers which followed the War of 1914–18 Baghdad was made once more the capital of an independent Arab state. It is significant that this restoration of the city to her old position should be associated with a supreme effort to undo the work of the Mongols and to convert the steppe once more into agricultural land.

This changing political position has coincided with far-reaching developments in methods of transport which have restored to Baghdad much of its former importance on the trade-routes. Before 1914 Baghdad lay outside these, and the railway was built only as far north as Shergat and therefore served no useful purpose. Apart from the uncertainty of river routes Baghdad remained isolated. Since this time a line has been built down the Euphrates to Basra—the Tigris line was merely a war-time measure. Of greater importance however has been the establishment of a big aerodrome at Hinaidi, a suburb of Baghdad and the development of aircraft services to Cairo and Basra. Further than this the old desert roads are now used at regular intervals by motorcars so that the journey from London to Baghdad can now be made in a week Baghdad has direct air connection with London and nith India and the Far East. The completion of the railroad to Turkey resulted in a direct rail connection with the Mediterranean.

Owing, no doubt, to the improvement in communications Baghdad in the 20th century began once more to regain her rightful place as the great market of the Middle East. The principal exports are carpets, wool, gum, hides and dates. A considerable import trade is carried on, especially in cotton and tea, most of which is re-exported. The Persian trade once more became of value and Mosul looked to Baghdad as the natural channel through which to sell her grain.

The traveller who wishes to see a purely eastern city will not find it in Baghdad except in the byways and in the few old mosques which remain. Hilla has preserved better its purely oriental character and recalls many of the features which characterized Baghdad before it was westernized. During the 20th century changes have taken place in the city itself which have altered it out of all recognition. Some of the main roads have been straightened and a macadam surface laid down, so that a great part of the city is available for motor traffic. There are a telephone and taxi-cab service; a modern water system replaces the old canals and insanitary methods of drawing water from the Tigris and its subsidiary channels, and there has consequently been considerable improvement of public health, though in spite of registration, statistics are not yet reliable. Pop. (1935) 287,000; (est. 1938) 400,000. Inside the town itself, although the old covered bazaars still survive, there are numerous stores on western lines, a hospital and modern hotels. Near the racecourse what is practically a garden suburb is rapidly developing and there is another large settlement growing up round the aerodrome at Hinaidi. Not the least interesting feature of the new regime is the establishment of a museum of Mesopotamian antiquities—largely through the energy and enthusiasm of Miss Gertrude Bell (*q.v.*). It receives a share of all the antiquities excavated in Iraq.

BIBLIOGRAPHY.—S. H. Longrigg, *Four Centuries of Modern Iraq*, 1925 (very complete bibliography). The most modern phase can be studied in Miss Bell's letters (edited by Lady Bell, 1927). Facts and figures will be found in the official reports especially *British Colonial Office, Mandated Territories, Iraq* (ann.).

For an account of the military operations which culminated in the capture of Baghdad on March 11, 1917, see MESOPOTAMIA, OPERATIONS IN. The vicinity of Baghdad and its airfields were again the scene of a short military campaign in World War II, when the British overthrew a pro-axis Iraqi government in May 1941.

BAGHDAD RAILWAY. The Baghdad railway in its origin was essentially a German enterprise. Politically, its bearings mere far reaching and formed the keystone of German activities in the Near East, especially in the Ottoman Empire. It was therefore a considerable menace to British interests, to Russia, and to the French power in Anatolia and Syria. There can be little doubt also that it was one of the important factors in influencing Turkey to join the central European Powers in World War I. Originally planned in 1889, the railway was to be built in 200 kilometre sections and to be completed in eight years first as a single line, with subsequent extension to a double line Eventually, after a long and unsatisfactory financial and diplomatic historv an agreement was made early in 1914 between the French and German interests, and in June of that year the British and German agreement practically settled all the previous difficulties. The war entirely altered the situation; during that period

the line was of great strategical importance, enabling Turkish troops to be moved both towards the Bosporus and to Mesopotamia, and for military purposes certain extensions were added to the line. After the war Russia had ceased to be a factor in the situation and the German dream of Berlin to Baghdad had vanished. The subsequent negotiations resulted eventually in the railway practically falling into three parts, namely, Turkish, within the modern state of Turkey; Syrian, within the French mandated territory; and Iraqi, within the kingdom of Iraq. The section connecting Turkey and Iraq remains uncompleted.

The line starts at Konia and runs through Eregli to the Taurus mountains. Thence it crosses the Cilician plain as far as the Amanus mountains and through tunnel systems on to Nisibin. It is connected with the Syrian system at Muslemiye, north of Aleppo, and there is a branch from Kale Keui to Alexandretta. In Iraq the only true branch of the railway is from Baghdad to Shergat, the line from Baghdad to Basra being a metre gauge. Its economic importance naturally falls into sections. West of the Taurus the railway passes through an unproductive tableland, only tapping fertile lands at intervals. The irrigation work done by the Germans at Ronia served to benefit the Anatolian railway westwards to Constantinople rather than the Baghdad railway, which in this section seems to provide a connecting link between the Taurus and the Anatolian system rather than to form an independent system. East of the Taurus the line runs through the fertile Anatolian plain, which is especially rich in cereals, has access to the Mediterranean ports of Mersina and Alexandretta and is likely to develop considerably. The further extension eastwards taps an ancient trade route and so connects the foothill region with the Mediterranean. The Iraq section is unsatisfactory, and proposals have been mdde to pull up the line and prolong the existing railway on the other side of the Tigris through the populous and fertile foothill region to Mosul. This city, however, has connections rather with the south than with the west and the volume of trade, even if the connecting links of the projected railway were filled in. is more likely to flow through Baghdad than to the west, although a connection between Iraq and the Mediterranean is of the greatest importance, and its place is at present inadequately filled by the motor route across the desert. (For further details, *see* ASIA MINOR; MESOPOTAMIA and 'IRAQ.)

See British Colonial and Foreign Office annual reports, and E. M. Earle, *Turkey, the Great Powers and the Baghdad Railway* (1923).

BAGHELKHAND, a tract of country in central India, occupied by a collection of Indian States. The Baghelkhand agency is under the political superintendence of the governor-general's agent for Central India, and under the direct jurisdiction of a political agent who is also superintendent of the Rewa State, residing ordinarily at Sutna or Rewa. The agency consists of Rewa State and 11 minor States and estates, of which the more important are Maihar. Nagode and Sohawal. The country is geographically and historically akin to Bundelkhand (*q.v.*), and is very susceptible to drought and famine. Wilson's *Glossary of Indian Terms* says that the Baghelas are a branch of the Sisodhyia Rajputs who migrated eastward and once ruled in Gujarat.

BAGHERIA, city, province of Palermo, Sicily, 8 mi. by rail S.E. of Palermo. Pop. (1936) 23,809, town; 25,820, commune. It contains many villas of the 18th century aristocracy of Palermo. many in decay. The ruins of Soluntum (*q.v.*) are 2 mi. east.

BAGILLT, town, Flintshire, Wales, 14 mi. from Chester on the estuary of the Dee, in the ancient parish of Holywell. Pop. (1931) of Holywell Rural C.P. 3,423. Its situation on the Welsh border brought it into prominence in the middle ages. Near by is Mostyn Hall, dating from the time of Henry VI., the seat of one of the oldest Welsh families. With the development of the North Wales coal-field during the latter half of the 19th century and the proximity of the Lancashire industrial area, the town became the centre of zinc, lead, iron, alkali and chemical works. Trade depression after World War I affected the prosperity of this and other industrial towns of the area.

Bagillt has a station on the L.M.S. main coast route—Chester to Holyhead.

BAGIMOND'S ROLL. In 1274 the council of Lyons imposed a tax of a tenth part of all church revenues during the six following years for the relief of the Holy Land. In Scotland Pope Gregory X. entrusted the collection of this tax to Master Boiamund (better known as Bagimund) de Vitia, a canon of Asti, whose roll of valuation formed the basis of ecclesiastical taxation for some centuries. Boiamund proposed to assess the tax not according to the old conventional valuation but on the true value of the benefices at the time of assessment. The clergy of Scotland objected to this innovation, and in Aug. 1275 prevailed upon Boiamund to return to Rome for the purpose of persuading the pope to accept the older method of taxation. The pope insisted upon the tax being collected according to the true value, and Boiamund returned to Scotland to superintend its collection. A fragment of Bagimond's roll in something very like its original form has been printed by James Raine in his *Priory of Coldingham* (Surtees Society, vol. xii.). The actual taxation to which this fragment refers was not the tenth collected by Boiamund, but the tenth of all ecclesiastical property in England, Scotland, Wales and Ireland granted by Pope Nicholas IV. to Edward I. of England in 1288. The fragments should therefore be regarded as supplementary to the *Taxatio Ecclesiastica Angliae et Walliae* printed by the record commissioners in 1802.

See *Statuta Ecclesiae Scoticanae* (Bannatyne club, Edinburgh, 1866).

BAGIRMI, a country of north-central Africa, lying S.E. of Lake Chad and forming part of the Chad colony of French equatorial Africa. It extends some 240m. N. to S. and has a maximum breadth of 150m., with an area of 25,000sq m. Pop. (1926) 153,706. The surface, which lies about 1,000ft. above sea-level, is almost flat with a very slight inclination north to Lake Chad. It forms part of what seems to be the basin of an immense lake, of which Chad is the remnant. The soil is clay. The river Shari (*q.v.*) forms the western boundary. Numerous tributaries of the Shari flow through the country, but much of the water is absorbed by swamps and sand-obstructed channels, and seasons of drought are recurrent. The southern part of the country is the most fertile. Among the trees the acacia and the dum-palm are common. Various kinds of rubber vine are found. The fauna includes the elephant, hippopotamus, lion and several species of antelope. Of domestic animals there are large herds of cattle and flocks of sheep and goats. There are some ostrich farms; an "indigenous" breed of horses and a few camels. Bees are very numerous, and considerable quantities of honey are produced. Millet and sesame are the principal grains cultivated. Rice grows wild, and several kinds of Poa grass are used as food by the natives. Cotton is grown to a considerable extent, especially by Bornu immigrants. Fort Lamy, at the confluence of the Logone and Shari. originally a purely military post, was (1936) a town of 7,300 inhabitants. It is the administrative centre of the Chad colony. Trade is chiefly with British Nigeria, and with the Anglo-Egyptian Sudan *viâ* Wadai. The ancient caravan route, which ran through Kanem and across the Sahara to Tripoli. is now little used.

The population of Bagirmi is mixed. Negroid peoples predominate, but there are many pastoral Fula and Arabs. The Bagirmese proper are a vigorous, well-formed race of Negroid-Arab blood, who, according to their own traditions, came from the eastward several centuries ago, a tradition borne out by their language, which resembles those spoken on the White Nile. On their arrival they appear to have taken the place of the Bulala dynasty. They subdued the Fula and Arabs already settled in the district, and after being converted to Islam under Abdullah, their fourth king (about 1600), they extended their authority over a large number of pagan tribes living to the south and east, whom they raided for slaves The most important of these tribes are the Sara, Gulla and Nduka. The Sara are a widespread people, intelligent, tall and well made. Tree worship is prevalent among two small tribes, the Somrai and the Gaberi. In upper Bagirmi some traces of a patriarchal stage of society linger, one small State being called Beled-el-Mra, "Women's Land," because its ruler was always a queen.

Bagirmi was made known to Europe by the travels of Dixon

Denham (1823), Heinrich Barth (1852), who was imprisoned by the Bagirmese for some time, Gustav Nachtigal (1872), and P. Matteucci and A. M. Massari (1881). The country in 1871 had been conquered by the sultan of Wadai, and about 1890 was over-run by Rabah Zobeir (*q.v.*), who subsequently removed farther west to Bornu. By this time French interest in the country surrounding Lake Chad region had been aroused. The first expedition to the lake through Bagirmi met with disaster, its leader, Paul Crampel, being killed by order of Rabah. Subsequent missions were more fortunate, and in 1897 Emile Gentil, the French commissioner for the district, concluded a treaty with the sultan of Bagirmi, placing his country under French protection. A resident was left at the capital, Massenia, but on Gentil's withdrawal Rabah descended from Bornu and forced the sultan and resident to flee. It was not until after the death of Rabah in battle and the rout of his sons (1901) that French authority was firmly established. At the same time Kanem (pop., in 1926, 116,309), a country north of Bagirmi and subject in turn to it and to Wadai, was brought under French control. In a comparatively short time Bagirmi settled down under French rule and in 1914 Gen. Largeau was able to make it a base for operations against the Germans in northern Cameroons. Wars and slave-raiding had devastated both Bagirmi and Kanem; recovery was slow, but after 25 years of French rule the population had increased by 50%.

See H. Barth, *Travels and Discoveries in North and Central Africa* (1857–58); G. Nachtigal, *Sahara und Sudan* (1879–89); E. Gentil, *La Chute de l'Empire de Rabah* (1902); FRENCH EQUATORIAL AFRICA.

BAGNACAVALLO, BARTOLOMMEO (1484–1542), Italian painter. His real name was RAMENGHI, but he received the cognomen Bagnacavallo from the little village where he was born. He studied under Francia, and then in Rome as a pupil of Raphael for whom he worked, with others, at the decoration of the gallery in the Vatican. His work, considered to be inferior in point of design to some other productions of the school of Raphael, is distinguished by rich colouring and graceful drawing. The best specimens of it, the "Dispute of St. Augustine" and a "Madonna and Child," are at Bologna.

BAGNÈRES-DE-BIGORRE, town, S.W. France, capital of an arrondissement in the department of Hautes Pyrénées, 13m. S.S.E. of Tarbes on a branch of the Southern Railway. Pop. (1936) 7,545. It is situated on the left bank of the Adour, at a height of 1,825ft. Bagnkres (*Vicus Aquensis*) was much frequented by the Romans, but afterwards lost its renown. In the 12th century Centulle III., count of Bigorre, granted it a liberal charter. The baths rose into permanent importance in the 16th century, when they were visited by many distinguished persons. It remains one of the principal health resorts of France and is frequented as an excursion centre both in summer and in winter. The variety in the temperature and chemical composition of the waters attracts many patients in the season (July–September). The Promenade des Coustous is the centre of the life of Bagnkres. Close by stands the church of St. Vincent (14th and 15th centuries). The old quarter of the town has several old houses and an octagonal tower (15th century) the remains of a Dominican monastery. The Néothermes, occupying part of the casino, and the Thermes (1824), which has a good library, are the principal bathing establishments. Some cloister arches and a doorway remain of the old church of St. Jean Bagnères has tribunals of first instance and of commerce, and a communal college. *Barège,* a light fabric of silk and wool, and woollen goods are produced; wood-turning is practised, and there are important marble and slate quarries.

BAGNÈRES-DE-LUCHON, town, south France, in the department of Haute-Garonne, 87m. S.S.W. of Toulouse, on a branch line of the Southern railway from Montréjeau. Pop. (1936) 3,517. The town, perhaps the most fashionable of Pyrénéan resorts, is situated at the foot of the central Pyrénées at the confluence of the One and the Pique. In the Allées d'Etigny, an avenue planted with lime-trees, is the Thermes, or bathing-establishment. The thermal springs are chiefly impregnated with sulphate of sodium. and range widely in temperature. Numerous Roman remains attest the antiquity of the baths, probably the *Onesiorum* Thermae of Strabo; they were revived in the late 18th century.

BAGNUN, a mild-mannered, long-headed, Senegalese people who file their incisor teeth, occupying the territory between the Lower Kasamansa and Lower Cacheu rivers. The men shave their heads and the women net their hair. They have independent villages inhabited by the extended family group. The hereditary chieftainship descends in the paternal line from its founder. The insignia of authority consists of a red cap. Divorce is frequent. Payment of blood-money is enforced for manslaughter and ordeal by vegetable poison is common. They are good husbandmen. The body of the deceased is exposed for three days before burial. The religion is animistic.

See Brosselard-Faidherbe, *Casamance et Mellacorée* (1893); Lasnet, *Une mission au Sénégal* (1900).

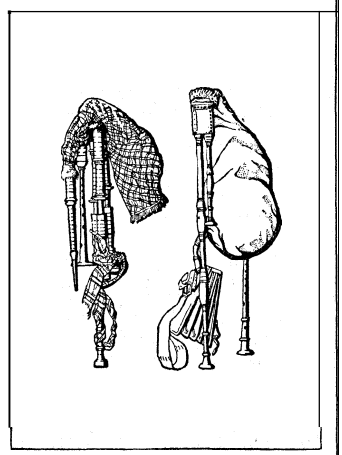
BAGOAS, a Persian name (Bagoi), a shortened form of names like Bagadāta, "given by God." often used for eunuchs. The best known of these ("Bagoses" in Josephus) became the confidential minister of Artaxerxes III. He threw in his lot with the Rhodian condottiere Mentor, and with his help succeeded in subjecting Egypt again to the Persian empire (probably 342 B.C.). Bagoas administered the upper satrapies and gained such power that he was the real master of the kingdom (Diod. xvi. 50; *cf.* Didymus, *Comm.* in Demosth. *Phil.,* vi. 5). He became very wealthy by confiscating the sacred writings of the Egyptian temples and giving them back to the priests for large bribes (Diod. xvi 51). When the high priest of Jerusalem. Jesus, murdered his brother Johannes in the temple, Bagoas (who had supported Johannes) put a new tax on the Jews and entered the temple, saying that he was purer than the murderer who performed the priestly office (Joseph., Ant, xi. 7. 1). In 338 Bagoas killed the king and all his sons but the youngest, Arses (*q.v.*), whom he raised to the throne; two years later he murdered Arses and made Darius III. king. When Darius attempted to become independent of the powerful vizier, Bagoas tried to poison him too; but Darius was warned and forced him to drink the poison himself (Diod. xvii. 5; Johann. Antioch, p. 38, 39 ed. Müller; Arrian ii. 14. 5; Curt. vi. 4. 10). Another eunuch, Bagoas, was a favourite of Alexander the Great (Dicaearchus in Athen. xiii. 603*b*; Plut., *Al.,* 67; Aelian, *Var. Hist.,* 3. 23; Curt. vi. 5. 23; x. 1. 25 et seq.).

BAGOBO, a Malayan tribe of Mindanao island in the Philippines with a Negrito strain, remarkable as horsemen and horse-breeders from remote times. Polygyny is practised; there seems to be no exogamous system, but marriage is barred to three degrees of blood-relationship. They believe in a Creator and subsidiary spirits, the war-god and his wife dwelling in a volcano. There are traces of head-hunting; human sacrifice is practised; portions of an enemy's liver are eaten, and graded insignia of red garments are worn by warriors. Clothing is made of hemp fibre; the spear and the dao are used as weapons, bows and blow-guns rather as toys, small bells for ornament are made by the *cire perdue* process. Fish are obtained by impregnating water with toxic plants.

See Colle, *Wild Tribes of Davao District* (1913).

BAG-PIPE, a complex reed instrument of great antiquity. The bag-pipe forms the link between the syrinx (*q.v.*) and the primitive organ, by furnishing the principle of a reservoir for the wind-supply, combined with a simple method of regulating this air pressure by means of the arm of the performer. The instrument consists of an air-tight leather bag having three to five apertures, each of which contains a fixed stock or short tube. The stocks act as sockets for the reception of the pipes, and as air-chambers for the accommodation and protection of the reeds. The pipes are of three kinds: (1) a simple valved insufflation tube or "blow-pipe," by means of which the performer fills the bag reservoir; (2) the "chaunter" (chanter) or the melody-pipe, having according to the variety of the bag-pipe a conical or a cylindrical bore, lateral holes, in some cases keys and a bell, and a double-reed; (3) the "drones," jointed pipes with cylindrical bore, generally terminating in a bell, but having no lateral holes and being capable, therefore, of producing but one fixed note.

The drone ground bass which sounds without intermission is the main characteristic of the bag-pipe whose numerous varieties fall into two classes according to the method of inflating the bag: (1) by the breath of the performer using the blow-pipe described above; (2) by means of a small bellows connected by a valved feed-pipe with the bag and worked by the other arm or elbow to which it is attached by a ribbon or strap. Class I comprises the Highland bag-pipe; the old Irish bag-pipe; the cornemuse; the Sackpfeife or Dudelsack; the bignou or biniou (Breton bag-pipe); the Calabrian bag-pipe; the ascaulus of the Greeks and Romans; the *tibia utricularis;* and the chorus. To class II. belong the musette; the Northumbrian or border bag-pipe; the Lowland bag-pipe; the union pipes of Ireland; and the surdelina of Naples.



BY COURTESY OF METROPOLITAN MUS. OF ART

THE TWO CLASSES OF BAGPIPES
The Scotch model on the left is inflated by the breath of the performer. The French model on the right is inflated by bellows operated by the arm

The origin of the bag-pipe must be sought in remote antiquity. It is true that no instrument in any degree similar to it is represented on any of the monuments of Egypt or Assyria known at the present day; but we are able nevertheless to trace it in ancient Persia and by inference in Egypt, in Chaldaea and in ancient Greece. The principle of the drone, *i.e.*, the beating-reed sunk some three inches down the pipe, was known to the ancient Egyptians, and the instrument was known in Greece in A.D. 100. The latter fact is supported by allusions in Aristophanes and in Plato's *Crito.*

We leave the realm of inference for that of certainty when we reach the reign of Nero, who had a passion for the Hydraulus *(see* ORGAN: *History)* and the *tibia utricularis.* That the bag-pipe was introduced by the Romans into the British Isles is a conclusion supported by the discovery in the foundations of the praetorian camp at Richborough of a small bronze figure of a Roman soldier playing the *tibia utricularis.*

From England the bag-pipe spread to Caledonia and Ireland, where it took root, identifying itself with the life of the people, and becoming a military instrument held in great esteem by the Celtic races. On the downfall of the Roman empire, the bag-pipe, sharing the fate of other instruments, probably lingered for a time among itinerant musicians, actors, jugglers, etc., reappearing later in primitive guise with the stamp of *naïveté* which characterizes the productions of the early middle ages, and with a new name, chorus (*q.v.*). From the 13th century, however, the bag-pipe became a court instrument played by minnesingers and troubadours as seen in literature and in the mss. and monuments.

As regards the musette it originated in France, among the courtiers and elegant world, turning from the pomps and luxuries of court life to an artificial admiration and cult of nature, idealized to harmonize with silks and satins. The cornemuse of shepherds and rustic swains became the fashionable instrument, but as inflating the bag by the breath was an ungraceful procedure the bellows were substituted, and the whole instrument was refined in appearance and tone-quality to fit it for its more exalted position. Lully introduced the musette into his operas, and in 1758 the iist of instruments forming the orchestra at the Opéra included one.

BAGRATION, PETER, PRINCE (1765–1812), Russian general descended from the noble Georgian family of the Bagratides, entered the Russian army in 1782, and served for some years in the Caucasus. He was engaged in the siege of Ochaltov (1788), and in the Polish campaign of 1794, being present at the taking of Praga and Warsaw. His merits were recognized by Suvarov, whom he accompanied in the Italian and Swiss campaign of 1799, winning distinction by the capture of Brescia. In the wars of 1805 his achievements were even more brilliant. With a small rearguard he successfully resisted the repeated attacks of forces five times his own numbers (Hollabrunn), and though half his men fell, the retreat of the main army under Kutusov was thereby secured. At Austerlitz he was engaged against the left wing of the French army, under Murat and Lannes, and at Eylau, Heilsberg and Friedland he fought with the most resolute and stubborn courage. In 1808 by a daring march across the frozen Gulf of Finland he captured the Åland Islands, and in 1809 he commanded against the Turks at the battles of Rassowa and Tataritza. In 1812 he commanded the II. Army of the West, and, though defeated at Mogilev (July 23), rejoined the main army under Barclay and led the left wing at Borodino (Sept. 7), where he received a mortal wound. A monument was erected in his honour by the Tsar Nicholas I. on the battlefield of Borodino. *(See* NAPOLEONIC CAMPAIGNS.)

BAGUIO, second Philippine municipality in order of incorporation (1909), situated in, and capital of, the subprovince of Benguet on the island of Luzon. Pop. (1939), 24,117, of whom 12,807 were males and 449 whites. The site was probably visited by Spaniards about 1829, and a small military contingent was stationed near there (La Trinidad); but the locality was little known and hardly at all developed until after the U.S. occupation. Governor Taft and the early U.S. officials intended it as a summer capital, but the idea was never carried out by the Filipinos. Meanwhile, however, it became a popular summer resort, not only for the Philippines but also for other parts of the far east, for it is in the mountains at an elevation of from 4,500 to 5,500 ft., with pine forests, picturesque rocks and hills and many attractive scenic features. It is about 160 mi. N. of Manila and is reached by railway to a point beyond Dagupan. Thence the traveller has the choice of two automobile routes—the famous Baguio zigzag road and the Naguilian. During the rainy season, from May or June till November, there is a heavy rainfall (annual mean, 181 in.), but the weather during the balance of the year is ideal. The native population (aboriginal) consists largely of Igorots (mountain people), and Episcopal missions in Baguio and elsewhere in the Mountain province have done much to improve the condition of these primitive folk. There is a school (the Brent) for young Americans and for a number of years, from 1908 on, the bureau of education conducted a teachers' encampment on one of the many hills. Camp John Hay, a U.S. military encampment, is located there, and one of its features is a natural stadium formed in one of the valleys. Baguio is an important mining centre. The United States high commissioner and the commonwealth president have maintained residences there, but the local administration is in the hands of a mayor and council. Many hotels, cottages and pretentious homes have been built and the locality attracts many from the lowlands during the hot season. Most modern improvements have been installed, including telephones, electric iights, waterworks, ice plant and sewage system. The *Manila Bulletin,* principal U.S.-edited newspaper in the Philippines, publishes a special Baguio edition. Baguio was occupied by the Japanese in Dec. 1941. (C. S. L.)

BAG-WORM or **BASKET-WORM,** the caterpillar of the moth *Thyridopteryx ephemeraeformis,* so called from its habit of spinning. as a protection, a bag of silk with which it moves about head downwards, and within which it ultimately pupates. Common in the northern United States, this destructive creature is particularly partial to shade-trees, which may be completely defoliated through its activities. The adult female is wingless and never leaves the puparium, within which she lays her eggs.

BAHADUR KHEL, a salt-mine in the Kohat district of the North-west Frontier Province of India, in the range of hills south of the village of Bahadur Khel between Kohat and Bannu. For a space of 4m. in length by ¼m. in breadth there exists an exposed mass of rock-salt with several large hillocks of salt on either side. The quarries extend over an area 1m. long by ½m. broad, and the salt is hewn out in large blocks with picks and wedges.

BAHADUR SHAH I. (bä-hah′dŏŏr), a Mogul emperor of Hindustan, 1707–12, the son and successor of Aurangzeb. At the time of the latter's death his eldest surviving son, Prince Muazim, was governor of Kabul, and in his absence the next brother, Azam Shah, assumed the throne. Muazim came down from Kabul, and offered to share the empire with his brother. Azam would not accept the proposal, and was slain on the plains of Agra. Muazim then ascended the throne under the title of Bahadur Shah.

BAHADUR SHAH II. (d. 1862), the last of the Mogul em-

perors of Hindustan, 1837–57. He was a titular emperor only. since from the time of the defeat of Shah Alam at Buxar in 1764 all real power had resided with the East India Company; but all proclamations were still worded under "The King's Realm and the Company's rule." His sole importance is due to the use made of his name during the Mutiny of 1857. At the time of the assault he fled to the Tomb of Humayun, 6m. from Delhi, where he was captured by Major Hodson. In Jan. 1858 he was brought to trial for rebellion and for complicity in the murder of Europeans. On March 29 he was found guilty and sentenced to imprisonment for life. He died at Rangoon on Nov. 7, 1862.

BAHÁ'Í FAITH, the religion founded by Bahá'u'lláh (b 1817, in Persia, d. 1892 at 'Akká, Palestine) who, after the martyrdom of his forerunner, the Báb (see BÁBÍISM), was imprisoned in Tihrbn and exiled successively to Baghdad, Constantinople, Adrianople and to 'Akkb. His fundamental teachings are: that God is unknowable except through His Manifestation, the Prophet; that divine revelation is continuous and progressive, man's spiritual and social evolution proceeding in cycles of approximately 1,000 years; that while outwardly different as to human personality the Manifestations are in essence one being and reveal one evolving truth; that the divine command for this age is to unify humanity within one faith and one order; and that religion, in its consummation, is not only a sacred law for the guidance of individual souls but also the supreme law for society and civilization.

Bahá'u'lláh left a testament appointing his eldest son, 'Abdu'l-Bahá, Interpreter and Exemplar of the religion. Before the outbreak of the World War, 'Abdu'l-Bahá journeyed to Egypt, Europe and America to promulgate the Bahá'í principles of universal peace, giving public warning of imminent social upheavals. Under 'Abdu'l-Bahb's testament (d. at Haifa, Palestine, 1921), Shoghi Effendi, Baha'u'llbh's great grandson, was constituted First Guardian of the faith and Head of the Future Universal House of Justice provided in Bahá'u'lláh's writings. Bahá'í communities exist today in forty countries of East and West, more than five hundred in Persia alone and some ninety in North America. A biennial volume (*The Bahá'í World*) records the activities and progress of the cause.

(H. HOL.)

BAHAMAS (Lucayos), an archipelago of the British West Indies, estimated to consist of 29 islands, 661 cays and 2,387 rocks, extending along a line from Florida on the north-west to Haiti on the south-east, between Cuba and the open Atlantic, over a distance of about 630m., from 80° 50′ to 72° 50′ W. and 22° 25' to 26° 40' N. Total estimated land area 5,450 sq.m., of which the main islands occupy 4,424 sq.m. Pop. (1933) 62,679, including about 12,000 whites. The main islands and groups, beginning from the north-west are: Little and Great Abaco, with Great Bahama to the west; Eleuthera (probably corrupted from Spanish *Isla* de *Tierra*) Cat, Watling or Guanahani, and Rum cay on the outer line towards the open ocean, with New Providence, the Exuma chain and Long Island forming an inner line to the west; still farther west Andros (a group of islands divided by narrow straits); and finally the Crooked islands, Mayaguana and Inagua. The Turks and Caicos islands continue the outer line, and belong geographically to the archipelago, but not politically. The surrounding seas are shallow for the most part, but there are three well-defined channels—the Florida or New Bahama channel, between the north-western islands and Florida, followed by the Gulf Stream, the Providence channels (north-east and north-west) from which a depression known as the Tongue of Ocean extends south along the east side of Andros, and the old Bahama channel, between the archipelago and Cuba. The Andros Islands are 9jm. long; area 1,600 sq.m. Great Abaco is ;om. long: area 680 sq m. Great Inagua, 34m. long. is 530 sq in. in area; and Grand Bahama 66m. with area 430 sq.m. The most important island, as containing the capital, Nassau, is New Providence, only 19⅜m. in length; area 85 sq.m. This island had a population in 1933 of 19,948 The next most important island is Eleuthera (6,048), followed by the Andros Islands (7,417), Long Island (4,684), Abaco (4,318), Cat Island (4,1jj), Grand Bahama (2,353), Exuma (3,925), Acklin's Island (1,808), Crooked Island (1,347).

Physical Geography.—The islands are of coral foundation and low-lying. Except in the considerable island of Andros there are no streams in the whole group. The inhabitants derive their water supply from wells. Owing to the porosity of the rock, many wells rise and fall with the tides of the sea. An artificial lake in New Providence, made for the use of turtle-catchers, is noted as exhibiting extraordinary phosphorescence. So called "banana holes," regular and up to 40ft. deep, frequently occur in the limestone and are caused (like the Jamaica "light holes") by the action of carbonic acid in rain-water The "Mermaid's Pool" in New Providence, which is deeper still, is partly filled with water. The rock also weathers into pinnacles, pillars and arches.

Geology.—The Bahamas consist almost entirely of aeolian deposits (see BERMUDAS) and coral reefs. The deposits which form the greater part of the island frequently rise in rounded hills to a height of 100 or 200ft., and in Cat Island to the highest elevation of nearly 400ft. The material is largely calcareous, derived from the disintegration of coral reefs and from the shells of animals living in the shallows. The rock on the surface is hard but underneath it gradually softens and furnishes an admirable stone for building, which can be sawn into blocks of any size, hardening on exposure to the atmosphere. On Andros there is a fine white marl almost resembling a chalky ooze. The coral reefs are of special interest in reference to the study of such formations.

Nassau.—The scenery of the islands is enchanting, gaining beauty from the splendid colouring of the sea and the rich vegetation. Nassau is a favoured winter health-resort for many visitors from the United States and Canada. It lies on a safe harbour on the north shore of New Providence, sheltered by the small Hog Island. There is a depth of 14ft. at low-water spring-tide on the bar. The town extends along the shore and up a slight ridge behind it. It contains the principal public buildings, and some old forts, from the 18th century, though the subterranean works below Fort Charlotte are earlier. From the same century dates an octagonal building formerly a gaol, now a good public library. The sea-bathing is excellent. February and March are the principal season for visitors. There is direct connection with New York by steamers, which make the journey in about four days; and also with Miami in Florida.

Climate, Flora, Fauna.—The climate is agreeable. Mean temperature of hottest months (June to September) 88° F., of coldest (Jan. to March) 60°. The prevalent winds are from the north-east or east. Hurricanes occur from July to October, and May to October are the rainy months. The average annual rainfall at Nassau is 18in. The soil is generally shallow but very fertile. A well-defined area in New Providence is known as the "pine barrens" (*Pinus cubensis*). Elsewhere three types of soil are distinguished—a black soil, of decayed vegetable matter, where the land is under forest, a reddish clay, and a white soil occurring along the shores. Andros Island and the Abaco Islands may be especially noted for their abundance of large timber, including mahogany, fustic, lignum vitae, iron and bullet woods. The want both of labour and of roads renders it impossible to turn this valuable timber to useful account, though attempts have been made to work it in Abaco. The produce includes tamarinds. olives, oranges, lemons, limes, citrons, pomegranates, pine-apples, figs, sapodillas, bananas, sour-sops, melons, yams, potatoes, gourds, cucumbers, pepper, cassava, prickly pears, sugar-cane, ginger, coffee, indigo, Guinea corn and pease. Tobacco and cascarilla bark also flourish; and cotton is indigenous and was woven into cloth by the aborigines. Sisal is grown in increasing quantity. The cultivation of tomatoes is making considerable progress. A fair

export trade in canned pine-apples has grown up. The extensive areas covered with pine forests are only partially exploited. The Board of Agriculture, which ceased to exist in 1910, was re-established in 1912 on broader lines. With the advice of the Marine Products Board the sponge industry is being pursued more scientifically.

There are many varieties of birds, including flamingoes, humming birds, wild geese, ducks, pigeons, hawks, green parrots and doves. The waters swarm with fish and the turtles caught here are particularly fine. There are good salt ponds, but their working has decreased. The portion of Nassau harbour known as the Sea Gardens has a beautiful development of marine organisms.

Government, Trade, **etc.**—The colony is under a British Governor, with an executive council of nine members, partly official, partly unofficial, and a legislative council of nine members nominated by the Crown. There is also a legislative assembly of 29 members, representing 15 electoral districts; the franchise being exercised by all white men of 21 years of age at least. The members' qualification is the possession of real or personal estate to the value of £200. Revenue rose from £84,386 in 1910–11 to the record figure of £852,573 in 1922–23. In 1926 it was £502,202. The expenditure in 1910–11 was £85,315; in 1924 £374,126. The reason for the increase in revenue is to be found in the expansion in the imports of spirits, resulting directly from the 18th Amendment to the Constitution of the United States in 1919. The public debt in 1926 was £170,000 of which £150,000 had been borrowed to finance a hotel company. The value of imports in 1926 was £2,159,000, of which £810,000 was for alcoholic liquors. The value of Island exports was £407,000, of which £261,709 was for local produce, almost one-half of it sponges. The Bahamas were represented at the Canada-West Indies Conference of 1925, and were signatories to the Trade Agreement of July 8 of that year, under which such produce of the Bahamas as is dutiable in Canada receives a preference of 50% of the duties, with a specific preference of one half cent per pound on canned pineapples, while Bahamas sponges of marine production are admitted free of duty, foreign sponges paying an ad valorem duty of 17½%. The Government of Canada undertook to provide, within 15 months after ratification, a fortnightly mail, passenger and freight service between St. Lawrence ports in summer and other Canadian ports in winter, calling at Bermuda, the Bahamas and Jamaica fortnightly. The Government of the Bahamas undertook to contribute £2,000 per annum towards such services when established.

The government supports elementary free schools, controlled by a nominated board of education, while committees, partly elected, exercise local supervision. There are higher schools and a Queen's college in Nassau. Nassau is the seat of a bishopric of the Church of England, created in 1861. The Bahamas are without railways, but there are good roads in New Providence and a few elsewhere. A cable connects Nassau with West Jupiter in Florida. (O.)

HISTORY

The Bahama Islands have a romantic place in history as the gateway by which Columbus entered the New World. He reached the group in Oct., 1492, and landed at "Guanahani," renamed by him San Salvador, the identity of which has been long disputed between advocates for Cat Island, Great Turk and others. In so far as the problem has any solution, it seems likely that Watling Island was the actual landfall; and this theory received the official sanction of the Bahamas Legislature in 1926. Columbus described the islands in enthusiastic terms: "This country," he wrote, "excels all others as far as the day surpasses the night in splendour; the natives love their neighbours as themselves; their conversation is the sweetest imaginable; their faces always smiling; and so gentle and so affectionate are they, that I s ear . . . there is not a better people in the world." Spain, however, had not long taken possession of the Bahamas.—under the Papal Bulls which divided the New World between Spain and Portugal—before these innocent and indolent natives were transported in large numbers to work in the mines and sugar mills of Hispaniola; and their islands were almost depopulated until English settlement began in the second quarter of the seventeenth century. Prior to this, the long silence was broken only by the visit of Juan Ponce de Leon, who stopped at several islands on his quest for the miraculous "Fountain of Youth," before making the valuable discovery of Florida.

The Spaniards made no settlements there, and in 1627 the Bahamas were included in the grant made by Charles I. of England to Sir Robert Heath; but the only result was an unimportant claim of title some generations later. By 1640 visitors were coming from Bermuda, and in 1647–49 the Company of Eleutherian Adventurers was formed in London for the systematic development of the islands, proprietary rights being granted with a charter providing for government with representative and elective elements. This grant led to the settlement of Eleuthera and, shortly after, of New Providence. The latter possessing the best harbour, soon became the island upon whose fortunes the history of the whole group turned. In spite of the success thus achieved Charles II. in 1670 granted the islands to the Duke of Albemarle and five other proprietors of Carolina. A year later John Wentworth who had already been elected governor by the settlers was appointed by the new proprietors; and a parliamentary system of government, centred on New Providence, was established, with the aim of being as near as conveniently possible to the constitution of England. The proprietary régime, although prolific in theoretical schemes for the development of the islands, did not save them from frequent depredations by Spaniards and French. The settlement was almost destroyed in 1684; and in 1703–04 the two powers joined to expel most of the inhabitants from the recently founded city of Nassau. At this time also the island became a favourite resort of pirates, chief among whom was the notorious Edward Teach, called Blackbeard, who was killed in 1718.

Throughout the proprietary period the career of the Bahamas was a stormy one. Little was done for their protection, although appeals to Jamaica brought considerable help from that island. The king himself had to order the proprietors to act against the pirates in 1684. Eleven years later a fort was begun. and the city named Nassau in honour of William III. The governors themselves were drawn into privateering enterprises; Parliament was far from docile; and in 1690 the governor trained his guns on their chamber. Conflicts between government and people increased after the sack of Nassau in 1703; and by 1708 official recommendations were being made for direct Crown control. English merchants petitioned; and after an uncertain period during which the proprietary governors received royal approval—usually with difficulty—the proprietors in 1717 surrendered the civil and military government to the King. An official preamble stated that "by reason of the great neglect of the proprietors of the Eahama islands, the Government of the said islands is fallen into great disorder and confusion"; and Capt. Woodes Rogers was appointed first royal governor, arriving in 1718. From this time there was a continuous line of royal governors under whom the constitution was revised, the population and resources increased, and the colony's motto made possible: *expulsis piratis comntercia restituta.* William Shirley, formerly governor of Massachusetts, was appointed to the office in 1760; and during the War of American Independence the Bahamas grew considerably in importance. The young American navy captured New Providence in 1776, but soon abandoned it. Five years later it was taken by the Spaniards, and cleverly recaptured in 1783, after the Peace of Versailles had already provided for its restoration to England. The emigration of American loyalists from the mainland brought many immigrants to the Bahamas, where estates were granted to them. Among the newcomers was Lord Dunmore, formerly governor of New York and of Virginia, who became governor from 1786–97. The constitution was again reformed, and in 1787 the proprietors surrendered their remaining rights for the sum of £12,000. The increase of population brought a corresponding increase of wealth, and also introduced large numbers of slaves to work on the cotton and other plantations. Cotton cultivation, however, was unlucky. Pests destroyed the crops in 1788 and in 1794, and cotton declined steadily in importance early in the

19th century. The abolition of slavery was accomplished in the Bahamas as easily as in any British colony. Free Negroes were given the vote in 1830, and after 1834–35 political careers were open to all. Many planters, however, emigrated as the abolitionist movement in England gained strength; and when, after the opposition of the assembly, the slaves were freed in 1838, at a cost of £128,296, paid in compensation, a decline in the agricultural industries followed. The great cotton plantations fell into decay, and the later sisal hemp and pineapple plantations often gave way to tomato-growing and—until pests again worked havoc—to orange groves and grapefruit orchards. Cultivation of the last-named was later stimulated by the growing tourist traffic, and an attempt was also made to revive the production of cotton.

In 1804 the authority of the Bahamas government was extended over the Turks and Caicos Islands, which, though discovered in the 16th century, had been used only for casual salt-raking visits prior to the American Revolutionary War. The Bermudans, who had the greatest interest in the salt ponds, made vigorous protest, and though this was overruled, the union of the islands was never harmonious. Their commercial products were entirely different; and the prosperous salt-producing communities had to pay a larger share to the treasury than seemed proportionate to what they received. The union was dissolved in 1848, although the Turks and Caicos Islands remained ecclesiastically, as they were geographically, part of the Bahamas group. Politically, they were now joined to Jamaica. The fertility of the islands had been a source of profit to the Bahamas, which suffered correspondingly after their removal.

During the American Civil War, the Bahama Islands enjoyed a wave of extraordinary prosperity, due to the closing of the southern ports, and the consequent blockade-running. Their trade increased between twenty and thirty-fold, and some of the wealth was used in the erection of public works. The greater part, however, brought little advantage to the colony as a whole, and a devastating hurricane in 1866 may be regarded as effectively closing the era of prosperity. Meanwhile arrangements had been made for better steamship communications with New York; and from the beginning of the 20th century great improvement was made in this way. The Bahamas became a popular tourist resort for the United States, with whose interests and tariff policy they are inevitably bound up. The War of 1914–18, to which the Bahamas made generous contribution, partly in conjunction with Jamaica, diverted trade still more to America; and after the United States carried its Prohibition amendment in 1920 a period of great prosperity came to the islands marked by the growth of investments and public works.

The Bahamans are justly proud of their long tradition of self-government on the English model.

BAHAWALPUR or **BHAWALPUR,** an Indian state. within the Punjab, stretching more than 300 mi. along the left bank of the Sutlej, Punjnud and Indus, the chief Mohammedan state in the Punjab. Area 15,003 sq.mi.; population 781,000; estimated gross revenue £375,000. The chief, whose title is Nawab, is a Mohammedan of the Daudputra family from Sind, and claims descent from Abbas, uncle of the Prophet. The dynasty established its independence of the Afghans towards the end of the 18th century, and made a treaty with the British in 1838. The territory is traversed throughout its length by the North Western and Southern Punjab railways. The state gave valuable help during World War I, its Camel corps being especially useful.

The town of Bahawalpur lies near the left bank of the Sutlej. Pop. (1931) 20,943. Except along the banks of the river the whole area of the state is a wilderness. Part has been reclaimed by canals which run during the summer floods, and the completion of the Sutlej Valley Irrigation project further extended and improved cultivation in the vicinity of the tom.

BAHIA (state): *see* BAÍA.

BAHIA (city): *see* SALVADOR OR BAÍA.

BAHÍA BLANCA, a city and port of Argentina, on the Napostá river, 3 mi. from its outlet into a deep, well-sheltered bay of the same name. Pop. (1940 estimate) 115,000, with suburbs. It is situated in the extreme southern part of the province of Buenos Aires and is 398 mi. by rail S.W. of the national capital, with which it is also connected by air route and by highway. The settlement of the national territories of La Pampa and Neuquén contributed largely to the growth and importance of Bahia Blanca. It is the natural shipping-port for these territories and for the southern districts of the province of Buenos Aires, from which great quantities of wheat and wool are exported. The bay has long been recognized as one of the best on the Argentine coast, and since the channel has been dredged, will admit steamers of 30 ft. draught at low water.

Bahia Blanca dates from 1828, when a fort and trading post were located there, but its development as a commercial centre began only in 1885, when its first railway line mas opened. There are four main features of the port: the Puerto Militar, a government military and naval station with extensive docks, machine shops, slips and dry docks, capable of handling the largest battleships; Puerto Belgrano, developed by the Rosario-Puerto Belgrano railway to handle their exports; Puerto Ingeniero White. named after the man who built it as a terminal for the Southern railway, and equipped with modern electrical freight-handling devices, fireproof elevators, freight yards and warehouses; and the equally up-to-date Puerto Galván constructed by the Pacific railway for loading and unloading its great cargoes of wheat, oats, wools, cattle and varied merchandise.

Though situated near the mountainous section of southern Buenos Aires, the immediate vicinity of the city is low and swampy, its water is brackish, and it has been decidedly unhealthful; but a better water supply with better drainage and street paving greatly improved matters.

Bahia Blanca is a modern city in every respect and ranks close to Buenos Aires in commercial importance.

BAHR, HERMANN (1863–1934), Austrian author and playwright, member of the Prussian academy, was born at Linz. Upper Austria, July 19, 1863. After studying at the universities of Vienna, Graz, Czernowitz and Berlin and travelling extensively, Bahr settled in Vienna where he worked as feuilletonist on the staffs of various newspapers. His earlier works consisted mostly of collected volumes of light essays. *Studien zur Kritik der Moderne* (1890) and *Die Ueberwindung des Naturalismus* (1891) mark the first phase of his varied career: his initial enthusiasm for naturalism, and his attempt to reconcile it with romanticism. *Wien*, a more remarkable essay on the soul of Vienna, enjoyed the distinction of being prohibited under the monarchy. Under the influence of Maeterlinck, Bahr next became a champion of mysticism and symbolism. Turning to the theatre, Bahr fell under the influence of Schnitzler. His comedies, which include *Wienerinnen* (1900), *Der Krampus* (1902) and *Das Konzert* (1909), are superficial but amusing and hit off the Viennese type of the day admirably. In 1903 Bahr became director of the Deutsches theatre, Berlin, and in 1918 he was for a short time director of the Viennese Burgtheatre. During World War I, he fell under the influence of Catholicism, and from his Austrian country home, became the leading representative of the typically Austrian conservative and strongly Catholic school, as instanced in his *Himmelfahrt* (1916).

BAHR, JOHANN CHRISTIAN FELIX (1798–1872), German philologist and historian, was born at Darmstadt on June 13, 1798. He was educated at Heidelberg and later became a professor there. His most important work was *Geschichte der römischen Litteratur (History of Roman Literature)*, which he wrote

in 1828 and which has become a classic in its field. He is also well-known for his edition of the works of Herodotus. He died on Nov. 29, 1872, at Heidelberg.

BAHR or **BAHAR,** the Arabic for "sea," with the diminutive *bahira* or *boheira.* Bahr also signifies a river, especially one with a large body of water, *e.g.,* the Nile, and is occasionally used to designate the dry bed of a river.

BAHRAICH, a town and district of British India, situated in the Fyzabad division of the United Provinces. The town is on the river Sarju. It contains the most popular place of pilgrimage in Oudh, the tomb of Masaud, a champion of Islam, slain in battle by the confederate Rajputs in 1033, which is resorted to by Mohammedans and Hindus alike. There is also a Muslim monastery, and the ruined palace of a nawab of Oudh. Pop. (1931) 33,783.

The district of Bahraich contains an area of 2,639 sq.mi. It consists of three tracts: (1) a central elevated triangular south-easterly projection from the Himalayas for about 50 mi.; (2) the great Gogra plain on the west, about 40 ft. below the plateau; and (3) on the east, the lesser basin of the Rapti. Forest and marshy tracts of the south slopes of the Himalayas merge within the district into drier land, stream beds become deeper and more marked, marshes disappear, and the plain of the Ganges is entered. The Gogra skirts the district for 114 mi.; and the Rapti, with its branch, the Bhalka, drains the high grounds. In 1931 the population was 1,136,348. A considerable trade is conducted with Nepal, chiefly in timber. The district is purely agricultural in character, and is one of large estates, 78% being held by *taluqdars,* of whom the four chief are H.H. the maharajah of Kapurthala, the maharajah of Balrampur, the rajah of Nanpara and the rajah of Payagpur.

Little is known of the history of the district before the Muslim invasion in A.D. 1033. Masaud was defeated and slain by Bahraich nobles in 1033, and the Muslim did not establish their authority here till the middle of the 13th century. About 1450 the Raikwars, or Rajput adventurers, made themselves masters of the west of the district, which they retain to this day. In 1816, by the Treaty of Segauli, the Nepal *tarai* was ceded to the British but was given back in 1860.

BAHRĀM, the name of five Sassanid kings (*Varahrān,* in Gr. Οὐαραράνης or Οὐραράνης, the younger form of the old *Verethragna,* the name of a Persian god, "the killer of the dragon Verethra").

1. BAHRĀM I (A.D. 274–277). From a Pahlevi inscription we learn that he was the son (not, as the Greek authors and Tabari say, the grandson) of Shapur I, and succeeded his brother Hormizd (Ormizdas) I. Bahrām I is the king who, at the instigation of the magians, put to a cruel death the prophet Mani, the founder of Manichaeism.

2. BAHRĀM II (277–294), son of Bahrām I. Of his reign some theological inscriptions exist (F. Stolze and J. C. Andreas, *Persepolis* (1882) and *E.* W. West, "Pahlevi Literature" in *Grundriss d. iranischen Philologie,* ii pp. 75–129).

3. BAHRĀM III, son of Bahrām II, under whose rule he had been governing Seistan. reigned only four months (in 294).

4. BAHRĀM IV (389–399), son and successor of Shapur III, under whom he had been governor of Kirman. Under him or his predecessor, Armenia was divided between the Roman and the Persian empires.

5. BAHRĀM V (420–439), son of Yazdegerd I, after whose sudden death (or assassination) he gained the crown against the opposition of the grandees by the help of al-Mondhir, the Arabic dynast of Hira. He began a systematic persecution of the Christians, which led to a war with the Roman empire. But a treaty was soon concluded by which both empires promised toleration to the worshippers of the two rival religions, Christianity and Zoroastrianism. Bahrām deposed the vassal king of the Persian part of Armenia and made it a province. He is a great favourite in Persian tradition and is called Bahrām Gor, "the wild ass," on account of his strength and courage.

BAHRAM CHOBIN or COBIN, Persian general and king of Persia, A.D. 590–91. He first came to prominence during the reign of Hormizd IV, who had so alienated his subjects by cruelty and rnismanagement that rebellions were cropping up over the entire Persian kingdom. Persia's enemies, taking advantage of the situation, began to encroach on Persian territory. Bahram successfully repelled the Turks, who formed the most serious threat, but in his next campaign in the Caucasus was defeated by Roman troops. Hormizd, jealous of Bahram's success and popularity, took advantage of the defeat to dismiss him from the army. Bahram revolted with his troops and refused to be pacified even after Chosroes II, who succeeded Hormizd in 590, offered him second place in the kingdom. Chosroes therefore marched against Bahram, but the king's troops revolted and Chosroes was forced to flee to the Romans for assistance. Bahram proclaimed himself king. His throne, however, was never secure; and in 591 Chosroes, who had meanwhile obtained Roman support, had little difficulty in defeating Bahram's army and recapturing the throne. Bahram took refuge with the Turks but Chosroes, determined to remove the threat to his position forever, was soon able to arrange his assassination.

BAHRDT, KARL FRIEDRICH (1741–1792), German theologian and adventurer, was born on Aug. 25, 1741, at Bischofswerda and died at Halle on April 23, 1792. At the age of 16 young Bahrdt began to study theology at Leipzig under the orthodox mystic, Christian August Crusius (1715–75), who in 1757 had become first professor in the theological faculty. In 1766 he was appointed professor extraordinarius of biblical philology. Bahrdt was successively professor of theology at Giessen, master of the "Philanthropin," a famous school at Marschlins, general superintendent at Diirkheim, and a lecturer on other subjects than theology at Halle. From these posts he was expelled in each case on account of irregular living, and for the last ten years of his life he kept an inn on the Weinberg near Halle. He is remembered for his *Neueste Offenbarungen Gottes in Briefen und Erzählungen* (1773–75), which purported to be a "model version" of the New Testament and drew down on him the scorn of Goethe.

See life, with detailed bibliography, by Paul Tschakert in Herzog-Hauck, *Realencyklopädie;* a more favourable account is given in J. M. Robertson's *Short History of Freethought,* ii. 278.

BAHREIN, an archipelago named from its chief island, in the gulf of the same name occupying the angle formed by the Qatar peninsula and the Hasa coast of Arabia. Bahrein Island, 27 mi. long and 10 mi. wide, lying north and south is a low flat expanse of sand, with a number of luxuriant oases, and the rocky crater-like hill of Jebel Dukhan, 400 ft., is its central and most prominent feature.

Manama, the port and capital, generally referred to as "Bahrein," extends 3 mi. along the shore with a population of about 25,000. It is connected by road, suitable for motors, with Sukhair, 18 mi. and Budaia, 12 mi. distant and has a municipal council. Opposite Manama across a narrow strait lies Muharraq, with 25,000 inhabitants, capital of the island of the same name; it is semicircular in shape and 4 mi. long by ½ mi. broad. With the exception of Sitra on the east, 3 mi. by 1 mi., the other islands of the group are unimportant. Besides the towns mentioned there are about 100 villages distributed over the islands.

The archipelago is the headquarters of the Persian gulf pearl trade, in which over 1,000 sailing boats of various sizes are engaged, and employ some 20,000 men. Its average annual value is over £1,500,000. Dates form the chief agricultural product. The islands produce a fine breed of white donkey, which, however, is no longer exported. Shipbuilding and the making of sailcloth and reed-mats are the chief industries. The climate is humid but not unhealthful, a remarkable feature of the locality being an abundant supply of submarine fresh-water, which was formerly tapped by the insertion of reed pipes. Latterly, however, more modern methods have been employed to tap this water supply which probably originates in the highlands of the central Arabian plateau, 150 mi. to the west. The population consists mainly of Arabs with a good sprinkling of Negroes. There is also a considerable community of Persians and of Indian (Hindu) merchants. In the northern part of Bahrein Island is an extensive plain covered with

a vast number (probably running to six figures) of burial tumuli of various sizes, containing two-chambered sepulchres built of slabs of limestone. A number of these have been explored by Durand, Bent, Prideaux, Mackay and others, who have found numerous relics and specimens of pottery, but nothing sufficiently distinctive to indicate the age of the necropolis. It was considered by the earlier explorers that it was of Phoenician origin, but this is not accepted by archaeologists.

The Portuguese occupied the islands in 1507 but were dispossessed in 1602 by Arab subjects of Persia from the opposite shores of the gulf, during the reign of Shah Abbas. They mere in turn ejected in 1783 by Arab hordes from the Arabian mainland, mainly of the Ataiba tribe, who have remained in possession up to the present day. The ruling family, of the Al Khalifah section of that tribe, was represented during a reign of 60 years, up to 1922, by Shaikh Isa bin Ali. In that year, having regard to his extreme old age and the prevalence of intrigues among his sons, Shaikh Isa was persuaded by the British authorities to abdicate in favour of his son. In 1932 Shaikh Hamad bin Isa became ruler and on his death in 1942 he was succeeded by his son, Shaikh Sulman bin Hamad.

The principality is recognized as independent, but is in treaty relations with the government of India, who are represented by a political agent, working under an order in council. The territories are under the protection of Great Britain, which has been several times called upon to intervene in order to defeat the attempts of various powers to assert dominion over the islands; *e.g.,* the sultan of Oman, the Wahabis, the Turks and the Persians.

The latter power has periodically advanced a claim to sovereignty over Bahrein, one of the occasions being in Nov. 1927. In their reply to the Persian government, dispatched on Jan. 18, 1928, with copy to the League of Nations. the British government refused to consider the claim and declared the intention of Great Britain to protect the islanders as previously against any attempt to subject them to foreign domination.

See Bent, *Southern Arabia* (London, 1900); Prideaux, in *Report of Archaeological Survey of India* (1908–1909); Hogarth, in *Geographical Journal,* vol. lxix (1927).

BAHR-EL-GHAZAL, the chief western affluent of the river Nile, N.E. Africa, which it joins in 9° 30′ N., 30° 25′ E. The Bahr-el-Ghazal (Gazelle river) is a stream formed by the junction of many rivers, of which the Jur *(see* below) is the most important. The basin of the Ghazal is a large one, extending northwest to Darfur, and southwest to the Congo watershed. The main northern feeder of the Ghazal is a large river, whose headwaters are in the country west of 24" E. where the Nile, Congo and Shari watersheds meet. It is reinforced by intermittent streams from the hills of Darfur and by considerable rivers flowing north from Dar Fertit, among them being the Bahr el Homr, the Bahr el Arab and its tributary the Lol and the river Jur or Agur. The latter is the most important of the southern affluents and is known in its upper course as the Sueh. The upper courses of the Lol include the Boru, Banga, Sopo. The Lol receives the Cheu (with the Biri) and the Pongo. Deim Zubeir, formerly the chief station of Zobeir Rahama (*q.v.*), is near the Biri tributary of the Cheu.

The town of Wau (7" 42' N., 28° 3' E.), on the Jur, is the capital of the Bahr-el-Ghazal province of the Anglo-Egyptian Sudan. Meshra-er-Rek, the chief station and trading centre of the early explorers, is on a backwater south of the point where the Jur turns northwards to join the Bahr-el-Ghazal. Between the Jur and the Nile, parallel with these rivers, several streams, including the Tonj, Rohl and Deleb, run north from the Congo-Nile watershed and join the Bahr-el-Ghazal. Lake No is a depression near the junction of the Bahr-el-Jebel and the Ghazal. The lake is about 7 mi. long from west to east, and the Bahr-el-Jebel, after passing through its eastern corner, is known as the Bahr-el-Abiad or White Nile.

In their upper courses the southern affluents of the Ghazal cut deeply into the central African plateau. North of 7° 20′ N. (where rapids interrupt the currents) the valleys open out although their channels are often choked by sandbanks. This alluvial region, flooded in the rainy season, gives place about 9° N. to a wide area of marsh, forming part of the huge swamp region of the Nile (*q.v.*). Through these swamps it is almost impossible to trace the course of the various rivers. From the confluence of the Bahr-el-Arab with the Jur, above which point none of the rivers is called Bahr-el-Ghazal, to the junction with the Nile at Lake No, is a distance of about 100 mi. Just above the Bahr-el-Arab confluence the Jur broadens out and forms a lake (Ambadi) 10 mi. long and 1 mi. broad at low water and very much larger in flood time. This lake is the home of many sudd plants but the papyrus and ambach are absent. The whale-headed *Balaeniceps rex,* elsewhere rare, is found here in large numbers. At first the Ghazal flows north with lagoon-like expansions having great breadth and little depth—nowhere more than 13 ft. Turning northeast the channel becomes narrower and deeper, and is characterized by occasional reaches of papyrus. Finally, the Ghazal turns east and again becomes broader until Lake No is reached. As a rule the banks in this section are marked by anthills and scrub. The rise of the Ghazal river and the lower reaches of its main tributaries in flood time is barely 3 ft., but this is sufficient to flood an enormous area of country.

Exploration of **the** River.—Rumours of the existence of the Bahr-el-Ghazal led some of the Greek geographers to imagine that the source of the Nile was westward in the direction of Lake Chad. The first map on which the course of the Ghazal is indicated fairly accurately is that of the French cartographer, d'Anville, published in 1772. The exploration of the river followed the ascent of the White Nile by the Egyptian expeditions of 1839–42, and for a considerable portion of the period between 1853 and 186; John Petherick, a Welsh mining engineer, explored the Ghazal region, particularly the main stream and the Jur. In 1859 a Venetian, Giovanni Miani, penetrated the southern regions of the Ghazal basin and brought back reports of a great river (the Welle) flowing west beyond the Nile watershed. In 1862 a Frenchman, Lejean, surveyed the main river, and published a map. Considerable additions to the knowledge of the region were made by the ill-fated Tinné expedition of 1863. Georg Schweinfurth (*q.v.*), between 1869 and 1871 traversed the southern district and discovered the Welle. Further exploration of a military nature was undertaken in 1879–81 by Gessi Pasha, the Italian governor of Ghazal under Gordon. Wilhelm Junker (*q.v.*), about the same period, explored the southern tributaries of the Ghazal. These were carefully surveyed, and the Jur (Sueh) followed throughout its course by A. H. Dyé and other members of the French mission under J. B. Marchand, which crossing from the Congo (Oct. 1897) reached Fashoda on the White Nile in July 1898.

Like the Bahr-el-Jebel the Bahr-el-Ghazal is liable to be choked by sudd. The river became almost blocked in this manner during the rule of the Mahdists. Early in the 20th century the sudd was removed by British officers from the Bahr-el-GhazaI, the Jur and other rivers, and uninterrupted communication was thus established during the flood season between Khartoum and Wau, a distance of some 930 mi. In 1905–07 R. C. Bayldon, C. Percival and D. Comyri partly explored the northern and western affluents of the Ghazal. The whole area of the Bahr-el-Ghazal basin, some 200.000 sq.mi., contributes practically nothing to the volume of the White Nile. All the tributaries flow through a vast marsh area in which quantities of water are evaporated or transpired by vegetation. The maximum discharge of the Bahr-el-Ghazal is about 1,700 cu.ft. per second and often is nothing at all.

See NILE and the authorities there quoted, especially Sir William Garstin's *Report upon tlze Basin of the' Upper Nile, Egypt,* No. 2 (1904), and Capt. H. G. Lyons's *The Physiography of the River Nile and its Basin* (Cairo, 1906); *Geographical Journal,* vol. xxx (1907).

BAHUT (a French word of unknown origin), a portable coffer or chest, with a rounded lid covered in leather, garnished with nails, used for the transport of clothes or other personal luggage, —it was, in short, the original portmanteau. *(See* CHEST.)

BAHYA, IBN PAQUDA, a Jewish ethical writer (11th century) of Saragossa. In 1040 he wrote, in Arabic, a treatise, Duties *of the Heart,* which was one of the most significant and influential

Jewish works of the middle ages. Bahya felt that Jews were laying too much stress on the written law and giving too little attention to the real spirit of it. Duties of *the* Heart was his attempt to formulate an ethical system from Jewish teachings which would reconcile this discrepancy and give the proper importance to the duties of the heart or spirit as opposed to those of the body. The law, in the rabbinical sense, was reverenced by Bahya, who made it part and parcel of the Jew's inner life.

His book was written in ten sections, each one representing one of the duties of the heart. Some selections from it have been translated into English by E Collins.

BAI, TOMMASO (*c.* 1650–1714), Italian musician, was born at Crevalcuore, Italy. He sang in the Vatican chapel for some years and a year before his death was made maestro of the chapel. His best work was a *Miserere* which critics compared favourably with similar compositions by Palestrina. He died in Rome on Dec. 22, 1714.

BAÍA, an Atlantic state of Brazil, bounded on the north by the states of Piauí, Pernambuco and Sergipe, east by Sergipe and the Atlantic, south by Espirito Santo and Minas Gerais. and west by Minas Gerais and Goiaz. Its area is 204,393 sq.mi., a great part of which is an arid, barren chapada (plateau), traversed from south to north and northeast by the drainage basin of the São Francisco river, and having a general elevation of 1,000 ft. to 1,700 ft. above that river, or 2,300 ft. to 3,000 ft. above sea level. On the west the chapada, with an elevation of 2,300 ft. and a breadth of 60 mi., forms the western boundary of the state and the watershed between the São Francisco and the Tocantins. East of the São Francisco it may be divided into three distinct regions: a rough limestone plateau rising gradually to the culminating ridges of the Serra da Chapada; a gneissose plateau showing extensive exposures of bare rock dipping slightly toward the coast; and a narrower plateau covered with a compact sandy soil descending to the coastal plain. The first two have a breadth of about zoo mi. each, and are arid, barren and inhospitable, except at the dividing ridges where the clouds from the sea are deprived of some of their moisture. The third zone loses its arid character as it approaches the coast and is better covered uith vegetation. The coastal plain varies in width and character; in some places low and sandy, or swampy. filled with lagoons and intersecting canals; in others more elevated, rolling and very fertile. The climate corresponds closely to these surface features, being hot and dry throughout the interior, hot and humid, in places unhealthful along the coast. Cattle raising is the principal industry in the interior. In the agricultural regions cacáo, sugar, cotton, tobacco, coffee, mandioca and tropical fruits are produced. The exports include cacáo, sugar, cotton, hides, mangabeira rubber, piassava fibre, diamonds, cabinet woods and rum. The population, largely of a mixed Negro and white racial origin, numbered 2,117,956 in 1900 and 3,938,909 in 1940. There is little immigration. The capital, Salvador or Baia (*q.v.*), which is one of the principal cities and ports of Brazil, is the export town for the Reconcavo, as the fertile agricultural district surrounding the bay is called. The principal cities of the state are Alagoinhas and Bomfim (formerly Villa Nova da Rainha) on the main railway line running north to the São Francisco, Cachoeira and Santo Xmaro near the capital in the Reconcavo, Caravelas and Ilhéus on the southern coast, with tolerably good harbours, the former being the port for the Baia and Minas railway, Feira de Santana on the border of the *sertão* and long celebrated for its cattle fairs, and Jacobina, an inland town northwest of the capital, on the slopes of the Serra da Chapada, and noted for its mining industries, cotton and tobacco. The state of Baia includes four of the original captaincies granted by the Portuguese crown—Baia, Paraguassú, Ilhéus and Pôrto Seguro, all of which reverted to the direct control of that government in 1549. During the war with Holland several efforts were made to conquer this captaincy, but without success. In 1823 Baia became a province of the empire, and in 1889 a state in the republic. Its government consists of a governor elected for four years, and a general assembly of two chambers, the senators being elected for six years and the deputies for two years.

BAIAE, ancient city, Campania, Italy, 10 mi. W. of Neapolis, on the Sinus Baianus, a bay on the west coast of the gulf of Futeoli. The grave of Baios, helmsman of Ulysses, was shown there; it was originally, perhaps, the harbour of Cumae. Its warm sulphur springs are remarkable for their variety and curative properties (Pliny, *Hist. Nat.* xxxi 4); it has mild climate and luxuriant vegetation. In Strabo's day it was as large as Puteoli. Julius Caesar possessed a villa here, of which there are probably remains on the ridge above the 16th century castle. Nero built a huge villa probably on the castle site. Hadrian died in Caesar's villa in A.D. 138, and Alexander Severus erected large buildings for his mother. Baiae formed part of the territory of Cumae. Its luxury and immorality were often censured.

Near Baiae was the villa resort of Bauli, so called from the *βοαύλια* (stalls) in which the oxen of Geryon were concealed by Hercules. By some it is identified with the modern village of Bacoli (presumed similarity of name), 2 mi. S.S E. of Baiae; by others with the Punta dell'Epitaffio, 1 mi. N.E. of Baiae. At Bauli, Pompey and Hortensius possessed villas, the former on the hills, the latter on the shores of the Lacus Lucrinus, remarkable for its tame lampreys and as the scene of the dialogue in the second book of Cicero's *Academica Priora;* it afterwards became imperial property and was the scene of Agrippina's murder by Nero. It was from Bauli to Puteoli that Caligula built his bridge of boats. Baiae has three large and lofty domed buildings, two octagonal, one circular, and all circular in the interior, popularly called temples but really baths. Fine fragments of Flavian architecture and sculpture have been found in the bay near them. The Punta dell'Epitaffio also is covered with remains; to the north of Bacoli is a small theatre, called the tomb of Agrippina; under the village are the ruins of a large villa; to the east the remains of a large water reservoir, the so-called Cento Camerelle; to the south another with vaulted ceiling, the *piscina* mirabilis, measuring 230 by 8j ft. The villa of Marius, bought by Lucullus, and afterwards in the possession of the imperial house, was the scene of the death of Tiberius. It is sometimes spoken of as Baiana, sometimes as *Misenensis* and is perhaps to be sought at Bacoli. Baiae was devastated by the Saracens in the 8th century and entirely deserted on account of malaria in 1500.

BAIBURT, a town of Asiatic Turkey, on the direct carriage road from Trebizond to Erzerum, situated on both banks of the Churuk river, which here traverses an open cultivated plateau (altitude, 5,100 ft.), before turning east. It is the chief place of a kaza in the vilayet of Gümüṣane; the bazaar is poor, and there is no special industry in the town. The houses run up the hillsides on both banks of the river to a considerable height. On an isolated mass of rock, on the left bank, is the old castle, with extensive walls partly ruined, built originally by the Armenians and restored by the Seljuks. The principal gate with some Arabic inscriptions stands at the southwest corner. There are remains of a vaulted chamber, a Christian church, a mosque and two covered staircases to the river. A fine view is seen from the summit over the plain and the Pontic ranges to the north. Population 48,842.

BAIḌĀWĪ (ʿAbdallāh ibn ʿUmar al-Baiḍāwī) (died c. 1286), Mohammedan critic. His chief work is the commentary on the Koran entitled *The* Secrets of Revelation and *the* Secrets of *Interpretation* (*Asrār ut-tanzīl wa Asrār ut-ta'* wil). This work is in the main a digest of the great Mu'tazalite commentary (*al-Kashshāf*) of Zamakhshari, though it is not complete in its discussion of any branch of theological or linguistic knowledge of which it treats, and is not always accurate (cf. Th. Noldeke's Geschichte des Qorans, Göttingen, 1860, p. 29). It has been edited by H. O. Fleischer (Leipzig, 1846–48; indices ed. W. Fell, Leipzig, 1878). A selection with numerous notes mas edited by D. S. Margoliouth as *Chrestomathia Beidawiana* (London, 1894).

See C. Brockelmann's *Geschichte* der arabischen *Litteratur* (Weimar, 1898), vol. i, pp. 416-418.

BAÏF, JEAN ANTOINE DE (1532–1589), French poet and member of the Pléiade, was born at Venice, the natural son of the scholar Lazare de Baïf, at that time French ambassador there. He was taught Latin by Charles Estienne, and Greek by

Ange Vergèce, the Cretan scholar and calligraphist who designed Greek types for Francis I. When he was 11 years old he was put under the care of the famous Jean Daurat (*q.v.*). Ronsard, who was eight years his senior, now began to share his studies. Claude Binet tells how young Baif, bred on Latin and Greek, smoothed out the tiresome beginnings of the Greek language for Ronsard, who in return initiated his companion into the mysteries of French versification. Baif possessed an extraordinary facility, and the mass of his work has injured his reputation. Besides a number of volumes of short poems of an amorous or congratulatory kind, he translated or paraphrased various pieces from Bion, Moschus, Theocritus, Anacreon, Catullus and Martial. He resided in Paris and enjoyed the continued favour of the court. He founded in 1567 an *académie* de musique et de *poésie,* with the idea of establishing a closer union between music and poetry; his house became famous for the charming concerts which he gave, entertainments at which Charles IX. and Henry III. frequently flattered him with their presence. Baïf elaborated a system for regulating French versification by quantity. In this he was not a pioneer. Jacques de la Taille had written in 1562 the *Manière* de *faire* des *vers en français comme* en grec *et* en *latin* (printed 1573), and other poets had made experiments in the same direction. Baïf's innovations included a line of 15 syllables known as vers *baïfin.* He also meditated reforms in French spelling. His theories are exemplified in *Etrenes* de *poezie Franzoeze* an vers *mezures* (1514). His works were published in four volumes, entitled *Oeuvres en rime* (1573), consisting of *Amours,* Jeux, *Passetemps,* et *Poëmes,* containing, among much that is now hardly readable, some pieces of infinite grace and delicacy. Baif was the author of two comedies, *L'Eunuque* (1565, published 1573), a free translation of Terence, and Le Brave (1567), an imitation of the *Miles* Gloriosus, in which the characters of Plautus are turned into Frenchmen, the action taking place at Orleans. Baif published a collection of Latin verse in 1577, and in 1576 a popular volume of *Mimes, enseignemens* et *proverbes.*

His father, LAZARE DE BAÏF, published a translation of the Electra of Sophocles in 1537, and afterwards a version of the Hecuba; he was an elegant writer of Latin verse.

The *Oeuvres* en rime (1881–90) of J. A. de Baif form part of the Pldiade *française* of M. Ch. Marty-Laveaux. See also Becq de Fouquières, *Poésies choisies* de J. A. de Bazf (1874), with a valuable introduction; and F. Brunetière, *Hist.* de la *litt. française* classique (1904, bk. iii. pp. 398–422). For an account of Baïf's academy see Edouard Frémy, *Les Origines* de *l'Académie Française* (1887). See also L. Pinvert, Lazare de Baif, *1496?–1547* (1900).

BAIKAL, a lake of East Siberia (known to the Mongols as Dalai-nor, and to the Turkish tribes as *Bai-kul*), the sixth in size in the world and the largest fresh-water basin of Eurasia. It stretches from south-liest to north-east (52° and 56° N. and 104° to 110° E), lying in the Buriat-Mongol A S S R., except for the coastal area north and south of the outlet of the Angara river, which is in the Irkutsk province and has a length of 674km. and a width of from 25 to 74 kilometres. Its south end penetrates into the high plateau of Asia, and the lake lies entirely in the mountain zone north-west of that plateau. Its area is 33,000sq km, *i.e.,* nearly as great as Switzerland. The length of its coast-line is 2,200 kilometres. Its altitude is 462 metres above sea level and 40 metres above the level of the Angara at Irkutsk (*Zapiski,* Russ. Geog. Soc., xv., 1885). Its level changes regularly during the year, being lowest in April and highest in September. The amplitude of variation is about 80 centimetres. Its level is also subject to irregular oscillations, and after five weeks of heavy rain in 1869 it rose more than two metres and submerged a large area at the mouth of the Selenga. The drainage area is estimated at 650,000 sq.km., and the intake of fresh water at 162cu.km. per annum.

Drizhenko, working in 1897–1902, produced a map published in *Pilot* for *the* Lake Baikal. This shows that, as regards depth, the lake may be divided into three sections. The southern section stretches from the west end to the Selenga delta and is enclosed between spurs of the East Sayan mountains in the west and the Khamar-daban mountains in the east. Both these ranges have precipitous granitic slopes down to the lake and into its depths, with soundings in places of more than 1,400 metres. From the Selenga delta, with its large alluvial deposits, a rise of the lake floor stretches north-west and is covered by only 200 to 530 metres of water. The second section stretches from the mouth of the Selenga to Svyatoi Nos on the east coast, and is extremely deep, a sounding of 1,522 metres being taken quite close to Cape Ishimei on the island of Olkhon; the lake floor here lies 1,060 metres below sea-level, and is thus the deepest crypto-depression of the earth's surface. As the average depth of Baikal is 700 metres, it is the deepest lake in the world, and in proportion to its area it has the largest volume of water, estimated at 23,000 cu.km., or approximately the volume of the Baltic and the Kattegat, though the surfaces of these together have an area 12 times that of Baikal. The third section stretches from Svyatol Nos to the north end; here the depths gradually diminish, but soundings of more than 500 metres occur almost everywhere. The water is beautifully clear.

Temperature. — The surface-layers have summer temperatures of 55½° to 57°, both close to the shores and at some distance from the mouth of the Selenga, but these warmer layers are not deep, and a nearly uniform temperature of 39" is found from a depth of zoo metres right down to the bottom. At various places round the shores, *e.g.,* the mouth of the Barguzin, hot springs exist. The lake freezes usually at the end of December, or in the beginning of January, and it remains frozen till the second half of May. Evaporation exercises a certain influence on the climate of the surrounding country, while absorption of heat for thawing of ice has a notable cooling effect in early summer. In summer the climate is cooler, in winter warmer than that of the surrounding region, the range of air temperature on the lake being only 56° as against 79° away from the lake.

Rivers. — Lake Baikal receives over 300 streams, mostly short mountain torrents, besides the Upper Angara, which enters its north-east extremity, the Barguzin, on the east, and the Selenga on the south-east. Its only outflow is the lower Angara, which issues through a rocky cleft on the west shore. The Irkut no longer reaches Baikal, though it once did so. After approaching its south-west extremity it abandons the broad valley which leads to the lake, and makes its way northwards through a narrow gap in the mountains and joins the Angara at Irkutsk.

Mountains. — Save at the Selenga delta, Lake Baikal is surrounded by mountains. The Khānar-daban border-ridge (the summit of a mountain of the same name is 1,800 metres above the lake), falling, with steep cliffs, towards the lake, fringes it on the south; a massive, deeply-ravined highland occupies the space between the Irkut and the Angara; the Onot and Baikal ridges (also Primorskiy) run along its north-west shore, striking it diagonally; a complex of still unexplored mountains rises on its north-east shore; the Barguzin range impinges upon it obliquely in the east; and the Ulanburgasi mountains intrude into the delta of the Selenga.

Geology.—Baikal may already have existed in the Jurassic period. It has certainly existed since the Miocene. At times it has stretched westwards into what is now the valley of the Irkut, and northward and eastward up the lower valleys of the Upper Angara and the Barguzin, but it has never been in connection with the Arctic ocean. It is a very old relict-lake, a deep depression among great mountain lines, which is still progressing, and earthquakes are frequent along its shores.

Fauna.—Dybowski and Godlewski (1876) and Korotnev (1902) found the fauna much richer than was supposed, and highly peculiar. A few animals of marine affinities are found; *e.g.,* a seal (*Phoca* foetida *sibirica,* Gmelin) but these animals have wandered up the lower Angara and have thus reached the lake. There may also have been at various times seasonal expanses of water from melting ice in the Yenisei basin. On the whole the fauna, and especially the lower animals in it, are, as it were, a sort of fresh-water museum of ancient species, several of which are endemic and peculiar. Baikal has 188 species of Gammarus, more than half the species of this genus described for the world; of these 184 are found only here. The waters swarm with fish (sturgeons and *salmonidae*), and herring (Salmo *omul*) is the chief product of the fisheries, though notably fewer have been taken

within the last 50 years. The most interesting fish is *Comephorus baikalensis,* resembling fishes living at great depths of the ocean. Plankton is very abundant. The little Lake Frolikha, situated close to the northern extremity of Lake Baikal, and communicating with it by means of a river of the same name, contains a peculiar species of trout, *Salmo erythreas,* which is not known elsewhere.

Navigation.— The lake was discovered in 1643, since when boats have been in use on it; steamers having been introduced in 1844. Sudden storms and absence of good bays and ports, hinder navigation. The principal port on the western shore, Listvinichnoe, near the outflow of the Angara, is an open roadstead at the foot of steep mountains. Steamers ply from it to Misovaya (Posolskoe) on the opposite shore, a few times a year, to Verkhne-Angarsk, at the northern extremity of the lake, and frequently to the mouth of the Selenga, which they ascend to Bilyutai, near the Mongolian frontier. They bring back tea, imported by way of Kiakhta, while grain, cedar nuts, salt, soda, wool and timber are shipped on rafts down the Khilok, Chikoi and Uda (tributaries of the Selenga), and manufactured goods are taken up the river for export to China, but now (1928) there is only little traffic. Attempts are being made to render the Angara navigable below Irkutsk down to the Yenisei. In winter, when the lake is covered with ice 1 metre thick, it is crossed on sledges from Listvinichnoe to Misovaya. But a highway, available all the year round, was made in 1863–64 around its southern shore, partly by blasting the cliffs, and it is (since 1905) followed by the trans-Siberian railway.

(1857 and 1902); Drizhenko, *Pilot for the Baikal Sea* (1908) and *Atlas of the Baikal Sea* (1908); Chersky, "Geological Map of Shores of Lake Baikal," 6½m. to the inch, in *Zapiski,* of Russ. Geogr. Soc., xv. (1886); "Report of Geological Exploration of Shores of Lake Baikal," in *Zapiski,* of East Siberian Branch of Russ. Geogr. Soc., xii. (1886); Obruchev, "Geology of Baikal Mountains," *Izvestia* of same society (xxi. 4 and 5, 1890); Dybowski and Godlewski on "Fauna," in same periodical (1876); Witkowski, on "Seals"; Yakovlev, "Fishes of Angara," in same periodical (1890–93); "Fishing in Lake Baikal and its Tributaries," in same periodical (1886–90); and *La Géographie* (No. 3, 1904). A detailed summary of knowledge concerning Baikal has recently been given, with many bibliographical references by H. Johansen (Mitteil, Geogr. *Gesell.,* München, bd. xviii., 1525).

BAIKIE, WILLIAM BALF'OUR (1824–1864), Scottish explorer, naturalist, and philologist, eldest son of Captain John Baikie, R.N., was born at Kirkwall, Orkney. He studied medicine at Edinburgh, and, on obtaining his M.D. degree, joined the royal navy in 1848. He early attracted the notice of Sir Roderick Murchison, through whom he was appointed surgeon and naturalist to the Niger expedition sent out in 1854 by Macgregor Laird with government support. On the death of the senior officer (Consul Beecroft) at Fernando Po, Baikie succeeded to the command. Ascending the Benue about 250m. beyond the point reached by former explorers, the little steamer "Pleiad" returned and reached the mouth of the Niger, after a voyage of 118 days, without the loss of a single man. The expedition had been instructed to endeavour to afford assistance to Heinrich Barth (*q.v.*), who had in 1851 crossed the Benue in its upper course, but Baikie was unable to gain any trustworthy information concerning him. Returning to England, Baikie gave an account of his work in his *Narrative of an Exploring Voyage up the Rivers Kwora and Binue . . .* (1856). In March 1857 Baikie—with the rank of British consul—started on another expedition in the "Pleiad." After two years spent in exploring the Niger, the navigating vessel was wrecked in passing through some of the rapids of the river, and Baikie was unable longer to keep his party together. All returned home but himself; in no way daunted, he determined single-handed to carry out the purposes of the expedition. Landing from a small boat, with one or two native followers, at the confluence of the Niger and Benue, he chose Lokoja as the base of his future operations, it being the site of the model farm established by the expedition sent by the British government in 1841, and abandoned within a year on the death of most of the white settlers. *See* Capt. W. Allen, R.N., and T.R.H. Thomson, M.D., *A Narrative of the Expedition . . . to the River Niger in 1841* (1848). After purchasing the site, and concluding a treaty with the Fula amir of Nupe, he proceeded to clear the ground, build houses, form enclosures, and pave the way for a future city. Numbers flocked to him from all neighbouring districts, and in his settlement were representatives of almost all the tribes of west-central Africa. To the motley commonwealth thus formed he acted not merely as ruler, but also as physician, teacher, and priest. In less than five years he had opened up the navigation of the Niger, made roads, and established a market to which the native produce was brought for sale and barter. He had also collected vocabularies of nearly 50 African dialects, and translated portions of the Bible and prayer book into Hausa. Once only during his residence had he to employ armed force against the surrounding tribes. He died at Sierra Leone while on his way home, on leave of absence. After his death the British government abolished the consulate (1866), and it was through private enterprise that some 20 years later the district where Baikie had worked so successfully was finally secured for Great Britain *(see* **NIGERIA**).

Baikie's *Observations on the Hausa and Fulfulde* (*i.e.,* Fula) *Languages* was privately printed in 1861, and his translation of the Psalms into Hausa was published by the Bible Society in 1881.

BAIL, in English common law, the freeing or setting at liberty of one arrested or imprisoned upon any action, either civil or criminal, on surety taken for his appearance on a certain day and at a place named. The surety is termed bail, because the person arrested or imprisoned is placed in the custody of those who bind themselves or become bail for his due appearance when required. So he may be re-seized by them (if they suspect that he is about to escape) and surrendered to the court, when they are discharged from further liability. The sureties must be sufficient in the opinion of the court to answer for the sum for which they are bound, and, as a rule, only householders are accepted; an accomplice of the person to be bailed or an infant would not be accepted. Bail is obligatory in all summary cases. It is also obligatory in all misdemeanours, except such as have been placed on the level of felonies, viz., obtaining or attempting to obtain property on false pretences, receiving property so obtained or stolen, perjury or subornation of perjury, concealment of birth, wilful or indecent exposure of the person, riot, assault in pursuance of a conspiracy to raise wages, assault upon a peace officer in the execution of his duty or upon any one assisting him, neglect or breach of duty as a peace officer, any prosecution of which the costs are payable out of the county or borough rate or fund. In cases of treason, bail can only be granted by a secretary of State or the king's bench division. A person charged with felony is not entitled as of right to be released on bail. The power of admitting a prisoner to bail is judicial and not ministerial, and the exercise of the discretion must not be punitive, the chief consideration being the likelihood of the prisoner failing to appear at the trial—cf. *Reg. v. Rose* (17 Cox. C.C. 717). This must be gauged from the nature of, and the evidence in support of, the accusation, the position of the accused and the severity of the punishment which his conviction will entail, as well as the independence of the sureties. The Bail Act 1898 gives a magistrate power, where a person is charged with felony or certain misdemeanours, or where he is committed for trial for any indictable offence, to dispense with sureties, if in his opinion the so dispensing will not tend to defeat the ends of justice. A surety may be examined on oath as to his means, while the court may also require notice to be given to the plaintiff, prosecutor or police. A person who has been taken into custody for an offence, not apparently of a serious nature, without a warrant, and cannot be brought before a court of summary jurisdiction within 24 hours, may be admitted to bail by a police officer of superior rank or the officer in charge of the police station; and this can be done while inquiries are being made (Criminal Justice Acts, 1914 and 1925). An appeal against a refusal to grant bail lies to the king's bench division, and the court of trial has power to grant bail when necessary.

As to bail for an arrested ship, *see* ADMIRALTY JCRISDICTION.

(W. DE B. H)

United States.—I. In civil cases, the right of the person arrested on mesne process to be admitted to bail is absolute. The amount of the bail, unless otherwise fixed by statute, generally depends upon the amount of the civil liability claimed to be enforced, although the court has some discretion to reduce or increase it. The bond, undertaking or recognizance runs to the arresting officer, generally the sheriff, or to the plaintiff creditor, as required by the statute of the particular jurisdiction. Sureties, if individuals, may generally be either householder or freeholder, or may be a surety company.

2. In criminal cases the right to bail, and to that in an amount not to be excessive, is guaranteed by constitutional provisions except in capital cases. In capital cases, bail may be allowed in the discretion of the court, dependent on the circumstances of the case and nature and degree of proof of the offence available. The court having jurisdiction over the trial of the offence has jurisdiction to admit to bail. The form of the bail bond or recognizance is generally fixed by statute. The amount, except that it must not be excessive, is in the sound discretion of the court. The sureties must generally be freeholders or a surety company. The sureties may surrender the prisoner if they deem their risk doubtful. If the prisoner fails to appear upon the date set by the court, bail is forfeited and the State may enforce the collection of the amount of the bail against the property of the sureties. (B. RE.)

BAILÉN or **BAYLEN,** a town of southern Spain, in the province of Jaén. Population 8.998. Bailén is probably the ancient Baecula, where the Romans, under P. Cornelius Scipio the elder, signally defeated the Carthaginians in 209 and 206 B C In its neighbourhood, also, in 1212, was fought the great battle of Las Navas de Tolosa, in which, according to the ancient chroniclers, the Castilians under Alphonso VIII slew 200,000 Moors, and themselves lost only 25 men.

Bailén, Battle of, 1808.—Dupont, invading Andalusia with 20,000 men, found his communications with Madrid through the Sierra Morena threatened by guerrillas *(see* PENINSULAR WAR). Hearing that Castanos was approaching from Seville with 30,000, Dupont took post behind the Guadalquivir, his right on the Seville road at Andujar, his left 15 miles away at Mengibar. while the divisions of Vedel and Gobert lay at Bailén, five miles behind Mengibar. Castanos demonstrated in front at Andujar and sent the divisions of Reding and Coupigny to cross the river at Mengibar; this was easily stopped by Vedel moving up from Bailén. Dupont, who throughout regarded Andujar as the point of importance, both in defense, and as a bridge-head for future offensive operations, ordered Vedel to bring his main body thither; whereupon Reding crossed at Mengibar and defeated Gobert's weak division before Bailén. Gobert himself fell, his successor retired through Bailén along the Madrid road to Guarroman, while Reding withdrew behind the Guadalquivir. Hurrying back, Vedel found Bailén deserted and assumed tnat the Spaniards had followed Dupont northwards. He in turn followed, leaving an ever widening gap between himself and Dupont. Into this gap stepped Reding and Coupigny with 17,000 men. Dupont at last decided to abandon Andujar and fall back upon Bailén, where he hoped to join Vedel; instead he found Reding and Coupigny on the hills before Bailén. He at once attacked, July 19, 1808, but his column was badly organized and encumbered by a huge baggage train. After 11 unsuccessful attacks, lasting from dawn to noon. Dupont heard the signal guns of Castanos army following in his rear. He was trapped in a valley between two Spanish forces, his men exhausted and maddened by thirst. Had Vedel, who heard the firing hurried south again, he would equally have entrapped Reding and Coupigny between himself and Dupont, but Vedel unaccountably tarried and Dupont in despair surrendered, Vedel's forces being included in the capitulation. The capture of 18,000 French regulars (2,000 were killed) by a not greatly superior Spanish force consisting largely of peasants was a stunning blow to French prestige.

See Clerc, *Capitulation de Bailén, causes et conséquences* (1907).

BAILEY, FLORENCE MERRIAM (1863–), American ornithologist, sister of C. Hart Merriam (*q v*), was horn at Locust Grove, N. Y., on Aug. 8, 1863. She graduated at Smith college in 1886 and in 1899 married Vernon Bailey (*q.v.*). She became a devoted and able student of birds, especially those of western North America, and a prolific writer on ornithological subjects, publishing upwards of 100 papers, the most 'noteworthy of which were field studies contributed to the *Auk* and the *Condor,* together with several valuable larger works.

Her writings include: *Birds Through an Opera Glass* (1889); *My Summer in a Mormon Village* (1895); *A-Birding on a Broncho* (1896); *Birds of Village and Field* (1898); *Handbook of Birds of the Western United States* (1902), her most notable bock; *Wild Animals of Glacier National Park,* with Vernon Bailey (1918); *Birds Recorded from the Santa Rita Mountains of Southern Arizona* (1923); and *Birds of New Mexico* (1928).

BAILEY, LIBERTY HYDE (1858–), American botanist and horticulturist, was born at South Haven, Mich., on March 15, 1858. He spent his early years on a farm and in 1882 graduated from Michigan State Agricultural college. In 1882–83 he was a student assistant in botany under Asa Gray at Harvard, and in 1884–88 he was professor of horticulture and landscape gardening in Michigan State Agricultural College. From 1888 to 1903 he was professor of horticulture and from 1903 to 1913 he was dean of the college of agriculture and director of the agricultural experiment station, Cornell university. He rose to front rank among American botanical educators and by his achievements as a teacher, lecturer, writer and editor contributed substantially to the advancement of horticultural science. In systematic botany he made researches on North American sedges (especially *Carex*), on blackberries and raspberries (*Rubus*), and also on New World palms, collecting in the American Tropics much valuable material for their scientific study. In connection with his horticultural and taxonomic investigations he built up an extensive private herbarium. He also made important studies in rural economics, rural sociology and agricultural education. In 1908–09 he served as chairman of the Roosevelt commission on country life.

He was the editor of several series of books on agriculture and horticulture and also of the important *Cyclopaedia of American Horticulture* (1900–02); *The Cyclopaedia of American Agriculture* (1907). and *The Standard Cyclopedia of Horticulture* (1914–17, new ed. 1927).

Besides 'numerous articles in scientific journals and popular magazines and poems on country life, he was the author of *The Nursery Book* (1891); *Plant Breeding* (1897, rev. ed. 1915); *The Principles of Fruit Growing* (1897, 20th ed., 1921); *Sketch of the Evolution of Our Native Fruits* (1898); *Principles of Agriculture* (1898, 16th ed. 1910); *The Nature Study Idea* (1903); *The Training of Farmers* (1909); *Manual* of *Gardening* (1910); *The Outlook to Nature* (1911): *Country Life Movement in the United States* (1911); *Ground Levels in Democracy* (1911); *Tlze Practical Garden Book* (1913, rev. ed. 1925); *Universal Service* (1918); *The Nursery Manual* (1920); *The Apple Tree* (1922); *Manual of Cultivated Plants* (1924); and *The Garden Lover* (1928).

BAILEY, NATHAN or **NATHANIEL** (d. 1742), English philologist and lexicographer. He compiled a *Dictionarium Britannicum: a more compleat universal etymological English dictionary than any extant,* bearing the date 1730, but supposed to have been published in 1721. This formed the basis of Dr. Johnson's great work. Bailey, who was a Seventh-day Baptist (admitted 1691), had a school at Stepney, near London, and was the author of *Dictionarium Domesticum* and several other educational works.

BAILEY, PHILIP JAMES (1816–1902), English poet, author of *Festus,* was born at Nottingham and had a legal education though he never practised seriously. He is a man of one book, the voluminous and incoherent poem of *Festus,* which appeared anonymously in 1839, when the author was only 23. He wrote other volumes, none of which had any great success. *Festus* was reissued several times, and Bailey incorporated in it fragments from his other works, so that the original length of 20,000 lines was almost doubled in the end. The story is based on the Faust legend, treated in the most diffuse and rambling way. It had an enormous vogue in its day, and undoubtedly contains some fine passages.

BIBLIOGRAPHY.—The 50th anniversary edition of *Festus* was published in 1893. Other volumes by Bailey arc: *Tlze Angel World* (1850), *Tke Mystic* (1855), *The Age* (1858) and *The Universal Hymn* (1867). See J. Ward, *Philip James Bailey, author of Festus, Personal Recollections* (1905).

BAILEY, SAMUEL (1791–1870), philosopher and economist, born at Sheffield, England, and founder of a bank there. His published works range over a wide field, including pamphlets on parliamentary reform and on the right of primogeniture and two volumes containing some not very felicitous suggestions for the textual emendation of Shakespeare's plays. I-lis most important writings are: *Essays on the Formation and Publication of Opinions* (1821) in which it is held that man's opinions are independent of his will, and a sequel. *Essays on the Pursuit* of *Truth and on the Progress of Knowledge* (1829); *A Critical Dissertation on the Nature, Measure and Causes of Value* (1825), directed against the opinions of Ricardo and his school; *Review of Berkeley's Theory of Vision* (1842); *Letters on the Philosophy of the Human Mind* (1855–63).

Both in his philosophical and economic writings Bailey's work was characterized more by a clear logical and critical faculty than by creative thought. In psychology his chief theories are the superiority of the method of introspection; the reduction of the so-called faculties to mere phenomena of consciousness; the direct perception of external things; and the necessity of experience as the source of abstract ideas. Bailey was a strong utilitarian in ethics and in politics an adherent of philosophic radicalism. His "Dissertation" on the theory of value does not attempt to establish a new doctrine but attacks Ricardo for appearing to uphold the existence of absolute value, and also for not allowing for the influence of rates of remuneration of labour as well as quantities of labour on the value of commodities. He held that value can only be ascertained in terms of actual exchange ratios at a given moment and that there is no standard of value possible in terms of which values can be composed at different periods.

BAILEY, VERNON (1864–1942), American biologist, was born in Manchester, Mich.. on June 21, 1864 Early in life he became devoted to natural history. In 1887 he was appointed chief field naturalist of the biological survey, U.S. department of agriculture, and served in this position until July 31, 1933. He made extensive researches on the geographical distribution and life zones of mammals, birds and plants. and conducted many biological surveys, notably in Texas, New Mexico, North Dakota, Oregon and Montana. He died April 20, 1942.

His publications include: *Spermophiles of the Mississippi Valley* (1893); *Pocket Gophers of the Mississippi Valley* (1895); *Mammals of District of Columbia* (1900, 1923); *Biological Survey of Texas* (1905); *Life Zones and Crop Zones of New Mexico* (1913); *Revision of the Porket Gophers of the Genus Thomomvs* (1915); with F. A M. Bailey, *Wild Animals of Glacier National Park* (1918): *Beaver Habits and Beaver Farming* (1923); *Animal Life of the Carlsbad Cavern* (Baltimore, 1938); *Mammals of Oregon* (1936).

BAILEY, an open space enclosed by a fortification, sometimes known as the "ward" If more than one line of fortification is present there will be an inner and an outer bailey. The word persists chiefly in proper names, such as the Old Bailey in London whose name is derived from its situation in one of the baileys that was a part of the old city fortifications.

BAILIFF AND BAILIE, a legal officer to whom some degree of authority, care or jurisdiction is committed.

The term was first applied in England to the King's officers generally. such as sheriffs. mayors, etc., and more particularly to the chief officer of a hundred The county within which the sheriff exercises his jurisdiction is still called his bailiwick, while the term bailiff is retained as a title by the chief magistrates of various towns and the keepers of royal castles, as the high bailiff of Westminster, the bailiff of Dover Castle, etc. Under the manorial system, the bailiff, the steward and the reeve were important officers; the bailiff managed the property of the manor and superintended its cultivation *(see* Walter of Henley, Hus*bandry,* R. Hist. Soc. 1890).

The bailiff of a franchise or liberty is the officer who executes writs and processes, and impanels juries within the franchise. He is appointed by the lord of such franchise (who, in the Sheriffs Act 1887, § 34, is referred to as the bailiff of the franchise).

The bailiff of a sheriif is an under-officer employed by a sheriff within a county for the purpose of executing writs, processes, distraints and arrests. Special bailiffs are officers appointed by the sheriff at the request of a plaintiff for the purpose of executing a particular process. The appointment of a special bailiff relieves the sheriff from all responsibility until the party is arrested and delivered into the sheriff's actual custody.

By the County Courts Act 1888 provision is made for the appointment of one or more high-bailiffs by the judge; and is empowered to appoint a sufficient number of able and fit persons as bailiffs to assist him, whom he can dismiss at his pleasure and for whom he is responsible. The duty of the high-bailiff is to serve all summonses and orders, and execute all the warrants, precepts and writs issued out of the court. The Law of Distress Amendment Act 1888 enacts that no person may act as a bailiff to levy any distress for rent, unless he is authorized by a county-court judge to act as a bailiff.

In the Channel Islands the bailiff is the first civil officer in each island. He is appointed by the Crown, and generally holds office for life. He presides at the royal court, and takes the opinions of the jurats; he also presides over the states, and represents the Crown in all civil matters.

Bailie.—In Scotland the word bailiff denotes an inferior officer locally appointed to watch and ward; *e.g.,* a water-bailiff. *In* the form "bailie" the word signifies an official appointed to exercise a local delegated jurisdiction, civil or criminal. The feudal bailies, formerly appointed by the superiors of regality or of barony lands to exercise jurisdiction within these lands have disappeared in consequence of the abolition of feudal jurisdictions. The municipal bailies still subsist and are now elected from among the members of town councils, and each holds office from the date of such election until he fails to retire from the council in ordinary rotation. (Town Council [Scotland] Act 1900, 55, j6 and 57.) They are, along with the provost, the magistrates of the burgh and are invested with certain judicial and administrative powers within the burgh for which they are elected. They sit as police-court magistrates, being assisted usually by a paid legal adviser, called an "assessor," and, in the larger burghs, act as a licensing court.

Bailli.—In France the bailiff *(bailli),* or seneschal in feudal days, was the principal officer of any noble importance. He it was who held the feudal court of assizes when the lord was not present himself. A great noble often also had a *prévôté,* where small matters were settled, and the preparatory steps taken relative to the more important cases reserved for the assizes. Among the great officers of the Crown of France a grand-seneschal formerly figured until the reign of Philip Augustus, when the last holder of the office was not replaced by a successor. It is also under Philip Augustus that local bailiffs first make a definite appearance. In the ordinance of 1190, by which the king, about to set forth on the crusade, arranged for the administration of the kingdom during his absence, they figure as part of a general system. Their essential function was at first the surveillance of the royal provosts (*prévôts*), who until then had had the sole administration of the various parts of the domain. They concentrated in their own hands the produce of the provostships, and they organized and led the men who by feudal rules owed military service to the king. They had also judicial functions, which, at first narrowly restricted in application, became much enlarged as time went on, and they held periodical assizes in the principal centres of their districts. When the right of appeal mas instituted, it was they who heard the appeals from sentences pronounced by inferior royal judges and by the seigniorial justices. Royal cases, and cases in which a noble was defendant, were also reserved for them. The royal *bailli* or seneschal (no real difference existed between the two offices, the names merely changing according to the district), was for long the king's principal representative in the provinces, and the *bailliage* or the *sénéchaussée* was then as important administratively as judicially. But the political power of the bailiffs was greatly lessened when the provincial governors were created. They had already lost their financial powers, and their judicial functions now passed from them to their *lieutenants.*

By his origin the bailiff had a military character; he was an officer of the "short robe" and not of the "long robe," which in those days was no obstacle to his being well versed in precedents.

But when, under the influence of Roman and canon law, the legal procedure of the civil courts became *learned,* the bailiff often availed himself of a right granted him by ancient public law; that of delegating the exercise of his functions to whomsoever he thought fit. But as this delegation became habitual, the position of the lieutenants was strengthened; in the 16th century they became royal officers by title, and even dispossessed the bailiffs of their judiciary prerogatives. The tribunal of the *bailliage* or *sénéchaussée* underwent yet another transformation, becoming a stationary court of justice, the seat of which was fixed at the chief town. During the 15th and 16th centuries ambulatory assizes diminished in both frequency and importance. In the 17th and 18th centuries they were no more than a survival, the *lieutenant* of such a *bailliage* having preserved the right to hold one assize each year at a certain locality in his district. The ancient bailiff or *hailli d'épée* still existed, however; the judgments in the tribunal of the bailliage were delivered in his name, and he was responsible for their execution. So long as the military service of the *ban* and *arrière ban,* due to the king from all fief-holders, was maintained (and it was still in force at the end of the 17th century), it was the bailiffs who organized it. Finally the *bailliage* became in principle the electoral district for the states-general, the unit represented therein by its three estates. The justiciary nobles retained their judges, often called bailiffs, until the Revolution. These judges, who were competent to decide questions as to the payment of seigniorial dues, could not, legally at all events, themselves farm those revenues.

See Dupont Ferrier, *Les Officiers royaux des bailliagrs et sénéchaussées et les institutions monarchiques locales en France à la fin du moyen âge* (1902); Armand Brette, *Recueil de documents relatifs à la convocation des états-généraux de 1789* (1904) (vol. iii. gives the condition of the *bailliages* and *sénéchaussées* in 1789).

(J. P. E.; W. A. B.)

BAILLET, ADRIEN (1649–1706), French scholar and critic, was born on June 13 1649, at the village of Neuville near Beauvais, in Picardy, and died in Paris on Jan. 21 1706. He became in 1680 librarian to M. de Lamoignon, advocate-general to the *parlement* of Paris, of whose library he made a *catalogue raisonné* (35 vols.), all written with his own hand. The remainder of his life was spent in incessant, unremitting labour; he is said to have allowed himself only five hours a day for rest. Of his numerous works the most famous is *Jugements des savants sur les principaux ouvrages des auteurs* (1685–86). At the time of his death he was engaged on a *Dictionnaire universel ecclésiastique.* The praise bestowed on the Jansenists in the *Jugements des savants* brought down on Bnillet the hatred of the Jesuits, and his *Vie des saints* (1701), in which he brought his critical mind to bear on the question of miracles, caused some scandal. His *Vie de Descartes* is a mine of information on the philosopher and his work, derived from numerous unimpeachable authorities.

See the edition by M. la Monnoye of the *Jugemens des savans* (Amsterdam, 1725), which contains the *Anti-Baillet* of Gilles Ménage and an *Abrégé de la vie de M. Baillet.*

BAILLIE, LADY GRIZEL (1665–1746), Scottish song-writer, eldest daughter of Sir Patrick Hume or Home of Polwarth, afterwards earl of Marchmont, was born at Redbraes castle, Berwickshire. When she was 12 years old she carried letters from her father to the Scottish patriot, Robert Baillie of Jerviswood, who was then in prison. Home's friendship for Baillie made him a suspected man, and the king's troops occupied Redbraes castle. He remained in hiding for some time in a churchyard, where his daughter kept him supplied with food, but on hearing of the execution of Baillie (1684) he fled to Holland, where his family soon after joined him. They returned to Scotland at the Revolution. Lady Grizel married in 1692 George Baillie, son of the patriot. She had two daughters, Grizel, who married Sir Alexander Murray of Stanhope, and Rachel, Lady Binning. Lady Murray had in her possession a ms. of her mother's in prose and verse. Some of the songs had been printed in Allan Ramsay's *Tea-Table Miscellany.* "And werena my heart licht I wad dee," the most famous of Lady Grizel's songs, originally appeared in *Orpheus Caledonius* (1725).

Memoirs of the Lives and Characters of the Right Hon. George Baillie of Jerviswood and Lady Grisell Baillie, by their daughter, Lady Murray of Stanhope, were printed in 1822. *See* also her *Household Book* (Scot. Hist. Soc. 1912). George Baillie's *Correspondence* (1702–08) was edited by Lord Minto for the Bannatyne club in 1842. "The Legend of Lady Grizelda Baillie" forms one of Joanna Baillie's *Metrical Legends* of *Exalted Character.*

BAILLIE, JOANNA (1762–1851), Scottish poet and dramatist, was born at the manse of Bothwell, on the Clyde. She belonged to an old Scottish family, which claimed among its ancestors Sir William Wallace. At an early period she moved with her sister Agnes to London, the two sisters settling at Hampstead, where they passed the remainder of their lives. Joanna Baillie published anonymously in 1790 a volume called *Fugitive Verses,* and in 1798, also anonymously, the first volume of her "plays on the passions" under the title of *A Series of Plays,* in which, says the title-page, "it is attempted to delineate the strange passions of the mind, each passion being the subject of a tragedy and a comedy." The book was followed by a second volume, *Plays on the Passions,* in 1802, a third in 1812 and three volumes of *Dramas* in 1836. *Miscellaneous Plays* appeared in 1804, and the *Family Legend* in 1810. Miss Baillie herself intended her plays not for the closet but for the stage, and *Family Legend* (1810) had a brilliant though brief success in Edinburgh while *De Monfort* (1809), because of the acting of John Kemble and Mrs. Siddons, had a run in London. *Henriquez* and *The Separation* were coldly received. Joanna Baillie is best remembered by some charming Scottish songs, though some of them, like *Woo'd and Married an'a',* are adaptations. She lived to be 89, and died on Feb. 23, 1851. Her sweetness of disposition made her a universal favourite, and her little cottage at Hampstead was the centre of a brilliant literary society.

See Joanna Baillie's *Dramatic and Poetical Works* (1851); *G.* Gilfillan, *Galleries of Literary Portraits,* vol. i. (1856); M. S. Carhart, *The Life and Work of Joanna Baillie,* "Yale Studies in English Bibl" (1923).

BAILLIE, MATTHEW (1761–1823), Scottish physician, was born at Shotts, Lanarkshire, on Oct. 27, 1761. He was educated at Balliol college, Oxford, and after studying medicine under his uncle, William Hunter, was made physician at St. George's hospital, London, in 1787. Two years later he received the M D. and the F.R.C.P. In 1795 appeared his *Morbid Anatomy of Some of tlze Most Important Parts of the Body,* which was the first attempt to treat pathology as a subject in itself. His *Lectures and Observafions on Medicine* were published in 1825.

BAILLIE, ROBERT (1599–1662), Scottish divine, was born at Glasgow. He was a member of the famous Glasgow Assembly (1638), professor of divinity at Glasgow (1642), one of the five Scottish clergymen who were sent to the Westminster Assembly (1643), and one of the commissioners sent to Holland to invite Charles II. to Scotland (1649). In 1661 he was made principal of Glasgow university. His *Letters,* by which he is now chiefly remembered, are of first-rate historical importance, and give a very lively picture of the period.

See D. Laing's edition of the *Letters and Journals of Robert Baillie* (1637–62), Bannatyne club, 3 vols. (1841–42).

BAIELIE, ROBERT (d. 1684), Scottish conspirator, known as BAILLIE OF JERVISWOOD, was the son of George Baillie of St. John's Kirk, Lanarkshire. In despair over the state of his country he determined in 1683 to emigrate to South Carolina, but the plan came to nothing. The same year, with some of his friends, he went to London and entered into communication with Monmouth, Russell and their party, in order to work for civil and religious liberty in Scotland. On the discovery of the Rye House Plot he was arrested, and being questioned by the king himself repudiated any knowledge of the conspiracy, but would not deny that he had been consulted with the view of an insurrection in Scotland. He was sent back a prisoner to Scotland where, though there was no evidence whatever to support his connection with the plot, he was fined £6,000 and kept in close confinement. On Dec. 3, 1684 he was brought up again before the high court on the charge of treason, and being pronounced guilty on the following day was hanged the same afternoon at the market cross at Edinburgh.

BAILLON, GUILLAUME DE (1538–1616), French physician, studied in Paris, and became physician to the Dauphin,

son of Henry IV. He has a place in the history of epidemiology on account of two books posthumously published (1640) on epidemics, in which he revived the Hippocratic doctrine of "epidemic constitutions" which seems to have influenced Sydenham's work. Baillon first described whooping-cough (1578), and he differentiated between rheumatism and gout, as Hippocrates had done.

His works include: *Definitionum* medicinalium liber (1639), a glossary of Hippocratic terms; *Consilia* (1635–49); treatises on gynaecology (1643), gout and calculus (1643) and two books on epidemics and ephemeral diseases (1640). His name is also spelt Baillou.

BAILLOT, PIERRE MARIE FRANÇOIS DE SALES (1771–1842), French violinist, was born at Passy, Paris, on Oct. 1, 1771, and died there on Sept. 15, 1842. Baillot was the last of the great classical Paris school of violinists, and his Art *du Violon* (1834) is still a standard work. His tradition was further maintained by his share in the *Méthode* du *Violon* issued by the Paris conservatoire. Baillot studied first under an Italian named Polidori and then under Sainte-Marie, and then in Rome under Pollani. From 1802 onwards he became known as a violinist in all the principal music centres of Europe. He excelled in chamber music and in the rendering of the classics.

BAILLY, JEAN SYLVAIN (1736–1793), French astronomer and orator, was born at Paris on Sept. 1j, 1736. He calculated an orbit for the comet of 1759 (Halley's), reduced Lacaille's observations of 515 zodiacal stars, and was, in 1763, elected a member of the Academy of Sciences. His *Essai sur* la *théorie* des satellites de *Jupiter* (1766), was followed up in 1771 by a dissertation Sur les *inégalités* de la *lumière* des satellites de Jupiter and by a series of important works on the history of science.

The Revolution interrupted his studies. Elected deputy from Paris to the states-general, he was chosen president of the Third Estate (May 5, 1789), led the famous proceedings in the Tennis Court (June 20), and acted as mayor of Paris (July 15 1789, to Nov. 16 1791). The dispersal by the National Guard, under his orders, of the riotous assembly in the Champ de Mars (July 17 1791), rendered him obnoxious to the infuriated populace, and he retired to Nantes, where he composed his *Mémoires d'un témoin* (published by MM. Berville and Barrière, 1821–22), an incomplete narrative of the extraordinary events of his public life. Late in 1793, Bailly quitted Nantes to join his friend Pierre Simon Laplace at Melun; but was there recognized, arrested and brought (Nov. 10) before the Revolutionary Tribunal at Paris. On Nov. 12 he was guillotined.

Notices of his life are contained in the *Éloges* by Mérard de Saint Just, Delisle de Salles, Lalande and Lacretelle; in a memoir by Arago, read Feb. 26 1844, before the Académie des Sciences, and published in Notices biographiques, t. ii. (1852). See also Delambre, *Histoire* de *l'astronomie* au *18me siècle*, p. 735, and Lalande, *Bibliographie* astrononzique, p. 730.

BAILMENT, a delivery of specific goods by one person, called the bailor, to another person, called the bailee, upon an understanding, express or implied, that the identical goods shall be restored to the bailor, or in accordance with his direction, as soon as the time or purpose, for which they were bailed, has elapsed or has been performed. A request for the return of the goods is usually an antecedent condition to proceedings for their recovery. Where goods in the lawful possession of a bailee are damaged by the negligence of a stranger, such third party is liable to the bailee although the latter may not be responsible to his bailors (*Glenwood* Lumber Co. v. Phillips [1904] A C. 410).

Bailments are divisible into six classes (Coggs v. Bernard [1704] 2 Ld. Ray 909). These are:—

(1) *Depositum,* a simple bailment, without reward, of goods to be kept for the bailor by the bailee who has no right to use them. Such a bailee is liable only for gross negligence which is "want of that care which every man of common sense . . . takes of his own property" It has been stated that bankers taking charge of their customers' securities are in this class (*Giblin* v. *McMullen* [1868] L.R. 2 P.C. 317); but as such accommodation is confined to customers of the bank the accuracy of the classification is doubtful.

(2) *Commodatum,* a bailment in which goods (afterwards to be returned to the owner in specie) are lent gratis to a bailee for use by him. The borrower for whose advantage the chattel is loaned guarantees not only to exercise the strictest care in its custody, but also warrants reasonable skill in its user and conformity to the purpose for which it was lent, slight negligence rendering him liable to indemnify the lender (Jones on Bailments 65).

(3) Locatio rei, or lending for hire. The hirer of the chattel is bound to exercise such ordinary diligence and care over the thing hired by him as a man of common prudence would take in the management of his own concerns (*Beal* v. *South Devon* Ry. Co. [1864] 3 H. & C. 342).

(4) *Vadium* or pledge, a bailment of personal goods by a debtor to his creditors to be kept till the debt is discharged. The measure of responsibility of the pledgee is ordinary diligence in safeguarding the chattel pledges.

(5) Locatio operis faciendi, a delivery of goods to be carried or in order that something may be done to them. Apart from legislation a common carrier is an insurer of the goods carried. A bailee receiving goods for repair must exercise ordinary diligence in preserving them.

(6) *Mandatum,* a delivery of goods to be carried or in order that something may be done to them gratuitously. The bailee must act in good faith and is liable for negligence or incapacity. (See also BAXKS AND BANKING, CARRIERS, DILIGENCE, FACTOR, HIRING, INNS AND INNKEEPERS, LIEN, NEGLIGENCE, PLEDGE, PAWNBROKING, PRINCIPAL AND AGENT, etc.).

UNITED STATES

In the United States the division of bailments into the classes above specified has not met with favour because of its lack of practical utility, and bailments in this country are divided into three classes: (1) bailments which benefit the bailor alone; (2) bailments which benefit the bailee alone; and (3) bailments which benefit both bailor and bailee. In all bailments title to and ownership of the property remain in the bailor, and the bailee takes only the interest specified for the object of the bailment. Possession in the bailee gives him a qualified property interest as against a third person. A bailee cannot deny his bailor's title, so the burden of proving ownership in bailment is always with the bailee. However, delivery of the property to one having a paramount title to the bailor is a sufficient excuse for non-delivery by the bailee to the bailor; in such case the bailee assumes the risk of establishing the title so recognized in another.

BAILY, EDWARD HODGES (1788–1867), British sculptor, the son of a carver of ship's figureheads, was born at Bristol on May 10, 1788. At school and in the commercial office which he entered on leaving school he made wax models and busts of his fellows, and in 1807 began to study under Flaxman; in 1809 he entered the academy schools. In 1821 he became R.A. Baily executed the bas reliefs on the south side of Marble Arch in Hyde Park, and many statues in London, notably that of Nelson in Trafalgar square. He died at Holloway, London, on May 22, 1867.

BAILY, FRANCIS (1774–1844), English astronomer, was born at Newbury, Berkshire. He made a fortune on the Stock Exchange, and acquired a great reputation for his actuarial calculations. He retired from business in 1825. He had already, in 1820, taken a leading part in the foundation of the Royal Astronomical Society; and its gold medal was awarded him in 1827, for his preparation of the Astronomical Society's Catalogue of 2881 stars (Memoirs R. Astr. *Soc.* ii.). The reform of the Nautical *Almanac* in 1829 was set on foot by his protests; he recommended to the British Association in 1837, and in great part executed, the reduction of Joseph de Lalande's and Nicolas de Lacaille's catalogues containing about 57,000 stars; he superintended the compilation of the British Association's Catalogue of 8.377 stars (published 1845); and revised the catalogues of Tobias Mayer, Ptolemy, Ulugh Beg, Tycho Brahe, Edmund Halley and Hevelius (Memoirs R. Astr. *Soc.* iv., xiii.).

His notice of "Baily's Beads," during an annular eclipse of the sun on May 15, 1836, at Inch Bonney in Roxburghshire, started

the modern series of eclipse-expeditions. The phenomenon, which depends upon the inequalities of the moon's limb, was so vividly described by him as to attract an unprecedented amount of attention to the totality of July 8, 1842, observed by Baily himself at Pavia. He completed and discussed H. Foster's pendulum-experiments, deducing from them an ellipticity for the earth of $\frac{1}{289}$ *(Memoirs R. Astr. Soc.* vii.); corrected for the length of the seconds-pendulum by introducing a neglected element of reduction; and was entrusted, in 1843, with the reconstruction of the standards of length. His laborious operations for determining the mean density of the earth, carried on by Henry Cavendish's method (1838–42), yielded for it the authoritative value of 5.66. Baily's *Account of the Rev. John Flamsteed* (1835) is of fundamental importance to the scientific history of that time. It included a republication of the British Catalogue.

See J. Herschel's *Memoir of* F. *Baily, Esq.* (1845), also prefixed to Baily's *Journal of a Tour,* with *a* list of his writings; *Month. Not.* R. *Astr. Soc.* xiv. 1844.

BAILY'S BEADS, a phenomenon seen during a total eclipse of the sun. Just before the moon's disc completely covers the sun the narrow crescent of sunlight is broken in several places, giving an appearance roughly compared to a string of beads. This is due to irregularity (mountains and valleys) on the edge of the moon's disc. These "beads" were named after Francis Baily (*q.v.*).

BAIN, ALEXANDER (1818–1903), Scottish philosopher and educationist. was born in Aberdeen, where he began life as a weaver. In 1836 he entered Marischal College, and towards the end of his arts course became a contributor to the *Westminster Review* (first article "Electrotype and Daguerreotype," Sept. 1840). This was the beginning of his life-long friendship with John Stuart Mill. In 1841 he acted as substitute for Dr. Glennie, the professor of moral philosophy, and in 1842 helped Mill with the revision of the ms. of his *System of Logic.* In 1845 he was appointed professor of mathematics and natural philosophy in the Andersonian University of Glasgow but resigned in the following year. In 1848 he obtained a post in the London Board of Health, under Edwin Chadwick, and became a prominent member of the brilliant circle which included Grote and J. S. Mill. In 185j he published *The Senses and the Intellect,* followed in 1859 by *The Emotions and the Will.*

In 1860 he was appointed to the new chair of logic and English in the University of Aberdeen. Bain succeeded in raising the standard of education generally in the north of Scotland, and also in forming a school of philosophy and in widely influencing the teaching of English grammar and composition. In 1863, he published the *Higher English Grammar,* followed in 1866 by the *Manual of Rhetoric,* in 1872 by *A First English Grammar,* and in 1874 by the *Companion to the Higher Grammar.* In 1861, *The Study of Character,* including an *Estimate of Phrenology,* appeared; but all his philosophical writings were condensed and retouched in his *Manual of Mental and Moral Science* (1868). In 1870, Bain published his *Logic,* based partly on J. S. Mill, but distinguished by its treatment of the doctrine of the conservation of energy in connection with causation and the detailed application of the principles of logic to the various sciences. His services to education in Scotland were recognized by an honorary LL.D. from Edinburgh in 1871. Next came two publications in "The International Scientific Series," namely, *Mind and Body* (1872), and *Education as a Science* (1879).

In Jan., 1876, appeared the first number of *Mind,* which Bain had instituted, under the editorship of a former pupil, G. Croom Robertson, of University College, London. To this journal, he contributed many important articles. Bain resigned his professorship in 1880 and two years later published his *Biography* of *James Mill,* together with *John Stuart Mill: a Criticism, with Personal Recollections.* Next came (1884) a collection of articles and papers, most of which had appeared in magazines, under the title of *Practical Essays.* This was succeeded (1887, 1888) by a new edition of the *Rheforic,* and a book *On Teaching English,* being an exhaustive application of the principles of rhetoric to the criticism of style; and in 1894 he published a revised edition of *The Senses and the Intellect.* His remaining years were spent in privacy at Aberdeen, where he died.

Wide as Bain's influence has been as a logician, a grammarian and a writer on rhetoric, his reputation rests on his psychology. He was the first in Great Britain to stress the necessity of cleuring psychology of metaphysics, of applying the methods of the exact sciences to psychological phenomena and of referring these phenomena to their correlates in the nerves and brain. He made a profound study of the physical origin of feeling and emotion, of instincts in relation to mental life and of the laws of association *(see* PSYCHOLOGY). In ethics, Gain was a utilitarian.

His autobiography, published in 1904, contains a full list of his works, and also the history of the last 13 years of his life by W. L. Davidson, of Aberdeen university, who further contributed to *Mind* (April, 1904) a review of Bain's services to philosophy. *See* also J. Seth, *English Philosophers* (1912); Th. Ribot, *La Psychologie anglaise contemporaine* (1870); J. T. Merz, *Hist. of European Thought in the Nineteenth Century* (1912).

Works of Bain (besides those already mentioned) include an edition, with notes, of Paley's *Moral Philosophy* (1352); *Education as a Science* (1879); *Dissertations on leading philosophical topics* (1903, mainly reprints of papers in *Mind*); he collaborated with J. S. Mill and Grote in editing James Mill's *Analysis of the Phenomena of the Human Mind* (1869), and assisted in editing Grote's *Aristotle* and *Minor Works;* he also wrote a memoir prefixed to G. Croom Robertson's *Philosophical Remains* (1894).

BAIN, ANDREW GEDDES (1797–1864), British geologist, was a native of Scotland. In 1820 he emigrated to Cape Colony, carried on for some years the business of a saddler at Graaf Reinet, and served in the Kafir War of 1833–34. He discovered the remains of many reptilia, including the *Dicynodon,* which was obtained from the Karroo beds near Fort Beaufort and described by Owen. Bain prepared in 1852 the first comprehensive geological map of South Africa, which was published by the Geological Society (London) in 1856.

Obituary by Dr. R. N. Rubidge in *Geol. Mag.* (Jan., 1865), p. 47; also *Trans. Geol. Soc. S. Africa* (June, 1896) vol. ii. part v. (with portrait).

BAINBRIDGE, JOHN (1582–1643), English astronomer, was born at Ashby-de-la-Zouch, Leicestershire. He started as a physician and practised for some years. Sir Henry Savile appointed him in 1619 to the Savilian chair of astronomy just founded by him at Oxford; Bainbridge was incorporated of Merton college and became in 1631 and 1635 respectively, junior and senior reader of Linacre's lectures. He wrote *An Astronomical Description of the late Comet* (1619); *Canicularia* (1648); and translated Proclus's *De Sphaera,* and Ptolemy's *De Planetarum Hypothesibus* (1620). Several manuscript works by him exist in the library of Trinity college, Dublin.

See Munk's *College of Physicians,* i. 175 Wood's *Athenae* (Bliss), iii. 67; *Biographia Britannica,* i. 419.

BAINBRIDGE, WILLIAM (1774–1833), commodore in the United States Navy, was born on May 7, 1774, in Princeton (N.J.). At 14 he went to sea in the merchant service and was in command of a trading schooner at an early age. When the Cnited States Navy was organized in 1798 he was included in the corps of naval officers and appointed to the schooner "Retaliation." When the United States found that bribing the pirate Barbary States did not stop their capture of its merchant ships in the Mediterranean, and was constrained at last to use force, he served against Algiers and Tunis. His ship, the "Philadelphia," ran aground on the Tunisian coast and he was for a time imprisoned. On his release he returned to the merchant service in order to make good the pecuniary loss caused by his captivity. But when the war of 1812 broke out between Great Britain and the United States, Bainbridge was appointed to command the United States frigate "Constitution" (44), in succession to Captain Isaac Hull (*q.v.*), and sent to cruise in the South Atlantic. On Dec. 29, 1812, he fell in with H.M.S. "Java," a vessel of 1,073 tons, formerly the French frigate "Renommée" (40). She was on her way to the East Indies, carrying the newly appointed lieutenant-governor of Bombay. She had a very raw crew, includ-

ing few real seamen, and her men had only had one day's gunnery drill. The United States Navy paid great attention to its gunnery, but the British navy, misled by its easy victories over the French, had neglected its own. In those conditions the fate of the "Java" was soon sealed. She was cut to pieces and forced to surrender, after suffering heavy loss and inflicting very little on the "Constitution." At the conclusion of the war with Great Britain, Bainbridge served against the Barbary pirates once more. During his later years he served on the board of navy commissioners. He died on July 28, 1833. (D. H.)

BAINBRIDGE, a city near the south-western corner of Georgia, U.S.A., on the Flint river and Federal highway 84; the county seat of Decatur county. It is served by the Atlantic Coast Line and the Seaboard Air Line railways, and by river steamers. The population was 4,792 in 1920 (46% Negroes), 6,141 in 1930 (about 36% Negroes), and in 1940, 6,352 by federal census. Bainbridge is a shipping point for cotton, peanuts and naval stores. It was founded in 1822 and incorporated in 1828.

BAINDIR, a town in Turkey in the Smyrna vilayet, situated in the valley of the Kuchuk Menderes. Population 25.500. It is connected with Smyrna by a branch of the Aidin railway, and has a trade in cotton. figs. raisins and tobacco.

BAINES, EDWARD (1774–1848), English newspaper proprietor and politician, was born Feb. 5, 1774, at Walton-le-Dale, near Preston, Lancashire, and died Aug. 3, 1848. In 1801 the assistance of party friends enabled him to buy the *Leeds Mercury*. Provincial newspapers did not at that time possess much influence; it was no part of the editor's duty to supply what are now called "leading articles," and the system of reporting was defective. In both respects Baines made a complete change in the *Mercury*. His able political articles gradually made the paper the organ of Liberal opinion in Leeds, and the connection of the Baines family with the paper made thtir influence powerful for many years in this direction.

Baines was an ardent advocate of parliamentary reform, and it was mainly by his influence that hfacaulay was returned for Leeds in 1832; and in 1834 he succeeded Macaulay as member. I-Ie was re-elected in 1835 and 1837, but resigned in 1841. In Parliament he supported the Liberal Party, but with independent views. Like his son Edward after him, he strongly advocated the separation of Church and State, and opposed Government interference in national education. His letters to Lord John Russell on the latter question (1846) had a powerful influence in determining the action of the Government.

His *Life* (1861) was written by his son, Sir EDWARD BAINES (1800–go), who was editor and afterwards proprietor of the *Leeds Mercury,* M.P. for Leeds (1859–74), and was knighted in 1880; his *History of the Cotton Manufacture* (1835) was long a standard authority. An elder son, MATTHEW TALBOT BAINES (1799–1860), was president of the Poor Law Board in 1849, and again from 1852 to 1855. In 1856 he entered the Cabinet as chancellor of the duchy of Lancaster.

BAINI, GIUSEPPE (1775–1844), Italian priest, musical critic and composer of church music, was born at Rome on Oct. 21, 1775, and died there on May 21, 1844. He was instructed in composition by his uncle, Lorenzo Baini, and afterwards by G. Jannaconi. In 1814 he was appointed musical director to the choir of the pontifical chapel, of which he had been a member since 1802. His compositions, of which very few have been published, show a reversion to the severe ecclesiastical style of the 16th century; and one, a ten-part *Miserere,* composed for Holy Week in 1821 by order of Pope Pius VII., has taken a permanent place in the services of the Sistine chapel during Passion Week. Of still greater value is his *Life of Palestrina (Memorie storico-critiche della vita e delle opere di Giovanni Pierluigi da Palestrim,* 1828), which is justly regarded as a classic in musical literature.

BAINVILLE, JACQUES (1879–1936), French historian and journalist, was born at Vincennes, near Paris, Feb. 9, 1879. His first literary work was a life of Louis II. of Bavaria (1900) written while travelling in Germany. He came under the influence of Maurras, joined the Royalist party, and, at the time of the Dreyfus case, became in 1899 one of the original editors of the monthly review, *Action Française.* This review in 1906 became a daily paper, of which Jacques Bainville was appointed foreign editor. From that time he devoted his energies to his short daily articles, which were clear, well-written, intelligent and full of striking phrases that soon became proverbial, such as that on the Treaty of Versailles, *"trop doux pour ce qu'il a de dur, trop dur pour ce qu'il a de doux."*

Jacques Bainville was the first writer in France to deal with the political philosophy of the World War. This he did in *L'lzistoire de deux peuples* (1915), a work in which the influence of hfaurras is modified by that of Thiers and Albert Sorel. The struggle between France and Germany is traced back to the far-off racial antagonisms from which it sprang, and one seems to be reading the documents of an endless lawsuit between the two peoples. The book is breathless and a little superficial, but clearly and brilliantly written. After the conclusion of peace he published *Les conséquences politiques de la paix* (1920) a reply to the well-known work of Mr. Maynard Keynes. The title itself of this book reflects the spirit of the *Action Française,* with its motto of "Politics First," and is an indication of how widely Bainville's views differed from those of the Cambridge economist. gainville's most celebrated work is his *Histoire de France* in one volume (1923), which is a model of clearness, intelligence, and grace of style. The doctrines of the *Action Française* in favour of the monarchical system are prominent, but they are considerably modified, and the dominating theme of the book is the continuity of political tradition in France. Latterly, Bainville wrote, after the style of Voltaire, a number of political essays, and, in 1926, a curious novel, *Jaco et Lori,* in which two parrots survey the political life of France during the second half of the 19th century and the beginning of the twentieth. **(A. T.)**

BAIRAM, a Perso-Turkish word meaning "festival," applied in Turkish to the two principal festivals of Islam. The first of these, according to the calendar, is the "Lesser Festival," called by the Turks *Kiichiik Bairām* ("Lesser Bairam"), or *Sheker Bairdm* ("Sugar Bairam"), and by Arabic-speaking Muslims *'Īd al-Fiṭr* ("Festival of Fast-breaking"), or *Al-'id aṣ-ṣaghīr* ("Lesser Festival"); it follows immediately the ninth or the fasting-month Ramadan, occupying the first three days of the tenth month, Shawwāl. Official receptions are held on it, and private visits paid; friends congratulate one another, and presents are given; new clothes are put on, and the graves of relatives are visited. The second, or "Greater Festival," is called by the Turks *Qurbān Bairdm,* "Sacrifice Bairam," and by Arabic speakers *Al-'id al-kabir,* "Greater Festival," or *'Īḍ al-adhd,* "Festival of Sacrifice." It falls on the tenth, and two or three following days, of the last month, *Dhū-l-hijja,* when the pilgrims each slay a ram, a he-goat, a cow or a camel in the valley of Minā in commemoration of the ransom of Ishmael with a ram. Similarly throughout the Muslim world, all who can afford it sacrifice at this time a legal animal, and either consume the flesh themselves or give it to the poor. Otherwise it is celebrated like the "Lesser Festival," but with less ardour. Both festivals, of course, belong to a lunar calendar, and move through the solar year every 32 years.

See Lane's *Modern Egyptians,* chap. xxv.; Hughes, *Dictionary of Islam,* pp. 192 ff.; Sir R. Burton, *Pilgrinzage,* chaps. vii., xxx.

BAIRD, SIR DAVID (1757–1829), British general, born at Newbyth, East Lothian, Scotland, entered the army in 1773, and went out to India as a captain in the 73rd (afterwards 71st) Highlanders in 1779. In the defeat of Col. Baillie's force by Hyder Ali, Baird was taken prisoner, and remained a prisoner for four years. After a short interval at home he returned to India in 1791 and took part in the campaign against Tippoo. After serving at the Cape of Good Hope he returned to India, and took part in the last war against Tippoo. Maj.-Gen. Baird stormed Seringapatam and became master of the place where he had so long been a prisoner. He was bitterly disappointed when the command of the place was given to Sir A. Wellesley (afterwards duke of Wellington), and resigned his command. His next campaigns were at the Cape of Good Hope (1805–06), and Copenhagen (1807). He was second in command at the battle of

Corunna (1808), and became commander-in-chief when Moore fell, but was wounded and superseded by Sir John Hope. He received the thanks of parliament, a K.B. and a baronetcy for his services, but, because of various political and personal enmities, was repeatedly passed over, and received no further command in the field, though he was promoted full general in 1814. He was commander-in-chief in Ireland from 1820 to 1822, and died on Aug 18 1829.

See *Lives* by Theodore Hook (1832), and W. H. Wilkin (1914).

BAIRD, HENRY MARTYN (1832–1906), American historian and educator, was born in Philadelphia on Jan. 17, 1832. He spent eight years of his early youth with his father in Paris and Geneva, and in 1850 was graduated from New York university. He then lived for two years in Italy and Greece, was a student in the Union theological seminary in New York, and in 1856 graduated at the Princeton theological seminary. He was a tutor for four years in the College of New Jersey (now Princeton university), and from 1859 until his death was professor of Greek language and literature in New York university. He is best known, however, as a historian of the Huguenots. His work, which appeared in three parts, entitled respectively *History of the Rise of the Huguenots of France* (1879), *Tlze Huguenots and Henry of Naaarre* (1886), and *The Huguenots and the Revocation of the Edict of Nantes* (1895), is characterized by painstaking thoroughness, by a judicial temper, and by scholarship of a high order. He also published *Modern Greece* (1856); a biography of his father, *The Life of tlze Rev. Robert Baird, D. D.* (1866); and *Theodore Beza, the Counsellor of the French Reformation* (1899). He died in New York city on Nov. 11, 1906.

His brother, CHARLES WASHINGTON BAIRD (1828–1887), a graduate of New York university (1848) and of the Union theological seminary (1852), and a minister at Brooklyn and Rye, N.Y., also published a scholarly work, *History of tlze Huguenot Emigration to America* (2 vols., 1885), left unfinished at his death.

BAIRD, JAMES (1802–1876), Scottish iron-master, was born at Kirkwood, Lanarkshire, on Dec. 5, 1802, the son of a coalmaster. In 1826 his father, two brothers and himself leased coalfields at Gartsherrie and in the vicinity, and in 1828 iron mines near by, and in 1830 built blast furnaces. In this year the father retired, the firm of William Baird and Co. was organized, and James Baird assumed active control. His furnaces, in 1864, were producing 300.000 tons annually and had 10.000 employees. The brothers became great landowners, and James was M P. for the Falkirk burghs in 1851–52 and 1852–57. He died at his estate near Ayr on June 20, 1876. He had been during his life a great public benefactor. founding schools and, in 1873, the Baird Trust of £500,000 for the Established Church of Scotland

BAIRD, JOHN LOGIE (1888–), British inventor, was born Aug. 13, 1888, in Helensburgh, Scotland and was educated at Larchfield Academy and Glasgow University. He served apprenticeship as an electrical engineer but abandoned engineering for a business career. In 1922 owing to ill health he gave up active business and retired to Hastings where he took up the study of television, his researches finally enabling him to give in January, 1926, a demonstration of television which has been claimed to be the first demonstration of true television ever given.

BAIRD, SPENCER FULLERTON (1823–1887), American naturalist, in his time the best informed man on the vertebrate fauna of North America, was born at Reading (Pa.) Feb. 3, 1823. In 1838 a meeting with Audubon, who gave Baird part of his own collection of birds, turned the young man's interest to ornithology. A year after his graduation from Dickinson college (1840), he made an ornithological excursion through the mountains of Pennsylvania. After studying medicine for a time, Baird became professor of natural history in Dickinson college (1845).

From the time he began his studies in natural science, Baird saw the pressing need of raw materials. By the time he was 27 he had accumulated 3,500 skins of birds; and collections of reptiles. embryos, skeletons, and skulls of North American vertebrates This became the nucleus of the vast collection of North American fauna which he assembled after he became assistant secretary of the Smithsonian institution in 1850. The great labour of correspondence, examination, description, and editing of reports for the Smithsonian collection was accomplished by Baird, in connection with the publication of the 13 fat quarto volumes of reports. In addition, Baird worked nights on the preparation of the volumes on birds, mammals, and reptiles. His great monographs at once became classics of systematic zoology. With the appearance of his volume on birds began what Dr. Elliott Coues (*Popular Science Monthly,* vol xxxiii , p. 553) calls the Bairdian period of American ornithology, lasting nearly 30 years. This volume, says Coues, "marked an epoch in the history of American ornithology."

In 1878 Baird succeeded Joseph Henry as secretary of the Smithsonian institution. Through Baird's efforts, Congress created the commission of fish and fisheries in 1874, and placed Baird at its head, in which position he did work worth millions of dollars to the country and organized fish culture in the United States so well that it has been widely copied as a model by other countries. Baird's influence with the government and authorities also brought about excellent field work in connection with nearly all government surveys and the signal service bureau, from the beginning of the Pacific railway surveys. He prepared for them manuals of instruction and reports of great importance.

G. Browne Goode said of him, "There is no name which occupies a more honourable place in the annals of American science than that of Spencer F. Baird." Among the more notable honours which he received were: Knight of the Royal Order of St. Olaf, conferred by the King of Norway and Sweden; silver medal of the Acclimatization Society of Melbourne, Australia; gold medal, Société d'acclimatation de France; and an honour by the emperor of Germany. Baird died at Woods Hole (Mass.) Aug. 19, 1887.

His most important works were: *Birds* (1858); *Mammals of North America* (1859); *History of North American Birds* (1875–84). A complete bibliography of his work and a detailed biography are given in the *Biog, Memoirs of the Nat'l Acad. of Sciences,* vol. iii. *See* also, Wm. F. Dalls, *Spencer* F. *Baird* (1915); G. Browne Goode, "Memorial and Bibliog.," *Bulletin 20 of US. Nat'l Museum;* C. Hart Merriam, "Baird, the Naturalist," *Scientific Monthly,* vol. xviii., pp. 588–595 (1924).

BAIRNSDALE, a town of Tanjil county, Victoria, Australia, on the Mitchell river, 171 m. by rail E. of Melbourne. Pop. about 4,000. It lies near the head of a lagoon (Lake King), which is open to the sea, and affords regular communication by water with Melbourne. In the district, which is chiefly pastoral, there are several goldfields, with both alluvial and reef mining. The town has tanneries and cheese and butter factories.

BAITER, JOHANN GEORG (1801–1877), Swiss philologist and textual critic, was born at Ziirich and was *Oberlehrer* at the gymnasium there from 1833 to 1876. Baiter's strong point was textual criticism, applied chiefly to Cicero and the Attic orators; most of his works were produced in collaboration with other scholars, notably Orelli. He edited Isocrates, *Panegyricus* (1831); with Sauppe, Lycurgus, *Leocratea* (1834), and *Oratores Attici* (1838–50); with Orelli and Winckelmann, a critical edition of Plato (1839–42), which marked a distinct advance in the text, two new mss. being collated; with Orelli, Babrius, *Fabellae Iambicae nuper repertae* (1845); Isocrates, in the Didot collection of classics (1846). He assisted Orelli in his great work on Cicero, and assisted in *Ciceronis Scholiastae* (1833) and *Onomasticon Tullianum* (1836–38). For the *Fasti Consulares* and *Triumphales* he was alone responsible. With Orelli and (after his death) Halm, he assisted in the second edition of the Cicero, and, with Kayser, edited the same author for the Tauchnitz series (1860–69). New editions of Orelli's Tacitus and Horace were also due to him.

BAIUS or **DE BAY, MICHAEL** (1513–1589), Belgian theologian, was born at Melun in Hainault. Educated at Louvain, he studied philosophy and theology and held various chairs there; in 1552 Charles V. made him professor of scriptural interpretation. At Louvain he was a leader in the anti-scholastic reaction under the banner of St. Augustine and so came into conflict with Rome on the vexed questions of grace and free-will. In 1567 Pius V. condemned 79 of his propositions in the Bull *Ex omnibus afflictionibus* Baius submitted, but indiscreet utterances by himself and his supporters led to a new condemnation in 1579 by Gregory

XIII. Baius, however, kept his professorship, and became chancellor of Louvain in 1575; he died there on Sept. 15, 1589. Baius is interesting as a forerunner of Cornelius Jansen (see JANSEN). His writings are described by Harnack as a fusion of Catholic orthodoxy with elements of Protestantism which were not regarded as such by Baius himself. The chief note of his teaching was the importance of sin, original and actual.

His principal works were published in a collected form at Cologne (1696); some large treatises have not been published. See F. X. von Linsenmann, *Michael Baius, und dze Grundlegung des Jansenismus* (Tubingen, 1867).

BAIZE, a material probably named from its original colour, though a derivation is also suggested from the Fr. baie, as the cloth is said to have been originally dyed with Avignon berries. It is generally a coarse, woollen cloth with a long nap, and is commonly dyed green or red. It is now also made of cotton. The manufacture is said to have been introduced into England in the 16th century by refugees from France and the Netherlands. It is used chiefly for curtains, linings, etc., and sometimes, in the lighter makes, for clothing. Table baize is a kind of oilcloth used as a cheap and easily-cleaned covering for tables.

BAJOUR or **BAJAUR,** a small district peopled by Pathan races of Afghan origin, in the north-west frontier province of India. It is about 45m long by 20m. broad, and lies at a high level to the east of the Kunar valley, from which it is separated by a continuous line of rugged frontier hills, forming a barrier easily passable at one or two points. Across this barrier the old road from Kabul to India ran before the Khyber pass was adopted as the main route. Bajour is inhabited almost exclusively by Tarkani (Tarkilanri) Pathans, subdivided into Mamunds, Isazai and Ismailzai, numbering, together with a few Mohmands, Utmauzais, etc., about 100,000. To the south of Bajour is the wild mountain district of the Mohmands, a Pathan race. To the east, beyond the Panjkora river, are the hills of Swat, dominated by another Pathan race. To the north is an intervening watershed between Bajour and the small state of Dir; and it is over this watershed and through the valley of Dir that the new road from Malakand and the Punjab runs to Chitral. Nawagai is the chief town of Bajour, and the khan of Nawagai is under British protection for the safe-guarding of the Chitral road. It was the active hostility between the amir of Kabul (who claimed sovereignty of the same districts) and Umra Khan of Jandola that led, firstly, to the demarcation agreement of 1893, which fixed the boundary of Afghanistan in Kunar, and, secondly, to the invasion of Chitral by Umra Khan (who was no party to the boundary settlement) and the siege of the Chitral fort in 1895.

An interesting feature in Bajour topography is a mountain spur from the Kunar range, which, curving eastwards, culminates in the well-known peak of Koh-i-Nor, which is visible from the Peshawar valley. It was here, at the foot of the mountain, that Alexander found the ancient city of Nysa and the Nysaean colony, traditionally said to have been founded by Dionysus. The Koh-i-Nor has been identified as the Meros of Arrian's history—the three-peaked mountain from which the god issued. It is also interesting to find that a section of the Kafir community of Kamdesh still claim the same Greek origin as did the Nysaeans; still chant hymns to the god who sprang from Gir Nysa (the mountain of Nysa); whilst they maintain that they originally migrated from the Swat country to their present habitat in the lower Bashgol. Long after Buddhism had spread to Chitral, Gilgit, Dir and Swat, whilst Ningrahar was still full of monasteries and temples, and the Peshawar valley was recognized as the seat of Buddhist learning, the Kafirs or Nysaeans held their own in Bajour and in the lower Kunar valley, where Buddhism apparently never prevailed.

The gazetteers and reports of the Indian Government contain nearly all the modern information available about Bajour. The autobiography of Baber (by Leyden and Erskine) gives interesting details about the country in the 16th century. For the connection between the Kafirs and the ancient Nysaeans of Swat, see R.G.S. *Journal*, vol. vii. (1896).

BAJZA, JOSEPH (1804–1858), Hungarian poet and critic. His earliest contributions were made to Kisfaludy's *Aurora*, which he edited from 1830 until 1837, when he was made director of the newly established national theatre at Pest. In 1847 Bajza edited the journal of the Opposition, *Ellenör*, at Leipzig, and in March 1848 Rossuth made him editor of his paper, *Kossuth Hirlapja*.

BAKALAI, a Bantu negroid tribe inhabiting the French Congo. They appear to be immigrants from the south-east, and are perhaps connected racially with the Galoa, one of the Mpongwe tribes and the chief river-people of the Ogowé. Their women display considerable ingenuity in dressing their hair, often taking a whole day to arrange a coiffure; the hair is built up on a substructure of clay and a good deal of false hair incorporated; a coat of red, green or yellow pigment often completes the effect. The same colours are used to decorate the hut doors. Some villages are fortified with palisades. Chiefs and rich men own plantations at some distance from the village to which their womenfolk are sent in times of war. The Bakalai of Lake Isanga cremate their dead; those of the Upper Ogowé throw the bodies into the river, except those killed in war. The body of a chief is placed secretly in a hut erected in the depths of the forest, and the village is deserted for that night, in some cases altogether; the slaves of the deceased are (or were) sacrificed, and his wives scourged and secluded in huts for a week. "Natural" deaths are attributed to the machinations of a sorcerer, and the poison-ordeal is often practised. Nearly all individuals refrain from eating the flesh of some particular animal.

BAKELITE, a synthetic resin developed by Dr. L. H. Baekeland in America. It has many industrial applications, but chiefly as an electrical insulator. It is prepared by the chemical interaction of phenolic substances, such as phenol and cresol found in coal-tar, and aldehydes such as formaldehyde, a derivative of methyl alcohol obtained either synthetically or by the distillation of wood. (See BAEKELAND; RESINS: Synthetic.)

BARER, SIR BENJAMIN (1840–1907), English engineer, was born at Keyford, Frome, Somerset, on March 31, 1840, and, after receiving his early training in a South Wales ironworks, became associated with Sir John Fowler in London. He was Fowler's chief assistant in the construction of the Metropolitan and District railways (London). He designed the cylindrical vessel in which Cleopatra's Needle, now standing on the Thames embankment, London, was brought over from Egypt to England in 1877–78. He made a thorough study of bridge construction, on which he wrote a series of important papers from 1867 onwards, and he was associated with Fowler in the design and erection of the Forth bridge completed in 1890. Fowler and Baker were consulted by the Egyptian Government on many important engineering undertakings. He sat on the commission appointed by Lord Cromer to consider Sir William Willcocks's plan for the storage of Nile water for irrigation purposes, and was consulting engineer for the making of the Aswan dam, opened in 1902. Sir Benjamin Baker, who also had a large share in the introduction of the system widely adopted in London of constructing intra-urban railways in deep tubular tunnels built up of cast-iron segments, obtained an extremely large professional practice, ranging over almost every branch of civil engineering. He served on many government and municipal commissions, and was a member of many learned societies, rendering especially valuable services to the Institution of Civil Engineers, on the council of which he sat for many years. He received a K.C.M.G. in 1890, and a K.C.B. in 1902. He died at Pangbourne, Berks, on May 19, 1907.

BAKER, GEORGE FISHER (1840–1931), American financier, was born in Troy, N.Y., March 27, 1840. When he was eight years old his family removed to Brooklyn, N.Y., and later to Williamsburg, N.Y. Most of his boyhood was spent at Dedham, Mass. After a brief period of schooling at Williamsburg, N.Y., he entered Semard university, Florida, N.Y., at which he graduated at the age of 16. From 1858 to 1863 he was a clerk in the State banking department, his services being interrupted for six months at the outbreak of the Civil War, when he acted as secretary to Gov. E. D. Morgan of New York. When the national banking system was created in 1863, John Thompson and his sons, Samuel C. and Frederick F. Thompson, with Baker, estab-

lished the First National Bank of New York city. Baker received a position as teller and was offered on credit all the stock he wanted. Baker refused, however, to go into debt, and bought only 30 shares with his savings.

The bank at first grew slowly, dealing chiefly in Government bonds; but when, in 1865, Baker became cashier and active head it began to expand rapidly, being admitted to the Clearing House in 1868. Baker was frequently consulted by the secretary of the Treasury and in 1877 he became president of the bank, the policy of which he continued to direct with such success as to make it one of the strongest banking institutions in America. In 1882 he acquired the Richmond and Danville railroad, which was the nucleus of a group reorganized as the Southern railway. Later he obtained control of the Jersey Central and the Delaware, Lackawanna and Western railways, when these systems were in difficulty.

In addition to the presidencies and directorships of numerous powerful corporations, he was president of the Metropolitan Opera House Association. His benefactions included large gifts to the Metropolitan Museum of Art, to the Red Cross and to universities, including one of $6,000,000 for the Graduate School of Business Administration of Harvard.

BAKER, GEORGE PIERCE (1866–1935), American educator, was born at Providence (R.I.), on April 4, 1866. He graduated from Harvard in 1887, and from 1905 to 1924 was professor of English there. His courses dealing with the theory of the drama were highly successful, and his famous laboratory, known as the "47 Workshop," afforded practical training for his students. He gave a course at the Sorbonne in Paris (1907–08) on the development of the English drama. In 1925 he became head of the department of dramatic art, School of the Fine Arts, Yale university. His works include: *The Development of Shakespeare as a Dramatist* (1907); *Dramatic Technique* (1919); and *Modern American Plays,* collected and edited with introduction (1920). He died Jan. 6, 1935.

BAKER, HENRY (1698–1774), English naturalist, was born in London on May 8, 1698. His invention of a system of instructing the deaf and dumb brought him to the notice of Daniel Deioe, whose youngest daughter Sophia he married in 1729. A year before, under the name of Henry Stonecastle, he was associated with Defoe in starting the *Universal Spectator and Weekly Journal.* He contributed many memoirs to the *Transactions* of the Royal Society, and in 1744 received the Copley gold medal for microscopical observations on the crystallization of saline particles. He was one of the founders of the Society of Arts in 1754, and for some time acted as its secretary. He died in London on Nov. 25, 1774. His name is perpetuated by the Bakerian lecture of the Royal Society, for the foundation of which he left by will the sum of £100.

BAKER, NEWTON DPEHL (1871–1937), American lawyer, administrator, and party leader, was born at Martinsburg, W. Va., Dec. 3, 1871. He was educated at Johns Hopkins (B.A. 1892) and at Washington and Lee (LL.B., 1894). In 1897 he began the practice of law in his native town, removing later to Cleveland, Ohio. There he soon distinguished himself as a lieutenant of Mayor Johnson in the latter's long struggle for tax reform and three-cent fares. Appointed city solicitor by the mayor in 1902, he held that office by election from 1904 to 1912 and that of mayor from 1912 to 1916. On the floor of the Democratic national convention oi 1912 he fought successfully to release the Ohio delegation from the unit rule, thereby contributing 18 votes toward the nomination of Wilson. As President-elect the latter offered him in 1913 the secretaryship of the interior, which he declined in order to push forward municipal reforms in Cleveland. Upon the resignation of Garrison three years later, however, he was appointed secretary of war. Although an avowed pacifist, immediately after the organization of the 65th Congress in 1917 he submitted a plan for universal military conscription, and remained at the head of the department of war throughout the whole period of the World War and to the retirement of Wilson in 1921. Administration policies regarding preparedness, conduct of the War, and treatment of conscientious objectors, became the subjects of severe criticism, much of it for partisan ends. In reply to this, he maintained before the Chamberlain Senate committee early in 1918 that "no army of similar size in the history of the world has ever been raised, equipped, or trained so quickly." After 1921 he resumed the practice of law in Cleveland. In the Democratic convention of 1924 he made a strenuous but losing fight for a strong League of Nations plank. (R. C. B.)

BAKER, SIR RICHARD (1568–1645), author of the *Chronicle of the Kings of England* and other works, was born probably at Sissinghurst, in Kent. He was educated at Oxford, and sat in Parliament for East Grinstead (1597). In 1620 he was high sheriff of Oxfordshire, but in 1623 his property in the county was seized for debts contracted by his wife's family, for which he had made himself responsible. He died on Feb. 18, 1645, in the Fleet prison where he spent the last ten years of his life.

His *Chronicle of the Kings of England from the Time of the Romans' Government unto the Death of King James* (1643, and many subsequent editions), was translated into Dutch in 1649, and was continued down to 1658 by Edward Phillips, a nephew of John Milton. The *Chronicle* was extremely popular, but its historical value is very slight. Baker also wrote many controversial and religious works during his imprisonment. His *Meditations* upon the psalms were edited by A. B. Grosart (1882).

See J. Granger, *Biographical History of England to the Revolution* (1804); *Biographia Britannica,* corrected *by* A. Kippis (1778–93).

BAKER, SIR SAMUEL WHITE (1821–1893), English explorer, was born in London, June 8, 1821, the son of a West India merchant. He was educated partly in England and partly in Germany. He spent two years in Mauritius (1844–46) and then went to Ceylon, where he founded an agricultural settlement at Nuwara Eliya, a mountain health-resort. He introduced emigrants from England and imported choice breeds of cattle. During his residence in Ceylon he published *The Rifle and the Hound in Ceylon* (1853), and two years later *Eight Years' Wanderings in Ceylon* (1855). After a journey to Constantinople and the Crimea in 1856, he undertook the supervision of the construction of a railway across the Dobruja, connecting the Danube with the Black Sea. In March 1861 he started upon his first tour of exploration in central Africa, "to discover the sources of the Nile, with the hope of meeting the East African expedition under Captains Speke and Grant somewhere about the Victoria Lake." After a year spent on the Sudan-Abyssinian border, during which time he learnt Arabic, explored the Atbara and other Nile tributaries, and proved that the Nile sediment came from Abyssinia, he arrived at Khartum, leaving that city in Dec. 1862 to follow up the course of the White Nile. Two months later at Gondokoro he met Speke and Grant, who, after discovering the source of the Nile, were following the river to Egypt. Their success made him fear that there was nothing left for his own expedition to accomplish; but the two explorers generously gave him information which enabled him, after separating from them, to discover the Albert Nyanza, of the existence of which credible assurance had already been given to Speke and Grant. Baker first sighted the lake on March 14, 1864. After some time spent in the exploration of the neighbourhood, during which Baker demonstrated that the Nile flowed through the Albert Nyanza—of the size of which he had formed an exaggerated idea—he started upon his return journey, and reached Khartum after many checks in May 1865. In the following October he returned to England with his wife, a Hungarian lady *née* Florence von Sass, who had accompanied him throughout the whole of the perilous and arduous journey. On his return the Royal Geographical Society awarded him its gold medal, and a similar distinction was bestowed on him by the Paris Geographical Society. In Aug. 1866 he was knighted. In the same year he published *The Albert N'yanza, Great Basin of the Nile, and Explorations of the Nile Sources,* and in 1867 *The Nile Tributaries of Abyssinia,* both books quickly going through several editions. In 1868 he published a popular story called *Cast up by the Sea.* In 1869 he attended the prince of Wales, afterwards King Edward VII., in a tour through Egypt. In the same year, at the request of the khedive Ismail, Baker undertook the command of a military expedition to the equatorial regions of the Nile, with the object of suppressing the slave-trade there and opening the way to com-

merce and civilization. Before starting from Cairo with a force of 1,700 Egyptian troops—many of them discharged convicts—he was given the rank of pasha and major general in the Ottoman army. Lady Baker, as before, accompanied him The khedive appointed him governor-general of the new territory for four years at a salary of £10,000 a year, and at the expiration of that time Baker returned to Cairo, leaving his work to be carried on by the new governor, Colonel Charles George Gordon. He had to contend with innumerable difficulties—the blocking of the river by sudd, the bitter hostility of officials interested in the slave trade, the armed opposition of the natives—but he succeeded in planting in the new territory the foundations upon which others could build up an administration. He returned to England with his wife in 1874, and in the folloning year purchased the estate of Sandford Orleigh in south Devon, where he made his home for the rest of his life.

He published his narrative of the central African expedition under the title of *Ismailia* (1874). *Cyprus as I saw it in 1879* was the result of a visit to that island.

He spent several winters in Egypt, and travelled in India, the Rocky Mountains and Japan in search of big game, publishing in 1890 *Wild Beasts and their Ways*.

See, besides his own writings, *Sir Samuel Baker, a Memoir*, by *T*. Douglas Murray and **A.** Silva White (1895).

BAKER, THOMAS (1656–1740), English antiquary, was born at Lanchester, Durham, England, and died at Cambridge. His most important printed work was his *Reflections on Learning* (1709–10). He spent the greater part of his life as fellow, and then as commoner-master of St. John's college, Cambridge.

BAKER, VALENTINE (BAKER PASHA) (1827–1887), British soldier, was a younger brother of Sir Samuel Baker (*q.v.*). He was educated at Gloucester and in Ceylon, and in 1848 entered the Ceylon Rifles as an ensign. He distinguished himself in the Kafir War of 1852–53 and in the Crimean War, and was for 13 years colonel of the 10th Hussars. He went through the wars of 1866 and 1870 as a spectator with the German armies, and in 1873 he started upon a famous journey through Khorasan. Though he was unable to reach Khiva, the results of the journey afforded a great deal of political, geographical and military information, especially as to the advance of Russia in central Asia. In 1874 he was back in England and took up a staff appointment at Aldershot. Less than a year later Colonel Baker's career in the British army came to an untimely end. He was arrested on a charge of indecent assault upon a young woman in a railway carriage, and was sentenced to a year's imprisonment and a fine. Two years later he entered the service of Turkey in the war with Russia. In 1883 he accepted the command of the newly-formed Egyptian army. On his arrival at Cairo, however, the offer was withdrawn and he obtained only the command of the Egyptian police.

When the Sudan War broke out, Baker, hastening with 3,500 men to relieve Tokar, encountered the enemy under Osman Digna at El Teb. His men became panic-stricken at the first rush and allowed themselves to be slaughtered like sheep. Baker himself with a few of his officers succeeded by hard fighting in cutting a way out, but his force mas annihilated. British troops soon afterwards arrived at Suakin, and Sir Gerald Graham took the offensive. Baker Pasha accompanied the British force, and guided it in its march to the scene of his defeat, and at the desperately-fought second battle of El Teb he mas wounded. He remained in command of the Egyptian police until his death in 1887. Among his works are *Our National Defences* (1860); *War in Bulgaria, a Narrative of Personal Experience* (1879); *Clouds in the East* (1876).

BAKER, one who bakes bread, biscuits, cakes, rolls, etc., for the market. The term is often extended to include those who simply sell bread, cakes and pastry. The term is sometimes applied to a portable oven for baking food and less commonly to an artificial fly used for salmon fishing and to the oven-bird, so named because it builds an ovenlike nest of clay or mud. (*See* BREAD AND BREAD MANUFACTURE; PASTRY. HOME MADE.)

BAKER, the largest city of eastern Oregon, U S A., about 338 mi. E. by S. of Portland, on the Old Oregon trail and the main line of the Union Pacific Railroad; it is the county seat of Baker county.

The Sumpter Valley railway connects at Austin (60 mi. S.W.) with stage lines for Grant county points. The population was 7,858 in 1930 and 9,342 in 1940 by federal census.

Baker lies in the beautiful valley of the Powder river, between the Cornucopia and the Elkhorn mountains, about 3,440 ft. above sea level. It is the centre of important mining, lumber, farming, dairying and livestock interests and has a large wholesale trade. Its industries include creameries, sawmills, planing mills and a cement plant.

The town was laid out in 1865, became the county seat in 1868, and was chartered as a city in 1874. The county and the city were named after Edward Dickinson Baker (b. 1811 in London), who served in the Mexican War as colonel, was prominent in local politics and met his death at Ball's Bluff, Va., Oct. 21, 1861. while serving as colonel in the Federal army.

BAKER ISLAND, a little sandspit in the Pacific ocean, lat. 0° 13′ N., long. 176° 28′ W. With Howland (*q.v.*) and Jarvis islands (q. *v.*), it mas placed under the jurisdiction of the U.S. department of the interior, by executive order of President Franklin D. Roosevelt, on May 13, 1936. The island was discovered by Michael Baker, of New Bedford, Mass., who visited it in 1832 and 1839, in the whaling ship "Gideon Howland." Baker Island is less than a mile in diameter and is surrounded by a ridge, the interior being almost entirely flat. The western shore line may change several times in the course of a year under the influence of shifting tides. The climate is hot and dry, and the vegetation is restricted to scattered herbs, grass and shrubs. The ridge which encloses the island rises to a height of 20 ft. at the southwest corner, where a steep sandy beach slopes down to the water's edge. An occasional light is shown from a white cylindrical stone tower in the western part of the island. Ships are warned that no supplies are available at Baker. It is one of the few steppingstones between Hawaii and Pago Pago, in American Samoa, and can be useful as a refueling station on the supply route of the U.S. navy between Hawaii and New Zealand.

(W. H. CH.)

BAKERSFIELD, a city of California, U S.A., on the Kern river, 100 mi. N.W. of Los Angeles, in the southern part of the San Joaquin valley; the county seat of Kern county. It is on federal highway 99; is served by the Santa Fe and the Southern Pacific railways, and by auto-stage lines to Los Angeles and San Francisco. It is one of the principal commercial airports on the Pacific coast mail line between Seattle and Los Angeles. The population was 4,836 in 1900; 18,638 in 1920; and was 29,252 in 1940 by federal census.

The city's prosperity rests on the agricultural development of Kern county and its oil fields. Cotton is the leading crop (123,000 bales ginned in 1940), followed closely by early vegetables, alfalfa and fruits, including seedless grapes. Oil was struck in the Kern river field in 1899, and the county's production for the calendar year 1940 was 60,336,987 net barrels. Pipe lines carry the oil to the harbours of Los Angeles and San Francisco, and Los Angeles takes all the natural gas sent out of the county. There are large oil refineries, and compressor plants making gasoline out of natural gas.

About 50 or 55 oil companies have offices in the city. The Elk Hills naval reserve is 23 mi. W.

The assessed valuation of property in Bakersfield was $42,000,000 in 1939. Bank clearings in 1940 approximated $86,031,596. The city has a planning commission and a city-manager form of government. A wild flower festival is held every March.

Pioneers coming by stage through Tejon pass settled here as early as 1858. A post office was established in 1868. The city was laid out in 1869 by Col. Thomas Baker, after whom it was named. He was a civil engineer who came in 1862 to supervise a reclamation project. In 1870 it had a population of about 600. It was chosen as the county seat by a popular election in 1873, and incorporated soon after. The Southern Pacific reached it in 1874. In 1889 it was almost entirely destroyed by fire. Thirty-eight miles S. is Fort Tejon, an adobe house built in 1854, which guarded the pass until 1864.

BAKEWELL, ROBERT (1725–1795), English agriculturist, was born at Dishley, Leicestershire, in 1725; in 1760 he took over the management of the estate at Dishley. His main object was to improve the breed of sheep and oxen, and in this he was highly successful, his new Leicestershire breed of sheep attaining within little more than half a century an international reputation, while the Dishley cattle (also known as the new Leicestershire long-horn) became almost as famous. He extended his breeding experiments to horses, producing a new and particularly useful type of farm-horse. He was the first to establish the trade in ram-letting on a large scale, and founded the Dishley Society, the object of which was to ensure purity of breed. The value of his own stock was quickly recognized. and in one year he made 1,200 guineas from the letting of a single ram. Bakewell's agricultural experiments were not confined to stock-breeding. His reputation stood high in every detail of farm-management, and as an improver of grass land by systematic irrigation he had no rival. He died on Oct. 1, 1795.

BAHEWELL, ROBERT (1768–1843), English geologist, wrote an *Introduction* to *Geology* (1813) which reached a fifth edition in 1838. He died at Hampstead on Aug. 15, 1843.

BAKEWELL, urban district, Derbyshire, England, on the river Wye, 25 mi. N.N.W. of Derby on the L.M.S. Ry. Pop. (1938) 3,191. Area 4.8 sq.mi. On Castle hill, in the vicinity, are remains of earthworks said to have been raised by Edward the Elder in 924. There was a settlement at the time of Domesday, where the church of All Saints receives mention. The almshouses (St. John's hospital) were founded in 1602, and the free grammar school dates from 1637. The village was almost depopulated by the plague of 1665. Bakewell has chalybeate springs and baths. Zinc and marble are worked in the neighbourhood. Haddon Hall is 2 mi. from the town and the picturesque village of Eyam (pr. Eem) is 6 mi. north.

BAKHCHI-SARAI (Turkish for "Garden palace"), a town in the Autonomous Crimean Soviet Socialist Republic. Lat. 44° 47' N., Long. 33° 56' E., on the railway 20 mi. S.S.W. of Simferopol. Population 10,800, mainly Tatar, making morocco leather, sheepskin cloaks, and small metal goods. From the 15th century to 1783 it was the residence of the Tatar Khans of Crimea and is still oriental in appearance. The Khan Sarai, erected in 1519 by Abdul-Sahal-Ghirai, and destroyed 1736, was restored through Potemkin for Catherine II: it contains tombs of the khans. There are 36 mosques in Bakhchi-Sarai, and 2½ mi. east, on almost inaccessible cliffs, is Chufut-Raleh (Jews' City), formerly the chief seat of the Karaite Jews, now deserted. The Uspenskiy monastery, on the cliff face between Bakhchi-Sarai and Chufut-Kaleh, was the scene of a great annual pilgrimage on Aug. 15 (29).

BAKHMUT, now ARTEMOVSK (*q.v.*).

BAKHTIARI, one of the great nomad tribes of Persia, whose camping-grounds are in the hilly district, known as the Bakhtiári province. The Bakhtiári are divided into the two great divisions, Haft-lang and Chahar-lang, and a number of branches and clans, and were known until the 15th century as the "Great Lurs," the "Little Lurs" being the tribes settled in the district now known as Luristan, with Khorremábád as capital. According to tradition the Lurs originally came from Syria in the 10th century, but they were probably in Persia 15 centuries before. They speak the Lur language, a Persian dialect.

For accounts of the Bakhtiári *see* Mrs. Bishop (Isabella Bird), *Journeys in Persia and Kurdistan* (London, 1893); C. de Bode, *Travels in Luristan* (London, 1841); Lord Curzon, *Persia and the Persian Question,* vol. ii. 283–303 (London, 1892); Sir H. Layard, *Early Adventures in Persia* (London, 1894).

BAKING POWDER, a prepared mixture to replace yeast in baking, containing as active ingredients, customarily, sodium bicarbonate (baking soda), and either potassium acid tartrate (cream of tartar), tartaric acid, or potassium aluminum sulphate (alum) or other material which, when moistened, acts as an acid to liberate carbon dioxide from the baking soda. Baking powders frequently contain starch, flour or other inert powdery materials, which serve to prevent premature reaction between the other ingredients,

BAKKARA, a tribe of Sudan Arabs. The young men are described as great dandies, and, though dark skinned, well formed noses seem to predominate. Their women, or at least the younger, wear the *rahad* (a deeply fringed belt of cut leather) or a width of cloth round the loins, but do not wear the length of cotton which envelopes the whole body, as even the women of the camel nomads do. With the possible exception of the Shaikia the Bakkara—who formed the backbone of the army of the Khalifa, himself a Ta'aishi—are the most warlike of the Sudan Arabs, and, living on the northern edge of the negro country, were inveterate slave raiders and traders until brought under control. Among their more notable tribes are, in Kordofan the Awlad Hamayd, the Habbania, the Hawaznia and the Messiria, in Darfur the Rizaykat, the Ta'aisha and the Beni Helba. ***See*** ARABS (Bibliography).

BAKÓCZ, TAMAS (BOKOTS), CARDINAL (1442–1521), Hungarian ecclesiastic and statesman, was the son of a wagoner, adopted by his uncle, who trained him for the priesthood and whom he succeeded as rector of Tétel (1480). Shortly afterwards he became one of the secretaries of King Matthias I., who made him bishop of Gyor and a member of the royal council (1490). Under Wladislaus II. (1490–1516) he became successively bishop of Eger, archbishop of Esztergom (1497), cardinal (1500), and titular patriarch of Constantinople (1510). From 1490 to his death in 1521 he was the leading statesman of Hungary and mainly responsible for her foreign policy. It was solely through his efforts that Hungary did not accede to the league of Cambrai, was consistently friendly with Venice, and formed a family compact with the Habsburgs. He was the only Magyar prelate who aspired to the papal throne. In 1513, on the death of Julius II., he went to Rome and barely failed to secure his election as pope. He returned to Hungary as papal legate, bringing with him the bull of Leo X. proclaiming a fresh crusade against the Turks. But the crusade degenerated into a *jacquerie* which ravaged the whole kingdom, and much discredited Bakócz. He lost some of his influence at first after the death of Wladislaus, but continued to be the guiding spirit at court, till age and infirmity confined him almost entirely to his house in the last three years of his life.

Bakócz was *a* man of great ability but of no moral principle whatever. His whole life was a tissue of treachery. He was false to his benefactor Matthias, false to Matthias's son János Corvinus, whom he deprived of the throne by arts of chicane, and false to his accomplice in that transaction, Queen Beatrice. His attempt to incorporate the wealthy diocese of Transylvania with his own primatial province was one of the principal causes of the spread of the Reformation in Hungary. He left a fortune of many millions. His one redeeming feature was a love of art.

See Vilmos Fraknoi, *Tamás Bakdcz* (Hung.) (1889).

BAKRI, ABŪ 'UBAID 'ABDALLAH IBN 'ABD UL-'AZĪZ UL-BAKRĪ (1040–1094), Arabian geographer, was born at Cordova. He compiled a dictionary of geographical names occurring in the poets (edited by F. Wuestenfeld, Goettingen, 1876–77).

See C. Brockelmann, *Gesch. der Arab. Literatur* (Weimar, 1898), vol. I., p. 476.

BAKST, LÉON (1866–1924), Russian painter, passed his childhood in St. Petersburg (Leningrad). He attended the Imperial Academy of Arts, but left after painting a too realistic "Pietà." A member of the Society of Painters in Water Colours and a teacher to the children of the Grand Duke Vladimir, he succeeded both as a court painter and in the fashionable world. From 1900 he was scenic artist, first at the Hermitage Court theatre and afterwards at the Imperial theatres. He designed the scenery and accessories for the tragedies of Sophocles in the spirit of the Greek theatre and in the archaic style of the Aegina sculptures. He made a voyage to Greece and Crete of ,which he wrote an account, and his famous picture "Terror Antiquus" expresses his vision of mythic Greece.

In 1906 he exhibited in the Russian section of the Salon d'Automne in Paris. Two years afterwards he achieved considerable fame as the chief painter of scenery for the Russian ballets produced by Diaghilev. "Cleopatra," "Scheherazade" (1909) and "Daphnis and Chloe" were among his most notable

achievements. He returned to Russia and founded a liberal school of painting. Afterwards he settled in Paris, where he designed the setting of the tragedies of D'Annunzio and of a play of Verhaeren. He painted the scenery and designed the costumes for the "Sleeping Princess," the fairy ballet of Tchaikovski produced in London in 1921. He also produced several plays at the Paris Opera, among them the "Bewitched Night." Léon Bakst revolutionized the application of the decorative arts of the theatre and aimed at unity of impression. The influence of his genius may also be seen in the costumes of the time. He died in Paris.

See André Levinson, ***The*** *Story of Ldon Bakst's Life* (1921).

(A. LE.)

BAKU, chief city of the Azerbaijan S.S.R., on the west coast of the Caspian sea, south of the Apsheron peninsula, 40° 22' N., 49° 50' E. Av. rainfall 9·5 inches. Av. temp. Jan. 38·1° F, July 78·8° F. A violent north-north-west wind blows in winter. It is the centre of the Baku region, area 4,970sq.km. Pop. (1926) 520,936, only 73,564 rural, the remaining 446,832 being concentrated in Baku city, the number of men being much in excess of that of women. The town has a larger proportion of Russians than the rest of Azerbaijan. It is chiefly famous for its naphtha, the output 1926–27 being 6,400,000 tons, about $\frac{1}{13}$ of which was from natural fountains and the rest from drill-wells. A hydro-electric power plant to supply the oil refineries was completed in 1927. Recently constructed pipe lines completed in 1928 convey oil to Batum and Poti. Baku has a good harbour and is served by a fleet, mainly for oil, consisting in 1925 of 81 motor driven vessels (tonnage 112,049), 162 oil barges (tonnage 246,000), 75 dry cargo steamers and 63 line steamers and tugs. The oil transport facilities are good, but the dry cargo vessels (mainly for Persian and Trans-Caspian products, raw cotton, silk, rice, wine, fish, dried fruit and timber) are antiquated and inadequate. The silting up of the Volga delta seriously interferes with up-river transport to Moscow, and dredging would improve trade. Baku has good rail connections with the Black sea, in the north via Vladikavkaz, and in the south via Tiflis to Batum. The new town is creeping up the hill, and has petroleum refineries and factories for oil fuel, flour milling, sulphuric acid and tobacco. Near the harbour are engineering works, dry docks, barracks, stores, etc. A fair (May and June) serves for exchange between the Union of Socialist Soviet Republics and Persia, the latter providing cotton, wool, carpets, rice and dried fruits in exchange for Russian sugar. Transactions in 1926, when a special building for the fair was opened, amounted to 10,000,000 roubles. Baku has a university, a polytechnic institute, and other centres for education, drama, art and music.

The old town lies west and has ancient walls, with traces of 9th century and 10th century Arab architecture, the mosque of the Persian shahs built in 1078 (now an arsenal), the ruins of the 16th century palace of the native khans and, nearer the sea, the "Maiden's Tower," now a lighthouse. Baku was mentioned by the 10th century Arab geographer, Masudi. From 1509 to 1723 it was under Persian rule; it was then captured by the Russians but restored 173 j, and finally incorporated in the Russian empire in 1806. It suffered severely in the anarchy of 1904–05, when many oilworks were burned, and again in 1914–21. On the Apsheron peninsula, 30m. from Baku, is the village of Nardoron, with 13th century relics: a recent shifting of the sand has revealed an ancient mausoleum of Sheikh Said-Yusif-Caliph, 8th century.

BAKUNIN, MIKHAIL (1814–1876), Russian anarchist, was born at Torjok, Tver. He served as an officer of the imperial guard in Poland, but resigned in protest against Tsarist methods. He then travelled in Germany, France and Switzerland, where he fixed his residence, refusing a summons of the Russian Government to return, an act which cost him the confiscation of his estates. In 1849 he, like Wagner, took part in the vain defence of the Dresden revolutionary government. He was arrested and handed over to the Russian Government which sent him to eastern Siberia (1855), whence he escaped and returned to Europe (1861). From this time he took the place of Proudhon (*q.v.*) as the leading anarchist of Europe, till his death in Berne on June 13, 1876.

His chief principles, as enunciated in his God *and the State* (1882) and his letters, are three: (1) Atheism, and the propaganda of atheism—not agnosticism; (2) the destruction of the State; the State being an organ of oppression all that is needful is to break its power. A system of anarchist communism will then automatically appear. The anxiety of the socialists to put in the place of a capitalist State another, revolutionary, State is consequently idiotic; (3) political action must be rejected, because the destruction of the State cannot be achieved by political action but by insurrection. But while he demanded the complete abrogation of authority in society and in the organizations to which he belonged, he followed a reverse principle in organizations under his own control. These consisted of devoted revolutionaries who placed the revolution before everything else and yielded implicit obedience to their leader. He wrote in 1870 to his lieutenant Albert Richard, "Have you never thought what is the principal cause of the power and vitality of the Jesuit order? . . . it is the complete effacement of individuals and of private wills in collective organization and action." For this purpose he organized the "Alliance of Socialist Democracy" which operated first in a body called the League of Peace and Freedom and then in the International Association of working men. Within the Alliance, which was not secret, was an organization of secret "national brothers," and above them again a supreme organization of 100 "international brothers." After 1872, when this organization was dislocated, Bakunin formed another secret body which was called simply "Y." In the organization of all these he was chiefly aided by a Russian named Nechaieff, and he drew in 1870 a bitter picture of his methods: "For him, truth, mutual confidence, real and strict solidarity only exist between a dozen individuals who form the *sanctus sanctorum* of the Society. All the rest are to serve as blind instruments . . . they are conspiracy-fodder. . . . In the name of the cause it is his duty to gain possession of your whole person without your knowledge. . . . If your friend has a wife or a daughter, he will manage to seduce her and give her a baby in order to force her to break away from official morality and into a revolutionary protest against society." His views gained wide acceptance in the International (*q.v.* for further details) before it was split in 1872, especially in Spain, Italy, Belgium and French Switzerland. An anarchist insurrection, personally directed, at Lyons in 1870 was a fiasco, but the Bakuninists played a great part in the Spanish revolution of 1873, being in control or part control of several towns during the year. Their influence died away in Belgium, but in Italy and later in Russia, Bakuninism was for years exceedingly powerful.

Bakunin was the progenitor of Nihilism, but was no great theorist himself. What elaborations he made on his three main principles were, as he himself said, due to the "great master of us all, Proudhon." His influence in his lifetime was largely personal: his sincere and impulsive character profoundly impressed men much his superior in intellect. His philosophy struck deep roots only in countries such as Italy, Spain and Russia which were industrially backward and had a large oppressed peasant population. Historically, he was justified in his claim to be the successor of Stenka Razin and the leaders of the *jacquerie*.

See INTERNATIONAL, THE; ANARCHISM, and their attached bibliographies, also R. W. Postgate, *The Workers' International* (1920, bibl.), and G. M. Stekloff, *History of the First International (1928,* bibl.). M. Nettlau's (German) life of Bakunin has not been published; there is a duplicated copy in the British Museum.

(R. W. P.)

BAKWE, a vigorous, fair-complexioned folk of medium stature on the French Ivory Coast between the Sassandra and Kavally rivers. The sub-tribes Ne, Houane, Pia, Abri, Pla and Ba live on the coast and supply crews known as *Krumen* for European vessels. The Bakwe properly so-called, the Ba, and the Te, dwell inland. The extended family has its patrimony in common. Marriage is exogamous, polygamy is allowed, the first wife being the head. Descent is patrilineal. The family property is inherited by the surviving brother, then by the eldest son. They are animists, and have ordeals by boiling oil or redwood.

See Thomann, *Essai de Manuel de la Langue Neoulé* (1905).

BA-KWIRI, a Bantu people in southern Nigeria. According to tradition they are migrants from the eastward. The "Brush-

men," for that is the meaning of their name, are grouped in about 60 separate clans. Most of the women are much shorter and far lighter in colour than the men. The law of blood for blood is mercilessly fulfilled, even in cases of accidental homicide. Their religion is ancestor-worship blended with witchcraft and magic. They believe in good and evil spirits, those of the forests and seas being especially feared. The Ba-Kwiri possess a curious drum language. By drum-tapping news is conveyed from clan to clan. Slaves and women are not allowed to master this language, but all the initiated are bound to repeat it to pass on the messages. The Ba-Kwiri have a horn language peculiar to themselves.

See P. A. Talbot, *The Peoples of* Southern Nigeria *(1926).*

BALA, market town and urban district of Merionethshire, north Wales, near the end of Lake Bala, the largest natural lake in Wales, on the Tryweryn just above its confluence with the Dee. Population of the urban district (1931) 1,395. A mound known as Tomen-y-Bala is thought to be a Norman motte and bailey castle and was possibly an outpost in the upper Dee valley. As one of the most important northern foci of Welsh Wales it came into proininence during the 18th and 19th centuries, both as a woollen centre, manufacturing chiefly flannel and hosiery, and also as a centre ior the religious and educational movements of the period.

In the latter capacity it is associated with Thomas Charles (1755–1814), Howell Harris (1714–73) and Thomas Edward Ellis (1859–99). A grammar school was founded in 1712 and a Calvinistic Methodist college in 1837, and later an Independent college now transferred to Bangor. At Bala junction near the town a branch railway up the Tryweryn valley to Festiniog separates from the railway which skirts Bala lake and proceeds south-westwards via Dolgelly to the sea coast.

BALAAM, a prophet in the Bible. Balaam, the son of Beor, was a Gentile seer; he appears in the history of the Israelites during their sojourn in the plains of Moab, east of Jordan, at the close of the forty years' wandering. Balak, king of Moab, alarmed by their conquests, sent for Balaam to curse Israel; Balaam came after some hesitation, but when he sought to curse Israel Yahweh compelled him to bless them.

The main passage concerning Balaam (Num, xxii.–xxv.) consists of a narrative containing seven oracular poems of unequal length and is doubtless based on ancient traditions.

The narrative is held to be compiled with editorial additions from the two ancient sources commonly denoted by the symbols J and E (on which see BIBLE: Old Testament). The distribution of the material between the two documents is uncertain; but some such scheme as the following is not improbable. The references to portions the origin of which is especially uncertain are placed in parentheses () whilst restorations of supposed omissions are given in brackets [].

(i) J.—xxii. 3*b*–7 (omitting "to Pethor . . . river") 11, 17 fr.). Balak, king of Moab, alarmed at the Israelite conquests, sends elders of Moab and Midian to Balaam, son of Beor, to the land of *Ammon* (seq. versions) to induce him to come and curse Israel. He sends back word that he can only do what Yahweh commands.

xxii. 22–34*a,* 36a. Nevertheless Balaam sets out with two servants, but the angel of Yahweh meets him. At first the angel is seen only by the ass, which arouses Balaam's anger by its efforts to avoid the angel. The ass is miraculously enabled to speak to Balaam. Yahweh at last enables Balaam to see the angel, who tells him that he would have slain him but for the ass. Balaam offers to go back, but is told to go on.

Speaking animals are a common feature of folklore; the only other case in the Old Testament is the serpent in Eden. Some scholars regard the statements about the ass speaking as figurative; but the ordinary literal interpretation is more probable. It does not follow, however, that the authors of the Pentateuch intended the story to be taken as historical in its details.

xxii. 36, 39; xxiv. 1, 2, 10–14, 25. Balak meets Balaam and they go together (and offer sacrifices); Balaam, however, blesses Israel; Balak remonstrates, but Balaam reminds him of his message and again blesses Israel. Then Balaam goes home. (For the relation of the poems to J's narrative, *see* below)

(ii.) E.—xxii. 2, 3*a,* 5*b* "to Pethor, which is by the river," 8–10, 12–16, 19–21, 35, 36*b*–37*a,* 38. Balak, king of Moab, alarmed at the conquests of Israel, sends the princes of Moab to Balaam at Petlzor on the river, that he may come and curse Israel. Some scholars take "river" (nakar) as the *"river"* (better "ravine" *nahal*) of Egypt to the south of Judah. But "river" used absolutely means the Euphrates, and *Pethor* can be identified with *Pitru* near Carchemish, mentioned in an inscription of Shalmaneser III. Deut. xxiii. 4 places Pethor in Mesopotamia.

God appears in a dream and forbids him to go. The princes return and report to Balak, who sends them back to Balaam. God in another dream permits him to go, on condition that he speaks what God tells him. He goes with the princes of Moab. Balak meets them, and Balaam warns him that he can only speak what God tells him.

xxii. 40, 41; xxiii. 1–6, 11–17. Balak offers sacrifices, but Yahweh inspires Balaam with a blessing on Israel. Balak remonstrates and Balaam explains. They try to get a more favourable result by sacrificing on a different spot, but he is again compelled to bless Israel. After further remonstrances and explanations [Balaam goes home]. (For the relation of the poems to E's narrative, see below.)

Deut. xxiii. 3–6 summarizes E's account of this incident, adding, however, the feature that the Ammonites were associated with the Moabites. Joshua, in his farewell speech to the Israelites (Josh. xxxiv. 9, 10. E) also refers to this episode. The Priestly Code (Num. xxxi. 8, 16) has a different story of Balaam, in which he advises the *Midianites* how they may bring disaster on Israel by seducing the people from their loyalty to Yahweh. Later on he is slain in battle, fighting in the ranks of Midian.

The Poems fall into two groups: the first four, in xxiii. 1.–xxiv. 19, are by most critics regarded as ancient lyrics which J and E inserted in their narrative.

The first two are found in an E setting, and therefore, if ancient, formed part of E. The First, xxiii. 7–10, prophesies the unique exaltation of Israel, and its countless numbers. The Second, xxiii. 18–24, celebrates the moral virtue of Israel, the monarchy and its conquests.

The second couple are connected with J. The *Third,* xxiv. 3–9, also celebrates the glory and conquests of the monarchy. Agag, in verse 7, can hardly be the Amalekite king of 1 Sam. xv.; Amalek was too small and obscure. Og has been suggested, but does not seem a great improvement. The *Fourth,* xxiv. 14–19, announces the coming of a king, possibly David, who shall conquer Edom and Moab.

The remaining poems are usually regarded as later additions. The Fifth, xxiv. 20, deals with the ruin of Amalek. It is of uncertain date; if the historical Amalek is meant, it may be early; but Amalek may be symbolical. The *Sixth,* xxiv. 21 f., deals with the destruction of the Kenite state by Assyria; also of uncertain date, Assyria being according to some, the ancient realm of Nineveh, according to others the Seleucid kingdom of Syria. The Seventh, xxiv. 23 f.. speaks of the coming of ships from the West, to attack Assur and "Eber"; it may refer to the conquest of Persia by Alexander the Great.

In the New Testament Balaam is cited as a type of avarice (II. Pet. ii. 16, 17; Jude 11). In Rev. ii. 14 we read of false teachers at Pergamum who held the "teaching of Balaam, who taught Balak to cast a stumbling-block before the children of Israel, to eat things sacrificed to idols, and to commit fornication."

Balaam has attracted much interest, alike from Jews, Christians, and Mohammedans. Josephus paraphrases the story and speaks of Balaam as the best prophet of his time, but with a disposition ill adapted to resist temptation. Philo describes him in the Life of Moses as a great magician. The later Targums and the Talmud represent him as a typical sinner; and there are the usual worthless Rabbinical fables, e g, that he was blind of one eye. There are also similar fables in Mohammedan writers. It has been conjectured that the Arabic wise man, commonly called Luqmān (*q.v.*), is identical with Balaam. The names of their fathers are alike, and "Luqman" means *devourer, swallower,* a meaning which might he got out of Balaam by a popular etymology.

If we might accept the various theories mentioned above, Balaam would appear in one source of J as an Edomite, in another as an Ammonite; in E as an Aramaean; in the tradition followed by the Priestly Code probably as a Midianite. All these peoples either belong to the Hebrew stock or are closely connected with it. We may conclude that Balaam was an ancient figure in traditions originally common to all the Hebrews and their allies, and afterwards appropriated by individual tribes.

The chief significance of the Balaam narratives for the history of the religion of Israel is the recognition by J and E of the genuine inspiration of a non-Hebrew prophet. Yahweh is as much the God of Balaam as he is of Moses. Probably the original tradition goes back to a time when Yahweh was recognized as a deity of a circle of connected tribes of which the Israelite tribes formed a part. But the retention of the story without modification may imply a continuous recognition through some centuries of the idea that Yahweh revealed his will to nations other than Israel.

BALACLAVA, a village in the Crimea, east of Sevastopol, famous for a battle in the Crimean War (*q.v.*). The action of Balaclava (Oct. 25, 1854) was brought about by the advance of a Russian field army under Gen. Liprandi to attack the allied English, French and Turkish forces besieging Sevastopol. The ground on which the engagement took place was the Vorontsov ridge and the valleys on either side of it. Liprandi's corps formed near Traktir bridge, and early cn Oct. 25 its advanced guard moved southwards to attack the ridge, which was weakly occupied by Turkish battalions behind slight entrenchments. The two nearest British divisions were put into motion as soon as the firing became serious, but were prevented by their orders from descending at once into the plain, and the Turks had to meet the assault of greatly superior numbers. They made a gallant resistance, but the Russians quickly cleared the ridge, capturing several guns, and their first line was followed by a heavy mass of cavalry which crossed the ridge and descended into the Balaclava plain. At this moment the British cavalry division under the earl of Lucan was in the plain, but their commander was prevented from engaging the Russians by the tenor of his orders. One of his brigades, the Heavy (4th and 5th Dragoon Guards, 1st, 2nd and 6th Dragoons) under Brig. gen. J. Y. Scarlett, was in the Balaclava plain; the other, the Light Brigade under Lord Cardigan (4th and 13th Light Dragoons, 8th and 11th Hussars and 17th Lancers) in the valley to the north of the Vorontsov ridge. All these regiments were very weak in numbers. The Russian cavalry mass, after crossing the ridge, moved towards Balaclava; a few shots were fired into it by a Turkish battery and a moment later the Heavy Brigade charged. The attack was impeded at first by obstacles of ground, but in the *mêlée* the weight of the British troopers gradually broke up the enemy, and the charge of the 4th Dragoon Guards, delivered against the flank of the Russian mass, was decisive. The whole of the Russian cavalry broke and fled to the ridge. This famous charge occupied less than five minutes from first to last, and at the same time some of the Russian squadrons, attempting to charge the 93rd Highlanders (who were near Balaclava) were met by the steady volleys of the "thin red line," and fled with the rest. The defeated troops retreated past the still inactive Light Brigade, on whose left a French cavalry brigade was now posted. The Russians were at this juncture reinforced by a mixed force on the Fedukhine heights; Liprandi's infantry occupied the captured ridge, and manned the guns taken from the Turks. The cavalry defeated by the Heavy Brigade was re-formed in the northern valley behind the field guns, and infantry, cavalry and artillery were on both the Fedukhine and the Vorontsov heights. Thus, in front of the Light Brigade was a valley over a mile long, at the end of which was the enemy's cavalry and 12 guns, and on the ridges on either side there were in all 22 guns, with cavalry and infantry. It was under these circumstances that an order was given by the British headquarters, which led to the charge for which above all Balaclava is remembered. It was carried to Lord Lucan by Capt. Nolan, 15th Hussars, and ran as follows:—"Lord Raglan wishes the cavalry to advance rapidly to the front and try to prevent the enemy carrying away the guns . . . French cavalry is on your left." Lucan, seeing no attempt on the part of the enemy to move guns, questioned Nolan, who is said to have pointed down the valley to the artillery on the plain; whereupon Lucan rode to Lord Cardigan, the commander of the Light Brigade, and repeated Lord Raglan's order and Nolan's explanation. The Light Brigade then advanced straight to its front, and soon came under fire from the guns on both flanks. Nolan mas killed as he rode across the front of the brigade, perhaps with the intention of changing its direction to the Vorontsov ridge. Five minutes later the guns in front began to fire with telling effect. The pace was increased, though the "charge" was not sounded, and Cardigan and those of his men who remained mounted, rode up to and through the Russian line of guns. Small parties even charged the Russian cavalry in rear and on either flank. The French 4th *Chasseurs d' Afrique* made a dashing charge which drove the Russians off the Fedukhine heights, though at considerable loss. Lucan had meanwhile called up the Heavy Brigade to support the Light, but it lost many men and horses and was quickly withdrawn. Only two formed bodies of the Light Brigade found their way back. The 13th Light Dragoons mustered but ten mounted men at the evening parade; the brigade as a whole had lost 247 men and 497 horses out of a total strength of 673 engaged in the charge, which lasted 20 min. from first to last. The two infantry divisions which now approached the field were again halted, and Liprandi was left undisturbed on the Vorontsov ridge and in possession of the captured guns. The result of the day was thus unfavourable to the allies, but the three chief incidents of the engagement—the two cavalry charges and the fight of the 93rd Highlanders—gave to it the glamour of a victory. The impression created by the conduct of the Light Brigade was expressed in Tennyson's well-known ballad, and the deeper truth contained in the equally celebrated remark of the French general Bosquet, *C'est magnifique mais ce n'est pas la guerre,* made iess impression on the British public, which has habitually cherished valorous stupidity above economical skill in its military annals—and thus helped to ensure a recurrence of such glamorous follies. (F. J. Hu.)

BALAENA, the genus of whales to which the Greenland right whale belongs. *See* CETACEA.

BALAENICIPITIDAE: *see* SHOE-BILL.

BALAENOPTERA, the generic name of the group of whales known as the rorquals, which form the main object of pursuit in modern whale-fisheries. *See* CETACEA.

BALAGHAT, a district of British India in the Nagpur division of the Central Provinces, with an area of 3.557 sq. m. The administrative headquarters are at the town of Burha. It forms the eastern portion of the central plateau which divides the province from east to west. These highlands, formerly known as the Raigarh Bichhia tract, remained desolate and neglected until 1366, when the district of Balaghat was formed. The district comprises: (1) The southern lowlands, a slightly undulating plain, comparatively well cultivated and drained by the Wainganga, Bagh, Deo, Ghisri and Son rivers. (2) The long narrow valley known as the Mau Taluka, lying between the hills and the Wainganga river, and comprising a long, narrow irregular-shaped lowland tract, intersected by hill ranges and peaks covered with dense jungle, and running generally from north to south. (3) The lofty plateau, in which is situated the Raigarh Bichhia tract, comprising irregular ranges of hills broken into numerous valleys, and generally running from east to west. The highest point is the Bhainsagat range, about 3,000 ft. The principal rivers in the district are the Wainganga and its tributaries, the Bagh, Nahra and Uskal; a few smaller streams, such as the Masmar, the Mahkara, etc.; and the Banjar, Halon and Jamunia, tributaries of the Nerbudda, which drain a portion of the upper plateau. A fine Buddhist temple of cut stone, belonging to some remote period, is suggestive of a civilization which had disappeared before historic times. The population in 1931 was 561.602. The Gondia-Jubbulpore line of the Bengal-Nagpur railway traverses the Wainganga valley in the west of the district.

BALAGUER, VICTOR (1824–1901), Spanish politician and author, was born at Barcelona and was educated at the university of his native town. His first dramatic essay *Pepin* el *jorobado,* was placed on the Barcelona stage when he was **14** years of age, and at **19** he was publicly "crowned" after the production of his second play *Don Enrique el Dndivoso.* From **1843** to **1868** he was the chief of the Liberal party in Barcelona, and as proprietor and editor of *El Conseller* promoted the growth of local patriotism in Catalonia. In **1857** he wrote his first poem in Catalan—a copy of verses to the Virgin of Montserrat. Henceforward he frequently adopted the pseudonym of "lo Trovador de Montserrat"; in 1859 he helped to restore the "Juegos Florales," and in **1861** was proclaimed *mestre de gay saber.* In **1867** he emigrated to Provence. On the expulsion of Queen Isabella, he returned to Spain, represented Manresa in the Cortes, and in 1871–72 was successively minister of the colonies and of finance. He resigned office at the restoration, but finally followed his party in rallying to the dynasty; he was appointed vice-president of congress, and was subsequently a senator. Long before his death he had become alienated from the advanced school of Catalan nationalists, and endeavoured to explain away the severe criticism of Castile in which his *Historia de Cataluña y de la Corona de Aragon* (1860–63) abounds. This work, like his *Historia politica* y *literaria de los trovadores* (1878–79) is inaccurate, partial and unscientific; but both books have done service to the cause of Catalonian nationalism.

BALAKIREV, MILY ALEXEIVICH (1 836–1910), was born at Nijni-Novgorod on Dec. **31, 1836** (O.S.), and died at St. Petersburg, May **16/29, 1910.** He began to study music with his mother, later received a few lessons from Dubuque and subsequently was taken in hand by Karl Eisrich, to whom he dedicated his early work for pianoforte and orchestra? a Fantasy on Russian Motives. In his youth he was fortunate also in living with Oulibichev, author of the well-known life of Mozart, who had a private band, from the performances of which Balakirev derived much benefit. At **18.** after a university course in mathematics, he went to St. Petersburg and there attracted attention as a pianist. He made the acquaintance of Glinka, and carried on that musician's influence as a member of the so-called "Nationalist" Russian School, which had sprung up in the 'fifties. Before he was **25** he found himself the acknowledged leader of an important group of his contemporaries, many of whom were destined to be heard of later, including as they did César Cui, Borodin, Mussorgsky and Rimsky-Korsakov. With Tschaikovsky also he was in close relations, although the latter was not actually to be reckoned as one of his disciples. Of his own compositions of this period many were never published, while others, such as the incidental music to *King Lear* and the tone-poem *Russia,* were only published many years after they were written. From the first, indeed, Balakirev appears to have displayed even more desire to promote the cause of Russian music generally than to advance his own individual claims. It mas to this end that he joined in **1862** with Lomakin and Stassov in founding the Free School of Music in St. Petersburg and with the same object that he organized many concerts at which representative works of the younger school were given a hearing unobtainable elsewhere. In **1869** he became director of the Imperial Chapel and conductor of the Imperial Russian Musical Society. He found, however, that official duties were quite incompatible with the development of his own creative powers, and in 1874, therefore, he retired into the country and devoted himself solely to composition, the most important product of his labours being revealed in due course in the shape of his finest work, the symphonic poem *Tanzara.* Although not to be reckoned among the greater masters, and one to be esteemed more for his inspiring influence on others than for his own individual achievements. Balakirev remains none the less a composer to be respected. His output is uneven, but such things as *Tamara,* the pianoforte fantasy *Islamy* and the tone-poem *Russia,* as well as some of his early songs, leave no room for doubt as to his creative powers.

BALALAIKA, a stringed instrument very popular in Russia among the peasants. It has a triangular sound-board to which is glued a vaulted back, forming a body having a triangular hase, enabling it to stand upright. To the body is added a fretted neck strung with two, three or four strings which are generally plucked but can also be swept by the hand to obtain glissando effects.

BALANCE, a generic term designating machines for comparing the weights of two bodies. This article deals chiefly with

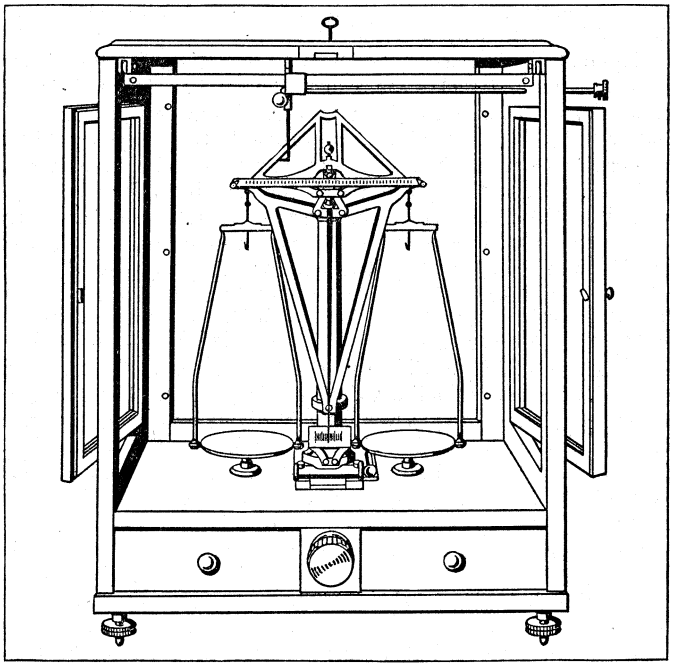

FIG. 1.—ONE OF THE MANY VARIETIES OF EQUI-ARM BALANCE
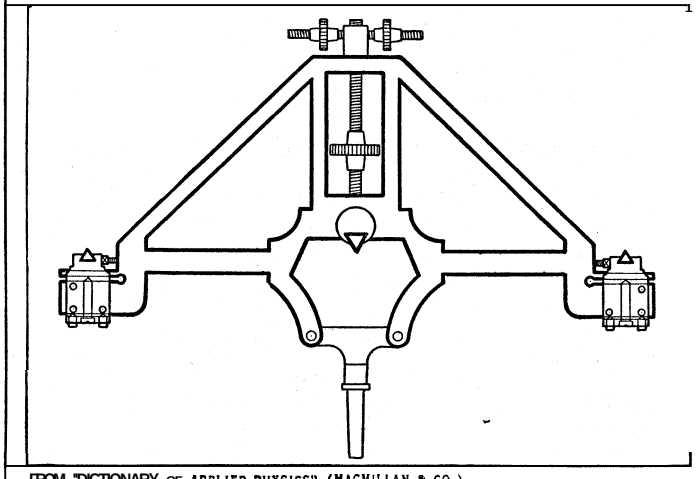
Essentially the balance is an equal armed beam which turns about a knife-edged fulcrum, while the weighing pans are suspended at the extremities of the beam, eauidistant from the fulcrum. Usually, when not in use. the beam and fulcrum are relieved of their loads by a convenient mechanism as here shown

the equi-arm type treated mainly as instruments of precision. (*See* also WEIGHING MACHINES.)

Of all the instruments used in making precise measurements, the familiar equi-arm balance is one of the most productive of high accuracy. The average type of balance is illustrated in fig. 1.

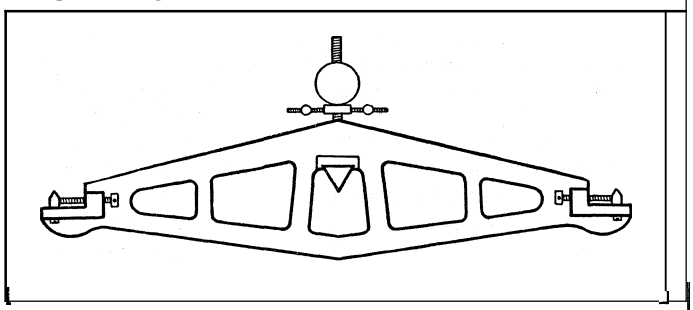


FROM "DICTIONARY OF APPLIED PHYSICS" (MACMILLAN & CO.)
FIG. 2.— TYPE OF BEAM OF A SENSITIVE ANALYTICAL BALANCE
Instead of the pans being suspended from hooks attached to the extreme ends of the beam, as in Fig. 1., many precision balances have the weighing pans suspended from terminal knife edges

Essentially the balance is an equi-arm lever consisting of a beam, usually of metal, which turns about a horizontal central knife-edge as fulcrum, while the objects weighed are supported on pans suspended at the extremities of the beam from terminal knife-edges which are equidistant from the fulcrum. Normally when the balance is not in use the three knife-edges are relieved of their loads. The balance reading is made by noting the angular swing of ihe beam about its fulcrum, and is ordinarily indicated

by the position, relative to a small fixed scale, of a metal pointer attached to the beam.

Design of Beam.—In order to obtain high sensitiveness of swing, the weight of the balance beam should be as small as possible, consistent with strength, relatively to the loads weighed from its extremities. Experience has shown that a beam about 7in. long is suitable for balances intended to take moderate loads; *e.g.*, up to 200 grams.



FROM "DICTIONARY OF APPLIED PHYSICS"

FIG. 3.— TYPE OF BALANCE BEAM FOR WEIGHING HEAVY LOADS
The general principles under-lying the construction of instruments for weighing heavy loads are the same in most cases as the lighter balances, except that the working parts are heavier and more stoutly constructed

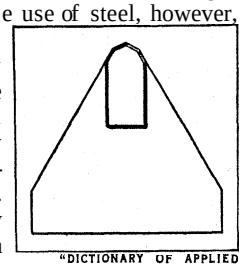
Some typical shapes of beams in general use are shown in figs. 2 and 3.

Balance beams are usually made of brass or bronze suitably covered with a protective coating, but in recent years aluminium alloy has also been employed on account of its low density while the use of invar steel has also been advocated owing to the low thermal expansibility of this material. The magnetic properties of invar however constitute a disadvantage.

In the working condition of the balance the centre of mass of the beam lies slightly below the fulcrum knife-edge. Instability will of course occur if the centre of mass lies above the fulcrum. The smaller the distance of the centre of mass below the fulcrum, the more sensitive is the balance, but the longer its period of swing. Adjustability of working conditions of sensitiveness and period of swing is obtainable by raising or lowering the "gravity bob" on the beam of the balance.

A separate adjustment for poise is also provided so as to enable the reading of the balance, when not loaded, to be brought to a convenient zero or reference mark on the scale.

Knife-edges.— The knife-edges should be straight, so that the load may be applied as nearly as possible along a straight line. They should also be hard and not tarnish. In spite of its tendency to rust, steel is very suitable for the construction of knife-edges owing to the great load it will support. The use of steel, however, for this purpose is exceptional, and apart from commercial balances is generally confined to cases where heavy loads are to be weighed. Agate is now in almost general use for the construction not only of the knife-edges but of the plane bearings which transmit the loads to the knives. Hard alloys, *e.g.*, stellite, are occasionally used for this purpose.



FROM "DICTIONARY OF APPLIED PHYSICS"

FIG. 4.—SECTIONAL VIEW OF AN AGATE KNIFE MOUNTED IN A BRASS TRIANGULAR BLOCK

Fig. 4 shows a sectional view of an agate knife mounted after the usual manner in a triangular brass block for convenient attachment to the beam. The knife-edge is formed by two facets inclined to each other at an obtuse angle. This type of knife-edge has been found to withstand many years' regular usage.

The precision obtainable from the balance depends especially on the accuracy with which the knives are mounted on the beam and adjusted to their correct relative positions. These fundamental adjustments demand much patience. As the central knife is usually first mounted square with the beam. the terminal knife-edges-have to be set parallel to, equidistant from and coplanar with the central one. These conditions are realized, to a moderate degree of accuracy in balances in general. In many balances made for low-precision work, all three knives are fixed to the beam without means of re-adjustment. In the more familiar types of balances used for chemical and technical purposes, the agate plane which bears on a terminal knife-edge is mounted in a metal stirrup which has at its lower end a hook, or an eye-hole, from which the balance pan hangs. This method of suspension has been found sufficiently good for most purposes. Improved methods of suspension have been used for special weighings of the highest precision.

Arrestment.—In general, three portions of the balance require means of arrestment for the purpose of loading or unloading. The central knife of the beam should be raised a short distance out of contact with its bearing plane, and it is desirable to be able to raise the suspension stirrups a little in order to remove the load on the terminal knives. Further, it is usual to provide an arrestment for the pans so as to facilitate loading and unloading, and to steady them, lest by swinging they should interfere with the oscillations of the beam when released. The arrestment should enable the beam and stirrups to be raised so that the respective knives are just clear of their bearing-planes, the margin of clearance being uniform throughout the length of a knife-edge. Clearances as small as one-thousandth of an inch are generally to be desired in all but large balances. It is important that the arrestment and release of the beam, and other parts, should be arranged to be made precisely and consistently each time. The beam, and preferably also the suspension stirrups, should be fixed definitely in position when arrested, and not allowed to have any rotational movement.

As to the mechanical gear for operating the arrestment, a cam controlled by a milled wheel outside the balance case raises or lowers a vertical frame which carries the arresting stops or points. The same motion raises or lowers the pan-supports, which are in good adjustment when they just touch the under surfaces of the pans as the arrestment is completed. It is preferable to design the arrestment so that, on releasing the balance for swinging, the load is transmitted to the terminal knives before the central knife is finally lowered on to its bearing plane. This is achieved in some makes of balance, but is by no means generally found.

Sensitiveness.— It is not possible, within the limits of this article, to give a detailed theoretical investigation showing the extent to which the performance of a balance is dependent on the relative positions of the three knives and the centre of mass of the beam. It can be shown, by considering the equilibrium of the beam under a given loading, that the sensitiveness of the balance, defined as the increase of angular deflection of the beam per unit increase in load on one pan is equal to

$$\frac{l}{Gs+2a(P+Q)}$$

where l = the length of each arm of the balance.
s = the distance of the centre of mass of the beam from the fulcrum.
a = the distance of the fulcrum above the horizontal plane through the terminal knife-edges.
G = the mass of the beam alone.
P = the mass of each pan with suspension stirrup (supposed the same for left and right pans).
Q = the load in each pan.

Further, if K is the radius of gyration of the beam alone about its fulcrum, and g is the value of gravity, a sufficiently good approximation to the complete period of swing of the balance can be shown to be

$$2\pi\sqrt{\frac{2(P+Q)(a^2+l^2)+GK^2}{g\{Gs+2a(P+Q)\}}}.$$

In this expression the small retarding forces due to friction, etc., have been neglected.

The square of the period of swing of the balance is therefore' proportional to

$$\frac{\text{The sensitiveness} \times \text{the moment of inertia of the whole moving system about the fulcrum.}}{\text{The length of beam.}}$$

The conditions of performance of a balance may now be summed up by an inspection of the above formulae:—

The ideal conditions of use of a balance are those in which the three knife-edges are coplanar for all loads placed on the balance pans, since the balance is then equally sensitive at all loads. This condition is not fully realized in practice. Even if the three knives were coplanar when relieved of their load, the slight bending of the beam under load would modify this relation at other loads. The period of swing of the balance will inevitably become slower as the load is increased.

Mode of Employment of the Balance.—It is desirable in choosing a site for a balance, to have a very rigid support (independent of the building foundation where possible) in a room with a pure atmosphere and a very steady temperature. For all accurate work the balance should be as far removed as possible from windows, and all sources of uneven heating. The disturbing effects of a variable temperature distribution inside the balance case are so much responsible for many of the difficulties encountered in accurate weighing, that the ideal conditions of use of the balance for the utmost precision would be to keep the balance case closed throughout the weighings, and to operate and read the balance from a distance. These precautions are practised in certain exceptional cases.

When the balance is first set up, if the component parts, including the arrestment, appear to be in good working order, the operator should test its performance thoroughly before putting it into general use. In some cases the method of weighing adopted will depend on the performance of the balance and its limitations. The sensitiveness and period of swing of the balance should be determined for a number of different loads and different positions of the gravity bob. The position finally chosen for the latter should be that which gives a sensitiveness compatible with the accuracy sought for, together with a suitably short period. Sometimes it may even be desirable to sacrifice sensitiveness in order to obtain a quicker swing. If facilities permit, an optical method of reading the balance may be used to obtain improved precision of observation while retaining a quick period of swing. The degree of equality of the arms of the balance should also be ascertained in order to decide to what extent the method of "single weighing" will suffice to give the required accuracy in certain operations in weighing.

The term "single weighing" implies that the body to be weighed is suspended only from one arin of the balance and poised against known weights operating on the other arm of the instrument, and clearly involves an assumption that the arms are equal. This assumption can always be tested easily by making a "double weighing"; *i.e.*, by seeing how the apparent weight of the body varies according to the arm from which it is weighed. It has been found that the effective lengths of the arms of a good analytical or chemical balance are usually equal to within 1 part in 100,000.

The constancy of the rest point of the balance should also be tested at several loads over a considerable period of time especially at the maximum load taken by the balance. Most balances exhibit small variations in rest point, even at no load, which may be caused by changes in temperature or by fatigue resulting from previous loading. Some observations should also be made on the use of a rider weight with the balance. Usually the graduated bar which holds the rider when in use is arranged to be in the plane through the terminal knives. This is not always the case, but unless it is so, the apparent weight of the rider when placed on the rider bar will depend on the inclination of the beam to the horizontal. The accuracy of graduation of the rider bar should also be tested, especially if it is intended to use relatively large rider weights. In work of the highest precision, it may be necessary to restrict the size of rider employed.

In all work with knife-edge balances, it will be found that the instrument is relatively slow to use. In general, the practice of weighing by the "null" method is followed; *i.e.*, the weights on one pan of the balance are arranged so as to obtain zero deflection of the beam, which is usually taken as corresponding to the position of the pointer opposite the central line of the scale. The realization of the equilibrium position is, of course, facilitated by a prior knowledge of the sensitiveness of the balance in terms of one division of the scale. Alternatively, and often preferably, if the operator has obtained balance with the pointer reading a few divisions away from the centre of the scale, he may calculate from the sensitiveness of the balance the extra loading on one pan necessary to make the pointer read zero.

In cases where the residual errors of inequality of the arms of the balance prohibit the use of the method of "single weighing." the choice lies between "counterpoise weighing" and "double weighing." In the former case, a constant mass is kept on one pan of the balance, and known weights are used on the other pan in addition to that which has to be determined. Weighing is thus made by substitution, and is independent of the length of the arm of the balance, provided that this length remains constant during the series of weighings. In "double weighing," the ordinary single weighing is repeated with the loads interchanged in the pans, the object being to minimize the combined errors due to inequality of the arms of the beam and unevenness of temperature distribution within the balance case. The double weighings may be repeated in the reverse order if for special reasons it is desired to eliminate errors due to changes in rest-point of the balance during the course of the weighings.

Performance of the Balance.—The following table indicates the main characteristics as regards the performance of a standard type of sensitive analytical balance:

Position of the gravity bob.	Load on each pan.	Mass to be added to one pan of the balance to change the rest point through one division.	Period of complete (to and fro) swing of balance.
	grm.	grm.	sec.
Low (most stable)	0	0·0008	13
	100	0·0008	21
	200	0·0008	28
Mean	0	0·0005	17
	100	0·0005	28
	200	0·0005	36
High (least stable)	0	0·0001	33
	100	0·0001	53
	200	0·0001	63

The above particulars refer to a balance in which the rest point is read by a pointer about 10in. long on a scale of which each division measures $\frac{1}{25}$ inch. One division thus corresponds to an angular deflection of the beam equal to about $\frac{1}{5}°$. For such a balance the distance of the centre of mass of the moving system would vary from 0·001 to 0·011in. according as the high or low position of the gravity bob were used.

The period of the balance should be regulated, in consideration of the above table, according to the nature of the weighings to be made, and the accuracy required. The least stable position is often not very useful as, owing to great sensitiveness, the balance cannot be poised unless the loads to be compared have very nearly the same weight.

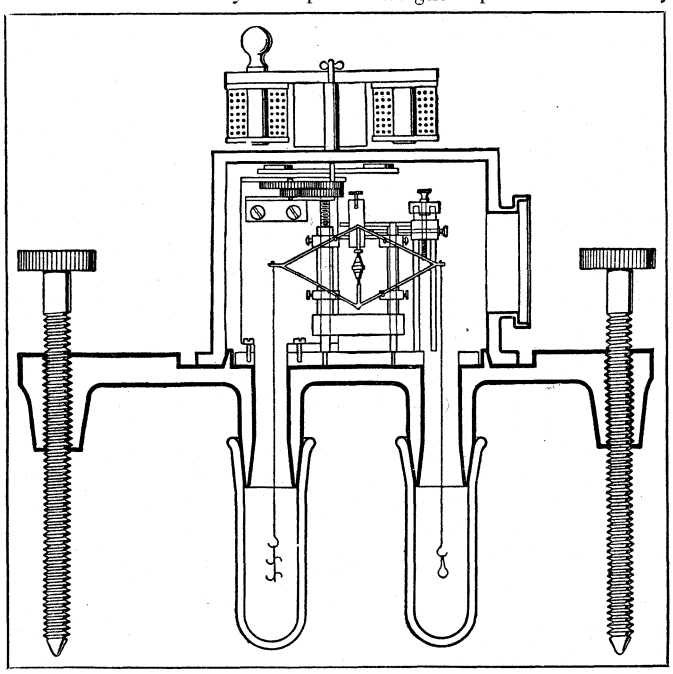
It is somewhat difficult to give a fair impression of the accuracy attainable in the use of the balance, since in many cases the balance is not used under conditions suitable for maximum accuracy. Under ordinary conditions of use, it may be said that a 100grm. balance weighs to an accuracy of 0·0001 gram. Similarly larger balances will weigh to an accuracy representing one part in a million of the maximum load weighed. Small balances, of the type used in assay work, are capable of weighing to 0·00001grm. in general. These estimates, however, will not hold good unless the weights used in the process of weighing are accurate, and correct allowance is made for the buoyant force of the atmosphere on the objects weighed.

Allowance for Atmospheric Buoyancy.—The upward buoyant force on a body is equal to the weight of air displaced by it; *i.e.*, is equal to its volume × the atmospheric density. The precision to which it is necessary to determine the buoyancy corrections will naturally vary with the conditions of the work For

some purposes it is sufficient to assume an average value of the density of air, but where the atmospheric ,variations must be taken into account (and this is usually the case uhen objects of widely different densities are being weighed) the evaluation of the air density can be made from observed values of pressure, temperature and humidity of the air by use of tables of air density based on accepted average values of the chemical constitution of the atmosphere. In exceptional cases where extreme accuracy is required, it may be necessary to determine the air density experimentally since the chemical constitution of the atmosphere is known to vary slightly from day to day.

Weights.— The process of weighing generally involves the use of some standard in terms of which weight is measured. For this purpose a set of weights is used, though more strictly it should be regarded as a set of standards of mass. since the weight of a material object may vary with the conditions of weighing while the mass may ordinarily be regarded as unvaried, being independent of the conditions of weighing. Standards of mass are more frequently called "weights," and in scientific work generally they take the form of decimally constituted sets of weights, those from 1grm. upward usually being of brass, while the fractions of a gramme are made of platinum, gold alloy, nickel-silver or aluminium. Rider weights, for use on the beam of a balance, may be made of platinum, aluminium or some suitable alloy.

Brass weights are sometimes coated with a metal-plating or a lacquer in order to prevent tarnishing. Lacquered weights. however, absorb moisture from the atmosphere and consequently may vary to the extent of 0·0001grm. for the denominations ordinarily used by chemists. For metal-plated weights, platinizing should be preferred to gilding owing to the softer nature of the latter. The stability of a plated weight depends considerably



BY COURTESY OF THE COUNCIL OF THE PHYSICAL SOCIETY

FIG. 5.—PETTERSSON S TYPE OF QUARTZ MICROBALANCE

Microbalances are used chiefly to determine the density of gases. The balance is usually enclosed in a gas-tight chamber and a change of weight is measured by the chanae in the net buoyant force on the balance due to the gas in which it is suspended

on the method and care of plating. In general, however, platinized brass weights are preferable to non-coated polished ones, and are often used in work of a high accuracy. In some cases where special precision is required even platinized-brass weights may not be sufficiently reliable, and it may be necessary to consider other materials such as nickel-chromium (80% nickel, 20% chromium) which has been used with success for the construction of some laboratory reference standards of mass. Weights of this material are not ordinarily obtainable on the market. Platinum is still regarded as the most stable and suitable metal for use in the construction of the fundamental standards of mass, but its cost limits its use to the construction of relatively small weights.

Torsion Balance.— There is another class of balance, distinct from a knife-edge balance, in which the beam is suspended from a torsion thread so that it can rotate about the axis of the thread, which may be horizontal or vertical according to the purpose of the balance. The torsion method of balancing very small couples appears to have been invented by the Rev. John Michell towards the close of the 18th century. Some of the earlier forms of balances with vertical torsion suspension thread were devised with the object of determining experimentally the gravitation constant and the mean density of the earth. A great advance in the technique of torsion threads generally was made in 1889 by Boys, who developed the method of drawing out quartz fibres and so rendered serviceable a material whose elastic properties are exceptionally suitable for certain types of torsion balances. Balances with beams suspended from a horizontal torsion thread have also been used for weighing small loads.

Microbalances.—For more precise weighings conducted on a small scale, a considerable variety of types of quartz microbalance have been developed in recent years, most of which have been used to weigh to an accuracy very much finer than that generally associated with the most sensitive light assay balances working on the principle of a metal beam with three knife-edges. Microbalances have been used chiefly to determine the densities of gases, particularly of gases which are obtainable only in small quantities. Both the torsion and knife-edge types of quartz balance have been used with success. The balance usually operates in a gas-tight chamber and a change in weight is measured by the change in the net buoyant force on the balance due to the gas in which the balance is suspended, the pressure of the gas being adjustable, and measured by means of a mercury manometer connected with the balance case. In one successful design the beam was suspended from two vertical quartz fibres which take the place of the fulcrum knife-edge used in some of the earlier types. Pettersson has been able to detect differences in weight of only $0{\cdot}25\times10^{-6}$mg. in a load of 250mg

BIBLIOGRAPHY.—The literature concerning balances is somewhat scattered. Detailed articles on balances will be found in the *Dzctzonary of Applied Chemistry* (1921), vol. i. edited by Sir Edward Thorpe, and published by Longmans, Green & Co., London; also in the *Dictionary of Applied Physics* (1922–23) vol. iii., edited by Sir Richard Glazebrook and published by Macmillan, London. Many references are given in these articles. For further information relating to balance work of the highest precision, reference should be made to the various volumes of the *Travaux et Mémoires du Bureau International des Poids et Mesures* (Paris, Gauthier-Villars). *See* also articles on WEIGHING MACHINES, MEASURES AND WEIGHTS; MEASUREMENT.

BALANCEMENT: see BEBUNG.

BALANCE OF POWER, in international relations, such a "just equilibrium" between nations as shall prevent any one of them being in a position to dominate the rest. The principle involved is as old as history, and was familiar to the ancients both as theorists and practical statesmen (see *e.g.,* Polybius, 1. i. cap. 83). In modern Europe it was first adopted as a fundamental maxim of statecraft in Italy, and later, as the conception of the sovereign state superseded feudal principles, everywhere else. Early in the 17th century, when international law began to take shape at the hands of Grotius and his successors, the theory of the balance of power was formulated as a fundamental principle. According to this, the European states formed a sort of federation based on the balance of power, and it was the right and duty of every state to interfere, if necessary by arms, when any of the conditions of the settlement were infringed by any other member of the community (*see* Vattel, *Le Droit des gens,* 1758). This principle was generally accepted. It was the justification of the coalitions against Louis XIV. and Napoleon and the occasion, or excuse, for most of the wars waged between the date of the Congress of Westphalia in 1648 and that of Vienna in 1814.

During the greater part of the 19th century the principle was obscured by the national upheavals which changed the map of Europe; but towards the end of the century it emerged again in the series of alliances and counter-alliances of which the osten-

sible object was to preserve peace. The outbreak of the World War is widely held to have discredited the whole principle of the balance of power. It would be truer to say, however, that the war broke out because Great Britain's attitude up to the last moment was uncertain, and that the balance had therefore not been kept conspicuously even. In any case, as the late Professor Oppenheim pointed out (*Internat. Law* i. 73), so long as there is no central authority capable of enforcing the rules of international law, the only sanction behind them, apart from the uncertain force of public opinion, is the capacity of the powers to hold each other in check. The League of Nations (*q.v.*) is a tentative effort to establish what H. H. Asquith called "a community of power" in place of "the balance of power." It has not been able to prevent, though it has done something to check and regularize, the system of separate alliances. In the United States, it may be added, the principle of the balance of power has always been denounced. This is easy to understand; for, in the expressive language of Secretary Olney, in the Americas "the fiat of the United States is law." The Latin Americans, equally naturally, dream of an ultimate balance.

See David *Hume, Essay on the Balance of Power* (1752); *Fr.* v. Gentz, *Fragments on the Balance of Power* (1806), and generally the standard works on International Law (*q.v.*). (W. A. P.)

BALANCE OF TRADE. This term in economics belonged originally to the period when the "mercantile theory" prevailed, and it is still in use, though not quite perhaps in the same way as at its origin, and the term "balance of payments" has largely taken its place. The "balance of trade" was of old identified with the sum of the precious metals which a country received in the course of its trading with other countries or with particular countries. There was no doubt an idea that somehow or other the amount of the precious metals received represented profit on the trading, and each country desired as much profit as possible. Princes and sovereigns, however, with political aims in view, were not close students of mercantile profits, and would probably have urged the acquisition of the precious metals as an object of trade even if they had realized that the country as a whole was exporting "money's worth" in order to buy the precious metals which were desired for political objects. The "mercantile theory" was exploded by Adam Smith's demonstration that gold and silver were only commodities like others with no special virtue in them, and that they would come into a country when there was a demand for them, according to the amount, in proportion to other demands, which the country could afford to pay; but the ideas in which the theory itself has originated have not died out, and the idea especially of a "balance of trade" to which the rulers of a country should give attention is to be found in popular discussions of business topics and in politics, the general notion being that a nation is prosperous when its statistics show a "trade balance" in its favour and unprosperous when the reverse is shown.

In modern times the excess of imports over exports or of exports over imports, shown in the statistics of foreign trade, has also come to be identified in popular speech with the "balance of trade," and many minds are no doubt imbued with the ideas (1) that an excess of imports over exports is bad, and (2) an excess of exports over imports is the reverse, because the former indicates an "unfavourable" and the latter a "favourable" trade balance. In the former case it is urged that a nation so circumstanced is living on its capital. Exact remedies are not suggested, although the idea of preventing or hampering foreign imports as a means of developing home trade and of thus altering the supposed disastrous trade balance is obviously the logical inference from the arguments. A consideration of these ideas, and of recent discussions about imports and exports, appears accordingly to be needed, although the "mercantile theory" is itself exploded.

TRADE BALANCE AND NATIONAL BALANCE

The phrase "balance of trade," then, appears to be an application of a trader's language in his own business to the larger affairs of nations or rather of the aggregate of individuals in a nation engaged in foreign trade. A trader in his own books sets his sales against his purchases, and the amount by which the former exceed the latter is his trade balance or profit. What is true of the individual, it is assumed, must be true of a nation or of the aggregate of individual traders in a nation engaged in the foreign trade. If their collective sales amount to more than their collective purchases the trade balance will be in their favour, and they will have money to receive. Contrariwise, if their purchases amount to more than their sales, they will have to pay money, and they will presumably be living on their capital. The argument fails, however, in many ways. Even as regards the experience of the individual trader, it is to be observed that he may or may not receive his profit, if any, in money. As a rule he does not do so. As the profit accrues he may invest it either by employing labour to add to his machinery or warehouses, or by increasing his stock-in-trade, or by adding to his book debts, or by a purchase of stocks or shares outside his regular business. At the end of a given period he may or may not have an increased cash balance to show as the result of his profitable trading. Even if he has an increased cash balance, according to the modern system of business, this might be a balance at his bankers', and they in turn may have invested the amount so that there is no stock of the precious metals, or "hard money," anywhere to represent it. And the argument fails still further when applied to the transactions between nations, or rather, to use the phrase already employed, between the aggregate of individuals in nations engaged in the foreign trade. It is quite clear that if a nation, or the individuals of a nation, do make profit in their foreign trading, the amount may be invested as it accrues—in machinery, in warehouses, in stock-in-trade, in book debts or in stocks and shares purchased abroad, so that there may be no corresponding "balance of trade" to bring home. There is no doubt also that what may be is in reality what largely happens.

In another particular the argument also fails. In the aggregate of individual trading with various countries, there may sometimes be purchases and sales as far as the individuals are concerned, but not purchases and sales as between the nations. For example, goods are exported from the United Kingdom, ammunition and stores and ships, which appear in the British returns as exports, and which have really been sold by individual British traders to individuals abroad; but these sales are not set off by any purchases on the other side which come into the international account, as the set-off is a loan by the people of one country to the people or government of another. The same with the export of railway and other material when goods are exported for the purpose of constructing railways or other works abroad. The sales are made by individuals in the United Kingdom to individuals abroad; but there is no set-off of purchases on the other side. *Mutatis mutandis* the same explanation applies to the remittance of goods by one country to another, or by individuals in one country to individuals in another to pay the interest or repay the capital of loans which have been received in former times. These are all cases of the movement of goods irrespective of international sales and purchases, though the movements themselves appear in the international records of imports and exports, and therefore it seems to be assumed, though without any warrant, in the international records of the balance of trade. There is yet another failure in the comparison, The individual trader would include in his sales and purchases services such as repairs performed by him for others, and similar services which others do for himself; but no similar accounts are kept of the corresponding portions of international trade such as the earning of freights and commissions, although in strictness, it is obvious, they belong as much to international trade as the imports and exports themselves, which cannot therefore show a complete "balance of trade."

The illusions which may result then from the confusion of ideas between a balance of trade or profit, and a balance of cash paid or received, and from the identification of an excess of imports over exports or of exports over imports with the balance of trade itself, though they are not the same thing, hardly need description. The believers in such illusions are not entitled to any hearing as economists, however much they may be accepted in the marketplace or among politicians.

The "balance of trade" and "the excess of imports over exports" are thus simply pitfalls for the amateur and the unwary.

On the statistical side, moreover, there is a good deal more to be urged in order to impress the student with care and attention. The records of imports and exports themselves may vary from the actual facts of international purchases and sales. The actual values of the goods imported and paid for by the nation may vary from the published returns of imports, which are, by the necessity of the case, only estimated values. And so with the exports. The actual purchases and sales may be something very different. A so-called sale may prove abortive through its not being paid for at all, the debtor failing altogether. In any case the purchases of a year may not be paid for by the sales of the year, and the "squaring" of the account may take a long time. Still more the estimates of value may be so taken as not to give even an approximately correct account as far as the records go.

MANY FACTORS OF THE BALANCE

The number of factors to be introduced into a "balance of trade" to make a complete account or "balance of payments" is considerable. Formerly, aiter accounting for all items of visible and invisible exports and imports, the net balance of the account was left to be regarded as settled by the import or export of gold, after allowing for any short term borrowing or "lag" in settlement of accounts. But the practice has now grown up of including all monetary items and attempting an exact balance, without any statistical residuum. This leads to an effort toward a new degree of precision.

For a long time international comparisons have been vitiated by differences in presentation and collection of statistics. A special sub-committee of the International Chamber of Commerce in April, 1927, drew up a uniform model to clear up the confusion, using as their basis the classification adopted by the economic and financial section of the League of Nations in their attempts to collect and publish balance of trade and balance of payment statistics from the various governments. This model in detail is as follows:—

I. Merchandise

1. (a) Merchandise, including silver bullion, exported (as per trade returns, including fish sold in foreign ports and analogous sales of commodities not already, included in statistics of exports).
   (b) Sale of ships.
   (c) Parcels post.
2. Adjustment for under or over-valuation of (1):
   (a) To arrive at f.o.b. value.
   (b) To convert "official" values which may relate to a prior date, to current "market" values.
   (c) To correct bias in traders' declarations, *e.g.*, where there is a tariff.
   (d) To include exports (or imports) of commodities under Government auspices (*e.g.*, reparation deliveries in kind) which do not appear in the regular trade returns.
   (e) To adjust the statistics to agree with the political territory (*e.g.*, mother-country, excluding colonies).
3. Contraband.

II. Bullion, Specie and Currency Notes

4. Gold bullion and gold specie exported (as per trade returns).
5. Specie (other than gold) exported (as per trade returns).
6. Currency notes not elsewhere indicated, exported.
7. Adjustment for under or over-valuation of (4) and (5) in order to arrive at the commercial value f.o.b.

III. Business Services to Foreign Countries

A. Transport Services:
8. Shipping freights, charter money, passage money and similar earnings, received by national ships on account of all foreign trade.
9. Port receipts from foreign shipping in national ports.
10. Transport and other charges received for foreign goods transshipped or in transit (if not included in Group 1., Nos. 1 to 3).
11. Post and telegraph and telephone earnings, not elsewhere indicated.

B. Trading Profits and Brokers' and Merchanting Commissions:
12. On exports and re-exports not included in f.o.b. price.
13. On commodities not entering into the country's imports or exports.

C. Banking and Financial Services:
14. Acceptance commissions.
15. Discount on foreign bills.
16. Commissions on issues of foreign loans.
17. Profits on exchange transactions.
18. Bank interest.

D. Insurance Services.
19. Insurance services.

IV. Interest

20. Interest received on foreign Government and municipal loans.
21. Other interest and dividends received from capital invested abroad.

V. Other Current Items on Private Account

A. Immigration and Emigration:
22. Funds brought in by immigrants and returned emigrants.
23. Remittances by emigrants.

B. Receipts from foreign tourists and travellers.

C. Charitable and educational donations from abroad.

D. Other current items.

VI. Government Transactions

A. Diplomatic consular and other expenditure.
24. By foreign governments.
25. By colonies.

B. Receipts in respect of loans paid direct to the home Government:
26. By foreign governments.
27. By colonies having the same monetary unit.
28. By colonies with monetary unit different from the Mother-Country.

C. Home Government receipts in respect of reparations.

D. Other receipts from abroad by the home Government.

VII. Capital Transactions

29. Receipt of payments on account of amortization of foreign Government and municipal loans:
   (a) Repayment of bonds at maturity.
   (b) Sinking fund operating for repayment of bonds.
30. Receipt of payments on account of amortization of other loans:
   (*a*) Same as 29.
   (*b*) „ „ 29.
31. Existing domestic securities sold to abroad (excluding if possible domestic securities purchased abroad by own nationals).
32. Foreign securities resold abroad.
33. Export of new domestic securities on account of new loans floated abroad.
34. Domestic real estate sold to foreigners.
35. Other foreign capital invested in . . .

VIII. Balancing *Items*

A. Increase of current short-period indebtedness.
36. Increased foreign deposits in home banks.
37. Increased foreign holdings of bills.
38. Increased commercial debts due to foreign nationals and outstanding not included in above.

B. Unexplained discrepancy between total credits and total debits.

A study of the above shows more clearly than any lengthy description the nature of the problem. The movements of gold are fairly well known, and the residual or balancing figure now tends to be the foreign investment items.

BRITISH AND AMERICAN STATISTICS

In spite of the practical differences which such estimates involve, the study of this question has received a remarkable amount of attention since the World War. Official estimates for the year 1923 or 1924 have been prepared by 1; governments, the most elaborate being those of the United States of America. For this country very detailed statements, official or non-official, have been compiled since 1919. These are summarized in the first table on p. 956.

The statement renders clear the manner in which the enormous net exports of the earlier years, largely to Europe, were covered by long-term loans and short-term credits, how the floating credits are being gradually liquidated, and how the export surplus itself sank from over $4,000,000,000 in 1919 to $389,000,000 in 1923. The increase of this surplus in 1924 was coincident with the revival of capital export to Germany in particular.

In 1926 very considerable revisions were made in the more recent estimates of the British balance of payments. The united figures for 1924 and 1925 and the preliminary estimate for 1926 appear in the second table on p. 956.

United States: Balance of Payments (Millions of Dollars)
(Credits+ Debits—)

	1919.	1920.	1923.	1924.	1925.	1926.
Exports of merchandise (net)	+4,016	+2,950	+389	+970	+666	+426

*Includes interest received by U.S. Government from foreign governments.
†In 1921 and 1922 the balances were respectively —228 and —308.

In conclusion it may be useful to repeat the main propositions laid down as to the balance of trade. (1) A "balance of trade" to the individual trader, from whose experience the phrase comes, is not necessarily, as is supposed, a balance received or receivable in the precious metals. It may be invested as it accrues—in machinery, or warehouses, or stock-in-trade, or in book debts, or in stocks and shares or other property outside the trader's business, as well as in cash. (2) What is true of the individual trader is also true of the aggregate of individuals engaged in the foreign trade of a country. Cash is only one of the forms in which they may elect to be paid. (3) The imports and exports recorded in the statistical returns of a country do not correspond with the purchases and sales of individual traders, as the sales especially may be set off by loans, while the so-called imports may include remittances of interest and of capital repaid. (4) When capital is repaid the country receiving it need not be living on it, but may be investing it at home. (5) The foreign trading of countries may also comprise many transactions, such as the earning of freights and commissions, which ought to appear in a vroper account showing a balance of trade, as similar transactions appear in an individual trader's account, but which are not treated as imports or exports in the statistical returns of a nation's foreign trade. (6) Import and export returns themselves are not the same as accounts of purchases and sales; the values are only estimates, and must not be relied on literally without study of the actual facts. (7) The excess of imports or exports may vary indefinitely at different times according as a creditor country is receiving or lending at the time, or according as a debtor country is borrowing or paying off its debts at the time, but the permanent characteristics are always to be considered. (8) Governmental obligations for international loans (interest and repayment of capital) and reparations, are now an important addition to the account.

(R. GI.; J. S.)

BALANCE SHEETS. A balance sheet is a summary of the balances remaining in the books of a business after those books have been closed by preparing and completing a proper revenue or profit and loss account. If the accounts have been properly prepared, the vital distinction between revenue items and balance sheet items will have been made; but if any balances have been wrongly excluded from the revenue account on either side, they will necessarily come into the balance sheet, and conversely any balances wrongly included in the revenue account will necessarily have been omitted from the balance sheet. Hence, it is difficult to criticize a balance sheet intelligently in the absence of the revenue account, and vice versa.

Not a Valued Statement.— If the balance sheet is properly compiled, those ledger balances included are in the nature of assets or liabilities. But a balance sheet does not profess to be a valuation of all the outstanding possessions of an undertaking on the one hand, set off against the liabilities and various kinds of obligations on the other. If one were to attempt year by year to revalue all the assets of a concern, the result would be to introduce into the balance sheet a number of alterations in value which, as a matter of book-keeping, would have to be treated as profits or losses, but which would have nothing whatever to do with the actual business of the undertaking. For example, an increase or decrease in the value of the premises in which a business is being carried on has no bearing on the earning capacity of the business. In fact, although it may be exceedingly difficult, if not impossible, to arrive at exact figures, the value of all kinds of property is subject to more or less continuous fluctuations. To include these fluctuations in the revenue account would be to render that account useless as a means of measuring the earning capacity of the business. An accurately compiled revenue account is essential for the information of those responsible for management. Hence, it becomes necessary in practical accounting to ignore these extraneous fluctuations, and in consequence to present a balance sheet which is not a valuation statement of assets and liabilities, but something very much more conventional.

It is usual for balance sheets to be prepared annually, and save in the case of quite unimportant concerns owned by private individuals or partnerships, it is usual for the accounts to be audited, and for the auditor to report upon the balance sheet submitted. In the case of public utility concerns, the law usually requires the accounts to be submitted in a prescribed statutory form, but there is no statutory form for the accounts of ordinary commercial concerns. Opinion is divided as to whether so much latitude is altogether desirable.

Balance Sheet a Summary.— A balance sheet is never a complete list of all the ledger balances that constitute it, but always a summary of those balances. Hence it follows that its value must depend to a large extent upon the way in which that summarization has been performed. Little or nothing is lost by grouping together similar items under a common heading, but a great deal is lost if wholly dissimilar items are grouped together under one heading without any indication of their relative importance. A very large

number of balance sheets of public companies are open to criticism upon this ground; in particular, a balance sheet must be unsatisfactory if it fails to distinguish quite clearly between what are called *fixed* and *floating* items.

"Fixed" and "Floating" Items.—What are technically known as fixed items are those which, in the ordinary course of events, are not continually changing, while floating items are those which, in the ordinary course of events, are continually in a state of flux. Fixed liabilities comprise the capital of the undertaking, any debenture debt that there may be, and any undivided profits which it is not intended to divide in the near future, *i.e.*, those liabilities, the payment of which has not to be provided for, at least for the time being. Floating liabilities, on the other hand, are those which in the ordinary course of business will fall due for payment at more or less fixed dates in the near future, the due payment of which has to be provided for if the undertaking is to continue in business. As regards assets, fixed assets are those which, in a broad sense, represent the equipment of the undertakings: the possessions which it owns with the object of continuing to hold them in their existing form, and to use them as a means, directly or indirectly, of making profits. They are held for use. The floating assets, on the other hand (apart from cash balances) are those which in the ordinary course of business it is the aim of the undertaking to convert into money with all convenient speed, making a profit in the process. Normally, the due payment of floating liabilities as they fall due can only be provided for by the liquidation of the floating assets; hence the ability of the undertaking to convert its floating assets into money sufficiently quickly to enable it to meet its floating liabilities as they fall due, is of vital importance. Thus no balance sheet can be regarded as satisfactory which fails to disclose quite clearly the full extent of the floating assets and liabilities.

Depreciation.—But because the fixed assets of an undertaking are not intended for sale, but rather for use, their precise realizable value at any given moment is comparatively unimportant, so long as there is always a sufficiency of floating assets to meet the floating liabilities as they fall due. Accordingly it is quite legitimate to treat fixed assets as outlays which affect current profits only in the sense that probably they will not for ever continue to be equally useful as equipment and will, therefore, from time to time, require to be replaced by others. The usual—and by far the most convenient—way of regarding fixed assets is to treat them as outlay to secure the temporary purpose of providing the necessary equipment, the cost of which must accordingly be treated as a working expense chargeable against the profits of the undertaking during the time they are in use. If the whole of the outlay on the original equipment had been exhausted before the balance sheet were prepared, the whole of such outlay would, of course, be charged against current profits. If only a part of the outlay has been exhausted, it follows that a corresponding part should be charged against the profits, to the earning of which it has contributed. When due provision is made for the depreciation of equipment it has this effect, and from year to year that portion of the original outlay not as yet charged against profits is carried forward in the balance sheet to be dealt with in future years. In this way the whole outlay is equitably apportioned over the series of years during which the equipment is in use, but the amount included in successive balance sheets does not profess to be the then realizable value of the equipment then in existence. For obvious reasons it is important to arrive at the most accurate statement of profits year by year, but it is by no means equally important year by year to arrive at an accurate realizable valuation of property which there is no intention of realizing.

BALANCE SHEET, 31ST DECEMBER 1927

Liabilities	£		*Assets*	£
Share Capital (100,000 shares of £1 each)		100,000	Goodwill	20,000
Reserve Fund		25,000	Business Premises, Plant, Machinery, etc.	44,000
Sundry Creditors		24,750	Stock-in-Trade and Work in Progress	28,750
Profit & Loss Account:			Sundry Debtors	35,000
Balance from 1926	£18,750		Investments	25,000
Dividends paid	12,500		Bank	22,250
	6,250			
Net profit for 1927	19,000			
		25,250		
		£175,000		£175,000

Extent of Information Supplied.—The *pro forma* balance sheet here shown is not supposed to represent a "model" balance sheet, but rather one typical of the practice at present usual among public companies. It will be observed that, without stating why, it suggests that there are assets worth a total of £175,000. No indication is given of how these figures are arrived at. For reasons already stated it is not reasonable in all cases to assume that the figures attached to the various items of a balance sheet represent in the view of the accounting parties their respective current realizable values; but it is submitted that, if the published balance sheet is to serve any useful purpose, the basis of valuation should be stated in each case. It is further suggested that as regards floating assets, and particularly stock in trade and work in progress, it would be an advantage if the identity of the individuals respectively responsible for the figures were to be stated. If that were done, it is possible that the responsible parties might take their duties somewhat more seriously. Certainly, it could do no harm. Similarly, as regards the sundry debtors, those responsible for making provision for bad and doubtful debts might very well be mentioned by name; and in the case of investments, it would always be advantageous to know whether these are included in the balance sheet at cost price, at current market price, or at what other figure.

Reserves.—On the truth of the figures attached to the various items on the assets side of the balance sheet must inevitably depend the truth of the figures put against the items reserve fund and profit and loss account. The true significance of the former is not always understood. A reserve fund is merely profits which have been set aside, or reserved, from immediate distribution by way of dividend. It is impossible for a company to protect its reserve fund from all possibility of subsequent loss. If anything happens to impoverish the concern the first thing to go is, of course, the balance of undivided profits as appearing on the profit and loss account. When this has been exhausted, if further losses occur the reserve fund must necessarily be reduced. It is normally a good practice for companies to acquire investments to an amount equal to their reserved profits; but this practice does nothing to protect the reserve fund itself against loss if anything happens to reduce the aggregate value of the assets as a whole. All that it does is to keep a corresponding amount of the company's resources in liquid form, available to be turned into money at short notice to meet any urgent need. Conversely, if the true value of the assets of the concern in question exceeds £175,000, the true extent of its undivided profits is to a corresponding amount in excess of that stated on the face of the balance sheet, and such excess is sometimes called an *internal reserve* or *secret reserve*. Similarly, if the actual amount of the liability to creditors is less than the balance sheet shows, there is a secret reserve in existence of a corresponding amount. Most successful companies have fixed assets actually worth more than the figures set against them in the balance sheet, and the provision for outstanding liabilities is commonly upon the generous side. Usually, therefore, a successful concern has in fact a secret reserve.

Foreign Balance Sheets.—In Latin, Teutonic and Scandinavian countries it is usual to present balance sheets showing assets upon the left-hand side and liabilities upon the right-hand side, and the items are often shown in considerably greater detail than is usually the case in Great Britain and its dependencies.

The British practice is based upon the form that a balance sheet would naturally take if one were to open a new set of books in connection with an established business, whereas the Continental and South American practice is based upon the form that a balance sheet would take if at the end of the financial period the balances remaining after the completion of the revenue account were to be transferred to another account, called *closing balance* or *balance de sortir*. If, however, the books be literally

"closed" in this way at the end of the financial period, they must necessarily be reopened at the commencement of the ensuing period, thus giving rise to a second "opening" balance sheet, which would take the form of the balance sheet customary in this country. It is submitted that inasmuch as books must be "opened" before they can be "closed," if the duplication of balance sheets is to be dispensed with, the form of the opening balance sheet is the more reasonable form to retain in current use.

See F. W Pixley, *How to Read a Balance Sheet* (1937 ed.); L. R. **Dicksee,** *Published Balance Sheets and Window Dressing* (1927); P. Tovey, *Balance Sheets* (1937). *See* also BOOKKEEPING. (L. R. D.)

UNITED STATES

There are some differences in the balance-sheet, in regard both to principles and to practice in the United States, as compared with that in Great Britain. These will be commented on under the three heads: (1) form; (2) content; and (3) interpretation.

Form. — In the United States the usual introduction to the study of accounting and to the principles of debit and credit, on which it rests, is through the medium of the proprietorship equation. This equation is used as a concrete definition of the balance-sheet element, net worth or proprietorship. The equation is usually stated in the following form: Assets—Liabilities=Proprietorship. Very frequently, particularly for internal use within the business. the manner in which the formal balance-sheet is drawn up follows the order and the mathematical relationship indicated by this equation. This is known as the report form of balance-sheet. Under this form, following the full title and date, the assets are shown first in accordance with whatever classification is adopted; then, beneath the assets are shown the liabilities, similarly grouped, the two group totals for assets and liabilities being extended into a free money column to the right. The third group or element of the balance-sheet, proprietorship, is then shown underneath the liability group and the total of the net worth is extended into the same column with the totals of assets and liabilities, the total net worth being the difference between the total assets and total liabilities. In this way the mathematics of the balance-sheet is shown by means of a vertical set-up of the elements on the page.

The other form of balance-sheet known as the account form as distinguished from the report form, is built up in accordance with the same basic equation; it is expressed, however, in the following form: Assets=Liabilities+Proprietorship. In the United States, as is generally true elsewhere, most balance-sheets issued for the purpose of publication are drafted in the account form. Under this form the right-hand elements, namely, liabilities and net worth, are frequently intermingled. The tendency at the present time is, however, to segregate the group of liabilities from the net worth group and secure totals for these separate groups just as is done in the case of the report form. It is customary here to show the assets on the left-hand side and liabilities and net worth on the right-hand side. Within these main groups practice varies as to the showing of the classified sections. If there is any prevailing practice it can be said to rest on the probable use to be made of the balance-sheet. In those concerns where the balance-sheet is used mostly for presentation to the banker as a basis for the granting of short term credit, it is customary to show the classified section containing the current assets first. This will then be follo ed by the fixed assets, and a similar arrangement as between current and fixed will be followed in the set-up of the liabilities. In other concerns, such, for example, as railroads and large manufacturing enterprises where the investment in fixed assets is very large compared with that in current assets, the fixed assets are frequently shown first on the balance-sheet, followed by the current. In such cases on the other side of the balance-sheet, when set up in account form, the capital stock item may be shown first, along with the bonds and other fixed liability items, in an effort to show the sources of the investment in exact juxtaposition with the properties acquired by that investment. When this is done, the final item of the proprietorship element, namely, surplus, appears as the last item on the right-hand side of the balance-sheet, and is thus separated from the other proprietorship element, capital stock. However, there is a rather decided trend to show in all balance-sheets, regardless of the purpose for which they are drawn up or the character of the company, the current assets and liabilities first, followed by the fixed assets and liabilities, and an entirely separate group for the showing of the proprietorship element.

Accounting in the United States has had a development which has been remarkably free from legal requirements. The Interstate Commerce Commission, a body of the Federal Government having general supervision over the interstate railways and other agencies of interstate commerce, has been given authority to prescribe accounting methods and forms. Accordingly there is an established form of balance-sheet for common carriers in accordance with which all reports to the Interstate Commerce Commission must be set up. This requirement does not prevent a railroad company from publishing its balance-sheet for other purposes in whatever form it sees fit, although such practice is becoming more and more rare. Similarly, the Public Utilities Commissions of the various States have similar forms in accordance with which reports must be made to them by the various public utility companies under their jurisdiction. There is also a very decided trend toward uniformity in connection with various trade associations. Some 150 of such associations have developed, or are undertaking to develop, uniform methods of accounting applicable to the entire industry. Such developments have resulted in the adoption of uniform balance-sheets and operating statements, the purpose of which is to provide for the building up of statistical data on a truly comparable basis. It should be noted that such uniformity is wholly voluntary on the part of the members of the associations or other users of the uniform statements. (See COST ACCOUNTING.)

Content. — In connection with the content of the balance-sheet, two basic problems are involved. One relates to the items which shall be admitted to the balance-sheet, the other to the valuation basis on which they shall be admitted. It may be said briefly with regard to the first that all properties owned and all liabilities incurred relative to a particular business entity should be shown in its balance-sheet. In a great many instances even what are known as contingent assets and contingent liabilities are shown by incorporation in the content of the balance-sheet, although these are frequently appended as foot-notes. Such items are typified by forward sales orders, that is, sales orders received for future delivery of goods, and purchase commitments covering goods bought but not yet received.

As to the valuation basis of the items admitted to the balance-sheet, this rests largely on the uses to which the average balance-sheet is to be put. At present time the chief use made of balance-sheets is as a basis for the granting of short term credit, or for the determination of the degree of solvency of the concern. By solvency is meant the ability of a business to pay its debts as they come due. For this purpose the current assets and liabilities are chiefly used, little attention or value being given to the fixed assets and liabilities. Accordingly, the principles of valuation applied to the current assets rest upon the assumption that these assets are to be used chiefly for the payment of the current debts falling due within, say, the next twelvemonth. This requires the valuation of the current assets on an extremely liquid basis. It may be said, therefore, that such assets are, with certain limitations, to be valued in accordance with their cash realizable value. That is, they should be stated at such values as represent, on the part of those best qualified to judge, the estimated amount of cash which will be realized when they are converted into cash. Accordingly, the accounts and notes receivable are stated, not at book value, but at such value less the estimated amount of loss through inability to collect. Similarly, current investments are usually to he valued on the basis of their cash realizable value on the date of the balance-sheet. Merchandise is usually valued on the basis of cost, or replacement cost, whichever is the lower, although that basis is not looked upon as entirely satisfactory in a great many cases. The fixed assets, because little regard is paid to them in the ordinary uses of the balance-sheet, are valued on the basis of cost less accrued depreciation to date. Seldom is any effort made to have the fixed assets reflect their true present value in accordance with the price trend at a given time. Thus, the standard practice results in a balance-sheet statement which does not reflect the

present worth of a business, as distinct from its net worth, which is determined on the valuation basis referred to above. A physical appraisal of the properties becomes necessary to determine the present value of a business.

Interpretation. — There is a decided trend at the present time, on the part of accountants, towards paying much more attention to the interpretation of balance-sheets than has been paid in the past. Very few business executives know how to read a balance-sheet intelligently. The accountant, who realizes better than any one else the way in which the items on the balance-sheet have been built up, is in a position to interpret them more readily than any one else. Accordingly, a great many accountants to-day are not satisfied merely with drawing up a balance-sheet and letting it speak for itself, but insist upon indicating in their reports the significant facts which an intelligent reading of the balance-sheet brings to light. Such items as the sufficiency of valuation reserves, the reserve for doubtful accounts and the reserve for depreciation; the sufficiency of the working capital employed in the business; the relationship between borrowed capital or funds and the owner's investment in the business; the relation of current assets to current liabilities — these are some of the more patent things about which the balance-sheet gives information and which certainly should be called to the attention of the owners. More and more there is a tendency to relate the interpretation of the balance-sheet to the position in the business cycle, and also to the price trend, as evidenced by price index numbers. All of this requires, on the part of the accountant, a grasp of the broad underlying economic condition of the country and also a knowledge of the basic conditions in the particular industry. Without such knowledge a really sound and discerning interpretation of the balance-sheet is not possible. Some accountants even go so far as to insist that the balance-sheet should reflect present valuations in both the current and fixed assets. Because of the relatively rapid turnover of merchandise and accounts and notes receivable, those items are for the most part valued on a basis which is fairly close to the current price level. The value of the fixed assets, particularly those with long lives, may be very far removed from a present valuation basis. Accounting methods have been devised whereby both the present value and the original cost value may be shown on the same balance-sheet and these present values incorporated in the books of account without disturbing the statement of operations of the business. While a good deal of research has been conducted in this direction, the matter is an extremely controversial one.

As to the frequency with which balance-sheets are prepared, there is an increasing trend toward the monthly balance-sheet. A great many concerns. particularly manufacturing and large retail establishments, use monthly balance-sheets for internal guidance.

See H G Stockwell, *How to Read a Financial Statement (1926);* C. B. Couchman, The *Balance Sheet* (1924); R. B. Kester, *Accounting Theory and Practice,* vol ii. (1933). (R. B. K.)

BALANOGLOSSUS, the name given by the Neapolitan naturalist, Delle Chiaje, to certain fragmentary specimens of a marine creature brought to him by a fisherman about 1820. The creature would be termed by any ordinary person a "worm" as it is soft bodied, without legs or other appendages and burrows in sand or mud at the bottom of comparatively shallow sea. The body is somewhat flattened and produced into a lobe or flap on each side and hence Delle Chiaje thought it looked like a tongue; but in front there is a pointed salient portion issuing from a collar-like ring, and this reminded Delle Chiaje of a barnacle (*q.v.*), hence the name, which literally means "barnacle-tongue."

Subsequently researchers into antiquarian zoology discovered that four years previous to the publication of Delle Chiaje's work in 1829 a Russian naturalist, Eschscholtz, had described a similar "worm" from one of the Pacific islands and had called it Ptychodera. Eschscholtz had mistaken the "worm" for a sea cucumber and his discovery attracted no notice at the time and was forgotten. Delle Chiaje's description however awakened interest and drew the attention of many other observers; the "worm" proved to have many startling features in its anatomy. The name Balanoglossus had thus become firmly embedded in zoological literature when it was stated Ptychodera must be used instead,

In time "worms" like these were found all over the world in the warm and temperate zones, wherever suitable conditions of muddy sand existed; they differed in the proportions of the various parts of the body. Delle Chiaje's old genus eventually became an order. The difficulty created by the historiographers was then partially got over by using both the names Balanoglossus and Ptychodera for two of the genera into which the old genus was divided. The name Balanoglossus has been retained also as a popular appellation for the whole group and in that sense it will be used in this article.

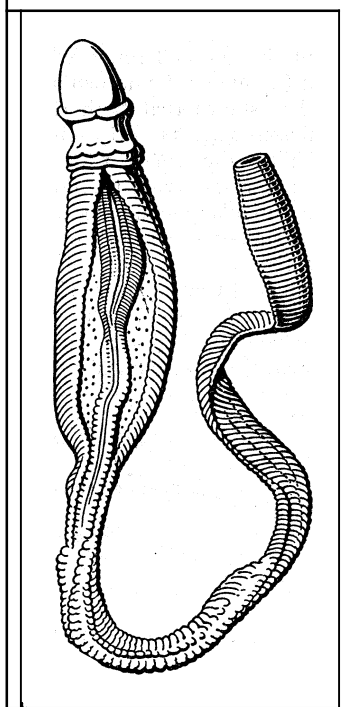

FIG. 1 — THE BALANOGLOSSUS IS A MARINE BURROWING WORM RELATED TO THE VERTEBRATES

The body of these worms is divided into three regions, as shown in fig. 1, which represents Eschscholtz's Ptychodera. In front is the conical projection now termed the proboscis and which was Delle Chiaje's barnacle. Behind it comes the "collar" region and behind this the long trunk In the genus Ptychodera this is produced at the sides into two great flaps, but in Balanoglossus (*sensu stricto*) these are absent. In every species however along the upper surface of the trunk in front there are found two long rows of pores which penetrate right through the alimentary canal. Nothing like these is known anywhere else in the animal kingdom except the gill-slits of fish and other aquatic vertebrates.

Balanoglossus resembles in its food and mode of life many burrowing creatures of widely dissimilar structure, amongst others the common lugworm and earthworm. Feeding and movement are essentially the same operation. As it burrows, it swallows the muddy sand and extracts the organic matter. Its mode of motion, however, is peculiar; the proboscis possesses a single pore and the collar a pair of ciliated pores. By these water is sucked in and the cavities of these regions distended. The muscles of these stiffened parts then wriggle and drag the passive trunk after them.

The reproductive organs are mere groups of cells situated in the sides of the trunk — in the flaps when these are present. The cell masses when ripe burst to the exterior, making their own openings — just as boils do in the human body. The sexual cells are discharged into the sea, their union being left to chance. From the fertilized egg there is developed an extraordinary larva, the tornaria, which strikingly resembles the larva of an Echinoderm (*q.v.*) and indeed was mistaken for such by its discoverer (Johannes Müller). This larva (fig. 2) is of glassy clearness. It possesses a gut consisting of gullet, stomach and intestine. The anus is at the posterior end of the body but the mouth lies on the under surface far behind the front end. Its movement is made by a peculiar folded ridge of skin which carries long cilia. This ridge is shaped roughly like an H, the sides of which run from anterior to posterior ends of the larva; whilst on the central surface deeply enfolded cross-pieces run backwards on the lobe in front of the mouth and forwards in front of the anus. In addition there is an independent ring of cilia round the hinder end. In front of the mouth there is a thin walled cellular vesicle which communicates with the exterior by a pore on the dorsal surface. This vesicle is of similar character and origin to the peritoneal vesicle of the Echinoderm larva (see INVERTEBRATE EMBRYOLOGY) and it becomes the cavity of the proboscis of the adult, still communicating with the exterior by a pore. Behind it lies a pulsating vesicle or "heart" and a similar vesicle is found in the Echinoderm. A pair of peritoneal vesicles is developed, as the larva grows older, in the collar regios between the gut and the skin, and

another such pair in the trunk. The pulsating vesicle persists as the pericardium and heart in the base of the proboscis. There seems to be no escape from the conclusion that Balanoglossus and the Echinodermata are widely divergent offshoots from the same stock. But is Balanoglossus really related to the Vertebrata and does it therefore form a link between these two great groups? Now in all Vertebrata besides the gill-slits, which even in land animals appear during embryonic life, there are two other distinguishing features, viz., (1) the notochord, a gelatinous rod developed from the mid-dorsal cells of the gut-wall round which the "vertebrae" are later built up; and (2) above the notochord a hollow tubular nerve cord. Bateson has shown that both these structures are represented in Balanoglossus (fig. 3), although restricted to the collar and neck, joining the collar with the proboscis. The notochord is a hollow outgrowth from the dorsal wall of the gut, surrounded by a tough cuticular membrane, especially underneath; it projects into and supports the neck of the proboscis. The nervous system over the whole surface of the proboscis and along the mid-dorsal and mid-ventral lines of the trunk is a mere plexus or nerve net lying at the base of the skin, but in the collar it is a deeply embedded tube opening to the exterior in front and behind. Subsequently it was shown by the

FIG. 2.—A LATERAL AND A VENTRAL VIEW OF THE FREE-SWIMMING, IMMATURE FORM OF THE BALANOGLOSSUS WHICH PASSES THROUGH A METAMORPHOSIS BEFORE ASSUMING THE ADULT CHARACTERISTICS

present author and others that the proboscis and collar cavities of Balanoglossus are represented in the simplest fish-like animal Amphioxus and in the higher Vertebrata by the pre-mandibular and mandibular head-cavities which lie in front of, and at the sides of, the mouth. The principal advance made by the higher Vertebrata over the condition found in Balanoglossus is the breaking up of the long trunk body cavities of Balanoglossus into a series of hollow muscular segments or *myotomes;* and this change was correlated with and no doubt caused by an advance to a more vigorous form of locomotion expressed in lateral wrigglings of the body. Whilst in the condition represented by the *tornaria* larva, the ancestral stock glided through the waters by means of cilia; in Balanoglossus which is perhaps a degenerate offshoot, the powers of locomotion are concentrated in the proboscis and collar.

(E. W. MACB.)

BALANTE, a long-headed. prognathous patrilineal people who file their incisor teeth, living in French Senegal and Portuguese Guinea between the Kasamansa and the Geba rivers. Their

FIG. 3.—A LENGTH-WISE SECTION OF AN ADULT BALANOGLOSSUS
This diagrammatic representation shows the arrangement of the gut, body-cavities, notochord, central nervous system and the gill-slits

language is related to Bagnun and Mandjak. They have age groups. There are no special marriage rules. They are mainly hunting people, engaging in cultivation, and are turbulent raiders. The dead are exposed for two or three days and then buried under their houses. The Balante practise ordeal by vegetable poison (tali).

See Dr. Lasnet, *Une mission* au *Sénégal* (1900); Capitaine Brosselard-Faidherbe, *Casamance* et *Mellacorée* (1893).

BALARD, ANTOINE JÉRÔME (1802–1876), French chemist, was born at Montpelier. In 1826 he discovered in sea-water a substance which he recognized as a previously unknown element and named *bromine.* He then succeeded L. J. Thénard in the chair of chemistry at the faculty of sciences in Paris, and in 1851 was appointed professor of chemistry at the Collège de France, where he had M. P. E. Berthelot first as pupil, then as assistant, and finally as colleague. The discovery of bromine and the preparation of many of its compounds was perhaps his most conspicuous piece of work. In his researches on the bleaching compounds of chlorine he was the first to advance the view that bleaching-powder is a double compound of calcium chloride and hypochlorite; and he studied the problem of economically obtaining soda and potash from sea-water, though here his efforts were nullified by the discovery of the much richer sources of supply afforded by the Stassfurt deposits. In organic chemistry

he published papers on the decomposition of ammonium oxalate, with formation of oxamic acid, on amyl alcohol, on the cyanides, and on the difference in constitution between nitric and sulphuric ether.

BALASH, Sassanian king in A.D. 484–488, was the brother and successor of Pērōz, who had died in a battle against the Hephthalites (White Huns), who invaded Persia from the east. He put down the rebellion of his brother Zareh. After a reign of four years he was deposed and blinded, and his nephew, Ravadh I., raised to the throne.

BALASORE, a town and district of British India, in the Orissa division of Behar and Orissa. The town is the administrative headquarters of the district, and is situated on the right bank of the river Burabalang, about 7m. from the sea-coast as the crow flies and 16m. by the river. Pop. (1931) 17,843. The British first settled here in 1633, and established a factory in 1642; they were followed by the Dutch, Danes and French. The French still retain a plot of land called a *loge* in the town. After the outbreak of hostilities with the Moghul government Balasore was captured by Job Charnock in 1687 and again next year by Capt. Heath. In the 18th century Ralasore rapidly declined in importance, on account of the silting-up of the river mouth.

The district forms a strip of alluvial land between the hills and the sea, varying from about 9 to 34m. in breadth. Area, 2,055 square miles. Population (1931) 990,600. The district naturally divides itself into three well defined tracts — (I) The salt tract, along the coast; (2) The arable tract, or rice country; and (3) The submontane tract, or jungle lands. The salt tract which is only a few miles broad, rises towards the beach into sandy ridges, from 50 to 80ft. high. Inland, it spreads out into prairies of coarse long grass and scrub jungle, with patches of rice cultivation. Salt used to be manufactured here by evaporation, but the industry is now extinct. The arable tract lies beyond the salt lands and embraces the chief part of the district. It is a long dead-level of rice fields, with depressions near the river-banks. The submontane tract is an undulating country with a red soil, broken up into ravines along the foot of the hills. Large tracts are covered with *sal* jungle, which nowhere, however, attains to any great height.

Balasore district is watered by six distinct river systems: those of the Subarnarekha, the Panchpora, the Burabalang, the Jamka, the Kansbans and the Dhamra. The main crop is rice, which is grown on nine-tenths of the cultivated area. The district is traversed throughout its entire length by the Bengal-Nagpur and High Level Coast canals, and also by the railway from Calcutta to Madras. The only port is Chandbali, over 20m. up the river Dhamra, which is visited regularly by small coasting steamers.

BALASSA, BALINT, Baron of Kékkö and Gyarmat (1551–1594), Magyar lyric poet, was born at Kékkö, and educated by the reformer, Péter Bornemissza, and by his mother, the highly gifted Protestant zealot, Anna Sulyok. He died of wounds at the siege of Esztergom. Balassa's poems fall into four divisions: religious hymns, patriotic and martial songs, original love poems, and adaptations from the Latin and German. They are all most original, exceedingly objective and so excellent in point of style that it is difficult even to imagine him a contemporary of Sebastian Tinodi and Peter Ilosvay. But his erotics are his best productions. They circulated in manuscript for generations and were never printed till 1874, when Farkas Deák discovered a perfect copy of them in the Radvanyi library. For beauty, feeling and transporting passion there is nothing like them in Magyar literature till we come to the age of Mihaly Csokonai and Alexander Petofi. Balassa was also the inventor of the strophe which goes by his name. It consists of nine lines—a a b c c b d d b—or three rhyming pairs alternating with the rhyming third, sixth and ninth lines.

See Áron Szilády, *Bdlint Balassa's Poems* (Hung., 1879).

BALATA, a valuable raw material, resembling gutta percha and used as a substitute for it, derived from the latex of the bullet tree (*Mimusops balata*), a near relative of the gutta percha tree. The bullet tree is native in the West Indies and South America and is abundant in Guiana. It is really an inferior gutta percha, the latex containing about 50% of that substance. It is used in machine-belting. (*See* Gutta Percha)

BALATON, the largest lake of central and western Europe, situated in Western Hungary. About 50m. in length it lies in a narrow north-east to south-west tectonic rift whose origin is associated with the Alpine uplift. The depth averages 6ft. and attains a maximum of about 38ft. near the Tihany peninsula. The northern shore is flanked by the vine-covered slopes of the Bakony mouniains whose thermal springs have led to the growth of several popular spas, while the southern shore is flat and dotted with watering places. Apart from these resorts, settlements are small and devoted to fishing the richly stocked lake and to the preparation of wines, though the growing popularity of the lake as a summer bathing resort for the population of Budapest is overshadowing these original activities.

See "Resultate der wissenschaftlichen Erforschung des Balatonsees," *Herausg. v. d. Ungar. Geographischen Gesellsclzaft* (Budapest, 1891–1916).

BALAYAN, a municipality in the province of Batangas (formerly called Balayan), on the island of Luzon, in the Philippine Islands at the head of Balayan bay, about 55 mi. by land S. by W. of Manila and 79 mi. by water. Pop. (1939), 15,224, of whom 7,453 were males; no whites. The municipality was formerly the provincial capital, but in 1732 the capital was moved to Taal, and later to Batangas. It has an administrative centre and 23 barrios (wards). The climate is healthful and its fertile, volcanic- soil produces abundant crops of rice, sugar, corn and various fruits. Horses and cattle are raised and marketed in considerable numbers, and fishing is an important industry. The number of parcels of land declared for taxation in 1938 was 3,327, and the owners numbered 2,149. The total land area of the municipality in 1939 was 9,660 hectares. (C. S. L.)

BALBI, ADRIAN (1782–1848), Italian geographer, was born in Venice. He was professor of geography at Murano, then of physics at Fermo, and for some years a customs officer in Venice. The years 1821–32 were spent in Portugal. His most important works were *Atlas ethnographique du globe . . .* (1826), and *Abrégé de Géographie* (1832). His son, Eugenio Balbi (1812–1884), professor of geography at Pavia, edited his father's *Scritti geografici* (Turin, 1841).

BALBO, CESARE, Count (1789–1853), Italian writer and statesman, was born at Turin of a noble Piedmontese family. From 1808 to 1814 he served in various capacities under the Napoleonic empire at Florence, Rome, Paris, and in Illyria. On the fall of Napoleon he entered the service of his native country. While his father, Prospero Balbo, was appointed minister of the interior, he entered the army and undertook political missions to Paris and London. On the outbreak of the revolution of 1821, of which he disapproved, although he was suspected of sympathizing with it, he was forced into exile; and though later he was allowed to return to Piedmont, all public service was denied him, and he turned to the literary expression of his political ideas. He sought the independence of Italy from foreign control but was not a partisan of revolution. Of true Italian unity he had no expectation and no desire; but he was devoted to the house of Savoy, which he foresaw was destined to change the fate of Italy. In his book *Speranze* (or *Hopes of Italy*), he suggests that Austria should seek compensation in the Balkans for the inevitable loss of her Italian provinces. He became the leader of a moderate party, and the steady opponent, not only of despotism, but of democracy. At last, in 1848, his hopes were to some extent satisfied by the constitution granted by the king. He was appointed a member of the commission on the electoral law, and became first constitutional prime minister of Piedmont, but only held office a few months. With the ministry of d'Azeglio he was on friendly terms. The most important of his writings are historico-political, and derive at once their majesty and their weakness from his theocratic conception of Christianity. He published *Quattro Novelle* (1829); *Storia d'Italia sotto i Barbari* (1830); *Vita di Dante* (1839); *Meditazioni Storiche* (1842–45); *Le Speranze d'Italia* (1844), *Pensieri sulla Storia d'Italia* (1858), *Della Monarchia ruppresentativa in Italia* (Florence, 1857).

See E. Kicotti, *Della Vita e degli Scritti di Cesare Balbo* (1856); A. Vismara, *Bibliografia di Cesare Balbo* (Milan, 1882).

BALBOA, VASCO NUÑEZ DE (*c.* 1475–1517), Spanish explorer and conquistador, the discoverer of the Pacific, was born at Jerez de los Caballeros, in Estremadura, about 1475, of gentle parentage. In 1501 he followed Rodrigo de Bastidas in his voyage of discovery to the western seas. He appears to have settled in Hispaniola and taken to cultivating land in the neighbourhood of Salvatierra. In 1509 the famous Ojeda (Hojeda) sailed from San Domingo with an expedition and founded the settlement of San Sebastian. He had left orders with Enciso, an adventurous lawyer of the town, to fit out two ships and convey provisions to the new settlement. Enciso set sail in 1510, and Balboa, whose debts made the town unpleasant to him, managed to accompany him by concealing himself, it is said, in a cask of "victuals for the voyage," which was conveyed from his farm to the ship. The expedition reached San Sebastian to find Ojeda gone and the settlement in ruins. While Enciso was undecided how to act, Balboa proposed that they should sail for Darien, on the Gulf of Uraba, where he had touched when with Bastidas. His proposal was accepted and a new town was founded, named Sta. Maria de la Antigua del Darien; but quarrels soon broke out among the adventurers, and Enciso was deposed, thrown into prison, and finally sent off to Spain with Balboa's ally, the alcalde Zamudio. Being thus left in authority, Balboa began to conquer the surrounding country, and by his bravery, courtesy, kindness of heart, and just dealing gained the friendship of several native chiefs. On one of these excursions he heard for the first time, frcm the cacique Cornogre, of the ocean on the other side of the mountains and of the gold of Peru. Soon after his return to Darien he received letters from Zamudio, informing him that Enciso had complained to the king and had obtained a sentence condemning Balboa and summoning him to Spain. In his despair at this message Vasco Nufiez resolved to attempt some great enterprise, the success of which he trusted would conciliate his sovereign. On Sept. 1, 1513, he set out with 190 Spaniards (Francisco Pizarro among them) and 1,000 natives; on Sept. 25 or 26 he reached the summit of the range and sighted the Pacific. Pizarro and two others were sent on to reconnoitre; one of these scouts, Alonzo Martin, was the first European actually to embark upon the new-found ocean, in St. Michael's Gulf. On Sept. 29 Balboa himself arrived upon the shore, and formally took possession of the "Great South Sea" in the name of the Spanish monarch. He remained on the coast for some time, heard again of Peru, visited the Pearl Islands, and thence returned to Darien, which he entered in triumph with great booty on Jan. 18, 1514. He at once sent messengers to Spain bearing presents, to give an account of his discoveries; and the king. Ferdinand the Catholic, partly reconciled to his daring subject, named him *Adelantado* of *the* South Sea, or admiral of the Pacific, and governor of Panama and Coyba. None the less an expedition sailed from Spain under Don Pedro Arias de Avila (generally called Pedrarias Dávila) to replace Balboa in the government of the Darien colony itself. Meanwhile the latter had crossed the isthmus and revisited the Pacific several (some say more than 20) times; plans of the conquest of Peru and of the exploration of the western ocean began to shape themselves in his mind; and, with a view to realizing these projects, two light brigantines were built, launched, and armed. With these Vasco Nuñez took possession of the Pearl Islands, and, had it not been for the weather, would have reached the coast of Peru. His career was stopped by the jealousy of Pedrarias, who enticed him to Acla, near Darien, by a crafty message. As soon as he had him in his power he threw him into prison, had him tried for treason, and forced the judge to condemn him to death. The sentence was carried out on the public square of Acla in 1517.

BALBOA, a town, Panama Canal zone, the port adjoining the city of Panama. The port is about 3m. distant from Panama city, and contains all the wharves and docks, Panama itself not being a seaport. (See PANAMA CANAL and PANAMA.)

BALBRIGGAN, town, Co. Dublin. Eire, 21¾ mi. N.N.E. of Dublin by the Great Northern railway. Pop. (1936) 2,434. The harbour affords a good refuge from the east or south-east gales. The town has considerable manufactures of cottons and hosiery, "Balbriggan hose" being well known. The industry was founded by Baron Hamilton in 1761. There is some coast trade in grain, etc., and also sea-fishery. Balbriggan is much frequented as a watering-place in summer.

BALBUS, literally "stammerer," the name of several Roman families. Of the Acilii Balbi, one, Manius Acilius, was consul in 150 B.C., another in 114. To another family belonged T. Ampius Balbus, a supporter of Pompey; afterwards pardoned by Julius Caesar (cf. Cic. ad *Fam.* vi. 12 and xiii. 70). We know also of Q. Antonius Balbus, praetor in Sicily in 82 B.C., and Marcus Atius Balbus, who married Julia, a sister of Caesar, and had a daughter Atia, mother of Augustus. The most important of the name were the two Cornelii Balbi, natives of Gades (Cadiz).

1. LUCIUS CORNELIUS BALBUS (called *Major*), was born early in the last century B.C. Pompey conferred Roman citizenship on him and his family for his services against Sertorius in Spain. Becoming friendly with all parties, he had much to do with the formation of the First Triumvirate, and was one of the chief financiers in Rome. He won the favour of Caesar, and went with him as *praefactus fabrum* (chief engineer) to Spain (61) and Gaul (58). His position as a naturalized foreigner, his influence and his wealth naturally made Balbus many enemies, who in 56 put up a native of Gades to prosecute him for illegally assuming the rights of a Roman citizen, a charge directed against the triumvirs equally with himself. Cicero, Pompey and Crassus all spoke on his behalf, and he was acquitted. During the civil war he tried to get Cicero to mediate between Caesar and Pompey. Balbus became Caesar's private secretary, and after Caesar's murder attached himself to Octavian; in 43 or 42 he was praetor, and in 40 consul—an honour then for the first time conferred on an alien. The year of his death is not known. Balbus kept a diary of the chief events in his own and Caesar's life (Suetonius, Caesar, 81). The 8th book of the Bell. Gall., which was probably written by his friend Hirtius at his instigation, was dedicated to him.

See Cicero, *Letters* (Ed. Tyrrell and Purser, iv. introd. p. 62) and *Pro Balbo* (ed. *J. S.* Reid, 1878, with introduction); *see* also *E.* Jullien, *De* L. *Cornelzo Balbo Maiore* (1886).

2. LUCIUS CORNELIUS BALBCS (called *Minor*), nephew of the above, received the Roman citizenship at the same time as his uncle. During the civil war, he served under Caesar. He also took part in the Alexandrian and Spanish wars. He was rewarded by being admitted into the college of pontiffs. In 43 he was quaestor in Further Spain, where he made a fortune by plundering the inhabitants. In the same year he crossed over to Bogud, king of Mauretania, and is not heard of again until 21, when he was proconsul of Africa. In 19 Balbus defeated the Garamantes, and on March 27 in that year celebrated a triumph, which was then for the first time granted to one who was not a Roman citizen by birth, and for the last time to a private individual. He built a theatre, which was dedicated at Rome in 13 (Dio Cassius liv. 25; Pliny, *Nat. Hist.* xxxvi. 12. 60). Balbus wrote a play on his visit to Lentulus in the camp of Pompey at Dyrrhachium, and, according to Macrobius (Saturnalia, iii. 6), a work called Ezegetica, dealing with the gods and their worship.

See Velleius Paterculus ii. 51; Cicero, ad Att. viii. 9; and on both the above the exhaustive articles in Pauly-Wissowa, *Realencyclopadie,* iv. pt. i. (1900).

BALCONY, a platform enclosed by a railing, and projecting from the wall of a bullding. In theatres the balcony, originally a stage box, is now one of the upper levels of the auditorium.

BALDACHINO, also known as a ciborium in architecture, the canopy over an altar or tomb, supported on columns, especially when free standing and disconnected from any enclosing wall. Early examples of the baldachino are found in the

basilicae of Kavenna and Rome. The usual form consists of four columns supporting entablatures which carry miniature colonnades topped by a pyramidal or gabled roof. In Romanesque work arches generally replaced the entablatures, and gables frequently topped the four sides as in San Ambrogio in Milan. Few baldachinos of the Gothic period remain, and their use, outside of Italy, seems to have been spasmodic; there is, however, a rich

Gothic example in the Ste. Chapelle at Paris (1247–1250) reconstructed by Viollet-le-Duc in the 19th century, which shows great richness of carving, gilding, jewelling and the use of coloured enamels. In the Renaissance the use of the baldachino became more common, probably owing to the influence of the enormous bronze baldachino which Bernini designed for the altar of St. Peter's in Rome. These late Renaissance examples make frequent use of the spiral column supporting canopies of extremely fantastic design. See also ALTAR and CANOPY. (T. F. H.)

BALDE, JAKOB (1604–1668), German Latinist, was born at Ensisheim, in Alsace. In 1624 he entered the Society of Jesus. and in 1633 was ordained priest. His lectures and poems had now made him famous; in 1638 he became court chaplain to the elector, Maximilian I. at Munich, where he remained till 1650. In 1654 he was transferred to Neuberg on the Danube, as court preacher to the count palatine. There he died on Aug. g, 1668. Balde ranks high among modern Latin verse writers.

A collected edition of Balde's works was published at Cologne (1650); a more complete edition at Munich (1729); also a good selection by L. Spach (Paris and Strasbourg, 1871). An edition of his Latin lyrics appeared at Regensburg (1884). There are translations into German of his finer odes, by J. Schrott and M. Schleich (Munich, 1870). *See* G. Westermayer, *Jacobus Balde, sein Leben und seine Werke* (1868); J. Bach, *Jakob Balde* (Freiburg, 1904).

BALDER, a Scandinavian god, the son of Odin. The story of his death is given in two widely different forms, by Saxo in his Gesta *Danorum* (ed. Holder), and in the prose Edda (*Gylfaginning*).

See F. Kauffmann, *Balder: Mythus und Sage* (Strassburg, 1902).

BALDERIC, the name given to the author of a chronicle of the bishops of Cambrai, written in the 11th century. This Gesta *episcoporum Cambracensium* (first printed in 1615) was for some time attributed to Balderic, archbishop of Noyon, but it now seems tolerably certain that the author was an anonymous canon of Cambrai.

The best edition is in the *Monumenta Germaniae historica. Scriptores.* Bd. vii. (1826–92) which contains an introduction by L. C. Bethmann. See *Histoire littéraire de la France,* tome viii. (1865–69).

BALDI, BERNARDINO (1533–1617), Italian mathematician and miscellaneous writer, was born at Urbino and was abbot of Guastalla for 25 years. He is said to have written 100 different works, the chief part of which have remained unpublished. He was a theologian, mathematician, geographer, antiquary, historian and poet. The Cronica dei Matematici (published at Urbino in 1707) is an abridgement of a larger work, on which he had bestowed 12 years of labour, and which was intended to contain the lives of more than 200 mathematicians. His life has been written by Affò, Mazzuchelli and others.

BALDINUCCI, FILIPPO (1624–1696), Italian writer on the history of the arts, was born at Florence. His chief work is entitled *Notizie de'Professori del Disegno* da *Cimabue* . . . (dal 1250 *sino al 1670)* (1681–1728). The capital defect of this work is the attempt to derive all Italian art from the schools of Florence. A good edition is that by Ranalli (Florence, 1845–47). Baldinucci's whole works were published at Milan (1808–12).

BALDNESS (technically alopecia), the result of loss of hair, particularly on the human scalp. Two forms may be distinguished: one the premature baldness common in young men, due to alopecia seborrhoica, the other alopecia areata, now regarded as an epidemic disease.

Alopecia seborrhoica is always due to the underlying disease seborrhoea, and, though it progresses steadily if neglected, is yet very amenable to treatment by sulphur and salicylic acid, 18 grains of each added to an ounce of vaseline making a good application. This should be rubbed well into the scalp daily for a prolonged period. The head must be frequently cleansed, and in very mild cases a daily washing with soap spirit will at times effect a cure unaided.

Alopecia areata is characterized by the development of round patches more or less completely denuded of hair. It is most commonly observed on the scalp, though it may occur on any part of the body where hair is naturally present. At the margin of the patches short, broken hairs are usually to be seen. Clinical evidence is steadily accumulating to show that this disease may be transmitted. The disease must be distinguished from ringworm (*q.v.*).

The loss of hair following acute fevers must be treated by keeping the hair short, applying stimulating lotions to the scalp, and attending to the general hygiene of the patient.

BALDOVINETTI, ALESSIO (1427–1499), Florentine painter and restorer of the disused art of mosaic, was born on Oct. 14, 1427, and died on Aug. 29, 1499. He belonged to the group of scientific realists and naturalists in art which included Andrea del Castagno, Paolo Uccello and Domenico Veneziano, the influence of the last-named master being particularly evident in his work. Tradition says that he assisted in the decorations of the chapel of S. Egidio in Santa Maria Kuova. That he was commissioned to complete the series at a later date (1460) is certain. In 1462 Alessio was employed to paint the great fresco of the Annunciation in the cloister of the Annunziata, which still exists in ruined condition. His favourite method in mall-painting was to lay in his compositions in fresco and finish them a secco with a mixture of yolk of egg and liquid varnish. This, says Vasari, was with the

view of protecting the painting from damp; but in course of time the parts executed with this vehicle scaled away, so that the great secret he hoped to have discovered turned out a failure. In 1463 he furnished a cartoon of the Nativity, which was executed in tarsia by Giuliano de Maiano in the sacristy of the Duomo, and still exists. From 1466 date the groups of four Evangelists and four Fathers of the Church in fresco, together with the Annunciation on an oblong panel, which still decorate the Portuguese chapel in the church of S. Miniato, and are given in error by Vasari to Pietro Pollaiuolo. A fresco of the risen Christ between angels inside a holy sepulchre in the chapel of the Rucellai family, also still existing, belongs to 1467. In 1471 Alessio undertook important works for the church of Sta. Trinità on the commission of Bongianni Gianfigliazzi. First, to paint an altar-piece of the Virgin and Child with six saints; this was finished in 1472 and is now in the Academy at Florence; next, a series of frescoes from the Old Testament which was to be completed according to contract within five years, but actually remained on hand for fully 16. Only some defaced fragments of it now remain.

Meanwhile Alessio had been much occupied with other technical pursuits and researches apart from painting. He was regarded by his contemporaries as the one craftsman who had rediscovered and fully understood the long disused art of mosaic, and was employed accordingly between 1481 and 1483 to repair the mosaics over the door of the church of S. Miniato, as well as several of those both within and without the baptistery of the cathedral.

See Vasari, ed. Milanesi, vol. ii.; Crowe-Cavalcaselle, *Hist. of Painting in Italy,* vol. ii.; Bernhard Berenson, *Study and Criticism of Italian Art,* 2nd series.

BALD PATE, the common name for a North American duck (*Anas,* or *Mareca, americana*), allied to the European widgeon (*q.v.*).

BALDRIC, a belt worn over one shoulder, passing diagonally across the body and under the other arm, either as an ornament or a support for a sword, bugle, etc.

BALDUINUS, JACOBUS, Italian jurist of the 13th century, a Bolognese and reputed to be of a noble family, was a pupil of Azo, and the master of Odofredus, Hostiensis and Jacobus de Ravanis (who first applied dialectical forms to legal science). His great fame as a professor of civil law at Bologna caused Balduinus to be elected *podesta* of the city of Genoa, where he was entrusted with the reform of its laws. He died at Bologna in 1225. His treatises on procedure were the earliest of their kind.

BALDUNG, HANS: *see* GRÜN.

BALDUS DE UBALDPS, PETRUS (1327–1406), Italian jurist of the noble family of the Ubaldi, studied civil law at Perugia under Bartolus, gaining the doctorate at the age of 17. Federicus Petrucius of Siena was his master in the canon law. Upon his promotion to the doctorate he went to Bologna, where he taught for three years; and then became a professor at Perugia, where he stayed 33 years. Afterwards he taught at Pisa, Florence, Padua and Pavia, when the schools of law in those universities disputed the palm with Bologna. The extant *Treatises* of Baldus hardly account for the reputation which he had in his own day, due partly to his public career, and partly to the fame of his consultations, of which there are five volumes (Frankfurt, 1589). Baldus was the master of Pierre Roger de Beaufort (Pope Gregory XI.), whose successor, Urban VI., called Baldus to Rome to assist him in 1380 against the anti-pope Clement VII. Cardinal de Zabarella and Paulus Castrensis mere his pupils. His *Commentary on the Liber Feudorum* is one of his best works, most of which he left unfinished. His brothers Angelus (1328–1407) and Petrus (1335–1400) were also eminent as jurists.

BALDWIN I. (1172–1205), emperor of Rumania, count of Flanders and Hainaut, was one of the most prominent leaders of the fourth crusade. On the capture of Constantinople he was elected first emperor of Rumania (May 9, 1204) and crowned a week later, after the imperial crown had first been refused by Doge Dandolo. Besides being feudal superior of the princes invested with portions of the conquered territory, Baldwin received as his own portion Constantinople, the adjacent regions both on the European and the Asiatic side, along with some outlying districts, and several islands, including Lemnos, Lesbos, Chios and Tenos He at once marched into Thrace to conquer the allotted territory, with the intention of occupying Thessslonica. He was immediately involved in a conflict with Boniface of Montferrat, who had been his rival candidate for the empire, and had been invested, in compensation, with a large territory in Macedonia and the title of king of Salonika. Boniface aimed at complete independence of the empire, and civil war between the rivals was only averted by the mediation of Dandolo, who persuaded Baldwin to agree to the establishment of the kingdom of Salonika. In the following winter the Franks made conquests in Bithynia, in which Henry, Baldwin's brother, took part; but in Feb. 1205 the Greeks revolted in Thrace, relying on the assistance of John (Kaloyan), tsar of Bulgaria, whose overtures of alliance had been unwisely rejected by the emperor. In a desperate battle under the walls of Adrianople (April 1j, 1205) the crusaders were defeated, the count of Blois slain and Baldwin captured. He was taken to the Bulgarian capital Trnovo, where a tower is still known as "Baldwin's tower," and held hostage; but he was afterwards killed by the Bulgarian tsar. The manner of his death is obscure. Kaloyan wrote to Pope Innocent III. that he had died in prison; but one contemporary writer says that his hands and feet were cut off and he was thrown into a valley, where he died on the third day. His brother Henry, who had acted as regent since his capture, succeeded him as Emperor in 1206, when his death was definitely known.

(1877); Pears, *The Fall of Constantinople* (1885); Gerland, *Geschichte des lateinischen Kaiserreiches von Konstantinopel,* pt. i. (Homburg v. d. Hohe, 1905); W. Miller, *The Latins in the Levant* (1908); Gibbon, *Decline and Fall,* vol. vi. (ed. Bury, 1912). (J. B. B.)

BALDWIN II. (1217–1273), emperor of Rumania, was a younger son of Yolande, sister of Baldwin I. Her husband, Peter of Courtenay, was third emperor of Rumania, and had been followed by his son Robert, upon whose death in 1228 the succession passed to Baldwin. The barons chose John of Brienne (titular king of Jerusalem) as emperor-regent for life; Baldwin was to rule the Asiatic possessions of the empire when he reached the age of 20, was to marry John's daughter Mary, and on John's death enjoy the full imperial sovereignty. The marriage took place in 1234, but when John died (1237) the realm to which Baldwin succeeded was little more than Constantinople, and the financial situation was desperate.

In 1236 Baldwin had visited Rome, France and Flanders, trying to raise money and men to recover the lost territory of his realm, and in 1240 he was able to bring a considerable army back to Constantinople. But he could accomplish nothing with this help and in 1245 travelled again to Italy and then to France, where he spent two years. The Empress Maria and Philip of Toucy governed during his absence. Louis IX. bought some relics from him, and redeemed his son Philip whom he had been obliged to give to some merchants as security for loans; but Baldwin spent most of his reign in inglorious mendicant tours.

In 1261 Constantinople was captured by Michael Palaeologus, Baldwin escaped in a Venetian galley to Negropont, and then proceeded to Athens, whence he passed to Apulia and finally to France, still in quest of help from the western powers. He went to Italy in 1267, and in May induced Charles of Anjou to sign a treaty for the reconquest of Constantinople and to pension himself and his son Philip. In Oct. 1273 Philip married Beatrice, daughter of Charles, at Foggia. A few days later Baldwin died.

See bibliography for BALDWIN I. above; also Norden, *Das Papsttum und Byzanz* (1903).

BALDWIN I. (1058–1118), prince of Edessa, and first king of Jerusalem (1100–18), was the brother of Godfrey of Bouillon (*q.v.*). He was originally a clerk in orders, and held several prebends; but in 1096 he joined the first crusade, and accompanied his brother Godfrey as far as Heraclea in Asia Minor. When Tancred left the main body of the crusaders at Heraclea, and marched into Cilicia, Baldwin followed, partly in jealousy, partly from the same political motives which animated Tancred. He wrested Tarsus from Tancred's grip (Sept. 1097), and left there a garrison of his own. After rejoining the main army at

Marash, he received an invitation from an Armenian named Pakrad, and moved eastwards towards the Euphrates, where he occupied Tell-bashir. Another invitation followed from Thoros of Edessa; and to Edessa Baldwin came, first as protector, and then, when Thoros was assassinated, as his successor (March 1098). For two years he ruled in Edessa (1098–1100), marrying an Armenian wife, and acting generally as the intermediary between the crusaders and the Armenians. During these two years he was successful in maintaining his ground, both against the Mohammedan powers by which he was surrounded, and from which he won Sainosata and Seruj (Sarorgia), and against a conspiracy of his own subjects in 1098. At the end of 1099 he visited Jerusalem along with Bohemund I.; but he returned to Edessa in January 1100. On the death of Godfrey he was summoned by a party in Jerusalem to succeed to his brother. A lay reaction against the theocratic pretensions of Dagobert, who was counting on Norman support, was responsible for the summons; and in the strength of that reaction Baldwin was able to become the first king of Jerusalem. He was crowned on Christmas Day, 1100, by the patriarch himself; but the struggle of church and state was not yet over, and in the spring of 1101 Baldwin had Dagobert suspended by a papal legate, while later in the year the two disagreed on the question of the contribution to be made by the patriarch towards the defense of the Holy Land. The struggle ended in the deposition of Dagobert and the triumph of Baldwin (1102).

As Baldwin had secured the supremacy of the lay power in Jerusalem, so he extended into a compact kingdom the poor and straggling territories to which he had succeeded. This he did by an alliance with the Italian trading towns, especially Genoa, which supplied, in return for the concession of a quarter in the conquered towns, the instruments and the skill for a war of sieges, in which the coast towns of Palestine were successively reduced. Arsuf and Caesarea were captured in 1101; Acre in 1104; Beirut and Sidon in 1110 (the latter with the aid of the Venetians and Norwegians). Meanwhile Baldwin repelled in successive years the attacks of the Egyptians (1102, 1103, 1105), and in the latter years of his reign (1111–18) he even pushed southward at the expense of Egypt, penetrating as far as the Red Sea, and planting an outpost at Monreal. In the north he had to compose the dissensions of the Christian princes in Tripoli, Antioch and Edessa (1109–10), and to help them to maintain their ground against the Mohammedan princes of north-east Syria, especially Maudud and Aksunkur, amirs of Mosul. In this way Baldwin was able to make himself the practical suzerain of the three Christian principalities of the north, though the suzerainty was, and always continued to be, somewhat nominal. In 1118 he died, after an expedition to Egypt, during which he captured Farama, and, as old Fulcher says, "caught many fish, and his death in eating them."

Baldwin was one of the "adventurer princes" of the first crusade, and as such he stands alongside of Bohemund. Tancred and Raymund. On the whole he was the most successful of his class. By his defense of the lay power against a nascent theocracy, and by his alliance with the Italian towns, he was the real founder of the Latin kingdom of Jerusalem. Events worked for him: he might never have come to the throne, unless Bohemund had fallen into the hands of Danishmend; and the dissensions among the Mohammedans alone made possible the subsequent consolidation of his kingdom. But he had *virtù* as well as *fortuna;* and on his tombstone it was written that he was "a second Judas Maccabaeus, whom Kedar and Egypt, Dan and Damascus dreaded." As king, he still retained something of the clerk in the habit of his dress; but he was at the same time a warrior so impetuous as to be sometimes foolhardy, and his policy was on the whole anti-clerical. He may be accused of greed; his life was not chaste; and the two defects met in his rejection of his Armenian wife and his marriage to the rich Sicilian widow Adelaide (1113). But "on the holiest soil of history, he gave his people a fatherland"; and Fulcher of Chartres, his chaplain, who paints at the beginning of Baldwin's reign the terrors of the lonely band of Christians in the midst of their foes, can celebrate at the end the formation of a new nation in the East (*qui fuimus* occidentales, *nunc* facti *sumus* orientates)—an achievement which, so far as it was the work of any one man, was the work of Baldwin I.

BIBLIOGRAPHY.—The *Historia* Hierosolymitana of Fulcher, who had accompanied Baldwin as chaplain to Edessa, and had lived in Jerusalem during his reign, is the primary authority for Baldwin's career. There is a monograph on Baldwin by Wolff (Konig *Baldwin* I. *von Jerusalem*), and his reign is sketched in R. Rohricht's Geschichte des *Königreichs Jerusalem* (1897), C. i.–iv. (E. B.)

BALDWIN II., count of Edessa (died 1131), king of Jerusalem (1118–31), originally known as Baldwin de Burg, was a son of Count Hugh of Rethel, and a nephew of Godfrey of Bouillon and Baldwin I. He appears on the first crusade at Constantinople as one of Godfrey's men; and he helped Tancred to occupy Bethlehem in June 1099. After the capture of Jerusalem he served for a time with Bohemund at Antioch; but when Baldwin of Edessa became king of Jerusalem, he summoned Baldwin de Burg, and left him as count in Edessa. From Edessa Baldwin conducted continual forays against the Mohammedan princes; and in the great foray of 1104, in which he was joined by Bohemund, he was defeated and captured at Balich. Tancred became guardian of Edessa during Baldwin's captivity, and did not trouble himself greatly to procure his release. Baldwin, however, recovered his liberty at the beginning of 1108, and at once entered upon a struggle with Tancred for the recovery of Edessa. In September 1108 he regained his principality; but the struggle with Tancred continued, until it was composed by Baldwin in 1109. For the next ten years Baldwin ruled his principality with success, if not without severity. Planted in the farthest Christian outpost in northern Syria, he had to meet many attacks, especially from Mardin and Mosul, in revenge for the provocation offered by his own forays and those of the restless Tancred. In 1110 he was besieged in Edessa, and relieved by Baldwin I.; in 1114 he repelled an attack by Aksunkur of Mosul; in 1115 he helped to defeat Aksunkur at Danith. At the same time, if Matthew of Edessa may be trusted, he also carried his arms against the Armenians, and plundered in his avarice every Armenian of wealth and position. In 1118 he was on his way to spend Easter at Jerusalem, when he received the news of the death of Baldwin I.; and when he arrived at Jerusalem, he was made king, chiefly by the influence of the patriarch Arnulf. In a reign of 13 years, Baldwin II. extended the kingdom of Jerusalem to its widest limits. His reign is marked by almost incessant fighting in northern Syria. In 1119, after the defeat and death of Roger of Antioch, he defeated the amirs of Mardin and Damascus

at Danith; in subsequent years he extended his sway to the very gates of Aleppo. In 1123 he was captured by Balak of Mardin, and confined in Kharput with Joscelin, his successor in the county of Edessa, who had been captured in the previous year. During his captivity Eustace Graverius became regent of Jerusalem, and succeeded, with the aid of the Venetians, in repelling an Egyptian attack, and even in capturing Tyre, 1124. In that year Baldwin II. succeeded in securing his liberty, under conditions which he instantly broke; and he at once embarked on strenuous and not unsuccessful hostilities against Aleppo and Damascus (1124–27),

exacting tribute from both. During his reign he twice acted as regent in Antioch (1119–30), and in 1126 he married his daughter Alice to Bohemund II. In 1128 he offered the hand of his eldest daughter, Melisinda, to Fulk of Anjou, who had been recommended to him by Honorius II. In 1129 Fulk came and married Melisinda, and in 1131, on the death of Baldwin, he succeeded to the crown.

Baldwin II. had much of the churchmanship of Godfrey and Baldwin I.; but he appears most decidedly as an incessant warrior, under whom the Latin domination in the East stretched, as Ibn al-Athir writes, in a long line from Mardin in the North to el-Arish on the Red Sea—a line only broken by the Mohammedan powers of Aleppo, Hamah, Homs and Damascus. The Franks controlled the great routes of trade, and took tolls of the traders; and in 1130 their power had reached its height.

BIBLIOGRAPHY.—Fulcher of Chartres narrates the reign of Baldwin II. down to 1127; for the rest of the reign the authority is William of Tyre. R. Rohricht, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898), C. vii.–x., is the chief modern authority. (E. B.)

BALDWIN III., king of Jerusalem (1143–1162), was the eldest son of Fulk of Jerusalem by his wife Melisinda. He was born in 1130, and became king in 1143, under the regency of his mother, which lasted till 1152. He came to the throne at a time when the attacks of the Greeks in Cilicia, and of Zengi on Edessa were fatally weakening the position of the Franks in northern Syria; and from the beginning of his reign the power of the Latin Kingdom of Jerusalem may be said to be slowly declining. Edessa was lost, however, in the year after Baldwin's accession, and the conquest by Zengi of this farthest and most important outpost in northern Syria was already a serious blow to the kingdom. Upon it in 1147, there followed the second crusade; and in that crusade Baldwin III., now some 18 years of age, played his part by the side of Conrad III., and Louis VII. He received them in Jerusalem in 1148; with them he planned the attack on Damascus and with them he signally failed in the attack. In 1149, after the failure of the crusade, Baldwin III. appeared in Antioch, where the fall of Raymund, the husband of the princess Constance, made his presence necessary. He regulated affairs in Antioch, and tried to strengthen the north of Palestine generally against the arm of Zengi's successor, Nureddin, by renewing the old and politic alliance with Damascus interrupted since 1147, and by ceding Tell-bashir, the one remnant of the county of Edessa, to Manuel of Constantinople. In 1152 came the inevitable struggle between the young king and his mother, who had ruled with wisdom and vigour during the regency and was unwilling to lay down the reins of power. Baldwin originally planned a solemn coronation, as the signal of his emancipation. Dissuaded from that course, he nevertheless wore his crown publicly in the church of the Sepulchre. A struggle followed: in the issue, Baldwin agreed to leave his mother in possession of Jerusalem and Nablus, while he retained Acre and Tyre for himself. But he repented of the bargain; and a new struggle began,, in which Baldwin recovered, after some fighting, the possession of his capital. From these internal dissensions Baldwin was now summoned to the north, to regulate anew the affairs of Antioch and also those of Tripoli, where the death of Count Ravmund had thrown on his shoulders the cares of a second regency. On his return to Jerusalem he was successful in repelling an attack by an army of Turcomans; and his success encouraged him to attempt the siege of Ascalon in the spring of 1153. He was successful: the "bride of Syria," which had all but become the property of the crusaders in 1099, but had since defied the arms of the Franks for half a century, became part of the kingdom of Jerusalem. From 1156 to 1158 Baldwin was occupied in hostilities with Nureddin. In 1j6 he had to submit to a treaty which cut short his territories; in the winter of 1157–58 he besieged and captured Harim, in the territory once belonging to Antioch: in 1158 he defeated Nureddin himself. In the same year Baldwin married Theodora, a near relative of the East Roman emperor Manuel; while in 1159 he received a visit from Manuel himself at Antioch. The Latin king rode behind the Greek emperor, without any of the insignia of his dignity, at the entry into Antioch; but their relations were of the friendliest, and Manuel—as great a physician as he was a hunter—personally attended to Baldwin when the king was thrown from his horse in attempting to equal the emperor's feats of horsemanship. In the same year Baldwin had to undertake the regency in Antioch once more, Raynald of Chatillon, the second husband of Constance, being captured in battle. Three years later he died (1162), without male issue, and was succeeded by his brother Amalric I.

Baldwin III. was the first of the kings of Jerusalem who was a native of the soil of Palestine. His three predecessors had all been emigrants from the West. His reign also marks a new departure from another point of view. His predecessors had been men of a type half military, half clerical—at once hard fighters and sound churchmen. Baldwin was a man of a subtler type—a man capable of dealing with the intrigues of a court and with problems of law, and, as such, suited for guiding the middle age of the kingdom, which the different qualities of his predecessors had been equally suited to found. Like his brother, Amalric I., he was a clerkly and studious king versed in law, and ready to discuss points of dogma. In an excellent sketch of Baldwin's character (xvi. cii.), William of Tyre tells us that he spent his spare time in reading and had a particular affection for history; that he was well skilled in the *jus consuetudinarium* of the kingdom (afterwards recorded by lawyers like John of Ibelin and Philip of Novara as "the assizes of Jerusalem"); and that he had the royal faculty for remembering faces, and could generally be trusted to address by name anybody whom he had once met, so that he was more popular with high and low than any of his predecessors. He had, William also reports, a gift of impromptu eloquence, and a faculty both for saying witty things pleasantly at other people's expense and for listening placidly to witticisms directed against himself; while he was generous to excess without needing to make exactions in order to support his generosity, and always respected the Church. If in his youth he had been prone to gambling, and before his marriage with Theodora had been somewhat lax in his morals, when he became a man he put away childish things; his married life was a shining example to his people and he was abstemious both in food and drink, holding that "excess in *either* was an incentive to the worst of crimes." Even his enemy, Nureddin, said of him, when he died—"the Franks have lost such a prince that the world has not now his like."

BIBLIOGRAPHY.—William of Tyre is the great primary authority for his reign; Cinnamus and Ibn-al-athir (see *Bibliography* to the article CRUSADES) give the Byzantine and Mohammedan point of view. His reign is described by R. Rohricht, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898), *C.* xiii.–xvi. (E. B.)

BALDWIN IV., the son of Amalric I. by his first wife Agnes, ruled in Jerusalem from 1174 to 1183, when he had his nephew Baldwin crowned in his stead. Educated by William of Tyre, Baldwin IV. came to the throne at the early age of 13; and thus the kingdom came under the regency of Raymund II. of Tripoli. The problems of the reign of Baldwin IV. may be said to have been two—his sister Sibylla and the fiery Raynald of Chatillon, once prince of Antioch, then a captive for many years in the hands of the Mohammedans, and since 1176 lord of Krak (Kerak), to the east of the Dead Sea. Sibylla was the heiress of the kingdom; the problem of her marriage was important. Married first to William of hfontferrat, to whom she bore a son, Baldwin, she was again married in 1180 to Guy of Lusignan; and dissensions between Sibylla and her husband on the one side, and Baldwin IV. on the other, troubled the latter years of his reign. Meanwhile, Raynald of Krak took advantage of the position of his fortress which lay on the great route of trade from Damascus and Egypt, to plunder the caravans (1182), and thus helped to precipitate the inevitable attack by Saladin. When the attack came, Guy of Lusignan was made regent by Baldwin IV., but he declined battle and was deposed both from his regency and from his right of succession, while Sibylla's son by her first husband was crowned king as Baldwin V. in 1183. For a time Baldwin IV. still continued to be active; but in 1184 he handed over the regency to Raymund of Tripoli, and in 1185 he died.

BIBLIOGRAPHY.—The narrative of William of Tyre concludes with Baldwin IV's. transfer of the regency to Raymund of Tripoli. R. Röhricht describes the reign of Baldwin IV. *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898), *C.* xix., xxi.

BALDWIN V., the son of Sibylla (daughter of Amalric I.) by her first husband, William of Montferrat, was the nominal king of Jerusalem from 1183 to 1186, under the regency of Raymund of Tripoli. His reign is marked by the advance of Saladin and by dissensions between the government and Guy of Lusignan.

BALDWIN, JAMES MARK (1861–1934), American philosopher, was born at Columbia (S.C.), Jan. 12, 1861, and educated at Princeton and several German universities. He was professor of philosophy in the University of Toronto (1889–93), of psychology at Princeton (1893–1903), of philosophy and psychology in Johns Hopkins university (1903–09) and in the National University of Mexico until 1913. After lecturing at Oxford and the French provincial universities, he became professor at the École des Hautes Études Sociales, Paris, in 1919. Prominent among experimental psychologists, he received many honours from learned societies in America and Europe. His works include.

Handbook of Psychology (1889–1891); *Elements of Psychology* (1893); *Story of the Mind* (1898); *Mental Development in the Child and the Race* (1896); *Hirtory of Psychology* (1913); *Between Two Wars* (1926); and contributions to the *Dict. of Philosophy and Psyclzology* (1901–05) and the *Psychological Review,* both of which he edited.

BALDWIN, MATTHIAS WILLIAM (1795–1866), American inventor and manufacturer, was born in Elizabethtown, N.J., on Dec. 10, 1795. He was trained as a jeweller but, being encouraged to engage in the manufacture of locomotives, eventually founded the Baldwin Locomotive Works (q v.). He died in Philadelphia on Sept. 7, 1866.

See W. Calkins, *Memorial of Matthias William Baldwin* (Phil., 1867) and *anon., History of the Baldwin Locomotive Works* (1924).

BALDWIN, ROBERT (1804–1858), Canadian statesman, was born at York (now Toronto) on May 12 1804. His father, William Warren Baldwin (d. 1844), went to Canada from Ireland in 1798. He opposed the religious and political oligarchy which was then at the head of Canadian affairs, and brought up his son in the same principles. Robert Baldwin was called to the Bar in 182j, and entered into partnership with his father. In 1829–30 he sat in the parliament of Upper Canada for the town of York. During the next six years, he constantly advocated a responsible executive as the one cure for the political and economic evils of the time. In 1836 he was nominated to the executive council, but resigned within a month. Though a reformer, he strongly disapproved of the rebellion of 1837–38. On the union of the two Canadas he became (1841) a member of the executive council under Lord Sydenham, but soon resigned on the question of responsible government. In 1842 he formed the first Liberal administration, in connection with Mr. (afterwards Sir) L. H. Lafontaine, but resigned the next year, after a quarrel with the governor-general, Sir Charles Metcalfe, on a question of patronage, in which he felt that of responsible government to be involved. At the general election which followed, the governor-general was sustained by a narrow majority, but in 1848 the Liberals were again returned to power, and he and Mr. Lafontaine formed their second administration under Lord Elgin and carried numerous important reforms, including the freeing from sectarian control of the Provincial university and the introduction into Upper Canada of an important municipal system.

Internal dissensions soon began to appear in the Liberal party, and in 1851 Mr. Baldwin resigned. The special struggle leading to his resignation was an attempt to abolish the court of Chancery of Upper Canada, whose constitution was due to a measure introduced by Baldwin in 1849. The attempt, though defeated, had been supported by a majority of the representatives from Upper Canada, and Baldwin's fastidious conscience took it as a vote of want of confidence. A deeper reason was his inability to approve of the advanced views of the Radicals, or "Clear Grits," as they came to be called. On seeking re-election in York, he declined to give any pledge on the burning question of the Clergy Reserves and was defeated. In 1858 the Liberal-Conservative party, formed in 1854 by a coalition, attempted to bring him out as a candidate for the upper house, which was at this date elective, but though he had broken with the advanced reformers, he could not approve of the tactics of their opponents, and refused to stand. He died on Dec. 9 1858. After the concession of responsible government, he devoted himself to bringing about a good understanding between the English and French-speaking inhabitants of Canada, and his memory is held as dear among the French Canadians as in his native province of Ontario.

See J. C. Dent, *Canadian Portrait Gallery* (1880). His life, by the Hon. Geo. W. Ross, is included in "The Makers of Canada" series (Toronto).

BALDWIN, STANLEY BALDWIN, 1ST EARL, OF BEWDLEY (1867–), British statesman, was born at Bewdley Aug. 3, 1867, the only son of Alfred Baldwin, Chairman of the Great Western Railway and for 16 years M.P. for Bewdley. Descended from a family, which had long been small landowners in Shropshire, Baldwin's great-grandfather, toward the end of the 18th century, migrated into Worcestershire and established at Bewdley an iron foundry which expanded with the passage of time into the great combination of iron and steel manufactories and collieries known as Baldwin's, Ltd. Stanley Baldwin is thus, on one hand, a son of the soil, on the other, a son of the forge and the factory, and his economic and social outlook was the result of close personal experience of the evolution of modern industry.

Besides the territorial and the industrial there was a third strain in Baldwin's character which came to him from his father's and his mother's people. It was that of Puritanism. Both his parents were of Puritan stock; both, indeed, were brought up as Wesleyan Methodists. His mother, who lived to see her son twice prime minister, was Louise, one of the five remarkable daughters of the Rev. G. B. Macdonald, a Wesleyan minister. Of Mrs. Baldwin's sisters, one became the wife of Sir Edward Burne-Jones; a second of Sir Edward Poynter, P.R.A., and a third of J. L. Kipling. Stanley Baldwin is thus a first cousin of Rudyard Kipling. His mother was a great favourite with Rossetti and William Morris, and it was in this circle and from his close and constant association with his gifted relations that Baldwin derived an abiding taste for the best things in art and literature. In 1881 he went to Harrow and in 1885 to Trinity college, Cambridge, where he took his B.A. in 1888.

After leaving Cambridge Baldwin went into his father's business; and when his father entered parliament in 1892 Stanley Baldwin became virtually the head of the concern. For nearly 20 years the business was the central interest of his life. He became a county magistrate and a county councillor, and lived the life of a country gentleman, with scholarly tastes and large business interests. In 1892 he had married Lucy, the eldest daughter of E. L. J. Risdale of Rottingdean, by whom he had two sons and four daughters. In 1906 he served his apprenticeship to politics by unsuccessfully contesting Kidderminster in the Conservative interest. Two years later his father died, and Stanley Baldwin succeeded to the chairmanship of the business, now converted into a joint stock company, to a seat on the board of the Great Western Railway and to the representation of the Bewdley division of Worcestershire.

On March 3, 1908, the future prime minister took his seat in the House of Commons, and on June 22 made his maiden speech. It was a characteristically modest and sensible contribution to a debate on a subject of which he had intimate knowledge. He spoke in opposition to the Coal Mines (Eight Hours) bill from the point of view of the class which he and his family had represented for four or five generations. In the session of 1909 he had the chance of making a private member's motion. He chose as his theme the investment of British capital abroad, and in the course of his speech revealed himself as an ardent Protectionist. But, although the House listened to him respectfully on the several occasions on which he spoke, he gave no special promise of future distinction. For nine years he did his work as a private member, quietly, effectively and modestly.

Official Career.—Lord Edmund Talbot, later Viscount Fitzalan and then chief whip, noted Baldwin's ability and advised Bonar Law to make him his parliamentary private secretary. This was done in Dec. 1916, and from that moment Baldwin's advancement mas astonishingly rapid. In Jan. 1917, he becdme a junior lord of the Treasury, but instead of going into the whip's

office, he was kept busy "on the bench," deputizing for the financial secretary who had no seat in the House. In June he became joint financial secretary to the Treasury and in that capacity gave valuable assistance in debate to Bonar Law and Austen Chamberlain — successively chancellors of the exchequer. Accustomed to control the policy of a great business concern, Baldwin was not perhaps well fitted for a subordinate place in the official hierarchy, but his efficient work in parliament was rewarded by admission to the Privy Council in 1920 and to the cabinet when, in 1921, he became president of the board of trade. It was there that he first gave proof of the stuff that was in him; but in party politics he was still almost an unknown factor.

His chance, however, came in 1922. The Coalition formed by Lloyd George in Dec. 1916, and cemented by the general election of 1918, was by that time manifestly breaking. Many Liberals, and still more Conservatives, found that the Coalition imposed too great a strain on their political consciences. Lloyd George and his personal followers were anxious to appeal again to the electors as a coalition. The majority of the Conservatives were opposed to them. The crisis came in Oct. 1922, when, in fear of a *coup d'état* by the Coalition ministers, a meeting of the Conservative M P.'s was called at the Carlton club on Oct. 19. Austen Chamberlain presided, and his weight, with that of almost all his colleagues in the cabinet, was thrown into the scale of the Coalition. But they did not prevail with the rank and file of the party, who decided, there and then, by 187 votes to 87 to cut themselves adrift from Lloyd George and the Liberal wing of the Coalition, and to appeal to the country as Conservatives *sans phrase*. That meeting was the turning-point in the history of modern Conservatism, and in the career of Stanley Baldwin.

The result was due, apart from the determination of the rank and file, pre-eminently to two men: Bonar Law and Baldwin. The former emerged from retirement, to rescue his party from the Coalition. His action was heroic; the hand of death was already on him, and nothing but a high sense of duty induced him to essay a task manifestly beyond his strength. But Baldwin's was the greater courage. Only recently admitted to cabinet rank, yet plainly destined to a high place in politics; just approaching the zenith of his powers, physical and intellectual; with everything to lose politically by a false step, he took his courage in both hands and did simply what he believed to be right. His speech was characteristically brief and direct. He went at once to the "root of the whole difficulty — the position of the prime minister," and expressed his conviction that if the "present association" were continued, the disintegrating process in the Conservative ranks, already far advanced, would "go on inevitably until the old Conservative Party was smashed to atoms and lost in ruins." Accordingly he declared himself "prepared to go into the wilderness if he should be compelled" by the dynamic force of Lloyd George to "stay with him."

The die was cast. The meeting voted with Bonar Law and Baldwin; Austen Chamberlain and other Unionist leaders went into the wilderness — temporarily — with Lloyd George; Bonar Law became prime minister — the first Conservative to hold the office in 16 years; Baldwin became chancellor of the exchequer and principal lieutenant in the Commons; Lord Curzon remained foreign secretary and leader in the House of Lords.

The electors endorsed the verdict of the Carlton club meeting; 344 Conservatives were returned, a clear though small majority over all other parties; but the premier was a stricken man and after a few months in office resigned. Length and distinction of service, no less than intellectual pre-eminence, pointed to Lord Curzon as his successor; but the King was persuaded that, since the Labour Party had become the official Opposition, a peer-premier was no longer practicable. Accordingly Baldwin was invited to form a ministry, and, assured of the loyal support of his colleagues, consented. The Ministry was easily reformed under the new premier, but some of the ablest and most experienced Conservatives still remained outside the Ministry and the loss of Bonar Law was severely felt.

Baldwin's first Ministry was short-lived. In Nov. 1923, despite the fact that his parliamentary majority was intact, he decided to ask the electors for a vote of confidence in himself and in the policy which he believed could alone cure trade depression and relieve unemployment — protection for native industries. The country refused its assent. Out of the three parties none commanded an absolute majority in the new parliament. Consequently the Baldwin Ministry, with 259 supporters, met parliament. The Liberals, however, coalesced with the Socialists and turned out the Conservatives. Ramsay MacDonald, thereupon, became the head of a Socialist Government and remained for nine months in office, until a hostile vote in the House of Commons compelled him to appeal to the country, with the result that Baldwin found himself at the head of a solid phalanx of 414 Conservatives. Commissioned to form a ministry he not only invited Austen Chamberlain and other Conservative exiles to rejoin the cabinet, but entrusted the chancellorship of the exchequer to Winston Churchill. Growing steadily in political stature, having won an electoral victory almost without parallel in recent history, he refused to exploit a party triumph, and made a heroic effort to secure, by conciliation and consent, the peace which industry so sorely needed. He failed. His pacific overtures were misinterpreted by the Socialists, who responded to them by proclaiming a general strike. This conspiracy failed ignominiously but parliament could not ignore the danger so narrowly averted, nor neglect precautions against its recurrence. Consequently, an important amendment of the law relating to trade disputes was enacted in 1927 *(see* STRIKES AND LOCKOUTS).

Personality and Character. — The career thus outlined is one of the most remarkable in English political history. Fortune has undoubtedly been kind to him, though in politics fortune rarely smiles except on those whom she suspects to be worthy of her favours. Baldwin has still to win a place in the select company of great statesmen, but fate has given him an opportunity and he himself has given promise that he can take advantage of it. He starts with several initial advantages. The first, and not the least, is that his countrymen know him to be, like Pitt, pecuniarily disinterested. Pitt was a poor man, but his refusal of the Clerkship of the Pells proved that he counted money as dross compared with the public interest. Baldwin, a rich man, proved his public spirit when in June 1919 he presented to the exchequer for cancellation £150,000 of the new War Loan, a sum representing approximately 20% of his total fortune. He hoped, in this way, to set an example of personal sacrifice. He clearly perceived that the country was in grave danger of "being submerged in a wave of luxury and materialism," and he believed that "a fool's paradise is only the ante-room to a fool's hell."

With the ideals of a patriot, Baldwin combines the instincts of a Puritan. He appeals, therefore, if not like Gladstone to the Non-conformist conscience, to the best feelings of all good men, whatever their creed. "I stick all through to what I believe to be right." So Baldwin said at the Carlton club meeting, and his countrymen instinctively recognized that he spoke with sincerity and simplicity. There is no pose about Baldwin, though his briar pipe comes (thanks to the photographers) perilously near one. Simple, sincere, disinterested, he is also shrewd. Keen of intellect, and many sided in interests (as is proved by a volume of non-political addresses On *England* published in 1926), he disdains ostentation and advertisement. He is slow of speech and a curious working of the face and puckering of the brows gives the impression that his thoughts are, like his speech, laboured. "My mind moves slowly," he wrote of himself.

His speeches reveal a fund of dry and rather caustic humour, but in verbal wit he does not excel, though his judgments on men and things are expressed, especially in private, with pungent force and directness. Rhetoric he profoundly mistrusts; oratory he regards with Froude as "the harlot of the arts." Yet he has a keen appreciation of style in literature, and though he is impatient of the intrusion of the intellectual into politics or industry, few men have a higher sense of the value of real education. Less of the scholar, in the narrower sense, than Gladstone or Peel, he belongs like them to the aristocracy of commerce. He loves good art and good literature, but above all he loves nature, and his joy in the sights and sounds and smells of the English

countryside is drawn from that quiet worship which is the basis of all true poetry. No one who was not at once patriot and poet could have made the speech which he delivered on St. George's day, 1924, reprinted in *On England*. (J. A. R. M.)

Apart from the general strike of 1926 and its consequences, the main features of the Baldwin administration of 1924–29 were the passing of the Representation of the People (Equal Franchise) Act (1928), which brought universal adult parliamentary suffrage: and the Local Government Act (1929), by which the Boards of Poor-Law Guardians were replaced by Public Assistance Committees *(see* POOR LAW). In May 1929 the Labour Party returned to office. On the formation of the National Government, 1931, Baldwin became Lord President of the Council and, June 1935 to May 1937, Prime Minister. On his retirement in May 1937 he was created an earl and K.G *See* ENGLISH HISTORY.

BALDWIN LOCOMOTIVE WORKS, THE, situated at Eddystone, Pa., were founded by Matthias W. Baldwin, who completed his first locomotive, the "Old Ironsides," in 1832. It proved a success, and other orders followed. By the time of Baldwin's death, in 1866, the works had a capacity of 125 locomotives *per annum,* and a total of 1,500 had been built. Baldwin, from time to time, had partners associated with him. After his death a new partnership was organized, and this form of management was continued until 1909, when the works were finally incorporated. The plant was concentrated in Philadelphia until 1906, when a large tract was purchased at Eddystone, Pa , about 12 m. from the city. The removal of the works to Eddystone was completed in 1928. The Eddystone tract contains about 500 ac., of which 110 ac. are under roof. To 1940 over 62,200 Baldwin locomotives have been built, the maximum annual production being 3,580 in 1918. The company's products now include besides locomotives of all types (steam, electric, Diesel and gasoline), marine boilers, forgings and steel castings, ferrous and non-ferrous castings, hydraulic press machinery, tensile and compression testing machines, water power equipment, Diesel engines, etc. (M. K. W.)

BALDWINS LIMITED. This British joint-stock company amalgamated, in 1902, a number of old-established undertakings, including colliery owners, steel manufacturers, and makers of tinned, galvanized, leadcoated and black sheets; it has since enlarged its operations by further amalgamations.

The company has many famous associations. The Rt. Hon. Earl Baldwin of Bewdley, a former prime minister, was a director until he resigned to join the Government in 1917; it was near the Pontypool works of the company that Major Capel Hanbury first produced iron sheets by rolling instead of hammering; it was at the company's Landore steel works that Dr. Siemens carried on the greater part of the research that ultimately led to the invention of the open-hearth method of producing steel; while at the Worcestershire village, Cookley, the first tinplate coated through rolls was made in the '60s. The Cookley tinpot was almost as great an advance in tinning over the old method as Hanbury's invention of rolling in the production of iron sheets. (L. C. M.)

BALE, JOHN (1495–1563), bishop of Ossory, English author, was born at Cove, near Dunwich in Suifolk, on Nov. 21, 1495. At the age of 12 he entered the Carmelite monastery at Norwich, removing later to the house of "Holme," probably the abbey of the Whitefriars at Hulne near Alnwick. Later he entered Jesus college, Cambridge, graduating B.D. in 1529. At Cambridge he came under the influence of Cranmer and of Thomas Wentworth, 1st Baron Wentworth, and became an ardent partisan of the Reformers. He obtained the living of Thornden, Suffolk, in spite of being married. He enjoyed the powerful protection of Thomas Cromwell, whose notice he is said to have attracted by his miracle plays. He was an unscrupulous controversialist, and in these plays he allows no considerations of decency to stand in the way of his denunciations of the monastic system and its supporters. The prayer of Infidelitas which opens the second act of his *Thre Laws* is an example of the lengths to which he went in profane parody. These violent productions were well calculated to impress popular feeling, and no doubt Cromwell found in him an invaluable instrument. But on his patron's fall in 1540 Bale fled with his wife and children to Germany. He returned on the accession of Edward VI. He received the living of Bishopstoke, Hampshire, being promoted in 1552 to the Irish see of Ossory. He refused to be consecrated by the Roman rite which still obtained in the Irish Church, and won his point, though the dean of Dublin entered a protest against the revised office during the ceremony *(see* his *Vocacyon of John Bale to the Bishopperycke of Ossorie, Harl. Misc.,* vol. vi.). Bale pushed his Protestant propaganda in Ireland with no regard to expediency, and on the accession of Mary, it was with difficulty that he was got safely out of the country. He eventually made his way to Holland and thence to Frankfurt and Basle. After his return, on the accession of Elizabeth, he received (1560) a prebendal stall at Canterbury. He died in Nov. 1563 and was buried in the cathedral. Of Bale's mysteries and miracle plays only five have been preserved. The *Thre Laws of Nature, Moses and Christ, corrupted by the Sodomytes, Pharisses and Papystes most wicked* (pr. 1538 and again in 1562) was a morality play. The direction for the dressing of the parts is instructive: "Let Idolatry be decked like an old witch, Sodomy like a monk of all sects, Ambition like a bishop, Covetousness like a Pharisee or spiritual lawyer, False Doctrine like a popish doctor, and Hypocrisy like a gray friar." *A Tragedye; or enterlude manyfesting the chief promyses of God unto Man . . .* (1538, printed in Dodsley's Old Plays, vol. i.), *The Temptacyon of our Lorde* (ed. A. B. Grosart in *Miscellanies of the Fuller Worthies Library,* vol. i., 1870), and *A brefe Comedy or Enterlude of Johan Baptystes preachynge in the Wyldernesse, etc.* (*Harl. Misc.* vol. i.) were all written in 1538. His plays are doggerel, but his *Kynge Johan (c.* 1548) has some historical importance, since it marks the transition between the old morality play and the English historical dramas.

But Bale's most important work is *Illustrium majoris Britanniae scriptorum, hoc est, Angliae, Cambriae, ac Scotiae, Summarium . . .* (Ipswich and Wesel, for John Overton, 1548, 1549). This contained five centuries, but another edition, almost entirely rewritten and containing 14 centuries, was printed at Basle with the title *Scriptorum illustrium majoris Britanniae . . . Catalogus* (1557–59). The chronological catalogue of British authors and their works was partly founded on the *Collectanea* and *Commentarii* of John Leland.

A list of Bale's works is to be found in *Athenae Cantabrigienses* (vol. i. pp. 227 *seq.*). Beside the reprints already mentioned, *The Examinations of Lord Cobham, William Thorpe and Anne Askewe, etc.* were edited by the Rev. H. Christmas for the Parker Society in 1849. Bale's autograph note-book is preserved in the Selden collection of the Bodleian library, Oxford. It contains the materials he collected for his two published catalogues arranged alphabetically, with no attempt at ornament of any kind, and without the personalities which deface his completed work. He also gives in most cases the sources from which his information was derived. This book was prepared for publication with notes by Dr. R. Lane Poole, with the help of Miss Mary Bateson, as *Index Britanniae Scriptorum quos . . . collegit Ioannes Baleus* (1902), forming part ix. of *Anecdota Oxeniensia.*

BALE. (1) Evil, suffering, a word obsolete except in poetry, and more common in the adjectival form "baleful." In early poetry, used in antithesis to "bliss"; (2) a bonfire, a northern English use more common in "bale-fire"; (3) in industry, a bundle or package of material, bound in canvas with bands of metal or other hoops. The size and weight of a bale varies with the custom of different trades. A bale of American cotton weighs 500 lbs.; of Egyptian cotton 700 lbs. (4) More correctly "bail," to empty water out of a boat by means of a bail or bucket.

BALEARIC ISLANDS (BALEARES), an archipelago of four islands, with a number of islets, in the Mediterranean, off the east coast of Spain, of which it forms a province. Pop. (1930) 365,512; (est. 1939) 389,760; area 1,935 square miles. The archipelago, which lies between 38° 40′ and 40° 5′ N., and 1° and 5° E., comprises two distinct groups. In the eastern and larger group, the ancient Gymnesiae Insulae and Insulae Baliares, are the two principal members, Majorca (Span., Mallorca) and Minorca (Span., Menorca), with the islet of Cabrera and others. The

western group, the ancient Pityusae or Isles of Figs, comprises two relatively large islands, Iviza (Span. Ibiza), the ancient Ebusus, and Formentera, the ancient Ophiusa, with a number of islets. Majorca, Minorca and Iviza are described in separate articles, and Formentera with the last named.

Geology and Topography. — The Balearic Islands are the emergent portions of two submarine plateaux rising from the sill by which, at a depth of some 3,000ft., the mountain chains of the province of Alicante are continued for over 150m. beyond the triple headland of Cape de la Nao. Both plateaux lie near the surface, so that a fall of only 150ft. in the level of the Mediterranean would make the western group into one large island, while a fall of about 300ft. would unite Majorca with the adjoining islets and leave it joined to Minorca by a narrow ridge. Formentera, an island in which two low tablelands (the higher, La Mola, 630ft.) are connected by a narrow isthmus of alluvium, continues the horizontal formations, mostly of Pleistocene date, of the south of Iviza; these reappear in the chain of islets dotting the intervening channel, and similar formations penetrate to the heart of Iviza from other parts of the coast. The older formations of Iviza, mainly Cretaceous but with upper Trias and upper Jurassic appearing in the north-east, have been violently folded by pressure from the south-east and rise to 1,560ft. in La Atalayasa; the island, like Majorca, is elongated in the direction of the submarine sill and at right angles to the direction of this pressure; the threefold imbricated structure of these formations corresponds to that of the mountain chain of north-west Majorca, and the post-Burdigalian date of folding to the date of the later folding movements in Alicante and south-east Majorca. In Majorca the horizontal formations, among which the fertile marls and mollasses of the Vindobonian levels of the Miocene are more important than in Iviza, lie in a broad belt of lowland, scarred by the courses of torrents descending mostly from the rugged sierras on the north-west (Puig Mayor, 4,736ft.) or from the zone of highland, less elevated (nowhere reaching 2,000ft.) and less rugged in profile, on the south-east; they also partly envelop the southern end of this highland zone. Between the structure of the highland zone and that of the high sierra zone no correlations have been established; the former is more obviously a zone of *charriages*, and bears clear evidence of folding movements of early Oligocene date besides the post-Burdigalian movements already mentioned. The older formations are brought up also as inliers, rising in hills above the central lowlands at Randa and Petra, by posthumous movements which are believed, to have continued into Pleistocene time. Like the structure, the geological history of Majorca is more complex than that of Iviza; the gaps in the stratigraphical sequence are fewer, for the Trias is complete, and the Lias and Lower Oolite appear here, though wanting in the Iviza group. Structural resemblances and the great similarity of facies of the strata which belong to the same horizon in the two islands indicate that Iviza and Majorca belong to the same tectonic unit and have had, broadly speaking, the same geological history.

The case of Minorca is quite different. The island stands on the edge of the subtnarine sill, overlooking deeps of 8,000ft. to the north-east and at a distance of only 25m. from Majorca. But its principal axis, roughly the line Mahon-Ciudadela, lies obliquely to the direction of the sill; the! older formations, which make up the zone to the north of this axis, have been subjected to pressure chiefly from the east; there are no Alpine characters in the structure of this zone, and Monte Toro, the highest of the small and usually arid hills which stand out from its somewhat worn relief, reaches only to 1,175ft. The direction and the pre-Burdigalian date of the pressure, the wide extension of palaeozoic formations (Devonian), unknown elsewhere in the Balearics, the dissimilarity of facies between the Trias and Neocomian of Minorca and contemporaneous strata in the other islands, and the general "Catalan," rather than Balearic, character of Minorca suggest that the island is to be regarded as a piece of débris from the Continental massif which formerly united Sardinia with Catalonia, rather than as an integral portion of the Alpides with which it is now accidentally associated. In the south of Minorca, separated by a well marked depression from the northern zone, the Vindobonian beds form a low tableland of gently rolling surface, not infertile in itself, and cut by broad ravines with highly fertile alluvial bottoms.

Climate. — The mildness and humidity of the climate and the differences of exposure between places at sea-level are indicated by the following meteorological data for Palma and Port Mahon: —

Particulars of climate	Palma	Port Mahon
Mean annual variation	60° F (max. 95°, min. 35°)	59° F (max. 93°, min. 34°)
,, daily variation	15° F (max. 71°, min. 56°)	11° F (max. 67°, min. 56°)
,, annual rainfall	484 mm.	628 mm.
Days of rainfall per ann.	73	80
,, ,, gales per ann.	1·4	27
Humidity	73%	70%

The summer months are almost rainless throughout the islands.

Industry and Trade. — Arboriculture is the traditional industry of Majorca and Iviza, and the cereals and legumes which are grown are usually intercalated in the orchards or olive groves; large numbers of swine are raised on the figs and other orchard refuse.

In Minorca, where shelter from the north-west wind is wanting, agriculture and stock-raising go hand in hand. Of the trees cultivated the most important are the olive and almond, which have largely replaced the vine in Majorca, the almond now gradually taking the place of the olive also. Next in importance to the almond among the fruits come the nopal, carob and apricot. The absence of permanent watercourses and the permeability of the soils make irrigation difficult outside the zone of the Albufera, into which the unhealthful marshlands of the Bay of Alcudia have been drained.

Stock-raising is handicapped by the lack of water for irrigation of pastures, but the number of artificial meadows, favoured by the humid climate and the heavy dews, is increasing. Greater security of land tenure in Minorca, where the *aparceria* (similar to the French *métayage*) for indefinite periods prevails, seems to assist progress. Sheep are numerous on the two larger islands and supply milk; they are shorn twice yearly, but the wool is of poor quality. The mineral productions include lignite and sea salt, and superphosphates, cement and coke are manufactured. Barcelona is the *entrepôt* for the chief imports of the Balearics. With Barcelona and Valencia there is a fair export trade in swine and occasionally in sheep. The direct export trade in fruits is vigorous; of these the almond is most widely distributed, ordinarily to Britain, France, Algeria, Puerto Rico and Cuba.

Inhabitants. — The islanders are closely akin to the Catalans; but the long period of Moorish rule has left its mark on their physical type and customs. Crime is rare. There are secondary and normal schools in Palma, but the standard of primary education is below the Spanish average and much below the Catalonian. Castilian is spoken by the upper and commercial classes; the lower and agricultural speak a dialect of Catalan; there is a French-speaking colony at Soller in Majorca.

History. — Of the origin of the early inhabitants of the Balearic Islands nothing is certainly known, though Greek and Roman writers refer to the Boeotian and Rhodian settlements. According to general tradition the natives, from whatever quarter derived, were a strange and savage people till they received some tincture of civilization from the Carthaginians, who built Mago (Port Mahon) and Jama (Ciudadela). About 23 years after the destruction of Carthage the island was conquered for the Romans by Q. Caecilius Metellus, who founded the cities of Palma and Pollentia, near the modern Alcudia, and introduced the cultivation of the olive. Besides valuable contingents of the celebrated Balearic slingers, the Romans derived from their new conquest mules (from Minorca), edible snails, sinope and pitch. In A.D. 465 the islands were seized by the Vandals and in 534 by Belisarius for the Byzantine empire. Though raided frequently by the Muslims as well as by the Normans, the islands were not permanently

conquered for the Omayyads of Córdova until 903. After the fall of the Omayyads and until their conquest by James I. of Aragon in 1232, they experienced the same alternations between independence and subjection to the Almoravids and Almohads as the small Muslim States of the Peninsula; an independent Almoravid dynasty maintained itself here until as late as 1203. The islands formed an independent kingdom until 1349, from which time their history merges with that of Aragon. In 1521 a peasant insurrection wiped out many of the nobility of Majorca, and the rebellion was suppressed only with difficulty. In the War of the Spanish Succession all the islands declared for Charles; Count Villars reduced Minorca in 1707 but it was not until 1715 that Majorca was subjected. Meanwhile the British under General Stanhope captured Port Mahon in 1708. The island was ceded to Great Britain in 1713, but in 1756 a French force defeated the British Admiral Byng and captured Port Mahon. The island was restored to England in 1763 and remained in Britain's possession until seized by Spain in 1782. Once more the British captured it in 1788, but by the peace of Amiens in 1802 it was finally ceded to Spain. In the nationalist revolution of July 1936, points in the islands were seized by insurgent troops. Loyalist forces recaptured Iviza and Formentera in Aug. 1936, but these were again lost to the rebels in September. Minorca remained longest in loyalist possession. For a time it was expected that the islands would be ceded to Italy in return for aid extended to General Franco during the rebellion.

ARCHAEOLOGY

No finds that can with certainty be attributed to the Stone Age have been made in the Balearic Islands, and it seems likely that the earliest population was not established here until the beginning of the metal era. To the aeneolithic period, then, must be attributed the few flint implements hitherto discovered, that are on this view the contemporaries of some simple arrowheads and a beaker sherd. To this period also are assigned certain cave-dwellings and artificial grotto-graves, and even the more complicated rock-hewn tombs of San Vincente in Majorca that are clearly related to the grottoes of south France. On the other hand, various natural and artificial grottoes in the same island, recently excavated, contained pottery assigned to the El Argar stage of the Spanish Bronze Age, so that it is probable that the continental Bronze Age was well established at the time of the development of the earliest civilization in the islands. At any rate, it seems certain that the most remarkable of the prehistoric remains in the Balearic group are not earlier than perhaps about 1,000 B.C., and represent a culture that persisted with little change until Roman times.

The Talayots and the Navetas are the best-known monuments of this culture. The Talayots (Catalan, watch-towers) are exceedingly numerous; they are conical towers about 20ft. in height with either a round or a square plan, and they enclose a chamber about 15 to 20ft. in width; this room was roofed, generally with the aid of supporting pillars, and there was an upper story, but in no instance has this survived in its complete original state. The masonry of the round towers, doubtless the oldest structures in the islands, is very rough, the walls being composed of immense rugged blocks of stone; but the four-cornered talayots, that are presumably later, show more careful workmanship. As a class they are obviously akin to the *nuraghi* of Sardinia, and it seems probable that, like the nuraghi, they served as fortified dwelling-places. It is true that there is clear evidence of the deposition of cremation-burials (and even signs of cremation-fires) in the talayots of Majorca, and that there is also proof of occasional burial in the talayots of Minorca, but the position and character of the structures, in particular as regards the entrance, the presence of occasional out-buildings, and the fact that they are often collected in settlements surrounded by a wall, prove that the talayots were built primarily as dwelling-places. Indeed, the *poblats* or villages, as at Lluchmajor in Majorca, are only more complicated forms of the same talayot architecture.

The *Naus* or *Navetas* (Catalan, ships), on the other hand, were graves. These are found chiefly in Minorca, and are elongated pyramidal structures, likewise built of immense blocks of stone, with a rounded end and a squared or slightly concave front; in this front face is a tiny door giving access through a passage to a long rectangular chamber that was roofed in a manner now unknown. In the famous Nau d'Es Tudons the total length of the structure was 45ft., and the height 12ft. The plan of the navetas is almost the same as that of the larger burial-grottoes of which they are probably copies. Many small artificial grottoes (coves) must also be counted among the remains of the talayot-culture; and while some of these have been found to contain both burnt and unburnt burials, many of them may have been used as habitations. Among the pottery from these sites is much Roman ware, and there have also been found a red figure crater, a Campanian vase, and sherds of painted Iberian ware. Furthermore, the native conical hollow-footed cups and lead plaques of the talayot-culture have been found in a Roman context. Bronze double-axes, bronze and iron bird-headed sceptres, and bronze figures of oxen, seem also to date from a late phase of this culture; thus, the important group of three bronze heads of oxen (two life-size) from Costig in Minorca cannot well be an immediate product of Cretan or Aegean influence, for though the type may perhaps be traced into the Early Iron Age cultures of Central Europe, it seems clear that in the islands these figures are not older than the second to first centuries B.C.

The "temples," such as the building at Costig, may, of course, have been used as ordinary habitations, though there is good reason to suspect their religious nature. They are squarish enclosures with one rounded side, and within the area stands a *taula* (table), a pillar 6ft. to 12ft. in height supporting a horizontal slab. These T-shaped taulas are probably central supports for roofing, an explanation warranted by the fact that there are often supplementary pillars between the taula and the outer wall and also by the fact that the taula-method of roofing is actually employed in the artificial grottoes. This, at any rate, was the view of E. Cartailhac and A. Bezzenberger, but the suggestion of A. Mayr that the taulas were a variety of baetyl in a hypaethral temple deserves consideration.

There is no doubt of the general relationship between the architecture of the talayot-culture and the megalithic architecture of the western Mediterranean, and there is philological proof of an intimate bond at an early period between the Balearics and Sardinia. Indeed: if the first population of the Balearics was an aeneolithic or Early Bronze Age folk derived from Spain, it may be that the talayot-culture represents a later Bronze Age immigration from Sardinia, a movement that possibly originated in north Africa. At any rate, it seems that for some time after the establishment of the talayot-culture Spanish influence was of little account, and was not asserted again until an advanced period in the Early Iron Age.

There is little evidence of direct Greek influence in the Balearics, though visits from merchants on their way to Ampurias are likely enough. A few fragments of pottery and some archaic bronze figures are, however, the only relics of the period; nor

is there any considerable sign of Carthaginian dominion. On the other hand, the Roman occupation in the second century B.C. seriously modified the talayot-culture, and in addition to the remains of the mixed civilization already described there are several notable Roman structures such as the aqueduct at Pollensa.

BALEN, HENRY VAN (1560–1632), Flemish painter, was born in Antwerp in 1560, and died there on July 17, 1632. He was a pupil of Adam von Noort, and after travelling for a time in Italy, he joined the Gild of St. Lucas at Antwerp in 1593. Balen was the first master of Van Dyck; he collaborated with various painters, including J. Breughel and F. Snyders. His subjects are chiefly religious and mythological. His painting of the Holy Family is in the chapel of Notre Dame, Antwerp. Other pictures at Antwerp are: "The Trinity" and "The Adoration of the kings"; the Musée de Paris has two—the "Holy Family in the desert, attended by angels," and "Abraham sending away Agar and her son Ismael."

BALES (BALESIUS), PETER (1547–1610?), English calligraphist, one of the inventors of shorthand writing, was born in London in 1547, and is described by Anthony à Wood as a "most dexterous person in his profession. . . ." John Evelyn speaks of him as having written, in the year 1575, "the Lord's Prayer, the Creed, Decalogue, with two short prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the queen, to whom he presented it at Hampton Court, all of it written within the circle of a single penny, inchased in a ring and borders of gold, and covered with a crystal, so accurately wrought as to be very plainly legible; to the great admiration of her majesty, the whole privy council, and several ambassadors then at court." Bales was very dexterous in imitating handwritings, and between 1576 and 1590 was employed by Secretary Walsingham in certain political manoeuvres. He was at the head of a school near the Old Bailey, London, in 1590, in which year he published his *Writing Schoolemaster, in three Parts.* This book included an *Arte of Brachygraphie,* which is one of the earliest attempts to construct a system of shorthand. He died about the year 1610.

BALFE, MICHAEL WILLIAM (1808–1870), Irish music composer, was born on May 15, 1808, at Dublin, the son of a dancing master. At the age of seven he composed a polacca and two years later appeared in public as a violinist. On the death of his father in 1823 he was engaged as a violinist in the orchestra of Drury lane, and then made an unsuccessful début as a barytone at Norwich in *Der Freischütz.* In 1825 he was taken to Rome by Count Mazzara, being introduced to Cherubini on the way. In Italy he wrote his first dramatic work, a ballet, *La Pérouse.* At the close of 1827 he appeared as Figaro in Rossini's *Il Barbiere* at the Italian opera in Paris. Returning to Italy, he remained there some nine years, singing at various theatres and composing a number of operas. During this time he married Mlle. Luisa Roser, a Hungarian singer whom he had met at Bergamo. Fétis says that the public indignation roused by an attempt at "improving" Meyerbeer's opera *Il Crociato* by interpolated music of his own compelled Balfe to throw up his engagement at the theatre La Fenice in Venice. By this time he had produced his first complete opera, *I Rivali di se stessi,* at Palermo in the carnival season of 1829–30; the opera *Un Avvertimento ai gelosi* at Pavia; and *Enrico Quarto* at Milan, where he had been engaged to sing with Malibran at the Scala. He returned to England in the spring of 1833, and on Oct. 29, 1835 his *Siege of Rochelle* was rapturously received at Drury lane. *The Maid of Artois* followed on May 27, 1836—the success of the opera being confirmed by the exquisite singing of Malibran. In 1838 he sang the part of Papageno in the first performance of *The Magic Flute* in English. Balfe was a prolific composer. His English operas alone include: *Siege of Rochelle* (1835); *The Maid of Artois* (1836); *Catherine Grey* (1837); *Joan of Arc* (1837); *Falstaff* (1838, Lablache in title-rôle); *Amelia, or the Love Test* (1838); *Keolanthe* (1841); *The Bohemian Girl* (Nov. 27, 1843); *The Daughter of St. Mark* (1844); *The Enchantress* (1845); *The Bondman* (1846); *The Devil's in it* (1847); *The Maid of Honour* (1847); *The Sicilian Bride* (1852); *The Rose of Castile* (1857); *Satanella* (1858); *Bianca* (1860); *The Puritan's Daughter* (1861); *The Armourer of Nantes* (1863); *Blanche de Nevers* (1863). Of all these works the most famous and successful was, of course, *The Bohemian Girl,* which was given all over Europe, and which even to-day keeps its place in the active repertory. Balfe also wrote several operas for the Opéra Comique and Grand Opéra in Paris, where MM. Scribe and St. George provided him with the libretti for his *Le Puits d'amour* (1843) and his *Les Quatre Fils Aymon* (1844). His *L'Étoile de Seville* was written in 1845 for the Académie Royale. In 1864 he retired to Rowney Abbey, Hertfordshire, and amused himself with farming. The briefest account of Balfe would be incomplete which did not mention that he was the composer of "When other Lips" and "I dreamt that I dwelt in marble halls." He died on Oct. 20, 1870.

BALFOUR, ARTHUR JAMES BALFOUR, 1ST EARL OF (1848–1930), British statesman, eldest son of James Maitland Balfour of Whittingehame, Haddingtonshire, and of Lady Blanche Gascoyne Cecil, a sister of the 3rd marquess of Salisbury, was born on July 25, 1848. Educated at Eton and Trinity college, Cambridge, in 1874 he became M.P. in the Conservative interest for Hertford and represented that constituency until 1885. When, in the spring of 1878, Lord Salisbury became foreign minister on the resignation of the 15th Lord Derby, Balfour became his private secretary, and accompanied him to the Berlin Congress. At this time also he became known in the world of letters, the intellectual subtlety and literary capacity of his *Defence of Philosophic Doubt* (1879) suggesting that he might make a reputation as a speculative thinker. Released from his duties as private secretary to Lord Salisbury, his uncle, by the general election of 1880, he began to take a rather more active part in parliamentary affairs. He was for a time politically associated with Lord Randolph Churchill, Sir Henry Drummond Wolff, and Sir John (then Mr.) Gorst, the quartette becoming known as the "Fourth Party" and gaining notoriety by the freedom of the criticisms directed by its leader, Lord Randolph Churchill, against Sir Stafford Northcote, Lord Cross, and other prominent members of the "old gang." In these sallies, however, Balfour had no direct share. He was thought to be merely amusing himself with politics. It was regarded as doubtful whether he had the bodily strength or the energy of character requisite for a big political career. The House did not take him quite seriously. Members did not suspect the reserve of strength and ability beneath what seemed to them to be the pose of a parliamentary *flaneur.* As a member of the very select social coterie known as the "Souls" he was, so to speak, "caviare to the general." Indolence was supposed to be the key-note of his character—a refined indolence, with cleverness of a somewhat sceptical and superior order.

These views were not shared by Lord Salisbury. In his first administration (June 1885–Jan. 1886) he made Balfour president of the Local Government Board, and in forming his second administration (July 1886) secretary for Scotland with a seat in the cabinet. Sir Michael Hicks-Beach resigned the chief secretaryship for Ireland in 1887, and in his stead Lord Salisbury appointed his nephew. By the Irish Nationalists the appointment was received with contemptuous ridicule, for none suspected Balfour's serene fearlessness, his tenacity with finesse, his debating power, his ability in attack, and his still greater capacity to disregard criticism. The debates on the Crimes bill and the Irish land bill quickly undeceived them, and the steady and even remorseless vigour with which the government of Ireland was conducted speedily convinced the House of Commons and the country that Balfour was in his right place as chief secretary. His policy was that of "coercion"—the fearless administration of the Crimes Act—coupled with remedial legislation; and he enforced the one while he proceeded with the other, regardless of the risk of outrage outside the House and of insult within. Balfour's work in this office covered one of the most turbulent and most exciting periods in modern parliamentary history and Irish administration. With

a courage that never faltered he broke down the Plan of Campaign in Ireland, and in parliament he not only withstood the assaults of the Irish Nationalists, but waged successful warfare with the Home Rule party. Events, it is true, were in his favour. The disclosures before the Parnell Commission, the O'Shea divorce proceedings, the downfall of Parnell, and the disruption of the Irish party assisted him in his task; but the fact remains that by persistent courage and undeviating thoroughness he reduced crime in Ireland to a vanishing point. His work was also constructive, for he broadened the basis of material prosperity and social progress by creating the Congested Districts Board in 1890. During this period, from 1886–92, moreover, he developed gifts which made him one of the most effective of public speakers. Impressive in matter rather than in manner of delivery and seldom rising to the level of eloquence in the sense in which that quality was understood in a House which had listened to Bright and Gladstone, his speeches were logical and convincing and their attractive literary form delighted a wider audience than that which listens to the mere politician.

On the death of W. H. Smith in 1891 he became first lord of the Treasury and leader of the House of Commons, and in that capacity introduced in 1892 a Local Government bill for Ireland. The Conservative government was then at the end of its tether, and the project fell through. For the next three years Balfour led the opposition in the House of Commons with great skill and address. On the return of the Unionists to power in 1895 he resumed the leadership of the House, but not at first with the success expected of him, his management of the abortive education proposals of '96 being thought, even by his own supporters, to show a disinclination for the continuous drudgery of parliamentary management. But after the opening session matters proceeded more smoothly. His successful conduct of an Irish Local Government bill, his championship of the voluntary schools, his adroit parliamentary handling of the problems opened up by the movement against ritualistic practices in the Church of England, and his pronouncement in favour of a Roman Catholic university for Ireland—for which he outlined a scheme that met with much adverse criticism both from his colleagues and his party—were the most important aspects of Balfour's activity during the years 1895–1900. During the illness of Lord Salisbury in 1898, and again in Lord Salisbury's absence abroad, he was in charge of the foreign office, and conducted the very critical negotiations with Russia on the important question of railways in north China. At the general election of 1900 he was returned for East Manchester (which he had represented since 1885) by a majority of 2,453, and continued in office as first lord of the Treasury.

On Lord Salisbury's resignation on July 11, 1902, his nephew succeeded him as prime minister, with the cordial approval of all sections of the Unionist party. Balfour reconstituted the cabinet. He himself became first lord of the Treasury and lord privy seal, with the duke of Devonshire (remaining lord president of the council) as leader of the House of Lords; Lord Lansdowne remained foreign secretary, Mr. (afterwards Lord) Ritchie took the place of Sir Michael Hicks-Beach (afterwards Lord St. Aldwyn) as chancellor of the exchequer, Mr. Chamberlain remained colonial secretary, his son Austen being postmaster-general with a seat in the cabinet. The task of clearing up after the war, both in South Africa and at home, lay before the government; but the prime minister's cordial relations with Chamberlain and the enthusiastic support of a large parliamentary majority made the prospects fair. Chamberlain went to South Africa in the late autumn, with the hope that his personality would influence the settlement there; and the Venezuela crisis was met by tactful handling and by an ultimate recourse to arbitration. The extension of the new Education Act to London and Wyndham's Irish Land Purchase Act were well received. But Ritchie's remission of the shilling import-duty on corn led to Chamberlain's crusade in favour of tariff reform and colonial preference, and as the session proceeded the rift widened in the Unionist ranks.

Balfour had always admitted the onesidedness of the English free-trade system, and had supported the desirability of retaliating against unfair competition and "dumping" by foreign countries. But Mr. Chamberlain's new programme for a general tariff, with new taxes on food arranged so as to give a preference to colonial products, involved a radical alteration of the established fiscal system, and such out-and-out Unionist free-traders in the cabinet as Ritchie and Lord George Hamilton, and outside it, like Lord Hugh Cecil and Arthur Elliot (secretary to the Treasury), were entirely opposed to this. Balfour was anxious to avoid a rupture, doubtful of the feeling of the country, uncertain of the details by which Chamberlain's scheme could be worked out. As leader of the party and responsible for the maintenance of so great a political engine, he was anxious not to be precipitate. He was neither for nor against the new movement and professed to hold "no settled convictions" on the subject. From the middle of May, when Chamberlain began to press the matter, Balfour had a difficult hand to play, so long as it was uncertain how the party would follow the new lead. Another opportunity for making political capital was provided by the publication of the report of the royal commission on the Boer War under Lord Elgin's chairmanship, which horrified the country by its disclosures (Aug. 26) of political and military muddling and the want of any efficient system of organization.

On Sept. 16 Balfour published a pamphlet on "Insular Free Trade," and on the 18th it was announced that Lord George Hamilton and Ritchie had resigned, Lord Balfour of Burleigh and Arthur Elliot following a day or two later. These were the strait free-traders, but at the same time Chamberlain resigned also. The correspondence between Chamberlain and Balfour (Sept. 9 and 16) was published, and presented the latter in the light of a sympathizer with some form of fiscal union with the colonies, if practicable, and in favour of retaliatory duties, but unable to believe that the country was yet ready to agree to the taxation of food required for a preferential tariff, and therefore unwilling to support that scheme. At the same time he encouraged Chamberlain to test the feeling of the public and to convert them by his missionary efforts outside the government. Chamberlain on his side emphasized his own parliamentary loyalty to Balfour. In his pamphlet on "Insular Free Trade" the prime minister reviewed the economic history since Cobden's time, pointed to the falsification of the promises of the early free-traders, and to the fact that England was still the only free-importing country, and insisted that he was "in harmony with the true spirit of free-trade" when he pleaded for "freedom to negotiate that freedom of exchange may be increased." This manifesto was at first taken, not only as the platform of the government, but also as that from which its resigning free-trade members had dissented; and the country was puzzled by a statement from Lord George Hamilton that Balfour had circulated among his colleagues a second and different document in fuller agreement with Chamberlain. The situation was confused by personal suspicion and distrust as well as by economic difficulties. But the public noted that the duke of Devonshire, whose orthodoxy was considered typical, remained in the cabinet.

On Oct. 1 Balfour spoke at Sheffield, reiterating his views as to free-trade and retaliation, insisting that he "intended to lead," and declaring that he was prepared to reverse the traditional fiscal policy by doing away with the axiom that import duties should only be levied for revenue purposes. The speech was not enthusiastically received by the National Union of Conservative Associations, known to be predominantly in sympathy with Chamberlain. The free-traders also did not like Balfour's formula as to reversing the traditional fiscal policy of irnport taxes for revenue only. Next day the duke of Devonshire resigned, a step somewhat bitterly resented by Balfour, who clearly thought that his sacrifices in order to conciliate the duke had now been made in vain. During this critical fortnight the duke had apparently acquiesced in Balfour's compromise and had co-operated in reconstituting the ministry.

During the remainder of 1903 the struggle within the Unionist party continued. Chamberlain spoke all over the country, advocating a definite scheme for reorganizing the budget, so as to have more taxes on imports, including food, but proposing to adjust the tsxation so as to improve the position of the working-classes and

to stimulate employment. The free-trade Unionists, with the duke of Devonshire, Lord Goschen, Lord James, and Lord Hugh Cecil as their chief representatives, started a Free Food League in opposition to Chamberlain's Tariff Reform league. They criticized Balfour's attitude and repudiated his assumption that retaliation would be desirable. Finally in December came the appointment of Chamberlain's Tariff Commission. There was no doubt about the obstinacy and persistency of both sections, and both were fighting, not only to persuade the public, but for the capture of the party and of its prime minister. Both sides were inclined to claim him; neither could do so without qualification. Balfour insisted that in any case no definite action could be taken till the next parliament; and while he declined to go the "whole hog"—as the phrase went—with Chamberlain, he did nothing to discourage Chamberlain's campaign. Minor changes were made in the ministry in 1903, the government held together, and in 1904 the Licensing bill was successfully carried. Though a few Unionists transferred their allegiance, notably Winston Churchill, and by-elections went badly, Balfour still commanded a considerable though a dwindling majority. On Oct. 3 Balfour spoke at Edinburgh on the fiscal question. The more aggressive protectionists among Chamberlain's supporters had lately become very confident. Mr. Balfour plainly repudiated "protection" in so far as it meant a policy aiming at supporting or creating home industries by raising home prices; but he introduced a new point by declaring that an Imperial Conference would be called to discuss with the colonies the question of preferential tariffs if the Unionist government obtained a majority at the next general election.

It was plain indeed that the fiscal question itself was ripe for the polls; Board of Trade statistics had been issued in profusion, and the whole case was before the country. But, though Chamberlain declared his desire for an early appeal to the electors, he maintained his parliamentary loyalty to Balfour. There were, moreover, public reasons why a change of government was undesirable. While foreign affairs were being admirably conducted by Lord Lansdowne, they were critical enough to make it dangerous to contemplate a "swopping of horses." The Russo-Japanese War might at any moment lead to complications. The exercise by Russian warships of the right of search over British ships was causing great irritation in English commercial circles during 1904; on Oct. 23 the outrageous firing by the Russian Baltic fleet on the English fishing-fleet off the Dogger Bank in the North sea was within an ace of causing war. There were also important negotiations on foot for a renewal or revision of the treaty with Japan; and it was felt that on these grounds it would be a mistake for the government to allow itself to be driven into a premature dissolution, unless it found itself unable to maintain a majority in parliament. The end came in Nov. 1905, precipitated by a speech made by Balfour at Newcastle on the 14th, appealing for unity in the party and the sinking of differences, an appeal plainly addressed to Chamberlain, whose supporters were clamouring for a fighting policy. But Chamberlain was no longer prepared to wait. On Nov. 21 at Bristol he insisted on his programme being adopted, and Balfour was compelled to abandon the position he had held with so much tactical dexterity for two years past. Amid Liberal protests in favour of immediate dissolution, he resigned on Dec. 4; and Sir Henry Campbell-Bannerman was entrusted by the King with the formation of a government. The Unionists went to the polls with divided counsels and sustained a crushing defeat, Balfour himself being defeated by a large majority in Manchester.

Negotiations took place, between Balfour and Chamberlain which resulted in the patching up of an agreement (expressed in a correspondence dated Feb. 14), and its confirmation at a meeting of the party at Lansdowne House a few days later. The new compact was indicated in Mr. Balfour's letter, in which he declared that "fiscal reform is, and must remain, the first constructive work of the Unionist party; its objects are to secure more equal terms of competition for British trade and closer commercial union with the colonies; and while it is at present unnecessary to prescribe the exact methods by which these objects are to be attained, and inexpedient to permit differences of opinion as to these methods to divide the party, though other means are possible, the establishment of a moderate general tariff on manufactured goods, not imposed for the purpose of raising prices or giving artificial protection against legitimate competition, and the imposition of a small duty on foreign corn are not in principle objectionable and should be adopted if shown to be necessary for the attainment of the ends in view or for purposes of revenue." Mr. Balfour's leadership of the whole party was now confirmed; and a seat was found for him in the City of London by the retirement of Mr. Gibbs.

The downfall of Mr. Balfour's administration, and the necessity of reorganizing the Unionist forces on the basis of the common platform now adopted, naturally represented a fresh departure under his leadership, the conditions of which to some extent depended on the opportunities given to the new opposition by the proceedings of the Radical government. His own administration had been wrecked, through no initiative of his, by the dissensions over the fiscal question. But his wide range of knowledge and interests, his intellectual *finesse*, his personal hold over his supporters, his statesmanlike grasp upon imperial problems, and his oratorical ability had been proved to a remarkable degree; and in foreign affairs his tenure of power had been conspicuously successful. He left his country, indeed, in a position of strength abroad which it had not held since the Crimean War. His institution of the permanent Committee of Imperial Defence and of the new Army Council (1904) were reforms of the highest importance, resulting from the report of a "triumvirate" consisting of Lord Esher, Sir John Fisher, and Sir George Clarke, appointed in Nov. 1903. The Unionist régime as a whole, however, had collapsed. Its ministers had become "stale." The heavy taxation of the war years was still retained, to the disgust especially of the income-tax payers; and new issues arose over the Education Act, labour questions, and the introduction of Chinese labour into South Africa (in 1904), which were successfully used against the government in the constituencies. The result was the electoral defeat which indicated, no doubt, a pronounced weakening of Mr. Balfour's position in public confidence. This verdict, however, was one based mainly on temporary reasons, which were soon to be over-shadowed by the new issues involved in the change of ministry. As a matter of fact, a year of opposition had not passed before his power in the House of Commons, even with so small a party behind him, was once more realized. The immense Radical majority started with a feeling of contempt for the leader who had been rejected at Manchester, but by 1907 he had completely reasserted his individual pre-eminence among parliamentarians. Mr. Balfour had never spoken more brilliantly, nor shone more as a debater, than in these years when he had to confront a House of Commons three-fourths of which was hostile. His speech at Birmingham (Nov. 14, 1907), fully accepting the principles of Mr. Chamberlain's fiscal policy, proved epoch-making in consolidating the Unionist party—except for a small number of free-traders, like Lord Robert Cecil, who continued to hold out—in favour of tariff reform; and during 1908 the process of recuperation went on, the by-elections showing to a marked degree the increased popular support given to the Unionist candidates. The rejection of this budget in Dec. 1909 by the House of Lords led to a desperate struggle at the polls in Jan. 1910. The Unionists won back over 100 seats, returning 273 strong, but were still in a minority, the Liberals numbering 275, Labour members 40, and Irish Nationalists 82. Mr. Balfour himself was elected for the City of London by an enormous majority.

Balfour's other publications, not yet mentioned, include *Essays and Addresses* (1893) and *The Foundations of Belief, being Notes introductory to the Study of Theology* (1895). He was president of the British Association in 1904, and became a fellow of the Royal Society in 1888. He was known from early life as a cultured musician, and became an enthusiastic golf player, having been captain of the Royal and Ancient Golf Club at St. Andrews in 1894–95. (H C.)

As Conservative leader, after the general election of Jan 1910, Balfour was confronted with an embarrassing situation While endeavouring to save the effective authority of a second chamber

and to avert Irish Home Rule, with his supporters still sore over the Tariff Reform controversy, he was faced by a Liberal ministry dominated once more by a body of 80 Irish Nationalists, who held the balance of power in the House of Commons and insisted on a forward policy. He advocated the reform of the House of Lords as an alternative to the Ministerial Veto resolutions, which he denounced as irrational.

In the lull in the party fight which followed the death of King Edward he welcomed the suggestion of a conference between the parties to endeavour to arrange a compromise, and was one of the eight leaders who met on 21 occasions between June and November without coming to an agreement. When the conferences failed and ministers announced another dissolution he did his best to rouse the country to the dangers which, in his opinion, threatened it. When the second general election of 1910 confirmed the verdict of the first, dissatisfaction with his leadership, which had been long entertained by a considerable section of the Unionists, began to spread. It was pointed out that he had now led the party to three electoral defeats in succession: in 1906, Jan. 1910, and Dec. 1910.

The course of the session of 1911 intensified this dissatisfaction. Balfour did indeed fight the Parliament bill, in its passage through the House of Commons, with courage, persistency, acuteness, and passion. In committee he strove hard, but in vain, to get fundamental laws exempted from its operation. But he shrank from encouraging the House of Lords to persist in opposition when ministers announced that they had obtained the King's consent to the creation of sufficient peers to make its passage certain. He did indeed move a vote of censure imputing to ministers a gross abuse of the constitution in the advice they had given to the Crown; but he declared that he would stand or fall with Lord Lansdowne in that statesman's recommendation to the Unionist peers to abstain from further resistance as being no longer free agents.

This attitude was passionately resented by a large group of "Diehards," who organized themselves under Lord Halsbury. Mr. Balfour's counsel prevailed, and the bill was allowed to pass; but his authority as leader had been seriously shaken, and in November he decided that the time had come for him to resign. In announcing his decision to a meeting of the Conservative Association of the City of London on Nov. 8 he said that he desired to abandon his heavy responsibility before he could be suspected of suffering from a sort of petrifaction in old courses and inability to deal with new problems; and that he felt he had not the vigour, at his time of life, again to conduct a ministry. The announcement, in spite of the signs of discontent, came as a great shock to the party and the country.

Mr. Balfour was then only 63, and his powers as a parliamentarian were really at their height. Although he proceeded to devote more time to his manifold other interests in life—philosophy, science, literature, and the fine arts—he still took at intervals a prominent part in debate, giving throughout a loyal support to his successor in the House of Commons, Mr. Bonar Law. The renewed controversy on Home Rule afforded him a great opportunity; and the powerful series of speeches which he delivered, at Westminster and elsewhere, in the course of the next three years, did much to awaken Great Britain to the imminent danger of civil war in Ireland, and to force ministers into the policy of excluding Ulster, in some form or other, from the operation of their bill.

When the World War broke out he cordially accepted the policy of the Unionist leaders to sink all political differences in support of the national Government. Speaking at the Guildhall, London, on Nov. 11, 1914, he said that the Allies were fighting for civilization and the cause of small States, and, whether the War was short or long, they would triumph. In this spirit he joined the first Coalition ministry in May 1915, becoming First Lord of the Admiralty under Mr. Asquith. He speedily restored the harmony of the Board of Admiralty which had been distracted by a quarrel between Churchill and Lord Fisher. He also reversed Churchill's policy of differentiating between prisonets from submarines as compared with other German prisoners. Perhaps the best work which he did at the Admiralty was the issue, at intervals, of some cogent papers, mainly for the benefit of the Americans, indicating the great work of the British Navy in the War.

The chief naval battle of the conflict, the battle of Jutland, was fought during his term of office, and he incurred widespread criticism by the manner in which the news was officially communicated to the public, the great losses in ships being dwelt on to such an extent as to suggest that, instead of being a victory, if an imperfect one, the action was a defeat. In Nov. 1916 Balfour brought Sir John Jellicoe into the Admiralty as First Sea Lord, Sir David Beatty becoming naval commander-in-chief. On the King's birthday, June 3, 1916, Mr. Balfour's eminence and his patriotic readiness to resume in wartime, in spite of advancing years, official labours in a secondary position were suitably recognised by the grant of the Order of Merit. When Mr. Lloyd George formed his Coalition ministry in Dec. 1916 the Foreign Office, on the retirement of Lord Grey of Fallodon, was pressed upon Mr. Balfour, as it was essential to have there a man of experience and weight. He took up his new duties only a few weeks before Germany instituted the unrestricted submarine warfare which brought the United States into the War; and in April 1917 he headed a British mission which visited America in order to arrange for regular co-operation between the two countries.

His attractive personality greatly impressed his hosts and he received the compliment of being invited to address the House of Representatives on May 5. He proceeded subsequently to Canada and there addressed the two houses of parliament. The concentration of power in the hands of the War cabinet and the great personal ascendancy which Lloyd George, as Prime minister, rapidly acquired tended to reduce the importance of the foreign secretary during Balfour's tenure of the post. It was, however, he, as foreign secretary, who in Nov. 1917 gave a promise on behalf of the British Government to provide a "national home" for the Jtws in Palestine after the War. He went to the Paris Conference in 1919 as the second British plenipotentiary and appended his signature to the Treaty of Versailles and to the abortive treaty of guarantee to France against German aggression

When the conference was over, Balfour relinquished the secretary of state's seals to Lord Curzon, but remained in Lloyd George's cabinet as lord president of the council. He was appointed chief representative of the British Government at the first Assembly of the League of Nations in 1920 and also at the International Conference at Washington, D.C., in the winter of 1921–22. At Washington he was, after Secretary of State Hughes, the leading figure of the conference; and his prompt and cordial acceptance of Hughes's proposals for the scrapping of capital ships and their future strict limitation greatly impressed the American public. The conference not only secured the limitation of navies, but also merged the Anglo-Japanese Alliance into the Four-Power Pacific Treaty, the other two Powers being the United States and France. On his return in 1922 from this mission Balfour was created, in March, a Knight of the Garter, though still a commoner, and in May, an earl.

During this year the question of Inter-Allied debts was pressingly raised by America, a purely creditor state; and Lord Balfour addressed the so-called Balfour note, on behalf of the British Government, to the French Ambassador and the representatives of other European Powers. He pointed out that, while Great Britain, though more a lender than a borrower, was in favour of a general cancellation of Inter-Allied debts, she could not agree to the cancellation of European debts due to her independently of the question of the British debt to the United States.

Lord Balfour had no sympathy with the feeling of hostility which was growing in the Conservative party throughout 1921–22 toward the continuance of a Coalition ministry, and spoke in that sense at the Carlton club meeting on Oct. 19, 1922, which broke up the Coalition. He resigned office along with the other Unionist Coalition ministers and did not join either Bonar Law's or Baldwin's Conservative ministry in 1922–23. But he maintained a friendly attitude, and. after the fall of the Government, he moved, in a party meeting on Feb. 11, 1924, a vote of confidence in the ex-premier which was carried by acclamation.

Lord Balfour was elected in 1919 chancellor of his old uni-

versity, Cambridge. In 1923 he published a further philosophical work, Theism and *Thought*, a *Study in Familiar* Beliefs. He became president of the British academy and was constant in his attendance at its meetings. He became president also of the National Institute of Industrial Psychology. Early in 1925 he paid a visit to Palestine and was received with enthusiasm by the Jewish population, which had accepted his invitation of 1917 to establish there a national home. No open Arab hostility was shown to him in Palestine; but in Syria, which he proceeded to visit, it flamed out in immediate menace and the French administration had to escort him hurriedly out of the country. On his return to England he accepted an invitation from Stanley Baldwin, on Lord Curzon's death, to join the Government as lord president of the council; and he was immediately detailed for the congenial task of presiding over a civil research committee instituted by the cabinet.

He survived the fall of Baldwin's second ministry by nine months, and died at Woking March 19, 1930. He was universally mourned as one of the last representatives of the old aristocratic type of political leaders. (See CONSERVATIVE PARTY; ENGLISH HISTORY.) (G. E. B.)

BALFOUR, FRANCIS MAITLAMD (1851–1882), British biologist, younger brother of A. J. Balfour (first earl), was born at Edinburgh Nov. 10, 1851. At Harrow school he showed but little interest in the ordinary routine, but in one of the masters, George Griffith, he fortunately found a man who encouraged and aided him in the pursuit of natural science, a taste for which, and especially for geology, had been cultivated in him by his mother from an early age. Going into residence at Trinity college, Cambridge in 1870, he was elected a natural science scholar of his college in the folloning year, and although his reading was not ordered on the lines usual for the schools, he obtained the second place in the natural science tripos of Dec. 1873. A course of lectures on embryology, delivered by Sir Michael Foster in 1871 definitely turned his attention to animal morphology and, after his tripos, he was selected to occupy one of the two seats allocated to the University of Cambridge at the Naples zoological station. The research work which he began there contributed in an important degree to his election as a fellow of Trinity in 1874, and also afforded him material for a series of papers (published as a monograph in 1878) on the elasmobranch fishes, which threw new light on the development of several organs in the vertebrates, in particular of the urogenital and nervous systems. His next work was to write a large treatise, Comparative *Embryology,* in two volumes; the first, published in 1880, dealing with the invertebrates, and the second (1881) with the vertebrates. This book displayed a vigorous scientific imagination, always controlled by a logical sense that rigidly distinguished between proved fact and mere hypothesis, and it at once won wide recognition, not only as an admirable digest of the numberless observations made with regard to the development of animals during the quarter of a century preceding its publication, but also on account of the large amount of original research incorporated in its pages. Balfour's reputation was now such that other universities became anxious to secure his services, and he was invited to succeed Professor George Rolleston at Oxford and Sir Wyville Thomson at Edinburgh. But although he was only a college lecturer, holding no official post in his university, he declined to leave Cambridge, and in the spring of 1882 the university recognized his merits by instituting a special professorship of animal morphology for his benefit. Unhappily he did not deliver a single professorial lecture. During the first term after his appointment he was incapacitated from work by an attack of typhoid fever. Going to the Alps to recruit his health, he died, probably on July 19. 1882, in attempting the ascent of the Aiguille Blanche, Mont Blanc, at that time unscaled. Besides being a brilliant morphologist, Balfour was an accomplished naturalist.

BALFOUR, SIR JAMES (of Pittendreich) (d. 1583 or 1584), Scottish judge and politician, son of Sir Michael Balfour of Montquhanny, was educated for the legal branch of the Church of Scotland. In June 1547 he was imprisoned, with John Knox and others, but was released in 1549. He then abjured the reformers, entered the service of Mary of Guise, and was renarded with some considerable legal appointments. Subsequently he went over to the lords of the congregation and then betrayed their plans. After Mary's arrival in Scotland he became one of her secretaries, in 1565 being reported as her greatest favourite after Rizzio. He obtained the parsonage of Flisk in Fife in 1561, was nominated a lord of session, and in 1563, one of the commissaries of the court which now took the place of the former ecclesiastical tribunal; in 1565 he was made a privy councillor, and in 1566 lord-clerk-register. and was knighted. According to Mary, his murder was intended together with Rizzio's in 1566. An adherent of Bothwell, he was deeply implicated in Darnley's murder, though not present at the commission of the crime. By his means Darnley was lodged at Kirk o' Field, his brother's house. He was supposed to have drawn up the bond at Craigmillar for the murder; he signed it, was made under Bothwell deputy governor of Edinburgh castle, and is said to have drawn up the marriage contract between Bothwell and Mary. When, however, the fall of Bothwell was seen to be impending, he rapidly changed sides and surrendered the castle to Murray, stipulating for his pardon for Darnley's murder, the retention of the priory of Pittenweem, and pecuniary rewards.

He was appointed president of the court of session on resigning the office of lord-clerk-register. He was present at the battle of Langside with the regent in 1568, and was accused of having advised Mary to leave Dunbar to her ruin. and of having betrayed to her enemies the casket letters. The same year, however, in consequence of renewed intrigues with Mary's faction, he was dismissed, and next year was imprisoned on the charge of complicity in Darnley's murder. He succeeded in effecting his escape by means of bribery, the expenses of which he is said to have paid by intercepting the money sent from France to Mary's aid. In Aug. 1571, during the regency of Lennox, an act of forfeiture was passed against him, but next year he was again playing traitor and revealing the secrets of his party to Morton, and he obtained a pardon from the latter in 1573 and negotiated the pacification of Perth the same year. Distrusted by all parties, he fled to France, where he seems to have remained till 1580. In 1579 his forfeiture was renewed by act of parliament. In Jan. 1580 he wrote to Mary offering her his services, and in June protested his desire to be useful to Elizabeth, lamented the influence of the Jesuits, and intended a journey to Dieppe to hear some good Protestant preaching. On Dec. 27 of the same year he returned to Scotland and effected the downfall and execution of Morton by producing a bond, probably that in defense of Bothwell and to promote his marriage with Mary, and giving evidence of the latter's knowledge of Bothwell's intention to murder Darnley.

In July 1581 his cause was reheard; he was acquitted of murder by assize, and shortly afterwards in 1581 or 1582 he was restored to his estates and received at court. His career, one of the blackest in the annals of political perfidy and crime, closed shortly before Jan 24, 1584. He was the greatest lawyer of his day, and part-author at least of Balfour's Practicks, the earliest textbook of Scottish law, not published, however, till 1754. He married Margaret, daughter and heir of Michael Balfour of Burleigh, by whom, besides three daughters, he had six sons, the eldest of whom was created Baron Balfour of Burleigh in 1607.

BALFOUR, SIR JAMES, BART. (of Denmylne and Kinnaird) (c. 1600–1657), Scottish annalist and antiquary, was acquainted with Sir William Segar and with Dugdale, to whose Monasticon he contributed. He was made Lyon king-at-arms in 1630. Some of his numerous works are preserved in the Advocates' library (now National Library of Scotland) at Edinburgh, together with his correspondence—from which rich collection

Haig published *Balfour's Annales of Scotland from Malcolm III to Charles II* (1824–25).

See Sibbald, *Memoria Balfouriana* (1699).

BALFOUR, ROBERT (BALFOREUS) (1550?–1625?), Scottish philosopher, was educated at St. Andrews and at Paris. He was for many years principal of Guienne college, Bordeaux His great work is his *Commentarii in Organum Logicum Aristotelis* (Bordeaux, 1618); the copy in the British Museum contains a number of highly eulogistic poems in his honour. Balfour was one of the scholars who contributed toward spreading over Europe the fame of the *praefervidum ingenium Scotorum*. His contemporary, Dempster, called him the "phoenix of his age, a philosopher profoundly skilled in the Greek and Latin languages, and a mathematician worthy of being compared with the ancients." His *Cleomedis meteora*, with notes and Latin translation, was reprinted at Leiden as late as 1820.

See T. Dempster, *Historia Ecclesiastica Gentis Scotorum* (Bonn, 1627); D. Irving, *Lives of Scottish Writers* (Edinburgh, 1839); W. Anderson, *The Scottish Nation*, i 217 (Edinburgh, 1863).

BALFOUR-BROWNE, WILLIAM ALEX. FRANCIS (1874–), British entomologist, was born Dec. 27, 1874, at London and was educated at St. Paul's school and at Magdalen college, Oxford. He was called to the bar in 1898 but returned to Oxford the following year to study zoology. After serving on the staff of the Marine Biological association's laboratory, Plymouth, he became director of the Sutton Broad laboratory at Norfolk in 1902. He later lectured at Queen's university, Belfast, and at the University of Cambridge. During World War I he was attached to the royal army medical corps. From 1925 to 1930 he was professor of entomology at the Imperial College of Science and Technology and in 1934–35 he was president of the Royal Microscopical society. He wrote several volumes and many papers on entomology, including *Keys to the Orders of Insects* and *Concerning the Habits of Insects*.

BALFOURIER, MAURICE (1852–1933), French soldier, was born at Paris and entered the military college at Saint Cyr in 1870, shortly before the beginning of the Franco-German war. In 1871 he was assigned to an infantry regiment, with which he remained until the end of the war. He then returned to Saint Cyr and was commissioned second lieutenant in 1872. He specialized in military transport, particularly railroads, and served with distinction on a number of military technical committees in the French army, soon advancing to the rank of colonel and to brigadier general in 1908. He was commander of the 11th infantry division at Nancy at the outbreak of World War I in 1914, and on Aug. 29 of that year succeeded Foch as commander of the 20th army corps, which took part in the battles of Grand Couronné, Picardy and Artois. In 1916 he was at Verdun, where he fought with great gallantry, particularly at Malancourt and Béthincourt. He was also present during the first stages of the battles of the Somme in July 1916. In September of that year he took command of the 36th army corps in Belgium, where he remained until March 1917, when he was placed on the reserve list. He died at Paris.

BALGUY, JOHN (1686–1748), English theologian, was born at Sheffield Aug. 12, 1686. He was educated at the Sheffield grammar school and at St. John's college, Cambridge, graduated B.A in 1706, was ordained in 1710, and in 1711 obtained the small living of Lamesley and Tanfield in Durham. He married in 1715. It was the year in which Bishop Hoadley preached the famous sermon on "The Kingdom of Christ," which gave rise to the "Bangorian controversy"; and Balguy, under the nom de plume of Silvius, began his career of authorship by taking the side of Hoadley in this controversy against some of his High Church opponents. In 1726 he published *A letter to a Deist concerning the Beauty and Excellency of Moral Virtue, and the Support and Improvement Which it Receives from the Christian Religion*, chiefly designed to show that, while a love of virtue for its own sake is the highest principle of morality, religious rewards and punishments are most valuable, and in some cases absolutely indispensable, as sanctions of conduct. In 1727 he was made a prebendary of Salisbury by his friend Hoadley. He published in the same year the first part of a tractate entitled *The Foundation of Moral Goodness*, and in the following year a second part, *Illustrating and Enforcing the Principles Contained in the Former*. The aim of the work was twofold—to refute the theory of Hutcheson regarding the basis of rectitude, and to establish the theory of Cudworth and Clarke. that virtue is conformity to reason—the acting according to fitnesses which arise out of the eternal and immutable relations of agents to objects. In 1729 he became vicar of Northallerton, in the county of York. His next work was an essay on *Divine Rectitude: or, a Brief Inquiry Concerning the Moral Perfections of the Deity, Particularly in Respect of Creation and Providence*. It was an attempt to show that the same moral principle which ought to direct human life may be perceived to underlie the works and ways of God: goodness in the Deity not being a mere disposition to benevolence, but a regard to an order, beauty and harmony, which are not merely relative to our faculties and capacities, but real and absolute; claiming for their own sakes the reverence of all intelligent beings, and alone answering to the perfection of the divine ideas. Balguy wrote several other terse and readable tracts of the same nature, which he collected and published in a single volume in 1734. In 1741 he published an *Essay on Redemption*, containing somewhat advanced views. He died at Warrogate Sept. 21, 1748.

BALI, an island, east of Java across the shallow Bali strait, only a mile wide at its narrowest; length 93 mi., extreme width 50 mi., area 2,095 sq.mi. With Lombok, it forms a residency with two divisions: Singaradja and South Bali Mountainous, with deep ravines southward, it has a large alluvial plain in the south. The chief range runs from Lombok strait to Bali strait. and is divided into (1) the eastern mountains, Mt. Agung, or Bali peak, a regular volcano reaching 10,499 ft.. rising sheer up from the crater lake of that name; Mt. Batur, in this section. is the only active volcano in the island; (2) the hills of the central division, of recent volcanic formation, with the crater lakes Bratan, Bujan, and Tamblingan; (3) the barren, uninhabited Jembrana mountains. fill the western division and extend right to the narrow part of Bali strait. A small plateau of chalk, 200 ft. above sea level connects with the mainland by the narrow and low Tafelhuk isthmus, which, with a spur projecting northwards on the eastern side, gives Bali—apart from the little-used Temuku, in the east—its only safe anchorage, Benua, the port for Den Pasar, though the entrance between coral reefs is tortuous. The coast is mostly steep and little indented, and on the north is exposed to the full force of the west monsoon, so the roadstead of Buleleng, the port of Singaradja, is often unsafe, whilst a heavy sea runs off the south coast during the southeast monsoon. Nine miles off the southeast coast lies the hilly island of Musa Penida, an old convict settlement. The rivers flow mostly steeply south from the central mountains and are quite unsuitable for navigation. Practically dry at one season. they become choked and liable to flood during the period of heavy rainfall. Bali belongs to Java in climate, flora and fauna. Tigers are known in the west, but not the rhinoceros or wild buffalo; deer exist, and mild pig, in considerable numbers. and they damage crops. hfammals, birds and insects of Asiatic origin found in Bali, but not east of the island, led Wallace to draw a line between Bali and Lombok—extending between Borneo and Celebes—marking the limit of the fauna of the oriental, or Indian region, and since termed "Wallace's line"; but later authorities are inclined to treat all the Lesser Sunda Islands as a transitional region. With extremely fertile soil, abundant rainfall, and very equable climate, ranging to subtropical in the mountains, Bali has luxuriant vegetation, with smaller trees than Java. Teak, coco-nut,

IN BALI, DUTCH EAST INDIES, DANCING GIRLS ARE TRAINED IN THE ART FROM CHILDHOOD

lontar and other palms are plentiful; sugar cane, coffee, cocoa, tobacco, indigo, ground nuts and all Malayan fruits are grown to perfection, with excellent European vegetables on the highlands. The Balinese are easily the most expert rice growers in the archipelago, irrigating admirably in native style. From a distance, the green terraced hillsides resemble hanging gardens. Coffee is grown for export, water buffalo, cattle, horses, dogs, goats and many pigs are kept—the last for export to Java and Malaya, for the Chinese there. Pop. (1930) 1,101,393, composed of 403 Europeans and Eurasians, 1,092,037 natives, and 8,953 foreign Asiatics, including Chinese. Agriculture and fishing are the chief activities.

The Balinese are expert craftsmen in gold, silver and other metals. They are clever in the manufacture of arms, in woodcarving, as stonemasons, and in designing in colour, and building good temples and houses of stone. Fine pottery is manufactured and the women weave beautiful garments in cotton and silk. and textures of gold and silver thread, of rich colouring and artistic pattern. The people are of Hindu-Javanese extraction, with an original strain of Papuan blood, probably mixed with Polynesian. Colonized from India direct, and from Java, by Hindu-Javanese immigrants. in the days when Hindu influence there was at its highest, and again later, when Arab invasion in Java threatened those Javanese who wished to retain their Hindu faith, the aboriginal element in Bali was well-nigh submerged, save among the Bali Aga in a few isolated places, who follow a Polynesian cult and keep to themselves in their own villages. A few Mohammedans live more or less secluded along the coast, but nearly everyone is Hindu in religion, though offerings to household deities, at little home shrines, show Polynesian religious influence. Brahma, Vishnu, and Krishna are known, but it is to Siva that the temples are dedicated. In temple sculpture, the form of Ganesh is sometimes seen, together with a repulsive form, the upper part human—the face, that of a man, having tusks—the lower, animal, known as Lorong, and the phallic symbol is seen. The temple, or *pura,* with three walled-in courts, contains small buildings, or sheds, for the priests and their various ceremonies. The third, or inner court, encloses the actual temples, small wooden buildings on stone foundations. Worship in the open is attended with feasting, flowers and music; there are female as well as male priests, and women, particularly young maidens, play a leading part. Caste is observed as in the four degrees of India—Brahman, Kshatriya, Vaisya, and Sudra; suttee was practised before Dutch rule came; the cow is revered, and cremation occurs on a scale unparalleled in any part of India.

The Balinese resemble better-class Javanese, with a lighter skin where the Hindu strain is pronounced. Their long dark hair is fastened by both sexes up on the head, but princes and nobles cut it short. They seem stronger than the Javanese, are observant, lively, hospitable, eager to learn, careful and zealous in religion. They are very fond of feasts, games, dancing (watching professional dancers) and dramatic performances with music. The spoken language belongs to the same class as Javanese, Sundanese, etc., and is akin to the Sasak spoken in Lombok. The literary tongue borrows from Old Javanese in the three modes of address, and in the alphabet. Balinese sacred literature is written in the ancient *Kawi* language of Java, and is well understood. The name of the country is held to derive from the Sanskrit word *balin*, strong, and Hindu influence is predominant in the art of the island, the form of agriculture and the representation of the drama, whether in the form of *dalang,* or "shadow-show," or *wayang,* in which there is a stage with actors, the female parts being taken by men. In both forms events taken from the Mahabharata and the Ramayana are presented. Rights and duties of the village are enshrined in written laws and enforced by a sort of village council. Practically all cultivable land is cultivated, and tenure and irrigation are regulated by local agricultural associations. Land descends from father to son, and it is very difficult for any outsider to obtain a landed interest in Bali; nor is outside influence in any way encouraged by the Dutch, who gave financial support to such of the peasantry as needed it, through a state bank, in the form of advances against crops. The landscape of Bali is very beautiful, full of contrasts, with profusion of vegetation and wonderful distant views from the mountains. There is the additional charm of its fine old temples—those of Tampak Siring—the oldest, the mysterious "drum of Pedjing," and the double-coned volcano of Batur. Many roads were made before the Dutch arrived; but they greatly improved them, and motoring is safe and enjoyable. No hotels existed, but the *pasangrahans,* or resthouses, built for government officials on tour, were available at a fixed charge in every important centre.

Singaradja, in the north, is the capital of Bali and the seat of the resident. It has attractive buildings of Dutch colonial type, government offices, business premises, etc., and a neat native quarter on the side of hills which slope gradually from Euleleng on the coast, a couple of miles or so below Singaradja, to the northern spurs of the central mountains. It has a population of 12,345 (188 Europeans and Eurasians), and is a market for native produce and imported goods. Such also are Den Pasar (Badung), with 16,639 inhabitants and an assistant resident, Karang Asem, where the semi-independent descendant of the old Balinese princes acts as stadtholder for the Dutch government, Klungkung (also the chief centre for native arts and crafts), Gianjar and Tabanan, all in the south, which holds the greater part of the population, and Negara, in the extreme west. The Royal Mail Packet company in normal times has a biweekly service between Bali and Java, calling at both Benua and Buleleng, and the island has telephone and telegraphic communication, but no railways or tramways.

From the language on brass tablets found in Bali in the 10th century it is known that a Hinduized culture existed there then which had come direct from India. Later it was probably under the suzerainty of Majapahit, in Java, becoming independent when that dynasty fell before Arab invasion. Several of the Majapahit princes fled to Bali, and their descendants undoubtedly shared in the partition of Bali (end of 17th century) into nine separate principalities—Klungkung, Karang Asem, Mengwi, Badung, Bangli, Tabanan, Gianjar, Buleleng, and Jembrana. Houtman had visited Bali in 1597, and in 1743 the susuhanan of Surakarta ceded his "rights" over Bali to the Dutch. who took no steps to claim them, but later a slave recruiting post was established in Badung. The Balinese princes recognized Dutch supremacy but retained local autonomy. They agreed to forgo their ancient right of confiscating the cargoes of wrecked ships. In 1844, however, the rajas of Buleleng and Karang Asem asserted this right, and the Dutch sent an expedition (1846) which brought them to terms. Later they recanted and the princes of Bangli and Lombok helped the Dutch against them. The prince of Bangli was given Buleleng as a reward, Karang Asem became a fief of the Lombok raja, and all the Balinese princes signed a new treaty recognizing Dutch supremacy, and prohibiting piracy, slavery, the exercise of shore rights and settlements of any other European power. Native misrule in Buleleng and Jembrana led to indirect Dutch government there in 1854–56 and direct government in 1882. Wars between the other Balinese states led Gianjar to seek Dutch protection in 1900, to avoid extinction, while before this, Mengwi had been divided among Badung, Tabanan, Klungkung and Gianjar. Karang Asem had not supported its overlord, the raja of Mataram, in Lombok in 1894 against the Dutch, and the regent in 1895 was made stadtholder. Klungkung then refused to give up criminals, Badung reasserted the right of looting wrecked ships, and Tabanan and Bangli joined this state. A Dutch expedition in 1906 resulted in the death of the raja of Badung, the submission and suicide of the raja of Tabanan, and Dutch control over south Bali. Insurrection in Klungkung in 1908 led to another Dutch expedition, the death of the Dewa-agong of Klungkung, and direct Dutch government over the whole island, the raja of Bangli being recognized as stadtholder. His successors ruled under the Dutch in Bangli and Gianjar as regents, and Karang Asem had its stadtholder. This was the only Balinese rule which survived.

Before World War II, the island enjoyed a remarkable popularity among tourists and was a stopping point for many

travellers' cruises each year. The small island became known throughout the world for its climate and its tropical splendour.

After the Japanese began their southward march through the Malay archipelago in Dec. 1941, the strategic importance of Bali as an approach to the eastern part of Java and the great Dutch naval base at Surabaya was emphasized again. The Dutch and their allies—British and Americans—made every effort to fortify the island's land defenses, and to protect it from attack by sea or air. The Japanese, however, penetrated the defending screen of United Nations' warships and effected a preliminary landing on Bali Feb. 20, 1942. A series of naval engagements followed during the next few days, but despite losses of numerous ships the invaders were able to retain and extend their beachheads, and by Feb. 22, when they captured the aerodrome at Den Pasar, in southeastern Bali, they had definite air superiority over the United Nations. The Japanese soon controlled the whole island, and only the narrow Bali strait, hardly a mile wide near the city of Banjoewangi on the opposite shore, separated them from Java. The strait proved to be no obstacle, and within a week the Japanese were landing at several points on Java, which was itself overrun in a few more days.

BALIKISRI or **BALIXESIR,** a town of Turkey, capital of the vilayet of the same name; on rising ground above a fertile plain which drains to the Sea of Marmora. Pop. (1935) 26.699. It is a centre of trade in opium, silk and cereals, communicating by carriage roads with Panderma. The neighbourhood is rich in mineral wealth; silver mines are worked at Balia and boracite mines at Susurlu. At or near Balikisri the Roman town of Hadrianutherae was founded, as its name commemorates, by the emneror Hadrian.

BALINE, ISRAEL: *see* BERLIN, IRVING.

BALIOE, the name of a family which played an important part in the history of Scotland. The founder of the family in England was a Norman baron, Guy or Guido de Baliol, who held the fiefs of Bailleul, Dampierre, Harcourt and Vinoy in Normandy. Coming to England with William the Conqueror. he received lands in-the north of England from William II, and his son, Bernard, built a fortress in Durham called Castle Barnard. Bernard fought for King Stephen during the civil war, was present at the battle of the Standard (1138), and was taken prisoner at the battle of Lincoln (1141). The date of his death is uncertain. Dugdale believes in the existence of only one Bernard de Baliol. but it seems more probable that the Bernard de Baliol referred to after 1167 was a son of the elder Bernard, and not the same individual. If so, the younger Bernard was one of the northern barons who raised the siege of Alnwick and took William the Lion, king of Scotland, prisoner in 1174. Practically nothing is known of his sons, Eustace and Hugh. who succeeded about 121 **j.** Hugh's son and successor, John de Baliol. who married Devorguila (d. 1290), daughter of Alan, earl of Galloway, was one of the regents of Scotland during the minority of Alexander III, but in 1255 was deprived of this office and his lands forfeited for treason. He then appeared in England fighting for Henry III against Simon de Montfort, and was taken prisoner at the battle of Lewes in 1264. About 1263 he established several scholarships at Oxford, and after his death in 1269 his widow founded the college which bears the name of the family. He left three sons, two of whom died without issue, and in 1278 his lands came to his son, John de Baliol (*q.v.*), who was king of Scotland (1292–96) and died in Normandy in 1315. John's eldest son by his marriage with Isabel, daughter of John de Warenne, earl of Surrey, was Edward de Baliol, who shared his father's captivity in England in 1296. He appears to have lived mainly on his lands in Normandy until 1324, when he was invited to England by King Edward II, who hoped to bring him forward as a candidate for the Scottish crown. **A** favourable opportunity, however, did not arise until after the death of King Robert the Bruce in 1329, when Edward III had succeeded his father on the English throne. Although Edward did not give Baliol any active assistance, the claimant placed himself at the head of some disinherited Scottish nobles, raised a small army, and sailed from Ravenspur. Landing at Kinghorn in Fifeshire in Aug. 1332, Baliol gained a complete victory over the Scots under Donald, earl of Mar, at Dupplin Moor, took Perth and on Sept. 24 was crowned king of Scotland at Scone. He then acknowledged Edward III as his superior, but soon afterwards was defeated at Annan (where his brother, Henry de Baliol, was slain) and compelled to fly to England. Regaining his kingdom after the defeat of the Scots at Halidon hill in 1333, Baliol surrendered the whole of the district formerly known as Lothian to Edward, and did homage for Scotland to the English king. His party, however, was weakened by disunion, and he won no serious support in Scotland. Entirely dependent on Edward, he again sought refuge in England, and took a very slight part in the war waged on his behalf. He returned to Scotland after the defeat of King David II at Neville's cross in 1346. After making an absolute surrender of Scotland to Edward III in 1356 at Roxburgh in return for a pension, Edward de Baliol died at Wheatley near Doncaster in 1367.

A cadet branch of the Baliol family was descended from Ingelram, or Engelram, a son of the younger Bernard de Baliol. Ingelram's wife was the daughter and heiress of William de Berkeley, lord of Reidcastle in Forfarshire, and chamberlain of Scotland, and by her he had a son Henry, who became chamberlain about 1223. Henry married Lora or Lauretta, a daughter of Philip de Valoines (Valsques), lord of Panmure, and in 1234 inherited part of the rich English fiefs of the Valoines family. He died in 1246. It is probable that Henry's son was Alexander de Baliol, lord of Cavers in Teviotdale, first mentioned in 1287 as chamberlain of Scotland. He shared in the negotiations between the Scottish nobles and Edward I of England, which culminated in the treaty of Salisbury in 1289 and the treaty of Brigham in 1290. Probably deprived of his office as chamberlain about 1296 he may have shared the imprisonment of his kinsman, John de Baliol the king. He then fought in Scotland for Edward, and was summoned to several English parliaments. He died about 1309, and his grandson, Thomas, is the last of the Baliols mentioned in the Scottish records.

BALIOL, JOHN DE (1249–1315), king of Scotland, was a son of John de Baliol (d. 1269) of Barnard Castle, Durham, by his wife Devorguila, daughter of Alan, earl of Galloway, and became head of the Baliol family (see above) and lord of extensive lands in England, France and Scotland on his elder brother's death in 1278. When the Scottish throne became vacant in 1290 owing to the death of Margaret, the "maid of Norway," he was one of the three candidates for the crown, claiming through his maternal grandmother. Margaret, great granddaughter of King David I. Baliol's principal rival was Robert Bruce, earl of Annandale, and the dispute was the somewhat familiar one of the eldest by descent against the nearest of kin. The English king, Edward I, was invited to settle this dispute; and when he met the Scottish nobles at Norham in May 1291, he demanded a formal recognition of his position as overlord of Scotland. After some delay this was acknowledged by Baliol and the other competitors, who all agreed to abide by his decision. A court of 80 Scotsmen and 24 Englishmen was then appointed to try the question. and on the advice of the court Edward decided in his favour. Having sworn fealty to the English king, Baliol was crowned king of Scotland at Scone on Nov. 30, 1292; in his new capacity he did homage to Edward at Newcastle. These amicable relations were soon disturbed. **A** Scottish vassal carried his case to Edward as Baliol's

overlord, and Baliol himself was summoned to the English court to answer a suit brought against him by Macduff, earl of Fife. After a short struggle he admitted Edward's right, and in May 1294 attended a parliament in London. He soon quarrelled with his overlord, the exact point at issue being doubtful, and returned to Scotland. Baliol and the Scots barons refused to support Edward in his war with France, and a council of 12 was appointed to assist Baliol. Englishmen were dismissed from the Scottish court, their fiefs were confiscated, and an alliance was concluded with Philip IV, king of France. War broke out, but Baliol did not take the field in person. Invading Scotland, Edward met with a feeble resistance. and at Brechin in July 1296, Baliol surrendered his kingdom to Antony Bek, bishop of Durham, as the representative of the English king. He also renounced his alliance with Philip IV and about the same time appeared before Edward at Montrose and delivered to him a white rod, the feudal token of resignation. With his son, Edward, he was taken prisoner to England and remained in captivity until July 1299, when he was released at the request of Pope Boniface VIII. He was then placed in the keeping of the papal delegate who had been sent by Boniface to negotiate peace between England and France. Baliol agreed to live wheresoever the pope directed him. He left England for his French estates arid did not return, though he apparently continued to be regarded by many Scotsmen, including Wallace, as the sovereign of Scotland. He died at Castle Galliard in Normandy, in 131j.

BALIBARA, a frontier station and tract of British India to the north of the Darrang district in Assam. The creation of the Balipara frontier tract followed murders by Abors and administration was remodelled. An eastern section was formed at Sadiya and a western section at Balipara, to which a portion of the Darrang district was transferred. This frontier tract constitutes a charge under a political officer and consists of the area in contact with various tribes; viz., the Bhotias, Daflas, Akas and Apa Tanangs. Balipara is connected with Tezpur by a light railway and a trade route leads from it to Lhasa in Tibet over the Udalguri-Amratula pass.

BALIUAG, a municipality with administrative centre and 17 barrios (wards) of the province of Bulacan, Luzon, Philippine Islands, on the Quiñgua river, 29 mi. (by rail) N.N.W of Manila. Pop. (1939), 22,972, and none was white. Baliuag is on an extension of the Manila and Dagupan railway, owned by the government. The town is noted for its manufacture of hats and other products of native fibre and silk. It is the trade centre of a fertile agricultural district and also for various lines of industry, such as furniture making, sugar and rice mills, distillation of alcohol, tanning and fish breeding. The gain in population since 1918 was 4,718. Of those between the ages of 6 and 19, 36.2% attended school and of those over 10, 68.7% was literate. Tagalog is the vernacular. (C. S. L.)

BALKAN ENTENTE, THE. The Balkan Entente was a political organization formally created by four Balkan countries: Yugoslavia, Rumania. Greece and Turkey on Feb. 9. 1934, for the purposes of mutual defense and other common interests.

The Background **of** the Balkan Entente. — The idea of Balkan confederation or unity, of one sort or another, is a very old one, to be traced on the one hand to the mediaeval backgrounds of Balkan history, and on the other, to the period since the French Revolution. With the birth of nationalism among the nations of southeastern Europe there developed a feeling that through unity the small nations might free themselves from the Ottoman or Habsburg yoke. Among the south Slavic peoples of the peninsula, the basic ethnic elements involved, a sentiment of kinship added a positive cement to the historic and geographic bonds. By the end of the 19th century and the opening of the 20th, it seemed clear that neither Habsburg nor Ottoman imperialism could bring any solution to the manifold problems of this vital highway astride the intercontinental crossroads of Europe and Asia.

Early in the 19th century men like the Serbian Dositej Obradovich and Vuk Stefanovich Karajich, following in the footsteps of the Greek Rigas de Féréo, and later the Croatian Ljudevit Gaj and Bishop Joseph George Strossmayer, worked in the direction of Balkan, and especially, south Slavic unity. For a time, with Napoleon's creation of the Illyrian provinces, it was thought that the Illyrian movement would lead toward some kind of federation. The Serbian statesman, Ilya Garashanin, in 1844, developed his Nachertanija, which was designed to draw Serbs, Croats and Bulgarians together. Under Prince Michael Obrenović III, Garashanin continued to work toward the end of Balkan union. and ideas of a Serb-Bulgarian-Greek-Rumanian group were developed through a series of agreements in 1867–68. The assassination of King Michael in 1868, however. put an end, for a time, to these ideas. From that period until the formation of the Balkan alliances of 1911–13, few practical steps were taken toward the development of the idea of confederation, though there were many projects formulated in the minds of Balkan and other thinkers. The alliances of Serbia and Bulgaria, Greece and Serbia, and Greece and Bulgaria, to which both Montenegro and Rumania were later to be added, did not finally develop beyond that stage. Austria-Hungary was opposed to any strong state or federation in the Balkans, as was also Italy. Moreover, Bulgaria, under the influence of Austria-Hungary and later Germany, not only broke from its alliances with Greece and Serbia in 1913 and attacked these countries, but joined the Central Powers in Sept.–Oct. 1915. All idea of Balkan or south Slavic unity seemed broken for years to come.

In the period following World War I, nevertheless, the idea of Balkan unity was revived. Radical groups, sometimes inspired by the communist ideology or that of social democracy, favoured a form of unity, generally centring around the concept of the class struggle. The agrarian groups, the basic element in the Balkan social structure, led by men like the Croatian leader Stjepan Radić, the Bulgarian Alexander Stambolisky and the Rumanian Julius Maniu looked toward close co-operation among the Balkan peoples. In the end, some form of unity was their aim.

The factors which worked against the fruition of these ideas, however, were very strong. World War I had stimulated a powerful and particularistic nationalism in the Balkans as elsewhere. The highly centralized Balkan governments which emerged from the war pursued policies of political and economic nationalism which further weakened the already weak economic ties between the nations of southeastern Europe. Moreover, Bulgaria, embittered by its defeats and losses in both the Balkan and the World nars, was not at all favourable to any project of collaboration or federation which would not restore what Bulgaria had lost or had hoped to gain in 1913 and 1915—Macedonia and the Dobruja in particular. Finally, while Austria-Hungary had been eliminated as a political factor operating against Balkan union, fascist Italy systematically opposed any uell-developed plan for co-operation in the Balkans, and directed its policy toward disunity in general and the destruction of Yugoslavia in particular. Soon a revived Germany under Adolf Hitler returned to the Balkan scene, and there were, once more, questions concerning the aims and intentions of Russian policy.

The Balkan Conferences, 1930–33.—By 1930, however, the movement toward some form of union was to continue in another form. From 1930 to 1933, four Balkan conferences, with representatives from Albania, Bulgaria, Greece, Rumania, Turkey and Yugoslavia, were held in Athens, Istanbul, Bucharest and Salonica While these meetings were unofficial in character, all the Balkan governments were represented, and the Greek and Turkish governments especially took a lead in directing the work of the Balkan conferences.

Essentially the Balkan conferences were interrupted by the development of the European crisis, the trend toward dictatorship in Greece and toaard authoritarianism in the Balkan region generally. Whatever their disagreements as to method and procedure, the delegates to the conferences were in accord as to the aim of federation. They also realized that their work must be one of long duration. By 1933 substantial achievements had been made toward the desired goal A political pact had been drafted by the Third conference in Bucharest in 1932, based on the ideas

of outlawry of war, arbitration and mutual assistance, and it provided machinery for the settlement of the troublesome problem of minorities, within the framework of existing treaties. The adoption of a draft convention on the right of Balkan citizens to live, work and travel throughout the Balkans was another worthy accomplishment, for it looked toward those social, economic and cultural contacts which would give a broad social basis for political understanding. Quite significant was the project adopted at Salonica in 1933 for a partial Balkan customs union. One should also mention the projects for intellectual co-operation and for broad collaboration in the field of social legislation. The conferences promoted a thorough system of sanitary and veterinary treaties as well as projects for a Balkan system of agricultural co-operatives, a program of agricultural credit and a Balkan chamber of agriculture. If many of these ideas remained on paper, others were actually carried into operation. A Balkan chamber of commerce and industry was established in Istanbul (1931), an oriental tobacco office was created in 1933 by Bulgaria, Greece and Turkey, and a Balkan medical union began to function in 1933. A commission of Balkan jurists performed pioneer service in the direction of future legal unification. Groundwork was done looking toward a Balkan postal union. The death of M. Alexander Papanastasiou, the former Greek premier and the outstanding leader of the Balkan conferences, in the fall of 1936, however, was a crippling blow to the conferences.

The Creation of the Balkan Entente. — But even before the Balkan conferences had practically ceased, a Four-Power Balkan pact was signed at Athens on Feb. 9, 1934, by Greece, Rumania, Turkey and Yugoslavia. Rumania and Yugoslavia were already members of the Little Entente with Czechoslovakia, while Greece and Turkey had long since settled their outstanding difficulties and had only on Sept. 14, 1933, signed a remarkable treaty of friendship. The Four-Power pact mas purely a political treaty of mutual guarantee of inter-Balkan frontiers. This was at once its strength and its fatal weakness. Albania was not invited to become a signatory because of the fear of antagonizing fascist Italy, and Bulgaria refused to become a member since it would not renounce its idea of territorial revision, under article xix of the covenant of the League of Nations.

Some months later, at Ankara, Turkey (Oct 20–Nov. 2, 1934), the four states which had signed the Balkan pact organized the Balkan Entente, with a permanent council and an advisory economic council as its controlling organs. The permanent council, composed of the ministers of foreign affairs of the member states, was to meet at least twice a year, and all decisions were to be made in unanimity. The advisory economic council, which was to function as an auxiliary organ of the permanent council and was to be composed of specialists and experts in economic, commercial and financial problems, was to work toward the progressive co-ordination of the economic interests of the four members of the Balkan Entente.

If the Balkan Entente were designed to preserve the *status* quo in the Balkans — and it was — it was none the less true that, as in the case of the Little Entente, its purpose was to give some kind of unity to the Balkans to prevent that region from becoming a pawn in the hands of the great powers. That u-as also one of the ideals of the Balkan conferences — and the program of the Balkan economic council indicated that the influence of the conferences was felt in other directions. For a program of wide economic collaboration was prepared in the Jan. 1935 meeting of the advisory economic council.

The Development of the Balkan Entente. — Meanwhile, the Balkan Entente demonstrated its usefulness in the fall of 1934 when, together with the Little Entente, it stood by Yugoslavia following the assassination of King Alexander, who had done so much to promote the fortunes of that organization, and again in the spring of 1935, when it served as a stabilizing influence during the abortive Venizelos revolt in Greece. Regular meetings of the council enabled the Balkan Entente to solve problems as they arose. And while in 1936 Greece indicated that the obligations of the members should not be construed against Italy, there were some signs of growing strength. Moreover, the Balkan Entente, like the Little Entente (*q.v.*), acted formally as a unit during the Ethiopian crisis, co-operating with Great Britain, the leader of the league sanctionist powers, in upholding the principle of collective security, despite the possible political dangers and the obvious economic losses involved. Another significant achievement of the Balkan Entente was the revision of the Convention of the Straits in behalf of Turkey at the Montreux conference of June 22 to July 20, 1936.

Meanwhile, the economic council of the Balkan Entente was attempting to prepare the ground for fruitful economic collaboration. On Jan. 24, 1936, for example, a Balkan Entente air convention was signed by Greece, Rumania, Turkey and Yugoslavia, greatly facilitating inter-Balkan air communications. Moreover the economic council, meeting at Bled, Yugos., in July, recommended collaboration with the Little Entente, in the establishment of a limited postal, telephone and telegraph union. A convention for this purpose was actually signed by the members of the two ententes on Oct. 12, and went into effect on March 1, 1937. Not only were facilities to be improved, but rates were generally reduced and provision was made for the introduction of common stamps in the future. In July 1936 Rumania and Yugoslavia, and Czechoslovakia and Rumania reached agreements relative to tourist traffic which looked toward the elimination of the passport visa. The latter part of November witnessed a long delayed agreement between Rumania and Yugoslavia providing for the construction of a bridge across the Danube between Turnu Severin, Rum., and Kladovo, Yugos., the bridge to be constructed within about three years. It was noteworthy too, that in the summer of 1937 suggestions were being made by both Turkey and Greece that a Danubian bridge be built between Rumania and Bulgaria. In the latter part of 1936 Turkey and Yugoslavia arrived at a new commercial accord.

The meeting of the advisory economic council of the Balkan Entente at Bucharest in Jan. 1936 provided for the calling of a conference of maritime experts at Istanbul (May–June 1936), and a permanent maritime committee was organized at Peiraeeus, Gr., in October. The conference of the central (national) banks of issue of the Balkan Entente held its first session at Athens on Dec. 17–20, 1936. The meeting was attended by the governors of all the central banks, and the conference studied the manifold financial and economic problems confronting the states of the Balkan Entente. The group urged that a more liberal and natural system of inter-Ealkan exchanges be achieved, following, if necessary, international action. In view of their fundamental interest in effective collaboration among Balkan central banks, and in order to give that collaboration a more permanent character, it was decided to organize in each central bank, sections especially charged with the study of the economic and financial situation of the countries of the Balkan Entente. It is interesting to note also that the governors of the central banks declared their desire that the Balkan Entente be represented on the Council of the Administration of the Bank of International Settlements at Basle.

Rumania and Yugoslavia signed a series of important agreements in the spring of 1937. There was, for example, the new accord of March 13 and the significant Treaty of Commerce and Navigation of May 13, as well as the Sanitary Veterinary Accord of the same date. The Treaty of Commerce and Navigation may well be compared with the similar project for the entire Balkan region which was drafted by the Balkan conferences.

In view of the progress attained, the economic council of the Balkan Entente, meeting at Athens in March 1937, could well report some substantial achievement both in economic matters and in the realm of communication. The meeting indicated continued study of the problem of a common policy for the sale of certain products on extra-Balkan markets, announced the calling of a congress of Balkan chambers of commerce, and reported progress in the matter of inter-Balkan communications. It was recognized that progress would be made only step by step, and that the relatively similar economic character of the Balkan countries limited the possibilities of co-operation, but the economic council was determined, within the limits of the possible and the practical, to pursue its aims toward closer economic collaboration and freer economic activity and commercial interchange in the Balkans.

Other steps were also taken. During the course of 1936 and the early part of 1937, Yugoslavia and Rumania on the one hand, and Turkey on the other, prepared to establish exchanges of professors in their universities. A Balkan press entente was organized in June 1936, but important though such an organization was, its functioning under authoritarian regimes was seriously limited in usefulness.

The Balkan Entente and the European Crisis. — The years 1936–38 witnessed intense diplomatic activity in central and Balkan Europe. Events on the larger European and world stage were bound to have a determining influence in southeastern Europe. The Ethiopian campaign had thrown fascist Italy and nazi Germany together against the League of Nations and against Great Britain and France in the west and soviet. Russia in the east. Moreover the Spanish revolt, which might hare remained within the confines of the republic, became the prelude to a great European struggle as a consequence of the aggressive action of Germany and Italy especially. In central and Balkan Europe both fascist Italy and nazi Germany sought to break the unity of the Little and Balkan Ententes and to sever their con-

nections with France and western Europe. Pierre Laval, as foreign minister of France after the assassination of M. Jean Louis Barthou in Oct. 1934, played his role in weakening French ties not only with Czechoslovakia, hut with Yugoslavia and Rumania. Despite his efforts to strengthen the ties with central and Balkan Europe, M. Leon Blum was unable to do so effectively. The fact was that the rise of national socialist Germany had created a new situation in Europe, and the nations of southeastern Europe were to take account of it. The German and Italian successes made serious impressions in that region. It was apparent that the system of collective security under the League of Nations was on the verge of collapse. Germany was intent on isolating and destroying Czechoslovakia, and on winning Rumania, Greece, Turkey and Yugoslavia, as well as Bulgaria, already under Italian and German influence, with a new series of economic and financial clearing agreements.

In spite of internal differences and external pressures, the Balkan Entente was not yet to be broken. Moves for co-operation between the Little Entente and the Balkan Entente with the so-called Rome bloc of Italy, Austria and Hungary were even initiated, but on Nov. 1, 1936, Mussolini revealed his real intentions when he simultaneously offered "friendship" to Yugoslavia and urged "justice" for the "4,000,000 Hungarians" torn from their country by the treaty of Trianon. The protest from Czechoslovakia and Rumania was unmistakable, both Prague and Bucharest interpreting the manoeuvre as an attempt to wreck the two ententes. The belief was strengthened that Italy and Germany already had reached an agreement not only to continue their mutual support of Gen. Francisco Franco in Spain, but to divide central and Balkan Europe into spheres of influence—a project the Little Entente and the Balkan Entente were designed to prevent any great power from carrying into execution.

By this time, however, a number of developments were progressively weakening the Balkan Entente as they were the Little Entente. The establishment of the dictatorship of Gen. John Metaxas in Greece and the complete destruction of parliamentary institutions raised many doubts about the position of Greece within the Balkan Entente, especially since Metaxas was thought to be pro-Italian and pro-German, though Greek fidelity to the Balkan Entente was at once proclaimed.

Moreover Bulgaria was not a member of the Balkan Entente at all, though the Bulgarian attitude toward the new organization was, for a time, diplomatically correct, if not friendly. King Alexander of Yugoslavia had done much to promote a better feeling between Yugoslavia and Bulgaria before his death in Oct. 1934. On Jan. 24, 1937, however, under the leadership of Dr. Milan Stoyadinovich, the Yugoslav premier, a Bulgaro-Yugoslav treaty of "sincere and perpetual friendship" was signed, pledging that the two countries would never again go to war against each other. The signing of this treaty, without proper notice to or the consent of either the Little or the Balkan Entente, raised many questions as to Yugoslav policy. The Greek and Rumanian governments were much concerned. Greece was fearful lest there be danger of an upset in the Balkan balance of power against its interests and uneasy about a possible Yugoslav-Bulgar pressure in the direction of Salonica. Rumania did not approve the bilateral procedure and feared for the unity of the Balkan Entente. Professor Nicolas Jorga, the distinguished historian and former premier of Rumania, openly declared that the treaty had been made without prior consultation on the part of Yugoslavia with either the Little Entente or the Balkan Entente. The Italians, who appear to have had much to do with the making of the treaty, and whose unfriendly sentiments toward both the ententes was well known, considered the Bulgaro-Yugoslav treaty a blow to the unity of the Balkan Entente.

When the Balkan Entente met in Athens on Feb. 15–18, 1937, it discussed the new situation created in the eastern Mediterranean by the Anglo-Italian understanding and the report of the Turkish foreign minister, Dr. Tevfik Rüstü Aras, on his conversations with the Italian foreign minister concerning Balkan problems and the Convention of the Straits signed at Montreux. The other problem was the Bulgaro-Yugoslav agreement. While the council "took note with satisfaction" of the Bulgaro-Yugoslav agreement, after an explanation of its innocent character, fears of its consequences were by no means allayed.

The independent action of Yugoslavia with respect to Bulgaria was followed by a similar action with respect to fascist Italy when on March 25, 1937, a Yugoslav-Italian agreement was signed. This agreement stipulated respect for common frontiers on land and sea, and in case of unprovoked aggression against one of the parties, the other was pledged to abstain from any action which might accrue to the benefit of the aggressor. If both were threatened, Yugoslavia and Italy were obligated to reach an understanding as to common measures to be taken. A commercial agreement between the two countries followed. Despite subsequent formal approval, there is no doubt that the Yugoslav-Italian treaty struck a serious blow against the unity of both the Little and the Balkan Ententes. Dr. Stoyadinovich appeared to be leading his country away from its traditional moorings and into collaboration with fascist Italy and national socialist Germany.

In fact, the pressure put upon the Balkan states by the two fascist powers was of such a nature that it had brought about a weakening of the forces of unity and produced a strengthening of the trend toward authoritarian regimes in individual Balkan states, with all that that implied in political and economic nationalism. Again, by that time national socialist Germany was able to obtain a progressively dominant position over the economic life of all the Balkan countries, taking about 50% of the average imports and supplying a similar percentage of the exports of the region as a whole. When the Balkan countries perceived the weakness and the wavering position of Great Britain and France, and their own failure to preserve an essential unity of action against the forces of aggression, it was not unnatural that the smaller states of southeastern Europe should have failed as well.

The Balkan Entente and the Munich Crisis.—The so-called "pact of Munich," of Sept. 30, 1938, which laid the foundations for the destruction of the independent existence of the republic of Czechoslovakia, naturally destroyed the Little Entente, of which Czechoslovakia was the keystone. The last meeting of that organization took place on Aug. 21, 1938, while the Balkan Entente, in anticipation of the crisis, met on July 31 and moved toward an understanding with Bulgaria by removing the military restrictions of that country. In return, Bulgaria pledged to pursue a pacific policy toward the members of the Balkan Entente.

While the Balkan Entente was not wrecked by the Munich agreement, the lessons were not lost on the members, and realism not sentiment was now to sway Balkan judgments. Indeed, one Balkan statesman, a later foreign minister of Rumania, Grigore Gafencu, exclaimed: "Germany has her plans: have other countries their plans? If the other powers have no plans, we must perforce go with Germany." A. Neville Chamberlain seemed to speak clearly in the British house of commons when he declared a few weeks after the Munich agreement: "Geographically Germany must occupy a dominating position in central and southeastern Europe. I do not see any reason why we should expect a fundamental change to take place in these regions." Germany, in fact, was then to proceed to the organization of a *Grossraumwirtschaft*, a German *Lebensraunz*, in the Balkans. The members of the Balkan Entente were but a negligible force, apparently, against the forces which were then to be brought against them.

The Balkan Entente and World War II.—As the world moved toward war in the period after the Munich agreement, national socialist Germany moved toward the peaceful conquest of the Balkan region, and the forces of disintegration within the increasingly weakened Balkan Entente aided in that task. Rumania was subjugated economically to Germany through the commercial agreement of March 23, 1939, while Bulgaria, Yugoslavia and Greece, as well as Turkey seemed already in Germany's economic orbit. Each Balkan power now seemed determined to pursue its own course, though formal unity within the Balkan Entente still apparently prevailed.

The council of the Balkan Entente met in Bucharest, Rum., Feb. 20–22, 1939, and unanimously affirmed the identical attitude of the four member states toward the progressive developments in Europe, stressed their profound attachment to the ideal of peace, and re-emphasized the complete solidarity which united the members of the Balkan Entente and their unanimous determination "to continue their efforts in the same spirit." But there was little evidence that these words were anything more than an empty formula, for a united policy was not to be pursued. Nor was the situation perceptibly improved when Great Britain and France, after their guarantee to Poland on March 31, 1939, namely on April 13, offered guarantees to Greece and Rumania if they became the victims of aggression and communicated that declaration to Turkey. Yugoslavia was not covered by the guarantee, probably because the Yugoslavs, already surrounded on three sides by the Berlin-Rome axis, were too afraid to accept such assurances.

When the advisory economic council of the Balkan Entente met in Bucharest May 17–27, 1939, it noted the increase in inter-Balkan commerce and noted with satisfaction the efforts of the Balkan governments to insert a special Balkan clause in commercial conventions with other states. But the economic council was especially pleased at the measures which were being outlined for the improvement of inter-Balkan communications, railway and air, the postal services and tourist traffic.

When the war finally came, with the German attack on Poland Sept. 1, 1939, the Balkan Entente once more was to affirm the solidarity of the views of all the member states, though each state, in fact, was to pursue its own independent course. The last meeting of the council of the Balkan Entente took place Feb. 2–4, 1940, in the city of Belgrade, Yugos. As the war was now drawing somewhat more closely to the Balkan region, and as all the members of the Balkan Entente seemed clearly endangered in one way or another by German aggression, there was a possibility that at last the members of the Balkan Entente would assert a genuine unity of thought and action. Proper note was taken that war was going on all around the members of the Balkan Entente. The Yugoslav minister of foreign affairs, M. Aleksandar Ancar Markovitch, however, sounded a strange keynote when he declared: "We are happy today to state that our peaceful efforts have given good results. We consider the future with the same optimism. The Balkans are not menaced from any quarter. The loyal and correct attitude of the Balkan peoples has been justly appreciated and respected by all." Particular satisfaction mas expressed over the pacific sentiments of Hungary, Bul-

garia and fascist Italy. M. Gafencu, the Rumanian foreign minister, stressed the resolutely peaceful attitude of the Balkan Entente, though it was known that the Rumanian government was extremely fearful of German aggression at the moment, and was anxious for a declaration of complete solidarity on the part of the Balkan Entente at the time. The final communiqué of the council of the Balkan Entente Feb. 4, 1940, was especially innocuous. It noted the common interest of the four states in the maintenance of peace, order and security in southeastern Europe. It expressed "their firm decision to pursue their resolutely pacific policy, while maintaining strictly their positions concerning the present conflict in order to preserve this part of Europe from the experiences of war." It reaffirmed their "firm will to remain united" within the Balkan Entente, which was directed against no state, and to guard in common the right of each to its independence and its national territory. It emphasized the desire to enter into and to develop friendly relations with the neighbour states —Hungary and Bulgaria. Finally, it stressed the necessity of perfecting economic relations and communications between the members of the Balkan Entente. The four ministers of foreign affairs, as was customary, were to keep in direct contact with each other until the next meeting of the council of the Balkan Entente, which was to be held in Athens, in Feb. 1941.

The last communiqui of the Balkan Entente, however, was symbolic of the unreality of the meeting for there was no evidence that real unity had prevailed at all, or that the states were prepared to take any effective measures in common against the aggression which actually threatened the independence of them all. The meeting of Feb. 1941 was never held. In the summer of 1940 Rumania was partitioned, with the soviet union taking Bessarabia and Bukovina, and Hungary marching into a portion of Transylvania, while German troops took over the very heart of the country. In the summer of 1941 Rumanian troops were to move into the soviet union along with those from Germany. On Oct. 28, 1940, fascist Italy attacked Greece, which was finally subdued when the forces of Germany and Italy destroyed the independence both of Greece and of Yugoslavia. Turkey became, for a time at least, completely immobilized. Despite the professions of unity on the part of the members of the Balkan Entente when danger seemed somewhat afar, one by one and one after another, the Balkan states became the victims of the aggression which they had sought to avoid through the unity of action which they did not, in fact, follow. (H. N. H.)

BALKAN PENINSULA. Since the early 19th century this name has been given to the most easterly of the three southern prolongations of the European continent. Balkan is a Turkish word meaning mountain, and though in modern usage it is applied only to a particular mountain belt lying south of the Lower Danube, it was formerly regarded as a general name for a chain supposed to run from east to west across the peninsula. This hypothetical range was thought to be the boundary between the early maritime civilizations of the south and the bleaker, more difficult lands of the interior, with their barbarian peoples. The actual relief conditions are not so simple as was believed, but the fact that the conception of a Balkan peninsula, comparable to the Iberian and Italian ones, is of so recent a date is of great interest. The conception owes its origin and spread to two sets of facts. It has been shown by modern geographical research that the area possesses certain basal resemblances to the two more familiar peninsulas, particularly in its relations to the folded mountain chains of southern Europe and in its structural elements. But these resemblances depend upon fairly detailed points, mainly of interest to the physical geographer, and coexist with well-marked and obvious differences. The term Balkan peninsula would not have acquired its present familiarity to the general public, if it had connoted only certain structural features. During the 19th century, when geographers and geologists were acquiring new knowledge of the interior of the region, and coming to regard it as an entity, not as merely a background to Greece and Byzantium, great political changes were taking place within it. The peoples submerged by the Turkish advance began to organize themselves into national states and, as the Turkish empire contracted, new names appeared on the map. The growth of the new states was accompanied by much turmoil, which had reflex effects outside the limits of the peninsula however these be drawn; but the essential point is that it drew general attention to the region. It became increasingly clear that all the older European states, if in varying degree, were interested in the delimiting of boundaries within it, and that thus the facts disclosed by detailed geographical study had more than purely technical importance.

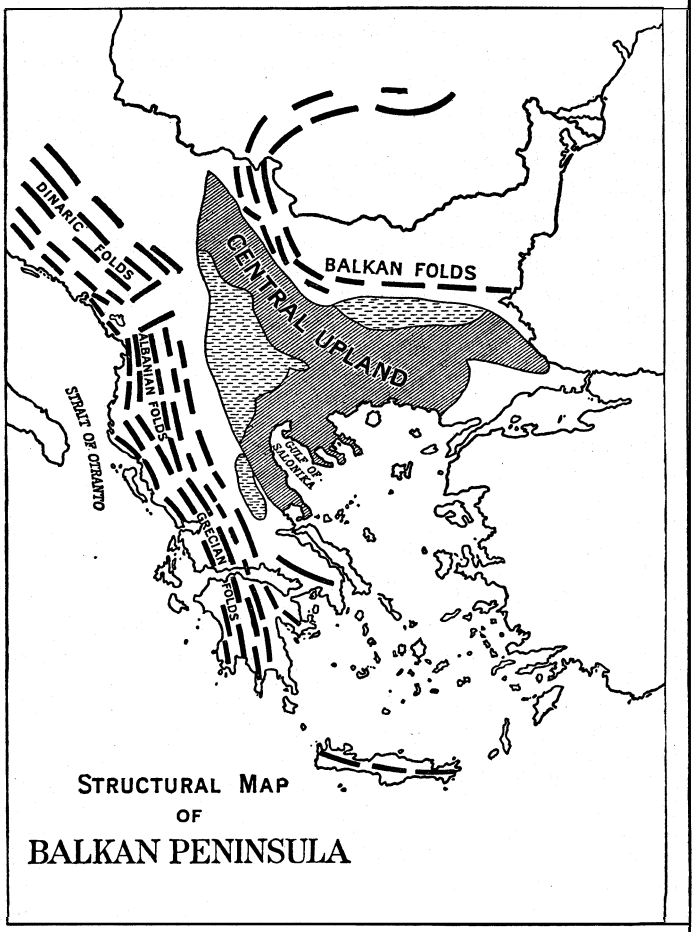
One of the reasons why the notion of the entity of the peninsula was so slow in taking root was that no mountain barrier separates it from the continental mainland, as Italy is separated by the Alps and the Iberian peninsula by the Pyrenees. There is thus no sharp break of continuity such as is experienced when the Alps are crossed and a new world is disclosed in Italy. The northern limit usually adopted is constituted by the line of the Danube, then the Save, then the small feeder of the latter called the Kulpa, from which an imaginary line is drawn to the port of Fiume. This limit has a certain justification, if not a complete one. The Danube-Save line is easily recognized on a map, and it served for a period as a boundary to the Turkish empire and thus as the frontier of Christendom. For a time also the Save-Kulpa-Fiume section, which has a certain air of unreality, did at least approximate to the frontier between Austria and the Turk. In point of fact, however, a geographically satisfactory frontier in this northwestern section is difficult to draw. Even the Danube-Save line, at least to the west of the Iron Gate of the Danube, has never been a limit so far as peoples are concerned: it bears now little relation to political frontiers. The first point about the Balkan peninsula is thus that on the north there is no real separation between it and central Europe. This physical continuity is accentuated by the notable increase in width of the peninsula towards the north. Thus the distance in a straight line from the mouths of the Danube to Fiume is about 750 mi.; for the sake of comparison it may be noted that the line by which Spain is attached to the continent measures only some 250 mi. from sea to sea, the Pyrenees being continuous throughout and leaving but a small gap at either end.

The second outstanding feature is the peculiar build, which causes the peninsula to fall into two very unequal and very dissimilar parts. To the south a secondary peninsula, with an average width of only about 125 mi., is attached to the main one. Though both sections are highly mountainous, not only is this secondary peninsula of Greece much narrower, but it has a peculiarly dissected coast line, which brings sea influences within easy reach of almost every part. The broad, continental northern section, on the other hand, is largely out of touch with the surrounding seas, not only because of its width, which makes places in the interior over 300 mi. from the nearest coast, but on account of the nature of the shore lines, and, in part, of the direction of the mountains. In climate, in vegetation, in possible crops, it differs profoundly from Greece. No less profound has been the effect of the actual remoteness from the sea routes so freely open to the peoples of the south. It is this division into two parts—one sharing to the full the life of Mediterranean peoples, the other cut off from it—rather than the absence of a definite northern limit, which made the European world so slow to recognize the existence of a Balkan peninsula. Till the peoples of the continental segment awoke, the whole northern area tended to be regarded only as a broader equivalent of Alps or Pyrenees: the real peninsula was the Grecian one.

Structure and Relief.—As just stated, it is the presence within the peninsula of young fold-mountains which has led geographers to recognize it as essentially similar to the other Mediterranean peninsulas. Two separate series of these can be recognized, one, of transverse direction, lying to the east, and the other, which is longitudinal, in the west. The Transylvanian Alps swing round in a great curve, the Danube breaking through at the Iron Gate at the western apex of the curve, and are continued in the Balkan mountains. which have a roughly parallel direction. Breaking off steeply on the shores of the Black sea, the Balkans rise to a maximum height of nearly 8,000 ft., and the most noted of their passes, the Shipka, has a summit level of well over 4,000 feet. At first sight it might seem as if the crest of these mountains should be taken as the northern limit of the peninsula, rather than the line of the Danube. But northwards they sink gradually to a chalky tableland, presenting a marked contrast to the alluvial plains of Walachia beyond the river, and the presence of this tableland means that the northern slopes up to the passes, relatively high though these are, are gentle. The Balkans have indeed proved in practice much less of a barrier to human movement than would appear from the map.

Just as the Balkans are a continuation of the Carpathian branch

of the Alpine chain, so the main chain itself bends down the western side of the peninsula. From the Julian Alps north of Trieste a series of mountains runs in a south-easterly direction close to the coast and parallel with it. These, to which the general name of Dinaric Alps may be given, rise to well over 8,000ft. in the peak of Durmitor; but their significance as a barrier does not depend upon their height. They are characterized by the great development of massive limestones, particularly ex-



A ROUGHLY TRIANGULAR CRUST-BLOCK OF RESISTANT ROCKS FORMS THE CENTRAL UPLAND, WITH YOUNG FOLD-MOUNTAINS TO THE WEST AND TO THE NORTH-EAST. BETWEEN THE TWO, SHOWN BY DOTTED LINES, LIE TRANSITION AREAS, WITHIN WHICH ARE FERTILE BASINS. DUE TO THE SINKING OF FRACTURED MASSES OF ROCK

tensive in the area lying behind the peninsula of Istria. These limestone areas, called karst in German and *carso* in Italian, display to a very marked extent certain peculiar topographical features, dependent on the effect of rain water on their constituent rocks. Thus the surface soil is very thin, bare rock being frequently exposed; running water is usually absent at the surface, most of the rivers sinking, after a short course, into cavities of the rocks; caves and sinks are common, as well as elongated depressions called locally *polyen,* or fields, because only in them as a rule is there sufficient depth of soil to permit of cultivation. The combination of these features makes the karst areas difficult to cross, because continuous river valleys to serve as natural routes are absent as a rule, and, where they occur, as in the case of the Narenta river, the stream tends to flow in steep-sided, canyon-like gorges which form a great obstacle to transverse movement. Further, not only do these lands form a barrier between the sea and the interior, but they can as a rule only support a scanty and scattered population, for the local resources are small.

In places the limestone mountains rise steeply from the shore of the Adriatic, but a certain amount of subsidence has occurred, with the result that numerous islands fringe the coast. Because the mountain folds run parallel to the shore, the islands tend to be elongated in the direction of the coast-line, and the straits and inlets tend to have the same direction. The islands are usually fertile and there is often a strip of productive land fringing the inlets. Water is also easy to obtain, for the streams which were lost on the heights above emerge as full-grown rivers where the rocky hills descend in cliffs to the sea margin, or springs even bubble up on the sea-floor itself. In contrast to the dry and barren lands above, therefore, there is a possibility of cultivation and settlement on the shore. But the coastal areas are too narrow, the difficulties of communicating with the interior too great, to have allowed for the rise of indigenous civilizations here. The scattered towns on this Dalmatian coast represent islets of ancient but alien culture, and have scarcely influenced the interior of the peninsula at all. They themselves arose as colonies, as offshoots, that is to say, of areas enjoying much greater advantages.

The Dinaric Alps may be said to extend to the neighbourhood of the mouth of the Drin. Here the coast changes in direction, trending almost north-to-south, and the mountain belt thins out and draws back from the coast, so that the Albanian lowland intervenes between it and the sea. This strip, which extends south to Valona, shows another contrast to the Dalmatian area further north in that a considerable number of permanent rivers flow from the mountains across the lowland to the sea; here, then, access to the interior becomes at least relatively easy. Another peculiarity is the proximity to south-eastern Italy. Valona is some 80m. distant from Brindisi, the actual Strait of Otranto being only about 50m. wide. The combination of this nearness to an area of old civilization and of natural routes to the hinterland is of great significance.

Valona, with the adjacent sheltering peninsula ending in Cape Linguetta, marks the beginning of a new change. The coast reassumes a south-easterly direction, the fold-mountains become more conspicuous as the Pindus range, which extends throughout the whole of Greece. In the Peloponnesus the mountains tend to acquire a north-to-south direction, finally swinging round to a west-to-east one in Crete.

According to current views of the mechanics of mountain-folding, a crust-block of old and hard rocks is always present, which receives the pressure of the thrust causing the folding. While the younger and softer rocks on its margins buckle up under the stress, it, by hypothesis, can only respond by faulting, with the sinking of certain segments and the uplift of others. Such a crust-block is present in the Balkan peninsula, forming its central core. This has a roughly triangular shape, the apex reaching the Danube east of Belgrade and the broad base approaching the shore of the Aegean sea. That sea is believed to overlie a former extension of the crust-block which has sunk beneath its waters. The numerous Greek islands represent fragments of the surface of this lost land, which have remained above sea-level when the remainder sank. The narrow straits of the Bosporus and Dardanelles are also regarded as flooded parts of the courses of rivers which crossed the old land.

The central core of the peninsula, though it has retained a position above sea-level, has been greatly modified as a result of the formation of the fold-mountains on its margins. The narrowed northern region, constricted between the Dinaric Alps and the curve of the Balkans, is a broken hilly country traversed by a continuous longitudinal depression through which the River Morava flows on its way to the Danube. South of Nish, however, and extending to the Gulf of Salonika is a region of great structural complexity, which seems to have received the full force of the thrust. Faults are innumerable, and closed basins alternate with short and steep highland belts. The basins tend to be elongated in a longitudinal direction. Many have formerly been lakes, and since they are floored with fertile soil, they are fitted to become centres of population; but their isolation from each other has had very important human effects.

As contrasted with this fractured and much subdivided region the south-eastern part of the triangle, that lying between the Balkans and the Aegean, shows relative simplicity. Here the core reaches its greatest height (over 9,500ft. in the Rila Dagh), and here also is the broadest unbroken mass of elevated ground. The

general name of Rhodope Dagh may be given to the whole block, though the separate parts have local names. The Rhodope Upland is separated from the Balkan mountains by a considerable lowland, the Rumelian plain, watered by the River Maritsa. This is one of the most considerable tracts of lowland within the peninsula and is continued, beyond the Maritsa, into an undulating tract extending to the shores of the Sea of Marmara. There is also an interrupted belt of plain between the Rhodope and the Aegean, the total result being to make the south-eastern part of the peninsula much less continuously hilly than the north-west, where lowlands are virtually absent.

Relief and Political Units. — In the above account emphasis has been laid on the distinction between the fold-mountains on the one hand, and the central crust-block on the other. The contrast is a geological one, based on the characters of the constituent rocks in the two cases, and is not visible on a relief map, where land is classified on the basis of its height above sea-level alone. The essentials of structure are worth note because the build of the peninsula has influenced the routes and the areas of settlement within, and the zones of effective contact with adjacent lands outside. But it is the ordinary atlas map which affords the most familiar representation of the area, and it is necessary to correlate the facts shown there with those obtained from the survey of the broad structural features, and particularly to connect the political and administrative units with the general lie of the land.

A map with orographical colouring shows an almost continuous area of high ground on the west, continued into the Grecian peninsula, which is almost wholly mountainous. In the north-west the way in which the high ground within the peninsula passes into the Alps proper means that the Danubian plains have no natural, easy exit to the Adriatic. But, owing to the presence of the broad Gulf of Quarnero, the mountain belt thins out behind the town of Fiume at its head. Beyond this narrowed section lies a tract of undulating country, mostly outside the peninsula as usually defined, for it extends beyond the Save-Kulpa line. This area is a continuation of the plains of the Danube, and, where the rivers Drave and Save converge towards one another, it includes a considerable area of true plain. Though the mountain belt which separates it from the Adriatic is neither wide nor lofty — it does not rise much above 5,000 ft. — yet on account of its karstic nature it forms a very effective barrier. The chief elements of the belt are the Kapela and Velebit mountains, both remarkably waterless and barren. The mainland shore of the Gulf of Quarnero is also inhospitable. This whole area, formerly the kingdom of Croatia-Slavonia, is therefore from the physical standpoint a transition region between Central Europe and the Balkan peninsula. It has little direct relation to the Adriatic, though economic and political causes led to Hungary making great efforts to develop Fiume as a grain port during the later 19th century. The western mountain section is well fitted to serve as a strategic frontier, and did mark the limit of the Turkish advance; but the fact that much of the boundary is formed by the Save river is important. A river line can be organized as a military frontier by a strong state, but it is not a natural barrier to the migration of peoples. In the past, Croatia-Slavonia has been politically, economically and culturally attached to Central Europe, but by its inhabitants it belongs to the Balkan peninsula. North-west of Croatia-Slavonia, in the region where the Dinaric Alps in the larger sense pass into the Julian Alps, lies the former Austrian Crownland of Carniola, a karst area, again lying outside the peninsula proper, but having a considerable Balkan element in its population.

To the south of the Velebit mountains a narrow strip of coast-line, with the mountain crest behind, forms Dalmatia. But the real Dalmatia is an interrupted series of maritime towns, Zara, Sebenico, Trau, Spalato and Ragusa being among the most important. For the reasons already noted these towns have little connection with the interior; their Roman antiquities, the Venetian lion which still decorates some of their old buildings, are visible indications that their position on the shore of the peninsula has had little effect on the life of their inhabitants.

The actual mountain belt, from the borders of Croatia-Slavonia to the confines of Greece, is divided among a series of separate units, forming, in order from north to south, Bosnia, Hercegovina, Montenegro and Albania. In Bosnia the limestone rocks of the coastal area give place to others, including sandstones, which at once allow of the development of deeper soils and of a more normal drainage system. The numerous rivers drain to the Save, and Bosnia can be reached from that river, and thus from the Danubian plains, with relative ease. Other route-lines connect it with the interior of the peninsula. Hercegovina is a karstic area, with only one important river, the Narenta, which flows to the Adriatic. But though a light railway connects Ragusa to Mostar, the capital of Hercegovina, and that city to Sarajevo, the capital of Bosnia, access to the Adriatic is difficult. Montenegro has a narrow strip of coast-line, but is essentially a mountain eyrie, a refuge which withstood invasion in the past as much perhaps because of its worthlessness as of the difficulty of conquest.

Albania, with its malarious lowland and its mountainous hinterland, is a region of much interest. As already seen, it affords the possibility of routes to the interior, and might thus be supposed to be a prize worth having. But the inhabitants, who are mountaineers with little interest in the sea or in sea traffic, have preserved a striking measure of individuality since very early times. The through routes which traverse their lands have never been of great value to them, and their territory is not particularly productive. The strongly manifested individuality of the Albanians has prevented the growth of an indigenous political system and encouraged alien control. Twenty years of experiment in self-government proved insufficient to develop a stable organization. and in 1939 the country came once more under foreign rule.

Broadly then we may say that the whole of the western mountain belt is a region of poverty and aloofness. There is no unity among the different parts, no area to act as a focal point about which a natural crystallization could take place; it is not here that the origin of Balkan problems is to be sought.

We come next to the western part of the crust-block, with its marked contrast between the northern section, draining to the Danube mainly by the Morava, and its complex southern section, draining to the Gulf of Salonika by the Vardar. West of the Morava the country is undulating and lowlands fringe the south bank of the Save. The Western Morava also, a tributary entering the main stream from the west, helps to define a block of land which affords possibilities of settlement. This was the nucleus of the Serbia of the 19th century, with Belgrade, at the junction of Save and Danube, as its capital. East of the Morava the surface is more elevated, the rocks of the crust-block abutting upon those of the Balkan mountains. The complex southern region is Macedonia, with its jumble of peoples, its long history of turmoil and disorder.

Thrace, a name used loosely for the area east of the Mesta river, is functionally the passage way between the southern edge of the crust-block and the sea. The Rhodope upland is continued eastwards, beyond the gap through which the River Maritsa has cut its way, into the Istranja mountains, which descend steeply to the shores of the Black sea. Between this upland tract and the Sea of Marmsra on the one hand and the Aegean on the other, is a considerable belt of low-lying land. Adrianople, on the Maritsa after it breaks through the narrow neck connecting the Rhodope and the Istranja, is the natural centre of this eastern part of Thrace. Further west the coastal lowland is narrowed by the nearness of the Rhodope to the Aegean, and is also interrupted by prolongations of the upland, particularly on the right bank of the Lower Naritsa. This narrowed strip affords a land route from Asia Minor to peninsular Greece; to Macedonia and so to the north and north-west; to Albania and so to the Adriatic coast. With the loss of Adrianople and almost the whole of Thrace to Greece, Turkey in Europe is reduced to the city of Constantinople and a triangular belt of land in its rear, extending from the Istranja mountains and the Black sea to the Sea of Marmara. This area is mostly steppe-like and of no great productivity.

There remains for consideration Bulgaria, which presents some

points of great interest. Post-war Bulgaria has as its northern frontier the Danube, save that where the river takes its great bend to the north, the frontier leaves it, and runs slightly south of east to the Black sea, the steppe-like Dobruja being included in Rumania. Southwards Bulgaria extends to the Rhodope crest, and is thus nearly bisected by the Balkan mountains. Sofia, the capital, lies in a small basin between the Balkan mountains and a north-westerly prolongation of the Rhodope, the basin being drained by the River Isker, which breaks through the Balkans to enter the Danube. South of the Balkan chain, and separated from it by a longitudinal depression, lies a parallel upland, the Anti-Balkans. The intervening depression is watered by the River Tunja, which seems to be making for the Black sea near the port of Burgas, but turns instead sharply south, breaks through the western end of the Istranja, and joins the Maritsa at Adrianople. The Upper Maritsa, on which stands Philippopolis, flows through the wider depression which we have called the Rumelian plain. These two fertile lowlands, with their bounding uplands, form Eastern Rumelia, not united politically to North Bulgaria till 1885. Geographically the important point is that this region, with southern Macedonia, formed the granary of Turkey in Europe, as it did of the earlier Eastern Empire. The Maritsa depression shows certain analogies to the valley of Andalusia in Spain, both in its position between fold-mountains and a crust-block, and in its value to an alien invader. The first Turkish capital Adrianople, is on the margin of the productive belt, but Constantinople is outside it.

Greece within its peninsula, Serbia in the Morava region, Bulgaria astride the Balkan mountains, all became independent states while Turkey still held Thrace, Macedonia, Albania and, at least nominally, a large part of the north-west. That the progressive contraction of Turkish territory led to such bitter and prolonged conflict was largely due to the nature of the routes within the Continental section of the peninsula, and particularly to the difficult access of both Bulgaria and Serbia to open water. Thus the natural route-lines demand careful consideration.

Routes and Lines of Communication. — On the northern, southern and eastern margins of the peninsula respectively are situated the three nodal points of Belgrade, Salonika and Constantinople, all owing their importance to the land and water routes which converge upon them, and all linked together by rail. That all are marginal, and that, with the partial exception of Sofia, no focal point of similar importance exists within, is a highly significant fact.

Belgrade lies where the two inland waterways of the Danube and the Save meet. The Danube is continuously navigable, despite the partial interruption of the Iron Gate, downstream to the Black sea, as well as upstream. The Save, though not a first-class waterway, can be used by steamers up to the Kulpa confluence. Apart from the rivers a number of land-routes converge on Belgrade. Communication is easy northward across the plains to Budapest and so to north-western Europe; the Save valley allows access westward to Zagreb and so to Fiume, or by Ljubljana to Trieste and North Italy. Finally the Morava valley gives an admirable line of entrance to the interior of the peninsula.

Salonika is the only good port on the north coast of the Aegean, and is the best exit to open water for the whole of the interior, Fiume being somewhat remote, and neither the other Adriatic ports nor the Black sea ones being of much value. Its political allocation has been complicated by the fact that two major land-routes and some minor ones converge upon it. The first group consists of the meridianal furrow indicated by the direction of the Morava and Vardar rivers, and the route from Constantinople by the Thracian lowland.

The Morava-Vardar furrow is followed by the railway from Belgrade to Salonika by way of Nish and Skoplje (Uskub). But though the headstreams of the two rivers, despite their contrary direction, actually anastornose in wet weather, it must not be assumed that a continuous valley line extends from the Danube to the Gulf of Salonika. The Morava, upstream from Nish, the Vardar, do nstream from Skoplje, both pass through gorges offering considerable resistance to through communication in pre-railway days. The Morava gorge at Varanje could be avoided by taking off from the river and entering the basin called the Kosovo Polye, north-west of Skoplje. It is worth noting in this connection that the gorge was the Serbian frontier at one stage in the development of that state — a clear indication of the break in the furrow here. Again, the Vardar gorge can be avoided by taking off from the river and following a belt of low ground which leads by Shtip and Strumnitsa to the valley of the Struma river. By this route it is possible to reach either Salonika or the Aegean coast further east, beyond the remarkable Chalcidice peninsula. Here lie the possible port of Orphano and the somewhat more important one of Kavala. But the Struma river rises not far from Sofia, giving that town a line of access to Salonika, or to the Aegean coast at Orphano or Kavala. A railway, indeed, connects Sofia with the line from Constantinople to Salonika, and thus with the latter port.

The fact that Salonika is politically Greek, and not attached either to Yugoslavia, despite the presence of the Morava-Vardar furrow, or to Bulgaria, despite the relative nearness of Sofia, is explicable rather by the strength of a cultural and historical tradition than by purely physical facts. It is an Aegean port of much importance in the modern world, and to the Greeks the idea that control of Aegean trade is their national right is one that admits of no argument. Part of its basis is of course the geographical fact that their somewhat barren land could not support them unless supplemented by the sea trade for which they have always shown natural aptitude.

One other minor land-route which leads to Salonika may be mentioned. As its Latin name of *Via Egnatia* indicates, it had historical significance, and though it is not followed throughout by a railway, nor even by a continuous road in the European sense, it may in the future reacquire value as a thoroughfare. It connects the small port of Durazzo (Roman, Dyrrachium, modern Albanian, Durres) by Okhrida and Monastir to Salonika and so to Constantinople. It thus renders possible a traverse of the peninsula from west to east, and was used for this purpose in Roman times. Its existence, combined with Italian presence in Albania, is an element in the Greek desire to hold Salonika. Monastir has also a connection with Valona, and is itself on a railway line forming a western loop of the main Skoplje-Salonika line.

Constantinople, with a superb natural position where the waterway from the Black to the Aegean sea crosses the land route from Asia Minor to the Balkan peninsula, is connected to Belgrade by a diagonal furrow, certainly as important as the north-to-south one from Belgrade to Salonika. The route follows the Morava valley to Nish, then ascends the Nishava tributary and crosses a pass to the basin of Sofia. From this basin by another pass it reaches the Maritsa valley, and follows this past Philippopolis and Adrianople, till the valley of Ergene tributary enables it to turn east to Constantinople.

Bulgaria, with a line running eastwards from Philippopolis to the Black sea port of Burgas connected across the Balkans to the Danubian tableland route from Sofia to Varna, has a fairly well-developed railway net. The fact that there is no coastal line running from Varna to Constantinople should be noted.

Though the three great routes cross one another within the peninsula, no notable centres, ancient or modern, stand at the points of intersection. The absence of such internal focal points is but a further indication of the minor importance of local traffic, associated with the fact that no great contrasts exist in the products of the different territories. Just as the external states tend to seek to advance into the peninsula by the line of the highways, so each of the units within seeks to hold as much as possible of the main route or routes passing through its lands, both in order to obtain an uninterrupted exit and entrance for its commerce, and to share in the profits of the through traffic.

Of the five separate political units, Greece has been far the most successful in expanding so as to obtain access to all the main routes. The pushing of the Greek frontier into Macedonia and Thrace gives the State hold of the greater part of that section of the west-to-east route which is important because

traversed by a railway; Greece also holds a part of the meridianal furrow, thus cutting off Yugoslavia from the Aegean, and a part of the diagonal furrow, thus cutting off Bulgaria similarly from the Aegean. At the same time this division of the highways into parts held by the different states affords a certain security against external penetration, and gives a possibility of internal adjustments. The Belgrade-Constantinople railway passes through the territories of Yugoslavia, of Bulgaria, of Greece and of Turkey; the Belgrade-Salonika one, prolonged from Salonika to Athens, is divided between Yugoslavia and Greece; the potential Durazzo-Constantinople one crosses territory belonging to Albania, Yugoslavia, Greece and Turkey. This gives a certain hope for the future, for it suggests that the five states may learn that they have common interests; in the immediate past the antagonisms rising out of the growth of national consciousness in each have too often been fomented from outside, and the first lesson the Balkan peoples have to learn is the need of living at peace with each other. That Yugoslavia has a free zone at the port of Salonika, and that Greece is linked to the railway system of the rest of Europe only by a line which passes through Yugoslav territory are notable facts; they indicate that the well-being of each state is bound up with that of the others.

Climate.—Next to the relief and the presence of the great highways, the factor which has most deeply influenced human life within the peninsula is the climate, acting mainly through its effect on natural vegetation and cultivated crops. Of the climatic types represented in Europe generally, two, the Mediterranean and the Central European, occur here in pronounced form, but there are also variants and transitional types. The outstanding peculiarity, however, is that the perfectly typical Mediterranean climate has a very limited extension, as compared with the Central European type, which prevails through the greater part of the broad northern section of the peninsula, and even extends into the centre of the northern part of the Greek section. While, therefore, five major climatic regions can be recognized, by far the largest of these is that which is in reality but an extension of the greater region lying to the north. In other words, no notable difference in climate separates the peninsula proper from the adjacent Danubian lands.

The Mediterranean climate is of peculiar interest because it is so closely linked to a particular type of culture showing a very delicate adaptation to local conditions. Though it is not quite true to say that this culture originated in the Balkan peninsula, Crete, which belongs to the region, was of great importance as one of the seats of its early development.

Three essential features differentiate the Mediterranean climate: the winters are warm in relation to latitude, and the greater part of the rain falls during that period; the summers are hot and dry, and one or more months may be practically rainless; throughout the year the skies are clear and there is abundant sunshine, for the winter rains come in heavy showers of short duration. Before these characteristic features can develop, there must be at once shelter from land influences and full exposure to sea ones. Further there must be no great elevation above sea-level, because with increasing height the winter temperatures become lower, the skies are cloudier, and rains occur in summer as well as in winter. The characteristic marked periodicity of rainfall and small temperature range thus become modified, and the wild plants and crops which are a response to these disappear. These conditions mean that the typical climate is best developed on coastal lowlands, particularly on islands and in narrow peninsulas penetrated by long sea-inlets. Two regions within the peninsula show typical Mediterranean climate, but are regarded as distinct from one another because latitude and position bring about differences in the distribution of the rainfall throughout the year, without affecting its marked periodicity.

One of these is made up by the Greek islands. the Peloponnesus, the margins of the northern part of the Greek peninsula, and a narrow strip on the coast of Albania. Even within the region so defined, however, elevation above sea-level, as in the mountains, or an upland girdle, as in the plain of Thessaly, may produce local modifications. We may take Athens and Corfu as representative stations within this region. Athens, on the eastern side of a peninsula, largely sheltered from rain-bearing winds, has a much smaller total rainfall than the island station of Corfu, which faces the wet winds of winter; but despite the difference in the amount of rain in the two places, its distribution is closely similar. At both stations winter temperatures, so far as monthly averages are concerned, do not fall below 48°–50°. This means that a

THE FIVE MAJOR CLIMATIC REGIONS OF THE BALKAN PENINSULA

1. Dalmatian Region has very mild winters with copious rain
2. Greek Region has hot, arid summers and relatively cool, moist winters
3. North Aegean Transition Region has cold winters, hot summers, and rainfall fairly evenly distributed throughout the year
4. Eastern Transition Region has cold winters, moderately hot summers and most rain in winter half-year
5. Balkan Region has most rain during warmer half of the year, cold winters, and moderately hot summers

certain amount of growth of hardy plants, such as grasses, can continue throughout the winter, for about 43° is regarded as the limit below which growth becomes impossible for plants of the temperate belt. Summer temperatures range from 78° to 81° (July averages), which permits of the ripening of sub-tropical fruits. At Athens July and August are practically rainless, and only about 23% of the total fall occurs in the period April to September, so that more than three-quarters of the total falls in the cooler half of the year. More than one-third falls in the two rainy months of November and December. Corfu has a rainfall four times as great as that of Athens, and though only July can be described as practically rainless, only about 20% of the total rainfall occurs in the period April to September. High summer temperatures which cannot be used for crops like cotton and sugar cane because of the summer drought, but are well suited for the ripening and drying of fruits; warm winters which permit some crops to make vegetative growth then, stimulated by the heavy showers: these are the outstanding features.

A narrow strip along the coast of Dalmatia is regarded as forming a second major region. We may take Ragusa as a typical station, bearing in mind, however, that it is the most southerly of the important towns of Dalmatia. The winter temperatures here are closely similar to those experienced in the Greek region, much of Dalmatia being remarkable for its mild winter climate. The summers are not quite so hot as at Athens or Corfu, but the real distinguishing feature is the less marked periodicity of the rainfall. There is now no rainless month, though July continues to be the driest period of the year. Over 30% of the total rainfall occurs during the period April to September, so that summer drought is far less marked; oranges can be grown without irrigation water, and their co-existence with the olive is a distinguish-

ing feature. Not only. however, is the strip with this typical Mediterranean climate very narrow, but changes occur with some rapidity towards the north. Except where, as at Spalato, the form of the coast-line gives shelter, the more northerly places are often exposed to the blast of the *bora,* or cold northerly wind of winter, which is at once a danger to shipping and excludes the more delicate Mediterranean fruit-trees. When Trieste is reached on this eastern Adriatic coast, the somewhat cold winters (January average below 40°), and the fact that the period April to September shows rather more than half the total amount of rain, with a rainfall maximum in October and a secondary one in June, mark the transition from the Mediterranean climate to the Central European one. The northerly Dalmatian towns and the coast of Croatia show stages of the transition. On the whole, it is easier to exaggerate than to under-estimate the significance of this second, or Dalmatian, climatic region. Ragusa, both in its climate and in its natural vegetation, is typically Mediterranean, but a very short journey from the coast brings the traveller into an area of quite different character.

Southern and Eastern Macedonia and Western Thrace fall into a third region, characterized by notable modifications of the Mediterranean climate. Salonika may be selected as a representative station. The winters are cold for the latitude (average January temperature 41°), because of the bitterly cold northerly winds which blow down the Vardar valley, and this feature is accentuated as the coast is left. But the summers are hot, and the range of temperature between summer and winter is greater than at any of the stations already discussed. There is no rainless month, and though July is still the driest period, and November and December the wettest months, there is a much more even distribution of rain throughout the year, the six colder months having very little more rain than the six warmer ones. The colder winters, especially where there is exposure to wind, again limit the distribution of the more delicate Mediterranean fruit-trees, and growth even of hardy plants is checked during winter. On the other hand the high summer temperatures and the fairly heavy summer rainfall, with the possibility of irrigation from the mountain snows, make it possible to grow crops demanding both heat and moisture, but indifferent to winter cold because of their annual nature. Among such are cotton, rice, tobacco, maize, opium poppy; all introducing a different note into the landscape.

As we pass northwards from Salonika into the interior of the peninsula the change from this modified Mediterranean to the true Central European climate is rapid, and is accentuated by the relief. The general features of that climate are the cold winters, the temperatures then showing little relation to latitude, the warm summers, and a rainfall well distributed throughout the year, but with a tendency towards an early summer maximum. Skoplje, in a latitude somewhat lower than that of Ragusa, though in a more elevated position, has mean January temperatures well below freezing-point, and fully 18° lower than those of Ragusa. This means that there is a definite winter stop to agricultural activities, December, January and February being all too cold even for the growth of grass. On the other hand, despite its elevation, the summer temperatures at Skoplje are not more than a few degrees lower than those of Ragusa. The rainfall is fairly well distributed throughout the year, but May, June and October are the rainiest months, the maximum fall coming in May, when temperatures are already fairly high (over 62°). Belgrade, considerably further north, but less elevated than Skoplje, has a very similar temperature range, but November is already a winter month. June instead of May is the rainiest month, and the summer rainy period lasts for the three months of May, June and July, again with a second rainfall maximum in October. Broadly speaking this climate, with summer heat and summer moisture coinciding, is one well suited to maize among cereals, while deciduous trees tend to form the natural plant-cover. The type, with local variations due to height above sea-level and degree of exposure, prevails throughout the greater part of the interior of the peninsula, which thus falls into a fourth or central major climatic region. The total rainfall shows a tendency to increase towards the north-west, in Bosnia and north-western Serbia: it diminishes towards the east.

As a fifth major region may be included Eastern Thrace and the lower grounds of Bulgaria. Over much of this region, especially in Thrace, the total rainfall is very small, giving the landscape a steppe-like appearance, and the winters are very cold, owing to exposure to winds from the Russian plain. But the Maritsa valley allows Mediterranean influences to penetrate into southern Bulgaria, where also the Balkans give a certain amount of shelter from the cold winds of winter. Parts of the valley plains of Bulgaria have in consequence much milder winters than northern Macedonia or Serbia, and as there is a tendency for the winters to be wetter than the summers, the climate is sometimes described as modified Mediterranean. The dry, sunny summers favour wheat rather than maize, and the vine is grown in sheltered places.

To this general division of the whole area into five climatic regions, of which the central one covers by far the greatest area, it may be added that the fact that so much of the surface is elevated introduces numerous modifications in detail. Because of the cold winters of the central area, much of the winter precipitation falls as snow. No mountain within the peninsula rises in the strict sense above the snow-line, but the higher peaks of the Rhodope are only snow-free for about one month in the year, and even the Balkan mountains show some snow till July. This long persistence of parts of the winter snow-cover has much influence on the flow of streams, and thus on the possibility of the use of irrigation water.

PEOPLES AND TYPES OF CULTURE

What has been said as to the diversity of relief and climate leads one to expect that a great variety of cultural types would occur within the peninsula. Further, the great highways which penetrate it from outside, and the position as a bridge between the steppe-lands of Asia Minor and the similar steppes of central Hungary, and between the Mediterranean shores with their ancient civilization and the derivative civilization of the forest areas of Central Europe, have resulted in a great mingling of racial stocks. In some cases there is definite historical evidence of the entrance and establishment of such new stocks, as of the Slavs, the Bulgars and the Turks. On the other hand, the composition of the population before the great historical migratory movements took place, is much more obscure. But from the purely geographical standpoint the problem of the ethnological origin of the different elements is of little importance. It is certain that a large amount of blending has taken place, and "race" names within the peninsula are used in a very loose sense, often to denote religious and national sympathies rather than physical characteristics. The real point of interest is that the cultures of the different groups show a fairly close relationship to the natural conditions in the areas which they respectively occupy, and the resultant variety emphasizes once again the complexity of the whole region.

Apart from alien elements, such as Armenians and Jews, six stocks seem to be represented in the peninsula, of whom five show national consciousness. These six are the Albanians; the Vlachs or nomadic shepherds; the Greeks; the Serbs, who form the main Slav element, the word Serb being used in a somewhat special sense to designate those South Slavs who belong to the Orthodox Church and use the Cyrillic alphabet, as well as in a general sense to indicate the citizens of the former independent kingdom of Serbia and the marginal areas; the Bulgars; and the Turks.

The Albanians occupy that part of the western mountain belt and its margins which forms the transition region between the mainly limestone and karstic Dinaric Alps in the north, and the Pindus range to the south, and is characterized by the north-to-south direction of the coast-line. The Albanians owe their individuality to the isolated character of their lands, though there is nothing improbable in the statement often made that they are the descendants of the ancient Illyrians, and thus truly indigenous. Their isolation also is a reality, despite the presence of the Via Egnatia and of towns of Roman origin on the coast, because the lowland is marshy and malarious, and much less fitted for

settlement than the hill country behind, the real home of the Albanian peoples. As they are essentially mountaineers and pastoralists, agriculture plays, or has played in the past, a minor part in their activities, and as is almost always the case with hillmen, conquerors have found them difficult to subdue, but exceedingly useful as material for armies. An Albanian problem did not arise until the subdivision of the peninsula into a number of separate states gave frontier lines a new importance.

It is sometimes stated that the Vlachs are the descendants of the Romanized inhabitants of Dacia and some parts of the peninsula, scattered as the result of the barbarian invasions. In this case, however, perhaps more than in any other, the question of origin is of very minor geographical importance. What is important is that their mode of life shows a peculiarly delicate adjustment to the natural conditions, particularly climate and relief.

From what has been already said as to the winter temperatures in the Mediterranean belt, it is clear that the low grounds there can furnish grazing throughout the colder months, there being no winter check to growth. Similarly, because elevation brings summer rain even in areas where the low grounds have the typical summer drought, there will be summer pastures in the mountains, at heights and on slopes where practically all forms of cultivation are excluded. Again, within the central part of the peninsula, the higher mountains are too cold and have too prolonged a snow-cover to permit of cultivation, but, as in the more familiar parts of the High Alps, will allow of summer grazing. It might be supposed that the low grounds in the Mediterranean area proper would be too valuable to be left in rough pasture. But in many cases, as notably in the Basin of Thessaly and parts of Macedonia and Western Thrace, there are considerable tracts too swampy and ill-drained to permit of cultivation. The pools and stagnant water serve as breeding places for mosquitoes, and these in many areas are heavily infected with the malarial parasite, so that such low-lying basins are veritable death-traps in the warmer season. Further, even where they have been drained, or have sufficiently effective natural drainage to permit of cereal cultivation, fallowed lands yield a large amount of herbage, and the sojourn of flocks is a means of restoring the fertility diminished by previous cropping. Because of these conditions a particular type of pastoral nomadism can be practised, the name of transhumance being given to indicate its differences alike from the large-scale movements carried on by the true Nomads of the Asiatic steppes, and the much more limited movements to progressively higher pastures in summer time practised by many pastoralists in hilly regions.

The Vlachs carry on no cultivation, not even of fodder crops; they do not even store fodder for the cooler season, as this is unnecessary. The whole group moves with the flocks, not merely the herdsmen, and though there are habitations in both the summer and winter pastures, it is the mountain or summer village which seems to form the true home. Sheep are the chief animals reared, and it has to be noted as a subsidiary cause of the vertical movements that these animals are very intolerant of the summer heat in Mediterranean lowlands. Although the Pindus region is that in which the greatest number of Vlachs occurs, and which seems to be particularly suitable to their mode of life, they are fairly widely distributed throughout the south and south-east of the broader part of the peninsula, especially during the summer season.

Out of their fundamental pastoral occupation there arise some interesting variants. Since they rear horses and donkeys to serve as pack animals during their movements, and are naturally well acquainted uith paths and routes, they frequently act as carriers in the parts where modern means of transport are lacking. From this another occupation, that of peddling, develops by an easy transition. This again brings contact with village life which leads many to take the further step of adopting settled occupations, retail trading and innkeeping being favourites; their distinctive characteristics are then largely lost.

The fact that their numbers have been steadily diminishing for many years is apparently due mainly to this process of assimilation, which turns them into "Greeks" or "Serbs" according to the dominant nationality in the area of settlement, rather than to an actual drop in numbers. Obviously also the demarcation of internal frontiers, with frontier posts and custom stations, must act as a check to their movements, while the spread of intensive agriculture in the lowlands of Mediterranean climate, with the draining of marshes and reclaiming of waste lands, is an even more serious interference with their characteristic mode of life. The absence of any national consciousness makes their submergence in the general population easy, and culturally they may be said to be in process of disappearing with the disappearance of the conditions to which they were adapted.

The Greeks regard themselves as the descendants of the Classical Greeks, and though ethnologically this is more than doubtful, for much mingling of blood has occurred, the belief is of some importance as helping to give a sense of differentness from Serbs and Bulgars. Greek consciousness of nationality antedated the foundation of the Greek State, and, in marked contrast to the Bulgars, who were long submerged by the conquering Turk, the Greeks succeeded in maintaining themselves as a people. In this they resemble the Albanians, though the cause was very different in the two cases. Owing to their commercial aptitudes and maritime instincts they interpenetrated the Turkish State, and the Turks were constrained to tolerate them, for they could carry on occupations for which the overlords showed no capacity. It seems unnecessary to regard these specific attributes as "racial" in the ethnological sense, for they arose out of long adaptation to a particular and highly peculiar set of natural conditions, and there is little reason to think that the possibility of such an adaptation is limited to one stock. But it has to be noted that the Greek success in making themselves indispensable to the Turk is an element in the origin of those group hatreds which have been the scourge of the recent history of the peninsula; for the Greeks, like the Albanians, often appeared to the other peoples as agents of the Turkish oppressor.

So far as natural vegetation and modes of cultivation are concerned, the Greek peninsula and islands do not differ notably from other Mediterranean lands. Except at considerable elevations high forest is absent, and is replaced by evergreen scrub. Cultivation is of the garden type with olive, vine, fig and other fruit-bearing trees predominating. The amount of land which can be put under cereal cultivation is small, and the goat is the main stock animal. Fishing is an important accessory occupation, and everywhere movement is easier by sea than overland. One result of the relative poverty of the land, the ease of communication by water, and the Greek instinct for trade, was that the Greeks were widely distributed both within the peninsula and outside it, particularly in Asia Minor but also on other Mediterranean coasts. In 1913 it was believed that there were nearly as many Greeks outside the motherland as within it, and till their expulsion from Asia Minor in the post-war period, they formed an important element in the population there. This Greek infiltration of lands within reach of the Aegean is one of the causes of the bitter conflicts for the possession of Macedonia and Thrace.

Serbs and Bulgars differ notably from the three groups already discussed and resemble each other in being mainly cultivating peasants, dwelling in lands suitable by climate and relief for self-sufficing agriculture, with cereal production on a considerable scale, and the possibility of a surplus of cereals and agricultural produce generally. This meant that neither group could evade the Turk as Albanians, Vlachs and a proportion of the Greeks could do. They became the *rayah*, the toiling cattle of the conquerors, and bore the burden of the conquest. The antagonism between them has its origin in the conditions under which national states arose, rather than in racial or cultural differences.

The Bulgars were in the direct line of the Turkish advance, and further, their lands, whether in Eastern Rumelia, as the Maritsa plains were called later, or in Thrace and Macedonia, afforded little opportunity for escape. Again, for the reasons already discussed, as well as because of the former extension of the Byzantine empire, the lands they occupied were not only productive,

but could yield a considerable variety of products. As an entity they disappeared for centuries, and, as we have seen, the beginning of the Bulgarian State was in the area of relatively extreme climate north of the Balkan mountains.

In a sense the Serbs were more fortunate in that opportunities of escape presented themselves, to the north into the Danubian plains, and to the west and north-west into the mountain belt. At the same time the extent of the area over which the movements could be carried on, and the diversity of the lands into which they brought the refugees, led to marked cultural differentiation among the various groups, with the loss of community of feeling among them.

In addition to possibilities of escape from the peninsula there were certain areas within it where a measure of security could be obtained from the worst exactions of the oppressor. One of these was the barren, karstic area of Montenegro, which was, however, too poor to serve as a centre about which a new national grouping could form. Another was the region called by the Serbs the Shumadia. This is the platform sloping gently to the Save and the Danube, lying mainly between the lower Morava and the Drina, and in part cut off to the south by the highlands lying west of Nish. This region corresponds to the northern part of the central crust-block, and is crossed by the open valleys of streams draining to the Morava and the Save. A point of special importance is that the whole region was originally clothed with deciduous forest, oaks and beech predominating. The soils are generally fertile, having been enriched by the forest humus, there is a copious summer rainfall, and water is abundant, both in the form of springs and of streams, so that there is not the limitation of settlement to particular areas, so characteristic of the largely waterless karst regions.

In its essential features the area resembles the forest tracts which formerly covered much of Central Europe. But whereas in western Europe forest clearing began early, here the primaeval woods persisted in large part till the beginning of the 19th century. This is in itself an indication that there was little settlement, and indeed occupation on any scale hardly began before the 18th century. Away from the highways of the Morava and the Drina there were large tracts of untouched woodlands, eminently suitable to serve as refuges for fugitives—Robin Hood bands; it was from these that modern Serbia arose.

It may be noted that the early home of the Slav peoples, so far as is known, was similar wooded land on the outer slopes of the Carpathians, and the Slavs have generally shown a preference for this type of country. It allows of mixed agriculture, and affords a considerable variety of resources, both natural and produced by human effort. Further, the Slav patriarchal organization, the *zadruga* or family group, makes colonization of such lands relatively easy. One of the social effects of the Turkish conquest was the strengthening, or even perhaps the re-birth, of this kind of organization. It had been largely lost during the pre-Turkish period when a great Serbia existed, but with the loss of the natural leaders there was something like a return to more primitive conditions. Small groups established themselves in the forest, grew by accretion of fresh refugees, and ultimately coalesced to form a peasant state.

The type of culture was a reflection of the conditions existing in the temperate deciduous forest belt wherever it occurs. Clearings in the forest were made to allow of cereal production, and the arduous nature of the task made additions to the man power of the group welcome. The climate is only moderately suited for wheat, but the hardier cereals, such as barley, rye and oats, do well, and maize, introduced from America, proves to be exceedingly well suited to the climate, with its combination of summer warmth and summer moisture. It is still the main bread plant of the Serbs. As in North America, also, the fact that maize is a pioneer's crop, not needing the care and labour of wheat production, and easily grown on roughly cleared land, was of great importance. The uncleared forest, with its wealth of nuts, particularly acorns and beech mast, made it possible to rear hardy breeds of pigs on a great scale, though, as in Europe generally, this primitive method has long since given place to stall feeding, maize being largely used for the purpose. Cattle could also be pastured in the lighter parts of the forest, though here, in marked contrast to the Pindus region, fodder had to be stored for the cold winters. Though in places the vine can be grown, its place is taken largely by hardier fruit-bearing trees, especially the plum (prune). It should be noted that there is a certain analogy between the products of the two plants. In both the fruits can be eaten fresh, or preserved by drying for winter use or export, or fermented to yield alcoholic drinks, plum brandy replacing wine. With the more recent growth of sugar beet, plum preserves are also made on a considerable scale in Serbia.

In addition to such possibilities of varied food production, the Shumadia yielded abundant wood for house-building and fuel, while the wild animal life gave a certain amount of food, as well as furs and skins. As against such advantages, the conditions which made the rise of an independent Serbia possible checked social development, so that the Serbs of Serbia remained primitive and backward as compared with the Croats and Slovenes, who had fuller cultural contacts with more advanced peoples; to some extent this was also true of the extra-peninsular Serbs in the Banat region. Further, the fact that Serbian agriculture arose as it were de *novo,* makes it less advanced than that of Bulgaria, where there was a pre-existing Byzantine tradition.

Outside of Serbia the Dalmatian Serbs, technically Croats because they are Catholics and use the Latin alphabet, tended to acquire the Mediterranean type of culture, their crop plants being very different from those of the interior, and influences from the adjacent Italian peninsula being strong. In Bosnia, which in its climate, its forests, and its cultivated plants is very similar to Serbia, development was checked by the more intense Turkish control, due to the easy access from the Save and from Macedonia. Many of the original Slav landowners here adopted the religion of the Turkish conquerors in order to keep their lands, and became indistinguishable from Turks. The peasants were practically serfs, and not only under direct Turkish rule, but under the Austrian protectorate, and after the Austrian annexation, agriculture was in a very backward state. The taxes paid in kind both to the landowner and to the sultan, as well as to the tax-farmer, were so crushing that no stimulus to increase production existed.

In northern Macedonia there was a certain blending of Serbs and Bulgars, though it is generally believed that the population of Macedonia is mainly. Bulgar in origin. Here the conditions were even worse than in Turkish Bosnia, the peasants being merely "cattle." The diversity of relief and climate, the multiplicity of contacts in all directions, combined with the nearness to the Turkish centre, made the development of a definite national spirit impossible. Even before the Balkan wars of 1912–13, all three neighbouring States, Greece, Serbia and Bulgaria, were endeavouring to "assimilate" the Macedonians. Those wars, followed by the World War, excluded Bulgaria from the district politically, but the social contacts between Bulgaria and Macedonia remain strong.

Of the sixth element in the peninsula, the conquering Turk, it is not necessary to say much. True Osmali Turks, as distinct from Muslim Bulgars, Albanians and Serbs, were probably never numerous. Within the peninsula they suffered from the demoralization which seems always to occur when a ruling class is separated by racial stock, religion and tradition from the producers of raw material. They became parasitic on the peasant cultivators, and both parties suffered in consequence.

The Separate States.—It thus appears that within the Balkan peninsula there are three focal regions, each with a certain topographical, climatic and cultural individuality, fitting them to become political units, with which the names of Serbia, Bulgaria and Greece are associated. But all three are marginal as regards the peninsula as a whole, and are linked to each other and to the neighbouring, extra-peninsular lands by areas of transition, whose political destiny has been the sport of historical accident. Serbia is now merged in the much larger and culturally heterogeneous State of Yugoslavia, or the Serb-Croat-Slovene State, which in addition to extensive territories outside the peninsula includes

within it Bosnia, Hercegovina, Montenegro. Dalmatia and part of Macedonia. Greece has been enlarged by the addition of parts of Macedonia and a large part of Thrace. Despite the diversity of its lands, however, it is more homogeneous than Yugoslavia, for there have always been two strands in its social polity, made up by the gardener-cultivators of its limited fertile tracts, and the traders and seafarers who have found the homeland in the narrower sense too small for their energies. Before the World War Bulgaria, among purely Balkan states, seemed to offer the best prospects for economic advancements; but the loss of territory to her neighbours proved a serious handicap. Albania after two decades of more or less independent existence once again fell under foreign domination; and the new Turkish state has preferred to emphasize its Asiatic rather than its European affinities. The last few years have, however, seen a general improvement in oolitical relations between the various states.

See Newbigin, *Geographical Aspects* of *Balkan Problems* (1915); Cvijić, *La Péninsule Balkanique* (1918); Ancel, *Peuples* et *Nations des Balkans* (1926), and the separate articles on the political units.

(M. I. N.)

HISTORY

The great Slavonic immigration began in the 3rd century A.D. and continued through the following four centuries. At the start of this movement the Byzantine empire was in actual or nominal possession of all the regions south of the Danube; the greater part of the native Thraco-Illyrian population of the interior had been romanized and spoke Latin. The Thracians, the progenitors of the Vlachs, took refuge in the mountainous districts and became nomad shepherds. In Albania the aboriginal Illyrian element maintained itself, and afterwards forced back the immigrants, occupying much of western Macedonia and northern Greece. The Greeks were driven to the seacoast, the islands and the fortified towns of the Balkan peninsula. In the 6th century the Slavs penetrated to the Morea. In the 7th the Serbo-Croats invaded the north-western regions (Croatia. Serbia, Bosnia, Hercegovina, Montenegro and Northern Albania), where they expelled or assimilated the Illyrian population and appropriated the old Roman colonies on the Adriatic coast. At the .end of the 7th century the Bulgars crossed the Danube and subjected Moesia and Thrace, but were assimilated by the conquered Slavonic population. Under their tsar Simeon (893–927) their empire extended from the Adriatic to the Black sea. In 971 the "first Bulgarian empire" was overthrown by the emperor John Zimisces. A Slavonic "Western Bulgaria" in Macedonia survived the fall, and soon attained considerable dimensions, but was crushed in 1014 by the Byzantine empire, which now ruled almost all the Balkans. In the 10th century the Vlachs reappeared as an independent power in southern Macedonia and the Pindus district, which were known as "Great Walachia." The Serbs first attained unity under Stephen Nemanya (1169–95), the founder of the Nemanyich dynasty. A new Bulgarian empire was founded at Trnovo in 1186 under the brothers Peter and Ivan Asên, who led a revolt of Vlachs and Bulgass against the Greeks. In 1204 Constantinople was captured by the Latins of the Fourth Crusade; the Venetians acquired several maritime towns and islands, and Frankish feudal dynasties were established in Salonika, Athens, Achaea and elsewhere. Greek rule survived in the despotate of Epirus. Constantinople was recaptured in 1261 by Michael VIII. Palaeoiogus, but most of the feudal Latin states survived till the Turkish conquest; the Venetian possessions several centuries longer. In 1230 Theodore of Epirus, who had conquered Albania, Great Walachia and Macedonia, was overthrown at Klokotnitza by Ivan Asên II., of Bulgaria (1218–41), who extended his sway over most of the peninsula. After his death the Bulgarian power declined, and was extinguished at the battle of Velbuzhd (1330) by the Serbians under Stephen Urosh III. Stephen Dushan of Serbia (1331–55) ruled over Albania, Macedonia. Epirus, Thessaly and northern Greece. The Serbian incursion was followed by a great Albanian emigration to the southern regions of the peninsula. After Dushan's death his empire disappeared, and Serbia fell a prey to anarchy. For a short time the Bosnian king Stephen Tvrtko (1353–91), became the principal power in the west of the peninsula. The internecine feuds of the various states prepared the way for the Ottoman invasion. In 1356 the Turks seized Gallipoli; in 1361 Murad I. established his capital at Adrianople; in 1389 the Serbians and their allies were routed at Kosovo. Bulgaria and Great Walachia were finally subdued in 1393. The despotate of Epirus succumbed in 1449, the duchy of Athens in 1456; in 1453 Constantinople fell; the greater part of Bosnia submittrd in 1463; the heroic resistance of the Albanians under Skanderbeg collapsed with the fall of Croia (1466), and Venetian supremacy in Upper Albania ended with the capture of Scutari (1478). Only Montenegro and the Italian city-states on the Adriatic coast escaped subjection. Under the Turkish régime numbers of Slavs, especially the ruling classes and the Bogumils in Bosnia and Bulgaria, were converted to Islam and henceforward they felt themselves to be Turks. Colonies of true Turks were planted in North and South Bulgaria, and in Macedonia. Southern Albania became predominantly Mohammedan, the northern districts remaining Christian. The Ottoman power declined after the unsuccessful siege of Vienna (1683). In the 18th century parts of the Balkans were practically independent fiefs. In the 19th the subject nations, which had generally retained their language, religion and characteristics, recovered their independence. The independence of Greece was acknowledged in 1839, that of Serbia (as a tributary principality) in 1830. The Ionian Islands were ceded by Great Britain to Greece in 1864. In 1878 the Treaty of San Stefano created a great Bulgaria extending from the Danube to the Aegean, and from the Black sea to the river Drin in Albania, her Aegean coastline extending to the walls of Salonika. Serbia and Montenegro were so enlarged as to become almost contiguous. The treaty of Berlin, ho ever, limited Bulgaria to the country between the Danube and the Balkans, while making Eastern Rumelia into an autonomous province. The proposed Montenegrin frontier was curtailed; Serbia received Nish, Pirot and Vranje on the east instead of the Ibar valley on the west; the Dobruja, somewhat enlarged, was ceded to Rumania. Austria-Hungary occupied Bosnia and Hercegovina, sending troops into Novi-Pazar under a subsequent convention with Turkey. The complete independence of Serbia, Rumania and Montenegro was recognized. Greece was given Epirus and Thessaly, but was only able to occupy Thessaly and Arta (1881). Rumania was proclaimed a kingdom in that year, Serbia in 1882. In 1880 Dulcigno was surrendered to Montenegro in compensation for the districts of Plava and Gusinye, restored to Turkey. In 1886 the informal union of Eastern Rumelia with Bulgaria was sanctioned by Europe, Tumrush and Krjali being given back to the Sultan. In 1897 Crete was withdrawn from Turkish administration. In 1908 Bosnia and Hercegovina were annexed to the Dual Monarchy and Bulgaria was proclaimed an indrpendent kingdom.

In 1913 the Balkan League of Greece, Serbia, Bulgaria and Montenegro attacked and defeated Turkey, this war being followed by a second between Bulgaria and her late allies. Greece received Crete and the Aegean Islands (except the Dodecanese); Rumania the Southern Dobruja; Bulgaria the Aegean coastline as far as Dedeagatch; and Serbia received all Macedonia west of the Vardar. Serbia and Montenegro partitioned the Sanjak of Novi-Pazar, and an independent Albania was created, extending from above Scutari to north of Yannina. After the World War, Bulgaria lost the coast of Thrace to Greece, and a strip along her south-east frontier to Serbia; and Turkey was confined to the province of Eastern Thrace. A Serb-Croat-Slovene kingdom was constituted comprising Serbia, Montenegro, Bosnia, Herzegovina, and other Yugo (=South) Slav regions of Austria and Hungary, together with north-western Macedonia and a portion of Albania. Italy received the extreme north-west coast of the Balkan Peninsula up to and including Fiume, and in addition, certain of the Adriatic Islands. Population exchanges on a large scale were carried out in order to stabilize the new frontiers. The Greek population of Asia Minor was forcibly expelled, and many Vlachs migrated to Rumania In 1939 an Italian army occupied Albania without encountering much resistance, and the country was placed under the sovereignty of the King of Italy

BALKAN WARS, 1912-13. This article gives an account of the campaigns of Bulgaria, Serbia, Greece and Montenegro, as allies, against Turkey, in 1912 and 1913, and also of the brief struggle that followed between the former allies, with Turkey and Rumania intervening, in the summer of 1913. When war broke out, all Macedonia, Albania and Epirus still formed part of the Ottoman Empire.

The Balkan League.—Military alliances, directed against Turkey, had been adjusted between Bulgaria and Serbia, and between Bulgaria and Greece during the early part of 1912; and the state of Macedonia, under Ottoman rule, served as an excuse for them to order mobilization on Sept. 30 and Oct. 1. War was declared as soon as their armies were on their war footing, and active operations at once followed, Montenegro, which had no formal agreement with the others, actually starting the hostilities. The Turkish regular forces in Europe at the time comprised 12 divisions of very weak establishment in Thrace, and 12 similar divisions stationed at various points in the extensive Ottoman territories further to the west; organization of a sort also existed for about doubling the number of divisions on mobilization; but the actual numbers available during the opening and decisive weeks of the struggle did not exceed about 100,000 combatants in Thrace and about 140,000 in the western theatres. Large military forces, it is true, existed in Turkey in Asia; but, owing to the activities of the Greek fleet, these could not be transferred to any part of European Turkey other than Thrace.

Against this, Bulgaria possessed nine very strong regular divisions, numbering about 180,000 combatants, with two strong reserve divisions formed after mobilization. Serbia promptly placed five somewhat weaker regular divisions in the field, making up a total of about 80,000 combatants, with five well-organized reserve divisions ready to follow. Greece could muster four regular divisions of somewhat weak establishment, the combatants at the start numbering perhaps 50,000, with four reserve divisions to be set up on mobilization. The Montenegrin Army on the other hand was wholly on a militia basis and ill-suited for fighting except among its own mountains or immediately outside its own frontiers. Thus the allies, at the outset, enjoyed the advantage in numbers; and, thanks to their reserve formations being much the better organized, they retained and indeed increased this advantage during the weeks of hostilities that followed.

I. THE THREE THEATRES OF WAR

Owing to the geographical situation, there were bound to be three practically distinct main theatres of war when the struggle began, viz.: on the Turko-Bulgarian frontier of Thrace, on the frontier between Macedonia and the allied Powers, Bulgaria and Serbia, and on the frontier between Greece and Turkey. Under a military understanding between Bulgaria and Serbia, six of the nine Bulgarian regular divisions were to have been allotted to the eastern theatre of war, while the remaining three co-operated with the Serbian Army in operations directed against Macedonia. But Bulgaria altered this arrangement at the last moment, retaining eight divisions for the east and employing only the remaining one in the western theatre, and this, moreover, as it turned out, moved independently toward Salonika. It was, from the purely military point of view, a sound decision, as the Turks could not be reinforced in Macedonia from Anatolia, whereas they could be so reinforced in Thrace; but the action of Bulgaria in the matter tended to cause somewhat strained relations between that kingdom and Serbia at the very start.

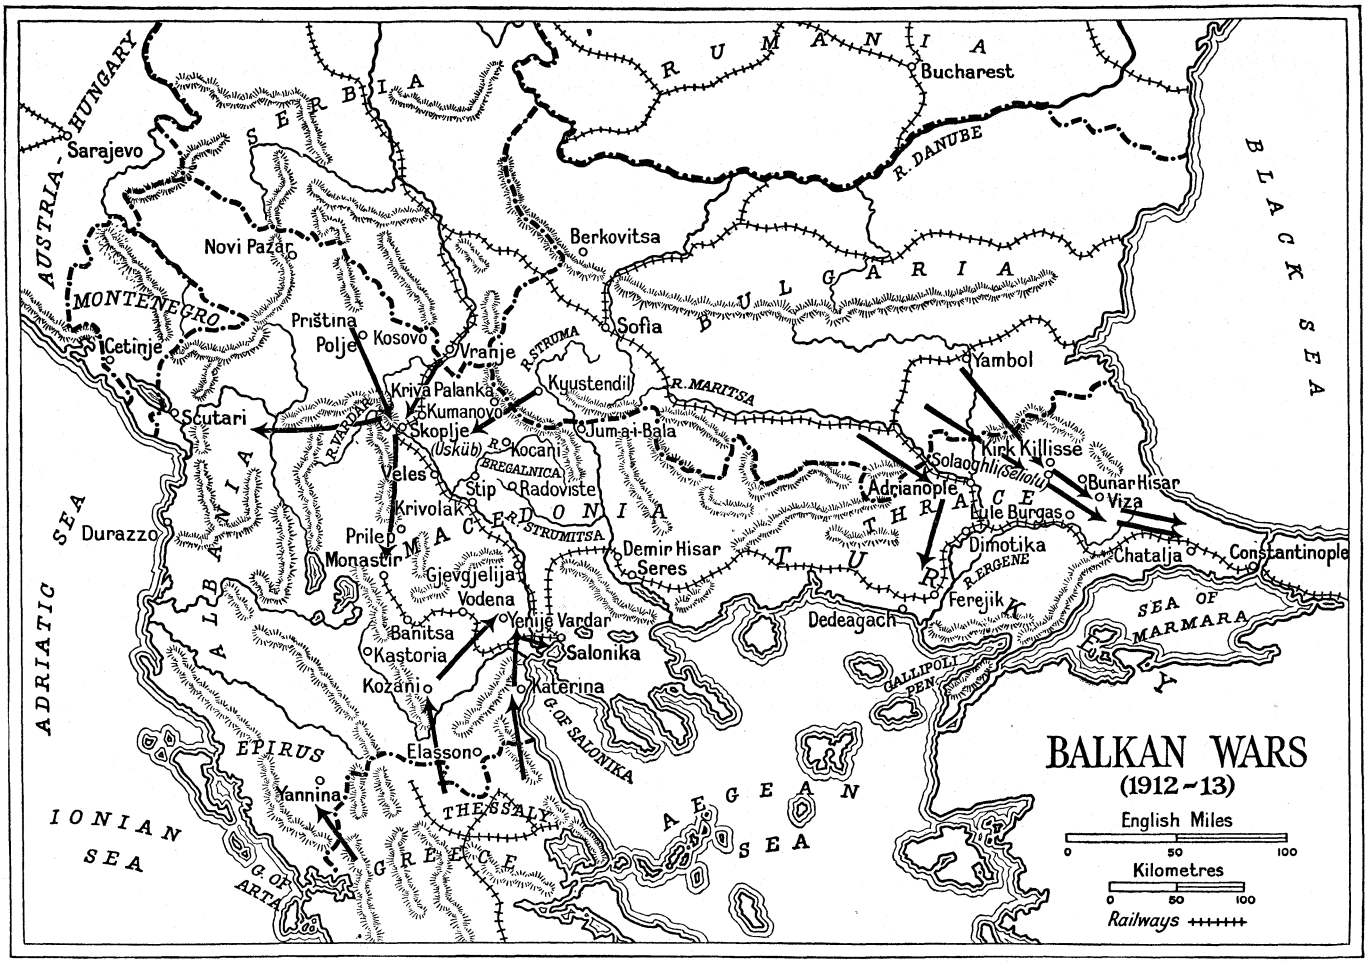
Campaign in Thrace.—The Bulgarian staff organized its eight regular divisions, destined for Thrace, with the two newly formed reserve divisions, as three armies, the 2nd Army on the right of Maritsa, prepared to move on Adrianople, the 1st Army in the centre more to the east, and the 3rd Army on the left about Yambol, prepared to move on Kirk Kilisse. On the declaration of war, on Oct. 17, the three armies advanced and they passed the frontier on the 18th and 19th to the north-west and north of Adrianople, and on the 22nd to the north-west and north of Kirk Kilisse.

Adrianople was a great entrenched camp, composed of many forts and works, fairly well armed; Kirk Kilisse was also provided with some works, but they were not of an efficient character. The 2nd Army advanced against Adrianople and to the west of it, with a view to investment, while the 1st Army followed a line more to the east and from the 22nd to the 24th was engaged with the enemy about Seliolu, the battle ending in its complete victory. On that same day the 3rd Army entered Kirk Kilisse, after some severe fighting, capturing an immense booty. The Turkish field forces had originally been formed up about the Ergene; but they had been ordered north to take the offensive, and had thus brought on the encounter battles at Seliolu and Kirk Kilisse, in which they were heavily defeated. They retreated in confusion to the line Lule Burgas—Bunar Hisar, the victorious Bulgarians, owing to having outrun supplies, losing touch with them and therefore giving them time to reorganize to some extent.

On discovering the direction of their opponents' retreat, the Bulgarian 1st and 3rd Armies found themselves, in the first instance, called upon to make a wheel to the left. Severe fighting took place on the 28th, 29th, and 30th in the country between Lule Burgas and Viza in which both sides suffered heavily and which ended in the Turkish right near Viza becoming seriously endangered; Nazim Pasha, the Ottoman commander-in-chief, thereupon ordered a general retreat, and his troops fell back to the Chatalja lines, covering Constantinople. The victors were too exhausted to pursue, so that all touch with the defeated army was lost for the moment. In the meantime, the Bulgarian 2nd Army had invested Adrianople, and some troops were pushed on to Dimotika and to Dédéagatch on the Aegean sea.

After a few days, the 1st and 3rd Bulgarian armies, being reinforced and having their lines of communications in working order, advanced towards the Chatalja lines and after a brief pause delivered an assault upon them on Nov. 17. The attack was repulsed at all points with heavy loss, and the Bulgarian command, sobered by this untoward experience, refrained from making a second attempt. The remains of the Ottoman field forces in the country to the west of the lower Maritsa had in the meantime been surrounded and compelled to surrender at Ferejik. Operations in Thrace now came to a standstill for a fortnight, and then. on Dec. 3, an armistice was signed between Bulgaria, Serbia and Montenegro on the one hand, and Turkey on the other, Greece being no party to it for reasons which will appear later. The Bulgarian campaign in Thrace had been brilliantly successful, although Adrianople remained in Ottoman hands; but the operations of the allies in the west had been no less triumphant.

Macedonia and the West.—The Serbian authorities had been very happy in their mobilization arrangements, and by the time that war was declared, they were already in a position to concentrate their five reserve divisions, as well as their five regular divisions, close to the Turkish frontier. Their 1st Army, of five divisions, was about Vranje; their 3rd Army, of four divisions, was further to the west, north of Priština; their 2nd Army, of one division, with the Bulgarian 7th Division was about Kyustendil



THE MAIN THEATRES OF THE FIRST BALKAN WAR, OCT. 1912–MAY 1313

Prior to hostilities the Ottoman Empire included Macedonia, Albania, and Epirus, so that with Serbia, Bulgaria, Greece and Montenegro allied against them, the Turks were forced by the geographical situation to fight three distinct campaigns. Within six months they were beaten on all fronts. The map shows the lines of advance of the Allies in the early stages of the campaign. The Bulgars marched against Adrianople, Kirk Killisse and Chatalja, threatening Lule Burgas and Constantinople. The Serbs supported by one Bulgarian Division attacked the lines of the River Vardar, and enveloped Scutari and Monastir, while the Greeks concentrated against Salonika, towards which the Bulgarian Division, which had been sent to the support of the Serbs, also advanced by way of the Struma valley

in Bulgaria. The plan was for the 1st and 3rd Armies to advance southward into Kosovo Polje and on Üsküb, while the and Army came in from the east and from Kyustendil, ready to operate against the right flank of the Turkish forces known to be assembled at Üsküb and to the north of it. The action of the Bulgarian staff in sending only the one division to this theatre, instead of three divisions as previously agreed upon, necessarily weakened the effect of the threat of the and Army against the Ottoman communications, and the 7th Bulgarian Division in fact afforded practically no help at all, being bent on an eccentric march on Salonika via the Struma valley.

All three Serbian armies crossed the Ottoman frontier on Oct. 19 and 20 through the mountains, meeting with slight resistance. The Turkish forces were necessarily much dispersed in view of the vast area of the territory to be guarded; but an army of five weak divisions in the Vardar valley had been moving northwards towards the Serbian frontier, and most of it reached Kumanovo on the 22nd. The head of the Serbian 1st Army had arrived within a few miles of that place on the same day and had taken up a position, where it was attacked by the Turks on the following day but succeeded in holding its ground. The remainder of the 1st Army came up on the 24th and a general action ensued in which the Ottoman troops were signally defeated. They fled southwards, evacuating Üsküb and withdrawing the detachments posted further to the north-west which had been opposing the advance of the 3rd Serbian Army from about Priština. The victors, however, hardly realized how complete had been their success and, hampered as they were by the difficulties of the country and the delays in bringing up their impedimenta from beyond the frontier, they failed to take full advantage of it. It was not till the 29th that their three armies had joined hands and were prepared for further advance.

The disorganized Turks had for the most part withdrawn partly down the Vardar, and partly from Veles by Prilep towards Monastir; and on becoming aware of this the Serbian staff made an entirely new disposition of available forces. The 2nd Army was sent off eastwards to aid the Bulgarians before Adrianople; part of the 3rd Army moved westwards into Albania; the 1st Army, reinforced, moved southwards to co-operate with the Greeks in disposing of the Turks known to be gathered about Salonika and Monastir. The sanjak of Novi Pazar had in the meantime been occupied by Serbian and Montenegrin detachments, and Montenegrin forces had advanced against Scutari, but they had failed to make any impression on its defences. Although some unimportant Ottoman detachments were still to be found in northern Albania, the whole of that portion of Turkey in Europe lying north of a line stretching from about Stip on the east, to just north of Scutari on the west, was by the end of October, for all practical purposes, in the hands of the allies, while the 7th Bulgarian Division was moving down the Struma valley and approaching Demir Hisar.

Greece and Salonika.—In the meantime, the Greek military forces had not been idle. The main army, under command of Crown Prince Constantine, had been concentrated in northern Thessaly when war was declared. A smaller force was assembling near the Gulf of Arta, destined for offensive operations in Epirus.

The Ottoman military authorities had only told off four weak divisions, partly regular and partly reserve, to guard against hostile invasion in this southern theatre of war, and the task of the Greek troops in the region immediately north of Thessaly, at the outset, proved a simple one. The Crown Prince crossed the frontier on Oct. 18, occupied Elasson next day, and on the 23rd routed the Turks a little further to the north, his left occupying Kozani on the 25th. His right advanced at the same time, and on the 28th occupied Katerina on the shores of the Gulf of Salonika, where an advanced maritime base was established.

The Turkish forces defeated near Elasson had for the most part retired on Monastir, where there was a considerable concentration of troops, owing to the army which had been defeated by the Serbs at Kumanovo having for the most part fallen back over the mountains towards this town. But Constantine, aware that the Bulgarians were on the move for Salonika, and determined for political reasons to get to that city first, merely pushed out one division north-westwards to guard his left flank, while with the bulk of his troops he advanced to Vodena. His position there was not wholly comfortable, for the Serbian forces were still a long way from Monastir and a Turkish army of three or four divisions had taken up position at Yenije Vardar so as to cover Salonika against hostile advance from the west. He attacked this position on Nov. 2 and 3, but was repulsed, and his flank guard was at the same time defeated at Banitsa and Kastoris by Ottoman troops that had been pushed south from Monastir. Two days later, however, a fresh attack upon Yenije Vardar proved successful, whereupon the Turks opposed to him there retired into Salonika, which he occupied on Nov. 9, 29,000 of the enemy laying down their arms.

On the following day the Bulgarian 7th Division arrived and claimed the city for Bulgaria; but an agreement on the subject was patched up and the Crown Prince now divided his army in two, half remaining east of the Vardar, and the remainder moving westwards to co-operate with the Serbian forces in dealing with the enemy forces gathered about Monastir.

II. THE TURKISH COLLAPSE

Part of the Serbian 1st Army had advanced to Prilep on Nov. 5 and had then halted for the remainder to come up in line, for Prince Alexander, who was in command, hoped to fight a decisive battle before Monastir with the whole of the troops that could be made available. The Turks had taken up a strong position north of the town and there they proposed to stand their ground In the circumstances, Prince Alexander, whose impedimenta took time to cross the hills out of the Vardar valley, was not prepared to commit his army to the attack before the 14th. The date was subsequently deferred to the 18th, his plan being to deliver a frontal assault, while at the same time turning both of the enemy's flanks.

As it happened, however, the isolated Serbian division told off to operate against the Ottoman left, delivered a premature night attack on the 15th, and had then to resist resolute Turkish counter-attacks during the succeeding two days, unsupported; but it managed to keep the enemy at bay, and when the battle was finally launched on the 18th, the Serbians were completely successful. The Turkish Army broke up. Half of it was killed, wounded, or captured; the other half made its way, in units or small parties, to the only friendly stronghold now left open—Yannina, in Epirus (Scutari was closely invested by this time). The victory of Monastir proved to be decisive, and all that remained for the allies to do in the western theatre of war was to march through Albania to the sea, occupying various points for police purposes, to reduce the two fortresses of Yannina and Scutari, and to take steps to meet the possibility of Austro-Hungarian intervention. Serbia and Montenegro therefore joined in the armistice that was signed on Dec. 3, as already mentioned, between Bulgaria and Turkey.

The Greek government, anxious to complete the occupation of Epirus and the capture of Yannina, were not parties to this suspension of hostilities. The operations north of the Gulf of Arta, in difficult country, had made somewhat slow progress at first; but on Nov. 10 Greek troops had arrived near Yannina, and within a few days a loose blockade had been established, which had not, however, prevented some of the Turkish fugitive detachments from entering the place after the battle of Monastir. A great part of the Hellenic field army was brought round by sea from Salonika during the winter, so as to ensure the fall of the fortress as soon as the weather should again become favourable for active operations.

Adrianople.—Negotiations between the belligerents were set on foot in London shortly after the armistice; but these were abruptly terminated on news arriving of a military coup *d'état* having been carried out on Jan. 23 at Constantinople, in which the existing government was overthrown and Nazim Pasha, the commander-in-chief, was murdered. The military government that had been set up denounced the armistice within a few days, and hostilities were resumed on Feb. 3, although Ottoman field armies had ceased to exist in Europe except within the Chatalja lines and the Gallipoli peninsula. The story of the second phase of this war is merely the final instalment of the sieges of Adrianople, Yannina, and Scutari. An effort was, it is true, made by the Turkish field forces in Thrace to debouch from the lines of Chatalja and Bulair with a view to relieving Adrianople, and this led to heavy fighting locally; but the Bulgarians held their own on both fronts, so Adrianople was perforce left to its fate by the Ottoman military authorities.

The terms of the armistice had not admitted of the revictualling of this extensive stronghold, which remained blockaded during the truce, and by the time that hostilities came to be resumed the garrison was already finding itself short of certain supplies. The investing forces at this time were composed of the Bulgarian 2nd Army, which had taken up the duty in the first instance, and of the Serbian 2nd Army, which had been transferred from the western theatre of war after the victory of Kumanovo. But although it soon became evident from attempts at sorties and increased desertion that the garrison was weakening, lack of transport and of artillery delayed preparations for an assault till the middle of March, and by that time the besiegers had been reinforced by three Bulgarian divisions which it was found possible to transfer from their former position before the Chatalja lines.

The fortifications around the city of Adrianople consisted of a number of substantial, but very conspicuous, forts, with a girdle of infantry redoubts further out, the whole forming an extensive perimeter; but the only really modern works were a certain number of batteries, distributed in the intervals. The infantry redoubts, moreover, were open at the gorge—a serious source of weakness. The garrison at the time of the assault numbered about 50,000, and the allies chose the eastern side of the fortress for attack. A preliminary intensive bombardment of the works was carried out on March 24, and that night the whole of the advanced line on the eastern side was stormed. On the following night an assault was delivered upon the main position; but this was brought to a standstill by the Turkish wire, except at a point where one of the forts was captured by a single regiment. Although the commander of the regiment found himself at dawn to be isolated, he promptly struck out right and left against the rear of the works on either hand, and he thus cleared the way for unit after unit that had been held up by the frontal wire, so that within a few hours the whole line of eastern defences was in Bulgarian hands Attacks were also being delivered at other points, and about midday on the 26th, the Turkish commandant surrendered unconditionally. The assault had cost the allies about 9,500 casualties.

Scutari.—Yannina had fallen three weeks earlier to a successful general assault delivered by the Greek troops under the Crown Prince. This took place on March 5 and the Turkish garrison, numbering about 30,000 wounded and unwounded, surrendered next day; at the end of March only Scutari remained to be taken. The Turkish commandant of this latter fortress had refused to recognize the armistice because its terms did not provide for his revictualling; but little actual fighting took place during the months of December and January. On Feb. 7, however, a determined assault on important defences on the eastern side of the stronghold, which was only partially successful was made by

the Montenegrins; another was delivered next day, which made no progress. But on the 9th, the trenches were carried after a fierce combat, and the besiegers thereby gained a footing within the Ottoman line of defense. They found. however, that they could advance no farther at this point.

A Serbian contingent had arrived shortly before this to take part in the siege, and the activities of the allies were now transferred to the south-western side of the fortress—its western side rested on Lake Scutari. Not until March 31 and April 1, however, was an assault attempted in this quarter, and then the undertaking failed. The Serbian general took over the chief command after this rebuff, but jealousies, military and political, speedily arose, and on April 16 he and his forces took their departure. The Montenegrins had now to take over the whole of the besieging line, and the stronghold seemed safe from further assaults in consequence, but it nevertheless suddenly capitulated on April 22. The Great Powers had, however, decided that the place was to belong to the new State of Albania, and, under pressure from them, the victors were obliged on May 6 to evacuate it.

III. THE SECOND BALKAN WAR

Negotiations with a view to bringing the contest to an end had by this time been in progress for some weeks, and peace was signed in London on May 30. Under its terms, Turkey in Europe was, with the exception of the country lying close to Constantinople and to the Gallipoli peninsula, partitioned between the victors, Bulgaria acquiring the lion's share. But the Balkan League was on the point of explosion, the Great Powers were trying to establish an independent Albania, Rumania in alarm at Bulgaria's aggrandizement was preparing to intervene, and a portion of northern Macedonia and Kosovo Polye remained in dispute between that kingdom and Serbia. Bulgaria also coveted Salonika, and had during April and May transferred her military forces from Thrace to the vicinity of the old Serbian frontier and of the borders of Macedonia, in preparation for making good her claims in the west. A state of tension consequently existed throughout the month of June, and at last, on the 30th, without warning or declaration of war, Bulgaria assumed the offensive against both Serbia and Greece.

The Bulgarian staff had arranged their forces as five armies, the 1st Army facing the Serbian frontier between Vidin and Berkovitsa, the jth Army on its left, the 3rd Army about Kiustendil, the 4th Army about Kŏcani and Radovište, and the 2nd Army between Strumitsa and Seres facing the Greeks. The Serbian forces were disposed in three armies, the 2nd Army guarding the old Serbo-Bulgarian frontier, the 1st Army in the centre about Kumanovo and Kriva Palanka, and the 3rd Army on its right about the Bregalnica; the Greek forces were holding a front between Gjevgjelija on the lower Vardar and the mouth of the river Struma.

The Bulgarian offensive, benefiting by surprise, was in the first instance successful. Their 4th Army broke in between the allies, reached the Vardar at Krivolak, and with the aid of the 3rd Army thrust back the Serbian front for some distance between that point and Kriva Palanka; their 2nd Army at the same time drove the Greek advanced troops in all along the front. But the allies were disposed in considerable depth, the Bulgarian soldiery had little heart for fighting once it became apparent that their antagonists meant to resist, by the night of July 1 the offensive had already died down, and it was then the turn for the Serbian and Greek troops to counter-attack.

Pressing forward on July 2, the Serbian 1st Army drove a wedge through the Bulgarian line in the direction of Kyustendil, and on the two following days hustled the defenders in a south-easterly direction; the Serbian 3rd Army was in the meantime effectually checking any further advance on the part of the enemy about the upper Bregalnica. The Greek Army had brought up its reserves, and on the 3rd and 4th it counter-attacked, forced the Bulgarian 2nd Army back all along the line, and by the 7th had effectually outflanked the enemy's left. The result of these operations in the south was that the Bulgarian 2nd Army found itself obliged to retreat northwards up the narrow Struma valley, running the risk of being cut off by Serbian forces should these, advancing from Kočani and Kriva Palanka, succeed in occupying Jum'a-i-Bala. So, in view of the critical position of affairs, the Bulgarians made a desperate effort to retrieve the situation by initiating a fresh offensive. Their 1st and 5th Armies moved forward by several routes to threaten old Serbia, only to be repulsed at all points by the Serbian 2nd and 1st Armies. The Bulgarian 3rd and 4th Armies at the same time advanced against the Serbian 3rd Army in the direction of the upper Bregalnica, and this latter effort achieved some measure of success; but it also had been definitely checked by July 10.

A brief pause ensued. Then, on the 15th, both Serbians and Greeks began pressing slowly forward. Bulgaria was by this time in a sorry plight, for Rumania had declared war and had begun an unopposed march on Sofia, while the Turks had issued from Chatalja and Bulair and had re-occupied Adrianople. By transferring their 1st Army from the north to the hills east of Jum'a-i-Bala, and attacking the Greeks in the Struma valley with this and their 2nd Army, the Bulgarian staff made a final attempt to stem the pressure. But the venture came to nothing, and on July 31 the aggressors in this second campaign, surrounded by hostile columns that were converging on their capital from every quarter, sued for peace. This was signed at Bucharest on Aug. 10.

BALKASH, a lake of Asiatic Russia, in the Kazak, A S.S.R., between the provinces of Semipalatinsk and Kurgai in 45° to 47° N. and 73° to 79° E., about 1,000m. to the east of Lake Aral. It is also called in Kirghiz *Ala-Tenghiz,* and in Chinese, Se-hai. It has an area of nearly 7,200sq.m., and lies at an altitude of goo feet. It is a broad crescent about 440m. long from west-south-west to east-north-east with concave side southwards; its width varies from 32 to 53 miles. On the north-west it is bordered by a dreary plateau, the Famine Steppe (*Bakpak-dala*). The south-east shore, on the contrary, is low, and bears traces of having extended formerly as far as the Sasyk-kul and the Ala-kul. The Kirghiz in 1903 declared that its surface had been rising steadily during the preceding ten years, though prior to that, from 1859, it was dropping. The chief feeder of the lake is the Ili, from the Khantengri group of the Tian-shan mountains. The Karatal, the Asku and the Lepsa also enter from the south-east, and the Ayaguz from the north-east. The first three rivers make their way with difficulty through sands and reeds, which at a quite recent time were covered by the lake. Although it has no outlet, its waters are fresh. It freezes generally from November to April. Its greatest depth is, as far as we know, not more than 36 feet. The fauna of the lake and of its tributaries, explored by Nikolsky, is more akin to the fauna of the rivers of the Tarim basin than to that of the Aral; it also does not contain the common frog. It seems therefore probable that Lake Balkash stood formerly in communication through lake Ebi Nor and lake Telli Nor with the lake that formerly filled the Lukchun depression (in 89" E. long. and 42" N. lat.) but researches show that a connection with Lake Aral—at least in recent times—was improbable. The lake has been investigated by L. S. Berg (*see Petermann's Mitteilungen,* 1903). See also Halbfass, Die *Seen* der Erde (1922).

BALKH (some think anc. Bactra or *Zariaspa*), Afghan city, about 100 m. E. of Andkhui and some 46 m. S. of the Oxus, sit-

uated on the right bank of the Balkh river, 1,200 ft. above the sea. It comprises about 500 houses of Afghan settlers, a colony of Jews and a small bazaar, set in the midst of a waste of ruins and débris. The outer walls (mostly in utter disrepair) are about 6½ to 7 m. in perimeter, and on the south-eastern borders are set high on a mound or rampart, indicating a Mongol origin. The walled and moated fort and citadel to the north-east are built above the town on a barren mound. The Masjid Sabz, with its green-tiled dome, is said to be the tomb of a Khwaja, Abul Narsi Parsar. The earlier Buddhist constructions have proved more durable than the Mohammedan buildings. The Top-i-Rustam is 50 yards in diameter at the base and 30 yards at the top, circular and about 50 ft. high. It is possible that in these ruins we may recognize the Nan Vihara of the Chinese traveller Hsiian Tsang. There are the remains of many other topes (or stupas) in the neighbourhood. The mounds of ruins on the road to Mazar-i-Sharif probably represent a city older than those on which is Balkh. Zariaspa and Bactra were probably distinct sites and may not have been identical with Balkh. The city is guarded by a few policemen; there is a garrison at Deb-Dahdi. The gardens to the north-east contain a caravanserai. The natives speak of it as the Mother of Cities. Its foundation is mythically ascribed to Kaiomurs, the Persian Romulus; and it is at least certain that, at a very early date, it was the rival of Ecbatana, Nineveh and Babylon. For a long time the city and country were the central seat of the Zoroastrian religion, the founder of which is said to have died within the walls. The most remarkable convent was the *Nau Behar, Nava Bihara* or New Convent, which possessed a very costly statue of Buddha. A curious notice of this building is found in the Arabian geographer Yāqūt. Arab travellers of the 10th and 12th centuries mention the town. There were several important commercial routes from the city, stretching as far east as India and China. In 1220 Jenghiz Khan sacked Balkh, butchered its inhabitants and levelled all the buildings capable of defence — treatment to which it was again subjected in the 14th century by Timur. Notwithstanding this, however, Marco Polo can still, in the following century, describe it as "a noble city and a great." Balkh formed the government of Aurangzeb in his youth. In 1736 it was conquered by Nadir Shah. Under the Durani monarchy it fell into the hands of the Afghans; it was conquered by Shah Murad of Kunduz in 1820, and for some time was subject to the khan of Bokhara. In 1850 Mahommed Akram Khan, Barakzai, captured Balkh, and from that time it remained under Afghan rule.

BALL, ALBERT (1896–1917), English airman, was born at Nottingham on Aug. 21, 1896, son of an estate agent. He entered the army in 1914 and passed into the Air Service in Oct. 1915, going out to France on Feb. 18, 1916. He proved to be one of the most daring aviators on the British side, and his activity during the operations on the Somme in the summer of that year helped to establish the superiority of the British air service there. On May 3, 1917, he destroyed 39 enemy machines, making a new record. Four days later on May 7, 1917, he was brought down by a squadron led by the German airman, von Richthofen. Ball received many war honours, including the posthumous award of the Victoria Cross.

BALL, SIR ALEXANDER JOHN, BART. (1759–1809), British rear-admiral and governor of Malta, came of a Gloucestershire family. He entered the navy, and in 1778 was promoted lieutenant. Three years later began a close association with Rodney, and, two days after his chief's crowning victory of April 12 1782, Ball was promoted commander, and in 1783 he became captain. At this time he spent a year in France with the double purpose of learning the language and living economically. Nelson, then a captain, was at this time, by no means favourably impressed by his future friend and comrade, and spoke of him as a "great coxcomb." It was not until 1790 that Ball received a command. From that year, however, he was continuously employed. In 1798 he rendered assistance to Nelson's ship in heavy weather, and from that time the two were close friends. Ball served under Nelson in the battle of the Nile, and his ship, the "Alexander," was the particular opponent of Brueys' flagship, "L'Orient," which blew up. Two months later he was ordered to the blockade of Malta, which was kept up without a break for the next two years. After the fall of Malta, Ball practically retired from the service, in spite of Nelson's urgent entreaty that he should continue afloat, and from 1801 (when he was made a baronet) to 1809 he was governor of Malta, where he endeared himself to the people by his regard for their interests, and his opposition to the policy of treating the island as a conquered dependency. He died on Oct. 20 1809, and was buried in Malta. Sir Alexander Ball befriended Coleridge and is highly praised by him in *The Friend,* "The Third Landing Place."

BALL, JOHN (d. 1381), an English priest who took a prominent part in the peasant revolt in 1381. Little is known of his early years, but he lived probably at York and afterwards at Colchester. He gained considerable fame as a preacher by expounding the doctrines of John Wycliffe, but especially by his insistence on the principle of social equality. These utterances brought him into collision with the archbishop of Canterbury, and on three occasions he was committed to prison. He appears also to have been excommunicated, and in 1366 all persons were forbidden to hear him preach. His opinions, however, were not moderated, nor his popularity diminished by these measures, and his words had a considerable effect in stirring up the rising which broke out in June 1381. Ball was then in prison at Maidstone; but he was quickly released by the Kentish rebels, to whom he preached at Blackheath from the text, "When Adam delved and Eva span, Who was then the gentleman?" He urged his hearers to attack the principal lords of the kingdom and the lawyers; and he was afterwards among those who rushed into the Tower of London to seize Simon of Sudbury, archbishop of Canterbury. When the rebels dispersed Ball fled to the midland counties, but was taken prisoner at Coventry and executed in the presence of Richard II., on July 15, 1381. Ball, who was called by Froissart "the mad priest of Kent," seems to have possessed the gift of rhyme. He undoubtedly voiced the feelings of the lower orders of society at that time.

Raynaud (1869–97); C. E. Maurice, *Lives of English Popular Leaders in the Middle Ages* (1875); C. Oman, *The Great Revolt of 1381* (1906); William Morris, *A Dream of John Ball* (1888).

BALL, JOHN (1818–1889), Irish politician, naturalist and Alpine traveller, eldest son of an Irish judge, Nicholas Ball, was born at Dublin on Aug. 20, 1818. He was educated at the Roman Catholic college at Oscott near Birmingham, and at Christ's college, Cambridge. He was botanist, Irish civil servant (1846), Liberal M.P. for Carlow (1852), and under-secretary for the Colonies (1885–87). He was first president of the Alpine club (founded 1857), and it is for his work as an Alpinist that he is chiefly remembered, his well-known Alpine ***Guide*** (1863–68) being the result of innumerable climbs and journeys and of careful observation recorded in a clear and often entertaining style. He also travelled in Morocco (1871) and South America (1882), and recorded his observations in books which were recognized as having a scientific value. He died in London on Oct. 21, 1889.

BALL, THOMAS (1819–1911) American sculptor, was born at Charlestown (Mass.) on June 3, 1819. After starting, self-taught, as a portrait-painter he turned his attention in 1851 to sculpture, his earliest work being a bust of Jenny Lind. At 35 he went to Florence for study. There, with an interval of work in Boston (Mass.) (1857–65) he remained until 1897, when he returned to America and lived in Montclair (N.J.) with a studio in New York city. His work includes many early cabinet busts of musicians (he was an accomplished musician himself, and was the first in America to sing *Elijah*). The equestrian statue of Washington in the Boston public gardens is probably his best work. BALLS USED IN POPULAR SPORTS, VARYING GREATLY IN SIZE AND CHARACTER

1. Left to right: Lacrosse; tennis; billiard; snooker; bagatelle; Eton fives; Rugby fives; large squash rackets; golf; small squash rackets; table tennis
2. Left to right: No. 1 (equestrian) polo: baseball: cricket; hockey; lawn tennis; lawn bowls jack; rounders; rubber stoolball
3. Left to right: Football; softball; crown green bowl; crown green jack; croquet ball
4. Left to right: Basketball; soccer ball; volley ball

ington; Edwin Forrest as "Coriolanus," in the Actors' home, Philadelphia, and the Washington monument in Methuen (Mass.) are other examples which have had a marked influence on monumental art in the United States and especially in New England. In 1891 he published an autobiographical volume, My *Three Score Years and Ten*. He died at Montclair on Dec. 11, 1911.

BALL. A rounded body, hollow or solid, preferably with a smooth surface, soinetimcs indented with an even pattern. (Mid. Eng. *bal. Cf. bale,* of Teutonic origin. Lat. *follis.* Gr. πάλλα).

Sometimes applied to such rounded protuberances as the root of the thumb and big toe, or as the "ball" joint of a bone fitting into the "socket" of another bone.

Also used (from late Lat. *ballare,* whence "ballad" and "ballet," or from Fr. *bal)* to mean a large gathering of people invited to join in dancing.

The ball (in its strict sense) has probably contributed more than anything else to the pleasures, pastimes, and sports of mankind, in length of time or in enjoyment. The rounded pebbles of the shore, the shapes of fruit and seeds, may each in turn have provided the prehistoric child with his primaeval rolling plaything. as it gave the palaeolithic warrior the missile for his hand or sling or throwing-stick. The ball is mentioned in the earliest literatures we know. Though the Hebrews were the least athletic of races, Isaiah must have been sure of his simile being understood when he wrote: "He will surely turn and toss thee like a ball"; and some form of ball-game is portrayed on early Egyptian monuments, as it is to-day enjoyed by primitive barbarous tribes. Homer was appealing to a sympathetic audience when he described how the Princess Nausicaa and her maidens "fell to playing at ball" in Scheria (which is Corfu), that far-off land of the Phaeacians washed by the utmost tides of ocean (Od. vi. 100); and again, when the wanderer reaches her father's palace, we hear how Halios and Laodamas played a ball-game, accompanied with dancing, before Alcinous and Odysseus (Od. vii. 370).

When we reach "historic" times, we find the Greeks keeping their bodies supple for sterner contests by ball-play (σφαῖραι); and in the Roman baths an apartment called *Sphaeristerium* was set apart for similar exercises. There are traces in later Greek authorities of ball-games not yet organized, but fully appreciated, in such words as ἀπόρραξις, which means patting the ball on the ground from the open hand; οὐρανία, flinging the ball skywards to be caught again; φαινίνδα, an odd expression which seems to indicate the skill of making a feint when the ball was thrown by one player to be caught by another; or ἐπίσκυρος an obscure name which suggests, if lines of players were engaged, some vague origins of football, though we hear nothing of any goals. It is curious that these words, and others, seem usually to retain, even in Roman times, their Greek origin; as in the *harpastum,* which may be an ancient prototype of the "scrimmage" in rugby football; or the *trigon,* in which three players stood in a triangle and struck the ball from one to the other with a kind of gauntlet on the arm, as may still be seen in Italy. This was a notable advance, and the leather ball used, filled with air, was called *follis,* a larger type than the *pila,* used in games of catch with the hand only, and different from the *paganica,* a heavy ball stuffed with feathers after the type of Scotland's ancient golf balls.

These early games seem to us naturally to be rather undefined, and it was only when skill was developed along certain lines with the ball alone, and in a more valuable direction by the use of various implements for striking it, that we reach the specialization resulting in our modern multiplicity. The picture given with this article shows how many differences from the simple type have now arisen. Only one of the "balls" in constant use to-day is not round, and that is used for rugby and American football; which is strange for the free use of a ball by hands and feet (with no additional implement) must have been one of the earliest developments in ball-games. Association football, however, has rejected primitive simplicities by the introduction of forbidding the use (or even the touch) of the hands. When the ball is made so much heavier for its size that it only leaves the ground with difficulty—as in bowls—the reverse restriction appears, and feet are not allowed. Directly an implement is added, the ball decreases in size: for hockey and cricket the ball is $5\frac{5}{8}$oz. and $9\frac{1}{8}$in. round; the polo-ball of light willow has a diameter of $3\frac{1}{2}$in.; lacrosse has a ball only $2\frac{3}{4}$in. in diameter, lighter still. The accuracy of the balls so far mentioned bears a certain relation to the area of play as well as to the fact that only one ball is used. But directly the area is restricted and more than one ball is used by the same player to make his score, very much greater accuracy is necessary; and the fact that a billiard-cue strikes its ball with the smallest surface of any implement employed in ball games necessitates exact measurements, greater comparative weight, and delicate manufacture. The ivory billiard-ball, with a diameter of $2\frac{1}{16}$in. weighs $4\frac{2}{3}$ ounces.

The player's use of a ball with an implement is very much complicated when another player, similarly equipped, tries to use the same ball for different purposes. Hence came the rich family of games which is distinguished by different forms of the racket, such as real tennis, lawn tennis, rackets, pelota, or squash rackets. The primitive rounders was perhaps the first ball-game in which one player tried, with the ball, to defeat another player who had the implement. Hence descended the American baseball and the English cricket.

BALLABILE, a musical term, now seldom used, signifying that a given work, or section of a work, as in an opera, is suitable for dancing purposes. From the Ital. *ballare,* to dance; and literally therefore "danceable."

BALLAD, the name given to a type of verse of unknown authorship, dealing with episode or simple motif rather than sustained theme, written in a stanzaic form more or less fixed and suitable for oral transmission, and in its expression and treatment showing little or nothing of the finesse of deliberate art. This is not an attempt at definition, for that is hard indeed, if not impossible. The familiar hints as to the character of the ballad, that it is "short," "adapted for singing," "simple in plot and metrical structure," and more emphatically, that it is "impersonal," help us to identify the *genre.* For practical purposes it is that kind of verse preserved in Sir Walter Scott's *Minstrelsy of the Scottish Border* and in Prof. Child's *English and Scottish Popular Ballads.* All the English material we have, and are likely to get, will be found in the latter. By general consent these Scottish and English ballads, and mainly the former, are the best and the most typical.

At the outset, two warnings may be given. First, that there is danger of laying stress on the lexicographical association of the *word* (back to late Latin *ballare,* to dance) and of finding for the known form a tradition originating in the dance. This is said not to anticipate any consideration of the communal dance theory but as a reminder of the misnaming and loose attribution of which our dictionaries and literary histories can offer so many examples. Secondly, that the extended use of the term, as shown in the nondescript varieties of later verse so-called, or in its technical application in music, is out of place in the present account.

Interest in the form and history of the ballad was awakened late. The Robin Hood gests issued by the first printers, the broadsides of the 17th century, and the collection of written and printed texts by Pepys and others are but evidence of business intelligence or the "curiosity" of the antiquary. When Sidney is moved by "the old song of Percy and Douglas," he cannot forget the incivility of the style and what a Pindar might have made of it; and when Addison, in the *Spectator,* praises the "perfection of simplicity," he is merely thanking "our poet" (not a prehistoric choral crowd) for relief from the "wrong artificial taste" of his day. As this sense of contrast grew throughout the 18th century, collectors like Percy and the poetical experts in "imitation" gave the public what it wanted to swell the protest against classical complacency, but the interest was that of a new fashion and adventure in art. Now and then there are hints of more serious critical concern—in the method of editors such as Herd and Ritson—but it is not till the beginning of the 19th century, when Scott published his *Minstrelsy of the Scottish Border* (1802–03) and in the edition of 1830 his "Introductory Remarks on Popular Poetry," that the foundation of the study of the ballads was truly laid in Great Britain. In the romantic fervour of the period there was encouragement to increase the number of ballads by search or by faking, and it was by the growth of this material, and especially by the

discovery of different texts, oral or written, that the desire to judge the comparative merits and discover the earliest and purest versions was aroused. From this to the vexed questions of origin and transmission was a logical and immediate move.

The Question of Authorship. — From the early stages of the great dispute argument was concerned with three, perhaps four, obvious differencesbetween the ballads and the verse of individual and known writers. There was the consideration that the ballads had been transmitted orally, apparently from a distant past, and that this method had continued after the introduction of printing, and even to the 19th century; secondly, that all are anonymous; thirdly, that in the matter of diction and metre they show a simplicity and unkempt art which separates them from all traditional literary expression, and, especially, that their metrical form, with its suggestion of dance-movement and choral song, is strangely at variance with each and every kind of professional unshared craftsmanship; and fourthly — though this was not pressed at first — that the existence of analogues in foreign literatures, close in subject rather than in form, seems to point to some ancient *genre* to which the familiar tests of literary origin do not apply.

Percy, his opponent Ritson, Scott, and indeed all the collectors and editors were of opinion, notwithstanding disagreement on minor points, that the ballads were the work of the minstrels and were derived from earlier and more "literary" work. "The editor is convinced," Scott wrote in the preface to "Lord Thomas and Fair Annie" in the *Minstrelsy*, "that the farther our researches are extended, the more we shall see ground to believe that the romantic ballads of later times are, for the most part, abridgments of the ancient metrical romances, narrated in a smoother stanza and more modern language." And again, in the Introduction to the same edition, he refers to, but declines to discuss, the question whether the ballads were composed by minstrels "professing the joint arts of poetry and music" or were "the occasional effusions of some self-taught bard." This view of a literary and recent origin was readily accepted: in Scott alone there is a hint that it might yet be defended, critically and historically.

In Germany, on the other hand, where Percy's *Reliques* had affected, even more powerfully than in England, the trend of national literature, we find a remarkable critical reaction at the very time when Scott gave a fresh start and direction to the minstrel-theory. It first declares itself in A. W. Schlegel's essay on Biirger (1800) in the statement that ballads were not made *for* the people, but "in a certain manner (*gewissermassen*) by the people as a whole" (*das Volk* im *Ganzen*) (*Werke*, ed. Böcking, viii. 80); that they represent primitive unsophisticated art, the counterpart of the work of the "artist" of later literature, and so illustrate that duality in process and product which is fundamental to the aesthetic theory of Schlegel and others. It was left to the brothers Grimm, in their *Altdeutsche Wälder* (1813), to advance to a generalization in which, hazily and with no hint of evidence, the early Folk in its communal strength actually assumes the function of poet. This called for protest from Schlegel in 1815 (*Werke*, ed. Bocking, xii. and esp. pp. 385–386) in which, while emphasizing the double principle of nature and art, he insisted that the latter must have its due. With this modification and Jacob Grimm's later claim (in 1851) for the source of poetry and music in the imaginative and personal emotion of the poet (*Kleinere Schriften*, 1864, *I.* p. 296) the early German view had become so confused that if a case was to be made out for it better evidence and argument must be found.

Professor Child's Theory. — It was not till the publication of Prof. Child's collection that a better ordered attack upon the upholders of a "literary" origin was begun, or could have been begun. His main purpose was as collector and editor, but once, in *Johnson's Universal Cyclopaedia* (New York, 1893), he offered views, which, however, he would not allow to be "regarded as final." Statements such as that ballads "do not write themselves," as William Grimm had said, and that, "though a man and not a people has composed them, still the author counts for nothing" call for interpretation. Yet it is clear in his summing up that Child never surrendered the individualist and literary position.

The most whole-hearted supporter of the communal theory has been Prof. F. B. Gummere, who in his account of the "rise of poetry as a social institution" claims the ballad as evidence of a co-operative folk-intelligence, first expressing itself in dance and choral song. His views attracted Andrew Lang who sought to strengthen them by reference to the folk-lore of savage and illiterate peoples. Prof. Kittredge, while declining Lang's revel in ethnological analogies, restates the communal arguments with a definiteness not to be found in Child's scattered observations. He allows an initial creation by an individual author but holds that "the processes of oral tradition amount to a second act of composition" —"a collective composition" — "of an inextricably complicated character," which is not to be identified with the corruption by scribes and editors of a classical text; that the original author is not a professional poet or minstrel but a member of the folk, and that the composition is not a solitary act but oral improvisation before an audience "in close emotional contact." When he describes, by picturesque stages, "the supposedly inconceivable phenomenon of a unanimous throng composing poetry with one voice" he has passed far from Child's conclusion "that the ballad is not originally the product or the property of the lower orders of the people." Thus elaborated, the tentative statements of Schlegel and the Grimms have been accepted by many as commonplaces of literary history.

Earlier writers had no occasion to prove their faith in the "poet," whether minstrel or not, or, like Scott, they declined to consider a defence; but the later working out of the Folk-theory has called forth a considered reply by the supporters of a literary origin, to whom the question of the place of the minstrel, whether as author or as transmitter, has lost its former importance. In 1895 W. J. Courthope protested against the "vague idea" that "as the ballad is before all things popular in its character, it was evolved in some mysterious manner out of the genius and traditions of the people themselves" (*Hist. of Eng. Poetry*, 1. p. 445), that the ballad "was usually a précis of a romance" by a selection of "the salient points" and that it developed "certain poetical features of its own" by reason of this relationship. This view was endorsed by T. F. Henderson, who concluded that "the lyric-epic did not originate amongst what is usually termed the folk," that the *carole* sung to concerted movement was, by Scottish and Danish evidence, the concern of high-born folk, and that its later history with the common people is a tale of decadence. The present writer, in 1900, discussed the relationship of the ballad to the romance and romance-poem, in respect of subject and prosodic development, and ventured to describe it "as part of the literary débris of the middle ages." Others added their support, and, indeed, recent opinion has more and more inclined to oppose the claims of the folklorists. The latest attack on the positions held by Profs. Gummere and Kittredge was made in 1921 by their countrywoman Prof. Louise Pound. If it be unfair to claim the late Prof. W. P. Ker as a sworn partisan of the "literary" theorists, one may still find in the concentrated learning of his paper read before the British Academy in 1909 much to disconcert their opponents — on the value of the European analogues, on the looseness of the term "communal authorship," on "Who are the People?" and the variety of answers to be given. Though he declares that the ballads "are not merely a limb of the great mediaeval body of romance" or "mere versified folklore," he holds to the literary quality and tradition, and his somewhat whimsical conclusion that the ballad stands apart, a thing by itself, an "Idea" in the Platonic sense, strengthens rather than weakens the belief in that tradition.

Communal Versus Individual Authorship. — The main points which appear most persistently in discussion of the problem of the ballads may be here summarized. The following notes incline to show that the theory of a communal origin fails in its challenge of that of individual and "literary" authorship; but no criticism can be dogmatic, when the evidence is, as it must remain, incomplete.

1. *Age.* The form is not found anywhere before the 15th century (*Judas* in Child's collection is not a ballad); and if older examples are yet to he discovered, they cannot be earlier than the appearance of rhyme or before the 11th century. The smallness of the

corpus is significant. The opinion that the ballads are later than the romance-poems, and, again, than the romance—that they are a perpetuation or recovery of the vital parts (episodes) of these decayed forms—coincides with what is known of the general curtailment in literary form everywhere, and in all kinds, in the 15th century. The application of "Homeric theory" tests as to the priority of ballad or epic leads to nothing, for there is evidence in many cases to show that the ballads (*e.g.*, on the subject of Robin Hood) are later than the cyclic texts of the romances. The choice of historical matter does not affect argument either way, for (i.) in few cases is the treatment contemporary, and (ii.) it is open to both "literary" and so-called "popular" art to work over traditional material.

2. *Transmission.* The assumption, suggested by oral transmission over a wide area and in a variety of versions, that the form must be primitive and may be studied to-day in the expression of illiterate people and even of savages, is not supported by examination of the ballads as we know them, even in their simplest form; and it would force the conclusion that they were at their best when made and recited at a period farthest from "literary" influence. The admitted degeneracies due to oral repetition by the "people" are not good testimony to an original popular talent in ballad-making. Oral dissemination, which was most active when printing was a limited agency, proves nothing as to origin. All efforts to obtain an "authentic" or *Ur* text by the elimination of popular or editorial meddling must fail, as has been shown in Prof. Brandl's redaction of *Willie of Winsburie*, which does not encourage appreciation of the art of the tribal syndicate. In the investigation of the partial fakings and full "imitations" of the 18th and 19th centuries, this critical method, aided by external evidence, may be more successful. Research has found no proofs that the spread of the ballad throughout Europe had been helped by the Crusades *(pace* Child in his *Cyclopaedia* art.) or by the gypsies whose itineraries begin in the 15th century.

3. *Anonymity.* The fact that there are no clues to authorship has encouraged belief in the folk-theory, and in recent years the anonymity of the trench and march songs and chanties of the World War has been cited in analogy. But to state that these "were composed nobody remembers by whom" does not mean that they were not composed by somebody. Such a criterion is as irrelevant as it would be if applied in cases of unknown authorship where individual workmanship is readily admitted.

4. *Sources.* The view that the "choral throng" was the first author overlooks such difficulties as the following: (i.) The earliest ballads, which deal with such subjects as religion and herostory, do not indicate dance or communal singing as likely media for their preparation. The narrative character precludes the conception of them *as an accompaniment* of the dance, as might be allowed in the case of the simple lyric; for though corporate singing and dancing may produce chanties, jingles, and the like, it cannot tell a story as the ballad does. On the other hand, it is possible, though the evidence is scanty, that dance and song were added later to assist in oral perpetuation. Only in this sense can the term "communal" be applied, and here again it is associated with textual degeneracy. (ii.) There is good testimony, especially in Scotland and Denmark, that the ballads were the concern of the "upper classes," and that if they were danced to, as in the *caroles,* the words, as in the later masque, had been supplied for the entertainment. The recital of pieces in the *Complaynt of Scotlande* excludes all suggestion of extempore or corporate genesis. To say that the ballads are "not aristocratic" is historically false and inadequate as a description of a *genre* concerned with the simple motives of general human interest, for whose expression, with the precision familiar in the ballads, a higher rather than a ruder art is requisite.

No one will maintain, as has been charged against some of the opponents of the communal theory, that *all* ballads are derived from earlier literary material and are to be explained, as so many can be, as parcellings of the longer romance-poems and the still longer romances, for some may be first drafts dealing with a simple motif, or may be directly inspired by *märchen,* or may be imaginary or misplaced accretions to accepted story.

5. *Impersonal Character.* The impersonal manner of the ballads, which is one of the stronger claims for a folk-origin, is inherent to a kind which is essentially narrative. It cannot be assumed that because the single and personal note (the "I" of the lyric) is absent, the explanation is to be found in the co-operation of a "throng" which has neither the opportunity nor the willingness to allow self-expression by any of its members; and it is easy to recall hundreds of impersonal poems by individual writers.

6. *Metre.* Even if it were allowed that the form is not too deliberate to be extemporized by the Folk, it would be difficult to explain away certain evidences of relationship with the metrical scheme of the romance-poem. No summary of this technical matter can be attempted here and the reader is referred to the bibliography. The main claim of the folk-lorists is based on the *refrain,* which is considered as a primitive aid in the building up of an extemporized song and as a reminder of the recurring movements of the dance. Yet, here again, the practice of the most sophisticated art bids us pause.

7. *Diction.* It may be largely a question of taste to decide between the primitive and artificial characteristics of the diction; and the investigation is often complicated by the interference of both the unlettered reciter and the literary reviser. The variations in a piece redelivered in different circumstances, with unequal care, by many unequally sensitive to expression, may give an appearance of folk-simplicity. It is difficult to reserve the *clichés* of words (*e.g.*, "three"), inversion, and other familiar devices in the ballads to the untutored crowd.

8. *Unique Character.* Emphasis has been put by some on the unique character of the ballad—that it achieves by its choice of material and its method results outside the range of other forms, and is, as stated above, the expression of an "Idea" in the Platonic sense. Few may care to dispute this, but some may hint (i.) that every literary form is unique, in its general effect or in some of its constituent qualities, and (ii.) that this acknowledgment puts the ballad in a category beyond the unconsidered writing of an unliterary "throng."

United States.—American ballads current long enough to be called folk-songs continue, for the most part, inherited patterns or develop variations of them. A text brought to some region of the United States, or originating there, may, in the course of time, roam to remote corners, taking on multiple forms.

Some of the American traditional pieces now made available by collectors are those of the southern Appalachians, including songs from Kentucky, Tennessee, the Virginias and the Carolinas, and those from New England, the West and the South-west. In addition to the immigrant ballads that first interested collectors, anthologists have now gathered the "logger" or "shanty-boy" songs of Maine and Michigan, songs of pioneer conditions and characters of the West and the South-west, songs of miners and "hobos" and similar pieces. Of interest also are songs of French-Canada, Spanish-Mexico, and of the Negroes and the Indians.

Many of the English and Scottish ballads of the romantic and legendary type have immigrated to the United States. As they

persist or roam westward they are likely to lose their archaic flavour and aristocratic touches, to drop their supernatural elements, and to accommodate themselves to New World settings. Many or most of the American traditional songs of the 19th century derived from Old World originals. By the 20th century indigenous songs, developing shifting texts, take their places alongside those entering from without, like the European "Lord Randal" and "The Two Sisters." Some indigenous pieces may be dated with fair certainty, while the history of others has already been lost. A considerable number of them were floated by itinerant bands of singers and old-time minstrel troupes or travelling entertainers, or were taken about the country in popular plays. Many often gained currency in "broadsides" or popular "songsters," or were sold at booths in fairs or in the wake of circuses. A frequent source of preservation is the manuscript book. Some widely current indigenous songs in oral tradition are "Springfield Mountain," "Young Charlotte," "Jesse James," "Casey Jones," and the piece emerging, perhaps, from bar-room currency, known variously as "Frankie and Johnny," "Frances and Albert," etc. Traditional song has survived best in isolated regions or out of the way places, sung to the music of the violin, accordion, mouth organ, cabinet organ or banjo. For many pieces, Irish popular songs served as models or were locally adapted. Other models were songs popular on the stage or even well-known hymns. Sometimes the original airs are retained but often the same piece is sung to various airs in many parts of the country.

A rough classification of American ballad material includes death-bed confession pieces, songs of local murders and disasters, of criminals and rovers, of occupational pursuits, narratives of faithless or murderous lovers, lovers' reunions and occasional comedy pieces. Alongside story pieces or ballads proper in oral currency are religious songs, pseudo-negro songs, "western" songs, temperance songs, game and nursery songs, nonsense songs, and many varieties of sentimental pieces.

It seems unlikely that the legacy of the present period to traditional song will be very great. The competition of the phonograph and the radio has lessened the amount of singing for entertainment among groups that in the past have done most to preserve older song. Lyrics today contain little violence and few tragic situations. Story pieces and pieces with striking refrains have the best chance of survival. In music the word ballad signifies a vocal setting of a ballad, or a purely instrumental setting inspired by a ballad. There are also choral ballads.

BALLADE, the technical name of a complicated and fixed form of verse, arranged on a precise system. An earlier form of the word "ballad," it afterwards came to be applied to an entirely distinct kind of verse. In its regular condition a ballade consists of three stanzas and an envoi; there is a refrain which is repeated at the close of each stanza and of the envoi. The entire poem should contain but three or four rhymes, as the case may be, and these must be reproduced with exactitude in each section. These rules were laid down by Henri de Croi, whose *L'Art et science de rhétorique* was first printed in 1493, and he added that if the refrain consists of eight syllables, the ballade must be written in huitains (eight-line stanzas), if of ten syllables in dizains (ten-line), and so on. The form can best be studied in an example. Take Andrew Lang's "Ballade to Theocritus, in Winter," for instance, which begins:

Ah! leave the smoke, the wealth, the roar
Of London, and the bustling street,
For still, by the Sicilian shore,
The murmur of the Muse is sweet.
Still, still, the suns of summer greet
The mountain-grave of Helikê,
And shepherds still their songs repeat
Where breaks the blue Sicilian sea.

The rhymes of this first stanza are exactly repeated in the second and third stanzas, and the refrain is repeated in the closing line of each. Then comes the "envoi," in which the rhymes of the second half of each stanza are repeated, and which is again brought to an end with the refrain. For example, Lang's ballade ends:

Master—when rain, and snow and sleet
And northern winds are wild, to thee
We come, we rest in thy retreat,
Where breaks the blue Sicilian sea.

The ballade may be said to have reached its most elaborate and highly finished form in the 14th century. It arose from the *canzone di ballo* of the Italians, but it is in Provençal literature that the ballade first takes a modern form. It was in France, however, and not until the reign of Charles V., that the ballade as we understand it began to flourish; instantly it became popular. Machault, Froissart, Eustache Deschamps and Christine de Pisan were among the poets who cultivated the ballade most abundantly. Later, those of Alain Chartier and Henri Baude were famous, while the form was chosen by François Villon for some of the most admirable and extraordinary poems which the middle ages have handed down to us. Somewhat later Clément Marot composed ballades of great precision of form, and the fashion culminated in the 17th century with those of Madame Deshoulières, Sarrazin, Voiture and La Fontaine. Attacked by Moliére and by Boileau, who wrote:

La ballade asservie à ses vieilles maximes,
Souvent doit tout son lustre au caprice des rimes,

the ballade went entirely out of fashion for zoo years, when it was resuscitated in the middle of the 19th century by Théodore de Banville, who published in 1873 a volume of *Trente-six ballades joyeuses*, which has found many imitators. The ballade, a typically French form, has been extensively employed in no other language, except in English. In the 1 jth and 16th centuries many ballades were written, with more or less close attention to the French rules, by the leading English poets, and in particular by Chaucer, by Gower (whose surviving ballades, however, are all in French) and by Lydgate.

The absence of an envoi will be noticed in Chaucer's, as in most of the mediaeval English, ballades. After the 16th century original ballades were no more written in English until the latter part of the 19th, when they were re-introduced, almost simultaneously, by Algernon Charles Swinburne, Austin Dobson, Andrew Lang, Edmund Gosse and W. E. Henley. Dobson's "The prodigals" (1876) was one of the earliest examples of a correct English specimen. In 1880 Andrew Lang published a volume of *Ballades in Blue China*, which found innumerable imitators. G. K. Chesterton in the twentieth century cultivated the form with success.

BALLAD OPERA, a simple type of opera peculiar to England. where it had its origin in the 18th century, the story being usually in the nature of a burlesque or extravaganza, while the music, confined mainly to detached numbers interspersed among the spoken dialogue, was drawn from pre-existing popular ballads to which the words of the lyrics were adapted. The most famous of all such works was Gay's "Beggar's Opera," but many others enjoyed hardly less popularity. Save for occasional revivals, the type is now extinct. (*See* MUSICAL COMEDY.)

BALLANCE, JOHN (1839–1893), New Zealand statesman, eldest son of Samuel Ballance, farmer, of Glenavy, Antrim, Ulster, was born on March 27, 1839. He migrated to New Zealand, and founded the *Wanganui Herald,* of which he became editor and remained chief owner for the rest of his life. During the fighting with the Maori chief Titokowaru, in 1867, Ballance helped to raise a troop of volunteer horse, in which he received a commission. He entered the colony's parliament in 1875 and, with one interval (1881–84), sat there till his death. Ballance was a member of three ministries, that of Sir George Grey (1877–79); that of Sir Robert Stout (1884–87); and that of which he himself was premier (1891–93). His alliance with Grey ended with a notorious

and very painful quarrel. In the Stout government his portfolios were those of lands and native affairs; but it was at the treasury that his prudent and successful finance made the chief mark. As native minister his policy was pacific and humane, and in his last years he contrived to adjust equitably certain long-standing difficulties relating to reserved lands on the west coast of the North Island. He was resolutely opposed to the sale of crown lands for cash, and advocated with effect their disposal by perpetual lease. His system of state-aided "village settlements," by which small farms were allotted to peasants holding by lease from the crown, and money lent them to make a beginning of building and cultivation, was on the whole successful. But his best achievement was the imposition, in 1891, of the progressive land-tax and progressive income-tax. As premier he brought together the strong experimental and progressive party which long held office in New Zealand.

BALLANCHE, PIERRE SIMON (1776–1847), French man of letters, was born at Lyons, where the horrors of the siege led him to devote himself to an examination of the nature of society, a work which brought him into connection with the literary circle of Châteaubriand and Madame Récamier. His great work is the *Palingénésie,* divided into three parts, *L'orphée, La formule, La ville des expiations.* The first deals with the prehistoric period of the world, before the rise of religion; the second, which like the third was never completed, was to deduce a universal law from known historical facts; the third to sketch the ultimate state of human perfection. A collected edition of his works in nine volumes was begun in 1830, but only four appeared. In 1833 a second edition in six volumes was published.

Ballanche belonged to the theocratical school which, in opposition to the rationalism of the preceding age, emphasized the principle of authority, placing revelation above reason and order above freedom and progress; but he endeavoured to unite what was valuable in these opposed systems. With the theocratists he held that individualism was impracticable since man exists only in and through society and he agreed with them that the origin of society was to be explained, not by human desire and efforts, but by a direct revelation from God. Lastly, he reduced the problem of the origin of society to that of the origin of language, and held that language was a divine gift. At this point he parts company with the theocratists, and in this very revelation of language finds a germ of progress. In the primitive state speech and thought were identical; but gradually the two separated, language becoming spoken, written, and finally printed. Thus the primitive unity and the original social order gave place to new institutions upon which thought acts, and in and through which it even draws nearer to a final unity, a *palingenesis.* Scattered throughout the works of Ballanche are many valuable ideas on the connection of events which makes possible a philosophy of history. Besides the *Palingénésie,* Ballanche wrote a poem on the siege at Lyons (unpublished); *Du sentiment considéré dans la litte'rature et dans les arts* (1801); *Antigone,* a prose poem (1814); *Essai sur les institutions sociales* (1818), intended as a prelude to his great work; *Le Vieillard et le jeune homme,* a philosophical dialogue (1819); *L'Homme sans nom,* a novel (1820).

See Ampère, *Ballanche* (1848); Ste Beuve, *Portraits contemporains,* vol. ii.; Damiron, *Philosophie de XIX^e siècle;* Gaston Frainnet, *Essai sur la philos. de P. S. Ballanche* (1903, containing unpublished letters, portraits and full bibliography); C. Huit, *La Vie et les ôeuvres de Ballanche* (1904).

BALLANTINE, WILLIAM (1812–1887), born in London on Jan. 3, 1812, the son of a London police-magistrate, was educated at St. Paul's school, called to the bar in 1834, and created a serjeant-at-law in 1856. He began in early life a varied acquaintance with dramatic and literary society, and his experience, pushing character and acute intellect obtained for him a large practice, both in civil and criminal cases. He was most skilful in cross-examination and in forensic strategy; but he did not attempt flights of eloquence. Among his great cases were the prosecution of the murderer Franz Müller in 1864, the prosecution of Madame Rachel (1868), the divorce suit *Mordaunt* v. *Mordaunt* (1870), his advocacy of the Tichborne claimant in the civil suit, 1871–72, and his defence of the gaekwar of Baroda in 1875. He died at Margate on Jan. 9, 1887, having published his *Reminiscences.* His private life was Bohemian; and having earned large sums, he died very poor.

See his *Some Experiences of a Barrister's Life* (5th ed. 1882) and a continuation of it, *The Old World and the New* (1884); also the article TICHBORNE CLAIMANT.

BAELANTYNE, ROBERT MICHAEL (1825–1894), Scottish writer of fiction, was born in Edinburgh, and came of the same family as the famous printers and publishers. When 16 years of age he went to Canada and was for six years in the service of the Hudson's Bay Company. He returned to Scotland in 1847, and next year published his first book, *Hudson's Bay: or, Life in the Wilds of North America.* In 1856 he began the series of excellent stories of adventure for the young with which his name is popularly associated. *The Young Fur-Traders* (1856), *The Coral Island* (1857), *The World of Ice* (1859), *Ungava: a Tale of Eskimo Land* (1857), *The Dog Crusoe* (1860), and other books, to the number of upwards of 100, followed.

See his *Personal Reminiscences of Book-making* (1893).

BALLARAT, a city of Grenville county, Victoria, Australia, consisting of 3 municipalities: Ballarat city, Ballarat East, Sebastopol. It lies at an elevation of 1,416 ft. on the plateau which here forms the "Great Divide." Close by, on the east, a sharp rise leads up a further 500 ft. to the Warrenheip plateau (mainly volcanic: Mt. Warrenheip: 2,463 ft.). The climate is bracing—temperate in summer and rather cold in winter (av. temp. *c.* 56° F); the average annual rainfall is 26.8 in. The intensely folded (Ordovician) slates and sandstones which form the country rock were highly mineralized. Gold was discovered in 1851 and Ballarat quickly became one of the foremost mining towns of Australia, its early history being marred by one of the few incidents involving bloodshed in the mining history of Australia. The surface (alluvial) deposits were soon worked out and thereafter reef-mining prevailed. The steady quality of the ore permitted mining to considerable depths (2,000 ft. and over) and gold to the value of over £70,000,000 has been obtained. The fields are now, apparently, nearly exhausted. The clays derived from the ancient rocks of the uneven and sparsely-timbered uplands afford good farmlands while the volcanic soils of the Warrenheip plateau are exceptionally fertile. Potatoes and oats are extensively grown and mixed farming is carried on. The wools of the district have always had a high reputation. Ballarat (pop. 1933, 35,681) is the largest inland city in Australia. It possesses fine gardens, pleasure parks (including Lake Wendouree) and public buildings. A market and commercial centre for a wide and prosperous area, Ballarat has also railway engineering works, woollen mills, etc., a good electric service (trams, light, etc.) and water supply, and is a noted summer resort for residents of Melbourne (74 miles by rail).

BALLAST, in shipping, heavy material, such as gravel, stone or metal, placed in the hold of a vessel in order to immerse her sufficiently to give adequate stability. In botany "ballast-plants" are so called because they have been introduced into countries in which they are not indigenous through their seeds being carried in such ballast. A ship "in ballast" is one which carries no paying cargo. In modern vessels the place of ballast is taken by water-tanks which are filled more or less as required to trim the ship. The term is also applied to materials like gravel, broken glass, burnt clay, etc., used to form the bed in which the sleepers or ties of a railway track are laid, and also to the sand which a balloonist takes up with him, in order that, by throwing portions of it out of the car from time to time, he may lighten his balloon when he desires to rise to a higher level. In building, ballast describes the heavy material used as a matrix in making concrete.

BALLATER (Gaelic for "the town on a sloping hill"), village and police burgh, parish of Glenmuick, Aberdeenshire, Scotland, 670ft. above sea, on the left bank of the Dee, here crossed by a fine bridge, 43¼m. by rail W. by S. of Aberdeen. Pop. (1931) 1,198. It is the terminus of the Deeside railway and the station for Balmoral, 8m. to the west. Founded in 1770 to provide accommodation for the visitors to the mineral wells of Pannanich,

1½m. to the east, it has since become a popular summer resort. Ballatrich farm, where Byron spent part of his boyhood, lies some 4m. to the east.

BALL BEARINGS, machine bearings in which friction is lessened by arranging loose steel balls to revolve in channels or races. Sometimes the balls run between coned surfaces. The balls and their races are manufactured with precision of high-grade hardened steel. For heavy work, rollers are sometimes used instead of balls. *(See* BEARINGS.)

BALLET, a performance in which dancing, music and pantomime are involved. The present acceptation of the word ballet is a theatrical representation in which a story is told only by gesture, accompanied by music.

This variety of theatrical representation by means of dancing, mimicry and orchestral music, had its origin in the pantomimic performances of ancient Rome. The earliest form of the modern ballet was the interpretation of a theatrical plot by means of dancing combined with speech, and even with song. In this form it was well known to the princely courts of Italy. In France, where it preserved its essentially artistic formation, it is closely associated with the history of the opera; but in England it came much later than the opera, for it was not introduced until the 18th century, and in the first Italian operas given in London there was no ballet. Catherine de Medici introduced these entertainments into France and spent large sums of money on devising performances to distract her son's attention from the affairs of the state. Baltasarini, otherwise known as Beaujoyeulx, was the composer of a famous entertainment given by Catherine in 1581 called the *Ballet Comique de la Reyne*. This marks an era in the history of the opera and ballet, for we find here for the first time dance and music arranged for the display of coherent dramatic ideas. Henry IV., Louis XIII. and Louis XIV. were all lovers of the ballet and performed various characters in them, and Richelieu used the ballet as an instrument for the expression of political purposes. Lully was the first to make an art of the composition of ballet music and he was the first to insist on the admission of women as ballet dancers, feminine characters having hitherto been assumed by men dressed as women. When Louis XIV. became too fat to dance, the ballet at court became unpopular. It was then adopted in the colleges at prize distributions and other occasions, when the ballets of Lully and Quinault were commonly performed.

The most notable personage in the history of the ballet is Jean Georges Noverre. He revived the ballet as Gluck revived the opera. His literary productions on dancing, published in 1760, are in style so vivacious that even to-day they are well worth reading, and at the same time they are indicative of the aesthetics of 18th century dancing. They ran into many editions and were translated into several languages. Noverre freed the dance from the starched rigidity of the farthingale, constructed in his libretti plots of great dramatic movement, and introduced into dance compositions the whole gamut of dramatic expression. He wrote ballets in abundance that were accounted heroic or lyric according to their subject. He ended the supremacy of the leaders of the ballet and with it their purely artistic setting in the dance, creating instead a composite work of art in which painting, for decorations and costumes and music (Mozart composed his ballet *Les Petits Riens*) found a place as active auxiliaries of dancing. Noverre was the last as well as the most notable representative of classical ballet dancing, for this elegant art disappeared at the outbreak of the French Revolution. In the great opera houses of Europe, *corps de ballet* still persisted; but the technique of these gradually lost its clear-cut perfection. In Russia alone was the great tradition of the old ballet carefully preserved, especially in the Royal opera houses of St. Petersburg and Moscow.

At the beginning of the 20th century a new convention for stage dancing, initiated in America and perfected by an American, Isadora Duncan (*q.v.*), appeared in Europe. In this new form the *maillot*, the padded shoes and the ballet skirts gave way to bare feet, classic tunic and flowing drapery. There was no dancing *sur les pointes*, but stately movement from one deliberate Greek pose to another, to the accompaniment of music always carefully chosen from the works of Chopin, Gluck or some equally famous master. It had the air of being easy and natural, but was really the outcome of much thought and long training. Miss Duncan's figure was lithe and supple, her sense of rhythm was good, and she had acquired the certainty of balance that marks the first-rate dancer. Neither her dancing nor her theories were taken seriously till she arrived in St. Petersburg in 1907, where the two conventions met, the classical and the classic, each at the highest point of its development. Reacting one upon the other, a new form emerged, the Fokine ballet, which combined the virtues of the two schools and quickly superseded both.

Fokine was strongly influenced by the theories of Isadora Duncan, and it was in accordance with her teaching that the best composers and painters were brought in to write and decorate the new ballets, and that the ballets themselves were cut down to one act of such a length that three or four could be played in one evening. Though the old technique was by no means abandoned, it was modified by the addition of many of the Duncanesque movements; and the bare feet and Greek tunic began to alternate with the traditional uniform. Within a year of his appointment Fokine managed to sweep away the accumulated traditions of two centuries, and the ballet was at last free to express itself in any form that the dramatic subject demanded. The Russian ballet remained practically unknown outside its own country till 1909, when a company from the Marinsky theatre of St. Petersburg appeared at the Chatelet theatre in Paris. Serge' Diaghilev (1872–1929), to whom the management of this season had been entrusted, was known in Russia as one of the younger leaders of the renaissance of Russian art He was one of the warmest supporters of Isadora Duncan during her visit to St. Petersburg, and an equally staunch supporter of Michel Fokine when he began to put her theories into practice.

The choreography of all the ballets was the work of Michel Fokine. He was the great eclectic, the master of the composite ballet, who used the methods of Duncan and of the Russian folk dancers each in its proper environment with equal success. He was the inventor of the modern ballet, and from his creations practically all the later developments can be traced. As a dancer Fokine was graceful and accomplished, but lacked the genius of his successor, Vaslav Nijinsky, who took command for the season of 1913. Nijinsky was influenced by Emile Jaques-Dalcroze, a Swiss exponent of musical calisthenics, in accordance with whose theories the dancing in Debussy's *Jeux* was made to synchronise exactly with the beat of the music; while in Stravinsky's *Le Sacre* du *Printemps* the movement became a sort of rhythmic counterpoint in opposition to it. As a dancer, Nijinsky ranks among the greatest in history, and his premature retirement was an irreparable loss to the ballet.

Léonide Massine, who first appeared in 1914 in Strauss's *Légende de Joseph*, produced his first ballets in 1917. His work was a development of the Fokine ballet, sharpened by contact with Andalusian forms, which he studied closely before the production of De Falla's *Tricorne*. The best example of his invention at this time was seen in *Le Rossignol* (1920) and in his use of mass movements as foreshadowed by Nijinsky in *Le Sacre du Printemps*. As a dancer he is alert and certain in his balance, with a marked sense of rhythm. Among the more notable names are those of Tamara Karsavina, a dancer of perfect technique and compelling grace, who between 1910 and 1914 created most of the principal roles. Anna Pavlova danced with the company in 1909 and 1911. Her technique, perfect even to the most trifling detail, and the persuasive charm of her personality, won her a world-wide reputation. She was the brightest star in the Russian ballet and was the last personification of the lovely art of the old ballet. Among the men, in addition to the three maîtres de ballet, have been Adolf Bolm, Woizikovsky, Idzikovsky and latterly Lifar. Diaghilev knew how to enhance his gifts and accomplishments as a dancer by securing the services of the most distinguished painters of his day as decorators and costume designers. Chief among these was Leon Bakst, and others were Picasso, Derain and Benois. Diaghilev also secured the co-operation of leading modern composers—of Ravel, Richard Strauss, Poulenc, Milhaud and above all, of Stravinsky. Among the most remark-

able ballets, which he produced in every capital city in the world, were: *Czmarosiana, Carnaval* (Schumann), *L'Oiseau de feu, Le Spectre de la Rose, Petrouchka, Sacre du Printemps, Tricorne* and *Les Biches.*

The 20th century has seen, besides the stimulus given to the old ballet by Diaghilev and his artistes through Isadora Duncan's reforms, and by Dalcroze through his system of eurhythmics, the rise of a new development in dancing With the death of Diaghilev in 1929, activity ceased in the Russian ballet until 1932, when fragments of the old troupe, along with young dancers recruited from the Paris schools of the ballerinas Egorova, Preobajinska, and Kchessinska, united under the guidance of De Basil for the formation of the Monte Carlo ballets. Their perforinances until the year 1938 were remarkable first of all for Massine's important choreographies based on symphonies *Les Presages* (Tschaikowsky 5th), *Choreartium* (Brahms 4th), *Symphonie Fantastique* (Berlioz). This period showed the development and recognition of the ballerinas Alexandra Danilova, Irina Baronova, and Tamara Toumanova, as well as the male dancers David Lichine, Yurek Shabelevsky, and Roland Geurard, ably carrying on the tradition of great dancing.

After 1930 England had a resident ballet company of its own—the Vic-Wells group, ably headed by Ninette de Valois. At first drawing much of their inspiration from the Russian school, they then began an almost nationalistic movement, developing vital young choreographers such as Frederic Ashton and Miss de Valois herself, who sought inspiration from English painters and English music. Some of their best known ballets are *The Rake's Progress* (de Valois), *The Haunted Ballroom* (Ashton), *Horoscope, Checkmate* (de Valois), *Wedding Bouquet* (Ashton)

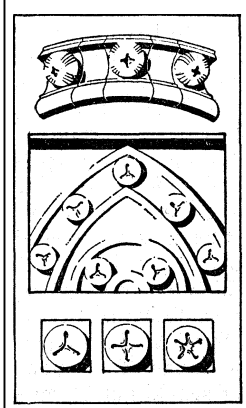
In practically every European opera house is maintained a corps de ballet principally for the traditional dances demanded by the opera scores, but in some instances this group appears on separate evenings giving complete ballet programs Copenhagen. Budapest, Leningrad, Milan, Vienna. and of course Paris are all noted for the beauty and excellence of their ballet productions.

In America, several companies have made their contributions to repertory Ballet Caravan, a group of eighteen under the direction of Lincoln Kirstein, has created such Americanisms as *Filling Statiorc* (Christianson), *Billy the Kid, Yankee Clipper* (Eugene Loring). Ruth Page, with her Chicago group, has added *Frankie arid Johnny, Hear Ye— Hear Ye*, and *The Gold Standard.* The Littlefield-Philadelphia Ballet (official ballet of the Chicago Opera Co) is best known for its *Barn Dance, Terminal, Cafe Society,* and *Ladies' Better Dresses.* In spite of the Americanism of these productions, all three of these companies are soundly based on the classical school and foundation of ballet, and include many of the abstract classical pieces in their repertories. While the French and Russian devotees of modern music wrote their ballets for Diaghilev, latterly musicians like Bartok, Hindemith and Toch have frequently composed dance music. It is apparent from later developments in the modern dance that a merging of the style and technique of the old ballet with the capability of expression of the new, is gradually taking place. Thus the question of aesthetics is less pressing than that of technique. Whereas the old ballet relied almost entirely on foot-and-leg aork, the modern dance requires the whole body as its medium of expression. Therefore it presupposes application to gymnastics for suppleness; the old ballet required stiffness, especially of the back. The rigid set pose of the old ballet is giving way to the continuous flowing movement of the modern dance. There is no doubt that the new dancing, with its possibilities of strong emotional expression, particularly in the display of mass movement, can be made the medium of the deepest artistic effects; and that this mass movement will be more truly a cultural expression of the basic experiences of life than was the elegant art of the old ballet. *(See* also DANCE; PANTOMIME.)

BIBLIOGRAPHY.—One of the most complete hooks on the ballet is by the Jesuit, Claude François Menestrier, *Des ballets ancienne et modernes,* 12mo (1682). He was the inventor of a ballet for Louis XIV, in 1685; and in his book he analyses about fifty of the early Italian and French ballets. See also Noverre, *Lettres sur la danse,* 1760 and 1804. In the last complete edition are to be found the libretti of many of his most notable ballets. H. Niedeken, *Noverre in his Relation to Music, Munich.* Important also are Cahusac's *La Danse ancienne et moderne ou traité historique de la Danse,* 1754; Weiter Castel-Blaze, *La danse et les ballets* (1832) and *Les Origines de l'opéra (1869)* the comprehensive work by Aoskar Bie, Der Tanz. **(C. LD.)**

BALL-FLOWER, an architectural ornament in the form of a ball inserted in the cup of a flower, which came into use in the latter part of the 13th, and was in great vogue in the early part of the 14th century. It is generally placed in rows at equal distances in the hollow of a moulding.

BALLIA, a town and district of British India, in the Benares division of the United Provinces. The town is on the left bank of the Ganges, below the confluence of the lesser Sarju. It is really an aggregation of rural villages. Population 16,400.



FROM VIOLLET-LE-DUC
TYPES OF BALL-FLOWER
The two upper figures show the use of the form as a moulding decoration

The district of Ballia, constituted in 1879, occupies an angle at the junction of Gogra and Ganges, being bordered by two districts of Bihar. It contains an area of 1,231 square miles. Owing to great pressure of population on the soil and its general productiveness, land in Ballia, for agricultural purposes merely, has a market value higher than in almost any other district in the province. In 1931 the population was 913,090. The principal crops are rice, barley and other food-grains, pulse and sugar-cane. Sugar is the only manufacture.

BALLIN, ALBERT (1857–1918), German shipowner, was born in Hamburg Aug. 1j, 1857. Educated for a mercantile career, his first notable achievement was the organization of the emigrant traffic on the Carr line. He then took over the management of the passenger traffic on the Hamburg-Amerika line, becoming, in 1886, director and shortly afterwards director-general of that enterprise. Under Ballin's leadership the Hamburg-Amerika line expanded steadily, acquiring numerous other shipping companies and increasing its capital tenfold. By negotiating agreements with other shipping companies, Ballin practically reorganized Germany's shipping trade; and he was the author of the German-American shipping agreement of 1902. He died suddenly in Hamburg Nov. 9, 1918.

See P. F. Stubmann, *Ballin: Leben* und *Werk eines deutschen Reeders (1926).*

BALLINA, urban district, Co. Mayo, Eire, on the river Moy, and on the Killala branch of the Great Southern railway Pop. (1936) 5,728. In the suburb of Ardnaree is the Roman Catholic cathedral (diocese of Killala), with an east window of Munich glass, and the ruins of an Augustinian abbey (1427) adjoining. There is a Roman Catholic diocesan college and the Protestant parish church is also in Ardnaree. A convent was erected in 1867. In trade and population Ballina is the first town in the county. The salmon-fishery and fish-curing are important branches of its trade; and it has also breweries and flour-mills and manufactures snuff and coarse linen. In 1798 Ballina was entered by the French.

BALLINASLOE, town, Co. Galway, Eire, 91 mi. W. of Dublin, on the Great Southern Ry. Pop. of urban district (1936) 5,834. The town contains remains of a castle of Elizabethan date. Industries include brewing, flour-milling, tanning, hat-making and carriage-building. Trade is assisted by water-communication through the Grand canal to the Shannon. The town is widely celebrated for its great annual cattle-fair held in October. Adjoining the town is Garbally castle, into the demesne of which the great fair extends from the town.

BALLISTIC GALVANOMETER, a galvanometer *(q.v.)* with a small damping factor and therefore a long period of oscillation.

BALLISTICS. Ballistics is that branch of Applied Physics which deals with the motion of projectiles and the conditions governing that motion. In practice the subject is confined to military projectiles, such as rifle bullets, artillery shells and

aeroplane bombs. There are two principal divisions of the subject, Interior Ballistics, which deals with the motion of the projectile while still in the gun, and Exterior Ballistics, which deals with the motion in free air. Obviously the former has no application to bombs. Subsidiary topics are Ballistics of Penetration, which deals with the motion of a projectile in penetrating armour or other dense media, and Fragmentation, which deals with the breaking up of an explosive projectile by its own bursting charge. (See AMMUNITION and ARMOUR PLATES.)

INTERIOR BALLISTICS

The high velocity imparted to a projectile as it leaves the muzzle of a gun appears, to the unaided senses to have been acquired instantaneously. Actually the acquisition of this velocity, although very rapid, has a history which may be studied in great detail either theoretically or experimentally. The energy necessary to produce the velocity is furnished by the "combustion" or "burning" of a propellant. The combustion of 'a propellant is an explosion; that is it differs from ordinary burning in that it takes place without requiring the presence of air. It resembles ordinary burning, however, in that it is a chemical reaction taking place only on the surfaces of the powder grains. In this it differs from the detonation of a high explosive which proceeds as a wave through the body of the explosive and is incomparably more rapid. The actual rate of burning of a propelling charge is very carefully regulated by the design of the powder grains both in shape and size. The reader should not be misled by the word grain, since a grain may be nearly an inch in diameter, and the word may even be applied to the long pieces of British cordite or French strip powder. Even among the smallest grains, such as those used in small arms, the size and shape of the grain is carefully regulated, the latter commonly being that of a hollow cylinder.

The general character of the phenomena taking place in a gun when it is fired is as follows. The powder is located in the *chamber,* which is a somewhat enlarged part of the bore near the breech. (See ORDNANCE.) The front of the chamber is formed by the base of the projectile and is more or less effectively sealed in the case of artillery by the driving *band* or rotating *band.* This is, a band of copper or other relatively soft metal encircling the projectile near the base. Its main purpose is to engage the rifling and so impart a spin to the projectile as it moves forward, the sealing of the chamber being subsidiary. When the powder is ignited it begins to generate gas and causes the pressure in the chamber to rise. When the pressure has reached a value sufficient to overcome initial band resistance, usually of the order of 1,000lb./in.², the projectile begins to move, thus starting to increase the volume available for powder and gases. The rate of burning is so rapid, however, that the pressure continues to rise until the projectile has moved a distance of the order of one or two calibres. The greatly accelerated motion of the projectile finally increases the volume available for the powder and gases more rapidly than the powder gas is generated, and the pressure then reaches a maximum and begins to decrease. The combustion of the powder may be complete shortly after this or may continue until the projectile nearly or quite reaches the muzzle. In any case the pressure continues to decrease but the projectile velocity continues to increase. As soon as the base of the projectile passes the muzzle there is an escape of gas and a more rapid fall in pressure, and the projectile receives only a slight further acceleration, so that it reaches its maximum velocity a very short distance beyond the muzzle. These phenomena take place in a time interval that varies from a value such as ·0014sec. for a calibre 0.30 rifle to ·06sec. or more for a 16in gun.

R. H. KENT, "THE FLIGHT OF PROJECTILE," JOURNAL OF THE FRANKLIN INSTITUTE, 1938. (RECORD FROM ABERDEEN PROVING GROUND.)

FIG. 1. PRESSURE VS. TIME FOR TWO ROUNDS IN A 155 MM. GUN (Read from right to left.) These are two actual records in the same gun. The upper indicates the pressure waves or surges of powder gas back and forth resulting in irregularities in variation in pressure. The lower shows a smaoth curve resulting from improved design of charge.

Basic Equations. — The study of interior ballistics is usually made to depend on three basic equations The first is the energy equation, which states that the energy developed by the combustion of the propelling charge is equal to that appearing in certain other forms of kinetic and potential energy. The second is the equation of motion of the projectile, which states that its acceleration is proportional to the force acting on it. The third is the equation of the law of burning, which gives the rate at which the burning surfaces of the powder grains recede as a result of the combustion of the ponder. Of almost equal importance with these three is the granulation function, which gives the volume of a powder grain consumed when a given thickness is burned from the surface. The development of the subject is carried out by reducing these laws to a system of differential equations, whose integration gives the relations connecting time, powder pressure, projectile travel and projectile velocity.

Energy Equation. — The energy E_c released by the chemical reaction of that part of the charge which has burned previously to any particular instant, must be accounted for in three ways: E_k, the mechanical kinetic energy of projectile, gun and charge; E_g, the energy of the powder gases due to their high temperature; and E_f, the energy dissipated by friction and direct heat losses. The energy equation may hence be written

$$E_c = E_k + E_g + E_f.$$

It remains to reduce this to the form of a differential equation To do this it is necessary to find suitable expressions for each of the terms.

As regards the term E_c it will be assumed that a unit weight of a specified powder liberates by its "combustion" a definite quantity of energy, n', and that this may be measured either in mechanical work that the resulting gas could do by expanding adiabatically to infinite volume and zero pressure, or in heat units that the gas would give up by cooling to absolute zero. It is obvious that neither of these processes can be carried out even approximately; but the absolute zero of temperature or pressure merely provides the most convenient energy level to reckon from. The quantity n' is called the specific energy of the powder and depends on its chemical composition and its temperature when fired. In certain cases where the pressure or temperature is unusually high the value of n' may depend somewhat on the pressure at which the combustion takes place; but in general this dependence is negligible. If the weight of the charge is c and the fraction which at any instant has been burned is G, then $cn'G$ is the energy released by the combustion proper. If, however, the gases originally generated undergo any further reaction upon cooling, this reaction will liberate an additional amount of energy (see CHEMICAL ACTION and THERMOCHEMISTRY) and mill produce a slight progressive increase in the value of n'.

The value of E_k is the sum of the kinetic energies of the projectile, gun and charge, the last including the powder gases and the unburned powder. The kinetic energy of the projectile includes that of rotation as well as translation. Of all these the energy of translation of the projectile is the principal component and is far greater than all the rest combined. In gravitational units it is equal to $pv^2/2g$, where p is the mass of the projectile, v its velocity and g the acceleration of gravity. By the principle of the conservation of momentum it is easy to show that the other components of the kinetic energy bear a ratio to this principal one which is very nearly constant for any given

round. Hence the combined kinetic energies may be written $E_k = p'v^2/2g$ where p' is called the reduced weight of the projectile, and is easily formulated as a mass slightly greater than that of the projectile alone.

The value of E, at any instant depends upon the fraction of the charge which has up to that instant been converted into gases, upon the chemical composition of these gases, and upon their pressure, temperature and volume, the last three being connected by the characteristic equation or equation of state (see LIQUEFACTION OF GASES) of the powder gas mixture. The composition of the powder gases depends of course upon that of the powder, and nearly all powders consist exclusively of compounds of the four elements, hydrogen, oxygen, nitrogen and carbon. (*See* EXPLOSIVES.) The composition depends also upon the equilibrium constants of the possible reactions among the powder gases, as was pointed out in discussing E_c, so that it varies with the (approximately adiabatic) cooling and expansion of the gases as the projectile moves forward. In all cases the principal constituents are the five gases, CO, CO_2, H_2O, H_2, and N_2. For the powder gases from nitrocellulose powders, which have a relatively low combustion temperature (2600°–2700°C.), or the NH powders, which are still cooler, and for any powder gases after moderate expansion, the presence of other gases is negligible. In the hotter gases from such powders as cordite before much expansion has taken place, there may be appreciable quantities of OH, NO, O_2, H, O, N, and possibly others, their combined concentration not exceeding 10% of the whole in any ordinary case. When only the five common gases are present, their relative amounts are completely determined by the amounts of the elements and the value of the equilibrium constant for the water gas reaction $CO+H_2O \rightleftarrows CO_2+H_2$, this constant depending mainly on temperature and very slightly on pressure.

The equation of state of each of the powder gasesmay bewritten

$$P(V-nB)=nRT, \tag{1}$$

where P, V and T are respectively the pressure, volume and absolute temperature of the gas, n is the number of gram-molecules present and R is an absolute constant. The quantity B is called the co-volume. It may be regarded as defined by equation (1); but for the high temperatures and pressures occurring in the powder gases B is nearly constant for each gas and there is a tendency for the slight variations of B in the individual gases to compensate each other in the powder gas mixture, so that (1) may be regarded as a very satisfactory equation for the mixture with B constant if n is replaced by Σ n, the sum of the numbers of gram molecules of all the gases. It is also an empirical fact that ΣnB for the powder gas mixture bears a nearly constant ratio to the volume of the solid powder, the ratio for nitrocellulose powders being very close to $3/2$. If covolume of unit weight of gas is called b we may replace ΣnB by bcG. It is then easy to show that the energy of the powder gases may be written

$$E_g = (V - bcG)/\beta$$

where

$$\frac{1}{\beta}=\frac{\Sigma n\int_0^T C_v dT}{RT\Sigma n}. \tag{2}$$

Here C_v is the molecular heat at constant volume, which is known for each gas as a function of T, the function being determined at moderate temperatures experimentally, and at higher temperatures by quantum theory (*q.v.*) from spectroscopic data. (Molecular heat is specific heat with the gram-molecule as unit of mass.) The dependence of E_g upon temperature and gas composition is thus confined to the factor β whose evaluation does not require a very accurate determination of the gas composition. With the latter known we may write

$$T=P(V-bcG)/R\Sigma n \tag{3}$$

Our knowledge of E_f is less satisfactory than that of any other term. The work of Crow and Grimshaw (see *Bibliography*) has included investigation of the thermal part. The frictional part may be further subdivided into band resistance and gas friction. The latter has been neglected until comparatively recently, but is probably of considerable importance in small arms. So little has been known about E_f that its analytic expression has been dictated mainly by convenience. Thus French writers frequently incorporate its effect in p'. In America an equivalent practice has been followed except that a separate provision has been made in the initial conditions for the increased band resistance at starting. With this provision we write $E_f = e_p E_k$ and assume e_p to be constant for the round.

The energy equation then will appear in the form

$$cGn' = \frac{(1+e_p)p'v^2}{2g}+\frac{P(V-bcG)}{\beta}. \tag{4}$$

It is customary to reduce this to the form of a differential equation with the time t as independent variable, and one of the dependent variables equal to u, the projectile travel with respect to the bore. This makes

$$v=\frac{1}{1+e}\frac{du}{dt'} \tag{5}$$

where e is the ratio of recoil velocity to projectile velocity. Also if C is the chamber volume and A the cross-sectional area of the bore, $C+Au$ will be the volume of powder and gases. If ϵ is the specific volume of the powder, the volume of the unburned powder is $c\epsilon(1-G)$ and hence

$$V=Au+C-c\epsilon(1-G). \tag{6}$$

Equation of Motion. — The evaluation of P is effected most conveniently by reducing the equation of motion to an energy form. Since the work done in pushing the projectile along the bore is equal to E_k+E_f, we may write

$$A\int_0^u P du=\frac{(1+e_p)p'v^2}{2g}$$

Differentiating this gives

$$AP\frac{du}{dt}=\frac{(1+e_p)p'v}{g}\frac{dv}{dt},$$

and hence

$$P=\frac{p'(1+e_p)}{gA(1+e)^2}\frac{d^2u}{dt^2}. \tag{7}$$

The substitution in (4) of the values of v, V, and P from (5), (6) and (7), reduces it to a differential equation of the second order in u with auxiliary variables β and G. The value of β can be found from (2) and (3). Only G then remains to be evaluated.

Law of Burning. — To evaluate G it is necessary to formulate certain assumptions. These are that all grains in the charge and all parts of the surface of each grain are ignited simultaneously. that the burning takes place by parallel layers (Piobert's Law, 1840), and that the linear rate of regression of the surface of a grain is a known function of the pressure. Most experimental evidence, but not all, tends to justify Piobert's Law. Ignition is probably almost simultaneous for a well designed charge (cf. Fig. 1). The law of burning that has been most commonly used is Vieille's Law (1893) which states that the linear rate of burning is proportional to some power of the pressure. The exponent of this power, however, has been given a variety of values lying between 0·5 and 1·0. There is little physical justification for a law of this form. All recent investigation points to a rate of the form a_0+a_1P where a_0 and a_1 are constants.

There still remains the determination of G in terms of the thickness burned from the surface. This is a purely geometric problem, involving only the size and shape of the grain. In fact if we replace the linear thickness burned by z the fraction of the web burned (where the web is the least linear dimension of the grain), the form of G as a function of z depends only on the shape of the grain, and is readily evaluated by elementary methods Most of the commonly used shapes of grain are degressive, *i.e.*, dG/dz decreases as z increases. The simple hollow cylinder has dG/dz nearly constant, and is said to be of constant emission. Powder for American artillery is usually progressive, *i.e.*, dG/dz

increases with z. This is accomplished by making the grains multiperforated, that is, provided with several cylindrical perforations (usually seven) all parallel to the axis. As the grains burn the areas of these surfaces increase in the aggregate more rapidly than the area of the outer surface diminishes. In this powder when the web is burned through, the grain is not completely consumed, but breaks up into "slivers" whose burning is of course degressive.

From the law of burning G is a known function of z, and z satisfies a differential equation of the form

$$\frac{dz}{dt} = \frac{f(P)}{w} \tag{8}$$

where w denotes the web thickness.

Treatment of the Equations. — Equation (8) and the second order equation derived from (4), together with the various auxiliary relations which have been developed, form a self contained system of which a solution is uniquely determined by a set of initial conditions. These include $u=o$ when $t=o$, and P equal to the pressure necessary to overcome the initial band resistance. This requires that the burning should have proceeded to an appreciable extent, so that z and G will not be initially zero. The solution of the system of equations can be carried out in any particular case by the process of numerical integration, or mechanical integration, both of which are discussed in the section on *Exterior Ballistics*. The achievement of any general theory by this method would, however, involve an entirely prohibitive amount of labour, since solutions would be needed for all possible combinations of a large series of values of each of the parameters, c, C, p, A, n', and various others having an appreciable effect. It is possible, however, to make a transformation of variables such that the number and effect of the independent parameters is very greatly reduced. This may be done in a variety of ways. For example, the travel u may be replaced by the *expansion ratio* $(C+Au)/C$. This clearly eliminates the great variation due to the difference in the size of guns. The two parameters c and C are often replaced by their ratio which, if measured in metric units, is called the density of loading. Changes of variables and combinations of parameters may be selected which will reduce the number of parameters and the effects of those that remain to such an extent that all possible cases may be computed and exhibited in a table or set of charts of reasonable extent.

The relations connecting the various parameters and variables of the original equations which become identified in this way is known as the theory of ballistic similitudes. It has been largely cultivated by French writers, but the most important single contribution is that of Rŏggla's diagrams (see *Bibliography*). The method of using such a set of diagrams or tables is as follows The known quantities, such, for example, as the dimensions of the gun, weight of projectile, weight of charge, etc., are combined by certain simple formulas to give arguments for entering the tables or charts The entries thus obtained are then combined with the known quantities to give the desired data, such as muzzle velocity, maximum pressure, time of travel, pressure or velocity at any point, etc. The short algebraic manipulations preceding and following the entries in the tables or charts make possible the condensation of the latter to an enormous extent, with a corresponding saving in labour both in preparing and in using them.

Empirical Factors. — Both in the tables or charts and in the formulas which are used with them, there are certain approximations, some explicit, some tacit. For example the factor e_p used in expressing the energy dissipated is likely to be poorly determined. Of course, the aim is always to reduce these doubtful influences to a minimum. Until they are eliminated it remains necessary to introduce empirical factors in order to "fit the firings." The principle upon which an empirical factor is introduced is that, whatever the nature of the unknown influence may be, it varies slowly and regularly. The value of such a factor for one firing, can therefore be estimated with considerable accuracy if its value is known for one or more firings under reasonably similar conditions. In this way, every available element of theory is utilized; but the final result is amended in the most plausible way to agree with observed facts for which the theory is not quite adequate. Two such empirical factors are commonly necessary in interior ballistics, one for muzzle velocity and one for maximum pressure, since these two are both routine measurements.

Experimental Data. — The foregoing discussion has been almost wholly theoretical. Experiment is needed both to verify and to complete the theory. For example, it was said that burning takes place by parallel layers and the linear rate has the form a_0+a_1P. Besides the need for justifying such statements, it is necessary to determine the values of a_0 and a_1 for a particular powder and to determine what these coefficients depend on. These are specifically ballistic problems. General physical theory may shed light on them; but concrete results must be obtained by observations actually performed on explosives. On the other hand, specific heats of gases, equations of state, heats of formation, equilibrium constants, etc., are matters of general interest in physics and chemistry, and fairly full information on these things may be found in general scientific literature. The distinction is not fundamental; but it is convenient here for the purpose of limiting the kinds of experimental data discussed.

There are two principal types of experimental firings in interior ballistics, those in a gun and those in a *closed chamber*. This latter is a vessel similar to the chamber of a gun except that it is permanently closed where the gun chamber is only temporarily closed by the projectile. If a charge of powder is fired in such a vessel, one may investigate the law of burning of the powder and certain features of the gas laws without the complication due to the change of volume of the gases and particularly the unknown passive resistance. Noble and Abel (1870) carried out the first extensive closed chamber experiments. They obtained extremely important results in spite of the fact that their instrument for measuring pressure gave them only the maximum pressure. and not a time record.

The measurement of pressures is not peculiar to ballistics; but there are certain distinctive features about methods suitable for the measurements of pressures whose complete rise and fall may last only a few ten-thousandths of a second and be accompanied by temperatures well above 3000°C. The commonest and simplest device for this purpose is the *copper crusher gauge*. This consists of a housing in which a freely moving steel piston has its outer end exposed to the powder gas pressure and its inner end compresses a small copper cylinder, which is replaced after each measurement. The outer end of the piston is provided with a copper obturating cup to prevent the leakage of gas into the housing The pressure is determined by measuring the length of the copper cylinder before and after using, and interpreting this in terms of powder gas pressure by an empirical calibration. One or more gauges of this sort may be placed loose in the chamber of a gun along with the powder or may be inserted in recesses made for the purpose in the chamber wall. Such a gauge records only the maximum pressure; but this is sufficient for routine purposes of proof firing of guns or acceptance tests of powder. It furnished the only pressure data in the pioneer work of Noble and Abel, and crusher gauge records are useful in ballistics even yet, because they exist in such large numbers over such a variety of conditions, that they may be made to furnish a statistical check on any proposed theory.

In the work of Noble and Abel, the maximum pressures furnished the following items of information. When combustion is complete, equation (3) becomes

$$P(V-bc)=RT\Sigma n. \tag{9}$$

For a given kind of powder Σn is proportional to c, and the combustion temperature T_c is independent of c Hence $f=RT_c\Sigma n/c$ is a quantity characteristic of the powder. It is called its *force* and is a quantity which may be used instead of specific energy in a modified form of the energy equation. Equation (9) may then be written $P(V-bc)=cf$, or

$$\frac{V}{c}-b=\frac{f}{P}.$$

Since V, b and f are constants, this is a linear equation in $1/c$ and $1/P$, with constant coefficients, of which V is known. If the ex-

periment is performed with various charges of the same kind of powder in the same chamber, plotting $1/P$ against $1/c$ should give a straight line from nhich b and f can be immediately determined. If the plotted points actually lie on a straight line the hypotheses used are measurably verified. If they do not, one must seek experimental errors before abandoning the theory. For example, cooling of the gas by the walls of the chamber may lower its temperature so that the theoretical maximum pressure is never reached, and this cooling will modify the results more with a small charge than with a large one. This question of a "cooling correction" has persisted as a difficulty in interpreting experiments in interior ballistics to the present day (1940). The most effective way of dealing with it is the use of closed chambers of different sizes, the larger the better.

Experiments giving only the maximum pressure throw no light on the law of burning. In *1893* Vieille modified the crusher gauge so as to bring one end of the piston outside the chamber and so allow a recording stylus to be attached to it. This permitted a time record of the rise in pressure. This apparatus is subject to various errors including a lag due to the inertia of its moving parts. The Petavel gauge (1905) uses the elastic deformation of steel instead of the plastic deformation of copper and greatly diminishes this defect. The piezo-electric gauge devised by Sir J. J. Thomson (1917) makes use of the electric charge developed on crystals of tourmaline or quartz by application of pressure. This gauge may be used to record pressures in guns as well as closed chambers, since the recording apparatus (a cathode ray oscillograph) is connected to the gauge itself only by wires, and hence is not affected by the motion of recoil. The pressure records in Fig. 1 were made by a piezo-electric gauge. It is clear that a time record of the pressure in a closed chamber affords a very substantial check on any law of burning. When this has been established, pressure records in a gun, in conjunction with chronograph records of projectile travel, check various other parts of the theory.

EXTERIOR BALLISTICS

After the projectile has moved a short distance from the muzzle, so that it is free from the muzzle blast, it is acted on by only two forces, gravity and air resistance. Under the influence of these two, its centre of mass describes a certain curve in space called its *trajectory*. The determination of a trajectory, which is the principal problem of exterior ballistics, includes not only a knowledge of the curve, but of the time relation also, that is, it is necessary to determine the co-ordinates as functions of the time t.

A trajectory derived on the assumption that air resistance can be neglected is called a vacuum trajectory. *(See* MECHANICS.) Its chief utility in practical ballistics is to serve as a limiting case. Only very rarely can it be regarded as a useful approximation to an actual trajectory.

All modern military projectiles have roughly the shape of an elongated cylinder with a more or less pointed "nose." For satisfactory flight such projectiles must be maintained "nose on," *i.e.*, their axis of figure must remain nearly tangent to the trajectory. With respect to this requirement, they are classified as *spin stabilized* and *fin stabilized*. The former are maintained nose on by a rapid spin imparted to them by the rifling or system of helical grooves in the bore of the gun. Their stability is very closely related to that of a top. The latter are stabilized by the attachment to the rear end of fins or vanes upon which the air exerts a restoring force when the projectile axis departs from tangency to the trajectory. Fin stabilized projectiles include all aeroplane bombs and certain mortar projectiles. All others are spin stabilized.

Differential Equations of Motion.—The general form for the equations of motion for the centre of mass of any moving body may be written

$$\frac{dx}{dt}=v_x, \quad \frac{dy}{dt}=v_y, \quad \frac{dz}{dt}=v_z, \tag{10}$$

$$m\frac{dv_x}{dt}=P_x, \quad n\,\frac{dv}{dt}=P_y, \quad m\frac{dv_z}{dt}=P_z \tag{11}$$

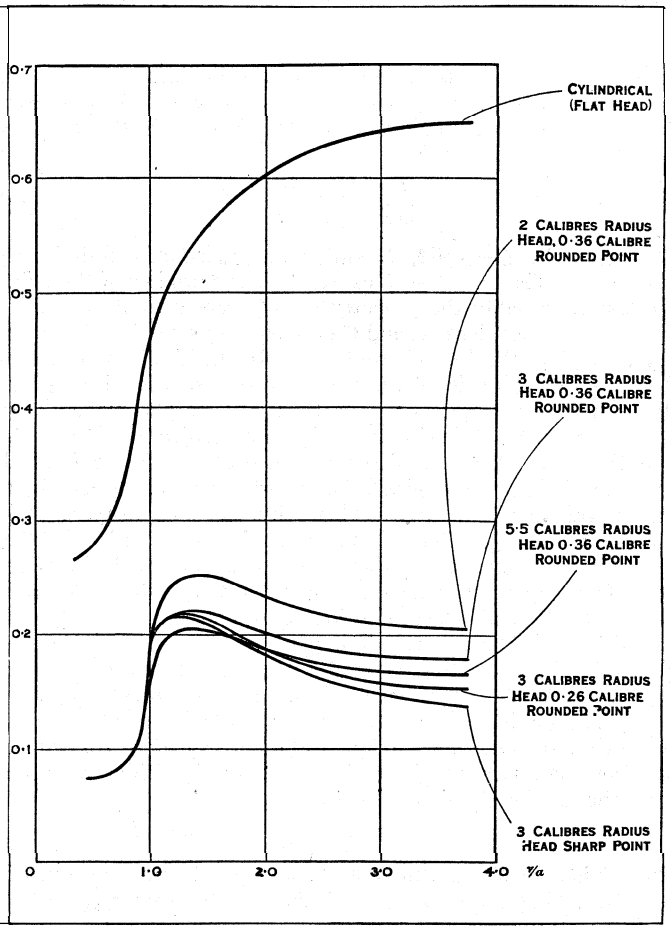
where x, y and z are the rectangular co-ordinates of the centre of mass, v_x, v_y and v_z, the corresponding components of its velocity v, and P_x, P,, P_z, the components of the resultant of all the forces acting. In ballistics the origin is taken at the point of departure, the x axis horizontally forward in the plane of fire, the y axis vertically upward, and the z axis to the right.

The complete determination of the system of forces acting on a rapidly spinning or oscillating projectile is relatively difficult and complicated. It depends not only on the characteristics of the air, the size and shape of the projectile, and the motion of the centre of mass, but also on the angular position and angular velocity of the axis of the projectile, which in turn depend on the previous action of the force system. Thus there are introduced other differential equations besides (10) and (11) which must be handled in connection with these. For many practical purposes, however, the assumption is made, and is usually sufficiently accurate except for determining deflections, that the only force necessary to consider besides gravity is the *drag*, which is that component of the total force due to air resistance whose direction is exactly opposite to that of the projectile's motion through the air. If this force is called D, and if there is no wind, the three components of D are $-Dv_x/v$, $-Dv_y/v$ and $-Dv_z/v$. It is readily seen that on these assumptions v_z and P_z will remain equal to zero, and that $P_x=-Dv_x/v$ and $P_y=-Dv_y/v-gm$. If E denotes D/mv, equations (11) become

$$\frac{dv_x}{dt}=-Ev_x, \quad \frac{dv_y}{dt}=-Ev_y-g \tag{12}$$

Here E may be called the *relative retardation* since it is the ratio of the retardation to the velocity. It remains to determine the laws governing the value of D or of E.

Considerations of dimensions *(see* UNITS, DIMENSIONS OF)



FROM DRYSDALE, "MECHANICAL PROPERTIES OF FLUIDS" (BLACKIE & SON)

FIG. 2.— THE DRAG COEFFICIENT FOR 10 CM. PROJECTILES
Showing how it varies with velocity. The effect of small changes in the shape of head can be seen in the curves. Note the effect at high velocity

verified in considerable part by experiment, lead to the form

$$D = K_D \rho d^2 v^2, \qquad (13)$$

nhere p is air density, d is projectile diameter, and K_D is called the drag *coefficient,* and is readily seen to be of zero dimensions. This means that its numerical value does not depend on the units used for mass, length, time, etc. The drag coefficient is a function of v/a, where a is the velocity of sound in air. This argument v/a is also of zero dimensions. The form of the function K_D depends notably upon the shape of the projectile, as is illustrated in Fig, 2. The various drag coefficients whose graphs are there given, are based on the Krupp experiments of 1912. Similar ones for other shapes have been developed elsewhere. One particular drag coefficient, however, known as the Gâvre function dominated ballistic practice for many years. This resembles rather closely the curve in Fig. 2 for a two calibre ogive. This function was formulated in 1898 by the French Commission d'Expérience de GBvre and was based on an exhaustive study of previous firings in many countries. Since, however, nearly all of these firings had been done with projectiles approximating to the particular shape mentioned, the GBvre function applied only to this shape, but was used by ballisticians for a long period for projectiles of all shapes.

Ballistic Coefficient. — When the differential equations for a particular trajectory are desired there are certain sources of inaccuracy connected with substituting the value of D from (13), in addition to the observational errors connected with any experimentally determined quantities. Only in rare cases will the shape of the projectile agree exactly with one of those for which a drag coefficient has been determined. Of course that one will be selected which is the best approximation; but the error due to the discrepancy may be appreciable. Moreover, on any actual trajectory the projectile has some yaw, *i.e.,* its axis is not exactly tangent to the trajectory, whereas the drag coefficients are determined for a yaw as nearly as possible equal to zero. As a result of yaw the magnitude of the drag is changed, and there may also be introduced an appreciable effect of a component of resistance perpendicular to the drag. To meet these conditions there is introduced into (13) a factor i called a form factor. On this basis we may write

$$E = \frac{D}{mv} = \frac{K_D i \rho d^2 v}{m} = \frac{GH}{C} \qquad (14)$$

where $H = \rho/\rho_0$, $C = m/id^2$, $G = v\rho_0 K_D$, and ρ_0 is standard air density at sea level. The form GH/C expresses E as a product of three factors having roughly the property that G depends only on velocity, H only on air density, and C only on the projectile. The quantity C is called the ballistic *coefficient.* In the ideal case it is constant for a given projectile. In nearly every case it is taken as constant for a given trajectory, even if it is necessary to make it vary between different trajectories for the same projectile. The variation is possible because of the presence of the factor i, which functions in exterior ballistics in the same way as the empirical factors mentioned in interior ballistics. The quantity G is in practice frequently taken as a function of v only and is tabulated for convenience against v^2, there being a separate table for G derived from each experimental drag coefficient such as shown in Fig. 2. (The significance of a in the argument v/a will be discussed later.) The quantity H is proportional to the air density. This depends somewhat on weather variations, but much more upon altitude above sea level, especially for firings from large guns. The method for treating density is to adopt a particular type of air structure as standard and obtain standard trajectories based on that. Other trajectories are then dealt with as variations from these. For standard air structure,

$$H = e^{-hy}, \qquad (15)$$

where h is a constant, commonly taken equal to 0·0001036 if y is in metres. This gives a good approximation to average conditions up to an altitude of 10 kilometres.

Trajectory Computation. — Under standard atmospheric conditions, which include the density law just stated, and the absence of wind, the computation of a trajectory consists in finding a particular solution of the system of differential and auxiliary equations (or their equivalent) which consist of (10), (12), (14) and (15), where C is given some constant value, G is a tabular function of v^2 and $v^2 = v_x^2 + v_y^2$. These equations are very far from representing all the physical facts which are known about the motion of projectiles. They represent, however, an approximation, which from 1914 to the present (1940) has been generally regarded as sufficiently accurate for the preparation of firing tables except for deflections. A great variety of transformations have been applied to these equations for the purpose of facilitating the solution. Among the most obvious of these is the selection of a variable other than t as independent variable. This may be a variable already present, such as x or v_x, or some new variable. Among new variables θ, m and v_x are often used, where $m = v_y/v_x = \tan\theta$. Such alternative systems of differential equations may be derived independently or by transformations of those given here. The suitability of a transformation depends on the ultimate method of solution contemplated and sometimes upon the type of initial conditions.

Prior to 1914 the usual purpose sought was to reduce the equations to a form susceptible of one of the classical methods of solution such as in terms of elementary functions, or series, or at worst, quadratures, or to a form which by a slight alteration would make one of these methods applicable. No such method capable of general application was found; but the method of Siacci (1880) is highly effective for trajectories where the direction of motion remains within a few degrees of the horizontal. This method uses a constant multiple of v_x as independent variable, makes an alteration in the differential equations, which is very small under the conditions noted, and achieves a complete solution of the equations thus modified in terms of four independent quadratures. A table of one argument giving the results of these four quadrature~which are called the primary Siacci functions, provides for the convenient solution of a great variety of trajectory problems, provided the projectile has the shape corresponding to the drag coefficient used in the quadratures and the Siacci restriction on angle applies.

In the general case the methods of attack on the differential equations are graphical, numerical and mechanical. These methods are of a general nature and not peculiar to the equations of ballistics. The graphical method for solving differential equations in general has been developed by various mathematicians. Application to the ballistic equations has been made by Cranz; but the method has not been very widely used. More recently mechanical methods of solution have been developed; but up to 1940 their use is much restricted because the necessary machines are few and costly. These are of t o types. One is a machine specially designed to solve the ballistic equations. A recent example of this is the Flugbahn-Rechengerat proposed by Fiisgen in 1937. The other is the Bush Differential Analyzer (see MATHEMATICAL INSTRUMENTS and PRODUCT INTEGRAPH) which is designed to furnish solutions of a very general class of systems of differential equations, and may be used to obtain those of the ballistic equations.

Numerical Integration. — Since 1917 the principal method of trajectory computation when the Siacci method is not applicable has been some form of numerical integration. The term "short arc method" is sometimes applied to any form of numerical integration, and sometimes confined to the particular form of the method used in France. The term, however, is descriptive of the general method since it proceeds along the trajectory by short arcs. The essence of the method is the assumption that each variable in the equations can be represented with sufficient accuracy in a short enough interval by a polynomial in the independent variable whose degree is usually not greater than the fourth. On this assumption it is easy to derive a formula expressing the difference in the function over a particular interval, in terms of several consecutive values of the derivative, or for convenience, one value and several orders of differences. If, then, the value of the function is known at one point it can be computed by this means at a point slightly farther along. If all the dependent variables are computed in this way at the new point, they may be

substituted in the differential equations to evaluate the derivatives at the new point. The new values of these will either verify or revise the values originally used for the derivatives. If they are revised the process is repeated until no further revision occurs. The whole procedure is then repeated for the next interval, and so on. It remains to explain how this process can be started, since it calls for the use of "several consecutive values of the derivative." Probably the simplest way is to start the integration with such small intervals that the polynomial approximation is linear. For example if the body of the computation is to use an interval of one second, one could begin with values of t equal to $\frac{1}{4}$, $\frac{1}{2}$, 1, $\frac{3}{2}$, 2, 3, . . ., or even prefix $t=\frac{1}{8}$. The process of numerical integration is laborious but has the great merit that it is applicable to any system of differential equations and so exerts no restriction on the physical hypotheses made in setting up the differential equations.

In the United States the method of numerical integration has been applied most commonly to the differential equations in the form in which they are derived in this article, the form developed for the whole process being due to Moulton In Great Britain and France essentially the same method has been applied to equations which may be derived from these by a change of variables, but some accounts of these methods have not separated the explanation of the change of variable from that of the method of integration. In the British method the independent variable is t, but m and $1/v_x$ are introduced as dependent variables. In the notation used here the equations in these variables are

$$\frac{dm}{dt}=\frac{-g}{v_x}, \quad \frac{d}{dt}\left(\frac{1}{v_x}\right)=\frac{E}{v_x}, \quad v_y=mv_x,$$

with the equations for x and y unchanged. The particular merit of this form of the equations is the smoothness at the beginning. The quantity m has its variation slowest near the muzzle. This makes it possible to start with longer steps than in the American method. The latter, however, requires less labour of computation per step.

Considerably prior to 1917 a highly specialized form of short arc method was developed in France by Garnier and Haag, and later modified by Marcus. In 1919 a somewhat similar form was used in the preparation of the **A.** L. V. F. Tables, a very comprehensive collection of trajectory results. The trajectory method for this table was essentially the use of an independent variable

$$\xi=\int_0^\theta \sec^3\theta d\theta,$$

and a set of differential equations

$$\frac{d}{d\xi}\left(\frac{1}{v_x^2}\right)=\frac{-2E}{gv}, \quad \frac{ds}{d\xi}=\frac{-v_x^2}{g}$$

where s is arc length and hence $dx/ds=\cos\theta$ and $dy/ds=\sin\theta$. In this method, in order to expedite the integration process, a special device was used which depends on the particular equations.

Differential Variations.—Unless mechanical integration is used the computation of a trajectory is so laborious that every device is sought to keep the number of trajectories as small as possible and extract the maximum amount of information from each one computed. To this end the method of differential variations was developed. By this, from a single trajectory one may infer with a high degree of approximation the values belonging to a large number of others provided the determining conditions for these do not differ too widely from those of the original. In this connection the conditions of the original trajectory are called standard and those of the inferred trajectories non-standard. Thus a trajectory is computed with a particular muzzle velocity, angle of departure, and ballistic coefficient, with standard density, standard temperature and no wind. Any variation from these conditions is called non-standard. If we denote by x and y the co-ordinates on the standard trajectory at any time t, and by $x+\xi$ and $y+\eta$ the co-ordinates on the non-standard trajectory at the same time, then for the former, (10) and (12) may be combined as

$$x''=-\mathrm{E}x', \quad y''=-Ey'-g, \tag{16}$$

and the corresponding equations for the latter will be

$$x''+\xi''=-(E+\Delta E)(x'+\xi'), \quad y''=-(E+\Delta E)(y'+\eta')-\mathrm{g}, \tag{17}$$

where $E+\mathrm{AE}$ is the new value of E obtained when x', y' and y are replaced by $x'+\xi', y'+\eta'$ and $y+\eta$. If $\xi, \eta, \Delta E$, etc., are regarded as small quantities in the sense that the product of any two of them can be neglected, then expanding (17) and simplifying by subtracting (16) and dropping second order terms, will yield

$$\xi''=-E\xi'-x'\Delta E, \quad \eta''=-E\eta'-y'\Delta E. \tag{18}$$

It can be shown that ΔE may be expressed linearly in terms of ξ', η' and η. This makes it possible to reduce (18) to a system of four linear differential equations of the first order in which the independent variable is t, and the coefficients are functions of t which are known by means of the standard trajectory. Two well-known mathematical theories are then available. One of these, employed by Moulton, proceeds from the fact that the general solution of such a system is linearly dependent on a "fundamental set" of particular solutions. This is applicable to differential variations of anti-aircraft trajectories, where the variations are needed at all points of the trajectory. The other theory is that of the *adjoint system*, developed by Bliss and Gronwall. This is an extremely efficient method for finding range variations, that is, displacements of the point of fall, due to all possible causes Since range variations are the only ones of importance in ground fire, the second method is preferable for this case. In each method it is necessary to find one or more particular solutions of a system of equations by numerical integration; but the labour is much less than that of computing the large number of new trajectories otherwise necessary.

Of course in order to apply either of these theories it is necessary to know what change in the differential equations or in the initial conditions is made by the introduction of any particular non-standard conditions. A change in muzzle velocity or angle of departure affects the initial conditions. Thus for a change Δv in muzzle velocity, $\xi_0'=\Delta v\cos\phi$ and $\eta_0'=\Delta v\sin\phi$, but for a change $\Delta\phi$ in angle of departure, $\xi_0'=-v_0\Delta\phi\sin\phi$ and $\eta_0'=v_0\Delta\phi\cos\phi$. For these two cases there is no change in the differential equations. For the other cases $\xi_0'=\eta_0'=0$; but there is a change in the differential equations. Of course in all cases $\xi_0=\eta_0=0$. The change in the equations due to a change in ballistic coefficient is explicit from (14). A change in density obtained by multiplying the standard density by a constant factor is also seen from (14) to be equivalent to multiplying C by the reciprocal factor. In discussing the drag coefficient K_D it was stated that its argument is v/a where a is the velocity of sound in air. The variation in the factor $1/a$ was then ignored. It must be considered in connection with temperatures. It is known that the velocity of sound in air is proportional to the square root of the absolute temperature. A change in temperature therefore alters K_D and hence G by changing the value of a and hence of the argument v/a.

In discussing the effect of wind on a trajectory it is convenient to resolve the wind vector into two components, the *range wind* in the plane of fire and the *cross wind* perpendicular to this. Since the air resistance is clearly dependent on the velocity of the projectile with regard to the air, the presence of a range wind of velocity w requires that in (16) x' shall be replaced by $x'-w$ both where it occurs explicitly and also in the formation of E. Cross wind will be discussed under deflections. The effect of the rotation of the earth need be considered only in the case of large guns. It can be shown that this effect replaces (16) by the equations,

$$x''=-Ex'-Ky', \quad y''=-Ey'-g+Kx',$$

and makes a corresponding change in (17), where $\mathrm{K}=2\Omega\cos\mathrm{L}\sin\alpha$, L is latitude, α is azimuth of fire measured from the north and Ω is the earth's rotational velocity in radians per second.

For a standard trajectory, the formal assumption is made that $z=0$. Any deflection is on this basis a differential variation. There are deflections due to cross wind and to the rotation of the earth, the treatment of which calls for the use of a differential equation in z similar to those given for x and y. In the case of a spin-stabilized projectile, the standard trajectory has a small deflection called *drift*. (*v. infra*)

The foregoing discussion has outlined the kinds of computations necessary in the preparation of a firing table. Such a table includes (a) a range elevation relation or table giving, for the particular gun in question, the elevation necessary to reach any range under standard conditions, and (b) a series of tables of differential effects each of which gives the effects on range or deflection of some particular departure from standard conditions, such as a decrease in muzzle velocity of 50ft./sec., an increase of 1% in air density or a cross wind of 10mi./hr. In the case of density, wind and temperature, the effects are given on the basis of the non-standard condition being constant for the whole trajectory. This is never the case in practice. All these conditions show variation with altitude, that of the wind being specially large. **A** method of dealing with this variation is the following.

Weighting Factors.—With either system for differential variations it is possible to find the effect of a non-standard condition beginning

at an arbitrary point of the trajectory. In the method of the adjoint system, this is especially easy. In fact it requires no additional work whatever except in the case of temperature, and in that case merely recording the intermediate sums in performing a quadrature. Thus in the case of a range wind or cross wind for example it is possible to write the effects of unit wind blowing in the last 5 seconds of the trajectory, in the last 10 seconds, and so on. If this effect is expressed as a fraction of the effect of the wind on the whole trajectory, it constitutes a *weighting factor* for that part of the trajectory. Clearly any part of the trajectory whatever can be expressed as the difference of two parts of this kind. If then different winds blow in different parts of the trajectory the total result is that of a weighted mean of the different values where the weights are furnished by the weighting factors thus derived. Such a weighted mean is called a *ballistic mnge wind* or *ballistic cross wind*. There is a similar meaning for *ballistic density* and *ballistic temperature*. These then are the factors which should be applied to the effects of unit wind, density variation or temperature variation to obtain the actual effect.

Range Firings and Their Reduction.—Standard trajectories for a given weapon can be computed only if appropriate values of C for the projectile are known. These are obtained from *range firings*, that is, firings at various angles of elevation (and for a zoned weapon, various muzzle velocities) in which the range, all firing conditions, and all weather conditions are carefully observed. The method of obtaining the value of C from such a firing is essentially that of trial and error, but the application of differential variations usually makes one trial sufficient. With the muzzle velocity and angle of departure of the range firing and an estimated C there is computed a standard trajectory and a set of differential variations. The observed range is then corrected for the weather conditions, etc., by means of the differential variations and the corrected result compared with the computed range. The discrepancy is attributed to error in C, of which the magnitude can he found by means of the differential variation for density, provided the discrepancy is not too great. In the latter case, the procedure must be repeated with an improved value of C for the trial. The final value of C for each range-firing point is then plotted and a smooth curve drawn which gives the values of C to be used for the firing table.

The Projectile as a Rigid Body.—The simplified hypothesis employed in deriving equations (12) is reasonably adequate for treating the topics dealt with up to this point. This hypothesis, that the drag is the only component of air-resistance, is virtually correct for small values of the *angle of yaw*, that is, the angle between the projectile axis and the tangent to the trajectory. A much more comprehensive theory is necessary to determine under what circumstances this angle remains small (*i.e.*, when is the projectile *stable)* and to account for the phenomenon of drift in spin-stabilized projectiles No account of that theory can be given here, but only a few words of description of the phenomena involved. The disturbance due to launching may produce a relatively large initial yaw. This produces a correspondingly large *cross wind force* or component of air resistance perpendicular to the drag and in the *plane of yaw*, which is the plane containing the projectile axis and the tangent to the trajectory. In the case of a spinning projectile, however, the plane of yaw rotates very rapidly at this stage. Consequently the direction of the cross wind force is repeatedly reversed and produces relatively little lateral displacement, so that the actual trajectory has merely a slight "corkscrew" shape winding around the smooth curve given by the simpler hypothesis. For a well-designed projectile, the initial yaw is quickly damped out; but as soon as the curvature of the trajectory due to gravity becomes appreciable a slight yaw due to this cause is introduced. The immediate effect of this is for the nose of the projectile to point above the trajectory. Because of gyroscopic action, however, the plane of yaw precesses slowly to the right if the spin is to the right. This introduces a cross wind force which continues to act to the right and so produces the drift.

Experimental Data.—The most fundamental data of exterior ballistics to be derived from experiments are the various drag functions. The finding of the value of one of these at a particular point requires the simultaneous determination of a velocity and a retardation. This can be done by a record of the times at which a projectile passes three or more points. This record may be made electrically by the projectile in a variety of ways, such as making or breaking an electric circuit, producing a current in a solenoid, etc. Data on the yaw of the projectile may be obtained by observing the shape of the hole it makes when fired through a cardboard, or by spark photographs, *i.e.*, shadow pictures made of the projectile in flight by the light of an electric spark of very short duration.

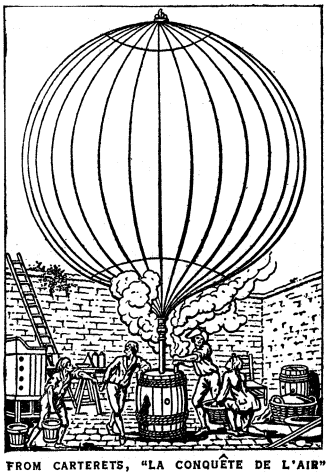
BALLOON, a bag of impermeable material which, when inflated with gas lighter than air, rises from the ground.

Invention of the Balloon.—The first practical balloon was invented by Joseph Michel Montgolfier (1740–1810) and Jacques Étienne Montgolfier (1745–99), of Annonay, a town about 40m. from Lyons The brothers had observed the suspension of clouds in the atmosphere, and it occurred to them that if they could enclose any vapour of the nature of a cloud in a large and very light bag, it might rise and carry the bag with it into the air. Towards the end of 1782 they inflated bags with smoke from a fire placed underneath, and found that either the smoke or some vapour emitted from the fire did ascend and carry the bag with it. Being thus assured of the correctness of their views, they determined to have a public ascent of a balloon on a large scale. They accordingly invited the States of Vivarais, then assembled at Annonay, to witness their aerostatic experiment; and on June 5, 1783, in the presence of a considerable concourse of spectators, a linen globe of 105ft. in circumference was inflated over a fire fed with small bundles of chopped straw. When released it rapidly rose to a great height, and descended, at the expiration of ten minutes at the distance of about $1\frac{1}{2}$ miles. This was the discovery of the balloon The brothers Montgolfier imagined that the bag rose because of the levity of the smoke or other vapour given forth by the burning straw; and it was not till some time later that it was recognized that the ascending power was due merely to the lightness of the heated air compared to an equal volume of air at a lower temperature. In this balloon no source of heat was taken, so that the air inside rapidly cooled, and the balloon soon descended.

The news of the experiment at Annonay attracted so much attention at Paris that Barthélemy Faujas de Saint-Fond (1741–1819), afterwards professor of geology at the Musée d'Histoire Naturelle, set on foot a subscription for paying the expense of repeating the experiment. The balloon was constructed by two brothers of the name of Robert, under the superintendence of the physicist, J. A. C Charles. The first suggestion was to copy the process of Montgolfier, but Charles proposed the application of hydrogen gas, which was adopted. The filling of the balloon, which was made of thin silk varnished with a solution of elastic gum, and was about 13ft. in diameter, was begun on Aug. 23, 1783, in the Place des Victoires. Bulletins were issued daily of the progress of the inflation; and the crowd was so great that on the 26th the balloon was moved secretly by night to the Champ de Mars, a distance of two miles. On the next day an immense concourse of people covered the Champ de Mars, and every spot from which a view could be obtained was crowded About five o'clock a cannon was discharged as the signal for the ascent, and the balloon when liberated rose to the height of about 3,000ft. with great rapidity. A shower of rain which began to fall directly after it had left the earth in no way checked its progress; and the excitement was so great, that thousands of well-dressed spectators, many of them ladies, stood exposed, watching it intently the whole time it was in sight, and were drenched to the skin. The balloon, after remaining in the air for about three-quarters of an hour, fell in a field near Gonesse, about 15m. off, and terrified the peasantry so much that it was torn into shreds by them.



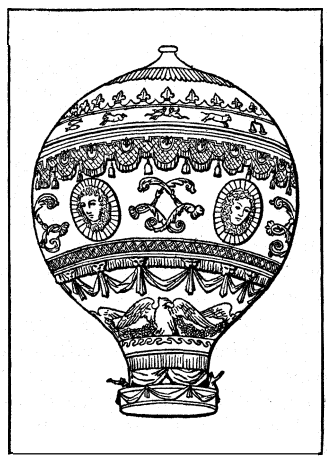
FROM CARTERETS, "LA CONQUÊTE DE L'AIR"

FIG I.—A D 1780 CHARLES' AND ROBERT S BALLOON. THE FIRST PASSENGER BALLOON TO BE INFLATED WITH HYDROGEN GAS

On Sept. 19, 1783, Joseph Montgolfier repeated the Annonay experiment at Versailles, in the presence of the king, the queen, the court and an immense number of spectators. The inflation was begun at one o'clock and completed in eleven minutes, when

the balloon rose to the height of about 1,500ft., and descended after eight minutes, at a distance of about 2m., in the wood of Vaucresson. Suspended below the balloon, in a cage, had been placed a sheep, a cock and a duck, which were thus the first aerial travellers. They were quite uninjured, except the cock, which had its right wing hurt in consequence of a kick it had received from the sheep; but this took place before the ascent. The balloon, which was painted with ornaments in oil colours, had a very showy appearance (fig. 2).

The First Balloonist.— The first human being who ascended in a balloon was Jean François Pilâtre de Rozier (1756–85), a native of Metz, who was appointed superintendent of the natural history collections of Louis XVI. On Oct. 15, 1783, and following days, he made several ascents (generally alone, but once with a companion, Girond de Villette) in a captive fire-balloon (*i.e.*, attached by ropes to the ground), and demonstrated that there was no difficulty in taking up fuel and feeding the fire, which was kindled in a brazier suspended under the balloon, when in the air. The way being thus prepared for aerial navigation, on Nov. 21, 1783, Pilâtre de Rozier and the marquis d'Arlandes first trusted themselves to a free fire-balloon. The experiment was made from the Jardin du Château de la Muette, in the Bois de Boulogne. A large fire-balloon was inflated at about two o'clock, rose to a height of about 3,000 ft., and passing over the Invalides and the École Militaire, descended beyond the Boulevards, about 9,000yds. from the place of ascent, having been between 20 and 25 minutes in the air.



FROM FOUVIELLE, "HISTOIRE DE LA NAVIGATION AERIENNE"

FIG. 2.—MONTGOLFIER'S GAS BALLOON. 1783

Inflated with hydrogen gas, this balloon rose 1,500 feet

Only ten days later, Dec. 1, 1783, J. A. C. Charles ascended from Paris in a balloon inflated with hydrogen gas. The balloon, as in the case of the small one of the same kind previously launched from the Champ de Mars, was constructed by the brothers Robert. one of whom took part in the ascent. It was 27ft. in diameter, and the car was suspended from a hoop surrounding the middle of the balloon, and fastened to a net, which covered the upper hemisphere. The balloon ascended very gently from the Tuileries at a quarter to two o'clock, and, after remaining for some time at an elevation of about 2,000ft., it descended in about two hours at Nesle, a small town about 27m. from Paris, when Robert left the car, and Charles made a second ascent by himself.

All the features of the modern balloon as now used are more or less due to Charles, who invented the valve at the top, suspended the car from a hoop, which was itself attached to the balloon by netting, etc. With regard to his use of hydrogen gas, there are anticipations that must be noticed. As early as 1766 Henry Cavendish showed that this gas was at least seven times lighter than ordinary air, and it immediately occurred to Dr. Joseph Black, of Edinburgh, that a thin bag filled with hydrogen gas would rise to the ceiling of a room. He provided, accordingly, the allantois of a calf, with a view of showing at a public lecture such a curious experiment; but for some reason it seems to have failed, and Black did not repeat it, thus allowing a great discovery, almost within his reach, to escape him. Several years afterwards a similar idea occurred to Tiberius Cavallo, who found that bladders, even when carefully scraped, are too heavy, and that China paper is permeable to the gas. But in 1782, the year before the invention of the Montgolfiers, he succeeded in elevating soap-bubbles by inflating them with hydrogen gas.

Spread **of** Ballooning.— Researches on the use of gas for inflating balloons seem to have been carried on at Philadelphia nearly simultaneously with the experiments of the Montgolfiers; and when the news of the latter reached America, D. Rittenhouse and F. Hopkinson, members of the Philosophical Society at Philadelphia, constructed a machine consisting of 47 small hydrogen gas-balloons attached to a car or cage. After several preliminary experiments, in which animals were let up to a certain height by a rope, a carpenter, one James Wilcox, was induced to enter the car for a small sum of money; the ropes were cut, and he remained in the air about ten minutes, and only then effected his descent by making incisions in a number of the balloons, through fear of falling into the river which he was approaching

Although the news of the Annonay and subsequent experiments in France rapidly spread all over Europe and formed a topic of general discussion, it was not till five months after the Montgolfiers had first publicly sent a balloon into the air that any aerostatic experiment was made in England. In Nov. 1783 Count Francesco Zambecarri (1756–1812), an Italian who happened to be in London, made a balloon of oil-silk, 10ft. in diameter and weighing 11lb. It was publicly shown for several days, and on the 25th it was three-quarters filled with hydrogen gas and launched from the Artillery ground at one o'clock. It descended after two hours and a half near Petworth, in Sussex, 48m. from London. This was the first balloon that ascended from English ground. On Feb. 22, 1784, a hydrogen-gas balloon, 5ft. in diameter, was let up from Sandwich, in Kent, and descended at Warneton, in French Flanders, 75m. distant. This was the first balloon that crossed the Channel. The first person who rose into the air from British ground appears to have been J. Tytler, who contributed largely to, and indeed appears to have been virtually editor of, the second edition (1778–83) of the *Encyclopædia Britannica.* He ascended from the Comely Gardens, Edinburgh, on Aug. 27, 1784, in a fire-balloon of his own construction. He descended on the road to Restalrig, about half-a-mile from the place where he rose.

Lunardi, 1784.—But it was Vincent Lunardi who practically introduced aerostation into Great Britain. Though Tytler had the precedence by a few days, still his attempts and partial success were all but unknown; whereas Lunardi's experiments excited an enormous amount of enthusiasm in London. He was secretary to Prince Caramanico, the Neapolitan ambassador, and his published letters to his guardian, the chevalier Compagni, written while he was carrying out his project, and detailing all the difficulties, etc., he met with as they occurred, give an interesting and vivid account of the whole matter. His balloon was 33ft. in circumference (fig. 3), and was exposed to the public view at the Lyceum in the Strand, where it was visited by upwards of 20,000 people. He originally intended to ascend from Chelsea Hospital, but the conduct of a crowd at a garden at Chelsea, which destroyed the fire-balloon of a Frenchman named de Moret, who announced an ascent on Aug. 11 but was unable to keep his word, led to the withdrawal of the leave that had been granted. Ultimately he was permitted to ascend from the Artillery ground, and on Sept. 15, 1784, the inflation with hydrogen gas took place.

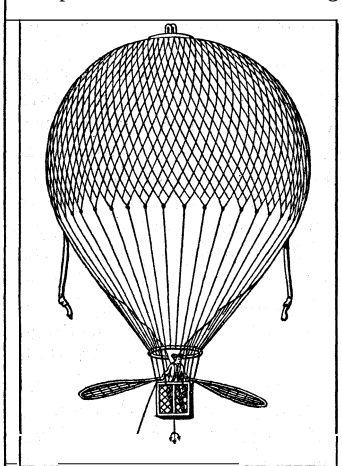


FIG. 3.—LUNARDI'S BALLOON
The balloon used in 1784, by Vincent Lunardi in his successful ascents from London, Edinburgh and Glasgow

It was intended that an English gentleman named Biggin should accompany Lunardi; but the crowd becoming impatient, the latter judged it prudent to ascend with the balloon only partially full rather than risk a longer delay, and accordingly Mr. Biggin was obliged to leave the car. Lunardi therefore ascended alone, in presence of the prince of Wales and an enormous crowd of spectators. He took up with him a pigeon, a dog and a cat, and the balloon was provided with oars, by means of which he hoped to

raise or lower it at pleasure. Shortly after starting the pigeon escaped, and one of the oars became broken and fell to the ground. In about an hour arid a half he descended at South Mimms, in Hertfordshire, and landed the cat, which had suffered from the cold; he then ascended again, and descended, after the lapse of about three-quarters of an hour, at Standon, near Ware, where he had great difficulty in inducing the peasants to come

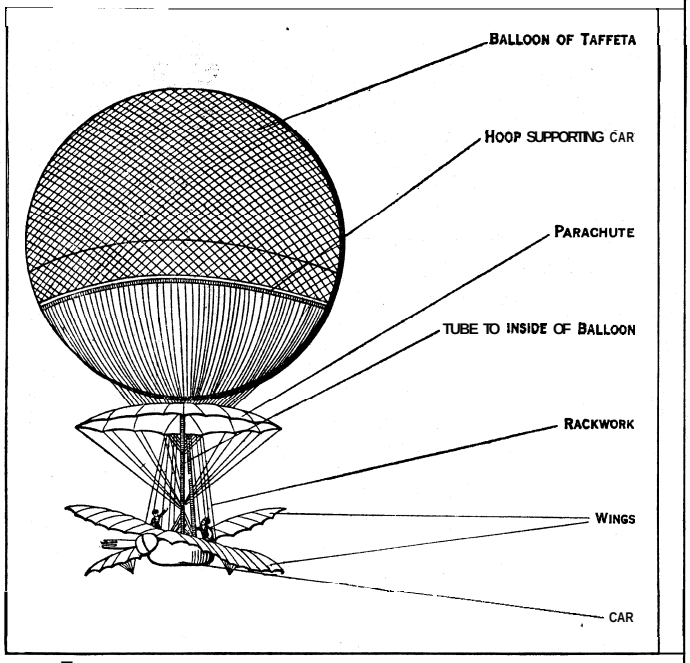

FIG. 4.—THE BALLOON OF BLANCHARD AND JEFFRIES. 1785
Structure of the balloon in which Blanchard and Jeffries made the first flight across the English channel

to his assistance; but at length a young woman, taking hold of one of the cords, urged the men to follow her example, which they then did. The excitement caused by this ascent was immense, and Lunardi became famous. In the following year Lunardi made several successful ascents from Kelso, Edinburgh and Glasgow (in one of which he traversed a distance of 110m.); these he described in a second series of letters.

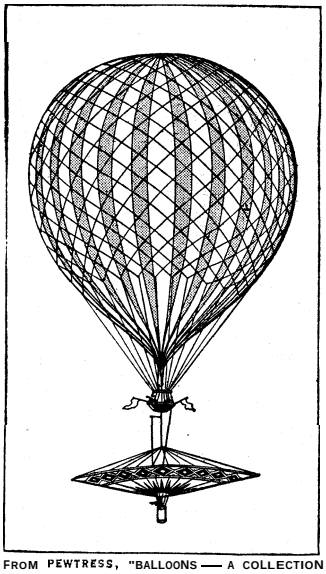
Crossing the English Channel.— The first balloon voyage across the English Channel was accomplished by Jean Pierre Blanchard (1753–1809) and Dr. J. Jeffries, an American physician, on Jan. 7, 1785. In the preceding year, on March 2, Blanchard, who was one of the most celebrated of the earlier aeronauts, made his first voyage from Paris in a balloon 27ft. in diameter (fig. 4), and descended at Billancourt near Sèvres. Just as the balloon was about to start a young man jumped into the car and drawing his sword declared his determination to ascend with Blanchard. He was ultimately removed by force. It has sometimes been incorrectly stated that he was Napoleon Bonaparte; his name in reality was Dupont de Chambon. In their Channel crossing Blanchard and his companion, who started from Dover, when about one-third across found themselves descending, and threw out every available thing from the boat or car. When about three-quarters across they were descending again, and had to throw out not only the anchor and cords, but also to strip and throw away part of their clothing, after which they found they were rising, and their last resource, viz., to cut away the car, was rendered unnecessary. As they approached the shore the balloon rose, describing a magnificent arch high over the land. They descended in the forest of Guinnes.

On June 15, 1785, Pilâtre de Rozier made-an attempt to repeat the exploit of Blanchard and Jeffries in the reverse direction, and cross from Boulogne to England. For this purpose he contrived a double balloon, which he expected would combine the advantages of both kinds—a fire-balloon, 10ft. in diameter, being placed underneath a gas-balloon of 37ft. in diameter, so that by increasing or diminishing the fire in the former it might be possible to ascend or descend without waste of gas. Rozier was accompanied by P. A. Romain, and for rather less than half an hour after the aerostat ascended all seemed to be going on well, when suddenly the whole apparatus was seen in flames, and the unfortunate adventurers came to the ground from the supposed height of more than 3,000ft. Rozier was killed on the spot and Romain only survived about ten minutes. A monument was erected on the place where they fell, which was near the sea-shore, about 4m. from the starting point.

Early Large Balloons.— The largest balloon on record (if the contemporary accounts are correct) ascended from Lyons on Jan. 19, 1784. It was more than 100ft. in diameter, about 130ft. in height, and when distended had a capacity, it is said, of over 500,000 cubic feet. It was called the "Flesselles" (probably from the name of its proprietor), and after having been inflated from a straw fire in 17 minutes, it rose with seven persons in the car to the height of about 3,000ft., but descended again after the lapse of about a quarter of an hour from the time of starting, in consequence of a rent in the upper part.

Another large fire-balloon, 68ft. in diameter, was constructed by the chevalier Paul Andreani, of Milan, and on Feb. 25 he ascended in it from Milan, remaining in the air for about 20 minutes. This is usually regarded as the first ascent in Italy (but see Monck Mason's *Aeronautica,* p. 247).

On Nov. 7, 1836, at half-past one o'clock, a large balloon containing about 85,000 cu ft. of gas ascended from Vauxhall Gardens, London, carrying Robert Holland, M.P., Monck Mason and Charles Green, and descended about two leagues from Weilburg, in the duchy of Nassau, at half-past seven the next morning, having thus traversed a distance of about 500m. in 18 hours; Liége was passed in the course of the night, and Coblentz in the early morning. In consequence of this journey the balloon became famous as the "Nassau Balloon" (fig. 5) Charles Green (1785–1870), who constructed it and subsequently became its owner, was the most celebrated of English aeronauts, and made an extraordinary number of ascents. His first, made from the Green Park, London, on July 19, 1821, at the coronation of George IV., was distinguished for the fact that for the first time coal-gas was used instead of hydrogen for inflating the balloon. In 1828 he made an equestrian ascent from the Eagle Tavern, City Road, London, seated on his favourite pony. Such ascents have since been repeated; in 1852 Mme. Poitevin made one from Cremorne Gardens, but was prevented from giving a second performance by police interference, on account of certain public criticism. It was in descending from the "Nassau Balloon" in a parachute that Robert Cocking was killed in 1837. Green was the inventor of the guide rope, which consists of a long rope trailing below the car. Its function is to reduce the waste of gas and ballast required to keep the balloon at a proper altitude. When a balloon sinks so low that a good deal of the guide rope rests on the ground, it is relieved of so much weight and therefore tends to rise; if on the other hand it rises so that most of the rope is lifted off the ground, it has to bear a greater weight and tends to sink.



FROM PEWTRESS, "BALLOONS — A COLLECTION OF CUTTINGS,,

FIG. 5.—THE GREAT NASSAU BALLOON, WHICH CREATED A SENSATION WHEN IT TRAVERSED 500 MILES IN 18 HOURS, 1836

In 1863 A. Nadar, a Paris photographer, constructed "Le Géant," which was the largest gas-balloon made up to that time and contained over 200,000 cu.ft. of gas. Underneath it was placed a smaller balloon. called a compensator, the object of which was to prevent loss of gas during the voyage. The car had two stories, and was, in fact, a model of a cottage in wicker-

work, 8ft. in height by 13ft. in length, containing a small printing office, a photographic department, a refreshment room, a lavatory, etc. The first ascent took place at five o'clock on Sunday, Oct. 4, 1863, from the Champ de Mars. There were 13 persons in the car, including one lady, the princess de la Tour D'Auvergne, and the two aeronauts Louis and Jules Godard. In spite of the elaborate preparations that had been made and the stores and provisions that were taken up, the balloon descended at nine o'clock at Meaux, the early descent being rendered necessary, it was said, by an accident to the valve-line. At a second ascent, made a fortnight later, there were nine passengers, including Mme. Nadar.

Directly after Nadar's two ascents, Eugene Godard constructed a fire-balloon of nearly 500,000 cu.ft. capacity — more than double that of Nadar's and only slightly less than that attributed to the "Flesselles" of 1783. The air was heated by an 18ft. stove, weighing, with the chimney, 980 lb. This furnace was fed by straw; and the "car" consisted of a gallery surrounding it. Two ascents of this balloon, the first fire-balloon seen in London, were made from Cremorne Gardens in July 1864. After the first journey the balloon descended at Greenwich, and after the second at Walthamstow, where it was injured by being blown against a tree.

In the summer of 1873 the proprietors of the New York *Daily* Graphic, reviving a project discussed by Green in 1840, determined to construct a very large balloon, and enable the American aeronaut, John Wise, to realize his favourite scheme of crossing the Atlantic ocean to Europe, by taking advantage of the current from west to east which was believed by many to exist constantly at heights above 10,000 feet. The project came to nothing owing to the quality of the material of which the balloon was made. When it was being inflated in Sept. 1873 a rent was observed after 325,000 cu.ft. of gas had been put in, and the whole rapidly collapsed. The size was said to be such as to contain 400,000 cu.ft. so that it would lift a weight of 14,000 pounds. Only two voyages exceeding 1,000m. are on record — that of John Wise from St. Louis to Henderson (N.Y.), 1,120m., in 1859, and that of Count Henry de la Vaulx from Paris to Korosticheff in Russia, 1,193m., in 1900. On July 11, 1897, Salomon Andrée, with two companions, Strendberg and Fränkel, ascended from Spitsbergen in a daring attempt to reach the North Pole, about 600m. distant. One carrier pigeon, apparently liberated 48 hours after the start, was shot, and two floating buoys with messages were found, but nothing more was heard of the explorers.

Scientific Work. — At an early date the balloon was applied to scientific purposes. So far back as 1784, Dr. Jeffries made an ascent from London in which he carried out barometric, thermometric and hygrometric observations, also collecting samples of the air at different heights. In 1803 the St. Petersburg [Leningrad] Academy of Sciences, entertaining the opinion that the experiments made on mountain-sides by J. A. Deluc, H. B. de Saussure, A. von Humboldt and others must give results different from those made in free air at the same heights, resolved to arrange a balloon ascent. Accordingly, on Jan. 30, 1804, Sacharof, a member of the academy, ascended in a gas-balloon, in company with a French aeronaut, É. G. Robertson, who at one time gave conjuring entertainments in Paris. The ascent was made at a quarter-past seven, and the descent effected at a quarter to eleven. The height reached was less than 1½ miles. The experiments were not very systematically made, and the chief results were the filling and bringing down of several flasks of air collected at different elevations, and the supposed observation that the magnetic dip was altered. A telescope fixed in the bottom of the car and pointing vertically downwards enabled the travellers to ascertain exactly the spot over which they were floating at any moment. Sacharof found that, on shouting downwards through his speaking trumpet, the echo from the earth was quite distinct, and at his height was audible after an interval of about ten seconds.

Some of the results reported by Robertson appearing doubtful, Laplace proposed to the members of the French Academy of Sciences that the funds placed by the Government at their disposal for the prosecution of useful experiments should be utilized in sending up balloons to test their accuracy. The proposition was supported by J. A. C. Chaptal, the chemist, who was then minister of the interior, and accordingly the necessary arrangements were speedily effected. The principal object of this ascent was to determine whether the magnetic force experienced any appreciable diminution at heights above the earth's surface. On Aug. 24, 1804, Gay-Lussac and Biot ascended from the Conservatoire des Arts at ten o'clock in the morning. Their magnetic experiments were incommoded by the rotation of the balloon, but they found that, up to the height of 13,000ft., the time of vibration of a magnet was appreciably the same as on the earth's surface. They found also that the air became drier as they ascended. The height reached was about 13,000ft., and the temperature declined from 63" to 51°. The descent was effected at Meriville, 18 leagues from Paris.

In a second experiment, which was made on Sept. 16, 1804, Gay-Lussac ascended alone. The balloon left the Conservatoire des Arts at 9.40 A.M., and descended at 3.45 P.M. between Rouen and Dieppe. The chief result obtained was that the magnetic force, like gravitation, did not experience any sensible variation at heights from the earth's surface to which we can attain. Gay-Lussac also brought down air collected at the height of nearly 23,000ft., and on analysis it appeared that its composition was the same as that of air collected at the earth's surface. At the time of leaving the earth the thermometer stood at 82°, and at the highest point reached (23,000ft.) it was 14·9°. Gay-Lussac remarked that at his highest point there were still clouds above him.

From 1804 to 1850 there is no record of any scientific ascents in balloons having been undertaken. In the latter year J. A. Bixio (1808–65) and J. A. Barral (1819–84) made two ascents of this kind. In the first they ascended from the Paris observatory on June 29, 1850, at 10.27 A.M., the balloon being inflated with hydrogen gas. The day was a rough one, and the ascent took place without any previous attempt having been made to test the ascensional force of the balloon. When liberated it rose with great rapidity, and becoming fully inflated it pressed upon the network, bulging out at the top and bottom. The ropes by which the car was suspended being too short, the balloon soon covered the travellers like an immense hood. In endeavouring to secure the valve rope they made a rent in the balloon, and the gas escaped so close to their faces as almost to suffocate them. Finding that they were descending then too rapidly, they threw overboard everything available, including their coats and only excepting the instruments. The ground was reached at 10.45 A.M., near Lagny. Of course no observations were made. Their second ascent was made on July 27 and was remarkable on account of the extreme cold met with.

In July 1852 the committee of the Kew Observatory resolved to institute a series of balloon ascents, with the view of investigating such meteorological and physical phenomena as require the presence of an observer at a great height in the atmosphere. John Welsh (1824–59) of the Kew Observatory was the observer, and the great "Nassau Balloon" was employed, with Green himself as the aeronaut. Four ascents were made in 1852, viz, on Aug. 17 and 26, Oct. 31 and Nov. 10. The heights attained were 19,510, 19,100, 12,640 and 22,930ft., and the lowest temperatures met with in the four ascents were 8·7° (19,380ft.), 12·4° (18,370ft.), 16·4° (12,640ft.) and 10·j° (22,370ft.). The decline of temperature was very regular. A siphon barometer, dry and wet bulb thermometers, aspirated and free, and a Regnault hygrometer were taken up. Some air collected at a considerable height was found on analysis not to differ appreciably in its composition from air collected near the ground. For the original observations see *Phil.* Trans. 1853, pp. 311–346.

Glaisher's Ascent. — At the meeting of the British Association for the Advancement of Science held at Aberdeen in 1859, a committee was appointed for the purpose of making observations in the higher strata of the atmosphere by means of the balloon. For two years nothing was effected, owing to the want both of an observer and of a suitable balloon. After its reappointment at the Manchester meeting of 1861, the committee communicated with Henry Tracey Coxwell (1819–1900), an aeronaut who had

made a good many ascents, and he agreed to construct a new balloon, of 90,000 cu.ft. capacity, on the condition that the committee would undertake to use it, and pay £25 for each high ascent made especially on its behalf, defraying also the cost of gas, etc., so that the expense of each high ascent amounted to nearly £50. An observer being still wanted, James Glaisher, a member of the committee, offered himself to take the observations, and accordingly the first ascent was made on July 17, 1862, from the gas-works at Wolverhampton, this town being chosen on account of its central position in the country. Altogether, Glaisher made 28 ascents, the last being on May 26, 1866. Of these only seven were specially high ascents, the greatest height attained being 37,000ft. at Wolverhampton (Sept. 5, 1862), but there is some doubt as to this record.

The primary object of the ascents was to determine the temperature of the air, and its hygrometrical state at different elevations to as great a height as could be reached; and the secondary objects were: (1) to determine the temperature of the dew-point by Daniell's and Regnault's hygrometers, as well as by the dry and wet bulb thermometers, and to compare the results; (2) to compare the readings of an aneroid barometer with those of a mercurial barometer up to the height of 5m.; (3) to determine the electrical state of the air; (4) the oxygenic condition of the atmosphere, and (5) the time of vibration of a magnet; (6) to collect air at different elevations; (7) to note the height and kind of clouds, their density and thickness; (8) to determine the rate and direction of different currents in the atmosphere; and (9) to make observations on sound. The instruments used included an electrometer. In one or two of the ascents a camera was taken up.

With regard to physiological observations, Glaisher found that the frequency of his pulse increased with elevation, as also did the number of inspirations. The number of his pulsations was generally 76 per minute before starting, about 90 at 10,000ft., 100 at 20,000ft., and 110 at higher elevations. But a good deal depended on the temperament of the individual. This was also the case in respect to colour: at 10,000ft. the faces of some would be a glowing purple, whilst others would be scarcely affected; at 4m. high Glaisher found the pulsations of his heart distinctly audible, and his breathing was very much affected, so that panting was produced by the slightest exertion; at 29,000ft. he became insensible. In reference to the propagation of sound, it was at all times found that sounds from the earth were more or less audible according to the amount of moisture in the air. When in clouds at 4m. high a railway train was heard; but when clouds were far below, no sound ever reached the ear at this elevation. The discharge of a gun was heard at 10,000 feet. The barking of a dog was heard at the height of 2m., while the shouting of a multitude of people was not audible at heights exceeding 4,000ft. In his ascent of Sept. 5, 1862, Glaisher considered that he reached a height of 37,000ft. But that figure was based, not on actual record, but on the circumstances that at 29,000ft., when he became insensible, the balloon was rising 1,000ft. a minute, and that when he recovered consciousness 13 minutes later it was falling 2,000ft. a minute, and the accuracy of his conclusions has been questioned.

Few scientific men have imitated Glaisher in making high ascents for meteorological observations. In 1867 and 1868 Camille Flammarion made eight or nine ascents from Paris for scientific purposes. The heights attained were not great, but the general result was to confirm the observations of Glaisher (for an account see Voyages *aériens,* Paris, 1870, or Travels *in the* **Air,** London, 1871, in which also some ascents by W. de Fonvielle are noticed). On April 15, 1875, H. T. Sivel, J. E. Crocé-Spinelli and Gaston Tissandier ascended from Paris in the balloon "Zenith," and reached a height of 27,950ft.; but only Tissandier came down alive, his two companions being asphyxiated This put an end to such attempts for a time. But Dr. A. Berson and Lieut. Gross attained 25,840ft. on May 11, 1894; Berson, ascending alone from Strassfurt on Dec. 4, 1894, attained about 31,500ft. and recorded a temperature of −54°; and Berson and Stanley Spencer are stated by the latter to have attained 27,500ft. on Sept. 15, 1898, when they ascended in a hydrogen balloon from the Crystal Palace, the thermometer registering −29°. On July 31, 1901, Berson and R. J. Siiring ascending at Berlin, actually noted a barometric reading corresponding to a height of 34,500ft., and possibly rose 1,000 or 1,500ft. higher, though in spite of oxygen inhalations they were unconscious during the highest portion of the ascent.

The personal danger attending high ascents led Gustave Hermite and Besançon in Nov. 1892, to inaugurate the sending up of unmanned balloons (*ballons sondes*) equipped with automatic recording instruments. Valuable meteorological records have thus been obtained.

For the development of navigable balloons and the construction of airships, see AIRSHIP. See also METEOROLOGY.

BALLOONS IN WAR. The first use of the balloon by the military appears to date from the period of the French revolutionary wars. Following experiments at Meudon, a corps of aeronauts (originally designated "aerostats") was formed and sent to Manberg, then under siege by Dutch and Austrian forces. The hydrogen-filled globe used was 30 ft. in diameter, and with a crew of two and 130 lb. of ballast, managed to rise to a height of 1,800 feet. The moral effect on the enemy was enormous. Imagining (quite incorrectly), that their every movement stood revealed to its observers, the Austrians became completely demoralized, and promptly lifted the siege. Transported, still inflated, to Charleroi where the French were on the offensive, it so dismayed the enemy garrison as to result in their speedy surrender. It later figured at Fleurus, then at Brussels, Liége, Aix-la-Chapelle and on the Rhine and Danube. A second corps of aerostats was formed for service in Egypt but never got into action as its apparatus suffered damage en route. In 1800, both corps were abolished. Later (1812), the Prussians employed balloons against the French, but without material result. At Solferino one of the Godard brothers made an ascent, but too late to affect the fortunes of the day.

In the American Civil War (1861–65), observation balloons saw use at the hands of the Federal troops, and certain of the ascents were recorded for posterity in the famous Brady collection of photographs of that conflict. Again, in the Spanish-American War (1898), a balloon accompanied Shafter's expeditionary force but, hovering as it did, low over the heads of friendly troops, enemy fire directed against it effected heavy casualties among the former, and its use was discontinued.

The British commenced to give real consideration to the balloon as an instrument of war in the late '70s and early '80s, conducting numerous experiments with specimens sent up at Woolwich Arsenal In some of these the basket carried a battery of eight cameras spaced equidistantly about its perimeter, thus making possible the photographing of the entire terrain overlooked, and apparently constituting the first serious effort at military aerial photography. In the earlier of these tests, communication from balloon to ground was effected by writing messages in crayon on the surface of a long, open-ended pasteboard tube weighted at one end by a rifle bullet. When this was ready for delivery, the tip of a small cord reaching from balloon basket to ground was detached from its fastening, passed lengthwise through the tube and reattached to its connections, the cylinder forthwith sliding down it to the earth. In later experiments, however, balloon and ground were connected by telegraph (not by telephone) wires enclosed in the retaining cable and paid out from specially constructed carts, a two-way system for the exchange of intelligence thus being established.

Soon thereafter (1880s), the ballaon saw war service in the French campaign against Tongking, and likewise accompanied the British Bechuanaland expedition of that period. Thereafter we do not hear of it, save in the Spanish-American War as above mentioned, until employed in a modest way by the Japanese in the Russo-Japanese conflict of 1904.

Here an airship was used, stabilized by a specially built fin in an effort to keep it from rotating in a high wind, a disagreeable feature present in all the spherical-type balloons up to then employed.

With the advent of the World War of 1914–18, every major nation began to pay the war balloon more attention. Germany produced the Drachen "kite balloon," a type conventionally termed "sausage." This embodied a bag, cylindrical in shape, and endowed with stability by the attachment of two small sails plus a large air-containing sac, located at its rear end, to act as a rudder and keep it heading into the wind. Such a balloon can function in a blow of 50 m.p.h., whereas the spherical type is helpless when wind velocity exceeds 20 m.p.h. But it must be flown at a considerable inclination to the horizon in order to attain the "kiting" effect without which it is useless. So inclined, it presents a large proportion of its surface area to the wind, thus unduly straining its cables and frequently causing them to snap. To eliminate these drawbacks, the French Capt. Caquot designed a streamlined type with three tails, one vertical and two lateral, attached at intervals of 120° for proper stabilization. This model, as used by the British army during the World War of 1914–18 (subsequently developed types embody the same basic design), had a length of 91 ft., a cubic capacity of 91,000 cu.ft., and could operate at heights to 6,000 ft.; a smaller naval model of similar general characteristics functioned up to about half this altitude.

British observation balloons proved markedly effective at Gallipoli where, sent up from vessels especially equipped to handle them, they "spotted" the effects of naval gunfire, reporting via their telephone cables and causing the enemy to withhold reprisal so long as they were aloft —for fear of revealing to them the positions of his batteries.

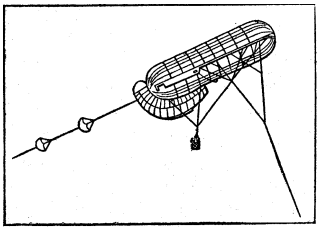

FIG. 1.—DRACHEN KITE BALLOON Used for observation purposes by both Allied and German armies at the beginning of the World War of 1914–18

Likewise on land, after warfare had become stabilized on the Western Front, sausages were in constant use for like purposes. And though always subject to attack by enemy aeroplanes, and not infrequently the victims of these, their crews usually lived to fly again, being ever prepared to bail out in their parachutes at an instant's notice.

Another use of the war balloon now instituted, and later greatly elaborated, was the setting up of "balloon barrages." As originally developed, these involved the release to a maximum height of 10,000 ft., of batteries of three kite balloons of 40.000 cu.ft. capacity each, one at the centre, and one at either end, of a horizontally floating cable 1,000 ft. in length. From this was suspended at regular intervals a series of steel wires trailing earthward like flexible teeth in an enormous comb. An attacking aeroplane was thus forced either to rise above this obstruction—to a height from which no bomb could at that period be accurately aimed—or, dive below it—and risk the effects of point-blank anti-aircraft fire.

With the advent of the European War in 1939, the balloon barrage, its ceiling now increased to 15,000 ft.. assumed new importance, especially in the defence of the city of London. Though constantly the object of aeroplane assault, these devices appear to have rendered yeoman service as an adjunct to the anti-aircraft gun and the friendly fighter plane. But they proved vulnerable to the forces of nature, and many were reported to have parted their moorings and floated off as the result of a heavy storm which visited England on Sept. 17, 1940. Similar "sausages" towed singly by destroyers or merchant vessels, served in the defence of convoys passing through the English Channel, rendering hazardous any attempt by hostile air raiders to carry out dive-bombing operations. The same type of balloon manned by one or more observers in a basket below, and similarly towed, has proven useful for spotting waiting submarines and notifying accompanying vessels of their positions.

Other Types.—The propaganda balloon, a small sphere of 5,000 cu.ft. capacity, was designed for liberation over enemy territory, there to release as it progressed, printed propaganda for the edification of the inhabitants. An automatic device keeps it at a uniform height until all attached ballast is exhausted. Its use has, however, become infrequent, since the aeroplane has proven an even better medium for the purpose intended.

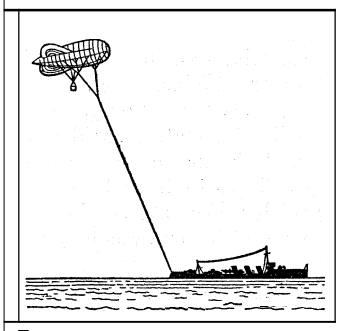

FIG. 2.—A CAPTIVE CAQUOT BALLOON TOWED BY A DESTROYER Ships with an observation balloon of this type in attendance were effective in anti-submarine warfare

Materials of Fabrication.—Silk and cotton cloth both figure in the construction of gas-containing envelopes for balloons. But the former does not ordinarily enter into the manufacture of the war balloon, in the production of which rubberized cotton in one or more of several different grades is conventionally employed. Fabric for captive balloons (U.S. Army) is constructed of two plies of such cloth, the outer biased, and the inner straight. Its weight is 8.6 oz. per square yard, and its tensile strength 50 lb. per square inch. Nets and rigging are commonly of Italian hemp, which is soft, very pliable, of high tensile strength and easily spliced.

(C. GD.)

BALLOT: *see* ELECTORAL SYSTEMS.

BALEOU, HOSEA (1771–1852), American Universalist clergyman, was born in Richmond, N.H., April 30, 1771. Self-educated, he early devoted himself to the ministry, and after preaching at various places, became pastor of the Second Universalist Church in Boston from December 1817 until his death there, June 7, 1852. He founded and edited *The Universalist Magazine* (1819; later called *The Trumpet)* and *The Universalist Expositor* (1831; later *The Universalist Quarterly Review);* and wrote many sermons, hymns, and polemic theological works. He is best known for *Notes on the Parables* (1804), *A Treatise on Atonement* (1805), and *Examination of the Doctrine of a Future Retribution* (1834); in these, especially the second, he showed himself the principal American expositor of Universalism. From the theology of John Murray, who like Ballou has been called "the father of American Universalism," he differed in that he divested Universalism of every trace of Calvinism and opposed legalism and trinitarian views.

His grand-nephew, HOSEA BALLOU (1796–1861), born in Guilford, Vt., Oct. 18, 1796, after long service in the ministry, was in 1853 elected first president of Tufts College at Medford, serving in that office until the time of his death at Somerville, Mass., May 27, 1861. He was associated with the elder Hosea Ballou in editing *The Universalist Quarterly Review* and wrote the *Ancient History of Universalism* (1829).

For the first Hosea Ballou consult the biography by Thomas Whittemore (4 vol., 1854–55) and that by O. F. Safford (1889); and J. C. Adams, *Hosea Ballou* and *the Gospel Renaissance* (1904).

BALLSTON SPA, a village of New York, U.S.A., 7 mi. S. of Saratoga Springs, on the main line of the Delaware and Hudson railroad; the county seat of Saratoga county. The population in 1940 was 4,443. Ballston Spa has long been a health resort. It lies among the foothills of the Adirondack mountains, and has many fine chalybeate and other springs, rising more than 700 ft. through solid rock. The village's factories manufacture a variety of products. The village was settled about 1787 by the grandfather of Stephen A. Douglas, and was incorporated in 1855. It was named after the Rev. Eliphalet Ball, an early settler. Its daily paper, the *Journal,* was established in 1798. The Saratoga county law library is there.

BALLYCASTLE, urban district, Co. Antrim, Northern Ireland, on a bay of the same name opposite Rathlin island. Population 1,986. It is connected with the Northern Counties (Midland) railway at Ballymoney by the Ballycastle light railway. The town consists of two divisions, about a quarter of a mile apart and connected by a fine avenue. Much money has been expended upon the pier and harbour, but the violence of the sea overthrew the one and the other became filled with sand. To the east of the town are the remains of Bonamargy abbey. Coal-seams, formerly extensively worked, appear in the cliffs towards Fair Head, and the fisheries are important.

BALLYMENA, a town in Co. Antrim, Northern Ireland, on the small river Braid an affluent of the Maine, 2 mi. above their junction. Pop. of urban district (1937) 12,928. It is 33 mi. N.N.W. of Belfast on the Northern Counties (Midland) railway. Branch lines run to Larne and Parkmore on the east coast. The town owes its prosperity chiefly to its linen trade, introduced in 1733. Brown linen is a specialty. Iron ore is mined in the neighbourhood. Gracehill, a Moravian settlement, was founded in 1746.

BALLYMONEY, town, Co. Antrim, Northern Ireland, 53 mi. N.N.W. from Belfast and a junction on the Northern Counties (Midland) railway. Population of urban district 3,168. The trade includes brewing, distilling and tanning, besides the linen manufacture common to the whole county. Soap, candles and tobacco are also manufactured, and the town is a centre for local agricultural trade.

BALLYMOTE, town, Co. Sligo, Eire, 14 mi. S. of Sligo by the Great Southern railway. Population (1936) 738. It has some agricultural trade. There are remains of a castle, built by Richard de Burgh, in 1300, and the scene of hostilities in 1641 and 1652; and also of a 13th century Franciscan foundation. This was a celebrated seat of learning where the *Book of Ballymote* (*c.* 1391), a miscellaneous collection in prose and verse of historical, genealogical and romantic writings, was written. There are also, near the town, ruins of a house of the Knights of St. John (1303).

BALLYSHANNON, town, Co. Donegal, Eire, at the mouth of the Erne; on the Bundoran branch of the Great Northern railway. Pop. (1936) 2,223. The river is here crossed by a bridge which connects the town with the suburb of The Port. Below the bridge the river forms a cascade, where salmon are trapped in large numbers. The fisheries are of great value, and there is an export trade to England in salmon. The harbour is a small exposed creek of Donegal bay, and is only accessible to small vessels owing to a bar. Previous to the Union Ballyshannon returned two members to the Irish parliament and it was incorporated by James I. There are slight remains of a castle of the O'Donnells, earls of Tyrconnell, where the English were defeated in 1597. There are numerous raths or encampments in the vicinity and other remains. Coolmore, 3 mi. northwest, is a bathing-resort.

BALM, fragrant herbs, mostly of the mint family (*Labiatae*). The bee balm (*Melissa officinalis*), of Eurasia, has opposite, ovate, crenulated leaves, which are wrinkled above, and small white or rose-spotted flowers. It is often grown in gardens and has become naturalized in the south of England and in North America. The name is from the Greek μέλισσα, the plant being visited by bees.

Bastard balm is an allied plant, *Melittis Melissophyllum*, a southern European species, found in the south and southwest of England. Balm of Gilead is a resin derived from the plant, *Commiphora meccanensis*, a member of the family *Burseraceae*. In America balm is often applied to various plants of the genus *Monarda*.

BALMACEDA, JOSE MANUEL (1838–1891), president of the republic of Chile, was born in Santiago in 1838, of wealthy parents. In his early days he was chiefly concerned in industrial and agricultural enterprise. In 186j he was one of the representatives of the Chilean government at the general South American congress at Lima, and after his return obtained distinction as an orator in the national assembly. After some diplomatic missions abroad, he became successively minister of foreign affairs and of the interior under the presidency of Señor Santa Maria, and, in the latter capacity carried compulsory civil marriage and several other laws obnoxious to the clergy.

In 1886 he was elected president; but, in spite of his great capacity, his imperious temper soon had him irreconcilably at variance with the majority of the national representatives, and on Jan. 1, 1891, he sought to terminate an intolerable situation by refusing to convoke the assembly and ordering the continued collection of the taxes on his own authority. This led to the Chilean Civil War of 1891, which ended in the overthrow of Balmaceda. He committed suicide on Sept. 18, 1891, the anniversary of his elevation to the presidency.

BALMAIN, a town of Cumberland county, N.S.W., Australia, on the western shore of Darling Harbour, Port Jackson, 2 m. by water from Sydney and suburban to it. Pop. (1933) 28,268. Sawmills, iron foundries, chemicals, glass and soap works, shipbuilding yards and a coconut-oil factory in connection with the soap-manufacture at Port Sunlight, England, are among the chief industrial establishments. Balmain became a municipality in 1860.

BALMERINO, JAMES ELPHINSTONE, 1ST BARON (*c.* 1553–1612), Scottish politician, was the third son of Robert, 3rd Lord Elphinstone (d. 1602). Rising to power under James VI. he became a judge and a royal secretary; he accompanied the king to London in 1603 and was made Lord Balmerino, or Balmerinoch, in 1604. In 1605 he became president of the court of session. In 1599, on the king's behalf, but without the king's knowledge, he had sent a letter to Clement VIII. in which he addressed the pope in very cordial terms. A copy of this letter having been seen by Elizabeth, the English queen asked James for an explanation, whereupon both the king and the secretary declared it was a forgery. There the matter rested until 1608, when the existence of the letter was again referred to during some controversy between James and Cardinal Bellarmine. Interrogated afresh Balmerino admitted that he had written the compromising letter, that he had surreptitiously obtained the king's signature, and that afterwards he had added the full titles of the pope. In March 1609 he was tried, attainted, and sentenced to death, but after a brief imprisonment he was released.

Balmerino's elder son JOHN (d. 1649) was permitted to take his father's title in 1613. In 1634 he was imprisoned for his opposition to Charles I. in Scotland, and by a bare majority of the jury he was found guilty of '(leasing-making" and was sentenced to death. But popular sympathy was strongly in his favour; the poet Drummond of Hawthornden and others interceded for him, and after much hesitation Charles pardoned him.

ARTHUR (1688–1746), 6th Lord Balmerino, joined the partisans of James Edward, the Old Pretender, after the battle of Sheriffmuir in Nov. 1715, and then lived for some time in exile, returning to Scotland in 1733 when his father had secured for him a pardon. He was one of the first to join Charles Edward in 1745; he marched with the Jacobites to Derby, fought at Falkirk and was captured at Culloden. Tried for treason in Westminster Hall he was found guilty, and was beheaded Aug. 11, 1746, behaving both at his trial and at his execution with great constancy and courage. On his death without issue the titles which he bore became extinct.

BALMES, JAIME LUCIANO (1810–1848), Spanish ecclesiastic, political writer and philosopher, was born at Vich in Catalonia, on Aug. 28, 1810, and died there on July 9, 1848. Having attacked the regent Espartero he was exiled. On his return he founded and edited the El *Pensamiento* de *la Nacion*, a Catholic weekly; but his fame rests on El *Protestantismo comparado con el Catolicismo en sus relaciones con la Civilisacion Europea* (1842–44, 6th ed. 1879; Eng. trans. 1849), an able defence of Catholicism as the spirit of obedience or order, against Protestantism, the spirit of revolt; it belongs to apologetics, and is not a history. His philosophical works are the *Filosofia Fondamental* (1846) Eng. trans. by H. F. Brownson (New York, 1856), and the *Curso* de *Filosoja Elemental* (1847), which he translated into Latin.

See A. de Blanche-Raffin, *Jacques Balmès*, sa *vie et ses ouvrages* (1849); and E. Bullón Fernández, Jaime Balmès y sus oberas (1903).

BALMONT, CONSTANTINE (1867–), Russian author, was born June 3, 1867, at Gumishche, in the province of Vladimir, in Central Russia. A student of Elizabethan drama and of Shelley, he first became known as the translator of the latter and the apostle of his ideas. His extensive travels in South Africa, Mexico, New Zealand and Spain account for the exotic vein in his poetry. He produced his best work during the 'nineties and the early years of the present century. The very titles of the voluines published during this period—Under *the Northern Sky* (1894), *Silence* (1898), In *Boundless Space* (1895), *The Burning Buildings* (1900), *Only Love* (1903), *Let us be like the Sun* (1903)—indicate the stages of his development from pure aestheticism to an aggressive and partly anarchical Nietzschean poetry, which brought him immense popularity and made him the acknowledged head of a younger generation of Russian symbolists. This vogue has long since passed, but he remained one of the finest of modern Russian lyric poets. *The Liturgy of Beauty* (1905), *Evil Charms* (1906), *The Bird of Flame* (1907) are representative of his later work. He has also written several volumes of prose. In 1918, shortly after the outbreak of the Bolshevik revolution, he went to live in Paris.

BALMORAL CASTLE (Gaelic, "the majestic dwelling"), private residence of the British sovereign, parish of Crathie and Braemar, Aberdeenshire, Scotland, on the right bank of the Dee (here spanned by a fine suspension bridge), 8m. W. of Ballater and at a height of 900ft. above the sea. It was sold by the Farquharsons of Inverey to Sir Robert Gordon and by his trustees to Albert Prince Consort who bequeathed it to Queen Victoria. The castle is in granite in Scots baronial style, with an east tower (100ft.) commanding a superb view. Memorial cairns to members of the Royal Family have been erected on Craig Gowan (1,319ft.). The parish church of Crathie (1903), replacing the kirk of 1806, is 1½m. to the west, and about 1m. farther west stands Abergeldie Castle, another Highland royal residence, an ancient building to which modern additions have been made, inhabited by King Edward VII. when prince of Wales, and after his accession to the throne used as a shooting-lodge.

BALNAVES, HENRY (1512?–1579), Scottish politician and reformer, was educated at St. Andrews, and afterwards at Cologne, where he adopted Protestant views. In 1538 he was appointed a lord of session, and in Jan. 1543 the regent Arran made him secretary of state. In the following November, when the regent went over to the priestly party, Balnaves was imprisoned in Blackness castle, and after his release by Hertford in May 1544 became a paid agent of the English Government. He took no part in the murder of Beaton, but helped to defend the castle of St. Andrews, and on its surrender was taken prisoner to Rouen. During his exile Balnaves wrote *The Confession of Faith*, which was found, with a preface by Knox, among his papers and published at Edinburgh in 1584.

In 1557 he returned to Scotland, and took an active part in the rising of 1559. In 1563 he was restored to his office as lord of the session, and four years later was one of Bothwell's judges for the murder of Darnley. He died in 1579 at Edinburgh.

Great Seal of Scotland; Hamilton Papers; Border Papers;* Knos, *Works;* Burnet, *Reformation;* Froude, *Hist.*

BALNEOTHERAPEUTICS, medical treatment by internal and external use of mineral waters, the principal constituents of which are sodium, magnesium, calcium and iron, in the form of chlorides, sulphates, sulphides and carbonates. Other substances occasionally present are arsenic, lithium, potassium, manganese, bromine, iodine, etc. The chief gases in solution are oxygen, nitrogen, carbonic acid and sulphuretted hydrogen. Argon and helium occur in some of the "simple thermal" and "thermal sulphur waters," while others contain minute quantities of radium. In the employment of the various mineral waters, many of the spas adopt special means by which they increase or modify their influence. Of these the "pine-needle" bath has the greatest repute; it is made by adding a decoction of the needles or young shoots of firs and pines. Fir wood oil (a mixture of ethereal oils) or the tincture of an alcoholic extract acts equally well. Similar effects follow the addition to the bath of aromatic herbs, such as camomile, thyme, etc. Astringent baths are prepared in a similar way from decoctions of oak bark, walnut leaves, etc. Mud baths are chiefly prepared from muddy deposits found in the neighbourhood of the springs, as at St. Amand. They act like a large poultice applied to the surface of the body, and in addition to the influence of the temperature, they exert a considerable mechanical effect. The pulse is accelerated some 6 to 12 beats a minute, the respiration number rises, and the patient is thrown into a profuse perspiration. They have very great value in gouty and rheumatic conditions and in some of the special troubles of women.

In advising balneotherapeutic treatment in any case, all the conditions and habits of the patient—pecuniary, physical and psychical—must be considered, as the spa must be fitted to the patient, not the patient to the spa. After rheumatic fever, if the joints remain painful and the heart is dilated, the thermal gaseous saline water of Nauheim, augmented by Schott's resistance movements, will often appear to work wonders. Chronic rheumatism, where there is much exudation round a joint or incipient stiffness of a joint, may be relieved by hot thermal treatment, especially when combined with various forms of massage and exercises. Simple thermal waters, hot sulphur springs and hot muriated waters are all successful in different cases. Chronic muscular rheumatism can also be benefited in a similar manner. Diseases of the nervous system are on the whole treated by these means with small success. Mental diseases other than very mild cases of depression should be considered inapplicable. Neurasthenics are sometimes treated at chalybeate or thermal muriated saline spas; but such treatment is entirely secondary to the general management of the case. Neuralgic affections and the later stages of neuritis, especially when dependent on gout or rheumatism, are often relieved or cured. Abdominal venosity (abdominal plethora), a feature of obesity, glycosuria, etc., are extremely well fitted for this form of treatment. The alkaline sulphated waters, the bitter waters and the common salt waters can all be prescribed, and after a short course can be supplemented with various forms of active and passive exercises. Diseases of the respiratory organs are far more suited for climatic treatment than for treatment by baths. In the anaemia dependent on malarial infection, the muriated or alkaline sulphated waters at spas of considerable elevation and combined with iron and arsenic are often beneficial. Gravel and stone, if of the uric acid variety, can be treated with the alkaline waters, but the case must be under constant observation lest the urine become too alkaline and a deposition of phosphates take place on the already formed uric acid stone. Gout is so variable both in cause and effect that much discrimination is required in its treatment. Where the patient is of "full habit," with portal stagnation, the sulphated alkaline or mild bitter waters are indicated, especially those of Carlsbad and Marienbad; but the use of these strong waters must be followed by a long rest under strict hygienic conditions. Where this is impossible, a milder course must be advised, as at Homburg, Kissingen, Harrogate, Wiesbaden, Baden-Baden, etc. For very delicate patients, and where time is limited, the simple thermal waters are preferable.

For radiant heat and light baths and electric baths of all kinds, *see* ELECTROTHERAPY; and for compressed air baths, AEROTHERAPEUTICS. *(See also* BATHS; THERAPEUTICS, and the articles on diseases.)

BALOCHI LANGUAGE, the speech of the Baloches of Baluchistan, is older than Old Persian, the court language of the Achaemenides, as shown by the close relationship between it and the language of the Avesta. It is not a bastard Persian dialect. It has borrowed and is still borrowing numerous words from modern Arabic, modern Persian and from the modern Indian Prakrits.

The Alphabet.— The few Baloches who are able to write invariably use the Persian characters. There are altogether 35 letters. As a rule these are sounded as in Urdū. There are two exceptions. The Ar. *tha* or *thai* when not initial has the sound of

th in our words "health," "wealth," etc. In the same way the Ar. *thal* or *zāl* at the beginning of a word has the simple sound of our *z,* but when not initial it is sounded as *th* in the Eng words "mother," "brother," etc. It thus follows the rule just given for the letter *tha* or *thai.*

The Grammar.— There are no articles and no genders. Males are masculine and females feminine. Lifeless objects possess no gender.

There is only one declension, and all nouns and pronouns may be said to be declined alike. The gen. case sing. may end in *egh, egha, ena,* or in *ī.* Which is used depends on euphony and on the class of word. The dat. case sing. ends in *rd, ār, ar,* or in *dra.* The acc. case sing. is generally the same as the dat. Most nouns form their pl. by adding *āñ* to the sing. The gen. case pl. may end in *ānī,* or in *egh,* the dat. in *āñra, ānar* or *dr.* The accusative case does not greatly differ from the dative, Prepositions govern the noun in the oblique case (form *ā*) and postpositions govern the noun in the genitive case.

The adjective generally precedes its noun but may follow it. The comparative is formed by adding *-tir,* superlatives by words such as *sake* (very).

The numerals are regular and follow the Persian closely. The ordinals are formed by the addition of the syllable *mi* to the cardinals *e.g., chidr,* four, *chidr-umi,* fourth.

The pronouns are defective and slightly irregular. Their declension on the whole follows that of the substantive. Thus, *ma,* I; *ma-i, ma-igh,* of me; *ma-na,* to me: *mi,* we; *mā-ī, mā-īgh,* of us; *mā-r, mā-ra,* to us. *Thau,* though; *tha-ī, tha-igh,* of thee; *tha-ra,* to thee: *shwā,* you; *shwd-i, shwd-igh,* of you; *shwā-r, shwā-ra,* to you. There is no personal pronoun of the third person. The demonstratives *esh* and *āñ* take its place. Pronominal suffixes are used.

The particle *kih* takes the place of a rel, pronoun, just as it does in Persian.

The verb has two bases—the present or simple root and the past—formed from the present and usually ending in *-agh.* Some verbs are irregular in the past participles, which, in transitive verbs, are passive in signification, thus requiring the agent or oblique case. Consonantal changes accompany the past tenses. Who? is represented by *khai,* and whose? by *kha-ī* or *kha-igh.*

All verbs except a very few end in *agh.* Thus: *thashagh,* to run; *thash-āñ,* I may run; *thash-āñ.* I shall run, *thashagh-āñ,* I am running; *thashagh-ethāñ,* I was running; *thakhtagh-āñ,* I have run; *thakhtagh-ethāñ,* I had run; *thakhtath-āñ,* had I run; *thash-okh,* the runner. The verb substantive, used also as an auxiliary verb, is irregular.

The particles offer no difficulty.

There are slight differences to be expected among the numerous tribes. The literal translation shows the simplicity of the language. *Thau ba-kho ravagh-el?,* thou to—where going—art? *Ma wath-i logh-a ravagh-āñ,* I myself—of the—house—to going—am. *Tha-i logh 'sh-edha dir eñ,* thee—of the—house from—here far is? *Inna, ma-i logh nazikh eñ* no, me—of the—house near is. *Āñ mar azh kho ākhta,* that man from where came? *Ma-na kal n-el?,* me—to information not—is. *Tha-ra kal* bi, thee—to information must—be. *Āñ pha chih edha akhta,* he for why here came? *Ma rav-añ azh āñ-hīa phol khan-āñ, I* will go, from him enquiry will—make. *Āñ chih gushagh-e,* he what saying—is? *Āñ hachī phasav nah deagh-e,* he any reply not giving—is.

BALQUHIDDER (Gaelic, "the farm in the back-lying country"), village and parish, Perthshire, Scotland. Pop. of parish (1931) 619. The village lies 3m W. of the station of the same name on the L.M.S. railway from Callander to Oban, and 27¾m. N W. of Stirling, at the east end of Loch Voil. The Maclaurins held the district from the 9th century till their Macgregor neighbours slew the chief and ousted the clan in 1558. Rob Roy died here in 1734 and his grave in the old kirkyard is marked by a stone with rude carving, executed probably centuries before his time. Another ancient stone is said to cover the grave of Angus, the Columban missionary, who first did Christian work in this part of the Highlands.

BALRAMPUR, a town of British India near the river Rapti, in the Gonda district of the United Provinces. Pop. (1931) 16,723. It gives its name to one of the largest *talukdari* estates in the province. The then rajah Sir Drigbijai Singh, K.C.S.I., was conspicuously loyal during the Mutiny, and was rewarded with accessions of territory and hereditary privileges. His adopted son and heir maintained the family tradition of princely charities and wise management of his great estates.

The handsome palace is the only feature of importance in the town.

BALSA, the name given to a tree *(Ochroma lagopus)* of the bombax family (Bombacaceae), called also corkwood, native to tropical South America and noted for its exceedingly light wood (Span. *balsa,* a raft or float). The wood resembles clear white pine (*Pinus Strobus*) or basswood (*Tilia americana*) and has a velvety feel. Well-seasoned commercial balsa wood, which weighs only 7 lb. to 8 lb. per cu.ft., is the lightest wood known. Because of this extreme buoyancy, about twice that of cork, it is admirably adapted for making floats for life lines and life-preservers. Its resiliency makes it an excellent shock-absorbing material for packing pianos, finely finished furniture and similar articles, and also for foundation pads for machinery.

On account of its insulating properties, it is extensively used for lining incubators, refrigerators and cold-storage rooms. Its lightness combined with high insulating power renders it extremely valuable as a material for constructing the various containers used in dry-ice transportation. It is also employed in the construction of passenger compartments for aeroplanes. *(See* CORKWOOD; DRY-ICE.)

BALSAM, a term properly limited to such resins or oleo-resins as contain benzoic acid or cinnamic acid or both. Those balsams which conform to this definition make up a distinct class, allied by their composition, properties, and uses. Those found in commerce are the balsam of Peru, balsam of Tolu, liquid storax, and liquidambar. *Balsam of Peru* is the produce of a lofty leguminous tree, *Myroxylon pereirae,* growing within a limited area in El Salvador, Central America, and introduced into Ceylon. It is a thick deep brown or black, viscid oleo-resin having a fragrant balsamic odour. It is used in perfumery. Though contained in the pharmacopoeias it has no special medicinal virtues. *Balsam of Tolu* is produced from M. *balsamum.* It is brown, thicker than Peru balsam, and becomes solid on keeping. It also is a product of equatorial America. It is used in perfumery and as a constituent in cough syrups and lozenges. *Liquid storax* or *Styrax preparatus* is *a* balsam yielded by *Liquidambar orientalis,* a native of Asia Minor. It is a soft resinous substance, with a pleasing balsamic odour, especially after it has been kept for some time. It is used in medicine as an external application in some parasitic skin diseases, and internally as an expectorant. An analogous substance is derived from *Altingia excelsa* in Java. *Liquidambar balsam* is derived from *Liquidambar styraciflua,* a tree found in the United States and Mexico. It contains cinnamic acid, but not benzoic acid.

Of so-called balsams, entirely destitute of cinnamic and benzoic constituents, the following are found in commerce: *Mecca balsam* or *Balm of Gilead,* from *Commiphora opobalsamum,* a tree growing in Arabia and Abyssinia. When fresh it is a viscid fluid, with a penetrating odour, but it solidifies with age. For *balsam of copaiba* see COPAIBA. Under the name of *wood oil,* or *Gurjun balsam,* an oleo-resin is procured in India and the Eastern Archipelago from several species of *Dipterocarpus,* chiefly D. *turbinatus,* which has the odour and properties of copaiba and has been used for the same purposes. Wood oil is also used as a varnish in India and forms an effective protection against the attacks of white ants. *Canada balsam* or *Canada turpentine* is the oleo-resin yielded by *Abies balsanzea,* a tree that grows in Canada and the northern parts of the United States. It is transparent, somewhat fluid when first run, but thickening considerably with age, possessed of a

delicate yellow colour and a mild terebinthous odour. It contains 24% of essential oil, 60% of resin soluble in alcohol, and 16% of resin soluble only in ether. Its chief uses are for mounting preparations for the microscope and as a cement for glass in optical work.

The garden balsam is an annual plant, *Impatiens balsamina*, family Balsaminaceae, and the balsam apple is the fruit of *Momordica balsamina*, family Cucurbitaceae.

BALSHAM, HUGH DE (d. 1286), English churchman, appears first as sub-prior of the monastic cathedral of Ely. On the death of William of Kilkenny in 12 j6 the monks elected him bishop of Ely, to the annoyance of Henry III., who had the temporalities given to John de Waleran. The election was confirmed by the pope in 1257 and Hugh set to work to repair the harm done by the intruder. In 1280 the bishop obtained a charter allowing him to replace the secular brethren residing in his hospital of St. John at Cambridge by "studious scholars"; a second charter four years later entirely differentiated these scholars from the brethren of the hospital, and for them Hugh de Balsham founded and endowed the college of Peterhouse at Cambridge.

BALTA, the chief town of the autonomous Moldavian S.S.R. Lat. 47° 55' N., Long. 29" 35' E. Pop. (1926) 21,374. It is linked by road and rail with Odessa and Kiev and has annual fairs, mainly dealing in cattle, horses, grain and hide. It has tallow-melting, soap boiling, tile-making and brewing industries. The town was formerly the residence of the Podolian voivode and was almost destroyed by the Russians in 1780, but after the peace of Jassy, 1792, when the Dniester was recognized as a frontier, Balta became definitely a Russian town.

BALTARD, LOUIS PIERRE (1764–1846), French architect and engraver, was born in Paris on July 9, 1764, and died there on Jan. 22, 1846. He was selected to prepare the plans for some of the largest public edifices in Paris. His reputation, however, is chiefly based on his great skill in engraving. Among the best known of his plates are the drawings of Paris, *Paris et ses monuments* (1803), the engravings for Denon's *Égypte*, the illustrations of Napoleon's wars (La *Colonne de la grande armée*), and those contained in the series entitled the *Grand prix de l'architecture*. His son Victor Baltard (1805–1874) designed the Paris Halles in 1851.

BALTIC, THE. A famous London Exchange; a market for the purchase and sale of cereals. Its full name is The Baltic Mercantile and Shipping Exchange. Shipowners and others interested in cargoes, as well as brokers, find it necessary to become members of this institution.

Originally, when merchants trading with Baltic ports foregathered for business, they met at a London coffee house; the exact date as to when it was first used cannot be traced, but in a newspaper published in 1744 an advertisement was published stating that the Baltic Coffee House would be removed to Threadneedle street. To-day the name "Baltic" is something of a misnomer, for, although it is quite true that some of the business transacted on the Exchange is connected with produce from the countries surrounding the Baltic Sea, its members deal in commodities from every other part of the world. In the old days, the members of the Baltic Coffee House were limited to 300; today the membership of The Baltic is about 2,000.

Large transactions in wheat, maize, barley and other products take place every day. Every transaction is by word of mouth; no written contracts or notes pass between the buyers or sellers, or brokers and shipowners. Nevertheless, it is very seldom that any difficulties arise that cannot be adjusted, the contracts being completed on the return of the members to their offices.

BALTIC SEA, a sea extending between 54° and 66" N. lat. and 9° and 30° E. long. surrounded by Sweden, Denmark, Germany, Poland, Lithuania, Latvia. Estonia. Russia and Finland (German *Ostsee;* Russ. *Baltiyskoe More*). The main axis runs approximately south-west to north-east and the distance from Kiel to Haparanda is 1,700 kilometres. It connects with the North sea by a channel between south Scandinavia and Denmark; the part north and west of the Skaw is called the Skagerrak and resembles the North sea, the part south of this line is the Kattegat and is the outer part of the Baltic. At its southern end the Kattegat is blocked by the Danish islands save for the Sound, the Great Belt and the Little Belt which communicate with the Baltic proper. There are several deep areas, the Arcona (50 metres) north of Rügen, the deep (105 metres) east of Bornholm, separated by the Middlebank from the Gottland (249 metres) which extends north-eastwards to the Gulf of Finland. Beyond the Middlebank, to the south-east, is the Danzig deep (113 metres). Along the Swedish coast a deep channel runs northward from outside the island of Öland; this is entirely cut off to the south and east by a bank which sweeps eastward and northward from near Karlskrona, and on which the island of Gottland stands, but it communicates at its northern end with the Gottland deep, and near the junction opposite Landsort is the deepest part of the Baltic (420 metres). On the east is the large shallow Gulf of Riga, not more than 46 metres deep. Lat. 60" N. marks the boundary between the Baltic proper and the Gulf of Bothnia and on it lie the Aland islands, to the west of which (Alands Haf) the sea is deep (237 metres) whereas to the east it is shallow. In the Gulf of Bothnia depths of more than zoo metres are reached, but north of the Nord Kvarken, situated on a submarine ridge, depths of only 100 metres or less are found in Bothnia-Wick. The most recent estimate of the area is 422,300km., including the Kattegat, and the mean depth is 55 metres.

Bottom Deposits.—In the deeper hollows in the south part of the Baltic the bottom consists almost invariably of either soft brown or grey mud or hard clay, while on the shallow banks and near the low coasts fine sand, of white, yellow or brown colour with small pebbles, is usually found. There are several areas of stony bottom, some of which are dangerous to ships, *e.g.* "Adlergrund" (only 6 metres) between Bornholm and Riigen. These are clearly remains of glacial moraines and they greatly hinder trawling. They may be compared with the Borkum bank in the North sea.

Coast Changes.—At some period during, or between the cold phases of, the Pleistocene ice age an arm of the sea extended across Sweden, submerging a great part of the littoral up to the Gulf of Bothnia, and including the present lakes Vener, Hjelmar and Mâlar. During this period the waters of the northern Baltic were sufficiently salt for oysters to flourish. Subsequent upheaval restricted direct communication with the open sea to the Danish channels, and the Baltic waters became fresher; the oyster disappeared, but a number of cold salt-water fishes and crustaceans, and even seals, became acclimatized. The Baltic was next elevated into a vast freshwater lake, the *Ancylus* lake of *G.* de Geer (named from the remains of the mollusc *Ancylus fluviatilis),* which is supposed to have included the whole of the present Baltic area and a large part of Finland, with Lake Ladoga. Then followed a subsidence, which not only re-established communication through the Danish channels, but allowed the Baltic to become sufficiently salt for such forms as *Littorina littorea* (Littorina period). At this time the Gulf of Bothnia must have suffered greater depression than the Baltic proper, for the deposits of that epoch show a thickness of 100 metres near Hernosand, but only 25 metres in the neighbourhood of Gottland. After this period of subsidence the process of elevation set in which gave the Baltic its present form and physical condition, and appears to be still in progress. The Gulf of Bothnia has been more strongly uplifted than the Baltic proper, just as previously it sank more. Hogbom (1913) showed, through the drawing of isobasic lines (lines of equal elevation), that the centre of the movement is in the Nord Kvarken and that the German Baltic coast has probably not moved up or down since the end of the ice age. Witting (1918) calculated a reduction of depth of about 0·2cm. per annum near Gottland, about 0·5cm. near Stockholm, 1cm. or more in the Bothnia Wick. This last has put out of use the former harbours of Vaasa, Kokkola (Gamla Karleby) and Raahe (Brahestad).

Coasts.—The coast of the Baltic is rocky only in the island-studded region at the head of the Baltic basin proper—a submerged lake-district—and the littoral generally is typically morainic. From Slesvig Nord eastwards to Liibeck bay the coast is pierced by a number of narrow openings or *Fohrden,* the result

of encroachment of the sea caused by subsidence. East of Liibeck, as far as the mouth of the Oder, these give place to *Bodden,* ramified openings studded with islands. Beyond the Oder the coast-line is unbroken as far as the Gulf of Danzig. It is then cut into by the estuaries of the Vistula, the Pregel and the Memel. Here the westerly winds have full play, and the coast is rimmed by a continuous line of dunes, which cut off the two great lagoons of the *Frisches Haff* and *Kurisches Haff* by sandspits or *Nehrungen.*

Baltic Levels.—If we start from a point in the North sea we find that the surface in the Kattegat is 10cm. higher, between Rügen and Bornholm 22cm., near Stockholm 31cm., and near Haparanda, as well as near Viipuri (Viborg) and Leningrad, 38cm. and more higher. The westerly winds tend to press the water eastwards but another factor is the large contribution of river water, which is lighter than sea water so that for equilibrium the surface in the Baltic must be above that of the North sea. The mean annual range of level is 11–15cm., the highest point being reached on the average at the end of summer, August being often rainy, the lowest point is usually noted in spring which is usually dry and attended by south-east winds which drive some of the water towards the North sea. Occasional north-east gales in winter, with snow and ice, are apt to cause devastating storm-floods on the south Baltic coasts. On Nov. 12–13, 1872, a great storm flood occurred, also in Nov. 1899 when the level of the sea was raised by 3–4 metres and enormous losses resulted. The tidal range at the Skaw is 0.28 metres, near Kiel only 0·07 metres, near Swinemunde 0·01 metres and near Memel 0·005 metres, so that the Baltic may be called tideless.

"The Freshwater Drainage Area."—This is estimated by Spethmann (1912) at 1,657,000km.; the most extensive river basin is that of the Neva, those of Vistula and Oder follow in size. The Baltic receives much more water by rainfall, discharge of rivers, etc., than it loses by evaporation; hence an enormous surplus must be got rid of by an outflowing current which is named the "Baltic Stream." This must be a surface current, because it originates from a redundancy of fresh water. On account of the earth's rotation, the main part of the Baltic stream must keep close to the coast of the Scandinavian peninsula. It must be a periodic stream, because the discharge of the rivers into the Baltic varies with the season of the year. In spring and summer the water from the Baltic is sufficiently abundant to cover the whole surface of the Kattegat and Skagerrak, but in winter the sources of the Baltic current are for a great part dried up by the freezing of the land water. From near Stockholm this Baltic stream flows south, along the south Swedish coast it goes west, and in the Sound and the Belts its direction is northwards. The fresher Baltic water can be traced far into the North sea especially along the Norway coasts even as far as North Cape. In the Baltic proper it includes the surface waters down to a depth of 30 to 50cm. and has a salinity of 6–8‰. Under this is a thin almost stagnant layer at a depth of 50–60cm., very cold even in summer (36·5°–39°). Beneath this, again, the water is warmer and more salt and belongs to an undercurrent coming in from the North sea. Salinities for this undercurrent are 30‰ in the Kattegat, 20‰ in the Great Belt, 13‰ in the Gottland deep. It flows quite irregularly into the Baltic and is inhabited by marine organisms which use up its oxygen content to such an extent that free carbon dioxide has been found in the mid and east Baltic. This is probably a factor of the poverty of the Baltic sea floor in fish-life.

Climate.—Climatic influences of the Baltic on neighbouring lands are slight and unusual. The relatively fresh surface water freezes over large coastal stretches and the melting of this ice in spring retards rise in temperature seriously, as compared with the rise over inland areas. The air over the Baltic in winter is only 2°–3½° warmer, in summer only 2°–3½° colder than that over the neighbouring lands. The sea near Haparanda has a mean January temperature of +14°, between Stockholm and the Aland island 28·5°, near Bornholm 32°, while the corresponding July temperatures are 57" (Haparanda), 61° (Aland island), 61·5° (Bornholm). This shows that differences between north and south are very great in winter but almost vanish in summer. On the west and south coasts of Sweden navigation is impeded by ice only in severe winters and then it is usually drift ice, compact sea-ice being very rare at present, as it has been through the 19th century.

Formerly, however, the south Baltic including the Kattegat and Skagerrak froze on several occasions; it was possible to go from Norway to Jutland over the ice in 1294, to cross similarly from Denmark to Pomerania in 1323, 1349, 1459 and 1545. In 1659 Charles X. of Sweden marched 20,000 men across the Sound and the Belts to Jutland, and the Sound last froze in 1740. O. Pettersson thinks that the salinity of Baltic waters was formerly much lower than now and that this promoted freezing. Unless strong icebreakers keep channels open, navigation between Stockholm and Visby stops between the end of December and about April 10. In very severe winters the Aland sea is covered with thick ice available for traffic. The south part of the Gulf of Bothnia is covered with ice every winter along the coasts, but rarely, if ever, in its central part. Navigation is interrupted by drifting ice from about the middle of November to the beginning of May, though the port of Hernosand has been known to remain in some years open during the whole winter. The northern part of the Gulf of Bothnia is frozen every winter for 120 to 210 days (near Haparanda). In the Gulf of Finland the sea is closed to navigation by ice for about 150 days in the year; but navigation is rendered possible throughout the winter by the use of ice-breakers, except in a very severe winter such as was, for example, 1925–26.
