ARBROATH or ABERBROTHOCK, royal, municipal, and police burgh and seaport, Forfarshire (Angus), Scotland, at the mouth of Brothock water, 17m. N.E. of Dundee by the L.N.E.R. Pop. (1938) 18,173. The town is under provost, bailies, and council, and, with Brechin, Forfar, Bervie, and Montrose, returns one member to parliament. It makes sailcloth, canvas, and coarse linens, boots and shoes, spins flax, tans, bleaches, works in iron, builds ships, and has fisheries. The harbour, 'originally constructed and maintained by the abbots, by an agreement between the burgesses and John Gedy the abbot in 1394, was enlarged in 1725 and 1844 and the old part made into a wet dock (1877) when the entrance to the new harbour was deepened. A signal tower, 1oft. high, communicates with the Bell Rock (*q.v.*) lighthouse on the Inchcape Rock, 12m. S.E. The parish church dates from 1570, but has been much altered, and the spire was added in 1831. Hospitalfield, ½m. E., once the abbey hospice, and the "Monks-barn" of Scott's Antiquary, is now an art school with a collection of Scottish art. The ruins of the abbey, once one of the richest in Scotland, stand in High street. It was founded by William the Lion in 1178 for Tironensian Benedictines from Kelso, and consecrated in 1197, being dedicated to St. Thomas Becket, whom the king had met at the English court. It was William's only personal foundation, and he was buried within its precincts in 1214. Its style is mainly Early English, the western gable Norman. The cruciform church measured 276ft. long by 160ft. wide. Here parliament met on April 6th, 1320 to send the pope the notable letter, asserting the independence of their country and reciting in eloquent terms the services which their "lord and sovereign" Robert Bruce had rendered to Scotland. Arbroath was created a royal burgh in 1186, and its charter of 1599 is preserved. King John exempted it from "toll and custom" in every part of England excepting London. Arbroath is "Fairport" of Scott's Antiquary. Auchmithie, 3m. N.E. ("Musselcrag" of the same romance), is an old-fashioned fishing village in picturesque coast scenery. At the 14th-century church of St. Vigeans, 1m. N. of Arbroath, stands one of the most interesting of the sculptured stones of Scotland, thought to be the only legible Pictish inscription. The parish—originally called Aberbrothock and now incorporated with Arbroath for administrative purposes—takes its name from a saint or hermit whose chapel was situated at Grange of Conon, 3½m. N.W. Two miles west by south are the stone quarries of Carmyllie.

ARBUTHNOT, ALEXANDER (1538–1583), Scottish ecclesiastic and poet, educated at St. Andrews and Bourges, was principal of King's College, Aberdeen, from 1569 until his death. His extant works are (a) three poems, "The Praises of Wemen" (224 lines), "On Luve" (10 lines), and "The Miseries of a Pure Scholar" (189 lines), and (b) a Latin account of the Arbuthnot family, *Originis et Incrementi Arbuthnoticae Familiae Descriptio* Historica (still in ms.), of which an English continuation, by the father of Dr. John Arbuthnot, is preserved in the Advocates' Library, Edinburgh.

The particulars of Arbuthnot's life are found in Calderwood, Spottiswood, and other Church historians, and in Scott's Fasti Ecclesiae Scoticanae. The poems are printed in Pinkerton's Ancient Scottish Poems (1786), i. pp. 138–155.

ARBUTHNOT, JOHN (1667–1735), British physician and wit, the friend of Swift and Pope, was born at Arbuthnot, Kincardineshire. The son of an episcopalian minister who had been deprived of his living, he supported himself for some time in London by teaching mathematics, and then in 1692 entered University College, Oxford. He was graduated M.D. at St. Andrews in 1696. His papers on mathematical subjects, notably an Essay *on the Usefulness* of Mathematical Learning (1701), brought him an F.R.S. He became a fashionable physician, and later became royal physician in ordinary to Queen Anne; but his memory lives for the wit and varied learning which made him the chosen friend and counsellor of Swift and Pope, and for his genius as a Tory pamphleteer. Arbuthnot fixed the popular conception of John Bull, though he did not invent the character, in the five tracts printed as "The History of John Bull" in *Miscellanies* in Prose and Verse (1727), the preface to which is signed by Pope and Swift.

Arbuthnot was one of the leading spirits in the Scriblerus Club, whose members were to collaborate in a universal satire on the abuses of learning. *The* Memoirs of the *extraordinary* Life, *Works,* and Discoveries of *Martinus Scriblerus,* of which only the first book was finished, first printed in Pope's Works (1741), was chiefly the work of Arbuthnot, who is at his best in the whimsical account of the birth and education of Martin. Swift, writing on July 3, 1714 to Arbuthnot, says: "To talk of Martin in any hands but yours, is a folly. You every day give better hints than all of us together could do in a twelvemonth; and to say the truth, Pope who first thought of the hint has no genius at all to it, to my mind; Gay is too young; Parnell has some ideas of it, but is idle; I could put together, and lard, and strike out well enough, but all that relates to the sciences must be from you."

The death of Queen Anne put an end to Arbuthnot's position at court, but he still had an extensive practice. Lord Chesterfield and William Pulteney were his patients and friends; also Mrs. Howard (Lady Suffolk) and William Congreve. His friendship with Swift was constant and intimate; he was friend and adviser to Gay; and Pope wrote (Aug. 2 1734) that in a friendship of twenty years he had found no one reason of complaint from him. Arbuthnot's youngest son died in Dec. 1731. He never quite recovered his former spirits and health after this shock. On July 17 1734 he wrote to Pope: "A recovery in my case, and at my age, is impossible; the kindest wish of my friends is Euthanasia." In Jan. 1735 was published the "Epistle to Dr. Arbuthnot," which forms the prologue to Pope's satires. He died on Feb. 27 1735 at his house in Cork Street, London.

The Miscellaneous Works of the late Dr. Arbuthnot were published at Glasgow in an unauthorized edition in 1751. This includes many spurious pieces. See also The Life and Works of John Arbuthnot (1892), by George A. Aitken.

ARBUTUS, a genus of evergreen trees and shrubs of the heath family (Ericaceae) characterized by smooth, red, exfoliating bark, handsome foliage, showy flowers in terminal clusters and attractive, red, berry-like fruits. There are about 12 species, found chiefly in the Mediterranean region, Central America and western North America. In mild climates several species of *Arbutus* are planted for their beautiful foliage, flowers and fruit. Of these, the best known is the strawberry tree (A. *unedo*), a native of southern Europe and Ireland. The Madrona (*A. menziesii*), a handsome tree of the west coast of North America, is sparingly transplanted. The trailing arbutus or mayflower (see ARBUTUS, TRAILING) of eastern North America, belongs to a different genus (*Epigaea*) of the heath family. (E. S. HR.)

ARBUTUS, TRAILING (*Epigaea repens*), a fragrant, flowering plant of the heath family (Ericaceae), also called mayflower, common in rocky woods and on hillsides from the Maritime provinces to Florida and westward to Minnesota. The flowers appear as early as April, while the snow still lingers, and are eagerly sought as one of the first signs of spring; in regions near towns they are often stripped from the woods by ruthless persons and also sold on street corners. The plant stems are tough and sturdy, rough-hairy, and creep close to the ground under the dead leaves of the preceding season. The old leaves are rusty, dull green and heavily mid-veined. New leaves develop in June, rough in texture with fine netted veins and paler on the lower surface than on the upper. The small nectar-bearing flowers, which exist in four forms (see C. Darwin, Forms of Flowers), are white to pale pink and delicately scented, five-lobed and tubular, and grow on stems 6 to 12 in. in length.

ARCACHON, town and bathing resort, S.W. France, in the department of Gironde, 37 mi. W.S.W. of Bordeaux on the Southern railway. Pop. (1936) 13,102. It is on the south shore of a large bay, the Bassin d'Arcachon, at the foot of pine-clad dunes and is renowned for its oyster breeding. The summer town, extending for $2\frac{1}{2}$ mi. along the shore, is frequented by bathers; the winter town, farther inland, is a climatic station among the pine woods.

ARCADE, in architecture, a series of arches assembled in a single composition, particularly when the arches are of approximately the same size and placed upon the same level. Arcades are used structurally as in the arcade between the nave and aisles of a church, which supports the clerestorey wall and the nave roof. They are also used, purely decoratively, where a band of horizontal decoration is required. Although the arch was known to many of the peoples of antiquity, it was the Romans who first appreciated its decorative possibilities and who made it, again and again, a dominant feature of great architectural importance, as in the Tabularium (*q.v.*) and in any Roman amphitheatre. An arcade, such as those used by the Romans, with the front face of each pier ornamented by a pilaster or engaged column that carries an entablature running over the tops of the arches, is known as a Roman arcade, and was a favourite motive of the Renaissance. During the late Empire, the Romans started to build arcades whose arches were carried directly upon the capitals of a range of columns (*e.g.,* the great court of the palace of Diocletian at Spalatro), and during the Romanesque and Gothic periods this became the normal type, although in the Byzantine work of the eastern empire, spreading blocks, known as impost blocks, were often placed between the capitals and the arches.

Arcades were used decoratively, to a great extent, in north Italian Romanesque. Some fronts, such as that of the cathedral at Pisa, consist entirely of rows of freestanding arcades. In the mediaeval architecture outside Italy (except for the Romanesque churches on the Rhine, where Italian influence *is* strong) decorative arcades were almost always actual parts of the wall and are known as wall arcades.

Interlacing arcades are those in which every arch spans the space, not to the adjacent support, but to one of those beyond. All of the arches are of the same size and, therefore, apparently overlap or intersect each other. They form a favourite motive for the decoration of walls, both exterior and interior, in the Romanesque work of northern Europe generally and the Gothic of England. The word arcade is also used, at the present time, to designate any covered passageway on which shops open. (T. F. H.)

ARCADELT or **ARCHADELT, JACOB** (c. 1514–c. 1575), celebrated Netherlands composer, who lived and worked chiefly in Italy. Among his numerous compositions five books of madrigals, published at Venice, probably gave a great stimulus to the beginnings of the Venetian school of composition. After 1555 he published three volumes of masses, besides contributing motets to various collections.

ARCADIA, in Greece, the central district of Peloponnesus. Shut off from the coast on all sides by mountain barriers (in the north Erymanthus [mod. *Olonos*] rises to 7,400ft., and Cyllene [*Ziria*] to 7,900ft.; in the south Parthenium and Lycaeum exceed 5,000ft.) this inland plateau is again divided by numerous subsidiary ranges. In east Arcadia these enclose a series of plains drained only by underground channels or *zerethra.* The west country is more open, with isolated mountain-groups and the winding valleys of the Alpheus (*q.v.*) and its tributaries the Ladon and Erymanthus. The ancient inhabitants were shepherds and hunters, worshipping Pan, Hermes and Artemis, primitive nature-deities. The difficulties of communication and especially the lack of a seaboard seriously hindered intercourse with the rest of Greece. Consequently the same population held the land throughout historic times, without admixture of Dorian immigrants, the dialect maintaining a peculiar resemblance to that of Cyprus. Arcadia was weak owing to chronic feuds between the towns. Its fortunes in Greek history turned on its position between Sparta and the

Isthmus. Unable to force their way through Argolis, the Spartans early set themselves to secure the passage through the central plateau. The resistance of single cities, and the temporary union of the Arcadians during the second Messenian war, did not defer complete subjugation past the 6th century. In 469 and again in 420 disaffected cities, backed by Argos, came near to establishing their independence. In 371, after the battle of Leuctra, a political league grew out of an old religious synod, and a federal capital was founded in a commanding strategic position at Megalopolis (*q.v.*). But a severe defeat by Sparta in 368 (the "tearless battle") and internal discord paralysed this movement. Megalopolis accentuated mutual jealousy. During the Hellenistic age Megalopolis stood staunchly by Macedonia; the rest of Arcadia rebelled against Antipater (330, 323) and Antigonus Gonatas (266). Similarly the cities divided their allegiance between the Achaean and the Aetolian Leagues, and fell a prey to Sparta and Macedonia. In Roman times Arcadia had fallen into decay. An influx of Slavonic settlers in the 8th century A.D. checked depopulation, but Arcadia suffered severely from the constant quarrels of its Frankish barons (1205–1460). Turkish rule, combined with Albanian immigration, raised the prosperity of the land, but in the Wars of Independence the strategic importance of Arcadia once more made it a centre of conflict. The population remains sparse, and pending complete restoration of the water conduits the soil is unproductive. The modern department of Arcadia extends to the Gulf of Nauplia, with a sea-coast of about 40 miles.

ARCADIUS (378–408), Roman emperor, the elder son of Theodosius the Great, mas created Augustus in 383, and succeeded his father in 395. The empire was divided between him and his brother Honorius, Honorius governing the two western prefectures (Gaul and Italy), and Arcadius the two eastern (the Orient and Illyricum). There was estrangement between the two governments throughout the reign of Arcadius. Honorius's general Stilicho (q.v.), was always on the watch to annex the prefecture of Illyricum. Arcadius was guided at first by the praetorian prefect Rufinus, and, after his murder, probably instigated by Stilicho (end of 395), by the eunuch Eutropius (executed end of 399). His wife Eudoxia (daughter of a Frank general, Bauto), had great influence over him; she died in 404. In the last years of his reign, Anthemius (praetorian prefect) was his minister. In 395–96 the West Goths, under Alaric, ravaged Greece. In 399–400 the Gothic General Gainas, with the aid of partisans in Constantinople, tried to set up a German domination. But he fell after having held the city for six months, and the German danger was averted from the east. The banishment in 404 of John Chrysostom (q.v.), patriarch of Constantinople, who had offended the empress and quarreled with the bishop of Alexandria, was important, as determining the supremacy of the emperor to the patriarch.

ARCADIUS, of Antioch, Greek grammarian, flourished in the 2nd century A.D. According to Suidas, he wrote treatises on orthography and syntax, and an onomasticon (vocabulary). An epitome of Herodian's work on general prosody, wrongly attributed to Arcadius, is probably the work of Theodosius of Alexandria or a grammarian named Aristodemus. The 20th book of this epitome is the work of a forger of the 16th century.

See text by Barker, 1823; Schmidt, 1860; *see* also Galland, *De Arcadii qui fertur Eibro de aicentibus* (1882), and Cohn in Pauly-Wissowa s.v. *Arkadios.*

ARCA MUSARITHMICA, an instrument or machine for the composing of music mechanically, by the arranging and combining of notes according to rule in various ways; described by Athanasius Kircher in his *Musurgia universalis,* Rome, 1660. Samuel Pepys possessed such a "composition box," which is still to be seen in the Pepys library at Magdalene college, Cambridge.

ARCESILAUS (316–241 B.C.), Athenian philosopher and founder of the New, or-Middle, Academy *(see* ACADEMY,-GREEK). His doctrines, which must be gathered from the writings of others (Cicero, *Acad.,* i. 12, iv. 24; *De Orat.,* iii. 18; Diogenes Laertius iv. 28; Sextus Empiricus, *Adv. Math.,* vii. 150, *Pyrrh. Hyp.* i. 233), represent an attack on the Stoic φαντασία καταληπτική *(Criterion).* He held that strength of intellectual conviction cannot be regarded as valid. The uncertainty of sensible *data* applies equally to the conclusions of reason, and therefore man must be content with *probability* which is sufficient as a practical guide. "We know nothing, not even our ignorance"; therefore the wise man wiil be content with an agnostic attitude.

ARCH, JOSEPH (1826–1919), English politician, founder of the National Agricultural Labourers' Union, was born at Barford, a village in Warwickshire, Nov. 10 1826, and died there Feb. 12 1919. He founded, in 1872, the National Agricultural Labourers' Union, of which he was president. Temporary rises in wages were secured, but the farmers were able within 18 months to break up the union. Arch was returned to Parliament for north-west Norfolk in 1885, and although defeated next year owing to his advocacy of Irish home rule, he regained his seat in 1892, and held it in 1895, retiring in 1900. He was deservedly respected in the House of Commons.

A biography written by himself, or under his direction, and edited by Lady Warwick (1898), tells the story of his career.

ARCH, any combination of blocks of building material, generally wedge-shaped and with radial joints, employed to cap an opening wider than any of the blocks themselves capping it. In form, arches are usually, though not always, built with the soffit (*q.v.*) following a curved line. By extension, the word arch is used for any curved head of an opening or recess, even when the material is homogeneous, as in a concrete arch. From the use of arch forms, to bridge the spaces between the beams in early fireproof construction, the word arch is employed technically for any structure between steel beams, even when the structure may be of reinforced concrete, and, therefore, theoretically a beam, and not an arch at all.

In the normal arch, the inside face or soffit is known as the intrados, the outside face as the extrados, the wedge-shaped blocks as voussoirs, the centre voussoir as the keystone and the two end voussoirs as the springers. The spring of the arch is the level of the bottom of the springers, which usually coincides with the beginning of the curvature, but a stilted arch is one in which the apparent spring is well below this beginning. The haunches of an arch are the parts between keystone and springer. A continuous arch, such as a tunnel, is known as a vault.

Due to the nature of its construction, with wedge-shaped blocks, any arch exerts at its spring, not only a downward weight, but a tendency to spread, which is known as thrust, and for the arch to remain stable it is necessary for this thrust to be resisted adequately by abutments, buttresses or the strength of the wall itself in which the arch is placed. This quality of exerting thrust has profoundly affected architecture *(see* BUTTRESS, FLYING BUTTRESS, GOTHIC ARCHITECTURE).

The principle of the arch has been known from very early times. When neolithic man discovered that a wide opening could be spanned by leaning tuo stones together at its apex, the first arch was made, and such triangular arches are widely found throughout the Mediterranean basin (for example, one at Alea in Arcadia; a similar triangular shape, though in corbelled construction is seen in the Gate of the Lions at Mycenae). The

earliest known developed arches with curved sides that occur in the Tigro-Euphrates valley, at least as early as 4000 B.C. In Egypt, also, the arch was known, although it was used only for utilitarian purposes. Almost all of these early examples are over drains, where the abutment question was simple, but in Asia, the Assyrians, at least, used the arch monumentally in gateways. It was, however, in Italy, at the hands of the Etruscans, that the arch received its most important early architectural treatment, as in the famous gate of Perugia. Following the Etruscans the Romans (see ROMAN ARCHITECTURE) adopted the arch as perhaps the chief structural feature in the design of their monumental buildings and by them its use was spread all over the civilized world to become an integral feature of all the architecture succeeding them until the middle of the 19th century. Since that time the discovery of the fact that iron, and later steel, could be formed into beams of great strength over long spans has reduced the use of the arch to a subsidiary and often merely decorative position.

For the different types of arch see the illustration and for its history the general articles under the headings of the various styles of architecture. See also ARCADE. (T.F. H.)

ARCHAEOLOGICAL ARTICLES. In addition to the general article ARCHAEOLOGY, where the development of the science is fully treated, there are numerous archaeological subsections to continents and countries (these subsections are found under the names of the territories). Special articles on individual civilizations appear under their distinctive names, *e.g.*, AEGEAN CIVILIZATION. As is the case with ANTHROPOLOGY (*q.v.*), large territories (*e.g.*, Africa) are subdivided for archaeological purposes into different areas of varying importance. Numerous short articles deal with some of the most prominent gods and rulers of ancient vanished peoples. So that APIS or HAPI; AMON; etc. receive adequate treatment and carry cross-references to articles where comparative material may be found.

Special subdivisions of archaeologic study have individual articles, *e.g.*, CAHOKIA MOUND, THE; CARNAC: Megalithic *Monuments*; CATACOMBS; CAVE; CLIFF-DWELLINGS; DEAD, DISPOSAL OF THE; EOLITHS; ETRUSCANS; FLINTS; HITTITES; IBERIANS; INSCRIPTIONS; LABYRINTH; LAKE DWELLINGS; LA TÈNE; MOUND-BUILDERS; PAPYROLOGY; SABAEANS; SARCOPHAGUS; SCARAB; SEQUENCE DATING; SHELL-MOUNDS; SPHINX; STONE MONUMENTS, PRIMITIVE; STRATIGRAPHY; TYPOLOGY; VILLANOVANS; and VITRIFIED FORTS.

Archaeological terms are defined and treated in short special articles having cross-references to the main articles, where more detailed information is given. Ample bibliographies to the larger articles give references to the most recent authoritative works.

ARCHAEOLOGICAL SOCIETIES: see LITERARY, HISTORICAL AND ARCHAEOLOGICAL SOCIETIES.

ARCHAEOLOGY is at the same time a science and an art. It is or should be a scientifically ordered branch of knowledge professed by men of truly scientific training, of a certain subject, namely the remains of ancient human activity. It is or should be also the art that deals scientifically with these remains, that excavates them from the earfh where they have been buried, conserves them and restores them (but only so far as to make them

intelligible), and publishes them for the information of ourselves and posterity. It is a science that has some difficulty in keeping true to its ideal, because the human interest of the subject attracts to its study many persons of untrained minds. The general public realizes that expert work is necessary in order to conserve and set up antiquities in the way they are seen in a public museum. And it will probably realize in time that expert work is necessary in order to dig properly as well. Quite rightly, therefore, the laws of some countries in which archaeology is an important matter take cognizance of the damage that may be done by untrained seekers after antiquities: Egypt, for instance, allows no person, however well-known he may be from the scientific point of view, to dig except under the aegis of a museum, university, or some other scientific body, and the amateur is totally barred unless he has a scientific explorer, authenticated as such, with him to control his digging.

Methods.—The methods of archaeology are exemplified in the study and in the field. The recent Glozel controversy showed that in France at any rate public opinion as reflected in the journals is still inclined to regard the archaeologist as the purely stay-at-home arm-chair "savant" of the old school, and that the modern field archaeologist is a conception new to it. It is perhaps a fact that the real old type of antiquarian scholar has survived untouched by new ideas longer in France than in England, where he is nearly extinct. The volume of work in the field that has been done by British archaeologists during the last half-century has impressed itself so deeply upon the minds of teachers and students here that the purely scholarly type hardly counts as an archaeologist at all in the modern sense of the word. Yet he has his uses still, and the most efficient all-round type is the man who is at once scholar, historian and worker in the field. Work in the study has still to be done and indeed becomes more and more necessary. The purely "scientific" field-worker in Egypt or Mesopotamia cannot progress without the help of his student colleague who reads the hieroglyphic or cuneiform inscriptions that he finds, or that of the historian and the anthropologist; and obviously the most useful man is he who can combine all these functions. But it is difficult to find men who are equally competent in all these spheres, and the work now is being done by an intimate alliance of the men who are primarily field-workers, but have a working knowledge of the languages and history of the ancient peoples whose relics they unearth, with those who are primarily scholars or historians but have a working knowledge of excavation and of conservation. Museum archaeologists should be of the latter type with a special knowledge of conservation. No excavator, whatever the excellence of his technique, can be really efficient unless he himself is also as much as possible a *savant* or he works in close association with *savants* on the "dig." If one merely brings things home for the scholars to appraise, efficiency is lost.

Thus the archaeologist's work is done in the study as well as in the field. The work of the student is obvious. When, as in the case of prehistoric Europe or America, there are no ancient languages to be known, it is much lightened. But in the case of Minoan Greece their place is taken by the classical knowledge that is indispensable to all workers in that sphere and in Italy, without which the results of excavation cannot satisfactorily be interpreted. The work is greatest in Egypt and Mesopotamia, where the scholarly archaeologist has to know at least something of scripts as complicated and difficult as Japanese, and of various types and in various languages! It is no wonder that the field-worker often has no time for more than a smattering of these tongues, and when this is the case has all the more to associate himself with his more scholarly colleagues. Only in the prehistoric field can he work with anthropological knowledge merely in addition to his praxis of excavation.

In the field the excavator has to be more or less expert in many ways. He has to have some knowledge of elementary engineering and of lifting heavy weights. He should be a practical photographer. He should be able to improvise practical methods of attacking any problem in digging and of conserving any object he may find: it is "up to him" to do this in the most efficient way possible with the means at his disposal; and the better he does it the better excavator he is; but he must be used to making good bricks without straw. He must know how to manage men, and especially Orientals, without friction: he may have to deal suddenly with strikes, he may find himself "in a tight place" at any moment: he must be able to work tactfully with others. He must have an eye for the lie of the land: the man who cannot diagnose what he is likely to find from the appearance of the terrain is not likely to be so successful as the man who can. He must know whether there is "likely to be anything there" or not. The random digger is not a scientific digger. And in a country like Egypt, where digging has gone on continuously for over fifty years, there is a *corpus* of experience to be drawn upon and to be learnt in a matter like this, where also the assistance of intelligent native helpers whose ancestors have dug for *antikas* for generations is by no means to be despised. This "eye for country" is one of the greatest assets of an excavator. And obviously the more he knows of the more studious side of his work, of the styles of art or of tomb-construction characteristic of the various periods of development of the ancient civilization he is investigzting, the better. Without such knowledge he remains but a hewer of wood or drawer of water for those who have it, despite all his field-technique, and despite the opinion of the market-place. So we see that the scientific excavator is indeed a labourer "worthy of his hire," which, by the way, is generally absurdly small.

Differences in Soil.—The actual methods employed in excavation vary of course with the nature of the soil. One does not work anywhere with steam nawies or pneumatic drills! The work is far too delicate for that. It is much too delicate for the ordinary North-European or American labourer to undertake at all except under the strictest supervision. Picks and shovels wielded by British navvies would do more harm than good. In the East the slow native methods of hoe and basket are the most efficient, allowing the archaeologist to intervene when necessary to do the fine work with his pen-knife. There large numbers of men may be employed. In the West only a few intelligent and well-trained workers can be safely employed. The happy mean between the two is probably found in Greece, where the diggers combine the delicate touch of the Oriental with the intelligence of the European. Different styles of work are required in the wet clay of Britain, the dry stony soil or the crumbling *kouskouras* rock of Crete, the sand, the limestone rubbish, or the argillaceous shale of Egypt, the compact earth of 'Iraq. As an instance of the care that is requisite, may be mentioned the ancient Babylonian walls of mud-brick, which it needs a practised eye to distinguish from the surrounding indurated earth. Only a trained archaeologist with native workmen using their primitive tools would ever be able to trace and clear them accurately. British Tommies, hacking with their entrenching tools with all the good will in the world to help (as they did in the World War), would never even see them. In Upper Egypt, where it only rains once in five years, or in Chinese Turkistan, with its dry cold, things are easier, on account of the aridity of the earth; the soil is easily removed, and because of this dryness in these regions objects are found preserved in a manner unequalled elsewhere, save in the peat-bogs of the North. An old boot thrown out on to the Egyptian desert will remain there, if not removed, unaltered for centuries. Palaeolithic flint implements are found on the desert surface in the *ateliers* where they were made: where one has lain over another the upper is burnt black by the oxidizing effect of the sun of centuries, while the lower remains unpatinated. In Crete, with its rain in winter, conditions somewhat resemble those in 'Iraq.

Conservation and Reconstruction.—A very difficult piece of excavation and reconstruction—a classical example of archaeological method—was the digging out and rebuilding of the grand staircase, corridors and halls on the east slope of the palace-hill at Knossos by Sir Arthur Evans. The building, three or more stories high, was found collapsed, but with its arrangement still recognizable. It has been re-erected as it was. ("It is indeed rarely that natural conditions allow an ancient building of three or four stories to be dug out, its charred beams carefully replaced by iron girders, and its calcined pillars replaced by new on the old lines, so that we can mount, as at Knossos, an ancient grand stairway of three

flights on its original steps, and with the original steps above us as we mount, in their proper place as they were built.") And this is not the only part of the Knossian palace in which Sir Arthur Evans has carried out reconstruction work of the kind, all, be it remembered, at his own personal expense. It is an ideal way of doing things, when it can be done, as in the present case, with some certainty of accuracy. Otherwise of course it should not be permitted to be attempted, however convinced the archaeologist himself may be of the accuracy of his theory; it is human to err.

An extension of the reconstruction method is exemplified at Knossos by Sir Arthur Evans's recent specimens of partially restored Minoan buildings, such as the South-East House, and part of the Hall of the Procession Frescoes. Whether it is advisable to carry out such reconstructions as these must always be a matter on which opinions may differ. In the present case they serve to show what the actual buildings probably were like, and are shelters for the reproductions of the frescoes (the originals being of course preserved in the Candia Museum) which it is a good idea to exhibit on the actual spot where they were found.

Analogous to the conservation of buildings is the conservation of objects found, not only in the field, but also in the laboratory at home. Objects can only be brought home somewhat summarily preserved in a "first field dressing" so to speak (well exemplified by Mr. Woolley at al-'Ubaid and Ur), and must be treated expertly on their arrival by chemists, if they are to survive. Examples of such work are to be found in the treatment of the copper and inlaid objects from Ur in the laboratory of the British Museum under Dr. Alexander Scott and Dr. Plenderleith, and the tissues and other objects from the tomb of Tut'ankhamun in the laboratory-tomb at Thebes by Dr. Scott and by Mr. A. Lucas.

Accuracy of Record; Scope of Publication. — A point of modern archaeological method is accurate recording. This was rare in early days, especially among French archaeologists, by whom *les* menus objets were not taken seriously. The ideal of anthropological science, to note everything, even the most insignificant matters, lest anything be ignored that present or future generations might consider important, was unknown to them. But a Scotsman, Rhind, working at Thebes in the 'sixties, had seen its importance, and made careful record of his work, though the absolute necessity for this was first emphasized by Prof. Sir Flinders Petrie, who astonished the old school of antiquaries in the early 'eighties by his insistence on the careful record of what seemed to them mere rubbish. What seemed rubbish to the elderly scholars of forty years ago does not always seem rubbish to us now. But this method may be too rigid. In many excavations now it is an impossibility to record and catalogue everything found, still less to publish everything found, to illustrate as well as describe everything. Reisner has tried to do the latter; Evans has not. Reisner's method of publication is that of the scientific catalogue. Evans writes a readable book. There is no doubt that with the first method we are in danger of not being able to see the wood for the trees, and money will not run to publication on a completely comprehensive scale. How could it be possible to publish Knossos on Reisner's method? And would it serve any good purpose to do so?

Also in publication there is the question nowadays of references to literature. While the results of excavation were still manageable and the number of workers few it might fairly be expected of an archaeological writer that he should show himself to be acquainted with the whole literature of his subject and be able to quote in his footnotes authority for every statement he makes. But with the great extension of the subject-matter of late years and the increase of the literature dealing with it, it has become almost impossible to keep tally of everything written on the subject in all countries (for the scientific man, it must be remembered, is international, and must have at least a working knowledge of many tongues). To give all references would make publications too lengthy and unreadable; and is unnecessary. So that it will soon be impossible, as it now is unjust, to criticize an archaeological writer for not referring to everything published that is germane to his argument. He must be allowed to omit references without being accused of being ignorant of them, which indeed he may often be, so far as obscure papers, say in Russian or Magyar, are concerned, without his work being seriously affected thereby. An example of the fullest footnote references, as complete as they can possibly be made, is Sir Arthur Evans's book on Knossos (*The* Palace of *Minos*), already mentioned, which well exhibits the author's wonderful knowledge of the literature of the subject and unrivalled power of illustration and comparison. In publication the question of footnotes versus end-notes is a theme of discussion.

Without copious illustration of course scientific publication is impossible. And the preparation of these illustrations begins in the field. The excavator should be himself a capable photographer, or have an expert with him, though elaborate apparatus is not generally necessary, and native boys can be trained to develop negatives admirably. Photographs must be taken of all the successive stages of the disinterment of an ancient burial, of the dkblaiement of an ancient building. Here Reisner's example is to be followed generally, though the number of photographs that can be taken is limited by the expedition's purse, and of course only a selection can be published; the rest kept for examination by students. As much as possible should be photographed on the ground. Photographs left to be done in the studio at home are rarely satisfactory, unless of course they are of objects the complete restoration of which was only possible in an European laboratory. Illustrations should be mainly photographic, and when possible in collotype; but it is a mistake to suppose that everything can be illustrated by photography. Line drawing is often necessary. Photography will not turn a corner satisfactorily nor will it reproduce faint indications. Neither will it satisfy as an illustrator of design. An ideal archaeological publication will then include illustrations not of everything, but of everything that is necessary to exhibit the results. The illustrations will be photographic (and in collotype) when possible: otherwise in line. Illustrations of the results should be as far as possible in plates at the end of the book. Illustrations in the text should be rigidly confined to purely "illustratory" pictures from other sources, designed to illustrate the finds further or to reinforce the argument of the text. Otherwise confusion with the plates and with the actual results of the "dig" is likely to occur. Every picture must have its scale given. And no book, however short, should be without an index.

Limits and Material. — It may be asked: what are the limits of the subject? what precisely is the material of archaeology? and how late a time does it concern itself with? or in other words when does the archaeologist become an antiquary? I take it that the material consists of what has been defined above as "the remains of ancient human activity," and that it begins at the beginning. The Palaeolithic period belongs to the sphere of the archaeologist, not the geologist; the Piltdown skull and its successors are archaeological as well as craniological material. Archaeology takes cognizance of all of ancient Man and his works. The boundary between archaeology and antiquarianism is an unreal one, for the scientific antiquary is an archaeologist, even if he be dealing only with the relics of the 'sixties, or let us say "Middle Victorian II*a*." But for practical purposes the line of division may be placed in England, France and Germany at the Renaissance: the middle ages belong to archaeology, whereas the sixteenth century is modern, and does not. In the Near East the division-line may be placed at the time of the taking of Constantinople: in Spain at that of the expulsion of the Moors: in Italy earlier, at the end of the trecento.

The actual nature of the material will of course differ according to the nature of the land; the objects are preserved well when the surrounding earth is dry, or if they are buried in such a preservative medium as peat. So dry is the earth in Egypt that tombs are found, like that of Tut'ankhamun, intact with all their objects in them as they were left. In wetter lands like Babylonia and Crete tombs are usually found full of infiltrated earth which has more or less damaged the contents unless they are of pottery or, as at Mycenae and Ur, of gold. Pottery is indestructible, for after it has been smashed the fragments survive. Silver oxidizes as does bronze or copper, and perishes more quickly than they — gold is inoxidizable, and only the most ancient objects show a ruddiness that is gold-rust. Leather and linen and cloth perish every-

where but in Egypt, in Chinese Turkistan, and in the bogs of the North. Dry cold in Greenland has preserved intact clothes of the fourteenth century. We have the actual garments that Egyptians wore in the days before Agamemnon; the cloth coats and breeks of Danish men of the Bronze Age. We have food and bread placed in the Egyptian tombs of the XIth Dynasty (c. 2000 B.C.), and fancy pastry from Astara near Turfan in Turkistan of the eighth century A.D. In Egypt we have the actual mummified bodies of many of the kings and great men. So the material is greatest in Egypt. We have more of the actual objects used by the Egyptians, especially those made of delicate material, than of those used by the Greeks and Romans. This contributes the special interest of Egyptian archaeology.

Conditions.— The special conditions of archaeological work have already been touched upon. Work in the field, or a good knowledge of it by the ordinary stay-at-home archaeologist is the first requisite condition. One can no longer be an archaeologist by reading books, however intelligent one may be. There is always much that cannot be understood without actual experience of excavation. A regular and uniform development of archaeological knowledge all over the world is hampered by the fact that so much more is known from the literary side of some civilizations and peoples than of others. To classical Greece and Italy, and the countries described by the classical authors, and to Palestine and Syria, we have for a century past been able to add Egypt as known not only from the classical writers but also from her own inscriptions and papyri, and for eighty years past the lands of the cuneiform script, Assyria, Babylonia, Elam and Persia, have also told us their story in their own words. We cannot yet add Minoan Crete and Greece, or the hieroglyphs of the Hittites of Anatolia to the list in spite of various efforts, though we can read Hittite when written in cuneiform, as it often is. Nay, nearer home, we have not yet been able to translate Etruscan, though, written as it is in Greek characters, we can read it. The same is the case with the fragments of the Eteocretan script, that no doubt enshrine words of the old Minoan tongue. The Cyprian syllabary, of Minoan origin, reads in Greek, so we understand the values of its signs, which would seem to point a way for the decipherment of Minoan. And we have the new "Indo-Sumerian" writing of Sind and the Punjab, recently discovered with remains of a culture contemporary with and connected with that of early Babylonia before 2500 B.C., by Sir John Marshall. When we cannot read the writing of a people our interpretation of its archaeology must necessarily remain one-sided. If we could not read Egyptian would our reconstitution of Egypt's history on archaeological grounds alone be likely to be anything near correct, however careful and scientific our method? The literary side of archaeology cannot be safely ignored if existent, while if non-existent, owing to the language remaining a sealed book, we can only hope that decipherment will soon bring it into existence. It may be regarded as ancillary to the practical side (the scholar would put the matter the other way), but the two factors must work hand in hand if correct results are to be obtained. So that nothing is more to be desired than a decipherment of the Minoan writing, to take one instance, and perhaps the most important one in view of the special importance to the early history of European culture and knowledge of the origins of Greek legend of a correct cognizance of the history of Bronze Age Greece. Till then, Aegean archaeology must necessarily present a one-sided and undeveloped character in comparison with that of Egypt or of Mesopotamia. To a less degree this is the case with the Hittites and even the Etruscans. Still more is it the case with the early peoples of Central Europe or South America. As in early Greece, what we know of the former is the history of the development of their pottery and their stone and bronze weapons, and the hints of manners and customs and of convulsions or invasions that study of their settlements may provide. We know of no historical events beyond those indicated by classical authors or by legend. Our information is merely better in the case of Greece, where also we hsve invaluable historical connections and synchronisms with Egypt, and even with Babylonia, to help us. We know more of the real history of the Maya in Yucatan, some of whose writing we can read, than of the Bronze Age Scandinavians. We know the names of Sumerian kings of 3200 B.C., though we do not know who the historical original of king Arthur was. The Swedes pride themselves on being the oldest constituted state in Europe, but we have no real historical knowledge of Sweden at any earlier date than we have of England: and Menes and the Thinites are more historical than are the Ynglingar. So archaeology, and with it ancient history, continues to develop in a somewhat lop-sided manner.

Relation to Other Studies.— If archaeology is not to become a tenth Muse herself, she is at least one of the most important handmaids of Clio. Of all the sciences, it is to that of History that Archaeology bears the closest relation. No modern historian can neglect archaeology. History nowadays is not conceived as the record of wars and of the reigns of kings primarily, but as the organized knowledge of the development of human civilization. Religion and art, the progress of invention, the housing of the people, the changes of fashion in costume of men and women, the growth of luxury, and the economic questions that have been the real cause of wars in the past as in the present, the impinging of one people on another and the conflict of characteristics that arises therefrom, all these things are the subject-matter of history and in the correct delineation of them archaeology must bear her share. Then comes the relation to anthropology. No archaeologist can neglect what the anthropologists can tell him of the culture of various races in modern times, if he is to understand those of ancient days: every anthropologist must have some knowledge of archaeology,-if he is to know anything of the origins and reasons of what he is observing. Of the relationship of the archaeologist to the engineer and the chemist we have already spoken. In this case we are mainly dealing with a temporary indebtedness for a specified purpose, but archaeology does owe much both to engineering and to chemistry. With the art of architecture the connection of archaeology is close. Without trained architects and surveyors in the field we could not secure reliable plans of our finds. And the architects have learnt much of use to them in the practice of their art from the results of archaeological research. Modern plans, elevations and decorations once more show the scholarly attention to fine ancient models that distinguished them at the end of the 18th century: the archaeological leaven is working, and is working truly, whereas the unconsidering enthusiasm of the Romantic period for mediaeval architecture was not based on scientific investigation of its models, and only succeeded in giving a meretricious mediaeval exterior appearance to Victorian interiors. Enthusiasts for mediaevalism in church architecture and liturgy may nowadays, if they employ architects and sacristans with the requisite modern archaeological knowledge, have their churches built and their rites performed as they should be, without tasteless and ignorant modern accretions of the 17th–19th centuries. And artists and actors, if they are not going to paint the Crucifixion or act Julius Caesar in modern dress, must consult the archaeologists if they want, to get things right.

History.— The history of archaeology begins with the end of the period with which it deals, viz., with the Renaissance. It naturally began in Italy in the fifteenth century when the minds of intelligent men began to concern themselves with the ruins of antiquity that lay around them. The coming of the Greek scholars to Europe after the fall of Constantinople brought the first knowledge of ancient Greece into the west, and in the sixteenth century the Humanists were the first real archaeologists. The great artists of the time studied the antique as the basis of their work, both in sculpture and architecture. The artistic Popes and Princes of Italy in the sixteenth century made the first collections of ancient sculptures, a taste which first the French and later the English acquired. In England in the seventeenth century an intelligent merchant like Tradescant collected antiquities, some of which still survive in the Ashmolean Museum at Oxford. We all know what the great nobles and landowners of England, the "Dilettanti," did in the eighteenth century to accumulate here the antiques that were admired by the taste of their day. Excavation began in Italy for the purpose of finding antique sculpture. At Naples in

the eighteenth century Pompeii and Herculaneum were discovered, and the regular excavation of Pompeii began. France, that has so often given the signal for new movements of culture, inaugurated Egyptian archaeology when Buonaparte took the *savants* with him to Egypt: the *Description* de *l'Égypte* was the first book on Egyptian archaeology, for the seventeenth century aberrations of the Jesuit Kircher can hardly be taken seriously. Then in the early nineteenth century improved taste led collectors and students, under the influence of Winckelmann, to Greece, and when Lord Elgin brought back to London the marbles of the Parthenon, the foundations of modern Greek archaeology were laid. Roman and Etruscan accretions were sloughed off gradually, and by the 'sixties Greek art was fully appreciated for itself. The work of Champollion unlocked the key of Egyptian lore. The museums of Europe were filled with Egyptian sculpture and other objects, brought back by Salt, Belzoni and others. Champollion himself led the first really scientific Egyptological expedition: the work of Rosellini was followed by that of the great Prussian expedition of the 'forties under Lepsius, which contributed to make the Berlin Museum one of the most up-to-date in Egyptian matters at that time. Then came the work of Botta and Layard in Assyria, and the bulls of Nineveh and Rhorsa'oad were set up in the halls of the new British Museum and under the vaults of the Louvre. This was the first modern excavation, to be soon followed by that of Mariette in Egypt, the results of which were to fill the new Viceregal Museum at Cairo. Mariette inaugurated a new system in Egypt, by which none was allowed to excavate but he. This monopoly persisted from the middle 'fifties to the early 'eighties, when after the British occupation a liberal policy allowed the Egypt Exploration Society to begin its work, under Naville and Petrie, which still successfully continues, though its activity seems likely to be hampered by the present restrictions, which though incorrectly described as a partial return to the system of Mariette, yet deprive the excavating societies of the full legitimate fruits of their labours, which for forty years had been divided amicably and justly on the half-and-half principle between them and the Cairo Museum. Mariette's system has not been completely imitated elsewhere, but Italy presents the nearest approach to it, for there no foreigner may dig: a curious piece of strictness. Greece has followed a different policy. There the help of learned and rich foreign societies has been welcomed, although the objects found by them have mostly been required to stay in the country. This is not felt to be such a grievance as is the present restrictive action of Egypt after experience of the more liberal Egyptian policy, which will always be associated with the honoured name of Maspero. 'Iraq follows a sensible policy, which reserves to Baghdad all objects of real outstanding importance and value while liberally giving to the excavating museums or learned bodies duplicates and all objects the conservation of which is beyond the powers of the nascent Baghdad Museum.

The modern epoch of archaeology the world over begins with the inception of the work of the Egypt Exploration Fund in 1883. Its dawn had been heralded by the enthusiastic and brilliantly successful work of Schliemann at Mycenae in 1875, which revealed—after Biliotti's tomb-digging at Rhodes (to the cost of which Ruskin contributed) in 1871—the first known relics of prehistoric Greece, the first found remains of the Minoan civilization. But Schliemann was an unscientific digger, as he showed at Troy. It was reserved for Petrie in Egypt to inaugurate the new system of careful excavation, recording and speedy publication which has always been characteristic of his work, whether for the Egypt Exploration Fund or for his own later organization, the Egyptian Research Account, which he called the British School of Archaeology in Egypt, a name that has survived, though it is not a British School of Archaeology in the same official sense as the schools at Athens and at Rome. For forty years he has laboured, to find himself at the last unable to agree with the new regulations, obliged to dig just beyond the borders of Egypt, in Palestine. His way of work, which is simply the way of common-sense tinctured by certain idiosyncracies, has inspired, with modifications and improvements, that of all other excavators since.

In Egypt during the forty-five years that have elapsed since 1883, de Morgan has discovered the predynastic age and Petrie has given it its chronology; and Petrie excavated the tombs of the earliest Egyptian kings scientifically; Naville has excavated Bubastis, the temples of Dair al-bahri and the Osireion at Abydos; and both he and Petrie considered that they had settled the question of the route of the Israelites though this is by no means considered so certain now. A list of the names of all the other international workers in this field would be too long even if only the protagonists were enumerated. De Morgan was even more distinguished by his work in Persia, and in Babylonia de Sarzec was the first to take up for France the mantle of Botta with his discoveries at Telloh of the Sumerian antiquities that are now the glory of the Louvre. And now the Germans, Koldewey and Andrae, with their work at Babylon and Assur, and the Englishmen Langdon and Woolley, for Oxford-Chicago and London-Philadelphia respectively at Rish and Ur, have made far-reaching discoveries. In Syria Hogarth inaugurated the excavation at Hittite Carchemish for the British Museum of which political conditions have prevented the continuance. Montet for France has revealed an astonishing Egyptian colonial settlement at Byblos (Jebail) in Phoenicia, dating back to 3000 B.C. In Anatolia, Hittite finds at Boghàz Kyöi and Cappadocian at Kül Tepè, Dorpfeld's work at Troy, the Americans at Sardis, Ramsay's journeys throughout Anatolia and Hogarth's excavation at Ephesus have been outstanding events. And in Crete the great excavation of Knossos by Sir Arthur Evans, and those of Phaistos and Hagia Triada by the Italians, have been epoch-making. In Greece itself the German work at Olympia and Tiryns, the French at Delos, the British at Sparta have been achievements of the great archaeological schools at Athens. In the other work done in Greece Americans have taken a leading part, and the Greeks have been by no means behindhand, especially in Crete (Xanthoudides). In Sicily (Orsi) and Malta (Zammit), important work has been done, and in Italy the labours of Boni and Lanciani at Rome and the continued excavation of Pornpeii are world famous. In Northern Africa the French have efficiently explored such mighty remains of Roman dominion as Timgad, and the Italians are undertaking the excavation of Leptis Magna At Constantinople the excavation of the Hippodrome has been started. All over Central Europe the labours of hundreds of archaeologists, German, Swiss, Austrian, Russian, Serbian, have revealed the Danubian, "Black Earth," Hallstatt and La Tène cultures; in Northern Europe those of men like Montelius in Sweden and Shetelig in Norway and many others have continued to tell us an enormous amount of the Stone, Bronze and Iron Age cultures of Scandinavia. In France prehistoric archaeology has taken the first place, and there the name of the Abbé Breuil is the most honoured. All know something of the story of the discovery and excavation of the caves of the Dordogne in France and those of Northern Spain, such as Altamira, which have given us such astonishing revelations of the most primitive human civilization in the West. Of British excavation such work as that at Silchester on a Roman site, of Sarum on a mediaeval one, the discovery of the Traprain hoard of Roman plate in Scotland, the recent use of the aeroplane to discover ancient traces on Salisbury Plain, and many another important archaeological event might be mentioned.

Passing eastward, we have modern discoveries of the most important nature in the Caucasian region by Russian archaeologists, and Sir Aurel Stein's epoch-making campaigns in Chinese Turkistan, that have connected up Chinese with classical civilization. followed by the German Lecoq; Prof. Pelliot's studies of Chinese archaeology; and the discoveries of the T'ang tombs (*c.* 700 A.D.) with their coloured pottery figures of guards, servants, horses and demons which are now such a feature of our museums. And the Swedes have now found the poetry of prehistoric China, while Japanese archaeologists (Umehara) have successfully excavated the tombs of ancient Korean kings. Finally, and with the exception of the latest finds at Ur, the newest of all, and certainly by far the most surprising of all, is the discovery by Sir John Marshall of the early bronze age "Indo-Sumerian" culture of the Punjab and Sind, with its undeniable connection with early Baby-

lonia c. 2500 B.C. The excavation of Taxila, interesting in itself, belongs to the historic period.

American archaeology is well illustrated by the work on the Maya cities of Yucatan and Guatemala, now followed by a British Museum expedition in British Honduras. And the discoveries of early culture on the coast of Ecuador and Peru show how much may yet be recovered from the land of the Inca.

Space fails in which to say more of the history of excavation. And it must be remembered that besides the publication of all this field-work, the study-work of the Egyptologists, the Assyriologists, the Sanskritists and the Sinologists has gone on, ever increasing the sum-total of our knowledge of the ancient peoples of the world.

The Future. — If one asks to what end all this labour, it can be replied that no labour is in vain which teaches us what our forerunners and culture-ancestors did in the world. To know the past is to be better equipped to deal with the question of our civilization in the present and in the future. We have seen what addilions to our knowledge have already been made: what of the future in archaeology? New realms have opened to us undreamt of before in prehistoric Greece, in Egypt, in Turkestan, in Central Europe and in America. New realms are opening in Anatolia, Syria, China, India and possibly even in Africa, where though Zimbabwe may be mediaeval, there are in the region east and north of the Great Lakes probable fields of far older human activity. The possibilities of Egypt may be nearly exhausted by the intensive work of half-a-century, though the tomb of Tut-'ankhamun has shown us that she still has surprises for us. Mesopotamia and India are comparatively untouched, and we are now going forward on the full tide of their new excavation with the modern methods practised long in Greece and Egypt but as yet poorly represented further east. It is there that the earliest revolutionary discoveries may be expected. The other fields open out beyond them a vista of undreamt possibilities. "Regions Caesar never knew, our posterity shall sway." But much depends on the intelligent co-operation of governments. A narrow policy of mere acquisitiveness, nominally for the national museums, really because politicians and officials, especially in the newly enfranchised countries of the East, have a vague idea that these things are "valuable property," will defeat its own object. For the nations that have developed archaeological work such as Britain, France, Germany, Scandinavia, America, Greece and Italy, and have the money (especially America) with which to carry it out efficiently, cannot be expected to do so if they are not permitted to possess a fair share of the results, not only for study, but to keep, in return for their expenditure of money and toil. Italy does not permit foreign excavation on her soil, so that there is no question there of foreign workers being badly treated by not being permitted to possess a fair proportion of their finds. Also in the past foreign museums have been well provided with the spoils of Italy. But work in the East will be seriously hampered unless the owner-nations realize that the excavator-nations should be generously, not parsimoniously treated in this matter. After all, the past of Greece or of Egypt is not, as their schoolmasters and politicians seem to think, exclusively the concern of Greece and Egypt: it is the concern of the whole civilized world, which equally with modern Greece is the heir of ancient Greece, far more than modern Egypt is the heir of ancient Egypt.

In England and America the tradition is that work of this kind should be carried on almost exclusively by private subscription (whether of the universities or of societies of private persons), except in England in so far as it is the work of the national museums. The British Government also contributes a small subsidy to the British Archaeological Schools at Rome and Athens. It is to be hoped that the newly founded school at Jerusalem (working now in collaboration with the old established Palestine Exploration Fund) will shortly justify a renewed official contribution to its funds, if it receives sufficient private support. But the sum-total of this official help is very much less than that afforded by some other nations, and despite the pressure of taxation, it is devoutly to be hoped that it may be found possible in the future to increase it. For, after all, archaeological exploration is not very expensive work on the whole; and it is a sound investment for a great nation to show that it has enlightened views as to the educational value of work of this kind, and is desirous of showing that it has officially and as a nation an appreciation of aesthetic and historical as well as of mere mechanical knowledge, that, in fact. it is really civilized and not merely barbarous.

BIBLIOGRAPHY.—A. Lucas, *Ancient Egyptian Materials* (London, 1926); *Antiques, their Restoration and Preservation* (ihid., 1924); W. M. F. Petrie, *Art and Crafts of Ancient Egypt* (ibid., 1910); *Methods and Aims in Archaeology* (ibid., 1904); Petrie, Hall and others, *How to Observe in Archaeology* (British Museum, 1920); A. Scott, H. J. Plenderleith, ***The*** *Cleaning and Restoration of Museum Exhibits* (Stationery Office, *1926)*; F. Rathgen, *Die Konservirung von Altertumsfunden* (Berlin, 1898).

It is impossible to give even a selected list of principal archaeological works, so large is the literature of the subject: the chief are the publications of the various learned societies, such as the Hellenic Society, the Egypt Exploration Society, British Schools of Archaeology at Athens and in Egypt, and the Palestine Exploration Fund; of the museums such as the British Museum and Philadelphia Museum (Excavations at Ur), the *Service des Antiquités* of Egypt and the Government of India Archaeological Service; and of private or subsidized investigators like Sir Arthur Evans or Sir Aurel Stein.

(H. **R.** H.)

1. STONE AGE

Although no fixed chronological epoch in world-history is understood by the words stone age, the term has the same connotation in the history of Asia as in that of Africa. It denotes the condition of a people or an ethnic unit unacquainted with the working of metal. Thus stone of various kinds is used as the material from which cutting implements and weapons are manufactured. It is the stone age of man's development in his appreciation and use of the materials by which he finds himself surrounded. It is obvious, therefore, that the stone age of some peoples is far behind them, while, with others, their present development indicates that their stone age ended but yesterday.

PALAEOLITHIC

In 1836 Christien Thomsen suggested that human history could be divided into three main stages: the first during which metal was unknown and all tools, weapons, etc., were made of wood, stone, bone, antlers or ivory; a second when the smelting of copper and the hardening effect produced by alloying it with tin (that is the manufacture of bronze) had been discovered and was practised; and finally the third when mankind had learned to prepare and work iron for all purposes.

We are here concerned with the earliest of these stages, generally known as the stone age, which is divided into a "dawn" or eolithic period, the old stone age (palaeolithic), the transitional (mesolithic), and the new stone age, or neolithic period.

In palaeolithic times men fashioned their stone tools exclusively by a chipping technique. The climatic conditions, too, were very dissimilar from those obtaining to-day, for this period coincided with the great ice age and geologically with Quaternary times. The mesolithic period commences with a complete change in climatic conditions and is intermediate between the end of the old stone age and the beginning of the new stone age, when agriculture, the domestication of animals and pottery making, had begun to be understood, and when tools were often manufactured by a grinding and polishing technique.

The following technical terms may be defined thus: —

Artefact: Any object fashioned by man.
Industry: An assemblage of artefacts at a given locality and of the same age.
Culture: The sum of the activities of the people as shown by their industries and other discoverable characteristics.

Excavation and typological study have shown that the palaeolithic period can be subdivided, there resulting a chronological sequence of cultures which show the different phases, through which mankind has passed. This sequence is obtained by studying the stratigraphy (*q.v.*) found in a large number of cave and rock shelter habitations. Naturally the cultures do not all occur universally. The best known sequence is that observed in western Europe, especially in France; it is called the Archaeological Record and can be tabulated as over: —

		Cultures.	Derivations of Names.
Palaeolithic Period	Upper Palaeolithic	Magdalenian	La Madeleine, a rock shelter near Les Eyzies (Dordogne).
		Solutrean	A rock shelter at Solutré near Mâcon.
		Aurignacian	A cave at Aurignac in the Pyrenees, now quarried away.
	Middle Palaeolithic	Mousterian	A rock shelter at Le Moustier (Dordogne).
		Micoquean	La Micoque, a rock shelter near Les Eyzies (Dordogne).
	Lower Palaeolithic	Acheulean	Gravel pits at St Acheul, Amiens.
		Chellean	Gravel pits at Chelles-sur-Marne.
		Prechellean	

Each of the cultures can be further divided into a number of stages partly on stratigraphical and partly on typological grounds. These smaller divisions, however, need not concern us further.

As to the climatic conditions prevailing during Quaternary times, whose effect on the contemporary cultures was profound, towards the end of the Tertiary period the climate of western Europe gradually became cold and a glacial period set in. There followed a succession of glacial maxima with warm intervals between. The number of these maxima is in dispute. Some authorities claim that there were two (Bayer), others three (Boule), and the more orthodox school four (following Penck and Obermaier). The latter have named the glaciations after four little rivers in the Alps. Günz (the earliest), Mindel, Riss and Wiirm. The intervening warm periods are called Günz-Mindel, Mindel-Riss and Riss-Wurm respectively. After the last glaciation the temperature rose but then fell again, though not far enough to constitute a glacial epoch except in the north. This is known as the Biihl oscillation. From Biihl times onwards the climate definitely ameliorated. Even during the glacial maxima Europe was not entirely covered by ice sheets and the mean annual temperature was probably only a few degrees lower than at present. But near mountain masses existing glaciers were very large and swept out into the plains in such districts as southern and eastern France, while in northern England veritable ice sheets existed and huge glaciers flowed down the eastern side of the country reaching nearly as far as the Thames. Naturally these great changes in climate affected the plant and animal life of Europe. For example, during a glacial maxima reindeer abounded and red deer were very rare; during an interglacial period the opposite was the case.

The correlation of the archaeological and geological records is naturally controversial. The Magdalenian culture, however, is clearly post-Wdrm, as at Schweizerbild, near Schaffhausen; Magdalenian industries have been found in a deposit resting on a glacial moraine of Würmian age. The Solutrean and Aurignacian cultures seem to be connected with some later phase of the Würm glaciation and the Mousterian in some areas with an early phase of Wiirm, in others as early as a late phase of the Riss glaciation. On stratigraphical grounds the Acheulean and Chellean cultures precede the Mousterian. From a study of the animal bones found associated with these cultures it seems that the former occurred while moderate or cool conditions prevailed, while the latter, apparently covering a long period of time, existed under various climatic conditions.

Lower Palaeolithic Cultures.— The distribution of lower palaeolithic industries is nearly world-wide. It is therefore possible that in them we are dealing with one of the main features of human development. Naturally the age in time of the cultures is not the same in widely separated regions. We do not know exactly where the cradle of the cultures was. They apparently reached Europe from north Africa and are found all over the western part of the continent and in the British Isles up to somewhere about the latitude of Hull. Coups de poing, the pear-shaped chipped stone tools typical of these cultures, are frequently found in the gravels of many English rivers, especially in East Anglia. They are common in the valley of the Hampshire Avon and in the gravels of the upper terraces of the Thames valley, and have been found in the older gravels of the Severn in Gloucestershire. In France their classic place of origin is the Somme valley, whence they were discovered in the middle of the last century by Boucher de Perthes, and after an investigation in 1859 by Prestwich and Evans were accepted as contemporary with the gravels in which they were found. Prechellean implements, tools similar to but rougher than those of the succeeding cultures, are found in the upper gravels of the Somme valley, but one of the best places for finding industries of this description is in the Cromer forest bed at Cromer. Here they consist mainly of large irregular flakes. Many such flakes have been washed out of the deposit and can be readily picked up at low tide from the pebble sheets which are then exposed on the beach. True Chellean industries yield many rough coups de poing, as well as rude borers and scrapers.

The animal remains most typically associated with them are those of a warmth-loving fauna, which includes *Machairodus neogaeus* (the sabre-toothed tiger), *Hippopotamus anzphibius*, *Elephas antiquus* and *Rhinoceros merckii*. The vegetable remains include those of the fig tree and canary laurel; the molluscs those of *Corbicula fluminalis*. In Acheulean industries the coups de poing are better made and an oval form known as the ovate develops. Also the "S" twist along the sides of the tools is found (FLINTS, *q.v.*). The fauna is a mixed warmth and cold loving one, indicating that a cool climate prevailed. It includes the Chellean fauna without the sabre-toothed tiger but with the addition of the *Elephas primigenius* (mammoth). *Rhinoceros tichorhinus* (woolly rhinoceros), etc. The Acheulean culture is quite evidently an autochthonous development from the Chellean in western Europe. At La Micoque small slender coups de poing occur, sometimes showing a large flake surface on the under side; though reindeer bones are not found in association, cold conditions had set in and industries of this type are probably due to influences from the approaching Mousterian culture.

So far no skeletons have been discovered that can be ascribed with certainty to the lower palaeolithic cultures.

The famous Piltdown skull cannot unfortunately be dated exactly, although in all probability it is of early Pleistocene age and would therefore be Prechellean. The equally well known Heidelberg jaw, found in the Mauer sands, is probably of the same age in time, but it must be connected on anatomical grounds with an early appearance of middle palaeolithic man.

The Middle **Palaeolithic** Culture.— The middle palaeolithic period is occupied only by the Mousterian culture which was brought into western Europe by the Neanderthal race, so named from a small valley near Dusseldorf, where a skull of peculiar type was found in 1856 which resembles several other skulls since discovered in association with Mousterian industries.

The Mousterian industries were first recognized in the French caves and occur there stratigraphically above the Acheulean, They are found associated with an Arctic fauna including *Cervus tarandus* (reindeer), *Elephas primigenius* (mammoth), *Canis lagopus*. L., etc. This epoch must then have coincided with the on-coming of a glacial period, and there is evidence to show that this was the last of the great glacial maxima. In central Europe where lower palaeolithic tools are rare their place is taken by what appear to be early prototypes of typical Mousterian tools, associated with a warmth-loving fauna such as is found with Chellean industries in France. This early Mousterian also occurs in one or two instances in England, in Belgium and in northern France at Montières, where it replaces the Acheulean. It would seem probable, then, that so far as western Europe is concerned, the Neanderthal folk arrived from central Europe, introducing the Mousterian culture. By the time the Dordogne district of France was reached the last glacial maximum was approaching. Whether the Mousterian culture developed in central Europe or was evolved still earlier elsewhere, merely sojourning for a time in central Europe until driven to migrate by the approach of cold condi-

tions, is not yet known. Its distribution is very wide, though perhaps not quite as extensive as that of the lower palaeolithic cultures. Typical industries have been found in Britain, France, Spain, north Africa, Italy, Germany, Switzerland, Czechoslovakia, Poland, Jugoslavia, Crimea, Siberia and perhaps China, Asia Minor and Palestine.

Typical tools found in Mousterian industries are the side-scraper, the point, the levallois flake and tortoise core. As regards technique the tools are made from flakes, there being as a rule a faceted platform, and the secondary working edge shows "resolved" flaking (FLINTS, g.~.).In the case of the point, both edges are so trimmed that they intersect and form a sharp tip. The levallois flake is oval and its upper side boldly flaked to form a flat surface, the edges often being made even and sharp by some "resolved" flaking.

The Mousterian culture in France is subdivided into three stages. In the industries belonging to the earliest we find many reminders of the former Acheulean industries, there being a numbers of coups de poing, though generally small in size, neatly made and often triangular or slightly heart-shaped. In mid-Mousterian times the coups de poing become rare and the tools though themselves well made exhibit but few types. In upper Mousterian times the coups de poing cease, and we find for the most part only a monotonous series of small neatly made side-scrapers and points.

A fact of extraordinary interest is the occurrence as early as Mousterian times of ceremonial burial, which shows that the Mousterian must have had some definite ideas about death. At La Chapelle-aux-Saints a skeleton was found by itself in a small cave buried in a carefully prepared trench together with beautifully made implements. No trace of any habitation was found at the site. This would clearly seem to indicate a careful burial. But at La Ferrassie the remains of a child were found in a trench below a large rock artificially placed there, the surface of the rock itself being covered with carefully made cup markings, which must not be confused with cup and ring markings.

The skeletons of Mousterian man exhibit distinctive characteristics. The skull have great beetling brows; the eyebrow ridges expand beyond the limits of the side of the head; the forehead is receding; the upper lip is long and the jaw is projecting and chinless. The thighs are curved and the arms long. It is questionable how far speech was possible, and casts of the inside of the skull exhibit a very simple form of brain. What has been said then as regards ceremonial burial becomes still more interesting. The more important Mousterian human remains are: a skull cap at Neanderthal, two skeletons at Spy (Belgium), a skeleton at La Chapelle-aux-Saints (Corrèze, France), a skull at La Quina (Charente, France), and recently a skull at Galilee, Palestine, and the skull of the child at Gibraltar, the discovery of which helps to substantiate the find of a Neanderthal-like skull made there long ago, the exact details of which were lost.

Upper Palaeolithic Cultures.— Three different cultures, the Aurignacian, the Solutrean and the Magdalenian, occupy the upper palaeolithic period. They were brought into Europe by neoanthropic man, a being quite different in appearance from and far more advanced than his Neanderthal predecessor who arrived apparently from the south, and spread over the whole of Europe and in Great Eritain, as far north as Derbyshire, coming perhaps from somewhere in north Africa where, at any rate, rich industries, generally called Capsian from the type station at Gafsa in Tunis, have been found along the northern margin of the continent. This area, at any rate, seems to have been the jumping off ground from which the new people entered Europe. The wealth and variety of the tools found in upper palaeolithic industries is astonishing and examples of most of the tool families occur. Tools made from bone, horn, antler and ivory appear for the first time and are especially common in Magdalenian industries, a number of types being confined to this period.

Aurignacian times appear to be just subsequent to the last glacial maxima of the great ice age, but cannot be dissociated from the glacial period. The fauna found with the industries remains cold-loving and the Pleistocene species still survive. The climatic conditions indicated by this fauna which includes the *Cervus tarandus* (reindeer), *Elephas primigenius* (mammoth), *Rhinoceros tichorhinus* (woolly rhinoceros), *Canis lagopus* (Arctic fox), *Bos priscus* (bison), *Cervus elaphus* (stag), *Ursus arctos* (brown bear), *Ursus spelaeus* (cave bear), etc., continued with smaller variations throughout upper palaeolithic times, the reindeer being especially prominent in Magdalenian times, which are therefore often known as the "reindeer age."

Aurignacian Culture.--On grounds of stratigraphy (*q.v.*) and typology (*q.v.*) the Aurignacian period can be subdivided into five stages or more simply into an earlier middle and later phase. Tools belonging to the earliest phase appear in the latest Mousterian industries in the Dordogne. The older culture, however, is soon replaced by that of the new and develops in France into the rich middle Aurignacian, the tools of which often show a wonderful fluting technique difficult to copy even to-day. The last phase in France does not seem to be derived from this middle Aurignacian and may be due to a fresh migration perhaps from north Africa. Finally the Aurignacian culture was submerged by the Solutrean incursion, except in areas not reached by the new folk; where therefore the Aurignacians continued to develop undisturbed, such as in western Europe, the Pyrenees, the western foothills of the Alps, and England, though here in the south-western and eastern regions a Solutrean influence, at any rate, seems to have been felt.

The tools of this period are quite unlike the Mousterian ones. Gone are the endless side-scrapers with "resolved" chipping. Instead we have beautifully made end-scrapers, keeled or otherwise, in which percussion flakes rise fanwise to a central point. Burins (*q.v.*) are numerous, and points having a sharp working edge and blunted back appear and develop. Sometimes there are double tools, a graver at one end and an end-scraper at the other, and also some bone tools among which the bone point with a split base is common in middle Aurignacian industries.

Ceremonial burial is known, the bodies being often buried in red ochre with beautifully made implements as well as ornaments and necklaces, sometimes made from sea shells, which must have been imported from a considerable distance. The skeletons are of more than one type, denoting either an intermixture of races or the development in *situ* in Europe or elsewhere of variations of the original stock. These variations, all covered by the generalized term "neoanthropic race" include Cro-Magnon man, Combe-Capelle man and perhaps, too, the Grimaldi "infants," an old woman and young man, who are said to possess some negroid characteristics. They resemble modern man in many ways, and the characteristics especially associated with Neanderthal have disappeared.

Solutrean Culture.— This culture has been divided into a proto, lower and upper Solutrean stage. The Solutreans seem to have been small in number who, through the invention of a type of slender javelin head, known from its shape as the laurel leaf, and made possible by the discovery of a pressure technique for flint flaking (FLINTS, *q.v.*), dominated for a time large parts of western Europe. They originated probably in Hungary and may perhaps be a hybrid product of Neanderthal and Aurignacian man. They seemed to have swept through central Europe into France. Traces of their influence can be noted in eastern and southwestern England. They appear as far west as Cantabria in north Spain, are not found around the Mediterranean nor in Palestine, and it is difficult to connect the laurel leaves found in certain African industries with the true Solutrean culture. The laurel leaf therefore must not be taken as typical of Solutrean industries only. In upper Solutrean times a certain type of tool, the shoulder point, developed by late Aurignacian man, reappears modified often by the peculiar pressure technique employed by Solutrean man. These herald the end and the Solutreans seem to have rapidly disappeared, their place being retaken by the folk of the earlier stock who, however, had developed considerably in the interval. Solutrean times must be considered as a sort of parenthesis in an evolutionary sequence from the early Aurignacian to the late Magdalenian.

Very few burials of undoubtedly Solutrean man have been made known. As has been suggested the Aurignacians probably

continued to exist throughout the period and it is difficult in any one case to be sure that we are really dealing with a specimen belonging to the invading and dominating people. An interesting burial, however, has been discovered at Klause in Bavaria where a Solutrean skeleton was buried in red ochre which probably indicates a ceremonial burial.

Magdalenian Culture.—The Magdalenian culture appears to have been mainly evolved in France, whence it spread far and wide, although there is very little evidence in such areas as Great Britain and Moravia for any replacement on a large scale of the Aurignacian inhabitants by Magdalenian folk themselves. As has been stated the Magdalenian culture is definitely post-glacial. Tools made from bone, horn, antler and ivory appear throughout upper palaeolithic times and in Magdalenian industries are most numerous and most beautifully made. The skill in bone working of these people is indicated by their beautiful fine-eyed needles. In this culture, too, prehistoric art, first noticed in Aurignacian times, reached its highest development. A six-fold division of the Magdalenian culture has been rendered possible by a stratigraphical and typological study of the industries, certain bone tools being utilized as type fossils. Lance-heads are used for this purpose in the earlier, harpoons in the later stages. Flint implements, too, abound and are beautifully made, although the perfection and vigour of middle Aurignacian workmanship is hardly again attained. At the end of the Magdalenian times certain Aurignacian types of tools reappear, at first in the Pyrenees district and later in the Dordogne. This would seem due to the arrival of the Azilian cultures belonging to the mesolithic period, which were, in all probability, themselves a late development from the basic Capsian stock.

The "Home" Art.—An engraving on a flat piece of bone was found in the cave Chaffaud at Sévigné (Vienne, France) as long ago as 1834, though its great antiquity was not then recognized. During extensive diggings in the Dordogne in the 60's undertaken by M. Lartet in association with Mr. Christy, however, a rich collection of decorated objects was discovered. Their age is unquestionable as the decorated objects are found associated with datable tools and the remains of a Quaternary fauna.

It was formerly stated on psychological grounds that sculpture must precede line engraving. But though sculpture is at first commoner than engraving, the latter is found from the earliest times.

It is doubtful whether Solutrean man practised any form of art, unless he was in contact with and influenced by the folk among whom he had penetrated, for little trace of it is found in Solutrean times. The "home" art is therefore divided into an Aurignacian and Magdalenian cycle. In the former the art is still crude though vigorous. Especially to be noted are the famous sculptures representing human beings, generally known as "Venuses," found at Brassempouy (Landes), at Mentone, at Willendorf (lower Austria), at Unter Wisternitz (Moravia) and elsewhere. Other human figures in high relief come from Laussel. (Les Eyzies, Dordogne), one example depicts a steatopygous woman with a bison's horn raised aloft in her right hand. An engraving of a horse on a fragment of bone has been found in an Aurignacian industry at the cave of Hornos de la Peña (Cantabria). Painting, as might be expected, is rarely preserved in the "home" art, but at Sergeac (St. Léon, Dordogne) human hands were found painted in red on a piece of rock with a late Aurignacian industry.

In Magdalenian times the "home" art flourished exceedingly, and hundreds of sculptures, reliefs, bone silhouettes and engravings, representing animals, as well as geometric patterns have been discovered. Frequently tools, such as spear-throwers, spatulae, etc., were decorated. Painting, too, has been noted but is naturally but rarely preserved.

The Magdalenian culture was in a stage of rapid evolution, and great developments, therefore, took place in the styles and technique of the art. Not only can an improvement and an increased skill in the use of the burin be noted, but also certain types of geometric patterns, etc., are made only at certain times.

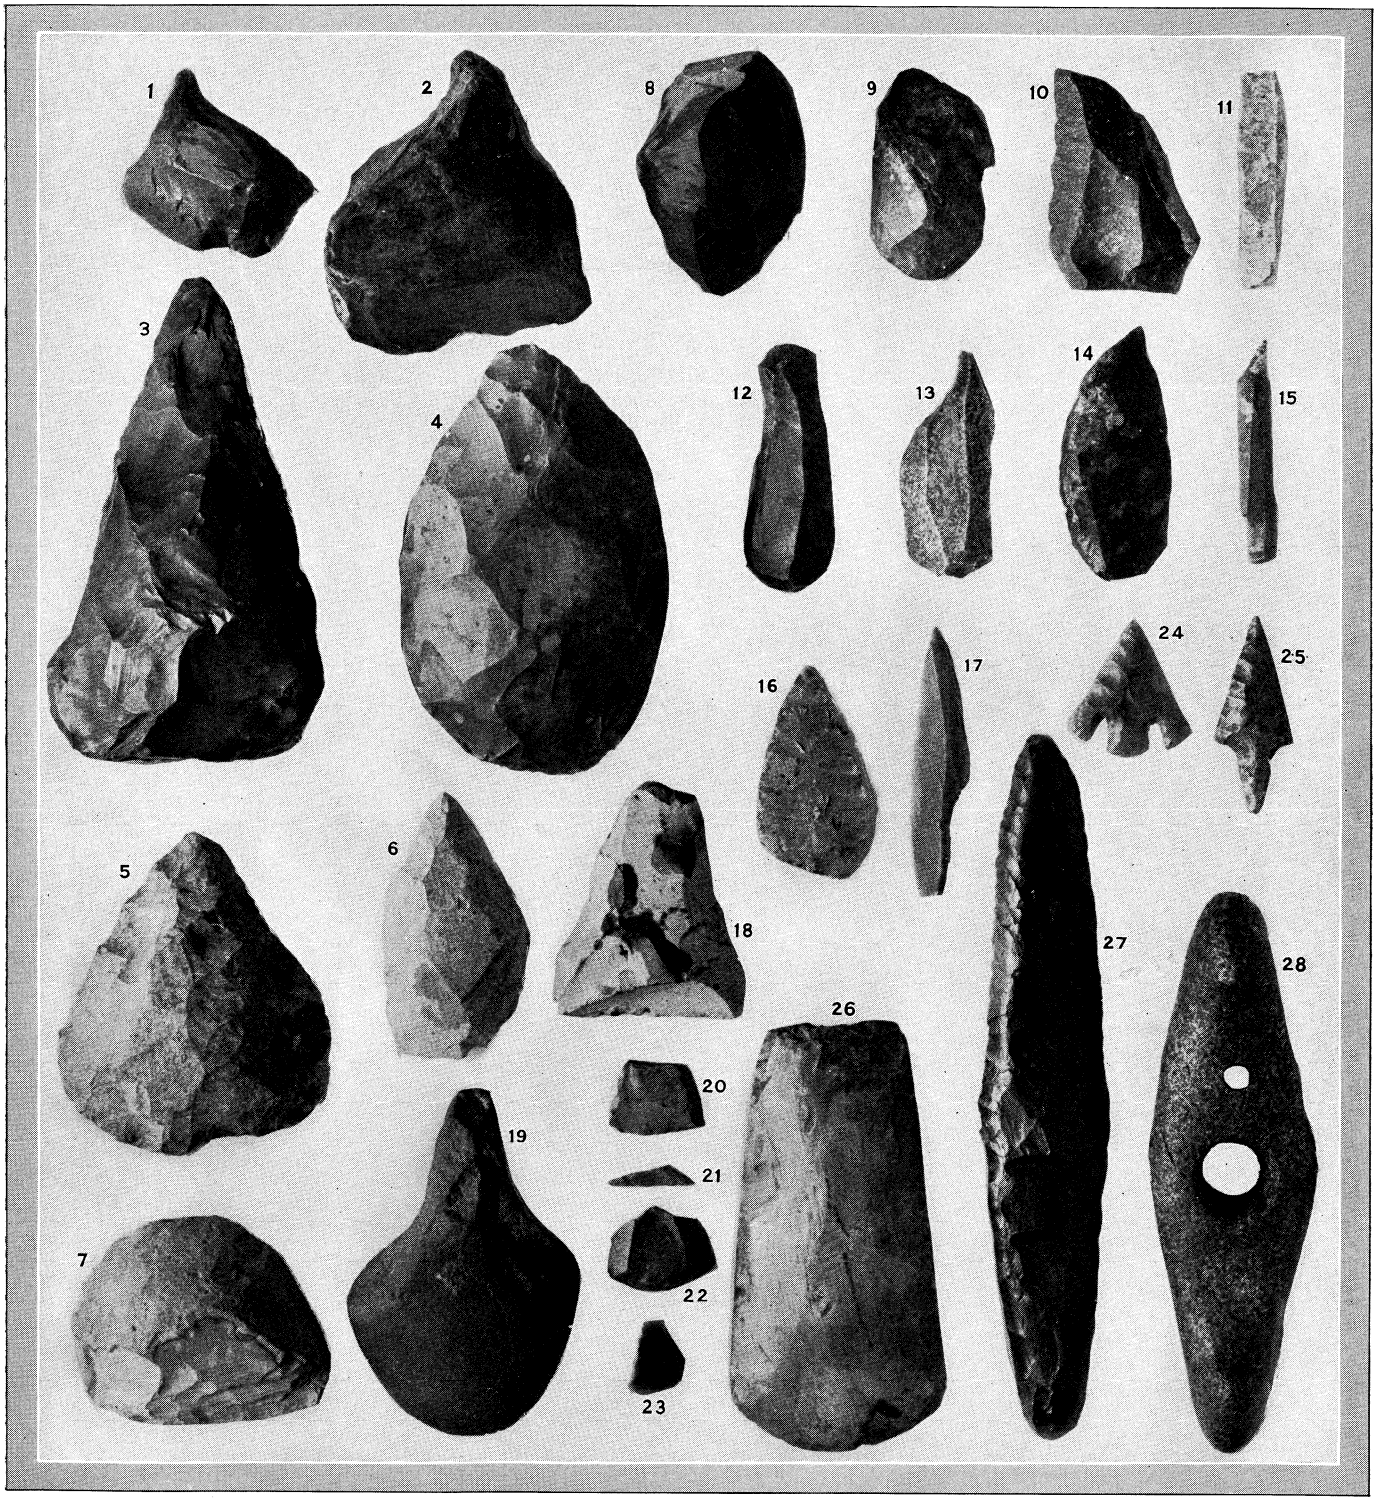
The "home" art can therefore be utilized by the prehistorian in subdividing the Magdalenian period, with results which agree in a remarkable way with those obtained from analysis of the industries. In the course of the evolution of the art the increase in the conventionalization of animal figures depicted is interesting, and a study of the conventionalizations themselves forms an important investigation. Series can be found starting with naturalistic representations of the animals and finishing with what appear to be mere patterns derived from them. Besides these "schematic" figures there are sometimes found what might be called "suggestion pictures." For example, in one case a herd of reindeer is depicted on a fragment of bone, but the first three and the last animals alone are reasonably well drawn, while between them are merely a number of engraved lines representing a forest of antlers.

The distribution of the "home" art in Magdalenian times is not perhaps quite so wide as it was in earlier Aurignacian days. This is to be expected; the Magdalenian culture was essentially a western European, not to say a French product. In western Europe itself we find the Magdalenian "home" art commonly in the Dordogne, in the Pyrenees, and in Cantabria. Eastwards it occurs in the Jura and its influence can perhaps be traced in Moravia, but the culture to which the art there belongs appears to be an autochthonous development of the Aurignacian, contemporary with the Magdalenian of France. "Home" art has been rarely found in England; the best known specimen is a poorly drawn figure of a horse which was found long ago at Cresswell Crags in Derbyshire.

The motives for this "home" art were probably many and varied. In some instances no doubt pure decoration was the reason; in other cases it may have been due to a desire for self-expression among what undoubtedly must have been an artistic people. Again the artist may have wanted to make sketches from nature, to be elaborated later into cave masterpieces. Undoubtedly, too, the drawings were often made as amulets or to ensure efficacy to weapons thus decorated. This is in accord with what is often found among modern primitive peoples. A certain amount of evidence exists to show that something in the nature of art schools must have been in existence. At a "home" like La Madeleine, for instance, only well made drawings and sculptures occur, but at Les Eyzies thousands of fragments of bone have been found, covered with attempts at drawing such as beginners would make.

The Cave Art.—It was in 1879 that the marquis de Sautuola and his little daughter, aged 5, went up to the cave of Altamira near the village of Santillana del Mar (Cantabria). The cave had been recently discovered while digging out the quarry in the course of a hunt and the marquis hoped by excavating in the floor of the vestibule to discover some bones and stone implements. He busied himself in this occupation while his daughter, becoming bored, walked about with a candle amusing herself. The ceiling is very low but owing to her small size she was, unlike her father, able to stand upright. Happening to look upwards she caught sight of one of the bison belonging to the now famous frieze, and called out to her father, "Toros! Toros!" *i.e.*, bulls! bulls! The marquis came to examine the spot and thus were the famous Altamira frescoes discovered. At first they were not accepted as prehistoric by the scientific world, and it was only in 1895 that evidence from La Mouthe finally convinced the sceptics. La Mouthe is a cave not far from Les Eyzies and consists of a large vestibule, formerly inhabited by prehistoric man, from the back of which a passage opens leading to corridors and chambers with engraved and painted walls. The entrance to this passage, however, was filled with archaeological deposits, the upper layers containing a Magdalenian industry, and it was not discovered or made passable for a human being until excavation had taken place. No one then had entered the decorated corridors behind since Magdalenian times. Since 1895 numerous painted and engraved caves have been discovered in the Dordogne, in Corrèze, in the central districts of the Pyrenees, and in Cantabria. A similar art occurs in south Spain, in the districts of Malaga and Ronda; there is also a site in the "heel" of Italy and one or two in Provence. Up to date no palaeolithic cave paintings have been discovered in Great Britain.

The engravings were made with sharp flint tools called burins (*q.v.*), examples of which are very common in upper palaeolithic industries, though from their number it would seem that they can-



IMPLEMENTS AND WEAPONS OF THE STONE AGE

1, 2. Eoliths from near Ipswich, England
3. Coup de Poing, Lower Paiaeolithio
4. Ovate, Lower Palaeolithic

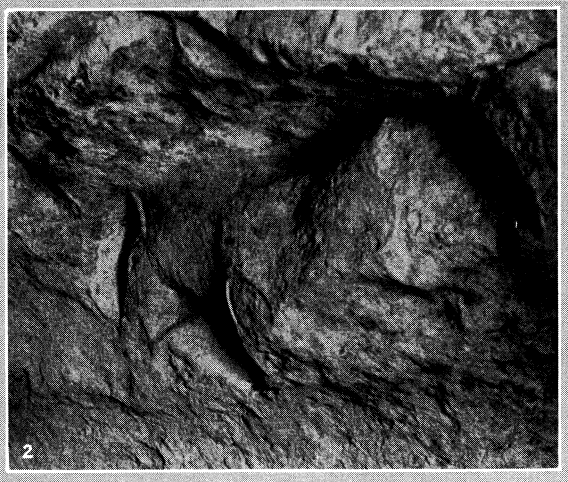
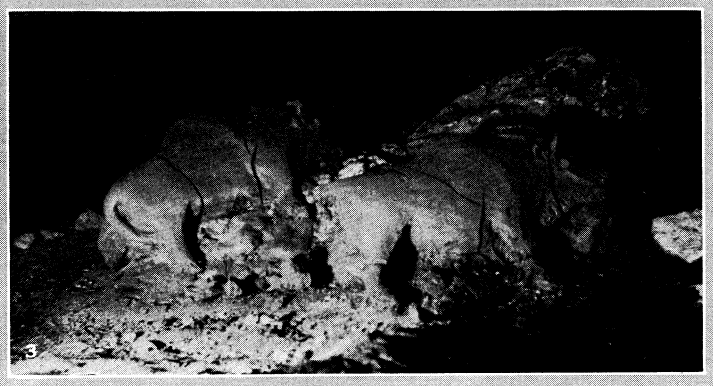
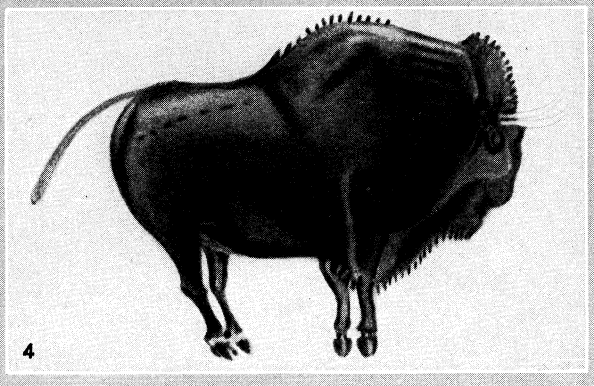
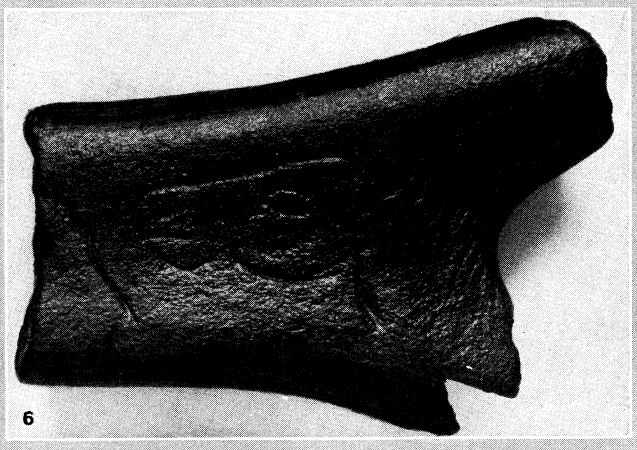
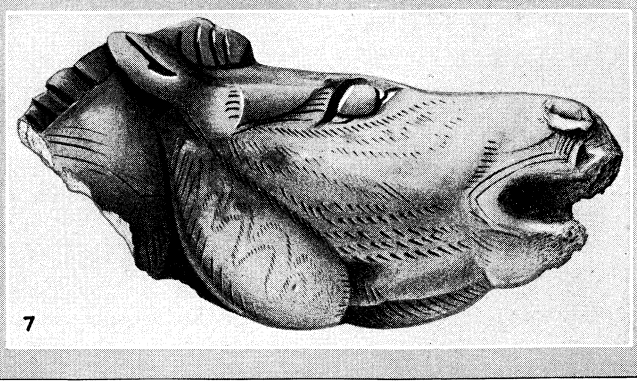
ARCHAEOLOGY











BY COURTESY OF (7) MASSON AND COMPANY FROM PIETTE, "L'ART PENDANT L AGE DU RENNE"; PHOTOGRAPHS, (1, 2) DELL AND WAINWRIGHT

EXAMPLES OF STONE AGE ART

1. Engraving described as reindeer discovered in the cavern of Cornbarelles, Dordogne. Probably Lower Magdalenisn period. 2. Sculpture of horse in high relief, Abri Cap Blanc, Dordogne. Probably Lower Magdalenian period. 3. Two bisons modeled in clay, from Cave of Tuc D'Audoubert, Pyrenees. 4. Polychrome picture of bison from cave at Aitamira, Spain (after tracing by H. Breuil). 5. The "Venus of Willendorf" sculptured out of a fine oolite limestone; from a cast, the original of which is in Vienna. Of the Upper Aurignacian Age. 6. Engraving of a horse, from Laugerie Basse, Dordogne. Late Magdalenian in style. 7. Horse's head carved in reindeer horn, from Mas d'Azil (Pyrenees) Palaeolithic

not have been exclusively used for this purpose. In one instance (Trois Frères) a burin was actually found lying on a projection from the cave wall just under an engraving of a lion. Doubtless when the artist had finished he laid down his tool and while surveying his work, forgot it; and there it remained for 10,000 years or more.

The painting material, as a rule, consisted of mineral oxides; those of iron gave various shades of red, that of manganese a blue-black. Besides these oxides, carbonates of iron were utilized, giving colours ranging from yellow to dark orange, and finally burnt bones provided the artists with black, a more fugitive pigment than that from the mineral oxides but sufficiently permanent when not exposed to weathering action. The raw colours were pounded and mixed with fat; bone paint tubes and palettes have actually been found in the industries. How the colours were applied is not actually known. Lamps which would be necessary in the darkness of the caves have been found hollowed out from a lump of stone, though a fragment of skull was often doubtless utilized for this purpose. The fuel was fat and the wick probably moss, as is the case with Eskimo lamps to-day. It must be remembered that some of the caves are of great length and the paintings often occur a long way underground; the necessity for a good light is obvious, as without illumination it would at times not be at all easy ever to find the exit.

The cave paintings are not all alike, nor of one age. They range in date from early Aurignacian to late Magdalenian times, though once again it is doubtful whether Solutrean man ever practised a pictorial art. A combination of the evidence obtained from stratigraphical and typological considerations applied to the art has given us a chronological sequence comprising a number of different styles and techniques. This has been made possible by the finding of a large number of painted palimpsests showing a sequence of different styles superimposed one upon another and by noting that whenever observed the sequence of the various styles is always the same. In this way four distinct phases, as they are called, of different age and assignable to definite cultures have been determined. Each of these phases shows a number of different styles of drawing which do not differ much from one another in age and belong to the same culture. They often have a limited geographical distribution. The artistic progress was not always constant, and there is evidence for a considerable degeneration at one period.

Phase 1.—The engravings consist of meandering parallel lines and poorly drawn outlined figures of animals. Except towards the end of the phase only two legs are represented, the animals' bodies are depicted in profile, while the head is shown full face. The same is true of the paintings with the addition that representations of the human hand occur. Where it is a direct impress it is known as a positive hand; where the hand has been placed on the cave wall and colour applied round it so that the surface of the wall is coloured; except where the hand actually was, it is known as a negative hand. Examples of both methods are known.

Phase 2.—The engravings show great progress; no longer do we find merely a simple outline; the figures of animals are vigorous and very true to life. All the little details like the cloven hoof in the ox family and so on have been carefully remembered. Another style especially common in Cantabria has been recognized where the engraving is much finer and the whole body of the animal is filled in with fine lines. The result is perhaps a little less naturalistic, but none the less vigorous. The paintings, too, show very great improvement and two styles have been isolated, "stump drawing," the shading producing an effect of relief and a technique where the outlines of the animal figures are made by delicate punctuations. Sculpture and reliefs are also known, and man's desire to obtain a figure in three dimensions is further exemplified by his habit of making use of natural bosses of stalactite in the caves, more or less resembling the figures of apimals, and painting on them such necessary details as horns, nostrils, hoofs, etc., so as to turn them into good representations of the animals ciesired.

Phase 3.—The engravings exhibit a certain falling off in vigour, though not in skill, but the paintings show great degeneration. The fine shaded paintings of phase 2 are replaced by poor effects in silhouette or "flat wash," the figure being often first engraved and the colour applied afterwards in such a may that the "register" is not exact. While the artist still took careful note of anatomical details, his painting of them was by no means always naturalistic.

Phase 4.—The engravings developed into fine scratchings which, though perhaps rather wooden, still show considerable artistic merit. The vigour of the paintings lost in phase 3 is regained, not by a return to the former techniques, but by the use of several colours resulting in the well known polychrome pictures.

By finding in the industries fragments of bone engraved in the same style, it is possible to correlate certain styles and therefore phases of the cave art with definite industries and therefore cultures. Again certain styles of engravings have been found covered by deposits containing datable industries. The engravings must then be older than the deposit by which they are covered. By a combination of these two methods phase 1 can be assigned to the Aurignacian period, phase 2 to the lower Magdalenian, phase 3 to the middle Magdalenian, and phase 4 to the late Magdalenian cultures.

The drawings were almost certainly made for purposes of "sympathetic magic." There are only two other possible explanations, namely that they were made for motives of decoration or self "expression." An examination of the circumstances in the caves disproves these two latter. Man never lived deep in the heart of the mountains where the paintings occur, and no trace of his industries is there found, so decoration of the "home" can be ruled out. Again not only do styles belonging to different phases, and therefore differing considerably in age, form palimpsests, but sometimes styles belonging to the same phase, and therefore not very different in time. occur one on top of another. The result is hardly decorative! The occurrence of the art in obscure crannies difficult of access argues against the desire of expression explanation! On the other hand "sympathetic magic" offers a reasonable and likely motive, comparable with many of the manifestations of "sympathetic magic" that have been observed among modern primitive peoples. The underlying fundamental desire was food—a dire necessity in the case of a hunting people living under difficult conditions, and practising neither agriculture nor domestication of animals, and having only inferior weapons, and no means of storing food. Doubtless as with many modern primitive peoples pent-up emotion gave rise to ceremonial dances and the like; but it would appear that part of the ritual consisted in taking the hunter into the long cave and then showing him pictures of animals, very often with an arrow represented in their sides, and then the sending him forth suggesting to him that he would likewise successfully hunt and kill them. The weirdness of the caves must have induced a state of mind on which suggestion would work easily, and the officiating sorcerer would induce self-confidence in the hunter. And since in matters of the chase self-confidence is half the battle, the sorcerer's rites were no doubt quite effective. That at any rate, in Magdalenian times, the artist-sorcerers formed a definite class is probable; similar changes in the phases take place simultaneously over wide areas, a fact which argues for definite schools of tradition; and further, a very interesting site has been discovered at Trois Frères (Montesquieu-Ariège, France), where there is a small chamber, with engraved walls which is dominated by a sort of pulpit, 12ft. from the ground and reached from behind, where no doubt the actual artist-medicine man-priest, stood. On the blank wall to the left is a representation of the sorcerer himself, showing a man masked with antlers of a stag and the tail of an ox or horse.

Another late palaeolithic art group is found covering the walls of rock shelters in eastern Spain. The best known sites are at Cogul near Lérida and Alpera. The whole appearance of this art is totally different from that with which we have been dealing. Scenes, rare in the former, are here common; human beings, generally conventionalized, are frequent; the bow and arrow is figured. Drawings of Quaternary animals, though known, are rare. Instead of occurring in long deep mysterious caves the paintings are found on the walls of shallow rock shelters, protected from the

weather, as is shown by the absence of lichen growths on the walls where paintings have survived.

The motives underlying this eastern Spanish group are quite unknown. The places were not homes, but possibly sacred spots, where ritual practices took place, which had been decorated for much the same reason as many of our churches are ornamented. The numerous hunting scenes depicted seem to show, as might be expected, that the quest for food was a dominant consideration. The situation in full daylight, however, is dissimilar to that of the cave paintings, and it would seem likely that the explanations which there held good do not here apply.

MESOLITHIC

The close of the palaeolithic period coincided with a sudden change in climate. The Arctic conditions which had obtained throughout its middle and later phases disappeared, the mean annual temperature rose, forests appeared and most of the old quaternary fauna either became extinct or migrated to cooler regions farther north. The cause of this sudden and complete climatic change is unknown, but it may perhaps have been connected with some such phenomenon as the final break through of the Strait of Dover and the resulting redistribution of ocean currents.

Magdalenian man with his wonderful culture and art disappeared, his place being taken by a number of different, more or less isolated, peoples who occupied most of Europe until the arrival of the true neolithic civilization. They have left us their industries which, though productive of many problems for the prehistorian, are for the most part unrelieved by artistic manifestations. The various cultures had different origins and some at least had their roots in the older upper palaeolithic cultures. But none the less in view of the new conditions under which they persisted, the interconnections between some of them and the fact that in general they certainly cannot be classed as palaeolithic, it has become advisable to create a new main stage in the archaeological record between the palaeolithic and neolithic periods. Several descriptive names—Transitional, Epipalaeolithic, Mesolithic—have been suggested for the new period; in many ways the last of these seems to be the most satisfactory.

The following different mesolithic cultures have so far been recognized in Europe: the Azilian, the Tardenoisean, the Asturian, the Maglemosean, the Kitchen Midden and the Campignian. This list of cultures does not indicate any chronological sequence; their relations to each other have not yet been completely determined.

The Azilian Culture.—This culture was first recognized at and named after a site above the village of Mas d'Azil (Ariège, France) on the left bank of the Arise just as the river enters a famous natural tunnel through the hill. While digging there the well known prehistorian M. Piette observed the following stratigraphy:—

Surface soil.
Neolithic and bronze age industries (with foundry).
Loam with the new industry (=Azilian).
Sterile loam with reindeer bones.
Black loam with reindeer bones and Magdalenian industries similar to some already excavated on the right bank of the river.
Sterile gravels.

The intermediate position of the new industry between upper palaeolithic and neolithic industries is here clearly seen. In place of the splendid Magdalenian bone and stone tools, the former often beautifully decorated, the Azilian industries comprise poorly made bone polishers, spatulae or chisels, rough bone awls and a monotonous series of flint tools, including scrapers, many being of the small round type. The only new variety of tool that appears is a broad, flat harpoon with poorly formed barbs which differ from their Magdalenian forerunners in that instead of being prominently cut out and much projecting from the round stem they are now formed by notches cut in the sides of the flat piece of material. This is usually stag antler, reindeer antler, almost exclusively used by the Magdalenians, being now very rare. There is generally a central attachment hole (round or almond shaped) cut through the base of the implement.

Hardly any engraved objects of Azilian date are known. There is one example from Sordes consisting of a small stone covered with meaningless lines. However, many river pebbles have been found painted in red ochre with dots and lines or combinations of both, forming veritable patterns. For what purpose these so-called "painted pebbles" were made is unknown. At one site a number were found, and every one had been carefully broken in two, a fact which might suggest that they had some definite ritual significance. They have been compared with Australian churingas: it has been suggested that they were toys, money, counting boards, etc. Dr. Obermaier considers that the painted patterns on the pebbles may represent highly conventionalized figures of human beings. Similar conventionalizations of the human form appear in a rock-shelter art group in southern Spain belonging to the late neolithic or copper age. But it is very uncertain whether any of this later conventionalized art can be referred to an Azilian culture, and comparisons therefore are dangerous unless a cultural connection between the two manifestations of art can be determined. The so-called Azilian painted pebbles long ago discovered in the precincts of a late Celtic broch in Caithness (Scotland) are quite unlike true Azilian painted pebbles and have no connection with them.

Using the flat harpoon as the "type fossil," Azilian industries have been recognized in north Spain as far west as Asturias; in the central districts of the French Pyrenees; in east France; in Switzerland just south of Basle; in Bavaria; in Belgium near Liége; in Great Britain at Victoria Cave near Settle (Yorks), near Kirkcudbright, at Oban, on Oronsay island and elsewhere.

Azilian man as well as his industries apparently developed from upper palaeolithic predecessors under stress of the new climatic conditions. Whereas the palaeolithic folk were almost invariably long-headed, an interesting Azilian burial found at Ofnet in Bavaria shows among a considerable total a certain proportion of round-headed individuals; this may perhaps indicate that the Azilians were a mixed race. The burial in question consists of two small pits or nests containing decapitated skulls arranged in concentric circles, all facing west; there is much ochre present as well as a number of necklaces and other objects of decoration. At one place at least the bones of a dog have been found in an Azilian site.

The Tardenoisean Culture.—The industries belonging to this culture and named after the type station at Fère en Tardenois in the department of the Aisne, in France, consist mainly of pygmy tools comprising crescents or lunates, triangles, blunted backs and the like. There is also a small burin which is typical of the culture. The pygmies indicate that Tardenoisean man had discovered the advantage of a composite tool which has the haft made of one material and the working edges of another. Thus a wooden or bone haft which is light and tough could be used to mount the flint pygmy knife blades or saw teeth which are sharp though brittle. Apart from their small size—crescents less than half an inch in length are known—the characteristic feature that all pygmy industries have in common is that, unlike the implements of the older types, the secondary chipping which they show is generally intended to make an edge blunt in order that it shall not cut into its haft rather than to shape or toughen a working edge. The working edge itself is simply formed by the intersection of two flake surfaces.

Pygmy industries have a world-wide distribution, but it is unsafe to class them all as Tardenoisean in culture. The discovery of the advantages of a composite tool may have been made by many peoples at very different times. Nevertheless the distribution of the Tardenoisean culture is wider than that of the Azilian. It occurs all round the shores of the Mediterranean and penetrates

northwards at each end of the alpine massif, being found in England, France and Belgium on the one hand and in the Crimea and Poland on the other. It is clearly connected with the late Capsian industries of north Africa and was undoubtedly evolved from an upper palaeolithic, probably late Capsian, culture. At Valle in north Spain Tardenoisean and Azilian tools are found together in the same archaeological layer; the two cultures are therefore contemporary. In fact they are often grouped together as the Azilio-Tardenoisean culture. At the Grotte des Enfants, near Mentone, occur many feet of archaeological deposits which show an Aurignacian culture steadily developing, undisturbed by Solutrean and Magdalenian invasions. It is interesting to note that almost insensibly the Aurignacian tools diminish in size and change their form, until in the top layers the student is surprised to find himself in the presence of an Azilio-Tardenoisean industry.

A Tardenoisean burial under a tumulus in the vicinity of Vittoria, Spain, has been described by Obermaier. At Ofnet, in Bavaria, Tardenoisean as well as Azilian tools have been collected, and in England Tardenoisean industries are found, notably at Hastings and on the Pennine hills near Huddersfield.

The Asturian Culture.—The Asturian industries occur chiefly in the north Spanish province of Asturias, where they were first brought to light by the Count de la Vega del Sella. They have been recognized also near Biarritz, and as far east as Catalonia; perhaps, too, traces of the culture occur farther north in France. The industries are found in veritable kitchen midden refuse heaps which consist largely of sea shells that have been thrown into the caves, these having served seemingly as dustbins for the inhabitants. From stratigraphical evidence the Asturian culture is post-Azilian, for deposits containing Asturian industries are found resting on others containing typical Azilian tools.

Asturian implements are very crude, but there is one characteristic tool, the pick, which is manufactured from a more or less oval river pebble by chipping one end of it so as to leave a rough point. There are also some poorly made bone tools. Among the enormous quantity of the remains of shell-fish that have been found is the species *trochus*. This fact is important as it indicates that the mean annual temperature of the district must have been slightly higher than it is to-day.

Maglemosean Culture.—This culture is essentially north European, and industries belonging to it have been found in districts stretching from Poland to the Baltic; they are especially common in the latter region. Isolated Maglemosean tools have been found as far west as eastern England, and a site has been discovered in north-east France, near Bologne.

Of great interest is the correlation of the Maglemosean culture with the earth movements that have taken place in the Baltic area since Quaternary times. At the end of the great ice age the whole area lay at a lower level than it does to-day and to the north of the Baltic sea there was a wide open channel connecting it with the Arctic ocean. The whole was known as the Yoldia sea, and in time this period corresponded with the post-glacial Bühl oscillation. There followed an uplift of the land when the Baltic became a lake known, from a small shellfish then common, as the Ancylus lake. At this period the pines which preceded the growth of oak-woods were predominant and it was now that the Maglemosean culture flourished.

Later a second depression of the land occurred, but this time it was not on a large enough scale to produce a connection with the Arctic ocean. However in place of the "Belts" a wide opening to the North sea existed, and the increased Ancylus lake is now known as the Littorina sea because of the common occurrence in it of the shells of *Littorina litorea*. We find the pines were now largely replaced by oaks and the Maglemosean culture by that of the Kitchen Middens. In Finland, however, Maglemosean industries are found associated with oak trees, which indicates that in this district they were of rather later date than in Denmark and were contemporary with the Kitchen Midden culture there. Finally a slight uplift occurred inaugurating conditions similar to those which prevail to-day, and at the same time the oaks gave way to the beech and the birch.

Since the Magdalenian culture in France probably coincided with the Biihl oscillation, the Maglemosean culture, which is post-Buhl and therefore post-Magdalenian, is thus seen to be truly mesolithic. It was in all probability contemporary with the Azilio-Tardenoisean culture farther south, but was earlier in time than the culture of the Kitchen Middens with which however it is linked by many ties and from which it cannot be sharply separated except in age. For this reason then, if for no other, the Kitchen Midden culture too must be classed as mesolithic.

Maglemosean industries were first recognized under the "great heath" near Mullerup on the west coast of Zealand. Since then many other sites have been discovered in Denmark. The industries consist of stone and antler tools. The former comprise scrapers—both end scrapers and core scrapers—awls and a few pygmies. The latter include pierced axes, or more frequently adzes, as well as a characteristic type of harpoon having a single row of barbs. There are also pierced antler sleeves in which stone implements were affixed to give a sharp working edge, while the sleeves themselves were hafted on to a stick; the directions of the holes through which the sticks must have passed relative to the direction of the flint working edges show that these tools were usually adzes and not axes.

The Kitchen Midden Culture.—The position of the Kitchen Midden culture relative to the Maglemosean culture and to the post-glacial earth movements in Scandinavia has been already given. As regards its distribution—it is found near the coasts of south Scandinavia and round the southern shores of the Baltic—it is in fact again an essentially Baltic culture. It remains to say a few words about the industries themselves and their occurrence. The Kitchen Middens form low mounds a yard or more in height and sometimes covering an area of as much as 100yds. by 50 yards. They occur close to the coast and are composed almost entirely of the remains of shellfish thrown aside by man. In these rubbish heaps are often rough stone and bone implements, and sometimes primitive burials. The remains of the dog are found and also a primitive pottery, the pots having a pointed bottom and a rough decoration just below the rim. The characteristic tool is a sort of chisel formed from a piece of flint or split stone pebble by squaring the sides, removing a large flake at one end and so obtaining a sharp edge by the intersection of this flake surface with the flat under-surface of the material. This tool also occurs commonly in the next culture to be considered. The same kind of antler tools and sleeves that were common in the Maglemosean culture persist, but now in the case of the sleeves it is noticeable that axes were the tools generally required. Tools made by a grinding or polishing technique are absent. There are indications that the climate must have been slightly warmer than it is to-day—may we for this reason suggest a contemporaneity for the Kitchen Midden and Asturian cultures?

The Arctic culture, perhaps connected with the Maglemosean culture, survived and developed undisturbed in the hinterlands where the Kitchen Midden folk do not seem to have penetrated. This culture is found in Scandinavia and Finland and may occur even farther eastwards; to it belongs, in all probability, the well known rock engraving art group of western Norway and northern and central Sweden, as well as some characteristically decorated pottery.

The Campignian Culture.—The Campignian culture is similar in many respects to that of the Kitchen Middens, but it is found in more southern areas distant from the coast-line. The type station is near Blangy-sur-Bresle (Seine Inférieure, France). Here are found a number of pit dwellings, oval in shape and varying in size, being sometimes as much as five yards in the longer diameter and several feet deep. Over these hollows there were doubtless roofs formed of rough beams with an infilling of twigs and mud. At Campigny several of these pit dwellings had been sunk in mammoth-bearing gravels of Quaternary age and the following section is vouched for by M. Capitan. At the bottom was found a hearth with cinders and charcoal. Above these cinders was a yellow sandy loam containing Campignian tools. On the top was a modern humus which yielded, in one instance, a few polished stone tools. The industries from the sandy loam included

the typical Campignian axe already described in connection with the Kitchen Midden industries, rough awls, scrapers, etc., and a coarse kind of pottery. The distribution of the culture is restricted to the northern part of western Europe, more especially to the north of France and Belgium.

The folk belonging to these various mesolithic cultures must have been in a primitive stage of civilization and must have eked out a somewhat precarious existence in the various parts of Europe. Nothing suggesting artistic tendencies in them has been found with the exception of a few more or less geometrically decorated objects of Maglemosean and Kitchen Midden age. Their story is very different from that of their immediate palaeolithic forbears; yet it is these people, in all probability, who very largely formed the basal stock of the later neolithic peoples of western Europe, absorbing the new knowledge introduced with the neolithic civilization, influences of which they began to feel both from the east and from the south at the end of mesolithic times.

NEOLITHIC

Civilization is the right word to use for this stage of man's history, for the mode of life and general outlook of the folk of the new stone age was profoundly different from that of their palaeolithic and mesolithic forerunners. For this change four new discoveries or practices were mainly responsible; viz., (1) agriculture, (3) domestication of animals, (3) manufacture of pottery, (4) tool-making by a grinding and polishing technique. The first two of these enabled man to lead a far less precarious existence than formerly, for he could by means of them store food against times of dearth. Further, a given area of country can support a far larger population under these conditions than it can when hunting and food collecting are the sole means of subsistence of the people. Again—and this particularly applies to the crop-growers—more settled communities developed, involving communal existence and therefore to a large extent specialization in work.

The manufacture of pottery played a not unimportant part in the refinement of the home. The surface of an unbaked pot simply calls for decoration and it is not too much to say that art for art's sake is in large measure coincident with the discovery of pottery making. A grinding and polishing technique enabled man to obtain a sharp and tough edge on fine-grained igneous rocks, a result unobtainable by chipping methods alone. In the case of flint a chipped edge is very sharp, but extremely brittle. A sharp, tough edge is essential for the carpenter, and any kind of woodwork had been impossible except on a very small scale before neolithic times.

Agriculture.— Information under this head has largely been gained from investigations in Switzerland where, for protection against wild animals and the like, neolithic man often built villages on piles above the marshy margins and indeed sometimes stretching quite a long way out above the surfaces of lakes. He threw his rubbish down from the pile-supported platforms of the huts and it has often been preserved for us in the accuinulations of mud and peat which have been deposited on the floor of the lake below. Examining these it has been found that amongst the earliest and most important of the various farinaceous groups cultivated by man there appears a small six-rowed barley (Hordeum *hexastichum sanctum*) and small wheat (*Triticum* vulgare antiquorum); after this comes the beardless compact wheat (*Triticum* vulgnre *compactum muticum*) and the larger six-rowed barley (*Hordeum hexastichum densum*) with occasionally its two-rowed relative. Two kinds of millet also appear, as well as Egyptian wheat (*Triticum* turgidum) which is, however, a rarity. Oats, spelt and rye have not yet been found. Apples, pears and the poppy have been collected, and the parsnip, pigweed, walnut and grape were certainly eaten, as well as raspberries and blackberries. But most of these species doubtless occurred wild. Flax was used for cloth-making and in the manufacture of fishing nets, etc. For cultivating and preparing such crops as those indicated above ploughs or hoes would be needed to break up the ground. sickles to reap the crop, and some form of handmill to powder the grain. All these have been discovered in neolithic industries.

The first must often have been made of wood, and ploughs of this nature can still be seen in out of the way districts in Spain and elsewhere, but it was soon found that an unprotected share is rapidly destroyed. It has been suggested that in all likelihood many of the roughly chipped and pointed bars of quartzite and other tough materials that are found may have been attached to the share in such a way as to protect it from rough usage. Doubtless too the land was often prepared for agricultural purposes by means of hoes, and polished tools suitable for hafting as such have been found, especially in the eastern, Danubian, area. The celt—the characteristic tool in neolithic industries (see FLINTS)—may itself have been sometimes hafted and used for this purpose.

Sickles consisted, as a rule, of a curved wooden haft, into a groove in the inner side of which long flint blades were fixed, their working edges being frequently denticulated. The constant friction of these edges against the straw while reaping has produced on them a polish which is very characteristic, although it is not unlike the sand polish found on flints in desert regions. The handmills were of the nature of pestles and mortars, or more frequently a sort of polished stone rolling pin and slightly concave slab of fine-grained sandstone.

The Domestication **of Animals.**—Palaeolithic man may have occasionally tamed wild animals and these may have been made to work for him, but true domestication involves breeding in captivity, a custom which does not appear before the neolithic civilization developed. The first animals to be domesticated were dogs, sheep and goats, cattle and pigs. The horse was not mastered until a later date. Bones of dogs have been found in one or two instances in mesolithic industries, and already in neolithic times there were two distinct varieties; one, derived from the jackal, being a housedog variety; another derived from the wolf, being a sheepdog. There are four basal stocks from which all sheep are derived: (1) the Mouflon, (2) the Urial, (3) the Argali, (4) the American Bighorn. The Mouflon existed wild in western Europe in Quaternary times, but the species seems to have become extinct before mesolithic times and the first domestic sheep known in Europe—the so-called "turbary" sheep of the Swiss lake dwellings—was of Urial stock, probably introduced from central Asia. Later there appears in Europe a hybrid of this with the Mouflon. Hybrids with the Argali stock are only found at a much later period. Wild cattle (Bos *primigenius*) existed in palaeolithic times. They were of large size and had immense spreading horns. The first cattle to be domesticated had, however, short horns, and were also probably introduced into Europe from central Asia. They are named Bos *longifrons* (formerly known as Bos *brachyceros*). Later the Bos *primigenius* itself was domesticated and hybrids developed. The wild pig existed in late palaeolithic times and was painted on the walls of caves by Magdalenian man. But the "turbary" pig found in a domestic state in neolithic settlements was a much smaller animal with comparatively long legs. Central Asia was probably its place of origin.

Pottery.— In one or two instances fragments of what has been described as pottery have been found in palaeolithic industries, but no finished article has been yet unearthed. True pottery (*q.v.*) is made by moulding carefully prepared clay into the required shape and scientifically firing it after it has been mixed with something, sand or other micaceous material, or charcoal made from burnt wood or bones, to render it porous so that the steam when formed may readily escape. Most clays contain a small quantity of iron salts, and if firing takes place in the presence of air, these oxidize and produce a red colour. If, however, the air is absent when the clay is fired, the colour is usually black or grey. Man soon learnt the use of "slip." The pot was moulded out of quite coarse material and then, just before firing, was dipped into a mixture made of a fine clay and water. A thin veneer of this mixture thus covered the pot and formed a smooth outer surface over the inner coarser material from which the main body of the pot was made.

Even in mesolithic times a crude attempt at decoration is found, generally made with a piece of stick or impresses of the finger. In later neolithic times pottery decoration included both engraved and painted vessels, and in the case of the former the

engraved lines were sometimes filled in with a white or coloured material, often giving a striking and beautiful effect.

The Grinding and Polishing of Tools.—Hitherto in Europe practically all stone tools had been made from flint or flinty material; but now in neolithic times, with the invention of the processes of grinding and polishing, any fine-grained compact rock could be used and could be given an edge both sharp and tough. For this purpose however slabs of fine-grained sandstone were needed to form the grindstones. In such areas as East Anglia. where sandstone suitable for this purpose does not occur, the chipping technique continued to be employed for everything far longer than elsewhere, as did also the use of flint. In fact, frequently a polished tool—no doubt a rare treasure—had to be resharpened by chipping. Flint itself can be ground and polished also, and the edge so produced is distinctly tougher than that formed when it is merely chipped.

Fine-grained igneous rocks occur in many places, especially in the west of England, but flint, which was still preferred for many purposes, has a more capricious distribution. It occurs in bands in limestone deposits, and primitive man frequently obtained his raw material by mining it. Many of these mines are known both in England and on the Continent. One of the most famous is Grimes Graves near Brandon in Suffolk. There a number of shafts were sunk which struck the flint-bearing strata at a depth of about 40 feet. From the bottom of the shaft passages radiated in all directions, along them the raw material was brought to the bottom of the shaft and thence hoisted to the surface. It would seem probable that mining in a simple way was started at Grimes Graves as early as late mesolithic times, but its importance grew throughout the neolithic period and it was, in all probability, still flourishing during the earlier part of the bronze age.

Throughout mesolithic and neolithic times the climate of Europe played an important part in the history of the cultures we are considering. Climatic changes show themselves in variations of both temperature and humidity. With the former of these we are but little concerned after the end of the great ice age. There were no startling temperature changes in mesolithic and neolithic times comparable to those of the old stone age, but there were alternately warm-dry and warm-damp periods, and these have profoundly affected humanity because during warm-damp periods forests increased and flourished, while in times of greater dryness they retreated and dwindled. Not until the days of the road-making Romans was man able to withstand the growth of forests and in consequence he had to retreat and migrate elsewhere. It is a fact that the many movements of peoples which took place in pre-Roman times were largely the result of forest growths and therefore of climatic changes. During most of the mesolithic period the climate was warm and dry, except near the Atlantic seaboard where damp conditions prevailed. But at the end of this time, warm, damp conditions set in with the result that forests flourished and in fact covered the whole of central Europe. For this reason the neolithic civilization in these districts was unable to spread over the continent and as a result there developed three more or less distinct cultural areas; an eastern including the basin of the Danube, a northern comprising the lands round the Baltic sea and north Germany, and a western which includes Britain, France, Belgium, parts of Holland, Switzerland, etc. Interchange or commerce between them was of course always possible up river valleys and over loess lands, where dense forests did not readily extend even under favourable climatic conditions, but between the northern and western areas communication was made specially difficult, as much of what is now north Holland was then under the sea.

At the end of neolithic times the climate again became warm and dry with the result that the primaeval forests dwindled and the people of all the three areas pushed in to occupy the now forest-free lands of central Germany. Naturally the contact with each other engendered a large number of hybrid cultures and the examination of these has developed into an exceedingly difficult and complex study.

Whence did the neolithic civilization penetrate into Europe? Probably to a great extent from those regions of central Asia which lie to the east of the Caspian sea. Though to-day these are desert lands, at the end of Quaternary times quite other conditions prevailed; large areas of country were covered by an immense inland ocean, of which the Caspian sea, Lake Aral and Lake Balkash, etc., are the dwindled remains, and the regions round about it were highly fertile. Neolithic influences too probably reached the western area from Spain and the Mediterranean regions.

Tombs.—In the northern and western areas one common feature is the development of a series of very interesting tombs constructed with immense roughly dressed stones, which in some cases weigh many tons. How these blocks of rock were moved into position remains a mystery. The simplest form of tomb, called a "dolmen," consists essentially of a large more or less flat slab of rock supported on three or more uprights. The whole was sometimes left open, sometimes covered with a mound of earth, forming a tumulus. Dolmens appear first and continue well into the bronze age. Somewhat later than their first appearance the passage-grave, corridor-grave or *allée couverte* was made. This consists of a small chamber of upright stones with a lid upon the top, access to which is obtained by means of a corridor, itself composed of upright stones upon which roofing flags are laid. The whole construction is usually covered by a mound of earth and there is often a sort of threshold where the end of the passage emerges from the tumulus. Several varieties of this grave type are known. Sometimes in France, more rarely in England, there is a division made between the passage and the chamber consisting of a large flag pierced by a round hole just large enough to admit a person. These are called "port-hole entrance" corridor-graves. Passage-graves are frequently of immense size. At the Cueva Menga, for example, near Antequera in the south of Spain, there is a chamber, over 25 metres long by rather more than 6 metres wide and nearly 3 metres high, completely covered by only five lid stones.

Finally there appears the "stone-kist." This consists of a small chamber, sometimes so small in size as to be a mere coffin, buried under a tumulus, there being no passage to the exterior. Stone-kists continued to be used in the bronze age. Excavations in these megalithic monuments have often yielded a rich funeral furniture consisting of pottery, implements and objects of decoration. The occurrence of animal bones may suggest the practice of sacrificial meals. Sometimes the human body or bodies were buried at once in the tomb; sometimes, however, the tombs seem to have been merely ossuaries where the bones were preserved after decomposition of the body had taken place elsewhere. Inhumation, not cremation, seems almost entirely to have been the rule in neolithic times. In some cases the stones composing the tomb have been roughly sculptured, it being possible to recognize poorly drawn animals, conventionalized figures of men, signs and the like.

Besides these tombs single standing stones marking a burial below are often found. These are sometimes of enormous height and may or may not be dressed; they are known as menhirs. Circles of small menhirs are known as cromlechs. Occasionally a single menhir is found in the centre of such a stone circle. Sometimes they are arranged in parallel lines forming a series of avenues. These are known as alignments. The most important yet discovered are those at Carnac (*q.v.*) in Brittany where there are ten such avenues stretching for more than a quarter of a mile and leading down from a large cromlech. The reasons for building these cromlechs and alignments and the uses to which they were put are not known.

The place of origin and the distribution of the practice of burial under megalithic constructions, as they are in general termed, is of great interest. One view is that the practice originated in Egypt and spread thence over parts of Europe. It is difficult, however, to find enough connecting links to support this theory. In southern Spain, megalithic tomb construction was practised throughout the new stone age, which was of very short duration there and early developed into a copper-using culture, owing to the occurrence locally of suitable ores. The various methods of building there employed and the great size to which the construc-

tions attained suggest that southern Spain *(see* SPAIN; Archaeology) may have been an actual cradle of the megalithic tomb culture, and this seems more than likely when we consider the geographical situation of Spain and how easily influences from the east would be felt there, tending to contribute to the early growth of a rich native culture.

The motives lying behind the construction of these megalithic tombs remain obscure. Undoubtedly they involve the conception of some sort of cult of the dead. If a dead body is just thrown on one side it becomes a prey of wild beasts. Again, if a heap of stones or earth, sufficient to protect the dead body from such wild animals, is heaped over the corpse, the weight crushes the body out of recognition. It may be that, in the first instance, the difficulty was got over by the creation of a small chamber in which the body could lie secure, and that later these chambers grew in size and the cult, whatever it was, developed. Exactly what the builders of the megalithic tombs believed about their dead or whether the details of the buildings were the result of any particular belief we cannot tell.

Dwellings. — Neolithic man lived in huts which were often grouped together in clusters or villages. Not infrequently these were fortified and on the tops of hills. The simplest form of hut is the pit dwelling, such as that described in connection with the Campignian culture, circular, oval or occasionally in the form of a trench with a fireplace in the bottom and a roof above it. In dry areas this kind of home has obvious advantages; it is warm, fairly draught-proof and the roof is easy to construct as it can spring directly from the level of the ground.. In late neolithic times, wooden houses, often well made, with two or even more compartments and occasionally two storeys, occur. In certain areas, especially in Switzerland and the countries bordering the Alps both on the northern and southern sides, villages were built on piles driven into the floors of lakes. The piles were sometimes 30ft. in length and gin. thick, and as many as 50,000 have been counted in a single village. Beams laid horizontally on the tops of the piles formed platforms on which the houses were constructed. Access to the shore was assured either by rafts or sometimes by a narrow causeway. This type of village had the obvious advantages of security and rubbish could be easily disposed of. *(See* LAKE DWELLINGS.)

The Western Area. — In all probability the neolithic people of the western area were in a large measure of the same stock as their mesolithic predecessors. The old folk adopted, and adapted themselves to, the new neolithic civilization, which enabled a larger population to exist in the same areas. This mesolithic background explains a certain monotony which is apparent in the neolithic industries of the western area. Indeed it was not till the end of neolithic times that western Europe began seriously to forge ahead. The new civilization seems to have been introduced partly from intercourse with the Danubians of the eastern area, which could take place by way of the Danube and the Rhine, following the forest-free lands of southern Germany, and partly from south Spain. In Belgium there appears what is known as the Omalian culture which on stratigraphical grounds seems to occur very early in a neolithic sequence. Omalian pottery shows undoubted connections with that of the eastern area. In a similar manner connections with south Spain can be demonstrated and the megalithic constructions penetrated northwards from that region.

The most typical tool in neolithic industries is the ground and polished celt. *(See* FLINTS.) The development of this tool in the western area is different from that in the northern area; the stumpy massive basal type becomes finer, longer and flatter and develops into an almost chisel-like tool. Another type of tool common in these industries is the so-called neolithic pick which consists essentially of a roughly chipped bar of flint or other material, blunted at one end and having a sharp cutting edge at the other. It varies considerably in length. A smaller variety, much more neatly made and sometimes ending in a rounded rather than a sharp working edge, is known as a fabricator. Awls also occur, as well as beautifully chipped flint arrow heads, but these latter only develop at the very end of neolithic times and during the earliest metal age. The pottery of the western area is largely made from coarse material and is but roughly decorated. Various types of pots, including cups, spoon-like objects and so on, have been found.

A number of special industries have been found in the lake dwellings of Switzerland and northern Italy. In the first place these areas seem to have been occupied by folk from the eastern area. Later, however, there was a change of climate; the lakes rose and the early villages were submerged. Then the level of the lakes again rank and the area was repopulated, but it is now rather to the West than to the East that we must look for the revival of the lake dwelling culture. Small, very beautifully made polished celts are found, often fashioned from a carefully selected green stone, and these were often hafted into antler sleeves. Bone awls, needles and harpoons were made. They are often well made but somewhat larger and quite different in appearance from their palaeolithic precursors. The pottery, too, is good and shows various characteristic forms and decorations. At the end of neolithic times quite a commerce in a special fine, honey-coloured flint found in France at Grand Pressigny grew up. Tools made from this material are found in Switzerland, as well as in Belgium and elsewhere.

The Northern Area. — In the northern area the development is not quite the same as in the western area and there seems to have been an admixture of peoples, a theory which is confirmed by the occurrence of several different types of skeletons. The basal stock was probably also mesolithic and it may be assumed that it was connected with that of the Kitchen Midden folk. The second influence was of a totally new people who introduced a characteristic type of stone tool, bored for hafting and known as the Battle Axe. Their dead were buried singly in flat graves, not several together in megalithic tombs. These single graves first appear in Jutland in early neolithic times. Some authorities consider that this culture developed around the shores of the Baltic, others that it arrived as an invasion, having been evolved originally in southern Russia. However this may be, the Battle Axe folk proved themselves to be the dominant strain and later, when the climate became dryer and the forests dwindled, we find large areas of the northern part of central Europe, hitherto scarcely inhabited, occupied by these people of the northern area.

The industries of the northern area comprise the celt, chisel, gouge, battle axe, etc., and the pottery both in form and decoration is more varied and better made than it was in the western area. The characteristic feature of the decoration consists of a series of close deep zigzags running round the body of the vessel, quite different from the shallower poorly engraved lines of the western area decorations. Scandinavian authorities have shown that the dolmen preceded the passage-grave which, in turn, appeared before the stone-kist. If we consider the evolution of the stone celt in the northern area (see FLINTS), the evolutionary series of this family will be found to agree with this determination, the final development being only found in the stone-kist, an earlier form in the passage-grave, and the first development from the original type in the simple dolmen. It is thus possible to divide the neolithic period of the northern area into three periods.

The neolithic civilization continued far longer in these northern regions than it did elsewhere, especially where natural copper was easily obtainable. In such areas the pure neolithic civilization was of short duration and it is probable, for example, that in south Spain copper was in use throughout most of the period contemporary with neolithic times farther north.

Owing to its geographical situation the problems connected with the neolithic civilization in England are not always easy to unravel. The country was undoubtedly influenced both from the northern and western areas. This can be shown from a study of the pottery, which falls readily into two groups. The distribution of one of these groups covers all the north of England and stretches down as far as Dorset, while the distribution of the other is centred farther south and only extends as far north as Yorkshire. All three kinds of megalithic tomb occur; the passage-grave is usually covered by an oval or pear-shaped tumulus (long barrow), that covering the later stone-kist (which in England already belonged to the bronze age) being circular (round barrow). The industries

are rich but vary considerably in different parts of the country and it is not always easy to assign them with certainty to a purely neolithic culture; thus the surface finds in East Anglia, which include arrow heads, awls, chisels etc., belong in part, at any rate, to the culture of the "Bealier" folk who reached East Anglia at the end of neolithic times, probably bringing with them the knowledge and practice of copper working together with characteristically shaped and decorated pottery vessels called "bell beakers." On the surface of the do ns in southern England, however, rough flint implements seem to have been in use until comparatively recent times, and Kipling's story of the stone worker going down into the woods to get the metal knife is by no means too fanciful. That flint was in use for certain purposes in the bronze age and even in the iron age is attested by the fact that flint implements are found in villages and settlements belonging to these periods.

With the change of climate at the end of neolithic times and the setting in of warm dry conditions it became possible to cross the Alps by way of the Brenner pass. The first people who seem to have penetrated by this route into northern Europe were the "Beaker" folk. From the cradle of their culture in south Spain they passed into Italy and thence into northern Europe, whence, turning westwards, they eventually arrived in England via the Rhine valley. Another branch of the same people reached Brittany, but there seems to have been no connection between that country and England as the types of pottery developed in the two areas are dissimilar. The "Beaker" folk introduced the use of copper to the northern peoples, but very soon afterwards the manufacture of bronze was evolved and a close contact with the more developed peoples of the Mediterranean was assured by the growth in the north of an export trade in metal ores, especially in tin from Bohemia.

Childe, *The Dawn* of *European Civilization* (1925); M. C. Burkitt, *Our Early Ancestors* (1926); and the *Cambridge Ancient History,* vol. i. (M. C. B.)

2. BRONZE AGE

The Bronze Age is the name commonly applied to that stage of human culture during which the alloying of copper with tin in regular proportions became a widespread practice, and the material thus obtained was used for tools and weapons as a supplement to or a substitute for stone. Its end begins when iron was first used for these purposes. The term has no absolute chronological value, but marks a period of civilization through which the peoples of Europe, Egypt, many parts of Asia, as well as some parts of Central America, passed at one time or another. At the beginning of the bronze age metal was relatively scarce, though more so in some places than in others, so stone tools were used for many purposes, while the poorer folk had to be content with the cheaper material for all their needs, and those who had bronze implements apparently remelted old ones to get material for new ones. Thus it happens that in many regions, especially in the north-west of Europe, flint tools and weapons were for a time made in imitation of those of bronze, and only sporadic finds of early bronze implements occur during the earlier phase of the bronze age. It is considered, however, that a region had entered the bronze age as soon as that metal had made its appearance there, however rare its use may have been. Thus the overlap of the different materials is considerable. Stone was used throughout the bronze age, and hoes and other flint implements were not uncommon during the earlier centuries of the iron age.

It is generally believed that bronze was first used about 2000 B.C., or perhaps a little earlier, and that the knowledge of this alloy spread rapidly to most parts of Europe and the adjacent parts of Asia and Africa. Some of the outlying areas, however, and those remote from trade routes, remained ignorant of the new material for several centuries, or, if aware of its existence, were too poor to obtain supplies. This seems to have been true for parts of south and central France, for Norway and for the north-east of Europe, while bronze did not appear in Switzerland until it arrived from Italy several centuries after it had been known in most of the coastal lands of Europe.

Use **of** Copper. — Copper had been known and freely used in the Near East from a very early date, and the knowledge of this metal spread thence to Crete, Greece and other parts of south-east Europe, as well as along the Mediterranean sea to south Italy, Sicily, Spain and Portugal. Thence it may have spread to Brittany and perhaps to Denmark, but whether it then reached the British Isles is uncertain. Copper tools of an early type have been found in Britain and more commonly in Ireland, but it is uncertain at present whether it is safe to speak of a British copper age. It seems, on the evidence available at the moment, that bronze was the first metal to reach these shores. It was difficult to obtain tin in Ireland, and bronze tools may well have been copied in copper in that island.

Small traces of tin, probably due to the accidental presence of impurities in the ore, have been found in a few copper objects of very early date found in Mesopotamia, but there is no evidence that true bronze, intentionally alloyed, occurs there earlier than elsewhere. A fine adze-head, with a hole perforated to receive the shaft, has recently been found at Ur some feet beneath buildings of the 1st dynasty of that city. It is composed of an alloy of gold, silver and copper, with a trace of tin. It has been stated that the statue of Pepi I., a king of the 5th dynasty in Egypt, was made of bronze; this has recently been shown to be erroneous, for the statue is of copper, though a band added much later is of bronze. Again a rod of bronze was found in a tomb of the 6th dynasty at Medhm, but, since this is the only example of bronze for which so early a date has been claimed, most authorities now believe that, owing to the carelessness of a workman, it must have fallen in from a higher layer. It has been claimed that the earliest tools and weapons found in Crete were of bronze, but recent analyses have shown that most of these were of copper, and the earliest daggers, proved to be of bronze, came from tombs that were in use as late as the first middle Minoan period. (See AEGEAN CIVILIZATION.)

Hissarlik Finds. — The earliest specimens of undoubted bronze were obtained by Schliemann from the second city at Hissarlik; they formed part of the famous hoard L. This city was twice rebuilt and the period of its existence may thus be divided into three phases. It seems clear that hoard L belonged to the third of these phases, which is roughly contemporary with the first middle Minoan period in Crete and with the 11th and 12th dynasties in Egypt. This phase may thus be dated roughly as having lasted from about 2200 to about 1900 B.C.

It has been pointed out recently that objects, some clearly made at the second city at Hissarlik and others that are imitations of such objects, have been found at various sites throughout the central portion of the Danube basin, in the Moravian gap, and still farther north in Silesia and Saxony. A line of trade seems to have existed along this route at that time, and it has been suggested that traders from Hissarlik came hither in search of metal ores. It is believed that ultimately they found and worked the copper deposits of the Erzgebirge and later on the tin lodes in the same region. As a result of this, it would seem, the discovery was made that a certain percentage of tin, added to the copper, increased its hardness and made it possible to make castings in a closed mould. How early this discovery was made, and whether by the Hissarlik traders or by the Bohemian miners, is uncertain; it seems likely, however, that bronze, hardened by the addition of about 6 to 10% of tin, was being made and used at Hissarlik as early as the beginning of the third phase of the second city, if not earlier. Thus we may believe, with a fair measure of certainty, that bronze was known" in the Aegean about 2200 B C. This date accords well with the available evidence from Crete, Egypt and other fields of archaeological activity.

Not long after the discovery of bronze we find a considerable development of metallurgy arising in Bohemia and Saxony. The civilization in which this first arose is known as the Aunjetitz culture, from the site at which this industry was first noted, a village some miles south of Prague. All the evidence available at the moment suggests that it was from these two centres, Hissarlik and Bohemia, that the knowledge of bronze became dispersed throughout Europe and the adjacent regions.

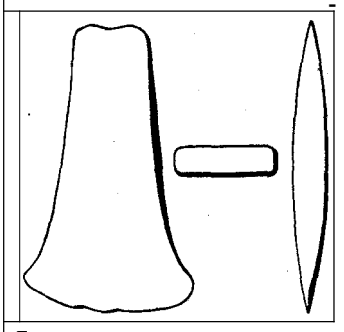
Trade Routes.—For some centuries preceding the discovery of bronze, Hissarlik had been in touch with Syria and Mesopotamia, probably by an overland route connecting it with the settlement of Sumerian traders at Kara Euyuk in the Halys basin, and thence also, through the Cilician gorge, with Cyprus. Hissarlik had sea connections with the Cyclades, the inhabitants of which were carrying on a trade with the people of south Russia and the northern slopes of the Caucasus; also with the Cretans, who had for long traded with Egypt. A further line of connection has been traced between Hissarlik and Euboea, and it is suspected that another trade route crossed the Balkan peninsula, perhaps by the line afterwards followed by the Via Egnatia, to the shores of the Adriatic. By some such routes the products of Hissarlik had already reached a line of trade, which, starting from the neighbourhood of Corinth, passed the island of Leucas to the eastern shore of Italy, and thence by sea to the south-east coast of Sicily, where the most important trading post was at the spot where Megara Hyblaea afterwards arose. From Sicily there are indications of trade in various directions; to the Ligurian coast, the mouth of the Rhone, to Sardinia and the Balearic islands, and as far as the coasts of Spain and Portugal. There is even reason for believing that from Portugal a further line of coastal trade ran to Brittany and the Channel islands, and ultimately to Ireland and the west of Britain, as well as to the amber coast of Denmark.

With the discovery of bronze, a few centuries before 2000 B.C., this trade increased, and we find objects, bearing unmistakable affinities to metal tools found at Hissarlik, Crete and Cyprus, at all the places mentioned as far as Portugal. In the Iberian peninsula various centres of metallurgy arose, and there can be little doubt but that the supplies of Cassiterite, found in that peninsula, were worked very early in the bronze age. The need for tin supplied an added impetus to this trade, and we find evidence of greater activity along the coastal regions.

In the Iberian peninsula there arose several metallurgical centres, of which two are the most important; one in the copper bearing region of south-east Spain, the other in south Portugal. The latter seems to have traded mainly with the west of Brittany, Ireland and the west of Britain, while the route from Spain passed by land along the coast to the neighbourhood of Narbonne, through the Carcassonne gap, down the Garonne valley and along the Atlantic coast to the Morbihan; thence it passed across Brittany, probably up the Cotentin peninsula, and thence to various points on the south coast of England. At an early date some of the traders who followed this route landed near St. Austell. and doubtless discovered the tin deposits of Cornwall. For a time, at least, the route to Denmark was discontinued.

The Aunjetitz culture arose in Bohemia out of a copper culture, in which a few objects of poor bronze are occasionally found. This copper culture is known as the Marschwitz culture, from the village of that name, near Ohlau in Silesia, where the culture was first noted. A few bronze axes, similar in shape to some found at Hissarlik II., found their way to Bohemia and farther north in Germany before the beginning of the true Aunjetitz culture, and their distribution north of the Elbe gap suggests the existence of trade routes to various places on the southern shore of the Baltic between Jutland and Danzig. It was not, however, until the latter half of the first period of the bronze age that the Aunjetitz culture, which received influences from Italy, and perhaps indirectly from Spain, was fully developed. The culture then spread rapidly to Silesia, Saxony, Moravia and Bavaria, and even as far as Lower Austria and Hungary. Though the people responsible for this culture did not spread north of a line running through Magdeburg from Glogau to Brunswick, their bronze wares were carried almost all over north Germany, especially in the region lying between the Ems and the Oder, while some found their way still farther to the north-east. Only along the shores of the Baltic are they lacking, except in the Province of Holstein. Thus we find two groups of implements, the one starting from the Aegean and spreading coastwise to Normandy, the British Isles, and, later, to Scandinavia, while the other radiates from the Erzgebirge region, spreading chiefly to the north and reaching Scandinavia mainly through Schleswig and Jutland.

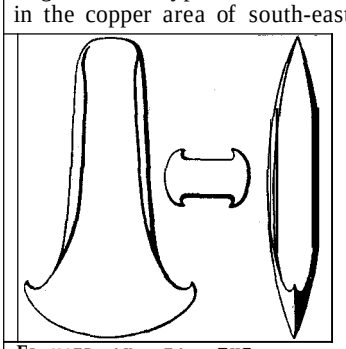
Since bronze, unlike copper, could be cast in closed moulds, it was possible to make a great variety of forms, and the bronze age is essentially a period of metallurgical experiments As regards tools and weapons, the bronze age exhibits far more types than are met with during the much longer period in which iron and steel have been in use. This is especially true for axes, spearheads, daggers and swords. The types show a steady development from the primitive shapes, formerly made in copper, based as they were in most cases upon stone models. There are, however, several parallel lines of development, which pursued their courses simultaneously in different regions. This is especially true of the axe-heads, which, owing to the many phases exhibited by their evolution, form the best series by which we can build up a relative and, to some extent, a positive chronology.



FLAT AXE-HEAD. THE EARLIEST TYPE OF BRONZE AXE

Axe-head Types.—The axe-heads found in the second city of Hissarlik are plain flat blades, with slightly expanded edges and the butts usually rectangular, though in a few cases they are semicircular; a few are long and narrow, with rectangular butts, and more nearly resemble the blades of chisels. This long and narrow type was most commonly used in the Aegean region, and, under the influence of the double axes of stone that had already developed in south Russia, these soon acquired a thickness at the centre, which was perforated for a haft, thus forming a long and slender double axe. As time went on the two blades became wider and shorter and the edges more extended. In Cyprus the axe-heads with the semicircular butts acquired narrower and more pointed butts, until the blade became triangular. Those with rectangular and with semicircular butts were carried to the Iberian peninsula, where the former became more commonly used in Portugal and the latter in south-east Spain. The Portuguese type was carried to the west of Brittany, to Ireland and the west of Britain, while the Spanish type seems to have travelled through the Carcassone gap and over land to the Cotentin and thence to England.

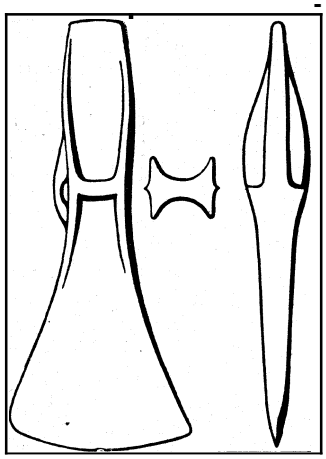
It was this latter type that acquired a thickness at the sides, due to blows designed to keep the blade in place, thus forming slight flanges. These were then cast and developed in depth until what is known as the flanged axe-head appeared. The place of origin of this type is uncertain, but it seems likely that it arose in the copper area of south-east Spain. Thence it travelled, not only to England by the route already traced, but along the shores of the Mediterranean, across the Rhone valley and the pass of Mt. Genevre into north Italy, where it assumed a more elongated form, with a more developed edge, sometimes spatulate in shape, and with a small notch in the butt. From Italy this last type of axe-head spread in many directions, across the Alps into Switzerland, into many parts of France, across the Brenner pass, down the valley of the Inn, and so through Bohemia into Saxony. Ultimately some form of flanged axe-head spread into most parts of Europe.



FLANGED AXE-HEAD. THE SECOND TYPE OF BRONZE AXE

The advantage of the flanges was that the axe-head could not now slip sideways from the cleft stick that formed the haft, but constant use of this tool caused the haft to split farther with every blow until it became useless. To avoid this, a ridge was cast across the middle of the blade. to receive the impact of the blow and thus to avoid the farther splitting of the haft; this is known as a stop-ridge. Thus was developed the form of axe-head, known as a palstave, with flanges or wings on the upper

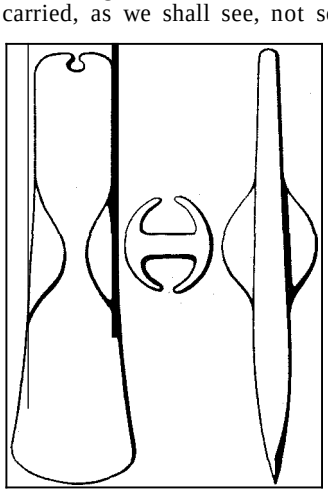
half of the blade and a pronounced stop-ridge. What appear to be the primitive forms of this palstave have been found in Schleswig, and the early development of the palstave took place principally in north Germany. The use of this type of axe-head spread widely in north Europe and ultimately down the west of the continent as far as Portugal, in which land flanged axes had been unknown. It remained in use for many centuries, during which at least six successive variants can be traced.



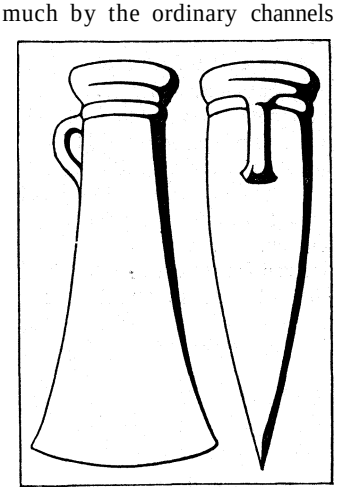
PALSTAVE, A LATER TYPE THAT DEVELOPED IN THE NORTH

In the south, however, the flanges developed in size, though they were confined, sometimes to the centre, but more often to the butt end of the blade. These flanges, or wings as they are called, were hammered round the haft until they almost met, and later were cast in this form. This last type, the winged axe-head, was the prevailing form in the south of Europe and in the southern part of central Europe, especially in Bavaria, and remained in use there until long after iron had become the material employed for most cutting tools and weapons. Towards the close of the bronze age this type was occasionally carried still farther north, for it occurs, though rarely, in England and Denmark.

In Saxony axe-heads like other tools took on forms peculiar to that area, though they were carried thence to most of the adjoining regions. It seems probable that it was in this area that there developed a new type of axe-head, known as the socketed axe-head, in which the haft fitted into a hollow socket in the blade, though how this form arose is still uncertain. The advantage of this form was that the end of the haft could not split, while every blow fixed it more firmly into the socket. This type of axe-head spread over most parts of Europe except the south, and has been found in great numbers in the Cotentin; it seems to have been carried, as we shall see, not so much by the ordinary channels of trade as by considerable movements of peoples, which took place in the centuries immediately preceding 1000 B.C.

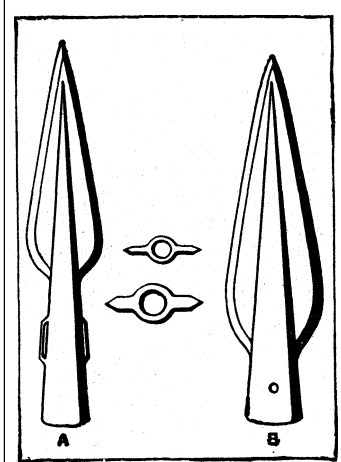


WINGED AXE-HEAD, A LATER TYPE THAT DEVELOPED IN THE SOUTH



SOCKETED AXE-HEAD, A TYPE THAT DEVELOPED IN CENTRAL EUROPE

Dagger **Types.**—We must now turn to another implement, which was in general use from the beginning of the bronze age, and had been made in considerable quantities during the preceding copper age. This was the dagger, often used, no doubt, as a knife. The earliest copper daggers found in Crete and the Aegean are roughly triangular, with broad butts to which the handles were attached by rivets. Similar daggers have been found in Sicily and south Italy. Before the close of the copper age the blades had become longer and the butts narrower, and these changes are still more marked in the first daggers of bronze, which cannot with certainty be dated earlier than the first middle Minoan period. Daggers of this type, often with their sides slightly concave, are found distributed over the Mediterranean region, especially in the Iberian peninsula. They did not, however, at the beginning of the bronze age reach the British Isles, where there occurs during the earliest period a type of flat dagger, with convex sides, the origin of which is obscure. Daggers of the Spanish type arrived first in Britain with flanged axe-heads. As time went on the daggers with concave sides became longer and with narrower butts, until these became trapezoidal in shape and attached to the handles with four rivets. This type is often called the dirk. These dirks continued to be made with longer and longer blades, until they became sword-like in length, when they are often known as rapiers. These rapiers were used all over the west of Europe, from Spain to Britain, until the introduction of the leaf-shaped sword, which arrived with the socketed axe-head under circumstances that will be described later. Another variant of the Aegean dagger seems to have developed in north Italy. This was absolutely triangular, with straight sides, parallel to which were two or three straight grooves. These were carried to France and more rarely to Britain; they have also been found in Switzerland, and more commonly in Bohemia.



SPEAR HEADS
A. Of middle Bronze Age
B. Of late Bronze Age

Daggers of the Spanish type were often attached to long poles by being inserted in a cleft and riveted; the blade was usually attached at right angles to the pole or nearly so. Daggers that have been so attached are known as halberds, and they are found abundantly in Spain and Portugal, also in Ireland. They occur more rarely in France and England and one has been found in Holland; they found their way, too, into the region of the Saale and the Elbe, whither the Aunjetitz culture had already penetrated, and here the shaft and blade were cast in one piece in bronze.

In Britain flat daggers, not unlike those of the Spanish type, but with a long tang, were attached upright at the ends of staves, and used as spear-heads. As the tang tended to split the staff, this was enclosed in a bronze ferrule, which was attached by rivets to the staff. Then blade and ferrule, including the rivet-heads, were cast in one piece, thus producing the first socketed spear-head. These at first had loops at their sides, and later at the base of the blade, through which leather thongs could be passed for strengthening the attachment. Finally this was achieved by passing a long rivet through socket and shaft.

During the pre-copper and copper ages there had been great movements of peoples across Europe and in some places a mingling of peoples of diverse origins and customs. During the earlier half of the bronze age the population seems to have been fairly stationary, and each group continued to develop its civilization in its own way. Trade, however, received an impetus from having a new commodity to carry, and from the need felt by manufacturers of procuring the raw material for their industry, namely copper and tin.

The Beaker Folk.—It was at one time believed that bronze was introduced into Britain by a people who buried their dead in round barrows accompanied by an earthenware drinking cup, of a type now known as a beaker. These people were fairly tall and very robust, with fairly broad and square heads and marked supraorbital ridges. They were known formerly as the bronze age invaders of Britain or the Round Barrow men. Since many of these skeletons have been found in Britain, and a few only were buried with implements of bronze, it has been doubted whether they introduced this alloy or whether they were even

users of it when they first arrived, and since the great majority of round barrows were erected to cover the cremated remains of another people at a later date, it has been suggested that both these names should be abandoned, and they are now usually known as the Beaker folk or the Beaker makers. Beakers, closely resembling the British types, have been found in a zone lying between the Rhine and the Elbe, stretching northwards from Bohemia and ending in Denmark and Holland. In Denmark the graves containing the beakers are known as single graves, and the earliest of these contain little if any metal; since metal, though already known, was scarce in that country before their arrival, it is impossible to decide whether they were acquainted with its use before they reached Jutland. No skeletons from the single graves have been sufficiently well preserved to enable anatomists to describe the skulls. In Holland bronze has been found only with one beaker interment; this has been described as a dagger, but it is in reality a halberd of Iberian type, and may well have reached that country by coastwise traffic from Spain or Portugal. The skeletons buried with the beakers in Holland, owing to the nature of the soil, have perished, but fragmentary remains of one have been preserved, and, though it is impossible to measure its skull, owing to its imperfect condition, the well-marked supraorbital ridges, characteristic of the British Beaker-makers, can be detected. It is said that some of the beakers found in Germany were accompanied by knives of Spanish type; it is possible, however, that these reached these people, as in the case of the Dutch example, by a sea route. Some Dutch archaeologists believe that these people came across Europe from the steppes of south Russia, and have pointed out that their manner of burial resembles that found in many of the Russian kurgans.

Bell-beakers. — It has been asserted by most archaeologists, though it is not universally agreed, that a form of beaker, known as the bell-beaker, developed in Spain, probably in imitation of baskets woven with esparto grass. These beakers had wide globular bodies, with hemispherical bases, and widely expanding mouths. They were decorated by zonal bands of geometric ornament. Smaller beakers of the same type, usually without the characteristic decoration, were carried northwards to Brittany and thence to the Channel Islands, but failed to reach the British coast.

The bell-beakers have been found very widely distributed over the greater part of Spain and Portugal, though they are relatively scarcer in the north-west of that peninsula. They have been found also in Sardinia, Sicily, in north Italy and some parts of France, pointing it is thought, to a route through the Belfort gap. Either by the latter route or by the Brenner pass they are said to have reached Bohemia, where their makers came into contact with those who used the cord-ornamented vases, which during the neolithic age had had a wide range over north Germany. These cord-ornamented vases had long cylindrical necks, and it has been conjectured that it was the influence of these that led to the development of the northern beaker, consisting of a globular body with a long, though slightly expanding cylindrical neck and a flat base. Be this as it may, the beakers that have been found north of Bohemia are many of them of the latter type, and the few bell-beakers discovered in that region have to some extent lost their resemblance to the Spanish form. The zonal decoration has often degenerated into a succession of parallel horizontal rings, often of true cord-ornament. Others would bring this ware from the Ukraine, believing that it passed from central Europe to Spain, where its characteristic zonal decoration was more fully developed. The beaker culture spread over the whole of England, though it has less commonly been found in the western counties; it is found sparingly in Wales, and is abundant in the eastern half of Scotland as far north as the Moray Firth, though rarely in the west. It has not yet been found in Ireland, though hemispherical bowls, which occur with beakers in Spain, have been fouhd in County Down. This culture lasted for some centuries in Jutland, Holland and Great Britain, and in the former country three distinct periods have been recognized.

Greece. — During the bronze age the mainland of Greece formed two cultural provinces, Thessaly and the Peloponnese, while the intervening region, central Greece, oscillated between the two Before the close of the copper age Cycladic mariners had made settlements in the Argolid, where their culture is known as Helladic; before the introduction of bronze they had penetrated northwards as far as the Spercheios valley, to some extent displacing Thessalian peasants, who had preceded them in this area. These Thessalian peasants had, at an earlier date, been ousted from eastern Thessaly by people coming, it is believed, from the Black Earth lands of south Russia, who had introduced the painted pottery known as Dhimini ware. Some centuries before the introduction of bronze this painted pottery deteriorated, and its place was taken by encrusted ware, decorated by the application of pink and white colour to the surface of grey-black or reddish pots, Finally the decoration was abandoned and plain pottery came into general use. It was while this degeneration of the pottery was taking place that bronze came gradually into use. After 2000 B C. a new type of pottery is found there; this is known as Minyan ware. It was wheel-made and of a silver-grey colour. The origin of this ware is unknown. Some authorities believe that it came from Asia Minor, others that it developed from the plain wares of Thessaly. It is found gradually superseding the previous wares in that province, and was introduced forcibly into central Greece by invaders, who destroyed the second city of Orchomenos. The makers of the Minyan ware, who were armed with daggers, halberds and spears of bronze, soon made themselves masters of central Greece, and extended their dominions to include the Peloponnese. Here their culture lasted until about 1625 B.C., when the whole mainland of Greece. except Thessaly, came under the control of Cretan lords, who introduced many elements of late Minoan culture.

Central Europe. — During the copper age Hungary and the middle Danube basin had been invaded from the east; it has been suggested that the invaders came from the south-east Russian steppes. About the time that the discovery of bronze was made, this region seems to have been subjected to two fresh invasions, one from the north by people using cord-ornamented pottery, and another from the east by men armed with battle-axes of copper. It seems likely that both groups of invaders had come earlier from the Russian steppes. Though bronze implements, imported from Hissarlik, were known, the metal most generally used was copper.

Aunjetitz Culture.—It was after the arrival of the Beaker folk that there arose in Silesia a civilization, known as the Marschwitz culture, in which bronze of a poor quality was sparingly used. This suggests that the people living north of the Erzgebirge were learning the use of bronze. About 1900 B.C. this culture developed into that known as the Aunjetitz culture, which spread from Silesia into Saxony, Moravia, Bohemia and Bavaria. The earlier implements from the Aunjetitz graves are clearly derived from north Italy, and in some cases indirectly from Spain, but with the raw materials of the industry close at hand the people of this part soon developed their own forms and exported them northwards to the plain of Germany and south-eastwards to Hungary, where, however, copper was still used for many purposes. Rather later special centres of distribution arose at various places in north Germany, notably to the east of Halle, around Bremen and Hamburg, and in Schleswig. At these centres various types of palstaves were developed and traded to the north and west. In Hungary, as before, many other influences came in from south Russia and Asia Minor.

Lausitz Culture. — Towards the close of the middle bronze age a new culture, with a more developed metal industry, arose in the south-west of Saxony and the adjacent part of Silesia. This is known as the Lausitz culture. The people responsible for this civilization burned their dead and deposited the ashes in biconical urns, over which they erected round barrows This culture spread into east Bohemia and Moravia, where it displaced the Aunjetitz culture; it was carried also eastward across Poland to the confines of Russia. The Lausitz culture was fertile in developing new types of implements, and it has been suggested that it was here that the socket axe-head was invented. Ulti-

mately, in conjunction with other culture influences from the plain of Hungary, the Lausitz burial customs and types of implements spread over the greater part of Europe.

Cremation. — It has often been stated that the dead were buried in the neolithic age and that cremation was introduced in the bronze age, some would say in the late bronze age. Such statements are, however, not strictly accurate. It seems probable that cremation was very generally practised in central Europe in the neolithic age, for, though a few cases of inhumation have been found, they are relatively rare in regions in which villages of this date are common. Cremated remains have recently been found in Belgium in a neolithic settlement, and burnt bones have been met with in long barrows in Yorkshire. Cremation was also practised at an early date in many parts of Germany. Still it is true that these cases of cremation were to some extent confined to limited regions, while in others both practices prevailed at the same time. The almost universal practice of cremating the dead and placing the charred remains in an urn, to be buried in a round barrow or in an urn-field, seems to have spread from central Europe, probably from the Lausitz region, at the beginning of the late bronze age, to almost every part of Europe.

Hungary. — It is believed that the plain of Hungary was twice invaded, for the first time in the middle of the third millennium and again at its close, and that these invaders had come, directly or indirectly, from the grassy steppes of south-east Russia. It is believed, too, that these invaders established themselves as war-lords over the peasants, who had for long occupied that region. Be that as it may, about **1500** B.C. the inhabitants of Hungary developed very efficient weapons of a larger size than were used elsewhere. In this region the dagger, originally of west European type, was made much larger, until the strain on the rivets, by which the hilt was attached to the blade, became insupportable. At length an experiment was made of casting with the blade a flanged tang, to which plates of bone or wood could be riveted to form the hilt, and afterwards of adding to this a hilt cast in bronze. The experiment was successful and the blades became longer and frequently expanded in the middle. Thus arose the leaf-shaped sword, the most formidable weapon yet invented.

It would seem that about this time the Lausitz people, with their improved art of bronze working, coalesced with the people of the Hungarian plain, and together they began to spread in almost every direction. The first move seems to have been to the north, in the direction of Jutland, and their arrival in these parts may have accounted for the growth of the bronze industry in the neighbourhood of Bremen and Hamburg. Later they reached the west of Schleswig, where more than three thousand round barrows have been noted. Up till then metal had been relatively scarce in the Baltic region, and such early specimens as have been found, many of copper, are of types that arrived by sea traffic from the west. The chief warlike implement was the perforated battle-axe of stone. After the arrival of the invaders from central Europe bronze became abundant and the conspicuous weapon was the bronze sword. There is reason for believing that about 1250 B.C. a movement was made towards the south, for several swords of central European type have been found in Greek lands, two at Mycenae, two at Muliana in Crete, and one at Levadia in Boeotia; besides these two have been found in Egypt, on one of which was engraved the cartouch of Seti II. It has been suggested that the presence of these swords in Greek lands betokens the arrival of northern invaders; these have been identified with the Homeric Achaeans and the Akaiwasha, who attacked Egypt in the reign of Meneptah. Others, however, think that the swords passed southwards by way of trade, or were loot taken by the Mycenaean inhabitants of Greece in some northern foray. Swords of similar type found their way into Italy, probably across the Adriatic, for the majority have been found in the neighbourhood of Lake Fucino.

The leaf-shaped swords found in western Europe are of a still later type, and the bearers of these cannot have left central Europe long before **1200** B.C., while some seem to have set out considerably later. These swords reached Switzerland fairly early, but were later in their arrival in France, where they have been found over the eastern half of the country, from the valley of the Seine to the mouth of the Rhone. It was not until a much later time that a still later form reached Brittany, probably by sea, and later still that they were carried across the Pyrenees into Spain. About 1100 B.C. the bearers of these swords seem to have passed down the Rhine into Holland, and then to have crossed the North Sea to the east coast of England, where they are thought to have arrived rather before 1000 B.C. There is also some evidence that at a slightly earlier date a few of them penetrated south Russia, though the evidence of their presence there is slight.

Wherever they went the bearers of the leaf-shaped swords carried with them socketed axe-heads, which seem to have been invented in the Lausitz region, socketed gouges and a great variety of tools. They also used spear-heads with a leaf-shaped blade and a single rivet through the socket. The shafts of these spears had their ends cased in bronze ferrules. The sudden arrival in most parts of Europe of a civilization, which had its origin in Saxony, Moravia and Hungary, seems to indicate that these new tools and weapons of bronze were carried, not by the ordinary channels of trade, but by invading hordes. It appears safe to attribute to these people the universal custom of cremation, which was adopted in the late bronze age, and we may with good reason attribute to them also the use of those cinerary urns that have been found in many of the round barrows and in the urn-fields, but without associated tools or weapons. A few settlements of these people have been noted and some of them excavated with care; little study has yet, however, been made of their domestic pottery, though large numbers of their cinerary urns have been studied. This culture, which was fairly uniform over most of Europe, lasted with but little change until the introduction of iron weapons.

Life in the Bronze Age. — Though much is known of the tools and weapons used at this time, and many examples of the domestic pottery of the earlier phases of the bronze age have been found in graves, as well as of cinerary urns used during the latest phase, relatively little is known of the way in which these people lived. No settlements, dating from the first phases, have been explored, while at the close of this age some of the people lived in villages, defended by a rectangular ditch and bank, and others seem to have made settlements in the low lands by the sides of lakes and rivers. Since the knowledge of agriculture had reached most parts of Europe earlier than implements of bronze, we may assume that the people of the bronze age cultivated grain, while remains of domesticated animals have been found in their later settlements. Of their clothing we know little by direct evidence, though the complete outfit of a man of this period has been found at Treenhol and that of a woman at Borum-Eskoi, in Jutland. These garments, of simple cut, were made of a woven woollen material. The man had worn a tunic and a mantle, stockings or some other woollen covering on his legs, and a high cap. The woman had worn a long skirt and a short jacket, and upon her head a bonnet made of a net-work of woollen threads. The ornaments worn were relatively few. Bracelets of bronze, more rarely of gold, have been found, dating from all parts of the bronze age; these are usually plain circlets of metal, though during the last phase they are sometimes decorated with geometrical designs; towards the end of the bronze age oval penannular bracelets sometimes occur, especially in central Europe. Metal ear-rings were also worn, sometimes of considerable size; these were often made of gold. The most important ornament, however, was the torque, usually made of a twisted band of bronze or gold. Torques have been found in several forms, characteristic of this age. The most curious ornament was the gold crescent or *lunula*, which has been found abundantly in Ireland, as well as in England, the north of France, north-east Germany, and Denmark. These *lunulae* are large thin plates of gold, shaped like crescents, with the points almost joining, and profusely decorated with incised geometric designs. How they were worn has not been explained. The people who carried the leaf-shaped swords throughout Europe seem to have worn over their shoulders a plaid or some similar garment; this they fastened with a long bronze pin. As this pin tended to

slip out, various devices were designed to keep it in place. At length, about 1400 B.C., it was bent, with a coil, into a simple brooch or fibula, like a safety-pin, and during the latest phase of the bronze age these fibulae began to pass through that series of changes which continued throughout the iron age.

Quest for Gold.—As has already been pointed out, the bronze age was especially a period of invention and active trade, more particularly during its earliest and latest phases. The need for a greater supply of copper and still more for tin, a much scarcer metal, caused traders to explore many parts of Europe, especially those easily accessible from the sea. Here they found many sources of supply, and had, apparently discovered the tin ores of Cornwall before flat axe-heads had given way to flanged. There was, however, another metal, sought for with much greater eagerness; this was gold. From a very remote antiquity gold has been prized, and numerous objects of the goldsmith's art have been recovered from graves lying many feet below the foundations of buildings that date from the 1st dynasty at Ur. The richest gold-field in Europe was in Transylvania, where the mines were worked under the Roman emperors. Gold from Transylvania seems to have reached Egypt before the close of the and dynasty, and this region seems for long to have supplied the needs of the Near East.

There is no part of Europe that has furnished so large a number of gold objects of prehistoric date as Ireland, and the great majority of these can be shown by their decoration or associations to have been made in the bronze age. Reference has already been made to the *lunulae* or crescents, found so commonly in Ireland, and it is generally agreed that these, wherever found, are of Irish gold, showing that the precious metal was at that time exported in many directions. The fact that two such crescents were found in a barrow near Harlyn bay, in association with a flat axe-head of bronze, shows us that this gold trade was well developed long before the close of the early bronze age. It has been pointed out that alluvial gold deposits were worked in the Wicklow hills in the 18th century, and there is little doubt that it was these deposits that attracted traders quite early in the bronze age. These deposits and the tin lodes of Cornwall, as well as certain copper and, perhaps, gold deposits in Wales, were the lures that tempted the first bronze traders to these countries. Thus it was that, within a very few centuries after the first use of this alloy, bronze was brought to the British Isles.

3. IRON AGE

Definition.—Care must be taken, in discussing the period known as the early iron age of Europe, to distinguish between the first appearance of wrought iron in any locality and the beginning of the local iron age. The period in question belongs to the history or prehistory of the European continent and islands; and with due qualifications for various countries, covers the thousand years immediately preceding the birth of Christ. It normally follows the bronze age, when that metal (an alloy of copper and tin) was used not only for objects of luxury, as it is to-day, but also for household and agricultural implements; but in most parts of Africa it seems to have succeeded the stone age, bronze being almost unknown there in prehistoric times. Egypt, however, is an exception to the rule in Africa, and has a chronological system which helps to establish the limits of the iron age in other countries.

Iron in Egypt.—Though the early iron age of Egypt did not begin till about 800 B.C. (between the 22nd and 25th dynasties), when the metal was produced locally and passed into general use, there are many iron objects preserved from much earlier dates, and the question has been raised whether they were of meteoric or telluric origin—that is, whether made from metallic masses which reached this planet from space and contained a large percentage of nickel; or from local iron ores reduced in some kind of furnace. A recent analysis of the lump found with copper implements and a mirror of the 6th dynasty at Abydos (now in the British Museum) shows that no nickel is present in the rusted surface, and only minute traces of it in the black crystalline core, which contained also traces of phosphate, sulphur, carbon and a notable quantity of copper. The inference is that even at that early date (2700–2500 B.C.) iron was being obtained from the local ores by primitive metallurgical processes, and not from meteoric sources. The earliest known example in Egypt is the group of oxidized iron beads found by Wainwright at El Gerzeh, dated about 4000 B.C.; and there is documentary evidence of the authenticity and early date of the iron tool found inside the great pyramid of Khufu at Gizeh, dating from the 4th dynasty (about 3100 B.C.). Other early specimens are quoted by J. N. Friend, who gives evidence that hard rocks can be chiselled with soft metals, provided due perseverance and patience are exercised: this in view of the contention that the stone of the pyramids cannot have been shaped without iron or steel tools. It should be observed that the earliest iron objects in Egypt and elsewhere are chiefly weapons and ornaments, not tools which had to wait for the iron age properly so called.

Iron in the Bible.—Biblical references to iron are of interest in connection with the view that the Philistines (1 Samuel, xvii. j) were connected with Crete and found a refuge in Palestine when Crete lost command of the sea and gave way to the Mycenaeans and Greeks of the Eastern Mediterranean. The iron chariots of Sisera in the days of the Judges gave the Canaanites an enormous advantage over the Israelites (Joshua, xvii. 16; Judges i. 19); but Lebanon soon became an industrial centre, and David collected iron in abundance for Solomon's temple, which was, however, for ritual reasons, erected without the use of iron tools. From the time of Amos (middle of the 8th century, B.C.) iron was in general use amongst the Hebrews as well as the Syrians, and smelting furnaces were known to the later Hebrew writers. It may be added that the passage in 1 Samuel, xiii. 19—"Now there was no smith found throughout all the land of Israel, for the Philistines said, Lest the Hebrews make them swords and spears"—is regarded by Cheyne and Black (Encyc. **Bibl.** under Samuel, Books, col. 4,27 j) as an incredibie statement, and merely a later interpolation in the text.

Crete and Greece.—Researches in Crete during the last 30 years have given a chronological standard only inferior to Egypt for dating the prehistoric finds of Europe; and it is generally admitted that the iron age began in the island about 1100 B.C. Iron was certainly known locally before that date, but was regarded as a precious metal, and in 1927 a cube of it was found by E. J. Forsdyke in a sealed tomb-deposit at Knossos dating from about 1800 B.C. Another stage in its adoption is marked by mention of it in Homer, *e.g.* Iliad, xxiii., 834, the poem no doubt dating from the full iron age of Greece but referring to the period about 1200 B.C. It was given as an athletic prize, but clearly for the production of tools and implements rather than weapons. Both Crete and Greece are noticed in separate articles, and it is only in connection with the iron age of Central Europe that they are mentioned here, in order to fix the route and period of the introduction of iron into Europe. The theory that the Achaeans (*q.v.*) brought the new culture from the Danube into the Bronze Age areas of Greece and the islands has not been widely accepted, but there is little doubt that the Dorian (*q.v.*) invasion played that rôle and put an end to the Mycenaean dominion, at least on

the mainland. The Greeks called it the Return of the Heraclids or sons of Hercules, and dated the event about 1104 B.C., approximately 80 years after the fall of Troy. That the newcomers were of alien race is indicated by their practice of cremation, the dead having been buried unburnt as a rule during the bronze age. Their civilization was evidently on a low level compared with that of the people they conquered; and the change from the Mycenaean to the Geometric style of pottery was contemporary with, even if not due to, their arrival from the barbarian north about 1050 B.C. Novel types of the sword and brooch are seen in late Mycenaean association, and specially striking are the brooches of spiral wire (as fig. 5) discovered at Sparta, as these are obviously connected with those of the Hallstatt (*q.v.*) area and period in Central Europe. The name is derived from a salt-mining site in the Salzkammergut, Upper Austria, and the period marks the first appearance of the Celts or at least of peoples speaking the Celtic language.

Recent excavations have thus given precision to prehistoric chronology in an area for which no written documents exist, and link up the bringers of iron into Central Europe with personages in Greek history. Whether the Dorians were Celt in origin is a secondary question of terminology; but the Greek connection may be expected to throw light on the nationality and tongue of the Hallstatt invaders who are often credited with the introduction of iron.

Celtic Culture.—With all due caution regarding the differences between Celtic blood-relationship and the use of the Celtic idiom, it is generally agreed that the Celts were located in Central Europe (the upper Rhine valley and the later Roman provinces of Rhaetia and Noricum) at the time when the use of iron spread from that very region, and they are known to have migrated in force to distant parts of Europe where their former presence can be traced in place-names and historical allusions. The Hallstatt culture may not have been Celtic at first, but in any case no people of Celtic speech can be traced on the map before the Hallstatt period, though the language was closely allied to Latin and was apparently the last to break off from the Aryan stem. Philologists no longer allow a Celtic population (whether by blood or language) in Britain, for example, during the Bronze Age, and insist that the Celtic connection cannot be earlier than the 7th century B.C. This agrees fairly well with recent archaeological evidence, but does not give an upper limit of date for the Celtic occupation of Central Europe.

Origin of Iron Working.—The legendary home of iron is North-east Asia Minor where the Chalybes (mentioned by Aeschylus in the 6th century B.C.) once had a kind of monopoly; but about 200 miles to the south was Commagene (*ubi ferrum nascitur,* the birthplace of iron), which also has serious claims to priority. Prof. Gowland mentioned two important districts in Western Asia where iron ores are very extensive and remains of early iron manufacture are found; but he preferred the south-east angle of the Black sea (ancient Paphlagonia and Pontus), which includes iron deposits along the slopes and foot-hills of mountains near the coast. At the north-eastern end of this area as well as north of the Caucasus, Ernest Chantre excavated cemeteries which yielded weapons and other iron objects closely allied to the Hallstatt products of Europe.

Though recognizing the prevailing uncertainty as to the beginnings of metallurgy, the late Jacques de Morgan was in favour of an oriental origin for iron, and thought that the art would have reached the Ligurians of Central Europe through some Continental trade-current as well as by way of the Mediterranean. "The Celts and the Dorians must have been the principal propagators of the iron industry . . . it is generally agreed that the Celts came from the east by the valley of the Danube." Apart from striking analogies in weapons and ornaments, in brooches and pottery found in Russian Armenia and the Hallstatt area of Europe, he insisted rather on the introduction of naturalism into the geometric art of the bronze age. Both in South-east Russia and in Persia products of the early Iron Age are characterized by representations of men and animals "of which both technique and style seem to derive entirely from the Geometric." This points to a development in *situ* of a civilization that was destined to spread to the Atlantic, and appeared suddenly in Central Europe as a new and independent creation. It is of interest to note in this connection Prof. J. L. Myres' theory that the Sigynnae, mentioned by Herodotus (v. 9) as living beyond the Danube and north of Thrace, may be identified with Strabo's Siginni of the Caucasus, and possibly the Sequani of the Jura, who extended later to the neighbourhood of Paris. The first two are said to have worn Median costume (trousers, like the Gaulish braccae, breeches), and to have driven shaggy ponies attached to carts. Herodotus adds that the Ligurians called the Sigynnae pedlars; and there is reason to associate a particular form of iron spear like the Gaulish *gaesum* and the Roman *pilum* with these people. Their extensive wanderings might account for its occurrence even in Cyprus, and it may be recalled that the Galates who dominated Gaul in the early iron age had settlements as distant as Galatia in Asia Minor.

Celts and Galates.—A new view of the Galates has been put forward by Dr. Jules Guiart, who distinguishes them from the three recognized human types of Western Europe—(i.) the tall, blond, long-headed (dolichocephalic) Nordics; (ii.) the short, dark, short-headed (brachycephalic) Celts of Central Europe, the Alpine race; and (iii.) the short, dark, long-headed Mediterranean race. In his opinion the Galates (Galatians, Gaulois) were tall, blond and short-headed people who in 1500 B.C. were still roaming over the steppes of South Russia and eventually passed westward to the north of the Hercynian forest (Taunus to Carpathians), settling for a time near the North sea coast west of the Elbe, whence they proceeded to occupy most of the northern half of France in the Hallstatt period, thrusting the native Celtic population almost to Marseilles and the Auvergne (to judge by the physical characteristics of the modern departments). It should be added that Celts and Galates were regarded as distinct peoples by Bertrand, whose arguments were amplified by Piroutet in 1920 (*L'Anthropologie,* xxx., 51). The latter sees in the Marne inhumations in trenches a Galatian population distinct from the true Celts, the latter being responsible for the barrows (grave-mounds, tumuli) over cremated burials in East and North-east France, as well as in South Germany. There is, in his view, no authority for the Celts before the second stage of the Hallstatt period (say 700 B.C.). Their arrival is put much later by Schliz (Hoops, Reallexikon, under Rassenfragen), who regards the Flachgraber (flat-graves, without barrows) of La Tène II. (about 400 B.C.) as the earliest traces of the Celts, who came from Gaul, the chief centre of brachycephaly in Western Europe; but he is careful to add that these Celts represent a blend of blond long-heads (Nordic) and dark short-heads (Alpine), and correspond to the classical description of the Celtic warrior: they are brachycephalic blonds.

Hallstatt Culture.—Whether lineally descended frotn it or not, the Hallstatt culture succeeds the bronze age of Central Europe; and, with Austria and South Germany as a centre, radiates in several directions. Intercourse with the south was by this time active, and there was a close connection with the Bologna area, where early iron age finds are abundant and are grouped under the name of Villanova (*q.v.*) (a suburb of Bologna). The contact with Thrace and the Caucasus is not so clear as with Illyria and the neighbourhood of Venice or with Eastern Germany (the Lausitz or Lusatian area); but it was mainly westward that the new culture spread via Switzerland and the Vosges to Eastern France, and later to the Atlantic coast as well as to Spain and Britain. This last movement is attributed to the Celts, a mobile and a conquering people; but most authorities attribute the Hallstatt culture of Central Europe to the Illyrians, who may have influenced the Germans on the north-east of what has been called the Celtic cradle. Hut-urns (sepulchral vessels of pottery made in the form of contemporary dwellings) are of frequent occurrence in Mecklenburg and near the mouth of the Vistula, and suggest some connection in the 7th century B.C. with Italy, though the type is also found from time to time in widely separated parts of South-eastern Europe, and in Italy (Alba Longa) is hardly later than 900 B.C.

CHRONOLOGY OF THE EARLY IRON AGE

HALLSTATT PERIOD

Celtic Europe			Italy.	Greek Pottery.
Hallstatt A,	1000–800 B.C.	Early Hallstatt, Geometric style.	Hut-urns: Biconical urns. Pit-graves: Early Villanova.	Sub-Mycenaean, 11th and 10th centuries B.C.
Hallstatt B,	800–700 B.C.	Middle Hallstatt, Orientalizing style,	Villanova period, Bologna district.	Geometric, 10th–8th century B.C.
Hallstatt C,	700–600 B.C.		Chamber-tombs, Proto-Etruscan.	Proto-Corinthian, 750–600 B.C. Corinthian, 7th century B.C. Black-figure ware, 6th century B.C.
Hallstatt D,	600–500 B.C.	Late Hallstatt, Early Greek style.	Certosa (Bologna), Etruscan period.	Early red-figure, late 6th century B.C

LA TÈNE PERIOD

Germany.	France.	*Switzerland.*
Reinecke's La Tène A, 5th century B.C.	Dbchelette's La Tène I., 500–300, B.C.	Viollier's La Tène I., 450–250, B.C.

" " " C, 3rd and 2nd centuries B.C.	" " " III., 100–1, B.C.	" " " III., Roman period.
" " " D, 1st century B.C.	La Tène IV. (only in Britain), 50 B.C.–A.D. 50.	

Iron in Italy. — The iron age of Italy forms part of the history of the peninsula, and need only be summarized here in connection with Central Europe. The terramara (*q.v.*) culture, spreading from the lakes to the Apennines, really belongs to the bronze age; but this is attributed by some to the Italici, who were later responsible for the Villanova culture, with their headquarters at Bologna, and are also credited with the foundation of Rome in 753 B.C. Villanova is five miles east of Bologna, and the district contained ancient cemeteries named after their modern proprietors (Benacci and Arnoaldi) and the local Charterhouse (Certosa, one mile west of Bologna). The last dated from the Etruscan conquest (late 6th century), when the name was changed to Felsina, and there was a Gaulish period (under the Boii) before the Romans colonized it in 189 B.C. under the name of Bononia. The Etruscans (immigrants from Asia Minor) first came into contact with the Villanovans about 850 B.C. in Etruria and Latium, where they soon asserted their supremacy, and buried their dead unburnt in oriental style, using in succession the shaft, trench, corridor and chamber; whereas the early Villanovans practised cremation, which gradually gave way to inhumation as at Hallstatt. Their civilization was of a high order, now fully represented at Bologna; and the bronzes at least were largely due to Greek traffic with the Etruscan coast. The pails (situlae) are conical (figs. 2, 2a) with lids and zones embossed with figure subjects representing contemporary life; and they have been regarded as the nearest approach to the shield of Achilles. An orientalizing tendency has been noticed in bronzes and other artistic products of Central Europe dating from the middle Hallstatt period (about 700–600 B.C.), contrasting with the earlier geometric and later classical styles (see HALLSTATT and VILLANOVANS).

Iron **Age** Burials. — In the Hallstatt period inhumation (burial of the dead unburnt) below a tumulus (grave-mound, barrow) was the rule in South Germany and in Eastern Gaul; and in the succeeding period (La Tène I.) the practice continued, with occasional cremation, in districts profoundly affected by the Hallstatt civilization. Old barrows re-used, or newly-constructed mounds of this period are found in Haute Marne, Burgundy, Franche-Comté, South Germany and South-west Bohemia. On the other hand, cemeteries without mounds, containing the unburnt body, are found on the outer fringe, in Gaul and Bohemia; and Déchelette concluded that barrows marked the original Celtic area in Europe, settled ever since the bronze age; whereas the vast cemeteries without mounds, as in Champagne, North Bohemia and Cisalpine Gaul, belonged to conquering tribes who originally came from the Celtic area. Déchelette considered the barrow area and the adjacent right bank of the Rhine as the primitive home of the Celts.

In a recent study of the upper Rhine population who burnt their dead and buried them in cemeteries called urn-fields without surface indications (unlike their bronze age predecessors of the *Hügelgräber,* the Grave-mound or Barrow people), Georg Kraft traces some elements in their pottery and bronze types to the south-east, others to the north-east, others again to the indigenous population that became subject to these invaders. The most likely people seem to be Illyrians moving from east to west, and participating in the great migrations which account for the passage of Thracians, Phrygians and Armenians into Asia Minor via the Bosporus and Dardanelles about 1180 B.C.; the Dorian invasion of Greece about 1100 B.C.; the entry of certain Balkan peoples into Italy, and the western extension of the Lausitz (Lusatian) culture of Eastern Germany. It is still an open question whether the urn-field people were Illyrians or a blend of Illyrians, Celts and other races, but the invasion of South-west Germany at this time is generally accepted, and archaeologically it coincides with the beginnings of the Hallstatt culture, though grave-mounds are still found in the Gündlingen area and period (Hallstatt B).

The urn-fields have yielded an unexpected variety of pottery and bronze, the most typical being urns with cylindrical neck and bulging body, and bronze armlets tapering at both ends, with spiral wire terminals. Schumacher dates the early urn-fields about 1200–1000 B.C. and regards the people as coming into South-west Germany from the south-east, much as the Ribbonware (*Band*-keramik) folk had done centuries before. They spread northward down the Rhine to the Saar and Eifel, and betray in their house-building and burial rites a close connection with the Italici of upper Italy; though this may be explained either by original contiguity or by blood relationship. They were good agriculturists, living in imposing villages established in the most prolific areas. The later urn-fields (about 1000–800 B.C.) mark the opening of the early iron age (Hallstatt A), when the indigenous population was pressed northwards into the mountains and side valleys of the Rhine by invaders provided with a certain amount of iron and addicted to agriculture. The pottery is made without the wheel, and includes urns, bowls and platters apparently copied from metal patterns; of bronze are small cups with handles, long pins with globular heads, brooches made of twisted wire, and sets of pendants designed to jingle (fig. 5).

Hallstatt Period. — The leading authorities on the iron age of Germany allow two centuries of overlap with the bronze age, and begin the second stage about 800 B.C., Gdndlingen near Freiburg (Baden) being the typical site for the 8th century (Hallstatt B). The contemporary swords (figs. 6–8) were either of bronze in imitation of the late bronze age type, with exaggerated chapes (scabbard-ends) of winged form; or of iron, emanatting from Noricum (the modern Styria and Carinthia, with parts of Austria, Bavaria and Salzburg — the chief European centre of the industry) and attaining huge proportions, with a two-edged blade for cutting and a broad point not suitable for thrusting.

FIGS. 1–9 — ARTICLES OF COMMON USE BELONGING TO THE HALSTATT CULTURE. 1000–800 B.C.

The name Halstatt is generally applied to articles of form and decoration like those found at Halstatt, in Upper Austria, during the excavations made between 1847 and 1864. The period of the Halstatt culture marks the first appearance of the Celts

The pottery urns (fig. 4) generally have a constricted neck and sharply out-turned lip, evidently an imported type; but there is some doubt as to the funeral rite, and perhaps both cremation and inhumation were practised.

The next century (7th B.C.), corresponding to Hallstatt C, saw certain changes in the material culture, and the typical sites are Salem (representing Wiirttemberg and Baden) and Koberstadt (Langen near Darmstadt, for Odenwald and Taunus). The former is about six miles north of the Lake of Constance, which in antiquity was known as *Lacus Venetus* and was therefore presumably controlled by the Venetians. The burials were mostly unburnt, and besides long iron swords there was an abundance of brightly coloured pottery, with panels and zones including geometrical designs, the urns having more open mouths and bulging shoulders than in the preceding century. Some of the burial mounds certainly contained unburnt skeletons. The Giindlingen and Salem groups have been traced across the upper Rhine and into Alsatia, entering France by the Burgundian gate and the Meurthe-Moselle valley; whereas the Koberstadt people kept more to the right bank of the Rhine, crossing later at Worms and Mainz. The Germans then lay to the north and Ligurians to the west, where they are noticed by Herodotus about 450 B.C., at any rate in the neighbourhood of Marseilles. Rademacher points out that on either side of the Rhine between Mainz and Bonn, extending from the Saar to the Fulda and again to the Saale, Celtic graves of the 6th century contained skeletons, whereas further down the Rhine barrows were raised over the cremated remains. This period (Hallstatt D) is marked by a change to short, pointed swords, generally with forked or "horseshoe" pommels (fig. 9); and the scabbard of one well-known example shows a cavalry leader with a sword, but spears only in the hands of troopers and infantry. The helmet, shield and cuirass are almost unknown in the Hallstatt area of Germany though common further east; and it was on their occurrence in such places as Glasinač (a plateau in Bosnia) and in the Homeric poems that the late Sir William Ridgeway chiefly based his theory that the Achaeans were a Hallstatt people from the Danube, but ultimately of Celtic and Nordic origin. Many of the hill-forts in Central and Western Europe are now attributed to the Hallstatt people, who (like the Normans in England) kept down the countries they invaded by establishing fortified posts in strong positions. In the majority of cases they burnt their dead and used cinerary urns of pottery; but it is remarkable that at Hallstatt itself burnt and unburnt burials have been found in almost equal numbers, and it is usual to assign the cremated burials, which are the more richly furnished, to the dominant race of invaders, and the poorer graves with skeletons to their indigenous subjects. The cemetery was systematically excavated by Ramsauer between 1846 and 1863, and the bulk of the finds may be seen in Vienna.

Salt Industry. — The site owed its wealth and distinction to the salt mines which were exploited in the early iron age, but other methods of obtaining salt were practised in the same period. Brine-springs near Halle and in the valley of the Saale (Saxony) and near Marsal in the Seille Valley (Lorraine), for instance, were evaporated by running the liquid over heated pottery of the coarsest description (called briquetage); and a similar process was employed on the coasts of Belgium and Brittany. In England salt mines do not seem to have been worked till Roman times, but the coastal Redhills of Essex which have yielded pottery of the early iron age, may be the debris of a process for extracting salt from sea-water; and Pliny (*Nat. Hist.* xxxi., 7) records such an industry in Gaul and Germany (see also Tacitus, Annals, xiii., 57).

La Tène Culture. — The change in the main armament of the Hallstatt period may have been due to the growing influence of North Italy on the Alpine and sub-Alpine districts, but Greek influence manifests itself in the second half of the early iron age (La Tène period). It is clear that the leading "barbarians" (non-classical peoples) from the 5th century B.C. down to the Roman empire were Celts, or at least spoke a dialect or dialects of the Celtic language; and the new sword pattern may mark the advent or the emergence of the Celts, whose martial and artistic achievements are now generally recognized. The period extends from about 450 to 50 B.C. and derives its name from a famous Swiss site (La Tène, the Shallows) (*q.v.*) at the east end of Lake Neuchâtel, which was occupied probably between 250 and 100 B.C. as a military post or arsenal; but the richest and earliest finds of this Celtic culture are on the middle Rhine and in Eastern France (Champagne). In the 6th century these people are known to have been settled in the Rhone valley and round the lakes of Switzerland and North Italy, but their earlier home is unknown, and their conquests unrecorded till the sack of Rome in 390 B.C. A plausible view is that they were Nordic warriors from the Baltic, marching in command of Alpine soldiery through Europe from end to end in search of plunder, rich lands to settle on, and a share in the luxuries of Mediterranean life.

In the first phase of La Tène culture (La Tène I.) burials on either side of the upper Rhine were richly furnished, but those of La Tène II. are less pretentious, and cemeteries of flat or surface graves (Flachgraber) came into fashion, containing the unburnt body, though there were numerous exceptions to this rule. The spread of cremation in the third phase of La Tène is attributed to the growing influence and the southern extension of the Germanic peoples of Northern Europe, where cremation was indigenous. This is in agreement with the historical record, for about 100 B.C. Teutonic tribes broke through the Celtic frontier, which is placed by Déchelette for the 3rd and 4th centuries B.C. a little south-west of Leipzig (where Celtic inhumations met the German cremations). Before the German advance, the Celts had occupied the middle Rhine and South-west Germany, Bohemia, Moravia, part of Silesia and lower Austria, not to mention successful expeditions to Italy, Greece and Asia Minor. In the period of La Tène, trade was almost as well organized as in Roman times, and the Rhone became the principal highway of commerce for Western Europe, Greek products being distributed through Marseilles and the colonies in North-eastern Spain, in competition with Northern Italy which had enjoyed a monopoly in the Hallstatt period.

Celtic Coinage. — In Central European unburnt burials of La Tène II. and III. are sometimes found cup-shaped pieces of electrum (gold with silver) called "little rainbow dishes" (Regenbogenschiisselchen), mostly in Bavaria and Wiirttemberg, the German name probably being derived from the superstitious belief that they may be found where the rainbow meets the earth, many having been washed out of the earth by heavy rain. Another explanation is that the device on some of them was taken for a rainbow, though it is more like the rising sun. Any resemblance to the original types was soon lost, but the comparative abundance of money in Gaul points to considerable trade and intertribal communication before the conquest of the country by Julius Caesar (50 B.C.). In the south silver copies were made, with more or less dexterity, of coins struck at Marseilles and other Greek colonies on the coast or in North-eastern Spain; and on the Danube Celtic moneyers preferred the silver stater of Philip II. of Macedon to his gold stater (fig. 14), which served as a model in the centre and north of France as in Britain. The gold stater was a little heavier than the British sovereign or pound sterling; and Gaulish copies were subject to progressive deterioration both in weight and artistic merit.

Iron Age in Spain. — The oldest historical inhabitants of the Spanish peninsula were the Iberians, but there is a possibility of Ligurians in the north about 500 B.C., and Herodotus (484–425, B.C.) records that the westernmost Celts were neighbours of the Cynetes, who inhabited the south of Portugal. This agrees well enough with the archaeological evidence of a Celtic invasion, flanking the Pyrenees, early in the 6th century. The Celtiberian name testifies to a mixed population, and there is a marked absence of any early Hallstatt types, the earliest swords, for example, being derivatives of the type with horse-shoe (antennae) pommel (fig. 9). Cremation was the funeral rite among the Celtic invaders, who reached the middle course of the Tagus and Guadiana; and the Hsllstatt pottery in their graves is not associated with Greek wares, the influence of the Greek settlements on the coast (Rhoda, Emporiae) not being felt till the

FROM "GUIDE TO THE EARLY IRON AGE ANTIQUITIES," BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

FIGS. 10–23. — ARTICLES OF COMMON USE BELONGING TO THE LA TÈNE CULTURE, 450–50 B.C.

The "La Tène" culture derives its name from a famous Swiss site at the east end of Lake Neuchâtel. It covers the second half of the early Bronze Age, and shows Greek influence on this early Celtic Culture

period of La Tène, when the cultural development ran parallel to that of Gaul, but produced some peculiar local forms, especially brooches and weapons. Coinage began in the 3rd century B.C., Greek and Sicilian types being imitated, but the Carthaginians supervened (232–219); and the Roman conquest, which culminated in the fall of Numantia (133 B.C.), may be considered the end of the Early Iron Age in the peninsula.

Austria and Germany.—The occurrence of a few brooches (fig. 17) of Certosa type (named after the Charterhouse outside Bologna) gives a limiting date for the Hallstatt cemetery and period, the site being within 40m. of Noreia, which gave its name to Noricum and is generally considered one of the earliest centres of iron-working in Europe. In Austria generally the bronze age culture gradually gave way to iron, and in late Hallstatt times there was a local revival in bronze-working, no doubt stimulated by trade with Northern Italy. Nearly all the local burials of that date were under grave-mounds (*tumuli*), and the dead were cremated. In the succeeding period (La Tène) the polychrome pottery characteristic of the Hallstatt period disappears and gives place to wheel-made ware, the first proof of the potter's wheel in this area. The embossed bronzes show an orientalizing tendency, and scrolls and palmettes indicate contact with Greek civilization. Italian influence did not, however, cease till the next stage (La Tène B), when the country became predominantly Celtic, and dependent on Western Europe. The Celts had extended their control to the Alpine area before they were finally incorporated in Roman provinces during the reign of Augustus. In the north-east they spread to Silesia and Western Galicia, and brought the culture of La Tène to East Germany and Poland, where Hallstatt survivals have been recognized but where the new civilization was firmly established only towards the end of the 2nd century B.C. Iron was then copiously used for weapons and ornaments; and while cremation with cinerary urns was common in the south, the northern tribes (perhaps the original Burgundians) buried all that remained of the funeral pyre without urns (Brandgrubengriiber), a custom that may have spread from the island of Bornholm.

Denmark and Sweden.—In the absence of a purely Roman period, the early iron age of Denmark runs on till the Migration period (5th century A.D.), and the date of its commencement falls in the 4th century B.C. when La Tène elements reached the Cimbric peninsula (Jutland). This phase is best represented in the moor (peat-bed) finds of Nydam and Thorsbjerg, including boats and iron weapons which were the predecessors of those brought to Britain by the Anglo-Saxons. Bronze swords of Hallstatt type found in Denmark cannot be taken as proof of a local iron age before La Tène, as Jutland was at one end of the amber trade-route across Europe and naturally received a larger share of southern metal-work in exchange for the amber of its coasts during the last centuries of its bronze age. Sweden, at least in the south, was at much the same stage of culture as Denmark, but the island of Gotland in the Baltic, as a trading centre, seems to have been somewhat in advance of the mainland.

Iron Age in Norway.—Physical and economic conditions were different in Norway, where the bronze age is little more than a name and the early iron age is comparatively late. Indeed there is little of the iron age till some of the best Roman products were introduced about A.D. 100 though it is generally assumed that Montelius' classification holds good. Another line has recently been taken by A. W. Brøgger of Oslo, who contends that in the pre-Roman period Norway had no bronze or iron for industrial or domestic purposes, and only became independent of foreign supplies about A.D. 350 when the Roman period elsewhere was drawing to a close, there being no period of Roman occupation in Norway, though the term is conveniently borrowed. According to this theory the stone age only came to an end with the general use of the iron axe, which enabled the population to clear the woodlands and bring something more than a coastal strip under cultivation. This was a turning-point as important as the introduction of domestic animals and agriculture; and after some tribal movements occasioned by the great migrations of the 4th and 5th centuries, the country entered on its later iron age, culminating in the splendid achievements and barbaric luxury of the Vikings. It is remarkable that there is hardly a trace of Celtic civilization in Norway—none of the characteristic weapons or artistic creations which were distributed over large areas of Europe in the last two or three centuries before Christ. Though cunning workers in metal themselves, the Celtic tribes, who were warriors first and last, did not communicate the craft to the Germans of the Continent or the related tribes of the Scandinavian peninsula. Norway owed its knowledge of iron and its first supply of weapons to the Romans, whose nearest depôts were on the western frontier of Germany; but soon learnt the method of reducing its native ores, and with home-made implements turned eagerly to boat-building, an art which contributed largely to local prosperity in the Viking period.

Britain.—In the second half of the bronze age it was the custom in Britain to burn the dead and erect funeral mounds of circular form (round barrows) over the ashes, with or without cinerary urns. Cemeteries of cremated remains in or under urns, without any superficial indications (urn-fields), have also been found, presumably late in the bronze age, though here and there containing objects of iron; and this association has led O. G. S. Crawford to attribute these graves to Celtic invaders, preferably of Goidelic (Gaelic) language and armed with the leaf-shaped sword of bronze (Antiquaries Journal, ii., 27). It should, however, be pointed out that according to philologists there are no traces of a Goidelic occupation of England, and the Gael only reached Scotland in the 5th century A.D. The very scarcity of iron objects in these urn-fields suggests their inclusion in the bronze age, as an iron age cannot be said to begin till the metal has passed into common use and is no longer an article of luxury. The varieties of the leaf-shaped sword referred to do not include the specific Hallstatt bronze sword, which has a spade-shaped prolongation of the hilt for a heavy pommel; and it is the latter type which characterizes the earliest Hallstatt phase abroad as well as in England: the inference is that other types are of the pure bronze age. All have been illustrated by Harold J. E. Peake who suspects that pottery with finger-tip ornament on raised bands was earlier than the bronze swords of Hallstatt type, and therefore contemporary with swords of the recognized bronze age patterns. Both pottery and swords represent in his opinion an earlier invasion from the Continent; and the Hallstatt type of bronze sword was brought by people retreating before the sword of iron. In support of this he points out that the Sequani (dwellers on the Sequana, Seine), who belonged to the Q Celts (Goidelic), had bronze swords and were not disturbed by wielders of the iron weapon, who apparently spoke a Brythonic language (P Celts). He sees a corresponding association of sword-pattern and dialect in Italy.

Hallstatt Period in Britain.—Till quite recently Britain has been denied a Hallstatt period, though in 1906 various Italian and Hallstatt types of brooches in the country were interpreted to mean at least commercial relations with Central Europe, and the argument was strengthened by the discovery of a cordoned bucket like fig. 3 (made in North Italy) at Brooklands, Surrey, in the following year. Brooches of La Tène I. type are common in certain parts of England (especially Wiltshire and neighbouring counties), and that stage has been generally recognized as the beginning of the British iron age, but recent discoveries tend to demonstrate not only trade but occupation by people of Hallstatt culture. Though most of the leaf-shaped swords must be referred to the bronze age, a few of the peculiar Hallstatt type have been found, and pottery is still better evidence of a new wave of population, for some distorted fragments found with a kiln at Eastbourne are not only of Hallstatt ware but were evidently made on the spot, as wasters would not be imported. Earlier discoveries at Hengistbury Head, Hampshire, included fragments attributed to the same period but not so easily recognizable; and these have been followed by a large number of typical fragments at All Cannings Farm near Devizes (Wiltshire), Scarborough (Yorkshire) and Park Brow near Worthing (Sussex). From these associations it may be possible to assign certain burials without mounds, in cinerary urns of cylindrical

form with finger-nail impressions. to the first part of the early iron age, though it is not clear at what stage of the Hallstatt period these newcomers arrived, as the finds are at present few and sporadic. Unburnt burials of early La Tkne date have been found (some with chariots) in Yorkshire, but more familiar are the urn-fields with cinerary urns of the pedestal type in South-eastern England (as at Aylesford and Swarling in Kent, Welwyn in Hertfordshire, and on several sites in Essex).

The artistic productions of this early iron age in Britain (as figs. 21–23) were at their best in the period between the invasions of Julius Caesar and the conquest under Claudius (roughly 50 B.C.–A.D. 50, known as La Tkne IV.); but the subject is discussed elsewhere (under La Tkne), and the examples given in the plate must here suffice. The coinage (fig. 1j) was at first borrowed from Gaul, and later struck by the local tribes at Colchester, St. Albans, Silchester and other centres, the first inscriptions being in Roman characters. There had, however, been a currency here before coins were introduced, and in 1905 the iron bars adjusted to a certain weight standard, as Caesar relates, were recognized in a number of flat blades with roughly shaped handles (fig. 16) found chiefly in British earth-works and evidently conforming to a standard of 4,770 grains (309.7 grammes or about 11oz. avoirdupois), no less than six denominations (fractions or multiples) being now recorded. They are almost confined to a square with its angles at Leominster, Northampton, Bridport and Portsmouth.

Ireland.— There are undoubted Hallstatt types in Ireland. E. C. R. Armstrong enumerated two dozen bronze swords with trapezium (or spade-shaped) pommels, one iron sword, seven winged chapes (end of sword-scabbards), seven pails (situlae) and other objects which, however, do not include bronze razors, cordoned buckets, swords with horse-shoe pommels (late Hallstatt), swan-necked pins or coloured pottery; but further excavation may fill some or all of these gaps, and the succeeding period of La Tkne is better represented, though mostly in its later phases. The ancient Irish population seems to have consisted of two main types: a short, dark, long-headed group of Mediterranean affinities (locally pre-Celtic), and a tall, fair, long-headed people of Nordic type, reprtsenting a Celtic invasion a few centuries before Christ. The earliest traces of La Tène culture date about 300 B.c., and burials of the period seem to have been after cremation. Ireland is comparatively rich in stone monuments of La Tène character, from Turoe (Galway), Castlestrang (Roscommon) and Mullaghmast (Kildare); but on the other hand there are no coins or even a bar-currency of the period in the country. The artistic tendencies of the Celt may be seen in the local treatment of the brooch, sword-scabbards and enamel work, but only a few specimens can be dated by comparison with Continental types, and it was in Ireland that the Celtic artist took refuge and maintained the traditional style uninfluenced by the Roman empire which included the rest of Western Europe.

4. AIR SURVEY

Long before aeroplanes were invented it was confidently hoped that vertical photographs would some day be taken, and it was felt certain that, if so, they would greatly assist archaeology. Maj. Elsdale was the pioneer of air-photography in the British army. Between about 1880 and 1887 he carried out many experiments from free balloons; but ballooning was not much in favour then and, although some progress was made, he received little or no official support in his experiments. During several years preceding the World War, Henry S. Wellcome successfully used large box-kites, with specially devised automatic control cameras, for photographing his archaeological sites and excavations in the upper Nile regions of the Anglo-Egyptian Sudan.

During the World War, when aeroplane photographs first became common, it was expected that archaeological features would be observed; but in the British sector in France none were seen. The photographs were often taken at a great height, over country which is archaeologically barren, or which was too rankly overgrown to show results. Only on other fronts was time found for archaeology in the air. Col. Beazeley observed and photographed in 'Iraq, in 1917, cities whose ruins were unintelligible on the ground. On an air-photograph these ruins were seen as an orderly arrangement of streets and houses. This definitely proved that air-photography could add to kno ledge, and that it would be an invaluable aid to excavation. To Col. Beazeley, therefore, is due the credit for the first actual application of aeroplane photography to archaeology.

The birth of the new study in England, however, dates from 1922 when Air Commodore Clark Hall observed certain curious marks on R.A.F. air-photos taken in Hampshire. With him must be mentioned Flight-lieut. Haslam, who took a number of photographs near Winchester showing what turned out to be prehistoric fields. Air Commodore Clark Hall showed these photographs to Dr. Williams-Freeman and O. G. S. Crawford, archaeology officer of the Ordnance Survey, who saw that their expectations were fulfilled, and even surpassed, by what was revealed. It was possible from these photographs to make a map of the prehistoric field-system near Winchester. Popular interest was first aroused by O. G. S. Crawford's discovery and publication of negatives showing, for the first time, the complete course of the Stonehenge avenue (eastern branch). The photographs were taken in the dry year of 1921 by the Old Sarum squadron; but their archaeological importance was not recognized until two years later, in 1923. The most important archaeological air-photographs obtained are those taken during 1924 by O. G. S. Crawford and Alexander Keiller. An aeroplane was specially hired, and about 300 photographs of archaeological sites were taken.

Outside England little has been done except in 'Iraq, Palestine, Transjordan and Egypt. In Palestine many sites have been photographed by the Royal Air Force, at the suggestion of the Department of Antiquities. A photograph of Masada on the Dead sea is described in Antiquity. Remarkable remains were revealed in the Amman region (Transjordan) by R.A.F. air-photographs. These show an elaborate system of stone walls and enclosures designed probably for the rapid herding of animals when threatened by a raiding party. A preliminary report on these was published by Flight-lieut. P. E. Maitland in 1927; further results have been obtained in the same area by Group-captain L. W. B. Rees, V.C. In Egypt valuable archaeological results were secured as a by-product of the third Nile aerial survey (1922). Oblique photographs have been taken of Numantia in Spain, but obliques are always inferior to verticals in archaeological value.

It is usually imagined that the camera, when fixed in an aeroplane, records marks on the ground which are invisible to the eye of an observer. That is not so. The observer can see these marks more plainly than the camera records them, for he sees them in colour. The most remarkable discoveries that have been made are due to plants, which are sensitive to slight differences of soil and moisture. For example, if a ditch has been dug on a chalk down and the down has afterwards been ploughed flat and sown with corn, for ever afterwards the subsoil filling (or silt) of that ditch differs from the adjacent never-disturbed soil. Nothing can ever restore chalk once dug to its former state. Archaeologists have long known this, for one of the principal needs in excavation is to distinguish between disturbed and undisturbed soil. But one cannot dig up a whole field or several fields to find a ditch which, after all, may not exist. Here it is that a vertical view helps; for the effect of this moister and more fertile silt upon a crop of corn is to promote its growth and deepen its colour. Thus from above one sees, and can photograph, a belt of darker green corn following the line of the vanished ditch. These lines are sometimes visible on the ground, from across a valley, or even at closer quarters. Sometimes (as in parts of the Stonehenge avenue) they are quite invisible. But always, when more than a single ditch is concerned, the distant view is necessary to convert chaos into order. The reason for this necessity can best be explained by means of a comparison. If one looks through a magnifying-glass at a half-tone illustration made through a coarse screen, it ceases to be seen as a picture and becomes a meaningless maze of blurred dots. If one holds it some distance off and looks at it with the naked eye it becomes a picture again. The observer on the ground is like the user of the magnifying-glass; the observer (or camera) in the air resembles him who looks at the picture from a distance. *(See* SURVEYING.)

The majority of British prehistoric sites, and many later ones, were a maze of ditches and pits, dug for drainage, storage, habitation, defence or boundary purposes. Many still exist on the downs, undisturbed and turf covered; many more have been flattened by cultivation. All of the latter can be re-discovered by air-photography, provided only that the arable has not been allowed to revert to grass. Even then traces of the ditches are sometimes visible, especially on poor soils and in dry summers, by a belt of darker green. Air observation, however, is most fruitful when young crops are growing; then discovery is easy and rapid, and every flight is productive. Such sites may afterwards be seen to exist by an observer on the ground; but few of them could ever have been discovered except from the air. Chalk is not the only soil that produces these streak-sites; they have been observed on oolitic limestone near Bath and gravel near Exbury.

Other factors enable air-photography to record ancient sites. Prehistoric cultivation-banks are revealed because they either throw slight shadows or because when ploughed they appear as belts of lighter soil, from the chalk grains mixed with them *(see* plate). From photographs the prehistoric field-system of a district can be accurately mapped. Again, rabbits work in the looser silt or filled-up ditches (as well as in the soil of the lynchets), and if there are many rabbits a white line, or row of white patches, is visible from the air. Daisies and poppies grow from choice above these ditches, and barrows and hill-top camps have thus been revealed by white and scarlet circles. Lastly, the low shadows at sunrise and sunset etch the slopes of low banks in deep black. That is the time to photograph lynchets. On a June morning before breakfast the greater part of Salisbury plain is seen to be covered with the banks of abandoned Celtic fields; but afterwards they "fade into the common light of day." The great ramparts of hill-top camps throw a shadow even at mid-day, but are best photographed when the sun is low, for then not only do the ramparts stand out best, but also the banks and pits of the habitations within.

Hambledon Hill, Dorset, England (see fig. 1 on plate), one of the finest hill-top camps, is on an isolated hill about 300ft. above the surrounding country. The entrance of the camp is protected by a hook-like prolongation of an outer rampart; from it led a pathway within the camp, passing between oblong and circular pits, the site of huts. Those, especially in the middle portion of the camp, are very clearly seen, and beside them is a long barrow, far older of course than the camp, which was probably made in the early iron age. Across the narrow ridge connecting the hill of the camp with the next hill, was built a formidable double scarp-to-scarp rampart; and beyond this can be seen the faint outline of a probably older camp (only partially included). The hill must have been permanently inhabited. A scattered flock of sheep in the inner portion of the camp will give some idea of the scale of the photograph.

Oakley Down, Dorset, England, another noted site, is between Salisbury and Blandford, on chalk soil now covered with turf. The principal features are: (1) The raised causeway of the Roman road running diagonally across the district; (2) a group of round barrows, or burial mounds of the early bronze age, older than the Roman road, which cuts its way through two disc-barrows; (3) a network of Celtic fields, particularly noticeable in one corner of the photograph. In the valley below is the remains of a contemporary pond (very large, but now dry), and there are signs of Celtic ploughing on both sides of the Roman road.

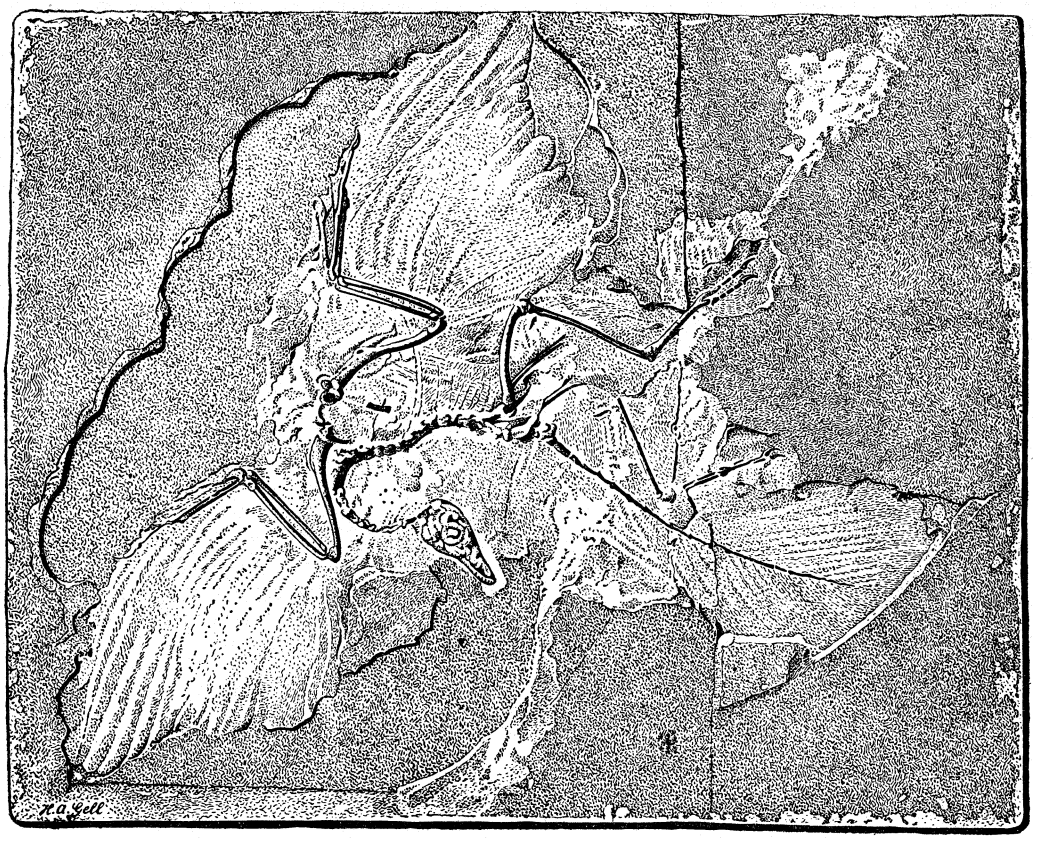
ARCHAEOPTERYX. The discovery of the impression of a feather in the lithographic limestone of Solenhofen, Bavaria, has enabled us to trace back the descent of birds of Jurassic times; though it afforded no clue as to the type of bird to which it belonged. This feather was named *Archaeopteryx lithographica,* by Hermann von Meyer, so far back as 1861. Later in the same year, and from the same quarry, a very imperfect skeleton was found, together with the "flight-feathers" of the wings and the feathers of the tail. These remains, it is of importance to notice, were those of a "perching-bird," though of a vastly more primitive type than any now existing. This specimen is now in the British Museum of Natural History, and was described by Owen under the name *Archaeopteryx macroura.*

In 1872 a second and nearly perfect specimen was found—again in the same quarry—and is now in the Berlin Museum. That it represents a distinct species of the genus *Archaeopteryx* is generally admitted. The adjoining text-cut (fig. 1) seems to justify the assumption that it fell to the bottom of some shallow lake, and was slowly covered with a deposit of fine mud, so that the bones, after the disintegration of the flesh, remained undisturbed. The interest and importance of these two specimens cannot easily be exaggerated. They have formed the theme of endless discussion by men of science; though from a lack of familiarity with avian anatomy the conclusions at which they have arrived are sometimes surprising.

That birds and reptiles are derivatives from the same common stock is convincingly demonstrated in the structure of living birds; but in *Arclzaeopteryx* we find what the evolutionist would



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

FIG. 1.—THE ARCHAEOPTERYX, THE EARLIEST OF KNOWN BIRDS. AFTER A CAST OF THE ORIGINAL IN THE BERLIN MUSEUM
Skeletal remains show that the Archaeopteryx forms a deflnita link between reptiles and birds

expect: stages in the transformation from reptile to bird, to be seen in modern birds only during embryonic and early post-embryonic life. The jaws were armed with teeth, as were those of *Ichthyornis* and *Hesperornis* of the later Cretaceous epoch. These teeth are reptilian heritages. The tail furnishes still more important evidence. In *Archaeopteryx*, as in the reptiles, this was formed of a long chain of vertebrae. The last 12 bore each a pair of stiff-shafted feathers, shown in fig. 2, directed backwards and outwards. In modern birds the tail-feathers, precisely similar in character, are arranged fan-wise, and fixed by their bases to a median lamina of bone, the "pygostyle." When this lamina is examined in the embryo it is found to be composed of a number of separate elements, answering to from six to seven originally separate vertebrae. In other words, the tail of modern birds has been derived by a process of "telescoping" the vertebrae, so that the pairs of feathers they originally supported have come to lie within a semicircle embracing what is now a "pygostyle," but what was once a number of vertebrae in linear series, as seen in fig. 2.

The wing is no less remarkable in this connection. In its essential features it agrees with the late embryonic and early post-embryonic stages of living birds. Thus, in modern birds the three metacarpal bones, answering to the bones of the palm of the hand, can be separated only during the early stages of development. In *Archaeopteryx* they never became welded together. In living birds the first and sometimes the second digit may terminate in a claw, but the third digit has been found to possess a claw only in one or two cases of embryos of the ostrich. The distal, or second row of wrist-bones in *Archaeopteryx* were welded together to form a semi-circular nodule of bone closely applied to the bases of the metacarpals. In modern birds a precisely similar welding together of the wrist-bones is found, but very early in post-embryonic life, and sometimes before, the fused mass comes to form one common bony tissue with the metacarpals. That the wing of *Archaeopteryx* was evolved *pari passu* with the feathers in response to the movements peculiar to the requirements of flight scarcely admits of doubt; though quite different functions have been claimed for it. The problem of the evolution of the skeleton of the wing cannot be divorced from the study of the indubitable "flight-feathers" which it supported. These, as in living birds, are divisible into the outermost, or "primaries," borne by the hand, and the "secondaries," borne by the fore-arm. They are as sharply defined as in modern birds, and this could not have come about save as a response to the same stimuli. In other words, they have the same form and arrangement because they served the same function. In one particular the wing of *Archaeopteryx* seems to differ from that of living birds, and this has proved a stumbling-block to many who have discussed this theme after no more than a very desultory survey of the facts. This differencelies in the fact that the second and third digits projected beyond the outermost primaries and terminated each in a claw—a condition that has been interpreted to show that the wing was used rather for climbing than as an organ of flight. We have a parallel in the wing of the nestling Hoatzin, and also in the wings of nestling Gallinaceous birds. In the Hoatzin the thumb and first finger, which is very long, are armed with claws which enable the wing to be used for climbing along the branches supporting the nest. Soon the "flight-feathers" of the hand begin to grow, but the development of the outermost primaries is inhibited till the inner feathers have provided a wing-surface sufficient to break the force of a fall. Not till then do the outer primaries make their appearance, and at the same time the claw at the tip of the second digit disappears, while by

changes in the rate of growth the hand becomes greatly shortened relatively to the fore-arm. The condition of the wing at the time of the inhibition of the primaries answers to the adult condition of the wing of *Archaeopteryx,* and suggests that the projecting'second and third digits, and their claws, were used as climbing-hooks during the annual moult when all the quills were shed at once, as in the *Anatidae,* for example, to-day.

The shoulder-girdle of *Archaeopteryx* is very "reptilian," especially in regard to the coracoid—the shaft projecting from the

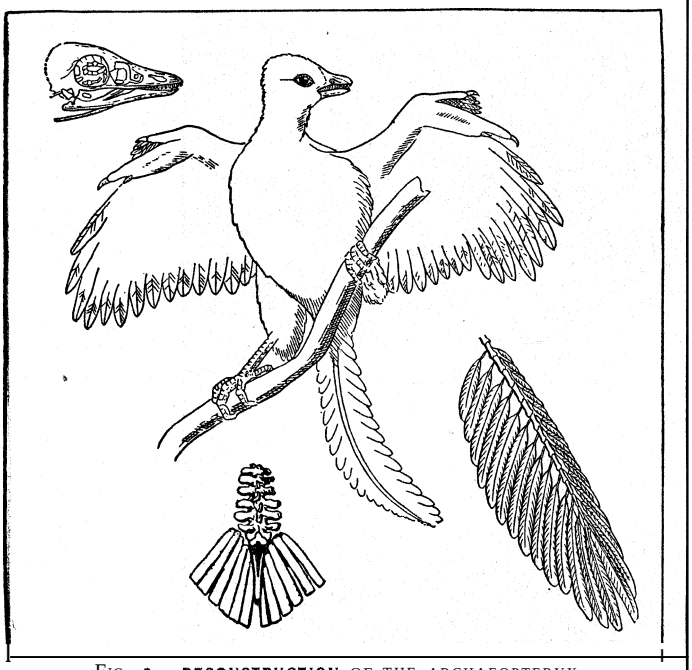


FIG. 2.—RECONSTRUCTION OF THE ARCHAEOPTERYX
The outstanding features are the long reptilian tail and the teeth, 13 in the upper jaw and 3 in the lower, all in distinct sockets. The Archaeopteryx was about the size of a rook

sternum for the support of the wing. Of the sternum we know nothing. The absence of a median keel to the sternal plate has been postulated on what is, at present, mere guesswork. The pelvis, though emphatically avian in type, presents many peculiar and interesting features. Of these one of the most striking is seen in the pubes, which met towards their hinder ends to form an elongated, triangular plate; restorations which have been made of the pelvic-girdle have left out of account the probable cartilaginous areas of the hinder border of the ilium and ischium, seen in the late embryonic and early post-embryonic pelves of modern birds. When these are added, a much more familiar look is given to the whole structure. The foot of *Archaeopteryx* is profoundly interesting, since, had it alone been found, it would have been regarded as that of a small Corvine bird. This means that it had already become transformed into the typical "Passerine" type of foot adapted both for perching and walking.

ARCHAISM, an old-fashioned usage, or the deliberate employment of an out-of-date and ancient mode of expression. Examples will be found in English in the forgeries of Chatterton and in the prose romances of William Morris.

ARCHANGEL. (1.) A nonautonomous region of the Russian S.E.S.R., decidedly smaller than the former Archangel province. Its boundaries are, north, the White sea; east, the autonomous Komi (Zyrian) area; south, the Vologda nonautonomous region, and west, the Karelian A.S.S R The area is 450,770 square kilometers. The province is divided into the following districts: —Archangel, Mezensk (the pop. of the town of Mezen is 70% greater in summer than in winter), Onega. Petchora, Shenkursky, the islands of the Arctic ocean (Novaya Zemlya, Vaigach, Kolguev, Franz Josef Land). The climate is severe. the Kanin peninsula and the Timan coast area lying in the Arctic zone. Archangel gulf freezes at the end of October on the average of 140 days, and the port of Archangel is blocked for 190 days, though the Gulf Stream influence is sufficiently felt to make the winter no more severe than that of Onega bay 200 mi. south. The heaviest precipitation is in autumn. At Archangel, the average rainfall is 15·3in.; January temperature 7·3°F., July 60·4F. In the north the land remains frozen all the year, since spring and autumn are moist, with frosty nights, and summer is foggy; therefore the north is in the tundra zone, chiefly sand and reindeer moss; the south is pine forest. The chief occupation on the coast is fishing (especially cod and herring) and in the forest, salmon fishing and hunting (brown bear, glutton, lynx. elk, fox, wolf), collecting cranberries and mushrooms to be dried and sent to the towns. The Kanin peninsula is inhabited by nomad Samoyedes, following the tundra limit with their reindeer, from which they get food, clothing and tent covers; in winter they visit the Russian and Zyrian towns and exchange their reindeer products for flour and ammunition. Barley, winter rye, oats, hemp and flax are grown in the south, but birch bark has often to be used for flour. Potatoes are grown south of latitude 65°. Pitch, tar and timber are obtained from the forests, and shipbuilding is carried on on the coast.

Cattle are raised in Kholmogory, west of the North Dvina river, and veal is sent to Leningrad. Naphtha and salt are produced in the Pinega area and lignite in Mezen. Mica is mined. Shenkursk and Kholmogory have sulphur springs.

(2). A town and port, the administrative centre of the region, on the right bank of the North Dvina river at the head of the delta, 64° 33' N. and 40° 50' E. The shortest day is 3hr. 12min., the longest 21 hr. 48 min. Pop. (1933) 194,302. Of the White sea trade, about 82% passes through Archangel. The harbour is immense, and can accommodate hundreds of ocean-going steamers. It has six sections, the depth of water being 24–25 feet. It is ice bound from November to May. It is linked by river, canal and rail with the south, and the railway line was converted from single to double up to Vologda in 1916. Its main exports are timber, tar, flax, linseed, skins, but timber forms 80%. Its chief industry is sawmilling. Others are fishing, sail and rope making, shipbuilding, cod curing, cod-liver oil preparation, skins and blubber. English and Norwegian vessels ordinarily use the port.

It was visited by Norsemen in the 10th century (Ottar or Othere 880–900 is best known), but the town dates from R. Chancellor's expedition, 1553, when an English factory was built. It was long the only seaport of Muscovy and was opened to all nations by Boris Godunov (1598–1605). Its bazaar and trading hall were built by Tatar prisoners (1668–84). It declined after the building of St. Petersburg (later Leningrad) in 1702, but when equal trading facilities were granted in 1762 it gradually recovered. It has a cathedral (1709–43), a museum, the monastery of the Archangel Michael (hence the name) and a school of navigation.

ARCHBALD, a borough of Lackawanna county, Pa., U.S.A., in the anthracite fields, 10 mi. N.E. of Scranton, about 900 ft. above sea-level. It is served by the Delaware and Hudson and the New York, Ontario and Western railways. The population in 1930 was 9,587; 8,296 in 1940 by federal census. Coal mining is the principal industry of the borough. Within its limits is a large glacial "pot-hole," about 20 ft. in diameter and 40 ft. deep. Archbald was named after James Archbald, formerly chief engineer of the Delaware and Hudson. It was incorporated in 1877.

ARCHBISHOP (Gr. ἀρχιεπίσκοπος) in the Christian church, the title of a bishop of superior rank, implying usually jurisdiction over other bishops, but no superiority of order over them. The functions of the archbishop, as at present exercised, developed out of those of the metropolitan (*q.v.*); though the title of archbishop when it first appeared, implied no metro-

politan jurisdiction. Nor are the terms interchangeable now; for not all metropolitans are archbishops, nor all archbishops metropolitans. The title seems to have been introduced first in the East, in the 4th century, as an honorary distinction implying no superiority of jurisdiction. Its first recorded use is by Athanasius, bishop of Alexandria, who applied it to his predecessor Alexander as a mark of respect. In the next century its use seems to have been more common; for several archbishops are stated to have been present at the council of Chalcedon in 451.

In the Western Church the title was hardly known before the 7th century, and did not become common until the Carolingian emperors revived the right of the metropolitans to summon provincial synods. The metropolitans now commonly assumed the title of archbishop to mark their pre-eminence over the other bishops; at the same time the obligation imposed upon them, mainly at the instance of St. Boniface, to receive the *pallium* (q.v.) from Rome, marked the defeat of their claim to exercise metropolitan jurisdiction independently of the Pope.

At the present day, the title of archbishop is retained in the Roman Catholic Church, the Orthodox and other Churches of the East, the Anglican Church, and certain branches of the Lutheran (Evangelical) Church.

Roman Catholic Church. — In the Roman Catholic Church the powers of the archbishop are considerably less extensive than they were in the middle ages, their rights having been greatly curtailed by the council of Trent. The confirmation and consecration of bishops (see BISHOP) is now reserved to the Holy See. The disciplinary powers once exercised by the archbishop can scarcely be said to survive. The right to hold a visitation of a suffragan's diocese or to issue censures against him was made by the council of Trent dependent upon the consent of the provincial synod after cause shown, and the only two powers left to the archbishop in this respect are to watch over the diocesan seminaries and to compel the residence of the bishop in his diocese.

Besides archbishops who are metropolitans there are in the Roman Catholic Church others who have no metropolitan jurisdiction; *e.g.,* certain archbishops of Italian sees who have no bishops under them. Archbishops rank immediately after patriarchs and have the same precedence as primates. The right to wear the *pallium* is confined to those archbishops who are not merely titular. The special ensign of the archbishop's office is the cross, *crux* erccta or gestatoria, carried before him on solemn occasions (*see* CROSS).

Eastern Church. — In the Orthodox and other churches of the East the title of archbishop is of far more common occurrence than in the West, and is less consistently associated with metropolitan functions.

Lutheran Church. — In the Protestant churches of continental Europe the title of archbishop has fallen into almost complete disuse. It is, however, still borne by the Lutheran bishop of Uppsala, who is metropolitan of Sweden, and by the Lutheran bishop of Abo in Finland.

Church of England. — In the Church of England and its sister and daughter churches the position of the archbishop is defined by the mediaeval canon law as confirmed or modified by statute since the Reformation.

The ecclesiastical government of the Church of England is divided between two archbishops — the Archbishop of Canterbury, who is "primate of all England" and metropolitan of the province of Canterbury, and the Archbishop of York, who is "primate of England" and metropolitan of the province of York. The jurisdiction of the Archbishop of Canterbury as primate of all England extends in certain matters into the province of York. He exercised the jurisdiction of *legatus natus* of the Pope throughout all England before the Reformation, and since that event he has been empowered, by 25 Hen. VIII. c. 21, to exercise certain powers of dispensation in cases formerly sued for in the court of Rome. Under this statute the archbishop continues to grant special licences to marry, which are valid in both provinces; he appoints notaries public, who may practise in both provinces; and he grants dispensations to clerics to hold more than one benefice, subject to certain restrictions which have been imposed by later statutes. The archbishop also continues to grant degrees in the faculties of theology, music and law, which are known as Lambeth degrees.

The Archbishop of Canterbury exercises the twofold jurisdiction of a metropolitan and a diocesan bishop. As metropolitan he is the guardian of the spiritualities of every vacant see within the province, he presents to all benefices which fall vacant during the vacancy of the see, and through his special commissary exercises the ordinary jurisdiction of a bishop within the vacant diocese. He exercises also an appellate jurisdiction over each bishop, which, in cases of licensed curates, he exercises personally under the pluralities act 1838; but his ordinary appellate jurisdiction is exercised by the judge of the Arches court (see ARCHES, COURT OF). The vicar-general exercises jurisdiction in matters of ordinary marriage licences and of institutions to benefices. The master of the faculties regulates the appointment of notaries public, and all dispensations which fall under 25 Hen, VIII. c. 21.

A right very rarely exercised by the Archbishop of Canterbury, but one of great importance, is that of the visitation and deprivation of inferior bishops (see LINCOLN JUDGMENT).

It is the privilege of the Archbishop of Canterbury to crown the Kings and Queens of England. He is entitled to consecrate all the bishops within his province. He takes precedence immediately after Princes of the blood royal and over every peer of Parliament, including the lord chancellor.

The Archbishop of York has immediate spiritual jurisdiction as metropolitan in the case of all vacant sees within the province of York, analogous to that which is exercised by the Archbishop of Canterbury within the province of Canterbury. He has also an appellate jurisdiction of an analogous character, which he exercises through his provincial court, whilst his diocesan jurisdiction is exercised through his consistorial court, the judges of both courts being nominated by the archbishop. It is the privilege of the Archbishop of York to crown the Queen Consort and to be her perpetual chaplain. The Archbishop of York takes precedence over all subjects of the Crown not of royal blood, but after the lord high chancellor of England (see further, ENGLAND, CHURCH OF).

The Church of Ireland had at the time of the act of union four archbishops, who took their titles from Armagh, Dublin, Cashel and Tuam. By acts of 1833 and 1834, the metropolitans of Cashel and of Tuam were reduced to the status of diocesan bishops. The two archbishops of Armagh and Dublin are maintained in the disestablished church of Ireland.

The title archbishop has been used in certain of the colonial churches; *e.g.,* Australia, South Africa, Canada, and the West Indies, since 1893, when it was assumed by the metropolitans of Canada and Rupert's Land (see ANGLICAN COMMUNION). Archbishops have the title of His (or Your) Grace and Most Reverend Father in God.

BIBLIOGRAPHY. — See Hinschius, *System des katholischen Kirchenrechts* (1869), also article "Erzbischof," in Hauck, *Realencyklopadie* (1898); Phillimore, *The Ecclesiastical Law of the Church of England,* and authorities there cited.

ARCHCHANCELLOR, or chief chancellor, a title given to the highest dignitary of the Holy Roman empire, and also used occasionally during the middle ages to denote an official who supervised the work of chancellors or notaries. A charter of the emperor Lothair I. dated 844 refers to Agilmar, archbishop of Vienne, as archchancellor, and there are several other references to archchancellors in various chronicles. This office existed in the German kingdom of Otto the Great, and about this time it appears to have become an appanage of the archbishopric of Mainz. When the empire was restored by Otto in 962, a separate chancery seems to have been organized for Italian affairs, and early in the 11th century the office of archchancellor for the kingdom of Italy was in the hands of the archbishop of Cologne. The theory was that all the imperial business in Germany was supervised by the elector of Mainz, and in Italy by the elector of Cologne. However, the duties of archchancellor for Italy

were generally discharged by deputy, and after the virtual separation of Italy and Germany, the title alone was retained by the elector. During the 12th century the elector of Trier took the title of archchancellor for the kingdom of Arles, although it is doubtful if he ever performed any duties in connection with this office. This threefold division of the office of imperial archchancellor was acknowledged in 1356 by the Golden Bull of the Emperor Charles IV., but the duties of the office were performed by the elector of Mainz. The office in this form was part of the constitution of the empire until 1803 when the archbishopric of Mainz was secularized. The last elector, Karl Theodor von Dalberg, however, retained the title of archchancellor until the dissolution of the empire in 1806.

ARCHDEACON, a high official of the Christian Church. The office of archdeacon is of great antiquity. Originally the archdeacon was, as the name implies, the chief of the deacons attached to the bishop's cathedral, his duty being, besides preaching, to supervise the deacons and their work. His close relation to the bishop gave him, though only in deacon's orders, great importance, which continually developed. In the East, in the 5th century, the archdeacons were already charged with the proof of the qualifications of candidates for ordination; they attended the bishops at ecclesiastical synods, and sometimes acted as their representatives; they shared in the administration of sees during a vacancy. In the West, in the 6th and 7th centuries, archdeacons had in addition certain well-defined rights of visitation and supervision, being responsible for the good order of the lower clergy, the upkeep of ecclesiastical buildings, and the safeguarding of the church furniture. During the 8th and 9th centuries the office tended to become more exclusively administrative, the archdeacon relieving the bishop of the details of government and keeping him informed of the condition of his diocese. The archdeacon had thus become the *oculus episcopi,* "the bishop's eye," but, empowered as he was to impose penance and even to excommunicate offenders, his power tended to grow at the bishop's expense. This process received a great impulse from the erection in the 8th to 12th centuries of defined territorial jurisdictions for the archdeacons. The dioceses were now mapped out into several archdeaconries, and these defined spheres gradually came to be regarded as independent centres of jurisdiction. The bishops, now increasingly absorbed in secular affairs, were content with a somewhat theoretical power of control, while the archdeacons rigorously asserted an independent position which implied great power and possibilities of wealth.

The power of the archdeacon reached its zenith at the outset of the 13th century. He possessed in his own right the powers of visitation, of holding courts and imposing penalties, of deciding in matrimonial causes and cases of disputed jurisdiction, of testing candidates for orders, of inducting into benefices; and these powers he might exercise through delegated *oficiales.* His jurisdiction had become, in fact, co-ordinate with that of the bishop.

From the 13th century onward a reaction set in. The bishops began to circumvent the power of the archdeacons by appointing new officials to exercise in their name the rights to which they laid claim. These were the *oficiales foranei,* whose jurisdiction was parallel with that of the archdeacons, and the *oficiales principales* and vicars-general, who presided over the courts of appeal. The clergy having thus another authority to appeal to, the power of the archdeacons declined; and, so far as the Roman Catholic Church is concerned, it received its death-blow from the Council of Trent (1564), which confined the power of the archdeacons to holding visitations in connection with those of the bishop and with his consent. In the Roman Church to-day the office of archdeacon, where it exists, is merely titular, his sole function being to present the candidates for ordination to the bishop. His ancient functions are exercised by the vicar-general.

In the Church of England the office, which occurs in 803, but did not become general until the Conquest, survives, with many ancient prerogatives. The archdeacons are appointed by their respective bishops, and they are, by an act of 1840, required to have been six full years in priest's orders. Their functions are ancillary to those of the bishop of the diocese. They inspect the churches to see that the fabrics are kept in repair, and hold annual visitations of the clergy and churchwardens of each parish, for the purpose of ascertaining that the clergy are in residence, of admitting the newly elected churchwardens into office, and of receiving the presentments of the outgoing churchwardens. They present all candidates for ordination to the bishop of the diocese. It is their duty also to induct the clergy into the temporalities of their benefices. Every archdeacon is entitled to appoint an official to preside over his archidiaconal court, from which there is an appeal to the consistory court of the bishop. The archdeacons are *ex officio* members of the convocations of their respective provinces.

In the Dominions the functions of archdeacons correspond to those of English archdeacons. In the Episcopal Church of America the office of archdeacon exists in only one or two dioceses.

ARCHDUKE, a title peculiar in modern times to the Austrian royal family (Lat. *archidux,* Ger. *Erzherzog*). The designation was exceedingly rare during the Middle Ages. The title of "archduke palatine" (*Pfalz-Erzherzog*) was assumed first by Duke Rudolph IV. (died 1365). Rudolph IV. used the title on his seals and charters till he was compelled to desist by the Emperor Charles IV. The title did not legally belong to the house of Habsburg until 1453, when the Emperor Frederick III. conferred the title of archduke of Austria on his son Maximilian and his heirs.

ARCHELAUS, received the kingdom of Judaea by the last will of his father, Herod the Great, though a previous will had bequeathed it to his brother Antipas. He was proclaimed king by the army, but declined to assume the title until he had submitted his claims to Augustus. Before setting out, he quelled with the utmost cruelty a sedition of the Pharisees, slaying nearly 3,000 of them. At Rome he was opposed by Antipas and by many of the Jews, but Augustus allotted to him the greater part of the kingdom (Judaea, Samaria, Ituraea) with the title of Ethnarch. He married Glaphyra, the widow of his brother Alexander, though his wife and her second husband, Juba, king of Mauretania, were alive. This violation of the Mosaic law and his continued cruelty roused the Jews, who complained to Augustus. Archelaus was deposed (A.D. 7) and banished to Vienne. The date of his death is unknown. He is mentioned in Matt. ii. 22, and the parable of Luke xix. 11 *seq.* may refer to his journey to Rome.

ARCHELAUS, king of Macedonia (413–399 B.C.), was the son of Perdiccas and a slave mother. He obtained the throne by murdering his uncle, his cousin and his half-brother the legitimate heir. He fortified cities, constructed roads and organized the army. He endeavoured to spread Greek civilization among his people and invited to his court, which he removed from Aegae to Pella, many celebrated men, amongst them Zeuxis, Timotheus, Euripides and Agathon. In 399 he was killed while hunting; according to another account he was the victim of a conspiracy.

BIBLIOGRAPHY.—*See* Diodorus Siculus xiii. 49, xiv. 37; Thucydides ii. 100.

ARCHELAUS OF CAPPADOCIA (1st century B.C.), general of Mithridates the Great in the war against Rome. In 87 B.C. he was sent to Greece with a large army and fleet, and occupied the Peiraeus after three days' fighting with Bruttius Sura, prefect of Macedonia. There he was besieged by Sulla, compelled to withdraw into Boeotia, and completely defeated at Chaeroneia (86). A fresh army was sent by Mithridates, but Archelaus was again defeated at Orchomenus (85). On the conclusion of peace, Archelaus, finding that he had incurred the suspicion of Mithridates, deserted to the Romans, by whom he was well received. Nothing further is known of him.

Appian, Mithrid. 30, 49, 56, 64; Plutarch, *Sulla,* 11, 16–19, 20, 23; *Lucullus,* 8.

ARCHELAUS, king of Egypt, was his son. In 56 B.C. he married Berenice, daughter of Ptolemy Auletes, queen of Egypt, but

his reign only lasted six months. He was defeated by Aulus Gabinius and slain (55).

See Strabo xii., p. 558, xvii. p. 796; Dio Cassius xxxix. 57–58; Cicero, Pro *Rabirio,* 8; Hirtius (?), *Bell. Alex.* 66; also PTOLEMIES.

ARCHELAUS, king of Cappadocia, was grandson of the last named. In 41 B.C. (according to others, 34), he was made king of Cappadocia by Antony, whom, however, he deserted after the battle of Actium. Octavian enlarged his kingdom by the addition of part of Cilicia and Lesser Armenia. He was accused by Tiberius, when emperor, of stirring up a revolution, and died in confinement at Rome (A.D. 17). Cappadocia was then made a Roman province.

ARCWELAUS OF MILETUS, Greek philosopher, 5th century B.C., born probably at Athens, though Diogenes Laërtius (ii. 16) says at Miletus. He was a pupil of Anaxagoras and is said by Ion of Chios (*ap.* Diog. Laërt. ii. 23) to have been the teacher of Socrates. Some argue that this is probably only an attempt to connect Socrates with the Ionian school; others (*e.g.,* Gomperz, Greek Thinkers) uphold the story. In general, he followed Anaxagoras, but in his cosmology he went back to the earlier Ionians, postulating primitive matter, mingled with mind, which produces fire and water. From these spring animal life. No fragments of Archelaus remain; his doctrines have to be extracted from Diogenes Laërtius, Simplicius, Plutarch and Hippolytus.

See IONIAN SCHOOL; for his ethical theories *see* T. Gomperz, *Greek Thinkers* (Eng. trans., 1901), vol. i. p. 402.

ARCHENHOLZ, JOHANN WILHELM VON (1743–1812), German historian, was born at Langfuhr, a suburb of Danzig, on Sept. 3, 1743, and died at Oyendorf, near Hamburg, on Feb. 28, 1812. He served in the Seven Years' War, and then retired from the army. He then spent a long period abroad, living in England from 1769 to 1779, and returned to Germany in 1780. His England *und Italien* (1785) gave a good picture of English political and social life. But his best known work is the history of the Seven Years' War, Geschichte des *siebenjährigen Krieges* (first published in the Berliner historisches *Taschenbuch* of 1787, and later in 2 vols., Berlin, 1793; 13th ed., Leipzig, 1892). This book is still a useful source of information.

ARCHENTERON, the term used in embryology (*q.v.*) to denote the primary body-cavity of the embryo which, in higher forms (Coelomata, *q.v.*), divides into alimentary canal and coelom (*q.v.*), in lower is retained as the coelenteron.

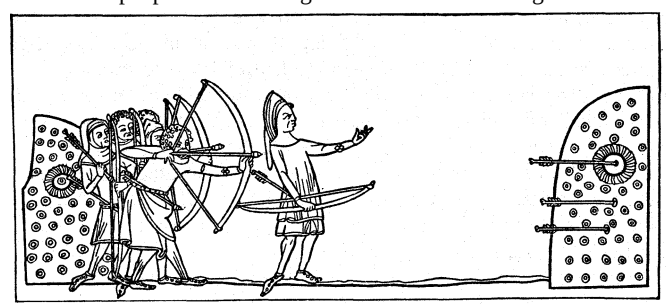
ARCHER, WILLIAM (1856–1924), English critic, was born at Perth, Sept. 23 1856, and was educated at Edinburgh University. He became a leader-writer on the Edinburgh *Evening* News in 1875, and after a year in Australia returned to England and became dramatic critic of various newspapers. Archer introduced Ibsen to the English play-going public by his translation of The Pillars of *Society,* produced at the Gaiety Theatre, London, in 1880. He translated, alone or in collaboration, other Scandinavian plays: Ibsen's *A* Doll's *House* (1889); Edvard Brandes's *A* Visit (1892), Ibsen's Peer Gynt (1892), *Master* Builder (1893), Little Eyolf (1895), and *John Gabriel Borkman* (1897). He also edited a collected edition of Henrik *Ibsen's* Prose Dramas (1890–91). Many of his dramatic criticisms were collected in book form. Archer's critical work exercised a real influence upon the English stage; but in most people's minds his work was associated almost exclusively with the more serious side of life and letters. Great was the surprise of his friends and of the general public when he produced (1921) an excellent but melodramatic piece, *The* Green Goddess, which was a popular success. He died Dec. 27, 1924. His death was a great loss to the English theatre.

ARCHER-FISH, the name given to several small fish of the Chaetodontidae on account of their habit of projecting water from their mouths, thus wetting insects and knocking them into the water. The best-known species, *Toxotes jaculator,* inhabits the fresh waters of Java and other Indo-Malayan islands. It reaches a length of 6 to 7in. and can throw a jet of water 5 or 6ft. An other species, *Chelmon* rostratus, also inhabits Java.

ARCHERMUS, a Chian sculptor of the middle of the 6th century B.C., is said by a scholiast (on Aristophanes' Birds, v. 573) to have been the first to represent Victory and Love with wings. This statement gives especial interest to a discovery made at Delos of a basis signed by Micciades and Archermus which was connected with a winged female figure in rapid motion (see GREEK ART), a figure first regarded as the Victory of Archermus. Unfortunately further investigation has discredited the notion that the statue belongs to the basis, which seems rather to have supported a sphinx.

ARCHERY, the art and practice of shooting with the bow and arrow. Nearly every country except Australia has the bow and its origin is lost in the uncertainties of the old Stone age. Excellent drawings of archers are found in the Palaeolithic carvings at Castellón (Spain), and elsewhere, which show a high development of tackle and shooting technique. Flint arrow-heads of Aurignacian culture date back, according to different anthropologists, from 25,000 to 50,000 years, and probably arrows without stone points were used for unknown ages before that.

Savage bows of to-day vary in size and strength from the feeble 3ft. stick of the African pigmy to the 8ft. long but moderate-weight bow of the Siriono Indian, or the heavy weapon of the African Wasukuma with a draw of 80lb. and a cast of 250 yards. The weight of a bow indicates the force required fully to draw its arrow. Primitive arrows differ according to the bow they fit. The pigmy shoots a sharpened twig of 80 grains, with or without an iron point, and the Siriono an arrow more than 8ft. long and an inch thick. The average, taken the world over, might show bows about 5ft. in length, weighing from 30 to 50lb., according to their thickness and the kind of wood. (The "weight" of a bow is the number of pounds required, when appended to the string, to draw to the head an arrow of 28in. for a man's bow and 25in. for a woman's.) The arrows, usually with three feathers and iron tips, are from 2ft. to 30 inches. Bows are generally made of wood, but in Asia, from very early times, a composite bow of horn, wood and sinew, in order from front to back, has been used by the great military nations, such as the Greeks, Assyrians, Hindus, Scythians, Turks and Chinese, and has been a potent factor in establishing their power. It is short and strong, weighing up to 100lb., and so resilient and elastic as to allow great reflexion, or bending frontwards when unstrung. This reflexed shape puts the strung bow in a state of high stress even



AFTER THE LOUTERELL PSALTER

ENGLISH ARCHERS OF THE 14TH CENTURY SHOOTING AT THE BUTTS
The long bow, with its arrow a cloth-yard long, was for centuries the principal weapon of English soldiers, and was used with memorable effect at Crecy, Poitiers and Agincourt. It continued in use until 1590

before the arrow is drawn and thus increases its quickness or casting power.

The interest of English-speaking people centres in the wooden, 6-ft. long bow which was, for more than a millennium, practically the only projectile weapon of Great Britain. It seems to have been developed by the Scandinavian races and carried by them into England at an early date. About 40 such bows of the 5th century, dug up at Nydam, Denmark, and much other evidence, support this view. Probably the preceding Celtic bow was a short, sturdy weapon, used chiefly at short range, of a type which persisted in Ireland. At Stamford Bridge the English archers were a formidable portion of the troops. William the Conqueror won the battle of Hastings largely through his Norman archers, who shot high in the air and dropped their arrows behind the English

wall of shields. From this fact it is often said, though erroneously, that he introduced the bow into England. The highest development of military archery was in the Hundred Years' War and in the Wars of the Roses, where it was the deciding factor at Creçy, Poitiers, Agincourt and elsewhere, in France, and, to a great extent, on several battle-fields in England.

With the improvement of fire-arms the use of the bow in English warfare rapidly declined, the forces of Elizabeth being the last in which it played an important rôle, although it was employed occasionally thereafter in such remote districts as the Scottish highlands. Archery then almost died. In fact, of all the myriads of bows that were made in old England only four are known to exist and two of these were recovered from a wreck which sunk in the Thames during the reign of Henry VIII. However, archery had been widely enjoyed as a sport during the middle ages. In fact, all men between 16 and 60 years were forced by law to practise it. It therefore survived among its amateurs, though comparatively feebly, in this form. A silver arrow, dated 1603, is still competed for in Scotland, and many other threads of continuity can be followed.

The old English archers shot in two ways; at a small prick or white spot, on a butt of turf, standing at a distance varying from 100ft. to a moderate, but uncertain, yardage, or at marks set from 150 to 300yd. away, which tried the full cast of the bow. If, at long range, the target were a white cloth stretched on a hoop, it was called a clout. Thus Shakespeare says:—"A' would have clapped i' the clout at twelve score, and carried you a forehand shaft a fourteen and fourteen and a half." This extreme is 290yd., but a forehand shaft is one aimed no higher than can be sighted over by the eye, which might suggest an even greater cast for an underhand shaft at 45° elevation. If a succession of marks, like posts, were installed, as in the Finsbury Fields near London, the game was called shooting at rovers, and possibly was a forerunner of golf.

Toward the end of the 18th century the formation of the Royal Toxophilite Society, of London, and the participation in the sport by the Prince of Wales, established modern archery as we know it. In 1844 the Grand National Meeting, which, ever since, has determined the championships of England, was held for the first time. Standards then adopted, which are still in force, were the four-foot target, coloured gold, red, blue, black and white and counting 9, 7, 5, 3, 1; the York Round, for men, of 72 arrows at 100yds., 48 at 80 and 24 at 60; and the National Round, for women, of 48 arrows at 60 and 24 at 50 yards. Usually these rounds are shot "double," or repeated, and the scores combined. The best English archer of all the years since then, probably the best of all time, was Horace Alford Ford, who shot from 1848 to 1867. His Single York of 137 hits—809 score, in private practice, and Double York of 245–1,251, in a public meeting, stand as world's records. The best woman archer was Miss Legh. Her magnificent Double National of 143–841, at the Grand National Meeting of 1904, is the world's record.

A small and curious meeting to shoot for a little silver dart called the Ancient Scorton Arrow has been held in Yorkshire since 1673 and is one of the oldest sporting events, with practically unbroken annual records, in the world. In Scotland archery is splendidly upheld by the King's Bodyguard for that country, called the Royal Company of Archers. The recorded minutes of this society date from 1676, its membership comprises Scotland's highest nobility, and it perpetuates the best traditions of shooting, both at 100ft. butts within doors and at 180 and 200yd. ranges without. The only other society which shoots over similar long distances is the Woodmen of Arden, of Meriden, England. On the Continent, archery is practically confined to Belgium and the parts of Holland and France that lie near it, including Paris. It is a sport of the working classes, not of the leisured as in England. Some *compagnies* are of great antiquity, that of Soissons claiming to have been formed in the Roman times of 471. The *Compagnie de St. Sebastien* at Bruges, with a fine mediaeval hall, includes Charles II. and Victoria of England among its former members.

Continental shooting is much like the old English butt-practice, In a typical *jardin des archers,* two open sheds face each other at 50 metres, one for a straw butt and small target and the other for the archers, who file in singly and shoot only one arrow apiece. *Le tir à la perche* (popinjay shooting) is widely and elaborately done, each village having its *mât,* or mast about 100ft. high, with a *grille,* of cross-bars, on which from 1 to 60 *oiseaux* and a *coq* (feathered, wooden birds) are placed. The archer knocks them off, while holding one foot against the pole, with a *maquet,* or heavy arrow with a blunt horn end.

In the Olympic games of 1908, against an English team and the best American archers of that time, and in more than half a dozen less formal matches in other years between English and French, the latter were always victorious at the distances to which they were accustomed. At one of the latter contests, at Le Touquet in 1914, Ingo Simon, a naturalized Englishman, shot 462yd. 9in. with an 80lb. Turkish composite bow. This modern performance rendered credible an authenticated shot of 482yd. made in 1795, at London, with the same sort of weapon, by Mahmoud Effendi, secretary to the Turkish ambassador.

In America the bow was the chief weapon of the aboriginal Indians, but their skill was not so great as story books would lead us to believe. They usually shot animals at very short ranges after skilfully stalking them. In many contests between Indians and white experts, the latter have always won by scores two or three times as great. Organized archery, on the English pattern, was initiated in 1828 by the United Bowmen of Philadelphia, a club of about 25 young men who shot regularly in that city for 30 years and whose handsome trophies are preserved in the Pennsylvania Historical Society. Dying out in the Civil War period, it was revived in 1878 by the formation of the National Archery Association, following a wave of enthusiasm produced by the writings of Maurice Thompson, a Confederate veteran, who, with his brother Will, had lived by the bow in the forests of the far south. Tournaments to determine the championships for both sexes have been held by this body annually, beginning in 1879, except for two years during the World War. At these tournaments the York and National Rounds are shot, as in England, but the hasty American temperament has added two shorter rounds called the American, for men, of 30 arrows at 60, 50 and 40yd. (go in all), and the Columbia, for women, of 24 arrows at 50, 40 and 30yd. (72 in all). The American championships, since 1915, have been computed on the sum of the hits and scores of both double rounds, for each sex. At other meetings various rounds may be shot, most of which are associated with English archery societies and carry their names. The best of American origin which tests a man's skill at all favourite distances is the Metropolitan, originated at New York in 1926, of 30 arrows at 100, 80, 60, 50 and 40yd., or 150 in all.

There is an important difference in the customs of the two countries, which makes the exact comparison of scores difficult, in that the English place targets at both ends of the range, shooting in two directions, while the Americans shoot in only one. How much this affects the score, if at all, has never been accurately determined. Among American archers, a few have affixed to their bows adjustable sights, usually of metal, to facilitate aiming. As this is a radical departure from the unassisted methods of the past, many feel that scores made with their aid should be classified separately from those made without it, although, as yet, no official action has been taken. The leading American archer is Paul Webb Crouch, of Boston. His best scores are:—in practice, Single York, 132–732, Single American, 90–684, Single Metropolitan, 148–932, the last being one of the world's outstanding feats in any sport; in tournament, Double York, 232–1,132, Double American, 180–1,232, Single Metropolitan, 134–810. Crouch is one of those who use the sight. The best woman archer was Mrs. M. C. Howell, of Cincinnati, O., whose Double National of 132–756, made in 1895, is still the record.

Flight-shooting in America is done with wooden bows only. In England, Rawson and Troward, in the 18th century, made unofficial shots of 360 and 340yd. As 290yd. by Maxson of Washington, D.C. (1891), remained the American record for 25 years, some scepticism regarding those figures existed until

Curtis, of Pembina, N.D., testing their possibility, shot 366yd. (1927), by lying down and drawing a bow against his feet. On New Year's day, 1928, Howard Hill, of Opa-Locka, Fla., a magnificently built man with a strain of Cherokee blood, set a new record by shooting, in the ordinary standing position, a 5-ft. osage-orange bow with the astounding weight of 172lb., sending a 22in. birch arrow 391yd. and 23 inches.

Hunting wild game with the bow is, from necessity, practised by all savages. Among civilized nations it was a sport of royalty until the bow was replaced by the gun. In modern times, although the Thompsons lived on small game shot with arrows, it was really left for the late Saxton T. Pope, with his close friend and pupil in archery, Arthur Young, both of San Francisco, to revive, after the Great War, the mediaeval broad-headed arrow and yew bow as instruments of death. These skilled hunters and great archers have killed specimens of practically every game animal in North America, from squirrels to the Kodiak bear, and from birds, fish, rabbits, deer, pumas, black-bears and grizzlies to the wary mountain sheep. In 1926 they hunted lions near Nairobi, Africa, but, while they did kill seven with the arrow only, they also proved that a charging lion must be stopped by some other defence. such as a shelter or a rifle.

The equipment for modern archery consists of a bow, with its string, arrows, a bracer or arm-guard, finger-tips or shooting glove, a quiver and a target. The standard English bow is divided by a handle, of plush, tape or leather, into upper and lower limbs. These taper gradually and are nearly flat on the back and half-round on the belly, or face. Nocks may be cut near the ends to receive the string, or curved tips of horn also nocked, may be added. Bows for men are from 5ft. 8in. to 6ft. in length and weigh from 36 to 80 pounds. Thirty-six to 40lb. is weak and of little use beyond 60 yards. Forty-six to 50 is about right for most men. Fifty-five to 60 is excellent at 100yd. when in strong hands. Greater weights are chiefly used in hunting, roving and flight-shooting. Women's bows are from 5ft. to 5ft. 6in. and weigh from 18 to 35lb., with 25 as an average. Because of their convenience in transportation, jointed bows, with separate limbs connected by metallic sleeves like a fishing rod, have long been used in continental Europe and, more recently, in America. Crouch made all of his big scores with them. In England they are not favoured. Owing to the rigid centre they have less wood to bend and, therefore, are very quick but rather more liable to break. Backed bows have a strip of tough wood, like hickory, glued to a more fragile belly. The backing is often of rawhide or hard fibre. A thin strip of steel has been used, but as yet this has been inadequately tested. Since 1927, jointed steel bows have been made in the United States which, at least in the writer's opinion, are fully equal to the best wooden ones. They are formed of either tapered seamless tubing or tapered U-bar, the latter being possibly the better. The best wood for bows is probably yew, some still coming from Italy and Spain, but most from the northern Pacific slope of the United States. It is light in hand, quickly resilient and divided into heart and sapwoods which must be properly proportioned in the making. Close rivals are osage orange, from the United States, and lemon wood and lancewood, from the tropics. Osage is so elastic that it may be shortened to 5ft. or less, with improved cast. Lemon and lance bows are more slender than yew but are equally strong and shoot just as far.

The parts of an arrow are the shaft, tip, feathers, nock and crest or painted rings. The woods most often used are spruce, Norway pine and Port Orford cedar. A self-arrow is made of a single stick of wood, sometimes with a short core of steel set in its end, while a footed-arrow has a piece of hardwood spliced on it to give balance and strength. The restless ingenuity of America has also brought into use hollow metal arrows made of seamless tubing of both duralumin and steel. The former were introduced in 1927 and the Double American Round was won with them at the tournament of the National Archery Association. The latter were not perfected until the following year. The steel is plated with cadmium to prevent rust and the feathers are affixed to both kinds by the medium of a coating of celluloid. The best strings, of hemp, are professionally made in Belgium, where the trade has come down from the middle ages, but excellent substitutes may be made of twisted coarse linen thread. One end is laid to form an eye and the other is tied in a timber-hitch. The centre is whipped with fine thread to prevent abrasion by the arrow-nock.

When shooting repeatedly at the targets it is necessary to protect the first three fingers of the drawing-hand and the inside of the wrist of the bow-arm from being injured by the string. For the former purpose a glove may be worn which is reinforced on the palmar surface of the fingers by an extra thickness of leather, or separate tips may be used which, in general, are patterned like long thimbles. For the wrist of the bow-arm a device is a strip or cuff of leather, laced with elastic to prevent slipping. In the occasional shots of hunting and rovers these adjuncts are frequently dispensed with. The standard target-back is made of straw rope, tightly compressed and sewn in a spiral. On permanent ranges stationary butts may be constructed of baled straw.

Pope, *Hunting with the Bow and Arrow* (1923); R. P. Elmer, *Archery* (1925); Henri Stein, *Archers* (1925, in French); and S. T. Pope, *The Adventurous Bowmen* (1926).

ARCHES, COURT OF, the English ecclesiastical court of appeal of the archbishop of Canterbury, as metropolitan of the province of Canterbury, from all the consistory and commissary courts in the province. It derives its name from its ancient place of judicature, which was in the church of *Beata Maria de Arcubus*—St. Mary-le-Bow or St. Mary of the Arches, "by reason of the steeple thereof raised at the top with stone pillars in fashion like a bow bent archwise." This parish was the chief of thirteen locally situated within the diocese of London but exempt from the bishop's jurisdiction, and it was no doubt owing to this circumstance that it was selected originally as the place of judicature for the archbishop's court. The proper designation of the judge is official principal of the Arches court, but by custom he came to be styled the dean of the Arches. The judge of the Arches court was until 1874 appointed by the archbishop of Canterbury by patent which, when confirmed by the dean and chapter of Canterbury, conferred the office for the life of the holder. But by the Public Worship Regulation Act 1874 the two archbishops were empowered, subject to the approval of the sovereign by sign-manual, from time to time to appoint a practising barrister of ten years' standing, or a person who had been a judge of one of the superior courts (being a member of the Church of England), to be, during good behaviour, a judge for the purpose of exercising jurisdiction under that act, and it was enacted (sec. 7) that on a vacancy occurring in the office of official principal of the Arches court the judge should become *ex officio* such official principal. In this way the late Lord Penzance became dean on the retirement of Sir Robert Phillimore in 1875. Lord Penzance received in 1878 a supplemental patent as dean from Archbishop Tait, but did not otherwise fulfill the conditions observed on the appointment of his predecessors. On Lord Penzance's retirement in 1899, his successor, Sir Arthur Charles, received a patent from the archbishop of Canterbury as official principal of the Arches court, and he took the oaths of office according to the practice before the Public Worship Regulation Act. He was subsequently and separately appointed judge under that act. Sir A. Charles resigned in 1903 and was succeeded by Sir L. T. Dibdin, who was succeeded in 1934 by Sir Philip Baker-Wilbraham. The official principal of the Arches court is the only ecclesiastical judge who is empowered to pass a sentence of deprivation against a clerk in holy orders. The appeals from the decisions of the Arches court were formerly made to the king in chancery, but they are now by statute addressed to the king in council, and they are heard before the judicial committee of the privy council. For many years past there has been but little business in the Arches court, mainly owing to the unwillingness of a large number of the clergy to recognize the jurisdiction of what they deny to be any longer a spiritual court, and the consistent use by the

bishops of their right of veto in the case of prosecutions under the Public Worship Regulation Act. On the rare occasions when a sitting of the court is necessary, it is held in the library of Lambeth Palace, or at the Church House, Westminster.

ARCHESTRATUS, of Syracuse or Gela, a Greek poet, who flourished about 330 B.C. After travelling in search of foreign delicacies for the table, he embodied the result in a humorous poem called Ἡδυπάθεια, afterwards freely translated by Ennius under the title *Heduphagetica*. About 300 lines of his poem, which parodies the style of the old gnomic poets, are preserved in Athenaeus.

See Ribbeck, *Archestrati Reliquiae* (1877); Brandt, *Corpusculum Poesis Epicae Graecae ludibundae,* i. 1888; Schmid, *De Archestrati Gelensis Fragmentis* (1896).

ARCHIAC, ETIENNE JULES ADOLPHE DESMIER DE SAINT SIMON, VICOMTE D' (1802–68), French geologist, was born at Reims Sept. 24 1802, and died Dec. 24 1868. He wrote a *Histoire des progrès de la géologie 1834–59* (Paris, 1847–60). He was appointed (1861) professor of palaeontology in the Museum of Natural History in Paris. He made important contributions to Tchihatcheff's *Asie mineure* (1866).

ARCHIANNELIDA, the most primitive of the classes of the Annelida (*q.v.*), or segmented worms.

ARCHIAS, AULUS LICINIUS, Greek poet, was born at Antioch in Syria 120 B.C. In 102 B.C. be came to Rome, where he obtained the patronage of Lucullus, whose gentile name he assumed. In 93 he received the citizenship of Heracleia, one of the federate towns, and indirectly, by the provisions of the lex Plautia Papiria, that of Rome. In 61 he was accused of having assumed the citizenship illegally; and Cicero successfully defended him in his speech Pro *Archia*. This speech, which furnishes nearly all the information concerning Archias, states that he had celebrated the deeds of Marius and Lucullus, and that he was engaged upon a poem on the events of Cicero's consulship. The Greek Anthology contains 35 epigrams under the name of Archias, but it is doubtful how many of these (if any) are the work of the poet of Antioch.

BIBLIOGRAPHY.—Cicero, *Pro Archia;* T. Reinach, ***De*** *Archia Poeta* (1890).

ARCHIBALD, RAYMOND CLARE (187 j–), American mathematician, was born in Colchester (N.S.), Canada, on Oct. 7, 1875. He graduated at the University of Mt. Allison college, New Brunswick, in 1894, and from Harvard university in 1896. Following two years' graduate work at Harvard, he studied at the University of Berlin in 1898–99 and at the University of Strasbourg in 1899–1900, from the latter receiving the degree of doctor of philosophy. Returning to Canada, he taught mathematics in Mt. Allison Ladies' college, Sackville, N.B., in 1900–07 and in Acadia university, Wolfville, N.S., in 1907–08. He then entered the faculty of Brown university, Providence, R.I., where he served successively as instructor, assistant professor, and associate professor in mathematics until 1923, when he was made professor. In 1918 he became a member of the council of the Matheinatical Society of America, of which in 1921 he was made librarian. He has contributed extensively to mathematical journals and edited important scientific publications.

Among his published writings are: *The Cardioid and Some of Its Related Curves* (1900); *Bibliography of Life and Works of Simon Newcomb* (1905, 1924); *Carlyle's First Love, Margaret Gordon, Lady Bannerman* (1910); *Mathematical Instruction in France* (1910); *Euclid's Book on Divisions of Figures with a Restoration* (1915); *The Training of Teachers of Mathematics* (1918); and *Benjamin Peirce, 1809–1880* (1925).

ARCHIDAMIAN WAR, the war between Athens and Sparta, with their respective allies, which began in 431 B.C. with the surprise attack of Thebes on Plataea. The name is taken from Archidamus, king of Sparta, who on the outbreak of the war led the first invasion of Attica. Over the victims of this raid Pericles delivered his famous funeral speech (Thuc. ii. 34, seq.). The war was marked by the great plague and the campaign of Brasidas in the north. It was ended by the peace of Nicias (421). It is generally, and with reason, considered as merely the earlier part of the Peloponnesian War. *(See* GREECE: ***History.)***

ARCHIDAMUS, the name of five kings of Sparta, of the Eurypontid house.

(1). The son and successor of Anaxidamus. His reign, which began soon after the close of the second Messenian War, is said to have been quiet and uneventful (Pausanias iii. 7. 6).

(2). The son of Zeuxidamus, reigned 476–427 B.C. (but *see* LEOTYCHIDES). He succeeded his grandfather, Leotychides upon the banishment of the latter, his father having already died. He was a friend of Pericles and a man of prudence and moderation. During the negotiations which preceded the Peloponnesian War he did his best to prevent, or at least to postpone, the inevitable struggle, but was overruled by the war party. He invaded Attica at the head of the Peloponnesian forces in the summers of 431, 430, and 428, and in 429 conducted operations against Plataea. He died probably in 427, certainly before the summer of 426, when we find his son Agis on the throne.

Herod, vi. 71; Thuc. i. 79-iii. 1; Plut. *Pericles,* 29. 33; Diodorus, xi. 48-xii. 52.

(3). The son and successor of Agesiiaus II., reigned 360–338 B.C. In 371 he led the relief force which was sent to aid the survivors of the battle of Leuctra. Four years later he captured Caryae, ravaged the territory of the Parrhasii and defeated the Arcadians, Argives and Messenians in the "tearless battle," so called because the victory did not cost the Spartans a single life. In 364, however, he sustained a severe reverse in attempting to relieve a besieged Spartan garrison at Cromnus in south-western Arcadia. He showed great heroism in the defence of Sparta against Epameinondas immediately before the battle of Mantineia (362). He supported the Phocians during the Sacred War (355–346), moved, no doubt, largely by the hatred of Thebes, which he had inherited from his father; he also led the Spartan forces in the conflicts with the Thebans and their allies which arose out of the Spartan attempt to break up the city of Megalopolis. Finally he was sent with a mercenary army to Italy to protect the Tarentines against the attacks of Lucanians or Messapians; he fell, together with the greater part of his force, at Mandonion[1], on the same day as that on which the battle of Chaeronea was fought.

Xen. *Hell.* v. 4, vi. 4, vii. 1. 4. 5; Plut. *Agis,* 3, *Camillus,* 19; *Agesilaus,* 25, 33, 34, 40; Pausanias iii. 10, vi. 4; Diodorus, xv. 54, 72, xvi. 24, 39, 59, 62, 88.

(4). The son of Eudamidas I., grandson of Archidamus III. The dates of his accession and death are unknown. In 294 B.C. he ,was defeated at Mantineia by Demetrius Poliorcetes, who invaded Laconia, gained a second victory close to Sparta, and was on the point of taking the city itself when he was called away by the news of the successes of Lysimachus and Ptolemy in Asia Minor and Cyprus.

Plut. *Agis,* 3, *Demetrius,* 35; Pausanias, i. 13. 6, vii. 8, 5; Niese, *Gesch. der griech. u. makedon. Staaten,* i. 363.

(5). The son of Eudamidas II., grandson of Archidamus IV., brother of Agis IV. On his brother's murder he fled to Messenia (241 B.C.). In 227 he was recalled by Cleomenes III., who was then reigning without a colleague, but shortly after his return he was assassinated. Polybius accuses Cleomenes of the murder, but Plutarch is probably right in saying that it was the work of those who had caused the death of Agis and feared his brother's vengeance.

Plutarch, *Cleomenes,* i. 5; Polybius, v. 37, viii. 1; Niese, *op. cit.* ii. 304, 311. (M. N. T.)

ARCHIL, a purple dye obtained from various species of lichens. Archil can be extracted from many species of the genera *Roccella, Lecanora, Umbilicaria, Parmelia* and others, but in practice two species of *Roccella*—*R. tinctoria* and *R. fuciformis* —are almost exclusively used. These, under the name of "orchella weed" or "dyer's moss," are obtained from Angola, where the most valuable kinds are gathered; from Cape Verde Islands; from Lima; and from the Malabar coast of India. The colouring properties are developed by special treatment. Archil is prepared for the dyer's use in the form of a liquor (archil) and a paste (persis), and the latter, when dried and finely powdered. forms

[1]So Plut. *Agis,* 3 (all mss.). Following Cellarius, some authorities read Manduria or Mandyrium.

the "cudbear" of commerce, a dye formerly manufactured in Scotland from a native lichen, Lecanora *tartarea*. The manufacturing process consists in washing the weeds, which are then ground up with water to a thick paste. If archil paste is to be made this paste is mixed with a strong ammoniacal solution, and agitated in an iron cylinder heated by steam to about 140°F. till the desired shade is developed—a process which occupies several days. In the preparation of archil liquor the principles which yield the dye are separated from the ligneous tissue of the lichens, agitated with a hot ammoniacal solution, and exposed to the action of air. When potassium or sodium carbonate is added, a blue dye known as litmus, much used as an "indicator," is produced. French purple or lime lake is a lichen dye prepared by a modification of the archil process, and is a more brilliant and durable colour than the other. The dyeing of worsted and home-spun cloth with lichen dyes was formerly a very common domestic employment in Scotland; and to this day, in some of the outer islands, worsted continues to be dyed with "crottle," the name given to the lichens employed.

ARCHILOCHUS, Greek lyric poet and writer of lampoons, was born at Paros, one of the Cyclades islands. The date of his birth is uncertain, but he probably flourished about 650 B.C.; according to some, about forty years earlier but certainly not before the reign of Gyges (687–652), which he mentions in a well-known fragment. His father, Telesicles, who was of noble family, had conducted a colony to Thasos, whither Archilochus afterwards removed, hard pressed by poverty, and indignant because Lycambes refused him his daughter in marriage. At Thasos the poet passed some unhappy years; his hopes of wealth were disappointed; according to him, Thasos was the meeting-place of the calamities of all Hellas. The inhabitants were frequently involved in quarrels with their neighbours, and in a war against the Saians—a Thracian tribe—he threw away his shield and fled. After leaving Thasos, he is said to have visited Sparta, but to have been at once banished from that city on account of his cowardice and the licentious character of his works (Valerius Maximus vi. 3, *externa* 1). He next visited Siris, in lower Italy. He then returned to his native place, and was slain in a battle against the Naxians by one Calondas or Corax, who was cursed by the oracle for having slain a servant of the Muses.

The writings of Archilochus consisted of elegies, hymns—one of which used to be sung by the victors in the Olympic games (Pindar, Olympia, ix. I.)—and of poems in the iambic and trochaic measures. To him certainly we owe the invention of iambic poetry and its application to the purposes of satire. The only previous measures in Greek poetry had been the epic hexameter, and its offshoot the elegiac metre; but the slow measured structure of hexameter verse was utterly unsuited to express the quick, light motions of satire. Archilochus made use of the iambus and the trochee, and organized them into the two forms of metre known as the iambic trimeter and the trochaic tetrameter. The trochaic metre he generally used for subjects of a serious nature, the iambic for satires. He was also the first to make use of the arrangement of verses called the epode. Horace in his metres to a great extent follows Archilochus (Epistles, i. 19. 23–25). All ancient authorities unite in praising the poems of Archilochus. (Longinus xiii. 3; Dio Chrysostom, *Orationes,* xxxiii.; Quintilian x. i. 60; Cicero, Orator, i.). Horace (Ars *Poetica,* 79) speaks of the "rage" of Archilochus, and Hadrian calls his verses "raging iambics."

His poems were written in the old Ionic dialect. Fragments in Bergk, Poetae Lyrici *Graeci;* Liebel, *Archilochi* Reliquiae (1818); A. Hauvette-Besnault, *Archiloque, sa* vie et ses *poésies* (1905).

ARCHIMANDRITE, in the Greek Church a superior abbot who has the supervision of several monasteries, or the abbot of some specially important monastery, the superior of an ordinary monastery being called hegumenos. The title is also conferred as an honorary distinction.

See the *Dictionnaire* d'arcbdologie *chrétienne* et ***de*** *liturgie.*

ARCHIMEDES (c. 287–212 B.C.), Greek mathematician and inventor, was born at Syracuse, in Sicily. He was the son of Pheidias, an astronomer, and was on intimate terms with, if not related to, Hieron, king of Syracuse, and Gelon his son. He studied at Alexandria and doubtless met there Conon of Samos, whom he admired as a mathematician and cherished as a friend. On his return to his native city he devoted himself to mathematical research. He himself set no value on the ingenious mechanical contrivances which made him famous, regarding them as beneath the dignity of pure science and even declining to leave any written record of them except in the case of the σφαιροποιΐα (*sphere-making*), as to which see below. As, however, these machines impressed the popular imagination, they naturally figure largely in the traditions about him. Thus he devised for Hieron engines of war which almost terrified the Romans, and which protracted the siege of Syracuse for three years. There is a story that he constructed a burning mirror which set the Roman ships on fire when they were within a bow-shot of the wall. It is probable that Archimedes had constructed some such burning instrument, though the connection of it with the destruction of the Roman fleet is more than doubtful. More important is the story of Hieron's reference to him of the question whether a crown made for him and purporting to be of gold, did not actually contain a proportion of silver. According to one story, Archimedes was puzzled till one day, as he was stepping into a bath and observed the water running over, it occurred to him that the excess of bulk occasioned by the introduction of alloy could be measured by putting the crown and equal weights of gold and of silver separately into a vessel of water, and noting the differences of overflow. He was so overjoyed when this happy thought struck him that he ran home without his clothes, shouting εὕρηκα, εὕρηκα (generally anglicized as Eureka—"I have found it, I have found it"). Similarly his pioneer work in mechanics is illustrated by the story df his having said 66s μοι ποῦ στῶ καὶ κινῶ τὴν γῆν (or as another version has it in his dialect, πᾶ βῶ καὶ κινῶ τὰν γᾶν, "give me a place to stand and I (will) move the earth"). Hieron asked him to give an illustration of his contention that a very great weight could be moved by a very small force. He is said to have fixed on a large and fully laden ship and to have used a mechanical device by which Hieron was enabled to move it by himself; but accounts differ as to the particular mechanical powers employed. The water-screw which he invented (see below) was probably devised in Egypt for the purpose of irrigating fields.

Archimedes died at the capture of Syracuse by Marcellus, 212 B.C. In the general massacre which followed the fall of the city, Archimedes, while engaged in drawing a mathematical figure on the sand, was run through the body by a Roman soldier. No blame attaches to the Roman general, Marcellus, since he had given orders to his men to spare the house and person of the sage, and, in the midst of his triumph he lamented the death of so illustrious a person, directed an honourable burial to be given him, and befriended his surviving relatives. In accordance with the expressed desire of the philosopher, his tomb was marked by a sphere inscribed in a cylinder, the discovery of the relation between the surface and volume of a sphere and its circumscribing cylinder being regarded by him as his most valuable achievement. When Cicero was quaestor in Sicily (75 B.C.), he found the tomb of Archimedes, near the Agrigentine gate, overgrown with thorns snd briers. "Thus," says Cicero (Tusc. *Disp.* v. c. 23, §64), "would this most famous and once most learned city of Greece have remained a stranger to the tomb of one of its most ingenious citizens, had it not been discovered by a man of Arpinum."

Works.—The range and importance of the scientific labours of Archimedes will be best understood from a brief account of those writings which have come down to us; and it need only be added that his greatest work was in geometry, where he so extended the method of *exhaustion* as originated by Eudoxus, and followed by Euclid, that it became in his hands, though purely geometrical in form, actually equivalent in several cases to *integration,* as expounded in the first chapters of our text-books on the integral calculus. This remark applies to the finding of the area of a parabolic segment (mechanical solution) and of a spiral, the surface and volume of a sphere and of a segment thereof, and the volume of any segments of the solids of revolution of the second degree.

The extant treatises are as follows:

(1) *On the Sphere and Cylinder* (Περὶ σφαίρας καὶ κυλίνδρου). This treatise is in two books, dedicated to Dositheus, and deals with the dimensions of spheres, cones, "solid rhombi" and cylinders, all demonstrated in a strictly geometrical method.

(2) *The Measurement of the Circle* (Κύκλου μέτρησις) is a short book of three propositions, the main result being obtained in Prop. 2, which shows that the circumference of a circle is less than $3\frac{1}{7}$ and greater than $3\frac{10}{71}$ times its diameter.

(3) *On Conoids and Spheroids* (Περὶ κωνοειδέων καὶ σφαιροειδέων) is a treatise in 32 propositions, on the solids generated by the revolution of the conic sections about their axes, the main results being the comparisons of the volume of any segment cut off by a plane with that of a cone having the same base and axis (Props. 21, 22 for the paraboloid, 25, 26 for the hyperboloid, and 27–32 for the spheroid).

(4) *On Spirals* (Περὶ ἑλίκων) is a book of 28 propositions. Propositions 1–11 are preliminary, 13–20 contain tangential properties of the curve now known as the spiral of Archimedes, and 21–28 show how to express the area included between any portion of the curve and the radii vectores to its extremities.

(5) *On Plane Equilibria or Centres of Gravity of Planes* (Περὶ ἐπιπέδων ἰσορροιῶν ἢ κέντρα βαρῶν ἐπιπέδων.) This consists of two books, and may be called the foundation of theoretical mechanics, for the previous contributions of Aristotle were comparatively vague and unscientific. In the first book there are 15 propositions, with seven postulates; and demonstrations are given, much the same as those still employed, of the centres of gravity (1) of any two weights, (2) of any parallelogram, (3) of any triangle, (4) of any trapezium. The second book in 10 propositions is devoted to the finding the centres of gravity (1) of a parabolic segment, (2) of the area included between any two parallel chords and the portions of the curve intercepted by them.

(6) *The Qzradrature of the Parabola* (Τετραγωνισμὸς παραβολῆς) is a book in 24 propositions, containing two demonstrations that the area of any segment of a parabola is $\frac{4}{3}$ of the triangle which has the same base as the segment and equal height.

(7) *On Floating Bodies* (Περὶ ὀχουμένων) is a treatise in two books, the first of which establishes the general principle of hydrostatics, and the second discusses with the greatest completeness the positions of rest and stability of a right segment of a paraboloid of revolution floating in a fluid.

(8) *The Psammites* (Ψαμμίτης, Lat. *Arenarius,* or sand reckoner), a small treatise addressed to Gelon, the eldest son of Hieron, expounding, as applied to reckoning the number of grains of sand that could be contained in a sphere of the size of our "universe," a system of naming large numbers according to "orders" and "periods" which would enable any number to be expressed up to that which we should write with 1 followed by 80,000 ciphers!

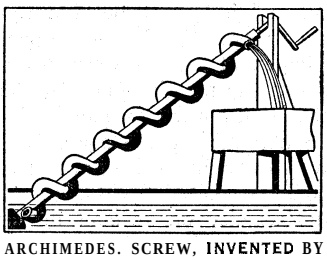
(9) The *Method,* addressed to Eratosthenes, is a treatise of vital interest, since in it Archimedes explains how he first arrived at many of his important results by means of mechanical considerations, namely, by weighing an indefinite number of elements of one figure against similar elements of another. This treatise, formerly supposed to be lost, was discovered in 1906 by J. L. Heiberg in a palimpsest at Constantinople, and now forms part of Heiberg's Greek text of Archimedes.

(10) *A Collection of Lemmas,* consisting of 15 propositions in plane geometry. This has come down to us through a Latin version of an Arabic manuscript; it cannot, however, have been written by Archimedes in its present form, as his name is quoted in it more than once.

Lastly, Archimedes is credited with the famous *Cattle-Problem* enunciated in the epigram edited by G. E. Lessing in 1773, which purports to have been sent by Archimedes to the mathematicians at Alexandria in a letter to Eratosthenes. Of lost works by Archimedes we find references to six: (1) investigations on *polyhedra* mentioned by Pappus; (2) Ἀρχαί, *Principles,* a book addressed to Zeuxippus and dealing with the *naming of numbers* on the system explained in the *Sand Reckoner;* (3) Περὶ ζυγῶν, *On balances or levers;* (4) Κεντροβαρικά *On centres of gravity;* (5) Κατοπτρικά, an optical work from which Theon of Alexandria quotes a remark about refraction; (6) Περὶ Σφαιροποΐας, *On Sphere-making,* in which Archimedes explained the construction of the sphere which he made to imitate the motions of the sun, the moon and the five planets in the heavens. Cicero actually saw this contrivance and describes it *(De Rep.* i. c. 14 §§ 21–22).

BIBLIOGRAPHY.—The *editio princeps* of the works of Archimedes, with the commentaries of Eutocius, is that printed at Basle (1544) in Greek and Latin, by Hervagius. A Latin version was published by Isaac Barrow in 1675. Torelli's edition (1792) remained the best Greek text until the definitive text edited, with Eutocius' commentaries, Latin trans. etc., by J. L. Heiberg (1880–81, 2nd ed. 1910–15) superseded it. T. L. Heath edited *The Works of Archimedes* in modern notation, with Introduction etc. (1897) and also, as a Supplement, the newly discovered *Method* (1912). Modern translations are those of F. Peyrard (Paris, 1808); E. Nizze, with notes (German, Stralsund. 1824); P. ver Eecke, *Les Oeuvres Complètes* (1921); A. Czwalina-Allenstein, *Kugel und Zylinder* (1922); *Uber Spiralen* (1922); *Die Quadratur der Parabel* (1923); *Uber Paraboloide, Hyperboloide und Ellipsoide* (1923), and *Uber Schwimmende Korper und die Sandzabel* (1925). *See* Plutarch's *Life of Marcellus* (in *Plutarch's Lives,* Eng. trans. Sir T. North, 1579, A. Stewart and E. Long, 1914–23); J. L. Heiberg, *Geometrical Solutions Derived from Mechanics* (trans. of the *Method,* Chicago, 1909), and *Mathematics and Physical Science in Classical Antiquity* (Eng. trans. 1922); F. Jansen, *De Cirkelquadratuur bij de Ericken* (Haarlem, 1909); P. Midolo, *Archimede e il suo tempo* (with useful bibliography, Syracuse, 1912); T. L. Heath, *Archimedes* (1920); and F. Winter, *Der Tod des Archimedes* (1924)

ior *a* possible though by no means certain portrait. (T. L. H.)



ARCHIMEDES. SCREW, INVENTED BY THE GREEK MATHEMATICIAN (c. 287-212 B.C.)
The screw was first used to remove water from the hold of a large ship.
The same principle is sometimes employed in machines for handling wheat

ARCHIMEDES, SCREW OF, a machine for raising water, said to have been invented by Archimedes for the purpose of removing water from the hold of a large ship that had been built by King Hiero II. of Syracuse. It consists of a water-tight cylinder which encloses a helix, and has its lower open end placed a half turn in the water. The water is therefore lifted mechanically by the turning of the machine. Other forms have the helix revolving free in a fixed cylinder, or consist simply of a tube wound-helically about a cylindrical axis. The same principle is sometimes used in machines for handling wheat, etc. *(see* CONVEYORS IN MASS PRODUCTION).

ARCHIPELAGO, a name now applied to (1) any island-studded sea, and (2) by transference, to a group of islands, but it was originally the distinctive designation of what is now generally known as the Aegean Sea (Αἰγαῖον πέλαγος), its ancient name having been revived. The word archipelago does not occur in ancient and mediaeval Greek. Ἀρχιπέλαγος in modern Greek has been introduced from Western languages. Several etymologies have been proposed: *e.g.* (1) a corruption of the ancient name, *Egeopelago;* (2) from the modern Greek: Ἅγιο πέλαγο, the Holy Sea; (3) it arose at the time of the Latin empire, and means the Sea of the Kingdom *(Arch.?).*

ARCHIPPUS, an Athenian poet of the Old Comedy, who flourished towards the end of the 5th century B.C. His most famous play was the *Fishes,* in which he satirized the fondness of the Athenian epicures for fish. The Alexandrian critics attributed to him four plays previously assigned to Aristophanes.

Titles and fragments of six plays are preserved, for which *see* T. Kock, *Comicorum Atticorum Fragmenta,* i. (1880); or A. Meineke, *Poetarum Comicorum Graecorum Fragmenta* (1855).

ARCHITECT, one who, skilled in the art of architecture *(q.v.),* designs buildings, determining the disposition of both their interior spaces and exterior masses, together with the structural embellishments of each, and generally supervises their erection. Formerly, the architect was often active in all phases of erecting a building, from the project to the various details of construction. To-day, with the growing tendency toward specialization and the increasing size of buildings, his designs are executed by various agencies—engineers, contractors, manufacturers, machines, etc.—

and his success, to a large extent, depends on the proper co-ordination of these elements. For a discussion of the architect's problems and methods *see* ARCHITECTURE; for a treatment of his training *see* ARCHITECTURAL EDUCATION.

Naval architect, one who designs ships and supervises their construction.

ARCHITECTURAL ARTICLES. Architecture is treated in this work under various headings, an account of which will help the reader to consult any part of the subject.

For a definition of architecture, a general survey of its evolution and a discussion of contemporary practice and theory, reference should be made to the article ARCHITECTURE.

The historic styles, being those divisions into which occidental architecture from the earliest times through the 19th century may generally be said to fall, will be found treated under EGYPTIAN ARCHITECTURE; WESTERN ASIATIC ARCHITECTURE (after Egypt to Archaic Greece); GREEK ARCHITECTURE; ROMAN ARCHITECTURE; BYZANTINE AND ROMANESQUE ARCHITECTURE; GOTHIC ARCHITECTURE; RENAISSANCE ARCHITECTURE; BAROQUE ARCHITECTURE; MODERN ARCHITECTURE: *18th* and *19th Centuries*. The important sub-divisions of these styles, while discussed in these articles, also appear under their own headings, as EMPIRE STYLE, GEOMETRIC PERIOD, COLONIAL STYLE, PERPENDICULAR PERIOD, etc.

Contemporary Architecture, being more affected by science and by social and economic influences than by tradition or national characteristics, is treated under headings whose significance is explained in the article ARCHITECTURE; for the articles themselves *see:* INDUSTRIAL ARCHITECTURE; SOCIAL ARCHITECTURE; HOUSE PLANNING; THEATRE: *Architecture;* HOSPITAL PLANNING; SCHOOL ARCHITECTURE; UNIVERSITY ARCHITECTURE; LIBRARY ARCHITECTURE; MUSEUM ARCHITECTURE; EXHIBITION ARCHITECTURE; GOVERNMENTAL ARCHITECTURE; RELIGIOUS AND MEMORIAL ARCHITECTURE. Wherever it has been deemed necessary to a proper understanding of these subjects, an historical introduction has been given.

Separate articles describe CHINESE ARCHITECTURE; INDIAN ARCHITECTURE; JAPANESE ARCHITECTURE; MOHAMMEDAN ARCHITECTURE; RUSSIAN ARCHITECTURE.

For a concise treatment of the important periods in the history of art throughout the world, the reader may well consult PERIODS OF ART.

A summary of the training available for a prospective architect to-day is given under ARCHITECTURAL EDUCATION.

LANDSCAPE ARCHITECTURE is fully treated under its own heading as is also TOWN AND CITY PLANNING. Other special articles are also given to COLOUR IN ARCHITECTURE; ORNAMENT, ARCHITECTURAL; RENDERING, ARCHITECTURAL; SCULPTURE: *Architectural;* SHOP FRONT DESIGN; ZONING. A large number of architectural subjects, such as BASILICA, DOME, FOUNTAIN, HOUSE, MOSQUE, PARTHENON, etc., and technical terms as, for instance, ARCHITRAVE, BASE, CAPITAL, COLUMN, GAINE and ORDER, are treated independently.

Finally, in the articles on many cities the reader will find descriptions of important buildings.

ARCHITECTURAL DRAWING: *see* DRAWING, ENGINEERING.

ARCHITECTURAL EDUCATION. The functions of the architect to-day are manifold and of a highly technical nature. He must first of all be expert in the actual planning of buildings, that is, he must be acquainted with the practical requirements of the accommodation of various kinds of structures, often of a complex order, such as factories and commercial buildings, hotels, theatres, hospitals and schools.

He must know how to arrange the several parts of these buildings in the most economical and convenient manner, for the art of planning is the very basis of the art of architecture.

He must have a thorough understanding of the ordinary methods of building construction, and sufficient knowledge of the principles of steel and ferro-concrete work to enable him to employ those modern structural resources as an artist.

A considerable body of applied science is now involved in architectural practice, but it is always part of the means and never the end of architecture. The architect must be instructed how to make the technical sciences the servants of his art. Not only methods of construction, but surveying, sanitation, hygiene, heating, lighting, ventilation and acoustics come within this category, as also do such ancillary subjects as the law and finance of building.

It is necessary too, that the training of the architect shall include the study of perspective, sciagraphy, rendering *(see* RENDERING, ARCHITECTURAL) and the preparation of working drawings *(see* DRAWING, ENGINEERING).

In addition, a knowledge of materials, their practical characteristics and the effects which can be obtained from them, is an essential element in the architect's education, since they determine the durability of the fabric and its appearance. The application of all this varied knowledge is implied in *design* in architecture.

And it is with design that the architect is primarily and ultimately concerned.

Architectural design involves thinking simultaneously in three dimensions, visualizing the work in plan, section and elevation in such a way that the resultant composition is expressive and beautiful. For this, efficient creative ability of a special order is required and no system of training can generate that ability. But training can make possible its fullest development, can direct it along the most profitable lines and can place at its disposal, in the best manner, the accumulated experience of the past. These are the objects with which the present systems of architectural education are chiefly concerned.

It is generally agreed that the study of architecture should be preceded by a liberal education. As one of the fine arts, historically associated with the arts of painting and sculpture, and as the background of civilized society, it demands both for its practice and its appreciation some measure of general culture. The tendency to-day is, therefore, for schools of architecture in Europe, the British Empire and America to require from candidates for admission evidence of a broad non-technical education; and in a number of cases liberal studies are pursued during at least the earlier portion of the professional course. A general survey of architectural education at the present time shows that it is principally administered in America by universities, and in Europe and the British Empire, either by universities or by institutions virtually of university rank, such as the *École des Beaux Arts* in Paris, the High School of Architecture in Rome and the Viennese academy. Sometimes the teaching of architecture has the advantage of being conducted under academic auspices in association with painting and sculpture. In certain schools the curriculum has a strong mathematical bias, whilst in others, emphasis is laid on preserving and developing traditional methods of design. Such differences are due to national and local influences. They do not materially affect the broad cosmopolitan character of modern architectural education. That education, it is now more and more realized, is the proper responsibility of the practising profession in each country. In France the fact has always been recognized, and, since academic education was instituted in Paris in the 17th century, the most eminent architects have themselves undertaken educational obligations. The result has been that in no other country has the practice and teaching of architecture been so completely and successfully related. Elsewhere in the early days of the scholastic system the attempt was made to divide the architectural profession into two classes—theoretic non-practising teachers, and architects who practised and did not teach. But architecture could not be taught by theorists any more than medicine and the experiment has been definitely abandoned. To-day architectural education in all countries is in the hands of practising teachers. Direct connection between the instruction given in the school and the experience of actual practice is thereby assured; the world of the school is not isolated from the world of the architect's studio or office. At the same time scholastic training cannot of itself complete the education of the architect. The conditions of practice must inevitably differ from those of theoretic training. For this reason, to effect a transition between the two, most systems of architectural education now in operation provide for some part of the school course being devoted to gaining actual experi-

ence of practice.

Italy. — The emergence of Italy as a unified nation in the 19th century finally closed that phase of architectural development in which the training of architects was undertaken by the independent academies founded during and after the Renaissance. Henceforth the State itself assumed the responsibility and established two types of institutions to discharge it — schools of civil engineering and institutes of fine arts. Architecture was taught in the first as a structural science and in the second as an art of design associated with painting and sculpture. The inherent defects of this arrangement were not long in showing themselves. By divorcing the study of modern constructional methods from that of composition, two separate classes of experts were created, structural engineers and architectural decorators. The former were well equipped in the scientific technique of building, but could not use their knowledge as artists; the latter, insufficiently trained in the material and practical aspects of their subject, were accomplished as a rule only in superficial design. As was inevitable in an age which exalted applied science and mechanical skill, the profession of structural engineers soon acquired a superior authority to that of the architects, with consequences unfortunate both for the latter and their work. To remedy this state of affairs a number of proposals and tentative experiments were made in the latter half of the century. The final outcome of these was the establishment in 1919 of the High School of Architecture in Rome, a school of university rank, which requires from entrants a liberal education and previous artistic training. It is the central institution for architectural education in Italy. Its professional course extends over five years and the curriculum provides for a properly adjusted balance of scientific and aesthetic studies. In the provinces, other institutions modelled on the Roman High school, are in process of being established or developed at Milan, Florence and Venice. Special provisions have recently been made by the State further affecting architectural education in Italy. An official qualification has been introduced which is awarded on examination after a certain period has been spent in acquiring practical experience subsequent to the completion of the school course. In addition, a carefully worked out scheme has been devised to secure candidates for the profession from as wide a field as possible and to ensure that their previous education is of the most suitable kind.

France. — The State control of French architectural education dates from the foundation under Colbert of the Royal Academy of Architecture in 1670. This control, temporarily interrupted by the Revolution, was resumed in 1795, when in the newly created *Institut de France* an academy of fine arts, embracing architecture, was included. The private school of architecture, set up by Leroi during the Revolution, was then taken under the protection of the *Institut,* incorporated with the other art schools administered by that body, and finally, in 1816, accommodated on the site which it now occupies, under the name, famous throughout the world, of *École des Beaux Arts*. Under Napoleon III., a decree was issued in 1863 which, drastically altering the organization of the school, restricted the authority of the Academy of Fine Arts over it, and introduced the régime which is in operation to-day. The school became directly a State institution, with a director at its head appointed by the minister of fine arts. Its professors were nominated by the educational council and its courses extended and increased in number. In addition to the professors who lectured, *patrons* or heads of *ateliers,* were officially appointed to the staff. The problem of style, which the dissensions of the Romanticists and Classicists had made an acute issue, was solved by eliminating it. There were no longer any prescribed or proscribed periods. All designs were judged by logical standards and matters of taste were permitted to remain matters of taste. Compositions might be submitted in any style or in no style at all; their value would be assessed upon grounds that had nothing to do with the question of architectural idiom. By thus adopting an attitude of the most complete catholicity the school was able to stabilize its position and to emerge from the trials of the 19th century with increased rather than diminished prestige.

To-day the teaching of architecture in France is still centralized in the *École des Beaux Arts* in Paris; although the influence of leading modern architects opposing the *École des Beaux Arts* is spreading fast among the younger generation. So far, the regional schools in Lille, Rouen, Rennes, Lyons, Marseille, Strasbourg, and other provincial cities are still branches of the Paris *École,* working on the same programs and conducting simultaneously the same competitions amongst their students. All of this work is sent to Paris and judged there side by side with that executed in the capital, on the same terms of anonymity. Thereafter the best designs are exhibited in the provincial schools, which in this way are acquainted with the general standards required and are stimulated to maintain and surpass them.

The course of studies leading to the government diploma in architecture is elaborate and difficult. There is first of all the preliminary training for admission to the *École* itself. Students are prepared for the entrance examination either in certain special ateliers which devote themselves exclusively to this task or in the large ateliers mainly concerned with the subsequent design work of the course. The examination comprises tests in design, drawing and modelling, mathematics, descriptive geometry, science and the history of art. Normally the number of entrants is about 450; 60 only, including 15 foreigners, are passed. After admission to the *École* the work falls into three sections — second class, first class and the great prize competitions, of which the most important is that for the *Grand Prix de Rome*. Before promotion from the second to the first class further tests must be passed in science, mathematics. geometry, perspective (*q.v.*), construction and design. Concluding the studies in the first class there are final examinations in physics, chemistry, building laws, regulations and design.

On the results of these the diploma is awarded after a course which, from the time of admission to the second class, usually extends over at least four to five years.

Great Britain and Dominions. — So long as English architects followed, as they did throughout the 17th and most'of the 18th centuries, a single architectural tradition, and were content simply to develop it; and so long as the technical requirements of building were relatively simple — the pupilage system was adequate for the education of the profession. But the foundations of this world of commonly shared artistic convictions and practice began to be undermined when architects ceased to be satisfied with giving to the style of the Italian Renaissance a national character, and sought their inspiration in the antique origins of that style. The re-study of Roman forms was followed by the discovery and copying of Greek, with the result that by the end of the 18th century the architectural student had already lost his certainty of outlook. The variety of the prospects opened up to him was further extended by the Romantic movement. This, finding its architectural expression in the Gothic revival, completed the confusion which had been initiated by archaeological research. The orderly development of English architecture was lost in a "battle of the styles," and the offices of practising architects, which had formerly served as the instruments of a common professional education, were reduced to dissociated units, each of them the vehicle of a personal concept of architecture. Finally, by the latter half of the 19th century, the practical requirements of building and the methods of construction employed had greatly increased in range and complexity, so that the technical equipment required for their mastery alone had become more than could be supplied by the normal office. All these factors combined to render the pupilage system no longer a satisfactory method of education for the profession. Institutional training had to take its place, and during the last 50 years considerable progress has been made in establishing and developing schools of architecture devoted to giving systematic courses of instruction in the whole technique of building, and endeavouring to replace the lost traditions of design by teaching based on rational principles.

There are to-day in Great Britain four types of institutions giving instruction in architecture: technical schools, schools of art, independent professional schools and universities. With few exceptions the first two offer courses of not more than three

years' duration, and the classes are in many cases held at night. The main function of schools of this order, which are usually under municipal control, is to supplement the pupilage system in those parts of the country, still of considerable extent, in which it yet survives. But the real qualifying work is undertaken by schools whose course is a full day-time one, extending over five or more years.

The full five year course was formally introduced at the Liverpool University School in 1920, when the Architectural Association school in London adopted one of similar character. Such courses, when taken at a university by matriculated students, lead to a degree; when taken at an institutioq of non-academic rank, to a diploma similar to that granted by the universities to graduates who have not matriculated.

At the present time the largest school of architecture in England is that of the Architectural Association and the next largest that of Liverpool university. Both these schools show definite tendencies away from the ***Beaux Arts*** influence and towards contemporary architecture, period design having been dropped almost entirely. In Scotland the Glasgow school has the greatest number of students. Through its affiliation with the University of Glasgow it has, since 1925, been able to offer a B.Sc. degree with honours in architecture. In Ireland a single school has been established, that of University college, Dublin. Here a course of three years in the school, followed by two spent in gaining practical experience, leads to the degree of Bachelor of Architecture. In the overseas dominions of the British empire — Canada, South Africa, Australia and New Zealand — university schools of architecture have been founded which conduct courses of study varying from three to five years in length. Particularly in the case of Canada and Australia, English influence in architectural education is accompanied by American, with the result that the complete transition from pupilage to training under university auspices seems likely to be more rapid in these countries.

The normal curriculum of the larger qualifying schools in Great Britain provides for the study of design and construction throughout five years. In addition to the work done in the school studios, courses of lectures are given on the theory of design and construction, history of architecture, descriptive geometry, sciagraphy, perspective, sanitation, hygiene, surveying, specification, estimates, contracts, professional practice and other cognate subjects. Provision is sometimes made for specialization during the last two years, the course being then taken with honours in either design or construction to meet the demand for advanced qualifications in both these spheres. In certain of the academic schools the first year's programme of study includes such liberal subjects as languages, social history and literature. A portion of the concluding part of the course is always spent by the students in gaining practical office experience. The Liverpool school, having established connection with offices of American architects, each year sends over a number of selected students to acquire such experience in the United States. Town planning (see TOWN AND CITY PLANNING) is now a recognized subject in most schools of architecture. Two of them, Liverpool and London university, have departments of civic design with professorships established respectively in 1912 and 1914, and both award certificates and diplomas in civic design.

From its foundation in 1835 the Royal Institute of British Architects has been the supreme controlling authority of the profession throughout the empire. At no time, however, has the R.I.B.A. itself undertaken the teaching of architecture. But by setting up, in the latter half of the last century, a centralized system of examinations when no professional tests existed in the country, it performed a notable service in raising the general level of professional knowledge. Through its board of architectural education it has now delegated to certain approved schools the task of qualifying candidates for admission to the institute, only maintaining its own centralized examinations for students not seeking entry through scholastic channels.

The following schools of architecture are now recognized for exemption from the R.I.B.A. final examination (except in the subject of "Professional Practice"): Robert Gordon's colleges, Aberdeen; Edinburgh College of Art; Royal Technical college, Glasgow; University of Liverpool; Architectural association, London; University of London; University of Manchester; McGill university, Montreal, Canada; University of Sydney, Australia. The schools of architecture in the following institutions are recognized for purposes of exemption from the R.I.B.A. intermediate examination: School of Art, Birmingham; Royal West of England academy, Bristol; University of Cambridge; Technical college, Cardiff; Leeds College of Arts; Leicester College of Arts and Crafts; Northern Polytechnic, London; Armstrong college, Newcastle-on-Tyne; University of Sheffield; Municipal School of Arts and Crafts, Southend-on-Sea; University of Toronto; Sir J. J. School of Art, Bombay. In both classes the maintenance of the requisite standard is assured by the periodic inspection of a visiting board, appointed by the R.I.B.A. board of architectural education, which reports to the institute on the work of the various schools granted or applying for exemption. The institute further requires to be satisfied as to the preliminary general education of students, and evidence has now to be submitted upon this point in each individual case. As scholasti'c training in architecture has tended to become increasingly lengthy and expensive, it has been feared that a certain proportion of potential talent might be excluded from the profession on that account. To meet this contingency the R.I.B.A., with its provincial allied societies, has instituted a scheme of maintenance scholarships which are competed for annually and are tenable at schools of architecture "recognized" by the institute. A number of valuable prizes and studentships are offered by the R.I.B.A. each year for competition amongst architectural students throughout the empire. Further open to students who are British subjects is the Rome Scholarship in Architecture, established in 1913 by the royal commissioners of the exhibition of 1851. The annual competitions for this scholarship are conducted under the direction of the faculty of architecture of the British school at Rome and the scholarship itself is tenable at that school for three years.

Germany, Holland, Switzerland, and Other European Countries. — Architectural education in Germany, Holland, Switzerland and the former Czechoslovakia is given by a variety of institutions — technical institutes of university rank, colleges, and schools of applied art. After the World War, modern European architects turned the educational system, particularly in these countries, toward more functional design and toward closer contact with contemporary productive methods. In Germany the Staatliches *Bauhaus* in Weimar (and later in Dessau) had started the combining of artistic training in modern design with practical training in crafts and building — a method which has since influenced various architectural curricula. As far as other European countries are concerned it may be said that the tendency is generally to make architectural education the business of specially organized schools. Belgium provides for the training of architects in municipal academies of fine arts and in the professional schools known as the St. Luc academies. At present the Royal Academy of Art is the only institution that provides a complete training for architects in Denmark. Norway has made architectural education a State responsibility and, in the Technical university established at Drontheim, a four years' course leading to a diploma is in force. The organized training of Swedish architects is divided between two institutions, the Architects' Professional school of the Technical High school and the Building school of the High School of Art. A period of six years covers the total course, four being spent in the Professional school. The technical colleges of Austria are of university rank and two of them, those of Vienna and Graz, give technical and artistic training in architecture. In addition, the Viennese Academy of Plastic Arts comprises two "master colleges" for architecture, which carry the education of students to a higher stage. State examinations are held, and for those who qualify there is legal protection for the title of architect. A special faculty of architecture in the Royal Joseph Technical university at Budapest is responsible for the professional education of Hungarian architects. A diploma is awarded on the successful conclusion of the course and, as in Austria, the title of architect is legally protected. In Spain architectural training is

given at the High School of Architecture at Madrid, which is affiliated with the university, and at the Barcelona school.

United States.—Organized architectural instruction in the United States was first given in the schools of technology, where design was taught as early as 1860 as a part of the science of building. Prior to 1860 the English pupilage system had been the only method of qualifying for practice. The first independent courses in architecture were established by the Massachusetts Institute of Technology in 1866, by the department of engineering of the University of Illinois in 1870, and by Cornell university in 1871. From the beginning these schools and others established at Columbia university and Harvard university in 1881 and 1890, took an active part in fostering the development of classic architecture. At a time when most architects in America were under the influence of English romanticism, the schools taught a system of design based upon the formulae of Vignola. The precision of this system no doubt appealed to the practical minds of the engineers in charge of them; but an impetus was given to more liberal teaching by the growing number of architects returning from study at the *École des Beaux Arts* in Paris. These architects introduced into the American schools the methods of the *École*, gradually eliminating the control of the engineering faculties. To further establish their system they brought French professors of design to America. The success of the latter. who were among the most brilliant teachers in the American schools, completed the supremacy of the *Beaux Arts* methods in the United States. And finally, a society of *Beaux Arts* architects was formed which supports the Beaux Arts Institute of Design, an organization that by the regular issue of programs and judgments intends to complement the work of the collegiate schools. However, corresponding to the new scope of architectural education abroad. the influence of the *École des Beaux Arts* is now fading. Reaction against the former separation of practice in building from academic learning is growing, and emphasis on training in functional contemporary design and construction is gradually displacing that on period design and decorative design. The main representatives of these modern methods of training are: The Graduate School of Design, Harvard university, Cambridge, Mass.; Armour Institute of Technology, Chicago, Ill.; Cranbrook Academy of Art, Bloomfield Hills, Mich. Other important schools are: University of California, Berkeley, Calif.; Carnegie Institute of Technology, Pittsburgh, Pa.; Columbia university, New York city; Cornell university, Ithaca, N. Y.; Georgia School of Technology, Atlanta, Ga.; University of Illinois, Urbana, Ill.; Massachusetts Institute of Technology, Boston, Mass.; University of Michigan, Ann Arbor, Mich.; University of Minnesota, Minneapolis, Minn.; Ohio State university. Columbus, O.; University of Pennsylvania, Philadelphia, Pa.; Princeton university, Princeton, N. J.; Yale university, New Haven, Conn.; University of Virginia, Charlottesville, Va.

Mexico.—The training of architects in Mexico is now, after passing successively through Spanish and Italian phases, being conducted on French lines by the Mexican National Academy of Fine Arts, an institution recognized as of university rank. The Academy course is a four years' one, modelled essentially upon that of the *Beaux Arts* and largely administered by professors who have had direct or indirect experience of the French system.

Japan.—Since 1873 Japanese architectural education has been organized in the Western manner. It is entrusted to high technical schools and to universities. Both have three year courses in which chief attention is paid to the constructional aspect of architecture. There are three universities with architectural departments in the faculties of engineering, the Tokyo and Kyoto Imperial universities and the Waseda university. In the imperial universities two years of post-graduate research may lead to the conferment of a degree.

ARCHITECTURAL RENDERING: *see* RENDERING, ARCHITECTURAL.

ARCHITECTURE, the art of so building as to apply both beauty and utility. The end of architecture is to arrange the plan, masses and enrichments of a structure in such a way as to impart to it interest, beauty, grandeur, unity and power without sacrificing convenience. Architecture thus necessitates the possession by the designer of creative imagination as well as technical skill, and in all works of architecture properly so called these elements must exist, and be harmoniously combined.

The pages immediately following are devoted to an editorial survey of architecture since it began. Any general survey that treats architecture only chronologically, however, burdens the reader with facts, interesting, but to-day of relatively small importance, for the new forms produced by steel have revolutionized the art. Modern architecture is therefore treated first; an historical survey of the influences on and the peaks of architectural evolution is appended. Elsewhere in this work the various manifestations of the art, as explained in this main article, and many architectural subjects and terms are discussed under their own headings *(see* ARCHITECTURAL ARTICLES).

INTRODUCTION

The problem that architecture sets itself to solve is how best to enclose space for human occupancy. For the earliest attempts at a solution *see* ARCHAEOLOGY, for architecture is recorded only in those buildings whose materials have endured. All building of a permanent character has been governed by four basic structural principles—the post and lintel, the wooden truss, the masonry arch and the modern steel skeleton—each of which, in evolving, gave the art new impetus. The post and lintel, the wooden truss and the masonry arch, however, all developed in periods mainly devoted to religion, agriculture, barter in the market-place and war. Industrialism created a new set of social and economic relationships. It made commerce the chief human activity. It introduced large-scale merchandising, calling for large and individual places in which to transact business. New types of enclosed spaces rose to meet the changed conditions. Steel appeared at the beginning of this new period; speed became possible; building acquired an entirely new element.

The transition of steel from merely strengthening stone to carrying the masonry load at each floor was the most momentous step in the history of architecture since the days of Rome. In a single bound architecture was freed from the shackles of stone-weight and made flexible beyond belief. Suddenly architecture gained a new dimension, the possibility of almost unlimited verticality. The extent to which steel has liberated architecture from the burdens of past building methods may be observed in its current use in every type of structure. It is now the accepted method of construction. It saves space and makes for economy and speed in building. Walls can be made thinner without sacrificing strength. Construction goes forward on many floors at once, much more rapidly and yet at less expense.

The historic architectural styles came from distinct nations isolated by difficult and limited means of transit and communication. Each was evolved by a segregated people, each had individual qualities, each in itself represented truly the society that bore it. But during the last 100 years architecture progressed so rapidly that the designer, impelled by an unprecedented demand for buildings, and with knowledge at his elbow of everything the world had yet produced, turned for embellishment to the historic styles, copying and adapting rather than creating. Consequently, many

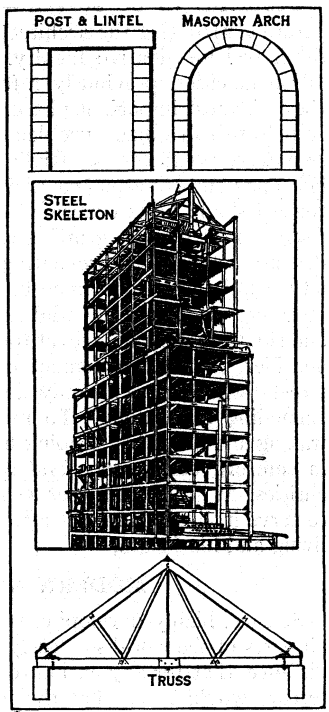
TRIAL MODELS AND COMPLETED STRUCTURE OF THE N. Y. TELEPHONE COMPANY BUILDING

1. First trial model, which, taking advantage of all the bulk possible under the restrictions of the zoning law, carried the tower higher than was finally deemed necessary
2. Second trial model, showing tower reduced in height, thus forming a pleasanter relation to the general mass of the supporting building
3. Final model. The top of the tower has been simplified
4. The completed building, at Barclay and Vesey streets, from the Hudson river side. Such an exceptional view, showing the apportionment of the tower to the building mass, cannot be obtained of most New York towers, because of lack of suffioient space in front

buildings to-day express neither contemporary nor any other culture. Architects have begun to realize the falseness of thus slavishly adhering to stylistic forms, and the new industrial and commercial architecture of Germany and America, for example, has issued directly from this fresh desire for logical design.

Building Activity.—In the United States of America the sustained demand for quantities of building is enormous; old buildings give way to new, new buildings seem almost to rise over night; and Europe, whose tendency has been to retain and use what exists, shows a marked trend in the same direction, as in the development of Kingsway and Regent street in London and in the Continental cutting of boulevards in Paris and in Rome. Anything that so enormously increases both the size and number of buildings must be accounted a potent factor in all kinds of architectural developments.



STRUCTURAL PRINCIPLES IN BUILDING

A prime cause of building activity is the concentration of population in and near the larger cities. Since about 1885 machinery had radically changed human relationships. Men and women released from the farms by traction ploughs and harvesters have flocked to the cities to produce manufactured articles. The production and use of more and more articles, both necessities and luxuries, require more buildings in which to make them, more buildings from which to sell them, more buildings in which to transact the business arising from their manufacture and sale, and more homes to house the workers. With this concentration of population have come the corporation, the trust and the super-trust. Great buildings, great at least in bulk and cost, are required to house vast numbers of workers. Formerly, only religious or governmental agencies could build large structures; to-day private enterprise, through control of capital in large amounts, builds on a greater scale and more expensively than either. This evident and rapid change influences every walk of life and each new building.

The New Architecture.—Artistically, architecture is the result of a search and struggle for beauty under restrictions imposed by the structural requirements of the plan problem and the aesthetic possibilities of the materials available. Strictly speaking, it is concerned only with those buildings that embody elements of beauty, or that at least vary from strict utilitarian necessities for the sake of better appearance. In the past, building was a slow, leisurely proceeding, expensive in terms of human energy, but now changes in style, which are nothing more or less than period changes in the life of the people, occur more rapidly. Undoubtedly the outstanding feature of the new period is a growing interest in, and enthusiasm for, the architectural improvement and embellishment of all types of buildings. Whether it be homes, workshops or playhouses, improvement in appearance is demanded. The need for more buildings, the will to have them beautiful, and steel with speed in building appeared almost simultaneously as the invigorating influences that started the new architecture off and determined its course.

The architect to-day is a sculptor in building masses. His forms are limited by the practical requirements of the plan problem, *i.e.*, the interrelation of the spaces to be enclosed and the legal restrictions on building, by the materials out of which his building must be made, the machines that shape these materials and the labour available for putting them into place. This has always been essentially true, but the recent and tremendous improvements in construction methods, the new materials and new machines used for building, and the modern type of workmen employed have given the oldest art a thoroughly new aspect. Steel and speed have completely altered human relationships and, therefore, changed architecture more than any factors that preceded them. The present-day architect has to consider not only how best to enclose space for human occupancy, but many tendencies of contemporary life as well.

The art of architecture is in constant flux, for it is an ever-changing medium of expression, incapable of being static. It results from human needs and conceptions of beauty determined by the way in which the ideas of a period happen to be associated. The new art, so-called, which is evolving in both Europe and America, in fact in every nation claiming cultural advancement, can in no sense be considered strange, exotic. It does what architecture has always done: it expresses faithfully its time. When it appears strange, it is likely that the architect, under the pressure of getting out work, has not had time to study the true feeling of his art as properly as he has its physical requirements. Formerly, his knowledge of building construction, and the capacity of workmen to execute his ideas, limited the architect. So they do now; but with this difference: the machine is everywhere supplanting handicraft, and the modern architect has ta design for it.

Machines Mastered.—At first, the ease and rapidity with which machines accurately repeat processes and designs resulted in many ugly forms being turned out. This caused the gingerbread decoration that blighted the 19th century. New materials as they appeared were disguised. Metal was used for objects previously made of wood, and, by means of a photographic process, very carefully surfaced with an enamel texture that simulated the grain of wood so perfectly that only an expert could distinguish it as false. Similarly, rubber was transformed into imitation marble floors and walls. Here again the designer, pressed by the necessity of producing, demanded that the new materials imitate the old in order to design with the old forms as the basis of his design problem. Submission to machine power passed, however; mastery replaced it. For the first time in history the economic problem became not how to produce enough to live, but how to market everything produced. To sell their goods manufacturers had to make them more attractive. The basis of the new art is not to use materials as substitutes, but rather to refine their characteristic qualities. By so taking advantage of them, and by learning the capacities of machines employed to shape them, the designer evolves new surfaces in colour and texture, and new combinations in form and line, with the machine as the most important factor in the process. The machines themselves have provided the wealth that carries on such work.

Wealth and Art.—There is little demand for art among a people crushed and poor, or during the rise of a nation. The essentials of life and the provision needed for its immediate future always come first. It is only after these essentials are assured and a demand has arisen for comfort and refinement that art becomes alive. But the quality of art produced by a people cannot be measured by its wealth. On the contrary, history contains many examples of peoples who have acquired great wealth and whose art has become flamboyant and debased. Art in its highest form is produced by peoples of culture who possess high ideals; artists can only be developed by a demand for art.

Meanwhile, there has developed in modern art a new and revolutionary factor. To the new art which is evolving, this factor—the machine—is becoming a most valuable slave. Supported by machines, the possibilities for modern art are boundless, for it can be enjoyed and partaken of, not only by a limited group, but by all mankind. Significantly, the machine has first manifested itself in architecture, the parent art. Each building is regarded as a machine planned, designed, constructed for a special purpose, a machine to be scrapped when need for its peculiar type of service ends. Post-war architecture, and art generally, tends to express itself in mass and form, in efficient essentials refined and made beautiful, in simplicity. Called on to enclose new forms of spaces, the architect has developed new methods of construction and is achieving new results.

Skeleton Construction. — The structural principle responsible for these new forms is the skeleton, of structural steel or of ferro-concrete (*q.v.*), which carries the building load. Steel takes up all the stresses to which a building is subjected; compressive, tensile and shear. Reinforced concrete acts similarly save that the tensile strain is cared for by the steel imbedded in the concrete and the compressive by the concrete itself. Steel, for protection from fire and corrosion, must always be faced by some material, such as stone or brick. Reinforced concrete can only be used in comparatively low buildings; while it gives a finished surface as well as a supporting structure, its surface is difficult to decorate; but concrete is cheap, for it eliminates highly technical labour, and effects are secured by carefully studied proportion and massing. Steel can be used in any type of building; reinforced concrete is most valuable for factories, aeroplane and airship hangars, hydraulic works, power plants and other similar purposes.

Logical Design. — The designs first used in facing the new structures were drawn from old masonry forms. Conventional styles are always slow to disappear; wooden forms influenced masonry design until the days of Rome; even rock-hewn tombs, as at Corneto, had feigned roof beams. Heretofore, Gothic (*q.v.*), which was applied to churches to point them heavenward, was the only style with any verticality, and when tall buildings appeared, architects, naturally enough, turned to it for their inspiration. The Woolworth building, New York (Cass Gilbert, Architect), was the first great example of its use. But as tall buildings became more common, architects began to develop their inherent stylistic qualities. Steel frame structures permit such height, and their interior requirements bring such unusual plan arrangements, that it'grows less and less logical for masonry to inspire the designer.

The steel frame is rectangular, neither curved nor arched. Its most expressive covering, therefore, is designed in straight lines and right angles. The best American work has a real "lift" that carries the eye upward in each line of construction, by emphasizing everywhere the vertical, by subordinating the aesthetically less pleasing horizontal, and by pyramiding the masses that support the central tower. Such designing assures suitable facing for the skeleton, and the minimum of wasted material and space. The jacket of the building is then true to the underlying structure, which bears the load.

In the Telephone building, New York (McKenzie, Voorhees and Gmelin, architects), the effect is one of proportional masses, and impressively simple. The architects approached their problem from the point of view of designing something with respect for this present "machine age"; they thought in terms of what could be done with the labour of to-day, with the construction of to-day and with the machinery that would shape the materials; an entirely new and thoroughly modern feeling is expressed. In matters of detail, the old-fashioned cornice, which is meaningless when raised to a height of 20 or 40 storeys, disappeared entirely. The vertical accent is never lost, however, even when the building reaches its climax; instead of crossing it with a horizontal band, the band is ornamented by inserts that give a proper finish to the wall composition without interrupting its verticality; the same holds true for the interior. All embellishments, and these, in keeping with modern simplicity, are few, were designed for manufacture by machines. The marble work, instead of being cut in pilasters with flutes carefully chiselled out, was designed for machine production. By so using machines as a basis, architects can evolve designs characteristic of this period. Notable results have already been reached.

Colour.—In view of the many new building materials that modern machinery has made available, colour, which was used extensively in ancient architecture, particularly in Egypt, western Asia and Greece, may again become an important factor in design. A few attempts of questionable success have been made, but most modern cities, in both Europe and America, are rather drab. Where used, colour has soon been lost under the smudge of dirt and soot that reduces everything to grey. But it is not unreasonable to suppose that improved methods of fuel consumption, electric transmission and city management may eventually eliminate soot and dust from city atmosphere. New materials, especially in the field of glazed tile of enduring colour, may then be used to advantage in giving modern cities the brilliance characteristic of antiquity. We are not here suggesting a mere plastering of colour in spots like postage stamps on otherwise drab buildings, but rather colour used as an inherent part of a building's composition, like, for example, shadow bricks, accentuating its line, form and proportion. (See COLOUR IN ARCHITECTURE.)

Problems to be Solved. — The problems of the immediate future confronting the architect demand a well-trained and highly developed imaginative faculty. With the concentration of population in cities, previously referred to, city architecture became the art's most important phase, and the architect is now called on to help to solve many problems not properly his own (see TOWN AND CITY PLANNING). Right concentration multiplies business efficiency and convenience, and the drift of building developments toward single units covering entire squares has an enormous influence on design. A growing tendency to bring business and residence together, thus preventing the present waste of transporting city populations from home to office twice daily, may well lead to structures with a residential zone on top, a business zone below and sidewalks at a high level for the residents. The architect must consider, too, the movement of traffic through the now crowded streets, whose capacity only double-decking, arcaded sidewalks or tunnelling can extend. To modern man, spending most of his waking and all of his sleeping hours indoors, buildings mean more in comfort, convenience and well-being than any other material entities. If architecture serves his purpose, life is good; if it fails to serve it, life is harsh; it affects his thought, his art, his mode of living and his future.

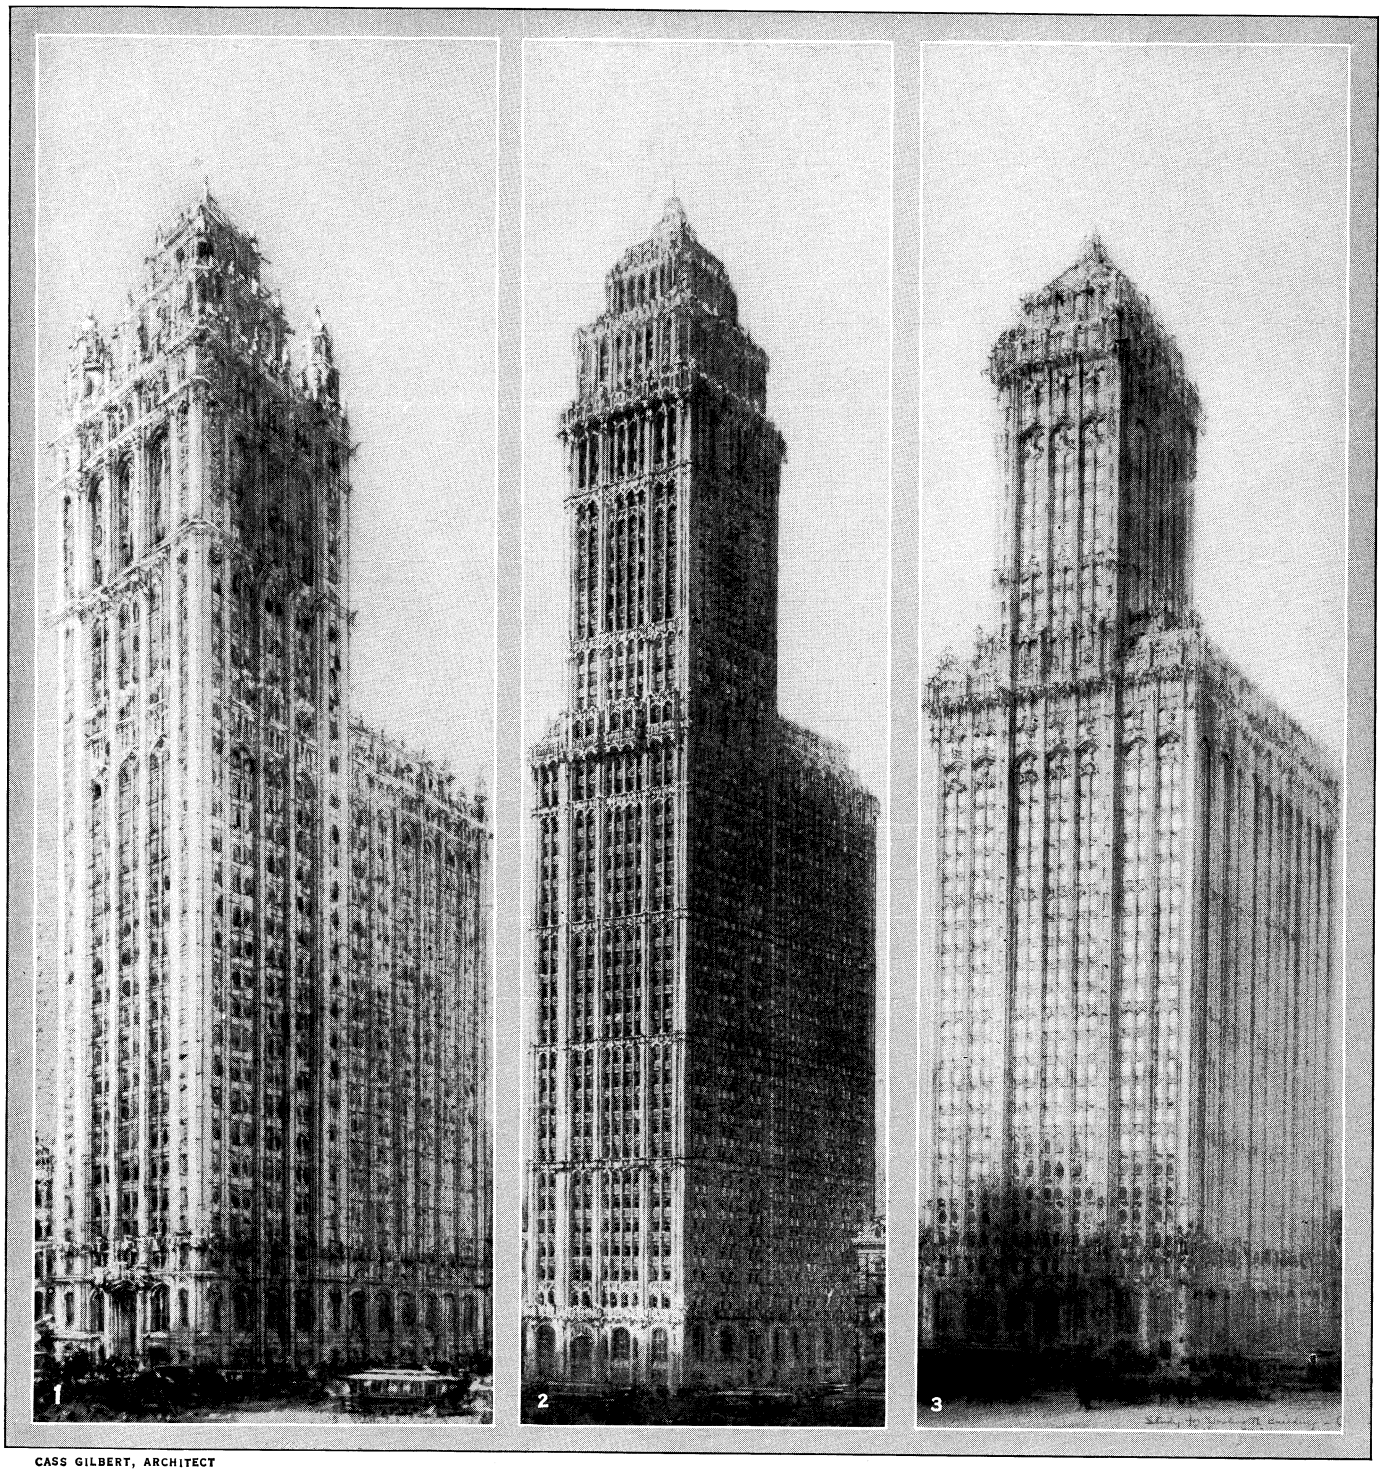
MODERN ARCHITECTURE

Science, highly developing transit and communication, has knit all parts of the world so closely together, and so reduced time and distance, that for any nation to develop a purely indigenous architecture would mean that the material and spiritual status of its people had been untouched by modern inventions. Modern architecture therefore will be discussed not by geographical boundaries, but according to those influences — industrial, social, educational, governmental, and religious and memorial — that are the basic causes of all building development, and common to all nations. They have been placed in the order of their importance, considered in terms of capital investment and the number of people involved.

I. INDUSTRIAL ARCHITECTURE

Under this classification are included all buildings in which manufacture, purchase, sale, exchange and transport of commodities are carried on, and in which the financing of business enterprises is negotiated. Industrial architecture has now peculiar significance, because the present period of civilization is normally neither an age of war nor an age of art, but a scientific and industrial age. It constitutes by far the most important architectural development since 1900, not alone as measured in terms of quantity, but in terms of actual progress as well. Industry and commerce, through combination and absorption, have grown far beyond the wildest imaginings of the '80s of the last century, and their necessities have developed a striking and significantly new architecture, highly expressive of the present age. The trend is toward larger and larger units — larger office buildings, larger department stores, larger banks, larger railway stations, larger industrial plants.

The increase in the height and mass of office buildings is perhaps the most phenomenal feature of this development. Many misapprehensions exist as to its cause. One of the most persistent is that in New York, where the so-called sky-scraper has received its chief development, the long, narrow shape of the island forced growth upward. This is far from the truth. There is still plenty of room for lateral expansion on Manhattan island. The tall buildings form a narrow ridge through the centre, following the general course of Broadway. Should all the buildings on the island proper be reduced to an average height, they would probably not exceed



CASS GILBERT, ARCHITECT

THREE RENDERED STUDIES IN PREPARATION FOR PLANS OF THE WOOLWORTH BUILDING

1. Design showing high portion of building carried over the entire property front several storeys lower than as finally erected
2. Design showing initial developments of the tower idea, to meet the conditions of additional property to the south which had been acquired
3. First study, showing tower in centre of Broadway front but not yet carried to height of final building

ARCHITECTURE

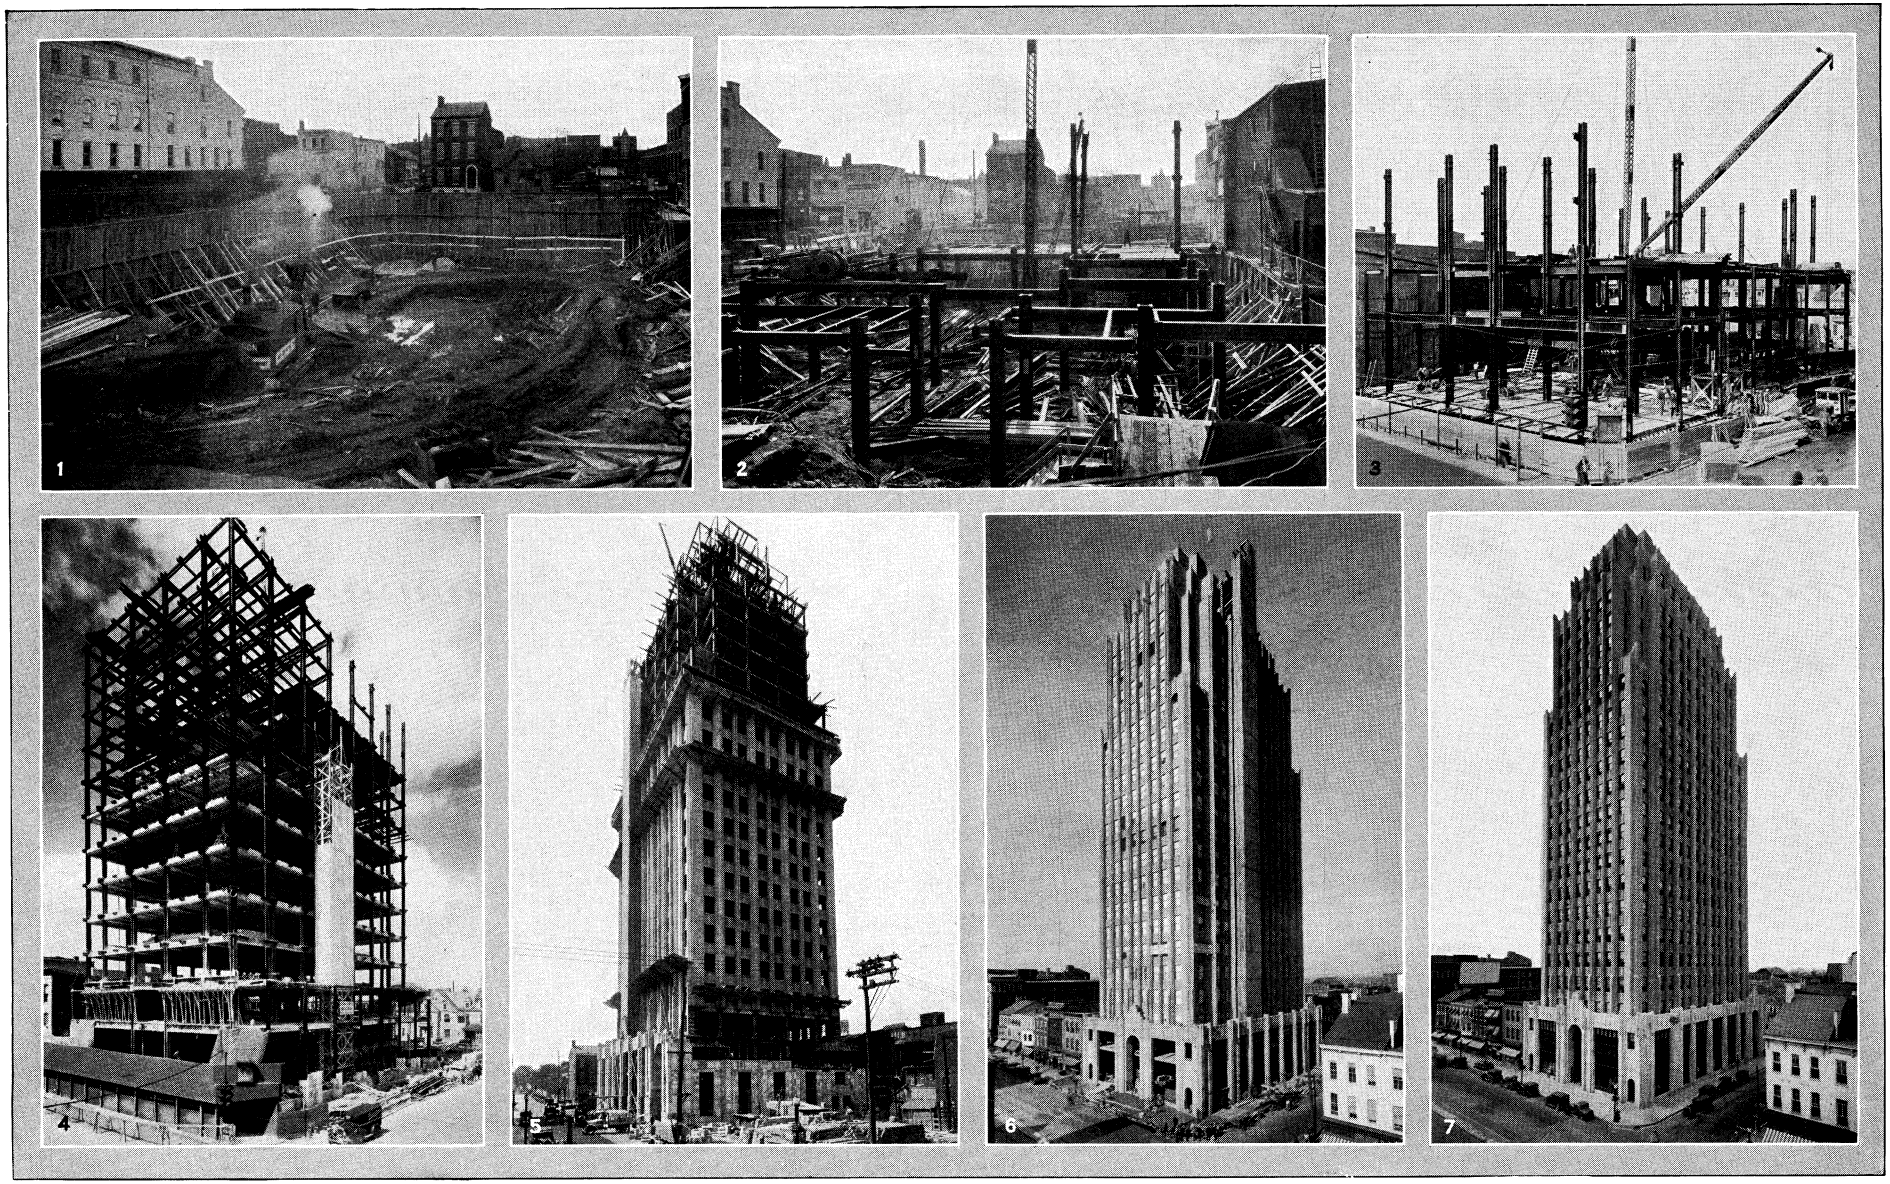
STUDIES AND PHOTOGRAPH OF FINISHED APARTMENT HOTEL

1. Preliminary sketch
2. Second study, substituting vertical surfaces and setbacks for the inclined plane
3. Final building mass as determined by adjusting setbacks to normal spacing of steel frame and reducing tower
4. View of finished building, at No. 1 Fifth avenue. New York city



PROGRESSIVE STEPS IN THE CONSTRUCTION OF A MODERN SKYSCRAPER

1. Excavation work for the Pennsylvania Light and Power building, at Allentown, Pennsylvania (Helmle, Corbett and Harrison, Architects), begun on Nov. 27, 1926. The soft limestone formation of the subsurface soil necessitated an excavation of 90 feet before a firm foundation was reached
2. Steel erection under way. All the steal work had been prepared in advance ready for shipment. so that each piece arrived at the exact time when it was needed
3. Steel work raised above grade level as it appeared on Feb. 10, 1927. A floor construction of steel had been installed for each floor, providing working surfaces for the mechanics
4. The steel work about half-finished nine weeks later. The brick exterior had been started at the second floor, and a service lift shaft was erected at the side of the building
5. The steel work shown completed, six weeks later, with the stone and brick exterior three-quarters finished
6. The enclosed building with the exterior finished, three months later
7. The finished building is shown ready for occupancy 16 months and 3 days after the excavation work in Fig. 1 was begun. The temporary service shaft had been removed, and all furniture and necessary eauiprnent was installed by means of a passenger and service lift in the centre of the building

six or seven storeys. This contention is proved by the rapid appearance of groups of tall buildings in many other cities where the special topographical conditions of New York do not exist.

The truth is that increased concentration makes for increased efficiency in commercial operations. It is probable that the tall building originated in the desire of real estate owners to exploit small and heavily taxed property holdings. Increased revenue could be obtained from a small area of land by building upward. But the sky-scraper has proved invaluable to efficiency in business, for, in the final analysis, all important business affairs are negotiated through personal contact, in spite of telephone, telegraph and other means of communication.

The City Factory.—The factory in cities is beginning to take on city dress. The open labour market commonly causes a large industrial plant, especially in such work as garment-making, to build in the heart of a city. Such a plant should not be a blot among fine buildings, but should be in harmony with its surroundings. The plan problem is as varied as the nature of the work carried on, but industrial plants may be divided into three types, depending on the different kinds of enclosed spaces: (1) plants of large area, of only one floor; (2) plants of large spaces for great machines, travelling cranes, etc., in conjunction with smaller spaces of the ordinary type; (3) plants of ordinary spaces, many-storeyed and dependent on light from the sides. The first type furnishes simply a problem of building over large areas and with "saw tooth" skylight construction; the second involves engineering for broad spaces, but both clerestory and top lighting are possible; the third type does not differ from the many-storeyed office building in which a conventional upper floor plan is developed as a series of typical office units along both sides of a corridor. The line of vertical circulation (lifts or elevators) is fixed at a central point on this corridor, utility spaces are added, and the ground floor is devoted to special purposes.

Importance of the Architect.--Only in the 20th century have such problems as steel plants, mining hoists, automobile works, etc., been considered in any sense architectural. Generally handled by engineers with practical considerations only in view, the architect had no essential part, but was called in, if at all, to add a bit of "dressing" to a predetermined structure. To-day, however, the large corporations are realizing more and more that beauty in its broadest sense is a commercial asset, and that thoughtful planning with consideration for the human occupants of buildings has utility.

The architect, by training and experience, has a more comprehensive sense of arrangement than the engineer or the contractor. A certain distinctive appearance, a certain completeness of design, a more perfect interior arrangement and a general suitability seem more likely to prevail when the largest industrial buildings are handled through an architect's office than when an architect is not in the picture. The architect is consulted to advantage from the outset of the problem; choice of site, plan arrangement, types of construction, fire prevention, natural lighting, welfare provisions, plumbing, heating, ventilation and artificial illumination are all matters of consideration in the design of any building. (See also INDUSTRIAL ARCHITECTURE.)

II. SOCIAL ARCHITECTURE

Social architecture comprises all buildings for human residence, recreation, entertainment and health. Not long ago, the home provided for all these activities. To-day they are more highly specialized, and are more and more taken care of in specially designed buildings. The theatre, picture house, stadium, athletic club, etc., provide recreation. The sick and dependent are ministered to in public and private hospitals, sanatoria, orphanages, etc. This custom is growing to such an extent that many people, particularly in cities, do little more at home than sleep and entertain their friends.

Private Dwellings.--A tendency to provide co-operatively for domestic drudgery has had fairly steady growth since 1885. The factory has increasingly taken over the work of the home: food is supplied in ready-cooked form; clothes are washed in quantity; heat and light are automatically provided. Even small dwellings are now being brought into groups. The construction of homes by individual owners has diminished steadily since the World War, not only due to these new methods, or to the burdens laid upon wealth, but to the difficulty of obtaining competent domestic servants also. The large house is dependent on this class of worker which, drawn away by the war, was unwilling to return to domestic duties at its close. (See also SOCIAL ARCHITECTURE; HOUSE PLANNING.)

Apartments (Flats), Hotels.—Apartment or flat building, especially in America, is not confined to cities and towns where the concentrated population might furnish an excuse; it has an increasing vogue even in small villages. The apartment building is simply a combination of compact homes one above the other. The plan problem consists of making a series of such home units, each comprising a living-room, dining-room, kitchen, and one or more bedrooms and baths. A foyer or entrance hall, library and study may be added to the living-room; a breakfast-room, pantry and servants' hall may be added to the kitchen and dining-room; and a nursery and servants' rooms to the bedrooms. These, however, are merely supplementary to the basic unit. The popular apartment hotel is simply an apartment house in which the kitchens and the servants' sections of all the apartments are concentrated in one place and conducted under hotel management. In the hotel proper improvement in mechanical arrangements is more manifest than any change in basic planning principle. As in most other types of buildings, the tendency is toward increased size. The heavy overhead expense of a modern hotel, giving complete service of every kind, makes it difficult to operate successfully with less than 1,000 rooms. The plan problem starts with a typical bedroom floor which is repeated many times and is the basis of income. The lower floors, the least in demand as bedrooms (for the public seems to have lost its fear of fire in modern structures and prefers to be high for light, air and freedom from noise), are used for the essential hotel offices, lounging spaces, parlours, dining-rooms, banquet-halls, restaurants, cafeterias, etc. (See also SOCIAL ARCHITECTURE.)

Specialized Buildings.—Theatre design has markedly progressed, and the picture house has added a new problem. In old theatres, stage and auditorium formed two nearly balancing elements. Improved mechanical equipment has somewhat reduced the size of the stage, and the different seating arrangements of the auditorium have increased proportionately the ground area of this part. The cinema requires almost no stage, and in many cases the auditorium has been enlarged almost beyond the reach of the human voice. In both types the cross section shows the use of but one balcony, and no supporting posts to interrupt the view. Architecturally most theatres of both types are problems in interior design. Being commercial enterprises, and requiring no natural light, they occupy spaces away from the street and have at most only a small street frontage. Of course the government-owned and municipal theatres are generally free standing, and, like the Paris Opera House, have an architectural treatment in keeping with their location.

For open-air entertainment, the most significant structure that has appeared is the great stadium (*q.v.*) rivalling in size, and in some cases in architectural embellishment, those of old. These are of three general classes: those completely elliptical in form and built on banked-up earth as at Yale university; those built up from the level of the ground like the Colosseum of Rome but open at one end as at Princeton university; and those built only at one side of the play-held. (See also THEATRE ARCHITECTURE.)

Care of the sick has received particular attention (see HOSPITAL PLANNING). The World War gave medicine and surgery opportunities for study and experiment that brought about great strides in both fields and many new features in hospital design. Two types of plans may be noted: the open scheme with few storeys where ample space is available, and the compact many-storeyed type required in cities. The open plans show a more orderly arrangement of building units, central administration, kitchen facilities and power plants; general orientation is a very important factor, and lines of communication unite the various elements in a direct and simple plan-scheme.

III. EDUCATIONAL ARCHITECTURE

Under this heading are included all buildings in which knowledge is imparted and acquired, either directly, by contact between teacher and pupil, as in schools, colleges and universities; or indirectly, as in museums, libraries and exhibition buildings. Compulsory elementary education prevails in most civilized countries, and government-directed institutions are on the increase. The one-time high school group which represented merely the finishing touches of an English education has become subdivided into many different forms. Modern education, which prepares the pupil for a later status in life, has divers schools where the pupil is trained in whatever vocation he selects, and is launched successfully on a career.

Schools. — The development of architecture in school buildings has been one of the most remarkable phases of architectural progress during the present century. The architect who specializes in schoolhouse construction must be a student of educational methods, and, moreover, he must know how to conserve the physical wellbeing of the pupil during school hours by surrounding him with every element of safety that will protect his health, his eyesight and his general physical condition. The tendency toward larger and larger units that runs through commerce and industry manifests itself again in educational buildings. The large institution is the only adequate means of meeting the demand for instruction, but there is a distinct limit to the number of students that a single teacher can handle. Much study and experiment on the part of experts in this field have evolved a classroom of fairly definite size and shape. The school plan revolves around this unit classroom. Unilateral lighting is preferred; wide corridors, leading to the exits, stairways, assembly hall, gymnasium and other special spaces, adjoin all rooms; ceiling heights are ample for ventilation purposes, and when there is 15ft. or more from floor to floor above, stairways can be doubled, thus securing two separate stair exits in the space formerly occupied by one. (See also SCHOOL ARCHITECTURE.)

Universities. — The most interesting feature of the newer colleges and universities is the comprehensive plan lay-out, permitting future expansion, upon which they are being built. The older universities of Europe grew through the centuries by successive accretions, and they possess, of course, the charm and interest of historical background and precedent. Certain modern universities, notably in America, have endeavoured to recapture this atmosphere by imitating the semi-monastic architecture of those older institutions — Harkness Memorial hall at Yale and the Graduate school at Princeton, to mention only two. On the other hand, there is a growing tendency to accept frankly the changed conditions of the time and build in the modern idiom. The University of Pittsburgh plans to build a sky-scraper to house its halls of learning. (See also UNIVERSITY ARCHITECTURE.)

Libraries. — Libraries are keeping step with the general increase in public education. Many large cities have a central building, extensive in scope and impressive in design, and one or more branches at convenient points in the populous districts. The general plan consists of a central public room, where books are loaned and returned, where card catalogues are convenient for consultation and where information is given. Together with the stack rooms, this forms the hub of the plan, around which are disposed other special spaces, such as children's rooms, periodical rooms, reference rooms, special exhibits, etc., as the scope of the work demands. (See also LIBRARY ARCHITECTURE.)

Museums. — Public museums constantly take a more important place in modern life as a means of indirect education. The addition of many commercial, industrial, mechanical, horticultural and other museums to the traditional art museum is proof of this. Here the plan is comparatively simple, consisting of large well-lighted spaces through which visitors pass from room to room. Good modern practice provides one entrance with control, and a disposition of rooms that permits of any given space being temporarily closed for rearrangement or installation of exhibits without shutting off other rooms from public access. The growing tendency of the modern museum to combine educational courses open to the public with its more traditional activities freauently calls for the addition of lecture-rooms, reference-rooms and even auditoriums to the usual plan. (See also MUSEUM ARCHITECTURE.)

Expositions. — Expositions are generally housed in temporary buildings constructed for the purpose. The plan problem is of special interest to the architect, because it gives him an opportunity to make experiments on a large scale which he might not care to risk in more permanent buildings. The Columbian exposition in Chicago in 1893 changed the whole tendency of architecture in America, creating a veritable renaissance of classic styles. The Paris Exposition Universelle in 1900 experimented with the flowing line and naturalistic ornament, but with no permanent effect on architecture in general. The Wembley exhibition near London revealed certain possibilities in the use of permanent concrete construction, but lost much effectiveness through lack of distinction in setting and approach. The French, on the other hand, made the most of their Exposition des Arts Décoratifs in Paris in 1925, and many of the temporary buildings displayed architectural forms of unusual interest: the straight line, the post and lintel, sculpture in low relief panels, strong contrasting colours; classical mouldings, capitals and cornices were conspicuous by their absence. The influence of the Paris exposition can be seen in certain commercial buildings in America, and will doubtless have a lasting effect, because the style so readily adapts itself to modern forms of machine-made construction. (See EXPOSITION ARCHITECTURE.)

IV. GOVERNMENTAL ARCHITECTURE

Many municipalities in Europe have erected new and imposing buildings to house local administrations. State governments in the United States have undertaken new capitols. New, modernized post-offices, custom-houses, town-halls, etc., have been built in many places.

The plan problem of modern administrative buildings is somewhat similar to that of the commercial office building except for two features: (1) the plan includes large and specially designed rooms for the assembly of boards, councils, delegates or gatherings of representatives, which dominate the plan and are surrounded by offices for government workers and permanent staffs; (2) architecturally, both exterior and interior are treated more extravagantly, with liberal provisions for landscaped settings (see LANDSCAPE ARCHITECTURE), all very properly done to impress the community with the power and authority of the State. The architectural problem is new only in so far as the tendency for the State to assume ownership of certain public utilities has considerably increased the space needed for government work. The London County Council hall, near the Houses of Parliament, the fine building of the Port of London Authority, the Town Hall of Stockholm and the State Capitol of Nebraska in the United States are conspicuous examples. (See also GOVERNMENTAL ARCHITECTURE.)

V. RELIGIOUS AND MEMORIAL ARCHITECTURE

Religious architecture, which includes all buildings erected for spiritual or commemorative purposes, appears to be in a transitional stage. In the endeavour to adapt itself to changing conditions, the Church is faced on one hand with the necessity of broadening its activities, and on the other with the problem of effecting a physical compromise with other forms of building. Architecturally this involves two distinct problems: (1) enlarging or modifying the church to house new activities; (2) combining it with commercial structures, a course adopted to some extent in the United States.

In the past, the church was a refuge for the poor and afflicted, a seat of learning and a centre of social life. One after another these functions began to be assumed by independent agencies. Education, except in the spiritual sense, fell chiefly under secular supervision; separate institutions began to care for the sick and the poor; the increased number of diversions weakened the church's social hold on the people. There seems to be, however, a tendency to resume some of these functions in the form of welfare work and community service. This has added to the necessary equipment of the church proper such spaces as small

2. Merchandise Mart, Chicago, illuminated
3. Chrysler Building, New York

auditoriums, Sunday-school rooms, gymnasia, committee-rooms, restaurants, etc. The modern church, excepting the ritualistic type, which has not materially changed in plan arrangement or source of design, tends more and more to assume the form of an auditorium in which the important consideration is to see and hear adequately.

The enormous growth of large cities has left many churches stranded in business or financial sections, miles from their parishioners, so that their very existence as buildings is jeopardized. In both London and New York there are many such churches which are preserved only for their architectural interest or historic associations. With a few exceptions, these will eventually have to give way. Even in newly developed residential communities, the small church finds it difficult to retain a fixed or stable congregation. Localities are no longer local. The automobile, the railway, the telephone and the radio have all conspired to diffuse and diversify public attention.

New Churches. — The most startling and essentially modern feature of religious architecture is the "sky-scraper church." In order to retain a position in the crowded, highly taxed business centres, certain churches in America have combined with office buildings. This enables them to carry on their social and community service without depending entirely on voluntary contributions for maintenance. The architectural problem is a commercial sky-scraper with an auditorium on the ground floor; one building is superimposed on another of quite different character.

In spite of adverse conditions, many impressive churches are being built; for instance, the cathedral at Washington, the great cathedral in Liverpool, and the cathedral of Saint John the Divine in New York. France tried a novel experiment in building the church of Notre Dame at le Raincy; this structure, built of reinforced concrete, is of rigidly simple modernistic design but of dubious aesthetic value.

Memorials. — As a problem, memorials have a peculiar fascination for the architect, because they are usually untrammelled by the practical restrictions of ordinary buildings and frequently offer the best opportunity for combination with the allied arts of sculpture and painting. The difficulties of the problem lie principally in the lack of limitations, for the freedom of choice makes selection of the appropriate mode of expression harder.

War memorials, which abound in every country, frequently employ weapons and military costumes as a basis of design. The most successful, however, stress abstract conceptions such as bravery and sacrifice, rather than the paraphernalia of war. An indication of the universal trend toward democracy since the World War is apparent in numerous memorials to the Unknown Soldier. War memorials range from simple wall tablets to buildings of impressive proportions. The latter sometimes take the form of memorial hospitals, soldiers' homes, assembly halls, stadiums, etc., in which case their inclusion under memorial architecture is merely nominal. Public interest in war memorials has brought about a recrudescence of other commemorative monuments. The monument of Vittorio Emanuele II., Rome, is one of the most impressive ever erected to one man. The Lincoln memorial at Washington, D.C., and the George Washington Masonic memorial at Alexandria, Va., overlooking the Potomac river, are other examples on impressive scales. (*See* also RELIGIOUS AND MEMORIAL ARCHITECTURE.)

HISTORICAL ARCHITECTURE

History furnishes the architectural designer with opportunities to study buildings in such mass and detail that new forms can be based on accurate knowledge of the old as they exist or existed, full size and in position, with their natural environment of light, shade, play of colour and variety of line. It gives him knowledge of the materials, the craftsmanship and the allied arts that have determined the form and character of buildings, and of the social, political and religious changes that affected nations in the past and were reflected in their buildings. Architectural history differs substantially from archaeology (*q.v.*) with which, nevertheless, it is too often confused. The archaeologist unearths and studies the forms, materials and embellishments of ancient buildings. The architectural historian relates the information gleaned by such scientific research and develops a record of past architectural styles together with the underlying human relationships that brought them into being.

To understand the evolution of the art of architecture intelligently one must first understand the mental processes by which man creates architectural works. Such procedure has not materially changed since ancient Egypt which, as far as is known, was the first western nation to establish a civilization with a fixed cultural background to leave enduring records of its achievements. The architect called on to enclose space, whether it be a tomb, shrine or simple dwelling, first looks about to see how it has been done before. If facilities are available, he travels to other lands to study foreign methods. If documents concerning ancient works exist, he turns to them also for enlightenment. From all such information as a background, from the practical requirements of his problem and from the materials and methods of construction at hand, he creates his work.

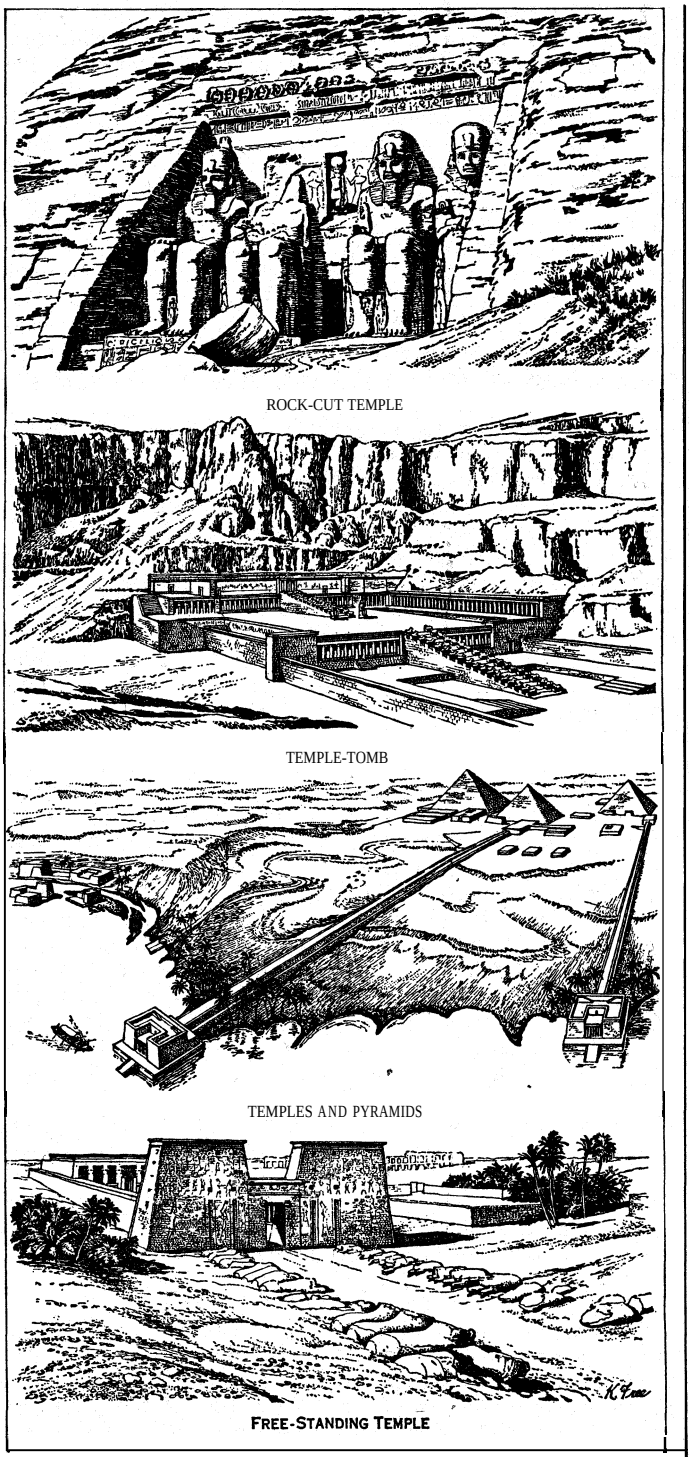
The lay mind frequently mistakes the origin of architectural styles. There are no strict demarcations between periods. Only the extent of centuries of history makes seeming divisions, because the high spot in each period is the determining factor, obscuring the transitional periods between. The present occidental art has been influenced more strongly by the ancient western countries, beginning with Egypt, than by India, China or Japan (*q.v.*); but the growing present-day connections between Far East and West may affect it more materially than past centuries of separated civilizations. The following outline is designed to relate the special articles, on such predominant periods as those of Egypt, Greece, Rome and the Gothic, which appear in this work under their own headings, with the general trend of the world's architectural development from the earliest recorded efforts. (*See* INDIAN ARCHITECTURE; CHINESE ARCHITECTURE; JAPANESE ARCHITECTURE.)

Unlike the other arts, architecture rose from a primary requirement of human life—the need for shelter. In the earliest days, the cave, the hut and the tent may have sheltered people devoted to hunting and fishing, to agriculture, to pastoral and nomadic lives. Architecture originated in more permanent dwellings in which wood was used less and less, and in which bricks, made of sun-dried alluvial clay as in the early work in Chaldaea and Egypt, became the basis of construction for walls that supported trunks of palm trees as lintels for doorheads and roofs. Some of the earliest rock-hewn tombs at Giza reproduce old wooden forms in stone, and so record the construction of periods whose buildings have long since disappeared (*see* ARCHAEOLOGY). The sun-dried bricks could not resist much pressure and required walls of great thickness with a batter, or raking side, which is even employed in the present-day huts of the fellahs.

I. EGYPTIAN ARCHITECTURE

Although structures discovered in Chaldaea, at Tello and Nippur, seem to date back to the fifth millennium B.C., the best examples of architecture prior to Greece exist in the monumental works of the Egyptians. The culture of the period was confined to a small ruling class, made up of priests and nobles. The desert relentlessly opposed man's struggle for existence, and the common people had to rely on their rulers for sustenance and protection, and on life after death to abolish cruelty and fear. During the seasons when the flooded Nile valley made agriculture impossible, the energy of the large slave population was directed to building vast tombs, temples and palaces for a reigning family of fixed position, unchanging religion and supreme power. Although stones had to be brought from distant quarries, the Egyptians achieved the most lasting architectural forms yet attempted by any civilization.

The three best-known pyramids are situated about seven miles south-west of Cairo, and were built by the second, third and fourth kings of the fourth dynasty — Khufu (c. 3969–3908 B.C.), Khafra (c. 3908–3845 B.C.), and Menkaura (*c.* 3845–3784 B.C.), who are better known as Cheops, Cephren and Mycerinus; their major interest to present-day civilization is more historic than



TYPES OF EGYPTIAN TEMPLES SHOWING THE PERSISTENCE OF THE OLD CONCEPTIONS OF TOMBS AND TEMPLES CONSTRUCTED IN CAVES

architectural (see PYRAMID). Many temples were also constructed, as that of the Sphinx, attributed to Cephren, and tombs, such as the Serapeum at Sakkara, in which the sacred bulls were embalmed and buried, and those of the kings and queens of Thebes.

We have already referred to the probable origin of the peculiar batter or raking side given to the walls of the pylons and temples, with the Torus moulding surrounding the same and crowned with the cavetto cornice. What is more remarkable is the fact that once accepted as an important and characteristic feature it should never have been departed from, and that down to and during the Roman occupation the same batter is found in all temples. Particularly notable is the strong influence of early methods of construction in wood and clay on the form and outline of the more permanent stone construction, in which no such thickness of wall or such extreme batter was necessary constructively. But their mass gives these structures a magnificent repose and an air of lasting through eternity.

A dominant will to do in each new work what had been done before seems to have been exerted in all Egyptian architecture. Variations were slight and in the direction of more extensive size and more impressive scale. One would suppose that the spirit moving Egyptian architects was always so to impress the people with the overpowering, almost supernatural, dominance of their rulers and deities that they might never think for themselves or entertain the possibility of changing their social status, a condition still existing among many of the peoples of the Far East. It is difficult for modern men and women, living in an ever-changing civilization, to realize that for so many thousands of years an entire civilization remained static, as the architecture of Egypt proves it must have done. An examination of the plan scheme of these temples shows a monotonous repetition of form, arrangement and general conception, varying only in extent. Although the high degree of conventionalization of ornament and sculpture has some value to the modern designer in his efforts to break away from purely naturalistic forms, the position that Egyptian architecture occupies as an influence on modern architecture is more historic and archaeological than otherwise, because its extreme stylistic quality is out of place in any of the later civilizations.

Only the one structural idea of the post and lintel was used; consequently all enclosed spaces of any size became a forest of columns. Flat roofs of massive stone slabs spanning outer walls and closely spaced internal columns were the most logical form of coverings. Central aisles of columns were of greater height than those elsewhere, giving a clerestory with a perforated stone screen through which a subdued light filtered. The wall surfaces were extensively decorated with carvings, paintings and hieroglyphics.

Each temple was planned on a long axis with regard for extreme and perfect symmetry, not only within its walls but outside them too, where the axis was extended forward in an avenue of great length flanked by sphinxes. They seem to have been designed for imperial pageants and other ceremonials, staged further to impress the masses with the power of their rulers, who were often their deities also. Probably no architectural period more visibly demonstrates how true an expression of life architecture is. Definite religious beliefs, consistent and lasting cultural habits, and limited and unchanging social relationships, must result in just such uniformity as Egypt showed. (See also EGYPTIAN ARCHITECTURE.)

II. WESTERN ASIATIC ARCHITECTURE

Many architectural records are to be found in the countries north-east of Egypt, where archaeologists have unearthed the remains of Assyrian and Persian structures. A great deal of historic value in explaining the movements of people in the development of dominant monarchies has come to light. About 800 B C. the Assyrians seem to have begun to build the magnificent series of palaces from which were brought the winged man-headed bulls and the sculptured slabs now in the British Museum. A type of architecture different from that of Egypt was developed, on account of disparate religious forms, dynasties less firmly established, less durable building materials and flat country subject to inundations which required erection of platforms to build on.

Structurally, the masonry arch, the barrel vault and even the dome were new factors, although records of the last are only preserved in bas-reliefs, not in *situ*. Excavations recently undertaken by the University of Pennsylvania have revealed indications of the same piling up of one culture on the ruins of a preceding one that is characteristic of many great cities of modern Europe. Such researches are of intense historic interest, and many beautiful objects of art, both in metals and tiles, have been discovered. But the existing remains of the palaces, even those giving fairly definite clues, are not sufficiently intact to permit restoration, or to have had any marked influence on recent architectural progress.

BUILDING THE GREAT HYPOSTYLE HALL AT KARNAK

The great hypostyle hall at Karnak as it may have appeared during its construction, 1313–1225 B.C. The immense scale, characteristic of much Egyptian work, may be realized from the fact that the ceiling of the central portion of the hall is more than 76 ft. above the floor and the central columns are 10 ft. 7 in. in diameter. The whole structure is roofed with slabs of stone, sufficiently wide to span from beam to beam over the columns. The central portion was lighted by the clerestorey windows, visible in this sketch, occupying the height between the roof of the lower portion and that of the central, higher portion. In order to give scale to the tremendous size of the building the surfaces of the columns are decorated with band on band of figure sculpture in low relief, with sunk outlines. These were, originally, richly coloured. The mechanical means by which the great stones were moved and set in place, has long been a subject for conjecture. It is generally considered that mounds of sand, occasionally faced with brick, and with inclined planes leading up to them, were used. These, and wooden frameworks known as rockers, combined with levers and blocking, would enable large stones to be raised slowly

CONJECTURAL RECONSTRUCTION OF AN ASSYRIAN GATEWAY

This conjectural reconstruction of the gateway to an Assyrian palace shows the characteristic architectural forms in the Tigris-Euphrates valley during the 9th and 8th centuries B.C. It is built of sun-dried brick, protected from the weather by a plaster of stucco coating on the upper parts of the walls and burned clay wainscots below. The form of the arch is not only a practical means of covering the gate opening, but also is made an opportunity for decorative embellishment. The two flanking man-headed bulls are characteristic Assyrian features. Besides serving as decoration, they had a religious significance, probably symbolizing the guardians of the gateway and the protectors of ail that was within. It is typical of the naïveté of the designers that each of the bulls was given five legs, for in no other way could the problem of full representation from both front and side be solved. The use of bands of rosettes to cap the wainscot and form the archivolt is another typical Assyrian decorative element. The restoration, as a whole, is intended to express the autocratic spirit that made its mark on Assyrian architecture

RECONSTRUCTION OF THE GREAT TEMPLE AT PAESTUM

The great temple at Paestum or Poseidonia, in south Italy, is the largest of a group of several buildings and probably dates from the beginning of the 5th century B.C. It is presumably the temple of Poseidon, the patron god of the city. Its construction shows the transition from the extreme heaviness of the earlier, archaic style to the later, thoroughly developed Doric style of the Periclean period. The subtle spacing of the columns, with those at the corners closer together than those between, the beauty of the curved taper or entasis of the columns themselves, and the simple, sweeping strength of the capitals are all characteristic of the Greek genius. No mere black-and-white drawing, however, can convey an adequate picture of a Greek temple in the days of its glory. Richness of colour was everywhere. Mouldings were painted with intricate patterns, and the frieze was brilliant with the alternation of rich red and blue. The temple of Poseidon is in a remarkable state of preservation: both pediments and the epistyle at the sides are still standing

RECONSTRUCTION OF THE ACROPOLIS AT ATHENS

A general view of the Acropolis as it may have appeared at the time of Pericles on a day of ceremony. Crowds throng the approaches to the Parthenon (upper right). which was the chief temple of Athene, the patron goddess of Athens. Both this building and the Propylaea (in the centre) show the perfected Doric order of the Periclean period

Plans of these palaces show long lines of parallel walls, evidently carrying vaults, and a general absence of columns, which were a dominant characteristic of the Egyptian work. The symmetry of the Egyptian temple is absent; while such features as entrance doors, interior courts and special rooms were symmetrical, the plans as a whole seem to have. been evolved without the preconceived and broad conception evident in Egyptian work. The restorations show stylistic treatment of distinctive designs. The buildings themselves did not stand long enough to have much bearing on later architecture.

Designers of modern high buildings have turned with interest to existing restorations of ziggurat towers. Probably the ziggurats, representing an early effort of man to rise to any considerable height above the flat alluvial plains, were the most striking architectural feature of the ancient Assyrian cities. The Tower of Babel, of Biblical renown, was undoubtedly a construction of the ziggurat type. Ziggurats were built in several storeys set back one behind the other with a winding ramp carried round the rectangular tower; or the set-backs of each storey formed terraces extending around the structure. At the great temple of Borsippa at Birs Nimrud the ground storey was 272ft. square, and it is known from a description on a cylinder found on the site that there were seven storeys, dedicated to the planets, each coloured with the special tint prescribed; the total probable height was 160ft., and on the top was a shrine dedicated to the god Nebo. Such towers are a marked illustration of how forms of religious worship have expressed themselves in architecture. Scarcely any records remain of the habitations of the common people; they were probably simple huts of sun-dried brick roofed with vaults of the same material. Only the ruling forces of religion and monarchy remain architecturally recorded.

Persian architecture, which had its origin in the Assyrian and Median dynasties, to whose empire the Persian monarch succeeded by conquest in 560 B.C., borrowed from the earlier types many features, such as the raised platform on which their palaces were built, the broad flights of steps leading up to them and the winged human-headed bulls flanking the entrance portals. The point of architectural interest is the reappearance, probably from Media, of the great halls of columns; but while in plan scheme they recall Egyptian practice, in detail they bear no resemblance to Egyptian form; these columns probably derived their form from the wooden ones at Ecbatana described by Polybius; the capitals are formed by twin bulls ingeniously arranged to carry the stone architraves that supported the roof. The plans of these palaces were symmetrically arranged and strikingly similar, with open porticos on at least one and sometimes three sides. But they lacked the preconceived Egyptian balance as was shown clearly when new palaces were added to the great platform on which earlier ones had been built, as at Persepolis.

In these new architectural forms we begin to see evidence of a less dominant ruling class, a freer population, more extensive forays into neighbouring countries, increasing intercommunication between nations and the consequent influence on architectural design. *(See* also WESTERN ASIATIC ARCHITECTURE, *from* Egypt to *Archaic Greece.)*

III. GREEK ARCHITECTURE

Coincident with this movement of civilization through western Asia the people of Greece were evolving a new culture and with it a new architecture that was destined to become the most influential, and still remains an ever recurring factor, in the art. Of the prehistoric period, much that is archaeologically interesting has been written; the extant remains, notably in the palace of Cnossus in Crete and the beehive tombs at Mycenae and in other parts of Greece, owe less to Egyptian and Chaldaean architecture than was at one time supposed; although there is evidence of commercial exchange between the several countries, it affected matters of detail and decoration more than the plan scheme of the palace referred to, or of the tombs. The point of architectural interest is the Greek freedom from the too binding and established precedent in design so characteristic of Egypt. A freer people in a mountainous country deeply cut by the sea required imagination to meet their peculiar problems, which gave their art more rapid and effective development than that in other lands of the same period.

About 2,000 B.C. the Achaeans began to migrate southward and, apparently, to mingle with the earlier Mycenaean civilization. This culture ultimately succumbed before Dorian invaders from still farther north. Before a new culture appeared some centuries passed; in the meanwhile, the invaders intermarried with the native population forming, in the mixture of the clear, cool, hardy northerner and the dark, gayer southerner, the ideal racial combination. The Greeks colonized the Aegean islands, Asia Minor, southern Italy and even Sicily. The prosperity of the colonies as well as the states proper is vouched for by splendid stone temples, the remains of many of which have lasted to this day.

For centuries Greek architecture evolved by a consistent progression. The very contour of the country must have engendered the freedom of thought, unique in the then-known world, which was expressed with equal force in philosophy, literature and architecture. Everything on this comparatively small area of land conspired to the development of a vigorous creative art. Nature herself was no small contributor. The temperate, invigorating climate, the clear atmosphere, the rich blue of the Mediterranean sea, and the mountains silhouetted against a sunny southern sky formed an ideal setting for buildings of refined lines and proportions; while the abundance of unrivalled marble, found in the mountains of Hymettus and Pentelicus near Athens and in the islands of Paros and Naxos, provided a finely textured building material that facilitated the exactness for which the Greeks are famous. Handicapped at the start by the established precedents of other countries, they were, nevertheless, too segregated by their geographical situation to be restrained in the development of their own peculiar talent.

In spite of the comparatively small area of Greece, no single group seems to have been able to control the peninsula and thereby dominate its art. Yet a common religion and love of music, the drama and the fine arts bound the peoples of the various states together. Nature was kinder than in Egypt, and life pleasanter; the fearful gods of former civilizations were abandoned; the deities worshipped were of human form idealized. Beauty of form, colour, mass, silhouette, texture and proportion became high considerations in the lives of the people as well as of the workers in the field of art. The Greeks loved beauty for itself and idealized their conceptions of everything. Just as the Greek philosophers loved thought for its own sake, the artists must have loved beauty for itself. A study of the progress of architectural forms shows consistent refinement, each step being made after careful study of what had preceded, and each modification of conventional style marking an improvement in beauty of form and delicacy of proportion. There is neither abject adherence to precedent nor a searching for the new merely to be different, but that gradual change for the better that so eminently characterizes a nation of great culture, in which beauty and truth are the ultimate goal.

The Parthenon (*q.v.*) at Athens represents the most perfect composition and its realization, and for centuries it has remained the ideal combination of building and setting. There is no sham or flamboyance in either structure or embellishments. In accuracy and delicacy the workmanship surpasses anything that even the modern machine can produce. Its studied refinements of line—such as the very slight curving of linesintended to appear straight, the slight tilting in of corner columns to correct the appearance of tilting outward that such vertical columns have, the spacing of the columns so as to produce a span at the centre slightly larger than that at the ends—these with the complete symmetry of the plan as viewed from each side and the use of only one structural principle, the post and lintel, all combined to give this building a simple and impressive dignity that has never been equalled. Philosophers, mathematicians, archaeologists and architects have attempted with infinite research and study to discover some mathematical rule by which the Greeks worked to produce this great masterpiece of architecture. Enthusiasm for their own theories has led many astray, but, judging from the literature on

all the theories, it may well be that the Greeks did develop some principle since lost.

It has already been seen that in Egypt the only form of popular entertainment was that of seeing the king or priests parade. In Greece, a freer people, actually participating in the government, demanded opportunities to enjoy and take part in the achievements of the time, and the open air theatre for the production of dramas and the staging of festivals appeared. In selecting the sites for their theatres, the Greeks always utilized the slope of a hill, which they could cut out, thus saving the expense of raising a structure to carry seats and at the same time obtaining a beautiful prospect for the background. These theatres went through a natural evolution of being first a gathering place formed by the natural contour of the ground, then being furnished in some regularity with wooden seats, and finally refitted with stone seats. To-day there are remains of the theatre of Dionysus at Athens and of others at Epidaurus, Eretria, Delos, Sicyon and Orobus.

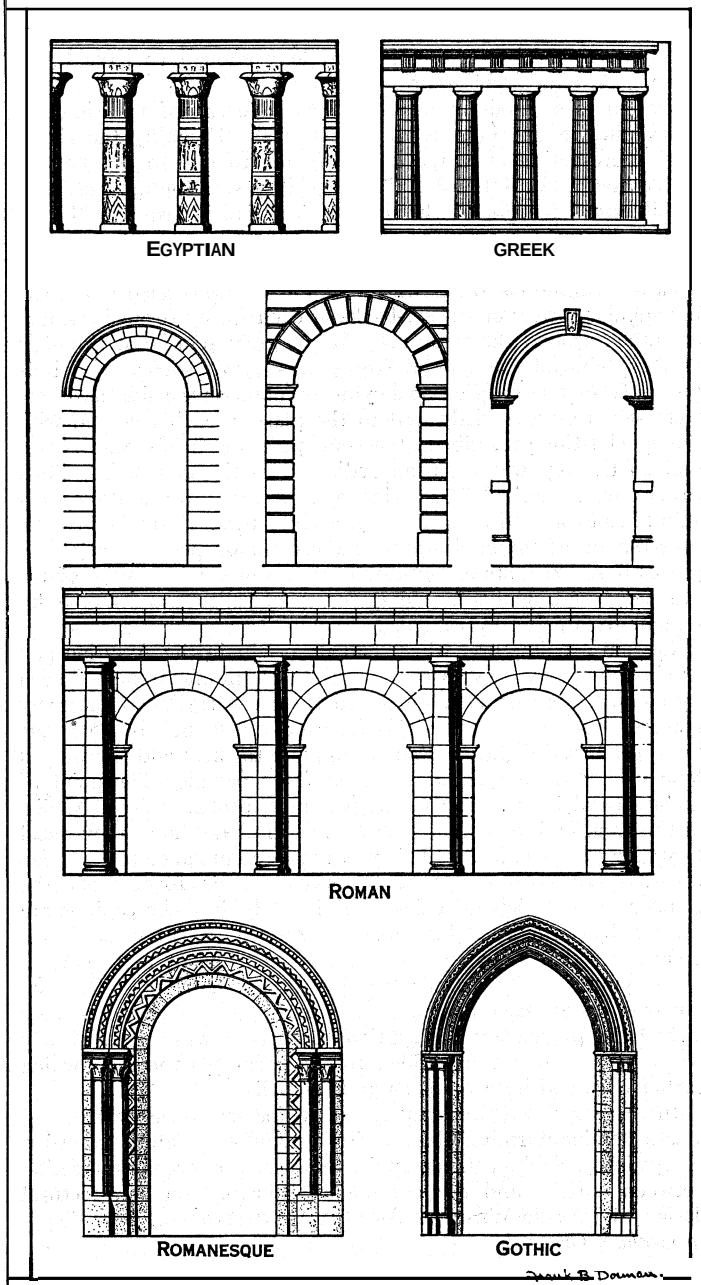
The point of architectural interest is the front row of seats, which were designed for dignitaries, and some of which still remain in *situ* in the theatre of Dionysus, Athens. The centre seat was made the most imposing and elaborate, but many others were inscribed, each with the name of its regular occupant. They were most graceful in line and proportion, they were embellished with exquisite detail and they are still an inspiration to the designer of seats in monuments and other places of importance.

Probably the most significant element in Greek architecture is the perfect correlation of architecture, sculpture and painting. We can speak with less assurance of painting, for while we know that colour was sec extensively in buildings, t ravages) time have left few defin exa d it is difficult tc le how much of the colour that has been found was part of the original conceptions. But of the sculpture there can be no question; when used it was an inherent part of the building's design and perfectly composed for its position with respect to scale, relief and the play of light and shade upon it. In fact, purely architectural form, such as appeared profusely in later periods, notably in Rome, was significantly simple in Greek work. Sculpture gave the necessary embellishment to their buildings, effecting desirable contrasts between plain surfaces and those in which light and shade were required. In every case the sculpture symbolized the purpose of the building, told the story of its function and became a coherent and truthful element of its composition. (*See* SCULPTURE, ARCHITECTURE.)

The temperate Greek climate, with its scant rainfall, encouraged open-air activities and most political and social ceremonies were so held. Consequently Greek architecture is largely devoted to temples whose deities symbolized natural phenomena. The most important temples were built in the 50 years following the battles of Salamis (480 B.C.) and Plataea (479 B.C.) in exultation at the complete defeat of the invading Persians. Athenian prosperity excited Sparta to jealousy, however, and the Peloponnesian War (431–404 B.C.) resulted, after which the leadership passed to Sparta, Thebes and Macedonia successively. Greek states disputing among themselves were easy prey for conquerors, and Rome's power in Greece steadily increased until in 146 B.C. the once proudly independent nation, whose art and thought were to remain fresh always, became a Roman province. (See also GREEK ARCHITECTURE.)

IV. ROMAN ARCHITECTURE

Roman architecture owes its historical importance as much to the quantity produced as to any inherent merit of the work itself. The Etruscans, who were the early inhabitants of central Italy, were great builders and employed the arched vault in their structures. Rome complicated architecture by combining this form with that of the Greeks which, as we have seen, was based only on the post and lintel. It is readily evident that when such a simple form of construction as the post and lintel is combined with one as radically different as the arch and dome, far greater spaces without supporting columns, and a more striking impression of pomp and wealth, can be secured; but neither a finer nor a greater art necessarily results. Everywhere Roman designers worked for enrichment. Since the great Roman empire included all of the then-known world, extending over all of the ancient Mediterranean countries and northward across Gaul and even Britain, and since the Roman conquerors always built in the image of the Imperial City, the Roman love of ornamental grandeur



TRANSITION FROM THE POSTS AND LINTEL TO THE POINTED ARCH. THE ARCH MADE POSSIBLE A GREATER CLEAR OPENING AND THEREFORE BECAME AN IMPORTANT AND IMPOSING FEATURE OF ENTRANCES AND PORTICOS

irrespective of underlying structural principles made an enduring impression on nearly all of the peoples of Europe.

The topography of Italy, unlike that of Greece, was sufficiently open to encourage unification of the early kingdoms in a republic. As the power of the state spread, Greece being conquered in 146 B.C., Gaul in 59 B.C., and Egypt in 30 B.C., the need for centralized government of distant provinces brought about the formation of the empire. Caius Octavius (31 B.C.–A.D. 14), later known as Augustus, which became the surname of all the Roman emperors, boasted that he found Rome a city of brick and left it a city of marble. His boast is true in a sense, for in his reign the sun of Imperial Rome was at full noon and building flourished; but as

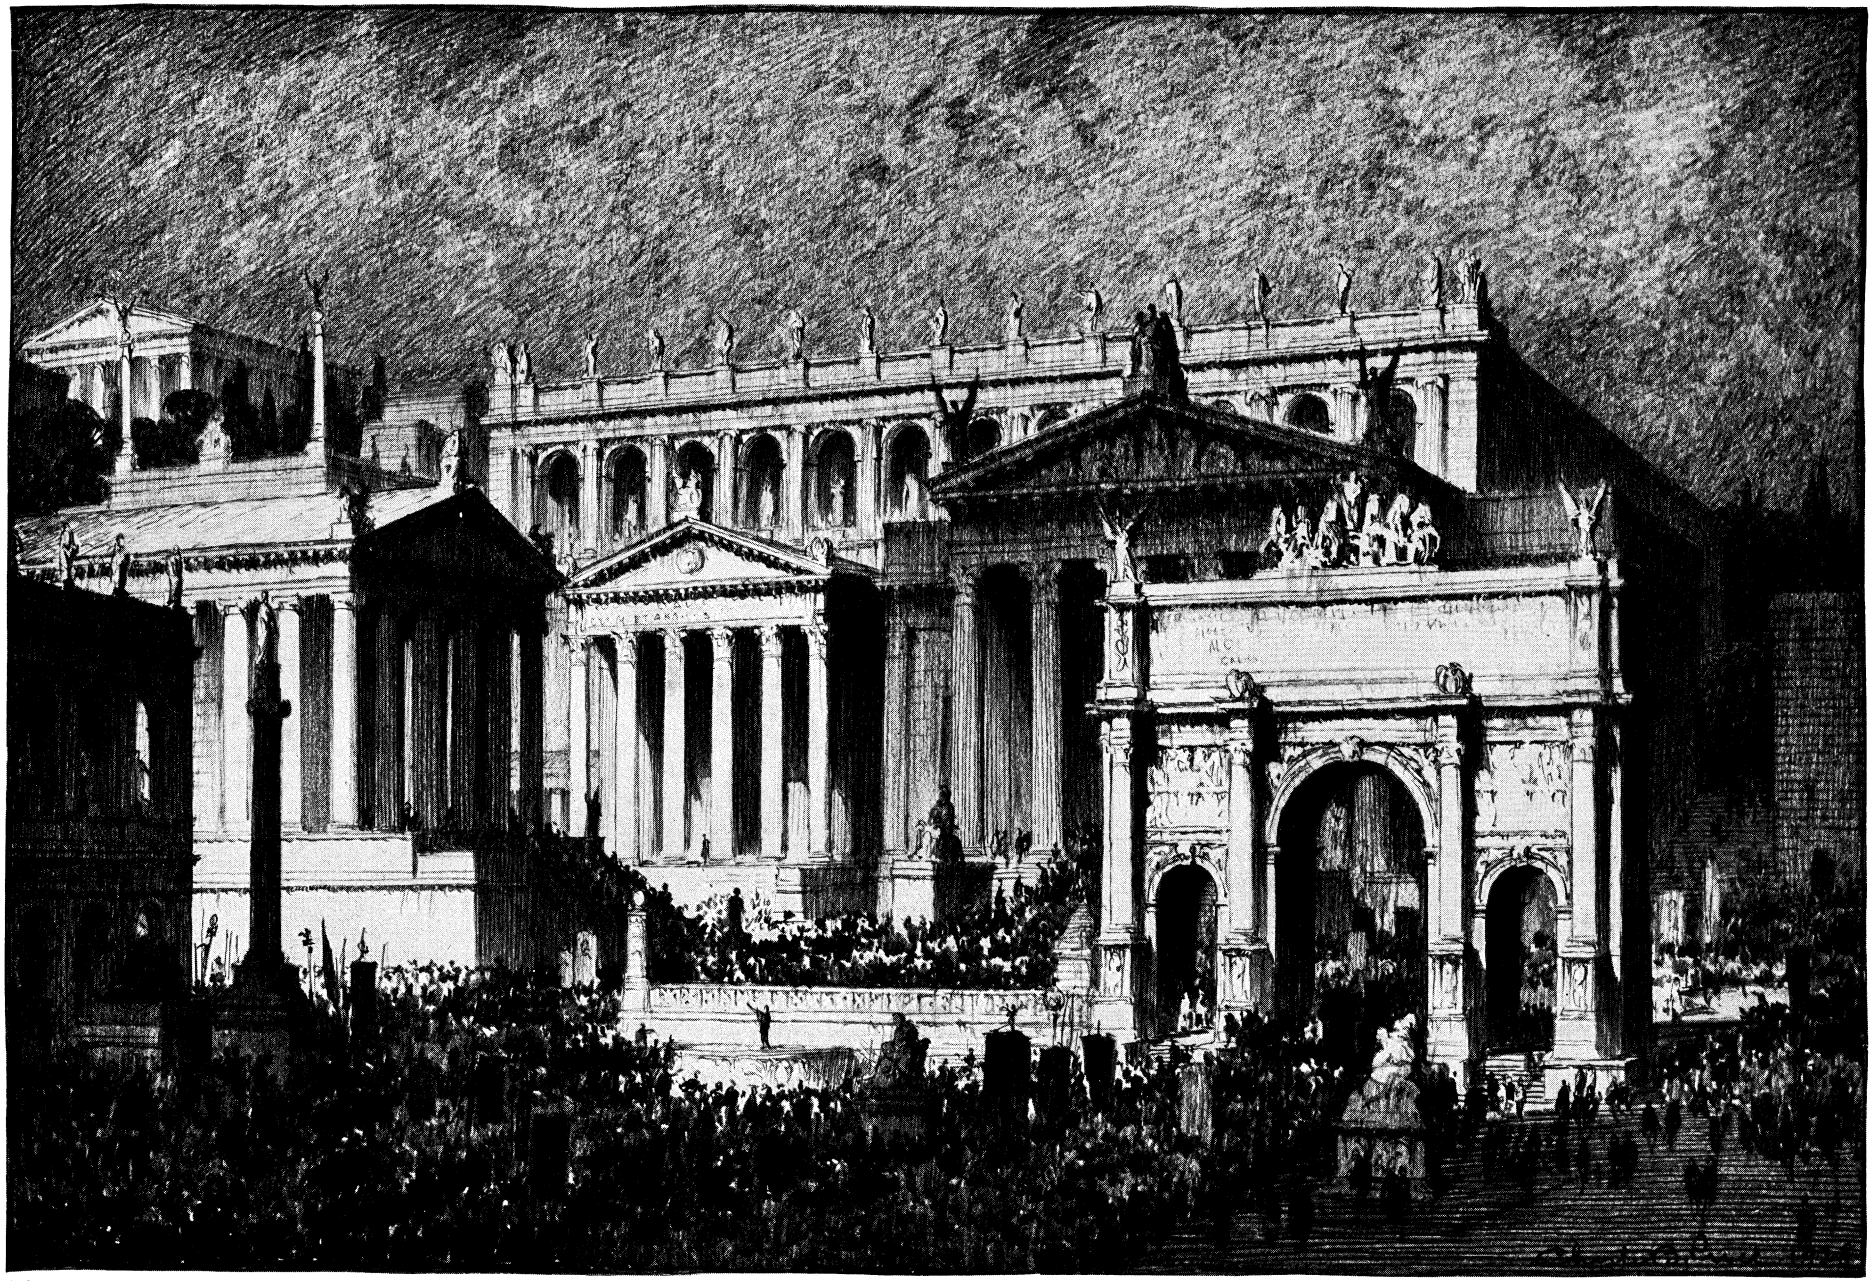
RECONSTRUCTION OF THE GREAT ALTAR AT PERGAMUM

The great altar of Zeus, erected by Eumenes II., 180 B.C., was the central feature of the acropolis of Pergamum. It consisted of a large terrace bordered on three sides by a colonnade and approached by a flight of steps between the ends of the flanking colonnades. In the centre of the terrace stood the altar proper. Around the retaining wall and acting as a pedestal for the outside columns of the colonnade was a great frieze, sculptured in high relief, representing the battle of the gods and the giants, the finest example of the Pergamum school of sculpture that survives. The architectural forms are Greek in origin, but the whole displays a feeling of luxury and dramatic climax that suggests the spirit of the earlier military monarchies of the near east. It is typically Hellenistic, rather than Hellenic. It is probably this altar which caused the writer of the Apocalypse to refer to Pergamum as "Satan's seat" (Rev. ii. 13) The remains of the altar and its surrounding buildings were excavated during the last quarter of the 19th century and taken to Berlin, where they are now set up in the Kaiser Friedrich Museum



FROM AN ORIGINAL DRAWING MADE FOR THE ENCYCLOPÆDIA BRITANNICA BY CHESTER B. PRICE

RECONSTRUCTION OF THE ROMAN FORUM

This view shows the Roman forum as it probably appeared under the later empire about the middle of the third century, A.D. In the background rise the arcades of the Tabularium, the national archives building. In front of it are the three temples of Saturn, Vespasian and Peace, and in the foreground at the right, the triumphal arch of Septimius Severus. The whole group, magnificent and rich as it is, lacks the subtlety and perfection of Greek work

a rule marble was used only as a facing, the core of the walls being formed by rubble, bricks or concrete. The rebuilding of Rome begun by Augustus was carried even farther by his immediate successors, and most of the earliest work was destroyed in the process.

The life of this victorious, self-honouring people is clearly depicted by their great forums, their law courts, their magnificent thermae or public baths, amphitheatres, bridges, triumphal arches, aqueducts and expensive town and country residences. The Romans were more practical men of the world than the Greeks, and their tastes more sophisticated, less fresh. Religion had begun to lose its grasp on the popular mind, and while it was adopted from the Greeks and kept up officially by the State, it centred more and more in a worship of imperial glory and the home, every house having an altar to its family gods.

One of the delights of Greek architecture is its perfect masonry form, marble blocks being accurately fitted together without mortar or cement by means of unequalled craftsmanship. Marble was practically the only building material Greece had. The quarries near Rome yielded a variety of stones, but the material that made structural innovation possible was pozzolana, a volcanic earth which, mixed with lime, formed an hydraulic cement of great cohesion. The Romans do not seem to have realized the tenacious properties of this pozzolana cement which in foundations formed a solid mass capable of bearing as much weight as the rock itself. They feared also the thrust of the immense vaults over their halls, to counteract which they always provided cross-walls, But when they had once covered large spaces with a permanent casing indestructible by fire, it not only gave an impetus to work in Rome, but led to a new type of plan which spread all through the Empire, and which only the differences in available materials and labour varied.

The studied and appropriate decoration of the Greeks, like their structural sincerity, disappeared in Roman architecture. The Roman legions brought home spoils from all the countries of the ancient world; niches and pedestals in Roman buildings supported alien statues. Owing to their cement, Roman builders required fewer columns to span greater spaces, and they could erect structures of several storeys, like the Colosseum. The column began to lose its structural significance; the engaged column and the pilaster were introduced and employed decoratively; in buildings of more than one storey the orders were superimposed; the composite order (*q.v.*), a combination of the Corinthian and the Ionic orders, was developed. The facings of the walls were highly polished, sometimes painted.

Rome was laid out in a series of splendid forums, or public squares, surrounded by public buildings, temples, basilicas, shops, porticos and colonnades, and containing arches and other monuments in honour of victorious emperors. The forums were the vital organs of the city. In them, commerce centred, generals were acclaimed and captives were paraded. They formed the nucleus of cities and towns even on the outskirts of the empire, and are early instances of good municipal planning.

Of the ancient Roman buildings, the Pantheon (*q.v.*) is best preserved. Now, shorn of its once splendid embellishments, it is a Christian church known as S. Maria Rotunda. It was built by Hadrian (A.D. 120–124) and originally consisted of an immense rotunda (142ft. in diameter) covered with a hemispherical dome (140ft. high); a portico was added later. Its walls are 20ft. thick and contain alternately semicircular and rectangular recesses, which probably once held statues of gods. Architecturally, its most interesting feature is its only, yet ample, source of light, a circular opening (30ft. in diameter) in the centre of the dome. The famous Colosseum (*q.v.*) is four storeys high, a sky-scraper for its day, though the topmost storey was not added until the first part of the 3rd century; it is notable for the excellent use of materials to accomplish desired structural effects; it records the love of entertainment that must have impelled the creation of such a vast structure solely for gladiatorial and similar exhibitions. Palaces were of a scale not conceived before or since. The villa of Hadrian extended over seven miles, and, in addition to numerous halls, courts, libraries, etc., Hadrian attempted to reproduce in it some of the most remarkable monuments that he had seen in his travels.

The influence of Roman architecture may be divided according to its effect on (1) the world of Roman times, (2) the world immediately following the decline of Rome, and **(3)** the world that came with the Renaissance (*q.v.*) in the 16th century. Jn Rome, quantity production and standardization tended to kill initiative, just as they do to-day; love of power, wealth and comfort, and lack of spiritual incentive produced art magnificently impressive but barren of truly emotional significance. The very grossness of life ultimately turned men's thoughts to spiritual matters, and the architecture that followed Rome's decline still inspires designers of religious buildings. When antiquity became the model for Renaissance artists, Rome had so many classical monuments that its style was dominant. No other period in history has received the study and research given to the Roman, and this, too, has helped to impress its spirit on modern architecture. Finally, science and machines excluded, the civilization of imperial Rome differed but slightly from ours; the seeming appropriateness of the Roman spirit to-day is therefore easily understood. (*See* ROMAN ARCHITECTURE.)

V. BYZANTINE ARCHITECTURE

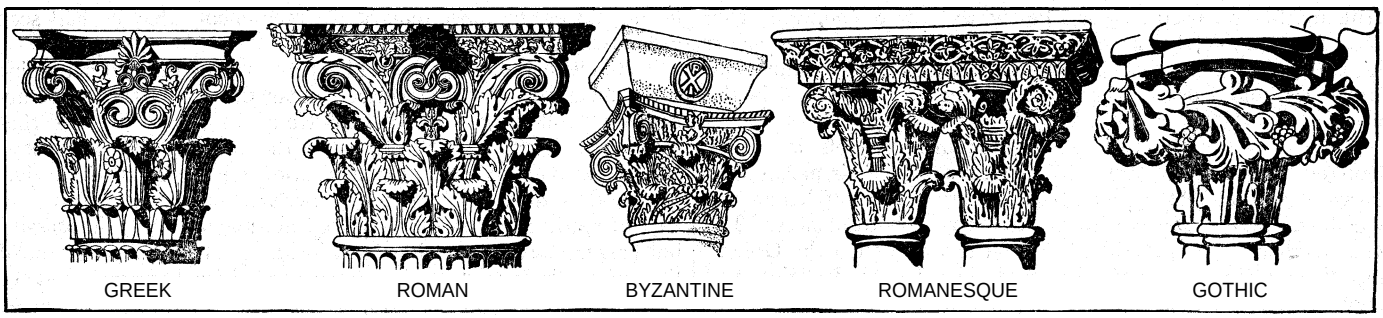
The decline of Roman imperialism was automatically accompanied by that of Roman architecture and its influence. To govern the empire from a more central location, Constantine, in A.D. 324, moved his capital from Rome to Byzantium, an ancient Greek city, to be known thenceforth as Constantinople. The same emperor had already established Christianity as the State religion, and when Byzantium was rebuilt on Roman lines the new form of worship made itself felt architecturally. As the power of Rome decreased, that of Christianity, which was destined to become the new unifying world force on which later civilizations would be built and later architecture developed, grew steadily.

Byzantine is the term applied to the style of architecture evolved in the new capital of the Roman empire. Constantine erected many churches, law courts and other buildings, practically all of which contained columns and slabs taken bodily from Roman buildings. These structures were neither indigenous to the country nor of durable form, and little or nothing of them remains. The architecture of the period had scant significance until Rome's influence diminished and what was built became more expressive of the new country, the new government and the new faith.

Passing to Justinian's time (A.D. 527–565) we find St. Sophia built between A.D. 532 and A.D. 537. It marks the highest development of the Byzantine style. In it the arch and vault, which, as explained in the section on Western Asia, probably originated in the East, were extensively developed. Christianity appealed to the mass of the population and required buildings that could accommodate congregations; it was devoted to one God instead of many; consequently it produced large churches rather than numerous small temples for various deities as earlier religions had.

St. Sophia affords one of the most perfect examples of high development of vault and dome. The great central space was acquired by means of the vast central dome which rests on pendentives (*q.v.*) leading down to four massive piers. The lateral thrust is cared for by secondary and much lower arches equally reinforced; the longitudinal thrust by two half domes each divided again into three semi-domes. The architects, Anthemius of Tralles and Isodorus of Miletus showed extraordinary skill in solving their problem. It is doubtful if modern engineers would attempt to reproduce such construction without employing the principle of the steel skeleton. In fact, the dome fell in A.D. jjj, and when rebuilt it was raised higher and pierced round its lower part with 40 circular-headed windows, which give an effect of extraordinary lightness to the structure. When considered in terms of its great span and comparatively great height, the main dome is a mere shell of unbelievable thinness.

The structure is of brick, and its being built of small elements bound together by a strong lime cement—an art developed highly by the Romans---explains the seeming mystery of its stability.



BY PERMISSION FROM SIR BANISTER FLETCPER, "HISTORY OF ARCHITECTURE ON THE COMPARATIVE METHOD." 8TH EDN. 1928 (BATSFORD)
THE DEVELOPMENT OF THE CAPITAL FROM THE GREEK TO THE GOTHIC INDICATES THE TREND OF DESIGN: IN SPITE OF THE TRANSITION IN FORM, THE RELATION OF EACH EXAMPLE TO THE OTHER IS EVIDENT

The binding nature of the cement actually absorbs the tensile strains to which it is subjected. The building measures 260ft. from entrance door to eastern apse; in width, including the aisles, 238ft.; and 175ft. from floor to the apex of the central dome. The Roman idea of surface decoration is carried to extremes; the Greek idea of structural expression in architecture disappears totally. The walls and vault above were covered with mosaics on a gold ground. The columns of the whole church on the ground floor are of porphyry, and on the upper storey of verd antique. The columns and arches give scale to the small apses, the small apses to the larger ones, and the latter to the dome, so that its immense size is grasped from the first. The lighting is admirably distributed, and the rich decoration of the marble slabs, the monolith columns, the elaborate carving of the capitals, the beautiful marble inlays of the spandrils above the arches, and the glimpses here and there of some of the mosaic showing through the stucco, all give a magnificent effect to the interior. Although often debased into a purely decorative feature, the column was used with real structural significance throughout the Roman work, in which it retained sufficient size to be an impressive element in the composition. But in St. Sophia the structural importance of the column is small, and in contrast with the enormous dcme, 107ft. in diameter, it is a secondary factor, more decorative than otherwise.

The exterior of St. Sophia has little of architectural interest except its size. Here again is a marked change from the Roman point of view, which made the superficial appearance of a building the most important element in its composition. To impress the passing throng must have been as important to Roman builders as the ceremonies carried on within their buildings. At the advent of Christianity the congregation and the ceremonies within an enclosed space became the means of impressing people. Byzantine architecture, which gave such predominant importance to the interior, has had its influence on subsequent buildings up to the present day. Its best examples, however, have appeared in south-eastern Europe. In the course of time the exteriors of buildings were embellished also, the most notable example of such treatment being St. Mark, Venice. *(See* also BYZANTINE and ROMANESQUE ARCHITECTURE.)

VI. ROMANESQUE ARCHITECTURE

The evolution of western architecture from the end of the Roman empire in the West (A.D. 475) to the Renaissance is so intimately related to that of the Christian Church that discussion of it belongs more properly to a study of the progress of the Church than to its particular manifestations in special countries. The early Christians, a persecuted people worshipping in secret, left little architecture; but where they were able to gather a following large enough to erect churches we find a most interesting combination of great religious fervour and ignorance of the building art as it had been evolved by Greece and Rome.

Throughout the dark ages the problem of the Christian Church was to tell the story of religion to a people unable to read and unacquainted with architecture, painting or sculpture. The Church was the poor man's only recourse; the struggle for existence had again become harsh and man again, as in Egypt, placed his hopes of happiness in life after death; the symbolism of the Church, the enshrined saints and the carved reliefs, all brought his goal of future happiness nearer. Symbolism and conventionalization of ornament became evident in all manner of embellishments. Sculpture became a more coherent part of buildings than it had been in Rome where niches, pediments and pedestals were prepared to receive works of sculpture that might or might not be specially designed. Eventually spiritual conceptions were carried outside the Church and appeared as elements in more elaborzte exterior designs. As Christianity became more general churches became outstanding architectural monuments in each community.

The style of architecture known as Romanesque which developed during this early period in the countries of Western Europe that had belonged to Rome, varied somewhat with the localities in which it appeared, yet was always dominated by Roman ideas, parts of Roman buildings being frequently installed in the new structures. The masonry arch was the structural form most used but understanding knowledge of its structural possibilities was limited. Attempts at great spans were few, and the compositions were essentially low and heavy. Used as a pier to support arches the column was stocky, robust, not graceful. Italian Romanesque, being nearer to the source and containing more columns and other motives taken from Roman buildings, was more graceful in proportion but lacked individual character and distinction; it has, therefore, been less influential in present-day design than French and German.

In plan, the addition of transepts and the prolongation of the sanctuary or chancel turned the Roman basilica, which was the model for early Christian churches, into a well defined cross. Walls were roughly built with external buttresses, massive and of great weight. Round arches supported on columns carried the wall of the clerestory in which small openings with semicircular arches occurred singly, in pairs or sometimes groups of three. One is impressed by the great amount of masonry used and the small proportion of the openings to the walled surface. Columns of stumpy proportion, with widespreading capitals in variations of the Corinthian or Ionic orders, gave to these structures a sense of stability and permanence to which time has proved they were entitled.

Among the best examples of the Romanesque style in architecture are: Pisa Cathedral; S. Zeno Maggiore, Verona; the Abbaye-aux-Dames, Caen; St. Trophime, Arles; Church of the Apostles, Cologne; Spires Cathedral; and Romsey Abbey, Hampshire. *(See* also BYZANTINE and ROMANESQUE ARCHITECTURE.)

VII. GOTHIC ARCHITECTURE

By the end of the 12th century the old Roman Empire had broken up into a number of distinct nations. The Church dominated each, however, for ecclesiastics possessed most of the knowledge and controlled much of the wealth of the period. Commerce had increased and the cities and towns rivalled each other in their architecture as they grew. About the year 1150 the architecture of western Europe changed rapidly toward a slenderer and more energetic type of building now called Gothic. For four centuries the art of building in this style, especially in France, was pursued with such zeal that incontestably superb churches exist within short distances of each other.

We continually refer to ecclesiastical architecture because it was absolutely dominant. The church in each community was the measure of its culture. For the people of the time the cathedrals

FRENCH AND ENGLISH GOTHIC ARCHITECTURE

1. Reims cathedral, as it was before World War I, showing a unity of composition in which lateral entrances flank the main entrance, above which the rose window lifts and unifies the whole

2. Westminster Abbey, with two towers balanced in mass, the entrance an inconspicuous part of the entire window, which rises to the full height of the nave

represented everything to which they might aspire. While the influence of Gothic verticality was felt, non-religious architecture remained essentially horizontal. To-day, in travelling through the mediaeval towns of Europe in which the modern spirit is not yet apparent, one finds the cathedral on the hilltop, rising above the little dwellings clustered at its foot and magnifying its importance, to be the only important piece of architecture.

The immense monastic activity of the time, and the need of accomplishing large results with limited means caused innovations in planning and structure contrary to Roman or even Romanesque methods. Through many experiments, the designers of the cathedrals learned that stone would carry much greater weight superimposed than had previously been imagined. The massive columns of the Romanesque evolved into tenuous and moulded Gothic piers. Every line was designed to carry the eye upward; the pointed arch, crowning the vault at the highest point of a transept, arrests the eye without, like the semicircular arch, swinging it back again. To add to this effect of lightness and delicacy, and to get the area of stone necessary to sustain the weight and take up the vault's outward thrust, the supporting piers were turned at right angles to the main axis of the nave, and great openings were left to be filled by stone tracery and leaded glass.

The pointed arch often referred to as the characteristic of the Gothic style is in fact only one feature; the most impressive characteristic is that of verticality and lightness. In the Roman work, and to a degree in the Romanesque, the points of change in the structural features—such as the archivolt, where an arch rested on a pier and the line changed from the straight to the curve; or the keystone of the arch, which locked it in position and made possible the removal of the temporary centring used during construction—were points of ornamentation and elaboration. This was not so in Gothic. The stones were merely a necessary factor. Regular courses, in the Roman many times rusticated so as'to accentuate the structural idea, were changed in the Gothic to irregular and random sizes as if to conceal their presence. To turn the eye from the horizontal to the vertical, ribs and mouldings were cut through. Overhanging cornices, which would have produced long horizontal lines, were largely eliminated. The great buttresses were converted into the lighter, well known flying buttresses; at its abutment each was strengthened by a vertical weight which, instead of being a massive block, was composed of a series of small stones piled in diminishing ratio one above the other and carved and embellished in the vertical spirit so as always to carry the eye upward to a point which seemed gradually to thin out to nothing. The horizontal bands used were interrupted by finials. Corbels were purposely so separated as to break any continued horizontality.

Complete in all parts, the Cathedral of Chartres is a splendid example of what this art was at its zenith. The plan has a nave with aisles, transepts with aisles on each side, a choir with two aisles all round it, and chapels beyond them. There are two immense steeples at the west end, two towers to each transept and two towers at the junction of the choir with its apse. The doorways are triple at the west end, whilst to each transept is a vast triple porch in front of the three doorways. The whole of these doorways are covered with sculpture, much of it refined, spirited and interesting to the highest degree. The interior even surpasses the exterior. The order of the columns and arches, and of all the details, is so noble and simple that no fault can be found. The whole is admirably executed; and, finally, every window is full of the richest glass coeval with the fabric.

The separation that exists to-day between architect, builder and labourer, with the architect as a professional man concerned with the preparation of drawings and specifications, the builder as an executive directing or assembling different sub-contractors in the execution of work, and each sub-contractor employing and directing men in his particular field, was not so marked in the days of the cathedral builders. All building was a more leisurely proceeding then; not that the workers had shorter hours, but time, the paramount factor in present-day life. was less important. It is very evident that the workers took pride and personal interest in their performance. They regarded it as ensuring their happiness in the next world. They recognized themselves as small but essential cogs in the wheel of progress. In studying the great cathedrals one realizes and feels the personal factor. Guilds of skilled craftsmen in stone, iron, bronze, gold, silver and glass developed, and their art was perpetuated through systems of apprenticeship. Each generation was guided by older and more experienced workers, gained knowledge from personal experience and evolved new methods after knowing and thoroughly understanding earlier ones. The cathedral builders were workmen who, feeling themselves to be part and parcel of the structure they were erecting, left evidence of their identities. To build in Gothic now with the full spirit of the original, requires either an exact copy of what has been done, in which case, of course, the copy is inevitably cold and uninspiring, or else re-creation of the guilds of workers actuated and guided by the same spiritual forces, and limited by the same physical and mechanical handicaps that existed when the cathedrals were built.

Exhaustive studies made by such men as Prof. W. H. Goodyear seem to prove that the cathedral builders employed studied refinements similar in principle to those practised by the Greeks. The lack of scientific instruments might easily have caused inaccuracies. But variations from rigid lines, right angles and repetitions in the inter-axe or spacing of the piers and other elements of the composition recur so frequently in the same manner as to indicate that they were designed. In the Christian church, which assembled people within its walls, the effect on the worshippers of subdued light, incense, candles and processionals became the starting point of religious influence. Anything that could impress a worshipper with fear of the cruel retribution in store for him if he failed to live according to the ethics of the Church, and with hope of reward for proper conduct, became potent in architectural design. Through their fear, religion held sway over a sensitive and superstitious people. Grotesque gargoyles and demons were carved in stone and, together with saints and angels depicted in glass, mosaics and paintings, created the special atmosphere desired. The dim interior of the old Romanesque churches was due to small and widely spaced openings. The grace and delicacy of Gothic cathedrals resulted in structures whose many and large openings would have flooded the interiors with light had stained glass not been used. But with great rose windows and pointed arch openings filled with deeply coloured glass on which the glory of the saints and the suffering of sinners was told and retold, a religious atmosphere was produced that inspires and uplifts even unbelievers in this materialistic age. (See also GOTHIC ARCHITECTURE.)

VIII. RENAISSANCE ARCHITECTURE

Greece sprang from the seeds of Egyptian and Western Asiatic cultures; Rome, in its turn, from the seed of Greece. The Renaissance (*q.v.*) that started in Italy during the 14th century was a new phenomenon only in that it affected all Western Europe and, later, even the American colonies. This modern Renaissance, which we purposely call modern because the present is part of its growth, was literally a rebirth of the arts, science, refinements of living, culture in general. Centuries of gradual change in the spiritual and material environments of man had nurtured the cultural seeds of the Roman empire. One, the Gothic, was carried so far afield and grew up in such alien soil that it flowered like a new species, distinctly separated from other architectural forms. Another for a time lay dormant in the south, particularly in Italy where something of the splendour and popular enlightenment of the ancient Roman civilization was perpetuated; it flowered in the Renaissance, carrying on the direct line of architectural development where it had broken off with the downfall of the Western empire.

The invention of printing (1453) made classical literature, from which the Renaissance drew its chief impulse, more generally known throughout Western Europe. By taking an important function from the painter, the sculptor and, indirectly, the architect, it revolutionized art. Henceforth, lessons that had been taught through the mediums of sculpture, painting, stained glass and fresco could be brought more immediately before mankind by the printed page. This change, however, was not sudden and those in

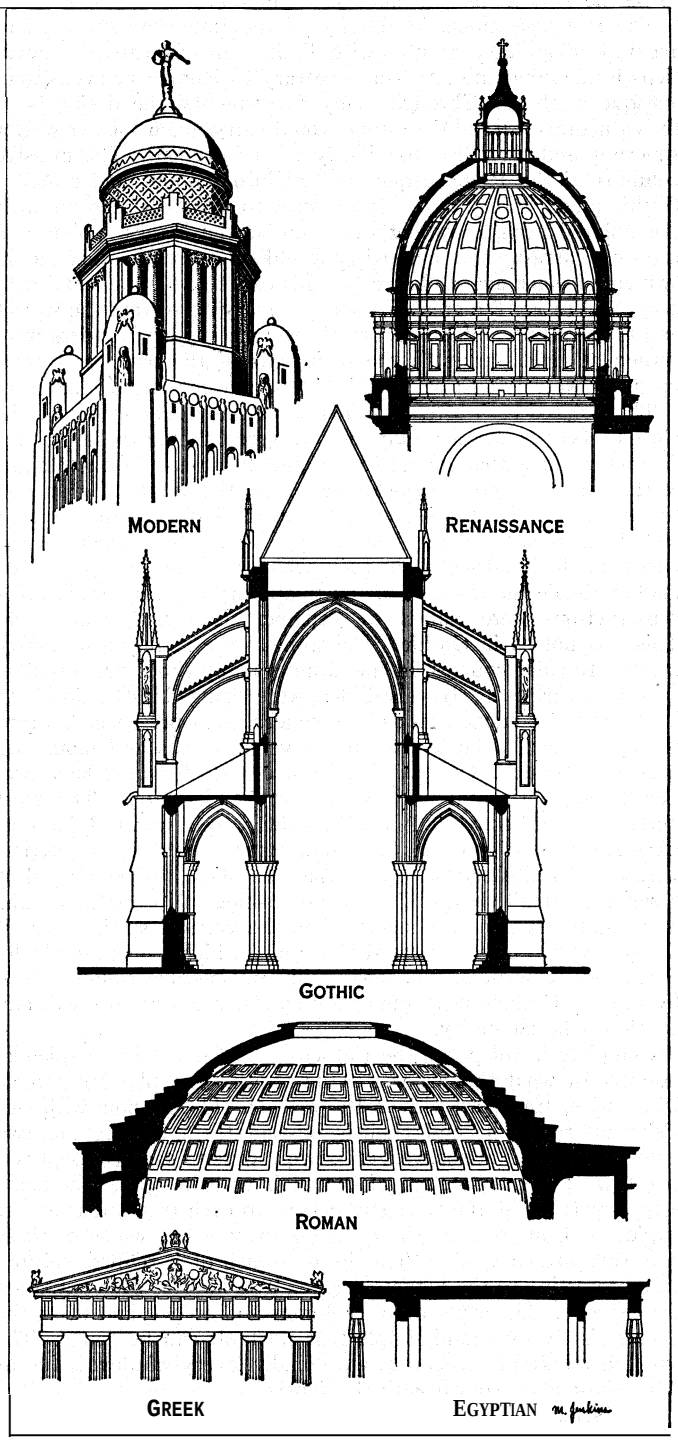
power continued to use buildings, monuments, etc., to demonstrate their importance. National governments became stabilized, material interests increased and wealth grew. Nobles, vying in material display even with the Church, became patrons of art. Scientists, philosophers, artists and scholars, whose individualities were again recognized, explored other than religious phases of life, diversifying thought. This was an age in which artist, craftsman and architect were one; artists were ready and able to accomplish whatever their patrons demanded. Michelangelo executed paintings in the Sistine chapel, sculpture in the Medici Mausoleum and the final architectural design for St. Peter's. Leonardo da Vinci, judging from his letter of self-recommendation, seems to have been prepared for any undertaking in art, science or war.

Throughout the first two centuries of the Renaissance, architecture and the other arts as part and parcel of it, developed with the Roman influence paramount. The manuscript of Vitruvius, a Roman architect, was discovered about 1452; it admirably describes the building materials employed in his day (c. 25 B.C.) and gives the correct proportions of the various orders (*q.v.*) together with a series of rules for their use. None of the original illustrations of this manuscript were preserved, and when parts of it were published by Italian architects, among whom Vignola and Palladio were the more important, woodcuts representing their interpretations of the lost illustrations were inserted. Thus textbooks of the orders were established. The Roman orders themselves became the architectural alphabet, and definite forms became the accepted fashion of the time.

The spirit of verticality so admirably developed by the Gothicists was abandoned. The column was used in free-standing colonnades, as engaged columns partly buried in walls and as pilasters to decorate wall surfaces and to frame openings. A comparatively new form appeared in the interior of basilica churches, where the clerestory wall was sometimes supported on columns and a semicircular arch substituted for a lintel. Many of the palazzi show a treatment distinctly characteristic of the period. Erected in the congested centres of cities, they were built on the street line with relatively few windows and a great expanse of simple wall heavily rusticated. The ground floor was particularly solid in appearance; its windows, small and high above the street level, were protected by metal grilles as if the designers had to provide for defence against mobs or rival families. The interior courtyard was treated lightly and delicately with two or more storeys in the form of an open arcade on which the grandiose rooms about the central patio opened. The wall was capped with an imposing cornice whose projection was proportionate to the height of the building. The palazzi were invariably built on a magnificent scale; the Palazzo Strozzi, Florence, for example, with only three apparent storeys, is 104ft. from street level to top of cornice.

In the later Renaissance the dignity of the simple interior wall was somewhat diminished by adding rows of paired pilasters, cornices and balustrades. Such decorative features occur in the Palazzo della Cancelleria, the Palazzo Pietro Massimi and the Palazzo Farnese, all in Rome. In these, the proportion of window openings to wall spaces was much greater than in the Florentine palazzi; pilasters were used as frames to windows and to give prominence to the central motif of the second storey. Most interesting combinations of ancient Roman motifs were developed; the villa of Pope Julius, Rome, has, on the garden side, a semicircular façade reminiscent of forms used in Roman baths.

While dominant in Italy, the Renaissance swept throughout western Europe, and the rise of independent nations gave the general movement distinctive trends. The conceptions of its early period, when artists' imaginations were inspired by an opportunity to create in an environment not yet conventionalized, were fresh, pure, naive. As more knowledge of ancient Roman architecture, with its mechanically repeated motifs and impressive scale, was acquired, the earlier charm of the Renaissance was supplanted by excessive standardization and a consequent loss of intimate interest. But artists, seeking new means of expressing their ideas, ever revolt at rules, and the Baroque style resulted from their struggle at this time to give imagination freer rein (*see* BAROQUE ARCHITECTURE). Flamboyant and grotesque forms which distorted classic motifs appeared in all countries. They produced little of lasting value because their inspiration was not due to a desire for structural improvement, but only for ornamentation and embellishment. Having broken his bonds, the artist found he had nowhere to go.



FROM THE POSTS AND LINTEL OF EGYPT AND GREECE TO THE MODERN ENCASEMENT OF THE STEEL FRAME. ROOFING HAS DEVELOPED WITH AN EVER INCREASING SPAN AND HEIGHT

Fashion in architecture has generally been set by the country of greatest wealth and power, and during the 17th century forces were at work in England that were to take full form under the empire builders a hundred years later. English architecture showed the result of increasing prosperity, power and national consciousness. The Roman influence was as marked as it had been in Italy earlier, but it was somewhat differently ex-

RENAISSANCE STYLE IN ITALY, FRANCE AND ENGLAND

1. Villa di Papa Giulio, Rome, designed by Giacomo Barozzo da Vignola in **1550.** A characteristic example of the Italian Renaissance palace, showing subtlety of proportion and a carefully adjusted relation between the mass of the façade and its decorative features. The contiast between the heavily rusticated entrance and the lighter loggia above is one often seen in this style
2. Farnese palace, Rome, built in **1534,** Antonio Sangallo the younger, architect. An example of the box-like type of building, showing a three-part horizontal composition, the three storeys being of nearly equal heioht. An effect of unitv is achieved by the repetition of motifs; the detail is finely conceived and carried out, but subordinated to the whole
3. Chlteau de Chambord, Touraine, built in **1526,** Pierre Nepveu, architect. An illustration of the French Renaissance chlteau style, characterised by the variety of its outlines and decorative motifs, in contrast with the more severe dignity of the Italian forms
4. Banqueting House, Whitehall, London, built **1619-21** by Inigo Jones, showing a strong Italian influence with two-part horizontal composition. The regularity of window arrangement and repetition of detail give an effect of uniformity, as in the Farnese palace
5. Hampton Court palace, Middlesex, combines Tudor and Renaissance architecture. The Tudor part was erected in **1515** for Cardinal Wolsey and the Renaissance part shown above was designed by Sir Christopher Wren and is a notable example of the combination of brick and stone frequently used in the English Renaissance,. The simplicity and regularity of the composition exhibit the Italian influence.
6. Blenheim palace, Oxfordshire, designed 1705 by Sir John Vanbrugh for the first Duke of Marlborough. A monumental example of the English Renaissance mansion. The plan shows perfect symmetry, with an imposing treatment of the entrance, in which the use of heavy two-storey columns unifies this feature and makes it an integral part of the whole design

ARCHITECTURE

FURTHER EXAMPLES OF THE RENAISSANCE STYLE IN ENGLAND AND FRANCE

1. Church of St. Clement Danes, the Strand, London, Sir Christopher Wren, architect; built in 1684, the steeple finished in 1719. In the spires, a feature of many of Wren's churches, the pointed form, reminiscent of the Gothic, was successfully combined with classical features. The church was destroyed in a German air raid in World War II
2. Church of the **Val-de-Grâce,** Paris, built 1645–50, **François Mansart,** architect, showing Italian influence, with great freedom and variety in the use of classical forms. The dome is regarded by architects as notably successful, and the composition as a whole has been the source of many subsequent designs
3. The Louvre, Paris. The present building was begun in 1546, in the reign of Francis **I.,** from the plans of Pierre Lescot, under whom worked Jean **Goujon,** the greatest decorative sculptor of the French Renaissance. The building illustrates successive stages of development in the Renaissance style, and was not **completed** until about 1880. The colonnade shown here, built about 1665, is from the design of Claude Perrauit. The long, monotonous **façade** has been relieved by the use of the recessed wall at either side of the central motif. The flatness of the end pavilion walls has been similarly relieved by recessing the central windows

pressed. A more stabilized society caused the city palace to be a building not of defence but of impressive elegance, and the growth of an imperial yet representative government necessitated great buildings to house its agencies. The work of Sir Christopher Wren in the latter part of the century inspired succeeding generations of architects, even influencing styles in America. Wren, working in the Renaissance spirit, adapted Roman forms to churches, which in northern countries had always been Gothic; even the spire, an essentially Gothic element, was designed classically by Wren in a number of ecclesiastical structures which pierce the London skyline. In the 18th century government buildings, hospitals, palatial estates and university and college buildings gave evidence of the growing wealth and power of the State and the genius of English architects. (See also RENAISSANCE ARCHITECTURE.)

CONCLUSION

Architecture was at a low ebb throughout the 19th century (see MODERN ARCHITECTURE, 18TH AND 19TH CENTURIES), a period that to-day seems to have been compounded of pompous and complacent materialism, conventionality and self-sufficiency. While painters, writers and musicians were preoccupied with developing new forms of expression, architects, in both Europe and America, were chiefly concerned with adapting, and much too often awkwardly adapting, the old. In America, the 19th century gave birth to the steel skeleton, but of architecturally memorable design it was almost barren everywhere. Fresh conceptions in mass or line were unknown until its end.

Between great periods of art there is a time of darkness in which inventiveness lies stagnant. For architecture, the 19th century was such. The material world was literally in flux. Such abrupt changes in man's ways of life as then occurred in swift succession might stimulate the painter or the writer, but at first they were appalling to the architect, for while the former may follow the dictates of imaginative impulse, the latter is always strictly governed by the need for buildings and the kind of buildings needed. In the 19th century he was called upon to build on a larger scale, an ever-growing scale, for a larger and ever-increasing number of persons without any special taste or knowledge of what constitutes the beautiful. Dissolution of old conceptions and development of new were alike impossible. Inevitably the age became one of revivals.

A few men persisted, as they still do, in the classic tradition, writing and talking as well as building in their efforts to perpetuate it. But the exuberance, the fresh vitality of spirit, that in the early Renaissance had given new meaning to fundamentally old forms, was lacking in the 19th century. Consequently the works in classic style at this time were for the most part uninspired and uninspiring. The so-called Gothic and Romanesque revivals were no more productive.

Art remained alive, but only among small groups. Life was speeded up by mechanical inventions and the attention of those men who had been patrons of the arts was turned from the problem of making their environment more pleasing to keeping pace with its improvements. Those who continued to regard building as an art, over-emphasized, perhaps quite naturally, the beauty of past periods. The mind absorbed with Greek or Gothic forms was hardly capable of designing for the steel skeleton when it appeared after the three-quarter century mark had passed. Thus the 19th lost to the 20th century what might have been a claim to architectural distinction, had its designers solved creatively the new problems in proportions, masses and spaces to be enclosed. The artists were not alone to blame for their sterility; lack of demand inevitably decreased the production of artistic works. For this there were three reasons.

The human capacity to absorb the arts is limited. When one predominates the others are sacrificed. Throughout antiquity, the middle ages and the early Renaissance, the arts of design were of first importance. Thereafter, the spread of literature was enormous, and it turned men's minds to reading. The fine arts, including architecture, became secondary and have so remained.

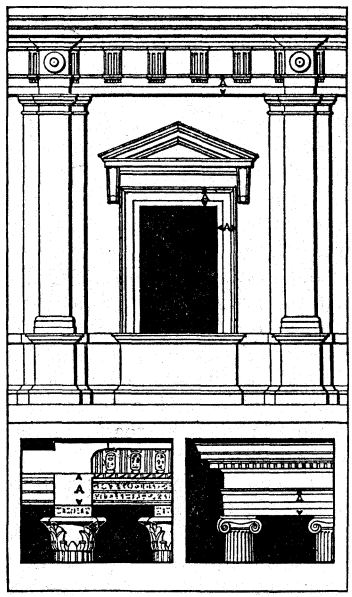
Democracy proved successful, and rulers who were also patrons of the arts vanished with the vestiges of feudalism. Formerly, each ruler and powerful noble created, as a manifestation of his importance, a setting which was designed to surpass his rival's and to which artists, architects and craftsmen all contributed. Various styles of Renaissance architecture resulted from such efforts of strong personalities, of which Napoleon was the last, to record their existence. Beauty in all its forms was then evidence of superiority. When class barriers were broken down, however, wealth and power passed from an aristocracy, which had employed and inspired artists as a necessary adjunct of its position, to any individual, irrespective of training or background, who could grasp them. The man of wealth but no official title was perhaps no different in his desires for display, but he lacked cultural and material precedents, such as the buildings and their contents belonging to historic families. He was afraid to create an artistic setting of his own, to demand works of art designed especially for himself. Feeling safe in surrounding himself with things of proved value that his bank account could procure, he turned, moreover, to works of art that had already been created and the ownership of which signified wealth.

The tremendous Progress of science and invention during the 19th century is the third reason for the stagnation of the arts. Men's energies, thoughts and talents were absorbed by exploration of these fields which ignorance and dogmatism had kept sealed during the middle ages and the early Renaissance. The subsequent evolution of industrialism with its concomitant mass production and mass consumption helped to turn men's eyes from creation and enjoyment of the arts to the problem of how to achieve more concentration, more production and knowledge of natural forces.

At the beginning of this article it was pointed out that modern architecture is becoming more truly expressive of contemporary culture; changes in the three conditions cited above indicate that a new flowering of the Renaissance is not impossible. The motion picture increases interest in things visual, and the radio is replacing printed words as a means of setting forth ideas. The quantity of literature now produced is so enormous that men are beginning to lift their eyes from printed pages and look about with growing enthusiasm for beautiful ,surroundings and a slowly awakening critical sense. Democracy, having passed through its formative period, functions more or less mechanically, releasing men's energies from the struggle to maintain it. Science and invention still occupy men's imaginations, but they produce for all mankind the two things most essential to successful art: wealth and leisure. Possessed of these, both individual and group are becoming less uncertain as to how to express themselves artistically; they are turning from the purchase and display of antiques to settings and environments created by contemporary artists. This demand for beauty is growing on every side and, like the early Renaissance, it encourages fresh design.

Journal* (London); *Moderne Bauformen* (Stuttgart); *L'Architecte* (Paris); and *Architettura e Artz Decorative* (Rome). (H. W. C.)

ARCHITRAVE, an architectural term for the chief beam which carries the superstructure and rests immediately on the columns In the classical entablature (*q.v.*) it is the lowest of the three divisions, the other two being the frieze and the cornice (see ORDER). The term is also applied to the moulded frame of any opening or panel.



"A" MARKS THE LOCATION OF VARIOUS ARCHITRAVES. UPPER FIGURE, ITALIAN RENAISSANCE; LOWER LEFT, EGYPTIAN. LOWER RIGHT. GREEK

ARCHIVE, a term (generally used in the plural) properly denoting the building in which are kept the records, charters, and other papers belonging to any state, community, or family (Lat. *archivum,* a transliteration of Gr. ἀρχεῖον, an official building), but now generally applied to the documents themselves (see RECORD).

ARCHIVOLT, an architectural term applied to the mouldings of an architrave when carried round an arched opening. (See next column.)

ARCHON, the title of the highest magistrate in many ancient Greek states (ἄρχων, ruler). The archons represented the ancient kings, whose absolutism yielded in process of time to the power of the noble families, supported no doubt by the fighting force of the state. Aristotle's *Constitution* of *Athens* (*q.v.*) mentions five stages: (1) the institution of the polemarch, who took over the military duties of the king; (2) the institution of *the* archon to relieve the king of his civil duties; (3) the tenure of office was reduced to ten years; (4) the office was taken from the "royal" clan and thrown open to all Eupatridae; (5) the office was made annual, and to the existing three offices, military, civil and religious, were added the six *thesmothetai,* whose duty it was to record judicial decisions. The change was effected by the devolution of the military and civil powers of the king to the polemarch and the archon, while the archon basileus (or king-archon) retained control of state religion. The archon became the chief state official and gave his name to the year (hence *archōn epōnumos*). The early history of the *thesmothetai* is not clear, but there is no reason for supposing that in the early times they, with the three chief archons, constituted a collective magistracy. At the time of the Cylonian conspiracy responsibility attached to the archon Megacles, not to the whole body. According to Aristotle, collective responsibility began in Solon's time.

Evolution of the Office.—The history of the democratization of the archonship is beset with equal difficulty. In the early days, the importance of the office (confined as it was to the highest class) must have been immense; there was no audit, no written law, no executive council. The popular assembly was ill-organized and summoned by the archons themselves. The only control came from the Areopagus (*q.v.*), which would generally be favourably disposed from the fact that the military and civil powers were not vested in the same hands. The institution of popular courts by Solon had within it the germ of democratic supremacy, but the immediate result was small; thus, Damasias held the archonship for more than two years in defiance of the new constitution. Gradually the archonship lost its power in judicial matters, until it retained merely the right of holding the preliminary investigation and the formal direction of the popular courts. Its administrative powers, save those wielded by the polemarch (*see* next column and cf. STRATEGUS), dwindled away into matters of routine. After 487 B.C. the list of archons contains no name of importance. This is due to the growing importance of the Strategus and to the institution of sortition (see next column), which, whether as cause or effect, is by the 5th century indicative of diminished importance.

Sortition.—From the Constitution of Athens (22) we gather that from the fall of the Tyranny to 487 B.C. the archons were αἱρετοί, not κληρωτοί (*i.e.*, chosen by vote, not by lot), and that in 487, limited sortition was introduced whereby fifty candidates were elected by each tribe, and from these the archons and their "secretary" were chosen by lot. It is perfectly clear that the lot was not used between the Tyranny and 487 B.C. and that after 487 the lot was always used; in fact, at a date not known, the mixed system of Aristeides gave place to double sortition, in which the first nomination also was by lot. To enter here into the theory of the lot is impossible. It should, however, be observed that in the somewhat material atmosphere of constitutional Athens the religious significance of the lot had vanished; no important office in the 5th and 4th centuries was entrusted to its decision. The real effect of sortition was to equalize the chances of rich and poor without civil strife.

Qualifications and Functions.—It remains to give a brief analysis of the qualifications and functions of the archons after the year 487 B.C. After election a short time had to elapse before entering on office to allow of the dokintasia (examination of fitness). In this the whole life of the nominee was investigated, and each had to prove that he was physically without flaw. Failure to pass the scrutiny involved a certain loss of civic rights (*e.g.,* that of addressing the people). The successful candidate had to take an oath to the people (that he would not take bribes, etc.) and to go through certain preliminary rites. Any citizen could bring an impeachment (eisangelia) against the archons. Any delinquency involved a trial before the Heliaea. Finally, an examination took place at the end of the year of office, when each archon had to answer for his actions with person and possessions; till then he could not leave the country, be adopted into another family, dispose of his property, or receive any "crown of honour." The archons at the end of their year of office became members of the Areopagus, which was, therefore, a body composed of ex-archons of tried probity and wisdom. On entering upon office the archon (*archōn epōnumos*) made proclamation by his herald that he would not interfere with private property. His official residence was the Prytaneum (q *v.*) where he presided over all questions of family, *e.g.,* the protection of parents against children and vice versa, protection of widows, wardship of heiresses and orphans, divorce; in religious matters he superintended the Dionysia, the Thargelia, the processions in honour of Zeus the Saviour and Asclepios. The archon basileus superintended the holy places, the mysteries, the *Lampadephoria* (Torch race), etc., questions of national religion and certain cases of bloodguiltiness. His official residence was the Stoa Basileios, and his wife, as officially representing the wife of Dionysus, was called *basilinna* (queen). The polemarch, who was commander-in-chief down to about 487 B.C., became in the 5th century a sort of consul who watched over the rights of resident aliens (metoikoi) in their family and legal affairs. He offered sacrifices to Artemis Agrotera and Enyalios, superintended funeral games and arranged for the annual honours paid to the tyrannicides His official residence was the *Epilukeion*

ARCHPRIEST, in the Christian Church, originally the priest who presided over the presbyters of a diocese and assisted the

bishop in matters of public worship. Where, as in Germany, the dioceses were of vast extent, these were divided into several archpresbyterates or rural deaneries, the office of archpriest ultimately becoming synonymous with that of rural dean. In Rome, the office of archpriest of St. Peter's developed into that of cardinal-vicar. The Roman Catholic clergy in England were under an "archpriest" from 1598 to 1623. In the Lutheran Church in Germany the title archpriest (*Erzpriester*) was in some cases long retained, his functions being much the same as those of the rural dean.

ARCHYTAS (c. 428–347 B.C.), of Tarentum, Greek philosopher and scientist of the Pythagorean school, famous as the intimate friend of Plato. He was seven times elected commander of the army. Under his leadership, Tarentum fought with unvarying success against the Messapii, Lucania and even Syracuse. According to a tradition suggested by Horace (*Odes,* i. 28), he was drowned on a voyage across the Adriatic, and he was buried, we are told, at Matinum in Apulia. He is described as the eighth leader of the Pythagorean school, and was a pupil of Philolaus. He was the first to draw up a methodical treatment of mechanics with the aid of geometry, and to distinguish harmonic from arithmetical and geometrical progressions. He evolved an ingenious solution of the duplication of the cube. The theory of proportion, and the study of acoustics and music were advanced by his investigations. He was said to be the inventor of a kind of flying-machine (see Aulus Gellius Noct. Att., x. 12, 9).

Fragments of his ethical and metaphysical writings are quoted by Stobaeus, Simplicius and others. Such of them as seem to be authentic are of small philosophical value, but Archytas must have been famous as a philosopher, as Aristotle wrote a special treatise (not extant) On the *Philosophy* of Archytas. Some positive idea of his speculations may be derived from two of his observations: the one in which he notices that the parts of animals and plants are in general rounded in form, and the other dealing with the sense of hearing, which, in virtue of its limited receptivity, he compares with vessels which when filled can hold no more.

ARCIS-SUR-AUBE, a town of eastern France, in the department of Aube, about 20 mi. N. of Troyes. Pop. (1936), 2,455. The ancient settlement was destroyed by successive fires from 1719 to 1814; and the little town now has an 18th-century appearance. A 15th-century church, however (St. Etienne), with a good portal, survives. In front of it stands a statue of Danton, who was born there. There is some carrying trade with Paris on the Aube, which becomes navigable at this point.

A battle was fought there on March 20 and 21, 1814, between Napoleon and the Austro-Russian army under Schwarzenburg. (See NAPOLEONIC CAMPAIGNS.)

ARCO (Ital., bow), a word used in music when, after a *pizzicato* passage (*i.e.,* a passage played by plucking the strings with the fingers) the player of a bowed instrument, such as the violin, is required to resume playing col arco or "with the bow."

ARCOLE, a village of N. Italy, 16m. E.S.E. of Verona, on the Alpone stream near the confluence with the Adige below Verona. The village names the three days' battle of Arcole (Nov. 15, 16, 17, 1796), in which Napoleon defeated the Austrians commanded by Allvintzy. This battle, perhaps the most critical in Napoleon's early career, is dealt with under FRENCH REVOLUTIONARY WARS. Its close was signalized by the successful ruse of sending a few French trumpeters to sound the charge in the rear of the Austrian army. Pop. (town) 1,945 (commune) 4,480.

ARCOS DE LA FRONTERA, a town in Spain, province of Cádiz; on the right bank of the river Guadalete. Pop. (1930) 17,675. It occupies a ridge of sandstone, washed on three sides by the river, and commanding fine views of the lofty peak of San Cristóbal on the east and the fertile Guadalete valley celebrated in ancient Spanish ballads for its horses. From the highest point a Gothic church with a fine gateway and a modern tower overlooks the town. The fame of its ten bells dates from the wars between Spaniards and Muslims in which "Arcos of the Frontier" received its name. The town was captured in 1250 by Ferdinand III. of Castile and Leon.

ARCOT, the name of a city and two districts of British India in the presidency of Madras. Arcot city is the principal town in the district of North Arcot. Prominent in the history of the British conquest, it has now lost its manufactures and trade and preserves only a few mosques, tombs and ruined fortifications as traces of its former grandeur. It is a station on the line of railway from Madras to Beypur. The most famous episode in its history is the capture and defence of Arcot by Clive. In the middle of the 18th century, during the war between the rival claimants to the throne of the Carnatic, Mohammed Ali and Chanda Sahib, the English supported the claims of the former and the French those of the latter. In order to divert the attention of Chanda Sahib from the siege of Trichinopoly, Clive attacked Arcot—which was garrisoned by a force of 1,100—with a force of only 200 Europeans and 300 natives, and took the fortress without a struggle. Chanda Sahib was obliged to detach a large force of 10,000 men to recapture the city, and the pressure on the English garrison at Trichinopoly was removed. Arcot was afterwards captured by the French; but in 1760 was retaken after the battle of Wandiwash. It was also taken by Hyder Ali when he ravaged the Carnatic in 1780, and held by him for some time. The town of Arcot, together with the whole of the territory of the Carnatic, passed into the hands of the British in 1801. Pop. (1931), 14,232.

The district of North Arcot is bounded on the north by the district of Chittore; on the east by the district of Chingleput; on the south by the districts of South Arcot and Salem; and on the west by the Mysore territory. The area of North Arcot is 4,648 sq.m., and the population in 1931 was 2,266,989. The country is flat and uninteresting in the east and south, but the west, along the foot of the eastern Ghats, as well as all the country northwards from Trivellam to Tripali and the Karkambadi Pass, is mountainous. The western elevated platform is comparatively cool, being 2,000ft. above the level of the sea. The hills are principally granite and syenite, with little vegetation, but they abound in minerals, especially copper and iron ores. The narrow valleys between the hills are very fertile and well watered at all seasons. The principal river is the Palar, which rises in Mysore and flows through North Arcot from west to east, eventually falling into the sea at Sadras. Although a considerable stream in the rainy season, and often impassable, the bed is dry or nearly so during the rest of the year. The largest towns are Vellore (the district headquarters), Tirupati (a great religious centre), and Wallajapet.

The district of South Arcot is bounded on the north by the districts of North Arcot and Chingleput; on the east by the French territory of Pondicherry and the Bay of Bengal; on the south by the British districts of Tanjore and Trichinopoly; and on the west by the British district of Salem. It contains an area of 4,207 sq.m., and its population in 1931 was 2,454,507. The country is low and sandy near the sea, and for the most part level till near the western border, where ranges of hills form the boundary between this and the neighbouring district of Salem. These ranges are in some parts about 5,000ft. high, with solitary hills scattered about the district. The principal river is the Coleroon which forms the southern boundary of the district, separating it from Trichinopoly. This river flows strongly far most of the year, and two irrigating channels distribute its waters. Other rivers are the Vellar, Pennar and Gadalum. A considerable proportion of land is irrigated from the rivers and from tanks. Manufacture and export of native cloth have now been almost entirely superseded by the introduction of European piece goods. The chief seaport of South Xrcot is Cuddalore, close to the site of Ft. St. David. The principal crops in both districts are rice, niillet, other food grains and ground nuts.

ARCTIC REGIONS, the term applied to the regions round the North Pole, covering the area (both ocean and lands) where the characteristic polar conditions of climate, etc., obtain. The Arctic circle is drawn at 66° 30′ N., but this has no geographical value as a boundary. A more satisfactory delimitation is the area north of the limit of tree growth. This embraces in addition to Greenland, Spitsbergen and other polar islands, the northern parts of the mainlands of Siberia, Alaska and Canada, the coasts of Labrador, the north of Iceland and a strip of the Arctic coast of Europe but the last, on other grounds, should be excluded.

EXPLORATION OF ARCTIC REGIONS

Ancient Ideas.—The ancients had no actual knowledge of the polar regions. By astronomical speculations the Greeks had come to the conclusion that north of the Arctic Circle there must be midnight sun at midsummer and no sun at midwinter. The general view was that the polar regions, north and south, belonged to the uninhabitable frozen zones; while according to a less scientific notion there was a happy region north of the north wind (Boreas), where the sun was always shining and the Hyperboreans led a peaceful life.

Pytheas.—The first traveller of history who probably approached the Arctic Circle was the Greek Pytheas (*q.v.*), from Massalia (Marseilles), who about 325 B.C. made a voyage of discovery northwards along the west coast of Europe. He visited Great Britain, the Orkneys, and probably also northern Norway, which he called Thule.

Irish Discovery of Iceland.—The Irish monk Dicuil, writing about 82j, mentions the discovery by Irish monks of a group of small islands (the Faeroes), and a greater island (Iceland), which he calls Thule. The fact that Irish monks lived in Iceland before the Norsemen settled there in the 9th century is verified by the Icelandic sagas.

Ottar.—In his translation of Orosius, King Alfred inserts the story of the Arctic voyage, told him by the Norwegian Ottar (Alfred calls him Ohthere), who about 870 rounded the North Cape, sailed eastwards and discovered the White sea, where he reached the south coast of the Kola peninsula and the boundary of the land of the Biarmians (Beormas). After Ottar's time many voyages, mostly of hostile nature but also for trade purposes, were undertaken from Norway to the White sea.

Eric the Red.—After having settled in Iceland in the end of the 9th century, the Norsemen soon discovered Greenland and settled there. The first who is reported to have seen the coast of Greenland was Gunnbjorn Ulfsson, who on his way to Iceland was storm-driven westwards. He came to some islands, afterwards called Gunnbjornskier, and saw a coast, but, without exploring the new land, he had evidently continued his way till he reached Iceland. The real discoverer and explorer of Greenland was Eric the Red, who, with his father had settled in Iceland. As he and his men had there been declared outlaws for having killed several people they had to leave Iceland for three years, and he went westward to find the land which Gunnbjorn was reported to have seen. He explored the west coast of Greenland for three years, probably about 982–985. He then returned to Iceland, but founded the following year a colony in Greenland (*q.v.*). Many colonists followed, and two Norse settlements were formed, viz., the *Österbygd* (*i.e.,* eastern settlement) on the south-eastern part of the Greenland west coast, between Cape Farewell and about 61° N. lat., and the Vesterbygd (*i.e.,* western settlement) between 63° and 66° N. lat. The Norse settlers carried on their seal and whale-hunting still farther north along the west coast certainly as far as Upernivik and even visited the east coast.

It is reported by Adam of Bremen (about 1070) that the Norwegian king Harold Haardraade (in the 11th century) made an expedition into the Arctic sea (probably northwards) in order to examine how far it extended, but we know nothing more about this voyage.

The Icelandic annals report that a land called Svalbardi (cold side or coast) was discovered in 1194. The land was, according to the sagas, situated four days' sailing from north-eastern Iceland northwards in the Hafsbotn (*i.e.,* the northern termination of the sea, which was supposed to end as a bay). There can be little doubt that this land was Spitsbergen.

On his way to Greenland from Norway in the year 1000 Leif Ericsson found America, certainly Labrador, and perhaps Newfoundland and Nova Scotia. Vinland the Good of the sagas may have referred to Nova Scotia, or it may have been a myth. A few years later Karlsefne is said to have sailed from Greenland to make a settlement in the land discovered by Leif. He found Helluland and Markland before reaching Vinland. Hostilities with the inhabitants caused the settlers to return to Greenland in 1066. The story is probably legendary. W

The Icelandic annals state that in 1347 a small Greenland ship which had sailed to Markland was afterwards storm-driven to Iceland with 17 men. This is the last known voyage made by the Norsemen of Greenland which with certainty reached America.

The discoveries of the old Norsemen extended over the northern seas from Novaya Zemlya in the east to Labrador and Newfoundland in the west; they visited all Arctic lands in these regions, and explored the White sea, the Barents sea and the Greenland sea, Davis strait, and even some part of Baffin bay. They were the first navigators in history who willingly left the coasts and sailed across the open ocean, and they crossed the Atlantic between Norway and America, thereby being the real discoverers of this ocean, as well as the pioneers in oceanic navigation. It is hardly an accident that the undertakings of England towards the west started from Bristol, where many Norwegians had settled, and which from the beginning of the 15th century had much trade with Iceland.

Cabot.—John Cabot, sent out by the merchants of Bristol, rediscovered the American continent in 1497. He came to Cape Breton and Nova Scotia, possibly the land that Leif Ericsson had discovered 500 years before. Of John Cabot's expedition towards the west in 1498 nothing is known, not even whether he returned or not. There is no reliable evidence to prove that John Cabot or his son Sebastian ever discovered Labrador, as has been generally believed.

The Portuguese Gaspar Corte-Real probably rediscovered Greenland in 1500, and in 1501 Newfoundland.

Cabot's and Corte-Real's discoveries were followed by the development of the Newfoundland and Labrador fisheries, and a whole fleet of English, Portuguese, Basque and Breton fishermen were soon met with in these waters: and they probably went along the Labrador coast northward as far as Hudson Strait, without having left any report of their discoveries.

It is believed, on good grounds, that expeditions (combined English-Portuguese) were sent out to the newly discovered regions from Bristol in 1501 and 1502. It is unknown what their discoveries were, but they may possibly have sailed along the coast of Labrador.

It is possible that Sebastian Cabot made an Arctic expedition in 1508–09, in search of a short passage to China towards the north-west, and later, in 1521, King Henry VIII. made an attempt to persuade the merchants of London to support him in sending out an expedition, under Sebastian Cabot, to the north-western countries. It is uncertain whether it ever started, but it is certain that it achieved nothing of importance.

Early in the 16th century several expeditions, including that of J. Rut (1527), tried to find a way to China through the Arctic seas, but no discoveries of importance are known to have been made in the Arctic regions.

Willoughby and Chancellor.—There are rumours that the Portuguese, as early as 1484, had sent out an expedition towards Novaya Zemlya in search of a north-east passage to India. The Genovese Paolo Centurione proposed to King Henry VIII. of England, in 1525, to make an expedition in search of such a passage to India north of Russia, and there is evidence to show that there had been much talk about an undertaking of this kind in England during the following period, as it was hoped that a new market might be found for English merchandise, especially cloth. But it led to nothing until 15j3, when Sebastian Cabot was one of the chief promoters. Three ships and 112 men under Sir Hugh Willoughby sailed from Ratcliffe on May 10 (20), 1553.

Richard Chancellor commanded one of the ships, which was separated from the two others in a gale off northern Norway on Aug. 3 (13). Willoughby, after having sighted land in various places, probably Kolguev Island, where they landed, the coast near the Pechora river and Kanin Nos, came on Sept. 14 (24) to a good harbour on the northern coast of the Kola Peninsula. Willoughby resolved to winter there, but he and all his men perished. Chancellor rounded the North Cape, to which he or his sailing-master, Stephen Borough, gave this name. He reached Vardohus, and followed the route of the Norsemen to the White sea and reached the Bay of St. Nicholas, with a monastery of this name, near the mouth of the Dvina river, where Archangel was built later. Chancellor undertook a journey to Moscow, made arrangements for commercial intercourse with Russia, and returned next year with his ship, which was, however, plundered by the Flemings, but he reached London safely with a letter from the tsar. In spite of the disaster of Willoughby and his men this expedition became of fundamental importance for the development of English trade. Chancellor's success and his so-called discovery of the passage to the White sea, which was well known to the Norwegian traders, proved to people in England the practical utility of polar voyages. It led to a charter being granted to the Muscovy Company of Merchant Adventurers, and gave a fresh impulse to Arctic discovery. Chancellor undertook a new expedition to the White sea and Moscow in 1555; on his way home in the following year he was wrecked on the coast of Scotland and perished.

In 1556 Stephen Borough (Burrough), who had served with Chancellor, was sent out by the Muscovy company to try to reach the river Ob, of which rumours had been heard. Novaya Zemlya, Vaigach Island, and the Rara strait were discovered. In 1580 the company fitted out two vessels under Arthur Pet and Charles Jackman, with orders to sail eastwards north of Russia and Asia to the lands of the emperor of Cathay (China). They penetrated through the Kara strait into the Kara sea; but met with much ice and were compelled to return. Pet reached London on Dec. 26, Jackman wintered with his ship in Norway and sailed thence in Feb., but was never heard of again.

About 1574 the Portuguese probably made an attempt to find the north-west passage under Vasqueanes Corte-Real. They reached "a great entrance," which may have been Hudson strait, and they "passed above twentie leagues" into it, "without all impediment of ice," "but their victailes fayling them, . . . they returned backe agayne with ioy."

Frobisher. — The opening of a profitable trade with Russia, via the White sea, inspired new life in the undertakings of England on the sea, at the same time the power of the Hanseatic merchants, called the Easterlings, was much reduced. It was therefore only natural that the plan of seeking a north-west passage to China and India should again come to the front in England. Sir Martin Frobisher opened that long series of expeditions all of which during 300 years were sent from England in search of the north-west passage. After having attempted in vain for 15 years to find support for his enterprise, he at last obtained assistance from Ambrose Dudley, earl of Warwick, and through him the interest of Queen Elizabeth was also secured. The Muscovy Company was now obliged to give a licence for the voyage in 1574, and the necessary money was found by London merchants. Frobisher sailed, on June 7, 1576, from Deptford with two small vessels of 20 and 25 tons, called the "Gabriel" and "Michael," and a small pinnace of 10 tons. On July 8 they lost sight of the pinnace, which was seen no more. On July 11 they sighted a high, rugged land, but could not approach it for ice. This was the east coast of Greenland, but, misled by his charts, Frobisher assumed it to be the fictitious Frisland, which was the fabrication of a Venetian, Niccolo Zeno, who in 1558 published a spurious narrative and map (which he pretended to have found) as the work of an ancestor and his brother in the 14th century. The Zeno map was chiefiy fabricated on the basis of a map by the Swede Olaus Magnus of 1537 and the map by the Dane Claudius Clavus of the 15th century. It was accepted at the time as a work of high authority, and its fictitious names and islands continued to appear on subsequent maps for at least a century, and have puzzled both geographers at home and explorers in the field. These islands had also been introduced on the charts of Mercator of 1569 and of Ortelius of 1570, which were probably used by Frobisher. Evidently frightened by the sight of the great quantities of ice off the Greenland coast, one ship, the "Michael" left him secretly, "and retourned home wyth greate reporte that he was cast awaye." Frobisher continued his voyage towards the north-west in the "Gabriel" alone. On July 29 (Aug. 8) he sighted high land which he called Queen Elizabeth's Foreland. This was the southern part of Baffin Island (Resolution Island) in about 62° N. lat. He entered an inlet which he considered to be the strait of the north-west passage, and he gave it his own name (it is now Frobisher bay or Baffin island). The land was called "Meta Incognita." Frobisher was not well prepared for going much farther, and after his boat with five men had disappeared he returned home, where, unfortunately, some "gold-finders" in London took it into their heads that a piece of dark heavy stone brought back contained gold ore. This caused great excitement; it was now considered much more important to collect this precious ore than to find the north-west passage, and much larger expeditions were sent out in the two following years. As many as 15 vessels formed the third expedition of 1578, and it was the intention to form a colony with 100 men in the gold land, but this scheme was given up. Frobisher came into Hudson strait, which was at first thought to be Frobisher strait and therefore called Mistaken strait. There was an open sea towards the west, and Frobisher was certain that he could sail through to the "Mare del Sur" (Pacific Ocean) and "Kathaya," but his first goal was the "gold mines," and the vessels returned home with full loads of the ore. One of them, a buss (small ship) called the "Emmanuel," reported that on her voyage home she had first sighted Frisland on Sept. 8 (18), but four days later she had sighted another land in the Atlantic and sailed along it till the following day; they reckoned its southern end to be in about 57½° N. lat. This land soon found its place on maps and charts south-west of Iceland under the name of Buss island, and as it was never seen again it was after 1745 called "the sunken land of Buss." The explanation is that, misled by the maps, Frobisher assumed Greenland to be Frisland of the Zeno map and Baffin island was afterwards assumed to be the east coast of Greenland. When the buss on her way home sighted Greenland in about 62" N., she therefore thought it to be Frisland, but when four days later she again sighted land near Cape Farem-ell and her dead reckoning probably had carried her about two degrees too far south, she naturally considered this to be a new land, which puzzled geographers and navigators for centuries. Owing to a similar mistake, not by Frobisher, but by later cartographers and especially by Davis, it was afterwards assumed that Frobisher strait (and also Mistaken strait) was not in Baffin Island but on the east coast of Greenland, where they remained on the maps till the 18th century.

Davis. — John Davis, who made the next attempt to discover a north-west passage, was one of the most scientific seamen of that age. Sailing from Dartmouth on June 7 (17), 1585, with two ships, he sighted on July 20 (30) "the most deformed, rocky and mountainous land, that ever he sawe." He named it the Land of Desolation, although he understood that he had rediscovcrcd "the shore which in ancient time was called Greenland." It was its east coast. He visited the west coast, where Frobisher had also landed mistaking it for Frisland. Davis anchored in a place called Gilbert's sound in 64" 10′ (near the present Danish settlement of Godthaab) and had much intercourse with the Eskimo. He then, crossing the strait which bears his name, traced a portion of its western shore southwards from about 66° 40' N. lat. and came into Cumberland sound, which he thought to be the strait of the north-west passage, but returned home on account of contrary winds. In his second voyage (with four ships) Davis traced the western shore of Davis strait still farther southwards, and sailed along the coast of Labrador. In his third voyage (with three ships) in 1587 he advanced far up his own strait along the west coast of Greenland and reached a lofty granite island in 72° 41′ N. lat., which he named Hope Sanderson. He met with

ice in the sea west of this place, but reported that there was not "any yce towards the north, but a great sea, free, large, very salt and blew, and of an unsearcheable depth." By contrary winds, however, he was prevented from sailing in that direction. He sailed into Cumberland sound, but now found that there was no passage. He also passed on his way southwards the entrance to Frobisher strait, which he named Lumley inlet, and Hudson strait, without understanding the importance of the latter. The result of Davis's discoveries are shown on the Molyneux globe, which is now in the library of the Middle Temple; they are also shown on the "new map" in Hakluyt's *Principal* **Navigations** (1598–1600).

Dutch Exploration. — As early as 1565 Dutch merchants formed a settlement in Kola, and in 1578 two Dutch ships anchored in the mouth of the river Dvina, and a Dutch settlement was established where Archangel was built a few years later. The leading man in these undertakings was Olivier Brunel, who is thus the founder of the White sea trade of the Dutch; he was also their first Arctic navigator. He had travelled both overland and along the coast to Siberia and reached the river Ob; he had also visited Kostin Shar on Novaya Zemlya. He propounded plans for the discovery of the north-east passage to China, and probably started with one ship in 1582, on the first Arctic expedition which left the Netherlands. Little is known of its fate except that it ended unsuccessfully with the wreck of the ship in the shallow Pechora bay, possibly after a vain attempt to penetrate through the Yugor strait into the Kara sea.

The Dutch, however, had begun to see the importance of a northern route to China and India, especially as the routes through the southern seas were jealously guarded by the Spaniards and Portuguese, and after 1584 all trade with Portugal, where the Dutch got Indian goods, was forbidden. By Brunel's efforts their attention had been directed towards the north-east passage, but it was not until 1594 that a new expedition was sent out, one of the promoters being Peter Plancius, the learned cosmographer of Amsterdam. Four ships sailed from Huysdunen on June 5, 1594. Two of these ships were under the command of Willem Barents, who sighted Novaya Zemlya, north of Matochkin Shar, on July 4; and from that date until Aug. 1 (11), Barents discovered the whole western coast as far as the Great Ice cape, the latitude of which he, with his admirable accuracy, determined to be 77° N. Having reached the Orange islands, he decided to return. The two other ships under the command of Cornelis Nay had discovered the Yugor strait, through which they sailed into the Kara sea on Aug. 1 (11). They reached the west coast of Yamal; finding the sea open, they thought they had found a free passage to Japan and China, and returned home on Aug. 11 (21). A new expedition the following year, 1595, with seven ships under the command of Cornelis Nay and Willem Barents merely made several unsuccessful attempts to enter the Kara sea through the Yugor strait. The third expedition was more important. Two vessels sailed from Amsterdam on May 10 (20), 1596, under the command of Jacob van Heemskerk and Corneliszoon Rijp. Barents accompanied Heemskerk as pilot, and Gerrit de Veer, the historian of the voyage, was on board as mate. They sailed northwards, and on June 9 (19) discovered Bear island. Continuing on the same course they sighted a mountainous snow-covered land in about 80° N. lat., soon afterwards being stopped by pack ice. This important discovery mas named Spitsbergen, and was believed to be a part of Greenland. Arriving at Bear island again on July 1, Rijp parted company, while Heemskerk and Barents proceeded eastward, intending to pass round the northern end of Novaya Zemlya. On Aug. 26 (Sept. 5) they reached Ice Haven, after rounding the northern extremity of the land. Here they wintered in a house built out of driftwood and planks and in the spring made their way in boats to the Lapland coast; but Barents died during the voyage. This was the first time that an Arctic winter was successfully faced. The voyages of Barents stand in the first rank among the polar enterprises of the 16th century.

The English enterprises were continued by the Muscovy Company, and by associations of merchants of London; and even the East India Company sent an expedition under Capt. Waymouth in 1602 to seek for a passage by the opening seen by Davis, but it had no success.

Hudson. — The best servant of the Muscovy Company in the work of polar discovery was Henry Hudson. His first voyage was undertaken in 1607, when he discovered the most northern known point of the east coast of Greenland in 73° 30' N. (Hold with Hope), and examined the ice between Greenland and Spitsbergen, probably reaching Hakluyt's headland in 79° 50′ N. On his way home he discovered the island now called Jan Mayen, which he named "Hudson's Tutches." In his second expedition, during the season of 1608, Hudson examined the edge of the ice between Spitsbergen and Novaya Zemlya. In his third voyage he was employed by the Dutch East India Company; he again approached Novaya Zemlya, but was compelled to return westwards, and he explored the coasts of North America, discovering the Hudson river. In 1610 he entered Hudson strait, and discovered the great bay which bears and immortalizes his name. He was obliged to winter there, undergoing no small hardships. On his way home his crew mutinied and set him, his little son and some sick men, adrift in a boat, and the explorer perished in the seas he had opened up.

The voyages of Hudson led immediately to the Spitsbergen whale fishery. English and Dutch whalers in the 17th century added much to the knowledge of Spitsbergen. Poole, Fotherby, Marmaduke, Edge and Carolus were noteworthy.

Meanwhile, the merchant adventurers of London continued to push forward the western discovery. Sir Thomas Button, with the "Resolution" and "Discovery," in 1612 entered Hudson bay, crossed to its western shore, and wintered at the mouth of a river in 57°10′ N. which was named Nelson river after the master of the ship, who died there. Next year Button explored the shore of Southampton Island as far as 65" N. An expedition under Captain Gibbons despatched in 1614 to Hudson bay was a failure; but in 1615 Robert Bylot and William Baffin in the "Discovery" examined the coasts of Hudson strait and to the north of Hudson bay. In 1616 Bylot and Baffin again set out in the "Discovery." Sailing up Davis strait they passed that navigator's farthest point at Sanderson's Hope, and sailed round Baffin bay. Baffin named the most northern opening Smith sound, after the first governor of the East India Company, and the promoter of the voyage, Sir Thomas Smith. Lancaster sound and Jones sound were named after other promoters. The fame of Baffin mainly rests upon the discovery of a great channel extending north from Davis strait; but it was unjustly dimmed for many years, owing to the omission of Purchas to publish the navigator's tabulated journal and map in his great collection of voyages. It was 200 years before a new expedition sailed north through Baffin bay. In 1619 Denmark sent out an expedition, under the command of Jens Munk, in search of the north-west passage, with two ships and 64 men. They reached the west coast of Hudson bay, where they wintered near Churchill river, but all died with the exception of one man, a boy, and Munk himself, who managed to sail home in the smallest ship.

In 1631 two expeditions were despatched, one by the merchants of London, the other by those of Bristol. In the London ship "Charles" Luke Fox explored the western side of Hudson bay as far as the place called "Sir Thomas Roe's Welcome." In Aug. he encountered Capt. James and the Bristol ship "Maria" in the middle of Hudson bay, and went north until he reached "North-west Fox his farthest," in 66" 47' N. Capt. James had to winter off Charlton Island, in James bay, the southern extreme of Hudson bay, and did not return until October 1632.

Hudson's Bay Company. — The Hudson's Bay Company was incorporated in 1670, and Prince Rupert sent out Zachariah Gillan, who wintered at Rupert river. A voyage undertaken in 1719 by J. Knight, nearly 80 years old, who had been appointed governor of the factory at Nelson river, was unfortunate, as his two ships were lost and the crews perished. A naval expedition under Capt. C. Middleton in 1742 discovered Wager river and Repulse bay. In 1746 Capt. W. Moor explored the Wager inlet. Later in the century the Hudson's Bay Company's servants mnde some

important land journeys. From 1769 to 1772 Samuel Hearne descended the Coppermine river to the sea; and in 1789 Alexander Mackenzie of the North Western Company discovered the mouth of the Mackenzie river.

The countrymen of Barents vied with the countrymen of Hudson in the whaling which annually brought fleets of ships to the Spitsbergen seas during the 17th and 18th centuries. Capt. Vlamingh, in 1664, advanced as far round the northern end of Novaya Zemlya as the winter quarters of Barents. In 1671 Frederick Martens, a German surgeon, visited Spitsbergen, and wrote the best account of its physical features and natural history that existed previous to the time of Scoresby. In 1707 Capt. Cornelis Gilies saw land to the east of Spitsbergen in 80° N., which has since been known as Gilies Land. The Dutch geographical knowledge of Spitsbergen was embodied in the famous chart of Van Keulen (edited by Gilies and Rep), (*c.* 1710). The Dutch whale fishery continued to flourish until the French Revolution, and formed a splendid nursery for training the seamen of the Netherlands.

The most flourishing period of the British fishery in the Spitsbergen and Greenland seas was from 1752 to 1820. In order to encourage discovery £5,000 was offered in 1776 to the first ship that should sail beyond the 89th parallel (16 Geo. III. c. 6). Among the numerous daring and able whaling captains, William Scoresby takes the first rank, alike as a successful whaler and a scientific observer. His admirable *Account* of *the Arctic Regions* is still a standard work. In 1806 he succeeded in advancing his ship "Resolution" as far north as 81° 12′ 42". In 1822 he forced his way through the ice on the east coast of Greenland, and surveyed that coast from 75° down to 69° N.

The Russians, after the acquisition of Siberia, succeeded in gradually exploring the whole of the northern shores of that vast region. In 1648 a Cossack named Simon Dezhneff equipped a boat expedition in the river Kolima, passed through the strait since named after Bering, and reached the Gulf of Anadir. In 1738 a voyage was made by two Russian officers frorn Archangel to the mouths of the Ob and the Yenisei. In 1735 Lieut. T. Chelyuskin got as far as 77° 25′ N. near the cape which bears his name; and in 1743 he rounded that most northern point of Siberia in sledges, in 77° 43' N. Captain Vitus Bering, a Dane, was appointed by Peter the Great to command an expedition in 1725. Two vessels were built at Okhotsk, and in July 1728 Bering ascertained the existence of a strait between Asia and America. In 1740 Bering sailed from Okhotsk in the "St. Paul," with G. W. Steller on board as naturalist. Their object was to discover the American side of the strait, and they sighted the peak named by Bering Mt. St. Elias. The Aleutian islands were also explored, but the ship was wrecked on an island named after the ill-fated discoverer. Bering died there on Dec. 8, 1741.

Thirty years after the death of Bering a Russian merchant named Lyakhov discovered the New Siberian or Lyakhov islands. These islands were more fully explored by an officer named Hedenstrom in 1809, and seekers for fossil ivory annually resorted to them.

From 1773 onwards to the end of the 19th century the objects of polar exploration were mainly the acquisition of knowledge in various branches of science. It was on these grounds that Daines Barrington and the Royal Society induced the British Government to undertake Arctic exploration once more. The result was that two vessels, the "Racehorse" and "Carcass," were commissioned, under Capt. C. J. Phipps. The expedition sailed on June 2, 1773, and was stopped by the ice to the north of Hakluyt headland, the north-western point of Spitsbergen. Phipps reached the Seven Islands and discovered Walden island. His highest latitude was 80° 48' N. Five years afterwards James Cook received instructions to proceed northward from Kamchatka and search for a north-east or north-west passage from the Pacific to the Atlantic. His ships, the "Resolution" and "Discovery," arrived at the edge of the ice, after passing Bering strait, in 70° 41′ N. The farthest point seen on the American side was named Icy Cape, and on the Asiatic side Cape North.

The wars following the French Revolution put an end to voyages of discovery till, after the peace of 1815, north polar research found a powerful and indefatigable advocate in Sir John Barrow. Through his influence a measure for promoting polar discovery became law in 1818 (58 Geo. III. c. 20), by which a reward of £20,000 was offered for making the north-west passage, and of £5,000 for reaching 89° N., while the commissioners of longitude were empowered to award proportionate sums to those who might achieve certain portions of such discoveries. In 1817 Barrow obtained sanction for the despatch of two expeditions, one to attempt discoveries by way of Spitsbergen and the other by Baffin bay. The vessels for the Spitsbergen route, the "Dorothea" and "Trent," were commanded by Capt. D. Buchan and Lieut. J. Franklin, and sailed in April 1818. Driven into the pack, both vessels were severely nipped, and had to return to England. The other expedition, consisting of the "Isabella" and "Alexander," commanded by Capt. J. Ross and Lieut. E. Parry, followed in the wake of Baffin's voyage of 1616. The voyage vindicated Baffin's accuracy as a discoverer and showed the way to a lucrative fishery in the "North Water" of Baffin bay, which continued to be frequented by a fleet of whalers every year. Ross thought that the inlets reported by Baffin were merely bays, while the opinion of his second in command was that a wide opening to the westward existed through the Lancaster sound of Baffin.

Parry and Franklin. — Parry was selected to command a new expedition in the following year. His two vessels, the "Hecla" and "Griper," passed through Lancaster sound, the continuation of which was named Barrow strait, and advanced westward. He was stopped by the impenetrable polar pack and obliged to winter in a harbour on the south coast of Melville island. Parry's scientific results were valuable. The vessels returned in Oct. 1820; and a fresh expedition in the "Fury" and "Hecla," again under the command of Parry, sailed on May 8, 1821, and passed their first winter on the coast of Melville peninsula in 66° 11′ N. Still persevering, Parry passed his second winter among the Eskimo at fgloolik in 69" 20′ N., and discovered Fury and Hecla strait. The expedition returned in the autumn of 1823. Meantime Franklin had been employed in attempts to reach by land the northern shores of America, hitherto only touched at two points by Hearne and Mackenzie. Franklin went out in 1819, with Dr. John Richardson, George Back and Robert Hood. They landed at York factory, and proceeded to the Great Slave lake. The following summer they descended the Coppermine river, and traced the coast from its mouth 550m. eastward to Cape Turnagain in 109° 25' W.

It was thought desirable that an attempt should be made to connect the Cape Turnagain of Franklin with the discoveries made by Parry during his second voyage. In 1824 three combined attempts were organized. While Parry again entered by Lancaster sound and pushed down Prince Regent inlet, Capt. Beechey was to enter Bering strait, and Franklin was to make a second journey by land to the shores of Arctic America. Parry was unfortunate, but Beechey entered Bering strait in the "Blossom" in Aug. 1826, and extended knowledge as far as Point Barrow in 71° 23′ 30″ N. lat. Franklin, in 1825–26, descended the Mackenzie river to its mouth, and explored the coast for 374m. to the westward; while Dr. Richardson discovered the shore between the mouths of the Mackenzie and Coppermine, and sighted land to the northward, named by him Wollaston Land, the dividing channel being called Union and Dolphin strait. They returned in the autumn of 1826.

Work was also being done in the Spitsbergen and Barents seas. From 1821 to 1824 the Russian Capt. Liitke was surveying the west coast of Novaya Zemlya as far as Cape Nassau. In May 1823 the "Griper," under Capt. D. Clavering, conveyed Capt. E. Sabine north to make pendulum observations. Clavering pushed through the ice in 75° 30' N., and reached the east coast of Greenland, where observations were taken on Pendulum island. He charted the coast-line from 76° to 72° N.

In 1827 Parry attempted to reach the pole from the north coast of Spitsbergen by means of sledge-boats (see PARRY). The highest latitude reached was 82" 45′ N., and the attempt was persevered in until it was found that the ice as a whole was drifting

to the south more rapidly than it was possible to travel over it to the north.

In 1829 Capt. W. A. Graah of the Danish navy rounded Cape Farewell in boats. He advanced as far as 65° 16′ N. on the east coast, where he was stopped by ice. He wintered in 63° 22′ N., and returned to the west side of Greenland in 1830.

In the year 1829 Capt. J. Ross, with his nephew J. C. Ross, having been furnished with funds by Felix Booth, undertook an expedition in the "Victory." Ross proceeded down Prince Regent inlet to the Gulf of Boothia, and wintered on the eastern side of a land named by him Boothia Felix. J. C. Ross crossed the land and discovered the position of the north magnetic pole on the western side of it, on June 1, 1831. He also discovered a land to the westward which he named King William Land, and the northern shore of which he examined. The Rosses, unable to get their little vessel out of its winter quarters, passed three winters there, and then fell back on the stores at Fury Beach, where they passed their fourth winter, 1832–33. Eventually they were picked up by a whaler in Barrow strait, and brought home. Great anxiety was naturally felt at their prolonged absence, and in 1833 Sir George Back, with Dr. R. King, set out by land in search of the missing explorers. They left Fort Reliance on June 7, 1834, and descended the Backs (Great Fish) river for 530m. In 1836 Back was sent, at the suggestion of the Royal Geographical Society, to proceed to Repulse bay in the "Terror," and then to cross an assumed isthmus and examine the coastline thence to the mouth of the Backs river; but the ship was obliged to winter in the drifting pack, and was brought home in a sinking condition.

The tracing of the polar shores of America was completed by the Hudson's Bay Company's servants. In June 1837 Thomas Simpson and P. W. Dease left Chipewyan, reached the mouth of the Mackenzie, and connected that position with Point Barrow, which had been discovered by the "Blossom" in 1826. In 1839 Simpson passed Cape Turnagain of Franklin, tracing the coast eastward so as to connect with Back's work at the mouth of Backs river. He landed at Montreal island, and then advanced eastward as far as Castor and Pollux river. On his return he travelled along the south shore of the King William island. Little remained to do in order to complete the delineation of the northern shores of the American continent, and this task was entrusted to Dr. J. Rae, a Hudson's Bay factor, in 1846. He went in boats to Repulse bay, where he wintered in a stone hut nearly on the Arctic circle; and there he and his six Orkney men maintained themselves on the deer they shot. During the spring of 1847 Dr. Rae explored on foot the shores of a great gulf having 700m. of coast-line. He thus connected the work of Parry, at the mouth of Fury and Hecla strait, with the work of Ross on the coast of Boothia, proving that Boothia was part of the American continent.

While British explorers were thus working hard to solve some of the geographical problems relating to Arctic America, the Russians were similarly engaged in Siberia. In 1821 P. F. Anjou made a complete survey of the New Siberian islands, and came to the conclusion that it was not possible to advance far from them in a northerly direction, owing to the thinness of the ice and to open water existing within 20 or 30m. Baron Wrangel in 1820–23 explored the coast between Cape Shelagski and the Kolima, making attempts to extend his journeys to some distance from the land, but he was always stopped by thin ice. In 1843 A. T. Middendorf explored the region around Cape Chelyuskin. The whole Arctic shore of Siberia had now been explored and delineated, but no vessel had yet rounded the extreme northern point.

The Franklin Expedition. — The success of Sir J. Ross's Antarctic expedition and the completion of the northern coastline of America by the Hudson's Bay Company's servants gave rise in 1845 to a fresh attempt to make the passage from Lancaster sound to Bering strait. The story of the unhappy expedition of Sir John Franklin, in the "Erebus" and "Terror," is told under FRANKLIN; but some geographical details may be given here. On leaving the winter quarters at Beechey island in 1846 Franklin found a channel leading south, along the west of North Somerset discovered by Parry in 1819. If he could reach the channel along the Canadian coast, he knew that he would be able to make his way to Bering strait. This channel, now called Peel sound, pointed directly to the south. He sailed down it towards King William island, with land on both sides. But directly the southern point of Prince of Wales island was passed and no longer shielded the channel, the great ice stream from the west was encountered and found impassable. Progress might have been made by rounding the eastern side of King William island, but its insularity was then unknown.

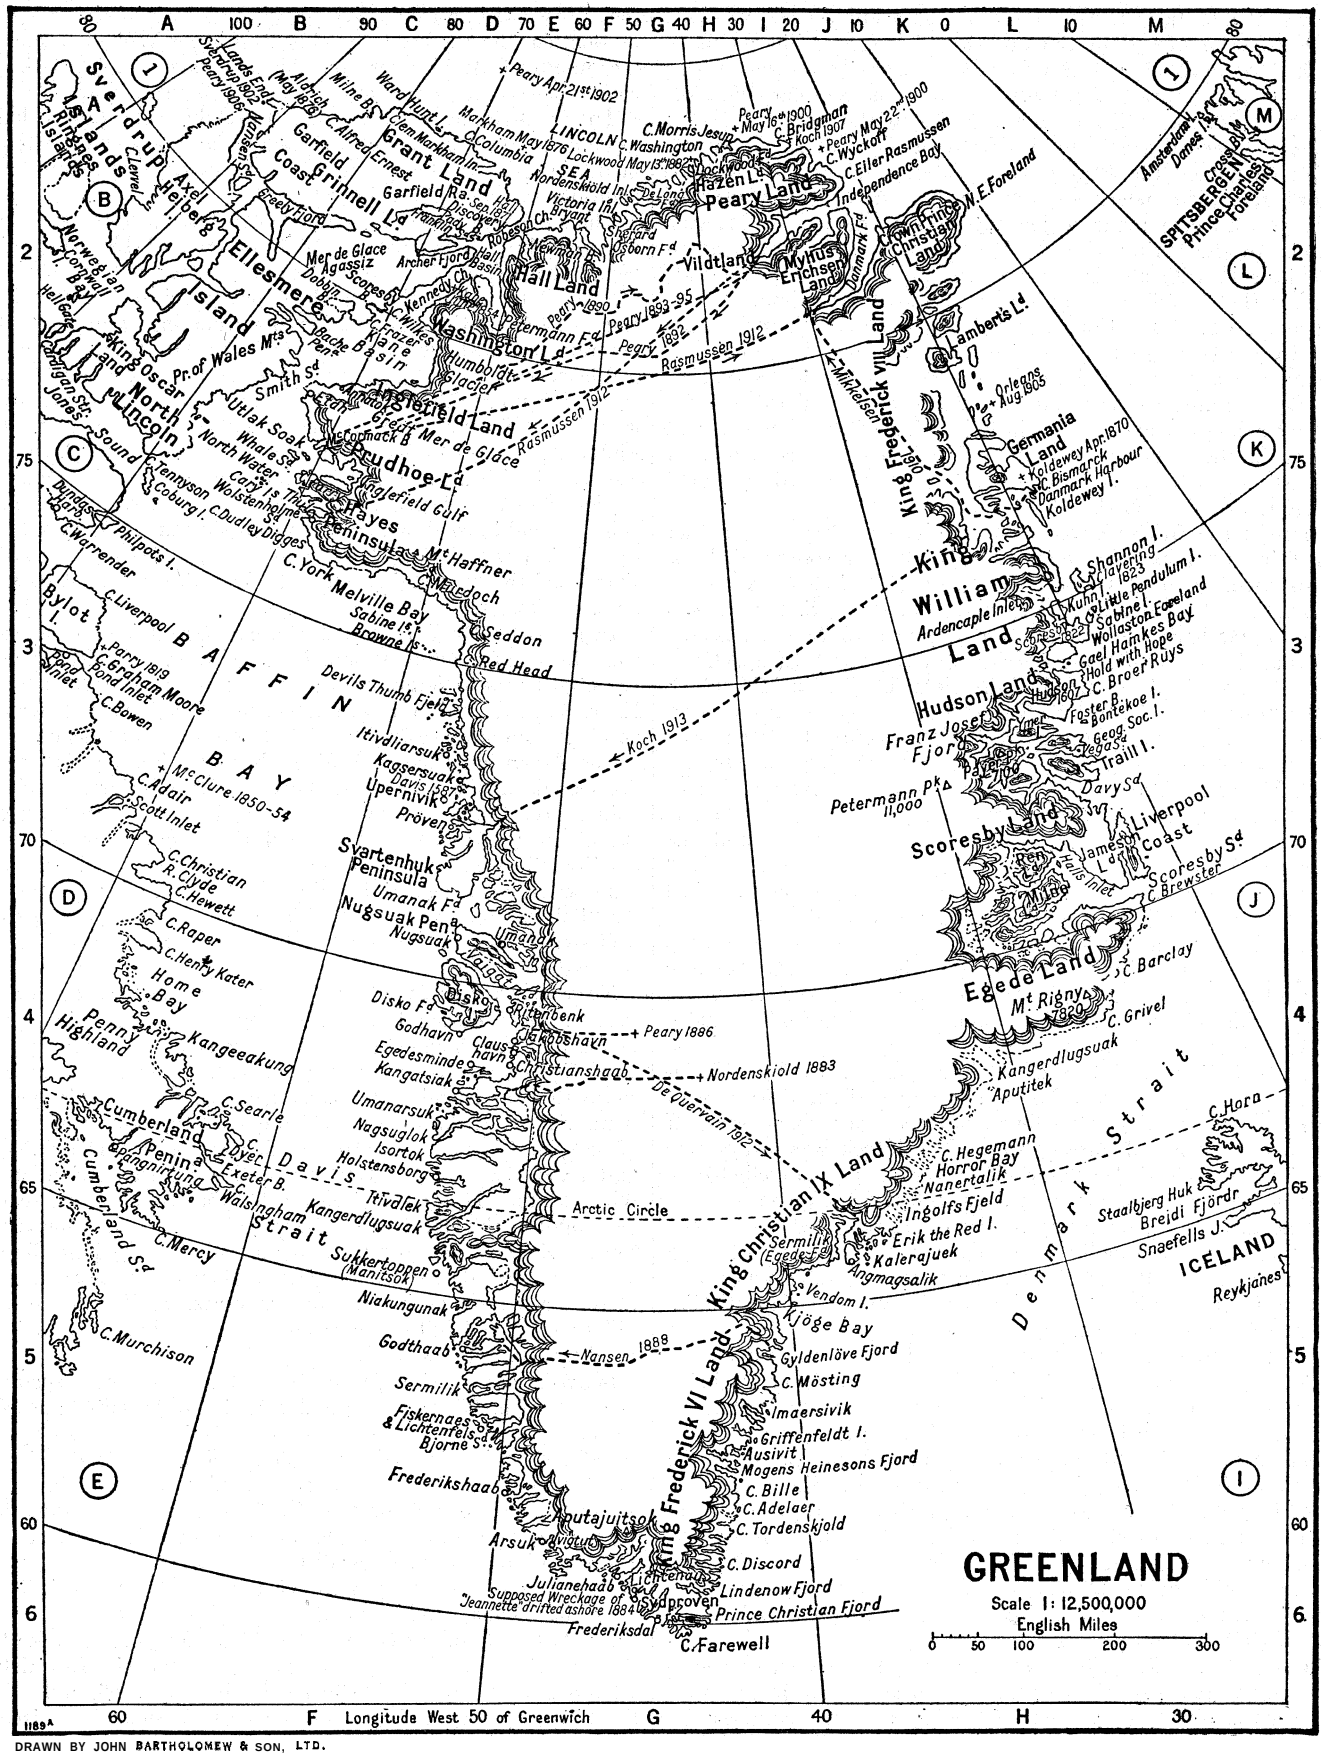
It was not until 1848 that anxiety began to be felt about the Franklin expedition. In the spring of that year Sir J. Ross was sent with the "Enterprise" and "Investigator," by way of Lancaster sound. He made a long sledge journey with Leopold M'Clintock along the northern and western coasts of the North Somerset, but found nothing.

On the return of the Ross expedition without any tidings, the country became thoroughly alarmed. An extensive plan of search was organized — the "Enterprise" and "Investigator" under Captains R. Collinson and R. M'Clure proceeding by Bering strait, while the "Assistance" and "Resolute," with two steam tenders, the "Pioneer" and "Intrepid," sailed on May 3, 1850, to renew the search by Barrow strait, under Capt. Horatio Austin. Two brigs, the "Lady Franklin" and "Sophia," under William Penny, an able whaling captain, were sent by the same route. He had with him Dr. A. Sutherland, a naturalist, who did much valuable scientific work. Austin and Penny entered Barrow Strait, and Franklin's winter quarters of 1845–46 were discovered at Beechey island; but there was no record of any kind indicating the direction taken by the ships. Austin's expedition wintered (1850–51) in the pack off Griffith island, and Penny found refuge in a harbour on the south coast of Cornwallis island. Penny undertook the search by Wellington channel. M'Clintock, who was with Austin, advanced to Melville island, marching over 770m. in 81 days; Captains E. Ommanney and S. Osborn pressed southward and discovered Prince of Wales island. W. H. Brown examined the western shore of Peel sound. The search was exhaustive; but, except the winter quarters at Beechey island, no record was discovered. Austin also examined the entrance of Jones sound on his way home, and returned to England in the autumn of 1851. This was a thoroughly well conducted expedition, especially as regards the sledge-travelling, which M'Clintock brought to great perfection.

In 1851 the "Prince Albert" schooner was sent out by Lady Franklin, under Capt. W. Kennedy, with Lieut. J. Bellot of the French navy as second. They wintered on the east coast of North Somerset, and in the spring of 1852 Bellot, in the course of a long sledging journey, discovered Bellot strait, thus proving that the Boothia coast facing the strait was the northern extremity of the continent of America.

The "Enterprise" and "Investigator" sailed from England in Jan. 1850, but accidentally parted company before they reached Bering strait. On May 6, 1851, the "Enterprise" passed the strait, and rounded Point Barrow on the 25th. Collinson then made his way up the narrow Prince of Wales strait, and reached Princess Royal islands, where M'Clure had been the previous year. Returning southwards, the "Enterprise" wintered in a sound in Prince Albert Land in 71° 35′ N. and 117° 35′ W. In the spring of 1852 sledge parties explored the strait and one reached Melville island. In Sept. 1852 the ship was free, and Collinson pressed eastward along the coast of Canada, reaching Cambridge bay (105° W.), where the second winter was passed. In the spring he examined the shores of Victoria Land as far as 70° 26′ N. and 100° 45′ W.; here he was within a few miles of Point Victory, where the fate of Franklin would have been ascertained. The "Enterprise" again put to sea on Aug. 5, 1853, and returned westward along the Canadian coast, until she was stopped by ice and obliged to pass a third winter at Camden bay, in 145° 29′ W. In 1854 Collinson brought the "Enterprise" back to England.

Meanwhile M'Clure, in the "Investigator," had passed the winter of 1850–51 at the Princess Royal islands, only 30m. from



DRAWN BY JOHN BARTHOLOMEW & SON, LTD.

MAP OF GREENLAND SHOWING THE ROUTES OF THE CHIEF ARCTIC EXPLORERS

Barrow strait. In Oct. M'Clure ascended a hill whence he could see the frozen surface of Barrow strait, but it was impossible to reach it on account of heavy ice; so, as soon as he was free in 1851, M'Clure turned southwards, round the southern extreme of Banks island, and forced a passage to the northward. He at length reached a bay on the northern shore of Banks island, which he named the Bay of God's Mercy. Here the "Investigator" remained, never to move again. After the winter of 1851–52 M'Clure made a journey across the ice to Melville island. In the spring of 1853 M'Clure was preparing to abandon the ship with all hands, and attempt, like Franklin's crews, to reach the Canadian coast; but succour arrived in time.

The Hudson's Bay Company continued the search for Franklin. In 1848 Sir John Richardson and Dr. Rae examined the Canadian coast from the mouth of the Mackenzie to that of the Coppermine. In 1849 and 1850 Rae continued the search; and by a long sledge journey in the spring of 1851, and a boat voyage in the summer, he examined and mapped the shores of Wollaston and Victoria Lands, which were afterwards explored by Capt. Collinson in the "Enterprise."

In 1852 the British government resolved to despatch another expedition by Lancaster sound. Sir E. Belcher commanded the "Assistance," and S. Osborn the "Pioneer." Belcher went up Wellington Channel where he spent two winters. S. Osborn and Com. G. H. Richards made sledge journeys to Melville island, and thus discovered the northern side of the Parry group. Capt. H. Kellett received command of the "Resolute," with M'Clintock in the "Intrepid." George S. Nares, leader of the future expedition of 1874–75, was also on board the "Resolute." Kellett passed the winter of 1852–53 at Melville island. During the autumn G. F. Mecham discovered M'Clure's record, and the position of the "Investigator" was thus ascertained. Lieut. P. T. Pim made his way to this point early in the following spring, and the officers and crew of the "Investigator," led by M'Clure, arrived safely on board the "Resolute" on June 17, 1853. They reached England in the following year, having not only discovered but traversed a north-west passage, though not in the same ship and partly by travelling over ice. For this great feat M'Clure received the honour of knighthood, and a reward of £10.000 was voted to himself, the other officers, and the crew. Collinson also discovered another N.W. passage.

The travelling parties of Kellett's expedition, led by M'Clintock, Mecham and Vesey Hamilton, completed the discovery of the north and west of Melville island, and the whole outline of Prince Patrick island, farther west. M'Clintock was away from the ship with his sledge party for 105 days, and travelled over 1,328m. Mecham was away 94 days, and travelled over 1,163m. S. Osborn, in 1853, was away 97 days, and travelled over 935m. The "Resolute" was obliged to winter in the pack in 1853–54, and in the spring of 1854 Mecham made a remarkable journey of 1,336m. in 70 days in the hope of obtaining news of Capt. Collinson at the Princess Royal islands.

Fearing detention for a third winter, Belcher ordered all the ships to be abandoned in the ice, the officers and crews being taken home in vessels which had come out from England to communicate. They reached home in Oct. 1854.

The drift of the "Resolute" was a remarkable proof of the direction of the current out of Barrow strait. She was abandoned in 74° 41′ N. and 101° 11′ W. on May 14, 1854. On Sept. 10, 1855, an American whaler sighted the "Resolute" in 67" N. lat. about 20m. from Cape Mercy, in Davis strait. She had drifted nearly 1,000m., and having been brought into an American port, was purchased by the United States and presented to the British Government.

In 1854 Dr. J. Rae after a winter at Repulse bay succeeded in connecting the discoveries of Simpson with those of James Ross, and thus established the fact that King William Land was an island. Rae also brought home the first tidings and relics of Franklin's expedition gathered from the Eskimo, which decided the Admiralty to award him the £10,000 offered for definite news of Franklin's fate. Lady Franklin, however, sent out the "Fox" under the command of M'Clintock (see FRANKLIN). M'Clintock prosecuted an exhaustive search over part of the west coast of Boothia, the whole of the shores of King William island and the mouth of Backs river, and Allen Young completed the discovery of the southern side of Prince of Wales island.

The catastrophe of Sir John Franklin's expedition led to 7,000m. of coast-line being discovered, and to a vast extent of unknown country being explored, securing very considerable additions to geographical knowledge.

The American nation was first led to take an interest in polar research through sympathy for Franklin and his companions. Henry Grinnell of New York sent out in 1850 the "Advance" and "Rescue," to aid in the search. They reached Beechey island and assisted in the examination of Franklin's winter quarters, but returned without wintering. In 1853 Dr. E. K. Kane, who had been with the last expedition, undertook to lead an American expedition up Smith sound. The "Advance" was stopped by ice in 78° 45′ N. only 1 jm. from the entrance. Kane named his winter quarters Van Rensselaer harbour. A great glacier was discovered with a sea face 45m. long and named the Humboldt glacier. Morton crossed the foot of this glacier, and reached a point of land beyond named Cape Constitution. Scurvy attacked the whole party during the second winter. In May 1855 Kane abandoned the brig, and reached the Danish settlement of Upernivik on Aug. 5.

In July 1860 Dr. I. I. Hayes, who had served with Kane, sailed from Boston for Smith sound, in the schooner "United States." His object was to follow up the line of research opened by Dr. Kane. He wintered at Port Foulke, in 78° 17′ N., but achieved nothing of importance, and his narrative is not to be depended on.

The American, Charles Hall, in his first journey (1860–62), discovered remains of a stone house which Sir Martin Frobisher built on the Countess of Warwick island in 1578. In his second expedition (1864–69) Hall reached the line of the retreat of the Franklin survivors, at Todd's island and Peffer river, on the south coast of King William island. Finally, in 1871 he took the "Polaris" for 250m. up Smith sound through Kane basin to Robeson channel and wintered in Thank God harbour, 81° 38' N., and here Hall died.

Norwegian and Swedish Explorers. — The Spitsbergen seas were explored during last century by Norwegian fishermen as well as by Swedish and German expeditions and by British yachtsmen. In 1827 the Norwegian geologist M. Keilhau made an expedition to Bear island and Spitsbergen. In 1863 E. Carlsen circumnavigated the Spitsbergen group for the first time in the sloop "Jan Mayen." In 1864 S. Tobiesen sailed round North-East Land. In 1872 J. Altmann and Nils Johnsen visited Edge's Wiche's Land. In 1869 Carlsen crossed the Kara sea and reached the mouth of the Ob. In 1870 E. H. Johannesen circumnavigated Novaya Zemlya. In 1871 Carlsen succeeded in reaching the winter quarters of Barents in Ice Haven, Novaya Zemlya, the first visitor since 1597, an interval of 274 years. He found the house still standing and full of interesting relics, which are now in the naval museum at The Hague.

Between 1858 and 1872 the Swedes sent several expeditions to Spitsbergen. That of 1864 under A. E. Nordenskiold and N. C. Duner explored the north-east coasts of Spitsbergen. In 1872 an expedition, consisting of the "Polhem" and "Gladen," commanded by Nordenskiold and L. Palander, wintered in Mossel bay in the north of Spitsbergen. In the spring an important sledging journey of 60 days' duration was made over North-East Land. The expedition was in some distress as regards supplies, but in the summer of 1873 they were visited by Mr. Leigh Smith, in his yacht "Diana," and supplied with fresh provisions.

Dr. A. Petermann of Gotha urged his countrymen to take their share in the work of polar discovery, and at his own risk he fitted out the "Germania," which sailed in May 1868, under Capt. K. Koldewey who, failing to reach east Greenland, cruised on the east of Spitsbergen. In 1870 Baron von Heuglin with Count Zeil explored Stor Fjord. In 1868 a two years' expedition was organized under Koldewey, consisting of the "Germania" and the "Hansa" Julius Payer, the future explorer of Franz Josef Land, was on board the "Germania." The expedition sailed from

Bremen on June 15, 1869, for the east coast of Greenland. In latitude 70° 46' N. the "Hansa" was separated from her consort and crushed in the ice. The crew built a house of patent fuel on the floe. The current carried them to the south, and finally, on June 14, 1870, they arrived safely at the Moravian mission station of Friedriksthal, to the west of Cape Farewell. The "Germania" sailed up the east coast of Greenland as far as 75° 30' N., and wintered at the Pendulum Islands of Clavering in 74° 30' N. In March 1870 a party under Koldewey and Payer reached Cape Bismarck, the northern limit of their discoveries. A deep branching fjord, named Franz Josef fjord, was discovered in 73° 15′ N. The expedition returned to Bremen on Sept. 11,1870.

After examining the edge of the ice and possible routes to the north between Spitsbergen and Kovaya Zemlya in the "Isbjorn" in 1871, Payer and K. Weyprecht organized an Austro-Hungarian expedition in 1872. They hoped to make the north-east passage. The "Tegethoff" left Tromso on July 14, 1872. The vessel was closely beset near Cape Nassau, at the north of Novaya Zemlya, in the end of Aug., and drifted in the direction of the prevailing wind. At length, on Aug. 31, 1873, a mountainous country was sighted about 14m. to the north. In Oct. the vessel was within 3m. of an island lying off the main mass of land. Payer landed on it, and found the latitude to be 79° 54' N. It was named after Count Wilczek, one of the warmest friends of the expedition. Here the second winter was passed. In 1874 Payer made several long sledge journeys. The whole country was named Franz Josef Land. In May it became necessary to abandon the ship and retreat in boats; on Aug. 14 the explorers reached the edge of the pack in 77° 40' N., and launched the boats. Eventually they were picked up by a Russian schooner and arrived at Vardo on Sept. 3, 1874.

One of the most interesting problems connected with the physical geography of the polar regions is the actual condition of the elevated ice-covered interior of Greenland. In 1867 Mr. Edward Whymper and Dr. Robert Brown tried to penetrate the interior, but their progress was stopped, after going a short distance over the ice, by the breaking down of the dog-sledges. The expedition brought home geological and natural history collections of value. Dr. H. Rink, for many years royal inspector of South Greenland, also visited the inland ice. An important inland journey was undertaken by A. E. Nordenskiold in 1870, accompanied by S. Berggren. Nordenskiold chose for a starting-point the northern arm of Auleitsivikfjord, and advanced 35m. to a height of 2,200ft.

The enterprises of other countries rekindled the zeal of Great Britain for Arctic discovery; and in 1875 the British Government dispatched the "Alert" and "Discovery," under Capt. G. S. Nares. Coin. A. H. Markham, Lieut. Aldrich, and Capt. H. W. Feilden, R A., as naturalist, were also in the "Alert." The "Discovery" was commanded by Capt. H. F. Stephenson, with Lieut. L. 4. Beaumont as first lieutenant. The expedition entered Smith sound in the last days of July. Lady Franklin bay was reached in 81° 44' N., where the '(Discovery" was established in winter quarters. The "Alert" pressed onwards, and reached the edge of the heavy ice named by Nares the palaeocrystic sea, the ice-floes being from 80 to 100ft. in thickness. Leaving Robeson channel, the vessel made progress and passed the winter off the open coast and facing the great polar pack, in 82° 27′ N. Sledge parties started on April 3, 1876. Markham with Lieut. A. A. C. Parr advanced over the pack to 83° 20′ N., at the time a record northern latitude. Aldrich explored the coast-line to the westward for a distance of 220m. Beaumont made discoveries of great interest along the northern coast of Greenland. The parties were attacked by scurvy, which increased the difficulty and hardships of the work a hundredfold. The expedition returned to England in Oct. 1876. The "Alert" reached a higher latitude and wintered farther north than any ship had ever done before.

In the same year 1875 Sir A. Young in his steam yacht the "Pandora" entered Peel sound, reached a latitude of 72° 14′ N., and sighted Cape Bird But here he was obliged to retrace his track, returning to England. In 1876 Sir A. Young made another voyage in the "Pandora" to the entrance of Smith sound.

Koolemans Beynen, a young Dutch officer, who had shared Young's two polar voyages, on his return successfully endeavoured to interest his countrymen in polar discovery. It was wisely determined that the first expeditions of Holland should be summer reconnaissances on a small scale. The schooner "Willem Barents" was commanded by Lieut. A. de Bruyne, with Beynen as second, and sailed from Holland on May 6, 1878. Her instructions were to examine the ice in the Barents and Spitsbergen seas, take deep-sea soundings, and make natural history collections. She was also to erect memorials to early Dutch polar worthies at certain points. These instructions were ably carried out. Beynen died in the following year, but the work he initiated was carried on, the "Willem Barents" continuing to make annual polar cruises for many years.

In 1879 Sir Henry Gore-Booth and Captain A. H. Markham, in the "Isbjörn" sailed along the west coast of Novaya Zemlya to its most northern point, passed through the Matochkin Shar to the east coast, and examined the ice in the direction of Franz Josef Land as far as 78° 24′ N.

In 1880 Mr. B. Leigh Smith, who had previously made three voyages to Spitsbergen, reached Franz Josef Land in the steam yacht "Eira." The "Eira" sailed along the south side of Franz Josef Land to the westward and discovered 110m. of coast-line of a new island named Alexandra Land, until the coast trended north-west. In the following year Leigh Smith sailed again for Franz Josef Land and continued his work to the west. But in Aug. the ship was caught in the ice and sank. A hut was built on shore in which Leigh Smith and his crew passed the winter of 1881–82, their health being well maintained, thanks to the exertions of Dr. W. H. Neale. On June 21, 1882, they started in four boats to reach some vessels on the Novaya Zemlya coast. They were seen and welcomed by the "Willem Barents" on Aug. 2, and soon afterwards were taken on board the "Hope," a whaler which had come out to search for them under the command of Sir A. Young.

Nordenskiöld and the North-East Passage.—A. E. Nordenskiold in 1875 turned his attention to the possibility of navigating the seas along the northern coast of Siberia. Capt. Joseph Wiggins of Sunderland was a pioneer of this route and his voyages in 1874, 1875 and 1876 led the way for a trade between the ports of Europe and the mouth of the Yenisei river. In June 1875 Nordenskiöld sailed from Tromso in the "Proven," reached the Yenisei by way of the Kara sea, and discovered a harbour on the eastern side of its mouth, which was named Port Dickson, in honour of Baron Oscar Dickson of Gothenburg. Nordenskiold undertook a voyage in the following year in the "Ymer," which was equally successful and convinced him that the achievement of the north-east passage was feasible. The king of Sweden, Baron Oscar Dickson, and M. Sibiriakoff, a wealthy Siberian proprietor, supplied the funds, and the steamer "Vega" was purchased. Nordenskiold was leader of the expedition, Lieut. A. L. Palander was appointed commander of the ship, and there was an efficient staff of officers and naturalists, including Lieut. A. P. Hovgaard of the Danish and Lieut. G. Bove of the Italian navy. The "Lena" was to keep company with the "Vega" as far as the mouth of the Lena, and they sailed from Gothenburg on July 4, 1878. On Aug. 19 they reached the most northern point of Siberia, Cape Chelyuskin, in 77" 43' N. A week later the mouth of the river Lena was passed, and the "Vega" parted company with the "Lena," continuing her course eastward. Nordenskiold very nearly made the north-east passage in one season; but towards the end of Sept. the "Vega" was frozen in off the shore of a low plain in 67° 7′ N. and 173° 20' W. near the settlements of the Chukchees. On July 18, 1879, the "Vega" again proceeded on her voyage and passed Bering strait on the 20th. After a lapse of 326 years of intermittent effort, the north-east passage had at length been accomplished without the loss of a single life and without damage to the vessel. The "Vega" arrived at Yokohama on Sept. 2, 1879.

In 1879 an enterprise was undertaken in the United States, with the object of throwing further light on the fate of Franklin's expedition, by examining the west coast of King William

island in the summer, when the snow is off the ground. The party consisted of Lieut. F. Schwatka of the United States army and three others. Wintering near the entrance of Chesterfield Inlet in Hudson bay, they set out overland for the estuary of Backs river on April 1, 1879, and crossed over to King William island in June. They examined the western shore of the island as far as Cape Felix. The return journey was commenced in Nov. by ascending Backs river for some distance and then marching over the intervening region to Hudson bay. Some graves were found, as well as a medal belonging to Lieut. Irving of H.M.S. "Terror."

Mr. Gordon Bennett, the proprietor of the *New York Herald*, having resolved to despatch an expedition of discovery at his own expense by way of Bering strait, the "Pandora" was purchased from Sir A. Young and rechristened the "Jeannette." Lieut. de Long of the United States navy was appointed to command, and it was made a national undertaking by special act of Congress. The "Jeannette" sailed from San Francisco on July 8, 1879, and was last seen steaming towards Wrangel island on Sept. 3. The "Jeannette" was provisioned for three years, but as no tidings had been received of her by 1881, two steamers were sent up Bering strait in search. One of these, the "Rodgers," under Lieut. R. M. Berry, explored Wrangel island. No news was obtained of the "Jeannette," but soon afterwards melancholy tidings arrived from Siberia. After having been beset in heavy pack ice for 22 months, the "Jeannette" was crushed and sunk on June 13, 1881, in 77° 15′ N. lat., and 155° E. long. The officers and men dragged their boats over the ice to an island which was named Bennett Island, where they landed on July 29. They reached one of the New Siberian islands on Sept. 10, and on the 12th they set out for the mouth of the Lena. But in the same evening the three boats were separated in a gale of wind. A boat's crew with G. W. Melville, the engineer, reached the Lena delta and searching for the other parties found the ship's books on Nov. 14, and the dead bodies of De Long and two of his crew on March 23, 1882. Three survivors of De Long's party had succeeded in making their way to a Siberian village; but the third boat's crew was lost.

The Danes have been very active in prosecuting discoveries and scientific investigations in Greenland, since the journey of Nordenskiold in 1870. Lieut. J. A. D. Jensen made an attempt to penetrate the inland ice in 1878. In 1879 Captain L. A. Mourier, of the Danish "Ingolf," sighted the E. coast and was enabled to delineate it from 68° 10′ N. to 6j° 55′ N., this being the gap left between the discoveries of Scoresby in 1822 and those of Graah in 1829. Nansen sighted part of the same coast in 1882. Lieut. Hovgaard planned an expedition to ascertain if land existed to the north of Cape Chelyuskin. He fitted out "Dymphna" and sailed in July 1882, but was unfortunately beset and obliged to winter in the Kara sea. In 1883 A. E. Nordenskiold undertook another journey over the inland ice of Greenland. Starting from Auleitsivikfjord his party penetrated 84m. eastward, to an altitude of 5,000ft. The Laplanders who were of the party were sent farther on snow-shoes, travelling to a height of 6,600ft.

Danish expeditions under Lieut. G. Holm explored the east coast of Greenland from Cape Farewell northwards between 1883 and 1885, and at Angmagsalik they encountered a tribe of Eskimo who had never seen white men before. Lieuts. C. H. Ryder and T. V. Garde continued the exploration of East Greenland, and Ryder explored Scoresby fjord.

Circumpolar Stations.—On Sept. 18, 1875, C. Weyprecht, one of the discoverers of Franz Josef Land, urged the importance of establishing some several stations within or near the Arctic Circle, and also a ring of stations as near as possible to the Antarctic Circle, in order to record complete series of synchronous meteorological and magnetic observations. Weyprecht did not live to see his suggestions carried into execution, but they bore fruit in due time. The various nations of Europe were represented at an international polar conference held at Hamburg in 1879 under the presidency of Dr. Georg Neumayer, and at another at Berne in 1880; and it was decided that each nation should establish one or more stations where synchronous observations should be taken for a year from Aug. 1882. This fine project was successfully carried into execution. The stations arranged for in the North polar region were at the following localities:—

Norwegians: *Bossekop*, Alten fjord, Norway (M. Aksel S. Steen).
Swedes: *Ice fjord*, Spitsbergen (Professor N. Ekholm).
Dutch: *Port Dickson*, mouth of Yenisei, Siberia (Dr. M. Snellen).
Russians:
Sagastyr island, mouth of Lena, Siberia (Lieut. N. D. Jiirgens).
Novaya Zemlya, 72° 23′ N. (Lieut. C. Andreiev).
Finns: *Sodankyla*, Finland (Professor S. Lemström).
Americans:
Point Barrow, Alaska (Lieut. P. H. Ray, U.S.A.).
Lady Franklin Bay, 81° 44′ N. (Lieut. A. W. Greely, U.S.A.).
British: *Great Slave Lake*, Canada (Lieut. *H*. P. Dawson).
Germans: *Cumberland Bay*, Baffin island (Dr. W. Giese).
Danes: *Godthaab*, Greenland (Dr. A. Paulsen).
Austrians: *Jan Mayen* (Lieut. E. *V*. Wohlgemuth).

The whole scheme was successfully accomplished with the exception of the part assigned to the Dutch at Port Dickson. They started in the "Varna" but were beset in the Kara sea and obliged to winter there. The "Varna" was lost, and the crew took refuge on board Hovgaard's vessel, which was also forced to winter in the pack during 1882–83. The scientific observations were kept up on both vessels during the time they were drifting with the ice.

The American stations commenced work in 1882 and one of these furnished a rare example of heroic devotion to duty in face of difficulties due to the fault of those who should have brought relief at the appointed time. Lieut. A. W. Greely's party consisted of two other lieutenants, 20 sergeants and privates of the United States army, and Dr. O. Pavy. On Aug. 11, 1881, the "Proteus" conveyed Greely and his party to Lady Franklin bay during an exceptionally favourable season; a house was built at the "Discovery's" winter quarters, and they were left with two years' provisions. Two winters were passed without accident. Lieut. J. B. Lockwood with 12 men made a journey along the north coast of Greenland and reached Lockwood island in 83° 24′ N. and 40° 45′ W., the highest latitude reached up to that time. A promontory of Greenland seen to the north-east was named Cape Washington. The party returned to Fort Conger on June 10, 1882, after an absence of 59 days. Greely made two journeys westward into the interior of Grinnell Land following up the northern branch of Chandler fjord to Hazen lake. In the spring of 1883 Lockwood made still more extensive journeys, crossing Grinnell Land to Greely fjord. The central depression of Grinnell Land abounded in musk oxen and was free from ice, though the higher land to north and south lay under permanent ice-caps. Important as these geographical discoveries were, the main object of the expedition was the series of scientific observations at the headquarters, and these were carried out during the whole period with the most scrupulous exactness. As no relief ship came in 1882, nor in 1883, Greely started from Lady Franklin bay with his men in a steam launch and three boats on Aug. 9, expecting to find a vessel in Smith sound. The boats had to be abandoned, the party reaching the shore across the ice with great difficulty. On Oct. 21, 1883, they were obliged to winter at Cape Sabine. A few depots were found, which had been left by Sir George Nares and W. M. Beebe, but all supplies were exhausted before the spring. Then came a time of great misery and suffering; some of the party proved insubordinate and the sternest measures were required to maintain military discipline. When the sun returned in 1884 the men began to die of actual starvation; but it was not until June 22, 1884, that the relieving steamers "Thetis" and "Bear" reached Cape Sabine. Greely and six suffering companions were found just alive, but with all their scientific records, their instruments in order, and the great collections of specimens intact. The failure of the relief expeditions

to overcome difficulties which were child's play to what Greely and his companions had come through only enhances the courage and determination of the heroic survivors.

In July 1886 Lieut. Robert E. Peary, civil engineer, U.S. Navy, accompanied by the Dane Christian Maigaard, made a journey on the inland ice of Greenland eastward from Disco bay. They reached a height of 7,500 ft., 100m. from the coast, and then returned. Dr. Fridtjof Nansen with Otto Sverdrup and five other companions, after overcoming great difficulties in penetrating the ice-floes, succeeded in landing on the east coast of Greenland in Aug. 1888 in 64° 23' N. and reached a height of 8,920ft. on the inland ice, which was crossed on ski in about two weeks to the west coast. On Sept. 26 they reached the head of the Ameralik fjord in 64° 12' N., having traversed 260m. of glacier. An important principle acted on for the first time in Arctic travel on this journey was that of starting from the less accessible side and pushing straight through with no possibility of turning back, and thus with no necessity for forming a base or traversing the same route twice over.

Peary spent the winter of 1891–92 at Inglefield gulf on the north-west coast of Greenland, Mrs. Peary, Dr. F. A. Cook, Eivind Astrup and a coloured servant Matthew Henson being in his party, and a large number of the Etah Eskimo in the vicinity. In April 1892 he set out for a journey across the inland ice to the north-eastward in the hope of reaching the east coast and also the northern extremity of the land. The highest part of the inland ice was found to be about 5,700ft. Great hardships were experienced, but on July 4, having left the ice and reached bare land in 81° 37' N., where musk oxen and other game were found, Peary was rewarded by a glimpse of the sea to the north-eastward, and named it from the date Independence bay. He also traced a channel to the north beyond which lay a new land largely free from snow, no doubt the southern part of the land along the north of which Markham and Lockwood had travelled to their farthest north. Peary returned to northern Greenland in 1893; on the shore of Inglefield gulf he wintered with a party of 13, including Mrs. Peary, and there their daughter was born. A series of accidents prevented much exploration the first summer, but in spite of scanty stores, Peary with two of his party, H. J. Lee and M. Henson, remained at Inglefield gulf for another winter, and on April 1, 1895, set out for Independence bay. The journey there and back added little to knowledge, but the experience of ice-travel and of Eskimo nature gained in the four years' almost continuous residence in northern Greenland were, however, destined to bear rich fruit.

Crossing Greenland. — The ice-sheet has since been crossed on several occasions: by K. Rasmussen from Inglefield gulf to Denmark fjord and back in 1912; by A. de Quervain from Disco bay to Angmagsalik the same year; by J. P. Koch from Louise Land south-westward to near Proven in 1913; and by L. Koch along its northern edge in 1921 (see GREENLAND).

Nansen: Drift of the "Fram."—Dr. F. Nansen, after making an exhaustive study of the winds and currents of the Arctic sea, and influenced largely by the occurrence of driftwood on the shores past which the ice-laden waters flowed southward between Greenland and Spitsbergen, satisfied himself that there was a general drift across the polar basin and perhaps across the Pole. He planned an expedition to take advantage of this drift on the principle which guided his crossing of Greenland, that of entering at the least accessible point and not turning back, thus having no line of retreat and making a relief expedition impossible. He planned a ship, the "Fram," which was immensely strong, to resist crushing, and of such a section that if nipped in the ice the opposing ice-masses would pass under her and lift her on to the surface. The plan of the expedition was based on scientific reasoning, but the methods were totally at variance with those of previous explorers. Otto Sverdrup, who had been one of Nansen's party in crossing Greenland, was captain of the "Fram," and the party included 11 others. The "Fram" left Christiania in the summer of 1893 and made her way through the Kara sea and along the north coast of Asia, until on Sept. 20 she was run into the ice in 77° 30' N. off the New Siberian islands, and the great drift commenced. As anticipated, she rose to the pressure of the ice and was borne on an even keel high above the water for the whole duration of the drift. The movement of the ice was irregular, but on the whole north-westward, until Nov. 15, 1895, when the highest latitude of the ship was attained, 85° 55' N. in 66" 31' E.; then it was westward and finally southward until the ice was broken by blasting round the ship in June in 83° N. lat.; and after being afloat, though unable to make much progress until the middle of July, the "Fram" broke out of the ice off the north coast of Spitsbergen on Aug. 13, 1896. No ship before or since has reached so high a latitude. In all her drift the "Fram" came in sight of no new land, but the soundings made through the ice proved that the Arctic sea was of great depth, increasing towards the Pole, the greatest depth exceeding 2,000 fathoms. The ship's company all returned in perfect health. After the second winter on the "Fram" at a time when the northward movement of the drift seemed to be checked, Nansen, accompanied by Lieut. H. Johansen, left the ship in order to explore the regions towards the Pole by travelling on ski with dog sledges carrying kayaks. It was obviously hopeless to attempt to find the drifting ship on their return, and Nansen intended to make for Spitsbergen in the hope of meeting one of the tourist steamers there. A more daring plan was never formed, and it was justified by success. Leaving the ship on March 14, 1895, in 84" N. 102° E., they made a fairly rapid march northward, reaching a latitude of 86" 5′ N. on April 8, the nearest approach to the Pole so far achieved. Turning southwestwards they travelled with much difficulty, sometimes on the ice, sometimes in kayaks in the open lanes of water, incurring great danger from the attacks of bears and walrus, but at length reaching Franz Josef Land. They travelled westward through this archipelago until Aug. 28, when they built a small stone hut roofed with their light silk tent, in which they passed the winter on Jackson island. There they lived like Eskimo on bear and walrus meat cooked over a blubber lamp. The journey southward was resumed in the spring of 1896, and on June 15 they met Mr. F. G. Jackson, in whose relief ship, the "Windward," they returned to Norway. Nansen and Johansen reached Vardo on Aug. 13, 1896, full of anxiety for the fate of their old comrades, when by a coincidence unparalleled in the history of exploration, the "Fram" was on that very day breaking out of the ice off Spitshergen and the original party of 13 was reunited at Tromso the following week and returned together to Christiania. On this remarkable expedition no life was lost, and the ship came back undamaged under the skilled guidance of Sverdrup with a great harvest of scientific results.

Mr. F. G. Jackson planned an exploring expedition to attain a high latitude by the Franz Josef Land route and was supported financially by Mr. A. C. Harmsworth (Lord Northcliffe). He was accompanied by Lieut. Albert Armitage, as second in command, and six scientific men, including Dr. R. Koettlitz; Dr. W. S. Bruce and D. W. Wilton joined in the second year. The Jackson-Harmsworth expedition sailed in 1894, and was landed at Cape Flora, where log houses were built. In the spring of 1895 Jackson made a journey northward to 81° 19′ N. In this and other journeys by land and in boats, he surveyed a considerable portion of the group. The expedition returned in 1897.

Franz Josef Land was visited by the American explorer W. Wellman in 1898 and 1900, and his companion E. Baldwin in the former year made the discovery of several islands in the east of the archipelago. A wealthy American, W. Zeigler, also sent out expeditions to Franz Josef Land in 1901 and between 1903 and 1905, in the course of which A. Fiala reached the high latitude of 82° 4′ N. in the "America," but the ship was afterwards lost in Teplitz bay.

The Italian expedition under the command of H.R.H. Prince Luigi, duke of the Abruzzi, was the most successful of all those which have attempted to reach high latitudes by way of Franz Josef Land. Sailing in 1899 in the "Stella Polare" the expedition wintered in Teplitz bay in Rudolf island. In the spring of 1900 an effort was made to reach the North Pole by sledging over the sea-ice. The duke of the Abruzzi having been disabled by

frost-bite, the leadership of the northern party devolved upon Capt. Cagni, who started on March 10, 1900, with ten men and nearly 100 dogs. Before losing sight of Rudolf island three men forming the first supporting party started to return, but they never reached winter quarters and all must have perished. The second party returned safely from latitude 83° 10′ N. Cagni pushed on with three companions, and on April 25, 1900, succeeded in reaching 86° 34′ N. in 61° 20′ E. Diminishing food supplies made it necessary to turn at this point, and although he had reached it in 45 days it took Cagni 60 days to return. At the farthest north no land was visible.

Franz Josef Land was to be the base of a march to the Pole by the Russian, G. L. Sedoff, but on his death near Rudolf island in 1913 the journey was abandoned and the "Phoca" (later the "Suvorin") returned to Archangel. G. L. Brusilov sailed in 1912 in the "Santa Anna" to attempt the north-east passage. The ship was caught in the ice of the Kara sea and in a year and a half drifted to 83° N., long. 63° E., north of Franz Josef Land, where 11 men left the ship. Two of them were found by the "Phoca" at Cape Flora; the others perished on the way. Nothing is known of the fate of the ship and the remainder of the crew.

As early as 1895 a scheme for an exploring expedition in a balloon was put forward seriously, and in 1897 the Swedish aeronaut S. A. Andrée carried it out. He had brought a balloon to Danes island, Spitsbergen, the previous year, but the weather was unpropitious and the ascent had to be postponed. On July 11, 1897, he started in a new and larger balloon with about five tons of supplies and two companions. It was hoped that the balloon could be steered to some extent by the use of heavy guide ropes dragging over the ice, and Andrée had already made successful flights in this way. Rising at 2.30 P.M. the balloon was out of sight of Danes island in an hour. At 10 P.M. Andrée threw out a buoy containing a message which was recovered, and this stated that the balloon was in 82° N. 25° E., moving towards the north-east at an altitude of 800ft. above a rugged ice-field. This was the last news received, and in spite of many rumours, nothing further has ever been ascertained.

In 1897 and subsequent years Sir Martin Conway explored the interior of Spitsbergen. Dr. A. G. Nathorst explored the eastern coast and off-lying islands, including Gilies land. In 1899 Nathorst visited the north-east coast of Greenland, mapped Franz Josef fjord, and discovered the great King Oscar fjord.

In 1899 Admiral S. O. Makaroff of the Russian navy arranged for the trial trip of the great ice-breaker "Yermak," which he designed, to the sea-ice off Spitsbergen. Though no high latitude was attained on this occasion he formed the opinion that a vessel of sufficient size and power could force a passage even to the Pole. The Russian-Japanese War put an end to the polar projects of this gifted man of science.

In subsequent years valuable surveys and scientific observations were made by the Prince of Monaco in his yacht "Princesse Alice," by Dr. W. S. Bruce, notably on Prince Charles ioreland, and by others.

Spitsbergen Surveys — Much detailed work has been done in Spitsbergen in recent years by Norwegians, British and Swedes. Norwegian government surveys of the western part of the mainland have been completed by G. Isachsen, A. Staxrud, A. Hoel and the survey ship "Fram." The opening of coal mines has been responsible for other surveys. In 1912 a German exploring expedition under Lieut. Schroeder-Stranz came to grief and almost total loss on the north coast, but in the same area in 1924 an Oxford university expedition under G. Binney did useful work in North-East Land and adjacent coasts. An expedition under F. A. Worsley in the "Island" did some oceanographical work east of Spitsbergen in 1925.

Otto Sverdrup planned an Arctic voyage for the circumnavigation of Greenland in the "Fram." G. I. Isachsen was the surveyor. Starting in 1899, he was obliged to abandon the attempt to get northward through Smith sound, and making his way westward into Jones sound he spent three years in exploring islands to the north of the field of the Franklin search expeditions. Axel Heiberg and other islands between Ellesmere and Melville islands were discovered and mapped, and a great deal of valuable work was accomplished.

Stefansson and **Macmillan.**—The western part of the Canadian Arctic archipelago was extensively explored by V. Stefansson in several expeditions from 1906 to 1918. Stefansson always lived in Eskimo fashion, hunting as he went, and so could travel light and avoid the need of falling back on a base for supplies. He added much to the survey of the Parry Islands, islands to the west of Axel Heiberg islands, and Banks island. The southern branch of his expedition of 1914–18 under R. M. Anderson conducted researches in Victoria island and the mainland of Arctic Canada. The "Karluk," under R. A. Bartlett, was caught in the ice north of Alaska and drifted to destruction in 72° N., 173° 50′ W., but all except four men, including J. Murray, Forbes McKay and H. Beuchat were eventually saved by the exertions of Bartlett. Sledge journeys and soundings of this expedition, one of E. Mikkelsen in 1907 and of D. B. Macmillan in 1914 towards Peary's hypothetical Crocker Land practically proved the absence of any further land in the Beaufort sea. Further work in Ellesmere Land including a westward journey to 82° 30′ N., 108° 22′ 30″ W. in a vain search for Crocker Land was carried out by D. B. Macmillan, W. E. Ekblaw and others of an American expedition which had its base at Etah on Smith sound from 1913–17. The Royal Canadian Mounted Police, who maintain several ports in Baffin and Ellesmere islands and elsewhere in the Canadian Arctic, are annually surveying and exploring these islands.

Toll and **Vilkitski.**—Russian surveyors and explorers continued to map portions of the Siberian coast, and in 1886 Dr. A. Bunge and Baron E. von Toll visited the New Siberian islands. Baron Toll continued this work in 1893. He set out once more in 1901 in the "Zarya," hoping to reach Sannikov island, a land reported to the north of the New Siberian group. In Aug. 1902 he reached Bennett island with the astronomer Seeberg and two men, and remained there until Nov. Nothing more was heard of the expedition, and a relief expedition in 1904, under Lieuts. M. P. Brusneff and A. V. Kolchak, failed to find any trace of the explorers beyond a record left on Bennett island, which gave a summary of their movements up to the time of leaving the island.

Between 1912 and 1915 the Russian ice-breakers "Taimir" and "Vaigach," under the command of B. A. Vilkitski, were employed in surveys of the Arctic coast of Siberia. Besides much accurate charting of the coasts, and oceanographical work, they discovered in 1913 Nicholas Land (Northern Land) and two small islands north-west of Cape Chelyuskin and made partial surveys of them in 1914. The northern limits of Nicholas Land are unknown. Bennett island was also explored, Jokhov and Vilkitski islands discovered to the south-east of it and Sannikov land practically disproved.

Amundsen.—In 1901 Captain Roald Amundsen, a Norwegian, who had been mate on the "Belgica" in her Antarctic voyage, planned an expedition to the area of the north magnetic pole visited by Sir J. Ross in 1831, in order to re-locate it, and as a secondary object he had in view the accomplishment of the north-west passage by water for the first time. A small sealing sloop, the "Gjoa," was fitted with a petroleum motor and strengthened to withstand ice-pressure. She left Christiania on June 17, 1903, with a total company of six men, second in command being Lieut. G. Hansen of the Danish navy. She passed through Lancaster sound down the west side of Boothia Felix, and took up winter quarters in Gjoa harbour in Petetsen bay, King William island. Here the vessel remained for two years while observations were carried out, and sledging excursions were made to the magnetic pole and along the coasts of Victoria island, which was charted up to 72° N. In August 1905 the "Gjöa" proceeded westward along the Canadian coast, but was frozen in off King Point for a third winter. On July 11, 1906, she got free, reached Bering strait and entered the Pacific, the first ship to pass from ocean to ocean north of Patagonia.

Between 1918–21 Amundsen made the north-east passage in the "Maud," wintering three times on the Siberian coast on his

may to Alaska. The voyage was preliminary to a journey across the Arctic Ocean on the lines of Nansen's drift in the "Fram." Unfavourable ice-conditions delayed the successful start of the drift until 1922. Amundsen returned to Europe to prepare for his polar flight and O. Wisting commanded the "Maud." H. U. Sverdrup was the scientific leader. From Wrangel island the ship drifted for two years south of and parallel to the track of the "Jeannette" to the north of the New Siberian islands. Then after another winter at the Bear islands near the Kolima mouth the "Maud" returned to Nome.

Greenland.—Danish explorers have continued to concentrate their attention on Greenland. Lieut. G. D. Amdrup, in a series of expeditions between 1898 and 1900, charted the east coast as far north as 70° 1j' N. The duke of Orleans in the "Belgica," under the command of Captain Gerlache in 1905 cruised along the coast between 76° and 78" N., and fixed the general outline of the land. This expedition did a large amount of work in oceanography. L. Mylius-Erichsen sailed in the "Danmark" in June 1906 and found winter quarters in Danmarkhaven, 75° 43' N., where the ship remained for two years, while systematic observations were kept up at the base and the work of exploring to the northward was carried on by sledge. The coast was found to curve much farther to the north-eastward than had been anticipated. Having left the winter quarters on March 28, 1907, Mylius-Erichsen, with Capts. J. P. Koch, N. P. Hagen, an educated Eskimo, Bronlund and two others, reached north-east foreland, the eastern extremity of Greenland (81° 20′ N., 11° 15′ W.) charting the coast as they went. Here they divided; Koch with A. Berthelsen and the Eskimo Tobias went north-westward to explore the east coast of Peary Land, and succeeded in reaching Cape Bridgman in 83° 29' N., thus linking up with Peary's work in 1900. From this great journey he returned in safety to winter quarters. Meanwhile Mylius-Erichsen, with Hagen and Bronlund, followed the coast westward into what was believed to be the Independence bay seen from a distance by Peary; this turned out to be a deep inlet now named Danmark fjord. Keeping to the coast, they entered Independence bay and pushed on to Cape Glacier in 82° N. and 35° W. by June 14, 1907, within sight of Navy Cliff, which had been Peary's farthest coming from the west side. Here the softness of the snow kept them all summer. When they could travel, more than a fortnight was wasted adrift on a floe in the effort to cross Danmark fjord. Here the sun left them, while they were without food, almost worn out and more than 500m. from the ship. It was impossible to attempt the long journey round the coast, and the only chance of safety, and that a very slender one, was to make a way southward over the inland ice and so cut off the eastern horn of Greenland which the expedition had discovered. Under the most terrible difficulties they accomplished the feat of marching 160m. in 26 days, and reached the east coast again in 79" N. Hagen died on the way; Mylius-Erichsen himself struggled on until he nearly reached the provisions left on Lambert island on the northern journey; but he too perished, and only Bronlund reached the supplies. He was unable to proceed further, and after recording the journey in his diary, he died also alone in the Arctic night. His records were discovered in the following year by Koch, and Erichsen's in 1910 by E. Mikkelsen.

Using as a base the Eskimo trading station of Thule in North Star bay on Smith sound, K. Rasmussen, L. Koch and other Danes have carefully explored the north of Greenland, and in 1921–24 Rasmussen, P. Freuchen and K. Birket-Smith continued their researches in Eskimo culture by visiting, between them, all the tribes from Greenland to Alaska. They also surveyed parts of Baffin island (Cockburn Land). Eskimo stations on Scoresby sound, east Greenland, founded 1925–26, have been the base of other work by L. Koch. In 1926 a Cambridge expedition under J. M. Wordie did some survey on the east between 72° and 75° N.

Peary: Journey to the North Pole.—After the return of the Jackson-Harmsworth expedition, Lord Northcliffe presented the "Windward" to Peary, who resumed in 1898 his systematic explorations of the Smith Sound region in the hope of finding a way to the Pole. He made some long sledge journeys in the winter of 1898–99, having his feet badly frost-bitten and losing eight toes, and wintered amongst the Etah Eskimo in 1899–1900. Next spring he made a successful journey to the north of Greenland, and pushed north over the sea-ice for 20m. farther, reaching 83" 54' N. Peary wintered again at Fort Conger in 1900–1, and for the fourth year in succession he went through the Arctic winter, 1901–2, at Payer harbour. In the spring of 1902 he made a great journey to Cape Hecla in the north of Grant Land and thence northward over the frozen sea to 84° 17′ N. in 70° W. Frequent open leads of water and the moving of the ice-floes made further advance impossible, and after an unparalleled sojourn in the farthest north, Peary returned to the United States. The Peary Arctic Club of New York, formed to support this indomitable explorer, provided funds for a new expedition and a ship named the "Roosevelt." In her he proceeded in the summer of 1905 through Smith sound to Cape Sheridan on the north coast of Grant Land, Capt. R. A. Bartlett being in command of the ship. From this point he advanced by sledge to Cape Hecla, whence he made a most strenuous attempt to reach the North Pole. Organizing his large following of trained Eskimo, whose confidence in him had been won by many years of friendship, and his few white companions in separate parties, he set off at the end of February 1906. A very broad lead of open water was encountered in 84" 38' N., and as the party did not carry kayaks much time was lost in getting across. The floes had a marked eastward drift and it was difficult to make progress northward; however, Peary struggled on by forced marches to 87° 6' N., which he reached on April 21, 1906, the most northerly point so far attained. His return journey was the most dangerous in his experience; many leads had to be crossed, sometimes on ice so thin that it bent beneath the weight of the explorers, provisions were exhausted and the men were reduced to eating their dogs before they made land at Cape Neumayer in the north of Greenland.

Returning to America, Peary prepared for a last attempt. Leaving New York in July 1908 the "Roosevelt," again under the command of R. Bartlett, brought the party, with the Eskimo who were picked up on the way, to Cape Sheridan by Sept. 5. During the winter all supplies were transported to Cape Columbia, farther west on the coast of Grant Land. Here there were ready to start in the first light of the Arctic day seven explorers, 17 picked Eskimo and 133 of the best dogs in Greenland, with 19 sledges. As the outcome of all Peary's experience the expedition was arranged to consist of a lightly equipped advance party to select the route and make the trail by clearing a way through rough ice, and a main party composed of units of four men each with sledges containing all their requirements marching one day behind the pioneer party. From this unit parties were to return southward at intervals with the empty sledges, leaving the diminished main party to push on fully provisioned. The "big lead," said to mark the edge of the continental shelf in 84" N., was crossed after some delay and here the sun appeared for the first time on March 5, 1909. D. B. Macmillan with three Eskimo and three sledges returned along the outward trail after March 7 from 84" 29' N. A sounding at this point showed the depth of the sea to be 825 fathoms. After five more marches G. Borup turned back in 8j° 23' with three Eskimo and three sledges, the best Eskimo and dogs remaining with the main party. From this point the advance was regular; the pioneer party started from the snow-houses they had built and slept in when the main party arrived, and while the latter slept the pioneers marched, selected a camp, built new snow-houses, and slept till the main party came up. At 86° 38' N. R. G. Marvin turned back, as usual with the three worst Eskimo and the worst dogs. His party reached the ship, but he himself was drowned in recrossing the "big lead," the only casualty of the expedition. At 88" N. Bartlett turned back on April 1 in accordance with the system with two Eskimo, one sledge and 18 dogs. Up to this point Peary had saved himself as much as possible, leaving the path-finding and the observations to his very competent colleagues; but now he put forth all his strength for the arduous

140m. which separated him from the Pole. He was accompanied by Henson and four Eskimo. The ice improved as he went on, and it was possible to do 25m. in a daily march of 10 hours, and on one occasion 30m in 12 hours. On April 6 an observation gave 89" 57' N., and here a camp was made and observations taken throughout 24 hours to fix the position, as well as excursions a few miles farther on and a few miles to right and left so as to be sure of actually reaching the Pole. No land was to be seen, and a sounding through the ice gave a depth of 1,500 fathoms with no bottom. The American flag was hoisted; the goal of all the ages of exploration had been reached.

The return journey was quick and easy. The tracks kept open by the passage of the various return parties were distinct, the snow-houses stood ready, and a northerly gale kept the ice pressed well together and the leads closed. On April 23 Cape Columbia was reached and soon after the party was safe on board the "Roosevelt." Success was due to the accumulated experience of 23 years' constant Arctic work, and to the thorough acquaintance with the Eskimo and their dogs, which enabled the best work to be got out of them.

Dr. F. A. Cook spent two years in the Arctic regions, 1907–9, and claimed to have reached the Pole by sledging alone with two Eskimo a year before Peary. He submitted the evidence for this achievement to the university of Copenhagen, which failed to find it satisfactory, and Dr. Cook did not appear to challenge this decision.

Polar Flights. — Three flights were made to the North Pole in 1926–28. On May g, 1926, Commander R. E. Byrd of the U.S. navy, flew from Spitsbergen to the pole and back in 16 hours; two days later Roald Amundsen, who had failed with an aeroplane in 1925, started from the same base with L. Ellsworth and Umberto Nobile in the Italian built dirigible "Norge," crossed the pole and reached Teller, Alaska, a distance of 3,391m., in 71 hours. No land was seen on the way, but at times mist obscured the view. General Nobile, starting from the Spitsbergen base in May, 1928, in the dirigible "Italia," first made a survey eastward over Franz Josef Land, and then turned due north, reaching the pole on May 24. On his return, the "Italian" was wrecked on North East Land, east of Spitsbergen, but Nobile and most of his crew were saved after six weeks on the ice. Amundsen, who had joined in the search for Nobile's party in an aeroplane, was lost.

Leaving Point Barrow, Alaska, on April 15, 1928, Captain George H. Wilkins and Lieut. Eielson flew across the Arctic ocean, reaching Spitsbergen in 203 hours, and covering 2,200 miles. Wilkins was knighted on his return.

Future Exploration. — There is little likelihood of new land except a few islands in groups already known being discovered in the Arctic, but the successful exploration of the polar basin has yet to be undertaken. Detailed topographical and geological surveys are required in many Arctic lands. Geodetic measurements and gravity determinations with modern instruments of precision are much needed. Investigations of terrestrial magnetism are of great importance. The study of Arctic meteorology cannot fail to throw light on the atmospheric circulation in the northern hemisphere and on the origin and course of cyclones. Statistical data are fairly numerous, but there is urgent need of using modern methods of research on the spot. A study of ice formation and currents, apart from its own interest and its bearing on possible climatic changes will probably be found to have bearings on the weather of Europe. Lastly, there are numerous problems in biology and the conditions of life in polar regions, apart from mere collecting, that can only be studied on the spot. Exploration of the future requires not so much travelling expeditions as fixed stations operating for a year or more.

THE ARCTIC OCEAN

The broad outlines of the physical geography of Arctic regions are known, although much has to be done in filling in details. The landlocked Arctic sea or ocean, lying eccentric to the North Pole includes, with the Greenland and Norwegian seas, about 5,400,000sq.m. A feature of the Arctic sea is its wide continental shelf on which lie numerous groups of islands, Greenland, Spitsbergen, Franz Josef Land, Novaya Zemlya, the Canadian Arctic islands, etc. (*q.v.*). No islands are known in the deep polar basin and there is little likelihood of any existing. The tidal observations of the "Maud" discourage the probability of any extensive land in the Beaufort sea, which is the one large unexplored area in which land has been suggested.

Depths. — The wide continental shelf is marked by several depressions below 100 fathoms. Baffin bay falls to depths of over 1,000 fathoms; the Greenland sea, including its south-eastern part which is sometimes called the Norwegian sea, falls to 2,000 fathoms, and the Barents sea, which is really a gulf of the Greenland sea, reaches over 300 fathoms in the west. The Kara sea is a shallow sea scarcely over 100 fathoms in depth between Novaya Zemlya and the Yamal peninsula. The name Beaufort sea applies to that part of the ocean between Alaska and the Parry islands. The Bering sea lies between Bering strait and the Aleutian islands. The deep polar basin has not been accurately charted since its surface is generally ice-covered. The deepest soundings are 2,100 fathoms in 81" N., 130′ E.; 2,020 fathoms in 84° 30' N., 75° E.; 2,050 fathoms in 87° 43' N., 10° 20' W.; and 3,076 fathoms in 77° 45' N., 175° W. The last is an echo sounding. A sounding of 2,561 fathoms in 72" N. 147° W. suggests the need of confirmation; it was probably only about 1,383 fathoms. Peary found 1,500 fathoms within five miles of the Pole. The basin of the Greenland sea is cut off from the polar basin by a ridge at about 800 fathoms between Greenland and Spitsbergen. This ridge has not been accurately defined. The Faeroe-Icelandic and Wyville Thompson ridge at less than 300 fathoms separates the deep Greenland sea from the depths of the Atlantic basin. Other connections of the Arctic waters and the great ocean basins are by the many shallow channels among the Canadian Arctic islands and the narrow Bering strait which is only 30 fathoms deep.

The origin of the polar basin is not clear, but there is some evidence that it is a relatively recent feature of the earth's surface and did not exist in Palaeozoic times. The wide continental shelf is probably a plain of marine abrasion in which the disintegrating power of frost, an active agent of destruction in the Arctic, has helped the action of the waves. If this explanation is true there must have been a change in the relative level of land and sea; either a sinking of the land or a rising of the sea. The lowering of sea-level during the Pleistocene ice age owing to the abstraction of water from the oceans offers a partial explanation, but wave and frost action needed a larger period of time than the duration of the ice age. Since its formation began the shelf has been undergoing depression by the weight of land waste accumulating on its floor, and at the same time denudation, by decreasing the weight of the land, is causing the coastal region to rise. The strandflat, a rocky platform at 60 to 100ft. above sea-level, is another significant feature of many Arctic and sub-Arctic lands. Nansen sees in it another plain of marine abrasion formed when the ocean water stood higher owing to feeble glaciation.

Deposits. — Bottom deposits in high latitudes contain little organic matter and only 1 to 4% of $CaCO_3$. Between Spitsbergen and Greenland the amount of lime increases to over 20 or even 30% owing to foraminifera. Diatoms which are abundant in surface waters do not, among the rock waste, form a high enough proportion to justify the name of diatom-ooze for any Arctic deposit.

Circulation. — Arctic surface waters in spite of being cold are relatively light on account of their low salinity, due both to lack of evaporation and steady inflow of great volumes of fresh water from the Eurasian and American rivers. The tendency of the light surface layers is to spread outwards, a movement which is helped by the prevailing winds, and the overflow necessary from a constricted basin to which inflow of river water is considerable and where evaporation is slight. Within the polar basin the surface waters are sweeping across from Alaska and Siberia towards Spitsbergen and Greenland on the Asiatic side of the Arctic sea. Most of this water and the ice it carries finds its way southwards into the Barents and Greenland seas by the east Spitsbergen and east Greenland currents which flow southward along these coasts

and tend to block them with streams of pack-ice. Some of the polar water finds its way out through Smith sound and other channels west of Greenland and feeds the Labrador current along the west of Davis straits and the coast of Labrador. Lastly some of the water finds its way westward through the Beaufort sea and merges again in the great transpolar drift except a little which flows southward on the western side of Bering strait. The Labrador current is dissipated by the Gulf Stream on the Newfoundland banks. The east Greenland current splits, sending one branch eastward to the north of Iceland and the Faeroes, eventually to be lost in the north Atlantic drift, and another round Cape Farewell and northward into Davis strait. In opposition to these cold outflowing currents there are northward setting drifts due to prevalent winds. The most noteworthy is the north Atlantic drift. This washes the coasts of Britain and Norway and has four main branches: (1) the North Cape drift along the Murman coast into the Barents sea; (2) the Spitsbergen drift northward past Bear island and western Spitsbergen; (3) the Irminger current, northwestward along the south and west coasts of Iceland into Denmark strait; (4) another north-westerly stream into Davis strait, washing the coasts of south-west Greenland. A small current sets northward along the eastern side of Bering strait. All these currents vary in intensity from year to year. The ultimate causes of the variation between inflow and outflow are not clear.

Temperature and Salinity. — In the polar basin the vertical distribution of temperature and salinity vary little in all places examined. From the surface to 100 fathoms temperature is below the freezing point of fresh water with a minimum of 28·6° or 28·7° (−1·9°C. or −1·8°C.) at 30 fathoms. Salinity increases from 29 or 30 per mille at the surface to nearly 35 at 100 fathoms, and below that depth it seems to remain constant. Temperature rises at 160 or 200 fathoms to 32·5° (0·3°C.) or even 33·8° (1°C.) and then falls to a second minimum of 30·5° (−0·8°C.) at 1,400 to 1,600 fathoms, below which it rises a few tenths of a degree towards the bottom. There is little variation in these figures in summer and winter, except near the surface, where a relatively fresh layer of 5 to 6ft. may occur owing to melting snow on pack-ice. Near the Siberian coast there is in summer a layer of warm surface water from the Siberian rivers which helps to keep those coasts free from ice at that season. In the Greenland and Norwegian seas the water below about 400 fathoms has a uniform salinity of nearly 35 per mille and a temperature at that depth slightly below 32°, falling to 29.8' (−1·2°C.) at the bottom. This is the same water that fills the polar basin. The lower temperature at the bottom of the Greenland sea than in the polar basin confirms the existence of a submarine ridge between Greenland and Spitsbergen which cuts off the colder bottom water of the Greenland sea. In the Spitsbergen current from the south. maximum surface temperatures of 41° at 42.8" and a maximum salinity of 35 per mille occur west of Spitsbergen. It is this Atlantic water which forms the warmer layer already referred to.

In the Barents sea the Atlantic drift waters have a salinity of nearly 35 per mille and a temperature of 41° to 43° (5° to 6°C.). The bottom temperature in the west and south-west is above 32". In the eastern part salinity and temperature are lower and the bottom temperature falls below 30·2° (−1°C.).

The Kara sea, with much river water, has a low salinity of 29 to 34 per mille. Baffin bay like the polar basin has an intermediate warm layer between cold surface and bottom layers.

Pack-ice. — Two-thirds of the Arctic sea is covered by drifting pack-ice which is formed by the freezing of surface layers during autumn, winter and spring. A small part of the ice comes from glaciers. This berg ice is distinguished easily by size and structure from sea-ice. It comes principally from Greenland with some from Franz Josef Land, Spitsbergen, Novaya Zemlya and Ellesmere island, but large icebergs, except in west Greenland waters, are rare in the Arctic. Pack-ice seldom grows thicker than 6 to 7ft. in one year, but by yearly accretions it may attain 15ft. or more. Floes are generally covered with sufficient weight of snow to depress the actual surface of the ice to sea-level. Pressure due to currents and wind may cause piled or rafted hummocks 40 to soft. above sea-level. Nares' palaeocrystic ice was probably rafted ice mixed with floe'-bergs from glaciers but was not more than four or five years old. There is some surface melting by solar radiation in summer, but it is only by drifting into warmer waters that much ice is destroyed. Apart from actual melting under those conditions the floes become soft and friable and easily disintegrate under wave action. All polar ice is in motion even in mid-winter and lanes and pools frequently appear between the floes.

Marine Life. — Those parts of the ocean continually covered with ice have a poor development of surface plant life, due probably to a lack of light, and a consequent poor development of animal life. The deeper strata are also poor in individuals though fairly rich in species. Where the sea is more open plant life teems in the surface waters to such an extent that diatoms sometimes tinge the sea bright green. This abundant phytoplankton is due to a combination of conditions. Warmer deep layers of water in which nitrates and carbon dioxide set free by animal metabolism rise to the surface in polar seas and afford food for pelagic plants, while the low temperature of the waters retards the actions of denitrifying bacteria. Animal plankton is less abundant, but in all shallow seas there is an abundant bottom fauna. The occurrence and erosive action of ice impedes the growth of a littoral fauna and flora on many coasts. Fishes are numerous, including a species of sea char or salmon, cod and halibut. Seals are abundant, especially along the margins of the drifting packs. Whales have been much reduced in number by hunting, but still occur outside the pack. In the ice-covered seas mammalian life is scarce except for a few seals, an occasional narwhal and a few wandering polar bears, but the Arctic is not a lifeless desert.

ARCTIC LANDS

Geology. — The northern parts of Europe, Asia and America almost encircle the Arctic sea. Beyond these Arctic mainlands lie various islands and island groups on the continental shelf. All these are relics of more extensive land areas and most of them show geological continuity with the nearest continental land. Some of them, such as Nicholas Land and the De Long islands, have been inadequately explored from a geological standpoint. In ice-covered lands the geological structure can only be inferred from the marginal rocks, and in few Arctic lands does the snowfall allow geological exploration except for a few weeks in summer. While Archaean rocks predominate in the Canadian Arctic and Greenland, rocks of palaeozoic and later ages are found exclusively in the Eurasian Arctic islands. For details see GREENLAND, SPITSBERGEN, etc. Present volcanic activity is rare. Beerenberg in Jan Mayen is an active volcano. Warm springs occur in Wood bay, Spitsbergen. Past volcanic activity is notable in the Tertiary basalts of Greenland, Spitsbergen, Franz Josef Land and the New Siberian Islands. There is clear geological evidence of a warmer Arctic climate during tertiary times, but during the Pleistocene ice age climate was more severe than at present and probably most Arctic land, except the Canadian Arctic islands, was ice covered.

Most Arctic hills are edged by slopes or scree of coarse or fine debris from the weathering of the rocks above. This loose material freezes together in winter, and though loose on the surface in summer is not carried away by running water, except where deep gullies cut across it. These screes hide the solid rock and make geological work difficult. Raised beaches are of frequent occurrence and deltaic lands are forming in many fjords.

Native Population. — The original people of the north of Europe are the nomadic Lapps who live by fishing and reindeer breeding, and further east in Russia and western Siberia the Samoyedes who follow the same mode of life. They also have small settlements on Novaya Zemlya. In eastern Siberia the chief Arctic people are the Chukchee, reindeer herders, between the Kolima mouth and Bering strait, but other tribes touch or occasionally visit the northern coast. American Indians wander north of the Arctic Circle in Alaska and Canada. Eskimo (*q.v.*) extend from eastern Siberia and Alaska to Ungava, Labrador and Greenland. They appear to be dying out by contact with civilization in spite of the protective measures of the Canadian and Danish gov-

ernments. Practically all the Eskimo of west Greenland, except the Polar Eskimo or Arctic Highlanders north of Melville bay, have Danish blood in their veins. There has never been a native population in Spitsbergen, Franz Josef Land and the New Siberian Islands.

CLIMATIC CONDITIONS

It is a commonplace of modern geography that there are two main kinds of climate, continental and insular, with the seacoasts of continents partaking somewhat of the insular qualities In continental climates there are greater extremes of heat and cold than on islands. It follows that the most intense cold in the Arctic is nowhere near either the mathematical centre, called the North Pole, or the sea-ice centre, called the Pole of Inaccessibility (84° N. lat., 160° W. long.). In Arctic Alaska, the coldest weather is, so far as we know, in the Yukon basin; in Canada it is in Yukon Territory; and in Siberia it is in the province of Yakutsk. All these places have been inhabited for a quarter of a century or more by Europeans who are not known to have been materially discouraged in their work by the mere disagreeableness of the climate, although they have been handicapped by the frozen ground and in other things that result directly from the cold.

The Coldest Region. — The coldest known region of the northern hemisphere is the province of Yakutsk, in the vicinity of the Arctic Circle, where temperatures colder than go" F below zero have been reliably recorded — and that on the edge of cereal farming, for the great Russian atlas issued just before the World War indicates that wheat, barley, oats and rye are cultivated, if not at the very cold pole of the Northern Hemisphere, at least within a camparatively short distance from it, where the temperature frequently drops lower than 80° below zero. This is colder than any known region in Arctic Alaska or Arctic Canada. We may conclude, then, that winter cold does not frighten away Europeans through its mere disagreeableness nor render it impossible for them to make a living.

No records apparently authentic of temperatures colder than 60" F below zero are available from any of the Arctic islands, and it is almost certain that they do not occur. The coldest spells that do occur come when the wind blows from the interiors of the islands. It seems unlikely, therefore, that the temperature ever drops as low as 55° below zero at the North Pole, the Pole of Inaccessibility, or, indeed, at any point on the Arctic sea.

Summer Temperatures. — There is probably no spot on a lowland in the continental Arctic, whether in Asia or America, that does not occasionally have a summer temperature warmer than 80° F in the shade. Or, if there is such a place, it must be on a peninsula, or on a narrow coastal strip between ice-covered mountains and the sea. Many places in the continental Arctic have occasional temperatures above 85" in the shade, and at least one Arctic weather bureau station, that of the U.S. Government at Ft. Yukon, Alaska, has a record of 100° in the shade. The slowness of the public to realize that there is such great summer heat in the Arctic is due partly to the prevalence of the ancient view that all the Arctic is always cold, and partly to the reports of travellers whose entire Arctic experience has been on the ocean or on a sea-coast.

The reason for the great mid-summer heat on Arctic lowlands is, of course, that the sun delivers an adequate number of heat units per day to account for it. The ordinarily accepted figures are 3 or 4% more at the North Pole than at the equator for the top of the atmosphere and 3 or 4% less for sea-level. This means that you would have "tropical" heat at any place in the Arctic where the sun's rays strike a dark surface and where there is no local reservoir of "cold" to neutralize it. The places, therefore, that do show a "tropical" heat are on lowlands that are sheltered from ocean breezes and from winds that come from ice-covered mountains. If the length of summer is measured by the season during which streams flow unfrozen and during which certain insects are alive and more or less active, the Arctic summer would range from a maximum of about five and a half months in such places as the north shore of Great Bear lake, to perhaps two months in places like Borden island.

But an important thing to remember is that there is a direct dependence of animals on plant life and that plants measure their summer not by the calendar but by the number of hours of sunlight. At Ft. Yukon, Alaska, for instance, on a day that varies from, let us say, 65" at the coldest to 95° at the warmest (in the shade), there would be approximately as much growing time as in two ordinary days in the humid tropics. This is why some plants grow so much more rapidly in certain parts of the Arctic than the same plants do in any part of the tropics or temperate zone. An interesting, and to most botanists an unexpected, corollary is that some plants also grow to far greater size in the Arctic than in the temperate zone or tropics, as cabbages, for instance. This may possibly be because they lose speed in the temperate zone where they have to stop and start again to conform with alternation of day and night, but can maintain a continuous and fairly uniform rate of growth in the Arctic where the daylight is continuous.

Arctic Weather. — Dr. Fridtjof Nansen announced as one of the outstanding conclusioris of his great scientific expedition of 1893–96, that the Arctic is, on the average, one of the least stormy large regions of the world. Stefansson's observations as a result

of 11 years spent north of the Arctic Circle and the studies of other observers have tended to confirm Nansen. In many parts violent gales are quite absent, or at least have not yet been observed by scientific men. Gales are common only where an open ocean is faced by high mountains or a plateau.

Snowfall. — It is difficult to measure Arctic snowfall because the snow is usually very dry and fluify and is driven about a great deal by even the lightest winds. There is no doubt that, however, on the average, Arctic precipitation is very light. It is estimated that, if the snow of winter be added to the rain of summer, the result would be about eight inches of water, certainly not more than ten, on most parts of the Arctic lowlands of Canada and Alaska. The Siberian lowlands may be even drier. We have, therefore, the apparent paradox that the average snowfall of the Arctic is much less than that of Scotland or of Illinois, for instance.

Glaciers. — It is now well established that there is no permanent snow or ice on any land in the Arctic unless it be mountainous. The required height of mountains varies roughly with the varying precipitation. The highest mountains of Melville island, for instance, are probably not more than 4,000 feet. This is not enough for the formation of any real glaciers. E. de K. Leffingwell, in his studies of Arctic Alaska, found that in the first coast range south of Flaxman island, the altitude of 6,000ft. was not enough for the formation of glaciers. But in the second range, a little farther south, which runs up towards 10,000ft., there were some glaciers. So far as we yet know, there is no evidence of ancient glaciation on the great low plains of Arctic Alaska. This must have been because they were then as now a region of very light snowfall.

Fogs. — Since fogs are caused by the meeting of air currents of differing humidity and temperature, it is obvious that the insular Arctic and the coast lands must be regions of frequent fogs. In summer, for instance, with a lowland steaming under a sun that creates an 80° temperature in the shade, and just in front of it an ocean the surface of which is around 30° F, any breeze blowing from the land would be suddenly cooled, producing a sea fog. Similarly, any breeze coming from the ocean would produce a fog over the superheated land. Such fogs would be thickest and most frequent where the sea and land meet. We gradually work out of the land fogs when we travel inland and out of the sea fogs when we steam away from land. From the flying point of view, it is important that these fogs have been found by experience to be very low on the average. They are often thick on the decks of whaling ships, but so thin at the masthead that the captains in the crow's-nests can see each other plainly while the men on the decks have no visual evidence that other ships are near.

Summing up, the Arctic winters are longer than those of most extremely cold places now inhabited by prosperous and contented Europeans, such as Dakota and Manitoba, for instance. They are also a little colder. But they are, on the other hand, less stormy and with a lighter snowfall. The summers, although shorter, are in some places almost or quite as hot. It would seem, then, that the same sort of people might be willing to live in the Arctic who are willing to live in Dakota and Manitoba. It will undoubtedly be difficult to get people to colonize the Arctic, but in the opinion of many this will not be any special Arctic problem but rather a general frontier one. For the tendency which brings American farmers to the cities, increasing the percentage of urban population, makes it as difficult to induce Londoners who are out of work to migrate to sub-tropical Australia as to sub-Arctic Canada. The weakening or dying out of the frontier spirit is one of the conspicuous social phenomena of our time.

NATURALRESOURCES

Since the climate, as such, will not prevent Arctic colonization, the ascertained resources may be enumerated.

Coal. — It is now known that coal is almost, if not quite, as likely to be found in the Arctic as in tropical or temperate lands It is not surprising, therefore, that seams of coal, of varying quality, of course, have been reported by most Arctic explorers. Stefansson, for instance, found coal in all but two of the islands north of western Canada. In these, Victoria island and Meighen island, further exploration may show coal. Coal of quality said to be equal to the best Welsh has been mined for several decades in Spitsbergen, some 500 or 600m. N. of the Arctic Circle, and these mines should eventually supply a great part of northern Scandinavia and of northern Russia. In Alaska, a coal mine at Cape Lisburne, well north of the Arctic Circle, was worked to supply the whaling fleet even before 188 j, and fell into disuse only with the abandonment of the whaling industry. The natives of the north coast of Alaska mine coal at Wainwright for their own use and to sell locally to missionaries, government schools, traders, etc. The members of Stefansson's expedition, living by hunting on Melville island, maintained two winter camps, one in Liddon gulf and the other on the north coast near Cape Grassy. They burned bituminous shale in the southern camp, but in the northern they burned lignite of good quality, some of it saturated with oil.

Oil. — Indications of oil have been found in many parts of the Arctic. The Imperial Oil Company of Canada, a branch of the Standard Oil Company of New Jersey, has wells on the Mackenzie river just south of the Arctic Circle, and the same oil-fields are known to extend beyond the circle. About 500m. N. from these wells and, therefore, about 500m. N. of the Arctic Circle, Stefansson found oil on northern Melville island. The U.S. navy has recently set aside a vast oil reserve in Arctic Alaska, and both private prospectors and representatives of large oil companies have staked claims east of the government reserve. These claims are near Cape Simpson which, but for Barrow, is the most northerly cape in Alaska.

Iron and Copper. — Hardly less fundamental than oil and coal are iron and copper. No large Arctic deposits of iron ore are known. There are iron "prospects," however, in many places. But the copper fields that lie between Bear lake and the centre of Victoria island in a district roughly 200m.sq., give great promise—if the world's need of copper increases, or if the spread of settlements to that country make mining more feasible. There are copper prospects in other parts of the Arctic, and gold, silver, platinum and tin have been found.

Vegetation. — A more fundamental resource than even the oil and coal is the vegetation of the Arctic that makes food-production possible. The coniferous forest extends beyond the Arctic Circle, in Canada in certain river valleys as much as 100m., and even farther in Siberia. Trees 100ft. high are found well north of the Arctic Circle. They rnake the Arctic more homelike to those who are used to forests, and they are doubtless valuable.. But many consider that the same land would be more immediately valuable if the trees were absent, for then it would be covered with grass, like most of the rest of the Arctic, whether continental or insular. It is one of the exploded beliefs that Arctic vegetation is mainly mosses and lichens. In 1909 Sir Cleinents Markham published the statement that the Arctic possesses 28 species of ferns, 250 lichens, 332 mosses and 762 flowering plants. Many species have been discovered since then, and many others will be discovered hereafter. There will probably be little disagreement with the estimate that we have in the Arctic at least ten times as many kinds of flowering plants as of non-flowering. There are a few small portions of the Arctic where cereals can be profitably cultivated, and still others where garden vegetables will be of some value. But, so far as can be seen at present, the chief thing to do with the Arctic soil is to permit that vegetation to continue growing which grows there already and to make an economic use of it by converting it into meat, hides and other animal products.

Reindeer. — There is one suitable animal, the reindeer, domestic in the Old World since prehistoric times. No one knows how many of these there may be in Arctic Siberia, where single owners often have from 5,000 to 10,000 head. But there are definite figures for the entire period of reindeer domestication in Alaska. The US. Government commenced by importing 16 head from Siberia in 1892. Up to 1902, when importation ceased because of an embargo imposed by the tsar's government, 1,280 animals

were brought from Siberia. These have never failed to double every three years since importation, so that by the spring of 1928 there were 800,000 head. The U.S. department of agriculture estimates that the grazing resources of Arctic and sub-Arctic Alaska will be adequate for 3,000,000 to 4,000,000. Since the climate and vegetation of Arctic Canada are, for reindeer purposes, the same as those of Arctic Alaska, with an area ten times greater, we can say, roughly, that Canada will support from 30,000,000 to 40,000,000 head. Undoubtedly the reindeer area in Asia and northern Europe is twice as large as the Alaskan and Canadian together, which would make total world figures between 100,000,000 and 125,000,000. This estimate is probably low. No animal now domestic can be profitable in the Arctic except the reindeer. Cattle, sheep, horses and goats can, of course, be raised in many parts, but under present costs and prices they would not pay. The reindeer pays handsomely because it needs no barn for shelter, no hay for feed, nor any protection from wind or weather.

Domestication of **Ovibos.**—There was a project under discussion in 1928 of domesticating the ovibos (musk ox) because it eats certain Arctic vegetation that reindeer do not eat and because the reindeer produces only meat and hides while the ovibos produces wool in addition. Ovibos beef is indistinguishable from ordinary domestic beef in colour, flavour, texture and odour. The wool, as determined by the textiles department of the University of Leeds (Prof. Aldred F. Barker), has good heat-retaining and wearing qualities, is easy to bleach and dye, is softer than cashmere, and will not shrink—in other words, is one of the finest of known wools. With the ovibos domesticated, the potentialities of the Arctic will be greater. But with only the reindeer, there is no doubt that the Arctic grasslands (which means all lands in the Arctic not so high and mountainous as to be snow-covered) will be colonized unless, indeed, the world movement of population from the country to the cities entirely stops further colonization. In most cases mining will develop after the ranchmen have occupied the grazing lands. But in some cases, notably with oil, the mining will precede colonization. That gold mining will precede colonization seems for the moment unlikely, although that is the one kind of mining that has hitherto taken people to the Arctic. But the rise in the cost of living is only another expression for a drop in the value of gold, so that the gold deposits, which paid fabulously in Alaska 20 years ago, are not so paying now even where production remains uniform.

Site-value.—Finally we must point out a resource of the Arctic that has nothing to do with climate, minerals or the like, but is due entirely to position. The history of civilization as we know it is essentially the history of the Northern Hemisphere. Generally speaking, civilization seems to have started in the sub-tropics—Yucatan for the New World; Egypt, Asia Minor, etc., for the Old World. As civilization has been spreading northward during historic time, it has really been spreading toward the centre of a circle. That centre is the Arctic.

It was an Elizabethan ideal to find a sea-way north from Europe to the Indies. No practical route was ever found, because of the floating ice in the Arctic sea. So, perforce, we have gone roundabout. But now ships of the air are opening up the roads of the air which lie straight in any desired direction. As the Elizabethans knew, China is north of Europe. But Peking is also north of New York, and the wheat-fields that are spreading over central Siberia are north of the growing wheat-fields of central Canada. The cities springing up in those wheat lands will be far from each other east and west, but not half so far north and south.

Air Routes.—The world is developing an increasing speed mania, both for messages and for passengers. The flying conditions of the Arctic are probably, on the average, as good as those of any other equally large area of the world. It follows, therefore, that the centre of the circle of civilization, which is the Arctic, will be the flying crossroads of the world. This will necessitate the establishment of way stations here and there. Of itself, that will to a small extent require colonization. It will have a vastly greater indirect effect by spreading accurate knowledge af the Arctic throughout the world. Thereupon will follow such colonization as the real climate and actual resources justify.

ARCTICS, the term commonly applied to overshoes of rubber or rubberized fabric, worn over the ordinary shoes in stormy weather. They fasten up the leg with buttons, latches or by an interlocking mechanism known in the United States as the zipper. The original arctic was of black waterproofed material, fleece-lined and constructed for utility rather than for style. It became popular with young people, particularly college students, but since the great vogue among women for dainty shoes and light-coloured hosiery arctics have been generally adopted by them only for warmth and protection during winter weather. They have become an important factor in shoe manufacture and every effort is made to offer a dainty and stylish article to the fastidious patron. In large cities where heavy traffic keeps the streets in a muddy state over a long winter season the arctic has supplanted the old-fashioned "rubber" or low overshoe which is clumsy and offers no protection except to the sole and lower part of the shoe.

ARCTINUS, of Miletus, author, according to Proclus in the Chrestonzathy, of two poems of the epic cycle, the *Aithiopis,* which took up the narrative from the close of the Iliad, beginning with the famous deeds and death of the Amazon Penthesileia, and ending with the death and burial of Achilles and the dispute for his arms, and the Sack of Troy (*Iliou* Persis), which gave the story of the wooden horse and ended with the departure of the Greeks after the outrage of Cassandra. (Of this poem 12 lines are extant.) The Little Iliad of Lesches formed the transition between the two. The poems are attributed to other authors by the Tabula Iliaca, Athenaeus and Pausanias.

ARCTURUS, one of the three brightest stars in the northern hemisphere, situated in the constellation Bootes (*q.v.*) in an almost direct line with the tail (ζ and η) of the constellation Ursa Major (great bear); hence its derivation from the Gr. ἄρκτος, "bear," οὖρος, "guard." In the Hebrew Bible, the Vulgate reads Arcturus for the stars mentioned in Job ix. 9, xxxviii. 32, and Amos v. 8. According to a Greek legend Arcas, son of Lycaon, king of Arcadia, was killed by his father and his flesh was served up in a banquet to Zeus, who was indignant at the crime and restored him to life. Subsequently Arcas, when hunting, chanced to pursue his mother Callisto, who had been transformed into a bear, as far as the temple of Lycaean Zeus; to prevent the crime of matricide, Zeus transported them both to the heavens (Ovid, Mefam., ii, 410), where Callisto became the constellation Ursa Major, and Arcas the star Arcturus (see LYCAON and CALLISTO).

ARCUEIL, a town in France, department of Seine, on the Bièvre, 2½ mi. N.E. of Sceaux. Pop. (1936) 16,590. The town takes its name from a Roman aqueduct, the *Arcus Iuliani* (Arculi), traces of which still remain. In 1613–24 a bridge-aqueduct over 1,300 ft. long was constructed to convey water from the ipring of Rungis, 4 mi. S. of Arcueil, across the Bièvre to the Luxembourg palace in Paris. In 1868–72 another aqueduct, still longer, was superimposed to help convey water from the river Vanne to Paris. In the 16th century it was the meeting place of

the poets of La Pléiade, headed by Ronsard. Bleaching, the manufacture of bottle capsules, patent leather and other articles are carried on at Arcueil and there are important stone quarries.

ARCULF, a Frankish bishop and pilgrim-traveller, who visited the Levant about 680, and was the earliest Christian traveller and observer of any importance in the Nearer East after the rise of Islam. On his return he was driven by contrary winds to Britain, and so came to Iona, where he related his experiences to his host, Adamnan Abbot of Iona, 679 to 704. The narrative of his journey, as written by Adamnan, was presented to Aldfrith the Wise, last of the great Northumbrian kings, at York about 701, and came to the knowledge of Bede, who inserted a brief summary of it in his *Ecclesiastical History of the English Nation,* and also drew up a separate and longer digest which obtained great popularity throughout the middle ages as a standard guide-book (the so-called *Libellus de locis sanctis*) to the holy places of Syria.

For bibliography *see* ADAMNAN.

ARDABIL, chief town of one of the administrative districts of the province of Azerbaijan, in north-western Persia, 48° 21′ E. and 38° 14′ N., 38m. from the Caspian sea and 25m. from the Araxes. The town stands on an almost circular plateau 4,940ft. above the sea-level surrounded on all sides by mountains, the most prominent peak being Savalan (15,792ft.) on the west. No trees or shrubs are visible for many miles round and the white chalk soil can be made fruitful only by artificial irrigation. The climate of the town, owing to its high situation, is inclement but is regarded as healthy. The vine, oranges and melons do not grow, but pears and apples are produced in abundance. Near the town are found warm mineral springs, on account of which, and the healthy air, Ardabil was formerly a favourite residence of the Persian court.

Ardabil is an important road centre: to Astara on the coast, to Tabriz, and to other places. Trade, unimportant compared with former times and mostly in the hands of Armenians, is mainly a transit trade between Russia and Persia through the Caspian port of Astara, where, in 1925–26, 10,000 tons of merchandise were landed and 5,700 tons shipped. The chief articles produced in the district for export are dried fruits, carpets and rugs.

The town, which is of great antiquity though it contains no ancient buildings of note, covers a large area surrounded by a ruinous mud wall flanked by towers, while 500 yards to the east is a mud fort constructed by Gardanne (a French general in Persian employ) ip the early years of the 19th century, now also in ruins. In the first half of the 8th century Ardabil was the residence of Shaikh Safi-ud-Din who died here: his shrine is an object of general veneration and is much visited by many Persians. The sanctuary also contains the tomb of the Shah Ismail (died 1524) founder of the Safavi dynasty. The building suffered considerably in the sack of the town by the Russians in 1827, and the famous library of Shaikh Safi, once the greatest in all Persia, was sent to St. Petersburg in 1827 and became part of the Imperial Library.

The European travellers Olearius (1637) and Chardin (1671) describe Ardabil as the most flourishing Persian town of the time, but Morier, in 1813, counted only 4,000 inhabitants. The town has now an estimated population of 16,000–20,000.

See F. Sarre, *Denkmäler Persischer Baukunst* (1901).

ARDAN, a small independent linguistic stock of South American Indians, so called from the Ardas, the most important of its tribes. The Ardan tribes lived west of Iquitos in north-eastern Peru, on the upper Mazan and Nanay rivers, tributaries of the lower Napo. They were of simple culture, and beyond the fact that their language (now extinct) seems to be quite unrelated to any other, little or nothing is known of them.

See A. F. Chamberlain, "Sur quelques familles linguistiques," etc. *(Journal Soc. Americanistes de Paris* [n.s.], vol. vii., pp. 179–202).

ARDASHIR, the modern form of the Persian royal name ARTAXERXES (*q.v.*), "he whose empire is excellent." After the three Achaemenian kings of this name, it occurs in Armenia, in the shortened form Artaxias (Armenian, *Artashes* or *Artaxes),* and among the dynasts of Persia who maintained their independence during the Parthian period *(see* PERSIS).

One of these, (1) Artaxerxes or ARDASHIR I. (in his Greek inscriptions he calls himself Artaxares, and the same form occurs in Agathias ii. 25, iv. 24), became the founder of the New-Persian or Sassanian empire. Of his reign we have only very scanty information, as the Greek and Roman authors mention only his victory over the Parthians and his wars with Rome. A trustworthy tradition about the origin of his power, from Persian sources, has been preserved by the Arabic historian Tabari (Th. Noldeke, *Geschichte der Perser und Araber zur Zeit der Sasaniden, aus der arabischen Chronik des Tabari,* 1879). He was the second son of Papak (Bābek), the offspring of Sassan (Sāsān), after whom the dynasty is named. Pāpak had made himself king of the district of Istakhr (in the neighbourhood of Persepolis, which had fallen to ruins). After the death of Pāpak and his oldest son Shapur (Shihpuhr, Sapores), Ardashir made himself king (probably A.D. 212), put his other brothers to death and began war against the neighbouring dynasts of Persis. When he had conquered a great part of Persis and Carmania, the Parthian king Artabanus IV. interfered. But he was defeated in three battles and at last killed (A.D. 226). Ardashir now considered himself sovereign of the whole empire of the Parthians and called himself "King of Kings of the Iranians." But his aspirations went farther. In Persis the traditions of the Achaemenian empire had always been alive, as the name of Ardashir himself shows, and with them, the national religion of Zoroaster. Ardashir, who was a zealous worshipper of Ahuramazda and in intimate connection with the magian priests, established the orthodox Zoroastrian creed as the official religion of his new kingdom, persecuted the infidels, and tried to restore the old Persian empire, which under the Achaemenids had extended over Asia from the Aegean Sea to the Indus. At the same time he put down the local dynasts and tried to create a strong concentrated power. His empire is thus quite different in character from the Parthian kingdom of the Arsacids, which had no national and religious basis but leant towards Hellenism, and whose organization had always been very loose. Ardashir extirpated the whole race of the Arsacids, with the exception of those princes who had found refuge in Armenia, and in many wars, in which, however, as the Persian tradition shows, he occasionally suffered heavy defeats, he succeeded in subjugating the greater part of Iran, Susiana and Babylonia. The Parthian capital Ctesiphon (*q.v.*) remained the principal residence of the Sassanian kingdom, by the side of the national metropolis Istakhr, which was too far out of the way to become the centre of administration. Opposite to Ctesiphon, on the right bank of the Tigris, Ardashir restored Seleucia under the name of Weh-Ardashir. The attempt to conquer Mesopotamia, Armenia and Cappadocia led to a war with Rome, in which he was repelled by Alexander Severus (A.D. 233). Before his death (A.D. 241) Ardashir associated with himself on the throne his son Shapur, who successfully continued his work.

Under the tombs of Darius I. at Persepolis, on the surface of the rock, Ardashir has sculptured his image and that of the god Ahuramazda (Ormuzd or Ormazd). Both are on horseback; the god is giving the diadem to the king. Under the horse of the king lies a defeated enemy, the Parthian king Artaban; under the horse of Ormuzd, the devil Ahriman, with two snakes rising from his head. In the bilingual inscription (Greek and Pehlevi), Ardashir I. calls himself "the Mazdayasnian (*i.e.* "worshipper of Ahuramazda") god Artaxares, king of the kings of the Arianes (Iranians), of godly origin, son of the god Pāpak the king" *(see* Sir R. Ker Porter, *Travels* (1821–22), i. 548 foll.; Flandin et Coste, *Voyage en Perse,* iv. 182; F. Stolze and J. C. Andreas, *Persepolis,* pl. 116; Marcel Dieulafoy, *L'Art antique de la Perse,* 1884–89, v. pl. 14). A similar inscription and sculpture is on a rock near Gur (Firuzabad) in Persia. On his coins he has the same titles (in Pehlevi). Like his father and his successors, he was worshipped as a god, probably as an incarnation of a secondary deity of the Persian creed.

Like the history of the founder of the Achaemenian empire, that of Ardashir has from the beginning been overgrown with legends; like Cyrus he is the son of a shepherd, his future greatness is predicted by dreams and visions, and by the calculations of astronomers he becomes a servcnt at the court of king Arta-

banus and then flies to Persia and begins the rebellion; he fights with the great dragon, the enemy of god, etc. A Pehlevi text, which contains this legend, has been translated by Noldeke (*Geschichte* des Artachshir *i Pāpakān,* 1879). On the same tradition the account of Firdusi in the Shahnameh is based; it occurs also, with some variations, in Agathias ii. 26 seq. Another work, which contained religious and moral admonitions which were put into the mouth of the king, has not come down to us. On the other hand the genealogy of Ardashir has of course been connected with the Achaemenids, on whose behalf he exacts vengeance from the Parthians, and with the legendary kings of old Iran.

(2) ARDASHIR II. (379–383). Under the reign of his brother Shapur II. he had been governor (king) of Adiabene, where he persecuted the Christians. After Shapur's death, he was raised to the throne by the magnates, although more than 70 years old. Having tried to make himself independent from the court, and having executed some of the grandees, he was deposed after a reign of four years.

(3) ARDASHIR III. (628–630), son of Kavadh II., was raised to the throne as a boy of seven years, but was killed two years afterwards by his general, Shahrbaraz. (ED. M.)

ARDEA, a town of the Rutuli, Latium, 3m. from the south-est coast, where its harbour (*Castrum Inui*) lay, at the mouth of the Fosso dell' Incastro, and 23m. S. of Rome by the Via Ardeatina. Its legendary founder was a son of Odysseus and Circe, or Danae, mother of Perseus. It was one of the oldest coast cities of Latium and the capital of Turnus, the opponent of Aeneas. In the treaty with Carthage 509 B.C. it was Roman but was later one of the 30 cities of the Latin league. It had the charge of the shrine of Venus in Lavinium. In imperial times the unhealthiness of the place led to its rapid decline. In the forests of the neighbourhood the imperial elephants were kept. A road, the Via Ardeatina, led to Xrdea direct from Rome.

The primitive site, later the citadel, holds the modern village; it is at the end of a long plateau between two valleys, and has perpendicular tufa cliffs some 60ft. high on all sides except the north-east, where it joins the plateau. Here it is defended by a fine wall of rectangular blocks of volcanic stone (tufa). The area of the place was apparently twice extended, a further portion of the narrow plateau, which now bears the name of Cittavecchia, being each time taken in and defended by mound and ditch; the nearer and better-preserved is about ½m. from the city and measures some 2,000ft. long, 133ft. wide and 66ft. high, the ditch being some 80ft. wide. The second, ½m. farther north-east, is smaller. "*Et* nunc *magnum manet* Ardea *nomen:* sed *fortuna fuit*"—"Ardea is still a mighty name: but its star has set"—as Virgil says.

w *See* O. Richter, in *Annali* dell' *Instituto* (1884), 90; J. H. Parker in Archaeologia, xlix. 169 (1885); A. Pasqui, in Notizie degli *scavi* (1900), 53.

ARDECHE, a department of France at the Cevenol edge of the *Plateau* Central bounded, east, by the river Rhône, south by Gard, south-west by Lozkre, north-west, by Haute Loire and Loire. Area 2,145 sq.mi. Pop. (1936) 272,698, marking a considerable decline during the 20th century. It was formed in 1790 from the Vivarais district of Languedoc. It is a hill country marked by valleys most of which run either north-west-south-east or south-west-north-east. The high volcanic mass of the Coirons stretches south-east-north-west to the eastern part of the larger volcanic area of Vélay, where Mt. Mézenc (5,755ft.), itself a volcanic mass, forms the culminating point of the department; thence the Mts. du Vivarais stretch north-eastward with the departmental boundary along their heights. The department stretches westward to the uppermost Loire and the Allier forms a good deal of its boundary over against Lozkre. The rivers are mostly torrential, with sudden floods and much of the scenery is wild.

In the south near the Rhône the climate is warm, but on the higher land winter is long and severe and even in summer sudden cold may occur. Grain (wheat and rye) and potatoes are cultivated, also the vine and olive near the Rhône in the south, the department's southern and more open lands marking the northern limit of cultivation of the olive in the Rhône valley. The vineyards of St. Péray near the Rhône in the northern part of the department are famous for white wines. Chestnut, walnut and mulberry, the last for silkworms, are widely grown. The rocky hills are useful for goats as well as for sheep and their skins promote a glove-making industry. There are also paper factories at Annonay. Hydraulic lime is produced from quarries at Le Teil and there are supplies of coal, iron, lead and zinc. Medicinal springs are numerous and some are hot; the chief are at Vals les Bains (cold), St. Laurent les Bains, Celles, Neyrac, etc.

Ardèche is served by the P.L.M. railway and has 43 miles of navigable river. The towns of Privas, Largentikre (capital of the department) and Tournon give their names to the three arrondissements; there are 31 cantons and 349 communes. The department forms the diocese of Viviers in the archbishopric of Avignon; it is in the region of the 15th Army Corps, in the *académie* (educational area) of Grenoble, and under the court of appeal at Nîmes.

Privas was destroyed in the 17th century religious quarrels, so it has little that is older, but there are many interesting Romanesque churches in the department (Bourg St. Andéol, Thines, Mélas, Cruas), while Mazan has a large church once part of a great abbey. Viviers cathedral is set on a rock above the town.

ARDEE, town, County Louth. Eire. on the river Dee, 48 mi. N.W. from Dublin, on a branch of the Great Northern railway. Pop. (1936) 2,383. The town is of high antiquity, and its name (Ather-dee) is taken to signify the ford of the Dee, a point of strategic importance. A large rath, or encampment, with remains of fortifications, stands to the south of the town. A castle of the lords of the manor was built early in the 14th century and remains, as does another adjacent fortified building of the same period. Roger de Peppart, lord of the manor early in the 13th century, founded the church (the present Protestant church) and a house of Crutched Friars. There was also a house of Carmelite Friars, but neither of these remains. Ardee received its first recorded charter in 1377. It was sacked by Edward Bruce (1315) and by O'Neill (1538); it was taken by the Irish and recaptured by the English in the wars of 1641, and was occupied later by the forces of James II. and of William III.

ARDEN, FOREST OF, a well marked physical area of north Warwickshire, England, the "woodland" as opposed to the "felden" or "fielden"; *i.e.,* open country, in the south, the river Avon separating the two. Originally part of a forest tract of far wider extent than that within the confines of the county, it is still, though lacking the true character of a forest, well-wooded. The undulating surface is from 250 to 500 ft. high. Wide lands in this district were held, in Edward the Confessor's day, by Alwin, whose son, Thurkill of Warwick, or "of Arden," founded the family of the Warwickshire Ardens who, in Queen Elizabeth's time, still held several of the manors. Shakespeare, whose mother, Mary Arden claimed to be of this family, knew the district well, and it probably inspired his pictures of forest life in As You Like It. The name is preserved in Henley-in-Arden and Hampton-in-Arden, etc.

ARDENNES, a district covering some portion of the ancient forest of Ardenne, and extending over the greater part of the Belgian province of Luxembourg, part of the grand duchy, and the French department of Ardennes. One derivation is from a word meaning "the forest," turned into Latin as Arduenna Silva, and derived from the Celtic word *ardu* (dark, obscure). Another derivation is from ar-Denn or ar-Tann, Breton for the, or among *the,* oaks, whence Ardenne would be forest of oaks. A. Carnoy, a modern worker, derives it from a Celtic form for high-land, *Ardu-enna* being from the Indo-European arduos = high. The Arduenna Silva was the most extensive forest of Gaul, and Caesar (Bello *Gallico,* lib.vi.cap.29) describes it as extending from the Rhine and the confines of the Treviri to the limits of the Nervii. At the division of the empire of Charlemagne between the three sons of Louis the Débonnaire, under the pact of Verdun in 843, the Ardenne forest had become the district *pagus Arduensis.* It was part of Lothair's share, and charters of 843 specify certain towns as in this pagus. In the 10th century the district had become a comitatus, subject to the powerful count of Verdun, who changed his style to that of count of Ardenne.

The geographical region of the Ardenne extends from France through Belgium to the Rhineland and the duchy of Luxembourg south and east of a line through Couvin, Rochefort, Marche, Durbry, Spa and Eupen, and its southern frontier is the Semois valley. Its geological boundary is that of the lower Devonian. It forms a broad low arch gently inclined north and south, the denuded base of a mountain chain once as high as the Alps, and then worn down to a peneplain. It consists of schists, sandstones and quartz-phyllites, with hardly any calcareous rock. The rivers in the uplifted peneplain cut gorges in the hard rocks, *e.g.*, Les fonds de Quarreux on the Amblkve, but have wider valleys where the rocks are softer. The picturesquely wooded ravines are less truly characteristic than the great flat tops, naked wastes in many cases, which account for most of the area. Decomposition of Cambrian schists has produced a waterproof clay soil in which sphagnum bogs grow, with their characteristic accumulation of basal peat. The Hautes Fagnes on the Baraque Michel plateau is the largest of these bogs. The peat was long used for fuel. On the more siliceous lands, farms have been established but woods cover large areas and are among the most beautiful in Europe. They include the woods of St. Hubert, the woods round La Roche, and those of the Amerois, Herbeumont and Chiny on the Semois. In the grand duchy the forest has almost entirely disappeared, but owing to the compulsory law of replanting in Belgium this fate does not seem likely to attend the Belgian Ardennes. There is still an immense quantity of wild game to be found in the Ardennes, including red and roe deer, wild boar, etc. Shooting is preserved either by the few great landed proprietors left in the country, or by the communes, who let the rights to individuals.

COURTESY OF THE BELGIAN NATIONAL RAILWAY

A PEASANT WOMAN OF ARDENNES ON THE WAY TO MARKET

ARDENNES, department, northern frontier, France, composed of the south-west side of the Ardennes towards the Paris basin, and of parts of the Meuse valley. Area 2,028sq.m.; pop. (1936) 253,632. After a long course nearly south to north between edges of secondary rocks, the Meuse turns west as it approaches the Ardennes. These are remnants of ancient mountains, planed down, and then slowly tilted up from the south-east, allowing the river time to cut its way down while the uplift went on. It thus happens that just below Mézières-Charleville the river enters a deep trench between moorland hills, and some of its entrenched meanders have given sites for isolated little towns like Revin. Mézières also is on the peninsula of a meander. Northwards towards Givet the country opens out again and that old fortress town is an outpost of France, which owns the Meuse trench but not the flanking highland, standing on limestone rock that gives the district a much drier character than has the Ardennes. The Meuse is small in volume for its length and has lost several tributaries, the now almost streamless valleys of which have been used for canals *e.g.*, that in this department between Meuse and Aisne.

In the south-west lowlands, with a fairly mild climate and often less than 800mm. of rain, general agriculture goes on, but among the higher lands (up to 1,640ft.) the winter is cold and the rainfall may exceed 1,000mm. Here there are riverside pastures, but the people depend partly on quarries of slates (Fumay) and building stone and also work in iron. There is also naturally a woollen industry centring at Sedan, and Mézières-Charleville is important as a railway junction. Mézières, Rethel and the tiny Vouziers give their names to arrondissements. The department is in Reims ecclesiastical province, Lille educational province (*académie*), Nancy appeal-court area and 2nd army corps province. The department was entirely occupied by the invaders 1914–18, but the defenders had just reached Sedan and Mézières at the end of the war. (For an account of the battles waged here in the World War see FRONTIER, BATTLES OF THE.)

ARDEN OF FEVERSHAM (FAVERSHAM), the title of an anonymous play, the first quarto of which was printed, in black letter, in 1592; there is a copy of this edition in the Bodleian Library, Oxford. The plot is founded on the story of Thomas Arden, mayor of Faversham (1548), who was murdered by his wife, her lover and accomplices in 1552. The style is dignified and restrained and it has been suggested that the play was, at any rate, revised by Shakespeare. There is, however, no internal evidence to support or refute this theory, and it is more probable that the author was Thomas Kyd (*q.v.*) or one of his school.

The play was acted in 1592, and not again until it was produced in London in 1897 and at Cambridge, England (by the Marlowe Dramatic Society) in 1921.

See Arden *of* Feversham, intro. by A. H. Bullen (1887); J. A. Symonds, Shakespeare's Predecessors (1900); *The Lamentable* and *True* Tragedy *of* M. Arden *of* Feversham, intro. by A. F. Hopkinson (1907).

ARDERNE, JOHN (c. 1306–*c.* 1390), English surgeon, practised first at Newark and then in London, and also in the army in France. He introduced certain new operations and was a bold and skilful surgeon and a good writer on his subject. See D'Arcy Power: Treatises of *Fistula* in Ano, etc. (1910); "The Lesser Writings of John Arderne," *XVIIth* Inter. Con. Med. *Sec.* XXIII. (1914).

ARDGLASS ("Green Height"), County Down, Ireland, 32m. S. by E. of Belfast on a branch of the Belfast and County Down railway. Pop. (1926) 634. Soon after the Norman invasion it became a busy port, a fact attested by the remains of no fewer than five castles in close proximity. There is an ancient church crowning the eastern hill and a curious fortified warehouse (called the New Works), dating probably from the 14th century, when a trading company was established here under a grant from Henry IV. Ardglass was a royal burgh and sent a representative to the Irish parliament. The chief industry is the herring fishery. Ardglass is a resort of visitors.

ARDITI, LUIGI (1822–1903), Italian musical composer and conductor, who, about the middle of the last century, was a prominent figure in London musical life, as conductor of the opera at Her Majesty's Theatre and in other capacities. He paid frequent visits also to America, conducting the opera in New York, where he produced his La *Spia* in 1856. His vocal waltz *Il* Bacio was sung by Patti and enjoyed much popularity.

ARDMORE, a city in the southern part of Oklahoma, U.S.A. 100 mi. S. by E. of Oklahoma City, 876 ft. above sea level; the county seat of Carter county. It is on federal highways 70 and 77, and is served by the Frisco and the Santa Fe railways. The area is 8 sq.mi.

The population of the city of Ardmore was 14.181 in 1920, of whom 2,008 were Negroes; 15,741 in 1930 and 16,886 in 1940 by federal census.

Ardmore is the wholesale and retail centre of southern Oklahoma serving a rich farming and grazing'region and numerous oil fields. The city has a daily newspaper and a radio station. An oil refinery, wholesale houses, cotton gins, cotton-seed oil mill, cotton compress, produce houses, flour mill and miscellaneous factories make up the industries. The Southern Oklahoma fair and exposition is held there. Among the educational institutions is Carter seminary, a school for Indian girls. Near Ardmore are the Lake Murray state park, comprising 20,000 ac., and the Arbuckle mountain regions. Ardmore was founded in 1887, incorporated in 1898. It adopted a commission-manager form of government in 1921.

ARDRES, ancient small town of northern France, in the department of Pas-de-Calais, 10m. south-south-east of Calais. Pop. (1936) 1,307. It was occupied by Francis I. at the time of his historic meeting with Henry VIII. in 1520, at the "Field of the Cloth of Gold" at Balinghem, 2½m. to the west. Ardres has a 14th century church and an important cattle market.

ARDROSSAN, seaport, municipal and police burgh, Ayrshire, Scotland, 29½m. S.W. from Glasgow by the L.M.S.R. Pop. (1938) 7,511. Hugh, 12th Earl of Eglinton, began the harbour and town in 1806, intending to connect it with Glasgow by canal; his successor completed the scheme on a reduced scale. The docks have since been extended. The exports are coal and

iron from collieries and iron-works in the neighbourhood; and the imports ores, timber, and general goods. Shipbuilding and fisheries are carried on. The town is under provost and council.

SALTCOATS (pop. 10,653), a mile to the south, is a police burgh and a popular seaside resort, with a brisk trade, due to its proximity to Ardrossan and Stevenston.

AREA, a Latin word, originally meaning a threshing-floor, namely a raised space in a field exposed on all sides to the wind; now applied in English (1) to a plot of ground on which a structure is to be erected, (2) to the court or sunk space in the front or rear of a building, (3) to the superficial space covered by a building, district, country, etc.

ARECIBO, an important town situated on the north coast of Puerto Rico. The population of the town itself was 12,863 in 1930 and 22,134 in 1940; and that of the municipal district in 1940 was 69,192. The port has not been improved, but a survey has been made and the development of the city as a port will follow. The district tributary to the city is rich in sugar-cane, coffee and fruits. Cotton and vegetables are also grown. The city is connected with the capital, San Juan, an important port and distributing station, by a railway which extends also west and south and almost around the island. First-class highways also extend east and west, while the interior is tapped by two main roads across the island.

Several industrial establishments are located in the town. The situation on a beautiful bay of the Atlantic is admirable, and the town has well paved streets, an independent water system, electric lights, telephone communication, hospitals, theatres and other public improvements. Arecibo has a superior school system, and religious, charitable and social institutions abound. There are many attractive residences and the stores and shops are modern and business conditions satisfactory. Arecibo is one of the oldest municipalities and towns of the island. The municipal corporation was authorized as early as 1537 by a royal decree of the Spanish Crown. The town itself was founded in 1616 by Felipe de Beaumont, who gave it the name of San Felipe de Arecibo.

(H. M. T.)

AREMBERG or **ARENBERG,** formerly a German duchy of the Holy Roman Empire in the circle of the Rhine Palatinate, between Jiilich and Cologne. The hamlet of Aremberg is at the foot of a basalt hill 2,067ft. high, on the summit of which are the ruins of the original castle of the family of Aremberg.

The lords of Aremberg first appear early in the 12th century, but had died out in the male line by 1279. From the marriage of the heiress Mathilda (1282–99) with Engelbert II., count of La Marck (d. 1328), sprang two sons. The second of these, Engelbert III. (d. 1387), inherited the lordship of Aremberg which remained in his family till 1547, when it passed, by his marriage with Margaret, sister of the childless Robert III., to John of Barbançon, of the great house of Ligne, who assumed the name and arms of Aremberg, and was created a count of the Empire by Charles V. He was governor of Friesland, and for a while commanded the Spanish and Catholic forces against the "beggars," falling at the battle of Heiligerlee in 1568. His son Charles (d. 1618) greatly increased the possessions of the house by his marriage with Ann of Croy, heiress of Croy and of Chimay-Aerschot, and in 1576 was made prince of the Empire by Maximilian II. His grandson, Philip Francis, was made duke in 1644 by the emperor Ferdinand III.

Duke Prosper Louis who had lost his possessions in 1810 by an act of Napoleon, regained them in 1815 at the Congress of Vienna, which, however, mediatized them.

ARENA, the central area of an amphitheatre on which the gladiatorial displays took place, its name being derived from the sand (Lat. *harena*) with which it was covered. The word is applied sometimes to any level open space on which spectacles take place.

ARENARIA or **SANDWORT,** a genus of plants of the pink family with small white flowers. They are annual or perennial, mostly weedy herbs and the majority inhabit sandy soil in temperate, arctic or alpine regions. There are about 100 species; some cultivated for ornament.

ARENDAL, a seaport of southern Norway, in Aust-Agder fylke (county), at the mouth of the river Nid, 46 mi. N.E. of Christiansand. Estimated pop. (1936) 10,400. It has a good harbour protected from the open waters of the Skagerrak by a series of islands, on some of which the town itself, founded in 1723, is built. At one time (1879) Arendal was second only to Oslo (then Christiania) as a ship-owning port, but it lagged behind when steamboats replaced sailing vessels. It is ordinarily a port of call for many steamship lines. The chief exports are timber, wood pulp, aluminum, ferroalloys, quartz and felspar. There are two smelting works in the neighbourhood (at Eydehavn) and quarries, sawmills, a wood-pulp factory and a shipbuilding yard. The vicinity is remarkable for its variety of minerals. A railway runs to Treitsund in Telemark. The town was occupied by German troops in April 1940.

ARENSKY, ANTON STEPHANOVICH (1861–1906), Russian musical composer, was born at Novgorod, July 31, 1861, and after studying with various teachers finally became a pupil of Rimsky-Korsakov at the conservatoire of St. Petersburg. In 1882 he became a professor at the Moscow conservatoire, and from 1894 to 1901 was director of music in the imperial chapel at St. Petersburg. He composed much chamber music, including the well-known trio and many songs, besides several operas, the chief of which are The Dream on the *Volga* (1890); Raphael (1894), and Nala and Damayanti (1899). He died at Terioki, Finland, Feb. 25, 1906.

AREOI (AREOITI), a secret society which originated in Tahiti and later extended its influence to other South Pacific islands. To its ranks both sexes were admitted. The society was primarily of a religious character. Members styled themselves descendants of Oro-Tetifa, the Polynesian god, and were divided into seven or more grades, each having its characteristic tattooing. Chiefs were at once qualified for the highest grade, but ordinary members attained promotion only through initiatory rites. The Areois enjoyed great privileges, and were considered as depositaries of knowiedge and as mediators between God and man. They were feared, too, as ministers of the taboo and were entitled to pronounce a kind of excommunication for offences against its rules. The chief purpose of the society was the worship of the generative powers of nature, and the ritual and ceremonies of initiation were grossly licentious. The women members were common property; the period of cohabitation was limited to three days, and the female Areois were bound by oath to strangle at birth any child born to them. If the infant was allowed to survive half an hour only, it was spared; but to have the right of keeping it the mother must find a male Areoi willing to adopt it. The Areois travelled about, devoting their whole time to feasting, dancing (the chief dance of the women being the grossly indecent Timorodee mentioned by Captain Cook), and debauchery, varied by elaborate realistic stage presentments of the lives and loves of gods and legendary heroes.

See R. W. Williamson, Social and Political Systems of Central Polynesia (1924).

AREOPAGUS, a bare, rocky hill, 370ft. high, north-west of the acropolis of Athens. The ancients interpreted the name as "Hill of Ares," but Ares was not worshipped on the Areopagus. Another explanation connects the name with arai, "Curses," known as Semnai, "awful goddesses," whose shrine was a cave at the foot of the hill, of which they were the guardian deities.

The council of the Areopagus (ἡ ἐν Ἀρείῳ Πάγῳ βουλή), is to be compared with the council of elders which we find among primitive peoples. Under the kings of Athens it must have resembled the council of elders described by Homer; it was the chief factor in the work of transforming the kingship into an aristocracy. Aristotle (Ath. Pol., viii. 2) attributes to it for the period of aristocracy the appointment to all offices, the chief work of administration, and the right to punish in cases, not only of violation of laws, but also of immorality. This evidence is corroborated by the remnants of political power left to it in later time, and by the designation *boulē,* which indicates that the body was once a State council. In addition to its political functions, the council from the time of Draco exercised jurisdiction in certain

cases of homicide. We may suppose that the name "Boulē of the Areopagus" developed from the simple term boulē, in order to distinguish it from the new Boulē (*q.v.*), or Council of Four Hundred. The reforms of Solon (594 B.C.) tended practically to limit the council of the Areopagus, though constitutionally it retained all its earlier powers augmented by the right to try persons accused of conspiracy against the state. It had power to inhibit in the Four Hundred or in the Ecclesia, (*q.v.*) any measure which it judged unconstitutional or prejudicial to the State, and in the levy of fines for violation of law or moral usage it remained irresponsible. The tyrants (*q.v.*) left to the council its cognizance of murder cases (560–510 B.C.), and the nominal enjoyment of its prerogatives. The council seems to have suffered no direct abridgment of power from the reforms of Cleisthenes (*q.v.*). In 487 B.C., however, the introduction of the lot in filling the archonship (see ARCHON) began to undermine its position through affecting the ability of its members. This deterioration was necessarily slow; in 480 B.C., on the eve of the battle of Salamis, the council of the Areopagus succeeded in manning the fleet, thereby regaining the confidence and respect of the people. The patriotic action of the council enabled it to recover considerable administrative control, which it exercised for the next 18 years, although its deterioration in ability, as well as the rapid rise of democratic ideas, prevented it from re-establishing its supremacy. Ephialtes (462 B.C.), Archestratus and Pericles (*q.v.*), carried measures for the transfer of most of its functions to the Boulē, the Ecclesia, and the popular courts of law. Among these functions were jurisdiction in cases of impiety, the supervision of magistrates and the censorship of the morals of citizens, and the inhibition of unconstitutional resolutions in the Boulē and the Ecclesia. It retained jurisdiction in cases of homicide and the care of sacred olive trees. From this time (462 B.C.) to the establishment of the "Thirty Tyrants" (404 B.C.), the Areopagitic council, degraded still further by the absolute use of the lot, was a political nullity. After the surrender of Athens and the appointment of the "Thirty," the appeal of the laws of Ephialtes and Archestratus prepared the way for the rehabilitation of the council as guardian of the constitution. The Areopagites could not hope to recover their full supremacy, but they did exercise considerable political influence, especially in crises. In the time of Demosthenes, accordingly, we find them annulling the election of individuals to offices for which they were unfit, exercising during a crisis a disciplinary power extending to life and death over all the Athenians "in conformity with ancestral law," procuring the banishment of one, the racking of another, and the infliction of capital punishment on several of the citizens. This authority seems to have been delegated to them by the Ecclesia. Lycurgus claims that by their action during the crisis after Chaeroneia (*q.v.*, see also PHILIP II.), they saved the State. Under Roman supremacy they had jurisdiction in cases of forgery and tampering with the standard measures; also the supervision of buildings, and the care of religion and of education. From the overthrow of the "Thirty" to the end of their history (C. A.D. 400), they held a reputation for ability and integrity.

The jurisdiction of the council in cases of homicide was as follows:—accusations were brought by relatives; on receiving the accusation the king-archon made three investigations of the case in the three successive months. After the examination he assigned the case to the proper court and presided over it during the trial which took place in the open air, that the judges and the accuser might not be polluted by being brought under the same room with the offender. The accuser and the accused, standing on two white stones termed "Relentlessness" (*Anaideia*) and "Outrage" (Hubris) respectively, bound themselves to the truth by solemn oaths. Each was allowed two speeches, and the trial lasted three days. After the first speech the accused, unless charged with parricide, was at liberty to withdraw into exile. If condemned, he lost his life, and his property was confiscated. A tie vote acquitted. (Aeschylus, Eumenides 735.) (See GREEK LAW.)

Whibley, *Companion to Greek Studies* (3rd ed., 1916) with useful bibliography. *See* also CLEISTHENES, PERICLES and ATHENS.

AREQUIPA, a coast department of southern Peru, surrounded by the departments of Ica, Ayacucho, Apurimac, Cusco, Puno and Moquehua (area 21,952 sq.mi.; pop., 1940, 270,996). The department includes an arid coastal zone traversed by deeply entrenched rivers, and a barren, mountainous region including a series of great volcanoes with spurs projecting toward the coast, between which are numerous fertile valleys watered by mountain streams. Crops include cotton, rice, sugar-cane, wheat, alfalfa, maize, barley, potatoes; also fruits and wine. Live stock is raised in the upper valleys. The mountains are rich in minerals, largely unexploited, and valuable deposits of borax are located at Salinas about 50 mi. N. of the capital. The chief port is Mollendo, a partially-sheltered, artificial cove. In spite of primitive living conditions, there are (1940) 12,628 inhabitants, mostly employees of importing and exporting houses, commission merchants, shipping agents, etc. The Southern railway runs, via Arequipa, to Puno on Lake Titicaca, a distance of 325 mi., connecting there by steamer with a railway to La Paz, Bolivia. Mollendo is second only to Callao in imports, one-third of which go to Bolivia. The Pan American highway branches at Vitor, near Arequipa, one spur leading to Chile, the other to Bolivia.

AREQUIPA, the third city of Peru, capital of the department of the same name, is located at an altitude of 7,600 ft. about 100 mi. north of its seaport, Mollendo. It lies in a valley on both banks of the Rio Chili at the foot of the extinct volcano El Misti (19,200 ft.). Although it has been quiescent for two or three centuries, emitting only vapours from time to time, El Misti is regarded with veneration, connected as it is felt to be with periodic earthquakes, the last of which (1868) practically destroyed the city. Other great peaks, Chachani and Pichu-pichu fill one-third of the horizon. Arequipa is famed for its beauty, a white city of a Spanish colonial type, surrounded by orchards, fields, market-gardens and eucalyptus avenues in the midst of a lofty, barren plateau rising toward snow-capped peaks. The climate is dry, the air pure and invigorating. There is a summer rainfall of 5 to 6 in., and during that season the sky is overcast much of the time. The city has (1940) 79,185 inhabitants and is the centre of the intellectual, religious and commercial activities of southern Peru. The rectangular Plaza Mayor is surrounded by arcades. The houses are massively built to resist earthquakes, the material used (*sillar*) is a white porous volcanic stone which hardens with age. There is a cathedral, many beautiful churches, monasteries, hospitals, a chamber of commerce, city hall and other public buildings, such as the prefecture and III. Army Division headquarters. The city, the seat of a bishopric, is noted for its religious fervour as well as for its intellectual activity. The Universidad del Gran Padre Augustín was founded in 1821 (four faculties, Philosophy, History and Letters, Natural Science, Political Science and Jurisprudence). There are several colleges, a normal school for girls and elementary schools. Arequipa is a distributing centre for mountain products. Wool is washed and prepared for export, and there are several large wholesale import and export houses, foreign and Peruvian, woollen and cotton textile mills, chocolate and biscuit factories, flour mills, foundries and machine shops for the Southern railway, and other smaller industries, also branches of many of the larger banks of Lima. The Sociedad Eléctrica de Arequipa, Ltd., furnishes power from its plant 10 mi. from the city. The city is well situated with respect to transportation. The Pan American highway provides direct routes to Lima, Puno, Mollendo and Arica. The Southern railway of Peru runs from Mollendo to Cusco and Puno via Arequipa, and a steamer from Puno to Guaqui on Lake Titicaca links the Southern Ry. with the railroads of Bolivia, which have direct connections with Buenos Aires. Regular plane service is maintained by the Faucett Aviation Co., and Arequipa is a scheduled stop on the Panagra-Panair flight from Lima to Rio de Janeiro. Telephone and telegraph lines connect with cable at Mollendo. There are paved highways to nearby resorts, such as the poetic Vale of Tiabaya. The favourite promenade is along the shady left bank of the Rio Chili to the springs of Tingo. The district of Arequipa is famous for its hot and cold springs, especially those of Yura and Jesús, the waters of which are bottled and used

throughout the country. The Boyden station of the Harvard college observatory (U.S.A.) founded in 1891, was located in Arequipa until 1927, when it was transferred to South Africa. The site of Arequipa was discovered, so the legend goes, by the Inca Mayna Capac, who sent 3.000 families to settle there. Diego de Almagro visited it on his return from Chile in 1537, and the present city was founded by Pizarro in 1540. It has since been the scene of events of importance in the history of Peru (*q.v.*) and the birthplace of many famous men.

ARES, in ancient Greek mythology, the god of war, or rather of battle, son of Zeus and Hera. (For the Roman god, identified with Ares, see MARS.) As contrasted with Athena, who added to her other attributes that of being the goddess of skilfully conducted military operations, he personifies brute strength and the wild rage of conflict. His delight is in war and bloodshed; he loves fighting for fighting's sake, and takes the side of the one or the other combatant indifferently, regardless of the justice of the cause. Splendidly armed, he goes to battle, sometimes on foot, sometimes in the war chariot made ready by his sons Deimos and Phobos ("Panic" and "Fear"), his usual companions. In his train also are found Enyo, the goddess of war (cf. the Roman Bellona), who delights in bloodshed and the destruction of cities; his sister, Eris, goddess of fighting and strife, and the Kēres, goddesses of death, whose function it is especially to roam the battle-field, carrying off the dead to Hades.

The primitive character of Ares has been much discussed. He is a god of storms; a god of light or a solar god; a chthonian god, one of the deities of the subterranean world, who could bring prosperity as well as ruin upon men. In this last aspect he was one of the chief gods of the Thracians, amongst whom his home was placed even in the time of Homer. In Scythia an old iron sword served as the symbol of the god, to which yearly sacrifices of cattle and horses were made, and in earlier times (as apparently also at Sparta) human victims, selected from prisoners of war, were offered. Thus Ares developed into the god of war, in which character he made his way into Greece. The story of his imprisonment for 13 months (Iliad, v. 385) by the Aloïdae (*q.v.*) points to the conquest of this chthonian destroyer of the fields by the arts of peace, especially agriculture.

In the Odyssey (viii.) Ares is the lover of Aphrodite, the wife of Hephaestus, who catches them together in a net and holds them up to the ridicule of the gods. In what appears to be a very early development of her character, Aphrodite also was a war-goddess, known under the name of Areia; and in Thebes, the most important seat of the worship of Ares, she was his wife. His worship was not so widely spread over Greece as that of other gods, although he was honoured here and there with festivals and sacrifices. At Sparta young dogs were offered to him under the name of Thēreitas. At Athens he had a temple at the foot of the Areopagus, where he was tried and acquitted by the gods for the murder of Halirrhothius, who had violated his daughter.

The figure of Ares appears in various stories of ancient mythology. Thus he engages in combat with Heracles on two occasions to avenge the death of his son Cycnus; once Zeus separates the combatants by a flash of lightning, but in the second encounter Ares is severely wounded by his adversary, who has the active support of Athena; maddened by jealousy, he changes himself into the boar which slew Adonis, the favourite of Aphrodite; and stirs up the war between the Lapithae and Centaurs (*q.v.*). His attributes were the spear and the burning torch, symbolical of the devastation caused by war (in ancient times the hurling of a torch was the signal for the commencement of hostilities). The dog and the vulture were sacred to him.

The worship of Ares being less general throughout Greece than that of the gods of peace, the number of statues of him is small; those of Ares-Mars, among the Romans, are more frequent. Previous to the 5th century B.C., he was represented as full bearded, grim featured and in full armour. From that time, apparently under the influence of Athenian sculptors, he was conceived as the ideal of a youthful warrior. He then appears as a vigorous youth, beardless, with curly hair, broad head, and stalwart shoulders and wearing helmet and chlamys. In the Villa Ludovisi statue (after the style of Lysippus) he appears seated in an attitude of thought; his arms are laid aside, and Eros peeps out at his feet. In the Borghese Ares (also taken for Achilles) he is standing, his only armour being the helmet on his head. He also appears in many other groups, with Aphrodite, in marble and on engraved gems of Roman times. But before this grouping had recommended itself to the Romans, with their legend of Mars and Rhea Silvia, the Greek Ares had again become under Macedonian influence a bearded, armed, and powerful god.

Harrison, 1890), and his *Histoire* de la Sculpture grecque (1892–97).

ARETAEUS, of Cappadocia, a Greek physician, who lived at Rome in the second half of the 2nd century A.D. We possess two treatises by him, each in four books, in the Ionic dialect: On the *Causes* and *Indications* of Acute and Chronic Diseases, and On their Treatment. His work was founded on that of Archigenes; like him, he belonged to the eclectic school, but did not ignore the theories of the "Pneumatics," who made the heart the seat of life and of the soul.

BIBLIOGRAPHY.—Editions by Kuehn (1828), Ermerius (1848). English translations: Wigan (1723); Moffat (1786); Reynolds (1837); Adams (1856). See Locher, Aretaeus aus Kappadocien (1847).

ARETAS, the Greek form of a name borne by kings of the Nabataeans resident at Petra in Arabia (Arab, *Hāritha*). (1) A king in the time of Antiochus IV. Epiphanes (II. Macc. v. 8). (2) The father-in-law of Herod Antipas (Jos. Ant. xviii. 5. 1, 3). In II. Cor. xi. 32 he is described as ruler of Damascus (*q.v.*) at the time of Paul's conversion. Herod Antipas had married a daughter of Aretas, but afterwards discarded her in favour of Herodias. This led to a war with Aretas in which Antipas was defeated.

An Aretas is mentioned in I. Macc. xv. 22, but the true reading is probably Ariarathes (king of Cappadocia). (See NABATAEANS.)

ARETE, a ridge or sharp edge (O.Fr. areste, Lat. arista, ear of corn, fish bone or spine), a French term used in Switzerland to denote any sharp bayonet-like ridge of precipitous rock; *e.g.,* the Weisshorn is formed of three great sharp ridges which meet in a pyramidal point. Arête now denotes any sharp mountain edge denuded by frost action above the snowline, where the consequent angular ridges give "house-roof" form.

ARETHAS (c. 860–940), Byzantine theological writer and scholar, archbishop of Caesarea in Cappadocia, was born at Patrae. He was a pupil of Photius, and was the author of a Greek commentary on the Apocalypse avowedly based upon that of Andrew, the previous archbishop. He annotated the margins of his classical texts with numerous scholia (many of which are preserved), and had several mss. copied at his own expense, amongst them the Codex Clarkianus of Plato (brought to England from the monastery of St. John in Patmos), and the Dorvillian ms. of Euclid (now at Oxford).

Most divergent opinions have been held as to the time in which Arethas lived; the reasons for the dates given above will be found succinctly stated in the article "Aretas," by A. Jiilicher in Pauly-Wissowa's Realencyklopadie der *klassischen Altertumswissenschaft* (1896). The text of the commentary is given in Migne, *Patrologia* Graeca, cvi.

ARETHUSA (*Arethusa bulbosa*), a common North American plant of the orchis family, found in bogs and swampy regions during May and June from Newfoundland south to North Carolina and west to Indiana and Minnesota. The flowers are magenta-crimson, having a crest formed of three hairy ridges, white or

yellow in colour, and with a lower lip spotted with magenta. They grow on single stalks 5in. to 10in. in height. The leaves appear after the flowers open and are long, narrow and single. The root is bulbous. A common name for arethusa is Indian pink.

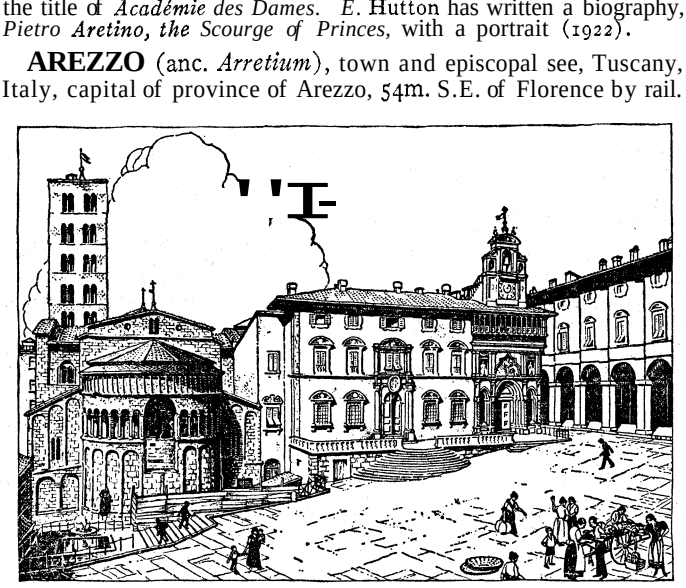
ARETHUSA, in Greek mythology, a nymph who gave her name to a spring in Elis and to another in the island of Ortygia near Syracuse. The river-god Alpheus fell in love with Arethusa, one of the retinue of Artemis; Arethusa fled to Ortygia, where she was changed into a spring; Alpheus made his way beneath the sea, and united his waters with those of the spring. In Ovid (*Metam.* v. 572 et seq.), Arethusa, while bathing in the Alpheus, was seen and pursued by the river-god in human form; Artemis changed her into a spring, which, flowing underground, emerged at Ortygia. In an earlier form of the legend, it is Artemis, not Arethusa, who is the object of the god's affections, and who escapes by smearing her face with mire, so that he fails to recognize her. The story probably originated from the fact that Artemis *Alpheiaia* was worshipped in both Elis and Ortygia, and also that the Alpheus in its upper part runs underground, as is confirmed by modern explorers. In Virgil (*Ecl.,* x.1) Arethusa is addressed as a divinity of poetical inspiration, like one of the Muses, who were themselves originally nymphs of springs.

For Arethusa on Syracusan coins, *see* B. V. Head, *Historia Numorum* (1911).

ARETINO, PIETRO (1492–1556), Italian author, born April 20 1492. Banished from Arezzo, his birthplace, for writing a satirical sonnet against indulgences, he made his way to Rome, where he found favour with Pope Leo X., until the composition, in 1523, of his obscene "Sonnetti Lussuriosi." He then left Rome, and was attached to the court of Giovanni de' Medici. At the death of Giovanni de' Medici he withdrew to Venice, where, living on the gifts of nobles and princes who feared his satire, he spent his time in writing licentious sonnets, dialogues, and comedies.

The dialogues and sonnets have been translated into French, under the title of *Académie des Dames.* *E.* Hutton has written a biography, *Pietro Aretino, the Scourge of Princes,* with a portrait (1922).

AREZZO (anc. *Arretium*), town and episcopal see, Tuscany, Italy, capital of province of Arezzo, 54m. S.E. of Florence by rail.



THE PIAZZA GRANDE. AREZZO. SHOWING THE PALAZZO DELLA FRATERNITA AND THE 11TH CENTURY APSE OF THE CHURCH OF S. MARIA DELLA PIEVE

Pop. (1936) 24,411 (town), 60,284 (commune). It is attractively situated on a hiil 840 to 970ft. above sea-level, in a fertile district. Its walls were erected in 1320 by Guido Tarlati di Pietramala, its warlike bishop, and reconstructed by Cosimo I. de' Medici between 1541 and 1568, on which occasion the bronze statues of Pallas and the Chimaera, now at Florence, were discovered. The streets radiate fanwise from the citadel (1502). The cathedral, close by, is good Italian Gothic (1277–1511) and contains some finely executed 14th-century sculptures. S. Maria della Pieve has campanile and façade of 1216. In the cloisters of S. Bernardo, on the site of the ancient amphitheatre, is a remarkable view of mediaeval Rome. S Francesco contains famous frescoes by Piero de' Franceschi, representing scenes from the legend of the Holy Cross. The Renaissance churches of S. Maria delle Grazie and the Santissima Annunziata may be noted. The most famous natives are the poet Petrarch, Pietro Aretino, the satirist (1492–1556), and Vasari, famous for his lives of Italian painters. Guido of Arezzo (d. c. 1050), inventor of the modern system of musical notation, was a resident of the city. Arezzo was the seat of a school of civil law and is important as the outlet for the wool of the Casentino. (See ARNO.)

See C. Signorini, *Arezzo, Citta e Provincia, Guida illustrata* (Arezzo, 1904); G. Franciosi, Arezzo (Arti Grafiche, Bergamo, 1909).

ARGALI (*ahr'gă-lĭ*), the Tartar name of the great wild sheep, *Ovis ammon,* of the Altai and other parts of Siberia. Standing as high as a large donkey, the argali is the finest of all the wild sheep. There are several related central Asian species, such as *O.* sairensis and O. littledalei. See SHEEP.

ARGAND BURNER, the first scientifically constructed oil-burner, was invented by A. Argand of Geneva in 1784. It consisted of a cylindrical wick confined between two concentric tubes; this device gave a circular flame with a current of air brought to play upon its inner surface. A glass chimney increased the draught and improved the illumination. Nearly a century later, Murdock, the pioneer of gas-lighting, adapted the Argand idea of two concentric circular pipes in the designing of gas-burners (see LIGHTING AND ARTIFICIAL ILLUMINATION).

ARGAO, a municipality on Bohol strait, 36 mi. S.S.W. of Cebu City, capital of the province of Cebu, Philippine Islands. Population (1939), 37,331, of whom 17,576 were males; there were no whites. Legazpi, first governor of the Philippines, assigned the municipality in *encomienda* in 1571, and the Augustinians and later the Jesuits established missions there at an early period. Much excellent cacao is produced in the vicinity, and rice and corn are other important products. A small amount of cotton is raised and woven, and some sinamay is exported. Literacy (ages of 10 years and upward) was 38.2% in 1939, and the school population in that year numbered 12,537, of whom 26.5% attended school. The number of parcels of land declared for taxation in 1938 was 19,291, and the number of owners was 12,408. (C. S. L.)

ARGAUM, a village of British India in the Akola district of the Central Provinces, 32m. north of Akola. The village is memorable for an action which took place on Nov. 28, 1803, between the British army, commanded by Maj.-Gen. Wellesley (afterwards duke of Wellington), and the Mahrattas under Sindhia and the raja of Berar, in which the latter were defeated with great loss. A medal struck in England in 1851 commemorates the victory.

ARGEI (*ahr-gā'-ē*), the name given by the ancient Romans to a number of rush puppets (24 or 27), resembling men tied hand and foot, which were taken down to the ancient bridge over the Tiber (pons sublicius) on May 14 by the *pontifices* and magistrates, with the wife of the Flamen Dialis in mourning guise, and there thrown into the Tiber by the Vestal virgins. There were also in various parts of the four Servian regions of the city a number of *sacella Argeorum* (chapels), round which a procession seems to have taken place on March 17, and where the puppets were probably kept until the second procession. The Romans had no historical explanation of these curious rites, and the theory of the common people that the puppets were substitutes for old men who used at one time to be sacrificed to the river, is not generally accepted.

W. Mannhardt, comparing numerous examples of similar customs among other European peoples, concluded that the rite was of extreme antiquity, of dramatic rather than sacrificial character, and that its object was possibly to procure rain; while Wissowa, who refuses to date it farther back than the latter half of the 3rd century B.C., sees in it the yearly representation of an original sacrifice of 27 captive Greeks (taking Argei as a Latin form of Gr. Argeioi) by drowning in the Tiber.

BIBLIOGRAPHY.—*See* W. W. Fowler, *Rontan Festivals* (1899); W. Mannhardt, *Wald- und Feldkulte* (1904–05); J. Marquardt, *Römische Staatsverwaltung* (iii. 1885); G. Wissowa, *Religion und Kultus der Römer* (1912); J. E. Harrison, *Prolegomena to the Study of Greek Religion* (1922).

ARGELANDER, FRIEDRICH WILHELM AUGUST (1799–1875), German astronomer, was born at Memel on March

22, 1799, and studied at Konigsberg. His treatise on the path of the great comet of 1811 appeared in 1822; he was, in 1823, made director of the observatory at Åbo; and he exchanged it for a similar charge at Helsingfors in 1832. His investigation of the sun's motion in space was published in 1837; and in the same year he was appointed professor of astronomy in the university of Bonn, where he died Feb. 17, 1875. He also published *Observatioaes Astronomicae Aboae Pactae* (1830–32); *DLX Stellarum Fixarum Positiones Mediae* (183 j); and the first seven volumes of *Astronomische Beobachtungen auf der Sternwarte zu Bonn* (1846–69), containing his observations of northern and southern star-zones, and his great *Durchmusterung* (vols. iii.-v., 1859–62) of 324,198 stars, from the north pole to −2° Dec. The corresponding atlas was issued in 1863. His observations (begun in 1838) and discussions of variable stars were embodied in vol. vii. of the same series.

See E. Schönfeld in *Vierteljahrsschrift der Astronomischen Gesellschaft,* x. pp. 150–178.

ARGENS, JEAN BAPTISTE DE BOYER, MARQUIS D' (1704–1771), was born at Aix in Provence on June 24, 1704 and died at Toulon on Jan. 11, 1771. After a dissipated and adventurous youth, he settled for a time at Amsterdam, where he began his *Lettres juives* (The Hague, 1738–42), *Lettres chinoises* (The Hague, 1739–42), and *Lettres cabalistiques,* 2nd. ed. (1769); also the *Mémoires secrets de la république des lettres* (1743–48), afterwards revised and augmented as *Histoire de l'esprit humain* (1765–68). He was invited by Prince Frederick (afterwards Frederick the Great) to Potsdam, and received high honours at court; but Frederick was bitterly offended by his marrying a Berlin actress, Mlle. Cochois.

ARGENSOLA, LUPERCIO LEONARD0 DE (1559–1613), Spanish dramatist and poet, was baptized at Barbastro on Dec. 14, 1559. He was appointed historiographer of Aragon in 1599, and in 1610 accompanied the count de Lemos to Naples, where he died in March, 1613. His tragedies — Filis, *Isabela,* and *Alejandra* — *are* said by Cervantes to have "filled all who heard them with admiration, delight, and interest"; *Filis* is lost and *Isabela* and *Alejandra,* which were not printed till 1772, are ponderous imitations of Seneca. Argensola's poems were published with those of his brother in 1634; they consist of excellent translations from the Latin poets, and of original satires.

His brother, BARTOLOMÉ LEONARDO DE ARGENSOLA (1562–1631), Spanish poet and historian, was baptized at Barbastro on Aug. 26, 1562. He was attached to the suite of the count de Lemos, viceroy of Naples in 1610, and succeeded his brother as historiographer of Aragon in 1613. He died at Saragossa on Feb. 4, 1631. His principal prose works are the *Conquista de las Islas Molucas* (1609), and a supplement to Zurita's *Anales de Aragdn,* which was published in 1630.

ARGENSON, the name of a French family, derived from an old hamlet in what is now the department of Indre-et-Loire. MARC RENE DE VOYER, marquis de Paulmy and marquis d'Argenson (1652–1721) held various legal offices at the French court, and in 1697 was appointed lieutenant-general of police. He held this post for 21 years, during which he was a party to every state secret, and a familiar friend of Louis XIV.; in 1709 he directed the destruction of the Jansenist monastery of Port Royal. In 1718 he became keeper of the seals and president of the council of finance; he was appointed by the regent to suppress the resistance of the parlements and to reorganize the finances, and was blamed for the failure of the schemes of John Law. He resigned in 1720 and died on May 8, 1721. *See* the contemporary memoirs, especially those of Saint-Simon (de Boislisle's ed.), Dangeau and Math. Marais; Barbier's *Journal;* "Correspondance administrative sous Louis XIV." in *Coll. des* doc. *inéd. sur l'histoire de France,* ed. G. B. Depping (1850–55); *Correspondance des contrôleurs-Généraux des finances,* pub. by de Boislisle (1873–1900); *Correspondance de M. de Marville avec M. de Maurepas* (1896–97); *Rapports de police de René d'Argenson,* pub. by P. Cottin (undated); P. Clément, *La police sous Louis XIV.* (1873).

RENÉ LOUIS DE VOYER DE PAULMY, marquis d'Argenson (1694–1757), eldest son of the preceding, was also a lawyer. As intendant of justice, police and finance in Hainaut he was employed in provisioning the troops, who were suffering from the economic confusion resulting from Law's system. He returned to the court in 1724 to exercise his functions as councillor of state. He was the friend of Voltaire, and frequented the Club de l'Entresol, the history of which he wrote in his memoirs. In May 1744 he was appointed member of the council of finance, and in November secretary of state for foreign affairs, his brother, the comte d'Argenson being at the same time secretary of state for war. France was then engaged in the War of the Austrian Succession, and the government was virtually in the hands of the two brothers. The marquis d'Argenson dreamed of a "European Republic," and wished to establish arbitration between nations. But the generals negotiated in opposition to his instructions; his colleagues laid the blame on him; the intrigues of the courtiers passed unnoticed by him; and the secret diplomacy of the king neutralized his initiative. He concluded the marriage of the dauphin to the daughter of Augustus III., king of Poland, but was unable to prevent the election of the grand duke of Tuscany as emperor in 1745. In 1747 he retired and spent the rest of his life in working at the Académie des Inscriptions, of which he was appointed president by the king in 1747, and in revising his *Mémoires.* Voltaire declared him to be "the best citizen that had ever tasted the ministry."

BIBLIOGRAPHY.—His son, Antoine René, published his *Considtrations sur le gouvernement de France* (Amsterdam, 1764), and *Essais dans le goût de ceux de Montaigne (ib.* 1785), republished as *Loisirs d'un ministre d'état* (1787). There are two important editions of the Mtmoires, the first with some letters not elsewhere published, by the marquis d'Argenson, his great-grand-nephew (1857, *et seq.);* the second, more correct, but less complete, published by J. B. Rathery, for the Société de l'Histoire de France 1859, *et seq.).* *See* Sainte-Beuve, *Causeries du lundi* (vols. xii. and xiv.); Levasseur, "Le Marquis d'Argenson" in the *Mémoires de l'Académie des Sciences Morales et Politiques* (vol. lxxxvii. 1868); and, especially, E. Zevort, *Le Marquis d'Argenson et le ministère des affaires étrangères* (1880). *See* also G. de R. de Flassan, *Histoire de la diplomatie française* (2nd ed., 1811); E. Boutaric, *Correspondance secrlte inédite de Louis XV.* (1866); E. Champion, "Le Marquis d'Argenson," in the *Révolution française* (vol. xxxvi., 1899); Arthur Ogle, *The Marquis d'Argenson* (1893); A. Alem, *D'Argenson tconomiste* (1899).

Other noted members of the family were: MARC PIERRE DE VOYER DE PAULMY, Comte d'Argenson (1696–1764), younger brother of the preceding, who, as secretary of state for war, began the reform of the new armies constituted after the War of the Austrian Succession; his nephew MARC ANTOINE RENÉ DE VOYER (1722–87) who after being employed as ambassador to Poland (1762–64) and at Venice (1766–70) devoted his time to history, and published *Mélanges tire's d'une grande bibliothèque,* 65 vols. (1779–88); MARC RENÉ, marquis de Voyer (1721–82), who fought in the War of the Austrian Succession and in the Seven Years War; and his son MARC RENÉ, marquis d'Argenson (1771–1842), who embraced the revolutionary cause, and later, as an adherent of Napoleon, helped to repel the English invasion of South Beveland and Walcheren (1809).

ARGENTA, province of Ferrara, Emilia, Italy, 25m. S. of Ravenna by rail, 13 ft. above sea-level. Pop. (1936) town, 3,684; commune, 28,032. It has some interesting mediaeval and Renaissance buildings and churches, and a good picture gallery.

See A. Beltramelli, *Da Comacchio ad Argenta* (Bergamo, Arti Grafiche, 1905).

ARGENTAN, capital of an arrondissement in the department of Orne, N.W. France, 27 mi. N.N.W. of Alençon by rail. Pop. (1936) 6,291. It is situated on the slope of a hill on the right bank of the Orne at its confluence with the Ure. Argentan was a viscounty from the 11th century onwards; it was often taken and pillaged. During the Religious Wars it remained attached to the Catholic Party. The château, now used as a law court, dates from the 15th century. The church of St. Martin (15th century) has good stained glass; that of St. Germain has a 15th-century sculptured porch. Argentan is the seat of a sub-prefect, has a tribunal of first instance and of commerce, and a communal college. Leather-working and the manufacture of stained-glass are leading industries. There are quarries of limestone in the vicinity.

ARGENTEUIL, a town of northern France, in the department of Seine-et-Oise, on the Seine, 3 mi. northwest of the fortifications of Paris. Pop, (1936) 59,314. Argenteuil grew up round a monastery (A.D. 656), which Charlemagne changed into a nunnery; it was afterwards famous for its connection with Héloïse (see ABÉLARD), and on her expulsion in 1129 was again turned into a monastery. It is a residential area related to Paris, having market gardens and vineyards. The *Fête* des *Vendanges* held in autumn is well known. Machine and chemical industries are carried on.

ARGENTINA, or the Argentine Republic (officially República Argentina), is second in area and population of the countries of South America. It has the shape of a wedge with the point towards the south and occupies the greater part of the southern extremity of the continent. The length of Argentine territory from north to south is approximately 2,070mi. and its greatest width about 860 miles. The area is 1,079,965 sq mi., not including the Falkland islands (*q.v.*), to which Argentina lays claim. On the north and north-east the country abuts on Bolivia, Paraguay, Brazil and Uruguay, with the Pilcomayo, Paraguay, Paraná and Uruguay rivers constituting the greater part of the boundary itself. Argentina is bounded on the west throughout its entire length by Chile; on the east and south-east by the Atlantic ocean; on the south by the converging lines of Chile and the Atlantic.

Physical Geography. — The Andean mountain chain which extends the entire length of South America forms a natural division between Argentina and Chile, as the boundary line is marked in large part by the highest peaks of the Andes which form the watershed for streams flowing in the general directions of the Atlantic and of the Pacific. In the north the Andean ranges extend east through approximately one-third of Argentine territory but farther south the width of the mountainous border diminishes sharply. All of the Argentine territory to the east of the Andes, comprising by far the greater part of the country, has the character of a plain rising from sea-level at the Atlantic coast to the Andean foothills.

The northern part of the Argentine plain is known as the Gran Chaco and is in part wooded and swampy. The treeless, grassy pampa, the fertile agricultural and grazing territory which has made the wealth of Argentina, occupies the central portion. From the Rio Kegro south the country is known as Patagonia and is composed principally of cold, arid steppes.

From the Bolivian border south to the Rio Negro (approximately one-half the length of the country) the Andean mountain zone extends east through one-third to one-fourth of the territory and comprises the elevated cordilleras and their plateaus, with flanking ranges and spurs towards the east. In the north the elevated plateaus and the valleys are semi-arid and are covered with extensive saline deposits. Along the Chilean border lies an extensive region of elevated desert land and mountain, without drainage, known as the Puna de Atacama. In the province of Córdoba are three short parallel ranges belonging to another and older formation than the Andes. North of the Córdoba Sierras lies a great saline depression known as "salinas grandes," 643ft. above sea-level, while to the north-east is another extensive saline basin enclosing the "Mar Chiquita" (Small Sea) and the morasses into which the waters of the Rio Saladillo disappear. The highest elevations in the Argentine Andes occur north of the Rio Negro, along the Chilean border. Of these the most important are: Aconcagua, the highest mountain in the Americas (23,080ft.); Mercedario (22,31jft.); and Tupungato (21,550ft.).

The Patagonian Andes, extending from the latitude of the Rio Negro to the southern extremity of the continent, differ in character from the northern Andes. They are much lower and diminish in height towards the south, the greatest elevation in Rio Negro being 11,155ft. and in Chubut and Santa Cruz, 6,988 and 7,090ft. respectively.

The region known as the Gran Chaco comprises that part of the Argentine plain extending from the Rio Pilcomayo on the northern border south to the Rio Salado del Norte. Its northern extremity lies within the torrid zone and is made up of tropical forest alternating with plain. The general elevation of the Gran Chaco varies from 600ft. to 800ft. above sea-level. As the slope to the east is very slight the rivers are commonly obstructed by sand bars, floating trees and vegetarion, and large areas are regularly flooded during the rainy season. A large part of the Gran Chaco region is wooded; in the south and south-west there are large grassy plains and large areas covered with salt pans. The Argentine "Mesopotamia," the area lying between the Paraná and Uruguay rivers, belongs naturally to the Gran Chaco region. It is wooded, flat and swampy in the north, but higher and undulating in the south.

The central, or pampa, region of Argentina is the most productive and has within its area or on its margin the bulk of the population and all the large cities of the country. It comprises the area from the Gran Chaco south to the Rio Negro, stretching through about 10 degrees of latitude It is a treeless, grassy plain, apparently lying on a dead level but in reality rising gradually from the Atlantic westward at an average rate of about 3ft. to the mile. This uniform level is broken along its southern margin, in the south of the province of Buenos Aires, by the small Tandil and Ventana Sierras and by ranges of hills and low mountains in the southern and eastern part of the territory of La Pampa. Extensive depressions are found, some of them subject to inundations, as along the lower Rio Salado in Buenos Aires. In a straight line west the elevation of the pampa varies from 65ft. at Buenos Aires to 1,250ft. at a point 400 mi. west.

Contrasting with the fertile pampa the southern region known as Patagonia is made up principally of arid steppes. Patagonia includes the area from the Rio Negro to the southern extremity of the continent. Except for a narrow coastal plain of varying width the surface of Patagonia is formed by a series of high plateaus at elevations varying from 300 to 1,600ft., with the general aspect of a great plain sloping from the west to the east. The surface of the plateaus is very uneven, with outcroppings of stone, and is crossed from east to west by deep, broad valleys between high cliffs. In the west the plateau area is separated from the Cordillera by a longitudinal depression or belt, within which conditions of climate and soil are more favourable than in any other part of Patagonia. This longitudinal belt is not continuous, but is broken into sections, one of which, in the south, is 200mi. long. Fertile and wooded, it offers most inducements to colonists.

The island of Tierra del Fuego adjoins the continent at the south. Its eastern section belongs to Argentina and the west to Chile. In character it is similar to Patagonia. In the north the surface is undulating prairie and in the south wooded hills with glaciers and numerous rivers and lakes.

Rivers and Lakes. — The three great rivers that form the Plata system — the Paraguay, the Paraná and the Uruguay — with their tributaries, drain the northern part of Argentina. The rivers of this mighty system have a total length of 2,330mi. and are navigable throughout 1,997 miles. The Paraguay, Paraná and Uruguay have their source in the highlands of Brazil and flow south. Each forms a part of the boundaries of Argentina with the countries to the north. The largest tributaries of the Plata system are the Pilcomayo, which rises in Bolivia and forms the north-eastern boundary of Argentina for about 400mi. and joins the Paraguay; the Bermejo, which rises on the northern frontier and flows south-east into the Paraguay; and the Salado del Norte (called the Rio del Juramento in its upper course), which rises on the slopes of the Andes in the province of Salta and flows south-east into the Paraná. The area known as the Mesopotamia, included between the Paraná and the Uruguay, is watered by a number of small streams which flow into those rivers.

The Rio de la Plata is in reality an enormous estuary and forms an ample gulf. It is about 100mi. long and 23mi. wide at the confluence of the Paraná and the Uruguay. Measured at its widest point, which is slightly west of Montevideo in Uruguay, the Plata is about 56mi. wide. The port of Buenos Aires has been constructed on the banks of the Plata.

The central part of the pampa region, including a considerable part of the province of Buenos Aires and La Pampa territory, is almost entirely without running streams, though it is not in any sense arid. On the eastern and southern pampa there are a num-

ber of small streams flowing into the Plata estuary and the Atlantic. Of these the only important one is the Salado del Sur, 360 mi. long. Many of the rivers of Argentina are brackish or saline in character, as implied by their names (Salado and Saladillo).

On the southern margin of the pampa flow the Colorado and Negro rivers, crossing the entire republic from the Andes to the Atlantic. Both are navigable. The Rio Negro is nearly 400mi. long and after the large tributaries of the Plata is the largest river in Argentina. Its waters are used for irrigating a large area.

The Patagonian region has a number of rivers which rise in the foothills of the Andes and flow in an easterly direction to the Atlantic. Of these the largest is the Rio Chubut, which has an important tributary, the Rio Chico. There are many large snow-fed lakes in Patagonia set in the Andean foothills, of which the largest are Lago Viedma, Lago Buenos Aires, Lago Argentina and Lago Nahuel Huapi. The scenery in the lake region of Patagonia, with its rugged snow mountains, forests and glaciers, is magnificent.

The lakes of Argentina are exceptionally numerous, though, except in Patagonia, few of them are large enough to be shown on an ordinary map. Buenos Aires province has more than 600 lakes, mostly small and some brackish. La Pampa territory, too, is dotted with small lakes. The large saline Mar Chiquita in Córdoba is fed from the Córdoba Sierra, and, like many lakes of the region, has no outlet.

Ocean and River **Ports.**—Argentina has a coast on the Atlantic 1,656mi. long, including the estuary of the Plata, but there are few natural harbours. The two ports most frequented by ocean-going vessels are those of Buenos Aires and Ensenada (La Plata), both in the Plata estuary, and both constructed by the National Government at great expense. The best natural harbour of the republic is probably that of Bahia Blanca on the Atlantic coast in the southern part of Buenos Aires province, 534mi. by sea from Buenos Aires. Here there is a large bay of good depth, sheltered by islands. The port is known as Puerto Belgrano, or Puerto Militar, as there is a naval base there. It is under the jurisdiction of the National Government. With a little dredging the harbour is kept accessible to the largest ocean-going vessels. There are ample port works and equipment. Within a few miles of Bahia Blanca are two other small ports known as Ingeniero White and Puerto Galván.

There are several small ports on the coast of Patagonia, visited only by coast-line steamers. These include San Antonio in Rio Negro; Comodoro Rivadavia (the centre of the Argentine petroleum industry) and Puerto Madryn in Chubut; Santa Cruz, San Julián and Puerto Deseado in Santa Cruz. Ushuaia on the Beagle channel is the port of Tierra del Fuego.

The port of Buenos Aires is situated on the Plata river at a point where it is approximately 24mi. wide. After New York it has a larger movement of traffic than any other American port. The harbour is made up of four sections known respectively as Riachuelo Port, Port Madero, New Port and South Dock. There is an aggregate of 6mi. of quay served by hydraulic and electric cranes. The Government warehouses in the port area have floor space of more than 90,000sq.ft., and over 7jmi. of railway lines. Five grain elevators have a capacity of 167,000 tons. Between 14,000 and 16,000 ships, averaging 13,000,000 to 14,000,000 tons, call annually. Some 5,000 of these, aggregating 8,000,000 to 9,000,000 tons, are foreign.

Argentina has within and adjacent to its territories several navigable rivers. This fact has been of importance in the development of the country as ocean-going steamers can penetrate to centres of production. The port of Rosario on the Paraná river, 260mi. inland from Buenos Aires, is the second port of the republic in commercial importance. It receives nearly the whole of the shipping traffic of the higher Paraná and Paraguay rivers and can be reached by overseas steamers drawing up to 21ft. of water. The port of Santa FC on the Rio Paraná, 360mi. from Buenos Aires, is also accessible to overseas steamers. There are many other river ports with a traffic of relative importance scattered along the banks of the Paraná, the Paraguay and the Uruguay. (X.)

Geology.—The older sedimentary rocks in Argentina are exposed in the Cordillera of the Andes, which borders the country on the west and constitutes the "backbone" of South America. The Andes are of geologically recent origin, having been uplifted in Tertiary time. The uplift was accompanied or followed by vulcanism, which produced extensive areas of rugged volcanic rock, mainly andesite, trachyte and basalt. Plastic igneous material intruded into the older rocks formed on cooling bodies of granite, syenite and diorite, and uplifted, folded and faulted the sedimentary Palaeozoic beds that lay along or near the axis of the range. The Cordillera is paralleled on the east and in places joined by the Sierras, lower ranges in which also intrusive rocks, Palaeozoic sedimentary beds and volcanic rocks are exposed. In areas somewhat farther east the older Palaeozoic rocks are overlain by beds of sandstone containing thin seams of coal and the remains of plants. Among the latter are some that belong to the Glossopteris or *Gangamopteris* flora, which thrived in India, Australia and South Africa in Permian time, when glaciers appear to have existed in South America. The occurrence of these fossil plants in Argentina favours the view, held by some, that a great land area, which has been called Gondwanaland, once extended from India to South America. The fossil plants of the Glossopteris flora were found at Bajo de Velis, in the province of San Luis. Fossil plants found elsewhere in Argentina belong to a higher geologic horizon—the upper Triassic, equivalent to the Rhanetic of Europe. Jurassic beds are seen in the Cordillera. Some Cretaceous freshwater beds are found in the western part of the country. The early Tertiary deposits consist largely of beds of reddish sandstone, which are exposed in the Cordillera and the Sierras, where they reach, at some places, a height of 100,000ft., and where they were folded by the Andean uplift. The marine deposits of late Tertiary time are confined to the neighbourhood of the coast and were probably laid down after the Andes had been uplifted, but freshwater deposits of about the same age are found in inland areas, especially in Patagonia.

The fauna of middle Tertiary and Quaternary time includes the remains of a gigantic ningless bird (*Phororhacus*), a huge armadillo-like animal (Glyptodon), giant ground sloths (*Megatherium* and Mylodon), a horse (*Hippidion*), and a bear-like animal (Arctotherium). Some of these have been found in the Pleistocene beds of the pampas, which consist mainly of rather loose deposits of very fine sand and clay. Large areas of glacial deposits show that masses of ice covered the Andean slopes in glacial time.

Ores of gold, silver, lead and copper are found in the neighbourhood of the eruptive rocks in the hilly regions near the Andes. (G. McL. Wo.)

Climate and Rainfall.—With the exception of the small area which lies north of the Tropic of Capricorn in the Torrid Zone, Argentina lies in the South Temperate Zone. The central or pampa district including the most populous provinces has a temperate, healthful climate, enjoying a large amount of sunshine and, as a whole, adequate rainfall. All over the republic January is the warmest month and the coolest season June and July.

There is little variation of climate over the pampa region considering its great extent, nearly ten degrees of latitude. It includes the provinces of Buenos Aires, southern Santa FC, the eastern part of Córdoba and La Pampa territory. In the capital of Córdoba, on the northern margin of the pampa, the annual average temperature is 62·4° F. The average temperature for January is 77" and 49·6° for June. In the city of Buenos Aires the average annual temperature is 61·1° F.; for January 73·7° and for July 49·2° F. There is thus little difference in temperature between Buenos Aires and Córdoba but there is a marked difference in rainfall. In Buenos Aires the rainfall reaches 37·9in., well distributed throughout the year, while Córdoba has 28 inches. Light frosts are sometimes experienced in Buenos Aires during the cold months but the vegetation is never frozen. The city of Bahia Blanca in the southern part of Buenos Aires province is on the southern margin of the pampa. It has an average annual temperature of 60° F., 70·4° F. for the month of January and 46·7° for the coldest month, July, with an average annual rainfall of 21·j inches.

Due to the length of Argentine territory, which extends through 33 degrees of latitude, and the great variations in altitude in its range from the Atlantic coast level to the peaks of the Andes, there is necessarily great variation of climate. The climate is further modified by prevailing winds and mountain barriers. Southern Patagonia and Tierra del Fuego, although they correspond in latitude to Labrador, are made habitable and an excellent sheep-raising country by the southern equatorial current along the continental coast.

The Torrid Zone area in the extreme north extends through about 1½ degrees and is about 30,720 sq.mi. in area. The eastern part of this area is the low, wooded plain of the Gran Chaco where the mean annual temperature is 73° F. and the annual rainfall 63 inches. The western extremity is the arid plateau of the Puna where the annual average temperature falls below 57° and the rainfall to 2 inches.

The region comprising the provinces of San Luis, Catamarca, La Rioja, San Juan, Mendoza, western Córdoba and south-viestern Santiago del Estero has a scant rainfall and irrigation is necessary for agriculture. The climate is hotter than on the pampa. In Santiago del Estero the temperature sometimes reaches 118° F. The climate in the Mesopotamian district does not present great variation of temperature. The Gran Chaco region has the heaviest rainfall of any part of the republic. Tucumán has ample rainfall with a hot summer in the lower sections. Salta and Jujuy are arid in part but have moisture in the lower valleys. The winter months (May to August) are the dryest in all parts of the republic north of the Rio Negro. In the northern Andean region there is a well marked dry and rainy season.

In general in Patagonia the temperature falls progressing southward, though Santa Cruz is colder than Tierra del Fuego. The climate is everywhere healthy. The coldest part of the republic in winter is a point in the western part of Santa Cruz where the mean temperature is 32°.

Flora. — Each of the different climatic zones of Argentina has its own characteristic flora—the tropical and subtropical regions of the north. the arid plateaus of the west and north-west, the pampa and the desert steppes of Patagonia. The territory within and bordering on the Torrid Zone has a vegetation of tropical luxuriance. In the forests the palm predominates in the extreme north, intermingled south of the Rio Bermejo with heavy growths of native hardwoods distinguished by the evenness and clearness of their grain and colour. In the elevated, dry and saline regions of the north-west and west where the rainfall is slight, the vegetation is sparse and of the desert type. There are large thickets of thorny bushes with scant foliage; cacti, some of great size, are characteristic of this region.

The pampa, covering so large a part of the republic, has no native trees whatever. The only trees on the pampa have been planted by men, often about their habitations. The pampa, except where the land is under crops, is covered with grasses edible for cattle, divided into two main classes: pasto duro (hard grass) and pasto blando (soft grass). The pasto duro is the native grass which is coarse and of strong growth This has been replaced in a steadily growing area by pasto blando or cultivated pastures, grown from imported seed. This substitution is an important gain from the economic point of view. The natural fertility of the pampa and the amount of rainfall over most of its area make it readily adaptable to every kind of cultivation suitable to this climate.

The greater part of Patagonia is barren and there is no arboreal growth except in the well watered valleys of the Andean foothills. Here there are regions of good, cultivable land, pasture land and timber. The water courses and depressions of the steppes afford pasturage sufficient for sheep. In places the steppes have a thorny shrub growth.

In Tierra del Fuego there is much moisture and an Antarctic vegetation is found. There are rich pastures and the forest growth is vigorous. The forests of Tierra del Fuego and of the Andean foothill region of Patagonia include pine, cypress, cedar, fir and Antarctic beech.

The total forest region of Argentina is 346,260.9 square miles. The provinces having the largest forest area are Salta, Santiago del Estero, Santa Fé and La Rioja and El Chaco territory. The native varieties include choice hardwoods suitable for cabinet making and a very important collection of woods for tanning, dyeing, textile and medicinal purposes. Many of the trees are indigenous and are identified only by their Indian names. The better known varieties found in the forests of northern Argentina include the algarrobo, the jacaranda, the laurel, the white and red quebracho, the lignum vitae, rosewood, walnut and orangewood.

The most valuable single item produced by the forests of Argentina is the quebracho, used in tanning. The red quebracho is also a particularly valuable hardwood for railway sleepers (ties), bridge piles, fence posts, paving blocks and the like. The variety of plants suitable for tanning and dyes is particularly large, with 23 species of dye plants in the Mesopotamian region alone, but, except for quebracho, this source of wealth is as yet little exploited. Yerba mate (Paraguay tea), a shrub native to the forests along the Upper Paraná, is now being extensively cultivated in Formosa and Misiones territories.

The advent of European civilization in Argentina created an extraordinary change in the Argentine flora, as it now includes useful trees and plants from every part of the world, including the cereals, alfalfa and new grasses for the plains and all varieties of fruits. The Australian eucalyptus has been planted in many places and thrives on the pampa. Other varieties which have been planted extensively in the pampa region include the acacia, the sycamore, the paraiso and a variety of evergreens.

Fauna. — Comparatively few species of animals exist on the steppes of Patagonia. In the northern provinces of Jujuy and Salta the wildcat and chinchilla are found. The guanaco, a wild species similar to the llama, the alpaca, vicuña and the vizcacha, a native variety of rodent, inhabit the cordillera. In the tropical region of the north and on its borders are found several species of monkey, the puma, the jaguar, ferret, racoon, vizcacha, anteater and rabbit as well as other species usual to the South American jungle. On the pampa are found the fox, skunk, martin, deer and armadillo The hare is found everywhere and the Patagonian hare on the pampa and in Patagonia. The carpincho, a wild pig, and the nutria are found in many provinces. Among the fauna of Patagonia are the fox, martin, guanaco, puma, deer. rabbit and armadillo. The vizcacha is found in Rio Negro territory. In the lagoons of the Mesopotamia are two species of cayman, popularly known as yacuarés. Frogs and toads are found on the pampa.

Argentina has a great variety of bird life. The condor inhabits the Andes and the Córdoba Sierras. Among those that inhabit the pampa are hawks, falcons, owls, herons, storks, swans, partridge, plovers, ducks, chajas and many others known by native names. Parrots and similar tropical birds are found in the extreme north. There is a variety of rhea in Patagonia and on the pampa. Penguins are found in Tierra del Fuego.

The coast waters and the Plata and interior rivers have an abundance of fish. The common varieties of shell fish are represented. Among fresh water fish are trout, salmon, eels and the pejerrey, considered a great delicacy.

GOVERNMENT AND ADMINISTRATION

Population. — Since independence three censuses of the entire country have been taken, with results as follows: 1869—1,830,214; 1895—3,954,911; 1914—7,885,237. Official estimates as of 1941 gave a total of 13,318,320. A census of the Federal District (co-terminous with the city of Buenos Aires) in 1936 gave 2,415,142, but official estimates were 2,290,778. The entire metropolitan area was estimated at 3,666,585. The other principal cities were officially estimated as follows (Dec. 31, 1940): Rosario, 512,872; Avellaneda (a suburb of Buenos Aires), 386.372; Córdcba, 310,070; La Plata, 247,515; Tucumán, 157,480; Santa Fé, 147,583; Bahia Blanca, 115,148; Mendoza, 86,500; Paraná, 74,856.

The same (1940) estimates gave the population of the Federal District and the provinces as follows: Federal District, 2,386,103; Buenos Aires, 3,525,068; Córdoba, 1,291,188; Santa Fé, 1,559,542; Entre Rios, 752,247; Tucumin, 550,279; Corrientes,

526,318; Mendoza, 523,141; Santiago del Estero, 496,530; San Juan, 221,452; Salta, 217,565; San Luis, 200,135; Catamarca, 152,519; Jujuy, 115,789; La Rioja, 111,899. The national territories as a whole were officially estimated as 688,545. Normally reliable, unofficial (1940) estimates. however, placed the figure 50% higher, as follows: El Chaco, 329,400; La Pampa, 148,700; Misiones, 186,200; Río Negro, 135,200; Formosa, 56,900; Chubut, 86,100; Neuquén, 75,200; Santa Cruz, 18,700; Los Andes, 7,100; Tierra del Fuego, 2,300.

During the first half of the 19th century civil wars and despotic government seriously restricted the growth of the population but since the consolidation of the republic in 1860, it has increased rapidly. Attracted by the good climate and opportunities, European immigrants arrived in ever increasing numbers. It will be noted that the population approximately doubled in the period of 26 years intervening between the first census and the second and again in the period of 19 years intervening between the second census and the third. During the years of World War I the number of those who left the country exceeded the number who entered by 214,959 and during this period growth was only from the natural increase. From 1914 to the end of 1938 the total increase of population was 4,736,964 of which 3,801,005 resulted from the surplus of births over deaths and 935,959 was the surplus of immigration over emigration.

Vital Statistics. — For the five years 1934 to 1938 inclusive, births averaged 25 per 1,000 for the republic and deaths 12.2 per 1,000. Both declined steadily during the 1930's (1910–14 average: 38.87 births, 17.08 deaths per 1,000). The natural increase was 12.5 per 1,000 (20.79 in 1910–14). The birth and death rates were highest in Jujuy (44.9 births, 31.1 deaths per 1,000) and lowest in the Federal District (18.0 and 11.9) and the province of Buenos Aires (20.34 and 10.26).

The Race. — As in the United States, a new type has developed in Argentina as the result of a mixture of European races. There is less admixture of non-white blood than in any other American nation, with the possible exceptions of Canada and Uruguay. The native Indians have almost died out, the 1914 census showing 53,000, or less than .68%. Subsequent immigration has further reduced the proportion. Nearly all the Indians live in the national territories of the north, Los Andes, Formosa, Chaco and Misiones. The southern territories include a few hundreds each. In the thinly populated northern provinces, a fair portion of the population has some Indian blood, but the more populous provinces have practically no admixture. The number of Negroes in the country is negligible.

During the period of Spanish domination the great bulk of immigration was Spanish, so that the stock on which the republic was built was principally Spanish creole. Since 1857, approximately 43.5% of the net immigration has been Italian, and 27% Spanish. Although the Italian portion has materially declined since 1914, the Italian strain in the Argentine population is estimated at 30% and higher. The 1936 census of the Federal District disclosed that 36.06% of the inhabitants of Buenos Aires were foreign-born, 33.3% being still unnaturalized. Around 35% of the foreign-born were natives of Spain, 30% of Italy.

Migration. — Argentina has used every means to attract immigration. The Immigration Law passed in 1876 includes provisions that immigrants shall be lodged and boarded for a limited time, and transported to their destination within the country at the expense of the Government; shall be assisted in finding work and allowed to import their goods duty free. During the Alvear administration a group of the principal private railroad companies organized to co-operate with the Government in colonizing along their respective lines. They will sell small land holdings to settlers on long term payments, without profit on the sale of land, and in other ways assist settlers. A Jewish colonization enterprise owns large holdings of land in the pampa provinces. For many years there has been a great movement of immigration, partially balanced by a counter-movement of emigration, largely composed of "swallows," that is, of persons who came for a season to work in the harvesting. In the World War decade of 1911–20, 935,825 immigrants arrived, but due to heavy emigration the net gain was only 269,094. In the next decade, however, a net of 970,435 remained, out of 1,397,415 immigrants entering the country.

In 1860 there were 5,656 immigrants and the number increased each year to 39,967 in 1870. Thereafter years that established new records of entries were: 1873—76,332; 1885—108,722; 1889—260,000; 1906—302,000; 1908—303,000. From 1910 to 1914 the migratory movement was very heavy. In 1910 345,275 entered and 136,405 left, with a net gain to the country of 208,870; in 1913 364.878 entered and 219,519 left, net gain 145,359. The war prevented workers from leaving Europe in the same numbers as previously and the number who returned to their countries was greater than those incoming, resulting in a net loss of 153,930 in the years 1914 to 1918 inclusive. In 1919 the movement was about balanced and by 1923 it was restored to its pre-war proportions. In that year, a net of 160,799 entered the country, and the annual net averaged 97,000 through the entire decade. During the depression years 1930–33 inclusive, the average annual gain from immigration was but 7,500, but by 1938, the annual net had reached 40,000.

During the years 1857 to 1937 inclusive, the total number of immigrants was 6,544,874, and of emigrants 3,109,397, leaving a net gain to the country of 3,435,477. After deducting emigrants, the immigration in that period comprised national groups as follows: Italians, 1,485,537; Spanish, 930,478; French, 132,439; Germans, 87.233; Russians, 73,024; Turks, Syrians, etc., 64,375; British, 58,404; Austro-Hungarians, 43,682; Portuguese, 29,762; Poles, 20,387; Swiss, 18.488; Yugoslavs, 13,431; North Americans, 8,898; Belgians, 8,017; Danes, 7,157; Netherlanders, 5,517; Swedes, 1,896; other nations, 120,543. In 1938 and 1939 the net immigration was 25.849 and 4,671, with Italian, German, Spanish and Polish nationals leading.

Government. — The Argentine Republic consists of 14 provinces, 10 territories (called *gobernaciones*) and a federal district. The national constitution is dated May 25, 1853, with modifications in 1860, 1866 and 1898. It is modeled closely on the constitution of the United States. The form of government is similar to that of the United States, the principal difference being that in Argentina power is somewhat more centralized in the National Government, which, under certain conditions, can intervene in the administration of the provinces. The legislative power is vested in a congress of two chambers, the senate composed of 30 members, and the chamber of deputies, composed of 158 members. There are two senators from each province and two from the federal district. The constitution provides that there shall be one deputy for every 33,000 inhabitants. Senators must have been citizens of the country for six years and deputies for four years. Senators are elected by the legislatures of the provinces and in the federal district by a special body of electors, for a term of nine years, and deputies are elected by direct popular vote. The two chambers meet annually from May 1 to September 30 in Buenos Aires, the national capital.

The president of the republic is elected by electors voted for by the people. His term is six years and he cannot succeed himself. The president must be native born and of the Roman Catholic faith. He is commander-in-chief of the army and navy and appoints all civil, military, naval and judicial officers. The vice-president is elected in the same way as the president and is the presiding officer of the senate. The president in his executive capacity is assisted by a cabinet of eight ministers, appointed by him, who are ministers of the interior, foreign affairs and worship, treasury, justice and public instruction, war, navy, agriculture and public works. There is universal male suffrage. In 1912 the electoral laws were modified and the secret ballot system substituted for open voting. The benefits resulting from this reform have been very important.

Local Governments. — Each province has its own constitution and elects its governor, legislators and provincial functionaries. Each has its own judicial system and enacts laws relating to the administration of justice, the distribution and imposition of taxes and all other local affairs. All the public acts and judicial decisions of one province have full legal effect and authority in all the others. Under certain conditions the National Government has the

right to intervene in the administration of any province by the appointment of an interventor who becomes the executive head of the province and fills the other provincial offices with his own appointees. This right of intervention has been invoked from time to time. Under Provisional President Uriburu (1930–32) there were interventions in 12 of the 14 provinces.

The territories are under the direct control of the National Government. The city of Buenos Aires is a federal district and is not a part of the province of Buenos Aires. It has a municipal council of 22 members elected by the taxpayers. The executive head is the *Intendente Municipal*, or mayor, who is appointed by the president of the republic.

Justice. — The judicial system is made up of federal courts and provincial courts. The supreme court of the nation in Buenos Aires has five members. There are five federal courts of appeal, each composed of five members, located in the federal district and at La Plata. Córdoba, Paraná and Rosario. There are also federal district judges. one at least in each province. The provinces each have their own judicial organization headed by a supreme court, with minor courts. There is also a system of local courts in the city of Buenos Aires. The federal courts deal with cases of national character, or in which different provinces or inhabitants of different provinces are parties. The judges of the federal supreme court and courts of appeal and the district judges are appointed by the president of the nation for life, with the approval of the senate.

Educational System. — Argentina has very complete and advanced legislation governing education. The constitution provides for free and compulsory primary education and the laws apply this to children from 6 to 14. The present school lam dates from 1884. Public instruction includes no religious instruction. Elementary education is under the control of the provincial Governments in the provinces. In the federal district and the national territories it is under the direction of the National Council of Education appointed by the president. The nation subsidizes primary education in the provinces. Furthermore, to combat illiteracy, a law was passed in 1905 providing for the establishment of nationally supported elementary schools in certain provinces. These, known as Lainez schools, are for the most part in isolated rural districts. In 1926 there were 3,004 of them; by 1932 the number had increased to 5,029, with an enrolment of 702,609. Within the next five years 50 more were established, and enrolment rose to 831,994. The budget for 1938 allotted 48,966,618 pesos to their support. Except for the Lainez schools, elementary education is supported by the provinces. In 1936, there were, all told, 12.286 public elementary schools, with 1,733,133 pupils. The 1938 national budget allotted 131,901,526 pesos to primary education Expenditures for 1939 were estimated in excess of 136,000,000 pesos.

Secondary or preparatory instruction is given in 258 public secondary schools, whose enrolment in 1936 was 105,350. There are likewise numerous private schools, many of them foreign-controlled and designed for foreigners and first-generation natives. During 1938, as a result of an investigation of charges of indoctrination of alien ideas in such schools in La Pampa territory, foreign schools were placed under more stringent regulation than formerly.

There are, principally in Buenos Aires, facilities for professional education too numerous to describe. These include commercial, professional and technical education, and instruction in the arts and crafts, languages, accounting, mining, agriculture, arts, music, dramatic art, dressmaking, etc.

The three census takings since the establishment of the republic have shown the following proportion of illiterates:

	Census, 1869	Census, 1895	Census, 1914
Men, per thousand	748	508	349
Women, per thousand	817	585	419

These figures show the progress accomplished by the educational system in the reduction of illiteracy. The great numbers of illiterate adults who have constantly arrived from abroad over a long period should be taken into consideration in connection with the figures of illiteracy, also the fact that the development of Argentina on anything like its present basis is comparatively recent. In 1913 illiteracy was lowest in the province of Buenos Aires, where it was 308 per thousand, and highest in the provinces of Jujuy and Los Andes, which had 674 and 667 per thousand. respectively.

Universities. — Argentina has six national universities, the national universities of Córdoba, founded in the 17th century; Buenos Aires, founded in 1821; La Plata, founded in 1906; the Littoral (divided between Rosario, Santa FC, Paraná and Corrientes) and Tucumán, both founded in 1918; and Cuyo, founded in 1939. The private Catholic university is at Buenos Aires.

The University of Buenos Aires is the most important and attracts students from other South American countries. It comprises six faculties, law and social sciences, medical sciences, philosophy and letters, economic sciences, agronomy and veterinary science. In 1926 there were 20,746 students enrolled in all the universities with 1,893 teachers. The cost of university instruction is approximately 20,000,000 pesos annually. The total annual expenditures of the nation and provinces on education are 236,000,000 pesos, or about one-fifth of the aggregate revenues of the nation, provinces and municipalities.

The Press. — Argentina is the most important Spanish-speaking country in the Western Hemisphere in publishing and printing. Books published at Buenos Aires circulate throughout the Spanish-speaking world. The industrial census of 1935 showed 2,187 establishments engaged in printing and allied enterprise, employing 26,795 persons, with an annual production aggregating 140,191,446 pesos. Of these, 1,302, with 19,436 employees, were located in the federal capital. Out of 844 dailies, periodicals and reviews being published, with 10,119 persons employed, 238, with 7,808 employees, were in Buenos Aires. The great daily *La Prensa* of Buenos Aires is ranked as one of the world's four best newspapers, and many regard its rival *La Nación* as its equal. Two important English-language dailies and several German and Italian newspapers are published.

Museums. — The most important museum is at La Plata, capital of Buenos Aires province. It has a large collection of specimens of the plant, animal and insect life of Argentina and South America and departments of geology, anthropology and mineralogy. The National Art Gallery (Museo de Bellas Artes) at Buenos Aires is small and has the nucleus of a collection of works of European painters, modern and old, as well as a number of works by contemporary Argentines and some interesting specimens of American Colonial art. The National History Museum, the Mitre Museum and Library, the Fernández Blanco Museum and the Municipal Museum, all in Buenos Aires, are small collections of objects connected with Argentine history. The Natural History Museum and the National Library are also in Buenos Aires.

Religion. — The constitution provides that the State shall support the Roman Catholic Church, but that there shall be liberty for all cults. The president of the republic must be a Roman Catholic. The great majority of the population profess this religion and there is no other religious movement that includes any important proportion of the population. The bulk of the immigration has been Catholic. There are several small churches of Protestant denominations in Buenos Aires, attended mostly by foreigners.

While the Argentines as a race are strongly Roman Catholic, the church confines itself to its function of spiritual guidance, especially in the more populous districts, and religious considerations enter very little into political issues. Instruction in the national and provincial schools is without religious bias. The president of the republic has the right of presentation to bishoprics and approves the bulls of the pope in accord with the supreme court. They require a law when they contain general and permanent provisions.

FINANCE

While the national expenditures have increased rapidly to keep pace with the needs of a growing country the opinion of com-

petent authorities is that they have not been excessive in view of the national resources. The financial situation of the Argentine Government is generally regarded as strong

Revenues. — For many years Government accounts have regularly shown an annual deficit. The excess of expenditures over revenues was due to various causes, but primarily to the unwillingness of congress to provide sufficient additional revenues to meet steadily increasing public expenditures. Much of the deficit, however, actually represented public works expenditures which, while properly capital items, were not segregated, so that no definite statement of their amount can be made. The 1935 budget was balanced, officially, and showed an actual surplus of 25,000,000 pesos. A nominal surplus was shown in 1936. In 1937, while expenditures ran ahead of estimates, cash revenues were very considerably greater than had been expected, and a 10.000.000 peso surplus existed. Disastrous crop failures in 1938, however, brought about a serious economic decline, and rigorous retrenchment A revised budget for the year called for total ordinary expenditures of 995,684.539 pesos and estimated revenues at 918,567,000 pesos, a deficit of 77,200,000 pesos. Estimates for 1939 presumed a further deficit of 134,465,546 pesos even after making a blanket allowance of 60,000,000 pesos in further economies. Actual revenues for the year, however, cut the anticipated deficit to 60,500,000 pesos.

Main Classifications of Revenue and Expenditure, 1939 Budget Estimates
(in thousands of paper pesos)

Government revenues and expenditures have mounted greatly since the World War of 1914–18. In 1919 they were, respectively, 401,000,000 and 427,900,000 pesos. In recent years at least, the increase can be ascribed in part to the falling value of the peso in terms of dollars and pounds sterling, as the greater part of the national debt is payable in those currencies. In addition the important Law for the Unification of Taxes, enacted in Dec. 1934, had considerable effect. Under this law the provincial Governments gave up their right to levy taxes on commodities already taxed by the Federal Government, in return for block grants. The arrangement is to have a duration of 20 years, with the possibility of extension for a further 10 years. Besides the effect of enlarging the national budget and of facilitating greater freedom of trade within the republic, the law, through other provisions, imposed a degree of control on the borrowings of the provincial Governments.

Foreign Investment. — Like the United States in an earlier period, the economic development of Argentina has been financed principally by foreign capital, either in the form of loans to the Governments used for public works, or foreign capital invested in railroads, public utilities and to some extent industries. The need for foreign capital still exists and will exist for many years to come. The chief source of capital has been Great Britain. During the World War the European money markets were closed to Argentina and the necessary accommodation was secured in the United States. Since 1918 the United States has continued to be the principal source of new capital, especially in loans. In 193j it was estimated that 45% of the investment in industry was foreign capital, British and North American direct investment in nianufacturing and utilities representing a third of the whole. British interests control most of the railways of the country and have an important stake in the United States-dominated meat-packing industry. Considerable additional British capital is in agriculture and livestock. French, German, Netherlands, Belgian, Italian, Norwegian and Swedish investment are also important.

As with the United States, the economic situation of Argentina was greatly consolidated during the World War, which created an unlimited demand for all Argentine products at prices without precedent. The large trade balances in favour of the country during the years of the war and those immediately following increased the national wealth and the gold stock.

Public Debt. — Due to economic progress and to the excellent record of promptness in meeting obligations, the securities of the Argentine Government itself command a higher price in world markets than do those of any other South American Government. During the 1920's, at a time when bond issues of other Governments were made at 7% and 8%, Argentine loans were floated at 6%. More recently many of those issues have been called and new issues made at a lower interest rate. Thus, in Oct. 1938, a $25,000,000 bond issue bearing 4½% interest was floated in New York at 9jf. No Argentine Government bonds have been in default either as to principal or interest, although some of the provinces and other subdivisions have felt compelled to default and to make readjustment. The dollar debt of Argentina (Jan. 1, 1939) was made up of four national issues totalling $151,603,000, 14 provincial issues totalling $75,175,290 and three municipal issues totalling $7,020,000, a grand total of $233,798,290. Two municipal issues were the only ones in complete default. In addition to the dollar indebtedness Argentina had external obligations as follows: £55,953,338; 129,932,450 Swiss francs; 90,785,000 Spanish pesetas; 40,085,500 French francs; 11,667,900 Italian lire; and further external indebtedness convertible into internal obligations of 3,527,100 gold pesos. On June 30, 1939, the internal indebtedness was 5,289,075,000 pesos, of which 3,574,021,000 pesos was national debt. In March 1939 two internal loans, of 100,000,000 pesos at 4½% and 50,000,000 pesos at 4% respectively, were issued.

Monetary System. — The Argentine monetary system is among the most stable in South America. Despite the uncertainties attendant upon the finances of a country whose prosperity depends preponderantly upon export of commodities whose value fluctuates widely in world markets, Argentina has maintained a relatively stable currency throughout the 20th century. In 1899. after a long period of unsatisfactory national finance, there was created, under the so-called Conversion Act, what was in effect an internal currency, *moneda nacional* (national money), represented by the paper peso. This was redeemable in gold pesos of 1 6129 grams of a standard of 9/10 fine gold at a fixed value of 44 cents gold for one paper peso. The gold peso, therefore, was $0.9648, par value, the paper peso $0.4245 in the U.S. dollar then current. The Caja de Conversión (Conversion Office) was given control of gold-buying and selling in order to maintain this ratio

At the outbreak of the World War in 1914, gold payments were suspended and not resumed until 1927. Meanwhile, the paper peso sank as low as 31½ cents U.S. in value in 1921, but gradually regained its legal level. Again, on Dec. 16, 1929, at the outset of the world-wide depression, gold payment was suspended, In the years immediately following, the Conversion system proved too inflexible, and the paper peso fell in international exchange. In 1931, therefore, a new system was inaugurated. In brief, it sought to stabilize peso quotations (initially in terms of dollars, after 1933 in relation to sterling) by restrictions on the buying and selling of foreign exchange. Under this plan exchange derived from exports was required to be sold to the exchange control commission of the Banco de la Nación (and after 1935 to the newly created Banco Central) with the dual purpose of eliminating short time fluctuations and of maintaining a fixed value in gold. The exchange control commission then disposed of this exchange in a rather well defined order of preference, with debt service coming first, then imports in order of their necessity. Should exchange be scarce the prospective importer might be denied it and be obliged to use what has come to be called in foreign exchange transactions the "unofficial peso," whose value has fluctuated considerably, but is always more costly to the importer than the "official peso." A part of the exchange policy has likewise been to give preference to exchange desired to cover imports from countries with which Argentina has a favourable trade balance. When the United States abandoned gold in 1933, the official rate was

tied to the pound sterling at the rate of 15 pesos to the pound, with some changes later. On Nov. 8, 1938, the rate was fixed at 17 pesos to the pound. In Nov. 1939, however, the official rate was fixed to the dollar at 26.81 cents per peso. The uncontrolled peso, however, averaged 23.1 cents U.S. in value in 1939 and closely approximated that figure in 1940.

Banking. — Argentine banking was thoroughly localized and unsettled until the formation in 1891 of the Banco de la Nación Argentina, which thereafter filled a position of great importance, acting as the Government's financial agent, while at the same time it established a wide network of branches throughout the country for the conduct of commercial banking business. The autonomous Caja de Conversión (Office of Conversion), was founded shortly afterward, with its main purpose the maintenance of the legal ratio between theoretical "money of account" and actually circulating currency. The need for a greater elasticity of currency, however, and for reform in general brought about an investigation of the system by British banking experts in 1933. Upon the basis of the reforms recommended, a group of financial reconstruction measures, with the Central Bank Bill as a nucleus, was adopted by the Government early in 1935, and the Banco Central de Argentina (Central Bank of Argentina) was established on May 31 of that year. The new institution took over the functions of the now abolished Caja de Conversión, together with those of sundry other autonomous bodies, as the Rediscount Committee and the Redemption Board. It also became Government depository, and was given general supervision over the banks of the country.

The same legislation of 1935 modified the existing regulations for the Banco de la Nación and the Banco Hipotecario, both Government institutions, and created several other financial organizations, notably a committee of experts representing various economic activities in an advisory capacity to the Government in financial and monetary reconstruction. In their essence the five different lams enacted created a unified system with the Banco Central to give unity to previously scattered functions, as the care of the circulating medium, rediscount operations and the regulation of the foreign exchange value of the national currency. The Banco Central is capitalized at 30,000,000 pesos, nith Government participation to the extent of 10,000,000, an equal sum being divided among the existing banks (including foreign banks) capitalized at 1,000,000 pesos or more. The balance was held for future allotment among banks attaining the minimum capitalization.

The Banco Central had (March 31, 1940) assets and liabilities of 2,567,502,860.12 pesos. Forty-one commercial banks, which together handle approximately 97% of the nation's banking business, had assets and liabilities of 5,493,316,300 pesos.

DEFENCE

Army. — Military service is obligatory for all citizens 20 years of age and lasts one year. After that the conscripts pass to the reserves. From 21 to 29 years of age they belong to the standing army, between 30 and 39 to the national guard and between 40 and 45 to the territorial guard. It is estimated that there are approximately 600.000 ex-conscripts in the three reserves. Students who can comply with certain conditions serve only three months. The permanent army numbers about 47,240 combatants, enlisted men and officers. The military college at San Martin near the national capital prepares all future officers. In 1937 it had 910 cadets. The Superior War-Training school provides training for officers. In 1936 there were 106 army aircraft in service.

Navy.—The Argentine navy had its origin in the Wars of Independence, in the second decade of the 19th century. Although its record in that, as well as later wars, was a commendable one, it was not until the closing years of the 19th century that boundary disputes and threat of war with Chile induced the Government to develop an appreciable navy. Throughout the 20th century a keen naval rivalry with Chile and, especially, with Brazil has been maintained.

In 1939 the Argentine navy consisted of a sea squadron of 2 battleships, the "Moreno" and the "Rivadavia," completed in 1914 and 1915, 3 cruisers, including "La Argentina," completed in 1938, 16 destroyers, 3 submarines, 6 mine-sweepers and 3 auxiliary ships and a river squadron of 4 gunboats and 8 mine-sweepers. Thirty planes are attached to the sea squadron, 20 planes to the river squadron.

There are two principal naval bases, Puerto Belgrano and Rio Santiago, with aerial forces of 70 and 35 planes respectively. These have dry docks and facilities for repair and construction of ships and arms. In addition there is a navy yard at Buenos Aires and an artillery arsenal at Zárate.

Under the navy come the following institutions: a war college for commanders, a naval and aviation school (with 470 midshipmen). a training-ship for midshipmen, three mine-sweepers for midshipmen training, a school for enlisted men and petty officers and two training-ships (one cruiser and one frigate) for sailors.

Naval personnel (1939) included: 1,065 officers, 1,200 petty officers, 3,500 corporals, 6,500 enlisted men, 5,000 conscripts (serving two years) and 3,000 enlisted men (maritime prefecture police).

PRODUCTION AND TRADE

Argentina is a producer of agricultural and pastoral products on a vast scale for export, purchasing the bulk of requirements of manufactured goods abroad. During the first quarter of the 20th century the republic progressed from a comparatively obscure position to one of considerable importance among the nations of the world, and to a place in the first rank of food-producing countries This rapid progress is the result of the great colonization movement which transformed the pampa. It can be said that the entire country lives from the pampa as the industries of the outlying districts have been developed primarily to supply the pampa, notably, the sugar industry of Tucumán and the wine industry of Mendoza. The pampa in turn lives on export. Its development has been made possible by the growth in population and the industrialization of the European countries, especially England. Depending so largely on export trade Argentine prosperity reacts quickly to changes in the economic situation of the European countries, which are its principal customers, and suffers during times of depression in those countries.

Agriculture. — Argentina is essentially an agricultural country, there being no other industries comparable in any way with crop farming and cattle raising, which, with their allied industries such as the elaboration of meat, sugar and wine, maintain the bulk of the population. Practically all items of production are articles of prime necessity which the world will need in increasing amounts. Although agriculture has had such a great development the full possibilities of the country have by no means been realized. The total land area is estimated at 279,271,300 hectares (689,409,000 ac.), distributed as follows:

Land According to Actual Development

Type	Acres	Per cent of total
Under cultivation	74,130,000	10.8
Pasture	306,404,000	44.4
Unproductive land, mountains; lakes and rivers	185,325,000	26.9
Forested regions	123,550,000	17.9
	689,409,000	100.00

Land According to Potential Development

Especially adaptable for cereal crops	197,680,000	28.7
Adaptable for other agriculture and for pastoral purposes	269,339,000	39.1
Forested regions	123,550,000	17.9
Unproductive areas	98,840,000	14.3
	689,409,000	100.00

The area under cultivation has increased by almost 25% since 1920, but it still represents only a small part of the cultivable portion. Even in Buenos Aires, the most highly developed province, there is still much room for growth. This should come with the extension of irrigation and transportation and the growth of the population. On the pampa the rainfall is generally sufficient,

but in the provinces of the west and north-west, nearly all farming is done by irrigation.

The principal agricultural problem confronting Argentina is that of the tenant farmer. A major part of the cultivable land is held by large landowners, many of whom live in Buenos Aires, or are absent from their farms a great part of the year. The crops are produced by tenants, many of whom wander the country in search of work, and who, by reason of high land values, only occasionally succeed in acquiring holdings for themselves. The need for settling stable groups of small farmers on lands of their own has long been recognized, but progress in that direction has been small. Private attempts at correction have usually failed because of the rapid increase in land values. Legislation to bring the assistance of the Federal Government to capable farmers who wish to acquire their own land has been drafted, however, and there is confidence that the program will bring satisfactory results.

Wheat. — Wheat is the leading crop, constituting in some years about $\frac{1}{5}$ the total value of exports. Argentina is one of the three leading wheat exporters of the world. The development of wheat production on a large scale has been comparatively recent, as in 1890 Argentina had only about 1% of the total world production. Over 95% (98% in 1938) of the wheat crop is produced in the provinces of Buenos Aires, Santa FC, Córdoba and Entre Rios.

The extension of the present wheat belt is limited because of the fact that the area to the south and west of it has an average rainfall less than 19in., insufficient for wheat, but the introduction of dry farming and irrigation will eventually permit extension. Weather conditions at times diminish the crop, principally droughts, late frosts and hail. In less degree rust and grasshoppers are a menace. The average yield per acre in Argentina is not high, 12 bushels against 17 for Canada and 30 for England. The yield per acre has already been increased and will be further increased with the development of more intensive methods. The total area sown to wheat increased from 3,379,000 hectares in 1900 to 7,216,798 hectares in 1939–40. Exports were 1,940,356 metric tons in 1938 and 4,745,944 in 1939, compared with 6,613,342 in 1929, the highest on record. Annual production averages somewhat over 6,000,000 metric tons (5,029,000 in 1937–38; 9,150,000 in 1938–39, second highest on record; estimates for 1939–40 were 3,212,000). From 30% to 40% of the production is milled within the country.

Other Crops. — In point of exports maize is the second crop in value. Argentina has second place as a maize-growing country after the United States and is the first exporter of maize. The best corn belt lies in the north-east section of Buenos Aires province where 50% of the entire crop is produced.

In 1939 production of maize was 4,864,000 metric tons, a slight increase over that of the drought year 1938 (4,424,000 in 1938, 9,134,730 in 1937 and 10,051,206 in 1936). Exports were 2,642,150 metric tons in 1939 (2,641,527 in 1938 and 9,087,363 in 1937).

Linseed ranks after wheat and maize in importance as an export commodity. Little progress has been made locally in exploiting the textile fibre of this plant, and it is cultivated for its seed. Argentina is the world's leading producer, with over half the world exportation. Linseed is produced mainly in Buenos Aires, Entre Rios and Santa Fé provinces. In 1939–40, 3,075,496 hectares were in linseed. Production was estimated at 1,127,000 metric tons (1,410,000 tons in 1938–39). Exportation for 1939 was 1,183,203 metric tons (1938: 1,265,150), against a record high of 2,027,609 metric tons in 1932. Two other cereal crops, oats and barley, constitute export items of importance. The area sown with oats in 1939–40 was 1,394,639 hectares. Production in 1939 was estimated at 924,000 metric tons (738,000 in 1938). Exportation was 359,791 metric tons (1938: 381,795 tons; 1937: 403,397). In 1939 there were 858,555 hectares sown with barley. Production was 400,000 metric tons against 480,000 in 1938 and 513,500 in 1937. Exportation was 259,513 in 1939 (211,360 in 1938 and 254,496 in 1937). Rye and birdseed also are raised extensively for export.

Cotton raising has undergone great development since 1930. From 1,738 hectares under cultivation in 1909–10, the area in cotton increased to 195,000 in 1933–34 and averaged 380,780 hectares and 59,700 tons production of cotton fibre a year for the five-year period 1934/35–1938/39. In 1938–39, 406,700 hectares were sown, producing 70,900 metric tons. Exports in 1938 were 22,361, practically all to Germany, but declined to 19,400 tons in the bumper year 1939. Alfalfa, sugar, yerba mate and grapes are important for domestic consumption. Acreage in alfalfa (5,560,000 hectares in 1937–38) is second only to wheat. Sugar cane production (180,000 hectares in 1938) totalled 521,000 metric tons in 1939, against normal consumption of 425,000 tons Sugar cane is produced principally in Tucumán, Jujuy and Chaco. The southern territory of Rio Negro produced 391 tons of beet sugar in 1938. Yerba mate (Paraguay tea), the national beverage, was formerly imported from Paraguay and Brazil in large quantities, but Argentina has now become the world's greatest producer. From 73 hectares in 1909–10 and 45,503 in 1934–35, the area devoted to yerba mate cultivation increased to 63,000 in 1937–38, although a third the domestic consumption is still imported, most of it from Brazil. In 1938, domestic production was 106.330 metric tons.

The grape and wine industry centres in Mendoza and, with fruit culture, makes the prosperity of that province. It is also carried on considerably in San Juan. (See under Grape and Wine Industry.)

Fruit Culture. — The longitudinal extension of Argentina is so great that it has the climate necessary to produce any variety of fruit. Mendoza is the leading fruit producer. For many years fruit has been exported to Uruguay and Brazil and since 1920 to North America and Europe. Pears, apples, grapes, plums, pomegranates and various melons, particularly the honey-dew, are the principal fresh fruits exported. In 1939, 52,700 tons (net weight) of fruits were exported, an all time high. Of the fruits exported, 53·2% were pears, 22·5% were apples and 17·6% were grapes.

Pastoral. — Cattle raising is the oldest and most characteristic of the Argentine industries. From the beginning the economic structure of the country has been built up around it. Crop farming, which requires a higher degree of economic development, early in this century became more important in value of output but that did not hinder the continued development of the cattle industry. The gaucho, or Argentine cowboy, is still regarded as the typical son of the pampa although his setting has changed in modern times. The large cattle breeders formed the first aristocracy and many of them are still of high economic and social position. Hides and tallow were the first trade articles. Live cattle have always been exported to the neighbouring countries and in the latter part of the 19th century England began to import cattle from Argentina. To cater to the British trade it was necessary to improve the native or "criollo" race. The more progressive breeders began to import pedigreed stock, bulls, cattle, sheep and swine, from abroad, mostly from England. English breeders also went into the business in Argentina. Since that time every effort has been made to improve the Argentine race. The best breeding animals have been bought abroad and the highest prices paid. There are rural associations devoted to this end and the numerous cattle shows attract great interest.

Meat Packing. — Frozen meat was first exported from Argentina in 1877. Previously meat was exported, dried, principally to Brazil and Cuba. An English concern in Argentina built the first freezing plant in 1883. Two other large meat preparing plants were established soon after. The number has increased steadily until the industry now represents a vast investment and fills a very important place in the economic life of the country. The industrial census of 1935 showed that there were 21 freezing plants, employing 26.210 persons, with an annual payroll of 44,006,160 pesos. Other meat-packing activity was carried on by 227 establishments, employing 1,783 persons. In 1938, 7,069,397 cattle, 7,838,557 sheep and 1,244,737 swine were slaughtered. The exports of the meat industry comprise approximately a third of the total exports (37% in 1938), the proportion varying from year to year. Its products include chilled and frozen meat, salted and canned meat, meat extract, hides and a large number of by-products, as bones (for fertilizer), tallow and margarine, The

packing companies are, with one important exception, controlled by foreign, principally British and North American, interests. The cattle industry has had its periods of prosperity, but the rampant economic nationalism of the world in the decade preceding the outbreak of the European war in 1939 so restricted the export trade that the industry's normal state was one of depression. Over half the total livestock products, and between 80 and 90% of the chilled and frozen meat was taken by Great Britain, largely because of the tremendous British exportation to Argentina. The market of the United States is practically closed to Argentine meat except in canned form, by tariff restrictions and the subterfuge of sanitary regulation.

The bulk of the meat is shipped chilled or frozen. Chilled meat must be consumed within 40 days after slaughtering. England takes principally chilled meat and the Continent frozen meat, for which the lower grades of cattle are used. European war demands more than doubled the export volume of frozen beef. Meat exports in recent years have been as follows (in tons):

	1935	1936	1937	1938	1939
Frozenmutton	49,881	50,035	51,660	47,623	54,772
Frozen beef	20,352	38,738	81,655	96,486	109,059
Chilled beef	353,817	363,890	353,103	347,964	350,055
Preservedbeef	56,178	59,145	62,925	60,474	80,744

Cattle raising is carried on principally in the provinces of Buenos Aires, Corrientes, Santa FC, Córdoba and Entre Rios. These same provinces and Santiago del Estero, along with the territories of Chubut, Santa Cruz, Rio Negro and La Pampa are sheep-raising centres. Buenos Aires province has approximately a third of the cattle, sheep and swine of the country. The livestock census of 1937 showed 33,100,512 cattle; 43,790,166 sheep; 3,975,716 swine; 8,527,181 horses; 4,875,990 goats; 905,041 mules and asses; and 43,285,311 poultry. The oniy outstanding changes from the previous census (1930) were in a slight decline of roughly 10% each in horses, goats and mules, and a 20% increase in poultry. Since 1922 the number of swine has almost tripled.

The number of sheep has fallen off since 1907, when the herds numbered 67,000,000, but after a progressive decrease to 36,000,000 in 1922, it rose to nearly 44,000,000, according to the livestock census of 1937. The greatest increase in recent years has been in Patagonia. Exports of wool in 1938 were 151,877 metric tons (116,101 in 1937).

Hides, which were one of the first trade articles of the country, still form an export item of value. Exports of dry and salted ox hides, horse hides and sheep and goat skins in 1937 aggregated 165,656 metric tons, and in 1938, 157,681.

Mining Industry. — Apart from building materials the only mineral production of importance in value is petroleum. Gold, silver, lead, zinc, copper, wolfram, tin, vanadium, asphalt, sulphur, asbestos, mica and talc are mined in a small way in different parts of the republic, mostly in very old workings, but the aggregate value of the output is not great. Salt is worked in various deposits for domestic consumption. Deposits of low grade coal and lignite have been located in various parts of the republic, the best quality being found in the province of Mendoza. Practically all the coal consumed however is imported, mostly from England. Coal imports in 1937 were 3,074,835 tons. Marble and onyx are quarried in different regions and there are deposits of semi-precious stones. It is claimed that iron and manganese have been found in large quantities in the provinces of Córdoba, Santiago del Estero and Tucumán. There is no mineral export of any importance and practically all the metals consumed in the country are imported.

Petroleum Production. — Petroleum was discovered in 1907 in the vicinity of Comodoro Rivadavia in Chubut (Patagonia). This oil region, which extends into the northern part of Santa Cruz, is still the principal producing field of Argentina, although fields in Salta and in Neuquén territory are important. The combined output is not highly significant when compared with the value of other Argentine products. The Government has taken the lead in petroleum development and nearly half the national production is from State-owned wells. Recent Government policy has been to restrict further expansion of private enterprise, although domestic production is sufficient to take care of only a little more than half of the country's needs. Production started in 1907 and increased slowly to a total for the country in 1915 of 81,580 cubic metres. In 1916 private companies began operations. Since then it has increased steadily, reaching 2,958,996 cubic metres in 1939, of which 1,625,204 was from State-owned wells. Of this, around 80% was from the Comodoro Rivadavia field. Production in 1939 increased 9% over that of 1938 (1938: 2,714,823 cubic metres). In 1939 Argentina ranked 11th in world production.

Petroleum Production in *Argentina* (1917-39)
(figures in cubic metres)

	Fiscal (State) production	Private production	Total
1917	181,704	10,667	192,371
1918	197,596	17,281	214,877
1919	188,112	23,188	211,300
1920	227,156	35,339	262,495
1921	278,725	48,180	326,905
1922	348,888	106,610	455,498
1923	407,186	123,023	530,209
1924	553,921	186,776	740,697
1925	624,170	328,029	952,199
1926	743,825	504,293	1,248,118
1927	822,931	549,089	1,372,020
1928	863,604	581,468	1,442,072
1929	872,171	620,896	1,493,067
1930	828,013	603,094	1,431,107
1931	873,592	987,821	1,861,413
1932	902,255	1,186,576	2,088,831
1933	921,788	1,254,771	2,176,559
1934	835,565	1,394,056	2,229,621
1935	943,830	1,328,775	2,272,605
1936	1,141,078	1,316,999	2,458,077
1937	1,237,313	1,438,420	2,675,733
1938	1,430,599	1,284,224	2,714,823
1939	1,625,204	1,333,792	2,958,996

Forests. — The forest area and timber resources are given under Flora. Forest products comprise one of the three main classifications of Argentine exports but this is made up entirely of quebracho extract and logs, with a negligible item of firewood. No other forest products enter the export trade and apart from quehracho the lumber industry supplies only home consumption. It is carried on principally in north Santa FC, Santiago del Estero, Salta and Jujuy provinces and the national territories of Formosa, El Chaco and Misiones. Pine and spruce timber are imported in large quantities, also hardwoods from North America.

Fisheries. — Argentina has abundant resources of fish in the Uruguay, Paraná, Plata and other rivers and along the Atlantic coast but this source of wealth has been neglected as the fishing industry is little organized. Not only is a limited amount of fish taken from the fresh and salt waters hut fish in considerable quantity is imported fresh or frozen from Montevideo and in less quantity from Brazil and Chile, also the United States, England and Spain. In 1935, there were 164 boats with a total tonnage of 18,011 engaged in maritime fishing. The value of all fish and game products exported in 1938 was 6,813,571 pesos.

Manufactures. — Argentina, in common with other more advanced Hispanic American countries, has experienced a marked industrial expansion since 1914. This has been motivated by a desire to free the country from the instability of world markets, inasmuch as nationalistic sentiments in her best customer countries have occasioned many attempts to restrict imports from Argentina, placing the markets for consumption of her most important exports on an unstable basis when viewed over a period of years. By encouraging industrialization and placing less emphasis on exports Argentina is proportionately less dependent upon widely fluctuating prices of raw commodities, and the ensuing strong repercussions which such changes effect in her entire economic and financial structure.

In 1935 an exhaustive industrial census was taken, the first since the national census of 1914. Total figures of the two censuses were as follows:

	Number of establishments	Personnel employed	Motive power (horsepower)	Raw material used (in 000's of paper pesos)	Value of goods manufactured (000's of paper pesos)
1914	48,779	410,201	678,757	1,086,779,606	1,861,789,710
1935	43,767	534,736	2,557,376	1,960,445,754	3,442,408,296
Per cent of increase or decrease, 1935 census as compared to that of 1914					
	−17	+34	+277	+80	+85

Estimates of capital invested and the value of production of several important consumption goods industries for the years 1931–32 and 1934 compare as follows (in paper pesos, 000's omitted):

	1931–32		1934	
	Capital	Value of product	Capital	Value of product
Cement	20,200	17,450	60,800	29,000
Shoes	23,200	43,500	46,000	80,725
Chemicals	22,695	24,785	60,000	85,000
Glass	18,796	11,043	18,000	20,000
Rubber goods, including tires and casings	21,779	15,293	48,778	26,752

Many new industries have been established in recent years, including factories for the production of silk goods, automotive products, electric and radio parts, toilet preparations and agricultural machinery. Foreign and domestic capital has been invested heavily in new plants. One of the largest of these is the pooling of interests of the Du Pont Company and Imperial Chemicals to form a company manufacturing a line ranging from heavy commercial and industrial chemicals to paints, dyes and mosquito killers.

In 1936 consumption of goods reached 4,817,000,000 pesos, of which 3,700,000,000 represented domestic production and 1,117,000,000 pesos (23·2%) imports, compared with the period 1910–13, when the imports accounted for 40% of consumption.

Of the country's 40,367 industrial establishments in 1935, 13,373 with 235,203 employees were located in the Federal District. 10,345 with 127,481 employees in Buenos Aires province. The Federal District and Buenos Aires province together produced over 70% of the goods manufactured. Santa FC and Tucumbn provinces were next in importance.

Textile Industry.— The industrial census of 1935 showed 4,727 establishments manufacturing textiles, employing 88,834 workers and using 360,979,064 pesos value of raw materials, with an annual production of 536,486,953 pesos value in finished materials. The most important subdivision was the weaving of woollen, cotton and other goods in 148 mills employing 25,055 persons, with a consumption of 24,372,412 pesos value of raw materials and 109,594,824 of finished product. The number of looms was 8,803; of spindles, 380,768. The vast majority of textile mills are in the Federal District, with almost all the remainder in Buenos Aires province.

Food Products: Sugar Industry.— The principal agricultural food products elaborated are sugar, wine, dairy products and flour. Of these the most important is the sugar cane industry, which centres in the northern provinces of Tucumbn, Salta and Jujuy. Of the total national production of 4,870,423 metric tons in 1937, 70·4% was produced in Tucumbn, 18·9% in Jujuy and 8·3% in Salta, the balance in Santa FC, Corrientes and Chaco territory. The industry began in Tucumbn in the middle of the 19th century. Tucumbn, which is the most densely populated of the Argentine provinces, has developed entirely around this industry. However, as Tucumbn is sub-tropical, sugar production there is very expensive as compared with tropical countries like Cuba and Java There are also other parts of Argentina better suited to sugar production. The sugar industry has always been protected, there being an import tariff on foreign sugars of about 7 cents gold per kilo. The industry formerly was on a more or less precarious basis because the native cane stock was degenerated and was sensitive to frosts and pests. In the years 1916–17 and 1917–18 the plantations were re-established almost entirely with new stock, known as the Java cane, which has given much better results. Since then the area planted to sugar has steadily increased, as well as the investment in mills. In 1935, out of 39 sugar mills in the country, 27 were located in Tucumán. In that year the value of the processed sugar totalled 98,739,795 pesos. National production is more or less balanced by consumption, although some sugar is imported, and a regular but small export trade to Bolivia exists.

The Tucumbn Experiment Station, founded in 1909 by the provincial Government, has done very important work in testing new varieties of cane and demonstrating the value of the Java stock now in general use. It fulfils various functions of supervision in connection with the sugar industry.

Grape and Wine Industry.— This industry is located in the provinces of Mendoza and San Juan. Mendoza, lying east of the Cordillera of the Andes, is flat and arid in the eastern part and elevated in the west. Irrigation has made it one of the most prosperous regions of Argentina. The grapes produced are of remarkable size and flavour. Out of the national total of 129,812 hectares planted in vineyards (1937–38) 83.750 hectares were in Mendoza, 26.861 in San Juan, 7,785 in Rio Negro. Low prices and decline in general quality of wine grapes in recent years have been met by Government regulation. Between 1934 and 1938 an average of 25% of the possible wine production was eliminated either by extirpation of vines or by purchase of grapes which afterwards were left to rot ungathered. In 1937 alone 15,875 hectares of vineyards, more than 10% of the entire wine grape area, were withdrawn from cultivation to eradicate diseased and low-producing vines. Over 14,000 hectares of this were in Mendoza. Exactly half of the 1,692 wineries of the country, producing annually 18,516,343 pesos value of wines (1935) out of the national production of 29,868,070 pesos value, are in Mendoza. In San Juan, 249 wineries produced 7,050,104 pesos value. In 1938–39 Argentine wine production totalled 925,460 kilolitres, 577,207 in 1936–37 and 790,742 in 1937–38.

Dairy Industry.— A subsidiary of the cattle industry is the dairy industry. Export of dairy products has, however, declined materially since 1930. Domestic consumption of butter accounts for approximately 22,000 tons annually, representing a lower per capita consumption than in most comparable countries. Exports in 1937 totalled 8,780 metric tons and 7,336 in 1938, compared with 25,363 tons in 1932 and an average of over 24,000 metric tons annually from 1919 to 1932. Over half of the butter exports normally go to Great Britain. Casein export in 1939 was 16.702 metric tons (15,474 in 1937; 19,933 in 1936). Cheese export, once an item of consequence (10,100 metric tons in 1920), averages between 1,000 and 1,500 tons annually.

Flour Milling.— Flour milling is carried on in nearly all the provinces, but principally in the Federal District, Santa FC, Córdoba and Buenos Aires provinces. Milling of wheat provided employment for 5,402 persons in 233 establishments in 1935. In 1938, 84.037 metric tons of wheat flour were exported (95,196 in 1937; 79,783 in 1936). Brazil normally takes about one-third, Great Britain, Paraguay and Bolivia take most of the remainder.

Quebracho Extraction Industry.— The most valuable single product of the Argentine forests is quebracho extract for tanning leather. The logging is carried on in the national territories of Formosa and Chaco. Formerly the trunks of the quebracho tree were exported but since 1911 exports in this form have steadily diminished while exports of extract have increased. Three and one-half tons of logs are required to produce one ton of extract so that shipping in the latter form produces a great saving in transportation. This industry is also carried on in Paraguay. The investment in Argentina alone is estimated at £10,000,000. The largest single enterprise in the industry is a British company. The process consists of chipping the quebracho logs to sawdust, which is treated with steam and water under pressure. Quebracho forms the largest single item of export after cereals and meat. In 1937 198,480 metric tons of quebracho extract mere exported, in 1938 167,940 metric tons and in 1939 195,863 metric tons. Exports of quebracho logs were 87,972 metric tons in 1937, 87,212 in 1938 and 87,241 in 1939.

Foreign Trade.— Under the Spanish regime trade mas a monopoly and free trading with foreign countries prohibited. There was therefore little incentive to increase production. The first trade articles were wool, tallow, fat and hides which as late as 1875 still constituted nearly the entire exportation. During the last part of the 19th century exports of these articles averaged about 60,000,000 gold pesos annually; from 1900 to 1920 about 80,000,000 gold pesos and in 1925 168,298,578 gold pesos. In 1875 exportation of cereals amounted to only 100,000 gold pesos, in 1885 to 11,000,000 gold pesos and in 189; io 40.000,000 gold pesos. In 1926 the value of cereal exports had reached the

vast total of 376,000,000 gold pesos. Meat contributed 7,000,000 gold pesos in 1888; in 1898 11,000,000 gold pesos; in 1905, 33,000,000 gold pesos; in 1912, 56,000,000 gold pesos; in 1926. 139,000,000 gold pesos. (The par value of the gold peso is $0.9648 U. S. currency.) By law of 1899 the paper peso was stabilized at 44 cents gold, and official statistics on exports and imports have been expressed in paper pesos, or *moneda nacional* (national money), since 1910. The foregoing figures have been rendered in gold for purposes of comparison.

For a long period previous to 1914 Argentina had a favourable merchandise trade balance (surplus in the value of exports over imports). In 1913 the total value of exports was 1,179,900,025 paper pesos and the value of imports 1,127,788,850 paper pesos. After 1914 prices obtained for Argentine commodities increased and the value of total exports increased each year until 1920 when the total was 2,372,921,295 paper pesos, the highest value for Argentine exports to that time. In 1913 the volume of exports was 11,800,000 metric tons. Volume fell off greatly in the years following, the increased values of exports over 1913 being due to higher prices, but 1920 mas a record year in volume as well as value, the volume in that year reaching 12,900,000 metric tons. The year 1921 was one of world-wide depression in nearly all commodities and in Argentina the tide turned. The volume of exports in 1921 fell to 8,000,000 metric tons and the value to 1,525,294,136 paper pesos. In 1922 the volume increased to 10,-100,000 metric tons, but the value was only 1,536,382,475 paper pesos (little more than in 1921) due to lower prices. By 1928 exports had reached a record high, with a total of 2,396,608,299 paper pesos. A mild decline in 1929 was followed by a sharp drop during the depression years after 1929. Since 1930, only in the phenomenally prosperous year 1937, when exports totalled 2,310,997,802 pesos. have they been as high as the lowest year of the 1923–29 period. Exports in 1933 (1,120,841,522 pesos) were the lowest since 1914.

The figures of foreign trade (in 000's of paper pesos) for the four years ending Dec. 31, 1939, are as follows:

The main classifications of imports in 1939 and their values were as follows: alimentary products, 85,452,000 pesos; tobacco, 14,076,000 pesos; wine, alcohol and intoxicants, 4,304,000 pesos; textiles and their products (silk, wool, cotton, linen. etc.), 219,-902,000 pesos; chemicals, drugs and related products, 97,622,000 pesos; paper and paper products, books, newsprint, etc., 65,351,-000 pesos; lumber and allied products, 57,411,000 pesos; machinery, motors, agricultural machinery, tractors, automobiles, etc., 131,714,000 pesos; non-ferrous metals and their products, 64,354,000 pesos; construction materials, 38,170,000 pesos; coal, petroleum and allied products, 231,299,000 pesos; rubber and rubber products (tires, tubes, shoes, cloth, etc.), 43,208,000 pesos; miscellaneous (live animals, hides, skins, musical instruments, electrical goods, radios, etc), 73,666,000 pesos. These figures are as reported by the customs offices and are based on values for tariff purposes.

The value of the four principal classifications of exports in 1939 was: livestock products, 686,029,000 pesos; agricultural products, 766,696,000 pesos; forest products, 47.959,000 pesos; miscellaneous (food, wine, alcohol, tobacco, textiles and sundry industrial products), 69,542,000 pesos.

Products of the pastoral industry comprised 43.7% of the totall exportation in 1939. The principal items and their value were: animals on the hoof, 14,849,000 pesos; meat, 330,332,000 pesos: hides, 113,930,000 pesos; wool, 162,740,000 pesos; dairy produce, 19,775,000 pesos; by-products, 44,403,000 pesos.

Agricultural products constituted 48.8% of the total exportation. The principal items, with their values, were: cereals and linseed, 691,295,000 pesos; wheat flour and by-products, 25,718,-000 pesos; vegetable oil products, 9,024,000 pesos; fresh fruit and vegetables, 12,301,000 pesos; other agricultural products, 28,358,000 pesos.

Forest products, constituting 3.06% of the total, were as follows: quebracho extract, 41,877,000 pesos; quebracho logs, 3,822,-000 pesos; other forest products, 2,260,000 pesos.

COMMUNICATIONS AND TRANSPORT

Railroads. — The first railroad in Argentina, 6mi. long, was opened to traffic in 1857. This was the nucleus of the line now known as the Western. In 1854 a concession was obtained by William Wheelwright, an American, for a railway from Rosario to Córdoba, which he finally constructed with the aid of British capital. The first section was opened in 1864 and now forms part of the Central Argentine system. The first railroads in Argentina were constructed under interest guarantees or cash subsidies from the Government. The interest guarantees were later discontinued, the Government granting rescission bonds in settlement. Railroad construction progressed rapidly and the mileage increased steadily up to 1914.

Argentine sources in 1937 estimated the total capital investment in railways in Argentina at 4,584,684,000 paper pesos, a majority of which was British owned. The State-owned railways represent an investment of over 850,000,000 paper pesos.

Argentina has approximately 41% of South American railway mileage and ranks seventh in the world. The total railway mileage in 1939 was 42,020km. (26,111mi.) of which 29,397km. were privately owned, and 12,623km. State owned, including the 179km. Argentine Transandine railway, on which service has been interrupted since the landslides of 1934. This railroad was purchased by the Government in 1939 in accordance with its policy of eventual national onnership of all railways. Under this policy the British-owned Central Córdoba railway, 1,960km. in length, was leased in 1937 and subsequently purchased

The railroads nearly all radiate outward from the port of Buenos Aires and the province of Buenos Aires is covered by a network so close that no point within the province is over 25 miles distant from a railroad. The provinces of Santa FC and Córdoba come after Buenos Aires in length of railroad mileage. With the exception of Mendoza and Tucumán there is little railroad development within any of the other provinces but practically all the provinces and national territories north of Chubut have railroad connection with Buenos Aires. There are three different widths of gauge in the Argentine railroads, wide, standard and metre, but no great inconvenience results because of well organized grouping of the different gauges.

The principal railway systems are the State-owned Argentine North Central, 9,927km.; Buenos Aires Great Southern (British), 8,179km.; Central Argentine (British), 5,954km.; Buenos Aires and Pacific (British), 4,508km.; Buenos Aires Western (British). 3,106km.; and the Province of Santa FC (French), 2,137 kilometres.

The administration of the State-owned railroads is organized as a body separate from the national railroad administration. While the foreign owned railroads centre in Buenos Aires and the other principal ports, the State has constructed its railroads in the extreme south and the extreme north with the object of opening up new territory. The two international railroads of Argentina are State owned. These are the Argentine Transandine railway through Mendoza which connects with the Chile Transandine railway on the Chilean frontier, and the North Central Argentine railway which connects with a Bolivian railroad near La Quiaca on the frontier of Bolivia. The Government also owns a railroad in each of the territories of Patagonia running inland from the port of Comodoro Rivadavia in Rio Negro (124 mi.); from Puerto Madryn in Chubut (78mi.); from Puerto Deseado in Santa Cruz (178mi.). The State-owned Argentine North Eastern railway has connection by ferry with the Central Paraguay railway at Posadas, and there is connection by ferry with the railroads of Uruguay.

Foreign Steamship Lines. — The Argentine ports have regular steamship service to the principal ports of Europe, North America

and Brazil, South Africa, Japan, etc., and are visited regularly by French, British, Italian, Dutch, Spanish, German, Swedish, Danish, Austrian, Brazilian, Greek, Japanese and North American steamers. The European passenger service includes some of the largest transatlantic steamers. In 1938 service to and from the United States mas improved by the addition of speedy de luxe ships operated by the United States Maritime Commission. Over 50 foreign lines maintain regular service to Argentine ports. In addition to the service on the interior waterways there are four domestic companies in coast service between Argentine ports including those of Pataqonia and one of these companies serves the port of Rio Grande in Brazil. The Argentine merchant marine itself stands at about 345.000 tons.

Highway System.—For many years concentration on railway building was such that but little thought was given to highway development, and as late as 1925 official figures gave the total highway mileage as 15,525mi., only two-thirds of the railway mileage. With the continued development of the automobile, however, there was created in 1932 the *Dirección Nacional* de *Vialidad*, or National Highway Board, charged with the duty of setting up a network of highways to serve the entire country. The plan adopted by the board included construction of two kinds. Building of "feeder" lines with funds collected from a tax on railroad income, already in force, was continued. These roads are primarily to facilitate traffic to and from the railways. In addition an independent system of highways was established. financed by taxes on the sale of gasoline. This system, when completed, will consist of two types of highway, 30,000mi. of arterial national highway exclusively under direction of the board, and 600,000mi. of provincial roads, jointly financed and supervised by the board and the individual provinces. It was originally designed by the board and the individual provinces. It was originally designed to take fifteen years, but it is estimated that it should be substantially completed in a much shorter time. From 1933 to the end of 1937 the National Highway Board spent approximately 135,000,000 pesos on construction of the national system, contributed 45,500,000 pesos for provincial highways and paid out 9,500,000 pesos for construction of "feeder" highways. In addition 16,000,000 pesos was spent on maintenance of already existing roads. A total of 214,628mi. of highways, mostly dirt, but some of them gravelled or hard-surfaced, were in use in 1937.

International highways are under construction and partially opened, from Buenos Aires to Chile, across the Andes; and by way of Rosario and Córdoba to Bolivia. One of these two roads will be the route of the projected Pan American highway. Other roads are being constructed to the Brazilian, Paraguayan and Uruguayan frontiers, all of which will utilize ferry service to cross the boundary rivers.

The number of automobiles in Argentina in 1939 was 405,743 (435,822 in 1930), slightly above one and a half to each mile of completed highway.

Aviation.— Since 1927, when a French company, Air France, inaugurated regular service between Natal, Brazil and Buenos Aires, there has been a phenomenal development in air transport facilities in Argentina. There are five principal lines operating in the country, extending as far south as Tierra del Fuego. Direct international connections exist with neighbouring countries, and through them with all parts of America. Until the outbreak of war in 1939 regular connections with Germany by way of Brazil and the transatlantic service of the German Condor Syndicate were maintained.

Posts, Telegraphs **and** Telephones.— The postal service is well organized and reliable. From July 1, 1927, the Argentine Government put into force the provisions of the Pan-American Postal Convention signed in Mexico under which internal postal rates are extended to correspondence, printed matter, commercial papers and samples exchanged between the subscribing countries.

In 1937 the number of telephones was estimated at 348,000, two and a half times the number in 1922. Telephone service is privately owned. The telegraph lines, 140,000mi. in length, are Government owned, and are operated in connection with the postal system.

Argentina is estimated to have over 1,000,000 radio sets. Over 40 stations, including one short wave station, are in operation.

(L. W. BE.)

HISTORY

The first European to reach what is today Argentina was probably Juan Diaz de Solís, who discovered the Rio de la Plata in Feb. 1516, and claimed it for Spain. He named it the *Mar Dulce*, or Freshwater sea, but his immediate contemporaries called it the river of Solís. Solís himself was killed by Indians on the Uruguayan shore, but the remnant of his expedition carried word of the discovery home to Spain, and soon others followed in Solís' wake.

The present name of Silver river came later when Sebastian Cabot sent home to Spain a quantity of rude silver ornaments obtained from the Indians (1526). This was seven years before Pizarro's dazzling conquest of Peru, at a time when persistent rumours filled all Spain of a land with vast treasures of gold and silver somewhere in the interior of the continent. Cabot's silver seemed to locate this Eldorado.

Cabot, like Solís, had been chosen for his skill in navigation to carry exploration into the Pacific. He had no errand in the Paraná but was attracted up the river by the greater abundance of food there, his supplies having run out. He built a fort which he called *Sancti Spiritú* above the present city of Rosario. It was the first settlement in what is now Argentine territory. From there Cabot went up the Paraná into what is now Paraguay, but he met opposition; he had no resources nor authorization to explore and settle here, so after nearly four years he went back to Spain discouraged.

Within four years after Cabot's return Pizarro had conquered Peru and its gold and silver began to flow towards Spain. Immediately the kingdom was deluged with offers from individuals eager to fit out expeditions at their own expense to conquer new principalities for themselves and for Spain in the New World. Among them was Pedro de Mendoza, who came out with a force of 1,200 men and 100 horses. In Feb. 1536, he founded the first Buenos Aires. Cortés in Mexico and Pizarro in Peru had found Indians living in settled communities, with considerable agricultural knowledge and able to furnish supplies of food in quantity. Mendoza expected to sustain his men similarly, but on the River Plata estuary conditions were different. The Indians lived in scattered bands, uncivilized nomads picking up a precarious living by hunting small birds and animals. They had small knowledge of agriculture and scant stores of food beyond dried fish and fish meal. Capture of one small band of savages merely increased the hostility of the rest. The Spaniards' food supplies gave out, and famine was followed by sickness. After a futile search for supplies up the Paraná, Mendoza became discouraged. Already seriously ill, he himself sailed for Spain (late April 1537) to seek reinforcements, but died at sea. His lieutenant, Juan de Ayolas, was left officially in charge.

At the time of Mendoza's departure, Ayolas was up the Paraná, in the vicinity of Paraguay. Leaving a force behind him under Domingo Martinez de Irala, he explored far inland, but while returning, he and his own force were killed by Indians. Irala, meanwhile, founded Asunción, first permanent city in the Plata basin (1537). The country here was better and the Indians had gone further in agriculture than any Indians farther south and it proved possible here to establish *encomiendas* of enslaved Indians to win the products of the soil for Spanish masters, much as in Mexico and Peru, except that there were no mines of gold or silver. Irala encouraged marriage with the native women, for the Spaniards had brought few women with them and the Guarani women are attractive. Thus began the first Spanish colony of the La Plata basin, and thus was founded the race of modern Paraguay.

By 1541 Buenos Aires had become untenable because of the hostility of the Indians of the vicinity and mas abandoned. The following year Irala was officially superseded by Cabeza de Vaca, who had acquired fame for his explorations in North America, but the colonists expelled the new governor and reinstated Irala. By 1573 the colony controlled the territory between the Paraguay

and Paraná rivers and had completely broken the resistance of the Indians to Spanish seizure of their lands. The country abounded in grasses and had only the mildest of minters The few horses, cattle, sheep and goats which the Spaniards brought with them needed no care to make them multiply until their numbers were beyond computation. In a few years they had spread across the Paraná into the pampa, completely transforming the economic possibilities of the country and laying the founddtions of the present wealth of the Argentine people. It was a band of these creoles of Paraguay that in 1573 drove out the Indians — on horseback like themselves — and founded the city of Santa FC, under the leadership of a Basque veteran of the conquest of Peru, Juan de Garay. Already a current of colonization from Peru had flowed into the north-west region and in 1 j51 had founded Santiago del Estero, first permanent settlement in what is now Argentina. Spreading south and east this movement was responsible for the founding of Tucumán in 1564 and Córdoba in 1573, the same year that Santa FC was founded. The two currents now met, and within a few years the trail to Charcas (Bolivia) and Peru was established by may of Córdoba and Tucumán Both the interior and the littoral regions became important as sources of supply for the miners of Peru, whose horses, mules, grains, cattle and even textiles came from Tucumán, as the whole interior region was known, or from the banks of the Paraná and the Plata.

But the peak of Argentine interest in Paraguay came in 1580 when Garay succeeded in planting the first lasting colony at Buenos Aires. With flocks, herds and crude instruments of husbandry they had migrated like the patriarchs of old from the Paraguayan settlements of Asunción. There was no thought of conquest now, nor of Indians to be enslaved that their masters might enjoy the results. Garay came prepared to divide the land and till the soil. The new colony was to live by its own labour.

Spain regarded her colonies as the personal territory of the sovereign, to be exploited solely for his benefit. All South America was under the viceroy of Peru. Under him were captains general. Governing councils called *audiencias* exercised judicial and administrative control under the captains general, or in cases like Bolivia (Upper Peru), where there was no captain general, constituted the complete government. The Argentine was under the Audiencia of Charcas in Bolivia. Each city had a cabildo of not more than 12 men appointed for life who exercised local judicial and administrative functions. On these cabildos occasionally creoles could serve; this was their only participation in the government. The settlements at Córdoba, Tucumán and Salta on the side of Bolivia were at watercourses in dry country, where cattle, mules and fodder could be raised for the mining lands of Peru. They were expected to supply themselves with European wares from Peru which in turn was to get them from the ships that came from Spain to Porto Bello on the Atlantic side of the Isthmus of Panama. Spanish interest in the new world was in the precious metals The Treasury's fifth was not safe unless the entire output could be made to flow through one channel. Exportation of precious metals through Buenos Aires was stringently forbidden; for that matter even tallow and hides and hair might not be sold there to English and Dutch ships. Everything the Buenos Aires creole had to sell must go overland to Panama. Everything he needed from Europe must be bought at Panama Even Spanish ships were almost completely barred from the Rio de la Plata.

The creoles of America could not fail to see that Spain conceded them no rights and made it her policy to hinder their increase of wealth and comfort in every way. Such a system could have but one result. Illicit trade grew apace in spite of the severity of penalties. The Dutch and English could furnish goods with profit at a sixth the price of those coming via Panama, and were glad to take in return hides and hair and such silver as had been smuggled down from Bolivia. The royal governors themselves connived at the trade. The people broke the laws at every chance. Still prices were exorbitant and life primitive. In 1618 permission was given to load two small ships at Cádiz with goods for Buenos Aires and attempts were made to keep these goods from getting into the interior and keep gold and silver from coming out in return, but all the interest of the people of the country was in evading the law.

For a long period a Portuguese settlement, Colonia, just across the river from Buenos Aires, afforded much opportunity for smuggling. The boundary between Portuguese and Spanish settlements was long indefinite. With its story is involved the terminating of the encomiendas in Paraguay in 1610, putting the Indians in the care of the Jesuits, the Jesuit missions, their invasion by the Paulistas from Brazil in 1632, the expulsion of the Jesuits in 1767 and the bargains between Spain and Portugal for territory. When the viceroyalty of the Rio de la Plata was formed in 1776, the Portuguese were at last driven out of Colonia, the south-west boundary of what is now Brazil was fixed about as now, and the Indians from the Jesuit missions took refuge in Spanish territory in Entre Rios or Uruguay. The new viceroyalty included the present republics of Uruguay, Paraguay and Bolivia as well as the Argentine. At this period the great bulk of the population was still in the northern provinces while Buenos Aires was a town of 20,000 people, the resort of smuggling merchants. With the creation of the viceroyalty it was given the privilege of free commerce with Spain At once the fact that the city was the only practicable outlet for the products of a large region began to bear fruit. The city grew rapidly in wealth and population. At the end of the century it had 40,000 white people

On the pampa between there had grown up among the teeming cattle and horses a new race, the *gauchos*. Spanish mainly of race, horsemen and cattle hunters by occupation, loyal followers of any man who was bolder and a better horseman than his fellows, almost exclusively meat-eaters, contemptuous of city people and city ways of life, recognizing no boundaries on unfenced pampa, no right but force, they were the natural material of revolutions. Edible grass in every month of the year and horses more numerous than people gave these gauchos extraordinary mobility. Cattle more numerous than the horses gave them self-transporting food. The introduction of Spanish cattle and horses into a prairie land which had been of no value at all nhen the Spaniards came was the most important outcome of the conquest of Peru. Indians of the pampa had soon learned to avail themselves of the herds and flocks and had been transformed from wretched savages into well fed formidable raiders.

The Buenos Aires people were prosperous and had increasing contacts with European culture. Young men of promise went to Europe for education or training in government and war. The writings of Rousseau, Voltaire and Montesquieu were familiar in the city. The revolt of the English Colonies in North America and events of the French Revolution mere followed with sympathy and interest. A traditional resistance to Spanish misrule was giving place to a recognition that Spain had no right to oppress them. This began to find articulate expression. Then the British came. In 1806 a fleet of British ships appe red off Buenos Aires with a landing force of 1,600 men under Sir Home Popham. When the viceroy Sobremonte received news of the fleet's appearance, he took refuge first in the citadel, then next day gathered what money he could from the Treasury, and fled inland to Córdoba. No defence was offered, and the British marched in.

Sullenly resentful of their viceroy's incompetence and cowardice the people of Buenos Aires at once began to organize for resistance. They had the help of Liniers, a capable French soldier long in the Spanish service, and the wealthy Spanish merchant Martin Alzaga, who provided funds for equipment, as well as the bodily assistance of many Spanish-born citizens. On August 12 they drove the invaders out of the city. A larger British force that came the nest year was also defeated and compelled to retire. The citizens distinguished themselves in this fighting to which the houses and streets of the city were well suited, and the creoles especially were elated. They felt it was their exploit, but though the Spanish governing body faiied them, Spanish-born citizens co-operated in every way and Liniers was no creole. When the poor viceroy came creeping down from Córdoba, just after they had won back the city from the British, they insisted on his instant removal from office. After a further display of ineptitude before Montevideo he departed for Europe.

In Europe Spain fared perhaps worse, for Napoleon had seized

Spain for his brother Joseph. A corner of Spain was free from enemy soldiers and a junta at Seville claimed to rule the kingdom in the name of the captive monarchs. Further it assumed authority over the colonies abroad. The main feeling in the New World was an outburst of patriotic fervour. Funds were raised to assist the home people against the invader. It will be understood that the creoles were often lukewarm in this. No one talked of independence from Spain, but the feeling was growing that the creole must have a more adequate part in ruling themselves. On May 20, 1810, a great assembly of people in arms in the public square of Buenos Aires demanded and obtained the resignation of the viceroy, and the convocation of a *cabildo abierto,* or open town meeting. Five days later, on May 25, the day celebrated ever since as Argentina's independence day, the *cabildo abierto* set up a governing junta of nine creoles. Though it professed to govern in the name of the captive Spanish king, this junta actually ruled independently. Formal independence of Spain was not declared until July 9, 1816, when deputies from all parts of the old viceroyalty met in assembly at Tucumán. But since the meeting of May 1810 no representative of Spain has ever governed in Buenos Aires.

Up in the silver country of Bolivia the Spaniards were strong and there fierce conflicts broke out between creoles and Spaniards. War was waged with the utmost savagery, each side shooting its prisoners. Among those thus summarily executed by the creoles were Liniers, hero of the reconquest, and Martin Alzaga, the wealthy Spaniard who supplied the defenders of Buenos Aires with funds. At last under the leadership of Belgrano the patriot armies won. But the greatest difficulty the creoles had to overcome was their incessant and violent quarrels with each other. In the decade following 1810 these disputes among the creoles would have enabled Spain to re-establish herself but for the singular steadfastness of the creole general, San Martin. Resigning a colonelcy in the Spanish armies, he returned to Buenos Aires in 1812. Convinced that no colony could be free until the Spanish were driven out of Bolivia and Peru, he set himself to drilling an army in Mendoza with which to invade Chile. Stubbornly refusing every summons from his friends to take part in civil wars, no matter hour desperate their need, he persisted in his preparations, training and equipping his 4,000 "horse grenadiers" till in 1817 he was able to take them, artillery and all, over the high passes of the Andes, above 12,000ft., and put an end to Spanish power in Chile by the battles of Chacabuco and Maipú. When the Spanish fleet on the Pacific had been dispersed by the daredevil seaman Lord Thomas Cochrane (later earl of Dundonald, *q.v.*) and others, San Martin was able to transport his army to Peru and, with Bolivar, put an end to Spanish rule on the South American continent.

But the dissensions among the creoles went on. Buenos Aires had by this time become preponderant in numbers as well as in wealth and culture and expected to rule the upland provinces in place of Spain, but this was by no means acceptable to the interior provinces. Agriculture and industry in the country were at so low an ebb that taxation mas almost impossible. The only considerable source of income was the custom-house. But the custom-house was at Buenos Aires and the province of Buenos Aires possessed it and used the revenue. It took many decades to force it to give up this income to the nation. Presently it appeared that there were two main parties in national affairs, Unitarists and Federalists. The Unitarists were strongest at Buenos Aires among people of wealth and culture, the Federalists were characteristic rather of the provinces, the gaucho party under local *caudillos* or chiefs. The year 1826 saw a constituent assembly in Unitarist control which elected Rivadavia president and put out a Unitarist constitution really giving Buenos Aires control over all the interior provinces. Rivadavia began many important works like schools, immigration, banking and correction of faults in government and the administration of justice, which seemed theoretical and impractical to many people, and the Government was rejected by the interior provinces, civil war breaking out more violently than ever. In Rivadavia's time, Uruguay, which had been overrun and conquered by the Portuguese from Brazil several years before *(see* URUGUAY), revolted against the now independent Brazil (1825), and Argentina soon entered the conflict, hoping that Uruguay might be brought into the Argentine Republic. Instead, however, largely through British mediation, Uruguay was erected into an independent republic (1828), despite Argentine victories over Brazil. Meanwhile, Rivadavia had fallen, and Federalists came into power under Manuel Dorrego. Returning troops from the campaigns against Brazil, however, soon overturned Dorrego's Government and executed him forthwith. The reaction against this violent act brought the Federalists back into power at Buenos Aires under a kinsman of Dorrego, Juan Manuel de Rosas.

Unification of the country was the great achievement of Rosas, who dominated the Argentine Confederation from 1829 to 1852. At the outset he was little more than senior partner in a quasi-alliance with regional leaders in the provinces, as Estanislao López of Santa FC, Bustos and Quiroga. With their aid long campaigns were waged against the Unitarists, who were suppressed for the time. In 1833 Rosas retired temporarily from formal office-holding, but retained control of the army and of the public eye by leading a successful campaign against the Indians of southern Buenos Aires province. During the late 1830's he made war on the dictator Santa Cruz of Bolivia, suppressed a Unitarist rising which was aided by the French, successfully resisted a French blockade and involved himself in partisan struggles in Uruguay, mhich he attempted to dominate.

Like most dictators Rosas ruled by force and, if force was insufficient, by terrorism. The so-called *Mazorca* (Ear of Corn) secret society, his chief weapon of fear, was like the Ogpu and Gestapo of the 20th century, spying for the dictator and inflicting direful punishment upon any disloyalty. Anti-Rosas writers have claimed that as many as 15,000 persons were put to death by Rosas and his lieutenants. To such action the Unitarists replied in kind when they could. Rosas has been called "the Creole Louis XI" for his elimination of opposition. One by one, by fair means and foul, potential rivals among his allies in the interior were done away with and power concentrated in Buenos Aires. A strongly nationalistic policy was followed mhich brought him, in 1845, into conflict with France and Great Britain, whose fleets blockaded Buenos Aires and regions under Rosas' rule for over two years. This broke his power, for it seriously injured the commerce of Buenos Aires from which he derived the revenues of his Government, and in 1851, his former lieutenant, Justo José de Urquiza, governor of Entre Rios, broke with him, and, allying himself with Brazil, the Unitarists and the anti-Rosas elements of Uruguay, and with British and French blessing, defeated Rosas at the battle of Caseros (Feb. 3, 1852) and forced him to flee the country on a British ship.

Urquiza called together a convention in Santa FC which in 1853 adopted a constitution much like that of the United States. What turned out important for political considerations was that the republic was to have the custom-house revenues, which Buenos Aires was now collecting, and that internal customs were abolished, which destroyed the main revenue of the interior provinces. For further discomfiture of the Buenos Aires people that city was to be made federal and separated from its province. As Buenos Aires declined to come into the confederation on those terms the national capital was temporarily loaned the city of Paraná, capital of the province of Entre Rios, for headquarters. Urquiza had been elected president by the convention, which was fortunate, for the nation had no money as yet and no military force and Urquiza had both, as landowner and caudillo of Entre Rios. Presently Buenos Aires was in rebellion and Urquiza had to go down and defeat General Bartolomé Mitre's army in the battle of Cepeda. Then he marched into Buenos Aires, which agreed to come into the confederation and give up part of the customs duties for the next five years. Urquiza's six years ended in 1860 and Derqui became president after him, the constitution forbidding the president to succeed himself. Urquiza was now merely general of the national army, which did not exist. Derqui had no province, no resources. Urquiza seemed lukewarm in his support and wanted Paraná for his own provincial capital. Disorders broke out in the impoverished interior provinces; Derqui intervened and restored order, in some cases by summary executions.

The president's obvious weakness encouraged Buenos Aires under Mitre to further resistance culminating in the battle of Pavón, Sept. 17, 1861, in which Mitre's troops decisively defeated the national forces. The main fighting for the federals was done by an army Derqui had raised in Córdoba. Urquiza was present at the battle with 4,000 men from Entre Rios, but hardly took part and as soon as things went against Derqui, withdrew his troops to Entre Rios. On November 5 Derqui resigned from the presidency and went to Montevideo. In May 1862 a new convention met and Mitre was elected president of the republic, arranging that Buenos Aires should remain the capital of the province but should entertain the Federal Government and give up the revenues from the custom house. In 1864 President Mitre helped foment trouble in Uruguay by supporting his old companion in arms, Venancio Flores, in a revolution there. Similar Brazilian aid, and active military intervention on Flores' behalf brought, first, protests from Paraguay, where Francisco Solano López was dictator at the time, and ultimately the Paraguayan War (see PARAGUAY), in which Argentina participated actively from 1865 to 1870.

Mitre took office Oct. 12, 1862, as president of the republic. In a way he was the last of the caudillos, but a very different type of man from most of them. His varied accomplishments would have won him recognition in any land. His histories of Belgrano and San Martin are classic works that have gone to many editions, and after completing his active military and political career he founded the newspaper La *Nación* in Buenos Aires which won him honour wherever it was known. He was governor of Buenos Aires when Mendoza was destroyed by an earthquake in March 1861 and won gratitude by the promptness of his province's generosity. As president he made treaties, opened the Paraná to navigation and encouraged immigration that had hitherto been impossible, prevented at first by Spanish prohibition and later by universal civil war. In Urquiza's day immigrants from Switzerland, Germany and Italy began to come into the almost worthless lands of Santa FC and to transform them almost as magically as Spanish horses and cattle had done three centuries before. In Rosas' day hides, hair, wool and tallow were almost the only resources of the land. Except in Buenos Aires no one ate bread and the bread for Buenos Aires was made in part from imported wheat. The country did not raise enough for its own needs.

Sarmiento was elected to succeed Mitre in 1868 without disorder. He called himself the schoolmaster president and was an enthusiastic believer in the need of popular education to maintain real prosperity in the country. He had studied schools in New England, and he founded teacher-training schools in the republic with teachers brought from the United States. He founded too the astronomical observatory at Córdoba. The country was prosperous. Sarmiento's measures could not hope to be generally popular, however. All knew that the cost was high. His nomination of Avcllaneda to succeed him as president caused some rioting, put down by young Col. Julio A. Roca of Salta.

Avellaneda was inaugurated in 1874. He made Roca his minister of war. Then came Roca's final reduction of the Indians on the pampa. They had come back on the fall of Rosas but now they were destroyed or captured and placed in servile capacities in the cities of the land. Buenos Aires felt a grievance when the new lands were divided among several provinces instead of coming intact to her. The city put up a candidate for president but Avellaneda controlled the election and Roca was easily elected in 1880, the sixth of the constitutional presidents. He was the first president to dispose of a really effective army of federal troops. He made the city of Buenos Aires a federal district, founding the new city of La Plata as provincial capital, thus solving the most difficult problem of the republic. His administration was a period of great material expansion. Immigration attained 40,000 a year and was increasing rapidly at the conclusion of his term. Production increased, railway mileage was doubled and in 1884 the country was for many months on a gold basis, a thing almost unheard of in South America. Roca's brother-in-law, Juárez Celmán, took over the succession in 1886 but proved unequal to the task. In 1890, after a period of disastrous extravagance and dishonesty, he was obliged to resign and the vice-president, Carlos Pellegrini, became president. In 1892 Luis Sáenz Peña became president, followed in 1898 by Roca on a second term. (M. JE.; C. PR.; X.)

The Twentieth Century. — With the turn of the century there was a recurrence of border quarrels with Chile, in two region — the Puna de Atacama in the north and Patagonia in the south. The former was settled in **1899** by arbitration of the American minister in Buenos Aires, but without appeasing popular agitation in either country. Three years later, the king of England, who had been asked to arbitrate the dispute in Patagonia, announced his award, which was a virtual division of the contested area. Thus was ended a controversy that had lasted more than a half century (1847–1902). In commemoration of this settlement the two nations later joined in erecting on their common boundary above the tunnel of the Transandine railway the famous statue known as the "Christ of the Andes." In 1904, Roca was succeeded in office by Manuel Quintana who served only two years of his six-year term before dying in office. The presidency then passed to José Figueroa Alcorta, who, in Oct. 1910, was followed by the regularly elected president, Dr. Roque Sáenz Peña. In 1910 the republic celebrated the centenary of her first bid for independence, commemorating with a successful international exhibition the events of May 25, 1810, when the residents of Buenos Aires ejected from office the Spanish-controlled municipal council and deposed the viceroy Cisneros.

After 100 years of recurrent political disturbances, a new era for Argentina had opened. The newly installed president gave the closest attention to reforms designed to foster and strengthen public respect for and confidence in the institutions of the country. The first step in this direction was the reformed electoral law which instituted the secret ballot. This was the outstanding and most valuable of his official actions, and incidentally it is worth noting that the first effect of the reform, at the next presidential election in **1916,** was the defeat of the Conservative party to which the author of the new law belonged, and which had enjoyed political control of the country for over a quarter of a century. Late in 1913 President Saenz Peiia was too ill to fulfil his duties, and the presidential mandate was assumed by the vice-president, Dr. Victorino de la Plaza.

President SBenz Peiia died in 1914, leaving to his successor, Dr. de la Plaza, the difficult task of directing the affairs of the nation through the early years of the World War. In a country with such a cosmopolitan population the sudden disruption of international relations necessarily had an immediate repercussion. All important contracts involving shipping, the exportation of grain and meat and the importation of manufactures, were cancelled and something like a business panic was imminent. It was averted only by the declaration of a moratorium. The strict neutrality of Argentina was proclaimed. It was soon recognized that the republic would play an important part in the provisioning of Europe, and out of a moment of threatened panic, the country emerged in a spirit of confidence that at least it could not be adversely affected by the war. So far as the shortage of manufactured goods was concerned Argentina found a substantial source of supply in the United States. The national wealth increased substantially during the war, the high prices obtained for foodstuffs more than compensating for any loss the country suffered by the adverse effect of the war in retarding the normal development program. The production of most cereals was enormously increased and the pastoral industry became more prosperous than it had ever been before.

Radical Administration. — The presidential election in **1916** withdrew all attention from the war to domestic politics. For the first time the elections were to be "free" under the secret voting system introduced by President Sáenz Peiia. The Radicals, in opposition for 30 years, nominated Dr. Hipdlito Irigoyen against the candidate whom the Conservatives confidently put forward. The result was a sensational victory for the Radicals. Dr. Irigoyen was comparatively unknown to the new generation, but 25 years earlier he had been one of the most vigorous "caudillos," or political "bosses" in the country, and had suffered exile for his association with Leandro N. Alem in the revolution of **1893.** When in the early part of 1917 the United States entered the war and President Wilson appealed to the Latin American countries to follow her lead, strong influences were brought to bear to change the official attitude of Argentina, but President Irigoyen permitted no departure from the country's proclaimed neutrality. The conclusion of the war was as entirely unexpected in Argentina as its outbreak. The country was enjoying great prosperity, suffering only to a limited extent from shortages of coal and certain manufactures. Immediately the armistice was signed there was confusion, especially as regards the condition of the primary industries engaged in supplying war contracts. Economic readjustments set in accompanied by frequent labour disturbances. Industrial troubles endured until after the end of Irigoyen's term of office. The president, however, was sympathetic toward the "proletariat," and much of the energies of his cabinet had been devoted to legislation designed to ameliorate the conditions of the labouring masses. The principal acts passed related to employers' liability; compensation for injured workers and those incapacitated by disease contracted at their work; the early closing of shops and business establishments; restriction of Sunday labour; official control of

sweated industries; and the provision of cheap homes ior workers.

Argentina joined the League of Nations in 1919 but withdrew the following year in protest against the repressive policy of the Allies toward Germany and did not resume membership until 1927.

In Oct. 1922 Dr. Irigoyen was succeeded as president by another Radical, Dr. Marcelo T. de Alvear. Under this administration, after a brief period of depression, the country entered upon four years of unprecedented prosperity. The gold standard was re-established in 1927 and by 1928 the republic was one of the largest gold holding countries in the world. In April 1928 Dr. Irigoyen was again chosen president, seemingly with sufficient strength to proceed with his party's program of social reform and industrial expansion. But his career was sharply terminated in 1930 by a conservative revolution, which ousted him from office and set up a provisional government under Gen. José Francisco Uriburu.

Several disturbances in the provinces occurred during 1931. President Uriburu followed a rigorous policy of repression and intervened in 12 of the 14 provinces. The Radical Party was declared ineligible to participate in the presidential elections. On Nov. 8, 1931, General Agustin Justo was elected president. In general his presidential acts were definitely more moderate than those of his predecessor, although political feeling continued to run high. His administration was featured by development of public works and by the prominent role played by his foreign minister, Carlos Saavedra Lamas, in developing cordial relations with neighbouring countries. In Nov. 1937, Roberto M. Ortiz, a former Radical who had served in the Justo cabinet, was elected president over former President Alvear in an election tainted by charges of many electoral irregularities. He took office Feb. 20, 1938.

Internally, the most important development under President Ortiz was his vigorous advocacy of honest elections and enforcement of the Sáenz Peña Law of 1912. In Jan. 1940 a serious political crisis broke when, defying the Conservative elements which had elected him, he exercised his constitutional prerogative and intervened in Catamarca province, where serious election frauds had occurred. Three Conservative members of his cabinet resigned in protest. When, a few weeks later, he intervened in Buenos Aires province, where corrupt political practices had been notorious for a decade, an open break with the Conservatives resulted. As a result of his vigorous stand, the Radical Party rallied its forces and in the congressional elections which followed obtained a majority in the lower house for the first time since 1930. The new political alignment was seriously threatened, however, in June, when illness forced Pres. Ortiz temporarily to relinquish his office to his Conservative vice-president, Ramón Castillo Two months later, when a scandal affecting members of the cabinet brobe, Pres. Ortiz resigned, but the resignation was rejected by the Congress.

At the outbreak of the European war, in 1939, Argentina proclaimed her neutrality and took a leading part in the Inter-American congress at Panama. Subsequently she led in forcing the expulsion of Russia from the League of Nations. Arrival of the crew of the scuttled German battleship "Admiral Graf Spce" at Buenos Aires (Dec. 1939) put a strain on Argentine maintenance of neutrality. Argentina in general co-operated closely with the United States on Western Hemisphere defence problems, although giving only qualified support at the Havana conference (July 1940).

ARGENTITE, a mineral consisting of silver sulphide (Ag_2S). It is occasionally found as uneven cubes and octahedra, but more often as dendritic or earthy masses, with a blackish lead-grey colour and metallic lustre. The mineral is perfectly sectile and has a shining streak; hardness 2.5, specific gravity 7·3. It occurs in mineral veins, and when found in large masses, as in Mexico and in the Comstock lode in Nevada, it is an important ore of silver. Silver sulphide is, however, cubic in crystallization only at temperatures above 91° C.; the cubic crystals found in nature sre really paramorphs, consisting of an intricate lamellar aggregate of orthorhombic crystals. The orthorhombic modification of silver sulphide stable below 91° C. is the mineral acanthite.

ARGENTON, a town on the north-western flank of the Plateau Central of France, on the Creuse, in the department of Indre. Pop. (1936) 5,240. Picturesque old houses line the river. Linen goods are made and there are numerous tanneries.

ARGETOIANU, CONSTANTIN (1871–), Rumanian statesman, was born at Craiova. He studied law and medicine in Paris and was in the diplomatic service from 1907 to 1913. In 1914 he was elected a Senator and became Minister of Justice in Gen. Averescu's Cabinet in 1918. Together with Averescu snd Cantacuzene he formed the People's League, which became the People's party in 1920. Later on, owing to dissensions, he left the party with a number of followers and joined the Nationalist-Democratic party under the presidency of Prof. Jorga. Later he was prominent in the National Rumanian party, and then leader of the Agrarian Union party. After the assassination of M. Calinescu in Sept. 1939, M. Argetoianu became premier.

ARGHANDAB, an Afghan river rising in the Hazara country north-west of Ghazni and flowing south-westward into the Helmand, 20 mi. below Girishk. Its upper course is said to be shallow and almost dry in summer, but it is very rapid and difficult to ford st other times. Irrigation results in a good population on its lower course, but here the water is said to be slightly brackish. It is 250 mi. long, and its chief confluent, the Tarnak, zoo mi. long, disputes with it the right to the ancient name Arachotus. The ruins at Ulân Robât, the supposed city of Arachosia, are in the Tarnak basin to the east of which lies Lake Ab-Istadah, the supposed Lake Arachotus. The Tarnak valley is used by the high road from Kabul to Kandahar, another reason for thinking it the Arachotus.

ARGHOUL, ARGHOOL or **ARGHUL** (in the Egyptian hieroglyphs, As or AS-IT). an ancient Egyptian and Arab woodwind instrument, still in use. It consists of two reed pipes of unequal lengths bound together so that the two mouthpieces lie side by side, and can be taken by the performer into his mouth at the same time. The mouthpiece consists of a reed having a small tongue detached by means of a longitudinal slit which forms the beating reed, as in the clarinet mouthpiece. An Egyptian

arghoul, presented by the Khedive to the Victoria and Albert Museum, measures 4ft. 8½ inches.

ARGILETUM, a district in ancient Rome, south of the Quirinal hill, occupied chiefly by mechanics and booksellers. Through it ran the street Subura.

ARGINUSAE, the name of certain islands off the coast of Asia Minor, opposite the southern end of Lesbos, and the scene of the last Athenian victory in the Peloponnesian War (Aug. 406 B.C.). The Athenian admiral Conon, having been pinned by superior Spartan forces in Mitylene, the Athenians by ruthless conscription of their last resources of men and wealth, raised a fresh fleet which engaged the Spartans and defeated them after 69 vessels had been sunk. A storm rose immediately and the eight generals in charge of the Athenian fleet retired to shelter without attempting to rescue the Athenian sailors on the 12 triremes that were sinking. For this, those of them who returned to Athens were executed, sharing with Houchard the distinction of being the only generals executed for incompetence after a victory.

ARGO, the large Ptolemaic constellation (*q.v.*) of the southern hemisphere (argo, a ship), which was subdivided by Sir John Herschel (*q.v.*) into Vela (sails), Puppis (poop), and Carina (keel) (*qq.v.*). Some writers however still refer to it as one complete constellation, *e.g.*, the variable star η Carinae is also called η Argus.

ARGOL, the commercial name of crude tartar (*q.v.*). It is a semi-crystalline deposit which forms on wine vats, and is generally grey or red in colour.

ARGON, a gaseous constituent of atmospheric air. For more than 100 years before 1894 it had been supposed that the composition of the atmosphere was thoroughly known. Beyond variable quantities of moisture and traces of carbonic acid, hydrogen, ammonia, etc., the only constituents recognized were nitrogen and oxygen. The analysis of air was conducted by determining the amount of oxygen present and assuming the remainder to be nitrogen. Since the time of Henry Cavendish no one seemed even to have asked the question whether the residue was, in truth, all capable of conversion into nitric acid.

Discovery of Inert Gas in Air.—The manner in which this condition of complacent ignorance came to be disturbed is instructive. Observations undertaken mainly in the interest of Prout's law, and extending over many years, had been conducted to determine afresh the densities of the principal gases—hydrogen, oxygen and nitrogen. In the latter case, the first preparations were according to the convenient method devised by Vernon Harcourt, in which air charged with ammonia is passed over red-hot copper. Under the influence of the heat the atmospheric oxygen unites with the hydrogen of the ammonia, and when the excess of the latter is removed with sulphuric acid, the gas properly desiccated should be pure nitrogen, derived in part from the ammonia, but principally from the air. A few concordant determinations of density having been effected, the question was at first regarded as disposed of, until the thought occurred that it might be desirable to try also the more usual method of preparation in which the oxygen is removed by actual oxidation of copper without the aid of ammonia. Determinations made thus were equally concordant among themselves, but the resulting density was about $\frac{1}{1000}$ part greater than that found by Harcourt's method (Rayleigh, 1892). Subsequently when *oxygen* was substituted for air in the first method, so that all (instead of about 3 part) of the nitrogen was derived from ammonia, the difference rose to ½%. Further experiment only brought out more clearly the diversity of the gases hitherto assumed to be identical. Whatever were the means employed to rid air of accompanying oxygen, a uniform value of the density was arrived at, and this value was ½% greater than that appertaining to nitrogen extracted from compounds such as nitrous oxide, ammonia and ammonium nitrate. No impurity consisting of any known substance could be discovered capable of explaining an excessive weight in the one case or a deficiency in the other. Storage for eight months did not disturb the density of the chemically extracted gas, nor had the silent electric discharge any influence upon either quality. ("On an Anomaly encountered in determining the Density of Nitrogen Gas," *Proc. Roy. Soc.*, 1894.)

At this stage it became clear that the complication depended upon some hitherto unknown body, and probability inclined to the existence of a gas in the atmosphere heavier than nitrogen, and remaining unacted upon during the removal of the oxygen—a conclusion afterwards fully established by Lord Rayleigh and Sir William Ramsay. The question which now pressed was as to the character of the evidence for the universally accepted view that the so-called nitrogen of the atmosphere was all of one kind, that the nitrogen of the air was the same as the nitrogen of nitre. Reference to Cavendish showed that he had already raised this question in the most distinct manner, and indeed, to a certain extent, resolved it. In his memoir of 1785 he writes:—

"As far as the experiments hitherto published extend, we scarcely know more of the phlogisticated part of our atmosphere than that it is not diminished by lime-water, caustic alkalies or nitrous air; that it is unfit to support fire or maintain life in animals; and that its specific gravity is not much less than that of common air; so that, though the nitrous acid, by being united to phlogiston, is converted into air possessed of these properties, and consequently, though it was reasonable to suppose, that part at least of the phlogisticated air of the atmosphere consists of this acid united to phlogiston, yet it may fairly be doubted whether the whole is of this kind, or whether there are not in reality many different substances confounded together by us under the name of phlogisticated air. I therefore made an experiment to determine whether the whole of a given portion of the phlogisticated air of the atmosphere could be reduced to nitrous acid, or whether there was not a part of a different nature to the rest which would refuse to undergo that change. The foregoing experiments indeed, in some measure, decided this point, as much the greatest part of air let up into the tube lost its elasticity; yet, as some remained unabsorbed, it did not appear for certain whether that was of the same nature as the rest or not. For this purpose I diminished a similar mixture of dephlogisticated [oxygen] and common air, in the same manner as before [by sparks over alkali], till it was reduced to a small part of its original bulk. I then, in order to decompound as much as I could of the phlogisticated air [nitrogen] which remained in the tube, added some dephlogisticated air to it and continued the spark until no further diminution took place. Having by these means condensed as much as I could of the phlogisticated air, I let up some solution of liver of sulphur to absorb the dephlogisticated air; after which only a small bubble of air remained unabsorbed, which certainly was not more than $\frac{1}{120}$ of the bulk of the dephlogisticated air let up into the tube; so that, if there be any part of the dephlogisticated air of our atmosphere which differs from the rest, and cannot be reduced to nitrous acid, we may safely conclude that it is not more than $\frac{1}{120}$ part of the whole."

Although, as was natural, Cavendish was satisfied with his result, and does not decide whether the small residue was genuine, it is probable that his residue was really of a different kind from the main bulk of the "phlogisticated air," and contained the gas afterwards named argon. The announcement to the British Association in 1894 by Rayleigh and Ramsay of a new gas in the atmosphere was received with a good deal of scepticism. Some doubted the discovery of a new gas altogether, while others denied that it was present in the atmosphere. Yet there was nothing inconsistent with any previously ascertained fact in the asserted presence of 1% of a non-oxidizable gas about half as heavy again as nitrogen. The nearest approach to a difficulty lay in the behaviour of liquid air, from which it was supposed, as the event proved erroneously, that such a constituent would separate itself in the solid form. The evidence of the existence of a new gas (named Argon on account of its chemical inertness, Gr. ἀ- privative and ἔργον, work), and a statement of many of its properties, were communicated to the Royal Society by the discoverers in January 1895.

Isolation of Argon.—The isolation of the new substance by removal of nitrogen from air was effectedby two distinct methods. Of these the first is merely a development of that of Cavendish. The gases were contained in a test-tube (fig. 1) standing over

a large quantity of weak alkali, and the current was conveyed in wires insulated by U-shaped glass tubes passing through the liquid and round the mouth of the test-tube. The inner platinum ends of the wire may be sealed into the glass insulating tubes, but reliance should not be placed upon these sealings. In order to secure tightness in spite of cracks, mercury was placed in the bends. With a battery of five Grove cells and a Ruhmkorff coil of medium size, a somewhat short spark, or arc, of about 5mm. was found to be more favourable than a longer one. When the mixed gases were in the right proportion, the rate of absorption was about 30c.c. per hour, about 30 times as fast as Cavendish could work with the electrical machine of his day. A convenient adjunct to this apparatus is a small voltameter, with the aid of which oxygen or hydrogen can be introduced at pleasure. The gradual elimination of the nitrogen is tested at a moment's notice with a miniature spectroscope. For this purpose a small Leyden jar is connected as usual to the secondary terminals, and if necessary the force of the discharge is moderated by the insertion of resistance in the primary circuit. When with a fairly wide slit the yellow line is no longer visible, the residual nitrogen may be considered to have fallen below 2 or 3%. During this stage the oxygen should be in considerable excess. When the yellow line of nitrogen has disappeared, and no further contraction seems to be in progress, the oxygen may be removed by cautious introduction of hydrogen.

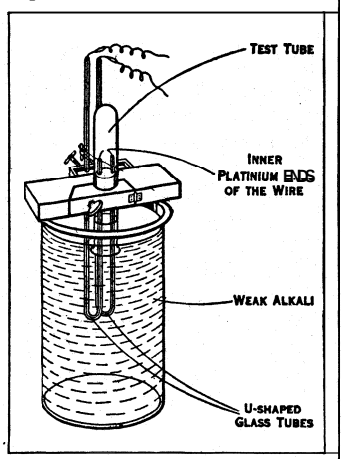

FIG. 1.—FIRST METHOD OF ISOLATING ARGON FROM AIR
Into a mixture of air and oxygen standing in a test tube over a weak caustic soda solution, wires, insulated by U-shaped glass tubes, are passed. The nitrogen is oxidised and absorbed. After removing the excess of oxygen, argon remains as a residue

The development of Cavendish's method upon a large scale involves arrangements different from what would at first be expected. The transformer working from a public supply should give about 6,000 volts on open circuit, although when the electric flame is established the voltage on the platinums is only from 1,600 to 2,000. No sufficient advantage is attained by raising the pressure of the gases above atmosphere, but a capacious vessel is necessary. This may consist of a glass sphere of 50 litres' capacity, into the neck of which, presented downwards, the necessary tubes are fitted. The whole of the interior surface is washed with a fountain of alkali, kept in circulation by means of a small centrifugal pump. In this apparatus, and with about one horse-power utilized at the transformer, the absorption of gas is 21 litres per hour. ("The Oxidation of Nitrogen Gas," Trans. *Chem. Soc.*, 1897.) In one egperiment, specially undertaken for the sake of measurement, the total air employed was 9,250c.c., and the oxygen consumed, manipulated with the aid of partially deaerated water, amounted to 10,820c.c. The oxygen contained in the air would be 1,942c.c.; so that the quantities of atmospheric nitrogen and of total oxygen which enter into combination would be 7,308c.c. and 12,762c.c. respectively. This corresponds to N+1·75O, the oxygen being decidedly in excess of the proportion required to form nitrous acid. The argon ultimately found was 75·0c.c., or a little more than 1% of the atmospheric nitrogen used.

The other method by which nitrogen may be absorbed on a considerable scale is by the aid of magnesium. The metal in the form of thin turnings is charged into hard glass or iron tubes heated to a full red in a combustion furnace. Into this air, previously deprived of oxygen by red-hot copper and thoroughly dried, is led in a continuous stream. At this temperature the nitrogen combines with the magnesium, and thus the argon is concentrated.

Preparation, Modern Methods.—In some respects the method of one of the discoverers of argon for preparing the gas may be regarded as obsolete. Argon is now produced on a commercial scale by processes depending *on* the liquefaction of air. The separation of argon is a more difficult problem than that of oxygen or nitrogen, as the boiling point is intermediate between those of the main constituents of air. Effective methods have been developed by Linde, Claude and others. In Claude's method, a jet of the mixture is partially liquefied by passing through a cooled vertical tube. The most volatile constituent, nitrogen, is got rid of and blows off above, while the liquid falls back and is treated in a rectifying column for the separation of oxygen and argon. Any residual oxygen may be burnt out with hydrogen.

It is not, in general, practicable to get rid of the last traces of nitrogen by these methods. For some purposes, however, *e.g.*, the use in incandescent lamps, this is not necessary, and a few units % of nitrogen may, without serious detriment, be allowed to remain. On the other hand, for experiments on the physical properties of argon, and on its behaviour under the electric discharge, high purity is necessary. On a small scale this is conveniently attained by purification with heated turnings of metallic calcium, which absorb nitrogen far more readily than the magnesium originally used, and have the advantage of absorbing a moderate quantity of other likely impurities as well. For larger-scale purification, heated calcium carbide may be used as an absorbent of the residual nitrogen, but, though cheaper, it is not so convenient in use as calcium.

A demonstration experiment may here be described by which the presence of argon in atmospheric air can be shown very quickly and simply. A vacuum discharge tube (fig. 2) is used consisting of two elongated electrode bulbs united by a capillary tube of, say, 1·5mm. internal diameter. The bulbs each contain a pool of the liquid alloy of sodium and potassium, introduced with a pipette before the glass work is sealed together. This tube is excited by an induction coil, the current being passed during continued exhaustion by a high-vacuum pump until the alloy ceases to give off hydrogen. A small dose of air, say 0·1c.c., is then introduced by means of the small space included between the stop-cocks. The alloy is, of course, avid of oxygen, but it also rapidly removes atmospheric nitrogen under the influence of the discharge, and the well-known band spectrum of the latter disappears, giving place to a line spectrum characteristic of argon. A further dose of air is then introduced, and similarly treated. If the tube is initially in the proper condition, enough argon to show the spectrum strongly can be separated in this way in a minute or two.

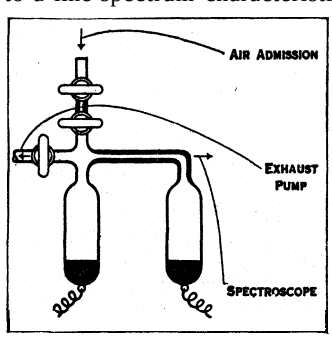

FIG. 2.—APPARATUS FOR RAPID OF THE PRESENCE OF ARGON IN AIR
The electric discharge is passed several times through successive doses of rarefied air, between two pools of sodium-potassium alloy. The oxygen and nitrogen are rapidly absorbed and the lines of the argon spectrum come out strongly

Spectrum.—As a rule, the spectrum of argon does not intrude itself upon the spectroscopist. The reason for this is now seen to lie in the high excitation potential of the usual argon lines,- which exceeds by several volts that of the red nitrogen bands. The result is that unless the argon atoms are present in high relative concentration, they have little chance of being excited, for the available energy of an impinging electron is almost certain to be taken up in exciting a nitrogen molecule before it has reached the value necessary for excitation of the visible argon lines. The case contrasts with that of the yellow sodium lines, which have a much lower excitation potential than, *e.g.*, the gases in a flame, and are therefore excited to the exclusion of the latter.

The spectrum of argon, when isolated, is somewhat complicated, and consists of numerous lines extending over the whole visual spectrum. None of these is of outstanding intensity, and the integrated effect in a vacuum discharge is of a rather pale red colour, easily distinguished by an accustomed eye from the red of nitrogen, hydrogen or neon. For recognizing the presence of argon the

group of green lines: 5,650·7, 5,607·8, 5,572·6, 5,158·7, 5.495.9, is conveniently made use of. Argon shows very conspicuously the abrupt change from an *arc* spectrum to a *spark* spectrum, the light changing from a red to a steely-blue colour when a condensed discharge is used. The blue spectrum is now known to be due to the ionized atom.

Properties. — Argon is soluble in water at 12° C. to about 4·0%, that is, it is about $2\frac{1}{2}$ times more soluble than nitrogen. The density of argon, prepared and purified by magnesium, was found by Sir William Ramsay to be 19·941 on the O = 16 scale. The volume actually weiqhed was 163c.c. Subsequently large-scale operations with the same apparatus as had been used for the principal gases gave an almost identical result (19·940) for argon prepared with oxygen. We should thus expect to find it in increased proportion in the dissolved gases of rain-water. Experiment has confirmed this anticipation. The weight of a mixture of argon and nitrogen prepared from the dissolved gases showed an excess of 24mg. over the weight of true nitrogen, the corresponding excess for the atmospheric mixture being only 11mg. Argon is contained in the gases liberated by many thermal springs, but not in special quantity. The gas collected from the King's Spring at Bath gave only $\frac{1}{2}$%, *i.e.,* half the atmospheric proportion. The refractivity of argon is 0·961 times that of air. The viscosity is 1·21 referred to air, somewhat higher than that of oxygen, which stands at the head of the list for the principal gases. The behaviour of argon at low temperatures was investigated by K. S. Olszewski. The following results are extracted from the table given by him: —

Name	Critical temp.	Critical press.	Boiling point	Freezing point
Nitrogen . .	—146·0° C	35.9 atmos.	—194° C	—214° C
Argon . .	—121·0	50·6	—187	—189·6°
Oxygen . .	—118·0	50·8	—182.7	?

The smallness of the interval between the boiling points and freezing points is noteworthy.

From the manner of preparation, it was clear from the first that argon would not combine with magnesium or calcium at a red heat, nor with oxygen, hydrogen or nitrogen under the influence of the electric discharge. Numerous other attempts to induce combination also failed; nor have observations on positive rays given evidence of even temporary association of argon atoms with one another, or with atoms of another element.

The positive-ray investigations of F. W. Aston indicate that argon consists in the main of one isotope, A^{40}, of exact atomic weight 39·971. A small quantity of A^{36}, amounting perhaps to 1% of the whole, is present in addition.

The most remarkable physical property of argon relates to the constant known as the ratio of specific heats. When a gas is warmed one degree, the heat which must be supplied depends upon whether the operation is conducted at a constant volume or at a constant pressure, being greater in the latter case. The ratio of specific heats of the principal gases is 1·4, which, according to the kinetic theory, is an indication that an important fraction of the energy absorbed is devoted to rotation or vibration. If the whole energy is translatory, the ratio of specific heats must be 1·67. This is precisely the number found from the velocity of sound in argon as determined by Kundt's method, and it leaves no room for any sensible energy of rotatory or vibrational motion. The same value had previously been found for mercury vapour by Kundt and Warburg, and had been regarded as confirmatory of the monatomic character attributed on chemical grounds to the mercury molecule. In the case of argon we have no chemical evidence to go upon to determine the atomicity, but the discoverers regarded it as monatomic on the grounds above stated.

Atomicity of Argon. — It was difficult to give any reason on the classical theory of atom mechanics why a single atom should be devoid of rotational energy, so at that time the evidence for the monatomicity of argon did not rest on a very secure foundation. The view now taken is as follows:—A very small moment of inertia results from the estimated minute dimensions of the atomic nucleus, in which the atomic mass is chiefly concentrated. If the energy of rotation is to be made large enough to be sensible in comparison with the known energy of translation at, *e.g.,* the ordinary temperature, a very rapid rotation of so small a fly-wheel will be needed. But Bohr's frequency condition, which has a weight of varied evidence behind it, only allows a certain limited series of rotational energies at a given frequency; and, with the rapid rotation indicated, even the lowest of the admissible energies is considerably too large to meet the requirements; so that the alternative of no rotational energy remains. This "explanation" is, of course, incomplete in the same measure as all explanations in terms of the quantum theory.

The conclusion then holds that argon is monatomic. This can be confirmed from other lines of evidence. Thus, the wave-length of the K-absorption edge in the X-ray spectrum of argon fixes the atomic number as 18, since it falls between chlorine (17) and potassium (19). The atomic weight must, therefore, be about double 18, and this leaves us no doubt that 40 must be taken, which is equal to the molecular weight, rather than 20, which would be half the molecular weight. Thus the atom and the molecule are identical. If we consider the periodic law (*q.v.*), and take the known X-ray spectra of the allied gases krypton and xenon into account, no room for doubt remains, and it is not necessary to enter on yet further evidence which might be cited.

Importance of Argon. — The discovery of argon was the starting point of many of the recent developments of physics. It led directly to the discovery of the other inert gases, helium (*q.v.*), neon, krypton and xenon (see ATMOSPHERE), and thus filled up a large *lacuna* in our systematic knowledge of the fundamental forms of matter. Through the discovery of helium, it led to further far-reaching discoveries. Argon has commercial importance as constituting the atmosphere in "gas filled" incandescent lamps. Its chemical inertness makes it much preferable to nitrogen for this purpose.

BIBLIOGRAPHY.—The fullest account of the discovery of argon will be found in the *Life of Lord Rayleigh,* by his son, the present Lord Rayleigh (1924). For a full account of the present state of the subject and a complete bibliography, *see* Gmelin's *Handbuch der Anorganischen Chemie* (1926). *(R.;* RA.)

ARGONAUTA, the paper nautilus, common in the Mediterranean. The female secretes a white beautifully fluted shell from two of her arms and carries her eggs therein. (See CEPHALOPODA. NAUTILUS.)

ARGONAUTS, in Greek legend, a band of heroes who went with Jason (q.v.) to fetch the golden fleece in the ship "Argo" (Gr. *Ἀργοναῦται,* sailors of the "Argo"). This task had been imposed on Jason by his uncle Pelias (q.v.), who had usurped the throne of Iolcus in Thessaly, which rightfully belonged to Jason's father Aeson. The story of the fleece follows: Jason's uncle Athamas had two children, Phrixus and Helle, by his wife Nephele, the cloud goddess. But after a time he became enamoured of Ino, the daughter of Cadmus, and neglected Nephele, who disappeared in anger. Ino, who hated the children of Nephele, persuaded Athamas, by means of a false oracle, to offer Phrixus as a sacrifice, as the only means of alleviating a famine which she herself had caused by ordering the grain to be secretly roasted before it was sown. But before the sacrifice, the shade of Nephele appeared to Phrixus, bringing a ram with a golden fleece on which he and his sister Helle endeavoured to escape over the sea. Helle fell off and was drowned in the strait, which after her was called the Hellespont. Phrixus, however, reached the other side in safety, and proceeding by land to Aea in Colchis on the farther shore of the Euxine Sea, sacrificed the ram, and hung up its fleece in the grove of Ares, where it was guarded by a sleepless dragon.

Jason, having undertaken the quest of the fleece, called upon the noblest heroes of Greece to take part in the expedition. According to the original story, the crew consisted of the chief members of Jason's own race, the Minyae. But when the legend became common property, other and better-known heroes were added to their number. The crew was supposed to consist of 50, agreeing in number with the 50 oars of the "Argo," so called from its builder Argos, or from Gr. *ἀργός* (swift). It was the first ship, or the first war-galley, ever built. Athena herself superintended its construction, and inserted in the prow a piece of oak from Dodona, which was endowed with the power of speaking

and delivering oracles. The Argonauts arrived at Lemnos, which was occupied only by women, who had put to death their fathers, husbands and brothers. Here they remained some months. It is known from Herodotus (iv. 145) that the Minyae had formed settlements at Lemnos at a very early date. Proceeding up the Hellespont, they sailed to the country of the Doliones, by whose king, Cyzicus, they were hospitably received. After their departure, being driven back to the same place by storm, they were attacked by the Doliones, who did not recognize them, and in a battle which took place Cyzicus was killed by Jason. After Cyzicus had been duly mourned and buried, the Argonauts proceeded along the coast of Mysia, where occurred the incident of Hercules and Hylas (q.v.). On reaching the country of the Bebryces, they again landed to get water, and were challenged by the king, Amycus, to match him with a boxer. Polydeuces accepted the challenge, and beat him. At the entrance to the Euxine, at Salmydessus, on the coast of Thrace, they met Phineus, the blind and aged king whose food was being constantly polluted by the Harpies. He knew the course to Colchis, and offered to tell it, if the Argonauts would free him from the Harpies. He was freed by the winged sons of Boreas, and Phineus now told them their course, and how to pass through the Symplegades or Cyanean rocks—two cliffs which moved on their bases and crushed whatever sought to pass. His advice was successfully followed, and the "Argo" made the passage unscathed, except for trifling damage to the stern. From that time the rocks became fixed and never closed again. After sundry minor adventures, they reached Colchis; but the king, Aeetes, would not give up the fleece until Jason should yoke his bulls, given him by Hephaestus, and which snorted fire and had hoofs of brpnze, to a plough, and with them plough the field of Ares. That done, the field was to be sown with the dragon's teeth, from which armed men were to spring. Helped by Aeetes's daughter, the sorceress Medea, who had fallen in love with him, Jason accomplished these tasks and carried off the fleece. He then fled with Medea, Aeetes meanwhile pursuing them. To delay him and thus obtain escape, Medea dismembered her young brother Absyrtus, whom she had taken with her, and cast his limbs about in the sea for his father to pick up.

In another account Absyrtus had grown to manhood then, and met his death in an encounter with Jason, in pursuit of whom he had been sent. Of the homeward course various accounts are given. In the oldest (Pindar), the "Argo" sailed along the river Phasis into the eastern Oceanus, round Asia to the south coast of Libya, thence to the mythical lake Tritonis, after being carried 12 days overland through Libya and thence again to Iolcus. Hecataeus of Miletus (Schol. Appollon. Rhod. iv. 259) suggested that from the Oceanus it may have sailed into the Nile, and so to the Mediterranean. Others, like Sophocles, described the return voyage as differing from the outward course only in taking the northern instead of the southern shore of the Euxine. Some (pseudo-Orpheus) supposed that the Argonauts had sailed up the river Tanaïs, passed into another river, and by it reached the North Sea, returning to the Mediterranean by the Pillars of Hercules. Again, others (Appollonius Rhodius) laid down the course as up the Danube (Ister), from it into the Adriatic by a supposed mouth of that river, and on to Corcyra. Then follow wanderings, partly based on those of Odysseus (q.v.), partly on the older Argonautic routes. Finally, they reached Iolcus, and the "Argo" was placed in a grove sacred to Poseidon on the isthmus of Corinth.

The story of the expedition of the Argonauts is very old. Homer was acquainted with it and speaks of the "Argo" as well known to all men; the wanderings of Odysseus may have been partly founded on its voyage. Pindar, in the fourth Pythian ode, gives the oldest detailed account of it. In ancient times, the expedition was regarded as a historical fact, an incident in the opening up of the Euxine to Greek commerce and colonization, and so it probably is, but with a great accretion of fabulous details of many kinds.

See Miss J. R. Bacon, *The Voyage of the* ***Argonauts*** (London, 1925), for further discussion and bibliography.

ARGONNE, a wooded plateau of north-east Prance, forming a natural barrier between Lorraine and Champagne, and including portions of the departments of Ardennes, Meuse, and Marne. The Argonne, S.S.E. to N.N.W., is 44m. long with an average breadth of 10m. and an average height of 1,150ft. It connects the plateaus of the Haute Marne and the Ardennes. The valleys of the Aire and other rivers traverse it longitudinally, a fact to which its importance as a bulwark of north-east France is largely due. On the east the plateau forms a line of rocky bluffs overlooking the plain of the Barre and the Aire gorge, but westwards it slopes gently towards the Aisne. The chief forest, the "Argonne," extends for 25m. See MEUSE-ARGONNE OPERATIONS.

ARGOS, the name of several ancient Greek cities or districts. Most important was the chief town in eastern Peloponnese, whence the peninsula of Argolis derives its name. The Argeia, or Argos proper, is a shelving plain at the head of the Argive gulf, well watered and fertile, with easy communications towards the Corinthian isthmus, and passes westward into Arcadia. Greek legends indicate its high antiquity and its early intercourse with Egypt, Lycia and other countries. Though eclipsed in the Homeric age, when it was the realm of Diomedes, by the later foundation of Mycenae, it regained its predominance after the invasion of the Dorians (*q.v.*), and was probably for some centuries the leading power in Peloponnesus. Under Pheidon Argos ruled all eastern Peloponnesus (8th or 7th century B.C.).

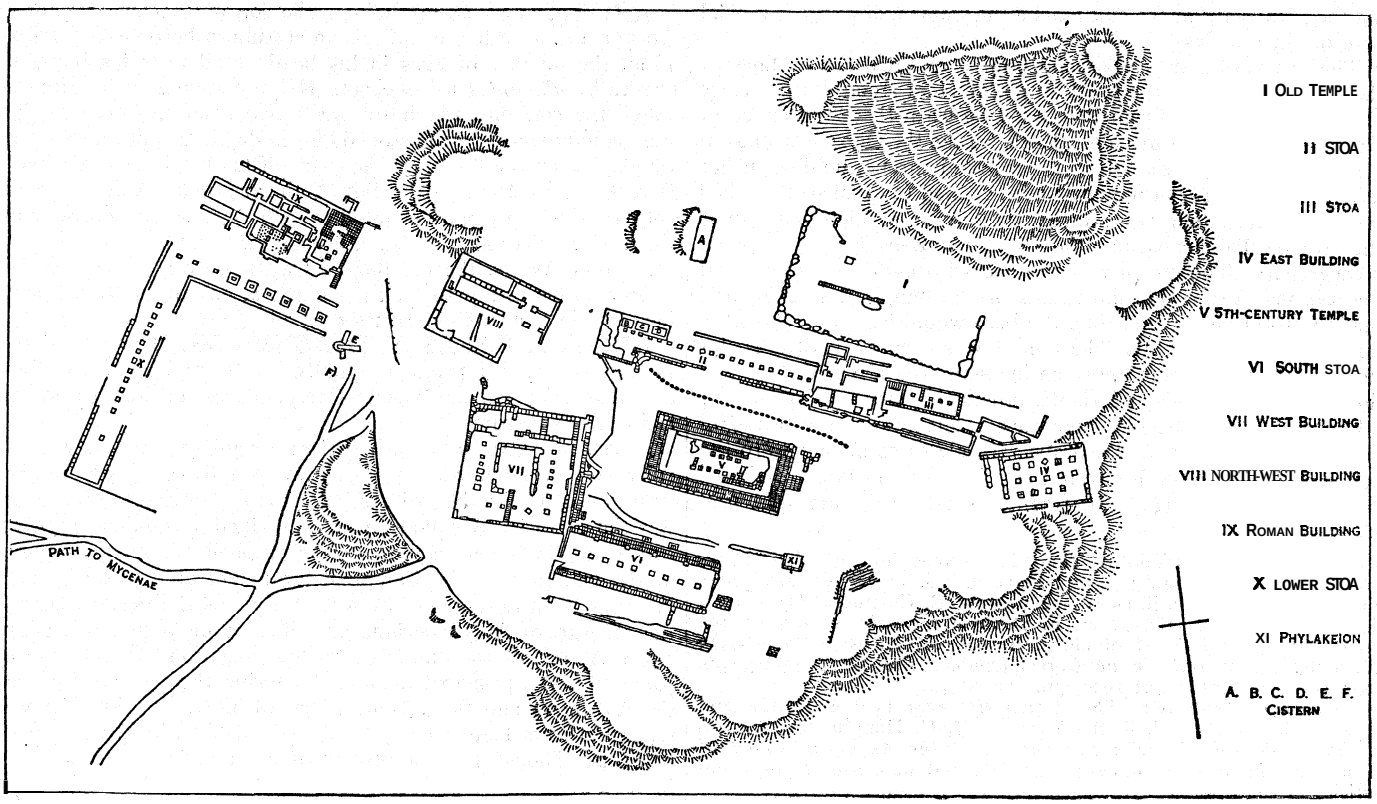
Argos was organized, like Sparta, in three Dorian tribes, with a class of Perioeci (neighbouring dependents), and one of serfs, nevertheless the two cities were enemies from the 8th century. In spite of a victory at Hysiae (apparently in 669 B.C.) the Argives were forced back. By 550 B C. they had lost the whole coast strip of Cynuria and were so weakened in about 495, through defeat by Cleomenes I., that they had to open the franchise to their Perioeci.

Argos (*c.* 470 B.C.) with the Arcadians fought Sparta again, but only destroyed their revolted dependencies of Mycenae and Tiryns in 468 or 464; they became allies of Athens in 461, renewing a link made by Peisistratus, but they had to make a truce with Sparta in 451.

During the early years of the Peloponnesian War Argos remained neutral; after the peace of Nicias (421) the alliance of this State, with its unimpaired resources and flourishing commerce, was courted on all sides. By throwing in her lot with the Peloponnesian democracies and Athens, Argos seriously endangered Sparta's supremacy, but the defeat of Mantineia (418) and a successful rising of the Argive oligarchs spoilt this chance. Though speedily restored the democracy gave Athens no further help except occasional mercenaries (see PELOPONNESIAN WAR).

In the early 4th century, Argos, in population and resources equalling Athens, was prominent in the Corinthian League against Sparta. Argives helped to garrison Corinth (394), and seem to have annexed it for a while. But the peace of Antalcidas (q v.) barred Argive pretensions to control all Argolis. After the battle of Leuctra the oligarchs attempted a revolution but were put down vindictively (370). The democracy consistently supported the victorious Thebans against Sparta, and sent a large contingent to the decisive field of Mantineia (362). When pressed in turn by their old foes, the Argives were among the first to call in Philip of Macedon, who reinstated them in Cynuria after becoming master of Greece. In the Lamian War Argos sided with the patriots against Macedonia; after its capture by Cassander from Polysperchon (317) it fell in 303 into the hands of Demetrius Poliorcetes. In 272 the Argives joined Sparta in resisting Pyrrhus of Epirus, who was killed in an unsuccessful night attack upon the city. They passed instead into the power of Antigonus Gonatas of Macedonia. Aratus (*q.v.*) contrived to win Argos for the Achaean League (229), in which it remained save during a brief occupation by the Spartans Cleomenes III. (*q.v.*) and Nabis (224 and 196).

The Roman conquest helped Argos by removing the trade competition of Corinth. Under the Empire, Argos was the headquarters of the Achaean synod and a resort of merchants. Though plundered by the Goths in AD. 267 and 395 it retained some of its commerce and culture in Byzantine days. The town was cap-



FROM THE "ARGIVE HERAEUM"

PLAN OF THE HERAEUM AT ARGOS. THE SANCTUARY OF THE GODDESS HERA, AND ONE OF THE OLDEST SACRED SITES IN GREEK LANDS

Below the floor level of the older temple (1) deposits of early figurines, vases, bronzes, engraved stones, etc., point to organized worship on this site many generations before Mycenae was built. The later temple (V) illustrates Grecian architecture of the 5th century B.C., and contained some of the works of the sculptor Polycleitus

tured by the Franks in 1210; after 1246 it was held in fief by the rulers of Athens. In 1397 and 1500 the Turks massacred the population at Argos in conflicts with the Venetians. Repeopled with Albanians, Argos was chosen as seat of the Greek national assembly in the wars of independence, was courageously defended by the patriots (1822), and was burnt to the ground by Ibrahim Pasha (1825) The present town of 10,000 inhabitants is purely agricultural. The Argive plain, though not yet sufficiently reclaimed, yields good crops of corn, rice and tobacco. The early Argives were known for their musical talent. Their school of bronze sculpture, whose first famous exponent was Ageladas (Hagelaidas), the reputed master of Pheidias, reached its climax towards the end of the 5th century in Polycleitus (*q.v.*) and his pupils. To this period also belongs the new Heraeum (see below), one of the most splendid temples of Greece.

The Argive **Heraeum.**—This temple was the most important centre of Hera worship in the ancient world; it always remained the chief sanctuary of the Argive district, and was one of the earliest sites in the country. It lies on the foothills east of the Argive plain, about 5m. from Argos, 3m. from Mycenae and Miden, and 6m. from Tiryns, and was maintained jointly by Argos and Mycenae till the destruction of the latter in 468. According to tradition the Heraeum was founded by Phoroneus at least thirteen generations before Agamemnon, *i.e.*, about 1750 B.C. This is in general agreement with the archaeological evidence for the earliest Minoan exploitation of the district. That the site was occupied at least as early as this is shown by rude walls and pottery of successive styles, beneath the later sanctuary; and close at hand there is a fine "bee-hive" tomb like those of Mycenae (*q.v.*). In the period of invaders in the 11th century, in spite of the new culture which was introduced by the Dorians the Heraeum maintained its importance; it was here that the succession of priestesses served as a chronological standard for the Argive people, and even far beyond their borders; and it was here that Pheidon deposited the discarded ingot-currency. ὀβελίσκοι, when he introduced coinage into Greece. When the old temple was burnt down in the year 423 B.C., through the negligence of the priestess Chryseis, the Argives erected a splendid new temple, built by Eupolemos, in which was placed the great gold and ivory statue of Hera, by the sculptor Polycleitus, contemporary and rival of Pheidias, which was one of the most perfect works of sculpture in antiquity. Pausanias describes the temple and its contents (ii. 17), and also saw the ruins of the older burnt temple.

In 1854 A. R. Rhangabé made tentative excavations on this site, and it was completely explored by the American Archaeological Institute and School of Athens in 1892–95, showing that the sanctuary, instead of consisting of but one temple with the ruins of the older one above it, contained at least 11 separate buildings, occupying an area of about 975 by 325 feet.

In the centre of the second terrace stands the substructure of the great second temple together with so much of the architectural members that it has been possible to design a complete restoration. On the north side of this terrace, between the second temple and the Cyclopean supporting wall, a long colonnade running from east to west ends in a well-house and waterworks. At the east end chambers were erected against the hill, in front of which were placed statues and inscriptions, and a large hall containing three rows of columns, with a porch and entrance facing the temple. Below the second terrace a large complicated building, earlier than the second temple, may have served as gymnasium or sanatorium. A ruder building north of this is probably much earlier. At the foot of the elevation on which this temple stands, and thus facing the city of Argos, a splendid stoa or colonnade, to which large flights of steps lead, was erected about the time of the building of the second temple, to give worthy access from the city of Argos. At the west extremity of the whole site lies a huge stoa running round two sides of a square and an extensive house of Roman times. The masses of votive offerings and other small objects illustrate a continuous succession of styles from the Middle Minoan to Roman; and are of exceptional interest for the period of transition from Minoan to Hellenic. Commonest dedications were small clay figures of the goddess, and bronze dress-pins prov-

ing the popularity of the cult among the women, always the special care of this goddess.

The excavations in the second temple revealed the outlines of the base upon which the great statue of Hera stood, but no trace of the statue itself. From Pausanias we learn that "the image of Hera is seated and is of colossal size." Like the Olympian Zeus of Pheidias, Hera was seated on a decorated throne, holding in her left hand a sceptre, surmounted by a cuckoo (as that of Zeus had an eagle), and in her right, instead of a figure of Victory (such as the Athena Parthenos and the Olympian Zeus held), simply a pomegranate. The crown was adorned with figures of graces and the seasons. From the dimensions of the temple it is computed that the total height including the base would be about 26ft., the seated figure about 18ft. The temple was decorated with "sculptures over the columns, representing some the birth of Zeus and the battle of the gods and giants, others the Trojan War and the taking of Ilium." Besides numerous fragments a very beautiful head, probably Hera, and a draped female torso belonging to the pediments, have been discovered. Of the metopes two are almost complete, and among many fragments ten heads are well preserved.

ARGOSTOLI, the capital of Cephalonia, Greece, one of the Ionian islands, and seat of a bishop of the Greek Church. Pop. 9,030. It possesses a good harbour, a quay a mile in length, and a fine bridge. Shipbuilding and silk-spinning are carried on. West of the harbour there is a curious stream, flowing *from* the sea, and employed to drive mills before losing itself in caverns inland. The fine ancient fortifications of Cranii are nearby.

See C. Fellows, *Journal* of *an Excursion in Asia Minor* in 1838, and Wiebel *Die Insel Kephalonia und die Meermühlen von Argostoli* (Hamburg, 1873); *see* also IONIAN ISLANDS.

ARGOSY, the term originally for a carrack or merchant ship from Ragusa and other Adriatic ports, now used poetically of any vessel carrying rich merchandise. In English writings of the 16th century the seaport named is variously spelt Ragusa, Aragouse or Aragosa, and ships coming thence were named Ragusyes, Arguzes and Argosies; the last form surviving and passing into literature. The incorrect derivation from Jason's ship, the "Argo," is of modern origin.

ARGUIN, an island (identified by some writers with Hanno's Cerne), off the west coast of Africa, immediately south-east of Cape Blanco, in 20° 25' N., 16° 37' W. It is some 4m. long by 2½ broad, produces gum-arabic, and is the seat of a lucrative turtle-fishery. Off the island, which was discovered by the Portuguese in the 15th century, are extensive and dangerous reefs. Arguin was occupied in turn by Portuguese, Dutch, English and finally French. Aridity and bad anchorage prevent permanent settlement; the fishing is mostly done from the Canary Isles.

ARGUMENT, a word meaning "proof," "evidence." (Lat. *arguere*, to make clear, from a root meaning bright, appearing in Greek ἀργής, white). From its primary sense are derived such applications of the word as a chain of reasoning, a fact or reason given to support a proposition, a discussion of the evidence or reasons for or against some theory. "Argument" means a synopsis of the contents of a book, the outline of a novel, play, etc. In logic it is used for the middle term in a syllogism, and for many species of fallacies (see FALLACY). In mathematics (*q.v.*) the term has received special meanings; in mathematical tables the "argument" is the quantity upon which the other quantities in the table are made to depend. The term is also used in astronomy (*q.v.*).

ARGUS, in Greek mythology, the son of Inachus, Agenor or Arestor, or, according to others, an earthborn hero (*autochthōn*). From the number of eyes in his head or all over his body, he was called Panoptes (all-seeing). He was appointed by Hera to watch the cow into which Io (*q.v.*) had been transformed, but was slain by Hermes, who stoned him to death, or put him to sleep by playing on the flute and then cut off his head. His eyes were transferred by Hera to the tail of the peacock. Argus with his countless eyes originally denoted the starry heavens. (Aeschylus, Prometheus *Vinctus* 569, Ovid, *Metam.* i. 264.)

Another ARGUS, the old dog of Odysseus, who recognized his master on his return to Ithaca, figures in one of the best-known incidents in Homer's Odyssey (xvii. 291–326).

ARGYLL, EARLS AND DUKES OF. The rise of this family of Scottish peers, originally the Campbells of Lochow and first ennobled as Barons Campbell, is referred to in the article ARGYLLSHIRE.

ARCHIBALD CAMPBELL, 5th earl of Argyll (1530–73), was the elder son of Archibald, 4th earl of Argyll (d. 1558), and a grandson of Colin, the 3rd earl (d. 1530). His great-grandfather was the 2nd earl, Archibald, who was killed at Flodden in 1513, and whose father was Colin, Lord Campbell (d. 1493), founder of the greatness of the Campbell family, created earl of Argyll in 1457. With Lord James Stuart, afterwards the regent Murray, the 5th earl of Argyll became an adherent of John Knox about 1jj6. As one of the "lords of the congregation" he was one of James Stuart's principal lieutenants during the warfare between the reformers and the regent, Mary of Lorraine; later he was separated from Knox's party by his friendship with Mary, Queen of Scots. Though he disapproved of her marriage with Darnley he took her part after Elizabeth's refusal to help Murray in 1565. Argyll was probably an accomplice in the murder of Rizzio; he was certainly a consenting party to that of Darnley; then separating from Murray he commanded Mary's soldiers after her escape from Lochleven. Soon afterwards he made his peace with Murray, but it is possible that he was accessory to the regent's murder in 1570. In 1572 Argyll became lord high chancellor of Scotland, and he died Sept. 12 1573. His first wife was an illegitimate daughter of James V., and he was thus half-brother-in-law to Mary and to Murray.

ARCHIBALD CAMPBELL, 1st marquis and 8th earl of Argyll (1607–61), eldest son of Archibald, 7th earl, by his first wife, Lady Anne Douglas, daughter of William, 1st earl of Morton, was born in 1607 (the date of 1598, previously accepted, is shown by Willcock to be incorrect), and educated at St. Andrews University. When his father renounced Protestantism in 1619 he took over the management of the estates. According to Baillie, "by far the most powerful subject in the kingdom," he had been made a privy councillor in 1628, and in 1638 Charles I. summoned him to London; but he refused to be won over and openly warned Charles against his despotic ecclesiastical policy. In consequence a secret commission was given to the earl of Antrim to invade Argyllshire and stir up the Macdonalds against the Campbells, a wild and foolish project which completely miscarried. Argyll, who inherited the title by the death of his father in 1638, now definitely took the side of the Covenanters in defence of the national religion and liberties. In 1639, in a statement to Laud, he defended the abolition of episcopacy by the Assembly, which continued to sit after its dissolution by Hamilton. After the pacification of Berwick he carried a motion, in opposition to Montrose, by which the estates secured to themselves the election of the lords of the articles, who had formerly been nominated by the king, and on the prorogation of the Parliament by Charles, in May 1640, Argyll moved that it should continue its sittings and that the Government and safety of the Kingdom should be secured by a committee of the estates. In June he carried out a commission against the royalists in Atholl and Angus with some cruelty. It was on this occasion that took place the burning of "the bonnie house of Airlie."

By this time the personal rivalry and difference in opinion between Montrose and Argyll had led to an open breach. The former arranged that on the occasion of Charles's approaching

visit to Scotland, Argyll should be accused of high treason in the Parliament. The plot, however, was disclosed, and Montrose with others was imprisoned. When the king arrived he was forced to make a series of concessions. He transferred the control over judicial and political appointments to the Parliament, created Argyll a marquis (1641) with a pension of £1,000 a year. Argyll was mainly instrumental at this crisis in keeping the national party faithful to what was to him evidently the common cause, and in accomplishing the alliance with the Long Parliament in 1643. In Jan. 1644 he accompanied the Scottish army into England as a member of the committee of both kingdoms and in command of a troop of horse, but was compelled to return in March to suppress royalist movements in the north and to defend his own territories. He compelled Huntly to retreat in April, and in July advanced to meet the Irish troops now landed in Argyllshire and acting in conjunction with Montrose, who was at the head of the royalist forces in Scotland. An indecisive campaign followed in the north. Argyll then threw up his commission, and retired to Inveraray Castle. Thither Montrose unexpectedly followed him in December, compelled him to flee to Roseneath and devastated his territories. On Feb. 2 1645, when following Montrose northwards, Argyll was surprised and defeated by him at Inverlochy, and was present at Montrose's further great victory on Aug. 15 at Kilsyth. He was at last delivered from his formidable antagonist by Montrose's final defeat at Philiphaugh on Sept. 13. In 1646 he was sent to negotiate with the king at Newcastle after his surrender to the Scottish army, when he endeavoured to moderate the demands of the Parliament. On July 7 1646, he was appointed a member of the Assembly of Divines.

Up to this point the statesmanship of Argyll had been highly successful. The national liberties and religion of Scotland had been defended and still further secured by the alliance with the English opposition, and by the triumph of the Parliament and Presbyterianism in England. Charles himself was a prisoner. But Argyll's influence could not survive the rupture of the alliance between the two nations on which his whole policy was constructed. He opposed in vain the secret treaty now concluded between the King and the Scots against the Parliament, and while Hamilton was defeated by Cromwell at Preston, Argyll joined the Whiggamores, a body of Covenanters at Edinburgh; and established a new Government, which welcomed Cromwell on Oct. 4. This alliance, however, was at once destroyed by the execution of Charles I., which excited universal horror in Scotland. In the series of tangled incidents which followed, Argyll lost control of the national policy. He supported the invitation from the Covenanters to Prince Charles to land in Scotland. When Charles came to Scotland, having signed the Covenant and repudiated Montrose, Argyll remained at the head of the administration.

After the defeat of Dunbar, Charles retained his support by the promise of a dukedom and the Garter, and Argyll attempted to marry the King to his daughter. On Jan. 1 1651, he placed the crown on Charles's head at Scone. But his power had now passed to the Hamilton party. He strongly opposed, but was unable to prevent, the expedition into England, and in the subsequent reduction of Scotland, after having held out in Inveraray Castle for nearly a year, was at last surprised in Aug. 1652, and submitted to the Commonwealth. His ruin was then complete. His policy had failed, his power had vanished, and he was hopelessly in debt. In Richard Cromwell's Parliament of 1659 Argyll sat as member for Aberdeenshire. At the Restoration he presented himself at Whitehall, but was at once arrested by order of Charles and placed in the Tower (1660), being sent to Edinburgh to stand his trial for high treason. He was acquitted of complicity in the death of Charles I., and his escape from the whole charge seemed imminent, but the arrival of a packet of letters written by Argyll to Monk showed conclusively his collaboration with Cromwell's government, particularly in the suppression of Glencairn's royalist rising in 1652. He was immediately sentenced to death and was beheaded May 27 1661.

While imprisoned in the Tower he wrote *Instructions* to a *Son* (1661; reprinted in 1689 and 1743). Some of his speeches, including the one delivered on the scaffold, were published and are printed in the *Harleian Miscellany*. He married Lady Margaret Douglas, daughter of William, 2nd earl of Morton, and had two sons and four daughters.

See also the *Life and Times of Archibald, Marquis of Argyll* (1903), by John Willcock, who prints for the first time the six incriminating letters to Monk; *Eng. Hist. Review*, xviii. 369 and 624; *Scottish History Society*, vol. xvii. (1894); *Charles II. and Scotland in 1650*, ed. by S. R. Gardiner, and vol. xviii. (1895); *History of Scotland*, by A. Lang, vol. iii. (1904).

ARCHIBALD CAMPBELL, 9th earl of Argyll (1629–85), eldest son of the 8th earl, studied abroad, and returned to Scotland with Prince Charles in 1650. The marquis of Lorne (by which title he was known until his accession to the earldom) fought at Dunbar (Sept. 3 1650), and after the battle of Worcester joined Glencairn in the Highlands. Lorne fell under the displeasure of both parties. He was imprisoned in 1657 for refusing to renounce allegiance to the Stuarts, and he was imprisoned (1663) after the Restoration for incautious attacks on the Government of Charles II. His staunch Protestantism, his opposition to the repressive measures against the Covenanters and his great territorial influence made him obnoxious to James, duke of York, when he came to Scotland as high commissioner. He was accused of treason, without any real evidence, in 1681, and sentenced to death. He escaped to Holland where he joined the conspiracy to set the duke of Monmouth on the throne. He then led an unsuccessful invasion of Scotland (1685), was taken prisoner at Inchinnan (June 18) and beheaded (June 29) by order of James II. on the old charge of 1681. His head was exposed on the west side of the Tolbooth, where his father's and Montrose's had also been exhibited.

See *Argyll Papers* (1834); *Letters from Archibald, 9th Earl of Argyle, to the Duke of Lauderdale* (1829); *Hist. MSS. Comm.*, vi. Rep. 606; *Life of Mr. Donald Cargile*, by P. Walker, pp. 45 et seq.; *The 3rd Part of the Protestant Plot . . . and a Brief Account of the Case of the Earl of Argyle* (1682); Sir George Mackenzie's *Hist. of Scotland*, p. 70; and J. Willcock, *A Scots Earl in Covenanting Times* (1907).

ARCHIBALD CAMPBELL, 1st duke of Argyll (?1651–1703), was the eldest son of the 9th earl. He tried to obtain the reversal of his father's attainder by seeking the king's favour, but being unsuccessful he went over to The Hague and joined William of Orange. In spite of the attainder, he was admitted in 1689 to the convention of the Scottish estates, and in 1690 an act was passed restoring his title and estates. The refusal of the Macdonalds of Glencoe to join in the submission to him led him to organize the terrible massacre which has made his name notorious. His political services were rewarded in 1701 by his being created duke of Argyll.

JOHN CAMPBELL, and duke of Argyll and duke of Greenwich (1678–1743), son of the preceding, was born Oct. 10 1678. In return for his services in promoting the Union, he was created (1705) a peer of England, with the titles of baron of Chatham and earl of Greenwich. He served at the battle of Oudenarde (1708) and at the sieges of Lille, Ghent, Bruges and Tournay, doing remarkable service at the battle of Malplaquet in 1709. He was very popular with the troops, and his rivalry with Marlborough on this account may have been the cause of their later enmity. In 1711 he was sent to take command in Spain; but being seized with a violent fever at Barcelona, and disappointed of supplies from home, he returned to England. In the House of Lords he censured the measures of the ministry with such freedom that all his places were disposed of to other noblemen; but at the accession of George I. he recovered his influence. In the rebellion of 1715 he was appointed commander-in-chief of the forces in north Britain, and effected the total extinction of the rebellion in Scotland without much bloodshed. He arrived in London early in March 1716, and at first stood high in the favour of the King, but in a few months was stripped of his offices. He supported the bill for the impeachment of Bishop Atterbury, and opposed the bill for punishing the city of Edinburgh for the Porteous riot. In the beginning of the year 1719 he was again admitted into favour, created Duke of Greenwich;

he held various offices in succession, and in 1735 was made a field marshal. He continued in the administration till after the accession of George II., when, in April 1740, a violent speech against the government led again to his dismissal from office. Restored on a change of the ministry, but disapproving the measures of the new administration, he shortly resigned all his posts, and spent the rest of his life in retirement. He died Oct. 4 1743. A monument by Roubillac was erected to his memory in Westminster Abbey.

ARCHIBALD CAMPBELL, 3rd duke of Argyll (1682–1761), brother of the preceding, was born in June 1682. He served for a short time under the Duke of Marlborough. In 1705 he was appointed treasurer of Scotland, and in the following year was one of the commissioners for treating of the Union. Having been raised to the peerage of Scotland as earl of Islay, he was chosen one of the 16 peers for Scotland in the first Parliament of Great Britain. In 1711 he was called to the privy council, and commanded the Royal Army at the battle of Sheriffmuir in 1715. He was appointed keeper of the privy seal in 1721, and was afterwards entrusted with the management of Scottish affairs to an extent which caused him to be called "king of Scotland." In 1733 he was made keeper of the great seal. Argyll was prominently connected (with Duncan Forbes of Culloden) with the movement for consolidating Scottish loyalty by the formation of locally recruited Highland regiments. He collected one of the most valuable private libraries in Great Britain. He died suddenly April 1 j 1761, without legitimate issue.

The succession now passed to the descendants of the younger son of the 9th earl, the Campbells of Mamore; the 4th duke died in 1770, and was succeeded by his son JOHN, the 5th duke (1723–1806). He fought at Dettingen and Culloden. In the House of Commons he represented Glasgow from 1744 to 1761, and Dover, till 1766, when he was created an English peer as Baron Sundridge, the title by which till 1892 the dukes of Argyll sat in the House of Lords. In 1759 he had married the widowed duchess of Hamilton (the beautiful Elizabeth Gunning), by whom he had two sons and two daughters. The eldest of his sons, George (d. 1841), became 6th duke, and on his death was succeeded as 7th duke by his brother John (1777–1847), who from 1799–1822 sat in Parliament as member for Argyllshire. He was thrice married, and by his second wife, Joan Glassell (d. 1828), had two sons, the elder of whom (b. 1821) died in 1837, and two daughters, the second of whom died in infancy.

GEORGE JOHN DOUGLAS CAMPBELL, 8th duke (1823–1900), the second son of the 7th duke, was born April 30 1823, and succeeded his father in April 1847. He had already written some pamphlets against the disruption of the Church of Scotland, and he rapidly became prominent on the Liberal side in Parliamentary politics. He was an eloquent speaker in the House of Lords, and sat as lord privy seal (1852) and postmaster-general (1855) in the cabinets of Lord Aberdeen and Lord Palmerston. In Mr. Gladstone's cabinet of 1868 he was secretary of state for India. His refusal, against the advice of the Indian Government, to promise the Amir of Afghanistan support against Russian aggression, threw the Xmir into the arms of Russia and was followed by the second Afghan War. In 1871 his son, the marquis of Lorne, married Princess Louise, the 4th daughter of Queen Victoria. His inability to assent to the Irish land legislation of 1881 led him to resign the office of lord privy seal which he held under Gladstone's administration of 1880. Detached from party politics the duke wrote many letters to *The Times* on questions which included the rights of landowners; but he opposed the Home Rule Bill with equal vigour. In spite of this political disagreement his personal relations with Gladstone, based on common intellectual interests, remained unchanged. His chief preoccupation was the reconciliation of the dogma of Christianity with the progress of scientific discovery. His books—he published *The Reign of Law* (1866), *Primeval Man* (1869), *The Unity of Nature* (1884), *The Unseen Foundations of Society* (1893), and other essays—found a wide public, and had a considerable influence on Victorian thought. He also wrote on the Eastern question, with especial reference to India, the history and antiquities of Iona, patronage in the Church of Scotland, and many other subjects. The duke (to whose Scottish title was added a dukedom of the United Kingdom in 1892) died April 24 1900. He was thrice married: first (1844) to a daughter of the 2nd duke of Sutherland (d. 1878); secondly (1881) to a daughter of Bishop Claughton of St. Albans (d. 1894); and thirdly (1895) to Ina Erskine M'Neill.

He was succeeded as 9th duke by his eldest son JOHN DOUGLAS SUTHERLAND CAMPBELL (1845–1914), whose marriage in 1871 to H.R.H. Princess Louise, daughter of Queen Victoria, gave him a special prominence in English public life. As marquis of Lorne he was governor-general of Canada from 1878 to 1883; Member of Parliament for South Manchester, in the Unionist interest, 1895 to 1900; and he also became known as a writer both in prose and verse. In 1907 he published his reminiscences, *Pages from tlze Past.* He died May 2 1914.

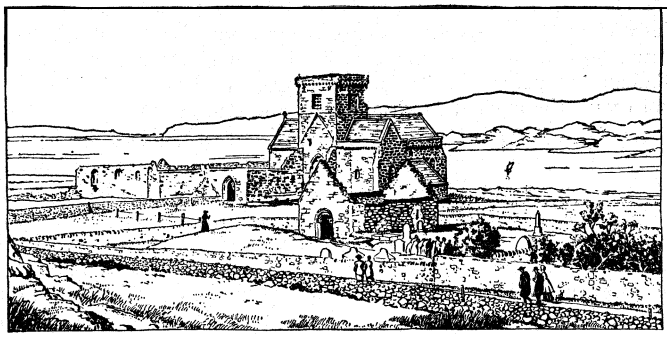
See the *Autobiography and Memoirs* of the 8th duke, edited by his widow (1906), which is full of interesting historical and personal detail.

ARGYLL ROOMS, famous London entertainment resort in the earlier part of the nineteenth century and one of the headquarters of the best public music in London for many years. They were situated near Oxford Circus in Argyll street (whence the name), on a site now occupied by 246 Regent street. Here the Philharmonic Society gave their first concerts, in the course of which Spohr, Moscheles, Liszt and Mendelssohn among others all made their first appearance in England. The premises were destroyed by fire in 1830 and though afterwards rebuilt never recovered their popularity.

ARGYLLSHIRE, a county on the west coast of Scotland, the second largest in the country, embracing a large tract on the mainland and a number of the Inner Hebrides including Coll, Tiree, Mull, Iona, Colonsay, Jura, Islay, Gigha, etc. The mainland portion is bounded on the north by Inverness-shire; on the east by Perth and Dumbarton, Loch Long and the Firth of Clyde; on the south by the North Channel (Irish sea); and on the west by the Atlantic. Area 1,990,472 acres (land) and 35,311 acres (water), total 3,165 square miles. It is for the most part mountainous and deeply indented by sea-lochs and fringed with islands; it has torrential rivers and many inland lochs and much of the finest scenery of western Scotland. In the north a peninsular portion of the mainland is defined by lochs Sheil, Eil and Linnhe. This portion is divided by Loch Sunart between the districts of Ardnamurchan and Morven, with Ardgour to the north-east, and is separated by the Sound of Mull from the island of Mull, in which Ben More reaches a height of 3,185 feet. The mainland rocks belong principally to the metamorphic series of the Scottish Highlands; late and sedimentary rocks, such as contain exposures of Jurassic age, cover only small areas, but among intrusive rocks there should be noticed the Tertiary gabbro which appears in Ardnamurchan Point (the western-most extension of the mainland of Scotland), and in islands farther north beyond the county boundary. Mull consists mainly of interbedded basalts, and the outlying islands, Coll and Tiree, of older gneissic rocks characteristic of the Hebrides. Many small islands lie west of Mull; among them Iona and Staffa (*qq.v.*) of historic and scenic fame. Loch Linnhe gives access far into the land, and to Glen More, the Great Glen, which strikes across the Highlands to Moray Firth on the east coast. The mainland part of Argyllshire east of Loch Linnhe may be demarcated into districts by the greater valleys radiating west, south-west and south from the western Grampians, and separated by ranges and groups of mountains. The valleys in this part of Argyllshire contain Loch Leven (an arm of Loch Linnhe), Loch Etive, Loch Fyne and Loch Long, sea-lochs, and Loch Awe (the largest inland loch in the county). Loch Etive connects with Loch Linnhe through a narrow channel at Connel Ferry, near which the Falls of Connel, more properly rapids, are carried by the rush of the ebbing tide over a rocky bar. Ossian called them the Falls of Lora.

Some district-names in this part of the county are well known in history and literature. Appin borders Loch Linnhe in the north; Benderloch lies between Loch Creran and Loch Etive. Lorne,

southward from Loch Etive, gives the title of marquess to the Campbells. Argyll, the district from which the shire takes name, is between lochs Awe and Fyne; it contains Inveraray castle and gives the titles of earl and duke to the Campbells. Cowall is between Loch Fyne and the Firth of Forth; Knapdale between Loch Fyne and the Sound of Jura. Southward from the last district extends the peninsula of Kintyre, almost isolated by West Loch Tarbert, and at its southern point, the Mull of Kintyre, reaching



THE CHURCH AT IONA, ARGYLLSHIRE, A REMINDER OF THE TIME WHEN THIS ISLAND WAS THE CENTRE OF CELTIC CHRISTIANITY. MANY MONASTIC RUINS ARE STILL EXTANT AND THE CHURCHYARD ON THE RIGHT HAS BEEN CALLED "THE BURIAL-PLACE OF KINGS"

within 13m. of the Irish coast, across the North Channel. The county includes the islands of Jura, Islay, Colonsay and others, westward of Knapdale and Kintyre.

The mountains of the mainland culminate in Ben Cruachan (3,689ft.), close above Loch Etive, where the upper part of that inlet penetrates deeply into an extensive mass of intrusive granite. Some of the very fine glens are famous in history, *e.g.* Glen Croe, Glen Etive, Glendaruel, Glen Lochy ("the wearisome glen" —some 10m. of bare hills and boulders—between Tyndrum and Dalmally), Glen Strae, Hell's Glen (off Loch Goil) and Glencoe, the scene of the massacre in 1692. The two principal rivers are the Orchy and the Awe. The Orchy flows from Loch Tulla through Glen Orchy, and falls into the north-eastern end of Loch Awe; and the Awe drains the loch at its north-west.

The metamorphic rocks already mentioned are associated with bands of epidiorite which have shared in the folding (north-east and south-west) and metamorphism of the region. Lower Old Red Sandstone, chiefly lavas and tuffs, rests unconformably upon the metamorphic series over a wide area in Lorne, in the high mountains on both sides of Glencoe, and elsewhere. Similarly the upper Old Red Sandstone forms isolated patches resting unconformably on all older rocks, on the west coast of Kintyre, etc. But the metamorphic series predominates generally in the county and nearly all its subdivisions (see SCOTLAND, Geology) are represented. A striking geological feature of the county is the number of dolerite and basalt dykes trending in a north-west direction and referred to the Tertiary period. Another group of dolerite dykes running east and west near Dunoon and elsewhere are cut by the former and are probably older.

History.—The early history of Argyll (Airer *gaidheal*) is obscure. At the close of the 5th century Fergus, son of Erc, a descendant of Conor II., *airdrigh* or high king of Ireland, came over with a band of Irish Scots and established himself in Argyll and Kintyre. Nothing more is known till, in the days of Conall I., the descendant of Fergus in the fourth generation, St. Columba appears. Conall died in 574, and Columba was mainly instrumental in establishing his first cousin, Aidan, founder of the Dalriad kingdom and ancestor of the royal house of Scotland, in power. In the 8th century the islands of Scotland and Man fell to the Norsemen who also fought and at times ruled on the mainland of Argyll until, in the 12th century, Somerled (or Somhairlie), a descendant of Colla-Uais, airdrigh of Ireland (327–331), established his authority as thane of Argyll and in Kintyre and the Western Islands. Somerled died in 1164 and his descendants maintained some measure of rule in Argyll and the islands, between the conflicting claims of the kings of Scotland, Norway and Man, until the end of the 15th century.

In 1222 Argyll was reduced by Alexander II., the Scottish king, to a sheriffdom, and was henceforth regarded as an integral part of Scotland. The Campbells of Loch Awe, a branch of the clan McArthur, now began to come to the fore, though the MacDougals owned most of the mainland. The house of Somerled were now feudatories of the king of Norway for the isles and of the king of Scotland for Argyll and they often kept a masterly neutrality. During the expedition of Alexander II. to the Western Isles in 1249, Ewan (Eoghan), lord of Argyll, refused to fight against the Norwegians; in 1263 the same Ewan refused to join Haakon of Norway in attacking Alexander III. Forty years later the clansmen of Argyll, mainly MacDougals, were warring on the side of Edward of England against Robert Bruce, by whom they were defeated on Loch Awe in 1309. The clansmen of the house of Somerled in the isles, on the other hand, the MacDonalds, remained loyal to Scotland in spite of the persuasions of John of Argyll, appointed admiral of Edward II.'s western fleet; and, under their chief Angus Og, they contributed much to the victory of Bannockburn. The alliance of John, earl of Ross and lord of the Isles, with Edward IV. of England in 1461 led to the breaking of the power of the house of Somerled, and in 1478 John was forced to resign Ross to the crown and, two years later, his lordships of Knapdale and Kintyre as well. In Argyll itself Colin, grandson of Sir Duncan Campbell of Lochow, first Lord Campbell, had married Isabel Stewart, eldest of the three co-heiresses of John, third lord of Lorne. He bought the greater part of the lands of the other sisters and got the lordship of Lorne from Walter their uncle, the heir in tail male, in exchange for lands in Perthshire. In 1457 he was created, by James II., earl of Argyll. He died on May 10, 1493. From him dates the greatness of the house of the earls and dukes of Argyll (*q.v.*), whose history belongs to that of Scotland. The house of Somerled survives in two main branches—that of Macdonald of the Isles, Alexander Macdonald (d. 1795) having been raised to the peerage in 1776, and that of the Macdonnells, earls of Antrim in Ireland. The principal clans in Argyll, besides those already mentioned, were the Macleans, the Stewarts of Appin, the Macquarries and the Macdonalds of Glencoe, and the Nacfarlanes of Glencoe. The Campbells are still very numerous in the county.

Argyllshire men have made few contributions to English literature. For long the natives spoke Gaelic only and their bards sang in Gaelic (see CELTIC LITERATURE, Scottish). Near Inistrynich on the north-east shore of Loch Awe stands the cairn in honour of Duncan Ban McIntyre (1724–1812), the most popular of modern Gaelic bards. But the beauty of the country has made it a favourite setting for the themes of many poets and story-tellers, from Ossian and Sir Walter Scott to Robert Louis Stevenson.

The antiquities comprise monoliths, circles of standing stones, crannogs and cairns. In almost all the burying-grounds—as at Campbeltown, Keil, Soroby, Kilchousland, Kilmun—there are examples of sculptured crosses and slabs. Besides the famous ecclesiastical remains at Iona (*q.v.*), there are ruins of a Cistercian priory in Oronsay, and of an abbey founded in the 12th century by Somerled, thane of Argyll, at Saddell. Among castles may be mentioned Dunstaffnage, Ardtornish, Skipness, Kilchurn (beloved of painters), Ardchonnel, Dunolly, Stalker, Dunderaw and Carrick.

Population and Government.—Owing to emigration, chiefly to Canada, the population declined, almost without a break, from 1831, when it was 100,973, to 70,902 in 1911. In 1921 it was 76,862, perhaps because taken in the tourist season. In 1931 it was 63,014. In that year the number of Gaelic-speaking persons was 20,913 (a decrease of nearly 4.000 since 1921), of whom 335 spoke Gaelic only. The chief towns are Campbeltown, Dunoon, Oban, with Ardrishaig, Ballachulish, Lochgilphead and Tarbert as smaller centres. It is in such places as these, and especially in those developed as holiday resorts and residential outposts from Glasgow, that the recent increase of population is found. The county returns a member to parliament. Argyllshire is a sheriffdom, and there are resident sheriffs-substitute at Campbeltown, Fort William and Oban; courts are held also at Dunoon and Bowmore in Islay. Both Presbyterian bodies are strongly represented;

there are Roman Catholic and Anglican Episcopal bishops of Argyll and the Isles, and there is a Roman Catholic pro-cathedral at Oban.

Agriculture.—Argyllshire was formerly partly covered with natural forests, and oak, ash, pine and birch are still visible in the mosses; but, owing to the clearance for sheep, and to past neglect of planting, the country is lacking in wood, except near Inveraray and a few other places. Nearly three-quarters of the county consists of mountain and moor, but many districts afford fine pasturage for sheep; and some of the valleys such as Glendaruel are fertile. The chief crops are oats and hay and there is a little barley. The crofting system exists, but is by no means universal: it is predominant in Tiree and the western district of the mainland, but elsewhere farms of moderate size are the rule. The cattle, though small, are good and are marketed in large numbers in the south. Dairy farming is carried on to some extent, especially in Kintyre, where there is a large proportion of arable land. In the higher tracts sheep have taken the place of cattle. The black-faced sheep is the species most generally reared by farmers in this county.

Industries.—Whisky is manufactured at Campbeltown, in Islay and at Oban. Gunpowder is made at Kames (Kyles of Bute) and Melfort. Coarse woollens are made for home use; but fishing is the most important industry and Loch Fyne is famous for its herrings, while fishing is carried on at one or other of the ports all the year round.

Communications.—Owing to paucity of industries and to the greatly indented coast-line (no place more than 12m. from the sea) the railway mileage in the country is very small. The Tyndrum to Oban section of the L.M.S. railway company's system is within the county limits; a small portion of the L.N.E. company's line to Mallaig skirts the extreme west of the shire, and the L.M.S. line from Oban to Ballachulish serves the north coast of the mainland. A cantilever bridge crosses the Falls of Lora with a span of 500ft., at a height of 125ft. above the waterway. The chief means of communication is by steamers, between Glasgow and various parts of the coast. The Crinan Canal (*q.v.*) (1793–1801) gives a short circuit for Kintyre. Before the railways the shire contained many famous coaching routes, now used by motor traffic, and in some directions in process of extension. In few other areas is the position of the main roads so closely controlled by physical conditions as it is in Argyllshire. Here they follow the lochs and the coast but an important one goes through the highlands from the head of Glen Falloch in Perthshire past the heads of Glen Lochy and Glen Orchy, along the west of Rannoch Moor past the top of Glen Etive to Glencoe, through which it descends to Loch Leven.

ARGYRASPIDES, "silver shields" a corps of Macedonian shield-bearers (hypaspists) which, after the death of Alexander, and still more after the death of Antipater (319) played an important part, under their general Antigenes, in the division of the empire. They consisted of 3,000 veterans. They were the sole body of Macedonian troops which had kept together as a unit, and they were in charge of the huge royal treasure at Cyinda. Popular opinion regarded them as invincible; their adhesion to Eumenes for two years was the basis of his power. In 317, in his war with Antigonus, they were for long his chief support, but after a defeat at Gabiene, they mutinied and handed Eumenes over to Antigonus, who executed him and burnt Antigenes alive. Antigonus then broke up the corps and distributed it among the forces of various frontier satraps.

ARGYRODITE, a mineral which is of interest as being that in which the element germanium was discovered. It is a silver sulpho-germanate, Ag_8GeS_6, and crystallizes in the cubic system. The botryoidal crusts of small indistinct crystals first found in a silver mine at Freiberg in Saxony were originally thought to be monoclinic, but were afterwards proved to be identical with the more distinctly developed crystals found in Bolivia. The colour is iron-black with a purplish tinge, and the lustre metallic. Hardness 2½, specific gravity 6·2. Isomorphous with argyrodite is the corresponding tin compound Ag_8SnS_6, also found in Bolivia as cubic crystals, and known by the name canfieldite.

ARGYROKASTRO (Albanian *Gjinokastër*), a town of southern Albania. Pop. (1930) 10,836, of whom nearly 75% were Muslims and the remainder Greek-speaking Orthodox Christians. It was practically depopulated by the plague in 1814. It is situated 1,060 ft. above sea-level on the Aoroceraunian mountains and possesses the ruins of a big fort, formerly headquarters of Muslim aristocracy. It was captured by the Turks in 1420 and held by them till the independence of Albania in 1913. At the close of the Balkan Wars (1912–13) the town was unsuccessfully claimed by Greece. Occupied by Italy in 1939, it was captured Dec. 8, 1940 by the Greeks, who held it until Germany's Balkan campaign the following April. It has been identified both with the ancient Hadrianopolis and Antigonea.

ARGYROPULUS or **ARGYROPULO, JOHN** (1416?–1486), Greek humanist, a very active promoter of the revival of learning in the West, was born in Constantinople, and became a teacher there, Constantine Lascaris being his pupil. He was teaching in Padua in 1434, being subsequently made rector of the university. About 1441 he returned to Constantinople, but after its capture by the Turks, again took refuge in Italy. About 1456 he was invited to Florence by Cosimo de' Medici, and was there appointed professor of Greek in the university. In 1471, on the outbreak of the plague, he removed to Rome, where he continued to act as a teacher of Greek till his death. Among his scholars were Angelus Politianus and Johann Reuchlin. His principal works were translations of the following portions of Aristotle,—*Categoriae, De Interpretatione, Analytica Posteriora, Plzysica, De Caelo, De Anima, Metaphysica, Ethica Nicomachea, Politica;* and an *Expositio Ethicorum Aristotelis.* Several of his writings exist still in manuscript.

See Humphrey Hody, *De Graecis Zllustribus,* 1742, and Smith's *Dictionary of Greek and Roman Biography, s.v.* Joannes.

ARIA, a musical term, equivalent to the English "air," signifying a melody apart from the harmony, but especially a musical composition for a single voice or instrument, with an accompaniment of other voices or instruments.

The classical aria developed from the expansion of a single vocal melody, generally on the lines of what is known as binary form *(see* SONATA and SONATA FORMS). Accordingly, while the germs of aria form may be traceable in advanced examples of folk-song, the aria as a definite art-form could not exist before the middle of the 17th century; because the polyphony of the 16th century left no room for the development of melody for melody's sake. When at the beginning of the 17th century the Monodists *(see* HARMONY and MONTEVERDI) dimly conceived the enormous possibilities latent in their new art of accompanying single voices by instruments, it was natural that for many years the mere suggestiveness and variety of their experiments should suffice, without coherent forms, to retain the attention of contemporary listeners. But, even at the outset, the most novel harmonies used with the most poignant rhetoric, were not enough in themselves to satisfy the pioneers. Accordingly, Monteverdi's famous lament of the deserted Ariadne is one of many early examples that appeal to a rudimentary sense of form by making the last phrase identical with the first.

As instrumental music grew, and the classical sense of key became strong and consistent (in the hands of Alessandro Scarlatti, *q.v.*) composers were driven to appeal to that sense of harmonically-solid melody which had asserted itself in folk-music before the history of harmonic music may be said to have begun.

By Scarlatti's time it was thoroughly established that an extended melody should normally modulate to the dominant after establishing its own key, and that the subsequent modulations should work through other related keys back to the tonic. Introduce the voice by an instrumental *ritornello,* containing the gist of the melody and recurring, in part or in whole, at every full close; and you have a form which can expand a melody so as to give ample scope both to the singer and to the accompanying players. The aria became the prototype of the CONCERTO (*q.v.*).

The addition of a middle section with a *da capo* results in the universal 18th century da *capo* form of aria. The possibilities of variety are greater than the description might suggest. The

voice may enter with a different theme from that of the ritornello; the ritornello may be stated in separate portions; the ritornello may have its own contrast between solo and tutti instruments; the vocal material may combine with it contrapunlally, etc., etc. All the arias and duets in Bach's B minor Mass and Christmas oratorio differ in these matters, and the differences well repay analysis, being often subtly suggested by the sense of the words. The middle section generally contributes no new element, except that it avoids the tonic. Gluck, who swept away the whole method as inherently anti-dramatic, points out, in the preface to Alceste, that the middle section is generally perfunctory, and that the sole object of the da capo is to enable the singer to display new ornaments. Nevertheless, the classical (or Neapolitan) aria is a composition of considerable length, in a form which cannot fail to be effective and coherent; and there is little cause for wonder in the extent to which it dominated 18-century music.

The aria forms are profoundly influenced by the difference between the sonata style and the style of Bach and Handel. But the scale of the form is inevitably small, and in any opera an aria is hardly possible except in a situation which is a tableau rather than an action. Consequently there is no such difference between the form of the classical operatic aria of Mozart and that of the Handelian type as there is between sonata and suite music. The scale, however, has become too large for the da capo, which was in any case too rigid to survive in music designed to intensify a dramatic situation instead of to distract attention from it. The necessary change of style was so successfully achieved that, until Wagner succeeded in devising music that moved absolutely *pari passu* with his drama, the aria remained as the central formal principle in dramatic music; and few things in artistic evolution are more interesting than the extent to which Mozart's predecessor, the great dramatic reformer Gluck, profited by the essential resources of his pet aversion the aria style, when he had not only purged it of what had become the stereotyped ideas of ritornellos and vocal flourishes, but animated it by the new sense of dramatic climax to which the sonata style appealed.

In modern opera the aria is almost always out of place, and the forms in which definite melodies nowadays appear are rather those of the song in its limited sense as that of a poem in formal stanzas all set to the same music. In other words, a song in a modern opera tends to be something that would be sung even if the drama had to be performed as a play without music; whereas a classical aria would in non-musical drama be a soliloquy.

In the later works of Wagner those passages in which we can successfully detach complete melodies from their context have, one and all, dramatically the aspect of songs and not of soliloquies. Siegmund sings the song of Spring to his sister-bride; Mime teaches Siegfried lessons of gratitude in nursery rhymes; and the whole story of the *Meistersinger* is a series of opportunities for song-singing. The distinctions and gradations between aria and song are of great aesthetic importance, but their history would carry us too far. The main distinction is obviously of the same importance as that between dramatic and lyric poetry.

The term aria form is applied, generally most inaccurately, to all kinds of slow cantabile instrumental music of which the general design can be traced to the operatic aria. Mozart, for example, is very fond of slow movements in large binary form without development, and this is constantly called aria-form, though the term ought certainly to be restricted to such examples as have some traits of the aria style, such as the first slow movement in the great serenade in B flat. At all events, until writers on music have agreed to give the term some more accurate use, it is as well to avoid it and its cognate version, Lied-form, altogether in speaking of instrumental music.

The air or aria in Bach's suites is a short binary movement in a flowing rhythm in not very slow common or duple time.

(D. F. T.)

ARIADNE, in Greek mythology, the daughter of Minos, king of Crete, and Pasiphae, the daughter of Helios the Sun-god. When Theseus landed on the island to slay the Minotaur (q.v.), Ariadne fell in love with him and gave him a clue of thread to guide him through the mazes of the Labyrinth. After he had slain the monster Theseus carried her off, but, according to Homer (Odyssey, xi. 322), she was slain by Artemis at the request of Dionysus in the island of Dia, near Knossos, before she could reach Athens with Theseus. In the later legend, while asleep on the island of Naxos, she was abandoned by Theseus. She was discovered by Dionysus on his return from India, who, enchanted with her beauty, married her when she awoke. She received a crown as a bridal gift, which was placed amongst the stars, while she herself was honoured as a goddess. (Ovid, *Metam.* viii. 152, Fasti, iii. 459). The name probably means "very holy" (ἁρι, ἁγνή).

Ariadne, originally a goddess of vegetation, is the personification of spring. Hence her festivals at Naxos present a double character; the one, full of mourning and sadness, represents her death or abandonment by Theseus, the other full of joy and revelry, celebrates her awakening from sleep and marriage with Dionysus. Thus nature sleeps and dies during winter, to awake in spring time to a life of renewed luxuriance. With this may be compared the festivals of Adonis and Osiris and the myth of Persephone.

The story of Dionysus and Ariadne was a favourite subject for reliefs and wall-paintings. Most commonly Ariadne is represented asleep on the shore of Naxos, while Dionysus, attended by satyrs and bacchanals, gazes admiringly upon her; sometimes they are seated side by side under a spreading vine. The scene where she is holding the clue to Theseus occurs on a very early vase in the British Museum.

ARIANISM: see ARIUS.

ARIANO, town and episcopal see, in the province of Avellino, Campania, Italy, 1,509 ft. above sea-level, on the railway between Benevento and Foggia, 24 mi. E. of the former by rail. The population in 1936 was 9,473 (town), 24,357 (commune). It lies in the centre of a fertile district, but has often been devastated by earthquakes; a considerable part of the population still dwells in caves. It occupies the supposed site of Aequum Tuticum, an ancient Samnite town, a Roman post-station on the Via Traiana; but this was probably at S. Eleuterio, 5½m. north.

ARIAS MONTANO, BENITO (1527–98), Spanish orientalist and editor of the *Antwerp* Polyglot, was born at Frejenal de la Sierra, in Estremadura. In 1562 he was appointed consulting theologian to the Council of Trent. He retired to Peña de Aracena in 1564, wrote his commentary on the minor prophets (1571), and was sent in 1568 to Antwerp by Philip II. to edit the polyglot Bible projected by Christopher Plantin. The work appeared in eight volumes folio, between 1568 and 1573. The last years of his life were spent in seclusion in Seville.

He is the subject of an *Elogio histórico* by Tomás Gonzalez Carvajal in the *Memorias de la Real Academia de la Historia,* vol. vii. **(1832).**

ARICA (SAN MARCOS DE ARICA), a town and port on the Chile-Peru border in the arid Chilean province of Tarapaca. Pop. (est.) 13,000. It is the port for Tacna. Peru, 39 mi. distant, with which it is connected by rail and highway, and the terminus of the Arica-La Paz (Bolivia) railway. The great earthquake of 1868, followed by a tidal wave, nearly destroyed the town and shipping. Arica was captured, looted and burned by the Chileans in 1880, and in accordance with the terms of the treaty of Ancon (1883) should have been returned to Peru in 1894, but this was not done. Late in 1906 the town again suffered severely from an earthquake. See TACNA-ARICA QUESTION.

ARICIA (mod. *Ariccia*), an ancient city in Latium, on the Via Appia, 16m. S E. of Rome. The nucleus of the old town, now the modern, lay high (1,350ft. above sea-level) above the circular Valle Aricciana, probably an extinct volcanic crater; remains of its walls are traceable. The lower town was situated on the north edge of the valley, close to the Via Appia, which descended into the valley from the modern Albano and reascended partly upon very fine substructions of opus quadratum, some 250yds. in length, to the modern Genzano. There are remains of the walls of the lower town, of the *cella* of a temple of the 2nd century B C. and also of later buildings connected with the post-station and baths. Aricia, one of the oldest cities of Latium, appears as a serious opponent of Rome at the transi-

tion from kings to republic. In 338 B.C. it was conquered by C. Maenius, but was soon given full civic rights. Its vegetables and wine were famous, and the district is still fertile.

See G. Florescu in Ephemeris Dacico-Romana, iii. (Rome, 1925).

ARICINI, the ancient inhabitants of Aricia (q.v), the form of the name ranking them with the Sidicini, Marrucini (q.v.), etc., as one of the communities belonging probably to the earlier or Volscian stratum of population on the west side of Italy, who were absorbed by the Sabine or Latin immigrants. Special interest attaches to this trace of their earlier origin because of the famous cult of Diana Nemorensis, whose temple in the forest close by Aricia, beside the *lacus* Nemorensis, was served by "the priest who slew the slayer, and shall himself be slain"; that is to say, the priest, who was called rex Nemorensis, held office only so long as he could defend himself from any stronger rival. This cult, which is unique in Italy, is picturesquely described in the opening chapter of Sir James Frazer's Golden *Bough* (3rd ed.) where full references will be found. The old-world custom was dying out in the 1st century A.D. It is a reasonable conjecture that this extraordinary relic of barbarism was characteristic of the earlier stratum of the population, who presumably called themselves Arici.

See also J. G. Frazer, Studies in the Early History of Kingship (1907).

ARIÈGE, a department in southern France, bounded on the south by Spain, west and north by Haute Garonne, north-east and east by Aude, south-east by Pyrénées Orientales. Area 1,893 sq.m. Pop. (1936) 155,134. The south includes the old folded rocks of the Pyrenean axis with snow peaks (P. de Montcalm, 10,512ft.) and several high passes, and the crestline is the international boundary but not a true economic one, for there are many communications between the hill pastures on both sides when the passes are open. The pass or col de Puymorens was specially important and a pilgrim way to Monserrat, and control of it was a basis of the power of the countship of Foix, which remained distinct till the Revolution of 1789, and now, with parts of Languedoc and Gascony, forms the department in the basin of the Ariège river. The hills furnish summer pasture and trackways for animals and muleteers who avoid the forested ravines; many flocks are driven down to the plains for wintering. The M. de Tabe and M. de Plantaurel are parallel ranges north of the main one; the steep slope down to the open lowland of tertiary rocks northwards has mainly calcareous rocks with gorges, caves and river tunnels. Tuc d'Audoubert and Trois Frères among caves and Mas d'Azil among tunnels are famed archaeologically The average temperature (sea level) in summer is 70°F.–72°F., in winter about 43°F., rainfall generally above 30in., over 40 in nearly all the highland, and over 60 on many heights.

Stock-raising is intensive in parts of the Ariège valley and small holdings abound, wheat, maize and potatoes being grown, with vines near Pamiers, etc. Minerals include iron, lead, copper, manganese, gypsum, talc, phosphates, salt (region of the River Salat), grindstones and building stones. Warm springs occur at Ax, Aulus, and Ussat. Iron foundries and forges exist at Pamiers, which is also the seat of a bishopric in the province of the archbishop of Toulouse. Mirepoix, an old bishop's seat, has a cathedral (15–16th cent.) with a fine spire. Foix is the capital and St. Girons capital of arrondissement. The department is in the educational division and under the court of appeal of Toulouse, and in the territory of the XVII. Army Corps.

ARIEL, the name of a Moabite mentioned in the Old Testament (II. Sam. 23; I. Chron. ii. R.V.). In Shakespeare's comedy The Tempest the spirit of the air delivered from captivity by Prospero, and henceforward his devoted familiar, is called Ariel. Milton used the name for one of the fallen angels in his Paradise Lost.

The word is generally interpreted as "lion (or altar) of God," and, although of Hebrew origin, the name has become familiar in English fairy-tale and folklore.

ARIES (the "Ram"), in astronomy, the first sign of the zodiac, denoted by the sign ♈, in imitation of a ram's head. According to a Greek myth, Nephele, mother of Phrixus and Helle, gave her son a ram with a golden fleece. To avoid the evil designs of Hera, their stepmother, Phrixus and Helle fled on the back of the ram, and reaching the sea, attempted to cross. Helle fell from the ram and was drowned (hence the Hellespont); Phrixus, having arrived in Colchis, sacrificed the ram to Zeus, who placed it in the heavens as the constellation.

The "first point of Aries," which is now far away from the constellation and is situated in Pisces, is the zero from which the right ascensions and longitudes of the stars are measured. It is at the crossing point of the equator and ecliptic on the celestial sphere.

ARIETTA (Ital.), diminutive of aria, an air, and hence signifying, in music, an aria of a shorter and simpler kind than one fully developed. (See ARIA.)

ARIKARA, a semi-sedentary Plains tribe of Indians, the northernmost offshoot of the Caddoans, combining maize farming with bison hunting. Traditionally and by speech they are a branch of the Pawnee. During the 19th century they were affiliated with the Siouan Mandan and Hidatsa, the three groups living in permanent settlements of earth-covered lodges on the Missouri river in North Dakota, and being known as "Village Indians" in distinction from the surrounding nomadic hunting tribes. The population has shrunk from two or three thousand to a few hundred. Maize rituals, mound burial, house type, organization on a village instead of band basis, indicate Arikara culture as basically of the type prevalent about the lower Mississippi, subsequently remodelled on the Plains. In fact, it may have been their example that led the Mandan and Hidatsa to adopt settled life.

ARIMASPI, an ancient people in the extreme north-east of Scythia (*q.v.*), probably the eastern Altai. All accounts of them go back to a poem by Aristeas of Proconnesus, from whom Herodotus (iii. 116, iv. 27) drew his information. They were supposed to be one eyed and to steal gold from the griffins that guarded it (the district is auriferous). In art they are usually represented as richly dressed Asiatics, picturesquely grouped with their griffin foes; the subject is often described by poets from Aeschylus to Milton. They are so nearly mythical that it is impossible to insist on the usual identification with the ancestors of the Huns.

ARIMINUM (modern Rimini), a city of Aemilia, N E. Italy, 6gm. S.E. of Bononia. Founded by Umbrians, in 268 B.C. it became a Roman colony. It was reached from Rome by the Via *Flaminia,* constructed 220 B.C., and became the bulwark of the Roman power in Cisalpine Gaul, to which province it even gave its name. Its harbour was of some importance, but is now silted up, the sea having receded. The construction of the *Via Aemilia* (187 B.C.) and the Via *Popilia* (132 B.C.) made it a road centre. In 82 B.C., having been held by the partisans of Marius, it was plundered by those of Sulla and a military colony settled there. Caesar occupied it in 49 B.C. after crossing the Rubicon. In 27 B.C. Augustus divided the city into seven vici, or quarters, after the model of Rome, from which the names of the vici were borrowed. He also restored the Via *Flaminia* from Rome to Ariminum. At the entrance to the latter the senate erected, in his honour, a triumphal arch which is still extant—a fine simple monument with a single opening. At the other end of the main street (3,000 Roman ft. in length) is a fine five-arched bridge over the Ariminus (modern Marecchia) built under Augustus and Tiberius. The present Piazza Giulio Cesare marks the site of the ancient forum, and the streets still follow the ancient lines. There are remains of the amphitheatre. In A.D. 69 the town was attacked by the partisans of Vespasian and was besieged for five months by the Goths in 538. It was one of the five seaports which remained Byzantine until the time of Pippin. (See RIMINI.)

See A. Tonini, Storia *della Città* di *Rimini* (Rimini, 1848–62).

ARIOBARZANES, the name of three ancient kings or satraps of Pontus, and of three kings of Cappadocia. Of the Pontic kings the most famous is Ariobarzanes I. He succeeded his father Mithridates in the satrapy in 363 B.C., revolted from Artaxerxes in 362, and founded the independent kingdom of Pontus. He and his three sons were made Athenian citizens. Of the Cappadocian kings, I. (Philo-Romaeus) reigned from 93–63 B.C., being

frequently driven out by Mithridates and restored by the Romans. He was finally established by Pompey, and soon after (c. 63) abdicated in favour of his son. 2. (Eusebes, Philo-Romaeus), grandson of the above, succeeded c. 51 B.C. He was friendly with Cicero during Cicero's proconsulate in Cilicia, and fought for Pompey in the Civil War. Caesar confirmed him in his kingdom, and protected him from Pharnaces of Pontus. In 42 B.C. Cassius accused him of conspiracy and put him to death.

ARION, (1) of Methymna, in Lesbos, a semi-legendary poet and musician, friend of Periander, tyrant of Corinth. He flourished about 625 B.C. He is said to have invented the dithyramb, *i.e.*, probably he gave it literary form. The name Cycleus given to his father indicates the connection of the son with the "cyclic" or circular chorus of the dithyramb. No genuine work of his survives. Of his life, only the following story in Herodotus (i. 23) and subsequent writers has come down. After a successful "tour" in Sicily and Magna Graecia he embarked at Taras (Tarentum) in a Corinthian vessel. The sight of his treasure roused the cupidity of the sailors, who resolved to possess themselves of it by putting him to death. Arion, as a last favour, begged permission to sing a parting song. The sailors, desirous of hearing so famous a musician, consented, and the poet, standing on the deck of the ship, in full minstrel's attire, sang a dirge accompanied by his lyre. He then threw himself overboard; but instead of perishing, he was miraculously borne up in safety by a dolphin, supposed to have been charmed by the music. Thus he was conveyed to Taenarum, whence he proceeded to Corinth, arriving before the ship. Periander, at first incredulous, eventually learned the truth by a stratagem. Summoning the sailors, he demanded what had become of the poet. They affirmed that he had remained behind at Tarentum; upon which they were suddenly confronted by Arion himself, arrayed in the same garments in which he had leapt overboard. The sailors confessed their guilt and were punished. Arion's lyre and the dolphin were translated to the stars. Herodotus and Pausanias (iii. 25, 7) both refer to a bronze figure at Taenarum which was supposed to represent Arion seated on the dolphin's back. But this is quite as likely to be, *e.g.*, Phalanthus, the founder (οἰκίστης) of Tarentum, on his dolphin. See Pausanias, x. 13, 10.

(2) ARION or AREION, a wonderful horse, offspring of Poseidon and Demeter Erinys (see *Denzeter),* which belonged to Adrastus (see OEDIPUS).

ARIOSO (Ital.), a musical term denoting a piece or passage of a melodious and song-like character, but lacking the design and form of a regular aria or air.

ARIOSTP, ATTILIO (c. 1660), operatic composer, was born at Bologna and brought out his first opera *Dafne* at Venice in 1686. Later he went to Germany and was Hofkapellmeister at Berlin in 1698. Subsequently he passed many years in London, producing there a number of operas, and becoming in 1720, with Handel and Bononcini, one of the first three joint directors of the London Academy of Music. He died in obscurity abroad, neither the date nor the place of his death being known.

See Alfred Ebert, *Attilio Ariosti in Berlin* (Leipzig, 1905).

ARIOSTO, LODOVICO (1474–1533), Italian poet, was born at Keggio, in Emilia, where his father was commander of the citadel. He showed a strong inclination to poetry, but was obliged by his father to study the law—a pursuit in which he lost five of the best years of his life. Allowed at last to follow his inclination, he applied himself to the study of the classics under Gregorio da Spoleto; but the early removal of his tutor to France deprived him of the opportunity of learning Greek, as he intended. His father dying soon after, he was compelled to forego his literary occupations to provide for his nine brothers and sisters, one of whom was a cripple. He wrote, however, about this time, some comedies in prose and a few lyrics, which attracted the notice of the cardinal Ippolito d'Este, who took the young poet under his patronage. This prince usurped the character of a patron of literature, whilst the only reward which the poet received for having dedicated to him the *Orlando Furioso,* was the question, "Where did you find so many stories, Master Ludovic?" The cardinal went to Hungary in 1518, and wished Ariosto to accompany him. The poet excused himself, pleading ill health, his love of study, the care of his private affairs and the age of his mother, whom it would have been disgraceful to leave. His excuses were not received, and even an interview was denied him. Ariosto then boldly said, that if his eminence thought to have bought a slave by assigning him the scanty pension of 75 crowns a year, he was mistaken and might withdraw his boon—which it seems the cardinal did.

The cardinal's brother, Alphonso, duke of Ferrara, now took the poet under his patronage. This was but an act of simple justice, Ariosto having already distinguished himself as a diplomatist, chiefly on the occasion of two visits to Rome as ambassador to Pope Julius II. The fatigue of one of these hurried journeys brought on a complaint from which he never recovered; and on his second mission he was nearly killed by order of the violent pope, who happened at the time to be much incensed against the duke of Ferrara. On account of the war, his salary of only 84 crowns a year was suspended, and it was withdrawn altogether after the peace; in consequence of which Ariosto asked the duke either to provide for him, or to allow him to seek employment elsewhere. A province, situated on the wildest heights of the Apennines, being then without a governor, Ariosto received the appointment, which he held for three years. The province was distracted by factions and banditti, yet it is said that Ariosto's government satisfied both the sovereign and the people confided to his care; and a story is added of his having been captured by a party of banditti, whose chief, on discovering that his captive was the author of *Orlando Furioso,* humbly apologized for not having immediately shown him the respect which was due to his rank. Although he had little reason to be satisfied with his office, he refused an embassy to Pope Clement VII. offered to him by the secretary of the duke, and spent the remainder of his life at Ferrara, writing comedies, superintending their performance as well as the construction of a theatre, and correcting his *Orlando Furioso,* of which the complete edition was published only a year before his death.

Ariosto was honoured and respected by the first men of his age, yet he lived and died poor. The epigram which he wrote over the entrance of his house, saying that, although small, it was suited to his needs and bought with his own money, serves to show the incorrectness of the assertion of flatterers, followed by Tiraboschi, that the duke of Ferrara built that house for him. The only man who seems to have given anything to Ariosto as a reward for his poetical talent was the marquess del Vasto, who assigned him an annuity of 100 crowns on the revenues of Casteleone in Lombardy; but it was only paid, if ever, from the end of 1531. That he was crowned as poet by Charles V. seems untrue, although a diploma may have been issued to that effect by the emperor.

The character of Ariosto seems to have been fully and justly delineated by Gabriele, his brother, who in some lines to his memory speaks of his piety and kindness, his humility and freedom from ambition.

In reading his satires, we are struck with the noble independence of the poet, who loved liberty with a most jealous fondness, and hence would never bind himself, either by going into orders or by marrying, till towards the end of his life, when he espoused Alessandra, widow of Tito Strozzi.

His Latin poems do not perhaps deserve to be noticed; in the age of Flaminio, Vida, Fracastoro and Sannazaro, better things were due from a poet like Ariosto. His lyrical compositions show the poet, although they do not seem worthy of his powers. His comedies, of which he wrote four, besides one which he left unfinished, are avowedly imitated from Plautus and Terence; and although native critics may admire in them the elegance of the diction, the liveliness of the dialogue and the novelty of some scenes, few will feel interest either in the subject or in the characters.

The most solid monument of his fame is the *Orlando Furioso.* An earlier poem on the same theme, *Orlando Innamorato,* by Boiardo (*q.v.*), had been left unfinished; many poets undertook the difficult task of its completion, but it was reserved for Ariosto

to provide a sequel that surpassed its model. He began to write his great poem about 1503, and after having consulted the first men of the age of Leo X. he published it in 1516, in only 40 cantos (extended afterwards to 46); and up to the moment of his death, he never ceased to correct and improve both the subject and the style. It is the magnificent style of this poem which won for him the name of *Divino Lodovico*. Even when he jests, he never compromises his dignity; and in pathetic description or narrative he excites the reader's deepest feelings. In his machinery he displays a remarkable vivacity of fancy; but he never lets his fancy carry him so far as to omit to employ, with an art peculiar to himself, those simple and natural pencil strokes which, by imparting to the most extraordinary feats a colour of reality, satisfy the reason without disenchanting the imagination. The death of Zerbino, the complaints of Isabella, the effects of discord among the Saracens, the flight of Astolfo to the moon, the passion which causes Orlando's madness, teem with beauties of every variety. The supposition that the poem is not connected throughout is wholly unfounded; there is a connection which, with a little attention, will become evident. The love of Ruggero and Bradamante forms the main subject of the *Furioso;* every part of it, except some episodes, depend upon this subject; and the poem ends with their marriage.

The immediate popularity of Ariosto's greatest work outside Italy is proved by the fact that about a dozen French translations of it appeared within 50 years of his death, not to speak of the Spanish version of Ieronymo de Urrea (1549), which was often reprinted and is quoted in *Don Quixote*. Men as different as Voltaire and Goethe have been fascinated by Ariosto; and in England his name will always be connected with that of Spenser, whose *Faerie Queene* was avowedly written to surpass the *Orlando Furioso* in its own style. Scott—"the Ariosto of the north," as Byron called him—learnt Italian as a boy, in order to read it; and Byron himself owed much to the poet whom he praises so highly in his *Prophecy of Dante* (iii. 110–119).

BIBLIOGRAPHY.—The first complete edition of the *Orlando Furioso* was published at Ferrara, in 1532, as noted above. The edition of Papini (Florence, 1903) gives a good text with useful notes. Of editions published in England, those of Baskerville (Birmingham, 1773) and Panizzi (1834) are the most important. The translations into English are all indifferent in quality. *See* also E. Gardner, *Ariosto, the Prince of Court Poets* (1906); J. S. Nicholson, *Life and Genius of Ariosto* (1914); and Benedetto Croce, *Ariosto, Shakespeare and Corneille* (Eng. tr. 1920).

ARIOVISTUS, a German chief who commanded the mixed force of German tribes which entered Gaul at the invitation of the Arverni and Sequani in 71 B.C. After years of warfare he defeated the Aedui at Admetobriga on the middle Rhine in 61, and reduced them to a client kingdom. His relations with Rome were at first friendly, the Romans apparently not appreciating the danger. By 58 Ariovistus had settled some 120,000 Germans on the left bank of the Rhine; the burden of the invaders was so heavy that in the spring of 58, when Caesar took over the Gallic provinces, a diet of the tribes of central Gaul decided to ask him for help. Caesar sent a courteous message to Ariovistus asking him to return the hostages of the Aedui, and bring no more Germans into Gaul. Ariovistus refused, and hostilities followed the same year. Caesar occupied Vesontio (Besançon), in the territory of the Aedui, and a campaign opened in which he had rather the worse of the preliminary manoeuvring. Ariovistus managed to split Caesar's army and attack one division of it, somewhere near Mulhouse. But a general engagement followed, doubtful at first, which was decided by the Roman reserve under P. Crassus. Ariovistus fled over the Rhine, and is not heard of again. Caesar seems to have left Ariovistus' settlements on the Rhine undisturbed.

See Caesar *B.G.*, I., 31–53. Dio Cas., XXXVIII., 34–50. For the topography of the battle, A von Goler, *Caesar's Gallische Krieg*, (1880); T. R. Holmes, *Caesar's Conquest of Gaul* (1911).

ARISTAENETUS, Greek letter-writer, flourished in the 5th or 6th century A.D. He was formerly identified with Aristaenetus of Nicaea, who perished in an earthquake at Nicomedia, A.D. 358, but internal evidence points to a much later date. Under his name two books of love stories, in the form of letters, are extant; the subjects are borrowed from the erotic elegies of Alexandrian writers, and the language is a patchwork of phrases from Plato, Lucian, Alciphron and others.

See: for text *Boissonade* (1822), Hercher, *Epistolographi Graeci* (1873). English translations: Boyer (1701); Thomas Brown (1715); R. B. Sheridan and Halked (1771 and later).

ARISTAEUS, a divinity whose worship was widely spread throughout ancient Greece, but concerning whom the myths are somewhat obscure. The name is derived from the Greek ἄριστος, "best." According to the generally received account, Apollo carried off the nymph Cyrene from Mount Pelion in Thessaly, and conveyed her to Libya, where she gave birth to Aristaeus. Having been brought up by the Ὧραι or by the centaur Cheiron, he left Libya and went to Thebes. Here he received instruction from the Muses in the arts of healing and prophecy and became the son-in-law of Cadmus and the father of Actaeon (*q.v.*). He is said to have visited Ceos, where, by erecting a temple to Zeus *Ikmaios* (the giver of moisture), he freed the inhabitants from a terrible drought. After travelling extensively, Aristaeus reached Thrace where he finally disappeared near Mount Haemus. While in Thrace he is said to have caused the death of Eurydice, who was bitten by a snake while fleeing from him.

Aristaeus was essentially a benevolent diety; he introduced the cultivation of bees (Virgil, *Georg.* iv., 315–558) and the vine and olive; he was the protector of herdsmen and hunters; he warded off the evil effects of the dog-star, and possessed the arts of healing and prophecy. He was often identified with Zeus, Apollo and Dionysus. In ancient sculptures and on coins he is represented as a young man, dressed like a shepherd, and sometimes carrying a sheep on his shoulders.

ARISTAGORAS (d. 497 B.C.), brother-in-law and cousin of Histiaeus, tyrant of Miletus. He acted as regent while Histiaeus was detained at the court of Darius. In 500 B.C. he persuaded the Persians to join him in an attack upon Naxos, but he quarrelled with Megabates, the Persian commander, who, according to Herodotus, warned the Naxians, and the expedition failed. Finding himself bankrupt and out of favour with Persia, Aristagoras, instigated by a message from Histiaeus, raised Ionia in revolt (*see* IONIA). He then went to Greece to secure help, and induced the Athenians to send the force which helped to burn Sardis. It was their intervention which led to Darius' invasion of Greece in 480.

After the failure of the revolt, Aristagoras emigrated to Myrcinus in Thrace, where he fell, in an attack on Ennea Hodoi (later Amphipolis), which belonged to a Thracian tribe.

See Herodotus, v. 30–51, 97–126; Thucydides iv. 102; Diodorus xii. 68; *see* also G. B. Grundy, *Great Persian War* (1901).

ARISTANDER, of Telmessus in Lycia, the favourite soothsayer of Alexander the Great.

See *Philopatris*, 21; Arrian, *Anabasis*, ii. 26, iii. 2, iv. 4; Plutarch, *Alexander;* Curtius iv. 2, 6, 15, vii. 7.

ARISTARCHUS, of Samothrace (*c.* 220–143 B.C.), Greek grammarian and critic. He settled early in Alexandria, where he studied under Aristophanes of Byzantium, whom he succeeded as librarian of the museum. On the accession of Euergetes II. he found his life in danger and withdrew to Cyprus, where he died. Aristarchus founded a school of philologists, called after him "Aristarcheans," which long flourished in Alexandria and afterwards at Rome. He is said to have written 800 commentaries alone, without reckoning special treatises.

He edited Hesiod, Pindar, Aeschylus, Sophocles and other authors; but his chief fame rests on his critical and exegetical edition of Homer, practically the foundation of our present text. In the time of Augustus, two Aristarcheans, Didymus and Aristonicus, undertook the revision of his work, and the extracts from these two writers in the Venetian scholia to the *Iliad* give an idea of Aristarchus's Homeric labours. He arranged the *Iliad* and the *Odyssey* in 24 books as we now have them.

See Lehrs, *De Aristarchi Stud. Homericis* (3rd ed., 1882); Ludwich, *Aristarchs homerische Textcritik* (1884); and especially Sandys, *Hist. of Class. Schol.* (ed. 1921), vol. i. with authorities; *see* also **HOMER**; ALEXANDRIAN SCHOOL.

ARISTARCHUS OF SAMOS, Greek astronomer, flourished about 270 B.C. He is famous for having been the first to maintain that the earth revolves round the sun. On this ground Cleanthes the Stoic declared that he ought to be indicted for impiety. His only extant work is a short treatise On the Sizes and Distances of *the Sun and Moon;* here he obtains, by elegant and rigorous geometry, certain results as regards sizes and distances which are only vitiated by the incorrectness of the assumptions, due to the imperfect state of knowledge at the time. The heliocentric hypothesis does not appear in the treatise, but a quotation in the *Arenarius* of Archimedes from another work of Aristarchus proves that he anticipated the great discovery of Copernicus. Moreover, Copernicus himself was clearly aware of the achievement of Aristarchus, for he mentioned it in a passage which he afterwards suppressed (see De revolutionibus caelestibus, ed. Thorun., 1873, p. 34 note). Aristarchus added $\frac{1}{1623}$ of a day to Callippus' estimate of $365\frac{1}{4}$ days for the length of the solar year. He is also said to have invented a hemispherical sun-dial (scaphe).

The Greek text of the extant treatise was first edited by Wallis (1688); for a new Greek text with English translation and notes see T. L. Heath, *Aristarchus* of Samos (1913).

ARISTEAS, a mythical personage in ancient Greece, said to have lived in the time of Cyrus and Croesus, or according to some c. 690 B.C. His poem *Arimaspeia* describes his travels in countries N. and E. of the Euxine; he visited the Hyperboreans, Issedonians and Arimaspians, who fought against the gold-guarding griffins. An important historical fact which seems to be indicated in his poem is the rush of barbarian hordes towards Europe under pressure from their neighbours.

Twelve lines of the poem are preserved in Tzetzes and Longinus. According to Suidas, Aristeas also wrote a prose theogony. The genuineness of his works is disputed by Dionysius of Halicarnassus.

See Tournier, De Aristea *Proconneso* (1863); Macan, Herodotus iv., 13, 14 (note), 15.

ARISTEAS, the pseudonymous author of a famous Letter in which is described, in legendary form, the origin of the Greek translation of the Old Testament known as the Septuagint (q.v.). Aristeas represents himself as a Gentile Greek, but was really an Alexandrian Jew who lived under one of the later Ptolemies. Though the Letter is unauthentic, it is now recognized as a useful source of information concerning both Egyptian and Palestinian affairs in the and and possibly in the 3rd century B C.

See modern editions of the Greek by H. St. J. Thackeray (in Swete's Introduction to *the* Old Testament in Greek, Cambridge, 1900), and by P. Wendland (Leipzig, 1900); and H. St. J. Thackeray, The Letter *of* Aristeas (1917), translation with critical introduction and bibliography.

ARISTEIDES (c. 530–468 B.C.), Athenian statesman called "the Just," was the son of Lysimachus, and a member of a family of moderate fortune. Of his early life we are told merely that he became a follower of the statesman Cleisthenes and sided with the aristocratic party in Athenian politics. He first comes into notice as strategus in command of his native tribe Antiochis at Marathon, and it was no doubt in consequence of the distinction which he then achieved that he was elected chief archon for the ensuing year (489–488 B.C.). In pursuance of his conservative policy, which aimed at maintaining Athens as a land power, he was one of the chief opponents of the naval policy of Themistocles (q.v.). The conflict between the two leaders ended in the ostracism of Aristeides, at a date variously given between 48; and 482 B.C.

Early in 480 B.C. Aristeides profited by the decree recalling the post-Marathonian exiles to help in the defence of Athens against the Persian invaders, and was elected strategus for the year 480–479 B.C. In the campaign of Salamis he rendered loyal support to Themistocles, and crowned the victory by landing Athenian infantry on the island of Psyttaleia and annihilating the Persian garrison stationed there (see SALAMIS). In 479 he was re-elected strategus, and invested with special powers as commander of the Athenian contingent at Plataea; he is also said to have judiciously suppressed a conspiracy among some oligarchic malcontents in the army and to have played a prominent part in arranging for the celebration of the victory. In 478 or 477 Aristeides was in command of the Athenian squadron off Byzantium, and the Ionian allies, after revolting from the Spartan admiral Pausanias, offered him the chief command and left him with absolute discretion in fixing the contributions of the newly formed confederacy (see DELIAN LEAGUE). His assessment was universally accepted as equitable, and continued as the basis of taxation for the greater part of the league's duration; it was probably from this that he won the title of "the Just." Aristeides soon left the command of the fleet to his friend Cimon (q.v.), but continued to hold a predominant position in Athens. At first he seems to have remained on good terms with Themistocles, whom he is said to have helped in outwitting the Spartans over the rebuilding of the walls of Athens. But in spite of statements in which ancient authors have represented Aristeides as a democratic reformer, it is certain that the period following the Persian wars during which he shaped Athenian policy was one of conservative reaction. His estate seems to have suffered severely from the Persian invasions, for apparently he did not leave enough money to defray the expenses of his burial, and it is known that his descendants even in the 4th century received State pensions. See ATHENS; THEMISTOCLES.

BIBLIOGRAPHY.—Herodotus viii. 79–81, 95, ix. 28; "Constitution of Athens" (Ath. Pol.), 22–24, 41; Plutarch, *Aristides;* Cornelius Nepos, Vita Aristidis. See also E. Meyer, Geschichte des *Altertums* (Stuttgart, 1901), iii. p. 481, 492. In the absence of positive information the 4th century writers (on whom Plutarch and Nepos mainly rely) wove round his surname of "Just" a number of anecdotes. Herodotus is practically our only trustworthy authority. (M. C.)

ARISTEIDES, of Miletus, generally regarded as the father of Greek prose romance (c. 150–100 B.C.). He wrote six books of erotic *Milesian* Tales (Μιλησιακά) which enjoyed great popularity, and were translated into Latin by Cornelius Sisenna (119–67 B.C.). They are lost, with the exception of a few fragments, but the story of the Ephesian matron in Petronius gives an idea of their nature.

See Plutarch, *Crassus,* 32; Ovid, Tristia, ii. 413, 443; Müller, *Fragmenta* Historicorum Graecorum, iv.

ARISTEIDES, AELIUS, surnamed Theodorus, Greek rhetorician and sophist (A.D. 117, or perhaps 129–189). After studying at Pergamum and Athens, he lived at Smyrna. In 178, when it was destroyed by an earthquake, he wrote an account of the disaster to Aurelius, and induced him to rebuild the city. His extant works consist of two small rhetorical treatises on political and simple speech, with Demosthenes and Xenophon as models (Spengel, Rhetores Graeci) and 55 declamations, of which only the Panathenascus and the Encomium of Rome were actually delivered. Of the others, The Sacred Discourses deal with his illness and with miraculous cures, and the rest are panegyrics or treat subjects from Greek history. Though they lack living interest, their style is correct, and they became school books and the subject of commentaries.

BIBLIOGRAPHY.—Editio princeps (52 declamations only) (1517); Dindorf (1829); Keil (1899); Schmid (1926). See Sandys, *Hist.* of Classical Scholarship, vol. i. (ed. 1920) and references there given.

ARISTEIDES, APOLOGY OF. Until 1878 our knowledge of the early Christian writer Aristeides was confined to the statement of Eusebius that he was an Athenian philosopher, who presented an apology "concerning the faith" to the emperor Hadrian. In that year, however, the Mechitharists of S. Lazzaro at Venice published a fragment in Armenian from the beginning of the Apology; and in 1889 Dr. Rendel Harris found the whole of it in a Syriac version on Mt. Sinai. While his edition was passing through the press, it was observed by Dr. J. Armitage Robinson that all the while the work had been extant in Greek, though in a slightly abbreviated form, as it had been embedded as a speech in a religious novel written about the 6th century, and entitled "The Life of Barlaam and Josaphat." Eusebius and the Armenian version quote its dedication to Antoninus Pius who reigned 138–161. The Syriac version quotes a dedication which confuses the names of Antoninus Pius and his predecessor Hadrian.

The Apology opens thus: "I, O king, by the providence of God came into the world; and having beheld the heaven, and the earth, and the sea, the sun and moon, and all besides, I marvelled at

their orderly disposition; and seeing the world and all things in it, that it is moved by compulsion, I understood that He that moveth and governeth it is God. For whatsoever moveth is stronger than that which is moved, and whatsoever governeth is stronger than that which is governed." Having briefly spoken of the divine nature in the terms of Greek philosophy, Aristeides proceeds to ask which of all the races of men have at all partaken of the truth about God. Here we have the first attempt at a systematic comparison of ancient religions. For the purposes of his enquiry he adopts an obvious threefold division into idolaters, Jews, and Christians. Idolaters, or, as he more gently terms them in addressing the emperor, "those who worship what among you are said to be gods," he subdivides into the three great world-civilizations—Chaldeans, Greeks, and Egyptians. He chooses this order so as to work up to a climax of error and absurdity in heathen worship. The direct nature worship of the Chaldeans is shown to be false because its objects are works of the Creator, fashioned for the use of men. They obey fixed laws and have no power over themselves. The gods of Olympus are challenged one by one, and shown to be either vile or helpless, or both at once. A heaven of quarrelling divinities cannot inspire a reasonable worship. These gods are not even respectable; how can they be adorable? "The Egyptians have erred worse than all the nations; for they were not content with the worships of the Chaldeans and Greeks, but introduced, moreover, as gods even brute beasts of the dry land and of the waters, and plants and herbs. . . ." Throughout the whole of the argument there is strong common-sense and a stern severity unrelieved by conscious humour. Aristeides is engaged in a real contest; he strikes hard blows, and gives no quarter. He cannot see, as Justin and Clement see, a striving after truth, a feeling after God, in the older religions, or even in the philosophies of Greece. He has no patience with attempts to find a deeper meaning in the stories of the gods. "Do they say that one nature underlies these diverse forms? Then why does god hate god, or god kill god? Do they say that the histories are mythical? Then the gods themselves are myths, and nothing more."

The Jews are briefly treated. After a reference to their descent from Abraham and their sojourn in Egypt, Aristeides praises them for their worship of the one God, the Almighty Creator; but blames them as worshipping angels, and observing "sabbaths and new moons, and the unleavened bread, and the great fast, and circumcision, and cleanness of meats." He then proceeds to the description of the Christians. He begins with a statement which, when purged of glosses by a comparison of the three forms in which it survives, reads thus: "Now the Christians reckon their race from the Lord Jesus Christ; and He is confessed to be the Son of God Most High. Having by the Holy Spirit come down from heaven, and having been born of a Hebrew virgin, He took flesh and appeared unto men, to call them back from their error of many gods; and having completed His wonderful dispensation, He was pierced by the Jews, and after three days He revived and went up to Heaven. And the glory of His coming thou canst learn, O king, from that which is called among them the evangelic scripture, if thou wilt read it. He had 12 disciples, who after His ascent into heaven went forth into the provinces of the world and taught His greatness; whence they who at this day believe their preaching are called Christians." This passage contains striking correspondences with the second section of the Apostles' Creed. The attribution of the Crucifixion to the Jews appears in several 2nd century documents; Justin actually uses the words "He was pierced by you" in his dialogue with Trypho the Jew.

"These are they," he proceeds, "who beyond all the nations of the earth have found the truth: for they know God as Creator and Maker of all things, and they worship no other god beside Him; for they have His commandments graven on their hearts, and these they keep in expectation of the world to come. . . . Whatsoever they would not should be done unto them, they do not to another. . . . He that hath supplieth him that hath not without grudging: if they see a stranger they bring him under their roof, and rejoice over him, as over a brother indeed, for they call not one another brethren after the flesh, but after the spirit. They are ready for Christ's sake to give up their own lives; for His commandments they securely keep, living holily and righteously, according as the Lord their God hath commanded them, giving thanks to Him at all hours, over all their food and drink, and the rest of their good things."

The style of the Apology is exceedingly simple. It is curiously misdescribed by Jerome, who never can have seen it, as "Apologeticum pro Christianis contextum philosophorum sententiis." Its merits are its recognition of the helplessness of the old heathenism to satisfy human aspiration after the divine, and the impressive simplicity with which it presents the unfailing argument of the lives of Christians.

See *The Apology of Aristides,* Syriac text and translation (J. R. Harris), with an appendix containing the Greek text, *Texts and Studies,* i. 1 (1891). There is an English tr. by Walford, 1909.

ARISTIDES, QUINTIEIANUS, the author of a treatise on music, who lived probably in the 3rd century A.D. According to Meibomius, in whose collection (*Antiq. Musicae Auc. Septem,* 1652) this work is printed, it contains everything on music that is to be found in antiquity. *(See* Pauly-Wissown, *Realencyk,* ii. 894.)

ARISTIPPUS (*c.* 435–356 B.C.), Greek philosopher, the founder of the Cyrenaic school. At an early age he came from Cyrene to Athens, and he became the pupil of Socrates. After travelling through a number of Grecian cities, he founded his school at Cyrene *(see* CYRENAICS). Starting from the two Socratic principles of virtue and happiness, he emphasized the second, and made pleasure the criterion of life. That he held to be good which gives the maximum of pleasure. In pursuance of this he indulged in all forms of external luxury. The five letters attributed to him are spurious. His daughter Arete, and her son Aristippus (μητροδίδακτος, "pupil of his mother"), carried on the school after his death. He comes very near to modern empiricism and especially to the modern Hedonist school.

See Aberweg's *Grundriss der Geschichte der Philosophie,* vol. i., Section 38 and Bibliography (1912).

ARISTO, of Pella, a Jewish Christian writer of the middle of the 2nd century, who like Hegesippus (q.v.) represents a school of thought more liberal than that of the Pharisaic and Essene Ebionites. He is cited by Eusebius (*Hist. Eccl.* iv. 6, 3) for a decree of Hadrian respecting the Jews, but is best known as the writer of a *Dialogue* on the witness of prophecy to Jesus Christ, which was defended by Origen against the reproaches of Celsus.

The literature is cited in G. Kriiger's *Early Christian Literature,* pp. 104 seq.

ARISTO or **ARISTON,** of Chios (*c.* 250 B.C.), a Stoic philosopher and pupil of Zeno, though he approximated more closely to the Cynic school. He considered only ethics worthy of study, and in that only general and theoretical questions. He rejected Zeno's doctrine of desirable things, intermediate between virtue and vice. There is only one virtue—an intelligent, healthy state of mind *(hygeia).* Aristo is frequently confounded with Ariston of Iulis, who became scholarch of the Peripatetics about 230 B.C. *See* STOICS.

ARISTOBULUS, of Cassandreia, Greek historian, accompanied Alexander the Great on his campaigns, of which he wrote an account, mainly geographical and ethnological. His work was largely used by Arrian.

BIBLIOGRAPHY. — Mueller, *Historicorum Graecorum Fragmenta;* Schoene, *De Rerum Alexandri Magni Scriptoribus* (1870).

ARISTOBULUS, of Paneas (c. 160 B.C.), a Jewish philosopher of the Peripatetic school. Gercke places him in the time of Ptolemy X. Philometor (end of 2nd century), Anatolius in that of Ptolemy II. Philadelphus; but the middle of the 2nd century is more probable. He was among the earliest of the Jewish-Alexandrian philosophers whose aim was to reconcile Greek philosophical conceptions with the Jewish religion. A few fragments of his work, apparently entitled *Commentaries on the Writings of Moses,* are quoted by Clement, Eusebius and other theological writers. He tried to prove that early Greek philosophers had borrowed from Scripture, but the passages quoted were obvious forgeries.

BIBLIOGRAPHY.—*See* E. Schürer, History of *the Jewish* People (Eng. trans., 1890–91), ii. 237 *seq.*; article ALEXANDRIAN SCHOOL: Philosophy, and *s.v.* "Aristobulus" in Jewish *Encyclopedia* (Paul Wendland).

ARISTOCRACY, a form of government variously defined at different times and by different authorities (Gr. ἄριστος, "best"; κράτος, "power"), In Greek political philosophy, aristocracy is the government of those who most nearly attain to the ideal of human perfection. Aristocracy is thus the government by those who are superior both morally and intellectually, and, therefore, govern directly in the interests of the governed, as a good doctor works for the good of his patient. Aristotle classified good governments under three heads—monarchy, aristocracy and commonwealth (πολιτεία), to which he opposed the three perverted forms—tyranny or absolutism, oligarchy and democracy or mob-rule. The distinction between aristocracy and oligarchy, which are both necessarily the rule of the few, is that whereas the few ἄριστοι will govern unselfishly, the oligarchs, being the few wealthy ("plutocracy" in modern terminology), will allow their personal interests to predominate.

Historically, aristocracy develops from primitive monarchy by the gradual progressive limitation of the regal authority. This process is effected primarily by the nobles who have hitherto formed the council of the king (for an excellent example in Athenian politics, see ARCHON), whose triple prerogative—religious, military and judicial—is vested, *e.g.*, in a magistracy of three. These are either members of the royal house or the heads of noble families, and are elected for life or periodically by their peers, *i.e.*, by the old royal council (*cf.* the Areopagus at Athens, the Senate at Rome [*qq.v.*]), now the sovereign power. From the earliest time, aristocracy became synonymous with oligarchy and the opposite of democracy.

The aristocracy of which we know most in ancient Greece was that of Athens prior to the reforms of Cleisthenes (*q.v.*), but all the Greek city-states passed through a period of aristocratic or oligarchic government. Rome, between the regal and the imperial periods, was always more or less under the aristocratic government of the senate, in spite of the gradual growth of democratic institutions (the Lat. optintates is the equivalent of ἄριστοι). The relations existing between his slaves and the ἄριστοι set up a philosophic doctrine, held even by Aristotle, that there were peoples who were inferior by nature (φύσει δοῦλοι) and adapted to submission; such people had no "virtue" in the technical civic sense, and were properly occupied in performing the menial functions of society, under the control of the ἄριστοι. Thus, combined with the criteria of descent, civic status and the ownership of the land, there was the further idea of intellectual and social superiority. These qualifications were naturally, in course of time, shared by an increasingly large number of the lower class who broke down the barriers of wealth and education. From this stage the transition is easy to the aristocracy of wealth, such as we find at Carthage and later at Venice, in periods when the importance of commerce was paramount and mercantile pursuits had cast off the stigma of inferiority (in Gr. βαναυσία).

At the present day the sovereign power of a state no longer resides in an aristocracy, and the word has acquired a social rather than a political sense, being practically equivalent to "nobility."

ARISTODEMUS (8th century B.C.), semi-legendary ruler of Messenia in the time of the first Messenian war. In the 13th year of the war, the Messenian king died childless, and Aristodemus was chosen as his successor. As a ruler he was mild and conciliatory. He was victorious in the pitched battle fought at the foot of Ithome in the fifth year of his reign, when the Messenians, reinforced by the entire Arcadian levy and picked contingents from Argos and Sicyon, defeated the combined Spartan and Corinthian forces. Shortly afterwards, however, led by unfavourable omens to despair of final success, he killed himself. Aristodemus may fairly be regarded as a historical character. His reign is dated 731–724 B.C. by Pausanias, and this may be taken as approximately correct, though Duncker (*History of Greece,* Eng. trans., ii. p. 69) inclines to place it eight years later.

Pausanias iv. 9–13 is practically our only authority. He followed as his chief source the prose history of Myron of Priene, an untrustworthy writer, probably of the and century B.C.; hence, a good deal of his story must be regarded as fanciful, though we cannot distinguish accurately between the true and the fictitious.

ARISTOGEITON: see HARMODIUS.

ARISTOLOCHIA, a genus of woody vines or herbs of the family Aristolochiaceae, found chiefly in the tropics. The flower forms a tube inflated at the base. The name (Gr. ἄριστος, best; λοχεία, child-birth) alludes to its repute in aiding parturition. The birthwort (*A. Clematitis*) is a central and south European species, found sometimes in England, apparently wild, on ruins and similar places, but not native. In the United States it rarely escapes from cultivation from New York to Maryland. The Dutchman's pipe or pipe vine (*A. durior*), native to rich woods in the eastern United States from Pennsylvania to Minnesota and south to Georgia and Kansas, is a vigorous climber widely planted in Europe and the United States as a porch-vine. The flower is of an odd shape and bent like a pipe. Some 10 other species are native to the United States. Among the best known of these are the Virginia snake-root (*A.* Serpentaria), called also sangree-root and serpentary, found in dry woods in the eastern United States, and valued medicinally for its aromatic-stimulant root; the woolly pipe vine (*A. tomentosa*), native to woods from North Carolina to Missouri and southward; and the western Dutchman's pipe (*A. californica*), native to California. Among the various species grown in greenhouses are the remarkable pelican-flower (*A. grandiflora*), a native of Jamaica, some varieties of which bear immense flowers often 20 in. across with a tail-like appendage 3 ft. or more long; and the showy calico-flower (*A. elegans*), native to Brazil, a graceful, free-blooming climber with solitary flowers having a yellow-green tube 1½ in. long and a purple and white blotched limb 3 in. across. The tropical kinds are often called goose-flowers.

ARISTOMENES of Andania, the semi-legendary hero of the second Messenian war. He was a member of the Aepytid family, the son of Nicomedes (or, according to another version, of Pyrrhus) and Nicoteleia, and took a prominent part in stirring up the revolt against Sparta and securing the co-operation of Argos and Arcadia. Under his leadership the Messenians won a victory at "the Boar's Barrow," but in the following year were defeated and had to retire to the mountain stronghold of Eira. When this was betrayed to the Spartans (668 B.C. according to Pausanias) Aristomenes took refuge in Arcadia. Thence he went to Rhodes, where he died. Though there seems to be no conclusive reason for doubting the existence of Aristomenes, his history, as related by Pausanias, following mainly the *Messeniaca* of the Cretan epic poet Rhianus (about 230 B.C.), is evidently largely interwoven with fictions. These probably arose after the foundation of Messene in 369 B.C. Aristomenes' statue was set up in the stadium there: his bones were fetched from Rhodes and placed in a tomb surmounted by a column (Paus. iv. 32. 3, 6); and more than five centuries later we still find heroic honours paid to him, and his exploits a popular subject of song (*ibid.* iv. 14, 7; 16, 6).

ARISTONICUS of Alexandria, Greek grammarian, lived during the reigns of Augustus and Tiberius. His chief work was Περὶ Σημείων Ὁμήρου, in which he gave an account of the "critical marks" inserted by Aristarchus in his recension of the Iliad and Odyssey. Important fragments are preserved in the scholia of the Venetian Codex A of the Iliad.

Friedländer, Aristonici Περὶ Σημείων Ἰλιάδος reliquiae (1853); Carnuth, Aristonici Περὶ Σημείων Ὀδυσσείας *reliquiae* (1869).

ARISTOPHANES (c. 448–385 B.C.[1]), the great comic dramatist and poet of Athens. His birth-year is uncertain. He is known to have been about the same age as Eupolis, and is said to have been "almost a boy" when his first comedy (The *Banqueters*) was brought out in 427 B.C. His father Philippus

[1]The dates in the text, as given by Jebb, are retained. According to R. G. Kent (*Classical* Review, April 1905, April 1906), Aristophanes mas born in 455, and died in 375 B.C.

was a landowner in Aegina. Aristophanes was an Athenian citizen of the tribe Pandionis, and the deme Cydathene. The stories which made him a native of Camirus in Rhodes, or of the Egyptian Naucratis, had probably no other foundation than an indictment for usurpation of civic rights (ξενίας γραφή) which appears to have been more than once laid against him by Cleon.

The Old Comedy which lasted c. 470–390 B.C. was possible only for a thorough democracy. Its essence was a satirical censorship, unsparing in personalities, of public and of private life, of everything which had an interest for the city or which could amuse the citizens. At Athens the poet of the Old Comedy had an influence analogous, perhaps, rather to that of the journalist than to that of the modern dramatist. But the established type of Dionysiac comedy gave him an instrument such as no public satirist has ever wielded. The wildest flights of extravagance were permitted to him. Nothing bound him to a dangerous emphasis or a wearisome insistence. He could deal the keenest thrust, or make the most earnest appeal, and at the next moment vary the serious strain by burlesque. He had, in short, an incomparable scope for trenchant satire directed by sure tact.

Aristophanes is for us the representative of the Old Comedy. But his genius, while it includes, also transcends the genius of the Old Comedy. He can denounce the frauds of a Cleon, he can vindicate the duty of Athens to herself and to her allies, with a stinging scorn and a force of patriotic indignation which makes the poet almost forgotten in the citizen. He can banter Euripides with an ingenuity of light mockery which makes it seem for the time as if the leading Aristophanic trait was the art of seeing all things from their prosaic side. Yet his truest and highest faculty is revealed by those wonderful bits of lyric writing in which he soars above everything that can move laughter or tears, and makes the clear air thrill with the notes of a song as free, as musical and as wild as that of the nightingale invoked by his own chorus in The Birds. The speech of Dikaios Logos in The Clouds, the praises of country life in The Peace, the serenade in The Ecclesiazusae, the songs of the Spartan and Athenian maidens in the Lysistrata, above all, perhaps, the chorus in The Frogs, the beautiful chant of the Initiated—these passages, and such as these, are the true glories of Aristophanes.

Fifty-four[1] comedies were ascribed to Aristophanes. Forty-three of these are allowed as genuine by Bergk. Eleven only are extant. These 11 form a running commentary on the outer and inner life of Athens during 36 years. They may be ranged under three periods. The first, extending to 420 B.C., includes those plays in which Aristophanes used an absolutely unrestrained freedom of political satire. The second ends with the year 405 B.C. Its productions are distinguished from those of the earlier time by a certain degree of reticence and caution. The third period, down to 388 B.C., comprises two plays in which the transition to the character of the Middle Comedy is well marked, not merely by disuse of the parabasis, but by general self-restraint.

I. First Period.—(1) 425 B.C. The *Acharnians*.—Since the defeat in Boeotia the peace party at Athens had gained ground, and in this play Aristophanes sought to strengthen their hands. Dicaeopolis, an honest countryman, is determined to make peace with Sparta on his own account, not deterred by the angry men of Acharnae, who crave vengeance for the devastation of their vineyards. He sends to Sparta for samples of peace; and he is so much pleased with the flavour of the Thirty Years' sample that he at once concludes a treaty for himself and his family. All the blessings of life descend upon him; while Lamachus, the leader of the war party, is smarting from cold, snow and wounds.

(2) 424 B.C. *The* Knights.—Three years before, in his Babylonians, Aristophanes had assailed Cleon as the typical demagogue. In this play he continues the attack. The Demos, or State, is represented by an old man who has put himself and his household into the hands of a rascally Paphlagonian steward. Nicias and Demosthenes, slaves of Demos, contrive that the Paphlagonian shall be supplanted in their master's favour by a sausage seller. No sooner has Demos been thus rescued than his youthfulness and his good sense return together.

[1]Or "44" (reading μδ′ for νδ′ in Suidas)

(3) 423 B.C. The Clouds (the first edition; a second edition was brought out in 422 B.C.).—This play would be correctly described as an attack on the new spirit of intellectual inquiry and culture rather than on a school or class. Two classes of thinkers, or teachers, are, however, specially satirized under the general name of "Sophist" (v. 331)—1. The Physical Philosophers—indicated by allusions to the doctrines of Anaxagoras, Heracleitus and Diogenes of Apollonia. 2. The professed teachers of rhetoric, belles lettres, etc., such as Protagoras and Prodicus. Socrates is taken as the type of the entire tendency. A youth named Pheidippides (obviously meant for Alcibiades) is sent by his father to Socrates to be cured of his dissolute propensities. Under the discipline of Socrates the youth becomes accomplished in dishonesty and impiety. The conclusion of the play shows the indignant father preparing to burn up the philosopher and his hall of contemplation.

(4) 422 B.C. *The* Wasps.—This comedy, which suggested Les Plaideurs to Racine, is a satire on the Athenian love of litigation. The strength of demagogy, while it lay chiefly in the ecclesia, lay partly also in the paid dicasteries. From this point of view *The* Wasps may be regarded as supplementing The Knights. Philocleon (admirer of Cleon), an old man, has a passion for lawsuits—a passion to which his son, Bdelycleon (detester of Cleon) fails to check, until he hits upon the device of turning the house into a law-court, and paying his father for absence from the public suits. The house-dog steals a Sicilian cheese; the old man is enabled to gratify his taste by trying the case, and, by an oversight, acquits the defendant. In the second half of the play a change comes over the dream of Philocleon; from litigation he turns to literature and music, and is congratulated by the chorus on his happy conversion.

(5) 421 B.C.[1] The Peace.—In its advocacy of peace with Sparta, this play, acted at the Great Dionysia shortly before the conclusion of the treaty, continues the purpose of The *Acharnians*. Trygaeus, a distressed Athenian, soars to the sky on a beetle's back. There he finds the gods engaged in pounding the Greek States in a mortar. In order to stop this, he frees the goddess Peace from a well in which she is imprisoned. The pestle and mortar are laid aside by the gods, and Trygaeus marries one of the handmaids of Peace.

II. Second Period.—(6) 414 B.C. Tlze Birds.—Peisthetaerus, an enterprising Athenian, and his friend Euelpides persuade the birds to build a city—"Cloud-Cuckoo-borough"—in mid-air, so as to cut off the gods from men. The plan succeeds; the gods send envoys to treat with the birds; and Peisthetaerus marries Basileia, daughter of Zeus. Some have found in The Birds a complete historical allegory of the Sicilian expedition; others a general satire on the prevalence at Athens of headstrong caprice over law and order; others, merely an aspiration towards a new and purified Athens—a dream to which the poet had turned from his hope for a revival of the Athens of the past. In another view, the piece is mainly a protest against the religious fanaticism which the incident of the Hermae had called forth.

(7) 411 B.C. The *Lysistrata*.—This play was brought out during the earlier stages of those intrigues which led to the revolution of the Four Hundred. It appeared shortly before Peisander had arrived in Athens from the camp at Samos for the purpose of organizing the oligarchic policy. The Lysistrata expresses the popular desire for peace at any cost. As the men can do nothing, the women take the question into their own hands, occupy the citadel, and bring the citizens to surrender.

(8) 411 B.C. *The Thesmophoriazusae* (priestesses of Demeter).—This came out three months later than the Lysistrata, during the reign of terror established by the oligarchic conspirators, but before their blow had been struck. The political meaning of the play lies in the absence of political allusion. Fear silences even comedy. Only women and Euripides are satirized. Euripides is accused and condemned at the female festival of the Thesmophoria.

(9) 405 B.C. *The* Frogs.—This piece was brought out just when Athens had made her last effort in the Peloponnesian War,

[1]*See* E. Curtius, *Hist.* of Greece, iii. (Eng. trans., p. 275).

eight months before the battle of Aegospotami and about 15 months before the taking of Athens by Lysander. It may be considered as an attempt to distract men's minds from public affairs. It is a literary criticism. Aeschylus and Euripides were both lately dead. Athens is beggared of poets; and Dionysus goes down to Hades to bring back a poet. Aeschylus and Euripides contend in the under-world for the throne of tragedy; and the victory is at last awarded to Aeschylus.

III. Third Period.—(10) 393 B.C.[1] The *Ecclesiazusae* (women in parliament).—The women, disguised as men, steal into the ecclesia, and succeed in decreeing a new constitution. At this time the demagogue Agyrrhius led the assembly; and the play is, in fact, a satire on the general demoralization of public life.

(11) 388 B.C. *The Plutus* (Wealth).—The first edition of the play had appeared in 408 B.C., being a symbolical representation of the fact that the victories won by Alcibiades in the Hellespont had brought back the god of wealth to the treasure-chamber of the Parthenon. In its extant form the *Plutus* is simply a moral allegory. Chremylus, a worthy but poor man, falls in with a blind and aged wanderer, who proves to be the god of wealth. Asclepios restores eyesight to Plutus; whereupon all the just are made rich and all the unjust are reduced to poverty.

Among the lost plays, the following are the chief of which anything is known:

1. *The Banqueters* (Δαιταλεῖς), 427 B.C.—A satire on young Athens. A father has two sons; one is brought up in the good old school, another in the tricky subtleties of the new; and the contrast of the results is the chief theme.

2. *The Babylonians,* 426 B.C.—Under this name the subject-allies of Athens are represented as "Babylonians"—barbarian slaves, employed to grind in the mill. The oppression of the allies by the demagogues—a topic often touched elsewhere—was, then, the main subject of the piece, in which Aristophanes is said to have attacked especially the system of appointing to offices by lot. The comedy is memorable as opening that Aristophanic war upon Cleon which was continued in *The Knights* and *The* Wasps.

The Merchantmen, The Farmers, The Preliminary *Contest* (*Proagon*) and possibly the *Old Age* (*Geras*), belonged to the First Period. The Geras is assigned by Süvern to 422 B.C., and is supposed to have been a picture of dotage similar to that in the *Knights*. A comedy called *The* Island is conjectured to have dealt with the sufferings imposed by the war on the insular tributaries. The *Triphales* was probably a satire on Alcibiades; The Storks, on the tragic poet Patrocles.

In the *Aeolosicon*—produced by his son Araros in 387 B.C.—Aristophanes probably parodied the *Aeolus* of Euripides. The *Cocalus* is thought to have been a parody of the legend, according to which a Sicilian king of that name slew Minos.

A sympathetic reader of Aristophanes can hardly fail to perceive that, while his political and intellectual tendencies are well marked, his opinions, in so far as they colour his comedies, are too indefinite to reward, or indeed to tolerate, analysis. Aristophanes was a natural conservative. His ideal was the Athens of the Persian wars. He disapproved the policy which had made Athenian empire irksome to the allies and formidable to Greece; he detested the vulgarity and the violence of mob-rule; he clave to the old worship of the gods; he regarded the new ideas of education as a tissue of imposture and impiety. How far he was from a clear view of the intellectual revolution which was going forward, appears from The *Clouds,* in which thinkers and literary workers who had absolutely nothing in common are treated with sweeping ridicule as prophets of a common heresy. Aristophanes is one of the men for whom opinion is mainly a matter of feeling, not of reason. He had a warm love for the traditional glories of Athens; a horror of what was ugly or ignoble; a keen perception of the absurd. The broad preferences and dislikes thus generated were enough not only to point the moral of comedy but to make him, in many cases, a really useful censor for the city. The service which he could render in this way was, however, only negative. He could hardly be, in any positive sense, a political or a moral teacher for Athens. His rooted antipathy to intellectual progress must lower his intellectual rank. But as a mocker—to use the word which seems most closely to describe him on this side—he is incomparable for the union of subtlety with riot of the comic imagination. As a poet, he is immortal. And, among Athenian poets, he has it for his distinctive characteristic that he is inspired less by that Greek genius which never allows fancy to escape from the control of defining, though spiritualizing, reason, than by such ethereal rapture of the unfettered fancy as lifts Shakespeare or Shelley above it—

Pouring his full heart
In profuse strains of unpremeditated art.

[1] The date is uncertain; others give 392 and 389.

BIBLIOGRAPHY.—Editio princeps (Aldine, Venice, 1498), by Marcus Musurus (not including the *Lysistrata* and Thesmophoriazusae); S. Bergler (ed. P. Burmann, 1760); Invernizi-Beck-Dindorf (1794–1834); I. Bekker (1829); H. A. Holden (expurgated text, 1868), with *Onomasticon* (new ed., 1902); F. H. M. Blaydes (1880–93), and critical edition (1886); J. van Leeuwen (1893 foll.); F. W. Hall and E. M. Geldart (text, 2nd ed. 1906–07), with the fragment (Oxyrhynchus papyri) of a dialogue between two women concerning a leathern phallus, perhaps from Aristophanes, T. Bergk (1913). There is a complete edition of the valuable scholia by F. Dubner (1842, Didot series), with the anonymous biographies of the poet; of the Ravenna ms. by A Martin (1883), and W. G. Rutherford (1896–1905). Among English translations mention may be made of those of W. J. Hickie (prose, in Bohn's Classical Library); (verse) J. Hookham Frere, five plays; T Mitchell, four plays; and, above all, B. B. Rogers, a brilliant work (now included in the Loeb series). There is a concordance to the plays and fragments by H. Dunbar (1883). On Aristophanes generally see H. Muller-Strubing, Aristophanes und die historische Kritik (1873); the article by G. Kaibel in Pauly-Wissowa's Realencyklopbdze, ii. 1 (1896); A. Cpuat, Aristophane et *l'ancienne comédie* attique (1889); E. Deschanel, Etudes *sur* Aristophane (3rd. ed., 1892); G. Dantu, Opinions et critiques *d'Aristophane sur* le mouvement politique et *intellectuel à Athènes* (1907). Starkie's edition of *The Wasps* (1897); W. Engelmann, Scriptores Graeci (1880); and "Bericht uber die Literatur der griechischen Komodie aus den Jahren 1892–1901" in C. Bursian's *Jahresbericht* uber die Fortschritte der *classischen Altertumswissenschaft,* cxvi. (1904); M. Croiset, Aristophanes and Political Parties at Athens, Eng. trans., J. Loeb (1909); L. E. Lord, Aristophanes, his Plays and Influence (1925). (R. C. J., X.)

ARISTOPHANES, of Byzantium, Greek critic and grammarian, was born about 257 B.C. Early in life he removed to Alexandria, where he studied under Zenodotus and Callimachus. At the age of 60 he was appointed chief librarian of the museum. He died about 185–180 B.C. Aristophanes produced a text of Homer which was an improvement on that of Zenodotus. He also edited Hesiod, Alcaeus, Anacreon, Pindar and the great dramatists; arranged Plato's dialogues in trilogies. His arguments to the plays of Aristophanes and the tragedians are in great part preserved. His works on Athenian courtesans, masks and proverbs were the result of his study of Attic comedy. He further commented on the *Pinakes* ("tablets") of Callimachus, a sort of history of Greek literature. As a lexicographer, Aristophanes compiled collections of foreign and unusual words and expressions, and special lists (words denoting relationship, modes of address). As a grammarian, he founded a scientific school, and in his Analogy systematically explained the various forms. He introduced critical signs—except the obelus; punctuation, prosodiacal, and accentual marks were probably already in use. The foundation of the so-called Alexandrian "canon" was also due to his impulse.

See A. Nauck, *Aristophanis Byzantii Grammatici Fragmenta* (1848); Sandys, History of Classical Scholarship (3rd ed. 1921, vol. i. ch. viii.).

ARISTOTELIANISM: see **ARISTOTLE.**

ARISTOTLE, philosopher, psychologist, logician, moralist, political thinker, biologist, the founder of literary criticism—was born at Stagira, a Greek colonial town on the north-western shores of the Aegaean, in 384 B.C. He was the son of Nicomachus, a doctor, belonging to the guild of the "sons of Aesculapius," who had acted as court physician to Amyntas II., the father of Philip of Macedon. We may perhaps attribute to this fact the interest which he afterwards showed in physiological and zoological studies—though it must be admitted that these studies belong to his later years, and were perhaps due less to heredity than to that

general passion for detailed enquiry in every direction which marks the later stages of his development. By race he was an Ionian. Stagira had been largely colonized from the Ionic district of Chalcis in Euboea; his mother was a native of that district; and to it he naturally retired at the end of his life. His Ionic blood has been called in evidence to explain his interest in the facts of nature. It was the Ionian philosophers of Asia Minor who had first investigated "Nature"; and Aristotle, it has been said, "was from first to last an Ionian, an observer of the facts of nature, a man for whom no problem was too detailed to whet his curiosity." But racial characteristics are at the best only dubious explanations; and the development of Aristotle's thought would, perhaps, have equally led him to detailed scientific enquiry if he had been born an Athenian or a Theban.

AFTER A CAST IN THE METROPOLITAN MUSEUM OF ART
ARISTOTLE, THE THINKER, WHOSE PHILOSOPHY HAS INFLUENCED THE WORLD FOR 2 000 YEARS

Life of **Aristotle.**—The life of Aristotle falls into three clearly marked periods. There is the period of work in the philosophic school of Plato, in the Academy at Athens, which covers the 20 years from the age of 17 to that of 37 (367–347 B.C.), and only comes to an end with the death of Plato. There is the period of his *Wanderjahre*—at Assus, in the south of the Troad; on the island of Lesbos opposite; and at the Macedonian court in Pella, some 80m. to the west of Stagira—which covers the dozen years from the age of 37 to that of 49 (347–335 B.C.), and ends with the majority and accession of his pupil Alexander. Finally, there is a second period of work in Athens—a period of work on his own account as the head of the Peripatetic school in the Lyceum—which covers, roughly, another dozen years of his life, from the age of 49 to that of 62 (335–322 B.C.), and ends with his retirement to Chalcis and his death. These periods are not only stages in the external course of a life. They are also—it has been contended by Prof. Jaeger in his work on Aristotle—stages in the internal development of a body of thought. The Aristotle of the first period differs from the Aristotle of the last; and it is thus of the first importance to follow the stages of his life in order to understand the stages, and the progress, of the development of his thought.

I. It must have been the greatest and the profoundest of factors in the life of Aristotle that he worked for 20 years by the side of Plato. He came as a disciple—a young disciple of 17—to sit at the feet of a master who had attained the age of 61; but in the course of years he must have become a fellow-worker in the studies of the Academy. The Plato of those years—the grey-haired Plato in the evening of a life which reached the age of 81—was no longer the Plato of the *Republic*; but he was still, and more than ever, the beloved master of a body of "friends" engaged together in the pursuit of truth and goodness. His school was now in the stage which is marked by the Theaetetus, the *Politicus*, and the other dialogues of this period: it had left the Socratic stage, and was occupied with the problems of "ideas" and with the division of "ideas," down and down, until the indivisible (or, as we say, the individual, by which Plato meant the *infima* species) was eventually reached. Here was the germ from which grew Aristotle's logic, and from which, again, his metaphysics took its beginning. But the Academy was also engaged in some measure of concrete and scientific study. Mathematics and astronomy were especially cultivated: the Laws of Plato, the work of his old age, presupposes a body of research in legal and constitutional questions; and the study of medicine seems also to have been in some measure pursued. We may guess that Aristotle took his part in these various studies. His sketch of an ideal State in the last two books of the *Politics*, which may be early, shows a close relation to Plato's *Laws*. He hardly shared, indeed, in Plato's passion for mathematics; and he was perhaps always more interested than Plato in biological study. Some scholars have drawn a distinction between Plato the mathematician and Aristotle the biologist. There is a truth in the distinction. Plato's interest in "ideas" found a natural basis in geometrical forms and the abstract rules of numbers: Aristotle's interest in the classification of genera and species led him naturally towards the world of organic nature; and the emphasis which he came to lay more and more on development (γένεσις) accentuated that tendency. Yet it may be contended that the mathematical knowledge of Plato went little deeper than that of Aristotle; and on the other hand it is easy to exaggerate the importance of the biological element in Aristotle's general system of thought. (See W. D. Ross, introduction to Selections from Aristotle.) What seems to be certain is that there is no proof of any serious division of opinion between Aristotle and Plato during the 20 years of their intercourse. Aristotle remained one of the circle of "friends" in the Academy throughout that period; he joined in its researches and possibly its teaching[1]; and the dialogues which he wrote during those years—dialogues now lost, but celebrated in antiquity alike for their style and their content—were largely modelled on the style of the later series of Platonic dialogues which begins with the *Theaetetus*. We may admit, indeed, that in his later dialogues, and particularly in that entitled De *Philosophia*, he diverged from the Platonic doctrine of "ideas" as "separable" from and existing "beyond" individual things; but there is no reason for thinking that this divergence ever approached the nature of a sharp contention, or was anything more than a friendly difference of opinion. The master and the pupil were undivided when Plato died in 347; and the noble words which Aristotle wrote, for an altar of friendship in memory of Plato, attest the depth of the pupil's feeling even after the master's death.

II. On the death of Plato his nephew Speusippus succeeded him as the head of the Academy. Aristotle and another of Plato's pupils, Xenocrates, thereupon left Athens, perhaps believing, as Professor Jaeger has said, that Speusippus was the heir not of the spirit, but only of the office of the master, and perhaps desiring to find a new place for the habitation of the spirit. The place they chose was Assus. There were interesting reasons for their choice. Two old pupils of Plato, Erastus and Coriscus, had taken his teaching back to their native town of Scepsis, on the slopes of Mt. Ida. Here they had come in contact with Hermias, a eunuch, who had perhaps been a banker's clerk, and had thriven sufficiently to buy mining property near Mt. Ida and eventually to acquire the title of prince from the Persians and establish himself as "tyrant" in Atarneus, a town to the south-east of Assus. The two Platonists and Hermias had studied together: Plato had written to them the sixth of his *Epistles* for their guidance; and Hermias, some time before the death of Plato, had given the town of Assus in gratitude to his two companions in study. To Assus, in this conjuncture of affairs, Aristotle and his fellow-pupil came in order to join the Platonic circle; and here Aristotle set up a school in which he taught for the next three years. Hermias was among his pupils; and Theophrastus came from the neighbouring islands of Lesbos to join the company. Two consequences followed. In the first place, Hermias gave his adopted daughter and niece, Pythias, in marriage to Aristotle. In the second place, perhaps on the suggestion of Theophrastus, Aristotle moved, about 344 B.C., to the island of Lesbos; and here, in what Prof. Wentworth Thompson has called a long honeymoon, he spent two years (344–342 B.C.) largely in the study of natural history, and especially in that of marine biology. But politics, as they had been present in his thought, and probably his teaching, from his first coming to Assus and joining the company of Hermias (we may attribute the beginning of the *Politics* to this date), continued to be present and pressing while he was at work in Lesbos. Hermias seems to have been negotiating about this time with Philip of Macedon, who was already thinking of the crusade against Persia, and might naturally desire a point *d'appui* on the south of the Dardanelles in the territory of the "tyrant" of Atarneus. It may have been in this way, and in consequence of these negotiations, that Aristotle, the son-in-law of Hermias, was

[1] Rhetoric was possibly the subject of his lectures; and we may perhaps date the beginning of the *Rhetoric* in this period.

invited by Philip to come to Pella and continue his teaching there for the benefit of the young Alexander. In 342 he accepted the invitation; and the next seven years of his life (342–335 B.C.) were spent in Macedonia. He had scarcely settled in Pella when he heard the news that Hermias had been seized by the Persians, taken to Susa, tortured and crucified, with the final words on his lips, "Tell my friends and companions that I have done nothing unworthy of philosophy." The news may have helped to inspire Aristotle (who wrote an ode celebrating Hermias, along with Achilles, as a follower of true valour) with anti-Persian feeling; and may have led him to inspire his pupil all the more to follow the way of Achilles[1] and, as the champion and leader of a united Greece, to lay low the great king of the East. Unfortunately, there is little evidence which bears on Aristotle's work and teaching in Macedonia. Possibly he had a little circle of "friends" (including Theophrastus) with whom he continued his general studies and teaching. We know that he formed a friendship with Antipater; and it is this friendship which is one of the chief factors in the last phase of his life.

III. Even before the death of Philip in 336 Alexander was more and more concerned in affairs, and Aristotle must have seen less and less of his pupil. After the accession of Alexander there was nothing to keep him in Macedonia, and he naturally returned to Athens, the intellectual centre of Greece, consecrated for him by the memory of Plato, where he could hope to work quietly under the protection of Antipater, now acting as regent in Macedonia and Greece after the departure of Alexander on his eastern campaign. His relations with Alexander were now practically at an end. True, his nephew Callisthenes accompanied Alexander to the East: true, he received scientific material from the scientific staff which accompanied the eastern expedition: true, again, he wrote a treatise, "Alexander or on Colonies," which seems to belong to the period of Alexander's foundation of colonial cities in Egypt and Asia. But Callisthenes was done to death by Alexander in 327; and even before that time Alexander had already departed widely from Aristotle's teaching, and had deserted anti-Persian feeling and notions of Greek supremacy for the plan of an empire resting on the equal and harmonious co-operation of Persians and Greeks. In any case the Aristotle of the last 13 years (335–322 B.C.) is an Aristotle immersed in pure science and investigation. Side by side with the Academy (now under Xenocrates, the fellow-pupil of Plato who had once followed him to Assus) he set up his own school in the Lyceum—a school which came to be known as the Peripatetic, from the περίπατος in its garden in which he walked and talked with his pupils. The school was a definite organization—a θίασος, somewhat like a college, which formed a society devoted to the cult of the Muses; and like a college it had its regular dinners and even its plate. It was furnished with maps and a library: it had something of a staff, and Theophrastus was among its lecturers. The great body of the extant Aristotelian treatises represents the lectures which Aristotle delivered in his school at Athens in the evening of his life—not that they were then all composed for the first time (on the contrary, many of them had grown during the years of wandering, and the extant forms still contain traces of earlier versions and earlier views), but that they were now reduced by Aristotle to the form in which we know them. The range of studies was catholic and indeed universal. It is now that Aristotle departs from his master Plato—not so much in altering his theory of "ideas," as in shifting the whole balance of his interest, and in turning from "the heavenly things that are the objects of the higher philosophy" to the detailed facts of historical and biological process. He leaves φιλοσοφία, we may say, for ἱστορία, in that wide sense of the word in which it means the sober registering of recorded fact; and here he shows himself more Baconian than the Bacon of the *Novum Organum*. The work of his last years is an encyclopaedia—an encyclopaedia of unique value, in that it proceeds from a single mind informed by a single set of controlling ideas. In the field of human history he produced, on the one side lists of the victors in the Pythian and Olympic games, and a chronology of the Athenian drama (which supplemented the *Poetics*); on the other, a record of 158 constitutions (which equally supplemented the *Politics*), an account of "the customs of barbarians," and a treatise on "cases of constitutional law." In the field of natural history the volume of his production was greater still. It included the *Historia Animalium*, a record of biological facts, in which the material furnished by Alexander's expedition seems to have been used (as it also seems to have been used in a treatise "on the rising of the Nile"); it included biological treatises based on these facts; it included a body of treatises which inaugurated the study of psychology; and it has been suggested that it also included both a scheme for the history of the sciences (physics—including metaphysics—mathematics and medicine) and researches in medical subjects such as anatomy and physiology. *Exegit monumentum . . . situ pyramidum altius;* and even if some of the steps of the monument are conjectural, we cannot but admire its height and its massive plan.

In 323, in the midst of all these activities, Aristotle received the news of the death of Alexander. Antipater had been summoned to the presence of Alexander and was absent from Greece; the nationalist party raised its head in Athens; and Aristotle fled to his mother's home in Chalcis, on the island of Euboea, where he died in 322 at the age of 62.[1] By his marriage with the daughter of Hermias he had a daughter, also called Pythias; by a later union he had a son, called according to Greek custom by the name of his grandfather Nicomachus. His personality is hidden behind his works. Tradition makes him speak with a lisp and pay attention to dress. The busts, which seem to be authentic, show firm lips and intent eyes. He was a man of affairs, versed in the ways of courts; and he had at its height the invincible and insatiable curiosity of the Greek mind. But there was something more in him than the light of a pure intellect. The study of his life leaves the impression of generous humanity. His will shows him concerned for every relative and dependant, and not least for the emancipation of his slaves. And there is a phrase in an Aristotelian fragment, which may come from a letter of his later years, which cannot be forgotten. "The more I find myself by myself and alone, the more I have become a lover of myth." "Myth may have meant to Aristotle a little of what revelation has meant to millions in later centuries; and for all his scientific labours he may yet have felt at the last—what indeed he suggests in passages of his own treatises—that there was a supreme consolation in the life of contemplation which might lead, at its highest moments, to visions of the Divine.

The Writings of Aristotle.—The writings of Aristotle fall into three main kinds. There are literary essays intended for publication, such as the early dialogues (now lost except for fragments); there are the set works of his later years, such as the *Constitution of Athens* (one of the 158 *Constitutions* which was rediscovered over 30 years ago); and above all there are what we may call treatises, intended for use in lectures or for the reading of the students of the Lyceum, of which we possess a large variety.

(1) The *dialogues*, written with a conscious art and a definite pursuit of style, were modelled on those of Plato; but they are said by ancient writers to have differed from Plato's dialogues in representing different persons as stating at length their different views on the subject treated. They were famed for their lucidity and the easy flow of their style; they belong to the period of Aristotle's discipleship in the Academy (367–347 B.C.); almost to the very last they followed the doctrine of Plato; and their

[1] One of the first acts of Alexander, after crossing the Dardanelles, was to place a garland on the tomb of Achilles.

[1] An archaeological discovery, which may bear on Aristotle, was made about 1890. Near Eretria, in Euboea, in an ancient cemetery in which non-residents as well as residents had been buried, there was exhumed from a rich tomb with marble foundations a number of object—seven gold diadems, two styluses, a pen, a signet ring and a terra cotta statuette of a man in an attitude like that which Christodorus (*Anth.* Pal., ii.) ascribes to a statue of Aristotle. On a sepulchral stone in the grave was found the inscription, in lettering of the early 3rd century B.C., [Β]ιοτη [Α]ριστοτελου. The grave may have been connected with the family of Aristotle (though Chalcis is over a dozen miles away from Eretria); the styluses, pen and statuette may, in that case, be connected with Aristotle himself; and a skull which was also discovered may have been his. (See *C.I.G.*, vol. xii., fasc. ix. under Eretria, where references are given to the literature on the subject.)

clear and stirring account of Platonic doctrine exercised a large influence in antiquity down to the days of St. Augustine. The two most famous and considerable of these dialogues were the *Protrepticus,* an exhortation to the philosophic life, which was a model for Cicero's *Hortensius* and was partly incorporated by Iamblichus (as Prof. Bywater first recognized in 1869) in a philosophic textbook for beginners, also called the *Protrepticus,* and the De *Philosophia,* perhaps the latest of all the dialogues, in which, as we have already seen, Aristotle first showed signs of a movement away from Plato's theory of "ideas." Generally, however, the dialogues of Aristotle were purely Platonic in the range and the substance of their thought; and several of them, such as the *Politicus* and the *Sophistes,* bear the same name and perhaps handled the same theme as Platonic dialogues. If only we could recover the lost dialogue "On Justice," which appears from its title to correspond to Plato's Republic (for the *Republic,* too, treats of justice, and indeed its alternative title is "On Justice"), it would be profoundly interesting to compare Aristotle's views in this dialogue both with those of his master and with his own later views on the doctrines of the Republic as they are expressed in the second book of the Politics.

(2) Midway between the dialogues and the treatises of Aristotle come a number of works which, like the dialogues, were set compositions in literary form intended for publication, but which, like the treatises, were mainly of the nature of scientific compilations. Apart from an essay *On* Monarchy, which may belong to the time of his residence at Pella, these works belong to the third and last period of his life, during which he was occupied in investigation and teaching in the Lyceum. They include the Alexander, or on Colonies; the accounts of 158 Constitutions; the compilations of "the Customs of *Barbarians"* and of "Cases of Constitutional Law"; the chronological tables of victors in the Pythian and Olympic games; and a list of the successful dramas produced at the festivals of Dionysus at Athens.

(3) The treatises, as we have seen, were in several cases begun in the period of *Wanderjahre* from 347 to 335, but in the form in which they have come down to us they belong to the final period between 335 and 322. They were all written by Aristotle in connection with his courses of lectures—not so much, probably, in the way of "notes," to be followed in the delivery of lectures (the actual lectures may have been more discursive and more of the nature of discussions or conversations with a class), but more in the way of "memoranda," which may have been written afterwards, to preserve a record of the main results attained in lectures and discussions.

The treatises may be grouped under some eight main heads, though we cannot for a moment say that each of these heads corresponds to a separate "course" of lectures, or that the classification is the same as Aristotle himself would have made. The first head is what Aristotle calls "analytics," or, as we should say, logic. Under this head we have some half-dozen treatises (the Categories, the de Znterpretatione, the Topics, the Sophistici *Elenchi,* and the Prior and Posterior Analytics) which came to be known, some centuries afterwards, as the *Organon,* or "instrument" of science and scientific reasoning. The second head we may call by the name of "physics," using that term in a wider sense than that in which we use it to-day, and taking it to mean the general study of inorganic "nature" (φύσις). Here we have to reckon the treatise on *Physics,* the De Caelo, the De *Generatione* et Corruptione and the Meteorologica. The third head may be termed psychology—of which (as also of logic) Aristotle was the inventor. Under it fall the De Anima and the *Parva* Naturalia —the latter a collection of essays on subjects such as sensation, memory, sleep and dreams. The fourth head may be called by the name of biology. We have seen that Aristotle was already interested in the study of this subject in his Lesbian days, about 344–342 B.C., and that he continued his interest and extended his studies in the final period of his life. His biological treatises are the *Historia Animalium* (a record of data corresponding, in the sphere of natural history, to the record of 158 constitutions in the sphere of politics), and a number of theoretical works, based on the data of the Historia, which include studies of the "parts," the "progression," the "motion" and the "reproduction" of animals. Whether or no we regard Aristotle as peculiarly biological in his general point of view and his general approach to the problems of knowledge, we must recognize that it was in the sphere of biology that he made one of his greatest contributions to the advancement of learning.

The remaining heads under which his treatises may be grouped are the metaphysical, the ethical, the political and the literary. Under the head of metaphysics, or "first philosophy," which is an enquiry into the nature of existence (οὐσία), and involves a discussion of the question whether universals exist as substances "separable" from their particulars, we have a composite treatise, containing different strata put together by later editors, which is called the *Metaphysics.* Under the head of ethics we have two treatises—the Eudemian Ethics (so called from Eudemus, one of Aristotle's pupils), and the *Nicomachean* Ethics (which derives its name from his son Nicomachus). It is now held that the former is a genuine work of Aristotle, belonging to the middle period of his life, which was subsequently edited by Eudemus, and that the latter is a statement, edited by his son, of his final views on ethics in the last period of his life. (We may remark, however, that even tht *Nicomachean* Ethics is somewhat simple, not to say elementary, in its psychological foundations, and that it shows little connection with the detailed study of the problems of psychology in the treatises which deal with that subject.) Under the head of politics we have the treatise called the Politics, which falls into three parts—a philosophical "theory of the State" in Books i.–iii.; a detailed study (running into practical suggestions) of the "forms and methods of government" in Books iv.–vi.; and a torso of a sketch of an ideal State in Books vii.–viii. Opinions differ in regard to the dates of the different parts; but it seems reasonable to believe that the last two books, which show a considerable dependence on Plato's Laws, are early, and that the three middle books, which go naturally with the collection of 158 Constitutions, and suggest in their method the biological studies of Aristotle's last period, are the latest. Finally, we have to count, under the head of literary criticism, the three books of the Rhetoric and the short treatise, Poetics.

More important than the classification of Aristotle's treatises is the chronology of their composition. Important as it is, it must also remain conjectural. We are justified, however, in saying that Aristotle seems to have moved from an earlier concern with logic and "the higher philosophy of heavenly things" (or, in other words, from the circle of Platonic interests) towards a later and more absorbing passion for the study and record of actual facts alike in the world of "nature" and in the world of political and literary "art." On this basis we may assign the first form of a number of treatises (which, it is true, must have been expanded later in connection with Aristotle's later lectures) to the period before 335. Among these we may count the *Organon,* the Physics, the third (and most general) book of the De Anima, the Eudemian Ethics, a considerable part of the Metaphysics, and probably the last two books (with perhaps also the first three) of the Politics. The rest of the treatises we may ascribe to the final period of Aristotle's life.

The Philosophy of **Aristotle.**—It is impossible, within the space of a brief article, to give any account of Aristotle's teaching on the many specific branches of knowledge with which he dealt; and the reader is referred to the articles on subjects such as Logic, Ethics and Metaphysics for a more adequate account of the contribution which he made to their development. Here we can only deal with the general development of Aristotle's thought, the general views which run through his treatises, and the particular opinions which have influenced subsequent thought most profoundly. Starting with a veneration for Plato and an acceptance of the Platonic tradition which lasted almost to the death of Plato and his own middle age, he followed more and more in the last 25 years of his life (347–322 B.C.) a peculiar and distinctive method of his own. Plato had studied reality as a whole, and the reality he had studied had been the super-sensible reality of "ideas." Aristotle divided reality into the several spheres of physics, biology, ethics, politics and psychology; and the reality

which he studied in these spheres was the observable facts (τὰ ὑπάρχοντα) of actual and concrete individual substances. The essence of his procedure in each field of "enquiry" was observation of the data (coupled, in biology at any rate, with experimental research in the way of dissection, with a view to determining the data more exactly); and the object of his study was to discover some general theory which, in the Greek phrase, "saved" —or, as we might say, explained without doing violence to them— the data which had been observed. ("The course of exposition," he lays it down in the *De Partibus Animalium,* "must be, first, to state the attributes common to whole groups of animals, and then to attempt to give their explanation.") Aristotle possessed in a remarkable degree the scientific habit of mind; on the one hand he distinguished the various '(sciences" (or, as he would have preferred to say, "enquiries"), drawing the lines of division between them and attaching to some of them the names they have since continued to bear; on the other hand he followed a scientific procedure in each of the subjects he treated, and within the limits of his technique (he had few instruments at his disposal, and he had to discover for himself the rules of reasoning) he observed the permanent canons of scientific enquiry. If the essence of his method and teaching had been followed, the fruit would have been a great period of scientific investigation and discovery. No nobler exordium to such a period could be furnished than the great passage in the *De Partibus Animalium* (642b *22 sqq.),* in which he propounds the programme and the justification of a study of Nature. But the essence of his teaching and method was not followed. The reason may partly be that his treatises seem to have been submerged from the time of his death for over a couple of centuries. According to a tradition of antiquity which may well be accepted, the library and the treatises of Aristotle passed at his death to Neleus, the son of that Coriscus of Scepsis whom he had left Athens to join in 347 B.C.; and they continued in the hands of the descendants of Neleus, apparently neglected and forgotten, until they were recovered for the learned world from the cellar of a house in Scepsis in the time of Sulla (80 B.C.). Destitute of the master's treatises, and rapidly forgetting his spirit, the Peripatetic school hardened into a logical tradition of its own; and even when the treatises were recovered, they were treated not as incentives to enquiry and further discovery but as a rounded body of complete knowledge (perhaps the last thing that Aristotle would have claimed for his tentative conclusions), on which commentators might write and lecture as if it contained the final word of perfection. As a spirit and an incentive, Aristotle was dead; he only lived, if indeed it can be called life, as a "master of those who knew" and a *corpus scientiae.* In this way the great researcher was made the enemy of research; and this continued to be his fate for century on century. The middle ages, as we shall see, inherited the Peripatetic cult of "the master"; they "made his torch," as Dryden said, "their universal light"; and thus the beginning of modern science in the 16th century took the form of a revolt against Aristotle—one of the most scientific spirits that ever lived. The life of Aristotle after his death has many of the elements of a tragedy.

But we must return to the real Aristotle who lived and worked in the 4th century B.C. He had a profound respect for given facts, and a deep passion for classifying these facts with a scrupulous respect for their exact character. He was no longer, when he reached the definitely scientific stage of his development, interested in "ideas" as they were conceived by Plato; but he was profoundly interested in "forms"—in the common attributes which can be observed in the same kind of things, and enable us to classify such things in terms of genera and species. "The principal object of natural philosophy," he wrote, "is not the material elements, but their composition, and the totality of the form." The aim of all science, we may say, is to form an intelligible universe by discovering the universal in the particulars—particulars which are the primary and only substances or existences, but which none the less have no existence independently of the universal which is their "form" and makes them the class or kind of existence which they are. Such universals are concepts formed by the intuitive reason on the basis of repeated "sensations," which rise to "memory," and then to "experience," of the same kind of thing. By making such concepts we make a world we can understand—the world of knowledge; and within that world we can reason and use the methods of valid argument. It is one of the greatest services of Aristotle to knowledge that he laid down, and was the first to lay down, these methods, and that he invented the science of logic. There was reasoning before Aristotle, and the dialogues of Plato abundantly imply its methods and rules. But Aristotle was the first to make them explicit; and the inventor of the syllogism, as he may justly be called, deserves to be celebrated in the annals of human thought.

One of the general views which runs through Aristotle's thought, if it is expressed more particularly in the *Physics,* is a view which we may call by the name of evolution or γένεσις. Whether this view was due to his study of biology, or his study of biology was a result and an application of a general view which he had formed on general grounds, we cannot pause to inquire. In any case, a pervading conception of growth is what chiefly distinguishes his thought from that of Plato. Plato had been more deeply interested in being than in becoming, which belonged in his view to the deceptive world of fallible sense; and he had tried to interpret true and permanent being in the light of the permanent truths of mathematics, making number the basis of the universe and identifying matter with space. His universe was thus a static universe. The universe of Aristotle is dynamic; his world is engaged in becoming; the "nature" of each thing is a potentiality which moves through a process of development (a process which is also "nature") to an actuality which is true and final and perfect "nature" —for "nature is the end," as he writes in the *Politics,* "and what each thing is when fully developed we call its nature." There is thus a teleological view behind Aristotle's conception of the nature of things. The movement which he sees incessantly at work is a movement towards an end immanent from the first in the subject of movement, and determining all its growth; "for the process of evolution is for the sake of the thing finally evolved, and not this for the sake of the process." This general conception is applied by Aristotle not only to developments in the sphere of organic nature, but also to constructions in the sphere of human art. The activity of man, whether in the building of a house or the making of a statue, in the putting together of a State or the composition of a tragedy, is the activity of realizing a plan or "form," and of causing a material which has the proper potentiality—be it wood and stone, or marble, or the human trend to association, or the human passion for imitation—to move towards the "form" which is also its "end." There is thus no distinction between "nature" and "art" in Aristotle's view. They move on parallel lines; they may co-operate. As he says of the State in the *Politics,* "by nature there is an impulse in all men towards political association, but he who first put them together (ὁ πρῶτος συστήσας) was the cause of the greatest of benefits."

Of all Aristotle's treatises it is perhaps those on ethics and politics (along with that on logic) which have exercised the deepest and most continuous influence on subsequent thought. There have been many who, like Archbishop Laud (St. Thomas Aquinas and Dante might equally have made the confession), have acknowledged Aristotle as their "master in *humanis."* The *Nicomachean Ethics* is one of the great books of the world. Its application of the doctrine of the mean to the various virtues; its theory of the relation between external goods and the inward happiness of the spirit; its doctrine of habits, and of the importance of the stage of habituation in moral development—all these are among the permanent possessions of human thought. We may reckon in the same category what Aristotle says of the life of contemplation (which is "a laying hold on immortality as far as is possible for men") and what he writes of the connection between "leisure" (an activity to be distinguished alike from "work" and from "amusement") and the contemplative life. The *Politics,* if it has not all the qualities of the *Ethics,* has furnished the generations with many of the great axioms of political truth. That "the State is by nature" (which does not prevent it from also being "by art"); that it exists for the good life, if it begins for the sake of life only; that law is the true sovereign of States, and

governments are servants of law; that there is a fundamental difference between the lawful monarch and the tyrant who governs by his arbitrary will; that there is a right inherent in the people, in virtue of their capacity of collective judgment, to elect their rulers and call them to account—these are some of the axioms on which men have argued from century to century. Here, and in this example, we can see a service which Aristotle—schematized and glossed and ossified as he might be in the teaching of the schools—none the less continued to render for generation on generation. He supplied the great "topics" of thought—the themes for discussion and the standard "commonplaces" on these themes; and he supplied, too, a terminology in the grooves of which thought could run. When thought had to be rebuilt after the collapse of classical civilization, and while the middle ages were toiling at the work, it was no small thing that men should have the tools of a terminology and the rules of accepted axioms.

The History of Aristotle's Writings and Philosophy.—The tradition of Aristotle was continued—and forgotten, perhaps, even more than it was continued—in the Peripatetic school. But it never affected classical antiquity so deeply as the tradition of Plato, which—whether it was fused, as by Posidonius of Apamea, into an eclectic philosophy which also included Stoic theory, or was exaggerated, as it was by the Neoplatonists, into a sort of mysticism—continued to be a magnet to ancient thought. It is in the thousand years that lie between the collapse of ancient civilization in the 5th century and the beginning of the classical Renaissance in the 15th that the influence of Aristotle is strongest and most diffused. It was the logic of Aristotle which for more than half of this period (from 500 to 1200 A.D) was alone known in the West; and not only so, but down to the beginning of the 12th century it was only the earlier and more elementary parts of the *Organon* which were known and studied. Even this was only studied in a Latin translation and commentary made by Boethius; and indeed the study of Aristotle through the whole of the middle ages was the study of Aristotle in a Latin version, and not in the original Greek. But the Latin version of the first half of the *Organon* was none the less a considerable instrument of education for many centuries. It was the staple of "dialectic," one of the three subjects of the mediaeval *Trivium;* and as dialectic was the subject of all others which set students effectively thinking, we may say that Aristotle was in this way the chief influence, outside theology, in the educational system of the early middle ages. His logical treatises were studied, century by century, in the chapter schools attached to cathedrals and in the schools of the Benedictine monasteries; and along with "grammar" and "rhetoric," the other two subjects of the *Trivium,* they were the discipline of thousands of students.

A new epoch begins in the 12th century. In the first place, the methods of dialectic, no longer studied merely as a discipline in schools, begin to be applied to problems of theology; and already in Berengar of Tours (*c.* 1070 A.D.) we find Aristotelian logic brought to bear on the problem of transubstantiation. The application of logic to theology became still more evident when Roscelin, William of Champeaux, and, above all, Abelard began to ventilate theories about the nature of universals and to draw their theories to theological consequences. The old difference between Platonic "ideas" and Aristotelian "forms" re-emerged in the field of theology; and conceptions of the nature of God were made to depend on the difference. In the second place, about 1130, the whole of the *Organon* became known to the West and began to be studied there; and before the middle of the 12th century Otto of Freising had come to Paris, as he tells us, to study the subtleties of Aristotelian logic in the later and profounder *Analytics* as well as in the earlier treatises of the *Organon.* Finally, somewhere about 1170, the University of Paris came into existence as an organized body; and with the foundation of the mediaeval university the great *cadre* was provided in which the whole body of Aristotelian writings might find a place, and in which, as soon as they had found their place, the great attempt might be made—the attempt which we call by the name of scholasticism—to reconcile their tenets and their secular wisdom with the revelation of the Bible and the divine wisdom of the Fathers of the Church.

In the course of the 13th century, between 1200 and 1270, the general body of the Aristotelian writings other than the *Organon* (the *Physics,* the *Metaphysics* and the *De Anima;* the *Politics* and the *Ethics*) began to be imported into the University of Paris, the University of Oxford, which had arisen at the same time, and the University of Cambridge, which had arisen a little later. It was from Cordova and Constantinople that the new knowledge of the works of Aristotle was derived; and the process of the transmission of his various writings to the Latin Nest is one of the curiosities, and one of the romances, of the history of learning.

Cordova in the 12th century was the great seat of Arabic learning. Arabic learning had included, since about 800 A.D., the study of the Aristotelian treatises, and especially of those which dealt with physics, metaphysics and psychology. The tradition of Aristotle hsd survived among the Syrians, and the Arabs had acquired the tradition in Syria when they conquered the country in the 7th century. Great Aristotelian commentators had arisen among the Arabs—especially Ibn-Sina (Avicenna, *q.v.*), who lived in the East and died at Hamadan in 1037, and Ibn-Roshd (Averroes), who lived in Arabic Spain and died at Cordova in 1198. The Arabic paraphrases and commentaries began to penetrate into the Latin Rest towards 1200, partly across the Pyrenees, and partly by way of Palermo, the half-Arabic capital of Sicily, in which the emperor Frederic II. was a patron of science and literature. They came in a curious form—the form of Latin translations (which sometimes sank to the level of transliterations, and sometimes were not even made directly, but only from an intervening Hebrew version) of Arabic exegesis, which itself was not based on the original Greek, but rested on Arabic versions of Aristotle, which might rest in turn on Syriac versions of the original text. Not only did they come in a curious form, but they also brought curious views of Aristotle's doctrines, which had suffered a change in the course of their wanderings; and Aristotle would hardly have recognized as his own the idea, which the Arabs had extracted from the De *Anima,* that the mortal soul of man was re-absorbed at death into the universal creative soul (*νοῦς ποιητικός*) of the Universe. With their curious form and their dubious views the Aristotelian treatises which the West received from the Arabs were at first suspect; their study was at one time prohibited by the Papacy, which frowned on the *fisica et metafisica;* but they won their way, and established their place in study. A school of "Averroists," which lasted until the 16th century, drew its inspiration from these nritings.

Constantinople supplied the West with a more sober and recognizable Aristotle. It had been captured by the Latins during the fourth Crusade (1204); and Latin clergy had settled in the Byzantine empire. They had learned Greek: they had found Greek manuscripts; and two of them (both Dominicans), William of Moerbecke in Flanders and Henry of Brabant, translated, under the impulse of the great Dominican scholar St. Thomas, and in collaboration with him, many of the writings of Aristotle (1260–1270). It was mainly in this way that St. Thomas learned the Aristotle on whom he wrote commentaries and whose views he sought to co-ordinate with Christian revelation in the great edifice of his *Summa.* In the writings of St. Thomas, Aristotle the encyclopaedist, 1,600 years after his death, was wrought upon by another great and massive encyclopaedist, who sought to inform the sum of ancient knowledge with the spirit of Christian faith; and the Pagan scholar, who had built his own great monument, was incorporated by a Christian thinker into another of the great and enduring monuments of human knowledge.

By 1300 Aristotle is the acknowledged "master of those who know." He is "the philosopher" of Dante, whose views run through the *De Monarchia,* appear in the exegesis of the poems of the *Vita Nuova,* and are part of the texture and framework of the *Divina Conzmedia.* The empire of Aristotle lasted for two centuries. It passed with the Italian Renaissance, which was Platonic rather than Aristotelian; it passed with the German Reformation, which, by the mouth of Luther, denounced the "Aristotelianism" of the schoolmen; it passed with the beginnings of modern science, which, seeking to escape from mediaeval tradition and dogma, in which Aristotle had been incorporated, left Aris-

totle aside, and neglected the deep and genuine science of his writings because it had been yoked with what they sought to escape. Only in the later 19th century, with the development of biological study, has Aristotle the scientist — the student of biology and the prophet, of growth — been once more recognized; and only in our own day is the development of his mind, and the growth of his philosophy of nature, beginning to be understood in terms of his own doctrine of "evolution."

BIBLIOGRAPHY.—The works of Aristotle in Greek are in the five volumes of the great Berlin edition (1831–70), which includes an excellent *Index Aristotelicus.* There are editions of the various treatises in the Teubner series of texts. The Oxford translation of *The Works of Aristotle,* ed. *J. A.* Smith and W. D. Ross, still in progress, includes a great number of the treatises. A volume of *Selections* in English has been published by W. D. Ross (Oxford Univ. Press, 1927). The Greek commentaries on Aristotle have been published at Berlin in 23 volumes, with three volumes of *Supplementum Aristotelicum,* 1882–1909. Editions by modern scholars of separate treatises are the following: T. Waitz, *Organon,* (Leipzig, 1844–46); J. Prantl, *Physics* (Leipzig, 1854); H. H. Jcachim, *De Generatione et Corruptione* (Oxford, 1922); W. Ogle, *De Partibus Animalium* (London, 1882); R. D. Hicks, *De Anima* (Cambridge, 1907); W. D. Ross, *Metaphysics* (Oxford, 1924); J. Burnet, *Ethics* (London, 1906); W. L. Newman, *Politics* (Oxford, 1887–1902); J. E. Sandys, *The Constitution of Athens* (London, 1912); E. M. Cope and J. E. Sandys, *Rhetoric* (Cambridge, 1887); *I.* Bywater, *Poetics* (Oxford, 1909).

The most modern works on Aristotle generally are W. Jaeger, *Aristoteles* (Berlin, 1923) and W. D. Ross, *Aristotle* (London, 1923). Among other general works may be mentioned: T. Case, the article on Aristotle in the 11th ed. of the *Encyclopædia Britannica,* a long, thorough and scholarly article; R. Eucken, *Die Methode der Aristotelischen Forschung* (Berlin, 1872); T. Gomperz, *Greek Thinkers,* Eng. trans., vol. iv. (London, 1912); G. Grote, *Aristotle* (London, 1883); C. Piat, *Aristote* (Paris, 1912); R. Shute, *History of the Aristotelian Writings* (Oxford, 1888); H. Siebeck, *Aristoteles* (Stuttgart, 1922); A. E. Taylor, *Aristotle* (London, 1919); U. von Wilamowitz Moellendorf, *Aristoteles und Athen* (Berlin, 1893); E. Zeller, *Philosophy of the Greeks,* Eng. trans. (London, 1897); The *Cambridge Ancient History,* vol. vi. (Cambridge, 1927).

On particular subjects mention may be made of the following: Logic: H. Maier, *Syllogistik des Aristoteles* (Tubingen, 1896–1900). Natural Science: A. Mansion, *Introduction à la Physique Aristotelicienne* (Louvain and Paris, 1913); T. E. Jones, *Aristotle's Researches in Natural Science* (London, 1912); W. D'Arcy Thompson, Essay on Aristotle in *The Legacy* of *Greece,* ed. R. W. Livingstone (Oxford, 1921). Metaphysics: W. Jaeger, *Studien zur Entstelzungsgeschichte der Metaphysik des Aristoteles* (Berlin, 1912). Politics: H. von Arnim, *Die Politischen Theorien des Altertums* (Vienna, 1910); E. ARISTOTLE'S LANTERN, the name applied to the complex masticatory apparatus of sea-urchins. (See ECHINODERMATA.)

ARISTOXENUS of Tarentum (4th century B.C.), a Greek peripatetic philosopher and writer on music and rhythm. He studied under the Pythagoreans and later under Aristotle, and wrote on philosophy, ethics and music. The empirical tendency of his thought is shown in his theory that the soul is related to the body as harmony to the parts of a musical instrument. In music he held that the notes of the scale are to be judged, not as the Pythagoreans held, by mathematical ratio, but by the ear. The only work of his that has come down to us is the three books of the Elements of Harmony (ῥυθμικά στοιχεῖα), an incomplete musical treatise. Grenfell and Hunt's *Oxyrhynchus Papyri* (vol. i., 1898), contains a five-column fragment of a treatise on metre, probably this treatise of Aristoxenus.

The best edition is by Paul Marquard, with German translation and full commentary, *Die harmonischen Fragmente des Aristoxenus* (Berlin, 1868). The fragments are also given in C. W. Muller, *Frag. Hist. Graec.,* ii. 269 *sqq.;* and R. Westphal, *Melik und Rhythmik d. klass. Hellenenthums* (2nd vol. edited by F. Saran, Leipzig, 1893). Eng. trans. by H. S. Macran (Oxford, 1902).

See also *W.* L. Mahne, *Diatribe de Aristoxeno* (Amsterdam, 1793); B. Brill, *Aristoxenus' rhythmische und metrische Messungen* (1871); R. Westphal, *Griechische Rhythmik und Harmonik* (Leipzig, 1867); L. Laloy, *Aristoxène de Tarente et la musique de l'antiquité* (Paris, 1904). *See* PERIPATETICS, PYTHAGORAS *(Music)* and art. "Greek Music" in Grove's *Dict. of Music* (1904). For the Oxyrhynchus fragment see *Classical Review* (Jan. 1898) and C. van Jan in Bursian's *Jahresberzcht,* civ. (1901).

ARISUGAWA, the name of one of the royal families of Japan, going back to the seventh son of the mikado Go-Yozei (d. 1638). After the revolution of 1868, when the mikado Mutsuhito was restored, his uncle, Prince Taruhito Arisugawa (1835–94), became commander-in-chief, and in 1875 president of the senate, After his suppression of the Satsuma rebellion he was made a field-marshal, and he was chief of the staff in the war with China. His younger brother, Prince Takehito Arisugawa (b. Feb. 11, 1862), was from 1879 to 1882 in the British navy, serving in the Channel Squadron, and studied at the Naval College, Greenwich. In the Chino-Japanese War of 1894–95 he was in command of a cruiser, and subsequently became admiral-superintendent at Yokosuka. Prince Arisugawa represented Japan in England together with Marquis Ito at the Diamond Jubilee (1897), and in 1905 was again received there as the king's guest. He died July 10, 1913.

ARITHMETIC, originally the science or theory of numbers; at present, as commonly understood in the English language, the art of computation and the applications of this art (Gr. ἀριθμητική from ἀριθμός number). In certain other languages the word still retains some of its early meaning and applies not only to a certain amount of theoretical work with numbers, but to the study of the fundamental operations with polynomials, such words as *Rechnung* (German) and *calcul* (French) being used for calculation and its simple applications. In this article the word will be used with the common Anglo-American meaning. The subject will be treated in an elementary way with respect to its bearing upon the school curriculum. The advanced theory will be considered under special topics to which reference is hereinafter made.

NUMBER

Using the term in the sense already mentioned, arithmetic is little concerned with the genesis of the concept of number, this being a philosophical question. Arithmetic takes number as it is found, dividing it into the general classes of cardinal and ordinal. With regard to the numerical measure of a group, as the result of counting or of computing, the term *cardinal number* is used, as when we say that there are five persons in a room. With respect to number as designating position in a sequence, the term *ordinal number* is used, as when we speak of the third page of a book. The cardinal number is that upon which arithmetic turns (Lat. *cardo,* a hinge); it is the important type. (See NUMBER.)

Of an assemblage of objects, the number that can be told at a glance is very limited. Unless the eye is aided by having the objects arranged symmetrically in some familiar order or so as to be divided readily into sub-groups, the eye grasp is usually limited to four or five. Similarly in counting, the mind does not easily grasp the significance of more than a few numerical terms. For example, we may count up to ten or twelve, but by that time we find it desirable to combine the names of smaller numbers, as when we say thirteen (three ten), rather than invent a wholly new term. Similarly in writing numbers, the world finds it necessary, by grouping, to make a few selected characters serve to represent any number however large. At first the groups were small, and there are numerous evidences that the "couple," "pair," "brace," "span," and the like are relics of early groupings made in part for convenience in counting.

Notation. — Peoples who developed independent alphabets also tended to develop independent numerical notations. The spread of Greek culture and commerce, however, carried the Greek numerals of the pre-Christian period into all the leading ports of the Mediterranean sea, and the still more extensive development of the Roman civilization made the Roman numerals dominant in the Occident for many centuries. In the 10th century the entry into Europe of the Indo-Arabic numerals, 1, 2, 3 . . . g, together with the zero, was followed by a slow acceptance of the convenient system of place value by which, with only ten numerals but with an indzfinite number of "places" (units, tens, hundreds, etc.),

any number could conveniently be written. The symbols went by the Latin names characteres and *notae,* and at a later period by the English names figures, numerals and cyphers, and by similar names in other countries. From *nota* came notatio — notation, or the writing of numbers. Thus we have the Egyptian, Greek, Roman, Indian, Arabic and other notations, each of the early written languages tending to have its own numerals. (See NUMERALS.)

The grouping of objects for purposes of counting led to the use of the same device in the writing of numbers. A grouping by fives is called a quinary *system* and is said to be based upon the scale of five, or to have five as the radix. Since man has five fingers on each hand and five toes on each foot, he has a natural counting abacus (*q.v.*) arranged on a scale of five, ten or twenty. While there are traces of the early use of each of these and other scales, the predominant one has been the denary (or decimal) scale— the one with the radix ten. (See NUMERALS.) A familiar relic of grouping by twenties, for example, is seen in the English score, as in expressions like "seven score acres" in relatively late legal documents, and the French *quatre-vingts* (four twenty) for 80 and (formerly) other multiples like *quinze-vingts* (fifteen twenty) for 300, as in the Hospice des Quinze-Vingt in Paris, dating from the 13th century. On this system ninety-six appears in French as quatre-vingt-seize (four-twenty-sixteen). On the pure scale of ten the English counting proceeds as follows: one, two, three . . . nine, ten, *oneteen* (one and ten), *twoteen,* thirteen (three and ten) . . . *twenty* (two tens). The fact that twelve is scientifically a more convenient radix than ten (having its half, third, and fourth easily expressible), seems to have led to the use of "eleven" and "twelve" instead of "oneteen" and "twoteen," after which the denary scale was followed. The tendency to favour twelve as a radix appears in the number of inches (Lat. unciae, twelfths) in a foot, of lines in an inch, of ounces (also from *unciae*) in the Roman and Troy pounds, and of pence in a shilling. The scale of twenty seems to have had considerable standing in certain barefoot countries, the native Mexicans counting to "man finished" and then beginning again. One evidence of the tropical origin of the Greenlanders is that their system of counting also uses twenty as a radix.

A perfect decimal scale requires ten primary word-forms below "hundred" — "one," "two," "three," . . . "ten," the other numbers being named by combining these, as in "fifty-seven" (five-ten-seven). It also requires ten characters, 0, 1, 2 . . . 9. The numbers from 1 to 10 corresponding to the ten fingers, seem to have been called by the early Latins *digiti* ("fingers"), whence our digits. With the coming of the Indo-Arabic numerals, however, it became convenient to use the word to designate the numbers expressed by 1, 2, 3 . . . 9, and also to designate the characters (χαρακτῆρες) (numeral figures) themselves. Since "one" was, by various early writers, spoken of as the fons et origo *numerorum* ("source and origin of numbers"), this was often excluded, the digits being then considered as the eight numbers (or characters) 2, 3, 4 . . . 9.

Similarly, a scale of eight would need eight primary word-forms and eight characters (0, 1, 2 . . .), and so for other scales. On the scale of 2, the number designated by the English word "eleven" would be represented by 1011, that is, $1 \times 2^3 + 0 \times 2^2 + 1 \times 2 + 1$, where (in denary symbols) $8 + 0 + 2 + 1 = 11$. Evidently, therefore, the smaller the radix the more times the characters must be written to express a given number; the larger the radix the more basic number names must be memorized. Either ten or twelve is a medium radix and tradition is too powerful to admit of change from the former to the latter, even though the duodecimal (Lat. duodecim, two-ten, whence the French *douzaine* and the English dozen) has a slight advantage over the decimal.

Numeration and Classification of Numbers. — The Latin numeratio comes from numerus, a number, and refers to the names of numbers. These number names have little etymological significance; in fact. their original meaning is quite speculative.

The various kinds and properlies of numbers are considered elsewhere (see NUMBER; NUMBERS, THEORY OF). A brief reference will, however, be made to those used in elementary arithmetic. With the child as with the race, the first need is for the integer (Lat., "whole") or whole number in the domain limited by the number of his fingers. He learns that "three" is the word to be used with a certain group, just as he learns the names of objects. With a group that is beyond his eye grasp, like six, he learns how to find the number name by memorizing a sequence — "one, two, three, four, five, six," pointing to each object as he counts. He thus subconsciously combines cardinal numbers with ordinal numbers, and thenceforth uses each as the need arises, learning the words "first," "second," and so on, as part of his everyday vocabulary.

His next step leads him to such unit *fractions* as $\frac{1}{2}$ and $\frac{1}{4}$, and he subconsciously learns that $\frac{1}{2}$ has a variety of meanings, as $\frac{1}{2}$ of an object, $\frac{1}{2}$ of a group, $\frac{1}{2}$ of a weight, $\frac{1}{2}$ as large, $\frac{1}{2}$ as light, $\frac{1}{2}$ as loud, $\frac{1}{2}$ as good, and so on, some of which suggest precision, as in the case of an object, while others are merely rhetorical. It is a considerable step from the notion of $\frac{1}{4}$ to that of $\frac{3}{4}$, and the world probably required many centuries in which to take it, and thousands of years to devise a satisfactory symbol for the fraction itself. To broaden the concept so as to include among fractions such cases as $\frac{2}{2}$ and $\frac{3}{2}$, and especially such fraction forms as have fractions for numerator or denominator, did not occur to arithmeticians until modern times. (See FRACTIONS.)

The distinction between abstract *numbers,* like 4, and concrete numbers, like 4ft., is an inheritance that serves no important purpose. A number that has a label attached to it, indicating the unit of measure to which it refers, is called a denominate *number.* Formerly it included such cases as "3 fourths" (as in Trenchant's arithmetic, 1566), but it is now usually limited to such "concrete" numbers as 3ft. and 2 lb. 3 oz. Numbers with more than a single denomination, such as 53 6s. 4d. and 3yd. 27in., are sometimes called compound *numbers.*

Denominate Numbers. — Denominate numbers in general and compound numbers in particular trace their origin to the difficulty which the ancients had in developing a satisfactory notation for either integers or fractions. In the days when one of the ways of writing 7291ft. was MMMMMMMCCLXXXXI pedes, it became convenient to reduce the length of the written number. It was simpler to write this as 1mi. 2011ft.; and then as 1mi. 3fur. 21ft.; and then as 1mi. 3fur. 1rd. $4\frac{1}{2}$ft.; and then, to avoid the fraction, to write $4\frac{1}{2}$ft. as 1yd. 1ft. 6in. Different trades, modes of life, and languages, brought in different units, and so arithmetic inherited such a variety of units of length as the league, mile, stadium, furlong, rod, fathom, yard, cubit, ell, perch, foot, palm, hand, inch and line. The force of tradition kept all of them in the schools till the latter part of the 19th century. In the United States all but four or five have been generally discarded, and in Great Britain there is a tendency in the same direction.

The principal tables of denominate numbers needed for general information in the British empire and the United States, as distinct from those needed in special trades and industries, and in countries where the metric system is used, are indicated as follow: — length: inch, foot, yard, rod (agriculture chiefly), furlong (Great Britain), mile, metre (meter), kilometre; area: square units (inch, foot, yard, mile, meter, kilometer), acre; capacity and *volume:* cubic units (1cu.in., 1cu.ft., 1cu.yd., 1cu. metre), gill, pint, quart, gallon, peck, bushel, litre; time: second, minute, hour, day, week, month, year, decade, century; *value:* the British and American units, with some knowledge of the mark and the franc (lira, peseta, and other gold equivalents); weight: ounce, pound (avoirdupois), stone (Great Britain), hundredweight (Great Britain), ton, gramme (gram), kilogramme (kilogram). These tables are constructed upon *varying* scales; that is, although 12 inches make 1 foot, it does not follow that 12 feet make the next denomination; in fact, the next item changes the scale and states that 3 feet make 1 yard. (See MENSURATION.)

Partly to avoid the inconvenience of a varying scale and partly to establish an international standard, French scientists at the close of the 18th century developed a decimal system of measures, this being known as the *metric system.* It is based upon the stand-

ard metre. originally intended to be one ten-millionth of the distance from the equator to the pole, a degree of accuracy impossible of exact attainment. The legal International metre (meter) is the length of the standard kept in the Bureau International des Poids et Mesures at the entrance of the Parc de Saint-Cloud, Sèvres, near Paris, of which the various civilized countries have copies.

Rational and Irrational Numbers. — The nature of rational and irrational numbers is discussed in the articles on NUMBER; NUMBERS, THEORY OF; and ALGEBRA. With the transfer to algebra of the theory of and operations with these numbers, there was left in elementary arithmetic only the topic of roots (evolution), this being limited to square root and cube root. With the increased use of tables, of logarithms, and of the slide rule and other calculating machines (*q.v.*), even these two operations have recently tended to receive little attention. As a result, cube root has disappeared from most of the arithmetics in the United States and square root will probably do the same, the theory of each being given a moderate amount of attention in algebra, and the practical finding of roots being dependent upon tables or mechanical aids. In Great Britain there is a similar trend. This leads to the arithmetical treatment (finding of approximate values) of irrational numbers in connection with decimal fractions, the nature of such numbers being considered in algebra and the number theory.

OPERATIONS WITH INTEGRAL NUMBERS

It is at present the custom to refer to four fundamental operations with numbers — addition, subtraction, multiplication and division. This classification is convenient but arbitrary. Historically, the number was at one time given as nine; at other times, eight; and at others, seven, six or five. It is often asserted, however, that there is only one operation that is fundamental, and that this is counting. To count by two is to add two; to count three twos is to multiply two by three; to count backwards by two is to subtract twos; and to count backwards by two, beginning with 16 and ending with o, is to find how many twos are contained in 16. Amongst those who gave nine fundamental operations was Sacrobosco (c. 1250), who listed numeration, addition, subtraction, duplation (doubling), mediation (halving), multiplication, division, progressions and the finding (extraction) of roots. The Crafte of *Nombrynge* (c. 1300, ms. in the British Museum) gave seven, omitting numeration and roots; Glareanus (1538) gave six, omitting roots; most of the 16th century reduced this number to five, omitting progressions; Gemma Frisius (1540) reduced it to four, as is now the custom; and Elia Misrachi (c. 1500) gave only three.

Writing and Reading of Large Numbers. — Since the eye grasp renders it difficult to read a number like 207234698, it is the custom to separate such sequences of numerals into groups. If the Greeks had known such a number system, these groups would probably have been of four figures each, the Greeks having used ten thousand (myriad) as the large unit in counting. Since we commonly read numbers by thousands, or thousand thousands (millions), we usually, as an aid to this reading, separate the figures into groups of three or of six. The world, however, has no uniform symbol for use in making this separation. Certain writers have used a vertical bar (Gemma Frisius, 1540; Recorde, c. 1j42; and others); others have placed dots over the figures for thousands, millions, and so on; and some have used full stops (periods) in grouping the figures by threes, or superposed arcs (Fibonacci, 1202) or letters. In Great Britain it is the custom to separate into groups of six, using a comma; in the United States the separation is also by a comma (written) or by a space (printed), there being three figures in a group. The groups have been called "periods" (Ramus, 1569), "regions" (Santa-Cruz, 1594), and "ternaries" (Recorde, c. 1542). Spanish writers, especially in the 16th century, commonly placed U or a symbol resembling the Greek θ after the figure for thousands, and qs (quentos, *cuentos*) after the one for millions, as in 160U; 462qs009U621 (*e.g.*, Texeda, 1546).

The naming of large numbers is comparatively recent. The word "million" appeared in the 13th century but seems not to have been used by mathematicians till about 1340. Its meaning was not confined to 10^6 till much later, certain writers in the 16th century taking it to be 10^9. The word "billion" appeared in the 15th century (French, Jehan Adam, c. 1480, and Chuquet, 1484). It was at first taken to mean 10^{12}, and this usage still prevails in Great Britain. By the 17th century certain Dutch and French writers used it to designate 10^9, the latter taking "milliard" as an equivalent. In the American colonies the usage was the same as in England, but owing to the French influence in the early 19th century the word "billion" was afterwards taken to mean 10^9, and this usage still prevails. The higher number names have only an historical interest. The need for very large or very small numbers is confined to scientists, and these depend upon symbols rather than names as in writing 1.8×10^{16} or 3×10^{-12}.

Operations. — The operation of addition has made but few changes through the centuries. The Romans could have added more readily than we do, although the writing of the numbers took longer. This is seen in the following additions: —

DCCCCLXXXXVIIII	999
CC XX V	225
MCC XX IIII	1224

The Roman required the learning of no addition facts; the units (ones, fives, tens, fifties . . .) were seen at once, and the only difficulty was that of "carrying." In pointing to the figures, it is easier to "add up" than to add downwards, and therefore certain writers (*e.g.*, Maximus Planudes, *c.* 1340) suggested writing the sum at the top.

Subtraction has been the subject of various experiments. On the abacus or with counters (see ABACUS) the simplest plan of taking 46 from 423 was to change 423 to $300+110+13$, after which there was no difficulty. This is essentially the plan of borrowing used by most people to-day. With the advent of the Indo-Arabic numerals other devices were suggested. One of these, the complementary plan, was known in India in the 12th century. It is based upon the identity $a-b=a+(10-b)-10$; that is, $12-7=12+(10-7)-10=12+3-10=5$. It found a worthy use when the modern calculating machine became common, subtraction being performed by adding the complement of a number, $10-7$ being the complement of 7. The plan of borrowing 1 from the tens of the minuend and repaying it by adding 1 to the tens of the subtrahend appears in Borghi's arithmetic (1484), but was already old in Europe. It seems to have been of Arabic origin, for Fibonacci (*q.v.*, 1202), who was much indebted to the Muslim writers, used it. The "addition method," seen in "making change" and sometimes called the Austrian method, was suggested at least as early as 1559, but did not become widely known till the 19th century. No one of these methods has shown such points of superiority in actual practice as to make it generally accepted as the best, and with the coming of calculating machines (*q.v.*) it is not important that it should.

The Indian writer, Bhāskara (c. 1150), gave five methods of multiplication, and Pacioli (*q.v.*, 1494) gave eight. To these may be added the ancient one of repeated addition as developed with considerable skill by the Egyptians before 1700 B.C., numerous special methods developed by the Arabs, and the method of quarter squares (*q.v.*).

Although the primitive method of dividing may have been that of repeated subtraction, the earliest one of which we have definite record is that of duplation and mediation — finding (by doubling and halving) the number of times the divisor must be used to make the dividend. The only method that was for any length of time a rival to our present plan is the Galley Method here shown.

	1	1
5	54	54
1728 (1	1728 (14	1728 (144
12	122	1222
	1	11

The problem is to divide 1728 by 12. The successive steps are shown, the last being the only one written in actual practice. It requires, in general, fewer figures than our common method. The

latter is of Oriental origin, but was brought to its present form in the 15th century.

As with all initial steps in any branch of learning, the early work in arithmetic requires the tacit assumption of certain laws, and the mechanism of the operations is accepted with a minimum of explanation. The prime necessity is that the work should become mechanical as soon and as completely as possible. The child—who is quite unable to grasp the significance of radix, scale, place value, associative law and commutative law involved in the operation—should tacitly assume all this knowledge. *(See* NUMBERS, THEORY OF; ALGEBRA; ASSOCIATIVE LAWS; COMMUTATIVE LAWS; DISTRIBUTIVE LAW.)

FRACTIONS

The subject of fractions in arithmetic involves a consideration of the primitive notion of fraction, the growth of the concept, the types of fractions, the symbolism, the names of the parts and the operations. These are discussed in the article on FRACTIONS. So far as elementary arithmetic is concerned, there are three types to be considered: (1) *Vulgar fractions* (Great Britain) or *common fractions* (United States), the name referring to such fractions as $\frac{2}{3}$ (a *proper fraction*), $\frac{3}{3}$ and $\frac{5}{3}$ (both being *improper fractions*); (2) *Sexagesintal fractions,* being fractions with unwritten powers of 60 as denominators, as in the case of $27^\circ\ 10'\ 32''$, meaning $27^\circ+\frac{10^\circ}{60}+\frac{32^\circ}{60^2}$; and (3) *Decimal fractions,* generally spoken of as *decimals.* These types will also be considered in the article on fractions.

Operations with Fractions.— Before decimal fractions began to be used, in the 16th century, and indeed before this use became at all general some two centuries later, the operations with fractions having Iarge numerators and denominators were very difficult. It became desirable to reduce such fractions to lowest terms, a process requiring the finding of the greatest common divisor by the so-called Euclidean method of continued division. Even when this was done, addition and subtraction required the finding of the least common denominator, while multiplication and division required still more work in the reduction to lowest terms. With the growing use of decimal fractions the necessity for teaching the operations with any but the simplest numerical fractions disappeared. Operations with decimals involve no difficulties if they are limited to cases which the pupil will sometime need in daily life.

In Great Britain and to a large extent in the entire British Commonwealth of nations and on the Continent of Europe, the notion of per cent. is used in a somewhat different way from that in the United States. The European usage is the historical one, permitting of such an expression as £6 per cent., meaning £6 out of (or in) £100. In the United States such an expression is practically never used. The rate of income, expenditure, increase in value or population, and so on is stated abstractly as 6%, 10%, $2\frac{1}{2}$%, and the like. Instead of the symbol % being considered to mean "in" or "out of" a hundred, as in £6 in a hundred (pounds), it is looked upon as synonymous with "hundredths" ("hundredth," "of a hundredth"). This usage has led to looking upon the work with per cents. as part of decimals. Since 6% is considered as 0.06, there is no object in treating of the two separately. In any case, however, if the treatment of per cents. is confined to those problems which someone is likely to meet sometime, and is not given largely to impractical puzzles and inverse cases, the subject offers no difficulty where measures are decimalized, and but little where they are not.

APPLICATIONS

Since the applications of arithmetic reach every branch of trade, industry, commercial activity and science, it is evident that an arbitrary limit must be placed upon what the schools can offer. It is also evident that, so far as the subject matter is concerned, this limit must vary with the world's needs and business customs. A further boundary is fixed by the abilities of the pupils in the elementary schools, this being a fairly measurable constant, at least in selected geographical and racial areas.

Each business application found in a textbook on arithmetic represents what is, or was at one time, a need. The problem of the pipes filling a cistern was a useful one in the days when the Romans established public fountains in every important town; partnership involving time was once as important as any problem involving corporations at the present time; the problem of the couriers was a real one when communication from place to place depended upon human endurance and fidelity; and the banker's draft was known even in Babylonian times. The schools always tend to be conservative.

The study of child psychology, which had its scientific beginning in the latter part of the 19th century, has established certain rather definite limits as to the nature of the arithmetic offered from year to year. This study does not concern the nature of problems so much as it does the pupil's ability to do the computation and to master the reasoning involved; it relates to the applied problem to the extent of seeing that its meaning is fairly within the mental grasp of the child This phase of the subject is at present attracting more attention than the actual practicability of the applied problems. It has resulted in an improvement in the course of study and has assisted in eliminating certain cases of computation (as in the division of unusable fractions and decimals) that are beyond the needs and the ready grasp of elementary pupils. The result has not been the standardization of topics or of applications, but the fixing of limits of difficulty for pupils of various degrees of ability. The chief problem of the schools is to find, from the wide range of applications, those that the great majority of people will sometime need to use and that psychology shows are within the mental reach of the pupils at the time they are introduced. In each of these respects the schools are making progress that is definite and is probably as rapid as circumstances permit. Among the present applications which have replaced those which are now obsolete are the following: personal and household accounts, budgeting, household inventory, sales slips, bills and invoices, transportation problems, pay-rolls, community problems (how money is raised and how it is spent), thrift and investments, business graphs, and government income and expenses.

Early Arithmetics: Cuthbert Tonstall, *De arte supputandi* (London, 1522); Robert Recorde, *The Ground of Artes* (London, 1542); Michael Stifel, *Arithmetica Integra* (Nürnberg, 1544); Gaspard de Texeda, *Suma de Arithmetica pratica* (Valladolid, 1546); Humphrey Baker, *The Well Spring of Sciences* (London, 1568); Jean Trenchant, *L'Arithmetique* (Lyons, 1578). These books are described in *Rara Arithmetica,* a catalogue of early Arithmetics, with an account of those in the library of George Arthur Plimpton, New York.

ARIUS (d. 336), name celebrated in church history, not so much on account of the personality of its bearer as of the "Arian" controversy which he provoked (Gr. Ἄρειος). Our knowledge of Arius is scanty, and nothing certain is known of his birth or of his early training. We first hear of him as a deacon in Alexandria. After some controversy he was ordained presbyter by Achillas the Bishop. in 311, and discharged his duties with apparent faithfulness and industry under Achillas, and afterwards under Alexander his successor. The cause of the controversy with which the name of Arius is associated lay not in any personalities but

in a fundamental difference of doctrine which had far-reaching religious and philosophical implications. "Is the Divine," says Harnack, "which appeared on earth and made its presence actively felt, identical with the supremely Divine that rules heaven and earth? Did the Divine which appeared on earth enter into a close and permanent union with human nature, so that it has actually transfigured it and raised it to the plane of the Eternal?"

Arius had received his theological education in the school of the presbyter Lucian of Antioch, a learned man, and distinguished especially as a biblical scholar. The latter was a follower of Paul of Samosata, bishop of Antioch, who had been excommunicated in 249, but his theology differed from that of his master in a fundamental point. Paul, starting with the conviction that the One God cannot appear substantially (οὐσιωδῶς) on earth, and, consequently, that he cannot have become man in Jesus Christ, had taught that God had filled the man Jesus with his Logos (σοφία) or Power (δύναμις). Lucian, on the other hand, persisted in holding that the Logos became man in Christ. But since he shared the above-mentioned belief of his master nothing remained for him but to see in the Logos a second essence, created by God before the world, which came down to earth and took upon himself a human body. In this body the Logos filled the place of the intellectual or spiritual principle. Lucian's Christ, then, was not "perfect man," for that which constituted in him the personal element was a divine essence; nor was he "perfect God," for the divine essence was a created being. It is this idea which Arius took up and interpreted. His doctrinal position is explained in his letters to his patron Eusebius, bishop of the imperial city of Nicomedia, and to Alexander of Alexandria, and in the fragments of the poem in which he set forth his dogmas. From these writings it can even nowadays be seen clearly that the principal object which he had in view was firmly to establish the unity and simplicity of the eternal God. However far the Son may surpass other created beings, he remains himself a created being, to whom the Father before all time gave an existence formed "out of nothing" (ἐξ οὐκ ὄντων). Arius was quite unconscious that his own monotheism was hardly to be distinguished from that of the pagan philosophers, and that his Christ was a demi-god.

For years the controversy may have been fermenting in the college of presbyters at Alexandria. Sozomen relates that Alexander only interfered after being charged with remissness in leaving Arius so long to disturb the faith of the Church. According to the general supposition, the negotiations which led to the excommunication of Arius and his followers among the presbyters and deacons took place in 318 or 319. Arius was not without adherents, even outside Alexandria. Those bishops who, like him, had passed through the school of Lucian were not inclined to let him fall without a struggle, as they recognized in the views of their fellow-student their own doctrine, only set forth in a somewhat radical fashion. Eusebius of Nicomedia, a comrade of Arius in the school of Lucian, entered the lists energetically on his behalf. But Alexander, too, was active; by means of a circular letter he published abroad the excommunication of his presbyter, and the controversy excited more and more general interest.

It reached even the ears of Constantine. Now sole emperor, he saw in the one Catholic Church the best means of counteracting the movement in his vast empire towards disintegration; and he at once realized how dangerous dogmatic strife might prove to its unity. Constantine had no understanding of the questions at issue; and no course was left but to summon a general or oecumenical council, which was convened in Nicaea (q v.) in 325. After various turns in the controversy, it was finally decided, against Arius, that the Son was "of the same substance" (ὁμοούσιος) with the Father, and all thought of his being created or even subordinate had to be excluded. Constantine accepted the decision of the council and resolved to uphold it. Alexander returned to his see triumphant, but died soon after, and was succeeded by Athanasius (*q.v.*), his deacon, with whose indomitable fortitude and strange vicissitudes the further course of the controversy is bound up.

It only remains for us here to sketch what is known of the later career of Arius and the Arians. Although defeated at the council of Nicaea, the Arians were by no means subdued. Constantine, while strongly disposed at first to enforce the Nicene decrees, was gradually won to a more conciliatory policy by the influence especially of Eusebius of Caesarea and Eusebius of Nicomedia, the latter of whom returned from exile in 328 and won the ear of the emperor, whom he baptized on his death-bed. Athanasius was banished in 335. In 336, while awaiting readmission to the church, Arius was suddenly taken ill while walking iri Constantinople, and died in a few moments. His death seems to have exercised no influence worth speaking of on the course of events. His theological radicalism had in any case never found many convinced adherents. It was mainly the opposition to the Homoousios, as a formula open to heretical misinterpretation, and not borne out by Holy Writ, which kept together the large party known as Semiarians, who carried on the strife against the Nicenes and especially Athanasius. Under the sons of Constantine Christian bishops in numberless synods cursed one another turn by turn. In the western half of the empire Arianism found no foothold, and even the despotic will of Constantius, sole emperor after 351, succeeded only for the moment in subduing the bishops exiled for the sake of their belief. In the east, on the other hand, the Semiarians had for long the upper hand. They soon split up into different groups, according as they came to stand nearer to or farther from the original position of Arius. The actual centre was formed by the Homoii, who only spoke generally of a likeness (ὁμοιότης) of the Son to the Father; to the left of them were the Anomoii, who, with Arius, held the Son to be unlike (ἀνόμοιος) the Father; to the right, the *Homoousians* who, taking as their catchword "likeness of nature" (ὁμοιότης κατ' οὐσίαν), thought that they could preserve the religious content of the Nicene formula without having to adopt the formula itself. Since this party in the course of years came more and more into sympathy with the representatives of the Nicene party, the *Homoousians,* and notably with Athanasius, the much-disputed formula became more and more popular, till the council summoned in 381 at Constantinople, under the auspices of Theodosius the Great, recognized the Nicene doctrine as the only orthodox one. Arianism, which had lifted up its head again under the emperor Valens, was thereby thrust out of the state Church. It lived to flourish anew among the Germanic tribes at the time of the great migrations, but here too as a distinctive national type of Christianity it perished before the growth of mediaeval Catholicism, and the name of Arian ceased to represent a definite form of Christian doctrine within the Church, or a definite party outside it.

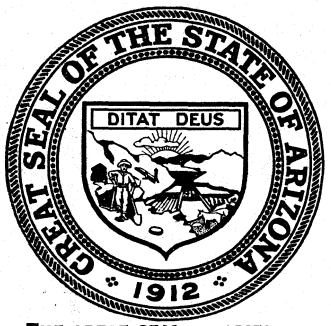
See H. M. Gwatkin, Studies of *Arianism* (2nd ed., 1900); Harnack, *History of Dogma,* Eng. tr., vol. iv.; Hastings, *Encyclopaedia* of *Religion and Ethics,* art. "Arianism." The religious and philosophical aspect of the question is discussed in Mellone, *The Price of Progress* (1924), ch. iv.

ARIZONA, the "Apache State," is a State situated in the southwestern part of the United States of America, between 31° 20′ and 37" N. and 109° 2′ and 114° 45' W. It is bounded north by Utah, east by New Mexico, south by Mexico and west by California and Nevada, the Colorado river separating it from California and in part from Nevada Of its total area of 113,909 sq mi. (water surface, 329 sq.mi.), approximately 39,000 are less than 3,000 ft. above sea level, 27,000 are from 3,000 to 5,000 ft., and 47,000 are above 5,000 feet. The popular name "Apache State" was given it because it is the home of the most of the Apache Indians.

Physical Features. — Three characteristic physiographic regions are distinctly marked: first, the great Colorado plateau, some 45,000sq m. in area, in the north part of the State; next, a broad zone of compacted mountain ranges with a southern limit of similar trend; and, lastly, a region of desert plains, occupying the south-western quarter of the State. The plateau is not a plain. It is dominated by high mountains, gashed by superb canyons of rivers, scarred with dry gullies and washes, the beds of intermittent streams, varied with great shallow basins, sunken deserts, dreary levels, bold buttes, picturesque mesas, forests and rare verdant bits of valley. The surface in general is rolling and drains through the Little Colorado (or Colorado

Chiquito), Rio Puerco and other streams into the Grand Canyon. Along the Colorado is the Painted Desert, remarkable for the bright colours—red, brown, blue, purple, yellow and white—of its sandstones, shales and clays. Within the desert is a petrified forest of Mesozoic time, the most remarkable in the United States. The marks of volcanic action, particularly lava-flows, are abundant and widely scattered.

Separating the plateau from the mountain region is an abrupt transition slope, often deeply eroded, crossing the entire State. In localities the slope is a true escarpment falling 150 and even 250ft. per mile. The mountain region has a width of 70 to 150m. and is filled with short ranges parallel to the plateau escarpment. Many of the mountains are extinct volcanoes. The south-eastern corner of Arizona is a region of greatly eroded ranges and gently sloping valleys. This mountain, zone has an average elevation of not less than 4,000 ft., while in places its crests are 5,000ft. above the plains below. These plains, the third or desert region of the State, have their mountains also, but they are lower, and they are not compacted; the plains near the mountain region slope toward the Gulf of California across wide valleys separated by isolated ranges, then across broad desert stretches traversed by rocky ridges, and finally there is no obstruction to the slope at all.



THE GREAT SEAL OF ARIZONA

The design in the centre represents a mountain range, a reservoir, and the two chief industries, mining and agriculture

Climate.—Arizona has a wide variety of local climates. In general it is characterized by clear air and low humidity. The scanty rainfall is distributed from July to April, with marked excess from July to September and a lesser maximum in December. Very little rain comes from the Pacific or the Gulf of California, precipitation being diminished by the mountains and the desert, as well as the adverse winds. Rain and snowfall usually come from clouds blown from the Gulf of Mexico and not wholly dried in Texas. The mean annual rainfall varies from 2 to 5·5in. at various points in the lower gulf valley and on the western border to 25 to 30in. in the mountains. Local thunderstorms and cloudbursts are a characteristic phenomenon, inundating limited areas and transforming dried-up streams into muddy torrents carrying boulders and débris. Often in the plateau country the dry under-air absorbs the rain as it falls; and rarely in the Moqui country do flooded gullies "run through" to the Little Colorado. The country of the cliff-dwellers in the north-east is desert-like. Only points high in altitude catch much rain. Mountain snows feed the Gila, the Little Colorado and the Colorado rivers. The floods come in May and June, and during the wet season the rivers, all with steep beds in their upper courses, wash along detritus that lower down narrows, and on smaller streams almost chokes their courses. These gradients enable the inconstant streams tributary to the Colorado to carve their canyons, some of which are in themselves very remarkable, though insignificant beside the Grand Canyon. From the Gila to the southern boundary the parched land gives no water to the sea, and the international boundary runs in part through a true desert. In the hot season there is almost no surface water. Artesian wells are used in places, as in the stock country of the Baboquivari valley.

The temperature of Arizona is somewhat higher than that of points of equal latitude on the Atlantic and Gulf of Mexico coasts. In the mountains on the plateau it ranges from that of the temperate zone to that of regions of perpetual snow; south of the mountains it ranges from temperate heats in the foothills to semi-tropic heat in the lower valleys of the Gila and Colorado. The average annual temperature over the region north of 34° is about 55°; that of the region south is about 68 degrees. The warmest region is the lower Gila valley. The daily variation (not uncommonly 60°) is of course greatest in the most arid regions, where radiation is most rapid. And of all Arizona it should be said that, owing to the extreme dryness of the air, evaporation from moist surfaces is very rapid, so that the high temperatures are decidedly less oppressive than much lower temperatures in a humid atmosphere. Intense heat prevails in July, August and September. In lowness of humidity and clarity of atmosphere, southern Arizona rivals Cpper Egypt and other famous arid health resorts.

Fauna and Flora.—Within the borders of Arizona are areas representative of every life zone save the humid tropical. From the summit of the San Francisco mountains one may pass rapidiy through all these down into the Painted Desert. In the highlands coyotes are very common; wild cats and mountain lions are fairly plentiful, but animal life in general is rather scant. Jaguars occasionally stray into Arizona from Mexico. Lizards and toads are conspicuous in the more desert areas. Snakes are not numerous. The Gila monster, tarantula and scorpion occur in come localities in the rainy season. A narrow belt along the lower Colorado river, with a short arm extending into the valley of the Gila, is so arid that it supports only desert birds and mammals.

The general conditions of distribution of the fauna of Arizona are shown even more distinctly by the flora. There are firs and spruces on the mountains, pines farther down, and piiion juniper, greasewood and sagebrush in the north, extending as far south as Flagstaff. In southern and western Arizona the giant cactus grows in groves, attaining a height of 40 and even 50 feet. In many localities the mesquite is the only important native tree. It is easy to exaggerate greatly the barrenness of an arid country. There are fine indigenous grasses that spring up over the mesas after the summer rains, furnishing range for live-stock; some of these grasses are extraordinarily independent of the rainfall. The cliff-dweller country supports a scant vegetation —a few cottonwoods in the washes, a few cedars on the mesas.

Continuous forest areas are few. A fair variety of trees—cotton-wood, sycamore, ash willow, walnut and cherry—grow in thickets in the canyons, and each mountain range is a forest area. Rainfall varying with the altitude, the lower timber line, below which precipitation is insufficient to sustain a growth of trees, is about 7,000ft., and the upper timber line about 11,500 feet. Since 1898 about 86% of the wooded lands have been made reservations, and work has been done also to preserve the forest areas in the mountains in the south-east, from which there are few streams of permanent flow to the enclosing arid valleys.

Soils and Irrigation.—The soils in the southern part of Arizona are mainly sandy loams, but vary from light loam to heavy close adobe. They are rich enough but lack water. For the reservation of the water partings, the increase of the forest areas and the creation of reservoirs, much has been done by the national Government. A reservoir below the junction of the Tonto and the Salt irrigates more than 1,000,000 acres. An East Indian weir dam across the Colorado near Yuma and levees on both sides of the Gila and the Colorado conserve the water supply. The Colorado river problem is the chief one. In 1919 Arizona adopted a comprehensive code of water laws but was unable to solve the international, interstate, financial and administrative difficulties of the Colorado river problem. 7. View of a ranch near Flagstaff
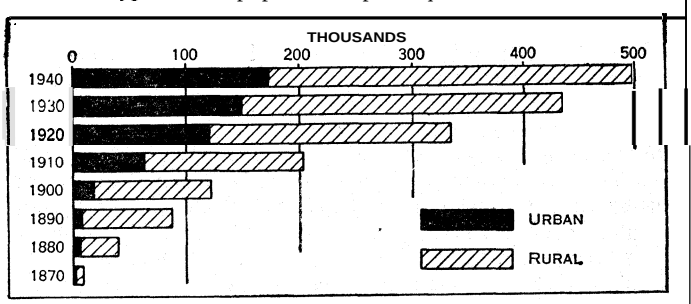
8. Tumacacori Mission, midway between Tucson and the Mexican border

formed in 1922, was rejected by the Arizona legislature in 1923, and even when revised and accepted by the legislature was vetoed by the governor, who was disinclined to surrender rights to water and power to the other six states in the agreement. In 1925 a conference of states interested broke up because of the uncompromising attitude taken by all. The number of acres irrigated in Arizona was 185,000 in 1900, 320,051 in 1910, 467,565 in 1920 and 1,085,627 in 1930.

Government. — Arizona became a territory of the first (or practically autonomous) class in 1863. Her organic law thereafter until 1910 consisted of various sections of the revised statutes of the United States. From the beginning she had a territorial legislature. Congress retained ultimately direct control of all government, administration being in the hands of resident officials appointed by the president and senate. Special mention must be made of the secret police, the Arizona rangers, organized in 1901 to police the cattle ranges; they are "fearless men, trained in riding, roping, trailing and shooting," a force whose personnel is not known to the general public. The legislature repealed the law licensing public gambling in 1907 and provided for juvenile courts and probationary control of children. The state constitution adopted in 1910 provides for the initiative and referendum and that no child under 16 may work "underground in mines, or in any occupation injurious to health or morals or hazardous to life or limb, nor in any occupation at night, or for more than eight hours in any day." By amendment to the constitution articles were added providing for the recall of judges (1912), for woman suffrage (1912) and for prohibition (1914, 1916). The death penalty, abolished in 1916, was restored in 1918, and in 1933 there was ratified the constitutional amendment making lethal gas the state's mode of capital punishment. In 1934 a system of old-age pensions was created. A state convention voted repeal of national prohibition in September, 1933.

Population. — The population of Arizona in 1870 was 9,658; in 1890 it was 88,243; in 1910, 204,354; and in 1940, 499,261. This last figure represents an increase of 14.6% over the population in 1930. The population per square mile was 4.4, as



BY COURTESY OF THE U S BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF ARIZONA, 1870–1940

compared with 44·2 for the United States as a whole. Of the 1940 population, 173,981, or 34·8%, lived in urban places, that is, in cities and towns of 2,500 or more. The rural population, occupying the remainder of the state, thus constituted 65.2% of the total. The population of the state and of its principal cities is summarized for recent censuses in the following table:

Ares	Population			Percent of increase	
	1940	1930	1920	1930–40	1920–30
The State	499,261	435,573	334,162	14 6	30 3
Urban	173,981	140,856	117,527	16 1	24 1
Rural	325,280	285,717	216,635	13 8	33 0
Percent urban	34 8	34 4	35 2		
Principal cities					
Phoenix	65,414	48,118	29,053	35 9	65 6
Tucson	36,818	32,506	20,292	13·3	60·2

The number of occupied dwelling units returned in the housing census of 1940 was 131,189, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 4 1 in 1930 to 3.8 in 1940. The white population of Arizona (including Mexicans) formed 85 6% of the total in 1940, as compared with 86·9% in 1930, about four-fifths of the nonwhite population being Indians and most of the remainder Negroes, with appreciable numbers of Chinese and Japanese. The number of males per 100 females in the entire population of the state was 108·3, though there was a slight excess of females in the urban population, the sex ratio being 98.9 for the urban population and 113·7 for the rural population. There were about 24,000 persons 65 years old and over in Arizona in 1940, as compared with 15,768 in 1930.

PAPAGO INDIANS ENGAGED IN DOMESTIC WORK OUTSIDE THEIR HOMES
While auartered on government reservations and provided with mission schools, many of the Indian tribes still follow the primitive customs of their forefathers

The Indians, organized in over 30 tribes, form an ever decreasing proportion of the population, representing only 10% in 1920. The more important are the Hualapaic or Apache-Yumas; the Mohaves; the Yavapais or Apache-Mohaves; the Yumas, whose lesser neighbours on the lower Colorado are the most primitive Indians of the U.S. in habits; the Pimas and Papagoes, who figure much in early Arizona history, and who are superior in intelligence, adaptability, application and character; the Hopis or Moquis, possessed of the same good qualities and famous for their prehistoric culture (Tusayan); and the Navahos and kindred Apaches, perhaps the most relentless and savage of Indian warriors. The Pimas and Papagoes, converted by th]
tain a tt of Christianity, plentifully alloyed with paganism. Apaches, Pimas and Papagoes have been employed by the federal government on irrigation works and have proved industrious and faithful. Since 1900 a few hundred Yaquis, because of difficulties with the Mexican government, have crossed into southern Arizona and settled there They have rapidly acquired American customs and make good labourers.

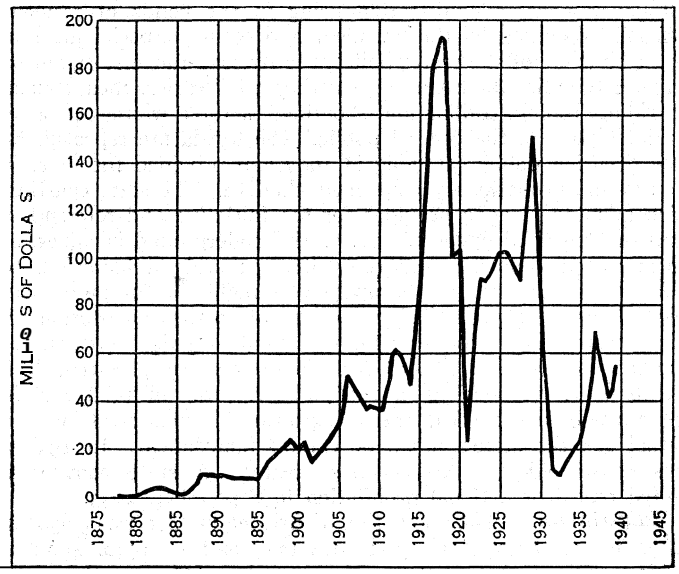
Finance and Taxation. — The total revenue of the state for the fiscal year ending June 30, 1940 was $26,906,810, slightly over 70% of which was raised by taxation. The chief sources of taxation were property, fuel and sales taxes, these three sources contributing over $4,000,000 each. The total governmental costs for the same period were $24,760,896, the largest items being highways, $7,550,971; welfare and correction, $7,299,351; and education, $4,486,202. The state cost of education promises to be higher in the future, since the voters at the general election in 1940 authorized the shifting of local school costs to the state. Previous to 1941 there were several futile attempts to free homes under $5,000 from taxation. The bonded debt of the state, June 30, 1940, was $3,092,275 of which $1,884,000 was indebtedness of state educational institutions and designated as self-liquidating.

Education. — The public school system mas established in 1871. A compulsory attendance law (1921) applies to children betueen 8 and 16 years of age, but it is not generally obeyed by the Mexican element. In 1939–40 the enrolment in elementary schools was 87,960 with an average daily attendance of 67,845; in high schools the enrolment was 22,245, with an average daily attendance of 17,722. Included in the elementary enrolment were 33 443 Mexicans, Negroes and other foreign races; in the high schools, 3,275 of the same races. The average salary of

teachers was $1,395 a year; of principals, $2.465; of superintendents, $3,982. There were 32 private and federal Indian schools with 7,208 pupils in 1939–40. In addition, there were 934 Indians in the state public schools. The Arizona State Industrial School for Boys, opened in territorial days at Benson (1903), was removed a decade later to Fort Grant, its present location. Over half its inmates were Mexicans and 35%, white. Tucson and Phoenix are noted for private schools attended by pupils from the north desiring a mild climate and outdoor life. Of the 60 accredited high schools, 45 were members of the North Central Association of Colleges and Secondary Schools in 1941. The Arizona State School for the Deaf and the Blind has been located at Tucson since its organization in 1910. The two junior colleges are the Gila Junior college and the Phoenix Junior college, the latter located since 1940 on a new and enlarged campus. Two state teachers' colleges are at Flagstaff and at Tempe. The University of Arizona is located at Tucson with an enrolment of 2,922 in 1940–41. The institution is composed of eight colleges: graduate college; college of agriculture; college of education; college of engineering; college of fine arts; college of law; college of liberal arts and college of mines. The agricultural experiment station, the Stewart observatory, the Arizona bureau of mines, the state pure food laboratory and the state museum are also on the campus. In 1916 the University of Arizona was admitted to the North Central Association; in 1919 it became a member of the Association of American Colleges, and in Nov 1924 the Association of American Universities added it to the list of approved institutions.

Agriculture.—Farming in Arizona is varied and intensive. The crops include strawberries, dates, cotton, alfalfa, hay, wheat, sorghum, oranges, olives, sweet potatoes, yams and sugar beets. Crop follows crop in quick succession, alfalfa producing from four to seven cuttings in a year. In 1940, 190,000 ac. yielded 427,500 tons of hay. Stock raising is a leading occupation, but it has probably attained its full development. The number of sheep and cattle, pastured mostly on public domain, is now limited by the extension of the national forest reserves (11,389,714 ac. in Arizona in 1939) and the regulations enforced by the U.S. government for the preservation of the ranges. The five-year average for beef cattle shipments (1935–39) was 343,000 head; for slaughtering in Arizona, 116.000 head. The number of sheep Jan. 1. 1941 was estimated at 805,000, over half of which were owned by Indians. The number of dairy cattle was estimated at 50,000. Truck farming furnishes large shipments to colder sections. In 1940 the 14,000 ac. of spring lettuce produced 7,300 carloads, and 9,880 ac. of cantaloupes, 3,823 carloads For over 20 years cotton has been an important product. In 1940 there were 155,000 ac. of short-staple, a decrease in acreage and production as compared with 1937; 64,000 ac. of American-Egyptian produced 35,000 bales. The total cash income for the year to cattle raisers and farmers was estimated at $58,000,000.

Minerals. — Mining is the leading industry of Arizona. Contrary to venerable traditions there is no evidence that mining was practised except to a very inconsiderable extent by aborigines, Spanish conquistadores, or Jesuits. In 1738 an extraordinary deposit of silver nuggets, quickly exhausted (1741), was discovered at Arizonac. At the end of the 18th century the Mexicans considerably developed the mines in the southeast. The second half of the 19th century witnessed several great finds: first, of gold placers on the lower Gila and Colorado (1858–69); later, of lodes at Tombstone, which flourished from 1879 to 1886, then decayed, but in 1905 had again become the centre of important mining interests; and still later, of copper at Jerome and around Bisbee. Several of the Arizona copper mines are among the greatest of the world. The Copper Queen at Bisbee from 1880–1902 produced 378,047,210 lb. of crude copper, which was then practically the total output of the territory, other valuable mines having been developed later; the Ajo, Morenci and Jerome districts arc secondary to Bisbee. Important mines of gold and silver, considerable deposits of wolframite, valuable ores of molybdenum and vanadium, and quarries of onyx marble, are also worked. Low-grade coal deposits occur in the east central part of the state and near the junction of the Gila and San Pedro rivers. Some fine gems of peridot, garnet and turquoise have been found. The total value of metal from Arizona mines in 1939 was $72,616,408; of this $54,519,296 was the value of copper; $11,075,855, of gold; $5,310,839, of silver and $1,012,474, of lead. Arizona in 1939 mined more copper than any other state, producing 32·9% of the total for the United States. Since 1910 the tendency has been toward the development of low-grade deposits. Similar to the stripping of Sacramento hill near Bisbee in 1920, was the removal of material in 1939 at Morenci to uncover an estimated reserve of 230,000,000 tons averaging 1·06% copper. The United Verde mine was reopened in 1935. In



GRAPH SHOWING VALUE OF COPPER PRODUCED IN ARIZONA, 1877–1939

1939 it ranked second in the state in production of gold and silver, and third in copper.

Manufactures. — The manufactures of Arizona are based chiefly upon the minerals in the state. In 1937 there were 290 establishments in the state employing 7,193 workers whose wages for the year amounted to $8,602,418. The value of the products increased from $20,438,987 in 1900 to $118,355,981 in 1937. The smelting and refining of copper is the principal industry, producing 518,000,000 lb. in 1939. Lumber and timber products are also important, 113,167,000 ft. (board measure) were shipped from the state in 1939 and 68,692,000 ft. were consumed within the state. Meat packing and the handling of cottonseed products are also important.

The Navaho and Moqui Indians make woollen blankets and rugs, and the Pimas make baskets. Onyx marbles of local source are polished at Phoenix.

Railways.—Two trans-continental railway systems, the Southern Pacific and the Santa Fe, were built across Arizona in 1878–83. They are connected by one line, and various branches have been built. The railway mileage on Jan. 1, 1938, was 2,271.

History. — The history of the southwest is full of interest to the archaeologist. A prehistoric culture widely distributed has left abundant traces. Pueblo ruins are plentiful in the basins of the Gila and Colorado rivers and their tributaries. Geographical conditions and a hard struggle against nature fixed the character of this "aridian" culture and determined its migrations; the onslaughts of nomad Indians determined the sedentary civilization of the cliff-dwellers. A co-operative social economy is evidenced by the traces of great public works, such as canals many miles in length. The pueblos of the Gila valley are held to be older than those of the Colorado. Casa Grande, 1 j mi. S.E. of a railway station of the same name on the Southern Pacific railway, is the most remarkable of plains ruins in the southwest, the only one of its type in the United States. It resembles the Casa Grande rain of Chihuahua, Mexico, with its walls of sun-dried earth and its area of rooms, courts and plazas, surrounded by

a wall. It was already a ruin when discovered in 1694 by the Jesuit Father Kino.

John Russell Bartlett described it in 1854, and in 1889 Congress voted that it be protected as a government reservation; in 1892 it was set apart by the Government. Excavations were made there in 1906–07 by Dr. J. Walter Fewkes. The valleys of the Salt river and its affluents, the Agua Fria, Verde and Tonto, are strewn with aboriginal remains; but especially important in the northward migrations of culture was the Little Colorado. A very considerable population must have lived once in this valley. It is possibly represented to-day by the still undeserted habitats of Zuñi (in New Mexico) and Tusayan; the Moquis, after the Zuiiis, are in customs and traditions the best survival of the ancient civilization.

Arizona north of the Gila, save for a very limited and intermittent missionary effort and for scant exploring expeditions, was practically unknown to the whites until well after the beginning of American rule. The Santa Cruz valley, however, has much older annals of a past that charms by its picturesque contrasts with the present. Arizona history begins with the arrival in Sonora in 1536 of Alvaro Nuñez Cabeza de Vaca, who, although he had not entered Arizona or New Mexico, had heard of them. and by his stories incited the Spaniards to explore the unknown North in hope of wealth. Marcos de Niza, a Franciscan friar to whom the first reconnaissance was entrusted, was. in 1539, the first Spaniard to enter the limits of Arizona. Members of Coronado's expedition explored the Moqui country and reached the Grand Canyon, and after this a succession of remarkable and heroic explorations followed through the century. All this has left traces in still living myths about the early history of the south-west. Early in the 17th century considerable progress had been made in Christianizing the Pimas, Papagoes and Moquis. Following 1680 came a great Indian revolt in New Mexico and Arizona, and thereafter the Moquis remained independent of Spanish and Christian domination. although visited fitfully by rival Jesuits and Franciscans. In 1732 regular Jesuit missions were founded at Bac and Guevavi. The region south of the Gila had already been repeatedly explored. In the second half of the century there were a *presidio* at Tubac and some half dozen *pueblos de visita,* including the Indian settlement of Tucson.

A few errors should be corrected and some credit given with reference to this early period. The Inquisition never had any jurisdiction whatever over the Indians; compulsory labour by the Indians was never legalized except on the missions, and the law was little violated; the Indians were never compelled to work mines; of mining by them for precious metals there is no evidence; nor by the Jesuits (expelled in 1767, after which their missions and other properties were held by the Franciscans), except to a small extent about the *presidio* of Tubac, although they did some prospecting. Persistent traditions have greatly exaggerated the former prosperity of the old south-west. The Spaniards probably provoked some intertribal intercourse among the Indians and did something among some tribes for agriculture. Their own farms and settlements. confined to the Santa Cruz valley, were often plundered and abandoned, save in the immediate vicinity of the *presidio.* From about 1790 to 1822 was a period of peace with the Apaches and of comparative prosperity for church and State. The fine Indian mission church at Bac. long abandoned and neglected, dates from the last decade of the 18th century.

BY COURTESY OF THE ATCHISON, TOPEKA AND SANTA FE RAILWAY COMPANY

A TRADING POST, THE INDIAN'S CONTACT WITH CIVILIZATION

Here he brings the products of his handicraft, such as baskets and blankets, and exchanges them for food and wearing apparel

The establishment of a *presidio* at Tucson in 1776 marks its beginning as a Spanish settlement.

The decay of the military power of the *presidios* during the Mexican war of independence, the expulsion of loyal Spaniards —notably friars—and the renewal of Apache wars led to the temporary abandonment of all settlements except Tubac and Tucson. The church practically forsook the field about 1828.

American traders and explorers first penetrated Arizona in the first quarter of the 19th century. As a result of the Mexican war, New Mexico, which then included all Arizona north of the Gila, was ceded to the United States.

California gold discoveries drew particular attention to the country south of the Gila, which was wanted also for a transcontinental railway route.

This strip, known as the "Gadsden Purchase" *(see* GADSDEN, JAMES), was bought in 1853 by the United States, which took possession in 1856.

This portion also was added to New Mexico. The Mexicans. pressed by the Apaches, had, in 1848, abandoned even Tubac and Tumacacori, first a visita of Guevavi, and after 1784 a mission. The progress of American settlement was interrupted by the Civil War, which caused the withdrawal of the troops and was the occasion for the outbreak of prolonged Indian wars.

Meanwhile a convention at Tucson in 1856 sent a delegate to Congress and petitioned for independent territorial government. This movement and others that followed were ignored by Congress owing to its division over the general slavery question, and especially the belief of northern members that the control of Arizona was an object of the pro-slavery party. By act of Feb. 24, 1863, Congress organized Arizona Territory as the country west of 109° W. longitude. In December an itinerant government, sent out complete from Washington, crossed the Arizona line and effected a formal organization. The territorial capital was first at Prescott and finally at Phoenix (since 1889), where the State capital now is.

There have been boundary difficulties with every contiguous State or territory. The early period of American rule was extremely unsettled. The California gold discoveries and overland travel directed many prospecting adventurers to Arizona. For some years there was considerable sentiment in favour of filibustering in Sonora. Mexico.

The Indian wars, breeding a habit of dependence on force, and the heterogeneous elements of cattle thieves, Sonora cowboys, mine labourers and adventurers led to one of the worst periods of American border history.

Agitation for statehood, which began as early as 1872, seemed on the point of success in 1891, when a Constitution was drafted, submitted to the people of the State and ratified. The U.S. Senate objected to this Constitution because it seemed to repudiate certain contracts and set up a double monetary standard. The Senate continued to reject bills providing for statehood until the State sent up a new Constitution in 1910.

This Constitution raised a question of national importance in the form of a provision for the recall of judges by popular vote. After much argument President Taft and the Congress finally agreed on a resolution granting statehood on condition that the provision for recall be struck out. This was done, and on Feb. 14, 1912, the President signed the proclamation admitting Arizona as a State. After admission the people of the State promptly inserted by amendment the original provision for the recall of judges.

Another issue of national interest was the Alien Labour law enacted by the voters of the State in 1914. The act provided that when any corporation, company, partnership or individual employed more than five workers, 80% of them should be qualified electors or native born citizens.

The ambassadors of Great Britain and Italy averred that the law violated existing treaties, and the Federal courts ruled that the law was unconstitutional because it denied equal protection to aliens.

Protest was made in 1934 by both the Japanese embassy in Washington and British consulate in Phoenix to the action of several hundred white farmers who had warned Japanese and Hindu farmers in the Salt river valley to leave, in view of a threatened enforcement of the state law prohibiting Orientals from owning or leasing land.

The election of Nov. 1916 resulted in a situation that aroused high party feeling. Previously Gov. Hunt, supported by a Democratic assembly, had been elected for two terms. In 1916 he was a candidate for the third time. On the face of the returns. Campbell, the Republican candidate, was elected; but Hunt, after being compelled to give up the office to Campbell, was restored by the State supreme court. The bitter political struggle reflected a tense industrial situation that culminated in a number of strikes, the most important of which was the one at Clifton and Morenci, beginning in Sept. 1915. The Bisbee deportation incident in July 1917, when more than a thousand members of the organization called the Industrial Workers of the World were deported summarily to Columbus, N.M., produced an even more critical situation. President Wilson at once warned the governor of the danger of such a precedent and appointed a committee to investigate and adjust the dispute. The committee found that any adjustment between employers and labour organizations was impossible and recommended a law making future deportation a Federal offence.

One of the major problems which confronted the State during the period from 1920 to 1935 was that of the future supply of water in the Colorado river for purposes of irrigation and hydroelectric power. This problem was rendered critical by the position of Arizona at the lower end of the river and by its own failure to develop hydro-electric power plants as extensively as its neighbours. Because of the fear that they might suffer from a lack of sufficient water for future irrigation projects if they were forced by any agreement to let Mexico have a large supply, the people of the State stood solidly behind their governors in the fight against the Colorado river compact and the construction of Boulder dam and afterwards against the building of the Parker dam to serve the Metropolitan Water District of Los Angeles, California.

In 1931 Arizona lost the suit, based on its contention that the Boulder dam act was unconstitutional and that the Secretary of the Interior was invading the state's rights by proceeding to construct the dam. In dismissing the case, the United States Supreme Court held that, since the Colorado river was once navigable, "commercial disuse resulting from changed geographical conditions and a congressional failure to deal with them does not amount to an abandonment of a navigable river or prohibit future exertion of Federal control."

Twice during 1934, in connection with the construction of Parker dam, Gov. Moeur called out the state's National Guard to prevent work on Arizona's side of the Colorado river.

When the matter was referred to the United States Supreme Court, that body supported the governor's course; the state, therefore, felt its position strengthened in obtaining from the Colorado river 7,500,000 acre-feet of water a year instead of the previously demanded 2,800,000.

The balance of parties in Arizona has been fairly close. In State politics the Republicans were successful in 1916, 1918, 1920 and 1928 whereas the Democrats carried the polls in 1922, 1924, 1926, 1930, 1932, 1934, 1938 and 1940.

Almost the reverse order prevailed in national elections, the State's vote going to the Democrats under Wilson in 1912 and 1916 but thereafter consistently to the Republicans cntil 1932. In that election, as well as in 1936 and in 1940, Roosevelt won by large popular majorities.

ARJUNA, in post-Vedic Hindu mythology son of Indra, a hero of the *Mahābhārata;* and the central figure in the part of that epic called the *Bhagavadgita.* In modern Hinduism he is unimportant.

See E. Washburn Hopkins, *Epic Mythology,* Strasbourg (1915).

ARK, a word meaning properly a chest or box, is used in the English Bible to translate two different Hebrew words.

(a) Heb. *tēbah,* probably an Egyptian loan-word meaning a box or coffin. It is used of (1) the reed basket or boat in which Moses was exposed by his mother. This is described as made of papyrus stems and rendered waterproof with bitumen. It was provided with a cover or lid, and was clearly intended to protect the child against wild animals, especially, perhaps, crocodiles. (2) The vessel in which Noah saved himself, his family and specimens of all living animals. (See DELUGE; NOAH.) In the older of the two narratives which have been combined to form our present text (the "Yahwist"), it is represented as large enough to contain seven specimens of every sacrificial animal and two each of all the rest. There is a window, made by Noah himself, and a covering which he is able to remove, though it seems that it had to be placed on the ark by Yahweh. The later account (the "priestly") gives a number of details, in a manner characteristic of the priestly writings. The material is "gopher" wood; it is divided into compartments and covered all over with bitumen; it has three decks with a window in the roof over the highest, and its dimensions are roughly 450 ft. by 75 ft. by 45 feet. One pair only of each species is taken into the ark, for animal food is only permitted after the Flood according to "P," and there is, therefore, no need of extra "clean" animals for sacrifice.

(b) Heb. *'arōn,* meaning a box, used in Gen. 1. 26 of the coffin in which Joseph's body was preserved, but more commonly applied to the "Ark of the Covenant" or "Ark of Testi-

mony," the most sacred religious symbol of early Israel. Though it is a familiar object in J and E (the "Yahwist" and "Elohist" sources) no account of its construction has survived. D (the "Deuteronomist") speaks of its material as being acacia wood, and in P there is an elaborate account of its structure, including a description of the lid, which was of pure gold and included two cherubs, one at each end, with their wings meeting in the

THE ARK OF THE LAW IN THE NEW SYNAGOGUE. GREAT ST. HELEN'S. LONDON, A REPLICA OF WHICH IS IN THE NEW SYNAGOGUE AT STAMFORD. CONNECTICUT

The actual ,Ark, which contains the Scrolls of the Law, is the built-in-cupboard in the centre. The doors are partly concealed by the velvet curtain. The Hebrew inscription on the frieze of the Corinthian order above the Ark means "Know in Whose presence thou standest"

middle. This cover was of special importance in the religious thought of Israel, for it was there, on the "mercy-seat," that Yahweh's presence might most certainly be found.

Whilst some of the details supplied by P may be of later origin, there can be little doubt that the possession of the ark goes far back beyond the conquest of Palestine, and that when Israel entered Canaan it was the centre of the national worship. Thus the early narratives give it an important place in the crossing of the Jordan and the capture of Jericho. After the settlement it is first found at Shiloh, under the care of Eli, but was captured by the Philistines at the battle of Aphek. Taken by them into their own territory it proved a dangerous possession, and was eventually returned to Israel. For a time it remained forgotten, or at least unnoticed, but was brought by David to Jerusalem when he made that city his capital. It was placed in the temple by Solomon, and probably remained there throughout the period of the monarchy. When it disappeared we do not know, but a late passage in Jeremiah (iii. 16) mentions it in terms which imply that it has ceased to exist.

The ark is held to be par *excellence* the home of Yahweh, and the earlier references leave no doubt as to the belief that He dwelt within it. Thus the formula used when it was taken into battle was "Arise, O Yahweh, and let thine enemies be scattered" (Num. x. 35, *cf.* ver. 36). It is true that, when taken into battle by Hophni and Phineas (I. Sam. iv. 4 ***seq.),*** it was captured by the Philistines, but the sequel shows that this was deliberately permitted by its Inhabitant. Set in the temple at Ashdod, it showed the presence of great power by the treatment of Dagon, and by the plagues which befell the Philistines. Most significant is the story of its return to Israel (I. Sam. vi.). Two cows have their calves removed from them and are harnessed to the cart on which the ark is placed. Then, though no human hand is placed upon them, instead of seeking their calves they take the straight road for Israelite territory, without deviating, though lowing in protest. Clearly they are being driven by a mighty force in the ark itself. Yet later, an accidental desecration is swiftly and terribly avenged (II. Sam. vi. 6), and there are other references which indicate that the ark was venerated as the divine dwelling. (T. H. R.)

ARKADELPHIA, a city of Arkansas, U.S.A., on the Ouachita river, about 75 mi. S.W. of Little Rock; the county seat of Clark county. It is on federal highway 67, and is served by the Missouri Pacific railroad. The population in 1930 was 3,380; in 1940, 5,078, federal census. Arkadelphia is picturesquely located among rolling hills. It has one of the largest flour mills in the state, cotton gins, tile plants, sawmills, and a cottonseed-oil mill. Abundant power is available from the hydro-electric development of the Ouachita. Arkadelphia is the seat of Ouachita college (Baptist; established 1888) and of Henderson State Teachers college (established 1890), both coeducational institutions. The first settler was John Hemphill in 1811. He set up a salt works, the first manufacture in the state. The manufacture of salt was continued until the Civil War, and was the cause of fighting for the possession of the city.

ARKANSAS (ahr'kăn-saw), popularly known as the "wonder state," is one of the south-central states of the United States of America. It is situated between 33° and 36° 30' N. lat. and 89° 40' and 94° 42' W., and its boundaries are north, Missouri, east, the Mississippi river, separating it from Tennessee and Mississippi, south, Louisiana and west, Texas and Oklahoma. Its area is 53,102 sq.mi., of which 377 are water surface. Arkansas was given the name "wonder state" by an act of the general assembly in 1923, because of its remarkable natural resources.

Physical Features.—Arkansas lies in the drainage basin of the lower Mississippi and has a remarkable river system. The Arkansas river bisects the state from west to east. Nine other large streams drain the state; the Red, the Ouachita, the White and the St. Francis being the most important. There are a number of swamps and bayous in the eastern part.

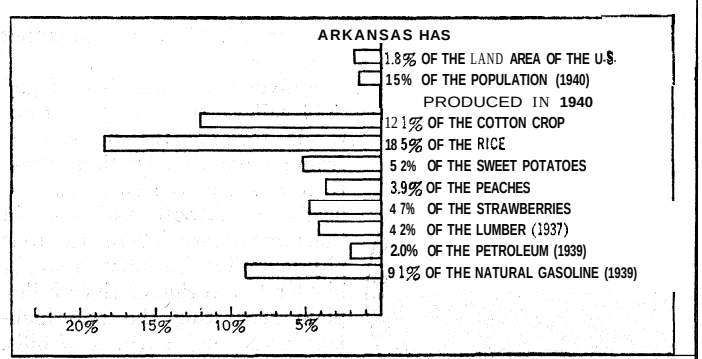
The surface of Arkansas is more diversified than that of any other state in the central Mississippi valley. It rises, sloping upwards towards the north-west, from an average elevation of less than 300ft. in the south-east to heights of 2,000ft. and more in the north-west. There are four physiographic regions: two of highlands, a region of river valley plain separating the two highland areas, and a region of hills, lowlands and prairie. This fourth region covers the eastern half of the state and is part of the gulf or coastal plain of the United States. If a line were drawn from the point where the Red river cuts the western boundary to where the Black cuts the northern, east of it would be the gulf plain and west of it the highlands (over 500ft.) and the mineral regions of the state. They are divided by the valley of the Arkansas river into two regions, which are structurally different. South of the river are the Ouachita mountains, and north of it are the Boston mountains. The Ouachita mountains are characterized by close folding and faulting. Their southern edge is covered with cretaceous deposits, and their eastern edge is covered as well

SEAL OF THE STATE OF ARKANSAS

with the tertiary deposits of the gulf plains. The Arkansas valley is marked by wide and open folding. The Boston mountains are substantially a continuation of the Ozark dome of Missouri. Their northern border is marked by an escarpment 500 to 700ft. in height. The trend is from east to west between Batesville (Ark.) and Wagoner (Okla.). The entire region is very much dissected by streams, and the topography is of a terrace and escarpment type. In the highlands north of the Arkansas the country is irregularly broken; south of the river the hills lie, less capriciously, in short, high ranges, with low, fertile valleys between them. The Ouachitas extend zoom., from within Oklahoma (near Atoka) to central Arkansas (near Little Rock). They are characterized by long, low ridges bearing generally west to east with wide, flat valleys. Near the western boundary of the state they attain a maximum altitude of 2,800ft. above the sea and 2,000ft. above the valleys of the Arkansas and Red rivers, falling in elevation eastward (as westward) to 500–700ft. Five peaks rise above 2,000 feet. Magazine and Blue mountains, each of 2,800ft. altitude are the highest points in the state. The streams are swift, and in their lower courses flow in gorges 500 to 1,000ft. deep, almost deserving the name of canyons. The main streams are tortuous, and their tributaries have cut the region into ridges. Along the upper course of the White river in the Bostons, and in the country about Hot Springs is the most beautiful scenery.

The climate of the state is "southern," owing to the influence of the Gulf of Mexico. The mean temperatures for the different seasons are normally about 41·6°, 61·1°, 78.8' and 61·9° for winter, spring, summer and autumn respectively. The normal mean precipitations are about 11·7, 14·5, 10·5 and 10·2in. for the same seasons. The extreme range of the monthly isotherms crossing the state is from about 35° in winter to about 81° in summer. and the range of annual isotherms from about 54 to about 60 degrees. The variation of mean annual temperatures for different parts of the state is, then, only six degrees. Precipitation varies from 34 to 64in. according to locality. Winter cold is seldom severe, and there is no summer drought. Sheltered valleys in the interior produce spring crops three or four weeks earlier than is usual in this latitude. The climate is generally healthy.

The state possesses a rich fauna and flora. The forest lands of the state include one-fourth of its area, with most of it actually covered by standing timber. Valuable trees are of great variety; cotton-wood, poplar, catalpa, red cedar, sweet gum, sassafras, persimmon, ash, elm, sycamore, maple, a variety of pines, pecan, locust, dogwood, hickory, various oaks, beech, walnut and cypress

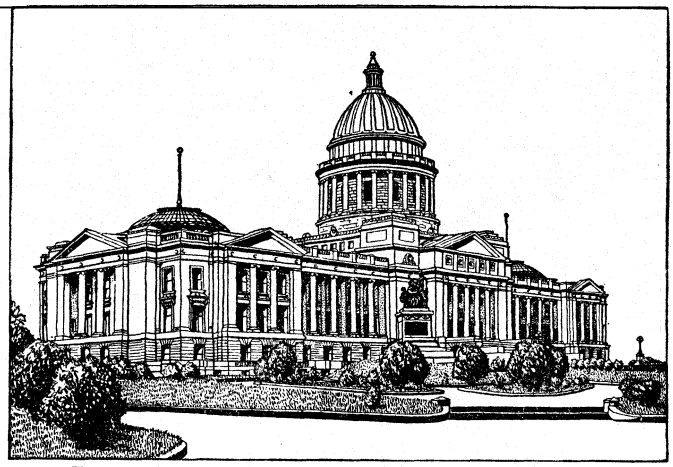


GRAPH SHOWING LAND AREA. POPULATION AND PRODUCTION OF ARKANSAS

are all abundant. There are 129 native species of trees The yellow pine, the white oak and the cypress are the most valuable growths. The northern woods are mainly hard, the yellow pine is most characteristic of the heavy woods of the south-central counties, and magnificent cypress abounds in the north-east. Hard woods grow even on the alluvial lands. "The hard-wood forests of the state are hardly surpassed in variety and richness, and contain inestimable bodies of the finest oak, walnut, hickory and ash timber" (U.S. census) The growth on the alluvial bottoms and the lower uplands in the east is extraordinarily vigorous. There are two Federal forest reserves (963,287 acres).

The soils of Arkansas are of peculiar variety. That of the highlands is mostly but a thin covering, and the larger portion is poorly fitted for agriculture. The uplands are generally fertile. The poor soils are distinctively sandy; the soils of the lowlands, clayey; but sand and clay are found combined in rich loams characterized by the predominance of one or the other constituent. The alluvial bottoms are of wonderful richness.

Government. — The present constitution, in an amended form, dates from 1874. Few features differentiate it from the usual type of such documents. The governor holds office for two years. He



THE STATE CAPITOL BUILDING AT LITTLE ROCK. ARKANSAS
The monument to the women of the Confederacy, in the foreground, suggests the important part Little Rock played as a Confederate centre during the first years of the Civil War

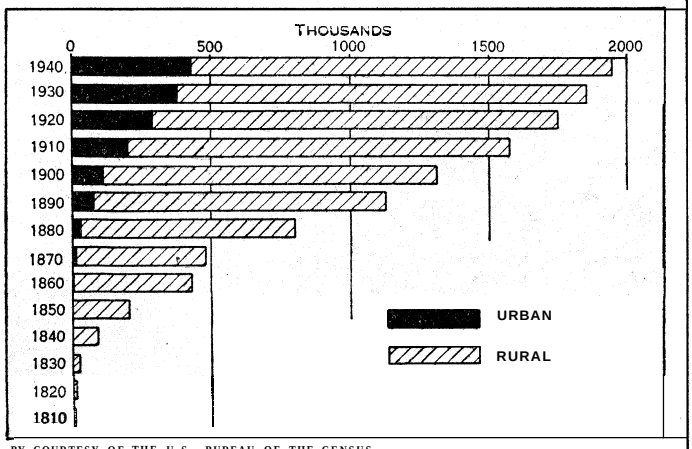
has the pardoning and veto power, but his veto may be over-ridden by a majority of the whole number elected to each house of the legislature.

The legislature is bicameral. Senators, 35 in number, hold office for four years; representatives, 100 in number, for two years. The length of the regular biennial session is limited to 60 days, but by a vote of two-thirds of the members elected to each house the length of any session may be extended 15 days. Special sessions may be called by the governor. A majority of the members elected to each of the two houses suffices to propose a constitutional amendment, which the people may then accept by a mere majority of all votes cast on the measure. Amendments may also be made by the use of the initiative and referendum. The supreme court has seven members elected by the people for eight years; they are eligible for re-election. Tbe state is divided into 18 judicial or circuit court districts and 14 chancery districts. The population of the state entitles it to seven representatives in the national house of representatives and to nine votes in the electoral college

An unusual provision of the constitution is that no law shall "be enacted whereby the right to vote at any election shall be made to depend upon any previous registration of the elector's name." An amendment of 1893 requires evidence of the payment of a poll-tax by every voter except those "who make satisfactory proof that they have attained the age of 21 years since the time of assessing taxes next preceding" the election. There is nothing in the constitution or laws of Arkansas with any apparent design to disfranchise the Negroes, though few vote. There are statutory provisions (1866–67) against intermarriage of the races and constitutional and statutory (1886–87) provisions for separate schools; a "Jim Crow" law (1891) requires railways to provide separate cars for Negroes, and also requires (1893) separate railway waiting rooms. The constitution provides that no county shall consist of less than 600 sq mi. of territory and 5,000 inhabitants. Lafayette, Pope and Johnson counties being excepted. New counties may be formed by the general assembly, provided the majority of the voters of the affected territory consent to the change. The county is divided into political townships, road districts, school districts and other groupings for administrative purposes. A homestead belonging to the head of a family and containing Po to 160 ac. (according to value) if in the country, or one-

fourth to one ac. (according to value) if in town, village or city, is exempt from liability for debts, excepting liens for purchase money, improvements or taxes. Homesteads up to $1,000 are exempt from state taxation.

Population. — The population of Arkansas in 1810 was 1,062; in 1830 it was 30.388; in 1850, 209,897; in 1880, 802.525; in 1910, 1,574,449; and in 1940, 1,949,387. This last figure represents an increase of 5·1% over the population in 1930. The population



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF ARKANSAS: 1810 TO 1940

per square mile was 37·0 as compared with 44·2 for the United States as a whole. Of the 1940 population, 431,910, or 22·2%, lived in urban places; that is, in cities and towns of 2,500 or more. The rural population, occupying the remainder of the state, thus constituted 77·8% of the total. The number of occupied dwelling units returned in the housing census of 1940 was 495,841, which is approximately the same as the number of families. The average population per family (occupied dwelling unit) declined from 4.2 in 1930 to 3.9 in 1940. The white population of Arkansas formed 75·2% of the total in 1940, as compared with 74·2% in 1930, practically all the nonwhite population being Negro. The number of males per 100 females in the entire population of the state was 103·4, the sex ratio being 104·7 for the white and only 99.6 for the nonwhite population. The population of the state and of its principal cities is summarized in the table:

Area	Population			Percent of increase	
	1940	1930	1920	1930–40	1920–30
The State	1,949,387	1,854,482	1,752,204	5·1	5·8
Urban	431,910	382,878	290,497	12·8	31·8
Rural	1,517,477	1,471,604	1,461,707	3·1	0·7
Percent urban	22·2	20·6	16·6	..	
Principal cities:					
Little Rock	88,039	81,679	65,142	7·8	25·4
Fort Smith	36,584	31,429	28,870	16·4	8·9

Finance and Taxation. — The two outstanding expenditures in 1939–40 were for highways and education. In that period $8,642,822 was expended on rural highways under the supervision of the state highway department, and $14,023,914 on public schools, that sum being raised mainly through local and sales taxes. Important state funds are: the general fund. the common school fund, the highway improvement fund, the Confederate pension fund and the university fund. General property taxes, motor licences, gasoline and sales taxes and the income tax are chief sources of revenue. The state expenditures for 1939–40 amounted to $46,401,665. The total gross debt for the state amounted to $147,830,526. The assessed valuation of all property, subject to levies of the general property tax, was $436,197,282. The per capita assessed valuation increased from $257 in 1912 to $323 in 1922, but decreased to $224 in 1939. A law of 1927 authorized a large bond issue for highway construction, a $1,500,000 revolving fund for building schools, and $14,000,000 for Confederate pensions. In 1935 a 2 per cent tax on merchants' sales was enacted for welfare, tax reduction and public schools.

In 1940 there were 166 state and private banks and trust companies and 49 national banks, the resources of which have increased greatly in the last three years.

Education. — The legal beginnings of a public-school system date from 1843; in 1867 the first tax was imposed for its support. Only white children were regarded by the law before reconstruction days. Separate schools are maintained for Negro children. Of the current expense of the common schools, about three-fourths is borne by the localities; the state distributes its contribution annually among the counties. There is also a permanent school fund derived wholly from land grants from the national government. Before 1909 hardly half the school population attended; and in general the rural conditions of the state, the shortness of the school terms and the dependence of the schools primarily upon local funds made the schools inadequate and of varying excellence. In June 1906 there were 1,102 schoolhouses in the state valued at $100 or less. Many districts have been consolidated. Amendments adopted in 1906, 1912 and 1926 have made possible large increases in local taxation for schools, and education has made rapid progress during recent years. The percentage of total school population enrolled in 1939–40 was 75·5; in 1900, 71. Of the total number enrolled, 398.246 were in kindergarten and elementary schools, and 73,768 were in secondary schools. The average number of days attended per year per pupil enrolled had increased from 48.1 in 1900 to 12 5·5 in 1939. Free textbooks were provided in 1936; retirement for teachers in 1937. Expenditures for public elementary and secondary schools increased from $1,369,000 in 1900 to $14,023,914 in 1939–40; a per capita (for ages 5 to 17) of $2.93 and $22.45 respectively.

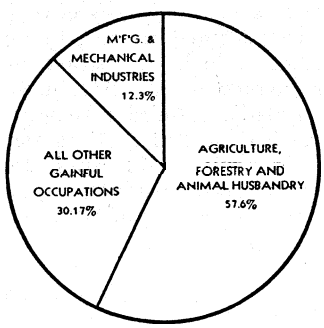
The University of Arkansas was opened at Fayetteville in 1872. Five colleges, one school, the experiment station and general extension are situated at Fayetteville, the medical school at Little Rock. A branch normal school, established in 1873 at Pine Bluff, provides courses for Negro students in literary subjects, agriculture, some of the mechanic arts and in teacher training. The university and the normal school are supported by state appropriations and the Morrill fund (see MORRILL, JUSTIN SMITH), the normal school getting three-elevenths of this fund. The agricultural experiment station, supported by the Hatch, Adams and Purnell funds, dates from 1887. In 1907 the legislature made an appropriation for the establishment of a normal school for white teachers; it was situated at Conway; in 1929 for another at Arkadelphia. Four agricultural high schools were provided for in 1911 and they mere situated at Jonesboro, Russellville, Magnolia and Monticello. In 1925 the legislature raised these schools and the normal school to the rank of colleges. A school for the deaf and one for the blind are maintained at Little Rock, where free board and tuition are given for ten years. Besides the state schools there are about a score of denominational colleges and academies, of which half a dozen are for Negro students. Among the larger of these colleges are Ouachita college, Arkadelphia; Hendrix college Conway; Arkansas college, Batesville; Little Rock college, Little Rock; College of the Ozarks, Clarksville; Centrai college for women, Conway; and Arkansas Baptist college (Negro), Little Rock.

Charities and Houses of Correction. — The penal system of Arkansas is excellent. The state maintains large penal farms near Tucker and Cummings. An effort is made to prevent convict production from competing with production by free labour. Delinquent boys under the age of 18 are cared for at the industrial school near Pine Bluff. There is also an industrial school for girls near Alexander, and a state farm for women near Jacksonville. Other institutions maintained by the state are the tuberculosis sanatorium near Booneville; the hospital for nervous diseases, which cares for the insane, and the Confederate soldiers' home, both near Little Rock. In all the state institutions Negroes and whites are kept separate. The legislature in the 1921 session levied a special tax of 1 2 mills to maintain the charitable institutions of the state after June 30, 1923, and 2 mills for ex-Confederate pensions.

Industry, Trade and Transportation. — Agriculture is still the leading industry, and cotton the chief crop. The variety of

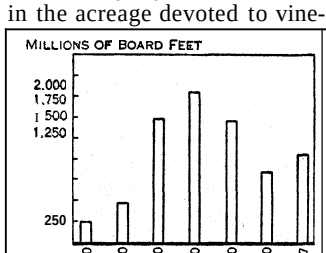
soils, a considerable range of moderate altitudes and favourable factors of heat and moisture, however, promote a rich diversity in agriculture. The farm area of 1900 was 49.5% of the whole area of the state; that of 1920 (17,457,000 ac.) was 51·9%. Since that time some farms have been abandoned, but there has been a slight increase in the total acreage, 18,046,542 in 1940.

The Civil War wrought a havoc from which full recovery was hardly reached by 1890. The economic evolution of the state since reconstruction, has been in the main that common to all of the old slave states developing from the plantation system, but somewhat diversified and complicated by the special features of a young and border community. The division of the old plantations to meet the new social order greatly increased the number of farms, but brought about a corresponding decrease in their size. This decrease has continued since 1900; in that year the average farm was 93·1 ac.; in 1940 it was 83.3 ac. The value of farm property had increased from $135,182,170 in 1900 to $456,848,156 in 1940. In 1940 the number of farms worked by tenants (163,108) exceeded the number worked by owners (100,636). The percentage of farms worked by tenants increased from 50 in 1910 to 63 in 1930. The share system of tenantry is in most common use. In actual numbers the white farmers heavily predominate: in 1940 there were 159,649 white farmers and 57,025 Negro farmers.



GRAPH SHOWING OCCUPATIONS OF THE 634,564 PERSONS ENGAGED IN GAINFUL EMPLOYMENT IN ARKANSAS IN 1930
Only one State has a higher proportion in agricultural pursuits

The cotton production for 1935 was 890,000 bales, valued at $50,062,000; for 1940, 1,545,000 bales, valued at $73,387,500 (1940 estimate). Cotton and cotton products account for over half the total value of agricultural crops. The total acreage given to cereals is hardly equal to that devoted to cotton culture. In 1940 the Indian corn crop was 42,462,000 bu., valued at $28,874,160. The only other cereals of great value are oats, which amounted to 2,244,000 bu., valued at $1,010,000; and rice, with a production of 10,047,000 bu., valued at $6,831,960. The rice industry has developed rapidly in Arkansas since its introduction in 1904. In 1935 the state ranked next to Louisiana in total production and was surpassed in yield per acre by California only. Potatoes and sweet potatoes had a farm value in 1940 of $5,978,250; 1,349,000 tons of tame and wild hay were valued at $10,255,420. Arkansas ranks high as a fruitgrowing state. Peaches, apples, pears, plums and grapes are cultivated extensively in the western and northwestern parts of the state. In the production of peaches the state was exceeded in 1935 only by California and Georgia. In 1920 it ranked fourth in the acreage devoted to vineyards, which since that time has been increased. More and more attention is being given to raising purebred livestock. The dairy industry, also, is developing. In 1940, 14,634,191 chickens were raised, and 38,594,353 doz. eggs produced. The broiler industry is growing rapidly. In 1939 there were in operation 1,178 manufacturing establishments giving employment to 36,454 wage earners and paying an annual wage of $24,577,234. The gross value of the manufactured products was $160,166,984. Lumber and timber products still held first place, with a gross production of about $51,243,344. Other leading industries in the order of their importance were: car and general construction and repair in steam railway shops; cotton-seed products; planing-mill products; printing and publishing; furniture; and smelting and refining. Cotton-seed products had previously held second place.



GRAPH SHOWING LUMBER CUT IN ARKANSAS IN 1880, 1890, 1900, 1910, 1920, 1930 AND 1937

Petroleum, first discovered in paying quantities in 1921, continued in 1940 to be the leading mineral industry. The industry centres around El Dorado and Smackover. The production in 1940 amounted to 25,758,367 bbl., giving Arkansas tenth place among the states, and was valued at $21,268,070. The first strong well of natural gas was opened in Crawford county in 1915; a well near El Dorado was opened in 1921. In 1939 wells were in operation in Crawford, Sebastian, Nevada, Ouachita and Union counties, their production amounting to 18,771,301 M.cu. ft., worth $545,936; natural gasoline 17,882,822 gal., worth $754,709. The output of coal rose rapidly until 1913; since then there has been a decline, due in part to labour troubles. The bauxite industry rose to 532,020 long tons in 1918 but declined to 475,507 long tons in 1940. The state ranks first in the production of whetstones and antimony ore. The clay found in Saline county is used for the making of pottery of an artistic type, called Niloak. Building stone and granite are found near Batesville. The only known diamond field in North America is in Arkansas.

LOADING ALUMINIUM ORE AT A REFINING PLANT IN CENTRAL ARKANSAS
Since the discovery of bauxite, an ore of aluminium, in Arkansas in 1887, its production has become one of the chief industries of the central section of the state

The popular income for 1940 was $510,000,000.

The rivers afford for light boats (of not over 3 ft. draught) about 3,000 mi. of navigable waters, a river system unequalled in extent by that of any other state. The U.S. government extended and very greatly improved this system, materially lessening the frequency and havoc of floods along the rich bottom lands through which the rivers plow a tortuous way in the eastern and southern parts of the state.

As a result of these improvements, land and timber values rose markedly; but the unprecedented flood in the spring of 1927 destroyed many miles of the levees and seriously damaged a large region.

River boats were formerly a means of transport for much of the state's production of cotton, lumber, coal, stone, hay and miscellaneous freight, but are now little used.

On Dec. 31, 1940, there were 74,866 mi. of roads of all types. Most of the early roads had been built by districts which soon found themselves heavily burdened. In 1927 the legislature adopted a state highway system, took over the roads already built and assumed the debts of the districts to over $50,000,000. It also issued bonds for the building of new roads and now has 9,469 mi., of which 1,729 are paved and 6,933 gravel. The fuel tax, motor licences and other fees amounted to $14,211,536 in 1940; the federal subvention, $4,232,037.

Arkansas is well supplied with railway facilities. In 1935 there were 4,741 mi. of main line trackage in operation, a decline from the 5,407 mi. in operation in 1915. The principal trunk lines operating in the state are: the Missouri Pacific, the Rock Island, the Cotton Belt, the St. Louis and San Francisco and the Kansas City Southern. Little Rock is the railway centre of the state. Transportation rates and rail-

way operations within the state are regulated by a state railroad commission.

History.—The Spanish explorer Hernando de Soto and his companions, in 1541, were the first Europeans to see and explore the region now known as the State of Arkansas. After quitting the villages of the Chickasaw Indians on the eastern bank of the Mississippi, de Soto and his party constructed rafts and crossed the river into Arkansas. They spent several months within the limits of the state, remaining there through the winter. After the death of de Soto the following spring, his companions built rude boats and departed for the Spanish colonies in Mexico. The region was not again visited by Europeans until 131 years later, when the Jesuit missionary Jacques Marquette and the fur trader Louis Joliet reached the country of the "Arkansea" Indians in June 1673. Nine years later La Salle with a few other adventurers visited the same region while they were on their way to the mouth of the Mississippi river. The first settlement grew out of a grant of land La Salle gave his trusted lieutenant Henri de Tonti in 1682. In the spring of 1686 de Tonti received orders to meet La Salle at the mouth of the Mississippi; but when after a long wait and careful searching he found no trace of him he returned to the Illinois country. On the return trip de Tonti explored his grant on the Arkansas river, and some of his companions became so impressed with the region that they asked permission to remain to open trade with the Indians. This event marked the beginning of Arkansas Post, the first settlement by Europeans in Arkansas. In 1718 an extensive grant on the Arkansas was made to John Law, and within the same year a colony was established. More colonists and some negro slaves arrived in 1719; but when the colonists learned of Law's failure (1720), they abandoned the settlement and went down the Mississippi. Their intention was to return to Europe, but many were persuaded to settle in Louisiana.

Early in the 18th century Bernard de la Harpe, acting under orders from the duke of Orleans, improved the stockade and placed a regular garrison at Arkansas Post. The post was maintained as a trading centre and Jesuit mission, even surviving an unexpected attack by the Chickasaw Indians in 1748. In 1762 the territory passed to Spain; in 1800, back to France; and in 1803, to the United States as a part of the Louisiana purchase. In the last decade of Spanish authority large numbers of Americans crossed the Mississippi and established claims in the region

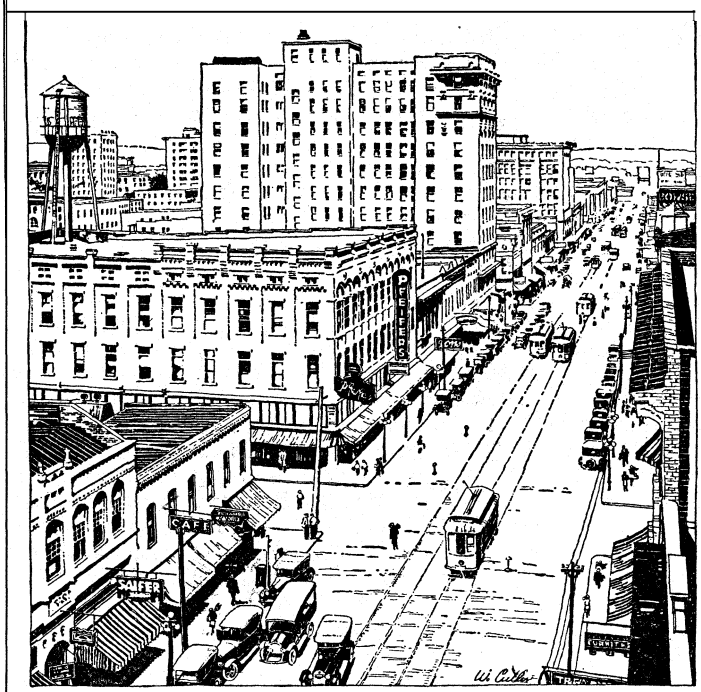
about Arkansas Post, and its importance as a trading station increased. After the United States took formal possession of the territory in 1804, emigration from the states east of the Mississippi continued; and when the territory was organized in 1819, the English-speaking inhabitants were in the majority. Arkansas Post, the former residence of the French and Spanish governors, was the first territorial capital, 1819–20.

From 1804 to 1812 what is now Arkansas was part of the district (and then the territory) of Louisiana, and from 1812 to 1819 part of the territory of Missouri, Its earliest county organizations date from this time. It was erected successively into a territory of the first and second class by acts of Congress of March 1, 1819 and April 21, 1820. By act of June 15, 1836 it was admitted into the Union as a slave state.

In Feb. 1861 the people of Arkansas voted to hold a convention to consider the state of public affairs. It assembled on March 4. Secession resolutions were defeated, and it was voted to submit



LITTLE ROCK, MAIN STREET. LOOKING NORTH

Modern Little Rock has few reminders of the original settlement founded in 1814. It transacts the business of the surrounding mineral and agricultural interests

to the people the question whether there should be "co-operation" with the other border states or "secession." The plan of holding a convention of the border slave states at Frankfort, Kentucky, May 27, to discuss a common policy was endorsed and delegates were elected, but the convention never met. Then came the fall of Ft. Sumter and President Lincoln's call for troops to put down rebellion. The governor of Arkansas curtly refused its quota. A quick surge of ill-feeling chilled loyalty to the Union. The convention reassembled on the call of its chairman, and on May 6, with only one dissenting vote, passed an ordinance of secession. It then repealed its former vote submitting the question of secession to the people. On May 16 Arkansas became one of the Confederate states of America.

In the years of war that followed a large proportion of the able-bodied men of the State served in the armies of the Confederacy; several regiments, four of coloured troops, served the Union. Union sentiment was strongest in the northern part of the state. In 1862 and 1863 various victories threw more than half the state, mainly the north and east, under the Federal arms. Accordingly, under a proclamation of the President, citizens within the conquered districts were invited to renew allegiance to the Union, and a special election was ordered for March 1864 to reorganize the state government. Meanwhile a convention of delegates, chosen mainly at polls, opened at the army posts, assembled in Jan. 1864, abolished slavery, repudiated secession and the secession war debt, and revised in minor details the constitution of 1836, but restricted the suffrage to whites. This new fundamental law was promptly adopted by the people; *i.e.*, by its friends, who alone voted. But the representatives of Arkansas under this constitution were never admitted to Congress.

During 1864 and the early part of 1865 the Federal and Confederate forces controlled different parts of the state, and for almost the whole period there were two rival governments; the Confederate capital was at Washington, in Hempstead county, while the Union capital was established at Little Rock. Chaotic

conditions followed the war. The 11th legislature (April 1864 to Nov. 1866) ratified the 13th amendment and passed laws against "bush-whacking," a term used in the Civil War for guerilla warfare, especially as carried on by pretended neutrals. Local militia, protecting none who refused to join in the common defence, and all serving "not as soldiers but as farmers mutually pledged to protect each other from the depredations of outlaws who infest the state," strove to secure such public order as was necessary to the gathering of crops, so as "to prevent the starvation of the citizens" (governor's circular, 1865). The governor in these years (1864–68) was Isaac Murphy, a republican, the delegate who cast the single Union vote in the convention of 1861; but the 16th legislature (1866–67) was largely democratic. It passed a law defining the rights of persons of African descent, which led to a few conflicts between the state authorities and officials of the Freedman's Bureau. The first reconstruction act having declared that "no legal state government or adequate protection for life or property" existed in the "rebel states," Arkansas was included in one of the military districts established by Congress. A registration of voters, predominantly whites, was at once carried through, and delegates were chosen for another constitutional convention which met at Little Rock in Jan. 1868. The secessionist element was decidedly in the minority. This convention framed the third constitution of the state, which was adopted in March 1868 by a small majority at a popular election marred by various irregularities. By its provisions negroes secured full political rights, and all whites who had been excluded from registration for the election of delegates to the convention were now practically stripped of political privileges. The constitution of Arkansas being now acceptable to Congress, a bill admitting the state to the Union mas passed over President Johnson's veto, and on June 22, 1868 the admission was consummated.

Arkansas was under the control of the republicans for several years and suffered considerably from the rule of the "carpet-baggers." The debt of the state was increased about $9,375,000 from 1868 to 1874, largely for railway and levee schemes; much of the money was misappropriated, and in a case involving the payment of railway aid bonds the action of the legislature in pledging the credit of the state was held nugatory by the state supreme court in 1877 on the ground that, contrary to the constitution. the bond issue had never been legally referred to popular vote. An amendment to the constitution approved by a popular vote in 1884 provided that the general assembly should "have no power to levy any tax, or make any appropriation, to pay" any of the bonds issued by legislative action in 1868, 1869 and 1871. The so-called "Halford" bonds, issued in connection with the state bank and the real estate bank (law of 1836), some of which had been sold in violation of the law, were also covered by this amendment. The current expenses of the state in the years of reconstruction were also enormously increased. The climax of the reconstruction period was the so-called Brooks-Baxter war.

Elisha Baxter (1827–99) was the regular republican candidate for governor in 1872. He was opposed by a disaffected republican faction led by Joseph Brooks (1821–77) and supported by the democrats. Brooks probably received a majority of the votes, but the republican legislature, which passed on returns for governor, declared Baxter elected. He soon showed a willingness to rule as a non-partisan, securing the re-enfranchisement of the whites and opposing corruption. After Baxter had been a year in office, Brooks obtained a writ of ouster against him from a circuit judge and got possession of the public buildings (April 1874). As a result of special elections to fill vacancies the democrats now controlled the legislature and they rallied to the support of Baxter, while the Brooks party assumed the name of "regulars" and received the support of the "carpet-bag" and negro elements. Both had armed forces, an ex-Confederate commanding for each. Both appealed to President Grant, but he, although favouring Brooks, directed the Federal troops to prevent fighting while the legislature was being reassembled. As this body was democratic it reaffirmed Baxter's election and then called a constitutional convention.

This convention, safely democratic, drew up (July to Oct. 1874) the present constitution. It provided a broad suffrage, forbade the passage of registration laws, reduced the patronage of the governor, shortened his term to two years, and allowed only the legislature to suspend the writ of habeas corpus—all this in an effort to guard against the evils of the reconstruction régime. The constitution was ratified by an overwhelming vote Oct. 13.

While this was going on a congressional committee was investigating the claims of Brooks and Baxter. After taking testimony in Washington and in Arkansas they reported (March 1875), with one dissenting vote, in favour of Baxter. There was considerable discussion, but Congress finally adopted the report by a large majority and President Grant acquiesced. Meantime a new governor, A. H. Garland, had been serving several months under the new constitution.

Levee construction and drainage operations were undertaken seriously after 1879, when the Arkansas legislature provided for the formation of levee districts. Through the co-operation of directors of the levee districts and the Mississippi river commission, large tracts of overflowed land were brought under cultivation.

The state has continued under the control of the democratic party since 1874. A new constitution was drafted in 1918 but was rejected in the election of that year by a vote of 23,782 for and 38,897 against. The 19th (woman suffrage) amendment to the Federal constitution was ratified by the state legislature in 1919. Down to 1924 only ten out of 39 proposed amendments to the constitution of 1874 had been declared adopted. This was due largely to a ruling of the supreme court that, even after the adoption of the new initiative and referendum measure in 1910, a majority of the total vote was necessary for adoption. In 1920 a new initiative and referendum measure, providing that only a majority of the votes cast on a measure was necessary for its adoption, forbidding all local acts by the legislature, and providing for the initiative and referendum in counties and municipalities, received a majority of the votes cast on it, but not a majority of the total vote.

Submitted again in 1922, it failed to receive a majority of the votes cast.

In 1924 three amendments received a majority of the votes cast, but not a majority of the total vote. A writ of *mandamus* was sought against the speaker to compel him to declare one of these adopted.

As all the amendments were in the same class, the supreme court judges declared themselves disqualified because one of the measures affected their salaries.

The governor accordingly appointed a special supreme court, which reversed the earlier decision and declared that only a majority of the votes cast on a measure was necessary for its adoption.

This decision was made retroactive and brought to life the new initiative and referendum measure which had been declared not adopted in 1920.

An attempt of the Arkansas legislature in 1933 to convert certain highway and toll-bridge bonds, bearing from 43 to 6 per cent interest, into 25-year bonds bearing only 3 per cent interest was fought and defeated by the bondholders, including the state of Pennsylvania and the Investment Bankers' association. In 1939 Gov. Carl E. Bailey got the legislature to pass another refunding bill.

This bill, however, was held up by a referendum and was defeated. Gov. Bailey also was drfeated for re-election. Gov. Homer M. Adkins secured from the legislature of 1941 another refunding act which was ratified at the polls.

The RFC bought the entire amount at 3·19% and sold immediately to banks $90,800,000, all available at that time, at 102·5, making a profit of $1,545,000.

Important legislation of recent years has included provision for a state farm for convicts, industrial schools for delinquent women and children, a compulsory education law, and measures giving women the right to hold office, legalizing cooperative marketing associations, and creating a warehouse and marketing bureau. In 1933 Arkansas voted reneal of national prohibition and in 1935

of its state law prohibiting traffic in liquor, establishing instead a local option law which is difficult to operate.

Arkansas has been unwavering in its Democratic loyalty, voting normally about 2 to 1 for the presidential candidates of that party until 1932 when the ratio was suddenly raised to over 6 to 1 in favour of Roosevelt. Heavy odds prevailed in 1940.

In the Centennial stadium in Little Rock, President Roosevelt delivered on June 10, 1936, the principal address in connection with Arkansas' celebration of a century of statehood.

BIBLIOGRAPHY.—The latest general and local history of Arkansas is *Arkansas and Its People, 1541–1930* (1930, vols. i, ii, history; iii, iv, biography) edited by David Y. Thomas. Other historical works are: F. Hempstead, *Pictorial History of Arkansas* (1890), and W. F. Pope, *Early Days in Arkansas* (1895). Similar to the first in popular character, vast in bulk and loose in method, are the *Biographical and Pictorial Histories*, covering the different sections of the state (one vol. by J. Hallum, 1887; four others compiled anonymously, 1880–or). For the reconstruction period *see* especially the Poland report in house rep. no. 2, 43 cong., 2 sess., vol. i (1874); John M. ARKANSAS CITY, a city of Cowley county, Kan., U.S.A., 200 mi. S.W. of Kansas City, on the north bank of the Arkansas river, just above the mouth of the Walnut. It is on federal highways 77 and 166 and is served by the Santa Fe, the Frisco, the Missouri Pacific and the Midland Valley railways It has a municipal airport. The pop, in 1940 (federal census) was 12,752.

The valley of the Arkansas and Walnut rivers is a fertile agricultural region, and within 50 miles of Arkansas City are many oil-fields and pools, and fields of natural gas. The city, a division headquarters of the Santa Fe, has a large wholesale and jobbing business, and several large oil refineries. It has flour-mills, foundries, creameries, a sand and gravel plant, overall factories and oil-field machine-shops. The Chillocco Indian school, established by the U.S. Government in 1884, is a few miles south of the city, in Oklahoma.

Arkansas City was settled as Creswell in 1870, and incorporated under it. present name in 1872. In 1880 the population was 1,012. When, following the Santa Fe, the Frisco (1885) and the Missouri Pacific (1886) built railway lines to the city, it had a "boom" which raised the population to 8,341 in 1890; but the opening to settlement of lands in Indian territory, just across the State line, drew- away some of this increase, and the census of 1900 showed only 6,140. Since then the development has been more normal. In 1910 the population mas 7,508; in 1920, 11,253.

ARKANSAS, a river of the United States of America, rising in the mountains of central Colorado, near Leadville, in lat. 39° 20' N., long. 106° 1j W., and emptying into the Mississippi, at Napoleon, Ark., in lat. 33° 40' N. Its total length is about 2,000m., and its drainage basin (greater than that of the Upper Mississippi) about 185,000 sq. miles. It is the greatest western affluent of the Missouri-Mississippi system. It rises in a pocket of lofty peaks at an altitude of 10,400ft. on a sharply sloping plateau, down which it courses as a mountain torrent, dropping 4,62 jft. in 120 miles. Above Canyon City it leaves the Rockies through the Grand Canyon of the Arkansas; then turning eastward, it flows with steadily lessening gradient and velocity in a broad, meandering bed across the prairies and lowlands of eastern Colorado, Kansas, Oklahoma and Arkansas, shifting its direction sharply to the south-east in central Kansas. The Arkansas ordinarily receives little water from its tributaries save in time of floods. In topography and characteristics and in the difficulties of its regulation, the Arkansas is in many ways typical of the rivers in the arid regions of the Western States. The gradient below the mountains averages 7·5ft. per mile between Canyon City and Wichita, Kan. (543m.), about 1·5ft. between Wichita and Little Rock (659m.), and 0·65 of a foot from Little Rock to the mouth (173m.).

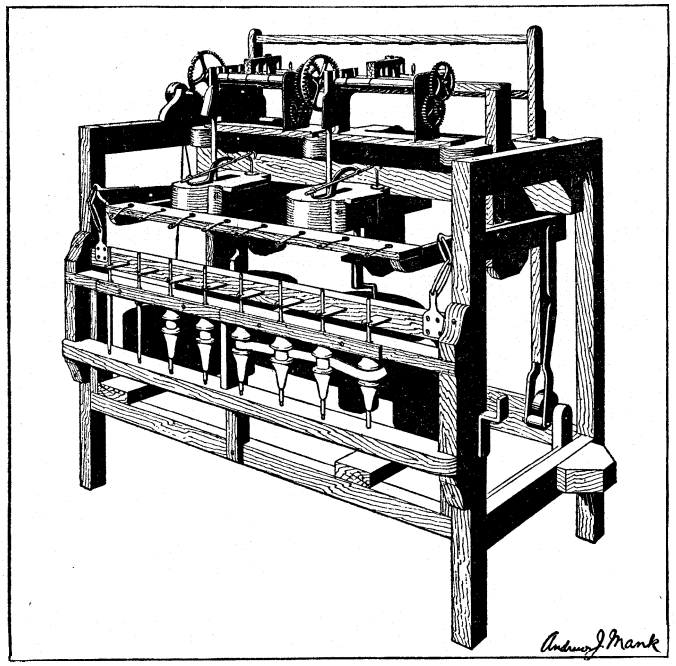
The shores are sand, clay or loam throughout some 1,300m., with very rare rock ridges or rapids, and the banks rise low above ordinary water. The waters are constantly rising and falling, and almost never is the discharge at any point uniform. Every year there are, normally, two distinct periods of high water; one an early freshet due mainly to the heavy winter rainfall on the lower river, when the upper river is still frozen hard; the other in the late spring, due to the setting in of rains along the upper courses also, and to the melting of the snow in the mountains. The lowest waters are from August to December. In the summer there are sometimes violent floods due to cloud-bursts. Everywhere along the course of the river there is never-ending transformation of the river's bed and contour. These changes become revolutionary in times of flood. All these characteristics are accentuated below Little Rock. The depth of water at this point has been known to vary from 2 jft. to only ½ft. and the discharge to fall to 1,1jo cu. ft. per second. In many places there are different channels for high and low water, the latter being partly filled by each freshet, and recut after each subsidence; and the river meanders tortuously through the alluvial bottom in scores of great bends, loops and cut-offs. It is estimated that the eating and caving of the shore below Little Rock averages 7·64ac. per mile every year (as against 1·99ac. above Little Rock). By way of the White river cut-off the Arkansas finds an additional outlet through the valley of that river in times of. high water, and the White, when the current in its natural channel is deadened by the backwaters of the Mississippi, finds an outlet by the same cut-off through the valley of the Arkansas. This backwater, where it meets and checks the current of the Arkansas, occasions the precipitation of enormous alluvial deposits and vast quantities of snags. The banks are disintegrated along this part of the river and built up again on the opposite side to their original height, in the extraordinarily short time of two or three years, the channel remaining all the while narrow. At the mouth of the White, the Arkansas and the Mississippi, the level of recurrent floods is 6 or 8ft. above the timber-bearing soil along the banks, and all along the lower river the country is liable to overflow; and as the land backward from the stream slopes downward from the banks heaped up by successive flood-deposits, each overflow creates along the river a fringe of swamps. Prior to the great flood of April and May 1927, much of the swamp area along the Arkansas had been reclaimed by means of levees built by local levee districts in co-operation with the U.S. Government. By the middle of May 1927, the whole Arkansas valley, from Ft. Smith to the Mississippi, had been flooded and much of the levees destroyed. Three breaks in the right levee near the mouth of the river, known as the Pendleton breaks, allowed the waters to race through south-eastern Arkansas, and to follow the valley of the Boeuf river into Louisiana. The damage caused by the flood, in common with other portions of the lower Mississippi valley, mounted into millions of dollars. U.S. army engineers believe that adequate flood protection will result from the $325,000,000 Mississippi Valley Flood Control act passed by Congress on May g, 1928.

After the advent of railways, traffic on the Arkansas decreased rapidly because of the hazards of navigation — snags, sandbars and the lack of a stable flow. However, traffic in 1920 was 30.568 tons valued at $177,000; in 1926 it was 87,720 tons valued at $367,260.

BIBLIOGRAPHY.—General descriptions of different portions of the river are indicated in the Icdex to the *Reports of tlze Chief of Engineers, U.S. Army* (1879 *seq.*). *See* also H. Gannett, "Profiles of Rivers in the U.S." (*U.S. Geolog. Survey,* 1901); Greenleaf, "Western Floods," in *Engin. Mag.* xii., 945–958; *U.S.* Geolog. Survey, *Bull.* 140; and I. C. Russell, *Rivers of North America* (1898).

ARKLOW, urban district. Co. Wicklow, Eire, 49 mi. S. of Dublin, by the Great Southern railway. Pop. (1936) 4,680. There are oyster-beds on the coast, but the oysters require to be freed from a peculiar flavour by the purer waters of the Welsh and English coast before they are fit for consumption. Copper and lead from the Vale of Avoca are shipped from the port. There are cordite and explosives works. In 1882 an act provided for improvement of the harbour and appointment of harbour commissioners. There are slight ruins of an ancient castle of the Ormondes, demolished in 2649 by Cromwell,

ARKWRIGHT, SIR RICHARD (1732–92), English inventor, was born at Preston, in Lancashire, on Dec. 23 1732, of parents in humble circumstances. He was the youngest of 13 children, and established himself as a barber at Bolton about 1750. This business he gave up about 1767 to devote himself to the construction of the spinning frame. The spinning jenny, which was not patented by James Hargreaves (d. 1778), a carpenter of



BY COURTESY OF THE SCIENCE MUSEUM

RICHARD ARKWRIGHT'S YARN SPINNING-FRAME, INFLUENTIAL IN THE INDUSTRIAL REVOLUTION WHICH. IN THE 18TH CENTURY, SUBSTITUTED MACHINE FOR HAND WORK AND WAS THE FOUNDATION OF BRITISH INDUSTRIAL SUPREMACY

Blackburn, Lancashire, until 1770, though he had invented it some years earlier, gave the means of spinning 20 or 30 threads with no more labour than had previously been required to spin a single thread. The thread spun by the jenny could not, however, be used except as weft, as it lacked the firmness or hardness required in the longitudinal threads or warp. Arkwright supplied this deficiency by the invention of the spinning-frame, which spins a vast number of threads of any degree of fineness and hardness.

The precise date of this invention is not known; but in 1767 Arkwright employed John Kay, a watchmaker at Warrington, to assist him in the preparation of the parts of his machine, and he took out a patent for it in 1769. The first model was set up in the parlour of the house belonging to the free grammar school at Preston. This invention having been brought to a fairly advanced stage, Arkwright removed to Nottingham in 1768, accompanied by Kay and John Smalley, of Preston, and there erected his first spinning mill, which was worked by horses.

But his operations were at first greatly fettered by want of capital, until Jedediah Strutt (*q.v.*), having satisfied himself of the value of the machines, entered with his partner, Samuel Need, into partnership with Arkwright and enabled him in 1771 to build a second factory, on a much larger scale, at Cromford in Derbyshire, the machinery of which was turned by a water-wheel. A fresh patent, taken out in 1775, covered several additional improvements in the processes of carding, roving and spinning. As the value of his processes became known, Arkwright began to be troubled with infringements of his patents, and in 1781 he took action in the courts to vindicate his rights. His patent was a source of prolonged litigation, but he was able to consolidate his position as a manufacturer in spite of all difficulties. He died at Cromford on Aug. 3, 1792.

ARLBERG TUNNEL, part of the Arlberg railway connecting the Vorarlberg (*q.v.*) with Innsbruck in the Tirol. It was opened in 1884, pierces the Arlberg Alp from Langen to St. Anton, is over 6m. long, and ascends as high as 4,300ft. It cost £1,500,000 to construct, and was electrified in 1923.

ARLES, south-east France, capital of an arrondissement in the department of Bouches-du-Rhône, 54 mi. N.W. of Marseille by rail. Pop. (1936) 19,137. A canal unites the town with the harbour of Bouc on the Mediterranean, Arles stands on the left bank of the Rhône where the river divides to form its delta. A tubular bridge unites it with the suburb of Trinquetaille on the opposite bank. The town is hemmed in on the east by the railway line from Lyon to Marseille, on the south by the Canal de Craponne.

Arelate was important at the time of the invasion of Julius Caesar. It was pillaged in A.D. 270 but restored and embellished by Constantine, who made it his principal residence, and founded Trinquetaille. Under Honorius it became the seat of the prefecture of the Gauls and one of the foremost cities in the western empire. Its bishopric, founded by St. Trophimus in the 1st century, was in the 5th century the primatial see of Gaul; it was suppressed in 1790. After the fall of the Roman empire the city passed into the power of the Visigoths, and rapidly declined. It was plundered in 730 by the Saracens, but in the 10th century became the capital of the kingdom of Arles (see ARLES, KINGDOM OF). In the 12th century it was a free city, governed by a podesfa and *consuls* after the model of the Italian republics, which it also emulated in commerce and navigation. In 1251 it submitted to Charles I. of Anjou, and from that time onwards followed the fortunes of Provence. A number of ecclesiastical synods have been held at Arles, as in 314 (see ARLES, SYNOD OF) 354, 452 and 475. Its streets are narrow and irregular. On the central Place de la République stand the *hôtel-de-ville,* the museum and the old cathedral of St. Trophime. Founded in the 7th century, St. Trophime has been several times rebuilt. Its chief portal, 12th century Romanesque, is a masterpiece. The choir opens into a beautiful cloister, two of the galleries of which are Romanesque, while two are Gothic. The *hôtel-de-ville* (17th century) contains the library. The museum, occupying an old Gothic church, is rich in Roman remains and early Christian sarcophagi; there is also a museum of Provençal arts and crafts founded by the poet Mistral. Arles possesses the ruins of an amphitheatre (the Arknes), capable of containing 25,000 spectators; a Roman theatre, in which the famous Venus of Arles was discovered in 1651; an ancient obelisk; the ruins of the palace of Constantine; the forum; the thermae; and the remains of the Roman ramparts and of aqueducts. There is, besides, a Roman cemetery known as the Aliscamps (*Elysii Campi*), consisting of an avenue bordered by tombs. The port of Arles is now of little importance. Sheep-breeding is a considerable industry in the vicinity.

ARLES, KINGDOM OF, the name given to the kingdom formed about 933 by the union of the old kingdoms of Provence (*q.v.*) or Cisjurane Burgundy, and Burgundy (*q.v.*) Transjurane, and bequeathed in 1032 by its last sovereign, Rudolph III., to the emperor Conrad II. It comprised the countship of Burgundy (*Franche-Comté*), part of which is now Switzerland (the dioceses of Geneva, Lausanne, Sion and part of that of Basel), the Lyonnais, and the whole of the territory bounded by the Alps, the Mediterranean and the Rhone; on the right bank of the Rhone it further included the Vivarais. It is only after the end of the 12th century that the name "kingdom of Arles" is applied to this district; formerly it was known generally as the kingdom of Burgundy, but under the Empire the name of Burgundy came to be limited more and more to the countship of Burgundy and the districts lying beyond the Jura. The authority of Rudolph III. over the chief lords of the land, the count of Burgundy and the count of Maurienne, founder of the house of Savoy, was already merely nominal, and the Franconian emperors (1039–1125), whose visits to the country were rare and brief, did not establish their power any more firmly. During the first 50 years of their domination they could rely on the support of the ecclesiastical feudatories, who generally favoured their cause, but the investiture struggle, in which the prelates of the kingdom of

Arles mostly sided with the pope, deprived the Germanic sovereigns even of this support. The emperors, on the other hand, realized early that their absence from the country was a grave source of weakness; in 1043 Henry III. conferred on Rudolph, count of Rheinfelden (afterwards duke of Swabia), the title of *dux et* rector *Burgundiae,* giving him authority over the barons of the northern part of the kingdom of Arles. Towards the middle of the 12th century Lothair II. revived this system, conferring the rectorate on Conrad of Zähringen, in whose family it remained hereditary up to the death of the last representative of the house, Berthold V., in 1218; and it was the lords of Zahringen who were foremost in defending the cause of the empire against its chief adversaries, the counts of Burgundy. In the time of the Swabian emperors, the Germanic sovereignty in the kingdom of Arles was again, during almost the whole period, merely nominal, and it was only in consequence of fortuitous circumstances that certain of the heads of the Empire were able to exercise a real authority in these parts. Frederick I., by his marriage with Beatrix (1156), had become uncontested master of the countship of Burgundy; Frederick II., who was more powerful in Italy than his predecessors had been, and was extending his activities into the countries of the Levant, found Provence more accessible to his influence, thanks to the commercial relations existing between the great cities of this country and Italy and the East. Moreover, the heretics and enemies of the church, who were numerous in the south, upheld the emperor in his struggle against the pope. Henry VII. also, thanks to his good relations with the princes of Savoy, succeeded in exercising a certain influence over a part of the kingdom of Arles. The emperors further tried to make their power more effective by delegating it, first to a viceroy, William of Baux, prince of Orange (1215), then to an imperial vicar, William of Montferrat (1220), who was succeeded by Henry of Revello and William of Manupello. In spite of this, the history of the kingdom of Arles in the 13th century, and still more in the 14th, is distinguished particularly by the decline of the imperial authority and the progress of French influence in the country. In 1246 the marriage of Charles, the brother of Saint Louis, with Beatrice, the heiress to the countship of Provence, caused Provence to pass into the hands of the house of Anjou, and many plans were made to win the whole kingdom for a prince of this house. At the beginning of the 14th century the bishops of Lyons and Viviers recognized the suzerainty of the king of France, and in 1343 Humbert II., dauphin of Viennois, made a compact with the French king Philip VI. that on his death his inheritance should pass to a son or a grandson of the French king. In 1349, being poor, he agreed to sell his possessions outright, and thus Viennois, or Dauphiné, passed into the hands of Philip's grandson, afterwards King Charles V. The emperor Charles IV. took an active part in the affairs of the kingdom, but without any consistent policy, and in 1378 he, in turn, ceded the imperial vicariate of the kingdom to the dauphin, afterwards King Charles VI. This date may be taken as marking the end of the history of the kingdom of Arles, considered as an independent territorial area.

See Leroux, *Recherches critiques sur les relations politiques de la France avec l'Allemagne* de 1292 à 1378 (1882); P. Fournier, *Le Royaume d'Arles et de Vienne* (1890). For the early history of the kingdom, L. Jacob, *Le Royaume de Bourgogne sous les empereurs franconiens* (1038–1129) (1906). The chief dissertations published concerning the rights of the Empire over the kingdom are indicated in A. Leroux, *Bibliographie des conflits entre la France et l'Empire* (1902). (R. P.)

ARLES, SYNOD OF. The first general council of the Western church, summoned in 314 at Arles by the emperor Constantine to settle the dispute between the Catholics and Donatists (see DONATISTS), after an assembly of referees meeting at Rome in 313 had failed to settle the questions at issue. Of these the most important was the eligibility for priestly office of *traditores* or those who had delivered up their copies of the Scriptures under the compulsion of the Diocletian persecution. Thirty-three bishops attended at Arles, three of whom were from Britain. The canons drawn up by the synod dealt with matters of ecclesiastical discipline, clerical and lay, and included a declaration that ordination was not invalid because performed by a traditor, if otherwise regular, thus condemning the principal contention of the Donatists.

See Smith and Cheetham, *Dictionary of Christian Antiquities*, art. "Arles"; W. Bright, *Chapters of Early English Church History* with references to other authorities given.

ARLINGTON, HENRY BENNET, EARL OF (1618–85), English statesman, son of Sir John Bennet of Dawley, Middlesex, was educated at Westminster School and Christ Church, Oxford. During the civil war he fought for the King, and after the King's execution, joined the Royal Family abroad. At the Restoration he was made keeper of the privy purse (1661), secretary of State (1662), and one of the postmasters-general in 1667. He was raised to the peerage as Baron Arlington in 1663. On the fall of Clarendon (1667), against whom he had intrigued, he became a member of the Cabal ministry, but did not obtain the predominant influence which he had expected, and was extremely jealous of Buckingham. Arlington was in charge of foreign affairs, and sought to undo the triple alliance arranged by Sir William Temple at The Hague, between England, Holland and Sweden, which led to the peace of Aix-la-Chapelle under which Louis XIV. agreed to make no more conquests on the northern frontier of France. In 1670 he and Clifford were the only two ministers to whom Charles confided the terms of the secret Treaty of Dover, concluded with Louis XIV., and he was largely responsible for the deception practised on the council. For his services Charles gave him an earldom and the Garter.

But Arlington was guided by personal considerations only, and on the appointment of Clifford to the treasurership, which he had always desired, he changed sides, and, in order to please his new allies, disclosed the terms of the Treaty of Dover to the staunch Protestants, Ormonde and Shaftesbury. But he had lost the confidence of all parties, and on Jan. 15 1674, was impeached by the House of Commons on charges of "popery," corruption and betrayal of his trust. Buckingham accused him of being the chief instigator of the pro-French and anti-Protestant policy, of responsibility for the Dutch war, and of embezzlement. The bill of impeachment was rejected, but Arlington resigned office and was appointed lord chamberlain. Although he continued to be employed in one capacity or another his influence was gone. He died on July 28 1685, and was buried at Euston, where he had bought a large estate and had carried out extensive building operations. His residence in London was Goring House, on the site of which was built the present Arlington street.

Arlington was a typical statesman of the Restoration, possessing outwardly an attractive personality, and according to Sir W. Temple "the greatest skill of court and the best turns of art in particular conversation," but thoroughly unscrupulous and self-seeking, without a spark of patriotism, faithless even to a bad cause, and regarding public office solely as a means of procuring pleasure and profit. His knowledge of foreign affairs and of foreign languages, gained during his residence abroad, was considerable, but long absence from England had also taught him a cosmopolitan indifference to constitutions and religions, and a careless disregard for English public opinion and the essential interests of the country. According to Clarendon, he "knew no more of the Constitution and laws of England than he did of China, nor had he in truth a care or tenderness for church or State, but believed France was the best pattern in the world."

He married Isabella of Beerwaert, daughter of Louis of Nassau, by whom he had one daughter, Isabella, who married Henry, Duke of Grafton, the natural son of Charles II. and Ladv Castlemaine.

ARLINGTON, a township of Middlesex Co., Mass., U.S.A., immediately W. of Somerville and Cambridge, and 6–8m. N.W. of Boston. It is traversed by Massachusetts avenue, and by the Lexington branch of the Boston and Maine railroad, which

has stations at the villages of Arlington and Arlington Heights. Its area is 5½sq.mi. The population was 40,013 according to the federal census of 1940. It includes Spy pond, one of the prettiest bodies of water in the vicinity of Boston. Market-gardening is an important occupation, and there are factories which make piano-cases, boiler finishings, and picture frames. Arlington became a separate town in 1807 under the name of West Cambridge. The present name was adopted in 1867.

See B. and *W.* R. Cutter, *History of the Town of Arlington . . . 1637–1879* (Boston, 1880); and C. S. Parker, *The Town of Arlington, Past and Present* (Arlington, 1907).

ARLINGTON HOUSE, an historic mansion situated in Virginia, on the heights overlooking the Potomac river, opposite Washington, D.C. The property once belonged to George Washington and descended to his adopted son, Parke Custis, who began his residence there in 1802. Later it became the home of Robert E. Lee, the Confederate general, who in 1831 married the daughter of Custis. Seized by the Federal forces early in the Civil War, but later purchased, the house was occupied as a headquarters by the Union army and the large adjacent estate was used as a camp for troops. Subsequently the property was made into a national cemetery in which many distinguished generals and thousands of soldiers, both Union and Confederate, have been buried. The stately Lee mansion, with its noble portico, is one of the finest examples of colonial architecture.

See Karl Decker and Angus McSween, *Historic Arlington* (1892); John B. Osborne, *The Story of Arlington (1899)*; and John T. Faris, *Historic Shrines of America* (1918).

ARLINGTON NATIONAL CEMETERY occupies a beautiful site of 408ac. in Virginia on the banks of the Potomac, directly opposite Washington, District of Columbia. The central feature of the cemetery is the mansion, built in 1802 of stuccoed brick on the estate of 1,100ac. by George Washington Parke Custis, the adopted son of George Washington. The land was part of the original tract of 6,000ac. granted by Sir William Berkeley on October 21, 1669, as a reward of services, to Robert Howsen, who subsequently sold it for six hogsheads of tobacco. The Lee mansion, as it is now called, is said to have been modelled after the temple of Theseus in Athens. The great portico, with its eight massive white columns, is a striking landmark, visible from the city across the river (for illustration see Vol. 22, facing p. 788). The view from the house, which stands on tne brow of the hill 200ft. above the Potomac, has been famous for more than a century. Many famous Americans and foreigners, among them Lafayette, have been entertained at the Lee mansion. In the drawing room, where visitors now register their names, Mary Ann Custis in 1831 married Robert E. Lee, then a lieutenant in the United States Army, afterwards commander-in-chief of the Confederate Army. When on April 22, 1861, Lee left Arlington to take command of the Virginia troops, Federal soldiers took possession almost immediately, converting the mansion into a headquarters and the grounds into a camp. Later a hospital was established there and in 1864, other burial-grounds proving insufficient, Arlington became a military cemetery by order of the Secretary of War. The first soldier to be buried there was a Confederate who had died in the hospital. For years the title of the property was in dispute, but in 1883 the United States Government paid to the son of Gen. Lee $150,000 for the property. Soldier dead from every war in which the United States has participated, including a few officers of the Revolution, are buried there—numbering in all more than 25,000. Under a granite sarcophagus lie the bones of 2,000 unknown soldiers, gathered after the Civil War from the field of Bull Run and the route to the Rappahannock.

The best known memorial in the cemetery is the Tomb of the Unknown Soldier, which consists of a solid block of marble, on which is inscribed a tribute to all the unidentified American dead of the World War. Near at hand stands the memorial amphitheatre erected, through the efforts of the Grand Army of the Republic in memory of departed heroes, as a fitting place of assembly for the thousands who attend Memorial Day services in their honour. It was dedicated on May 15, 1920. The roofless, white marble structure, with its eastern façade overlooking the Potomac river and Washington encloses a natural amphitheatre. Copied after both the theatre of Dionysus at Athens and the Roman theatre at Orange, France, the proportions and distances convey the charm of an old Greek ruin. Crypts where especially distinguished soldiers, sailors and marines may be buried are placed under the colonnade, while within the entrance is a reception hall, a chapel and a muse'um. Covering an area of 34,000 sq.ft. and providing seating capacity for 5,000 people in the tiers of white marble benches within the theatre proper, the theatre can accommodate several thousand more in its colonnades and on its stage.

But the eyes of visitors—who may enter Arlington daily between sunrise and sunset—turn repeatedly to the Fields of Dead, with their endless lines of plain stones, of the pattern adopted in 1872 for use in all the National Cemeteries.

(J. T. F.)

ARLON, chief town, province of Luxembourg, southern Belgium, on a hill (1,240ft.) above the headwaters of the Semoise. Pop. (1930) 11,658. The Orolaunum of the Romans was a station on the Antoninian way connecting Reims and Trbves, and the name is probably Celtic. Extensive views are obtainable from the church of St. Donat, which crowns the hill. Vauban turned it into a fortress in 1671, damaging the old Roman wall, the foundations of which were practically intact. In the local museum are many Roman antiquities, including several large sculptural stones.

ARM, the human upper limb from the shoulder to the wrist, and the fore limb of an animal. (See ANATOMY: Superficial *and* Artistic, and SKELETON: Appendicular.) The word is also used of any projecting limb, as of a crane, or balance, of a branch of a tree, and so, in a transferred sense, of the branch of a river or a nerve. Arm in military language is a branch of the army whose primary duty is to fight, *e.g.,* infantry, artillery, used in contradistinction to a "service" whose duty is to supply or aid the fighting troops. In the plural, the word is applied to the soldier's weapons. "Arms" or "armorial bearings" are the heraldic devices displayed by knights in battle on the defensive armour or embroidered on the surcoat worn over the armour and hence called "coats of arms." These became hereditary and are borne by families; similar insignia are used by nations, cities, episcopal sees and corporations generally. (See HERALDRY.)

ARMADA, THE. The Spanish or Invincible Armada was the great fleet sent by Philip II. to assist in the attempted invasion of England in 1588. The idea was not a new one, but so far it had been prevented by the expense of providing an army to sail on board the fleet all the way from the Peninsula, in addition to the expense of maintaining an army in the Spanish Netherlands. The Marquis of Santa Cruz, the original commander-in-chief, having died, Philip II. appointed the Duke of Medina Sidonia, a nobleman who lacked sea experience and was unwilling to lead the expedition. By the new plan of campaign, his instructions were to fight his way up the Channel and to convoy to England the Spanish army already in the Netherlands under the Prince of Parma, at that moment blockaded in Dunkirk and Nieuport by a Dutch squadron under Justinus of Nassau.

During the year 1587, Sir Francis Drake had destroyed a great part of the Spanish shipping at Cadiz and had prevented the concentration of the outlying squadrons; but in the spring of 1588 the Armada assembled at Lisbon and, after many delays, began to sail on May 18. It consisted of 130 vessels, about half of which were transports and victuallers, and it was drawn from all parts of the Spanish Empire, there being no Spanish royal navy. It was manned by some 7,000 sailors and upwards of 17,000 soldiers. Heavy squalls, bad water, and bad provisions forced most of the fleet on June 9 to run into Coruña, though some maintained their course to the Scilly Isles, which was the first rendezvous. It was not till July 12 that the Armada again set sail, and it was sighted off the Lizard on July 19.

The English defence consisted of the Queen's ships and armed merchantmen, some 90 in all, collected at Plymouth under Drake, who was properly commander-in-chief, assisted by Sir John Hawkins and Sir Martin Frobisher, though Charles Lord Howard of Effingham, who was at the head of the admiralty administration in London, elected on this occasion to go to sea.

There was also a squadron in the Downs, under Lord Henry Seymour and Sir William Wynter, co-operating with the Dutch. A total of 197 English ships took part in the campaign, but many were so small that they were of little use, the fighting being almost entirely between the big ships of both sides. It is difficult to compare the fighting strength of the opposing fleets; the individual tonnage of the largest ships on each side was about the same, and the Spaniards possessed more of them, though the English were superior in weight, number and distribution of armament.

The Armada mas organized more like a land army than a fleet, the sailors and navigators occupying a very low status, while in the English fleet the sailors far outnumbered the soldiers and most of the captains had previous sea experience. The object of the English fleet was to prevent the junction of Medina Sidonia and Parma by getting to windward of the Armada, assuming south westerly winds, and so cutting it off from its base and driving it up the Channel and past Dunkirk.

The Operations.—Owing to bad weather and lack of provisions, no proper system of reconnaissance was maintained, and when the Armada appeared off Plymouth on July 20 the English were only just able to get to sea and avoid being blockaded. On July 21 the English worked to windward of the Spaniards and engaged them at long range for two hours, capturing Pedro de Valdez, the commander of the Andalusian squadron, whose ship was damaged. A change of wind gave the Spaniards the weather gage and on July 23 another action was fought off Portland, during which Frobisher became isolated in a sudden calm and was in danger of being captured by the Spanish galleasses. Next day the English fleet was re-inforced from the shore by fresh ships and many volunteers, and was re-organized in four distinct squadrons under Howard, Drake, Hawkins, and Frobisher. The chase continued up the Channel, and on July 25 another action took place off the Isle of Wight. So far the Spaniards had kept better order in a military sense than the English, but they were then completely demoralized and had lost several of their best ships. Crossing the Channel, they anchored in Calais roads on July 27. Medina Sidonia then sent a message to Parma vainly asking him to put to sea at once, which was of course impossible owing to the closeness of the blockade. Howard was joined by Seymour and Wynter, and on the night of July 28, after a council of war, fireships were sent against the Spaniards. No Spanish ships were touched, but the panic caused by this dreaded form of attack caused them to cut their cables and put to sea in great confusion, one large ship running aground. On July 29, while they were straggling up the coast of Gravelines, Drake led the English to the attack and the fiercest battle of the campaign took place, the English doing immense damage by keeping to windward and firing at long range with alternate broadsides. The Spaniards fought with great heroism; but with their poor gunnery and bad seamanship they were outmatched and were unable to close and board, which was their only possible chance of success. By the afternoon 16 Spanish ships were cut off and should have been made prizes; but a sudden squall drove them to leeward and stopped the action, and at the same time the English ammunition became completely exhausted. The sea increased in fury during the night, and by the morning of July 30 the Spaniards were well past Xieuport and in great danger of being driven on a lee shore, as they were unable to rig any spare anchors. At the most critical moment in the day, with only six fathoms below them and the English to windward, the wind suddenly shifted to the south-west and they were able to run north and so escape destruction. The English followed them as far as the Firth of Forth and then returned—seeing that the enemy were obviously not going back through the Strait of Dover, while they themselves had little food and no ammunition. The Armada became distressed through lack of fresh water and soon encountered strong westerly winds, which added to its troubles as it attempted to sail home round Scotland and the west coast of Ireland. Many ships were wrecked, and in Ireland their crews were massacred; many more sank in the open sea. Only half of the ships that left the Tagus returned to Spain or Portugal. and in those death and sickness were appalling.

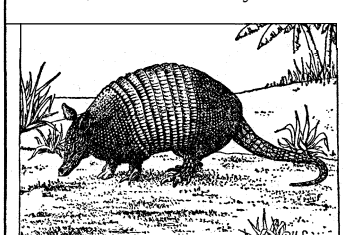
The complete failure of the invasion project was due to the English plan of keeping to windward and fighting at long range, which was followed throughout; and but for a fortunate change of wind and the failure of the English ammunition supply the whole Armada would certainly have been driven ashore on the Zealand banks.

Medina Sidonia acted with great courage throughout, but he was unable to control the provincial navies under his command and had neither the personality nor seamanship necessary for such a task. Philip II. foresaw the English methods of gunfire and warned him of what to expect, but at the same time he entirely failed to realize the difficulty which Medina Sidonia would encounter in trying to bring out Parma's army in the face of the Dutch blockading flotilla, which could sail closer inshore amongst the shoals than the great ships of Spain.

Queen Elizabeth had some difficulty in understanding Drake's plan of campaign and was greatly concerned that the English made no attempt to board the Spanish ships, though the accusations levelled at her of starving the fleet of ammunition and food can hardly be substantiated. More fighting took place than was foreseen by either side, and consequently supplies of all kinds proved insufficient. Although many of the Spanish commanders had worldwide sea experience, the Armada was greatly handicapped by its military and provincial organization, while the English fleet was naval and national in character and its personnel all spoke a common language. Moreover, the difficulty of convoying Parma's army was so great that the Armada had little chance of success, its whole strategic conception being at fault. Its failure checked the naval growth of Spain and assisted the Dutch to secure their independence.

BIBLIOGRAPHY.—The English side of the Armada campaign can be best studied in Sir Julian Corbett's *Drake and the Tudor Navy* (1898) and in the *State Papers relating to the defeat oj the Spanish Armada,* ed. by Sir John Laughton for the Navy Records Society (1894). The Spanish side will be found in *La Armada Invencible, by* Capt. C. F. Duro (1884). Froude summarized Duro's work in his *Spanish Story of the Armada* (1892). A popular account will be found in J. R. Hale, *Great Armada* (1913). (G. A. R. C.; W. C. B. **T.**)

ARMADILLO, a mail-clad mammal (order Edentata, family *Dasypodidae)* closely allied to the sloths and ant-eaters. Its armour consists of a bony case, partly composed of solid buckler-like plates, and partly of movable transverse bands. Armadillos are omnivorous, feeding on roots, insects, worms, reptiles and carrion, and are mostly nocturnal. They are harmless inoffensive creatures, their principal means of escape being the rapidity with which they burrow in the ground, and the tenacity with which they retain their hold in their subterranean retreats. Notwithstanding the shortness of their limbs they run with rapidity. Most of the species are esteemed good eating by the natives. They are all inhabitants of the tropical and temperate parts of South America, though a few species range farther north, the nine-banded armadillo being found from Argentina to southern Texas. The largest species is the giant armadillo (*Priodon gigas*), nearly a yard long, from Surinam and Brazil. For the distinctive characters of the genera see EDENTATA.



THE NINE-BANDED ARMADILLO (DASYPUS NOVEMCINCTUS), REMARKABLE FOR ITS COVERING OF HARD, BONY, BUCKLER-LIKE PLATES

ARMAGEDDON, Rev. xvi. 16 (A.V.), HAR-MAGEDON (R.V.). This is probably the Greek equivalent of the Hebrew har *megiddō* (often, but *megiddōn,* Zech. xii. 11), the mountain district of Megiddo, *see* various readings of the Septuagint (Josh. xvii. 11). The final destruction of the armies of Gog (understood to mean the forces of Antichrist) was to be on "the mountains of Israel" (Ezek. xxxix. 2, 4), here defined as near Megiddo, the scene of past battles (Judges iv. 13; II. Ki. xxiii. 29; II. Chron. xxxv. 22). Other suggestions are: (1) *har migdo,* "his fruitful mountain" (i *e.,* the mountain land of Palestine); (2) 'ir *Chemdah,* "the desirable city"; (3) *har mo'ed,* "the mountain where

the gods meet[n]—a hint of a myth of the battle of the gods. (See Charles, Revelation, ii. p. 50.) Armageddon is often used to-day of a great slaughter or final conflict.

The name is revived in the title of Field-Marshal Lord Allenby of Megiddo (cr. 1919).

ARMAGH, an inland county of Northern Ireland (Act of 1920), bounded north by Lough Neagh, east by County Down, south by Louth, and west by Monaghan and Tyrone. The land area is 489 sq.mi. Population (1937) 108,815. The northern low-lying area is made up of Tertiary basalts, Pliocene deposits and sandstones. It is very fertile and may formerly have been covered by the waters of Lough Neagh. To the south there is a gradual rise to the mountains of Ordovician and Silurian rocks, probably extensions of similar formations in the southern uplands of Scotland. Farther south, the granite mountain-core is revealed, whilst younger intrusive rocks form Slieve Gullion (1,893ft.).

Historical Survey.—During early neolithic times lakes and swamps covered large portions of the lowlands of Ulster, the drier districts being thickly wooded. The first settlements were, therefore, largely confined to the coasts. In the bronze age colonization of the lowlands developed, and at its end the country immediately south of Lough Neagh had considerable importance. The fortress of Emhain Macha was built *c.*300 B.C. about 1½m. W. of the modern city of Armagh and became in time the religious and political centre of the district. Later, however, iron-using people moved northward and drove some of the previous inhabitants of North Armagh into the mountains of county Antriin and county Down. To consolidate their conquests, they built an earth-work, erroneously known as the Dane's Cast, which follows approximately the modern boundary between county Armagh and county Down. From this time Emhain Macha declined, the later associations of the district being woven around Armagh (*q.v.*) near by, which became in the fifth century the ecclesiastical capital of Ireland, partly because of its connections with St. Patrick. Scandinavians sailed up the Bann and established a permanent fleet on Lough Neagh. They also had squadrons on the loughs of Belfast, Strangford and Carlingford. From these centres they raided the interior and during one such expedition they destroyed Armagh but, recognizing the advantages of the site, used it for several years as the Scandinavian capital of North Ireland.

The Normans experienced great difficulties when moving against the North and kept to coastal routes and lowlands. They thus had comparatively little influence in Armagh, particularly in the southern hilly portion. The county was made shire ground in 1586.

Economic Survey.—The lowlands of the northern half of the county are composed of recent rocks and are very fertile. Around Charlemont there is an area which remains boggy but this is said to be reclaimable. The southern portion of the county is rocky and barren with some bog in the neighbourhood of Newtown-Hamilton. The climate is temperate and rainfall comparatively light. Agriculture does not flourish. Oats and potatoes are the principal crops, but all grain crops are decreasing, whilst flax, formerly much grown, is now neglected. The numbers of cattle, sheep, pigs and poultry are increasing. Fruit cultivation is encouraged and the orchards of the county are justly famous. The principal industry is the manufacture of linen. This does not necessitate any unwholesome crowding of people into large towns but can be carried on successfully in villages and farm-houses. The spinning and reeling of the yarn and the bleaching process can be done after farm work and domestic duties. This development of rural industry may account for the relative neglect of the land. Whilst the condition of agriculture might indicate a poor region, the county is in fact a comparatively rich one and supplies other parts of Ulster with vegetables and fruits.

The chief towns are in the northern lowlands. Xrmagh (*q.v.*), with its religious associations, is a route centre and market town. Both Lurgan and Portadown have considerable manufactures, chiefly connected with linen. The latter is also an important railway centre. The county is poor in minerals though lead veins have been worked spasmodically. There are extensive granite quarries at Bessbrook. The scattered nature of the population of the mountains is shown by the fact that the railways enclose the area but send off no important branches. Along the east of the mountains is the line from Armagh to Newry and Carlingford; on the west, the line from Armagh to Castleblayney and Dundaik.

The county is divided into five urban districts, three rural districts and two Poor Law unions. It returns four members to the parliament of Northern Ireland and one member to the parliament of Great Britain and Northern Ireland.

ARMAGH, urban district and county town. Co. Armagh, Northern Ireland, 89½m. N.N.W. of Dublin by Great Northern railway, at junction of the Belfast-Clones line. Pop. 7.356. The city is of great interest because of its religious associations, some claiming that it was founded by St. Patrick in the 5th century. It was the seat of a flourishing college and early became the metropolis of Ireland, inheriting much of the importance of the old fortress of Emain Macha. which was destroyed in the 4th century. As a result of Danish incursions and the ravages of the English wars the settlement became much diminished and very dilapidated, its bishops moving to Drogheda, where they enjoyed the greater security of the coastal plain. With the more settled conditions of the 18th and 19th centuries, the fortunes of Armagh revived and it once again became a prosperous and well-built centre. As the seat of an archbishop in both the Protestant and Roman organizations, it possesses two cathedrals and two archiepiscopal palaces

ARMAGNAC, formerly a province of France and the most important fief of Gascony, now wholly comprised in the department of Gers (q *v.*). In the 15th century, when it attained its greatest extent, it included, besides Armagnac, the neighbouring territories of Fezensac, Fezensaguet, Pardiac, Pays de Gaure, Rivière Basse, Eauzan and Lomagne, and stretched from the Garonne to the Adour. Armagnac is a region of hills ranging to a height of 1,000ft., watered by the river Gers and other rivers which descend fanwise from the plateau of Lannemezan. On the slope of its hills grow the grapes from which the famous Armagnac brandy is made. In Roman Gaul this territory formed part of the diocese of Auch (*civitas Ausciorum*), which corresponded roughly with the later duchy of Gascony (*q.v.*). About the end of the 9th century Fezensac (*comitatus Fedentiacus*), was erected into an hereditary countship. This latter was in its turn divided, the south-western portion becoming, about 960, the countship of Armagnac (*pagus Armaniacus*). The domain of this countship continued steadily to increase, and about 1140 Count Gerald III. added the whole of Fezensac to his possessions. Under the English rule the counts of Armagnac were turbulent and untrustworthy vassals; and the administration of the Black Prince, tending to favour the towns of Aquitaine at the expense of the nobles, drove them to the side of France.

At the accession of Henry V. Count Bernard VII. was all-powerful at the French court; and Charles of Orleans, in order to be able to avenge his father, Louis of Orleans, who had been assassinated in 1407 by John the Fearless, duke of Burgundy, married Bonne, Bernard's daughter. This was the origin of the political party known as "the Armagnacs." With the object of combating the duke of Burgundy's preponderant influence, a league was formed at Gien, including the duke of Orleans and his father-in-law, the dukes of Berry, Bourbon, and Brittany, the count of Alençon, and all the other discontented nobles. The Peace of Hourges, which was confirmed at Auxerre, put an end to the war which followed. But in Aug. 1413 the Armagnacs in their turn became masters of the government and of the king, and the duke of Burgundy, besieged in Arras, only obtained peace on condition of not returning to Paris.

Several months later Henry V. declared war against France; and when, in Aug. 1415, the English landed in Normandy, the Armagnacs and Burgundians united against them, but were defeated in the battle of Agincourt (Oct. 25 1415). John the Fearless then began negotiations with the English, while Bernard VII., appointed constable in place of the count of Saint-Pol, who had been killed at Agincourt, returned to defend Paris. However, the excesses committed by the Armagnacs incensed the populace, and John the Fearless, who was ravaging the surrounding dis-

tricts, re-entered the capital on May 29 1418, in consequence of the treason of Perrinet Leclerc. On June 12 Bernard VII. and the members of his party were massacred. From this time onward the Armagnac party, with the dauphin, afterwards King Charles VII., at its head, was the national party, while the Burgundians united with the English. This division in France continued until the Treaty of Arras, on Sept. 21 1435.

In 1444–45 the emperor Frederick III. obtained from Charles VII. a large army of Armagnac adventurers to enforce his claims in Switzerland, and the war which ensued took the name of the Armagnac War (*Armagnakenkrieg*). In Germany the name of the foreigners, who were completely defeated in the battle of St. Jakob on the Birs, not far from Basel, was mockingly corrupted into *Arme Jacken,* Poor Jackets, or *Arme* Gecken, Poor Fools.

On the death of Charles of Armagnac, in 1497, the countship was united to the crown by King Charles VII., but was again bestowed on Charles, the nephew of that count, by Francis I., who at the same time gave him his sister Margaret in marriage. After the death of her husband, by whom she had no children, she married Henry of Albret, king of Navarre; and thus the countship of Armagnac came back to the French crown along with the other dominions of Henry IV. In 1645 Louis XIV. erected a countship of Armagnac in favour of Henry of Lorraine, count of Harcourt, in whose family it continued till the Revolution.

In 1789 Armagnac was a province forming part of the *Gouvernement-général* of Guienne and Gascony; it was divided into two parts, High or White Armagnac, with Auch for capital, and Low or Black Armagnac. At the Revolution the whole of the original Armagnac was included in the department of Gers.

See E. Wulcker, *Urkunden und Schreiben betreffend den Zug der Armagnaken* (1873); Kameau, "Guerre des Armagnacs dans le Mâconnais" (1418–35) in the *Rev. soc. lit. de l'Ain* (1884); Paul Dognon, "Les Armagnacs et les Bourguignons, le comte de Foix et le dauphin en Languedoc" (1416–20) in *Annales du Midi* (1889); Witte, *Die Armagnaken im Elsass, 1439–1445* (1889); U. Chevalier, *Repertoire des sources hist. du moyen âge,* s. Armagnac (1894).

ARMAMENTS: see AIR FORCES; ARMY; ARTILLERY; BATTLESHIP; CAVALRY; CRUISER; DESTROYER; MIKES; NAVY; TORPEDOES.

ARMATOLES, the name given to Greeks who discharged certain military and police functions under the Turkish government. When the Turks conquered Greece in the 15th century, many of the Greeks fled into the mountainous districts of northern Greece and maintained a guerrilla warfare. These men were called *Klephts* (Gr. κλέπτης, a brigand): the Turkish pashas came to terms with some of them, and these men were confirmed in the possession of certain districts, undertaking in return some duties, such as the custody of the highroads. They were called *armatoles,* and the districts in which they lived *armatoliks.* They rendered good service, but their power and independence were disliked by the Turks. After the peace of Belgrade the Turkish government sought to weaken their position, and towards the end of the 18th century their numbers were seriously reduced. They afforded valuable assistance to their countrymen during the Greek war of independence in 1830.

ARMATURE, a covering for defence. In zoology the word is used of the bony shell of the armadillo. In architecture it is applied to the iron stays by which the lead lights are secured in windows. (See STANCHION and SADDLE: *Saddle-Bars.*) In magnetism Dr. William Gilbert applied the term to the piece of soft iron with which he "armed" or capped the lodestone in order to increase its power. It is also used for the "keeper" or piece of iron which is placed across the poles of a horse-shoe magnet, and held in place by magnetic attraction, in order to complete the magnetic circuit and preserve the magnetism of the steel; and hence, in dynamo-electric machinery, for the portion which is attracted by the electro-magnet. The term is now applied to that member of an electric generator (*q.v.*) or motor (*q.v.*) in which currents are induced by the action of the field.

ARMAVIR, ruined capital of Armenia, on the slopes of the extinct volcano, Ala-Geuz. It was built, according to legend, by Armais in 1980 B.C., and was the capital of the Armenian kings until the 2nd century A.D. A village, Tapadibi, fills the site,

ARMAVIR. (1) A province in North Caucasian area of the Russian S.F.S.R. Area 21,13j sq.km. Population (1926) 926,851; urban 105.396, rural 821,455. It is a fertile black earth plain, but includes a part of the forested mountain slopes in the south. Wheat is the main crop, and rye, oats, barley, millet, maize, tobacco, flax, hemp and potatoes are grown. Vines and garden fruits are increasingly cultivated. (2) A town, the centre of the area, 45" N. and 41° 8' E., on the Black sea-Caspian railway with a branch to Tuapse on the Black sea. Pop. (1926) 74,370—a great increase since its foundation in 1848. It is a trading centre and has a grain elevator.

ARMED MERCHANT CRUISER: see FLEET AUXILIARY VESSELS.

ARMED NEUTRALITY: see NEUTRALITY.

ARMENIA, a Socialist Soviet Republic created in 1918, and united with Azerbaijan and Georgia (Gruzia) in 1922 to form the Transcaucasian S.F.S. republic with unification of the transport and economic system. Area 30,948sq.km. Pop. (1926) 879,872, urban 133,658, rural 746,214. It is divided for administrative purposes into nine districts, of which the most important are Leninakan (162,579), Erivan (175,816), Etchmiadzin (113,930) and Pambak-Loriisk (132,341). Its boundaries are: — North, the Georgian S.S.R., west and south-west, Turkey, south-west, the Nakhichevan A.S.S.R., south, the Araxes river and east, the Azerbaijan S.S.R. It thus in no sense coincides with the former Armenia, much of which is now in Turkey, though Etchmiadzin, the ancient seat of the Armenian patriarchs, is included in it. It has no seaport and is therefore economically dependent on Georgia and Azerbaijan. It is mainly a plateau region (6,000–8,000ft.), with short ridges and isolated volcanic mountains. Alagoz, 14,440 ft. was active in Tertiary times. Lake Gokcha (540sq.m.) is encircled by volcanic mountains and the neighbourhood of Leninakin is covered with volcanic débris. Leninakin and the surrounding district suffered severely from the earthquake of October 1926. The climate varies with altitude and aspect, but everywhere the winters are severe and the climate extreme and dry. At Leninakin (alt. 5,078ft.) the average temperature is, January, 12°F., July, 65°F.; yearly rainfall, 16·2in. The Aras (Araxes), with its tributary the Zanga river drains the republic and on the latter the Rykov hydro-electric station was opened 1926. The Aras river is a rapid, muddy, dangerous stream when snows melt, but fordable at other times. In its valley cotton, mulberry (for silk), vine, apricots, fruits, rice and tobacco are grown. The vines must be buried during winter frosts. Irrigation is extending under the direction of the Erivan department of agriculture and schemes are being carried out at Leninakan and Etchmiadzin and a tinned fruit (especially peach) industry is springing up, but cotton is the chief product. Cattle-rearing and forestry are important in the hilly districts and Lori is developing a dairy industry. Camels are bred and leeches are exported from the swamps. The Katara copper mines are productive and were reopened in 192;. Communications are poor, though a railway from Tiflis to Tabriz in Persia passes through Leninakan and Erivan, and from Leninakan there is a branch to Kars in Turkey. The chief towns are Erivan (*q.v.*) and Leninakan. The conditions of life are poor in many parts and mud huts are common in the hills. In spite of the destruction of school buildings during the World War, education is increasing, though the schools are mainly primary. New premises are being built and teachers are being trained. A university, a musical academy and trade technical schools have been established. The Armenian tongue is in use.

The people are Armenians, Russians and Turco-Tatars. The "Armenoid" type physically is tall, dark, broadheaded, with prominent nose, high head and flattened occiput: but here it is much modified by intermixture. (X.)

HISTORY

Modern research has very largely modified the ancient conceptions of the history and the political position of Armenia. The physical features of the country played some part in shaping the destinies of the people, for the isolation of the valleys especially in winter, encouraged a tendency to separation which

showed itself in the middle ages in weakening the central power. The hillsides have always been the home of hardy mountaineers jealous of their independence, and have served as a sanctuary to the lowland people in times of foreign invasions. The country stands as an open doorway between the East and the West. Through its fertile valleys run the roads that connect the Iranian plateau with the harbours of Asia Minor and for its temporary possession nations have contended from the remote past.

BY COURTESY OF THE NEAR EAST RELIEF

ARMENIAN VOLUNTEER SOLDIERS

Armed escort is necessary in parts of Armenia, especially the southern section inhabited by the Kurds, who are notorious robbers

Ethnology. — There is evidence to assume that about 1500 B.C. Armenia was inhabited by a non-Aryan people, the type of which is called "Armenoid" by modern ethnologists. The Hittites were the representatives of this type. These original inhabitants of Armenia called themselves Khaldini or Khaldians from the name of their chief god Khaldi. At a period not yet ascertained, but presumed to be about 710 B.C., an Indo-European race, either Phrygians from the West or Cimmerians from the Caucasus mountains, invaded the highlands of Armenia and imposed their language on the natives. Later, on the rise of Media and Persia, these formed the military aristocracy of the land. These two races soon amalgamated, thus forming the main type of the modern Armenian, except where in isolated districts one or other ethnic element still predominates. The Armenian Arshakuni (Arsacid) kings (190 B.C.–A.D. 428) brought also many Jewish and Greek artisans and colonists.

In the recesses of Mount Taurus the peasants are tall, handsome, agile and brave. In the valleys of Armenia and Asia Minor they are robust, thick-set and sometimes bearing the characteristics of the proto-Armenians, as depicted on their monuments, with straight black hair and often hooked noses. They are good cultivators of the soil and cattle breeders. Some still live in semi-subterranean houses as their ancestors did in the days of Xenophon. The townsmen have more regular features of the Aryan type. They are skilled artisans and merchants, remarkable for their industry, their quick intelligence, their aptitude for business and for their enterprising spirit, which led their ancestors to trade with Scythia, China and India. The upper classes are well-educated.

Ancient Kingdom. — The early history of Armenia, as recorded by the earliest historians of the country, is confirmed in many important aspects by the native and Assyrian inscriptions. It can now be stated that in the second millennium B.C. the Assyrian monarchs were trying hard to overcome the "Nairi" confederation, which consisted of the Armenians, the Kurds and other autochthonous peoples. There is evidence that these Nairi kings were often in alliance with the Hittite empire at Boghaz-Keui. At about 900 B.C., however, the Khaldian kingdom of Van acquired hegemony over all the Nairi lands. Called Ararat by the Bible, Urartu by the Assyrians and Alarodians (Ἀλαρόδιοι) by Herodotus (iii.-94) these proto-Armenian kings became a formidable foe to Assyria, until the downfall of both. The last Khaldian king, Rusas III., fought against the Lydians on the Halys, in 585 B.C. as an ally of Cyaxares. Its history and the recent discoveries are dealt with under URARTU.

In the Behistun inscription of Darius Hystaspes (521 B.C.) first appears the name of Armeniya or Armina. This Persian monarch represents Armenia as one of his satrapies, whereas his own records state that he had to send armies year after year to quell rebellions, and that five battles he mentions were fought in Media; yet Armenia was an almost independent unit in the Persian monarchy, governed by native dynasties, as we see them in 401 B.C. when Xenophon and the Ten Thousand passed through the country. These two dynasties, Tiribazus in the north and Erwant (Orontes, Ἀροάνδης) in the south-west, governed the country owing nominal allegiance at first to Persia and then to Seleucids until 191 B.C. when Artashes (Artaxias) made himself sovereign king of Armenia Major with his capital at Artashat (Artaxata) on the Arax and Zareh (Zariades) a descendant of the Erwant dynasty of Armenia Minor.

The Arshakuni Kingdom. — This dynasty became essentially Armenian under Tigranes the Great (94–56 B.C.) who united the country and conquered seventy valleys from Parthia, Northern Syria and Cappadocia, all this territory having been held by the Khaldians. He built a new capital at Tigranocerta, now identified by Prof. Lehmann Haupt with the ancient city of Farkin. In defiance of Rome he shielded Mithridates the Great, of Pontus, his father-in-law, who had fled to his court. This brought him into conflict with Lucullus, the Roman commander, who attacked Tigranocerta.

There are no records from the Armenian side, but modern research has greatly diminished the value of Roman boastings. (Kurt Eckhardt, "Die Armenischen Feldzüge des Lucullus" in *Klio* ix.–x. [1909–10].) Ultimately the Romans held the Euphrates frontier claiming "sovereignty" over Armenia and Kurdistan. The ethnical and cultural affinities fostered by Persia and Parthia, coupled with the influence of Zoroastrianism, has so profoundly shaped the outlook of all peoples living between the Caucasus and the Iranian plateau, that Hellenism scarcely penetrated beyond the Euphrates. The Romans considered Armenia as a "buffer State" but the Armenian rulers only at moments of struggle against Persia sought the friendship of Rome, just as more powerful nations do so even to-day. Under the rule of its own Arshakuni kings the Armenian people kept its complete political entity within the frame of Iran until A.D. 303, when King Tirdat (Tiridates) converted by St. Gregory *the* Illuminator, established Christianity as the religion of the State and set an example followed later by Constantine. This spiritual break-off from Iran produced religious wars with Zoroastrian Persia which considerably weakened Armenia during the 4th and 5th centuries. Persia and the Eastern Empire "divided" Armenia into zones of influence in 387, although both Pers-Armenia and further west Arshakuni kings and powerful princes (Nakharars) governed the country in their own way, bearing titles of Marzban (Margrave) and Curopalatii.

The establishment of a national Church in 303, followed later by the discontinuance of the Greek language in the Armenian Holy offices and a separation from the Council of Chalcedon; the invention of a national alphabet by St. Mesrop resulting in the translation of the Bible and the development of literature; and finally a "Holy war" led by Prince Vardan Mamionian against Persia in A.D. 451 which provided martyrs — these three events combined, in the course of a century and a half, stamped such an indelible national individuality on the Armenian people that it has stood the test of centuries of trials. The downfall of the Persian Sassanian Empire in 642 opened the way to the Arabs, who for the following two centuries organized occasional marauding expeditions from the Kurdish foothills up to the Caspian Sea.

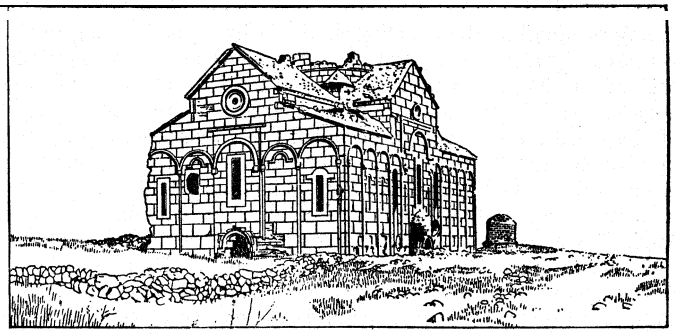
The **Bagratuni** Kingdom. — The Armenians constantly harassed the few Arab garrisons posted on some of the main roads. In 702 alone the Armenian *catholicos* (supreme head of the Church) intervened to make peace between the Armenian princes and the Arab Caliph. Armenian governors (Ostikans) were nominated by the Caliph. Under the leadership of the great Bagratuni (Bagratid) princes the country prospered so greatly that Ashot I. assumed the title of "Prince of Princes" and was recognized both by Basilius I. and the Caliph in 886, who made a treaty of friendship with King Ashot. The country developed and agriculture attained unusual prosperity. The magnificent cathedral of Ani, their capital on the Arpa-Chai, innumerable churches, monuments and irrigation works were built all over the country, the ruins of which stand out until to-day as a token of their constructive genius. A little later Prince Kagig Artsruni, another great Armenian family, crowned himself King of Vaspurakan (the province of Van). If Armenia failed under these Bagratuni and Artsruni kings to con-

solidate itself and become one of the powers of the region it is partly due to the constant Byzantine efforts to convert the Armenian church to orthodoxy, and partly to the Seljuk hordes which, after sweeping before them dozens of Arab and Persian Emiriates, appeared on the frontiers of Armenia. From 1020 onwards for about 40 years the Armenian kings fought and drove back wave after wave of Seljuk horsemen. But the Eastern Empire seized the opportunity to attack Ani and detain at Constantinople King Kagig I., who had gone there to discuss matters. Soon the empire paid the price of its treachery. The Seljuks overran the whole country and advanced into Greek Asia Minor. They established a united Government for Armenia and Kurdistan at Aklat. This Government, however, soon passed into the hands of Kurdish Shah-i-Armens (kings of Armenia) the first of whom was a cousin of the great Salaheddin, the Kurd. From 1240 onwards the Mongols occupied almost the whole of western Asia.

During these stormy times many Armenian families left their homes and went to Poland, Galicia and Byzantine lands; other families crossed the Taurus and established an independent kingdom in 1080 at Cilicia under Prince Rupen, a scion of the Bagratunis of Ani. This kingdom of Lesser Armenia had many dealings with the crusaders and made an alliance with the Mongols as against the Mamelukes of Egypt. It lasted until 1375 and the last King Leon VI. died in Paris and was buried at St. Denis. With the break-up of the rule of the Mongol Ilkhans in 1351, a large number of Kurdish, Armenian and Turkoman independent principalities arose all over the country, and the feudal lords of the valleys (Derebeys) reigned supreme over their small areas.

Turkish Occupation.— After the death of Timur in 1405, the Turkoman Ak-koyunlus established their rule at Diarbekir until they were overthrown by the Safavi Shah Ismail of Persia in 1502. This regeneration of Iran was however soon challenged by the Ottoman Turks, who in 1514–16 defeated Persia and within the next 40 years gradually established their rule over Armenia. In 1514, Sultan Selim I. entrusted Idris, a Kurdish Mollah "to reorganize" Armenia under the Turkish rule. Idris found the country bristling with castles of independent Derebeys of Kurdish and Armenian origin. Idris induced many Kurdish tribes south of Taurus to settle on Armenian lands in the north, and the Sultan gave them honours and administrative posts so as to use them against Persia. In spite of this organization of the country the sympathy of the people always remained with Persia.

In 1605 Shah Abbas transferred thousands of Armenians to New Julfa, near Isfahan, where they formed a prosperous colony in Central Persia, whence Armenian colonies expanded to India and the Far East, long before any European was allowed to trade. The periodic renewal of wars between Persia and Turkey in 1575, 1602 and under Nadir Shah partly devastated the frontier regions; but after the political troubles of the last centuries, the Ottoman rule accorded the country at least a certain measure of stability. The people suffered from a chronic anarchy; but after the capture of Constantinople 1453, Mohammed II. organized the Christian Communities of the Empire under their own ecclesiastical chiefs to whom he gave absolute authority in civil and religious matters and in criminal offences that did not come under the Muslim religious law. Under this system the Armenian Bishop Hovakim was appointed Patriarch of Constantinople by the Sultan and became practically not only the ecclesiastical but also the political leader of the Armenian nation (Ermeni Milleti) and a recognized officer of the Imperial Government. He was assisted by a council of clergy and was represented in each province by a bishop and his council. This practical self-government secured to the Armenians a recognized position before the law, the free enjoyment of their religion and national traditions, and the right to educate their children and manage their national and municipal affairs. It also encouraged the growth of a community life which eventually gave birth to a longing for national life. The leadership of the clergy, however, was bound to degrade the clergy itself, who often used unwarrantable methods for promotion to the detriment of their spiritual functions. After the issue, 1839, of the Hatti-i Sherif of Gulhaneh, the artisans and tradesmen asserted their rights to take part in the management of national affairs. The constitution approved by the Sultan in 1863 gave the Armenians in Turkey the status of a self-governing nation in a political sense under the sovereignty of Turkey. All real power passed into the hands of lay and clerical councils elected by the people. The national assembly at Constantinople consisted of 140 members representing about $2\frac{1}{2}$ million Armenians in Turkey. The education of the people received a fresh impetus at the hands of the representative councils. Early in the 18th century the Armenian Mekhitarist



THE RUINS OF THE CATHEDRAL AT ANI, ONE OF THE MANY FINE CHURCHES BUILT UNDER THE PRINCES OF THE HOUSE OF BAGRATIDES BETWEEN A.D. 702 AND 1060

Fathers had already established printing presses in Venice and Vienna, and had revived the Armenian and Greco-Roman classics. The more the reforming movement progressed in Turkey, the more the Armenians benefited by it.

Russia and the Armenians.— The Russians appeared in Transcaucasia and occupied Georgia in 1801. They gradually occupied also the Khanates of Shirvan and Sheki and by the war of 1828 against Persia they brought under their rule the whole plain of Erivan, including Echmiadzin, the seat of the Armenian catholicos. They assisted the Armenian Church to reorganize itself and as a modern State opened up great possibilities of economic and national progress. During 1829–77 the Armenians under the Russian rule increased and prospered considerably and played an important part in the economic development of Transcaucasia. Russia did not recognize an Armenian or any other question. She conquered territories, established order, and opened them up for enterprise.

"The Armenian Question."—When Abd-ul-Hamid came to the throne of Turkey in 1876 the conditions of Armenians both in Turkey and Russia were much better than they had been for centuries. But with the close of the Russo-Turkish war of 1878 came the "Armenian question" in consequence of British intervention. Russia occupied another slice of Georgia and Armenia including Batum, Kars, Ardahan, Erzerum and the upper Euphrates valley; but on the threat of war Great Britain demanded the evacuation of Erzerum, alleging that the safety of roads leading to India and commercial interests were being endangered. *(See* British Government Memo of April 1, 1878; Hertslet's Map of *Europe by Treaties,* vol. iv. p. 2,704.) Russia evacuated Erzerum and the upper Euphrates valley and as an alternative Turkey engaged to Russia by the Treaty of San Stephano to carry out reforms in the provinces "inhabited by the Armenians and to guarantee their security against the Kurds and the Circassians." Russia's aim was to attach permanently to her own interests some element in the population of the territory which she had been forced to evacuate; but it was a dubious piece of diplomacy to embroil the Armenians and the Kurds who had lived and defended themselves together from time immemorial when there were no European Powers.

By the Treaty of Berlin of July 1878, and owing to British insistence, a like engagement to the six signatory Powers was substituted for that of Russia. The same clause of "protection against the Kurds, etc." was again introduced. But before that Great Britain secretly concluded the convention of Cyprus with the Sultan for the "protection of the Christians and other subjects of the Porte" in Asia Minor. As a reward to Great Britain for defending the Asiatic frontiers of Turkey against Russia, and on condition that she should maintain the integrity of Turkey in Asia thereafter the Sultan authorized Great Britain to occupy Cyprus so long as

Kars, Ardahan and Batum remained in the hands of Russia. This British undertaking meant the prolongation of the oppressions of those peoples whom the Cyprus convention intended to protect, since Great Britain would not permit Russia to step in, and yet was not in a position to intervene effectively herself. It was generally admitted that this convention placed the Armenians under the special protection of Great Britain. But it seems that Lord Salisbury (Lady Gwendolen Cecil, *Life* of *the Marquess of Salisbury*, 1921, vol. ii. p. 321) did not then believe either in "reforms" or in any protection; the primary aim of British policy being to prevent Russia from occupying the Armenian fortresses. During a tour of the European capitals in 1877 Lord Salisbury found that none of the Great Powers took the slightest interest in the extent of the territory in Armenia occupied by Russia; therefore, when in 1880–82 the British Government was urging the Concert of Europe to common action, the Powers paid no attention. Thus the Armenian leaders, unwillingly and helplessly caught in the coils of Anglo-Russian rivalry, did nothing which might be interpreted as a deviation from the traditional loyalty to Turkey. Among the Armenians the common saying was that Turkey was their fatherland, and distinguished bishops and laymen expressed their unreserved mistrust of both Russia and Great Britain. But there were uninitiated Armenian teachers and poets who believed in the "Christendom and humanity" of Europe. The British and Russian ambassadors at Constantinople patronized Armenian charity balls and other social functions. British and Russian agents and press correspondents were interesting themselves greatly in the Armenian people and their conditions. Such courses are natural enough in Western countries, but in Turkey under the psychological conditions of those days, they struck an altogether different note.

Encouraged by these demonstrations, some Armenian teachers formed in 1885 a "revolutionary" society called Hunchak to educate and rouse the self-consciousness of the people. Another society called Daschnak was formed in 1890 in Tiflis with a more active programme, which consisted of writing songs, drilling the people in gymnastics and the use of arms. After the death of Patriarch Varjabedian who was involved in the Berlin Congress, the national assembly at Constantinople elected a new patriarch who declined to have any intercourse with foreign Powers. In Russia, Tsar Alexander II. was dead and the General Loris-Melikov, an Armenian nobleman who had conquered Kars and Erzerum in 1877, had lost his power. In accordance with her traditional policy, Russia after the war with Turkey concentrated her attention on Central Asia. Up to then Russia had been openly and unreservedly a friend to the Armenians, but concluding that the Armenian people in Turkey had been transformed into an instrument of British anti-Russian policy, she became hostile to the Armenians. By stages the use of the Armenian language was prohibited in Armenian schools in Transcaucasia; then the schools and institutions were closed, and finally all church properties were confiscated in 1903. In 1890 Russian frontier guards arrested and exiled to Siberia some 30 Armenians who wished to go to Erzerum to rescue their threatened compatriots. In face of this Russian hostility to Armenia, Great Britain did nothing to fulfil her obligations assumed by the Convention of Cyprus. After the occupation of Egypt in 1882 British interest towards the Armenians fluctuated, according as a political lever was required to bring pressure upon the Sultan. During 1887–88 Lord Salisbury both admitted and denied the British obligations regarding the Armenians. This ambiguity and the British friendship towards Bulgaria in 1886 encouraged the Armenian secret societies to believe that the more noise they made the more attention they would call upon their cause. The Sultan who up to then had still considered the Armenians as the "loyal nation," started persecutions and arbitrary imprisonments.

The Massacres.—Finally came the massacres. In the mountainous region of Sasun, in the Taurus, hardy Armenian and Kurdish communities had lived and defended themselves together from the days of Assyria. As throughout Armenia they had quarrelled over local matters, often a joint party of both races attacking another similar party. There had never been any race feeling or hatred. Some Armenian teachers had visited Sasun in the early '90s, but were not well received. In 1894 a party of Kurds attacked a party of Armenians and after a fight the quarrel seems to have been settled, when Abd-ul-Hamid fearing "revolutionary" activity sent regular troops to quell the "rebellion." About 300 Armenians were murdered and a few villages burnt by Turkish troops. In Nov. 1894 a Turkish commission of inquiry was sent to Armenia and was accompanied by the consular delegates of Great Britain, Russia and France. The latter two Governments had made no secret of their indifference in the matter, and Russia in particular was openly hostile. The commission elicited the fact that there had been no revolt, but did not state that it was merely a family quarrel. During the winter of 1894 the British Government with the lukewarm support of Russia and France, pressed for administrative "reforms" in the vilayets of Erzerum, Van, Bitlis, Diarbekir, Kharput, and Sivas. In May 1895 the three Powers presented to the Sultan an illusory scheme of "reforms" which was more calculated to broaden the breach between the Porte and its Armenian subjects than to achieve any results. Misguided young men, unaware of the political game of the contending Powers, renewed their activities in Constantinople in spite of the wise counsels of responsible Armenian leaders and clergy. Finally, the Sultan accepted the reform schemes in Oct. 1895, under British pressure. Simultaneously with the signing of the scheme the Sultan gave the signal for massacres. About 80,000 Armenians perished in the provinces. The American missionaries, who for the past sixty years had done a great educational work among the Armenians, and the French and Persian Consuls everywhere behaved in a chivalrous manner. In Van and Urfa, the townsmen offered armed resistance to the Turkish rabble. In Zeitun, in particular, the mountaineers held out against a regular Turkish siege, until the Powers intervened.

Exasperated at the massacres, some 20 Armenians attacked the Ottoman Bank in Constantinople in Aug. 1896. The European Ambassadors, however, instead of saving the innocent Armenians of the capital, secured the safety of those desperate "Nihilists" and sent them out of Turkey. In the following two days the organized Turkish mob murdered 6,000 people before the eyes of those Powers responsible for the protection of the Armenians.

In the same year the Armenians elected Mgr. Ormanian as patriarch. With the help of high Armenian officials of the Porte, the new patriarch conciliated the Sultan, who immediately proclaimed a general amnesty for Armenian political prisoners and set up *a* court to try some of the notorious murderers. Throughout the Ottoman Empire the Armenian element slowly recovered within the next decade and the "Dashnak" party started cultivating the traditional friendship with the Kurds and other neighbours.

The proclamation of the Turkish Constitution in 1908 was genuinely hailed by the Armenians as a new era of friendship. Notwithstanding the murders of Adana in 1909 the Young Turk administration produced noticeable improvement in the conditions of the Armenian people. Political refugees returned home and recovered their properties. Agriculture and trade made unusual progress resulting in great prosperity. Military service in the army and deputies in the chamber gave the Armenians a new status in Turkey.

The Armenian people in Transcaucasia under the Russian rule were in a not less favourable condition. Assisted by the Entente Powers Russia prepared a scheme of "reforms" for the Armenian vilayets under the supervision of European inspectors. Just as in 1878, no Armenian demanded reforms from the foreign Powers because in 1914, when the scheme was imposed on Turkey, the people on both sides of the frontier had never been more united and prosperous.

Armenians in the World War.—When the Turks entered the war, the Armenian leaders assured them of their loyalty. Harsh Turkish requisitions and ill-treatment of Armenian troops in the Turkish army caused racial friction. Armenian peasants in the war areas were driven from their homes and murdered. The successful self-defence of the Armenians of Van in April 1915, and Allied declarations of war aims induced the Turks to murder the Armenian people in Turkey. The scheme was carried out in June–July

1915, with unparalleled barbarity: men, women and children were robbed and murdered indiscriminately and the remainder were deported to the desert to fend for themselves.

This "evacuation" of the Armenians produced a change in the attitude of the Entente Powers. The Grand Duke Nicholas conquered Armenia early in 1916, and proclaimed "the liberation of Armenia from the Turkish yoke"; but he tried to bar the surviving people from returning to their homes, because Russia had planned to colonize with Cossacks the fertile Armenian-Kurdish lands in the Arax and Euphrates valleys. In his Guildhall speech of 1916 the British Premier declared that his Government "was resolved to secure the liberation of this ancient (Armenian) people." Throughout the War many similar declarations and promises were made by British and partly also by French Premiers.

The Independence **of** Armenia. — After the Russian Revolution of 1917 the Armenians of Transcaucasia proclaimed their independence (with their capital at Erivan) under the auspices of German military leaders then in the Caucasus, and with the help of the Turks. On his accession to power Lenin proclaimed the union and independence of Armenian lands. But under the Brest-Litovsk Treaty of March 1918, Soviet Russia ceded the districts of Batum and Kars to the Turks, who advanced to capture them. After the armistice British and French authorities made some efforts to make Cilicia the home of Armenians, but it was abandoned by France in 1921.

At the peace conference at Paris 1919 Boghos Nubar Pasha and M. Aharonian, the Armenian delegates, were induced to demand "a great Armenia" extending from sea to sea. President Wilson was being urged to accept a mandate which the American senate did not want. Meanwhile, the Armenian delegates concluded an agreement with Kurdish delegates. In the conferences held in London and San Remo in the spring of 1920, the Armenian delegates pleaded their cause. But the Allied Powers were disingenuous towards Armenia as they had been before. In May 1920, Soviet Russia re-appeared in Transcaucasia. The Armenian delegates in Moscow were offered assistance if Armenia allowed transport of Russian troops over the Kars railway to go to the rescue of the Turks who were fighting the Greeks in Asia Minor. The Armenian Government rejected the Russian offer.

In August, 1920, the Armenian delegates signed the Treaty of Sèvres which recognized the de *jure* independence of the Armenian republic. Three months later, however, the Turks attacked Armenia and occupied Kars. After the Armenian Government had signed a treaty of peace with the Turks, Russia hurried troops to Erivan led by Armenian Communists and invited the Turks, by telegram, to stop any further advance.

S. S. Republic **of** Armenia. — A Soviet Armenian Government was established in Erivan in Dec. 1920. Since that time the Armenian Communist party, about 1,000 strong, has been governing the country. With the financial support of Soviet Russia, Georgia and Azerbaijan, the Armenian Government has established peace and a measure of prosperity. Barren lands and marshes have been reclaimed by a scientific system of irrigation and considerable encouragement is given to cotton and tobacco growing. Copper mines are in process of exploitation and schemes of generating electric power are in progress.

ARMENIAN CHURCH. The earliest notice of an organized church in Armenia is in Eusebius, H. E. vi. 46, to the effect that Dionysius of Alexandria (*c.* 250) sent a letter to Meruzanes, bishop of the brethren in Armenia. There were many Christians

in Melitene at the time of the Decian persecution in A.D. 250, and two bishops from Great Armenia were present at the council of Nicæa in 325. King Tiridates (c. A.D. 238–314) had already been baptized some time after 261 by Gregory the Illuminator. The latter was ordained priest and appointed catholicus or exarch of the church of Great Armenia by Leontius, bishop of Caesarea in Cappadocia. This one fact is certain amidst the fables which soon obscured the history of this great missionary. Thus the church of Great Armenia began as a province of the Cappadocian see. But there was a tradition of a line of bishops earlier than Gregory in Siuniq, a region east of Ararat along the Araxes (Aras), which in early times claimed to be independent of the catholicus. Almost the earliest document revealing anything of the inner organization and condition of the Armenian church in the Nicene Age is the epistle of Macarius, bishop of Jerusalem, to the Armenian bishop, Verthanes, written between 325 and 33; and preserved in the Armenian language. Its genuineness has been unreasonably suspected. It insists on the erection of fonts; on distinction of grades among the ordained clergy; on not postponing baptism too long; on bishops and priests alone, and not deacons, being allowed to baptize and lay hands on or confirm the baptized; on avoiding communion with Arians; on the use of unleavened bread in the Sacrament, etc. The Armenians must, like the Georgians a little later, have set store by the opinion of the bishop of Jerusalem, or they would not have sent to consult him. It was equally from Jerusalem that they subsequently adopted their lectionary and arrangement of the Christian year; and a 9th century copy of this lectionary in the Paris library preserves to **us** precious details of the liturgical usages of Jerusalem in the 4th century. We can trace the presence of Armenian convents on the Mount of Olives as early as the 5th century.

Tradition represents the conversion of Great Armenia under Gregory and Tiridates as a sort of triumphant march, in which the temples of the demons and their records were destroyed wholesale, and their undefended sites instantly converted into Christian churches. The questions arise: how was the transition from old to new effected? and what was the type of teaching dominant in the new church? Armenian tradition, confirmed by nearly contemporary Greek sources, answers the first question. The old order went on, but under new names. The priestly families, we learn, hearing that the God preached by Gregory needed not sacrifice, sent to the king a deputation and asked how they were to live, if they became Christians; for until then the priests and their families had lived off the portions of the animal victims and other offerings reserved to them by pagan custom. Gregory replied that, if they would join the new religion, not only should the sacrifices continue, but they should have larger perquisites than ever. The priestly families then went over en *masse*. How far the older sacrificial rules resembled the levitical law we do not know, but in the canons of Sahak (c. 430), the priests already receive the levitical portions of the victims. The earliest Armenian rituals contain ample services for the conduct of an *agapē* (*q.v.*) or love feast held in the church off sacrificial meat. In the canons of the catholicus Sahak the priest is represented as eating the sins of the people in these repasts.

The mother church of Armenia was established by Gregory at Ashtishat in the province of Taron, on the site of the great temple of Wahagn, whose festival on the 7th of the month Sahmi was reconsecrated to John the Baptist and Athenogenes, an Armenian martyr and Greek hymn writer. The first of Kavasard, the Armenian new year's day, was the feast of a god Vanatur or Wanadur (who answered to Ζεὺς ξένιος) in the holy pilgrim city of Bagawan. His day was reconsecrated to the Baptist, whose relics were brought to Bagawan. The feast of Anahite, the Armenian Venus and spouse of the chief god Aramazd, was in the same way rededicated to the Virgin Bfary, who for long was not very clearly distinguished by the Armenians from the virgin mother church. The old cult of sacred stones and trees by an easy transition became cross-worship, but a cross was not sacred until the Christ had been, by priestly prayer and invocation, transferred into it.

Another survival in the Armenian church was the hereditary priesthood. None but a scion of a priestly family could become a deacon, elder, or bishop. Accordingly (except for an interregnum of 25 years) the primacy remained in the family of Gregory until the end of the 4th century, when it was transferred to another family. But by this time the autonomy of the Armenian church was thoroughly established. The right of saying grace at the royal meals, which was the essence of the catholicate, was transferred by the king, in despit of the Greeks, to the priestly family of Albianus, and thenceforth no Armenian catholicus went to Caesarea for ordination. The ties with Greek official Christendom were snapped for ever, and in subsequent ages the doctrinal preferences of the Armenians were usually determined more by antagonism to the Greeks than by reflection. If they accepted the Council of Ephesus in 430 and joined in the condemnation of Nestorius, it was rather because the Sassanid kings of Persia, who thirsted for the reconquest of Armenia, favoured Nestorianism, a form of doctrine current in Persia and rejected in Byzantium. But later on, about 480, and throughout the following centuries, the Armenians rejected the decrees of Chalcedon and held that the assertion of two natures in Christ was a relapse into the heresy of Nestor. From the close of the 5th century the Armenians have remained monophysite, like the Copts and Abyssinians, and have only broken the record with occasional short interludes of orthodoxy.

Monastic institutions were hardly introduced in Armenia before the 5th century, though Christian rest-houses had been erected along the high-roads long before. Out of these grew the monasteries. The monks were, strictly speaking, penitents wearing the cowl, and not allowed to take a part in church government. This belonged to the elders. At first there was no separate episcopal ordination, and the one rite of elder or priest sufficed. There were also deacons, half-deacons, and readers. Besides these there was a class of *wardapets* or teachers, answering to the didascalos of the earliest church, whose province it was to guard the doctrine and for whom no rite of ordination is found in the older rituals.

A few other peculiarities of Armenian church usage or belief deserve notice. In baptism the rubric ordains that the baptized be plunged three times in the font in commemoration of the entombment during three days of the Lord. In the West trine immersion was generally held to be symbolic of the triune name of "Father, Son, and Holy Ghost." This name the Armenians have used, at least since the year 700; before which date their fathers often speak of baptism into the death of Christ as the one essential. As late as about 1300 a traveller hostile to the Armenians reported to the pope that he had witnessed baptisms without any trinitarian invocation in as many as 300 parish churches.

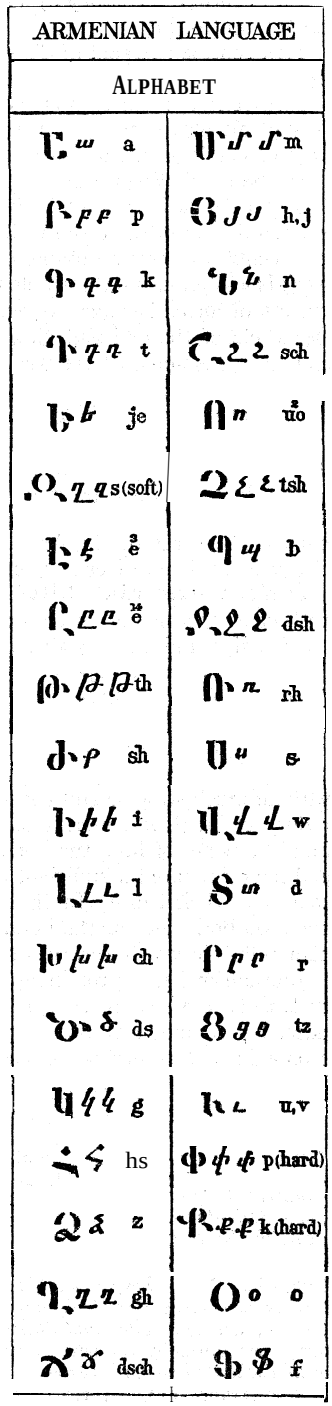
There were abortive attempts to unite the Armenian Church with the Byzantine in the 9th century under the patriarch Photius, and again late in the 12th under the emperor Manuel Comnenus, when a joint council met at Romkla, near Tarsus, but ended in nothing (A.D. 1179). Neither could the Armenians keep on good terms even with the Syriac Monophysites. From the age of the crusades on, the Armenians of Cilicia, whose patriarch sat at Sis, improved their acquaintance with Rome; and more than one of their patriarchs adopted the Roman faith, at least in words. Dominican missions went to Armenia, and in 1328, under their auspices, was formed a regular order called the United Brethren, the forerunners of the Uniats of the present day, who have convents at Venice and Vienna, a college in Rome, and a numerous following in Turkey. They retain their Armenian liturgies and rites, pruned to suit the Vatican standards of orthodoxy, and they recognize the pope as head of the church.

The recent history of the Armenian Church is inseparable from the history of the Armenian people during and after the World War. Previous to the World War, and after the settlement (if such it can be called) following the Balkan War of 1913, the Armenian population of over 3,000,000, between the Euphrates and the Kura, constituted a strong and healthy nationality. But from the year 1915 onwards the greater part of the population of Turkish Armenia was expelled from its territory. Large numbers were massacred or perished in their wanderings on the mountains. In 1921, the Armenian Republic of Erivan, in Russian

Transcaucasia, adopted the Soviet régime and became part of the Federated Union of Socialist Soviet Republics. Hundreds of thousands of Armenian refugees have fled to Syria, Mesopotamia, Transcaucasia, as well as to Greece and Russia. The disintegration of national religious customs and traditions, involved in these events, needs no comment.

See the articles ARMENIA; ARMENIAN LANGUAGE and ARMENIAN LITERATURE, with the references there given; also (pre-war) articles ARMENIA, ARMENIANS, in Hastings' *Encyclopaedia of Religion and Ethics*, vol. i., **and** Conybeare, *Rituale Armenorum* (Oxford, 1905).

ARMENIAN LANGUAGE. The Armenian language is an independent member of the Indo-European family of languages (*q.v.*) which, spoken in a mountainous region, has never spread widely or permanently. It possesses great vitality despite many persecutions. It was not reduced to writing until the spread of Christianity in Armenia when, according to tradition, in the 5th century, an alphabet was drawn up to suit it. In the language as then written were composed translations of the Bible and other pious works as well as original compositions such as that by Bishop Eznik. This language-is still preserved as the ritual language of the Gregorian or Armenian Church, and up to the 19th century was the language used by Armenian scholars.



The spoken language meanwhile evolved independently and in all parts of the country differed widely from the literary language. Lay writers used the forms current in their region, so that from the time of the Crusades we have historic tents in the vulgar speech of the Armenian Kingdom in Cilicia as then constituted. When in the 19th century modern literary languages appeared, there was great diversity in form. Some Armenians were then Russian subjects, others under Ottoman rule, yet others under Persia. One literary language developed at Erivan under Russian rule and was used by the numerous Armenians settled at Tiflis. Another was formed at Constantinople, where from the days of the Byzantine emvire there had been an important Armenian colony. Both these languages deliberately eliminated words brought in under Islamic and Turkish domination and replaced them by true Armenian words largely taken from the old written language, and thus in vocabulary both agree in many points. Pronunciation and grammar have diverged considerably though true to the general linguistic type. Thus in Erivan Armenian, Jacob is pronounced Hakob and in Turkish Armenian is *Hagop*.

Armenian is the continuation of a group of Indo-European languages intermediate between Indo-Iranian (Aryan) and Greek but distinct from both. As a result of contact with other languages, Armenian has developed in its own way and is widely removed from the early Indo-European type.

The consonantal system coincides largely with that of the southern group of Caucasian languages, represented by Georgian. The so-called occlusive consonants, *p, t*, k, and b, d, g, have undergone complete mutation, so that where Indo-European has a d, there is a *t*, thus the numeral tasn for ten corresponds to the ancient form decem as in Latin, cf. Armenian *hayr*=father, Gothic fadar and Latin *pater*. The changes from the original form have been considerable as in the numerals two and three, which in Latin are *duo* and fre and in Armenian are erku and erekh.

The grammatical forms are traceable to Indo-European origins but assumed new shapes. Thus grammatical gender had disappeared from Old Armenian. A good number of old words has been preserved, such as *kev*=cow, showing the mutation of g to k. The old form had a g as in the Sanskrit gav. Words of higher culture are mainly borrowed since Armenian has always been exposed to foreign influence. From the 3rd century B.C. to the 3rd century after Christ the country was ruled by a Parthian aristocracy, so that the language has many Iranian words. The terminology of Christianity came with the spread of the Syrian and Byzantine Churches, and there are Greek words and from the time of the Crusades French words.

ARMENIAN LITERATURE. The Armenians had a temple literature of their own which was destroyed in the 4th and 5th centuries by the Christian clergy so thoroughly that barely 20 lines of it survive in the history of Moses of Khoren (Chorene). Their Christian literature begins about A.D. 400 with the invention of the Armenian alphabet by Mesrop. The alphabet once perfected, the catholicus Sahak formed a school of translators who were sent to Edessa, Athens, Constantinople, Alexandria, Antioch, Caesarea in Cappadocia, and elsewhere, to procure codices both in Syriac and Greek and translate them. From Syriac were made the first version of the New Testament, the version of Eusebius' History and his Life of Constantine (unless this be from the original Greek), the homilies of Aphraates, the Acts of Gurias and Samuna, the works of Ephrem Syrus (partly published in four volumes by the Mechitharists of Venice). They include the commentaries on the *Diatessaron* and the Paulines, Laboubna and History of Addai, the Syriac canons of the Apostles.

From the original Greek were rendered in the 5th century many authors and works including Eusebius' Chronicon, and Josephus on the Jewish War.

An asterisk (*) is prefixed to the names of works which have been printed.

The Armenians were so busy in this century translating Greek and Syriac fathers that they have left little that is original. Still a number of historical works survive: *Faustus of Byzantium relates the events of the period A.D. 344–392 in a work instinct with life and racy of the soil. It was perhaps first composed in Greek, but it gives a faithful picture of the court of the petty sovereigns of Armenia, of the political organization, of the blood feuds of the clans, of the planting of Christianity. Procopius preserves some fragments of the Greek. The "History of *Taron*, by Zenobius of Glak, is a somewhat legendary account of Gregory the Illuminator, and may have been written in Syriac in the 5th, though it was only Armenized in a later century.

*Elisaeus Wardapet wrote a history of Wardan (Vardan), and of the war waged for their faith by the Armenians against the Sassanids. He was an eye-witness of this struggle, and gives a good account of the contemporary Mazdaism which the Persians tried to force on the Armenians. *Lazar of Pharp wrote a history embracing the events of the 5th century up to the year 485, as a continuation of the work of Faustus.

*A history of St. Gregory and of the conversion of Armenia by Agathangelus is preserved in Greek, Armenian, and Arabic.

The *History of Armenia by Moses of Khoren (Chorene) relates events up to about the year 450. Some critics put down the date of composition as low as about 700, and it was certainly retouched in the late 6th century.

*A long volume of rhetorical exercises, based on Aphthonius, is also ascribed to Moses of Khoren, and appears to be of the 5th century. The *geography which passes under his name may belong to the 7th century. Various homilies of Moses survive, as also of Elisaeus.

Goriun wrote in this century a *Life of Mesrop, and Eznik a *Refutation of the Sects, based largely on antecedent Greek works. The sects in question are Paganism, Mazdaism, Greek Philosophy, and Manichaeism.

Of the 6th and 7th centuries few works survive. To the late 7th century belong the *calendarial works of Ananiah of Shirak, who also has left a **chronicon* compiled from Eusebius, Andreas of Crete, Hippolytus, and other sources. The chief literary monument of the 7th century is the "history of the wars of Heraclius and of the early Mohammedan conquests in Asia Minor, by the bishop Sebeos, who was an eye-witness. The *history of the Albanians of the Caucasus, by Moses Kalankatuatzi, also belongs to the end of this century. To this century also seems to belong the Armenian version of a "history of the Iberians, by Djuansher, a work full of valuable information.

The early 8th century was a time of great literary activity. Gregory Asheruni wrote an important "commentary on the Jerusalem Lectionary, and his friend *John the catholicus (717–728) commentaries on the other liturgical works of his church; he also collected all existing canon law, Greek or Armenian, respected in his church, wrote *against the Paulicians and Docetae, and composed many beautiful hymns. *Leoncius the priest has left a history of the first caliphs.

In the 9th century Zachariah, catholicus, the correspondent of Photius, wrote many eloquent homilies for the various church feasts. Shapuh Bagratuni wrote a history of his age, now lost. Mashtotz, catholicus, collected in one volume the Armenian rituals.

In the 10th century (*c.* 925) the catholicus John VI. issued his "history of Armenia, and Thomas Artsruni a *history of his clan carried up to the year 936. Ananias of Mok (943–965) wrote a great work against the Paulicians, unfortunately lost. Chosroes wrote a *commentary on the eucharistic rites and breviary, *Mesrop a history of Nerses the Great; *Stephen of Asolik wrote a history of the world, and a commentary on Jeremiah; *Gregory of Narek his famous meditations and hymns.

In the 11th century John Kozerhn wrote a history, now lost, as well as a work on the Armenian calendar; Stephen Asolik a *history of Armenia up to the year 1004; *Aristaces of Lastiverd a valuable history of the conquest of Armenia by the Seljuk caliphs.

The 12th century saw many remarkable writers mostly in Cilician Armenia, viz., Nerses the Graceful (d. 1165), author of an *Elegy on the taking of Edessa, of *voluminous hymns, of long "Pastoral Letters and Synodal orations of value for the historian of eastern churches. *Samuel of Ani composed a chronicle up to 1179. Nerses of Lambron, archbishop of Tarsus, left a *Synodal oration, a *Commentary on the liturgy, etc., and his contemporary Gregory of Tlay an *Elegy on the capture of Jerusalem and various *dogmatic works. In this century the *history of Michael the Syrian was translated; Ignatius and Sargis composed *commentaries on Luke and *the catholic epistles, and *Matthew of Edessa a valuable history of the years 952–1136, continued up to 1176 by Gregory the priest. Mechithar (Mekhitar) Kosh (d. 1207) wrote an elegant *Book of Fables, and compiled a *corpus of civil and canon law (partly from Byzantine codes).

In the 13th century the following works or authors are to be noticed:—*history of Kiriakos of Ganzak, which contains much about the Mongols, Georgians, and Albanians; *Malakia the monk's history of the Tatars up to 1272; "Chronicle of Mechithar of Ani (fragmentary); *Vahram's rhymed chronicle of the kings of Lesser Armenia; *history of the world, by Vartan, up to 1269.

14th century: "history of Siunik, by Stephen Orbelian, archbishop of that province (1287–1304); *Sempat's chronicle of Lesser Armenia (952–1274), carried on by a continuator to 1331; *Mechithar of Airivanq, a chronography; *Hethoum's account of the Tatars, and chronography of the years 1076–1307. John of Orotn (d. 1388) compiled commentaries on John's gospel and the Paulines, and wrote homilies and monophysite works; his disciple Gregory of Dathev (b. 1340) compiled a **Summa* theologiae called the Book of Questions, in the style of the Summa of Aquinas, which had been translated into Armenian (c. 1330), as were a little later the *Summa of Albertus and works of other schoolmen.

15th century: "History of Tamerlane, by Thomas of Medsoph, carried up to 1447.

17th century: Araqel of Tabriz wrote a "history of the Persian invasions of Armenia in the years 1602–1661.

18th century: the catholicus Abraham of Crete wrote the history of his own times (1734–1736), and his relations with Nadir, shah of Persia, at whose coronation he was an eye-witness.

In the above list are not included a number of medical, astrological, calendarial, and philological or lexicographic works, mostly written during or since the Cilician or crusading epoch. Since the 15th century a certain number of profane poets have arisen, whose work is less jejune on the whole than that of the hymn and canticle writers of an earlier age. Gregory Magistros (d. 1058) abridged the whole of the Old and New Testaments in a *rhyming poem, and set a fashion to later writers. Such works as *Barlaam and Josaphat, the *History of the Seven Sages, the *Wisdom of *Ahikar,* the *Tale of the City of Bronze, were freely turned into verse in the 13th and following centuries.

The 16th century saw the first books printed in Armenian. The press which has done most in printing Armenian authors is that of the Mechitharists of Venice. There in 1836 was issued a magnificent thesaurus of the Armenian language, with the Latin and Greek equivalents of each word.

Modern Armenian Literature.— About the middle of the 19th century a modern school of literature came into existence in the Russian and Turkish districts of Armenia. The new literary language was based respectively on the modern dialects of Ararat (*q.v.*) and Constantinople, differing considerably in grammar, but not in vocabulary, from ancient classical Armenian, which had been almost unintelligible to the people since the middle ages. The change from the old school to the new naturally did not take place without much struggle and controversy, but the modern school can rightly claim three generations of new writers who have worked in all branches of literature — poetry, novels, drama, satire, etc.— and have produced a sufficient number of valuable literary works to justify their cause. In the meantime great efforts have been made on both sides of the boundary to collect and publish Armenian folk-lore which deserves special attention.

Journalism has a prominent place in modern Armenian literature, to such an extent that, in spite of the present scattered and unsettled condition of the people, and notwithstanding the great economic and numerical loss during and after the World War, there are more than 70 newspapers and periodicals published in various parts of the world in the modern literary language.

Marr of Petrograd (in Russian), by Joseph Karst (of the Cilician dialect); Langlois, Collection d'historiens *arméniens* (1867); Dulaurier, *Recherches sur les* chronologie arme'nienne (1889) and Historiens *arméniens* des Croisades; H. F. B. Lynch, Armenia, 2 vols. (1902); Brosset, Collection d'historiens *arméniens* (1874), and numerous other works by the same author; C. F. Neumann, Geschichte der armenischen Literatur (1836).

ARMENOID, a term devised by Deniker to indicate one of the three brunette sub-types of the broad-headed complex of white races. The Armenoid sub-type is very peculiar; it has the head abruptly flattened behind, especially in the Ararat mountain-region peoples. The head is characterized by a very lofty vault with outward-drooping orbits, and the abrupt flattening of the

back of the head has been erroneously ascribed to artificial deformation by both ancient and modern writers.

ARMENTIÈRES, a town of France, department of Nord, on the Lys, 13 mi. W N.W. of Lille by rail. Pop. (1936) 22,446. Before its complete destruction (1914–1918) it was important for spinning and weaving of flax and cotton, bleaching, dyeing and the manufacture of machinery. Its association with textiles goes back to the woollen industry of the middle ages. Two miles behind the British lines during most of World War I, it was lost in the German advance of April 1918. Before World War II, it had recovered from these devastations. There is a board of trade arbitrators and a chamber of commerce.

ARMET, a form of helmet which was developed out of existing forms in the latter part of the 15th century (diminutive of Fr. *arnte).* It was round in shape, and often had a narrow ridge or comb along the top, It had a pivoted or hinged vizor and nose-piece, and complete chin, neck and cheek protection, closely connected with the gorget. It was distinguished from the basinet by its roundness, and by the fact that it protected the neck and chin by strong plates, instead of a "camail" or loose collar of mail; from the salade and heaume by its close fit and skull-cap shape; and from the various forms of vizored burgonets by the absence of the projecting brim. It remained in use until the final abandonment of the complete closed head-piece.

ARMFELT, GUSTAF MAURITZ, COUNT (1757–1814), son of Charles II.'s general, Carl Gustaf Armfelt, was born in Finland March 31 1757. Gustavus III. of Sweden employed him in the negotiations with Catherine II. (1783) and with the Danish Government (1787), and during the Russian war of 1788–90 he was one of the king's most trusted and active counsellors. He displayed great valour in the field. In 1788 when the Danes unexpectedly invaded Sweden and threatened Gothenburg, it was Armfelt who, under the king's directions, organized the Dalecarlian levies and led them to victory. He remained absolutely faithful to Gustavus when nearly the whole of the nobility fell away from him; brilliantly distinguished himself in the later phases of the Russian war; and was the Swedish plenipotentiary at the conclusion of the Peace of Verelā. During the last years of Gustavus III. his influence was paramount, though he protested against his master's headstrong championship of the Bourbons.

On his death-bed Gustavus III. (1792) committed the care of his infant son to Armfelt and appointed him a member of the council of regency; but the anti-Gustavian duke-regent Charles sent Armfelt as Swedish ambassador to Naples to get rid of him. From Naples Armfelt communicated with Catherine II., urging her to make a military demonstration in favour of the Gustavians The plot was discovered by the regent's spies, and Armfelt only escaped from the man-of-war sent to Naples to seize him with the assistance of Queen Caroline. He now fled to Russia. When Gustavus IV. attained his majority, Armfelt was completely rehabilitated and sent as Swedish ambassador to Vienna (1802), but was obliged to quit that post two years later for sharply attacking the Austrian Government's attitude towards Bonaparte. From 1805 to 1807 he was commander-in-chief of the Swedish forces in Pomerania, where he retarded the conquest of the duchy as long as it was humanly possible.

Armfelt was the most courageous of the supporters of the crown prince Gustavus. and was expelled from Sweden. He found refuge in Russia, where he obtained great influence over Alexander I. He contributed more than anyone else to the erection of the grand-duchy into an autonomous State. and was its first and best governor-general. The plan of the Russian defensive campaigns is, with great probability, also attributed to him, and he gained Alexander over to the plan of uniting Norway with Sweden. He died at Tsarskoe Selo, Aug. 19, 1814.

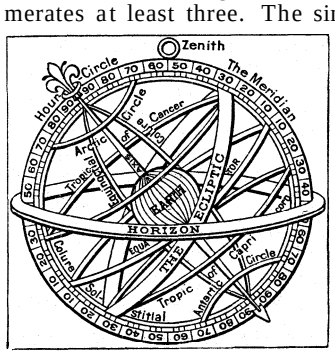
ARMIDALE, a town in Sandon county, is situated on the New England plateau towards the north-east corner of New South Wales. The undulating upland surfaces afford space for settlement, and Armidale is a typical New England town. It is situated at a height of 3,313ft.—an elevation which, in spite of the latitude (30° 32' S.), gives it a cool and bracing climate and a sufficient rainfall (mean annual 31–32in) derived mainly from the Pacific side. Armidale is the centre of a thriving agricultural and pastoral area. Mining (tin, gold, antimony) is carried on in the surrounding areas (though the mines are mostly small) and the streams of the south-eastern gorges and valleys (Gara, Chandler, Okey, Styx) are capable of yielding hydro-electric power, the development of which is projected. Climate, attractive scenery, and a convenient position on the main Northern line (Sydney–Brisbane) have helped to make Armidale an educational and ecclesiastical centre. It possesses several fine schools, besides two cathedrals (Anglican and Roman Catholic). It has been a municipality since 1863 and has grown steadily in population (1891: 3,826; 1933: 6,794), though the population of the district served is considerably greater.

ARMIGER: *see* ESQUIRE.

ARMILLA or **ARMILLARY SPHERE,** an astronomical model representing the great circles of the heavens, including in the complete instruments, the equator, meridian, ecliptic, and tropics. It is a skeleton celestial globe, with circles divided into degrees for angular measurement. In the 17th and 18th centuries such models, either suspended, rested on a stand. or affixed to a handle, were used to show the difference between the Ptolemaic theory of a central earth, and the Copernican theory of a central sun.

The earliest known complete armillary sphere with nine circles is believed to have been the *meteoroskopion* of the Alexandrine Greeks (C. A.D. 140), but earlier and simpler types of ring instruments were also in general use. Ptolemy in the Almagest, enumerates at least three. The simplest of all was the *Equinoctial Armilla,* a ring of bronze fixed in the plane of the equator. At Rhodes and elsewhere the arrival of the equinoxes was noted by observing when the shadow of the upper half of the ring exactly covered the lower half. Similarly, the *Solstitial Armilla,* a double ring erected in the plane of the meridian with a rotating inner circle was used for measuring solar altitudes, and probably by Eratosthenes (276–196 B.C.) for measuring the obliquity of the ecliptic. Hipparchus (160–125 B.C.) is stated to have used a sphere of four rings and in Ptolemy's instrument *astrolabon* (A.D. 139) there were diametrically disposed tubes upon the graduated circles, the instrument being kept vertical by a plumb line.



AFTER BLUNDERVILLE, "A PLAINE TREATISE OF COSMOGRAPHIE 1594

AN ARMILLARY SPHERE

The earth is equipped with a visible axis, and the imaginary circles of astronomy are represented by metal rings

The Arabs employed similar instruments with diametric sight rules or alidades, and it is likely that those made and used in the 12th century by Moors in Spain were the prototypes of all later European armillary spheres. One large Chinese armillary sphere in Pekin is said to date from 1274, but another belongs to the period of 17th century Jesuit astronomers. **(R. T. G.)**

ARMIN, FRIEDRICH SIXT VON: *see* SIXT VON ARMIN.

ARMINIUS, the Latinized form of the name HERMANN, or more probably ARMĪN (17 B.C.–A.D. 21), the German national hero. He was a son of Segimer, a prince of the tribe of the Cherusci (*q.v.*), and in early life served in the Roman armies. Returning to find his people chafing under the yoke of the Roman governor, Quintilius Varus, he fomented rebellion, and, in the autumn of A.D. 9. surprised Varus in the Teutoburger Wald, and utterly destroyed three legions. This disaster caused panic at Rome and forced the Romans to withdraw their frontier from the Elbe to

the Rhine. Then in A.D. 15, Germanicus Caesar led the Romans against Arminius, and captured his wife, Thusnelda. An indecisive battle was fought in the Teutoburger Wald, where Germanicus narrowly escaped the fate of Varus, and in the following year Arminius'was defeated. But the campaigns had been so costly that Germanicus was recalled, and the Romans gave up for ever the idea of the Elbe frontier. The hero's later years were spent in fighting against Marbod, prince of the Marcomanni, and in disputes with his own people. He was murdered in A.D. 21.

In 1875 a great monument to Arminius was completed. This stands on the Grotenburg mountain near Detmold. Klopstock and other poets have used his exploits as material for dramas.

Much discussion has taken place with regard to the exact spot in the Teutoburger Wald where the great battle between Arminius and Varus was fought. There is an immense literature on this subject, and the following may be consulted:—T. Mommsen, *Die Ortlichkeit der Varusschlacht* (1885); *E.* Meyer, *Untersuckungen über die Schlacht im Teutoburger Walde* (1893); A. Wilms, *Die Schlacht im Teutoburger Walde* (1899); F. Knoke, *Das Schlachtfeld im Teutoburger Walde* (1899); *E.* Diinzelmann, *Der Schauplatz der Varusschlacht* (1889); and P. Hofer, *Die Varusschlacht* (1888). For more general accounts of Arminius *see:* Tacitus, *Annals,* edited by H. Furneaux (Books I. and II.) (1884–91); O. Kemmer, *Arminius* (1893); F. W. Fischer, *Armin und die Romer* (1893); *W.* Uhl, *Das Portrait des Arminius* (1898); *F.* Knoke, *Die Kriegszüge des Germanicus in Deutschland* (1887); and W. A. Oldfather and H. V. Cantor, "The Defeat of Varus," in *Univ.* of *Illinois studies in the Social Sciences* (Urbana, Ill., 1915).

ARMINIUS, JACOBUS (1560–1609), Dutch theologian, author of the modified reformed theology that receives its name of Arminianism from him, was born at Oudewater, South Holland, Oct. 10 1560. Arminius is a Latinized form of his patronymic Hermanns or Hermansen. His father, Hermann Jakobs, a cutler, died while he was an infant, leaving a widow and three children. Theodorus Aemilius, a priest, who had turned Protestant, adopting Jakobs, sent him to school at Utrecht, but died when his charge was in his 15th year. Rudolf Snellius (Snel van Roijen, 1546–1613), the mathematician, a native of Oudewater, then a professor at Marburg, happening at the time to visit his early home, met the boy, saw promise in him and undertook his maintenance and education. He had just settled at Marburg when the news came that the Spaniards had besieged and taken Oudewater, and murdered its inhabitants almost without exception. Arminius hurried home, but only to find all his relatives killed. Arminius was then sent to study theology at the newly established University of Leiden. The six years he remained at Leiden (1576–82) were years of active and innovating thought in Holland. The War of Independence had started conflicting tendencies in men's minds. To some it seemed to illustrate the necessity that the State should tolerate only one religion, but to others the necessity that the State should tolerate all religions. Dirck Coornhert argued in private conferences and public disputations that it was wrong to punish heretics and his great opponents were as a rule the ministers, who maintained that there was no room for more than one religion in a State. Caspar Koolhaes, the heroic minister of Leiden—also its first lecturer in divinity—pleaded against a too rigid uniformity; for such an agreement on "fundamentals" as had allowed Reformed Lutherans and Anabaptists to unite. Leiden had been happy, too, in its first professors. There taught in theology Guillaume Feuguières or Feuguereius (d. 1613), a mild divine, who had written a treatise on persuasion in religion, urging that "men could be led, not driven" in religious matters; Lambert Danaeus, who deserves remembrance as the first to discuss Christian ethics scientifically, apart from dogmatics; Johannes Drusius, the orientalist, one of the most enlightened and advanced scholars of his day, settled later at Franeker; Johann Kolmann the younger, best known by his saying that high Calvinism made God "a tyrant and an executioner." Snellius, Arminius's old patron, now removed to Leiden, expounded the Ramist philosophy, and did his best to start his students on the search after truth, unimpeded by the authority of Aristotle. Under these men and influences, Arminius pursued his studies. In 1582 he went to Geneva, studied there awhile under Theodore Beza, but owing to his active advocacy of the Ramist philosophy, soon had to remove to Basel. After a short but brilliant career there, he turned to Geneva, studied for three years, travelled, in 1586, in Italy, heard Giacomo Zarabella (1533–89) lecture on philosophy in Padua, visited Rome, and, open-minded enough to see its good as well as its evil, was suspected by the stern Dutch Calvinists of leanings toward Catholicism. Next year he was called to Amsterdam, and there, in 1588, was ordained. In 1603 he was called, in succession to Franz Junius, to a theological professorship at Leiden, which he held till his death on Oct. 19 1609.

Arminius is the founder of the anti-Calvinistic school in Reformed theology, which created the Remonstrant Church in Holland (see REMONSTRANTS), and contributed to form the Arminian tendency or party in England. He was a man of mild and liberal spirit, broadened by varied culture, constitutionally averse to narrow views and enforced uniformity. He lived in a period of severe systematizing. Calvinism had become, towards the close of the 16th century, supreme in Holland, but the very rigour of the uniformity it exact'ed provoked a reaction. Coornhert could not plead for the toleration of heretics without assailing the dominant Calvinism, and so he opposed a conditional to its unconditional predestination. The two ministers of Delft, who had debated the point with him, had, the better to turn his arguments, descended from the supralapsarian to the infralapsarian position; *i.e.,* had made the divine decree succeed the Fall rather than to precede or determine it. This seemed to the high Calvinists of Holland a grave heresy. Arminius, fresh from Geneva, familiar with the dialectics of Beza, was simultaneously invited in 1589 by the ecclesiastical court of Amsterdam to refute Coornhert, and by Martin Lydius, professor at Franeker, to combat the two infralapsarian ministers of Delft. Thus led to confront the questions of necessity and free will, his own views became unsettled, and the further he pursued his inquiries the more he was inclined to assert the freedom of man. This change occasioned much controversy in the ecclesiastical courts where, however, he successfully defended his position. The controversy was embittered and the differences sharpened by his appointment to the professorship at Leiden. He had as colleague Franz Gomarus, a strong supralapsarian, perfervid, irrepressible; and their collisions, personal, official, political, tended to develop and define their respective positions.

Arminius died, worn out by uncongenial controversy and ecclesiastical persecution, without having developed any logical and consistent system such as that maintained by his successor, Simon Episcopius. His work was rather a criticism than a new logical creed. His position with regard to the supralapsarian and infralapsarian doctrines has been thus summarized by Dr. Fairbairn: "He held that it (the doctrine) made God the author of sin,. that it restricted his grace, that it left multitudes outside without hope, that it condemned multitudes for believing the truth; viz., that for them no salvation was either intended or provided in Christ, and it gave an absolutely false security to those who believed themselves to be the elect of God."

Arminius's works are mostly occasional treatises drawn from him by controversial emergencies, but they everywhere exhibit a calm, well furnished, undogmatic and progressive mind. He was essentially an amiable man who hated the zeal for an impossible orthodoxy that constrained "the church to institute a search after crimes which have not betrayed an existence, yea, and to drag into open contentions those who are meditating no evil." His friend Peter Bertius, who pronounced his funeral oration, closed it with these words: "There lived a man whom it was not possible for those who knew him sufficiently to esteem; those who entertained no esteem for him are such as never knew him well enough to appreciate his merits."

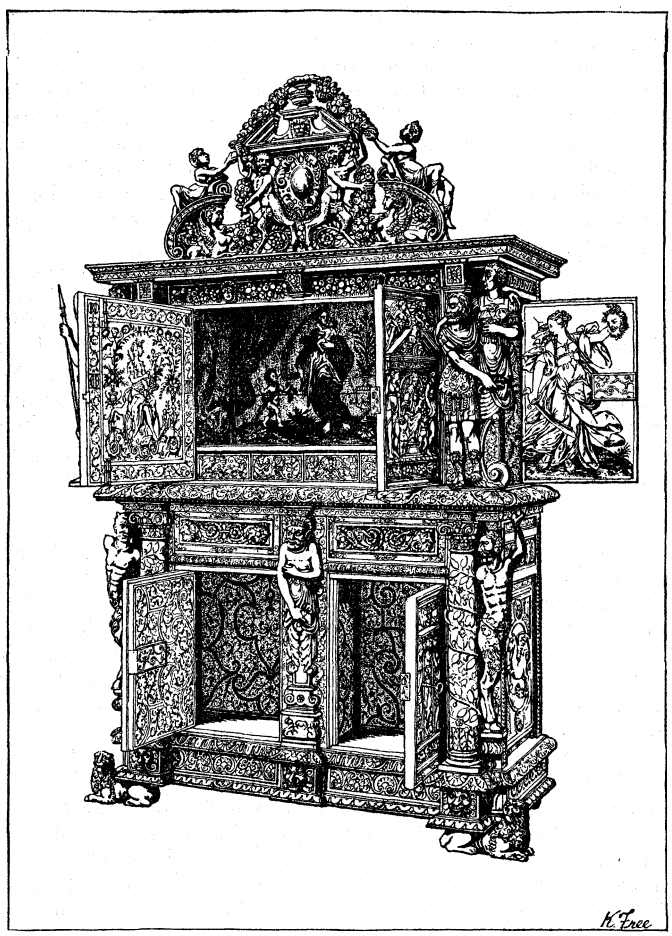
For the formal development of the ideas of Arminius, ***see*** EPISCOPIUS, SIMON.

BIBLIOGRAPHY.—The works of Arminius (in Latin) were published in a single quarto volume at Leiden in 1629, and at Frankfort in 1631 and 1635. Two volumes of an English translation, with copious notes, by James Nichols, were published at London, 1825–28; three volumes (complete) at Buffalo, 1853. A life was written by Caspar

Brandt, son of Gerard Brandt, the historian of the Dutch reformation, and was published in 1724; republished and annotated by J. L. Mosheim in 1725; and translated into English by the Rev. John Guthrie, 1854. James Nichols also wrote a life (London, 1843).

ARMISTICE, a suspension of hostilities by mutual agreement between two nations at war or their respective forces. An armistice may be either general or particular. In the first case there is a complete cessation of hostile operations in every part of the dominions of the belligerent powers; in the second there is merely a temporary truce between two contending armies, or between a besieged fortress and the force besieging it. Such a temporary truce, when for a very limited period and for a special purpose, *e.g.*, the collection of the wounded and the burial of the dead, is termed a *suspension* of arms. A general armistice cannot be concluded by the commanders-in-chief unless special authority has been previously delegated to them by their respective Governments; otherwise any arrangement entered into by them requires subsequent ratification by the supreme powers of the States. A partial armistice may be concluded by every commander of even the smallest detachment without any special authority from his Government or superior officer. The conduct of belligerent parties during an armistice is usually regulated in modern warrare by express agreement between the parties.

ARMISTICE DAY, the anniversary of the cessation of hostilities in the World War (Nov. 11, 1918), and of the signing of an armistice between the Allies and Germany. In London this anniversary is observed by a two minutes' silence in memory of the fallen, together with a special service at the Cenotaph (*q.v.*) in Whitehall. The two minutes' silence is generally observed throughout the British Empire. In the United States Nov. 11 is a legal holiday in 23 States and is observed in others by the Governor's proclamation. The day is marked by appropriate ceremonies, including parades and campaigns for the relief of war veterans



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

A BURGUNDIAN RENAISSANCE ARMOIRE, OR CUPBOARD. OF THE 16TH CENTURY, IN THE STYLE OF HUGUES SAMDIN

ARMOIRE, the French name (cf. ALMERY) given to a tall movable cupboard, or "wardrobe," with one or more doors. It has varied considerably in shape and size, and the decoration of its doors and sides has faithfully represented mutations of fashion and modifications of use. It was originally exceedingly massive and found its chief decoration in elaborate hinges and locks of beaten iron. The finer ecclesiastical armoires or aumbries which have come down to us—used in churches for the safe custody of vestments, eucharistic vessels, reliquaries and other precious objects—are usually painted, sometimes even upon the interior, with sacred subjects or with incidents from the lives of the saints. By the end of the 14th century, when the carpenter and the wood-carver had acquired a better mastery of their material, the taste for painted surfaces appears to have given place to the vogue of carving, and the rectangular panels gradually became sculptured with a simple motive, such as the linen-fold or parchment patterns. The 15th century armoire became less obviously and aggressively a thing of utility. Enriched with columns and pilasters, its panels carved with mythology, its canopied niches filled with sculptured statuettes, it was widely removed from the iron-mounted receptacle of earlier generations. During the 16th century the armoire relapsed into plainness. By the middle of the 18th century it was found in every French house and throughout a considerable part of Europe. About the beginning of the 19th century the armoire developed into the wardrobe, now in general use as a piece of bedroom furniture (*see* WARDROBE).

ARMORICA (AREMORICA), the Roman name, derived from two Celtic words meaning the "seaside" (*ar,* on, and *mor,* sea), for the land of the Armorici, roughly the peninsula of Brittany. At the time of Caesar's advance on Gaul there were five principal tribes in Armorica, among whom were the Veneti (q.v.), who were entirely destroyed by Caesar. Under the empire it formed part of the province of Gallia Lugudunensis. It contained hardly any towns and was perhaps less Romanized than the rest of Gaul. In and after the later part of the 5th century it received many Celtic immigrants from the British Isles, fleeing (it is said) from the Saxons; and the Celtic dialect which the Bretons still speak is thought to owe its origin to these immigrants. (See BRITTANY.)

ARMOUR, JONATHAN OGDEN (1863–1927), American merchant, was born in Milwaukee (Wis.), Nov. 11, 1863, the son of Philip D. Armour (*q.v.*). In 1883 he joined the business of Armour and Co. Made a partner the iollowing year, he became general manager and head of the company after the death of his father. Under his guidance the business became one of the largest in the United States. He died in London, August 16, 1927.

ARMOUR, PHILIP DANFORTH (1832–1901), American merchant and philanthropist, was born in Stockbridge, N.Y., May 16, 1833. He was educated at Cazenovia academy, Cazenovia, N.Y., worked for several years on his father's farm, and in 1852 ment overland to California, w-here he laid the foundations of his fortune. In 1856 he became associated with his friend, Frederick S. Miles, in a wholesale grocery and commission business at Milwaukee. In 1863 he became the head of the firm of Armour, Plankington and Co., pork packers. He also obtained a large interest in the firm of H. O. Armour and Co., which was founded by his brother, Herman Ossian Armour (1837–1901), and which, starting as a grain commission business, in 1868 established also a large pork-packing plant. Of this firm, the name of which was changed to Armour and Co. in 1870, he became the head in 1875. Besides contributing to many charitable enterprises, Armour founded the Armour Institute of Technology at Chicago in 1892 and the Armour flats in Chicago, built for the purpose of supplying at a low rental good homes for working men and their families. He died on Jan. 6, 1901.

ARMOUR AND COMPANY, one of the largest of meat-packing and slaughtering establishments, has its headquarters in Chicago, Ill. It prepares and distributes meats, live stock by-products, and various closely related products such as butter, eggs, cheese and poultry. Founded in Chicago in 1867 by Philip D. Armour, the capacity of its original plant was 30.000 hogs

per annum. Expansion was rapid and very shortly beef and lamb were added. In 1898 the first of many plants outside of Chicago was opened in Omaha, Neb. In 1900 there was a merger with the Armour Packing Company of Kansas City, Mo., a company organized and developed by Philip D. Armour's brothers—the new concern carrying on under the name of Armour and Company. The business continued to grow, many more plants were established, and in 1923 the physical properties, trade-marks and goodwill of Morris and Company, another long established packing concern, were purchased. This involved the reorganization of the financial structure of Armour and Company and an increase in its capital stock to an aggregate of some $235,000,000. In 1935 Armour and Company had some thirty packing plants, half a hundred produce plants, and some 300 branch houses which distributed its products throughout all the principal consuming centres.

In 1934 the Company's capital structure was reorganized. Total assets after reorganization were $295,782,508. The Company handles a volume of business ranging from $500,000,000 to $1,000,000,000, depending on the prevailing price levels. (G. A. E.)

ARMOURED CAR. Three types are recognized, viz.: (1) an armed and armoured, wheeled, military, motor vehicle capable of high road speed plus a moderate amount of cross-country mobility, (2) an enclosed, armoured truck for the safe transport of specie or other valuables, (3) a standard passenger automobile so modified by the installation of laminated (bullet-proof) glass and armour plate (concealed by upholstery) as to render occupants safe from small arms fire, while to the casual eye differing in no way from an unarmoured car of the same make.

The Military Armoured Car.—This had its genesis in the U.S.A. in 1898 when Major (later Colonel) R. P. Davidson, Illinois National Guard, caused to be constructed by the Duryea Corporation a three-cylinder, gasoline-driven motor car mounting a Colt machine gun behind a light steel shield. With a crew of four (seated back to back, in pairs) it carried 125 rounds of ammunition (enough for 15 seconds of automatic fire) and fuel sufficient for a trip of 200 miles. Travelling from Illinois to Washington with a message to Lt. General Nelson A. Miles, this strange vehicle so impressed that officer that he promptly recommended that five regiments of American horse cavalry be provided with similar equipment and trained in special reconnaissance duties—in short, mechanized. Thirty years later his advice was adopted, in part.

But the ice was broken, and within a relatively short space England produced her first armoured car—the Pennington, and France hers—the Charron. Thereafter, evolution was both rapid and intense, and even prior to 1914 this new instrument had received its baptism of fire in actual military operations, being employed by the Italians in their campaign against Tripoli and Cyrenaica (1913). But its importance appears to have been best appreciated in Germany, that country entering the World War of 1914–18 equipped with no less than 700–800 light, armoured vehicles, and 200–300 of a heavier type.

The conventional armoured car of 1940 (U.S.A.) is primarily a high speed, road vehicle which makes small effort to ape the cross-country mobility of the tank. Lightly armoured, it has a four-wheel drive, and carries two machine guns of ·30 calibre and one of ·50 calibre. Known as a "Scout Car" it is present in considerable numbers in the new Armoured Division whose tables of organization call for 588 of these vehicles distributed among a force of 1,011 officers and 18,267 men. As in the past, it is employed primarily for reconnaissance, though its arms and armour permit it to engage small enemy forces under favourable circumstances.

Armoured Truck.—This was developed in the United States, where the predations of hold-up gangs began, soon after the termination of the World War of 1914–18, to cause serious concern. Operated by armed crews of two or more, it exhibits a completely enclosed armoured body, and is employed in the transfer of valuables of all kinds between banks, mercantile establishments, etc.

Armoured Passenger Cars.—These, likewise an American phenomenon, are in use by law-enforcing agencies, also by individuals who have reason to fear for their personal safety. An interesting variation upon this type was the armoured passenger vehicle developed prior to the World War of 1914–18 by gangs of international smugglers operating across the Franco-Belgian boundary. Designed to permit steering from either end, road barricades erected by customs officials held few terrors for these illicit land cruisers.

(C. GD.)

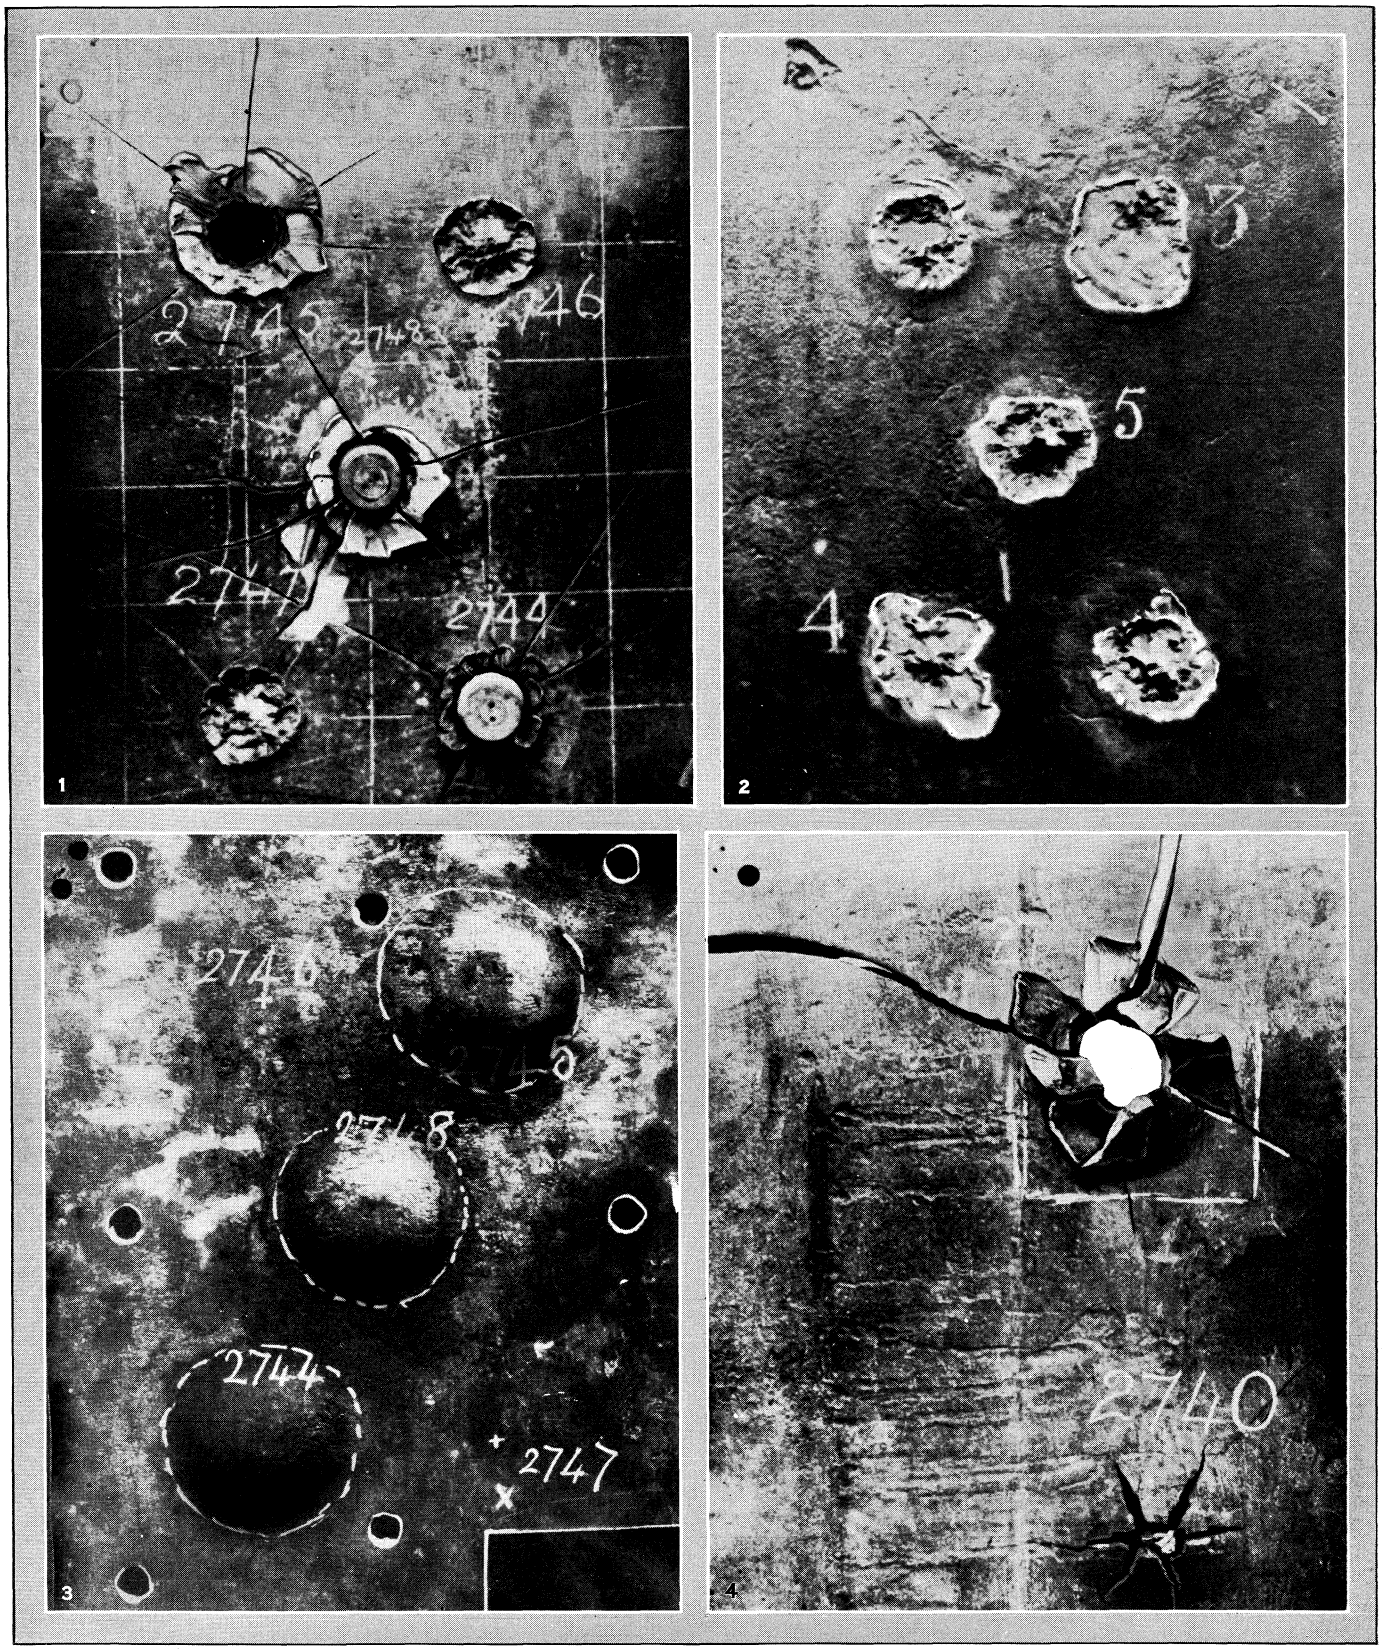
ARMOURED TRAINS. In the earliest days of the application of railways to war uses, the idea presented itself of utilizing the weight-carrying capacity of the railway and the pulling power of the locomotive for tactical as well as for strategic purposes. "Railroad batteries" figured in the American Civil War and in the war of 1870–71 and armoured trains have appeared thereafter sporadically in most wars, particularly in South Africa, 1899–1902. Their utility, though confined within narrow limits, was unquestionable until the development of mechanical road transport.

In countries where the rail system is sufficiently developed to give such trains real freedom of movement there exists an even fuller system of main roads on which armoured cars can operate, and in the World War period of 1914–18 the fighting train only figured in such theatres as those of the Russian civil wars, in which roads fit for heavy traffic are as a rule rarer than railways. As against the armoured car working on good roads the train must always suffer from being limited to certain tracks which are easily interrupted by raids, air bombing or artillery fire, and in the future, as cross-country cars of the six-wheeled or caterpillar types improve, the limitations of the armoured train will be accentuated in comparison.

On the other hand, the old railroad battery, considered as a form of gun-mounting, possesses many advantages over other forms of mounting heavy ordnance for field warfare. In the well-laid bed of a railway track, organized to distribute heavy strains equably, such mountings have their firing platform ready made, and the power of the locomotive gives heavy artillery a mobility that otherwise it would lack. In this form, then, the train represents the battery vehicles of horsed or motor artillery The central member is the heavy truck carrying the gun, and the others are arranged for ammunition and for the accommodation of the gun personnel. Light armour is frequently used for the protection of the vehicles against shrapnel bullets, and in some cases the gun itself is provided with a shield. (See ORDNANCE.)

ARMOUR PLATES. The idea of giving extra protection to the hulls and decks of war vessels is a very ancient one. Archimedes, in building the famous "Syracusan"—that most palatial of ancient ships—for King Hiero, around 250 B.C. provided for "mats composed of stout ropes suspended by brazen chains." No doubt these were a provision against ramming and missiles; and the cables that were made taut around the hulls of Greek ships served at least a part of the same purposes. The "Syracusan," too, was completely surrounded by an iron balustrade; we are not told its vertical dimensions. In Rome, there was an accepted technical distinction which divided all war vessels into apertae (with uncovered deck) and cataphracts such as the quinqueremes, wherein the wall of the ship was carried up beyond the gunwale to the deck as a protection to the rowers. In Byzantine times, when combustible—and perhaps explosive—missiles came into use. leather curtains were adopted or else saturated woollen sheaths. By the 11th century the Scandinavian sea-kings had vessels that were armoured in the modern sense. In the *Svarfdaela* we read: "Ljot the Pale is in the east in the Swedish isles; he has . . . a 'dragon' covered with iron above the sea; it goes through every ship." There mas another such owned by Fridthjof's father, Thorstein, "and its sides were sheathed with iron" (*Fridthjof's* Saga, I.). The iron hands over the prows of the mediaeval ramships are well known. A ms. of about 1430, describing the side-wheeler, mentions a "covered" ship of that type as in use by Catalonians; and there have come down other mentions of that formidable Catalonian ship.

Until the close of the Napoleonic wars ships-of-the-line were virtually armoured for their sides of almost two feet of oak were



COMPOUND ARMOUR AND NICKEL-STEEL PLATING PRODUCED BY BRITISH AND AMERICAN FIRMS

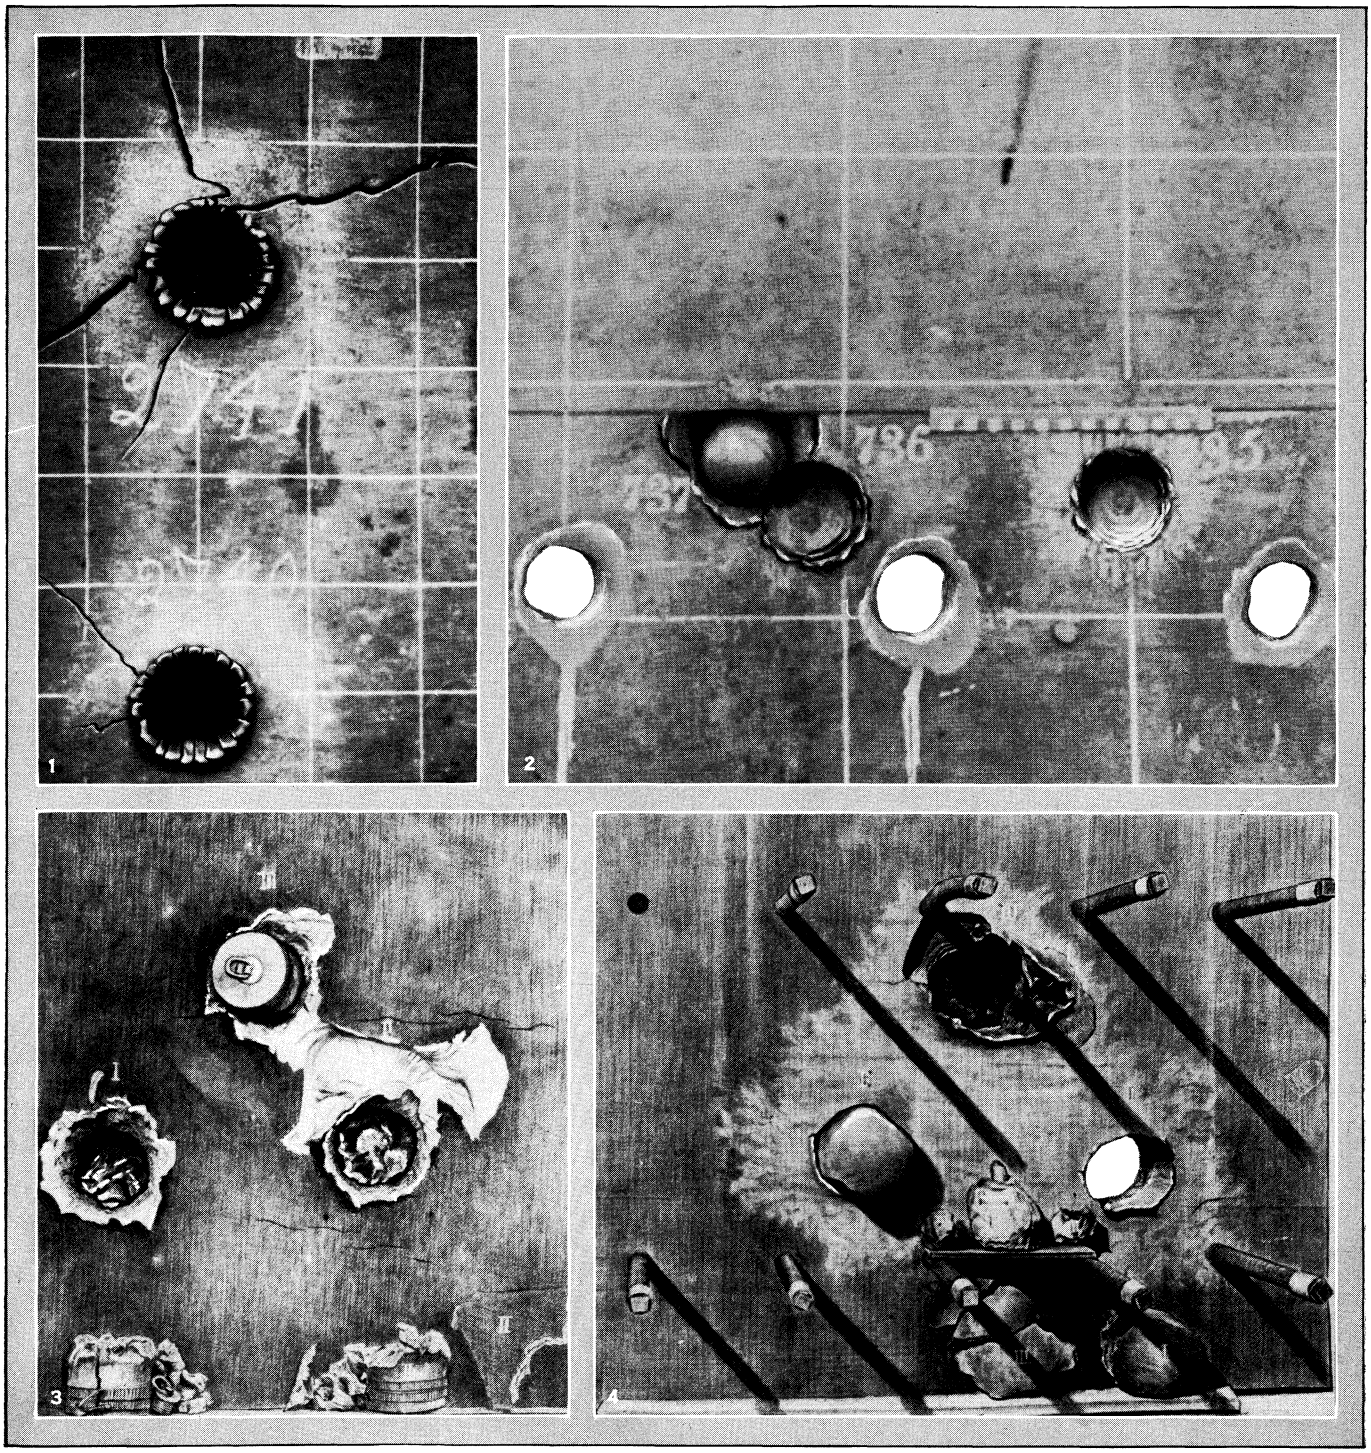
1. Front view of the face of a ten and a half inch Cammell compound plate with armour-piercing shot embedded in it. Compound armour with a steel face and wrought-iron back was first introduced to combine the advantages of greater resistance offered by steel with the toughness associated with wrought iron in order to prevent the plate from cracking badly if repeatedly struck

2. Front view of Harveyized nickel steel plate. Comparison of this illustration with fig. 1, Plate II., shows the improvement in steel-plate resistance brought about by the Harvey process of hardening. The test was made in 1892, and the five shots fired were broken up in each case after ineffective penetration

3. Back view of compound armour-plating. Three of the five armour-piercing shot whose effects are shown in the front view of this compound armour plate, fig. 1, penetrated the steel, and the three areas ringed show the effect of shot penetration on the wrought-iron back. In no case was a hole made in the back

4. Back view of Vickers nickel steel armour plate. The damage done indicates that the back of the plate was insufficiently tough. The face was comparatively soft, judging by the impression made by the head of shot in the plate, fig. 1. Plate II. Comparison with Plate 1, fig. 2, shows the correction made in this defect by later developments

ARMOUR PLATES



HAMMERED IRON PLATES FITTED TO THE FIRST BRITISH ARMOURED WARSHIP, AND IMPROVED ARMOUR DEVELOPED FOR MODERN WARFARE

1. Front view of Vickers 14% inch nickel-steel armour plate which threw back two 9.2 armour-piercing shots with a striking velocity of eighteen hundred feet per second when tested, in 1893. The first shot was thrown back whole, and the second was broken into three pieces, although it holed the plate as shown in fig. 4, Plate I.
2. Four and a half inch hammered iron-plate armour of the first British ironclad, a warship built in 1861. This type of iron armour was fitted in subsequent ships up to 1881, and the illustration shows an eight inch steel round shot, fired from a 68-pounder gun, embedded in the metal
3. Front view of Krupp face-hardened plate. The effects shown in the picture were produced by 12-inch armour-piercing shells on a 14.4 inch Krupp face-hardened plate, tested in 1896. In each case the damage was at the point of impact only, and, while two of the shells were broken up, the third remained embedded
4. Back view of Krupp face-hardened plate. The toughness of the plate is shown by the fact that no cracking resulted after it was struck by three 12-inch armour-piercing shells, although clean plugs were punched out. A comparison with fig. 4, Plate I., shows the great advance made against shell penetration

nearly shot-proof to naval artillery of the day at all but short ranges. The increase of gun powder towards the middle of the 19th century made metal armour indispensable.

Historically, the earliest of modern proposals to employ armour for ships of war (for body armour, etc., *see* ARMS ASD ARMOUR) appears to have been made in England by Sir William Congreve in 1805. In *The Times* of Feb. 20 of that year reference is made to Congreve's designs for an armoured floating mortar battery which the inventor considered would be proof against artillery fire. Among Congreve's unpublished papers there is also a suggestion for armour-plating the embrasures of casemates. Nothing, however, seems to have come of these proposals, and a similar lack of appreciation befell the next advocate of armour, John Stevens of Hoboken, N.J., who submitted the plans of an armoured vessel to Congress in 1812. The Stevens family, however, continued to work at the subject, and by 1841 had determined by actual experiment the thickness of wrought-iron armour which was proof against the projectiles then in use.

In 1827 a proposal to apply iron for defensive purposes was put forward by Major General Ford, R.E., who suggested iron bars as a protection for the face of masonry in forts, but the result of the experiment was not encouraging. In 1840 experiments were conducted by the British Admiralty to ascertain the effect of shot on iron plates backed with various soft and elastic substances. These experiments were instituted not so much for the purpose of testing the value of defensive armour against shot as to ascertain the value of iron as a material of construction for ships of war. The employment of thick iron plates as an external casing for the protection of ships of war appears first to have been carried out by the French, who in the Russian War employed three iron-cased floating batteries in the attack upon Kinburn on Oct. 17, 1855. These batteries were exposed to a heavy fire at a distance of 700 yards for about three hours, unsupported by the fleet, and although some casualties occurred from shell and shot entering the large old-fashioned portholes yet the floating batteries themselves were practically uninjured. Early in the American Civil War the value of protective armour was again conclusively proved in the battle, March 9, 1862, between the "Monitor" and the "Merrimac" (*q.v.*), both armoured vessels. In the Civil War railroad iron was sometimes used for side armour, and turret-armour was built up of laminated one-inch plates. Thenceforth the utility of iron armour in protecting ships of war became apparent, and the present article describes the successive steps by which modern armour has been evolved.

In 1857 experiments were made at Woolwich with a set of 4 in. plates, some of iron and some of steel, and it was found that in some cases the plates offered a good resistance at 600 yards to 68-pdr. solid shot, but that with a repetition of blows the plates were broken up. Wrought-iron shot appeared much more destructive than cast iron, and as a defensive material steel plates were far inferior to wrought iron in point of resistance.

Tests were also made in 1857 at Woolwich on the resistance of blocks of cast iron. These blocks were 8 ft. long, 2 ft. broad and $2\frac{1}{2}$ ft. thick, fitted together by tongues and grooves. They were fired at from a 68-pdr. with cast-iron solid shot, and wherever the shots struck radiating cracks were formed sometimes extending through the block, and the block was more or less displaced. With wrought-iron shot a greater effect was produced, these shot recoiling unbroken whereas the cast-iron shot always broke up.

For the purpose of investigating thoroughly the application of iron to defensive purposes of war a special committee on iron was appointed in 1861 by the Secretary of State for War with the concurrence of the Admiralty. The committee consisted of Captain Dalrymple Hay, R.N. (Chairman), Major Jervois, R.E., Brevet-Colonel W. Henderson, R.A., Dr. Percy of the Museum of Geology, W. Fairbairn, Esq., and W. Pole, Esq., with Captain A. Harrison, R.A., as Secretary. This committee sat until 1864 and conducted a large series of investigations and experiments.

The committee came to the conclusion that a steel material, either alone or in combination with iron, was objectionable, and the most suitable material was simple wrought iron, the best kind of iron being that which combined in the greatest degree the qualities of softness and toughness. In order to allow the energy of the shot to be absorbed in indenting and battering the plates without producing further fracture, rolled iron plates were on the whole found to be better than hammered plates, as hammered plates generally had the tendency to be hard and unequal, though at the same time rolled plates were frequently affected by unsoundness of welding.

Great interest had always attached to the question of backing most suitable for ship armour plates. When armour plates were first used they were fixed directly upon the hull of timber ships, and when first applied to iron ships it was thought expedient to imitate the former condition by placing a backing of wood between the armour plate and the hull of the vessel. Many objections were raised to this, among them being the liability of the wood to decay and to be destroyed by fire and shells, but the committee were unable to recommend that wood backing could be dispensed with, as it appeared to perform important functions for which no thoroughly efficient substitute could be found. The wood backing was finally thinned down until its use was confined to fairing the surface of the ship so that the armour could be really fitted to it.

Iron Armour.—The earliest armour was therefore made of iron; both rolled and hammered plates being used. The French ship "Gloire," a wooden frigate protected by a complete belt of iron armour 4Q in. in thickness, completed in 1859, was the first armour-clad ship of war. The British ship "Warrior," completed in 1861, was the first armour-clad warship to be built entirely of iron, the armour belt consisting of iron armour 43 in. thick. The increase in calibre of guns, and the use of steel shot, necessitated an increase in thickness of armour, and in the "Bellerophon," completed in 1866, a thickness of 6 in. of armour was fitted. The introduction of Palliser's ogive-pointed chilled-iron shot and further improvements in size and penetrative power of naval ordnance were met by further increases in thickness of armour, resulting in the "Inflexible," completed in 1881, carrying a belt of 24 in. in thickness, worked in two thicknesses of 12 in.

Plate II, fig. 2, shows a $4\frac{1}{2}$ in. hammered iron armour plate, on a target with 18 in. of wood backing, representing the side of H.M.S. "Warrior." The plate, which was 8 ft. long by 4 ft. wide, was made by the Thames Iron Works. It was tested at Shoeburyness on Jan. 8, 1864. Round 735 was an 8 in. solid cast-iron shot, weight 66 lb., and rounds 736 and 737 were 8 in. solid forged steel shot, weight 75 lb., all fired from a 68-pdr. gun, the striking velocity of the iron shot being about 1,400 ft. per second and the steel shot about 1,300 ft. per second. The steel shot penetrated 4.8 in. and the cast-iron shot 1·75 in., showing the superiority of steel over iron shot. The steel shot at round 736 remained bedded in the plate, and when knocked out by the subsequent round was found to measure $8\frac{1}{2}$ in. by 7 in.

Compound Armour.—In the meantime, however, important experiments were being carried out in the use of steel for armour plates, among the most important being the Spezia trials in 1876 on a Schneider steel armour plate. Steel plates were harder than wrought iron, and offered greater resistance. but the steel was not tough enough and consequently cracked badly when struck two or three times. This defect in steel armour led to the adoption of compound armour, this armour consisting of a steel face with a wrought-iron back. As early as 1867 some experimental armour plates were made by welding steel-face plates to wrought-iron backs. The object of welding the steel and iron together was to prevent fissures extending through the armour, and as the ductility of the iron was superior to that of steel it was supposed that the welding of the plates would also hold the outer face of steel in its place after being broken by impact of projectiles. The first trial of this compound armour, however, showed that the welding of the two metals was imperfect and that they separated under impact. Satisfactory compound armour plates were, however, introduced by the two Sheffield firms, Cammell and Brown, the processes being known as the "Wilson" and "Ellis" respectively. In the Wilson process a wrought-iron plate, while red hot. was placed in a mould, and liquid steel was run in. The temperature of the liquid steel being much in excess of the welding heat of iron, the surface of the iron plate became partially fused by the liquid steel, and

thus a complete union between the two metals was obtained. In this case, the weld is not limited to a simple line of junction between the iron and steel, but the change from iron to steel is gradual. When the steel became solid, the plate was removed from the mould, and after reheating was rolled down to the thickness required. In Cammell's plate 18.9 in. thick, tested at Spezia in 1882, the plate was rolled down from 30 in. thick, the final hard-steel face being about six inches.

In the Ellis process a steel plate for the face and a wrought-iron plate for the back were united by running molten steel between them, the combined plate being subsequently rolled down to the correct thickness. In Brown's 18.9 in. plate tested at Spezia in 1882 the final hard face was about 3 in. thick, the total thickness of steel being about six inches. As a result of trials, a proportion of about one-third steel and two-thirds iron was found to give the best results.

Compound armour was first used on the turrets of the "Inflexible" and continued in general use in the British Navy up to the "Royal Sovereign" class (1892), in which ships the belt was of compound armour 18 in. thick, The superiority of compound armour over iron mas computed to be in the proportion of about three to two.

The introduction about 1886 of the Holtzer and other forged steel-armour piercing shot, which could not be shattered as the Palliser shot had been, presented fresh problems. The compound plate relied upon breaking up the shot, but if the shot pierced the hard face without breaking up, the soft iron back could not offer much resistance. Plate I. fig. 1, shows the face and Plate I, fig. 3, the back of a 10½ in. compound plate manufactured by Messrs. Cammell and Co., tested in 1893. Rounds 2,744, 2,745 and 2,748 were Firth's 6 in. armour-piercing shot, and rounds 2,746 and 2,747 were Palliser 6 in. shot, all rounds being fired at 10 yards range. The considerably increased penetrating power of the later armour-piercing shot compared with the earlier Palliser shot is apparent from the photographs. It will be observed that the Firth shot perforated the steel face and caused considerable cracking, while the Palliser shot simply splashed on the face and broke up. It will be seen from fig. 3 that the wrought-iron back was not pierced by any of the rounds. The Firth shot caused considerable bulging, which was entirely absent in the case of the Palliser shot.

Steel Armour. — Considerable improvements in solid steel armour were made by the French firm of Schneider, and in 1888 the Sheffield firm of Vickers produced a very good all-steel armour plate. From 1882 to 1890, several international trials took place at which various makes of compound and all-steel armour were tested, and although compound armour was generally adopted in Great Britain, yet on the Continent the superiority of this armour over all-steel armour was not universally acknowledged, and French ships of this period were protected by steel and compound armour in about equal proportions.

The attention of makers who favoured compound armour was thus directed to the necessity of increasing the hardness of the steel face, and in 1887 Captain T. J. Tresidder patented a method of rapidly chilling the steel face by means of jets of water under pressure. This method of chilling the face of armour plates is in general use at the present day.

The progress made in steel armour resulted in its adoption in 1891 for the secondary defence of battleships in Great Britain, the main belt being of compound armour. In the "Royal Sovereign" class the upper belt consisted of four inches of steel armour.

Pl. II, fig. 1 shows the face, Pl. I, fig. 4 the back of a 14½ in. nickel steel armour plate manufactured by Messrs. Vickers, tested in 1893. The plate was tested with Firth's 9.2 in. armour-piercing shot, with a striking velocity of 1,800 ft. per second. The first shot, round No. 2,740, penetrated the plate and made a star-shaped crack at the back, the shot being thrown back whole. The second shot holed the plate and caused cracking as shown, the shot being thrown back broken in three pieces.

Harveyed Armour. — The next important improvement was the introduction in 1891 of Harveyed armour. Mr. Harvey, in America, having obtained considerable success in water-hardening cemented steel in the case of small articles, turned his attention to the manufacture of armour plates by the same process. The method consisted in carburizing or cementing the face of a steel armour plate by keeping it at a high temperature in contact with finely divided charcoal, so that the heated surface absorbed a certain amount of carbon, which penetrated to some considerable depth. After cementation, the plate was allowed to cool to a dull red heat and mas then chilled by the application of water, but by a less perfect method than that employed by Tresidder. Steel plates treated by the Harvey and Tresidder processes combined possessed about twice the resisting power of wrought iron, and about one and a half times the resisting power of the former steel armour and compound armour. The best American results had been obtained with Harveyed nickel steel, but there was considerable difference of opinion as to the value of introducing nickel, and its adoption was not universal in England. Harveyed armour was first used in the British Navy in the "Renown," laid down in 1893, where the belt armour was 10 in. thick.

Plate I, fig. 2 is a 10½ in. nickel Harveyed plate, made by Messrs. Vickers, tested in 1892. Rounds 1, 2 and 5 were 6 in. Holtzer armour-piercing shot, and rounds 3 and 4, 6 in. Palliser shot. The striking velocity in each case was 1,973 ft. per second The shot was broken up in each case, with only a slight bulge at the back of the plate. The Holtzer shot penetrated about four inches into the plate, and the Palliser shot about three inches This plate on further trial stopped and broke up the 9.2 in. Holtzer armour-piercing shot at velocities of 1,698 and 1,808 it. per second.

Krupp Armour. — The basic invention in all modern armour was Harvey's discovery as to carbonizing the front face of the plate, but the Harvey plate suffered from the defect that the back was not sufficiently tough, and after various experiments with steel of different composition Krupp, of Germany, produced Krupp cemented plate in 1894, based on Harvey's invention. This was a nickel-chrome alloy. The addition of chromium permitted the carburization or cementation to extend deeper into the armour plate and increased the toughness of the entire plate. The outstanding development in Krupp cemented plate was the introduction of differential heating. This consisted in heating the carburized face to a temperature sufficient to produce a glass-hard surface when water-quenched, at the same time keeping the back to a much lower temperature, in order to produce a tough and fibrous back. Both face and back were water-quenched simultaneously. This process, with slight variations, brought about as a result of the development of more scientific principles in the casting and treatment of steel, is that usually adopted in modern armour making. Krupp cemented plates gave results which indicated that they were equal to wrought-iron plates of about two and a half times their thickness. Krupp armour was first fitted in the "Canopus" class laid down in 1896. The Krupp method of differential heating was also applied to thinner plates which were not carburized. These were known as Krupp non-cemented plates.

Plate II, figs. 3 and 4, shows the face and back of a 14·4 in. Krupp face-hardened plate tested in 1896. Round 1 was a 12 in. St. Chamond armour-piercing steel shell, weight 716 lb., striking velocity 2,159 ft. per second. The shell was broken up and punched a cylindrical plug out of the plate. Round 2 was with a similar shell at 2,157 ft. per second. The shell punched back a cylindrical plug to a depth of 9.4 in. but the plug remained fast in the plate. the shell being broken up. Round 3 was a 12 in. Krupp armour-piercing shell with a striking velocity of 2,152 ft. per second. The shell punched a piece out of the plate and remained stuck in the hole. It will be observed that the back of the plate is free from cracks.

Manufacture. — The manufacture of cemented armour is a specialized process, involving great care in the selection of materials, and the subsequent casting and heat treatments. The details of composition and manufacture vary to some extent between different makers, but an average composition is 0·35 to 0·5% C, 3·5 to 4% Ni, 1·5 to 2·5% Cr, 0·4% Mn, 0·15% Si. A general description is as follows:

The ingot is slabbed down in the press and is then rolled to approximately the finished thickness required, with an allowance for machining and for wastage due to oxidation which takes place

during the subsequent operations. In some cases, the plate is rolled direct from the ingot. The plate is then annealed, cooled and straightened, and is ready for carburizing. For this operation plates are usually taken in pairs, the two plates being placed face to face with a layer of finely divided charcoal between. The plates are then placed in the carburizing furnace, and are kept at a high temperature for a period of two to three weeks. After carburization the plate is tempered by oil or water cooling, or sometimes by both, to give the required tensile strength and ductility. At this stage any holes required in the hard face are drilled. The plate is then subjected to the differential heat treatment for hardening, the face being brought to a high temperature while the back is kept to a comparatively low temperature. When the plate has reached the required temperatures on face and back, it is mithdrawn and cooled rapidly by being water-sprinkled on face and back simultaneously which prevents warping. An armour plate for a battleship may be as large as 12 ft. 6 in. by 10 ft., and 14 in. thick, weighing when finished about 30 tons.

Deck Armour. — During the war of 1914–18 naval engagements occurred at long ranges with the consequent result that the decks of naval ships had to be protected against plunging fire of heavy guns. The increasing threat of aircraft attack further emphasized the need for deck armour. The attack from heavy projectiles striking at oblique angles, could best be resisted by an armour having great strength and toughness which would be capable of suffering considerable deformation without rupture and thereby deflect the projectile. This armour should also be capable of detonating aircraft bombs and when fitted on more than one deck level, should prevent or restrict the entry of bomb splinters into the vitals of the ship. A hard, brittle, face-hardened armour, similar to Krupp armour would be unsuited for this purpose, as it would tend to crack before the attacking projectile was deflected.

A non-cemented armour has been developed for this purpose. This material is a nickel-chrome alloy, the composition of which varies with the different manufacturers. Its ballistic properties result from the heat treatment to which the plate is subjected during manufacture. Specimens subjected to tensile tests have shown ultimate tensile strength as much as 120,000 lb. per square inch with an elongation in two inches of 18%.

As a result of World War (1914–18) experiences that have been further emphasized in the war beginning in Europe in 1939, a thin armour has been developed to resist penetration of machine gun bullets and aircraft bomb splinters. The plate had to be sufficiently soft in the untreated condition to permit machining, and hard enough after treatment to resist perforation by bullets or bomb splinters. Although strength was important, the necessity for good ductility was predominate. Various alloys, including nickel, chromium cobalt, manganese and vanadium have been tested, but a nickel-chrome alloy has given the best results

Laws of Resistance. — The case of shell perforating armour plates involves so many unknown factors, both as regards the shell and the armour, that it cannot be regarded as an exact science. Many formulae have been evolved from time to time based on various theoretical considerations, the general form of the equation being $V = C.T^{t}.D^{d}.W^{w}$, V being the striking velocity of the shell, T the thickness of plate, D the diameter of projectile, W the weight of the shell, C a constant usually determined from actual trial results, and t, d and w indices, the numerical value of which varies somewhat in different formulae. From theoretical considerations of similitude, there are grounds for supposing that the indices should be so related to one another that $t+d+3w=0$. In the formulae which follow, the units adopted are V in feet per second, T and D in inches, and W in lbs.

The committee on iron, to which reference has been made, endeavoured to investigate the laws of resistance of plates of different thicknesses to projectiles of different weight and with different velocities. They arrived at the inference that mith plates of equally good quality the resisting power might be approximately considered as proportional to the square of the thickness, but in attempting to compare this with the damaging power of the projectile. found the latter to depend so much on the material of which it was made that they were unable to deduce any rule.

Fairbairn, in 1861, derived from results of cast-iron shot on wrought-iron plates the formula for perforation $V = 1300\ T.D^{\frac{1}{2}}/W^{\frac{1}{2}}$. The form of the expression is arrived at by considering the work done in punching a hole in a plate to be equal to the kinetic energy of the projectile. Experiments show that the force required to punch a hole in a plate varies as the plate's thickness if the diameter of hole is constant, and as the diameter of hole if the thickness of plate is constant. The force is therefore proportional to the product of thickness and diameter. The distance through which the force must act to remove the plug of metal is proportional to the thickness of plate and consequently the work done is proportional to T^2D. The kinetic energy of the shell is proportional to $W.V^2$. From the assumption made, therefore, $T^2D \propto W.V^2$, or $V \propto TD^{\frac{1}{2}}/W^{\frac{1}{2}}$ Fairbairn's law, even over the restricted range of velocities in use at the time, required some variation in the value of the constant for any substantial change of velocity. A list of suitable values was tabulated and fairly satisfactory results were obtained, within the limits of velocity then in use, but the formula failed on application to the higher velocities obtained later.

On the assumption that in high speed punching, such as is the case with a projectile perforating a plate, the force required to punch a hole in a plate is proportional to the product of the thickness of plate and diameter of hole and inversely proportional to the velocity of punching. Tresidder obtains the formula for perforation of wrought iron $T^2 = WV^3/cD$, c being a constant given by $\log c = 8.8410$. This formula may be applied to the perforation of hard faced armour plates by introducing a numerical co-efficient to T. This co-efficient is called the "figure of merit," and under any given attack is the ratio between the thickness of wrought iron and the thickness of the particular armour under consideration which will be perforated at that attack. The "figure of merit" of an armour plate will vary with the quality of the plate, the relation between thickness of plate and diameter of projectile, the quality of the projectile, and whether capped or uncapped. Experimental firing showed that a soft steel cap on the end of hard pointed armour-piercing projectiles held the point together on impact and gave deeper penetration. For a 6 in. cemented plate and a 6 in. uncapped projectile the figure of merit might be 2·7, for the same plate with the same projectile capped 2, and for a 12 in. cemented plate with the same projectile capped and uncapped 1·8 and 2·3 respectively.

The Krupp formula for wrought iron is $T^{4/3} = \frac{WV^2}{c.D^{5/3}}$, $\log c = 5.7776$. With similar projectiles the weight will vary as the cube of the diameter, and in this case the Krupp formula is in agreement with Tresidder's.

The formula of Commandant Jacob de Marre for wrought iron is $T^{.65} = \frac{W^{.5}V}{c.D^{.75}}$, $\log c = 2.9616$.

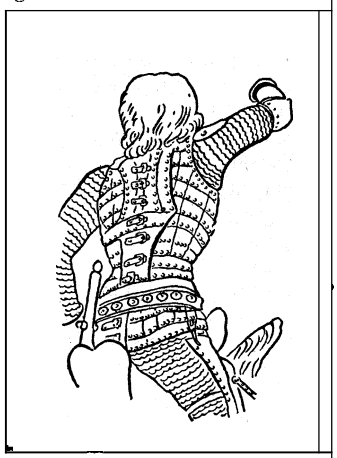
A later formula adopted by Krupp for hard faced plates is $T^2 = \frac{WV^2}{c.D}$, $\log c = 6.3532$. It is curious to note that on the assumption that W varies as D^3, this formula agrees in form with Fairbairn's formula for wrought iron. For any particular projectile and striking velocity, the thickness of wrought iron perforated according to Fairbairn's formula would be about twice the thickness of hard-faced armour given by the Krupp formula.

A method of measuring the performance of armour and shell which is largely used is based on de Marre's later formula for perforation of ordinary steel. This formula is $T^{.7} = \frac{W^{.5}V}{c.D^{.75}}$, $\log c = 3.00945$. The criterion of performance is the ratio between the velocity required to perforate any given armour plate and the velocity calculated from the formula as being required to perforate an ordinary steel plate of the same thickness. This ratio is known as the "de Marre co-efficient." The numerical value of this co-efficient is not constant for any particular type of armour or projectile, but is affected by the same factors as have been referred to in the case of the figure of merit. As an example, a 12 in. shell perforating a 12 in. plate at a velocity of 2,000 ft. per

second has a de Marre co-efficient of 1·56, and a 9·2in. shell perforating a gin. plate of the same quality at a velocity of 1,950ft. per second a co-efficient of 1·51.

The various formulae for perforation may be used to obtain a rough comparison of performance between shell and plates of varying dimensions, provided the factors involved in the cases considered do not differ too widely. (W. J. B.)

ARMS AND ARMOUR. In considering the history of defensive armour in the middle ages it is essential that some notice should be taken of the armourer on whose skill depended the lives of his patrons and with them often the security of kingdoms and empires, for the early battles were won to a large extent by the prowess of individuals, and a gap in the joints of the harness of a leader might well spell defeat for the whole army. In all craftsmanship there are certain essential rules which must be observed and without which the productions of the craftsman are valueless. These are: (1) suitability, (2) convenience in use, (3) recognition of material, (4) soundness of constructional methods, (5) subservience of decorations to the preceding rules. In Greek and Roman armour we have defences which, being practical, finely constructed and convenient in use, achieve their object in the best possible manner, and indeed after experiments for many centuries the armourer reverted to very similar designs in the middle of the 17th century.



FROM FFOULKES, "THE ARMOURER AND HIS CRAFT" (METHUEN)

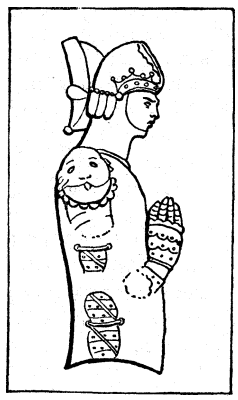
STATUE OF ST. GEORGE, PRAGUE, 1375

With the conquest of Europe by barbarians, however, the armour of the Roman legionary disappeared and the evolution of a practical defence had to begin all over again. At first armour was composed of leather, or quilted fabrics, and, in the case of wealthier fighting men, interlaced chain mail brought from the East. The only details of plate armour were the shield, which as often as not was toughened leather or wood, and the helmet and helm. The Normans adopted a very satisfactory headpiece, conical in shape and provided with a nasal, or nose guard; its shape was practical in the extreme, for it provided that essential quality of all the best armour: a "glancing surface" from which blows from sword or axe would slide. For some unknown reason in the 13th century this helmet gave place to the barrel helm with a flat top which was about as unpractical a defence as it was possible to devise, for not only did it oppose a flat surface to the weapon but it so completely enclosed the head and was so supported by a padded cap which covered the head, that a blow on the side would place the wearer hors de combat.

FFOULKES, "THE ARMOURER AND HIS CRAFT" (METHUEN)

13TH CENTURY GARMENT OF BANDED MAIL

The padded and quilted defences were no doubt sufficient defence against the crude weapons in use in the earlier periods, but, by degrees, piece by piece, small portions of plate were added—first to the knees, then to the shins and then to the arms—until by the year 1400 the knight was encased entirely in plate metal with articulated joints. It is unnecessary to point out that this fabrication of plate armour was only evolved by slow degrees, for it required very considerable skill to forge the various pieces so that they not only defended the wearer adequately but also gave him as far as possible freedom of movement. In 1300 there was a gild of linen armourers in London, at a later date the merchants Taylor's Company, and these supplied defences of fabric. In 1347 we find a gild of heaumers, who dealt solely in helms and helmets, a clear proof that the armourers as such did not exist at that time. It is not till 1453 that the armourers company received its charter and absorbed the heaumers. It is one of the mysteries in the history of armour how the crusaders can have fought under the scorching sun of the East in thick quilted garments covered with excessively heavy chain mail for this equipment was so cumbersome to take on and off that it must have been worn frequently night and day, and the very nature of the fabric made it almost impossible to move the sword arm with more than a wide swinging cut. A practical experiment with a thick padded garment or a shirt of mail, or better still with both, will show that the whole weight of the defence is borne by the shoulders alone and that the action of raising a sword collects folds in the bight of the arm and is further hampered by the dragging weight from the waist upwards. One of the principal drawbacks of the 14th century armour must have been that the superimposed small plates of metal were attached to the mail or the fabric by laces or thongs of leather which if cut laid the wearer open to attack or hampered his movements very considerably. The complete armour of mail appears definitely at the end of the 13th century though it is probable that it was worn as early as the Norman Conquest. Under the mail was worn a gambeson of leather or quilted fabric and this was added to early in the 14th century when a pourpoint, similar to the gambeson, but lighter, was worn over the mail and over all a surcoat, known also as the cyclas or jupen.



FFOULKES, "THE ARMOURER AND HIS CRAFT" (METHUEN)

EFFIGY AT ASH CHURCH, KENT, 14TH CENTURY

But little of the early 15th century armour survives, for most of it was remade to suit new fashions, but what there is shows that the material was light and the methods of construction simple, with none of the exaggerations which are such a notable feature of the armour of the later part of the century. At this period the flat-topped helm had been discarded in favour of the conical basinet, from which hung the camail, or mail defence for the neck. Under the plate defence a shirt of comparatively light mail was worn which protected the parts of the body, not covered by plate, such as the armpits and forebody. In later years the complete shirt was given up in favour of a leather jerkin to which small pieces of mail were attached. Towards the end of the 15th century the armourer began to experiment, taking his cue from the tailor who at this period produced civilian costumes which were extravagant in the extreme. As an example we may cite the solleret or steel shoe which almost invariably followed the design of the civilian footwear. In the middle of the 15th century sollerets of absurd length were worn, and as it was impossible for the wearer to use them when on foot, the toe was added with a turning pin after he was mounted. This form of defence was changed again in the 16th century and the wide-toed solleret, known as the bear paw was adopted, again copying the civilian fashion. We learn from monumental brasses, *e.g.*, that in Thame church, Oxfordshire, that the elbow cops, or defences for the elbow, were of enormous size and must have made easy movement almost an impossibility; and we also see in the delightful painting of St. George and St. Anthony in the National Gallery, London, by Pisanello, that the pauldrons, or defences for the shoulder, were equally cumbersome. It is more than probable that the fighting man blindly followed fashions in armour precisely as do his descendants of the present day in

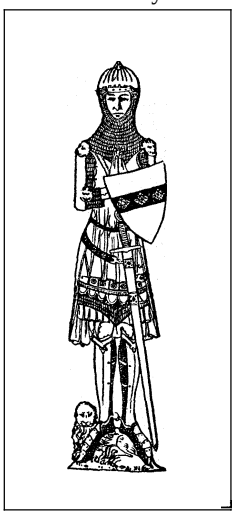
ARMOUR AND HELMETS WORN BY EUROPEAN KNIGHTS DURING THE MIDDLE AGES

1. Heavy armour, often distinguished by large overlapping plates with fluted edges and great elbow-caps as well as by the high standing collar and loosely fitting cap, worn by the knights in Germany for the Stechzeug, or German joust
2. The closed helmet or "armet" worn by Sir Henry Lee. This type was provided with a movable visor which could be locked or opened as desired and was one of the best head defences evolved during the middle ages. It appeared towards the end of the fifteenth century
3. A salade belonging to the Negroli family, a style of helmet distinguished by its lightness and graceful lines. This head defence was evolved about the middle of the fifteenth century and was worn very loosely, with the result that it was as easily displaced as the flat topped helmet
4. Suit of cuirassier's armour of the seventeenth century, close fitting and fairly graceful — acting as a protection to all the vital parts of the body without hampering its movements unnecessarily
5. "Maximilian" armour, named from the Emperor Maximilian and said to have been invented by the armourer Seusenhofer. The fluted work distinguished this particular style, which was worn in the early part of the sixteenth century
6. Armour of Count Sigismund of Tirol (1427–1496). The fantastic style of the foot covering, as well as some of the other affectations, is characteristic of this period, when the armourers are believed to have attempted to follow the lines of the civilian styles
7. Plate armour about 1540, when the skill of the craftsmen had reached its height

civilian dress irrespective of his practical needs; but that the expert man-at-arms had his own ideas on the subject we may be sure from the fact that the Emperor Maximilian I., in discussing a new suit of armour with his armourer Conrad Seusenhofer, is recorded to have said; "You shall arm me according as I wish, for it is I and not you who have to take part in the tournament." By the middle of the 11th century a light and graceful helmet appeared called the salade. This when worn with the chin piece was of certain practical value, but it had the same disadvantages as the flat-topped helm in that it was loose on the wearer's head and a smart blow would displace it. Towards the end of the 15th and through the 16th century a new helmet appears called the armet or close helm and this in its finest form, about the year 1540, is the best possible defence for the head, for it is provided with a movable visor and face defence, or mezail, which can be locked when in use or opened as required. The later pattern is further fitted with an embossed rim which engages a smaller rim on the gorget, thereby protecting the head and neck entirely and making it impossible for the helmet to be displaced. It has been found that if all the joints of the movable parts of the suit, such as elbows and knees, are measured exactly to the wearer, there is little inconvenience experienced except in the actual weight of the metal, but this is so well distributed that a comparatively heavy suit can be worn without much discomfort.



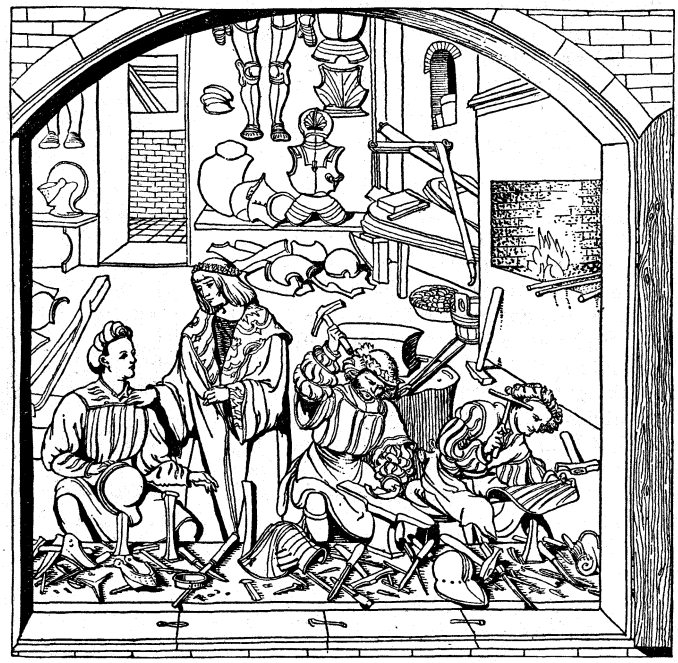
FFOULKES, "THE ARMOURER AND HIS CRAFT" (METHUEN)
SIR JOHN DE CREKE

Again referring to the Emperor Maximilian I., it is to him and his armourer Seusenhofer that is credited the invention of the fluted or channelled armour, now commonly known as Maximilian. Here the craftsman had discovered that increased strength and rigidity could be obtained by fluting the metal without adding to the weight, a principle which has been adopted at the present day not only in the case of corrugated iron and girders, but also in cars for racing craft. Another advantage of this fluted armour was that it provided to the fullest extent possible the glancing surface, for wherever the weapon, which in the 16th century was principally the lance, struck the armour it was deflected up or down the fluting until it glanced harmlessly from the wearer's body.

FFOULKES, "THE ARMOURER AND HIS CRAFT" (METHUEN)
AN UNKNOWN KNIGHT AT LAUGHTON

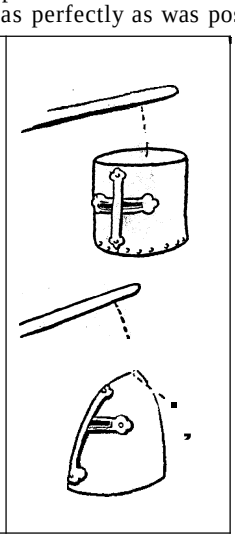
The armour for the joust exemplifies this glancing surface to the fullest possible extent, the wearer being heavily armed on the left side, which was opposed to the lance of the adversary, all the pieces being smooth and curved so that the lance would find but little hold on them. Perhaps the finest suit which was ever designed from a constructional point of view was that made for Henry VIII. as a young man for fighting on foot in the lists, preserved in the Tower armouries. This completely covers the wearer back and front, under the arms, at the back of the legs and every part of his body, with lames or narrow plates working easily on rivets.

Armour for Horses.—From the 13th to the middle of the 16th centuries the horse, like his rider, was overloaded with defences which protected the head, neck and body but left the vital parts unprotected. The legs were entirely at the mercy of the foot soldier, and the added weight of metal appreciably diminished that mobility which is the essential quality of the mounted man in action. In the 13th century the horse was covered by a trapper of heavy fabric, down to his hocks, a useful defence, it is true, but so inconvenient as to bring the level of efficiency of his rider down to that of the slowest footman. At the battle of Nueva Croce in 1237 it is recorded that 6,000 mail-clad horses were in action, and a wall painting, formerly in the painted chamber, Westminster, suggests that this mail must have been chain-mail, which was almost insupportable, even when lined with fabric or leather. In the 16th century horse armour was generally made to match that of his rider, of solid plate reaching to his quarters and often weighing as much as 80 pounds.



FROM FFOULKES, 'THE ARMOURER AND HIS CRAFT" (METHUEN)
THE EMPEROR MAXIMILIAN WITH HIS ARMOURER

Effects of the Renaissance.—By the middle of the 16th century the craft of the armourer suffered as did all the other crafts, under that influence generally known as the Renaissance. The craftsman had learned all there was to be known about the practical side of defensive armour; he had defended his patron as perfectly as was possible; he had given him freedom of movement; he had dealt respectfully with his material. Skill, indeed, could go no further, and his reputation was second to none in all the crafts of Europe. His successors, however, were not content merely to carry on these fine traditions and looked for some new way of emphasizing their skill. This being the age of extravagance and personal advertisement the arts and crafts began to be debased; decoration was added by degrees to their fine and splendid simplicity. At first it was restrained and did not destroy the utility of the defence, as it consisted of etching, engraving or inlaying with gold, but this afterwards became more extravagant, and such craftsmen as Negroli, Cellini, the Picinini and the mysterious Louvre school were pressed into service and designed richly embossed armour which entirely destroyed the glancing surface and turned what was once a magnificent example of craftsmanship into a piece of jewellery. So far did this craze for extravagance go that actually the puffed and slashed civilian dress was copied in steel, even down to minute reproductions of the stitches. These over-elaborated armours are mostly to be found in Germany, Italy and Spain; the English craftsmen, of whom Jacobe Holder of Greenwich, and William Pickering are the chief masters, avoided excessive ornamentation and consistently produced work which though splendid in appearance, had all



FFOULKES, "THE ARMOURER AND HIS CRAFT" (METHUEN)
THE "GLANCING SURFACE"

the practical advantages of the earlier examples. But the blight of the Renaissance had done its work and as the craftsman employed himself more and more in decorating his productions so by degrees he lost the constructive skill of his forefathers till in the 17th century the rudiments of construction are lost and armour such as that of Charles I. in the Tower, or of Louis XIV. in the Musée d'Artillerie in Paris are simply arrangements of stove-piping of little technical value and of no grace whatsoever.

By the 17th century fire-arms began to be practical weapons and the armourer who had previously been only concerned with providing a defence against sword, spear, axe or arrow was called upon to increase the weight of the armour and was obliged to test his material by musket or pistol shot. This he did in a fairly satisfactory manner but as the efficiency of the fire-arm increased he was obliged to increase the weight of the metal, for steel as we know it to-day was in its infancy, and the race continued between the musketeer and the armourer in precisely the same manner as the contest raged between gun and armour plate in the navies of the world during the 19th century. Still the armourer held his own for a time and it was only because the weight of his defences was so great that they were eventually discarded.

SIR JOHN D'AUBERNOUN, SURREY, 1277

We have noted the graceless forms of the armour of the mounted man of the middle of the 17th century, but the same cannot be said of the armour of the foot soldier, which, following very closely the lines of Greek and Roman armour, defended the vital parts of the body without unduly hampering the movements of the wearer; but in the end the fire-arm was triumphant and piece by piece the metal defences were abandoned. They were entirely discarded until the World War, when the British adopted a helmet of somewhat similar type to the sallade of the 15th century, and the German army produced bullet-proof body armour very similar to that of the pikeman of Oliver Cromwell.

Weapons.—The weapons in use from the 13th century were the sword, axe, mace, lance, halberd and long pike. Both axe and mace were essentially practical weapons, especially so when one remembers that their function was to break up defensive armour of metal, but the sword has ever been of unpractical design. Up to the 15th century it was heavy and badly balanced with merely a cross-guard and, though pointed, of little use for the thrust. When the gauntlet was discarded the rapier with complex guard came into favour—a better weapon, but still, on account of its length, badly balanced. It was not till modern times that we get the fine cutting sword of the light cavalry, 1784, and the well nigh perfect thrusting sword of the cavalry, 1908, both admirably adapted for the purpose for which they were designed. The lance and pike were practical as thrusting staff weapons, hut the inordinate length of the latter in Cromwellian times (18ft.) became a source of grave inconvenience in an organized army and it was soon discarded. The halberd with its offshoots, the bill, gisarmé and glaive. are useful only in their early and simpler forms. The later halberd and the gisarmé with their hooks, and projections must have been seriously inconvenient as weapons for fighting at close quarters. (*See* METAL **WORK.**) (C. FF.)

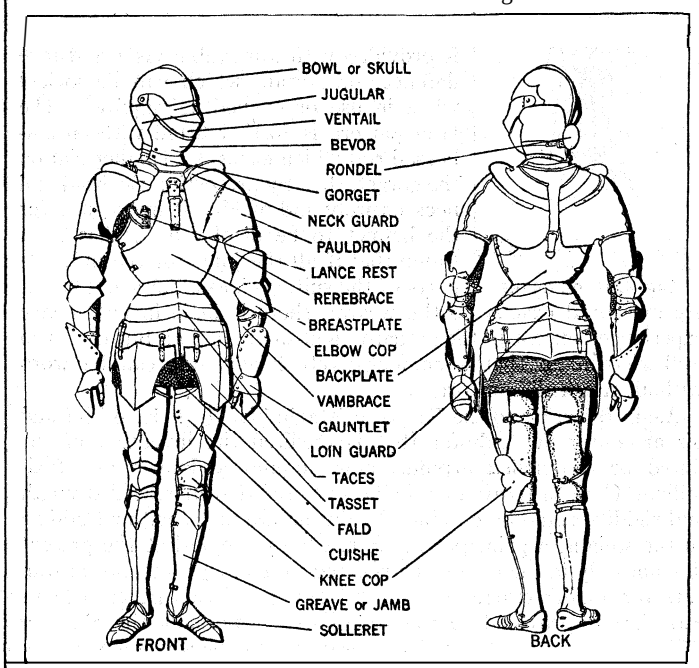
ARMSTEAD, HENRY HUGH (1828–1905), English sculptor, was first trained as a silversmith, and achieved excellence in the "St. George's Vase" and the "Outram Shield." His chief works are the external sculptural decorations of the Colonial Office in Whitehall, the sculptures on the southern and eastern sides of the podium of the Albert Memorial, the large fountain at King's college, Cambridge. He was elected associate of the Royal Academy in 1875 and a full member in 1880.

ARMSTRONG, ARCHIBALD (d. 1672), court jester, called "Archy," was a native of Scotland or of Cumberland, and according to tradition first distinguished himself as a sheep-stealer; afterwards he entered the service of James VI., with whom he became a favourite. When the King succeeded to the



BY COURTESY OF THP METROPOLITAN MUSEUM OF ART

A COMPLETE SUIT OF EUROPEAN ARMOUR OF THE SECOND HALF OF THE 15TH CENTURY

English throne, Archy was appointed court jester. He became presumptuous, insolent and mischievous, excited foolish jealousies between the King and Henry, Prince of Wales, and was much disliked by the members of the court. In 1623 he accompanied Prince Charles and Buckingham in their adventure into Spain, where he was much caressed and favoured by the Spanish court and, according to his own account, was granted a pension. His conduct here became more intolerable than ever. He rallied the infanta on the defeat of the Armada and censured the conduct of the expedition to Buckingham'~face. Buckingham declared he would have him hanged, to which the jester replied that "dukes had often been hanged for insolence but never fools for talking." He retained his post on the accession of Charles I., and accumulated a considerable fortune, including the grant by the King of 1,000 ac. in Ireland. After the death of Buckingham in 1628, whom he declared "the greatest enemy of three kings," the principal object of his dislike and rude jests was Laud, whom he openly vilified and ridiculed. He died at Arthuret, Cumberland, 1672, and was buried on April 1. *A Banquet of Jests: A Change* of *Cheare,* published about 1630, a collection chiefly of dull, stale jokes, is attributed to him, and with still less reason probably *A* choice *Banquet of Witty Jests . . . Being an addition to Archee's Jests, taken out of his Closet but never published in his Lifetime* (1660).

ARMSTRONG, HENRY EDWARD (1848–1937), British chemist born May 6, became professor of chemistry at South Kensington in 1874 Elected F.R.S. in 1876, he served on the council

RESTORATION OF SIXTEENTH CENTURY ARMOURER'S SHOP AT ABBEVILLE, FRANCE

This view is taken from the rear of the courtyard of an early 16th century Abbeville house and shows the front of the stairway. Some of the panels are original. The woodwork of the bench is modern, while the bench vise at the left is an example of north Italian workmanship of the period, boldly decorated with foliation and mascaron. The rack on the wall holds several kinds and sizes of hammers needed by the craftsman, as well as the pincers calipers, punches for leather, clippers for metal plates, a die for cutting screws and an ancient hacksaw. Numerous anvil-like stakes are in the sockets of the bench, and near them are files, punches, chisels, matrices and patterns for armour plates. Between typical 16th century horse-shoeing irons on the wall above the bench and tools, hangs a small statue of St. Eloi, the patron saint of hammer-workers

of the Royal Society 1888–90, 1900–02 and was vice-president in 1901–02. He achieved considerable success in his researches on organic and general chemistry, particularly in his work on the terpenes, the naphthalene and benzene series and on physical chemistry. He died July 13, 1937.

ARMSTRONG, JOHN (1758–1843), American soldier, diplomatist and political leader, born at Carlisle (Pa.) on Nov. 25, 1758. His father, also named John Armstrong (1725–95), a native of the north of Ireland, who had emigrated to the Pennsylvania frontier between 1745 and 1748, served as a brigadier general and was a member of the Continental Congress in 1779–80 and again in 1787–88. The son studied for a time at the college of New Jersey (now Princeton university), and served as a major in the Revolutionary War. In March 1783, while the continental army was stationed at Newburgh (*q.v.*) (N.Y.), he wrote and issued, anonymously, the famous "Newburgh Addresses." In 1784 he led a force of Pennsylvania militia against the Connecticut settlers in Wyoming valley, and treated them in such a high-handed manner as to incur the disapproval even of the Pennsylvania legislature. In 1789 he married the sister of Chancellor Robert R. Livingston of New York, and removed to New York city, where his own ability and his family connection gave him great political influence. In 1801–02 and again in 1803–04 he was a member of the U.S. Senate. From 1804 to 1810 he was the U.S. minister to France, and in March 1806 he was joined with James Bowdoin as a special minister to treat through France with Spain concerning the acquisition of Florida, Spanish spoliations of American commerce and the "Louisiana" boundary. During the War of 1812, he was a brigadier-general in the United States army from July 1812 until Jan. 1813, and from then until August 1814 secretary of war in the cabinet of President Madison, when his unpopularity forced him to resign. "In spite of Arrnstrong's services, abilities and experience," says Henry Adams, "something in his character always created distrust. He had every advantage of education, social and political connection, ability and self-confidence; . . . but he suffered from the reputation of indolence and intrigue." Nevertheless, he "introduced into the army an energy wholly new," an energy the results of which were apparent "for half a century." He died at Red Hook (N.Y.), April 1, 1843. He published *Notices of the War of 1812* (1836; new ed., 1840), which is greatly impaired by its partiality.

The best account of Armstrong's career as minister to France and as secretary of war may be found in Henry Adams's *History of the United States, 1801–1817* (1889–90).

ARMSTRONG, SAMUEL CHAPMAN (1839–1893), American soldier, philanthropist and educator, was born on Maui, one of the Hawaiian islands, on Jan. 30, 1839, his parents Richard and Clarissa Armstrong, being American missionaries. He was educated at Oahu college, Honolulu, and at Williams college, Williamstown, Mass., where he graduated in 1862. He served in the Civil War, on the Union side, 1862–65, rising in the volunteer service to the regular rank of colonel and the brevet rank of brigadier general, and, after Dec., 1863, acted as one of the officers of the coloured troops commanded by Gen. William Birney. His experience as commander of negro troops had added to his interest, always strong, in the negroes of the south, and in March 1866 he became superintendent of the Ninth District of Virginia, under the Freedman's bureau, with headquarters near Ft. Monroe. While in this position he became convinced that the only permanent solution of the manifold difficulties which the freedmen encountered lay in their moral and industrial education. He remained in the educational department of the bureau until this work came to an end in 1872; though five years earlier, at Hampton, Va., near Ft. Monroe, he had founded, with the aid principally of the American Missionary Association, an industrial school for negroes, Hampton institute, which was formally opened in 1868, and at the head of which he remained until his death, there, on May 11, 1893. After 1878 Indians were also admitted to the institute, and during the last 15 years of his life Armstrong took a deep interest in the "Indian question." Much of his time after 1868 was spent in the northern and eastern states, whither he went to raise funds for the Institute.

See *Samuel Chapman Armstrong, a Biographical Study* (New York, 1904), by his daughter, Edith Armstrong Talbot.

His brother, WILLIAM N. ARMSTRONG, was attorney general in the cabinet of the Hawaiian king Kalakaua I. He accompanied that monarch on a prolonged foreign tour in 1881, visiting Japan, China, Siam, India, Europe and the United States, and in 1904 published an amusing account of the journey, called *Round the World with a King*.

ARMSTRONG, WILLIAM GEORGE ARMSTRONG, BARON (1810–1900), British inventor, founder of the Elswick manufacturing works, was born on Nov. 26, 1810, at Newcastle-on-Tyne, and educated at a school in Bishop Auckland. From 1833 to 1847 he was engaged in active practice as a solicitor in Newcastle. In 1841–43 he published several papers on the electricity of effluent steam, and the inquiry was followed by the invention of the "hydro-electric" machine, a powerful generator of electricity. The question of the utilization of water-power had engaged his attention even earlier, and in 1839 he invented an improved rotary water motor. Soon afterwards he designed a hydraulic crane, which contained the germ of all the hydraulic machinery for which he and Elswick were subsequently to become famous.

The Elswick works were originally founded for the manufacture of this hydraulic machinery, but it was not long before they became the birthplace of a revolution in gunmaking. Modern artillery dates from about 185j, when Armstrong's first gun made its appearance. This weapon embodied all the essential features which distinguish the ordnance of to-day from the cannon of the middle ages—it was built up of rings of metal shrunk upon an inner steel barrel; it was loaded at the breech; it was rifled; and it threw, not a round ball, but an elongated projectile with ogivai head. The guns constructed on this principle yielded such excellent results, both in range and accuracy, that they were adopted by the British Government in 1859. At the same time the Elswick Ordnance Company was formed to manufacture the guns under the supervision of Armstrong, who, however, had no financial interest in the concern; it was merged in the Elswick Engineering Works four years later. Defects in the breech mechanism led to the abandonment by the British Government of the new gun. For 17 years the government adhered to the older method of loading, in spite of the improvements which experiment and research at Elswick and elsewhere had during that period produced in the mechanism and performance of heavy guns. But at last Armstrong's results could no longer be ignored and wire-wound breech-loading guns were received back into the service in 1880. The use of steel wire for the construction of guns was one of Armstrong's early ideas.

Lord Armstrong, who was raised to the peerage in 1887, was the author of *A Visit to Egypt* (1873), and *Electric Movement in Air and Water* (1897), besides many professional papers. He died on Dec. 27, 1900, at Rothbury, Northumberland. His title became extinct, but his grand-nephew and heir, W. H. A. F. Watson-Armstrong (b. 1863), was in 1903 created Baron Armstrong of Bamburgh and Cragside.

ARMSTRONG (SIR W. G.) WHITWORTH AND CO., LTD. On Nov. 24, 1845, a solicitor, William George Armstrong, afterwards Lord Armstrong, proposed the application of the pressure of water in the street pipes to the working of the cranes upon the quayside, and, in 1846, the Newcastle Cranage Company was formed. In the following year the famous Elswick Works first came into being. The total share capital of the new company was only £22,500. This venture was successful and in 1882 became a public company. A further development led to the formation of the Elswick Ordnance Company. This was the result of Armstrong's successful experiments with rifled cannon, which culminated in 1858 in the production of an 18-pounder gun and its adoption, after extensive trials, by the British War Office. The Elswick Ordnance Company was formed therefore in 1859; and a year later Captain (afterwards Sir Andrew) Noble joined the firm. In 1862, the re-armament of the services being complete, the Government withdrew from the company which was then amalgamated as Sir W. G. Armstrong and Co., with a capital of £180,000. In 1882 there was further amalgamation and the

formation of a new company under the title of Sir W. G. Armstrong Mitchell and Company, Limited, with a capital of £2,000,000.

Soon afterwards a shipyard was started at Elswick. Thenceforward the Elswick Yard concentrated entirely on warship building, and the Walker Yard on mercantile ships. The fast and heavily armed Elswick cruisers (actually built at Walker) of which the "Esmeralda" was the first and most famous of a long line, attracted world-wide attention.

The next important development in the company's history was the readjustment of the capital account in 1896, followed in 1897 by the purchase of the Whitworth Works at Openshaw in Manchester, where shortly afterwards a large armour-plate plant was installed. The capital by this time was over £4,000,000, and the style of the company became, as it remained, Sir W. G. Armstrong, Whitworth and Company, Limited.

For the next 18 years steady progress and expansion continued. The increasing size of battleships led to the construction of the Armstrong naval yard at Walker-on-Tyne.

In 1900 Lord Armstrong died, and was succeeded in the chairmanship by Sir Andrew Noble, who continued to act as chairman until his death in 1915.

The subsequent history of the company, though of great interest, is on somewhat different lines. Throughout the War, when the peak of its greatness was reached, its activities were of incalculable value to the Allies, but the conditions under which it worked were changed, and it developed into what amounted to a national arsenal. After 1918 a new set of problems confronted it, culminating in the sale in 1927 of the Elswick and Openshaw Works to a new company called Vickers Armstrongs, Limited. In 1929 the name was changed to Armstrong Whitworth Securities Co., Ltd. When the Admiralty acquired in 1937 its last remaining engineering works (Scotswood works) the company ceased manufacturing and became an investment company in the course of a gradual liquidation. (See VICKERS **LIMITED.**) (L. C. M.; X.)

ARMY (from Fr. *armée*, Lat. *armata*), a considerable body of men armed and organized for the purpose of warfare on land (Ger. Armee), or the whole armed force at the disposal of a state or person for the same purpose (Ger. *Heer*=host). The application of the term is sometimes restricted to the permanent, active or regular forces of a state. The history of the development of the army systems of the world is dealt with in this article in sections 1 to 37, being followed by sections 38 to 51 on the characteristics of present-day armies. For the history and the existing condition of the principal armies of the world see under the country heading.

HISTORY UP TO 1870

1. Early Armies.—It is only with the evolution of the specially military function in a tribe or nation, expressed by the separation of a warrior-class, that the history of armies (as now understood) begins. Numerous savage tribes of the present day possess military organizations based on this system, but it first appears in the history of civilization amongst the Egyptians. By the earliest laws of Egypt, provision was made for the support of the warriors. The exploits of her armies under the legendary Sesostris cannot be regarded as historical, but it appears certain that the country possessed an army, capable of waging war in a regular fashion, and divided thus early into separate arms, these being chariots, infantry and archers. The systems of the Assyrians and Babylonians present no particular features of interest, save that horsemen, as distinct from charioteers, appear on the scene. The first historical instance of a military organization resembling those of modern times is that of the Persian empire.

2. Persia.—Drawn from a hardy and nomadic race, the armies of Persia at first consisted mainly of cavalry, and owed much of their success to the consequent ease and rapidity of their movements. The warlike Persians constantly extended their power by fresh conquests, and for some time remained a distinctly conquering and military race, attaining their highest power under Cyrus and Cambyses. Cyrus seems to have been the founder of a comprehensive military organization, of which we gather details from Xenophon and other writers. To each province was allotted a certain number of soldiers as standing army. These troops, formed originally of native Persians only, were called the king's troops. They comprised two classes, the one devoted exclusively to garrisoning towns and castles, the other distributed throughout the country. To each province was appointed a military commander, responsible for the number and efficiency of the troops in his district, while the civil governor was answerable for their subsistence and pay. This organization seems to have fully answered its original purpose, that of holding a vast empire acquired by conquest and promptly repelling inroads or putting down insurrections. But when a great foreign war was contemplated, the standing army was augmented by a levy throughout the empire. The extent of the empire made such a levy slow to assemble, and the heterogeneous and unorganized mass of men of all nations so brought together was a source of weakness rather than strength. Indeed, the vast hosts over which the Greeks gained their victories comprised but a small proportion of the true Persians. The cavalry alone seems to have retained its national character, and with it something of its high reputation, even to the days of Alexander.

3. Greece.—The Homeric armies were tribal levies of foot, armed with spear, sword, bow, etc., and commanded by the chiefs in their war-chariots. In historic times all this is changed. Greece becomes a congeries of city-states, each with its own citizen-militia. Federal armies and permanent troops are rare, the former owing to the centrifugal tendency of Greek politics, the latter because the "tyrannies," which must have relied very largely on standing armies to maintain themselves, had ultimately given way to democratic institutions. But the citizen-militia of Athens or Sparta resembled rather a modern "nation in arms" than an auxiliary force. Service was compulsory in almost all states, and as the young men began their career as soldiers with a continuous training of two or three years, Hellenic armies, like those of modern Europe, consisted of men who had undergone a thorough initial training and were subsequently called up as required. Cavalry, as always in the broken country of the Peloponnesus, was not of great importance, and it is only when the theatre of Greek history is extended to the plains of Thessaly that the mounted men become numerous. In the 4th century the mainstay of Greek armies was the *hoplite* (ὁπλίτης), the heavy-armed infantryman who fought in the corps de bataille; the light troops were men who could not provide the full equipment of the hoplite, rather than soldiers trained for certain special duties such as skirmishing. The fighting formation was that of the *phalanx*, a solid corps of hoplites armed with long spears.

4. **Sparta.**—So much is common to the various states. In Sparta the idea of the nation in arms was more thoroughly carried out than in any other state in the history of civilization. In other states the individual citizen often lived the life of a soldier, here the nation lived the life of a regiment. Private homes resembled the "married quarters" of a modern army; the unmarried men lived entirely in barracks. Military exercises were only interrupted by actual service in the field, and the whole life of a man of military age was devoted to them. Under these circumstances the Spartans maintained a practically unchallenged supremacy over the armies of other Greek states; sometimes their superiority was so great that, like the Spanish regulars in the early part of the Dutch War of Independence, they destroyed their enemies with insignificant loss to themselves.

5. Greek Mercenaries.—The military system of the 4th century was not called upon to provide armies for continuous service on distant expeditions. When, after the earlier campaigns of the Peloponnesian War, the necessity for such expeditions arose, the system was often strained almost to breaking point (*e.g.*, in the case of the Athenian expedition to Syracuse), and ultimately the states of Greece were driven to choose between unprofitable expenditure of the lives of citizens and recruiting from other sources. Mercenaries serving as light troops, and particularly as *peltasts* (a new form of disciplined "light infantry") soon appeared. The corps de bataille remained for long the old phalanx of citizen hoplites. But the heavy losses of many

years told severely on the resources of every state, and ultimately non-national recruits — adventurers and soldiers of fortune, broken men who had lost their possessions in the wars, political refugees, runaway slaves, etc.—found their way even into the ranks of the hoplites, and Athens at one great crisis (407) eniisted slaves, with the promise of citizenship as their reward. The Arcadians, like the Scots and the Swiss in modern history, furnished the most numerous contingent to the new professional armies. A truly national army was indeed to appear once more in the history of the Peloponnesus, but in the meantime the professional soldier held the field. The old bond of strict citizenship once broken, the career of the soldier of fortune was open to the adventurous Greek. Taenarum and Corinth became regular *entrepôts* for mercenaries. The younger Cyrus raised his army for the invasion of Persia precisely as the emperors Maximilian and Charles V. raised regiments of *Landsknechte*—by the issue of recruiting commissions to captains of reputation. This army became the famous Ten Thousand. It was a marching city-state, its members not desperate adventurers, but men with the calm self-respect of Greek civilization. On the fall of its generals it chose the best officers of the army to command, and obeyed implicitly. Cheirisophus the Spartan and Xenophon the Athenian, whom they chose, were not plausible demagogues; they were line officers, who, suddenly promoted to the chief command under circumstances of almost overwhelming difficulty, proved capable of achieving the impossible. The merit of choosing such leaders is not the least title to fame of the Ten Thousand mercenary Greek hoplites. About the same time Iphicrates with a body of mercenary peltasts destroyed a corps of Spartan hoplites (391 B.C.).

6. **Epaminondas.**—Not many years after this, Spartan oppression roused the Theban revolt, and the Theban revolt became the Theban hegemony. The army which achieved this under the leadership of Epaminondas, one of the great captains of history, had already given proofs of its valour against Xenophon and the Cyreian veterans. Still earlier it had won the great victory of Delium (424 B.C.). It was organized, as were the professional armies, on the accepted model of the old armies, viz., the phalangite order, but the addition of peltasts now made a Theban army, unlike the Spartans, capable of operating in broken country as well as in the plain. The new tactics of the phalanx, introduced by Epaminondas, embodied, for the first time in the history of war, the modern principle of concentration to obtain a local superiority of force, and suggested to Frederick the Great the famous "oblique order of battle." Further, the cavalry was more numerous and better led than that of Peloponnesian states. The professional armies had well understood the management of cavalry; Xenophon's handbook of the subject is not without value in the 20th century. In Greek armies the dearth of horses and the consequent numerical weakness of the cavalry prevented the bold use of the arm on the battlefield. (*See* CAVALRY.) But Thebes had always to deal with nations which possessed numerous horsemen. Jason of Pherae, for instance, put into the field against Thebes many thousands of Thessalian horse; and thus at the battle of Tegyra in 375 the Theban cavalry under Pelopidas, aided by the corps *d'élite* of infantry called the Sacred Band, carried all before them. At Leuctra Epaminondas won a glorious victory by the use of his "oblique order" tactics; the same methods achieved the second great victory of Mantineia (362 B.C.) at which Epaminondas fell. Pelopidas had already been slain in a battle against the Thessalians, and there was no leader to carry on their work. But the new Greek system was yet to gain its greatest triumphs under Alexander the Great.

7. Alexander. — The reforms of Alexander's father, Philip of Macedon, may most justly be compared to those of Frederick William I. in Prussia. Philip had lived at Thebes as a hostage, and had known Iphicrates, Epaminondas and Pelopidas. He grafted the Theban system of tactics on to the Macedonian system of organization. (See MACEDONIAN ARMY.) That the latter —a complete territorial system — was efficient was shown by the fact that Philip's blow was always struck before his enemies were ready to meet it. That the new Greek tactics, properly used, were superior to the old was once more demonstrated at Chaeronea (338 B.C), where the Macedonian infantry militia fought in phalanx, and the cavalry, led by the young Alexander, delivered the last crushing blow. On his accession, like Frederick the Great, Alexander inherited a well-trained and numerous army, and was not slow to use it. The invasion of Asia was carried out by an army of the Greek pattern, formed both of Hellenes and of non-Hellenes on an exceedingly strong Macedonian nucleus. Alexander's own guard was composed of picked horse and foot. The infantry of the line comprised Macedonian and Greek hoplites, the Macedonians being subdivided into heavy and medium troops. These fought in a grand phalanx, which was subdivided into units corresponding to the modern divisions, brigades and regiments, the fighting formation being normally a line of battalion masses. The arm of the infantry was the 18ft. pike (sarissa). The peltasts, Macedonian and Greek, were numerous and well trained, and there was the usual mass of irregular light troops, bowmen, slingers, etc. The cavalry included the Guard (ἄγημα), a body of heavy cavalry composed of chosen Macedonians, the line cavalry of Macedonia (ἑταιροι) and Thessaly, the numerous small contingents of the Greek states, mercenary corps and light lancers for outpost work. The final blow and the gathering of the fruits of victory were now for the first time the work of the mounted arm. The solid phalanx was almost unbreakable in the earlier stages of the battle, but after a long infantry fight the horsemen had their chance. In former wars they were too few and too poorly mounted to avail themselves of it, and decisive victories were in consequence rarely achieved in battles of Greek versus Greek. Under Epaminondas, and still more under Philip and Alexander, the cavalry was strong enough for its new work. Battles were now ended by the shock action of mounted men, and in Alexander's time it was noted as a novelty that the cavalry carried out the pursuit of a beaten army. There were further, in Alexander's army, artillerymen with a battering train, engineers and departmental troops, and also a medical service, an improvement attributed to Jason of Pherae. The victories of this army, in close order and in open, over every kind of enemy and on every sort of terrain, produced the Hellenistic world, and in that achievement the history of Greek armies closes, for after the return of the greater part of the Europeans to their homes the armies of Alexander and his successors, became gradually orientalized.

The decisive step was taken in 323, when a picked contingent of Persians, armed mainly with missile weapons, was drafted into the phalanx, in which henceforward they formed the middle ranks of each file of 16 men. But, like the third rank of Prussian infantry up to 1888, they normally fought as skirmishers in advance, falling into their place behind the pikes of the Macedonian file-leaders only if required for the decisive assault. The new method, of course, depended for success on the steadiness of the thin three-deep line of Macedonians thus left as the line of battle. Alexander's veterans were indeed to be trusted, but as time went on, and little by little the war-trained Greeks left the service, it became less and less safe to array the Hellenistic army in this shallow and articulated order of battle. The purely formal organization of the phalanx 16 deep became thus the actual tactical formation, and around this solid mass of 16,384 men gathered the heterogeneous levies of a typical oriental army. Pyrrhus, king of Epirus, retained far more of the tradition of Alexander's system than his contemporaries farther east, yet his phalanx, comparatively light and mobile as it was, achieved victories over the Roman legion only at the cost of self-destruction. Even elephants quickly became a necessary adjunct to Hellenistic armies.

8. **Carthage.**—The military systems of the Jews present few features of unusual interest. The expédient of calling out successive contingents from the different tribes, in order to ensure continuity in military operations, should, however, be noticed. David and Solomon possessed numerous permanent troops which served as guards and garrisons; in principle this organization was identical with that of the Persians, and that of Europe in the 16th and 17th centuries. Particular interest attaches to the Carthaginian military forces of the 3rd century B.C. Rarely has any army achieved such renown in the short space of 62 years (264–202 B.C.). Carthage produced a series of great generals, culminating

in Hannibal, who is marked out, even by the little that is known of him, as the peer of Napoleon. But Napoleon was supported by a national army, Hannibal and his predecessors were condemned to work with armies of mercenaries. For the first time in the world's history war is a matter with which the civil population has no concern. The merchants of Carthage fought only in the last extremity; the wars in which their markets were extended were conducted by non-national forces and directed by the few Carthaginian citizens who possessed military aptitudes. The civil authorities displayed towards their instruments a spirit of hatred for which it is difficult to find a parallel. Unsuccessful leaders were crucified, the mercenary soldiers were cheated of their pay, and broke out into a mutiny which shook the empire of Carthage to its foundations. But the magnetism of a leader's personality infused a corporate military spirit into these heterogeneous Punic armies, and history has never witnessed so complete an illustration of the power of pure and unaided *esprit de corps* as in the case of Hannibal's army in Italy, which, composed as it was of Spaniards, Africans, Gauls, Numidians, Italians and soldiers of fortune of every country, was yet welded by him into thorough efficiency. The army of Italy was as great in its last fight at Zama as the army of Spain at Rocroi; its victories of the Trebia, Trasimene and Cannae were so appalling that, **200** years later, its leader was still, to a Roman, the "dire" Hannibal.

In their formal organizations the Carthaginian armies resembled the new Greek model, and indeed they were created in the first instance by Xanthippus, a Spartan soldier in the service of Carthage, who was called upon to raise and train an army when the Romans were actually at the gates of Carthage, and justified his methods in the brilliant victory of Tunis (255 B.C.). For the solid Macedonian phalanx of 16,000 spears Xanthippus substituted a line of heavy battalions equal in its aggregate power of resistance to the older form, and far more flexible. The triumphs of the cavalry arm in Hannibal's battles excelled those of Alexander's horsemen. Hannibal chose his fighting ground whenever possible with a view to using their full power, first to defeat the hostile cavalry, then to ride down the shaken infantry masses, and finally to pursue *au fond.* At Cannae, the greatest disaster ever suffered by the Romans, the decisive blow and the slaughter were the work of Hannibal's line cavalry, the relentless pursuit that of his light horse. But a professional long-service army has always the greatest difficulty in making good its losses, and in the present case it was wholly unable to do so. Even Hannibal failed at last before the sustained efforts of the citizen army of Rome.

9. Roman Army Under the Republic. — The earliest organization of the Roman army is attributed to Romulus, who formed it on the tribal principle, each of the three tribes contributing its contingent of horse and foot. But it was to Servius Tullius that Rome owed, traditionally, the complete classification of her citizen-soldiers. For the details of the Roman military system, *see* ROMAN ARMY. During the earlier period of Roman history the army was drawn entirely from the first classes of the population, who served without pay and provided their own arms and armour. The wealthiest men *(equites)* furnished the cavalry, the remainder the infantry, while the poorer classes either fought as light troops or escaped altogether the privilege and burden of military service. Each "legion" of **3,000** heavy foot was at first formed in a solid phalanx. The introduction of the elastic and handy three-line formation with intervals (similar in many respects to Alexander's) was brought about by the Gallic wars, and is attributed to M, Furius Camillus, who also, during the siege of Veii, introduced the practice of paying the soldiers, and thus removed the chief obstacle to the employment of the poorer classes. The new order of battle was fully developed in the Pyrrhic Wars, and the typical army of the Republic may be taken as dating from the latter part of the 3rd century B.C. The legionary was still possessed of a property qualification, but it had become relatively small. An annual levy was made at Rome to provide for the campaign of the year. Discipline was severe, and the rewards appealed as much to the soldier's honour as to his desire of gain. A legion now consisted of three lines *(Hastati, Principes, Triarii),* each line composed of men of similar age and experience, and was further subdivided into **30** "maniples," each of two "centuries." The normal establishment of **300** cavalry, **3,000** heavy and **1,200** light infantry was still maintained, though in practice these figures were often exceeded. In place of the old light-armed and somewhat inferior *rorarii,* the new *velites* performed light infantry duties (211 B.C.), at the same time retaining their place in the maniples, of which they formed the last ranks (compare the Macedonian phalanx as reorganized in 323, § 7, p. 397). The 300 cavalry of the legion were trained for shock action. But both the offensive and defensive strength of the Roman army lay in the heavy legionary infantry — except for one brief period at the end of the second Punic War when Scipio Africanus, appreciating the decisive value of cavalry exemplified in Hannibal's battles, set out to forge a similar instrument, and at Zama triumphantly turned Hannibal's master-weapon against him. The lesson, like other of Scipio's innovations, was, however, lost sight of in succeeding generations. The **30** maniples of each legion stood in three lines of battle, but the most notable point of their formation was that each maniple stood by itself on its own small manoeuvre-area, free to take ground to front or flank. To the Roman legion was added a legion of allies, somewhat differently organized and possessing more cavalry, and the whole force was called a "double legion" or briefly a "legion." A consul's army consisted nominally of two double legions, but in the Punic Wars military exigencies rather than custom dictated the numbers of the army, and the two consuls at Cannae (216 B.C.) commanded two double consular armies, or eight double legions.

10. Characteristics of the Roman Army. — Such in outline was the Roman military organization at the time when it was put to the severe test of the Second Punic War. Its elements were good, its military skill superior to that of any other army of ancient history, while its organization was on the whole far better than any that had gone before. The handy formation of maniples at open order was unique in the ancient world, and it did not reappear in history up to the advent of Gustavus Adolphus. In this formation, in which everything was entrusted to the skill of subordinates and the individual courage of the rank and file, the Romans met and withstood with success every type of impact, from the ponderous shock of the Macedonian phalanx and the dangerous rush of Celtic savages to the charge of elephants. Yet there would have been danger in thus articulating the legion had it been composed of any but the most trustworthy soldiers. To swiftness and precision of manoeuvre they added a dogged obstinacy over which nothing but overwhelming disaster prevailed. It is, therefore, not unnatural to ask wherein the system which produced these soldiers failed, as it did within a century after the battle of Zama. The greatest defect was the want of a single military command. The civil magistrates of Rome were *ex officio* leaders of her armies, and though no Roman officer lacked military training, the views of a consul or praetor were almost invariably influenced by the programme of his political party. When, as sometimes happened, the men under their command sided in the political differences of their leaders, all real control came to an end. The soldiers of the republic hardly ever forgot that they were citizens with voting powers; they served as a rule only during a campaign; and, while there could be little question as to their patriotism and stubbornness, they lacked almost entirely that *esprit de corps* which is found only amongst the members of a body having a permanent corporate existence. Thus they had the vices as well as the virtues of a nation in arms, and they fell still further short of the ideal because of the dubious and precarious tenure of their generals' commands. The great officers were usually sent home at the end of a campaign, to be replaced by their elected successors, and they showed all the hesitation and fear of responsibility usually found in a temporary commander. Above all, when two armies, each under its own consul or praetor, acted together, the command was either divided or exercised on alternate days. Under a prolonged trial, such as the Punic Wars, this system was modified, yet even so the strength of its grip is well illustrated in the interference with, and attempted supersession of, Scipio during his African campaign which ended in the overthrow of Carthage.

11. **Roman** Empire.—The essential weakness of militia forces and the frequent changes in military commanders due to political considerations required the adoption of various expedients which for a time obviated the evils to which allusion has been made.

A change of far greater importance, however, followed the final exploits of the armies of the old system. The increasing dominions of the Republic, the spread of wealth and luxury, the gradual decadence of the old Roman ideas, all tended to produce an army more suited to the needs of the newer lime than the citizen militia of the 3rd century. Permanent troops were a necessity; the rich, in their newly acquired dislike of personal effort, ceased to bear their share in the routine life of the army, and thus the proletariat began to join the legions with the express intention of taking to a military career. The actual change from the old *régime* to the new was in the main the work of Gaius Marius. The urgent demand for men at the time of the Teutonic invasions caused the service to be thrown open to all Roman citizens irrespective of *census*. The new territories furnished cavalry, better and more numerous than the old *equites,* and light troops of various kinds to replace the *velites*. Only the heavy foot remained a purely Italian force, and the spread of the Roman citizenship gradually abolished the distinction between a Roman and an allied legion. The higher classes had repeatedly shown themselves unwilling to serve under plebeians (*e.g.,* Varro and Flaminius); Marius preferred to have as soldiers men who did not despise him as an inferior. Under all these influences for good or for evil, the standing army was developed in the first half of the 1st century B.C. The tactical changes in the legion indicate its altered character. The small maniples gave way to heavy "cohorts," ten cohorts forming the legion; as in the Napoleonic wars, light and handy formations became denser and more rigid with the progressive decadence in *moral* of the rank and file. It is more significant still that in the days of Marius the annual oath of allegiance taken by the soldier came to be replaced by a personal vow, taken once and for all, of loyalty to the general. *Ubi bene, ibi patria* was an expression of the new spirit of the army, and Caesar had but to address his men as *quirites* (civilians) to quell a mutiny. *Hastati, principes* and *triarii* were now merely expressions in drill and tactics. But perhaps the most important of all these changes was the growth of regimental spirit and tradition. The legions had come to be numbered throughout the army, and the Tenth Legion has remained a classic instance of a "crack" corps. The *moral* of the Roman army was founded no longer on patriotism, but on professional pride and *esprit de corps.*

With this military system Rome passed through the era of the Civil Wars, at the end of which Augustus found himself with 45 legions on his hands. As soon as possible he carried through a great reorganization, by which, after ruthlessly rejecting inferior elements, he obtained a smaller picked force of 25 legions, with numerous auxiliary forces. These were permanently stationed in the frontier provinces of the empire, while Italy was garrisoned by the Praetorian cohorts, and thus was formed a regular long-service army, the strength of which has been estimated at 300,000 men. But these measures, temporarily successful, produced in the end an army which not only was perpetually at variance with the civil populations it was supposed to protect, but frequently murdered the emperors to whom it had sworn allegiance when it raised them to the throne. The evil fame of the Italian cohorts has survived in the phrase "praetorianism" used to imply a venal military despotism. The citizens gradually ceased to bear arms, and the practice of self-mutilation became common. The inevitable *dénouement* was delayed from time to time by the work of an energetic prince. But the ever-increasing inefficiency and factiousness of the legions, and the evanescence of all military spirit in the civil population, made it easy for the barbarians, when once the frontier was broken through, to overrun the decadent empire. The end came when the Gothic heavy horse annihilated the legions of Valens at Adrianople (A.D. 378).

There was now no resource but to take the barbarians into Roman pay. Under the name of *foederati,* the Gothic mercenary cavalry played the most conspicuous part in the succeeding wars of the empire, and began the reign of the heavy cavalry arm, which lasted for almost 1,000 years. Even so soon as within six years of the death of Valens 20,000 Gothic horse decided a great battle in the emperor's favour. These men, however, became turbulent and factious, and it was not till Emperor Leo I. had regenerated the native Roman soldier that the balance was maintained between the national and the hired warrior. The work of this emperor and of his successors found eventual expression in the victories of Belisarius and Narses, in which the Romans, in the new rôle of horse-archers, so well combined their efforts with those of the *foederati* that neither the heavy cavalry of the Goths nor the phalanx of Frankish infantry proved to be capable of resisting the imperial forces. At the battle of Casilinum (553) Roman foot-archers and infantry bore no small part of the work. It was thus in the Eastern Empire the Roman military spirit was revived The Byzantine army evolved from the Justinian system and became eventually an outstanding example in mediaeval history of a thoroughly organized military service.

12. **The "Dark** Ages."—In western Europe all traces of Roman military institutions quickly died out, and the conquerors of the new kingdoms developed fresh systems from the simple tribal levy. The men of the plains were horsemen, those of marsh and moor were foot, and the four greater peoples retained these original characteristics long after the conquest had been completed. In organization the Lombards and Franks, Visigoths and English scarcely differed. The whole military population formed the mass of the army, the chiefs and their personal retainers the *élite*. The Lombards and the Visigoths were naturally cavalry; the Franks and the English were, equally naturally, infantry, and the armies of the Merovingian kings differed but little from the English *fyrd* with which Offa and Penda fought their battles. But in these nations the use of horses and armour, at first confined to kings and great chiefs, gradually spread downwards to the ever-growing classes of *thegns, contites,* etc. Finally, under Charlemagne were developed the general lines of the military organization which eventually became feudalism. For his distant wars he required an efficient and mobile army. Hence successive "capitularies" were issued dealing with matters of recruiting, organization, discipline and field service work. Very noticeable are his system of forts (*burgi*) with garrisons, his military train of artillery and supplies, and the reappearance of the ancient principle that three or four men should equip and maintain one of themselves as a warrior. These and other measures taken by him tended to produce a strong veteran army, very different in efficiency from the tumultuary levy, to which recourse was had only in the last resort. War still remained an art and the fighting had become the special function of men devoted to the profession of arms. After Charlemagne's time the typical feudal army. composed of extremely well equipped cavalry and ill-armed peasantry serving on foot, rapidly developed. Enemies such as Danes and Magyars could only be dealt with by mounted men who could ride round them, compel them to fight, and annihilate them by the shock of the charge; consequently the practice of leaving the infantry in rear, and even at home, grew up almost as a part of the feudal system of warfare. England, however, sought a different remedy, and thus diverged from the Continental methods. This remedy was the creation of a fleet, and, the later Danish wars being there carried out, not by bands of mounted raiders, but by large armies of military settlers, infantry retained its premier position in England up to the day of Hastings. Even the *thegns,* who there, as abroad, were the mainstay of the army, were heavy-armed infantry. The only contribution made by Canute to the military organization of England was the retention of a picked force of *hus carles* (household troops) when the rest of the army with which he had conquered his realm was sent back to Scandinavia. At Hastings, the forces of Harold consisted wholly of infantry. The English array was composed of the king and his personal friends, the *hus carles,* and the contingents of the *fyrd* under the local *thegns;* though better armed, they were organized after the manner of their forefathers. On that field there perished the best infantry in Europe, and henceforward for three centuries there was no serious rival to challenge the predominance of the heavy cavalry in the warfare of the middle ages.

13. The Byzantines *(see* **ROMAN EMPIRE, LATER**).—While the west of Europe was evolving feudalism, the Byzantine empire was acquiring an army and military system scarcely surpassed by any of those of antiquity and not often equalled up to the most modern times. The *foederati* disappeared after the time of Justinian, and by A.D. 600 the army had become at once professional and national. For generations, regiments had had a corporate existence. Now brigades and divisions also appeared in war, and, somewhat later, in peace likewise. With the disappearance of the barbarians the army became one homogeneous service, minutely systematized, and generally resembling an army in the modern sense of the word. The militia of the frontier districts performed efficiently the service of surveillance, and the field forces of disciplined regulars were moved and employed in accordance with well reasoned principles of war; their maintenance was provided for by a scutage, levied, in lieu of service, on the central provinces of the empire. Later, a complete territorial system of recruiting and command was introduced. Each "theme" (military district) had its own regular garrison, and furnished a field division of some 5,000 picked troopers for a campaign in any theatre of war. Provision having been made in peace for a depot system, all unfit men and horses could be left behind, and local duties handed over to second line troops; thus the field forces were practically always on a war footing. Besides the "themes" under their generals, there were certain districts on the frontiers, called "clissuras," placed under chosen officers, and specially organized for emergency service. The corps of officers in the Byzantine army was recruited from the highest classes, and there were many families (*e.g.*, that from which came the celebrated Nicephorus Phocas) in which soldiering was the traditional career. The rank and file were either military settlers or men of the yeoman class, and in either case had a personal interest in the safety of the theme which prevented friction between soldiers and civilians. The principal arm was, of course, cavalry, and infantry was employed only in special duties. Engineer, train and medical services were maintained in each theme. Of the *ensemble* of the Byzantine army it has been said that "the art of war as it was understood at Constantinople . . . was the only system of real merit existing. No western nation could have afforded such a training to its officers till the 16th or . . . 17th century." The vitality of such an army remained intact long after the rest of the empire had begun to decay, and though the old army practically ceased to exist aiter the great disaster of Manzikert (1071), the barbarians and other mercenaries who formed the new service were organized, drilled and trained to the same pitch of military efficiency. Indeed the greatest tactical triumph of the Byzantine system (Calavryta, 1079) was won by an army already largely composed of foreigners. But mercenaries in the end developed praetorianism, as usual, and at last they actually mutinied, in the presence of the enemy, for higher pay (Constantinople, 1204).

14. Feudalism.—From the military point of view the change under feudalism was very remarkable. For the first time in the history of western Europe there appears, in however rough a form, a systematized obligation to serve in arms, regulated on a territorial basis. That army organization in the modern sense—organization for tactics and command—did not develop in any degree commensurate with the development of military administration, was due to the peculiar characteristics of the feudal system, and the virtues and weaknesses of mediaeval armies were its natural outcome. Personal bravery, the primary virtue of the soldier, could not be wanting in the members of a military class the *métier* of which was war and manly exercises. Pride of caste, ambition and knightly emulation, all helped to raise to a high standard the individual efficiency of the feudal cavalier. But the gravest faults of the system, considered as an army organization, were directly due to this personal element. Indiscipline, impatience of superior control and dangerous knight-errantry, together with the absence of any chain of command, prevented the feudal cavalry from achieving results at all proportionate to the effort expended and the potentialities of a force with so many soldierly qualities. If such defects were habitually found in the best elements of the army—the feudal tenants and sub-tenants who formed the heavy cavalry arm—little could be expected of the despised and ill-armed foot-soldiery of the levy. The swift raids of the Danes and others had created a precedent which in French and German wars was almost invariably followed. The feudal levy rarely appeared at all on the battlefield, and when it was thus employed it was ridden down by the hostile knights, and even by those of its own party, without offering more than the feeblest resistance. Above all, one disadvantage, common to all classes of feudal soldiers, made an army so composed quite untrustworthy. The service which a king was able to exact from his feudatories was so slight (varying from one month to three in the year) that no military operation which was at all likely to be prolonged could be undertaken with any hope of success.

15. Mediaeval Mercenaries.—It was natural, therefore, that a sovereign who contemplated a great war should employ mercenaries. These were usually foreigners, as practically all national forces served on feudal terms. While the greater lords rode with him on all his expeditions, the bulk of his army consisted of professional soldiers, paid by the levy of *scutage* imposed upon the feudal tenantry. There had always been soldiers of fortune. William's host at Hastings contained many such men; later, the Flemings who invaded England in the days of Henry I. sang to each other—

"Hop, hop, Willeken, hop! England is mine and thine,"—

and from all the evidence it is clear that in earlier days the hired soldiers were adventurers seeking lands and homes. But these men usually proved to be most undesirable subjects, and sovereigns soon began to pay a money wage for the services of mercenaries properly so called. Such were the troops which figured in English history under Stephen. Such troops, moreover, formed the main part of the armies of the early Plantagenets. They were, as a matter of course, armed and armoured like the knights, with whom they formed the men-at-arms *(gendarmes)* of the army. Indeed, in the 11th and 12th centuries, the typical army of France or the empire contained a relatively small percentage of "knights," evidence of which fact may be found even in so fanciful a romance as *Aucassin and Nicolette*. It must be noted, however, that not all the mercenaries were heavy cavalry; the Brabançon pikeman and the Italian crossbowman (the value of whose weapon was universally recognized) often formed part of a feudal army.

16. Infantry in Feudal Times.—These mercenary foot soldiers came as a rule from districts in which the infantry arm had maintained its ancient predominance in unbroken continuity. The cities of Flanders and Brabant, and those of the Lombard plain, had escaped feudal interference with their methods of fighting, and their burgher militia had developed into solid bodies of heavy-armed pikemen. These mere very different from those of the feudal levy, and individual knightly bravery usually failed to make the slightest impression on a band of infantry held together by the stringent corporate feeling of a trade guild. The more adventurous of the young men, like those of the Greek cities, took service abroad and fought with credit in their customary manner. The reign of the "Brabançon" as a mercenary was indeed short, but he continued, in his own country, to fight in the old way, and his successor in the profession of arms, the Genoese crossbowman, was always highly valued. In England, moreover, the infantry of the old *fyrd* was not suffered to decay into a rabble of half-armed countrymen, and in France a burgher infantry was established by Louis VI. under the name of the *milice des communes*, with the idea of creating a counterpoise to the power of the feudatories. Feudalism, therefore, as a military system, was short-lived. Its limitations had always necessitated the employment of mercenaries, and in several places a solid infantry was coming into existence, which was drawn from the sturdy, and self-respecting middle classes, and in a few generations was to prove itself a worthy opponent not only to the knight, but to the professional man-at-arms.

17. The Crusades.—It is an undoubted fact that the long wars of the Crusades produced no substantial improvement in the feudal armies of Europe. In the East large bodies of men

were successfully kept under arms for a considerable period, but the application of crusading methods to European war was altogether impracticable. In the first place, much of the permanent force of these armies was contributed by the military orders, which had no place in European political activities. Secondly, enthusiasm mitigated much of the evil of individualism. In the third place, there was no custom to limit the period of service, since the Crusaders had undertaken a definite task and would merely have stultified their own purpose in leaving the work only half done. There were, therefore, sharp contrasts between crusading and European armies. In the latter, systematization was confined to details of recruiting; in the armies of the Cross, men were from time to time obtained by the accident of religious fervour, while at the same time continuous service produced a relatively high system of tactical organization. The statement that the Crusaders had a direct influence on the revival of infantry is hardly susceptible of convincing demonstration, but it is at any rate beyond question that the social and economic results of the Crusades materially contributed to the downfall of the feudal knight, and in consequence to a rise in the relative importance of the middle classes. Moreover, when "simple" and "gentle" both took the Cross there could be no question of treating Crusaders as if they were the mere feudal levy. But the little direct influence of the whole of these wars upon military progress in Europe is shown clearly enough by the fact that at the very close of the Crusades a great battle was lost through knight-errantry of the true feudal type (Mansurah).

18. The Period of Transition (1290–1490).—Besides the infantry already mentioned, that of Scotland and that of the German cities fought with credit on many fields. Their arm was the pike, and they were always formed in solid masses (called in Scotland, *schiltrons*). The basis of the mediaeval commune being the suppression of the individual in the social unit, it was natural that the burgher infantry should fight "in serried ranks and in better order" than a line of individual knights, who, moreover, were almost powerless before walled cities. But these forces lacked offensive power, and it was left for the English archers, whose importance dates from the latter years of the 13th century, to show afresh, at Creçy, Poitiers and Agincourt, the value of missile action. When properly supported by other arms, they proved themselves capable of meeting both the man-at-arms and the pikeman. The greatest importance attaches to the evolution of this idea of mutual support and combination. Once it was realized, war became once more an art, and armies became specially organized bodies of troops of different arms. It cannot be admitted, indeed, as has been claimed, that the 14th century had a scientific system of tactics, or that the campaign of Poitiers was arranged by the French "general staff." Nevertheless, during this century armies were steadily coining to consist of expert soldiers, to the exclusion of national levies and casual mercenaries. It is true that, by his system of "indents," Edward III. of England raised national armies of a professional type, but the English soldier thus enrolled, when discharged by his own sovereign, naturally sought similar employment elsewhere. This system produced, moreover, a class of unemployed soldiers, and these, with others who became adventurers from choice or necessity, and even with foreign troops, formed the armies which fought in the Wars of the Roses—armies which differed but slightly from others of the time. The natural result of these wars was to implant a hatred of soldiery in the heart of a nation which had formerly produced the best fighting men in Europe, a hatred which left a deep imprint on the constitutional and social life of the people. In France, where Joan of Arc passed like a meteor across the military firmament, the idea of a national regular army took a practical form in the middle of the 15th century. Still, the forces thus brought into existence were not numerous, and the soldier of fortune was yet to attain the zenith of his career.

19. The Condottieri.—The immediate result of this confused period of destruction and reconstruction was the condottiere, who becomes important about 1300. In Italy, where the *condottieri* chiefly flourished, they were in demand owing to the want of feudal cavalry. and the inability of burgher infantry to undertake wars of aggression. The "free companies" (who served in great numbers in France and Spain as well as in Italy) were "military societies very much like trade guilds," which (so to speak) were hawked from place to place by their managing directors, and hired temporarily by princes who needed their services. Unlike the older hirelings, they were permanently organized, and thus, with their experience and discipline, became the best troops in existence. But the carrying on of war "in the spirit of a handicraft" led to bloodless battles, indecisive campaigns, and other unsatisfactory results, and the reign of the condottieri proper was over by 1400, subsequent free companies being raised on a more strictly national basis. With all their defects, however, they were the pioneers of modern organization. In the inextricable tangle of old and new methods which constitutes the military system of the 15th century, it is possible to discern three marked tendencies. One is the result of a purely military conception of the now special art of war, and its exposition as an art by men who devote their whole career to it. The second is the idea of a national army, resulting from many social, economical and political causes. The third is the tendency towards a more minute organization and subdivision within the army. Whereas the individual feudatories had disliked the close supervision of a minor commander, and their army had in consequence remained always a loosely knit unit, the men who made war into an art belonged to small bands or corps, and naturally began their organization from the lower units. Herein, therefore, was the germ of the regimental system of the present day.

20. The Swiss.—The best description of a typical European army at the opening of the new period of development is that of the French army in Italy in 1494, written by Paolo Giovio. He notes with surprise that the various corps of infantry and cavalry are distinct, the usual practice of the time being to combine one lancer, one archer, one groom, etc., into a small unit furnished and commanded by the lancer. There were Swiss and German infantry, armed with pike and halberd, with a few "shot," who marched in good order to music. There were the heavy men-at-arms (gendarmes), accompanied as of old by mounted archers, who, however, now fought independently. There were, further, Gascon slingers and crossbo men, who had probably acquired, from contact with Spain, some of the lightness and dash of their neighbours. The artillery train was composed of 140 heavy pieces and a great number of lighter guns; these were then and for many generations thereafter a special arm outside the military establishment. (See ARTILLERY.) In all this the only relic of the days of Creçy is the administrative combination of the men-at-arms and the horse archers, and even this is no longer practised in action. The most important element in the army is the heavy infantry of Swiss and Germans. The Swiss had for a century past gradually developed into the most formidable troops of the day. The wars of Žižka (*q.v.*) in Bohemia (1420) materially assisted in the downfall of the heavy cavalry; and the victories of the Swiss, beginning with Sempach (1386), had by 1480 proved that their solid battalions, armed with the long pike and the halberd, were practically invulnerable to all but missile and shock action combined. By fortune of war they never met the English, who had shown the way to deal with the schiltron as early as Falkirk. It was natural that a series of victories such as Grandson, Morat and Nancy should place them in the forefront of the military nations of Europe. The whole people devoted itself thereupon to professional soldiering, particularly in the French service, and though their monopoly of mercenary employment lasted a short time only, they continued to furnish regiments to the armies of France, Spain and the Pope up to the most modern times. But their efficiency was thoroughly sapped by the growth of a mutinous and insubordinate spirit, the memory of which has survived in the proverb *Point* d'argent, *point* de *Suisse*, and inspired Machiavelli with the hatred of mercenaries which marks every page of his work on the art of war. One of their devices for extorting money was to appear at the muster with many more soldiers than had been contracted for by their employers, who were forced to submit to this form of blackmail. At last the French, tired of these caprices, inflicted on the Swiss

the crushing defeat of Marignano (*q.v.*), and their tactical system received its death-blow from the Spaniards at Pavia (1525).

21. The **Landsknechts.**—The modern army owes far more of its organization and administrative methods to the Landsknechts ("men of the country," as distinct from foreigners) than to the Swiss. As the latter were traditionally the friends of France, so these Swabians were the mainstay of the Imperial armies, though both were mercenaries. The Emperor Maximilian exerted himself to improve the new force, which soon became the model for military Europe. A corps of Landsknechts was usually raised by a system resembling that of "indents," commissions being issued by the sovereign to leaders of repute to enlist men. A "colour" (*Fähnlein*) numbered usually about 400 men, a corps consisted of a varying number of colours, some corps having 12,000 men. From these troops, with their intense pride, *esprit de corps* and comradeship, there has come down to modern times much of present-day etiquette, interior economy and "regimental customs"—in other words, nearly all that is comprised in the "regimental" system. Amongst the most notable features of their system were the functions of the provost, who combined the modern offices of provost-marshal, transport and supply officer, and canteen manager; the disciplinary code, which admitted the right of the rank and file to judge offences touching the honour of the regiment; and the women, who, lawfully or unlawfully attached to the soldiers. marched with the regiment and had a definite place in its corporate life. The conception of the regiment as the home of the soldier was thus realized in fact.

22. The Spanish Army.— The tendencies towards professional soldiering and towards subdivision had now pronounced themselves. At the same time, while national armies, as dreamed of by Machiavelli, were not yet in existence, two at least of the powers were beginning to work towards an ideal. This ideal was an army which was entirely at the disposal of its own sovereign, trained to the due professional standard, and organized in the best way found by experience to be applicable to military needs. On these bases was formed the old Spanish army which, from Pavia (1525) to Rocroi (1643), was held by common consent to be the finest service in existence. Almost immediately after emerging from the period of internal development, Spain found herself obliged to maintain an army for the Italian wars. In the first instance this was raised from amongst veterans of the war of Granada, who enlisted for an indefinite time. Probably the oldest line regiments in Europe are those descended from the famous *tercios*, whose formation marks the beginning of military establishments, just as the Landsknechts were the founders of military manners and customs. The great captains who led the new army soon assimilated the best points of the Swiss system, and it was the Spanish army which evolved the typical combination of pike and musket which flourished up to 1700. Outside the domain of tactics, it must be credited with an important contribution to the science of army organization, in the depot system, whereby the *tercios* in the field were continually "fed" and kept up to strength. The social position of the soldier was that of a gentleman, and the young nobles (who soon came to prefer the *tercios* to the cavalry service) thought it no shame, when their commands were reduced, to "take a pike" in another regiment. The provost and his gallows were as much in evidence in a Spanish camp as in one of Landsknechts, but the comradeship and *esprit de corps* of a *tercio* were the admiration of all contemporary soldiers. With all its good qualities, however, this army was not truly national; men soon came from all the various nations ruled by the Habsburgs, and the soldier of fortune found employment in a *tercio* as readily as elsewhere. But it was a great gain that corps, as such, were fully recognized as belonging to the Government, however shifting the *personnel* might be. Permanence of regimental existence had now been attained, though the universal acceptance and thorough application of the principle were still far distant. During the 16th century the French regular army (originating in the *compagnies d'ordonnance* of 1445), which was always in existence, even when the Swiss and *gendarmes* were the best part of the field forces, underwent a considerable development, producing amongst other things the military terminology of the present day. But the wars of religion effectually checked all progress in the latter part of the century, and the European reputation of the French army dates only from the latter part of the Thirty Years' War.

23. The 16th Century.— The battle of St. Quentin (1557) is usually taken as the date from which the last type of a purely mercenary *arm* (as distinct from *corps)* comes into prominence. "Brabançon" or "Swiss" implied pikemen without further qualification, the new term "Reiter" similarly implied mercenary cavalry fighting with the pistol. Heavy cavalry could disperse arquebusiers and musketeers, but it was helpless against solid masses of pikemen; the Reiters solved the difficulty by the use of the pistol. They were well armoured and had little to fear from musket-balls. Arrayed in deep squadrons, therefore, they rode up to the pikes with impunity, and fired methodically *dans le tas*, each rank when it had discharged its pistols filing to the rear to reload. These Reiters were organized in squadrons of variable strength, and recruited in the same manner as were the Landsknechts. They were much inferior, however, to the latter in their discipline and general conduct, for cavalry had many more individual opportunities of plunder than the foot, and the rapacity and selfishness of the Reiters were consequently in marked contrast to the good order and mutual helpfulness in the field and in quarters which characterized the regimental system of the Landsknechts.

24. Dutch System.— The most interesting feature of the Dutch system, which mas gradually evolved by the patriots in the long War of Independence, was its minute attention to detail. In the first years of the war, William the Silent had to depend, for field operations, on mutinous and inefficient mercenaries and on raw countrymen who had nothing but devotion to oppose to the discipline and skill of the best regular army in the world. Such troops were, from the point of view of soldiers like Alva, mere *canaille*, and the ludicrous ease with which their armies were destroyed (as at Jemmingen and Mookerheyde), at the cost of the lives of perhaps a dozen Spanish veterans, went far to justify this view. But, fortunately for the Dutch, their fortified towns were exceedingly numerous, and the individual bravery of citizen-militia, who were fighting for the lives of every soul within their walls, baffled time after time all the efforts of Alva's men. In the open, Spanish officers took incredible liberties with the enemy; once, at any rate, they marched for hours together along submerged embankments with hostile vessels firing into them from either side. Behind walls the Dutch were practically a match for the most furious valour of the assailants.

The insurgents' first important victory in the open field, that of Rymenant, near Malines (1577), was won by the skill of "Bras de Fer," de la Noue, a veteran French general, and the stubbornness of the English contingent of the Dutch army—for England, from 1572 onwards, sent out an ever-increasing number of volunteers. This battle was soon followed by the great defeat of Gembloux (1578), and William the Silent was not destined to see the rise of the Dutch army. Maurice of Nassau was the real organizer of victory. In the wreck of all feudal and burgher military institutions, he turned to the old models of Xenophon, Polybius, Aelian and the rest. Drill, as rigid and as complicated as that of the Macedonian phalanx, came into vogue, the infantry was organized more strictly into companies and regiments, the cavalry into troops or cornets. The cavalry followed the Reiter tactics of the pistol, the infantry fought with pikes, halberds and "shot." This form was generally followed in central Europe, as usual, without the spirit, but in Holland it was the greater trustworthiness of the rank and file that allowed of more flexible formations, and here we no longer see the foot of an army drawn up, as at Jemmingen, in one solid and immovable "square." In their own country and with the system best suited thereto, the Dutch, who moreover acquired greater skill and steadiness day by day, maintained their ground against all the efforts of a Parma and a Spinola. Indeed, it is the best tribute to the vitality of the Spanish system that the inevitable *débâcle* was so long delayed. The campaigns of Spinola in Germany demonstrated that the "Dutch" system, as a system for general use, was at any rate no

better than the system over which it had locally asserted its superiority, and the spirit, and not the form, of Maurice's practice achieved the ultimate victory of the Netherlanders. In the Thirty Years' War the unsuccessful armies of Mansfeld and many others were modelled on the Dutch system—the forces of Spinola, of Tilly and of Wallenstein, on the Spanish. In other words, these systems as such meant little; the discipline and spirit behind them everything. Yet the contribution made by the Dutch system to the armies of to-day was not small; to Maurice and his comrades we owe, first the introduction of careful and accurate drill, and secondly the beginnings of an acknowledged science of war, the groundwork of both being the theory and practice of antiquity. The present method of "forming fours" in the British infantry is ultimately derived from Aelian, just as the first beats of the drums in a march represent the regimental calls of the Landsknechts, and the depots and the drafts for the service battalions date from the Italian wars of Spain.

(C. F. A.; X.)

25. The Thirty Years' War.—Although in this period of almost constant strife various sovereigns kept such forces as they had on a perpetual war looting, gtnerally the size of the military establishments depended on the military, religious or political situation of the moment. The expense of maintaining armies at this period forbade any other system than this, called in German the *Werbe-system,* which may be roughly translated into English as an "enlistment" or '(levy" system. It made possible the rapid expansion of an army in time of need and its equally rapid contraction when the emergency passed. Spain, when temporarily at peace, maintained a relatively large regular army, but elsewhere a few personal guards, a few small garrisons and a small regular force sufficed for the peaceful interlude. Because of conditions which the Dutch confronted, their regiments under this system had a comparatively long life, but when the danger period for the Dutch passed, their army was quickly reduced. The British army from about 1740 to 1820 was an example of the *Werbe-system* in practice. On the Continent, however, the Thirty Years' War produced an unusual continuity of service in corps raised about 1620–30. Some 50 years later the principle of the standing army was universally accepted and the senior regiments of the Prussian and Austrian armies date from about 1630. At this time, too, Gustavus Adolphus of Sweden landed in Germany with an army better trained, equipped and organized than any which had preceded it. This army by its victory of Breitenfeld (1631) ushered in the era of "modern" war and it is to Gustavus that the student must turn for the initial point in the progressive development which has produced the armies of today. With his appearance the Spanish and Dutch methods became as obsolete as those of the Landsknechts.

26. The Swedish Army.—Although in the 16th century most of the fighting was done by mercenaries. Sweden had a national regular army based on a militia which supplied the regular establishment with replacements. The regulars were intended for wars abroad; the militia for home defence and for supplying replacements to the regulars. Troops were raised by a draft systemunder which all able-bodied males from 15 years of age upward were liable for military service. Eight cavalry and 20 infantry regiments of varying strengths composed the militia. Each of these units was raised in whole or in part in a given district and ranged in size from about 1,200 to about 3,000 men. The system had been in operation about a century when Gustavus Adolphus came to the throne in 1611. He reorganized the system thoroughly. standardized the size of the companies and regiments and drilled them thoroughly in his own ideas of tactics—ideas which marked the first step toward modern war. With his contemporaries placing their main reliance on massed pikemen, and regarding musketeers as fit only for scouting and outpost duty, Gustavus realized that firearms, properly handled, held the power to decide battles and developed his tactics accordingly. He improved the mobility of the musketeer and increased the percentage of musketeers in his army. By 1631 he was using entire regiments of musketeers. His military organization was based on a company of 150 men, formed in files six deep and deployed to a depth of three files for battle. Four companies made a squadron or a battalion, eight companies a regiment and three regiments a "great regiment" or brigade. It had been the practice of cavalry to ride toward the enemy at a leisurely pace with each rank delivering its fire when within range, wheeling and swinging back to the rear to give place to the succeeding lines which followed it and did likewise. Gustavus trained his cavalry to charge at a gallop, fire, and then press on with lance or sabre.

Artillery had been cumbersome—ranging in weight from 1,700lb. for a six-pounder to 6,000lb. for a 24-pounder—and consequently no attempt was made to shift it once it was set in place on the battlefield. Gustavus developed a light three-pounder which could be moved as needed by one horse or three men. It could be fired slightly faster than a musket and Gustavus utilized its fire-power to the fullest. Having improved his separate arms Gustavus developed them into a combat team.

In other armies, at the time Gustavus began forging his military machine, artillery, cavalry and infantry operated more or less independently, each without much regard to the activities of the others. Under Gustavus, their activities were co-ordinated. His artillery softened up the enemy forces; his cavalry cracked them up and his infantry mopped them up. The victorious career of Gustavus established a great military reputation for the Swedes. But it did not long survive his death at Liitzen in 1632. It had been due partly to his inspiring leadership and partly to his system. He had taught his system to his generals with great care. but in two decades of war his opponents had also learned it and had adopted enough of it to put them on equal footing with his pupils, if not with the master himself. (H. A. DR.)

27. The English **Civil War** *(see* GREAT REBELLION).—The armies on either side which, about the same time, were fighting out the constitutional quarrel in England were essentially different from all those of the Continent, though their formal organization was similar to that of the Swedes. The military expression of a national conscience had appeared rarely indeed in the Thirty Years' War, which was a means of livelihood for, rather than an assertion of principle by, those who engaged in it. In England, on the other hand, there were no mercenaries, and the whole character of the operations was settled by the burning desire of a true "nation in arms" to decide at once, by the arbitrament of battle, the vital points at issue. A German critic (Fritz Hoenig) has indicated Worcester as the prototype of Sedan; at any rate, battles of this kind invariably resulted in failure when entrusted to a "standing" army of the 18th century. But the national armies disappeared at the end of the struggle; after the Restoration, English political aims became, so far as military activity was concerned, similar in scope and execution to those of the Continent; and the example of Cromwell and the "New Model," which might have revolutionized military Europe, passed away without having any marked influence on the armies of other nations.

28. Standing Armies.—Nine years after Nordlingen, the old Spanish army fought its last and most honourable battle at Rocroi. Its conquerors were the new French troops, whose victory created as great a sensation as Pavia and Creçy had done. Infusing a new military spirit into the formal organization of Gustavus' system, the French army was now to "set the fashion" for a century. France had been the first Power to revive regular forces, and the famous "Picardie" regiment disputed for precedence even with the old *tercios* The country had emerged from the confusion of the past century with the foreign and domestic strength of a practically absolute central power. The Fronde continued the military history of the army from the end of the Thirty Years' War; and when the period of consolidation was finally closed, all was prepared for the introduction of a "standing army," practically always at nar strength, and entirely at the disposal of the sovereign. The reorganization of the military establishments by Louvois may be taken as the formal date at which standing armies came into prominence. *(See* historical sketch of the French army under FRANCE) Other Powers rapidly followed the lead of France, for the defects of enlisted troops had become very clear, and the possession of an army always ready for war was an obvious advantage in dynastic politics. The French proprietary system of regiments, and the general scheme

of army administration which replaced it, may be taken as typical of the armies of other great Powers in the time of Louis XIV.

29. Character of the Standing Armies.—A peculiar character was from the first imparted to the new organizations by the results of the Thirty Years' War. A well-founded horror of military barbarity had the effect of separating the soldier from the civilian by an impassable gulf. The drain of 30 years on the population, resources and finances of almost every country in middle Europe, everywhere limited the size of the new armies; and the decision in 1648 of all questions save those of dynastic interest dictated the nature of their employment. The best soldiers of the time pronounced in favour of small field armies, for in the then state of communications and agriculture large forces proved in practice too cumbrous for good work. In every country, therefore, the army took the form of a professional body, nearly though not quite independent of extra recruits for war, set apart entirely from all contact with civil life, rigidly restricted as to conduct in peace and war, and employed mostly in the "maintenance" of their superiors' private quarrels. Iron discipline produced splendid tenacity in action and wholesale desertion at all times. In the Seven Years' War, for instance, the Austrians stated that one-fifth of their total loss was due to desertion, and Thackeray's *Barry Lyndon* gives no untrue picture of the life of a soldier under the old *régime*. Further, since men were costly, rigid economy of their lives in action, and minute care for their feeding and shelter on the march, occupied the attention of their generals. Armies necessarily moved slowly and remained concentrated to facilitate supply and to check desertion, and thus, when a commander had every unit of his troops within a short ride of his headquarters, there was little need for intermediate general officers, and still less for a highly trained staff.

30. Organization in the 18th Century.—All armies were now almost equal in fighting value, and war tended to be reduced to a set of rules (not principles), since superiority was only to be gained by methods, not by men. Soldiers such as Marlborough, who were superior to these jejune prescriptions, met indeed with uniform success. But the methods of the 18th century failed to receive full illustration, save by the accident of a great captain's direction, even amidst the circumstances for which they were designed. It is hardly to be wondered at, therefore, that they failed, when forced by a new phase of development to cope with events completely beyond their element. The inner organization was not markedly altered. Artillery was still outside the normal organization of the line of battle, though in the period 1660–1740 much was done in all countries to improve the material, and above all to turn the *personnel* into disciplined soldiers. Cavalry was organized in regiments and squadrons, and armed with sabre and pistol. Infantry had by 1703 begun to assume its three-deep line formation and the typical weapons of the arm—musket and bayonet. Regiments and battalions were the units of combat as well as of organization. In the fight the company was entirely merged in the higher unit, but as an administrative body it still remained. As for the higher organization, an army consisted simply of a greater or less number of battalions and squadrons, without, as a rule, intermediate commands and groupings. The army was arrayed as a whole in two lines of battle, with the infantry in the centre and the cavalry on the flanks, and an advanced guard; the so-called reserve consisting merely of troops not assigned to the regular commands. It was divided, for command in action, into right and left wings, both of cavalry and infantry, of each line. This was the famous "linear" organization, which in theory produced the maximum effort in the minimum time, but in practice, handled by officers whose chief care was to avoid the expenditure of effort, achieved only negative results. To see its defects one need only suppose a battalion of the first line hard pressed by the enemy. A battalion of the second line was directly behind it, but there was no authority, less than that of the wing commander, which could order it up to support the first. All the conditions of the time were opposed to tactical subdivision, as the term is now understood. But far beyond any faults of organization and recruiting, the inherent vice of these armies was, as Machiavelli had pointed out two centuries previously, and as Prussia was to learn to her cost in 1806, that once they were thoroughly defeated, the only thing left to be done mas to make peace at once, since there was no other armed force capable of retrieving a failure.

31. Frederick the Great.—The military career of Frederick the Great is very different from those of his predecessors. With an army organized on the customary system, and trained and equipped, better indeed, but still on the same lines as those of his rivals, the king of Prussia achieved results out of all proportion to those imagined by contemporary soldiers. It is to his campaigns, therefore, that the student must refer for the real, if usually latent, possibilities of the army of the 18th century. The prime secret of his success lay in the fact that he was his own master, and responsible to no superior for the uses to which he put his men. This position had never, since the introduction of standing armies, been attained by anyone, even Eugene and Leopold of Dessau being subject to the common restriction; and with this extraordinary advantage over his opponents, Frederick had further the firmness and ruthless energy of a great commander. Prussia, moreover, was more strictly organized than other countries, and there was relatively little of that opposition of local authorities to the movement of troops which was conspicuous in Austria. The military successes of Prussia, therefore, up to 1757, were not primarily due to the system and the formal tactics, but were the logical outcome of greater energy in the leading, and less friction in the administration, of her armies. But the conditions were totally different in 1758–62, when the full force of the alliance against Prussia developed itself in four theatres of war. Frederick was driven back to the old methods of making war, and his men were no longer the soldiers of Leuthen and Hohenfriedberg. If discipline was severe before, it was merciless then; the king obtained men by force and fraud from every part of Germany, and had both to repress and to train them in the face of the enemy. That under such conditions, and with such men, the weaker party finally emerged triumphant was indeed a startling phenomenon. Yet its result for soldiers was not the production of the national army, though the dynastic forces had once more shown themselves incapable of compassing decisive victories: nor yet the removal of the barrier between army and people, for the operations of Frederick's recruiting agents made a lasting impression, and further, large numbers of men who had thought to make a profession of arms were turned adrift at the end of the war. On the contrary, all that the great and prolonged *tour de force* of these years produced was a tendency, quite in the spirit of the age, to make a formal system out of the art of war. Better working and better methods were less sought after than systematization of the special practices of the most successful commanders. Thus Frederick's methods, since 1758, essentially the same as those of others, were taken as the basis of the science now for the first time called "strategy," the fact that his opponents had also practised it without success being strangely ignored. Along with this came a mania for imitation. Prussian drill, uniforms and hair-powder were slavishly copied by every State, and for the next 20 years, and especially when the war-trained officers and men had left active service, the purest pedantry reigned in all the armies of Europe, including that of Prussia. One of the ablest of Frederick's subordinates wrote a book in which he urged that the cadence of the infantry step should be increased by one pace per minute. The only exceptions to the universal prevalence of this spirit were in the Austrian army, which was saved from atrophy by its Turkish wars, and in a few British and French troops who served in the American War of Independence. The British regiments were sent to die of fever in the West Indies; when the storm of the French Revolution broke over Europe, the Austrian army was the only stable element of resistance.

32. The French Revolution.—Very different were the armies of the Revolution. The French volunteers of 1792 were a force by which the routine generals of the enemy, working with instruments and by rules designed for other conditions, were completely puzzled, and France gained'a short respite. The year 1793 witnessed the most remarkable event that is recorded in the history of armies. Raw enthusiasm was replaced, after the disasters and

defections which marked the beginning of the campaign, by a systematic and unsparing conscription, and the masses of men thus enrolled, inspired by ardent patriotism and directed by the ferocious energy of the Committee of Public Safety, met the diciplined formalists with an opposition before which the attack completely collapsed. It was less marvellous in fact than in appearance that this should be so. Not to mention the influence of pedantry and senility on the course of the operations, it may be admitted that Frederick and his army at their best would have been unable to accomplish the downfall of the now thoroughly roused French. Tactically, the fire of the regulars' line caused the Revolutionary levies to melt away by thousands, but men were ready to fill the gaps. No complicated supply system bound the French to magazines and fortresses, for Europe could once more feed an army without convoys, and roads were now good and numerous. No fear of desertion kept them concentrated under canvas, for each man was personally concerned with the issue. If the allies tried to oppose them on an equal front, they were weak at all points, and the old organization had no provision for the working of a scattered army. While ten victorious campaigns had not carried Marlborough nearer to Paris than some marches beyond the Sambre, two campaigns now carried a French army to within a few miles of Vienna. It was obvious that, before such forces and such mobility, the old system was doomed, and with each successive failure the old armies became more discouraged. Napoleon's victories finally closed this chapter of military development, and by 1808 the only army left to represent it was the British. Even to this the Peninsular War opened a line of progress, which, if different in many essentials from Continental practice, was in any case much more than a copy of an obsolete model.

33. The Conscription. — In 1793, at a moment when the danger to France was so great as to produce the rigorous emergency methods of the Reign of Terror, the combined enemies of the Republic had less than 300,000 men in the field between Basle and Dunkirk. On the other hand, the call of the "country in danger" produced more than four times this number of men for the French armies within a few months. Louis XIV., even when all France had been awakened to warlike enthusiasm by a similar threat (1709), had not been able to put in the field more than one-fifth of this force. The methods of the great war minister Carnot were enforced by the ruthless committee. and when men's lives were safer before the bayonets of the allies than before the civil tribunals at home, there was no difficulty in enlisting the whole military spirit of France. There is therefore not much to be said as to the earliest application of the conscription, at least as regards its formal working, since any system possessing elasticity would equally have served the purpose. In the meanwhile, the older plans of organization had proved inadequate for dealing with such imposing masses of men. Even with disciplined soldiers they had long been known as applicable only to small armies, and the deficiencies of the French, with their consequences in tactics and strategy, soon produced the first illustrations of modern methods. Unable to meet the allies in the plain, they fought in broken ground and on the widest possible front. This of course produced decentralization and subdivision; the army was therefore constituted in a number of divisions, each of two or more brigades with cavalry and artillery sufficient for its own needs. It was even more important that each divisional general, with his own staff, should be a real commander, and not merely the supervisor of a section of the line of battle, for he was almost in the position that a commander-in-chief had formerly held. The need of generals was easily supplied when there was so wide a field of selection. For the allies the mere adoption of new forms was without result, since it was contrary both to tradition and to existing organization. The attempts which were made in this direction did not tend to mitigate the evils of inferior numbers and *moral*. The French soon followed up the divisional system with the further organization of groups of divisions under specially selected general officers; this again quickly developed into the modern army corps.

34. Napoleon. — Revolutionary government, however, gave way in a few years to more ordinary institutions, and the spirit of French politics had become that of aggrandizement in the name of liberty. The ruthless application of the new principle of masses had been terribly costly, and the disasters of 1799 reawakened in the mass of the people the old dislike of war and service. Even before this it had been found necessary to frame a new act. the famous law proposed by Gen. Jourdan (1798). With this the conscription for general service began. The legal term of five years was so far exceeded that the service came to be looked upon as a career, or servitude, for life; it was therefore both unavoidable and profitable to admit substitutes. Even in 1806 one quarter of Napoleon's conscripts failed to come up for duty. The *Grande Arme'e* thus from its inception contained elements of doubtful value, and only the tradition of victory and the 50% of veterans still serving aided the genius of Napoleon to win the brilliant victories of 1805 and 1806. But these veterans were gradually eliminated by bloodshed and service exposure, and when, after the peace of Tilsit "French" armies began to be recruited from all sorts of nations, decay had set in. As early as 1806 the emperor had had to "anticipate" the conscription, that is, call up the conscripts before their time, and by 1810 the percentage of absentees in France had grown to about 80, the remainder being largely those who lacked courage to oppose the authorities. Finally, the armies of Napoleon became masses of men of all nations fighting even more unwillingly than the armies of the old *régime*. Little success attended the emperor's attempt to convert a "nation in arms" into a great dynastic army. Considered as such, it had even fewer elements of solidity than the standing armies of the 18th century, for it lacked the discipline which had made the regiments of Frederick invincible. After 1812 it was attacked by huge armies of patriots which possessed advantages of organization and skilful direction that the *levée en masse* of 1793 had lacked. Only the genius and magnificent tenacity of Napoleon staved off for a time the inevitable *débâcle*.

35. The Grande **Armée.**—In 1805–06, when the older spirit of the Revolution was already represented by one-half only of French soldiers, the actual steadiness and manoeuvring power of the *Grande Arme'e* had attained its highest level. The army at this time was organized into brigades, divisions and corps, the last-named unit being as a rule a marshal's command, and always complete as a small army with all the necessary arms and services. Several such corps (usually of unequal strength) formed the army. The greatest weakness of the organization, which was in other respects most pliant and adaptable, mas the want of good staff-officers. The emperor had so far cowed his marshals that few of them could take the slightest individual responsibility, and the combatant staff-officers remained, as they had been in the 18th century, either confidential clerks or merely gallopers. No one but a Napoleon could have managed huge armies upon these terms; in fact the marshals, from Berthier downwards, generally failed when in independent commands. Of the three arms, infantry and cavalry regiments were organized in much the same way as in Frederick's day, though tactical methods were very different and discipline far inferior. The greatest advance had taken place in the artillery service. Field and horse batteries, as organized and disciplined units, had come into general use during the Revolutionary wars, and the division, corps and army commanders had always batteries assigned to their several commands as a permanent and integral part of the fighting troops. Napoleon himself, and his brilliant artillery officers Sénarmont and Drouot, brought the arm to such a pitch of efficiency that it enabled him to win splendid victories almost by its own action. As a typical organization we may take the 3rd corps of Marshal Davout in 1806. This was formed of the following troops:—

Cavalry brigade—Gen. Vialannes—three regiments, 1,538 men. Corps artillery, 12 guns.

1st Division—Gen. Morand—five infantry regiments in. three brigades, 12 guns, 10,820 men.

2nd Division—Gen. Friant—five regiments in three brigades, 8 guns, 8,758 men.

3rd Division—Gen. Gudin—four regiments in three brigades, 12 guns, 9,077 men.

A comparison of this *ordre de bataille* with that of a 1914 army corps will show that the general idea of corps organization

underwent but slight modification between the days of Napoleon and the World War. Yet the spirit of 1806 and that of a century later were essentially different, and the story of the development of this difference through the 19th century is vital to an understanding of the military nature of the World War.

36. The Wars of Liberation. — The Prussian defeat at Jena was followed by a national surrender so abject as to prove conclusively the eternal truth: that a divorce of armies from national interests is fatal to national well-being. But the oppression of the victors soon began to produce a spirit of ardent patriotism which, carefully directed by a small band of able soldiers, led in the end to a national uprising of a steadier and more lasting kind than that of the French Revolution. Prussia was compelled, by the rigorous treaty of peace, to keep only a small force under arms, and circumstances thus drove her into the path of military development which she subsequently followed. The stipulation of the treaty was evaded by the *Kriimper* system, by which men were passed through the ranks as hastily as possible and dismissed to the reserve, their places being taken by recruits. The regimental establishments were therefore mere *cadres*, and the *personnel*, recruited by universal service with few exemptions, ever-changing. This system depended on the willingness of the reserves to come up when called upon, and the arrogance of the French was quite sufficient to ensure this. The *dénouement* of the Napoleonic wars came too swiftly for the full development of the armed strength of Prussia on these lines; and at the outbreak of the Wars of Liberation a newly formed *Landwehr* and numerous volunteer corps took the field with no more training than the French had had in 1793. Still, the principles of universal service *(allgemeine Wehrpflicht)* and of the army reserve were, for the first time in modern history, systematically put into action, and military development during the 19th century concerned itself more with the consolidation of the *Krümper* system than with the creation of another. The *début* of the new Prussian army was most unsuccessful, for Napoleon had now attained the highest point of soldierly skill, and managed to inflict heavy defeats on the allies. But the Prussians were not discouraged; like the French in 1793 they took to broken ground, and managed to win combats against all leaders opposed to them except Napoleon himself. The Russian army formed a solid background for the Prussians, and in the end Austria joined the coalition. Reconstituted on modern lines, the Austrian army in 1813, except in the higher leading, was probably the best organized on the Continent. After three desperate campaigns the Napoleonic *régime* came to an end, and men felt that there would be no such struggle again in their lifetime. Military Europe settled down into grooves along which it ran till 1866. France, exhausted of its manhood, sought a field for military activities in colonial wars waged by long-service troops. The conscription was still in force, but the citizens served most unwillingly, and substitution produced a professional army, which as usual became a dynastic tool. Austria, always menaced with foreign war and internal disorder, maintained the best army in Europe. The British army, though employed far differently, retained substantially the Peninsular system.

37. European and American Armies 1815–70. — The events of 1815–59 showed that such long-service armies were incomparably the best form of military machine for the purpose of giving expression to a hostile "view" (not "feeling"). Austrian armies triumphed in Italy, French armies in Spain, Belgium, Algeria, Italy and Russia, British in innumerable and exacting colonial wars. Only the Prussian forces retained the characteristics of the levies of 1813, and the enthusiasm which had carried these through Leipzig and the other great battles was hardly to be expected of their sons, ranged on the side of despotism in the troubled times of 1848–50. But the principle was not permitted to die out. The Bronnzell-Olmiitz incident of 1850 *(see* SEVEN WEEKS' *WAR)* showed that the organization of 1813 was defective, and this was altered in spite of the fiercest opposition of all classes. Soon afterwards, and before the new Prussian army proved itself on a great battlefield, the American Civil War, a fiercer struggle than any of those which followed it in Europe, illustrated the capabilities and the weaknesses of voluntary-service troops. Here the hostile "view" was replaced by a hostile "feeling," and the battles of the disciplined enthusiasts on either side were of a very different kind from those of contemporary Europe. Thus the great struggle in North America passed without affecting seriously the war ideas and preparations of Europe. The weakness of the staff work with which both sides were credited helped further to confirm the belief of the Prussians in their system, and in this instance they were justified by the immense superiority of their own general staff to that of any army in existence. It mas in this particular that a corps of 1870 differed so essentially from a corps of Napoleon's time. The formal organization had not been altered save as the varying relative importance of the separate arms had dictated. The almost intangible spirit which animates the members of a general staff causes them not merely to "think"—that was always in the quartermaster-general's department — but to "think alike," so that a few simple orders called "directives" sufficed to set armies in motion with a definite purpose before them, whereas formerly elaborate and detailed plans of battle had to be devised and distributed in order to achieve the object in view. A comparison of the number of orders and letters written by a marshal and by his chief of staff in Napoleon's time with similar documents in 1870 indicates clearly the changed position of the staff. In the *Grande Armée* and in the French army of 1870 the officers of the general staff were often absent entirely from the scene of action. In Prussia the new staff system produced a far different result — indeed, the staff, rather than the Prussian military system, was the actual victor of 1870. Still, the system would probably have conquered in the end in any case, and other nations, convinced by events that their departure from the ideal of 1813, however convenient formerly, was no longer justified, promptly copied Prussia as exactly, and, as a matter of fact, as slavishly, as they had done after the Seven Years' War. (C. F. A.; X.)

DEVELOPMENTS FROM 1870 TO 1914

38. General Tendencies. — The Franco-German War of 1870–71 marks a very definite stage in the evolution of armies. The striking successes of the short-service German army over a professional long-service army, reputed the finest in Europe at the time, ushered in a new era of development, which was to last for nearly 43 years, that is right down to the outbreak of the World War. As a result of the 1870 campaign the armies of Europe at once set out to re-model themselves on the pattern which Prussia had created. The period of reform may be put down as from about 1873 to 1890. For the following 25 years — a time of tense struggle during peace for superiority in the next war — the general pattern of the machine was unchanged, though its power and efficiency were progressively improved. Germany set the pace and other nations had perforce to follow. The elements of the system under which the principal armies of the world — Japan too followed the German model — were developed in this period, its merits and its disadvantages, require some examination.

39. Principles of the Modern System. — The first principle was the substitution of universal liability to personal service in place of the methods of conscription formerly practised, which selected by lot a proportion of the manhood of the nation and permitted those on whom the lot had fallen to hire substitutes. The practical result of the old system was to produce an army composed partly of professional soldiers, each of whom was paid by several successive conscripts to discharge their obligations, and partly of conscripts who had no particular taste for soldiering but who were too poor to procure substitutes Thus only a comparatively small part of the nation was trained to war and the well-to-do class usually escaped service altogether. Under the Prussian system now adopted by all the principal armies no substitution whatever was allowed. Only rejection by a medical board could relieve a man from his obligation to service between certain ages. When the numbers of the physically fit in the annual contingent reaching military age exceeded those required to fill the complement of the active army, certain classes were chosen for immediate transfer to the reserves without a period of training in the standing army or navy. Such choice was normally made on the grounds of family circumstances: *i.e.*, relief was given to

those on whom—as the sole supporters of a family, for example—the burden of active military service in peacetime would press most hardly. There was one other remission: attainment of a certain standard of education conferred the privilege of a shortened period of active service followed by transfer to the reserve as an officer or non-commissioned officer. The system was, in theory, at least, an entirely democratic one, based on the equal personal service in the military forces of every citizen, irrespective of his rank or wealth. It mas certainly an advance on the former system, which allowed service by deputy.

The second principle was that the period of active service in the standing army should be as short as was consistent with efficient training, so that the maximum numbers could be instructed and passed to the reserve with the minimum of cost, and also that the able-bodied strength of the nation should be withdrawn from industry for as brief a time as possible. This period of active service varied in the different armies and at different times, and often also according to the arm of the service. The average period in the principal Continental armies at the outbreak of the World War may be taken as three years. Thus in France it was three years for all arms, in Germany and Austria-Hungary three years for cavalry and horse artillery and two years for other arms, in Russia three years for infantry and artillery and four years for other arms. This period, which was one of hard and intensive training, was followed by a period of from five to seven years in the first class of the reserve, the rôle of which was to bring the standing army up to war strength on mobilization. From this category men passed for a iurther five years or so to the second class of the reserve, used in war either to form second-line units or to replace casualties in the field army. The reserves were kept up to date by occasional short periods of training. The remainder of the obligation to military service was usually discharged in an auxiliary force—*Landsturm* in Germany, Terriforiul *Army* in France, *Opolchenie* in Russia—intended mainly for home defence or for duties in the area behind the front-line armies. As a general average it may be taken that a man's liability to service lasted from the age of 20 to the age of 45, of which term three years were spent in the active army, six years in the first reserve, six years in the second reserve, and the remainder in some form of auxiliary or home-defence force. Thus the standing army and its first reserve, which together constituted the first line or field army in war, comprised the able-bodied manhood of the nation between the ages of 20 and 30. Behind this stood a second line of the older men from 30 to 45. The above figures are a generalization and do not correspond exactly with the organization or terms of service of any one nation.

The third principle lay in the elaboration of the arrangements for rapid mobilization in the event of war. As explained above, the essence of the system lay in a comparatively small short-service standing army with large reserves of trained men. The advantage to be gained by the army which could most quickly and smoothly expand from a peace footing to a war footing was obvious, and was sought by every means that the staff could devise. The gain of even a few hours was of the utmost value, the gain of a day might be decisive. To such a pitch of nicety were the calculations eventually brought that a nation could hardly afford to delay even a single hour, once a rival had issued orders to mobilize. This was clearly seen in the crisis of July 1914. The order to mobilize became in fact equivalent to an opening of hostilities. A corollary to this need for rapid mobilization was the "territorialization" of the armed forces. Time would be saved if the reserves required to complete a formation to war strength normally resided in the same area in which the formation was stationed in peace. Hence arose a system by which each army corps had a district allotted to it where it was permanently stationed and recruited and where it mobilized for war. The army corps district was usually subdivided into divisional areas, which again were parcelled out into brigade and regimental areas. This system had obviously many advantages. It was economical of time on mobilization and economical of money in peace, since it involved the minimum of expense in travelling; also it caused the least dislocation to those called up for service, who usually discharged their obligation in their own district, close to home. There were certain exceptions to this territorial principle, due often to the presence in a nation of an alien population not yet wholly absorbed in the nation nor fully trusted. Thus in Germany the principle was not extended to Alsace-Lorraine, and in Russia, where the system of recruiting was only partially territorial, Jews, Poles and other non-Russians were distributed throughout the army.

The efficient working of the system required a corps of officers who made the army their career for life. The need to train successive contingents of recruits to the complicated business of modern war in a short term imposed on the officers a high standard of professional capacity and an unremitting industry—the latter a quality hardly associated hitherto with the profession of arms in peace. They were compensated for small pay and long hours of work by an exaggerated social status, especially in Germany, where the cult of military power most flourished. To assist the officers in the instruction of the rank and file was a body of long-service non-commissioned officers, selected from those of the annual contingent who showed an aptitude for military life and volunteered to remain in the active army after their obligatory period of service had expired. They were attracted by increased pay and privileges and by the promise of subsequent civil employment in a Government post. Lastly, the armies produced under this modern system called for a highly educated (in the military sense) staff. The organization in peace, and the movement and supply in the field, of such masses of men became a complex and highly technical business, and made greater demands on the staff than ever before. In all armies the staff system was overhauled, and great improvements were made in the training of staff officers.

40. Merits and Disadvantages of the System.—The above is a brief outline of the chief features of the method of raising armies which is often referred to as "The Nation in Arms." So far as the rank and file were concerned, it aimed at quantity rather than quality: the "veteran" professional soldier practically vanished from the drill-grounds, the barrack-rooms and the battlefields of Europe. On the other hand, those taken for service included the best of the nation's manhood; and in their three years' intensive training they had forced into them as much military knowledge as the old-type professional soldier absorbed in his many years with the colours. There was naturally bound to he in armies raised under the compulsory system a certain unreliable element, which would fail under the stresses of war. But in a brave and patriotic nation like the Germans, who invented the system, such element was small and could be coerced by a rigid discipline. The moral advantage which the volunteer is supposed to hold over the pressed man has little application to armies like these, which embody the whole manhood of a nation. Financially, the system enabled far larger numbers to be kept under arms and trained to war than would have been possible under any voluntary system. The pay of the soldier was practically a negligible item, and there was not the necessity to study his comfort in the same way as in a voluntary army, which had to attract its recruits.

Thus the system was on the whole efficient, economical and just. The ethical arguments against compulsory service—*e.g.*, that it promotes wars and a warlike spirit or that it hampers industrial progress—are dealt with elsewhere. (See CONSCRIPTION.) From the purely military point of view, however, there were certain defects and difficulties in the Prussian system. The chief of these was the effect on the officers of the hard work and almost unvarying routine which the training of such large masses imposed. The great majority of regimental officers passed their whole military life in the same garrison town, instructing at high pressure successive batches of recruits in the details of military service. Such officers had inevitably a narrow mental outlook and tended to lose initiative and the ability to improvise, two qualities which the conditions of active service—the march, the bivouac and the battlefield—continually demand. *Aus* Kleine *Garnison,* a book which brought its author, an officer of the German army, court-martial and imprisonment a few years before the war, gives a picture drawn from life of the monotony and evils of life in a small garrison town. Kuprin's Poyedinok (The Duel) gives an even darker impression of a similar garrison in Russia.

The reserve officer, of whom large numbers were required on mobilization to complete the field army and to form second-line units, presented a different problem. The chief source from which they were drawn was the "one-year volunteer"; *i.e.*, those who, in consideration of having reached a certain educational standard, served for one year only in the ranks and then became officers of the reserve, in which capacity they were called up for short periods of training. This class naturally comprised some of the best of the nation. But their military training was inadequate to make them really efficient officers, while their superior intelligence and education often led them to dislike military life and to despise the professional officer. In Russia, for instance, the *intelligenzia* class, from which a large proportion of the reserve officers were drawn, was frankly anti-militaristic and served with reluctance. A certain number of commissions in the reserve of officers were given to men who had served long terms as non-commissioned officers in the standing army. This class—the retired sergeant-major—did not usually produce a good type of officer, but was useful for work in depots and in garrison units. The problem of finding sufficient officers to expand these huge national armies in war is obviously one of their principal difficulties, and is inherent in any system which makes numerical strength its main objective. Good non-commissioned officers were also difficult to secure in sufficient numbers, and the low-class tyrannical non-commissioned officer who abused his power constituted one of the most objectionable features of compulsory armies. The difficulty of finding non-commissioned officers was increased when the nation had colonial possessions to be defended Such oversea possessions had to be garrisoned by forces raised on a professional and voluntary basis, short-service armies of the type described being quite unfitted for garrison work abroad. These colonial forces absorbed many men who took up soldiering as a profession and who would otherwise have been available as non-commissioned officers in the home army. In Russia the difficulties of filling the establishment of non-commissioned officers was especially acute owing to the low standard of education of the nation.

To sum up, the difference between the armies thus evolved in Europe at the end of the 19th century and those which they replaced can perhaps best be expressed by the terms "machine-made" and "hand-made." The change was more or less contemporary with the substitution in the industrial world of the machine-made for the hand-made article. Like the machine-made article in commerce, the machine-made soldier had the advantages of cheapness and rapidity of production, but lacked some of the finish and polish of the hand-made article. For a powerful indictment of the objectionable features of the system in Germany, the student may consult a novel published in Germany not long before the war—*Jena* oder *Sedan*. He may also read the story of the "Zabern incident" in 1913.

41. Armies up to the World War.—The chief feature of the quarter of a century from 1890 to 1914, was the contest between the principal European armies for predominance in numbers. Thus Germany, which in 1874 had a peace establishment not much over 400,000, had by 1914 one of 850,000: whereas in 1870 she had put into the field 15 army corps, by 1914 she had ready 25 active corps and nearly as many reserve corps. She had available for war over 4,000,000 trained men. France struggled desperately to hold the pace set by Germany; with her smaller population she was in the position of a runner who has to exert every nerve to keep at the shoulder of his rival whom he sees running easily within himself. She trained every available man, with very few exemptions, while Germany could still afford to exempt from active service nearly half of the annual contingent passed medically fit. France's law of military service of 1913 was practically the last spurt of which she was capable; it increased the period of active service from two years to three and the total liability to service from 25 years to 28. Thus in order to maintain something like equality both in peace and in war strength with Germany, her population was called on to serve one year longer in the active army and two years longer in the reserve—three more years military service in all. Austria-Hungary's effort was approximately similar to Germany's; her peace establishment was close on 500,000 and her war strength 2,000,000. Russia with her almost inexhaustible resources in men trained a smaller proportion of her population than the other great nations, yet had a peace strength of nearly 1,500,000 and about 6,000,000 trained men ultimately available for war. The smaller armies of Europe were all cast in the same mould, and all trained to arms the greater part of the able-bodied manhood of their nations.

Of all the states which maintained standing armies of any size or power, only Great Britain and the United States maintained the principle of voluntary enlistment. It was the temperament of these peoples that insisted on avoiding compulsion for military service, but it was the fact that sea power, not military power, was their first line of defence that made this insistence possible without immediate disaster. For Great Britain, moreover, the principal military problem was, at least up to the beginning of the 20th century, that of maintaining large garrisons of regular troops in her overseas possessions. For this a voluntary long-service army was a better and more comfortable instrument than an army raised on the Continental system. The main trouble about a voluntary army is its expense, since the enlistment of recruits depends on high pay and attractive conditions of service. Thus the strength of the military forces tends to be governed by financial considerations rather than by the demands of strategy. Again, the hours of duty, the rules of discipline and the circumstances of the soldiers' life have all to be determined with an eye to the supply of recruits. Hence a voluntary soldier cannot be worked so hard and takes longer to learn his trade. A long period of colour-service means small reserves, so that a voluntary army has comparatively little capacity of rapid expansion for war. The British army up to 1870 had had practically no reserves, a soldier's whole term of service—usually about 12 years, often extended to 21—was with the colours. Under the Cardwell reforms, which began in 1870, steps were taken to build up a reserve, and the normal term of service was eventually fixed at seven years with the colours and five in the reserve. The British second-line force was not, like the second line of Continental armies, composed of older men who had served in the first line, but of patriotic citizens who voluntarily undertook short periods of training annually, to fit themselves for home defence. This second line was reorganized into the Territorial Force under Mr. Haldane's administration in 1908. (See GREAT BRITAIN.) In the last ten years or so before the outbreak of the World War a considerable body of military opinion—of which Field-Marshal Lord Roberts was the protagonist—urged on the British nation the abandonment of the voluntary principle and the adoption of universal service to meet the increasing menace of German militarism in Europe. But the difficulties of combining within the national budget a voluntary army for service abroad with a compulsory force for home service were great, and none of the schemes produced ever had a chance of acceptance by the nation at large, which has a deep-rooted dislike and mistrust of military service.

The two principal wars of the period under review may be said to have had a local rather than a general influence on the development of armies. The experience of the Boer War (1899–1902) was invaluable to the British army, and led up to the reforms which enabled it to put into the field in 1914 an army equal in equipment and organization, and superior in training, to any in Europe. It also brought Dominion forces into the field in support of the mother country for the first time, and thus inaugurated the preparations which made possible the military effort of the Dominions 1 j years later. The Russo-Japanese War in Manchuria (1904–05) similarly resulted in great efforts in Russia to bring the army up to date. But neither campaign was held by Continental experts to justify any serious modification in organization or theory. The operations in Manchuria were considered a triumph for German methods, on which the Japanese army had formed itself. The warning given by the protracted nature of the battles. and by the sluggishness of the operations generally, passed unheeded.

42. Developments in Armament and Equipment.—Meanwhile weapons and warlike material were being rapidly improved by the discoveries of science. The invention of smokeless powder

changed the whole appearance of the battlefield; the small-bore magazine rifle more than doubled the volume and accuracy of infantry fire; the mitrailleuse of 1870 developed into the modern machine gun, the deadly power of which was recognized only by a few before the World War; and the artillery increased in range, calibre and rapidity of fire. The effects of the petrol (gasolene) engine were only beginning to be suspected when the World War broke out; armies still moved on their feet and were served mainly by horsed transport; the air arm was in its infancy. The principal nations watched each other so jealously that it was difficult for any of them to obtain any decided advantage in armament over its rivals. But armies tended to cultivate proficiency in one particular weapon according to the national traditions and temperament. Thus the French were justly proud of the technical superiority of their quick-firing artillery; the Germans had soonest realized the potentialities of the machine gun; the British rifle fire was in volume and accuracy far above that of Continental nations; while the Russians still wistfully quoted the maxim of Suvorov: "The bullet is a fool; the bayonet only is wise."

Such were the armies which the spirit of Prussia—ruthless, efficient but unimaginative—had imposed on Europe when the World War at last blazed out in a kind of passionate protest against a system that made peace almost as hard a military struggle as war. The standard of strength of these armies was primarily a man-power standard; the aim of each was to place in the field the largest possible host of armed men in the shortest time, and to overwhelm the adversary forthwith by sheer weight of numbers. In such a conception of war minute preparation in peace was held to count for more than generalship in the field, since little manoeuvre was possible once the great masses had been launched to cover every road leading to their objective. The midnight oil of the administrator, who by the scrupulous improvement of mobilization arrangements or by the skilful manipulation of time-tables of railway movement could snatch half-a-day's advantage of time, might do more to win victory than any lightning flash of genius in the battle. It was a theory of brute force against which the French military mind revolted. But the question their strategists put to themselves: "What would Napoleon have done?" had found no very definite answer when 1914 came.

ARMY ORGANIZATION

43. General.—In the foregoing sections the principles on which armies were raised up to the time of the World War have been examined. Before passing on to consider what changes or modifications the grim needs of a prolonged and deadly war occasioned, some outline must be given of the methods on which those armies were organized and commanded, how their order of battle was built up, what laws governed their subdivision into bodies and groups and the composition of those groups.

Military forces may be treated of in three categories: the fighting troops, the auxiliary or administrative troops, and the command and staff. The three principal fighting arms were still in 1914, as they had been for some centuries, cavalry, artillery and infantry. The work of the engineers had increased in importance owing to technical developments—signal communication by cable or wireless had, for instance, become one of their most important responsibilities—but though they worked in the front line, fighting was with them only a secondary rôle; machine guns had not yet been developed into a separate arm, but were incorporated into the cavalry and infantry; mounted infantry were only an improvization, to which the peculiar circumstances of the Boer War gave prominence for a time; and the air force was as yet unarmed. Infantry remained the predominant partner, to further whose efforts to close with the enemy was the main task of the other arms. The administrative troops comprised the supply, medical and veterinary services and so forth. The activities of the fighting troops and the administrative troops were controlled and directed by the commanders and their staffs. Details of the organization, tactics and functions of these various component parts will be found under such headings as ARTILLERY, CAVALRY, INFANTRY, SUPPLY AND TRANSPORT, STAFF. Only enough, however, will be said here to show the general principles involved in assembling these parts into an effective whole.

An essential problem in organizing an army is to determine the proportions which the principal arms should bear to one another. These proportions—generally expressed in the terms of so many sabres and guns per 1,000 rifles—had undergone comparatively little change since 1870. In the French and German armies the proportions ruling for the field armies in 1914 may be taken roughly as about 120 sabres and 6 guns per 1,000 rifles. The Austrian and Russian armies were stronger in cavalry and weaker in guns, about 200 sabres and 4 guns per 1,000 rifles. The proportion of technical troops was increasing with scientific developments and improvements, such as wireless telegraphy, aircraft, mechanical transport and searchlights. The administrative services, too, gained in size and importance as warlike equipment grew more complicated and as the demands of the fighting troops for ammunition and technical stores grew heavier. This scientific expansion of the means of war greatly enhanced the advantage of a State with large manufacturing establishments and an industrial population on which to draw for the technical corps over States such as Russia and Austria, where industrial development was relatively low. But how vital a factor industrial strength was to prove in the forthcoming conflict was not yet fully realized, since it was believed that wars would be short and sharp and that the issue would be decided before the reserves of munitions accumulated in peace were exhausted.

44. Organization of the Fighting Troops.—The first step in military organization is to form each arm independently into units; these units are then combined into what—for want of a better word—are termed formations, (in French, grandes unite's), the lower of which usually consist of one arm only, while the higher include all arms.

To take the infantry first: the unit adopted by all armies was in 1914, as it had been for many years, the battalion of about 1,000 men, subdivided into four companies, the company again being subdivided into three or four sub-units, each of which constituted a subaltern officer's command (varying from about 50 to 75 men). The British army had retained an organization into eight companies up to 1913, when it also adopted the Continental system of four companies. Though the battalion was still spoken of as the unit of infantry, it had long ceased to be so tactically. The definition of a military unit for tactical purposes is the largest body which can be commanded and controlled on the battlefield by the voice of one man, and it was as such that the battalion had originally been constituted at its existing size. Once command has to be exercised indirectly, by means of a staff conveying messages to a number of subordinate commanders, the body ceases to be a unit in the tactical sense and becomes a formation. Thus it had already for some time been recognized that the company had supplanted the battalion as the tactical unit, while many foresaw that the real tactical unit was now the subaltern's command of about 50 men. Similarly the functions of the fire unit (*i.e.*, the largest body whose fire could be controlled in action by one man) had descended from the company to the squad or section of eight to ten men under a junior non-commissioned officer. The battalion was therefore tactically no longer a unit but a formation. It was the normal European practice to group three battalions (in Russia four) into a regiment; two regiments formed an infantry brigade (six battalions—in Russia eight); and two infantry brigades were included in a division. The British grouping was different and will be referred to later.

Of cavalry the unit was the regiment, organized into a number of squadrons. The strength of the squadron (the tactical unit) was in all armies standardized at approximately 150, subdivided into four troops, commanded by subalterns; but the number of squadrons varied in different armies from three to six (Great Britain and United States three, France and Germany four, Italy five, Russia and Austria six). Thus the strength of the regiment varied from a little over 500 up to 1,000. A cavalry brigade comprised two regiments (in the British army, three); and two or three brigades constituted a cavalry division.

The unit of artillery was the battery, normally of six guns

(France four, Russia eight). The subaltern's command was the section of two guns. Three batteries usually constituted a *group* (illogically named a brigade in the British army); and two or three groups a regiment.

As stated above, a subaltern officer's command was usually about 50 men. Originally the duties of junior officers had been mainly to inspire the men around them by their personal example. But as the range and effectiveness of weapons extended the area of the battlefield, the tactical handling of the combat passed into the hands of the junior leaders, by whose quality the effectiveness of an army was largely measured. The next grade of officer was the captain, whose command (in European armies) was a company, a squadron or a battery; then came the major, who commanded a battalion of infantry or a group of artillery. Regiments of all arms were commanded by colonels. In Great Britain batteries were commanded by majors, companies and squadrons by majors or captains; battalions, cavalry regiments and artillery brigades by lieutenant-colonels. The other combatant arms and the administrative services were organized and commanded on similar principles. The army of the United States, it may be noted here, had in peace no higher organization than the regiment.

45. **The** Grouping of Units. — Generally speaking, the number of units grouped in a formation should not be less than three nor more than six. In a formation composed of two units only, the influence of the commander of the formation is small; while it has been found by experience that six units is the maximum that can conveniently be commanded and administered by one headquarters. The student who wishes to make a closer examination of the arguments on this question is referred to the chapter on "Order of Battle" in the second book of Clausewitz's famous work On *War*. The normal number of units in a group is three or four, and the relative merits of the "triangle" or "square" as a tactical formation have been widely discussed. The principle of economy of force is often best served by the "triangle," *i.e.*, two units in front line with a third behind ready to add its weight at the most favourable point; but the "square," in which the two front-line units have two units behind them, certainly facilitates reliefs in the battle and enables the superior commander to retain a reserve in hand for a longer time.

The higher formations are the brigade, the division, the army corps, and, in war, the army. The brigade is composed of one arm only, the others of all arms. In European armies the infantry brigade in 1914 consisted of two regiments (six battalions) with a total of 6,000 to 7,000 combatants at war strength. The cavalry brigade consisted of two regiments, with a war strength of from 1,500 to 2,000. The artillery brigade comprised two regiments (12 batteries), some 2,500 to 3,000 men. The British infantry brigade of four battalions and the artillery brigade of four batteries corresponded with the Continental regiment of those arms; the cavalry brigade was of three regiments, but, since the regiments were smaller, its war strength was approximately the same as that of the Continental cavalry brigade. The commander of a brigade was on the Continent usually a major-general, in the British army a brigadier-general (but the artillery brigade was a lieutenant-colonel's command).

Divisions were of two kinds. A *cavalry* division included a staff, two (exceptionally three) brigades of cavalry, some batteries of horse artillery, a detachment of engineers, and occasionally a battalion of light infantry, with a total strength approaching 5,000. An ordinary *division* (sometimes termed an infantry division) is the smallest body fully organized for the conduct of an operation of war, complete with all arms and with all the necessary administrative services. In all the principal European armies the basis was the same, two brigades of infantry (12 battalions, in Russia 16). The main difference between the divisions of various armies lay in the allotment of artillery. Thus, while the German division had 72 guns, the Russian had 48, the French 36 and the Austrian only 24. These discrepancies did not necessarily mean a much smaller total proportion of artillery; they indicated rather a difference in organization. Thus in the French and Austrian armies a larger portion of the artillery was left at the disposal of the army corps. Practically all divisions had some cavalry allotted to them, usually a regiment; and all had a detachment of engineers. The division was self-contained in administrative services, and its total strength varied from about 17,000 to 20,000 men. The British division had the same number of battalions (12), but they were organized in three brigades of four battalions each; the number of guns was 70.

Some armies — the Japanese, British and Belgian, for instance — had no higher organization than the division. The views of Jomini and Clausewitz were that this was suitable for armies up to 100,000 men. But all the larger armies were organized into army corps both in peace and in war. The normal army corps consisted of two divisions, a varying quantity of artillery and certain technical and administrative units. The Russian army corps included a division of cavalry. In numbers, the army corps amounted to something over 40.000 men all told. It was held to represent the largest body of troops that could march along a single road and come into action in one day. The commander was a lieutenant-general. It will be noticed that the normal European organization — two regiments to a brigade, two brigades to a division, two divisions to an army corps — violated the principle enunciated at the beginning of this section that a group should consist of not less than three units. The brigade was, tactically, an unnecessary link, and the divisional commander could have handled the four regiments direct. The disadvantages of organizing the corps into two divisions was recognized, but it was held that a corps of three divisions would be too cumbersome a body for open warfare and would necessitate two roads being allotted to a corps on the march. The development of mechanical transport mas, however, modifying this view.

Finally, the size of the military forces of the Great Powers made necessary a further organization in war, the grouping of army corps into *armies*. These did not exist in peace and their composition in war was kept secret. Whereas the other higher formations were uniform in their composition, the composition of an army was variable, dependent on the strategical plan. It might include from three to six corps. The Japanese in Manchuria formed armies of a number of divisions, omitting the army corps link. It may here be mentioned that a uniform organization of divisions and army corps, while greatly facilitating command and staff work, assists the enemy's intelligence service to compile a correct order of battle. Napoleon for this reason always strictly avoided regularity in the organization of his forces, and his corps varied very widely in strength.

ARMIES IN THE WORLD WAR

46. Developments in Armament. — Of the developments in the constitution of armies during the World War — to be considered under the three headings: armament, personnel and organization — those in armament were the most considerable. The progress made in aviation during the years 1914–18 introduced into warfare a completely new factor, as radical in its effects as the invention of gun-powder, but far more rapid and disturbing in its development. This subject is dealt with in the articles AIR FORCES; AIR WARFARE. Of the weapons already in existence at the outbreak of hostilities, the machine gun became the "key" weapon of the war. It was the deadliness of the machine gun in defence, protected by entrenchment and barbed wire, that led to the prolonged stagnation on the Western Front. The Germans were the first to realize the potentialities of the machine gun, and throughout the war used it more effectively than any other combatant. The rapid and accurate rifle fire of the original British Expeditionary Force in the opening engagements had almost the stopping effect of machine gun fire, but subsequent reinforcements could not be trained up to this standard and rifle fire declined in value. The light automatic gun, of which the Lewis gun is a type (see INFANTRY and SMALL ARMS), still further increased the volume of fire delivered by infantry and strengthened the defence. The problem for which the attackers sought a solution throughout the war was to subdue the fire of the defenders' machine guns and automatic weapons sufficiently to enable the infantry to advance and occupy the position. The first solution

attempted was to crush resistance by weight of artillery fire. The number of field guns was increased, high-explosive shell was largely substituted for shrapnel, and great quantities of heavy artillery with calibres from 6in. to 18in. were brought into the field. The selected front of attack was subjected to a prolonged bombardment designed to destroy all hostile resistance before the infantry advanced. But it was found that this solution, even when successful in annihilating the enemy, defeated its own ends by so ploughing up the grouqd as to render any rapid advance or exploitation of success impossible. Weight of material failed even as had weight of man power. The solution eventually found to the problem was the introduction of an entirely new weapon, the tank. The invention of this bullet-proof vehicle, armed with light quick-firing guns or machine guns or both, and capable of moving across country on caterpillar tracks, stands to the credit of the British. It first appeared on the battlefield in Sept. 1916, but it was not till nearly t o years later that its influence became decisive. A full account of this weapon, of its development and of its tactical employment, will be found in the article TANKS.

The other new weapon to which the World War gave birth was poisonous gas (see CHEMICAL WARFARE). first used by the Germans in April 1915 in violation of international law, and subsequently by all the combatants. The gases used were of several kinds, asphyxiating, lachrymatory or vesicant, and were discharged by means of cylinders, projectors or shells. Gas added many complications to a war aiready complex. Troops were compelled to add to their growing burden of equipment a respirator. which they had frequently to wear for long periods, during which speech and vision were restricted and eating or drinking impossible. A persistent gas, such as mustard gas (the most effective of the war gases), rendered the area over which it was spread untenable without heavy casualties, since it penetrated the clothing and severely blistered the skin. Another innovation was the use of smoke projected by shells as a protective screen. The aim was so to dispose a cloud of smoke as to blind the enemy without hampering the movements of one's own troops. Smoke was often an effective weapon, but not an easy one to use. Its introduction further complicated the problem of ammunition supply for field guns, which at the opening of the war had relied almost entirely on the man-killing projectile, shrapnel, but at the close might be called on to fire gas shell, smoke shell, high explosive or shrapnel.

There is space only for the merest catalogue of the other military novelties which four years of intensive killing provoked. Some were applications to warlike purposes of recent scientific discoveries, such as the improvements in wireless telegraphy and in mechanical transport, sound-ranging apparatus to locate hostile guns, artillery to fire at aeroplanes, and so forth. Others were expedients dug out of rusty old wars and furbished up for modern use: such were the grenade, the mortar, the flame-thrower, mining, and the use of the carrier-pigeon for inter-communication. From the animal world the soldier borrowed the art of protective mimicry, camouflage. Lastly may be mentioned a weapon not made with hands, aimed at the mind, not at the body, no soldier's weapon but a deadly one, propaganda. Propaganda declaring the high destiny of the nation, the invincibility of her army, the justice of any course her ruler set, had been part of the German peace preparation for a war. In the closing stages of the war subversive propaganda, which aimed at convincing the German people and German army of the hopelessness of their position, did much to hasten the collapse of Germany. (See PROPAGANDA.)

47. The Man Power Problem. — The assumption under which the nations took the field in 1914 was that the conflict would be a short one and would be decided before the reserves of young trained men had all been drafted into the front line and before the stock of munitions held in peace had all been exhausted. The Germans did in fact nearly win the war at the outset by virtue of the superior peace organization which enabled them to place Reserve Corps (formed from surplus reservists) in the field at once. But their first thrust failed, the expectation of a short war was falsified, and before the end came practically every able-bodied citizen of the principal belligerents was engaged on war work. War ceased to be an affair of the armed forces alone; industry and invention were mobilized to make munitions; the Press — after some gropings and perplexities — was enlisted to spread propaganda; chemistry was recruited to seek new poisons or their antidotes, and so forth. Women took a great part in many war activities.

For armies which had a compulsory service system in peace the keeping of the ranks filled was a comparatively simple affair, even though the war wastage was far heavier than had ever been contemplated. Interest for the military student lies rather in the methods adopted by those nations which had to form new armies, Great Britain and her Dominions and, later, the United States. Once again the plain teaching of history, that it is better to expand an existing force, than to create an entirely fresh one, was disregarded. Lord Haldane, the creator of the Territorial Force, had rightly intended that any expansion of the national forces should be carried out through the agency of the same organization that administered the Territorials; *i.e.*, the County Associations But Lord Kitchener, who became War Minister at the outbreak of war, decided to create an entirely new force. So far as essential fighting value was concerned, the decision made little difference. but many difficulties of administration would have been avoided had the medium of the County Associations been used. A majority of the Territorial Force, which in peace enlisted for home service only. at once accepted a liability for service abroad. So that the British had three types of units serving in the war: the Regular, the Territorial, and the New Army. Another axiom in raising large forces, that every available trained officer or non-commissioned officer should be retained to instruct the new levies, was also unfulfilled. The engagement of the first seven divisions of the regular army in the forefront of the fight was of course necessary; and the loss of the flower of the nation's trained men in the first battles was unavoidable. But in the winter of 1914–15 many priceless lives were squandered in the mud of the trenches which might have been preserved to guide and instruct the pew armies.

The United States and the British Dominions had similar problems of raising large forces with a very small nucleus of trained instructors. The circumstances of the conflict were singularly favourable to the birth and upbringing of these new armies. The deadlock in the main theatre gave time for their training to be completed, and the sedentary conditions of trench warfare allowed them to be introduced to their new trade gradually, instead of being thrust at once into the open field, as were the French levies of 1871, for example. When the newly created forces were thus gradually broken in to their work they soon became efficient. It was found that drafts to replace wastage could be incorporated into seasoned units after a very few weeks' training, but then no high standard of manoeuvre was demanded of the troops on the Western Front. As to compulsion in recruiting, Great Britain passed reluctantly to conscription — via national registration and the Derby Scheme — at the beginning of 1916; Canada clung to the voluntary principle till Nay 1917, and Australia throughout the war; the United States passed a compulsory service act on her entry into the struggle.

48. Developments in **Organization.**—The war period, while it necessitated continual modifications, additions and adjustments in detail, produced no organic change in the general framework on which armies were built. The most radical departure was made late in the war by the British, when they decided to separate their air force from the navy and army and to form it into a separate service. This will be discussed later, since its full significance only came to light when the World War was over. In the proportion of arms the chief features were the increase in artillery, which rose to about ten guns per 1,000 rifles, and the decline of cavalry, which found little scope in the European theatres, though the campaigns in Palestine and Mesopotamia showed that the day of the mounted man was by no means over. Infantry remained in name the principal arm, but it was a lame and overburdened infantry, only able to hobble forward on the crutches of artillery and tanks, and propped up by machine guns in defence. The platoon, reduced in size to some 30 men, became the tactical unit in battle. The British made their machine gunners into a separate corps, as they did also their tank personnel. In

other armies the machine guns remained an integral part of the infantry or cavalry arm. In the artillery the French four-gun battery was almost universally adopted, although the British returned to the six-gun battery before the end of the war owing to the shortage of battery commanders. The proportion of the rearward services to the fighting troops grew abnormally with the static nature of the war. An enormous organization sprang up at the bases and behind the lines to supply the multifarious requirements in warlike stores and to minister to the comfort of the troops. New and strange units were formed for such tasks as salvage of derelict material, cleaning and disinfecting the clothing of soldiers from the trenches, camouflage, meteorological forecasts and the like. Out of the United States army of a little over 2,000,000 at the time of the Armistice, over 650,000 were employed on the communications; that is, for every two men in the front line there was one on the communications.

The composition and functions of the division, the army corps and the army underwent no greater changes than followed naturally from the stagnancy of the operations. Corps usually consisted of three, sometimes of four, divisions; and the tendency was to group the bulk of the artillery under corps control, giving the divisional artillery only a limited independence. On the whole it may be said that the organization conceived in peace stood the test of war well. The British, who had had no higher organization in peace than the division, adopted a corps organization immediately on taking the field in 1914. (A. P. W.)

ARMIES SINCE THE WORLD WAR, 1914-18

49. General Tendencies. — In addition to instruments of force, the opposing alliances in the World War, 1914–18, made full use of propaganda to enhance the morale at home, and to impair the morale of the opponent. Each side made a special effort, in domestic propaganda, to place the blame for the war on the other, and succeeded so far as its own people were concerned. The effect on the peoples of the defeated nations, especially the people of Germany, was the creation of a determination to find some method by which they could rearm and make a new bid for victory.

On the peoples of the victorious democracies — Great Britain, France and the United States — the effect was the creation of a belief that, with Germany beaten and disarmed, its military forces limited to a regular army of 100.000 serving a 12-year period, the chief menace to world peace had been rendered permanently impotent, and that there was no longer any necessity for maintaining strong military establishments. Confused idealists joined those who favoured peace at any price to spread a belief that there would never be another war, and that the maintenance of military establishments was a waste of the public funds. Politicians, sensing the trend of public opinion, gathered public support by promising to reduce military expenditures — and reductions were made until the defensive forces of Great Britain and the United States, based on voluntary enlistments, were close to the vanishing point. Those of France, supplied by conscription, were far below what realistic French patriots considered safe.

The United States and Great Britain reduced their regular armies until there were waiting lists of applicants for enlistment. Officer personnel was limited, and, with the exception of normal additions from military academies, the totals remained far below requirements. This public attitude in these two democracies had a softening effect on youth, with the result that the waiting list of prospective recruits vanished, and it became difficult to obtain enough voluntary enlistments to keep the regular armies even at the low strengths desired.

In France, the obligation of every male citizen to bear arms for the republic was universally recognized, but the pacifist trend created a steadily increasing reluctance on the part of the youth to perform their military service. and on the part of the people to approve expenditures for military purposes. French politicians vied with one another in obtaining as many exemptions as possible, in keeping the eligibles called to the colours as small a percentage of the total number as possible, and in demanding reductions in the length of the training period. The French Foreign Legion, a highly-trained volunteer force of professional soldiers, together with the native troops of the French colonies and such force as the relaxed conscription system provided, gave France a military establishment superior in numbers to that permitted her most probable opponent — Germany. Feeling safe in this preponderance of numbers, the French people regarded the gradual weakening of their army with equanimity.

French and British statesmen were not wholly in agreement with the generally accepted view of the perpetual character of the current peace, but feared that any political party which sponsored increased military expenditures would be driven from power. Popular reaction to occasional pleas for better national defence in France, Great Britain and the United States confirmed this fear. Those who made such pleas — some of them distinguished World War commanders — were denounced as war mongers. The peoples of the three great democracies had become so intolerant of the thought of war that they resented pleas for national defence as insulting insinuations that their belief war had been abolished forever was foolhardy. This popular attitude, however, prevailed only in the three great democracies, France, Great Britain and the United States.

Fascist Italy, as well as the independent nations set up by the Treaty of Versailles, established and maintained, by conscription, as powerful armies as they could afford. Their peoples were no more war-minded than those of the great democracies, but the majorities were strongly nationalistic and willing to fight to keep the "place in the sun" the Versailles Treaty had given them. Dictators ruling these small nations manipulated the national consciousness so as to maintain relatively large armies, on the plea that such organized forces enhanced the national prestige, as, in fact, they did. In 1936 the combined peace-time forces of Great Britain, France and the United States exceeded by only about 60,000 the combined peace-time forces of Rumania, Poland, Yugoslavia and Czechoslovakia, all of which existed only by grace of the Treaty of Versailles. The combined reserves of these four small powers was more than three times the combined reserves of the United States and Great Britain, and both Poland and Rumania had larger peace-time armies than either Great Britain or the United States. This military policy in the smaller Treaty nations was encouraged by French and British statesmen, fearful of the political consequences of an attempt to prepare their own countries for military action. They hoped it would provide security against Germany and Russia. They knew Germany was rearming in defiance of the Versailles Treaty but clung to the hope she would be unable to break out of the "iron ring" of small but highly militarized nations with which they sought to surround her. They also hoped that these and several other well-armed small nations would serve as buffers against Russia, which was arming on a grand scale and by 1936 had a peace-time army of 1,185,000, backed up by 14,540,000 trained reserves. In addition, Russia had a large air force, a generous supply of ordnance, and considerable motorized and mechanized transportation for arms and personnel. Its military efficiency, however, was not highly rated, and the potential power of the Germans worried the statesmen more than the Russian army in being.

In the meantime aviation and the machine age became serious factors in the development of the armament of armies. Some military leaders envisioned the far-reaching influence of these new developments on the weapons of warfare. Others denied the importance of these new developments and held to the view that the weapons of the last mar would suffice for future combat. In the democracies this latter view, plus the widespread aspirations for universal peace, were skilfully exploited by politicians to secure reduction of military expenditures.

An additional deterrent to military expenditures in the democracies was the increasing utilization of mechanical inventions for the purposes of war, and the rapidity nith which such devices were superseded by more effective ones. Military leaders hesitated to spend their scanty funds in quantity purchases of implements which were likely to become obsolescent before there was any emergency requiring their use. They mere likewise reluctant to experiment because as soon as discussion attracted attention

to a new weapon, popular imagination pictured it as removing the need for the old and tried military agencies. The appropriations for these were then reduced, without, however, any provision being made for equipping the national forces with the new arm. In the United States a controversy as to whether or not the aeroplane was the master of the battleship brought that nation's naval construction to a standstill for a number of years without giving appreciable impetus to a program for air development.

In the meantime Japan was arming to the limit of her resources in conformity to a military doctrine similar to that of Germany. This was an obvious menace to the Far Eastern interests of the Western democracies. But the prospect of a Japanese attack on the homelands of the democratic peoples appeared remote, so the rise of Japan to a dominant position as a military power in the Far East failed to stir the peace-loving peoples from their dreams of a warless world.

While the victorious democracies of the World War, 1914–18, were turning pacifist, the defeated Germans were devoting their energy and intelligence to evading the terms of the Versailles Treaty, and to discovering some method by which they could rearm without drawing upon themselves the restraining force of their conquerors. This was a phase of national policy on which the numerous political parties of the country agreed. Many schemes were developed for producing the forbidden materials of war and for creating the machinery for making them. The Disarmament Commission had effectively destroyed or removed German arms and armament after 1918. Relieved of the burden of large stocks of old equipment, Germany was free to develop the most modern machinery for war. German industrialists and scientists co-operated closely in fostering a peace-time industry so tooled that it could be switched to mass-production of war munitions without delay.

The problem of acquiring a trained reserve offered some difficulty. The peace treaty had fixed the enlistment period in Germany's limited regular army at 12 years, to prevent the creation of a trained reserve by rapidly turning over the man-power of Germany through the regular army for short training periods. This was one provision of the treaty the victors appeared determined to enforce. So the Germans made no attempt to evade it. The small army became, in fact, a large officer corps, trained for 12-year periods in the duty of command for a new German army.

Various political clubs organized athletic groups of all descriptions, recruited most of the country's able-bodied youth into them, and thorough basic military training was taught under the guise of physical culture. Such weapons as the regular army possessed mere borrowed by the clubs for training purposes, and training in weapons which Germany was forbidden to possess was given with wooden models, or commercial devices similar in method of operation to the military equipment. As these groups were being trained, a supply of weapons was being secretly accumulated, so that by the time the World War victors were sufficiently disturbed to contemplate action against Germany, the Germans had developed considerable military strength. Only determined and costly military action could have restrained Germany to the status provided for by the Treaty of Versailles. Statesmen who recognized the need for such action dared not take it, lest they be voted out of office by the pacifist elements. Germans, understanding perfectly why they were unmolested, increased the tempo of their rearmament.

When Adolf Hitler came to power, he shrewdly concluded that the stronger his military establishment became, the less danger there would be of interference by the French or British. He dropped all pretence of secrecy and frankly set out to restore Germany to the status of a first-class military power. Recognizing the superiority of his adversaries' resources, he realized that to win he would have to win quickly. Lacking formal military education, he was unhampered by any of the tactical doctrines which caused some professional military men to hesitate at adopting new and untried methods of war. He studied the devices made available by modern science with the idea of finding new tactical applications for machine-age materials, and of adopting new inventions to tactical procedures which had been successful before new weapons had made them dangerous or impossible.

Without adopting completely the Douhet theory of the use of the air arm alone on offensive missions, while the naval and ground forces remain on the defensive, Germany developed the use of the air arm in conjunction with offensive attack by all arms. The Douhet theory has not yet been universally accepted. nor have adequate tests been made to determine its true value. Minor approaches to the complete application of this theory were seen in Spain and in other limited areas, prior to Jan. 1, 1940. The German application of the use of the air arm in combination with other arms in offensive actions resulted in the initial aerial bombardment of fortified positions, lines of communication, supply depots and reserve centres of concentration

This use of the air arm preceded the actual advance of other arms and carried aerial bombardment to distant points in rear of the front lines. In addition, the Germans developed the use of the air arm in conjunction with mechanized attacks, and to accomplish the actual movement of the ground forces against an opponent.

For the disconcerting raid in the rear of slow-moving infantry by fast horse units, he substituted raids by parachute troops. To replace the decisive shock of heavy cavalry riding down massed infantry before the latter could reload their clumsy muzzle-loading muskets, he developed a combat team of fast tanks and hedge-hopping aeroplanes which could strike with lightning speed and terrific force and clear the way for his infantry. He developed intelligent and resourceful leaders, trained in the use of the machine on the field of battle, an essential requirement for complete success.

The effectiveness of this method was demonstrated by the speed with which German forces conquered Poland, Norway, Holland, Belgium and France. Its introduction marked a new era in the development of the art of war—the era of the Blitzkrieg—and the end of pacifist domination of the Western World for the time being.

The cultivation of fear and the creation of periods of intense apprehensior in the minds of probable victims of aggression are pre-combat techniques developed with surprising effectiveness as contributing factors of modern warfare. Fear of war and the uncertainty of when or where attacks might develop created a "war of nerves" or "white war," which exerted tremendous effect among the nations facing invasions. The under-cover encouragement of subversive activities within a rival state, the support given to treacherous individuals preaching the futility of defence, the spread of bribery among military and political officials and organizations—these as well as the actual destruction of essential physical structures, on or coincident with the opening of hostilities, have been associated with the modern practice of warfare.

Although history records the activities of many spies, saboteurs and traitors, the extent of operations and the complexity attending them have made modern practices prominent, as companion efforts in the conduct of war. Attacks designed to effect large-scale evacuation of densely populated areas, with the consequent congestion of highways by refugees, appear to be deliberate actions planned as impediments to the manoeuvres of enemy armed forces in the field of combat.

Conclusion.—The development of armies since 1918 indicates four principal characteristics:

(a). The armed forces of a nation represent only one element in the preparation for and conduct of warfare.

(b). The concept of a nation in arms includes intense training and continuous employment of all individuals toward the accomplishment of the national effort of warfare.

(c). The development of aviation, mechanized and motorized equipment with the consequent increase in fire power, has required greater national dependence upon industrial preparedness.

(d). The development of total warfare has introduced wider fronts, greater speed, more powerful action, and requires greater knowledge and positive control by the officers and men in the armed forces. (H. A. DR.)

Liddell Hart, *Paris: or the future of War* (1925), and *The Remaking of Modern Armies* (1927): League of Nations *Armaments Year Book* (Geneva, 1924, etc.).

The principal general military periodicals are: English, Royal United Service Institution, *Journal* (1857, etc.) and *The Army Quarterly* (1920, etc); American, *Infantry Journal;* Belgian, *Bulletin Belge des Sciences Militaires:* French, *Revue Militaire Française;* German, *Militar Wochenblatt;* Austrian, *Streffleurs,* with which was amalgamated the *Organ des Militär Wissenschaft Vereins.*

See also biographical headings and articles dealing with the separate arms, etc. *See* further the section *Defence* under different countries for an account of their armies. (X.)

THE FUTURE OF ARMIES

The Nation. — It remains true that force continues to be an essential element of the modern state. Organized force for the prosecution of war includes concepts which embody all citizens within the state, as well as organizations subject to state control. The continuation of political aims by warfare has developed in some nations intense application of the principle that the individual exists for the benefit of the state. Where the expanding benefits of civilization have been accepted as the result of the contrary principle — that the state exists for the benefit of the individual — there has been less intensity in the creation of a nation in arms. Dependent upon these contrary principles, governments have accepted or rejected the development of universal national organization for the prosecution of warfare.

In 1940, with warfare in progress in Western Europe and in the Far East, nations both large and small initiated or continued efforts to secure national aims by the employment of organized force. The success or the failure of these efforts remains in doubt as these words are written. The lines of opposition have been clearly established between the conflicting principles. The methods adopted have provided new forces for offensive action, and have raised doubts of the value of defensive action alone. The conflict of national policies, the rise of governments devoted to state-power, the present decline in importance of the individual within the state, the disruption of peaceful pursuits, the actual spread of warfare through the powerful nations of the world, leave the further development of armies in doubt as to the final form, but emphasize sharply certain basic essential requirements for armed forces.

The Army.—Primarily the armies of the world are dependent upon three essentials:

(a). National morale, which prompts the willing acceptance of the burdens of war, and inspires the fighting forces to meet the sacrifices of battle.

(b). A national industrial program for the production in large quantities of the modern weapons for warfare.

(c). The creation of maximum man-power trained, organized and equipped for modern combat.

The successful realization of the maximum effectiveness of an army is dependent upon the development of these three essentials. They are companion pieces in the framework of national security.

Advancement of one at the expense of the other will not promote national aims. The continuous advance of each is the only solution permitting an approach to the realization of national policy.

In the field of the employment of armies, the doctrine of the supremacy of the defensive appears to be a major obstacle in the successful accomplishment of national policy. Every individual in the armed forces of a nation must be imbued with the offensive spirit, in order to employ efficiently and effectively the aids of modern equipment. Modern weapons are of no value if the offensive spirit is lacking in the military personnel. Mechanized forces, aeroplanes, motorized equipment, automatic weapons, require new skills and greater specialization on the pert of military men. The conduct of warfare has broadened to include mechanical accomplishment as well as physical stamina and mental attitudes on

the field of battle. Armies may be equipped with the most modern machinery that science can devise, but the employment of these machines is measured by mental equipment, which can and must direct the conduct of battle.

The technique of modern warfare requires offensive spirit, adequate knowledge of modern equipment, complete co-ordination in the use of machines of war, and incredible speed in the delivery of decisive action at critical moments, to insure complete success.

A few basic requirements for the employment of modern equipment and war illustrate the problems which armies of the future face. In the air, supremacy must be obtained over the opponent at the initial stage of hostilities. This supremacy should be combined with continuous and close co-operation between air bombardment and the operation of ground forces. The use of aerial bombardment permits the approach and attack in force of ground elements, and provides opportunities to disrupt rear echelons back of the front lines. Mechanized forces, both heavy and light, closely followed by motorized troops and artillery, are required if the initial attack is to be successfully exploited. Large mechanized forces are required to deliver powerful blows against flanks, and to accomplish encirclement and effective disruption of enemy organizations. All elements of modern attack require increased speed of delivery, increased power in every attack, and continuous co-ordination of all arms, in order to accomplish the maximum result.

The realization of the modern technique in the conduct of warfare presupposes that every effort of the nation can be directed toward the accomplishment of adequate training with modern equipment in organizations designed for most efficient conduct of warfare on the field of battle.

Since the development of motors facilitating speedy movement of troops, and the adaptation of mechanized equipment, including the air arm, a popular assumption exists that the solution of most military campaigns rests upon rapid and wide troop movements. Encircling movements, raids against supply lines and distant objectives are of first consideration in support of this assumption. Such operations are important, and may at times have decisive influence, but eventually, before a final decision can be secured, a battle must be fought. Irrespective of speed during preliminary movements, an army will engage in a ground battle before securing a final decision. Rapid movement may secure the advantage of position, but cannot ensure decision without the conduct of a ground battle. Consequently training and organization of forces should be directed toward the conduct of battle. Without it, speed of movement will be of little avail. Strategy in warfare includes the disposition of large forces and remains the function of the higher commander. Tactics include the fighting of the battle, and are the function of every individual in the army. The tactics and technique of battle, particularly with modern equipment, are more difficult of accomplishment than speed of movement, and the direction of wide encircling movements. For these reasons the conduct of the battle is far more important than speed alone.

There are specific advantages in speed off the battlefield. It has its place in the art of war and is important. Yet there is nothing in the recent experience on European or Asiatic battlefields to give any indication that mobility off the battlefield can compensate for inefficiency in the conduct of a fight. The actual conduct of a battle, that is, the mechanism of battle, remains the only process through which a final decision may be secured.

The increased fire power and range of modern aviation and field artillery, coupled with the rapid movements of mechanized forces, require battle operations in great depth and width. The combined ground and air battle of the future will embrace an area of conflict equivalent, at least, to the range of light artillery. Decision will seldom be gained until the real area of light artillery is penetrated. Initial combats along the front will develop with a tendency to lack of co-ordination. Supporting artillery will be required to make frequent forward moves, with resultant losses of contact with infantry. Attack air units will be required to join in the fight and supplement artillery. Co-ordination of the attack by aviation, artillery, mechanized units, tanks and motorized infantry will be essential for the conduct of battle.

The use of air bombardment against sensitive points and populous areas to secure decisive results has not been adequately tested at present. The theory behind this use promotes the idea that such air bombardment, by the impairment of industrial production and by the weakening or destruction of the morale of the civilian population, will accomplish decisive results. It appears that such employment of the air arm results in serious effects, but against civilized and courageous people there is no indication that decisive results can be produced. The European War in 1939 and 1940 leaves this question open for future conclusion.

The great difficulty which all armies face is the preservation of the integrity of the fighting units and the maintenance of continuous effort to deliver decisive blows. Speed in combat is essential, both on and off the field of battle. Co-ordination of all arms in the delivery of the maximum fire power directed toward the accomplishment of definite objectives is the real basis for success.

In modern warfare the machine remains the servant of the trained soldier. Well-trained soldiers dominate mechanical equipment, and well-led forces correlate the use of modern arms. Only under these circumstances does the machine remain the means to victory and not the master of man-power. Modern warfare, a reflection of modern life, has made men acutely aware of the increased demands for intelligence, decision and control. The development of these traits requires training not only in the use of modern equipment, but in the art of leadership. The successful army of the future will accomplish the national goal under the leadership of commanders who can win and hold respect from alert, intelligent, adequately-trained, properly-equipped, aggressive soldiers, imbued with the dominant spirit of the offensive and the unshakable will to victory. (H. A. Dr.)

I. Armed Strength of Certain Selected Nations in 1900

Nation	Peace establishment	Militia and reserve forces	Total war strength
Germany	691,900	4,908,300	5,600,200

Gasset* (Nancy, 1919), with English trans. by Hilaire Belloc (1919). *See* also J. R. (ancien élève de l'école supérieure de guerre), *Foch, Essai de psychologie militaire* (1921); Émile Mayer, *La psychologie du commandement: Avec plusieurs lettres inédites du Mare'chal Foch* (1924); Ardant du Picq, *Études sur le conzbat*, Eng. trans. by J. F. C. Fuller, *The Reformation of War* (1c 3) and *The Foundations of a Science of War; C.* von der Goltz, *The Nation in Arms* (Eng. trans. *by* P. A. Ashworth, new ed. 1907).

ARMY-WORM (*Ciphis unipuncta* or *Leucania unipuncta* of the family *Noctuidae*) is a small striped green, and nearly naked, caterpillar, found chiefly in the United States and Canada east of the Rocky Mountains, but also in New Mexico, Arizona, California and in some parts of South America. From time to time it becomes enormously destructive to growing cereals and sometimes to forage crops. The fully developed parent of the army-worm is a moth measuring about $1\frac{1}{2}$ in. across the expanded wings, brownish-gray in colour, and having a single small white spot near the centre of the front pair of wings. This moth lays its eggs on the under side of blades of grass, or grass-like grain, preferring marshes and low spots. There the worms hatch and grow rapidly. The greed and capacity of the full grown worm for food is most remarkable. When an army is at work in a field the champing of the jaws may be plainly heard as they devour every tender green blade in sight. When the worms have exhausted the food in the vicinity of their breeding place, they mass together and march (hence the name army-worm) in search of new fields. It is usually in this stage that they are first discovered.

If noticed in their younger stages the army-worm may be destroyed by burning the infested spot or by spraying heavily with a mixture of Paris green in the ratio of 1 lb. to 50 gal. of water. Spraying poison in their line of march is also useful but a more certain method is to plow around the infested area, throwing the earth toward the army so that the worms will have difficulty climbing the opposite and perpendicular side of the furrow and will crawl along the bottom instead. Here they may be destroyed by crushing, or by digging post holes about every 20 ft. in the furrow bottom, into which they will fall. Crude coal oil or petroleum can then be poured into the post hole.

See A. Gibson, "The Army-worm" (Dominion of Canada, Dept. of Agri., Entomological Branch, *Bulletin No. 9*, 1915); W. R. Walton, "The True Army Worm and its Control" (U.S. Dept. of Agri., *Farmers' Bulletin No. 731*, 1916); H. H. Knight, "The Army-worm in New York" (Cornell Agri. Exp. Sta., *Bulletin* No. 376, 1916); H. T. Fernald, "The Army-worm" (Mass. Bd. of Agri., *62nd Ann. Rept.*, 1915).

ARNAL, ÉTIENNE (1794–1872), French comedian, was born at Meulan, Seine-et-Oise, on Feb. 1, 1794. After serving in the army, and working in a button factory, he took to the stage. His first appearance (1817) was in tragedy, and for some time he was unsuccessful; it was not until 1827 that he showed his real ability in comedy parts, especially in plays by Félix August Davert (1795–1876) and Augustin Théodore Lauzanne (1805–77), whose *Cabinets particuliers* (1832), *Le Mari de la dame de choeurs* (1837), *Passe' minuet, L'Homme blase'* (1843), *La Clef dans le dos* (1848), etc., contained parts written for him. He was 20 years in vaudeville, and completed at the various Parisian theatres a stage career of nearly half a century, retiring in 1863. He was also a charming poet, the author of *Epître à bouffe* (1840); *Les Gendarmes* (1826); *Les Acteurs et les Prêtres* (1831); and *Boutades en vers* (1861). He died in Geneva in 1872.

ARNALDUS DE VILLA NOVA, also called *Arnaldus de Villanueva, Arnaldus Villanovanus* or *Arnaud de Villeneuve* (*c.* 1235–1313), alchemist, astrologer and physician, appears to have been of Spanish origin, and to have studied chemistry, medicine, physics, and also Arabian philosophy. After having lived at the court of Aragon, he went to Paris, where he gained a considerable reputation; but he incurred the enmity of the ecclesiastics and was forced to flee, finally finding an asylum in Sicily. About 1313 he was summoned to Avignon by Pope Clement V., who was ill, but he died on the voyage. Many alchemical writings, including *Thesaurus Thesazrrorum* or *Rosarius Philosophorum, Novum Lumen. Flos Florum,* and *Speculum Alchimiae,* are ascribed to him, but they are of very doubtful authenticity.

Collected editions of them were published at Lyons in 1504 and 1532 (with a biography of Symphorianus Campegius), at Basel in 1585, at Frankfort in 1603, and at Lyons in 1686. He is also reputed author of medical works including *Breviarum Practicae.*

See J. *B.* Hauréau in the *Histoire littéraire de la France* (1881), vol. xxviii.; E. Lalande, *Arnaud de Villeneuve, sa vie et ses oeuvres* (1896). A list of writing is given by J. Ferguson in his *Bibliotheca Chemica* (1906). *See* also U. Chevalier, *Répertoire des sources kist., etc., Bio-bibliographie* (1903).

ARNAUD, HENRI (1641–1721), pastor and general of the Vaudois or Waldensians of Piedmont, was born at Embrun. About 1650 his family returned to their native valley of Luserna, where Arnaud was educated at La Tour (the chief village), later visiting the college at Basel (1662 and 1668) and the academy at Geneva (1666). He then returned home, and seems to have been pastor in several of the Vaudois valleys before attaining that position at La Tour (1685). He was thus the natural leader of his co-religionists after Victor Amadeus expelled them (1686) from their valleys. William of Orange gave him help and money.

Arnaud occupied himself with organizing his 3,000 countrymen who had taken refuge in Switzerland, and who twice (1687–88) attempted to regain their homes. The English revolution of 1688, and the election of William to the throne, encouraged the Vaudois to make yet another attempt. Furnished with detailed instructions from the veteran Josué Janavel (prevented by age from taking part in the expedition) Arnaud with about 1,000 followers started (Aug. 17 1689) from near Nyon on the Lake of Geneva for the glorieuse rentre'e. On Aug. 27 the valiant band after many hardships and dangers reached the Valley of St. Martin, having passed by Sallanches and crossed the Col de Very (6,506 ft.), the Enclave de la Fenêtre (7,425 ft.), the Col du Bonhomme (8,147 ft.), the Col du Mont Iseran (9,085 ft.), the Grand Mont Cenis (6,893 ft.), the Petit Mont Cenis (7,166 ft.), the Col de Clapier (8,173 ft.), the Col de Côteplane (7,589 ft.), and the Col du Piz (8,550 ft.). They soon took refuge in the lofty and secure rocky citadel of the Balsille, where they were besieged (Oct. 24 1689 to May 14 1690) by the troops (about 4,000 in number) of the king of France and the duke of Savoy. They maintained this natural fortress against many fierce attacks and during the whole of a winter. In particular, on May 2, one assault was defeated without the loss of a single man of Arnaud's small band But another attack (May 14) was not so successful, so that Arnaud withdrew his force under cover of a thick mist and led them over the hills to the valley of Angrogna, above La Tour.

A month later the Vaudois were received into favour by the duke of Savoy, who had then abandoned his alliance with France for one with Great Britain and Holland. Hence for the next six years the Vaudois helped Savoy against France, though suffering much from the repeated attacks of the French troops. But by a clause in the treaty of peace of 1696, made public in 1698, Victor Amadeus again became hostile to the Vaudois, about 3,000 of whom, with Arnaud, found shelter in Protestant countries, mainly in Württemberg, where Arnaud became the pastor of Durrmenz-Schonenberg, N. W. of Stuttgart (1699).

Once again (1704–06) the Vaudois aided the duke against France. Arnaud, however, took no part in the military operations, though he visited England (1707) to obtain pecuniary aid from Queen Anne. He died at Schonenberg (which was the church hamlet of the parish of Durrmenz) in 1721. During his retirement he compiled from various documents by other hands his *Histoire* de la *glorieuse rentrée* des Vaudois dans leurs *vallées,* which was published (probably at Cassel) in 1710, with a dedication to Queen Anne. It was translated into English (1827) by H. Dyke Acland, and has also appeared in German and Dutch versions. A part of the original ms. is preserved in the Royal Library in Berlin.

See K. H. Klaiber, *Henri Arnaud, ein Lebensbild* (Stuttgart, *1880)*; A. de Rochas d'Aiglun, Les *Vallées vaudoises* (1881); various chapters in the *Bulletin du bicentenaire de la glorieuse rentrée* (Turin, 1889).

(W. A. B. C.)

ARNAULD, the surname of a family of prominent French lawyers, chiefly remembered in connection with the Jansenist troubles of the 17th century. At their head was ANTOINE ARNAULD (1560–1619), a leader of the Paris bar; in this capacity he delivered a famous philippic against the Jesuits in 1594, accusing them of gross disloyalty to the newly converted Henry IV. This speech was afterwards known as the original sin of the Arnaulds.

Of his 20 children several grew up to fight the Jesuits on more important matters. Five gave themselves up wholly to the Church HENRI ARNAULD (1597–1692), the second son, became bishop of Angers in 1649 and represented Jansenism on the episcopal Bench for as long as 43 years. The youngest son, ANTOINE, (1612–1694), was the most famous of Jansenist theologians (see below). The second daughter, ANGÉLIQUE (1591–1661), was abbess and reformer of Port Royal; here she was presently joined by her sister AGNES (1593–1671) and two younger sisters, both of whom died early.

Only two of Antoine's children married—ROBERT ARNAULD D'ANDILLY (1588–1674), the eldest son, and CATHERINE LEMAISTRE (1590–1651), the eldest daughter. But both of these ended their lives under the shadow of the abbey. Andilly's five daughters all took the veil there; the second, ANGÉLIQUE DE ST. JEAN ARNAULD D'ANDILLY (1624–1684) rose to be abbess, was a writer of no mean repute, and one of the most remarkable figures of the second generation of Jansenists. One of Andilly's sons became a hermit at Port Royal; the eldest, ANTOINE (1615–1699), was first a soldier, afterwards a priest. As the Abbé Arnauld, he survives as author of some interesting *Memoirs* of his time. The second son, SIMON ARNAULD DE POMPONNE (1616–1699), early entered public life. After holding various embassies, he rose to be foreign secretary to Louis XIV. and was created Marquis de Pomponne. Lastly Madame Lemaistre and two of her sons became identified with Port Royal. On her husband's death she took the veil there. Her eldest son, ANTOINE LEMAISTRE (1608–1658), became the first of the solitaires, or hermits, of Port Royal. There he was joined by his younger brother, ISAAC LEMAISTRE DE SACI (1613–1684), who took holy orders and became confessor to the hermits.

The Arnaulds' connection with Port Royal (*q.v.*)—a convent of Cistercian nuns in the neighbourhood of Versailles—dated back to 1599, when the original Antoine secured the abbess's chair for his daughter Angélique, then a child of eight. About 1608 she started to reform her convent in the direction of its original Rule; but about 1623 she made the acquaintance of du Vergier (*q.v.*) and thenceforward began to move in a Jansenist direction. Her later history is entirely bound up with the fortunes of that revival. Angélique's strength lay chiefly in her character. Her sister and collaborator, Agnes, was also a graceful writer; and her Letters, edited by Prosper Feugère (1858), throw most valuable light on the inner aims and aspirations of the Jansenist movement. The first relation to join their projects of reform was their nephew, Antoine Lemaistre, who threw up brilliant prospects at the bar to settle down at the Abbey gates (1638). Here he was joined by his brother, de Saci and other hermits, who led an austere semi-monastic existence, though without taking any formal vow. In 1646 they were joined by their uncle, Arnauld d'Andilly, hitherto a personage of some importance at court and in the world; he was a special favourite of the queen regent, Anne of Austria, and had held various offices of dignity in the government. Uncle and nephews passed their time partly in ascetic exercises—though Andilly never pretended to vie in austerity with the younger men—partly in managing the convent estates, and partly in translating religious classics. Andilly put Josephus, St. Augustine's Confessions, and many other works into singularly delicate French. Lemaistre attacked the lives of the saints; in 1654 Saci set to work on a translation of the Bible. His labours were interrupted by the outbreak of persecution. In 1661 he was forced to go into hiding; in 1666 he was arrested, thrown into the Bastille, and kept there more than two years. Meanwhile his friends printed his translation of the New Testament—really in Holland, nominally at Mons in the Spanish Netherlands (1667). Hence it is usually known as the *Nouveau Testament* de Mons. It found enthusiastic friends and violent detractors. Bossuet approved its orthodoxy, but not its over-elaborate style; and it was destructively criticized by Richard Simon, the founder of Biblical criticism in France. On the other hand it undoubtedly did much to popularize the Bible, and was bitterly attacked by the Jesuits on that ground.

By far the most distinguished of the family, however, was Antoine—*le* grand Arnauld, as contemporaries called him—the 20th and youngest child of the original Antoine. Born in 1612,

he was originally intended for the bar; but decided instead to study theology at the Sorbonne. Here he was brilliantly successful and was on the high-road to preferment, when he came under the influence of du Vergier and was drawn in the direction of Jansenism. His book, *De la fréquente Communion* (1643), did more than anything else to make the aims and ideals of this movement intelligible to the general public. Its appearance raised a violent storm, and Arnauld eventually withdrew into hiding; for more than 20 years he dared not make a public appearance in Paris. During all that time his pen was busy with innumerable Jansenist pamphlets. In 1655 two very outspoken *Lettres à un duc et pair* on Jesuit methods in the confessional brought on a motion to expel him from the Sorbonne. This motion was the immediate cause of Pascal's *Provincial Letters*. Pascal, however, failed to save his friend; in Feb. 1656 Arnauld was solemnly degraded. Twelve years later the tide of fortune turned. The so-called peace of Clement IX. put an end to persecution. Arnauld emerged from his retirement, was most graciously received by Louis XIV., and treated almost as a popular hero. He then set to work with Nicole (*q.v.*) on a great work against the Calvinists: *La Perpétuité de la foi catholique touchant l'eucharistie*. Ten years later, however, another storm of persecution burst. Arnauld was compelled to fly from France and take refuge in the Netherlands, finally settling down at Brussels, There the last 16 years of his life were spent in incessant controversy with Jesuits, Calvinists, and opponents of all kinds; there he died on Aug. 8, 1694. His inexhaustible energy is best expressed by his famous reply to Nicole, who complained of feeling tired. "Tired!" echoed Arnauld, "when you have all eternity to rest in?"

Nor was this energy by any means absorbed by purely theological questions. He was one of the first to adopt the philosophy of Descartes, though with certain orthodox reservations; and between 1683 and 1685 he had a long battle with Malebranche on the relation of theology to metaphysics. On the whole, public opinion leant to Arnauld's side. When Malebranche complained that his adversary had misunderstood him, Boileau silenced him with the question: "My dear sir, whom do you expect to understand you, if M. Arnauld does not?" And popular regard for Arnauld's penetration was much increased by his *Art de penser*, commonly known as the *Port-Royal Logic*, which has kept its place as an elementary text-book until quite modern times.

But a purely controversial writer is seldom attractive to posterity. It is to be feared that, but for his connection with Pascal, Arnauld's name would be almost forgotten — or, at most, live only in the famous epitaph Boileau consecrated to his memory—

> Au pied de cet autel de structure grossière
> Git sans pompe, enfermé dans une vile bière
> Le plus savant mortel qui jamais ait écrit.

Full details as to the lives and writings of the Arnaulds will be found in various books mentioned at the close of the article on Port Royal. The most interesting account of Angélique will be found in *Mémoires pour servir à l'histoire de Port Royal* (Utrecht, 1742). Three volumes of her correspondence were also published at the same time and place. There 'are excellent modern lives of her in English by Miss Frances Martin (*Angélique Arnauld*, 1873) and by A. K. H. (*Angélique of Port Royal*, 1905). Antoine Arnauld's complete works were published in 1775–81. No modern biography of him exists; but there is a study of his philosophy in Bouillier, *Histoire de* la *philosophie cartésienne* (1868); and his mathematical achievements are discussed by Dr. Bopp in the 14th volume of *Abhandlungen zur Geschichte der mathematis-hen Wissenschaften* (Leipzig, 1902.) The memoirs of Arnauld d'Andilly and of his son, the abbé Arnauld, are reprinted both in Petitot's and Poujoulat's collections of memoirs illustrative of the 17th century.

ARNAULT, ANTOINE-VINCENT (1766–1834), French dramatist, was born in Paris. His first play, *Marius à Minturnes* (1791), immediately established his reputation. A year later he followed up his first success with a second republican tragedy, *Lucrèce*. He was commissioned by Bonaparte in 1797 to reorganize the Ionian islands, and was nominated to the Institute and made secretary general of the university. He was faithful to his patron through his misfortunes, and after the Hundred Days remained in exile until 1819. His tragedies are perhaps less known now than his *Fables* (1813, 1815 and 1826), which are written in very graceful verse. Arnault collaborated in a *Vie politique et militaire de Napoléon* (1822), and wrote some interesting *Souvenirs d'un sexagénaire* (1833), which contain much out-of-the-way information about the history of the years previous to 1804.

His eldest son, ÉMILIEN LUCIEN (1787–1863), wrote several tragedies, the leading rôles in which were interpreted by Talma. *See* Sainte-Beuve, *Causeries du lundi*, vol. vii. Arnault's *Oeuvres complètes* were published at The Hague and Paris in 1818–19.

ARNDT, ERNST MORITZ (1769–1860), German poet and patriot, was born on Dec. 26, 1769, at Schoritz in the island of Rügen, which at that time belonged to Sweden. He was educated at Stralsund, Greifswald, and Jena, and qualified for the Lutheran ministry. At the age of 28 he renounced the ministry, and for 18 months he led a wandering life, visiting Austria, Hungary, Italy, France, and Belgium. Returning homewards up the Rhine, he was moved by the sight of the ruined castles along its banks to intense bitterness against France. The impressions of this journey he later described in *Reisen durch einen Theil Deutschlands, Ungarns, Italiens, und Frankreichs in den Jahren 1798 und 1799* (1802–04). In 1800 he settled in Greifswald as *Privatdozent* in history, and the same year published *Über die Freiheit der alten Republiken*. In 1803 appeared *Germanien und Europa*, "a fragmentary ebullition," as he himself called it, of his views on the French aggression. This was followed by one of the most remarkable of his books, *Versuch einer Geschichte der Leibeigenschaft in Pommern und Rügen* (1803), a history of serfdom in Pomerania and Riigen, which was so convincing an indictment that King Gustavus Adolphus IV. in 1806 abolished the evil. In 1806 Arndt was appointed to the chair of history at the university. In this year he published the first part of his *Geist der Zeit*, in which he flung down the gauntlet to Napoleon and called on his countrymen to rise and shake off the French yoke. So great was the excitement it produced that Arndt was compelled to take refuge in Sweden to escape the vengeance of Napoleon. In pamphlets, poems, and songs he communicated his enthusiasm to his countrymen. Schill's heroic death at Stralsund impelled him to return to Germany and, under the disguise of "Almann, teacher of languages," he reached Berlin in December 1809. In 1810 he returned to Greifswald, but only for a few months. He again set out on his adventurous travels, lived in close contact with the first men of his time, such as Blucher, Gneisenau, and Stein, and in 1812 mas summoned by the last named to St. Petersburg to assist in the organization of the final struggle against France. Meanwhile,' pamphlet after pamphlet, full of bitter hatred of the French oppressor, came from his pen, and his stirring patriotic songs, such as *Was ist das deutsche Vaterland? Der Gott, der Eisen wachsen liess*, and *Was blasen die Trompeten?* were on all lips. When, after the peace, the university of Bonn was founded in 1818, Arndt was appointed to the chair of modern history. In this year appeared the fourth part of his *Geist der Zeit*, in which he criticized the reactionary policy of the German powers. The boldness of his demands for reform offended the Prussian government, and in the summer of 1819 he was arrested and his papers confiscated. Although speedily liberated, he was in the following year arraigned before a specially constituted tribunal. Although not found guilty, he was forbidden to exercise the functions of his professorship, but was allowed to retain the stipend. The next 20 years he passed in retirement and literary activity. In 1840 he was reinstated in his professorship, and in 1841 was chosen rector of the university. The revolutionary outbreak of 1848 rekindled in the venerable patriot his old hopes and energies, and he took his seat as one of the deputies to the National Assembly at Frankfort. He formed one of the deputation that offered the imperial crown to Frederick William IV., and indignant at the king's refusal to accept it, he retired with the majority of von Gagern's adherents from public life. He died at Bonn on Jan. 29, 1860.

Arndt's untiring labour for his country rightly won for him the title of "the most German of all Germans." His lyric poems are not, however, all confined to politics. Many among the Gedichte (1803–18; complete edition, 1860) are religious pieces of great beauty. Among

his other works are *Reise durch Schweden* (1797); *Nebenstunden, eine Beschretbung und Geschichte der schottländischen Inseln und der Orkaden* (1820); *Die Frage über die Niederlande* (1831); *Erinnerungen aus dem ausseren Leben,* an autobiography, and the most valuable source of information for Arndt's life (1840); *Rhein- und Ahrwanderungen* (1846); *Wanderungen und Wandlungen mit dem Reichsfreiherrn von Stein* (1858) and *Pro populo Germanico* (1854), which was originally intended to form the fifth part of the *Geist der Zeit.* Arndt's *Werke* have been edited by H. Rosch and H. Meisner in 8 vols. (not complete) (1892–98). Biographies have been written by E. Langenberg (1869) and Wilhelm Baur, 5th ed. (1882). *See* also H. Meisner and R. Geerds, *E. M. Arndt, ein Lebensbild in Briefen* (1898), and *R.* Thiele, *E. M. Arndt* (1894). There are monuments to his memory at Schoritz, his birthplace, and at Bonn, where he is buried.

ARNDT, JOHANN (1555–1621), German Lutheran theologian, was born at Ballenstadt, in Anhalt, and studied in several universities. He was at Helmstadt in 1576; at Wittenberg in 1577. At Wittenberg the crypto-Calvinist controversy was then at its height, and he took the side of Melanchthon and the crypto-Calvinists. He became pastor of Badeborn in 1583, but in 1590 he was deposed for refusing to remove the pictures from his church and discontinue the use of exorcism in baptism. He found an asylum in Quedlinburg (1590), and afterwards was transferred to St. Martin's church at Brunswick (1599).

Arndt's fame rests on his writings. These were mainly of a mystical and devotional kind, and were inspired by St. Bernard, J. Tauler, and Thomas à Kempis. His principal work, *Wahres Christentum* (1606–09), which has been translated into most European languages, has served as the foundation of many books of devotion, both Roman Catholic and Protestant. After *Wahres Christentum,* his best known work is *Paradiesgärtlein aller christlichen Tugenden,* which was published in 1612. Arndt has always been held in very high repute by the German Pietists.

A collected edition of his works was published in Leipzig and Gorlitz in 1734. A valuable account of Arndt is to be found in C. Aschmann's *Essai sur* la *vie, etc., de J. Arndt. See* further, Herzog-Hauck, *Realencyklopiidie.*

ARNE, THOMAS AUGUSTINE (1710–1778), English composer, was born in London, being the son of an upholsterer. Intended for the legal profession, he was educated at Eton, and afterwards apprenticed to an attorney for three years. His natural inclination for music, however, proved irresistible, and his father, after strongly opposing his wishes for a time, eventually provided the means for his training. On March 7, 1733, he produced his first work at Lincoln's Inn Fields Theatre, a setting of Addison's *Rosamond,* the heroine's part being performed by his sister, Susannah Maria, who afterwards became celebrated as Mrs. Cibber. This, proving a success, was immediately followed by a burletta, entitled *The Opera of Operas,* based on Fielding's *Tragedy of Tragedies.* The part of Tom Thumb was played by Arne's younger brother, and the opera was produced at the Haymarket Theatre. On Dec. 19, 1733, Arne produced at the same theatre the masque *Dido and Aeneas,* a subject which Purcell had treatedmore than half a century earlier in such amemorable fashion.

Arne's individuality of style first distinctly asserted itself in the music to Dr. Dalton's adaptation of Milton's *Comus,* which was performed at Drury Lane in 1738, and speedily established his reputation. In 1740 he wrote the music for Thomson and Mallet's *Masque of Alfred,* which, if otherwise unnoteworthy, will always be remembered as containing *Rule, Britannia!* In 1740 he also wrote his beautiful settings of the songs *Under the greenwood tree, Blow, blow, thou winter wind* and *When daisies pied,* for a performance of Shakespeare's *As you like it.*

Four years before this, in 1736, he had married Cecilia, the eldest daughter of Charles Young, organist of All Hallows, Barking. She was considered the finest English singer of the day and was frequently engaged by Handel for his performances. In 1742 Arne went with his wife to Dublin, where he remained two years and produced his oratorio *Abel,* containing the beautiful melody known as the *Hymn of Eve,* and the operas *Britannia, Eliza* and *Comus,* and where *he* also gave a number of successful concerts. On his return to London he was engaged as leader of the band at Drury Lane Theatre (1744), and as composer at Vauxhall (1745).

In 1745 he composed his successful pastoral dialogue, *Colin and Phoebe,* and in 1746, in connection with a revival of Shakespeare's *Tempest* at Drury Lane, one of the most delightful of his songs, *Where the bee sucks.* In 1760 he transferred his services to Covent Garden Theatre, where, Nov. 28, he produced his *Thomas and Sally.* Here, too, Feb. 2, 1762, he produced his *Artaxerxes,* an opera in the Italian style with recitative instead of spoken dialogue, the popularity of which is attested by the fact that it continued to be performed at intervals for upwards of 80 years. The libretto, by Arne himself, was a very poor translation of Metastasio's *Artaserse* In 1762 also was produced the ballad-opera *Love in a Village* His oratorio *Judith,* of which the first performance was Feb. 27, 1761, at Drury Lane, was revived at the Chapel of the Lock Hospital, Pimlico, Feb. 29, 1764, in which year was also performed his setting of Metastasio's *Olimpiade* in the original language at the King's Theatre in the Haymarket. At a later performance of *Judith* at Covent Garden Theatre Feb. 26, 1773, Arne for the first time introduced female voices into oratorio choruses. In 1769 he wrote the musical parts for Garrick's ode for the Shakespeare jubilee at Stratford-on-Avon, and in 1770 he gave a mutilated version of Purcell's *King Arthur.* One of his last dramatic works was the music to Mason's *Caractacus,* published in 1775. Dr. Arne died March 5, 1778, and was buried at St. Paul's, Covent Garden.

Though not to be reckoned the equal of his great predecessor Purcell, Arne has none the less high claims. There is true inspiration in such airs as *Blow, blow, thou winter wind,* and *Where the bee sucks,* while *Rule, Britannia!* will last, it is hardly too much to say, as long as the English language. If as a writer of glees Arne does not take such high rank, he deserves notice as a leader in the revival of that peculiarly English form of composition. It may be added that he was author as well as composer of *The Guardian Outwitted, The Rose, The Contest of Beauty and Virtue,* and *Phoebe at Court.*

See the article *in* Grove's *Dictionary* and two interesting papers in the *Musical Times,* Nov. and Dec. 1901.

ARNETH, ALFRED, RITTER VON (1819–1897), Austrian historian, born in Vienna on July 10, 1819, was the son of Joseph Calasanza von Arneth (1791–1863), an historian and archaeologist, who wrote a history of the Austrian empire (Vienna, 1827) and several works on numismatics. Alfred Arneth studied law and became an official of the Austrian State archives, of which in 1868 he was appointed keeper In 1879 he was appointed president of the *Kaiserliche Akademie der Wissenschaften* (Academy of Sciences) in Vienna, and in 1896 succeeded von Sybel as Chairman of the historical commission at Munich. He died July 30, 1897. Arneth was an indefatigable worker, and his scientific temper and the special facilities which he enjoyed for drawing from original sources gave to his numerous historical works a special value.

Among his publications may be mentioned: *Leben des Feldmarschalls Grafen Guido Starhemberg* (1863); *Prinz Eugen von Savoyen (ibid,,* 1864); *Gesch. der Maria Theresa (ibid.,* 1863–79); *Mario Theresa u. Marie Antoinette, ikr Briefwechsel (ibid.,* 1866); *Marie Antoinette, Joseph II. und Leopold II., ihr Briefwechsel* (1866); *Maria Theresa und Joseph II., ihre Korrespondenz samt Briefen Josephs an seinen Bruder Leopold* (1867); *Beaumarchais und Sonnenfels* (1868); *Joseph II. und Katharina von Russland, ihr Briefwechsel* (1869); *Johann Christian Barthenstein und seine Zeit* (1871); *Joseph II. und Leopold von Toskana, ihr Briefwechsel* (1872); *Briefe der Kaiserin Maria Theresa an ihre Kinder und Freunde* (1881); *Marie Antoinette: Correspondance secrbte entre Marie-Thérèse et le comte de Mercy-Argenteau* (1874), in collaboration with Auguste Geffroy; *Graf Philipp Cobenzl und seine Memoiren* (1885); *Correspondance secrète du comte de Mercy-Argenteau avec l'empereur Joseph II. et Kaunite* (1889–91), in collaboration with Jules Flammermont; *Anton Ritter von Schmerling. Episoden aus seinem Leben 1835, 1848–49* (1895); *Johann Freiherr von Wessenberg, ein osterreichischer Staatsmann des 19. Jahrh.* (1898). Arneth also published in 1893 two volumes of early reminiscences under the title of *Aus meinem Leben.*

ARNHEM, capital, province of Gelderland, the Netherlands, on the right bank of the Rhine (here crossed by a pontoon bridge), and a junction 35 mi. by rail east-southeast of Utrecht. Pop. (1939) 88,997. Tramways connect with Zutphen and Utrecht, and there is a regular service of steamers to Cologne, Amsterdam, Nijmwegen. Tiel, 's Hertogenbosch and Rotterdam.

Arnhem is beautifully situated. It was known in the Middle Ages as *Arnoldi Villa* and may be the *Arenacum* of the Romans. It is first mentioned in 893. In 1233 Otto II, count of Gelder, resided there and conferred municipal rights on the town, and fortified it. Later it entered the Hanseatic league. Charles the Bold of Burgundy captured it in 1473 and Philip, son of Maximilian I, gave it coining rights in 1505. In 1514 Charles of Egmont, duke of Gelder, took it from 'the Spaniards; but in 1543 it fell to the emperor Charles V, who made it the seat of the council of Gelderland. It joined the union of Utrecht in 1579, and came finally under the states general in 1585. In 1586 Sir Philip Sidney died in the town. The French took it in 1672, but left it dismantled in 1674 It was refortified by Coehoorn, in the 18th century. In 1795 it was again stormed by the French and in 1813 was taken from them by the Pmssians. Gardens and promenades have taken the place of the old ramparts. The Groote kerk of St. Eusebius has a chime of forty-five bells. The Roman Catholic church of St. Walburgis is of earlier date, and a new Roman Catholic church dates from 1894. The town hall was built as a palace in the 15th century, and converted to its present use in 1830. The provincial government house occupies the site of the former palace of the dukes of Gelder. Arnhem is an important market centre. It is the seat of a court. Two miles away are the fine residential suburbs of Velp and Oosterbeek. Three miles from the city is the famous castle of Middachten (13th century property of Count van Aldenburg Bentinck). The surrounding woods and parks are considered the finest in Holland. There are several national parks.

ARNICA, a genus of plants belonging to the family Compositae, and containing 50 species, mostly north-west American, of which the most important is *Arnica montana*, a perennial herb of the mountains and uplands in northern and central Europe. The root-stock of *A. montana* is tough, slender, of a dark brown colour and an inch or two in length. It gives off numerous simple roots from its under side, and shows on its upper side the remains of rosettes of leaves. It yields an essential oil in small quantity, and a resinous matter called arnicin ($C_{12}H_{22}O_2$), a yellow crystalline substance with an acrid taste. The tincture prepared from it has a popular reputation in the treatment of bruises and sprains.

Typical of the various far northern species is *A. angustifolia*, with very narrow leaves, occurring in Arctic Asia and America. The heads of flowers are 2 to $2\frac{1}{2}$ in. across, orange-yellow in colour, and borne on the summit of the stem or branches; the outer ray-flowers are an inch in length. The fruit is brown and hairy, and crowned by a tuft of stiffish hairs. The plant was introduced into England in the 18th century.

In North America arnicas are most numerous in the Rocky Mountain region from Colorado northward but there are also many in the Sierra Nevada and Cascade ranges. Conspicuous species may be observed in Rocky Mountain, Glacier, Yosemite, Mount Rainier and other national parks of the western United States and Canada. Four arnicas occur in the northeastern United States and adjacent Canada, mostly on the higher mountains.

ARNIM, ELISABETH (BETTINA) VON (1785–1859), German authoress, sister of Klemens Brentano, and daughter of the Maximiliane Brentano, who had been one of the intimates of Goethe's youth, was born at Frankfort-on-Main on April 4, 1785. From Goethe's mother Bettina had heard stories of the poet's childhood, and she was an ardent admirer of his works and had corresponded with him before she met him in Weimar in 1807. In that year she paid two visits to Weimar, and poured out her enthusiasm and devotion at Goethe's feet. He was delighted with her gaiety and elfin charm, though her demonstrations of affection often wearied him, and she bitterly complained of his coldness. In 1811 she married Ludwig Achim von Arnim, and in that year again visited Goethe. But a violent scene with Christiane, Goethe's wife, put an end to the long standing affection between the poet and Bettina, and Goethe forbade her the house. In 1831 von Arnim died, and in 1835 Bettina published *Goethes Briefwechsel mit einem Kinde*. For years it was regarded as purely fictitious, but the publication of G. von Loeper's *Briefe Goethes an Sophie Laroche und Bettina Brentano, nebst dichterischen Beilagen* (1879) proved that the *Briefwechsel* was based on authentic material. But the whole is treated in a romantic and fantastic spirit. Possibly Bettina herself had so woven the real story into her dreams that she could no longer disentangle truth from fantasy. Equally fantastic is her correspondence *Die Günderode* (1840), with her unhappy friend, the poet, Karoline von Gunderode (1780–1806), who committed suicide, and that with her brother Klemens Brentano, under the title *Klemens Brentanos Frühlingskranz* (1844). She died at Berlin on Jan. 20, 1859.

Part of a design by her for a colossal statue of Goethe, executed in marble by the sculptor Karl Steinhauser (1813–78), is in the museum at Weimar.

Her collected works (*Sämtliche Schriften)* were published in Berlin in 1853. *Goethes Briefwechsel mit einem Kinde* was edited by H. Grimm (4th ed., 1890).

See also *C.* Alberti, B. *von Arninz* (Leipzig, 1885); Moritz Carriere, *Bettina von Arnim* (Breslau, 1887); *Briefe von und an Joseph Joachzm* (1911; Eng. trans. 1914); and the literature cited under Ludwig von Arnim.

ARNIM, HARRY KARL KURT EDUARD VON, COUNT (1824–81), German diplomatist, was born in Pomerania, Oct. 3, 1824, and brought up by his uncle Heinrich von Arnim, who was Prussian ambassador at Paris and foreign minister from March to June 1848. After holding other posts in the diplomatic service Arnim was in 1864 appointed Prussian envoy (and in 1867 envoy of the North German Confederation) at the papal court. In 1869 he proposed that the Governments should appoint representatives to be present at the Vatican council, a suggestion which was rejected by Bismarck, and foretold that the promulgation of papal infallibility would bring serious political difficulties.

After the recall of the French troops from Rome he attempted unsuccessfully to mediate between the pope and the Italian Government. He was appointed in 1871 German commissioner to arrange the final treaty with France, and was afterwards appointed German envoy at Paris, and in 1872 received his definite appointment as ambassador, a post of the greatest difficulty and responsibility:.

Differences soon arose between him and Bismarck; he wished to support the monarchical party which was trying to overthrow Thiers, while Bismarck ordered him to stand aloof from all French parties; he did not give that explicit obedience to his instructions which Bismarck required. In the beginning of 1874 he was recalled and appointed to the embassy at Constantinople, but this appointment was immediately revoked. A Vienna newspaper published some correspondence on the Vatican council, including confidential despatches of Arnim's, with the object of showing that he had exhibited greater foresight than Bismarck. It was then found that a considerable number of papers were missing from the Paris embassy, and on Oct. 4 Arnim was arrested on the charge of embezzling State papers. Arnim avoided imprisonment by leaving the country, and in 1875 published anonymously at Zurich a pamphlet entitled *Pro nihilo,* in which he attempted to show that the attack on him was caused by Bismarck's personal jealousy. For this he was accused of treason, insult to the emperor, and libelling Bismarck, and in his absence condemned to five years' penal servitude. From his exile in Austria he published two more pamphlets on the ecclesiastical policy of Prussia, *Der Nunzius kommt!* (Vienna, 1878), and *Quid faciamus nos?* (ib. 1879). He made repeated attempts, which were supported by his family, to be allowed to return to Germany in order to take his trial afresh on the charge of treason; his request had just been granted when he died, May 19, 1881.

In 1876 Bismarck carried an amendment to the criminal code making it an offence punishable with imprisonment or a fine up to £250 for an official of the foreign office to communicate to others official documents, or for an envoy to act contrary to his instructions. These clauses are commonly spoken of in Germany as the "Arnim paragraphs."

ARNIM, LUDWIG ACHIM (JOACHIM) VON (1781–1831), German poet and novelist. was born in Berlin on June 26, 1781, and died at Dahme, Prussia, on Jan. 21. 1831.

From the earlier writings of Goethe and Herder he learned to appreciate German legends and folk-songs. He published a collection of these (1806–08), in collaboration with Klemens Brentano (*q.v.*) under the title Des *Knaben* Wunderhorn. Arnim's best work is to be found in the short stories *Fürst* Ganzgott und *Sänger* Halbgoft and Der tolle *Invalide* auf dem Fort Ratonneau and the unfinished romance Die *Kronenwächter* (1817), which promised to develop into one of the finest historical romances of the 19th century.

BIBLIOGRAPHY.—*Arnim's* Samtliche Werke were edited by his widow and published in Berlin in 1839–40 with an introduction by Wilhelm Grimm; second edition in 22 vols., 1853–56. Selections have been edited by J. Dohmke (1892); M. Koch, *Arnim,* Klemens und Bettina Brentano, Gorres (1893). *Des* Knaben *Wunderhorn* has been frequently republished, the best edition being that of A. Birlinger and W. Crecelius (2 vols., 1872–76). See R. Steig, Achim von *Arnim* und Klemens Brentano (1894).

ARNIM-BOYTZENBURG, HANS GEORG VON (1581–1641), German general and diplomatist, was born in 1581 at Boytzenburg in Brandenburg. He served in the Swedish army under Gustavus Adolphus, took part in the Russian war, and afterwards fought against the Turks in the service of the king of Poland. In 1626, though a Protestant, he was induced by Wallenstein to join the new imperial army. He quickly rose to the rank of field marshal, and became Wallenstein's close friend and faithful ally. This attachment to Wallenstein, and a spirit of religious toleration, were the leading motives of a strange career of military and political inconstancy. After the dismissal of Wallenstein, Arnim left the imperial service for that of the elector of Saxony, and commanded the Saxon army which fought by the side of the Swedes at Breitenfeld (1631), and indeed the alliance of these two Protestant powers in the cause of their common religion was largely his work. During the Lützen campaign, Arnim was operating with success at the head of an allied army in Silesia. In the following year he was under the hard necessity of opposing Wallenstein in the field, but little was done by either. In 1634 Wallenstein was assassinated, and Arnim began at once more active operations. He won an important victory at Liegnitz in May 1634, but from this time he became more and more estranged from the Swedes. The peace of Prague followed. Soon after this event he refused an offer of high command in the French army and retired from active life. From 1637 to 1638 he was imprisoned in Stockholm, having been seized at Boytzenburg by the Swedes on suspicion of being concerned in various intrigues. He made his escape ultimately, and died suddenly at Dresden in 1641, whilst engaged in raising an army to free German soil from foreign armies of all kinds (see THIRTY YEARS' WAR).

See K. G. Helbig, "Wallenstein und Arnim" (1850) and "Der Prager Friede," in Raumer's Historisclzes Taschenbuch (1858); also E. D. M. Kirchner, Das *Schloss* Boytzenburg, etc. (1860); and Archiv fur die *sächsische* Geschichte, vol. viii. (1870).

ARNO, ARN or **AQUILA** (750?–821), archbishop of Salzburg and scholar, entered the church at an early age, became abbot of Elnon, or St. Amand, where he made the acquaintance of Alcuin. In 785 he was made bishop of Salzburg, and in 787 was employed by Tassilo III., duke of the Bavarians, as an envoy to Charlemagne at Rome. Through Charlemagne's influence Salzburg was made in 798 the seat of an archbishopric; and Arno became metropolitan of Bavaria and received the pallium from Pope Leo III.

The area of his authority was extended to the east by the conquests of Charlemagne over the Avars. He acted as one of the *missi* dominici, and spent some time at the court of Charlemagne, where he was known as Aquila, and his name appears as one of the signatories to the emperor's will. Soon after the death of Charlemagne in 814, Arno appears to have withdrawn from active life, although he retained his archbishopric until his death Jan. 24, 821.

Aided by a deacon named Benedict, Arno drew up about 788 a catalogue of lands and proprietary rights belonging to the church in Bavaria, under the title of *Indiculus* or Congesturn *Arnonis* (ed. F. Keinz, Munich, 1869). Other works produced under the protection of Arno include a Salzburg consuetudinary (ed. L. Rockinger in *Quellen* und Erorterungen zur bayrischen und deutschen Geschichte, Band vii. (Munich, 1856). W. von Giesebrecht suggests that Arno was the author of an early section of *Annales Laurissenses maiores,* a history of the Frankish kings from 741 to 829 (Monumenta Germaniae *historica Scriptores,* Band i., p. 128–131. G. H. Pertz, Hanover, 1826). If this supposition be correct, Arno was the first writer whose works are extant to apply the name Deutsch (theodisca) to the German language.

ARNO (anc. *Arnus*), river, Italy, rising in Mte. Falterona, about 25m. E.N.E. of Florence, 4,265ft. above sea. It first runs south-south-east through the beautiful Casentino; near Arezzo it turns west, and at Montevarchi north-north-west; 10m. below it forces a way through limestone rock at Incisa and 10m. farther on it is joined by the Sieve. Thence it runs west to Florence and through the gorge of Golfolina to Empoli and Pisa, and falls into the sea 7½m. west of Pisa, after a course of 155m. The Serchio (anc. *Auser*), joining the Arno at Pisa in ancient times, now flows into the sea independently. Barges can go up the Arno to Florence; but it is liable to sudden floods, and so needs careful regulation. Great floods occurred in 1537 and 1740; in 1537 the water rose to 8ft. in the streets of Florence. The valley between Montevarchi and Rignano contains fossil bones of deer, elephant, rhinoceros, mastodon, hippopotamus, bear, tiger, etc., of the middle and upper Pliocene; while S. Giovanni Valdarno, 4m. below the former, is the centre of lignite mines.

ARNOBIUS (called AFER, and sometimes THE ELDER), early Christian writer, was a teacher of rhetoric at Sicca Venerea in proconsular Africa during the reign of Diocletian. His great treatise, in seven books, *Adversus* Gentes (or *Nationes*), on account of which he takes rank as a Christian apologist, appears to have been occasioned by a desire to answer the complaint then brought against the Christians that the prevalent calamities and disasters mere due to their impiety and had come upon men since the establishment of their religion.

The work of Arnobius appears to have been written when he was a recent convert, for he does not possess a very extensive knouledge of the Scriptures. He knows nothing of the Old Testament, and only the life of Christ in the New, while he does not quote directly from the Gospels.

ARNOBIUS (called THE YOUNGER), Christian priest or bishop in Gaul, flourished about 460. He is the author of a mystical and allegorical commentary on the Psalms, first published by Erasmus in 1522, and by him attributed to the elder Arnobius. It has been frequently reprinted, and in the edition of De la Barre, 1580, is accompanied by some notes on the Gospels by the same author. The opinions of Arnobius, as appears from the commentary, are semi-Pelagian.

ARNOLD, known as "Arnold of Brescia" (d. 1155), one of the most ardent adversaries of the temporal power of the popes. He was born probably at Brescia, in Italy, towards the end of the 11th century. He studied theology in Paris, but there is no proof that he was a pupil of Abélard. Returning to Italy he became a canon regular. His life was rigidly austere, St. Bernard calling him homo nequc *manducans neque bibens.* He fought against the corruption of the clergy, and especially against the temporal ambitions of the high dignitaries of the church. During the schism of Anacletus (1131–37) the town of Brescia was torn by the struggles between the partisans of Pope Innocent II. and the adherents of the anti-pope, and Arnold incited the people to rise against their bishop, and, exiled by Innocent II., went to France. St. Bernard accused him of sharing the doctrines of Abélard (see Ep. 189, 195), and procured his condemnation by the council of Sens (1140) at the same time as that of the great scholastic. It seems certain that Arnold professed moral theology in Paris and several times reprimanded St. Bernard, whom he accused of pride and jealousy. St. Bernard persuaded King Louis VII. to take severe measures against Arnold, who took refuge at Zürich. There he found support with the lay nobility; but, denounced anew by St. Bernard, he turned his steps towards

Rome (1145). Two years previously, in 1143, the Roman commune had rejected the temporal power of the pope. The urban nobles had set up a republic, which, under forms ostensibly modelled on antiquity, concealed but clumsily a purely oligarchical government. Pope Eugenius III. and the cardinals had been driven into exile at Viterbo. Arnold denounced the Roman clergy, and, in particular the Curia, which he stigmatized as a "house of merchandise and den of thieves." According to Otto of Freising (Lib. *de gestis Friderici,* bk. ii. chap. xx.) the whole of his teaching, outside the preaching of penitence, was summed up in these maxims:—"Clerks who have estates, bishops who hold fiefs, monks who possess property, cannot be saved." Arnold's was the only vigorous personality which stood out from the mass of rebels, and he was the principal victim of the repression that ensued. On July 15, 1148, Eugenius III. anathematized Arnold and his adherents; but when soon afterwards the pope entered Rome Arnold remained in the town unmolested, under the protection of the senate. But Frederick I. (Barbarossa) concluded with the pope a treaty of alliance (Oct. 16, 1152); and when the second successor of Eugenius III., the energetic and austere Adrian IV. (the Englishman, Nicholas Breakspear), placed Rome under an interdict the senate, already rudely shaken, submitted and Arnold was forced to fly into Campania (1155). He was seized by order of the emperor Frederick, then in Italy, and delivered to the prefect of Rome, by whom he was condemned to death. In June 1155 Arnold was hanged, his body burnt, and the ashes thrown into the Tiber. It is probable that Arnold's adherents became merged in the communities of the Lombard Waldenses, who shared their ideas on the corruption of the clergy. Legend, poetry, drama, and politics have from time to time been much occupied with the personality of Arnold of Brescia. He was before everything an ascetic, who denied to the church the right of holding property, and who occupied himself only as an accessory with the political and social consequences of his religious principles.

The bibliography of Arnold of Brescia is very vast and of varying value. The following works will be found useful: W. von Giesebrecht, *Arnold von Brescia* (Munich, 1873); G. Gaggia, *Arnaldo da Brescia* (Brescia, 1882); and notices by Vacandard in the *Revue des questions historiques* (1884), pp. 52–114; by R. Breyer in the *Histor. Taschenbuch* (Leipzig, 1889), vol. viii. pp. 123–178, and by A. Hausrath in *Neue Heidelberg. Jahrb.* (1891), Band i. pp. 72–144.

ARNOLD, **BENEDICT** (1741–1801), American soldier, was born in Norwich, Conn., on Jan. 14, 1741. He was the great-grandson of Benedict Arnold (1615–78), thrice colonial governor of Rhode Island between 1663 and 1678; and was the fourth in direct descent to bear the name. He received a fair education but was not studious, and his youth was marked by the same waywardness which characterized his whole career. At 15 he ran away from home and took part in an expedition against the French, but he soon deserted and returned home. In 1762 he settled in New Haven, where he engaged successfully in trade with the West Indies. Immediately after the battle of Lexington, Arnold led the local militia company, of which he was captain, to Cambridge, and on April 29, 1775, proposed to the Massachusetts committee of safety an expedition against Crown Point and Ticonderoga. The offer was accepted, and as a colonel of Massachusetts militia he was directed to enlist the men necessary for the undertaking. He was forestalled, however, by Ethan Allen (*q.v.*), acting on behalf of some members of the Connecticut assembly. Under him, reluctantly waiving his own claim to command, Arnold served as a volunteer; and soon afterwards, Massachusetts having angered Arnold by sending a committee to make an inquiry into his conduct, he resigned and returned to Cambridge. He was then ordered to co-operate with Gen. Richard hfontgomery in the invasion of Canada. Starting with 1,100 men from Cambridge on Sept. 17, 1775, he reached Gardiner, Me., on the 20th, advanced through the Maine woods, and, after suffering terrible hardships, his little force reached Quebec on Nov. 13. The garrison had been forewarned, and Arnold was compelled to await the coming of hfontgomery from Montreal. The combined attack on Dec. 31, 1775, failed; Montgomery was killed, and Arnold was severely wounded. Arnold, who had been commissioned a brigadier general, remained in Canada until the following June, being after April in command at Montreal.

Some time after the retreat from Canada, charges of misconduct and dishonesty were brought against him. These charges were tardily investigated by the Board of War, which in a report made on May 23, 1777, declared that his "character and conduct" had been "cruelly and groundlessly aspersed." Having constructed a flotilla on Lake Champlain, Arnold engaged a greatly superior British fleet near Valcour Island (Oct. 11, 1776), and after inflicting severe loss on the enemy, made his escape under cover of night. This engagement was the first between British and American fleets. Arnold's brilliant exploits had drawn attention to him as one of the most promising of the Continental officers, and had won for him the friendship of Washington. Nevertheless, when in Feb. 1777, Congress created five new major generals, Arnold, although the ranking brigadier, was passed over, in favour of his juniors. At this time it was only Washington's urgent persuasion that prevented Arnold from leaving the service. Two months later while he was at New Haven, Governor Tryon's descent on Danbury took place; and Arnold attacked the British with such vigour at Ridgefield (April 27, 1777), that they escaped to their ships with difficulty.

In recognition of this service Arnold was now commissioned major general. After serving in New Jersey with Washington, he joined General Philip Schuyler in the Northern Department, and in Aug. 1777, proceeded up the Mohawk valley against Colonel St. Leger, and raised the siege of Fort Stanwix (or Schuyler). Subsequently, after Gates had superseded Schuyler (Aug. 19), Arnold commanded the American left wing in the first battle of Saratoga (Sept. 19, 1777). His ill-treatment at the hands of General Gates led to a quarrel which terminated in Arnold being relieved of command. He remained with the army, however, and although nominally without command served brilliantly in the second battle of Saratoga (Oct. 7, 1777), during which he was seriously wounded. For his services he was thanked by Congress, and received a new commission giving him at last his proper relative rank.

In June 1778, Washington placed him in command of Philadelphia. Here he soon came into conflict with the state authorities. In the social life of Philadelphia, largely dominated by families of Loyalist sympathies, Arnold was the most conspicuous figure; he lived extravagantly, entertained lavishly, and in April 1779, took for his second wife, Margaret Shippen (1760–1804), the daughter of Edward Shippen (1729–1806), a moderate Loyalist. Early in Feb. 1779, the executive council of Pennsylvania, presided over by Joseph Reed, one of his most persistent enemies, presented to Congress eight charges of misconduct against Arnold. In April 1779, Congress, though throwing out four charges, referred the other four to a court-martial. Despite Arnold's demand for a speedy trial, it was December before the court was convened. It was probably during this period of vexatious delay that Arnold, always sensitive and now incited by a keen sense of injustice, entered into a secret correspondence with Sir Henry Clinton with a view to joining the British service. On Jan. 26, 1780, the court, before which Arnold had ably argued his own case, rendered its verdict, practically acquitting him of all intentional wrong, but directing Washington to reprimand him for two trivial offences. Arnold, who had expected absolute acquittal, was inflamed with a burning anger that even Washington's kindly reprimand, couched almost in words of praise, could not subdue.

It was now apparently that he first conceived the plan of betraying some important post to the British. With this in view he sought and obtained from Washington (Aug. 1780) command of West Point, the key to the Hudson valley. Arnold's offers now became more explicit, and, in order to perfect the details of the plot, Clinton's adjutant-general, Major John André, met him near Stony Point on the night of Sept. 21. On the 23rd, while returning by land, André with incriminating papers was captured, and the officer to whom he was entrusted unsuspectingly sent information of his capture to Arnold, who was thus enabled to escape to the British lines. Arnold, commissioned a brigadier general in the British army, received £6,315 in compensation for

his property losses, and was employed in leading an expedition into Virginia which burned Richmond, and in an attack upon New London in September, 1781. In Dec. 1781, lie removed to London and was consulted on American affairs by the king and ministry, but could obtain no further employment in the active service. Disappointed at the failure of his plans and embittered by the neglect and scorn which he met in England, he spent the years 1787–91 at St. John, N.B., once more engaging in the West India trade, but in **1791** he returned to London, and after war had broken out between Great Britain and France, was active in fitting out privateers. He gradually sank into melancholia, and died in London June **14,** 1801.

BIBLIOGRAPHY.—Jared Sparks' "Life and Treason of Benedict Arnold" (Boston, 1835), in his *Library of American Biography,* is biased and unfair. The best general account is Isaac Newton Arnold's *Life of Benedict Arnold* (Chicago, 1880), which, while offering no apologies or defense of his treason, lays perhaps too great emphasis on his provocations. Charles Burr Todd's *The Real Benedict Arnold* (1903) is a curious attempt to make Arnold's wife wholly responsible for his defection. Two good accounts of the Canadian Expedition are Justin H. Smith's *Arnold's March from Cambridge to Quebec* (1903), which contains a reprint of Arnold's journal of the expedition; and John Codman's *Arnold's Expedition to Quebec* (1901). Arnold's *Letters on the Expedition to Canada* were printed in the Maine Historical Society's *Collections* for 1831 (repr. 1865). *See* also William Abhatt, *The Crisis of the Revolution* (1899); *The Northern Invasion of 1780* (Bradford Club Series, No. 6, 1866); "The Treason of Benedict Arnold" (letters of Sir Henry Clinton to Lord George Germaine) in *Pennsylvania Magazine of History and Biography,* vol. xxii. (Philadelphia, 1898); *Proceedings of a General Court Martial for the Trial of Major General Arnold* (Philadelphia, 1780; reprinted with introduction and notes, 1865); and Kenneth L. Roberts, *March to Quebec* (New York, 1938) the journals of the members of Arnold's expedition.

ARNOLD, BION JOSEPH (1861–1942), U.S. electrical engineer, was born at Casnovia, near Grand Rapids, Mich., on Aug. 14, **1861.** He studied at the University of Nebraska in 1879–80, graduated from Hillsdale college, Hillsdale, Mich., in **1884,** and did graduate work at Cornell university in 1888–89. Establishing himself in Chicago as an independent consulting engineer in **1893,** and later in the Arnold Engineering Company, of which he was president, he became widely known as an expert on electric traction. Important undertakings in which he was engaged as chief engineer or authoritative adviser include the electrification of the New York Central railroad's terminal in New York city, the construction of subways in New York city, and the rebuilding of the Chicago street railway system. He also acted at various times as advisory engineer on traction problems for Pittsburgh, San Francisco, Los Angeles, Cincinnati, Toronto and many other cities. During World War I he was a member of army and navy consulting boards and in 1917–19 served in the regular army in various engineering activities, especially in connection with aircraft production. He invented a magnetic clutch, various storage battery improvements and numerous devices and systems for electric railway operation, and was one of the first to make use of alternating current and single-phase electric traction systems. He died Jan. 29, 1942 at Chicago.

ARNOLD, SIR EDWIN (1832–1904), British poet, scholar and journalist, was born on June 10 1832, and was educated at the King's school, Rochester; King's college, London; and University college, Oxford, where in 1852 he gained the Newdigate prize for a poem on Belshazzar's feast. Arnold went out to India as the principal of the government Sanskrit college at Poona Returning to England in **1861** he joined the staff of the *Daily Telegraph,* with which he continued to be associated for more than 40 years. He was a brilliant journalist, full of ideas and of enthusiasm for his work. Nevertheless he was best known to his contemporaries as a poet, author of the *Light of Asia, or the Great Renunciation* (*Mahābhinshkramana*) (1879), an Indian epic. In it the life and teaching of Buddha are exponnded with much wealth of local colour and not a little felicity of versification. Oriental scholars complained that it gave a false impression of Buddhist doctrine; on the other hand the suggested analogy between Sakyamuni and Christ offended the taste of some devout Christians. The latter criticism probably suggested to Arnold the idea of a second narrative poem of which the central figure should be the founder of Christianity, as the founder of Buddhism had been that of the first. But *The Light of the World* (1891), in which this idea took shape, failed to repeat the success attained by *The Light of Asia.* In his later years Arnold resided for some time in Japan, and his third wife was a Japanese lady. In *Seas and Lands* (1891) and *Japonica* **(1892)** he gives an interesting study of Japanese life. Sir Edwin Arnold, who had received the K.C.I.E. in **1888,** died March **24,** 1904.

Arnold's other works include: *The Book of Good Counsels,* from the Sanskrit of the Hitopadesa (1861); *The Indian Song of Songs,* from the Sanskrit of the Gita Govinda of Jayadeva (1875); *Indian Idylls* (1883) and *The Song Celestial* (1885), both from the Mahabarata; and other translations. He also wrote a *History of the Administration of British India under the late Marquis of Dalhousie* (186244). His poetical works were collected in 8 vols. in 1888.

ARNOLD, GOTTFRIED (1666–1714), German Protestant divine, was born at Annaberg, in Saxony, where his father was a schoolmaster. His first work, *Die erste Liebe zu Chrisfo,* to which in modern times attention was again directed by Leo Tolstoy, appeared in **1696.** It went through five editions before **1728,** and gained the author much reputation. In **1699** he began to publish his largest work, *Unparteiische Kirchen- und Ketzerhistorie,* in which he has been thought by some to show more impartiality towards heresy than towards the Church (*cf.* Otto Pfleiderer, *Development of Theology,* p. **277).**

See Calwer-Zeller, *Theologisckes Handwörterbuch,* and the account of him in Albert Knapp's edition of *Die erste Liebe zu Christo* (1845).

ARNOLD, MATTHEW (1822–1888), English poet, literary critic, and inspector of schools, was born at Laleham, near Staines, on Dec. 24, **1822.** He was the son of the famous Dr. Arnold, of Rugby, and was educated at Winchester, Rugby and Balliol college, Oxford. After a year at Winchester, Matthew Arnold entered Rugby school in **1837.** He early began to write and print verses, His first publication was a Rugby prize poem, *Alaric* at *Rome,* in **1840.** This was followed, in **1843,** after he had gone up to Oxford in **1840** as a scholar of Balliol, by his poem *Cromwell,* which won the Newdigate prize. In **1844** he graduated with second-class honours, and in **1845** was elected a fellow of Oriel college, where among his colleagues was A. H. Clough, his friendship with whom is commemorated in that exquisite elegy *Thyrsis.* From **1847** to **1851** he acted as private secretary to Lord Lansdowne; and in the latter year, after acting for a short time as assistant-master at Rugby, he was appointed to an inspectorship of schools, a post which he retained until two years before his death. This was probably not the career he would have chosen,

FROM RUSSELL, "MATTHEW ARNOLD"

PAINS HILL COTTAGE AT COBHAM, SURREY, THE HOME OF THE ENGLISH POET AND CRITIC. MATTHEW ARNOLD, FROM 1873 TO HIS DEATH IN 1888

but his impending marriage (June 1851), with Frances Lucy Wightman, made a settled income desirable. Meanwhile, in **1849,** appeared *The Strayed Reveller, and other Poems, by A,* a volume which gained a considerable esoteric reputation. In 1852 he published another volume under the same initial, *Empedocles on Efna, and other Poems. Empedocles* is as undramatic a poem, perhaps, as was ever written in dramatic form, but studded with lyrical beauties of a very high order. In **1853** Arnold published a volume of *Poems* under his own name. This consisted partially of poems selected from the two previous volumes. A second series of poems, which contained, however, only two new ones, was published in 1855. So great was the impression made by these

in academic circles, that in 1857 Arnold was elected professor of poetry at Oxford, and he held the chair for ten years. In 1858 he published his classical tragedy, *Merope.* Nine years afterwards his *New Poems* (1867) were published. While he held the Oxford professorship he published several series of lectures, which gave him a high place as a scholar and critic. The essays (edited in 1905 with an introduction by W. H. D. Rouse) *On Translating Homer: Three Lectures given at Oxford,* published in 1861, supplemented in 1862 by *On Translating Homer: Last Words,* a fourth lecture given in reply to F. W. Newman's *Homeric Translation in Theory and Practice* (1861) and *On the Study of Celtic Literature,* published in 1867, were full of subtle and brilliant criticism. So were the two series of *Essays in Criticism,* the first of which, consisting of articles reprinted from various reviews, appearing in 1865. The essay on "A Persian Passion Play" was added in the editions of 1875; and a second series, edited by Lord Coleridge, appeared in 1888.

Arnold's poetic activity almost ceased after he left the chair of poetry at Oxford. He was several times sent by the Government to make enquiries into the state of education in France, Germany, Holland and other countries; and his reports, with their thorough-going and searching criticism of continental methods, as contrasted with English methods, showed how conscientiously he had devoted some of his best energies to the work. His fame as a poet and a literary critic has somewhat overshadowed the fact that he was, during 35 years of his life (1851–86) employed in the education department as one of H.M. inspectors of schools. The influence he exerted on schools, on the department, and on the primary education of the whole country was very great. His annual reports of which more than 20 were collected (1889) into a volume (new edition, with additional matter and introduction by F. S. Marvin, [1908]) by his friend and official chief, Sir Francis (afterwards Lord) Sandford attracted, by reason of their freshness of style and thought, more public attention than is usually accorded to Blue Book literature.

In 1859, as foreign assistant commissioner, he prepared for the duke of Newcastle's commission to enquire into the subject of elementary education a report (printed 1860) which was afterwards reprinted (1861) in a volume entitled *The Popular Education of France, with Notices of that of Holland and Switzerland.* In 1865 he was again employed as assistant-commissioner by the Schools enquiry commission under Lord Taunton; and his report on this subject, *On Secondary Education in Foreign Countries* (1866), was subsequently reprinted under the title *Schools and Universities on the Continent* (1868). Twenty years later he was sent by the education department to make special enquiries on certain specified points, *e.g.,* free education, the status and training of teachers, and compulsory attendance at schools. The result of this investigation appeared as a parliamentary paper, *Special Report on certain points connecfed with Elernentary Education in Germany, Switzerland and France,* in 1886. He also contributed the chapter on "Schools" (1837–87) to the second volume of Mrs. Humphrey Ward's *Reign* of *Queen Victoria.* All these reports form substantial contributions to the history and literature of education in the Victorian age. They have been quoted often, and have exercised marked influence on subsequent changes and controversies. One great purpose underlies them all. It is to bring home to the English people a conviction that education ought to be a national concern. To this theme he constantly recurred in his essays, articles, and official reports. *"Porro unum est necessarium.* One thing is needful; organize your secondary education."

Arnold's critical work includes: *Culture and Anarchy* (1869); *St. Paul and Protestantism . . .*; *Friendship's Garland: being the Conversations, Letters and Opinions of the late Arminius Baron von Thunder-ten-Tronckh* (1871); *Literature and Dogma: an Essay towards a Better Apprehension of the Bible* (1873); *God and the Bible: a Review of Objections to Literature and Dogma* (1875); *Last Essays on Church and Religion* (1877); *Mixed Essays* (1879); *Irish Essays and Others* (1882); *Discourses in America* (1885). These books startled the public. But, objectionable as Arnold's rationalizing criticism was to contemporary orthodoxy, and questionable as was his equipment in point of theological learning, his spirituality of outlook and ethical purpose were not to be denied. Yet it is not Arnold's views that have become current coin so much as his literary phrases—his craving for "culture" and "sweetness and light," his contempt for "the dissidence of Dissent and the Protestantism of the Protestant religion," his classification of "Philistines and barbarians." His death at Liverpool, of heart failure on April 15, 1888, was sudden and quite unexpected.

Arnold was a prominent figure in that great galaxy of Victorian poets who were working simultaneously (Tennyson, Browning, Rossetti, William Morris and Swinburne), poets between whom there was at least this connecting link, that the quest of all of them was the old-fashioned poetical quest of the beautiful. Beauty was their watchword, as it had been the watchword of their immediate predecessors—Wordsworth, Coleridge, Keats, Shelley and Byron. That this group of early 19th century poets might be divided into two (those whose primary quest was physical beauty, and those whose primary quest was moral beauty) is no doubt true. Still, in so far as beauty was their quest they were all akin. And so with the Victorian group to which Arnold belonged. Notwithstanding the exquisite work that Arnold has left behind him, some critics have come to the conclusion that his primary impulse in expression was that of the poetically-minded *prosateur* rather than that of the born poet. And this has been said by some who, nevertheless, deeply admire poems like "The Scholar Gypsy," "Thyrsis," "The Forsaken Merman," "Dover Beach," "Heine's Grave," "Rugby Chapel," "The Grande Chartreuse," "Sohrab and Rustum," "The Sick King in Bokhara," "Tristram and Iseult." Perhaps the place Arnold held and still holds as a critic is due more to his exquisite felicity in expressing his views than to the penetration of his criticism. Nothing can exceed the easy grace of his prose at its best. It is conversational and yet absolutely exact in the structure of the sentences; and in spite of every vagary, his distinguishing note is urbanity. Keen-edged as his satire could be, his writing for the most part is as urbane as Addison's own. His influence on contemporary criticism, and contemporary, ideals was considerable and generally wholesome. His insistence on the necessity of looking at "the thing in itself," and the need for acquainting oneself with "the best that has been thought and said in the world," gave a new stimulus alike to originality and industry in criticism; and in his own selection of subjects (such as *Joubert,* or the *De Guérins*) he opened a new world to a larger class of the better sort of readers, exercising in this respect an awakening influence in his own time akin to that of Walter Pater a few years afterwards. The comparison with Pater might indeed be pressed farther, and yet too far. Both were essentially products of Oxford. But Arnold, whose description of that "home of lost causes, and forsaken beliefs, and unpopular names, and impossible loyalties," is in itself almost a poem, had a classical austerity in his style that savoured more intimately of Oxford tradition, and an ethical earnestness, even in his most flippant moments, which kept him notably aloof from the more sensuous school of aesthetics.

The first collected edition of Arnold's poems was published in **1869** in two volumes, the first consisting of *Narrative and Elegiac Poems,* and the second of *Dramatic and Lyric Poems.* Other editions appeared in 1877, **1881**; a library edition (1885); a one-volume reprint of the poems printed in the library edition, with one or two additions (1890); another edition **(1926)** is edited with an introduction by A. T. Quiller-Couch and notes by G. St. Quintin. Publications by Matthew Arnold not mentioned in the foregoing article include: *England and the Italian Question* **(1859)** *a* pamphlet; *A French Eton; or, Middle Class Education and the State* **(1864)**; *Higher Schools and Universities in Germany* (1874), a partial reprint from *Schools and Universities on the Continent* **(1868)**; *A Bible Reading for Schools; The Great Prophecy of Israel's Restoration,* an arrangement of *Isaiah,* chs. xl.–lxvi. (1872), republished with additions and varying titles in **1875** and **1883**; an edition of the *Six Chief Lives from Johnson's Lives of the Poets* (1878); editions of the *Poems of Wordsworth* (1879), and the *Poetry of Byron* (1881) for the Golden Treasury series, with prefatory essays reprinted in the second series of *Essays in Criticism;* an edition of *Letters, Speeches and Tracts on Irish Affairs by Edmund Burke* (1881); and many contributions to periodical literature. *The Letters of Matthew Arnold* (1848–88) were collected and arranged by G. W. E. Russell in **1895** (reprinted 1901). *Matthew Arnold's Note Books, with a Preface by the Hon. Mrs. Wodehouse,* appeared in **1902.**

A complete and uniform edition of *The Works of Matthew Arnold* (1904–05) includes the letters as edited by Russell. Vol. iii. contains a complete bibliography of his works, many of the early editions of which are very valuable, by T. B. Smart, who published a separate bibliography in 1892. A valuable note on the rather complicated subject of Arnold's bibliography is given by H. Buxton Forman in Arnold's *Poems, Narrative, Elegiac and Lyric* (Temple classics, 1900). There are innumerable reprints of Arnold's different works.

It was Arnold's expressed desire that his biography should not be written, and before his letters were published they underwent considerable editing at the hands of his family. There are, however, monographs on Matthew Arnold (1899) in *Modern English Writers* by Prof. Saintsbury, and by H. W. Paul (1902), in the English Men of Letters series. These two works were supplemented by G. W. E. Russell, in a sense, as the editor of Arnold's letters, the official biographer, in *Matthew Arnold* (1904, Literary Lives series). There are also studies of Arnold in J. M. Robertson's *Modern Humanists* (1891), and in W. H. Hudson's *Studies in Interpretation* (1896), Sir J. G. Fitch's *Thomas and Matthew Arnold* (1897); one by G. K. Chesterton in the "Everyman" edition of the *Essays,* and by *W.* L. Jones in *Cambridge History of Modern Literature,* vol. xiii. (1916), and a review of some of the works above mentioned in the *Quarterly Review* (Jan. 1905) by T. H. Warren.

ARNOLD, SAMUEL (1740-1802), English composer, was born in London and educated at the Chapel Royal, though his subsequent activities were mainly associated with the stage. He was indeed little more than 20 when he was appointed official composer to Covent Garden Theatre, and between 1765 and 1802 he wrote as many as 43 operas, after-pieces and pantomimes. He also composed numerous oratorios and in 1793 became organist of Westminster Abbey, where he was buried. His collection of *Cathedral Music,* once much esteemed, is now less highly thought of on account of its serious omissions.

ARNOLD, THOMAS (1795–1842), English clergyman and headmaster of Rugby School, was born at West Cowes, in the Isle of Wight, on June 13 1795. He was the son of William and Martha Arnold. His father was collector of customs at Cowes. He was educated at Winchester and Corpus Christi College, Oxford; in 1815 he was elected fellow of Oriel College; and there he continued to reside until 1819. This interval was diligently devoted to the pursuit of classical and historical studies, to theology, ecclesiastical polity and social philosophy. For the writings of Thucydides and Aristotle he formed an attachment which remained until the close of his life. He left Oxford in 1819 and settled at Laleham, near Staines, where he took pupils for the university. His spare time was devoted to the prosecution of studies in philology and history, more particularly to the study of Thucydides, and of the new light which had been cast upon Roman history and upon historical method by the researches of Niebuhr. Shortly after he settled at Laleham, he married Mary, youngest daughter of the Rev. John Penrose, rector of Fledborough, Nottinghamshire. After nine years at Laleham, he was elected headmaster of Rugby School in Dec. 1827, and in Aug. 1828 entered on his new office.

Under Arnold's superintendence the school became not merely a place where a certain amount of classical or general learning was to be obtained, but a sphere of intellectual, moral and religious discipline, where healthy characters were formed, and men were trained for the duties, struggles and responsibilities of life. His energies were chiefly devoted to the business of the school; but he found time also for much literary work, as well as for an extensive correspondence. Five volumes of sermons, an edition of Thucydides, with English notes and dissertations, a history of Rome in three volumes, besides numerous articles in reviews, journals, newspapers and encyclopaedias, show the untiring activity of his mind. His interest in public matters also was incessant, especially ecclesiastical questions, and matters that bore upon the social welfare and moral improvement of the masses.

In 1841, after 14 years at Rugby, Dr. Arnold was appointed by Lord Melbourne to the chair of modern history at Oxford. On Dec. 2 1841, he delivered his inaugural lecture. Seven other lectures were delivered during the first three weeks of the Lent term of 1842. He died on Sunday, June 12 1842. His remains were interred on the following Friday in the chancel of Rugby Chapel, immediately under the communion table.

Dr. Arnold was not a notable scholar, and he had not much of what is usually called tact in his dealings either with the juvenile or the adult mind. What gave him his power, and secured for him so deeply the respect and veneration of his pupils and acquaintances, was the intensely religious character of his whole life and his severe and lofty estimate of duty.

ARNOTT, NEIL (1788–1874), Scottish physician, was born at Arbroath May 15 1788, and died in London on March 2 1874. He invented the "Arnott water-bed," the "Arnott ventilator," the "Arnott stove," etc. He was a strong advocate of scientific, as opposed to purely classical, education; and gave £2,000 to each of the four universities of Scotlandand to the University of London, to promote practical scientific study.

ARNOULD, MADELINE SOPHIE (1740–1802), famous French actress and operatic singer, was born in Paris, where, from her début in 1757 to her retirement in 1778, she enjoyed almost unrivalled popularity. In Gluck's *Iphigénie en Aulide* and *Orphée* she created the parts of Iphigénie and Eurydice. She was renowned, incidentally, hardly less for her wit and conversation than for her histrionic powers.

ARNOULD-PLESSY, JEANNE SYLVANIE (1819–1897), French actress, was born in Metz, the daughter of a local actor named Plessy. She made her début at the Comédie Française in 1834 in Alexandre Duval's *La Fille d'honneur,* and for the next 11 years filled leading rôles there. Suddenly she broke her contract and left for London to marry J. F. Arnould, the dramatist. She then played in St. Petersburg for 11 years. In 1855 she returned to the Comédie, where she was especially successful in Émile Augier's *Le Fils de Giboyer* and *Maître Guérin.*

ARNSBERG, a town in Westphalia, Germany, built on high ground almost surrounded by the river Ruhr, 44 mi. S.S.E. of Miinster. Pop. (1939) 14,788. Near by are the ruins of the castle of the counts of Arnsberg which was blown up in 1762. Arnsberg received its first charter in 1237 and later joined the Hanseatic league. It is the seat of the provincial authorities, and has a chamber of commerce. Paper is made.

ARNSTADT, a town in Thuringia, Germany, 11 mi. S. of Erfurt. Pop. (1939) 22,911. It dates from the 8th century and was bought in 1306 by the counts of Schwarzburg, who lived here till 1716. The Liebfrauenkirche is Romanesque (12th and 13th centuries). The town hall dates from 1561. There are copper mines and tepid springs in the neighbourhood. The industries are partly based on the mines, but also include machine making. chemical and dye works. There is trade in wheat, leather, seeds and cattle.

ARNSWALDE, a town of Germany, in the Prussian province of Pomerania, in a marshy district, 20 mi. S.E. of Stargard on the railway to Posen. Pop. (1939), 14.116. Its industries include spinning and weaving and the manufacture of brushes, bricks, sugar, machinery. Trade is in corn.

ARNULF (850?–899), Roman emperor, illegitimate son of Carloman, king of Bavaria and Italy, was made margrave of Carinthia about 876, and on his father's death in 880 his dignity and possessions were confirmed by the new king of the east Franks, Louis III. He did homage to the emperor Charles the Fat in 882, and spent the next few years in constant warfare with the Slavs and the Northmen. In 887, however, Arnulf identified himself with the disgust felt by the Bavarians and others at the incapacity of Charles the Fat. Gathering a large army, he marched to Tribur; Charles abdicated and in 888 the Germans recognized Arnulf as their king, a proceeding which L. von Ranke describes as "the first independent action of the German secular world." Arnulf's real authority did not extend far beyond the confines of Bavaria, and he contented himself with a nominal recognition of his supremacy by the kings who sprang up in various parts of the empire. He continued the struggle with the Northmen in 891, and gave effective aid to

Zvatorpluk, king of Moravia, in his struggle with the nobles. Invited by Pope Formosus to deliver him from the power of Guido III., duke of Spoleto, who had been crowned emperor, Arnulf went to Italy in 894, but after storming Bergamo and receiving the homage of some of the nobles at Pavia, he was compelled by desertions from his army to return. In the next three years he succeeded in establishing his illegitimate son, Zwentibold, as king of the district afterwards called Lorraine. The restoration of peace with the Moravians and the death of Guido prepared the way for a more successful expedition in 895 and Arnulf was crowned emperor by Formosus in Feb. 896. He then set out to establish his authority in Spoleto, but on the way was seized with paralysis. He returned to Bavaria, where he died in Dec. 899, and was buried at Regensburg. He left, by his wife Ota, a son Louis surnamed the Child.

AROLSEN, a town of Germany, in the Prussian province of Hesse-Nassau, formerly capital of the principality of Waldeck, 25 mi. N.W. of Cassel, with which it is connected by rail via Warburg. Pop. 2,564. Arolsen is the birthplace of the sculptor C. Rauch, and of the painters Wilhelm and Friedrich von Kaulbach.

ARONA, a town in Piedmont, Italy, province of Novara, on Lake Maggiore, 3 mi. from its southern extremity, 23 mi. N. of Novara, and 42 mi. N.W. of Milan by rail on the Simplon line. Pop. (1936) 5,667 (town), 8,632 (commune). On a hill to the north a colossal bronze statue of S. Carlo Borromeo (born here 1538) was erected in 1697.

ARORA: *see* CASTE.

AROSA, a climatic station of Switzerland, situated at a height of 6,000 ft. in the high valley of the Plessur, south-east of Chur Here, among extensive pine forests (remnants of which still shelter the valley), a village has existed from the 14th century. The extension of the tourist industry and the development of winter sports have made it one of the best-known Alpine resorts.

ARPEGGIO, in music, the playing of the notes of a chord, not simultaneously but in succession, as on a harp.

ARPEGGIONE, a musical instrument whose nature is indicated by its alternative name of guitar violoncello; that is to say, it was shaped like a guitar but played with a bow, being about the size of a viol da gamba or small violoncello. It was invented by G. Staufer, of Vienna, in 1823, but was never taken up and is now remembered only by reason of the fact that Schubert wrote a sonata for it.

ARPI (Gr. Ἀργύριππα), ancient city, Apulia, 20m. W. of the coast and 5m. N. of the modern Foggia. Legend attributes its foundation to Diomedes, and the figure of a horse on its coins shows the local importance of horse-breeding in early times. Its territory extended to the sea, and Strabo says that from the extent of the city walls one could gather that it had been one of the greatest cities of Italy. As a protection against the Samnites Arpi became an ally of Rome and remained faithful until after the battle of Cannae, but Fabius captured it in 213 B.C., and it never recovered its former importance.

ARPINO (anc. ARPINUM), a town of Lazio, Italy, in the province of Frosinone, 1,475ft. above sea-level; 12m. by rail N.W. of Roccasecca, a station on the older railway from Naples to Rome. Pop. (1936) 2,613 (town), 10.564 (commune). Arpino occupies the lower part of the ancient Volscian town finally taken from the Samnites by the Romans in 305 B.C. It received full civic privileges in 188 B.C. with Formiae and Fundi. The finely preserved polygonal walls are among the best in Italy, 11ft. high in places and 7ft. wide at the top. A single line of wall, with mediaeval round towers at intervals, runs on the north side from the present town of Civita Vecchia (2,055ft.), site of the old citadel. Below Arpino, in the valley of the Liris, lies the church of S. Domenico, on the site of the villa in which Cicero was born and often lived. The painter Giuseppe Cesari (1560–1640), more often known as the Cavaliere d'Arpino, was also born here.

See O. E. Schmidt, *Arpinum, eine topographisch-historische Skizze* (Meissen, 1900).

ARQUA PETRARCA, village of Venetia, Italy, 3m. S.W. of Battaglia. Pop. (1936) 684 (town), 2,487 (commune). Petrarch lived his last few years and died here in 1374. Near Arqua. on the banks of the small Lago della Costa, is the site of a prehistoric lake village.

ARQUATA SCRNIA, village, province of Alessandria, Italy, from which it is 20 miles S S.E. by rail. Pop. (1936) 2,485 (commune 4,149). It is the junction of the lines to Genoa from Turin and Milan, and was the supply base for British forces in Italy (1917–1919). Two miles north are the ruins of Libarna, a Roman town on the Via Postumia from Genua (Genoa) to Placentia (Piacenza), an amphitheatre, a theatre, streets and houses have been found. The town was rectangular, and buildings found belong to the 1st or 2nd centuries A.D. For full details *see* Moretti in *Not. Scavi,* 1914, 113 *sqq.;* Barocelli, *ib.* 1922, 362 ***seq.***

ARQUEBUS, also called HARQUEBUS, HACKBUT, etc., a firearm of the 16th century, the immediate predecessor of the musket. The word itself is certainly to be derived from the German *Hakenbühse* (mod. *Hakenbüchse, cf.* Eng. *hackbut* and *hackbush*), "hook gun." The French *arquebuse* and Italian *arcobugio, archibugio,* often and wrongly supposed to indicate the hackbut's affinity with the crossbow ("hollow bow" or "mouthed bow"), are popular corruptions, the Italian being apparently the earlier of the two and supplanting the first and purest French form *haquebut.* Previous to the French wars in Italy, hand-gun men and even arbalisters seem to have been called arquebusiers, but in the course of these wars the arquebus or hackbut came into prominence as a distinct type of weapon. The Spanish arquebusiers, who used it with the greatest effect in the Italian wars, notably at Bicocca (1522) and Pavia (1525), are the originators of modern infantry fire action. Filippo Strozzi made many improvements in the arquebus about 1530, and his weapons were effective up to four and five hundred paces. He also standardized the calibres of the arquebuses of the French army, and from this characteristic feature of the improved weapon arose the English term "caliver." In the latter part of the 16th century (c. 1570) the arquebus began to be displaced by the musket.

ARQUES-LA-BATAILLE, village of northern France, in the department of Seine-Inférieure, 4 mi. S.E. of Dieppe by the Western railway. Pop. (1936), 2,269. Arques is situated near the confluence of the rivers Varenne and Bethune; the forest of Arques stretches to the north-east. The castle, built in the 11th century, was regarded as a menace by William the Conqueror, who besieged and occupied it. It later came into the possession of the English, who were expelled in 1449 after an occupation of thirty years. In 1589 its cannon decided the battle of Arques in favour of Henry IV. In 1869 the castle was made state property.

ARQUIJO, JUAN DE (c. 1564–1623), Spanish poet, belonged to the Italianate school of poetry at Seville. A delicate simplicity characterizes his *Sonetos* (ed. J. Colon y Colon, Seville, 1841) and *Poesias* (ed. A. de Castro, 1854).

ARRACK, RACK or **RAK,** a generic name applied to a variety of spirituous liquors distilled in the Far East. According to some authorities the word is derived from the Arabic *arak* (perspiration), but according to others *(see* Morewood's *History* of *Inebriating Liquors,* 1834, p. 140) it is derived from the *arecanut,* a material from which a variety of arrack was long manufactured, and is of Indian origin. The liquor to which this or a similar name is applied is (or was, since the introduction of European spirits and methods of manufacture is gradually causing the native spirit industries on the old lines to decay) manufactured in India, Ceylon, Siam, Java, Batavia, China, Korea, etc., and its manufacture still constitutes a considerable industry. The term arrack as designating a distilled liquor does not, however, appear to have been confined to the Far East, as,

in Timkowski's Travels, it is stated that a spirit distilled from koumiss (*q.v.*) by the Tartars, Mongols and presumably the Caucasian races generally, is called arrack, araka or *ariki*. In Ceylon arrack is distilled chiefly from palm toddy, which is the fermented juice drawn from the unexpanded flower-spathes of various palms, such as the Palmyra palm (Borassus flabelliformis) and the cocoa palm (*Cocos nucifera*). At the beginning of the 19th century the arrack industry of Ceylon was of considerable dimensions, whole woods being set apart for no other purpose than that of procuring toddy, and the distillation of the spirit took place at every village round the coast.

On the Indian continent arrack is made from palm toddy, rice and the refuse of the sugar refineries, but mainly from the flowers of the muohwa or mahua tree (*Bassia* latifolia). The mahua flowers are very rich in sugar, and may, according to H. H. Mann, contain as much as 58% of fermentable sugar, calculated on the total solids. Even in modern times the process of manufacture is very primitive, the fermentation as a rule being carried on in so concentrated a liquid that complete fermentation rarely takes place. According to Mann, the total sugar in the liquor ready for fermentation may reach 20%. The ferment employed (it is so impure that it can scarcely be called yeast) is obtained from a previous fermentation, and, as the latter is never vigorous, it is not surprising that the resulting spirit contains, compared with the more scientifically prepared European spirits, a very high proportion of by-products (acid, fusel oil, etc.). The injurious nature of these native spirits has long been known and has been frequently set down to the admixture of drugs, such as hemp (*ganga*), but investigation appears to show that this is not generally the case. The chemical constitution of these liquors alone affords sufficient proof of their inferior and deleterious character.

ARRAH, a town of British India, headquarters of Shahabad district, in the Patna division of Bihar and Orissa. Pop. (1931) 48,922. Arrah is famous for an incident in the Mutiny, when 15 Englishmen and Eurasians, with 50 Sikhs, defended a small building against 2,000 Sepoys and a body of armed insurgents, perhaps four times that number, under Kuav Singh. A British relief force from Dinapur was disastrously repulsed; but they were ultimately rescued, after eight days' fighting, by a small force under Maj. (afterwards Sir) Vincent Eyre.

ARRAIGNMENT, a law term, properly denoting the calling of a person to answer in form of law upon an indictment. After a true bill has been found against a prisoner by the grand jury, he is called by name to the bar, the indictment is read over to him, and he is asked whether he be guilty or not of the offence charged. This is the arraignment.

His plea in answer to the charge is then entered, or a plea of not guilty is entered for him if he stands mute of malice and refuses to plead. If a person is mute by the visitation of God, *i.e.*, deaf and dumb, it will be no bar to an arraignment, provided he is sane and intelligence can be conveyed to him by signs or symbols.

The arraignment is complete when the accused has pleaded.

ARRAN, EARLS OF. The extinct Scottish title of the earls of Arran (not to be confused with the modern Irish earls of Arran —from the Arran or Aran Islands, Galway—a title created in 1762) was borne by some famous characters in Scottish history With the exception of the first earl, Thomas Boyd and James Stewart, all the holders of this title were members of the Hamilton family.

JAMES HAMILTON, 1st earl (1475?–1529), son of James, 1st Lord Hamilton, and of Mary, daughter of James II. of Scotland succeeded to his father's titles and estates in 1479. In 1503 he negotiated the marriage of James IV. with Mary Tudor, and mas created earl of Arran. Arran was intercepted in England on his way home from a mission to France in 1507 and was imprisoned for a short time. In 1513 he was entrusted with the command of a naval expedition against England, but failed lamentably. On his return he found his rival Angus married to the queen dowager and supreme at court, and joined the party of Albany, and was president of the council of regency from 1517 to 1520. In the feuds of these years Arran supported now one party, now another. The most spectacular encounter was in 1520 when the fierce fight between the Hamiltons and the Douglases known as "Cleanse the Causeway" took place in the streets of Edinburgh in 1520. On the proscription of Angus and the Douglases (1528) Arran joined the king at Stirling. He died in 1529.

JAMES HAMILTON, 2nd earl of Arran and duke of Chbtelherault (1515?–75), became heir presumptive to the throne on the death of James V. and the accession of Mary, and was appointed protector of the realm. After arranging for a marriage between Mary and Prince Edward (afterwards Edward VI. of England), he suddenly joined the French party, repudiated the proposed English marriage and repudiated Protestantism. After a first resistance he agreed to share the regency with Mary of Lorraine. The repudiation of the English alliance brought war with England, and the Scots were defeated at Pinkie. He then agreed to the marriage of Mary with the dauphin of France, and in 1554 resigned office. In 1559, however, he joined the Lords of the Congregation and became one of the provisional governors of the kingdom. He was in disgrace and exiled from 1564 to 1569, but on her abdication Mary named him one of the regents for her son James VI. and he returned to Scotland to support the queen's cause. It was not until 1573 that he admitted James's authority and laid down his arms. He died Jan. 22, 1575.

JAMES HAMILTON, 3rd earl (1537–1609), was intended by his father to marry Mary, Queen of Scots. Later on Henry VIII. promised the hand of his daughter Elizabeth as the price of the adherence of Hamilton's father to the English interest. He was immersed in the political factions of the time in Scotland. In 1550 he went to France and received the command of the Scots Guards, but in 1559 was obliged to leave France. On his return to Scotland he became one of the Lords of the Congregation, and was supported by the Protestants as a suitor for Mary's hand. In 1561 he showed signs of insanity and the rest of his life was spent in confinement. He died in 1609.

During the insanity of the 3rd earl, his honours were claimed, and for a short time enjoyed by JAMES STEWART, his cousin, known as earl of Arran from 1581 to 1586. He was the rival of Lennox for the chief power in the country, but both were deprived of office by the raid of Ruthven Aug. 22, 1582, and Arran was imprisoned till September under the charge of the earl of Gowrie. In 1583, however, he assembled a force of 12,000 men against the new government; the Protestant lords escaped over the border, and Arran, returning to power, was made governor of Stirling Castle and in 1584 lord chancellor. The same year Gowrie was captured through Arran's treachery and executed after the failure of the plot of the Protestant lords against the latter's government. He now obtained the governorship of Edinburgh Castle and was made provost of the city and lieutenant-general of the King's forces. Arran's tyranny and insolence, however, stirred up a multitude of enemies and caused his rapid fall from power. On account of the murder of Lord Russell on the border in July 1585, of which he was accused by Elizabeth, he was imprisoned at the castle of St. Andrews, and subsequently the banished lords with Elizabeth's support entered Scotland, seized the government and proclaimed Arran a traitor. He fled in November, and from this time his movements are furtive and uncertain. In 1586 he was ordered to leave the country, but it is doubtful whether he ever quitted Scotland. He contrived secretly to maintain friendly communication with James, and in 1592 returned to Edinburgh, and contrived to get reinstated in the court and kirk. His unscrupulous and adventurous career was terminated towards the close of 1595 by his assassination near Symontown in Lanarkshire by Sir James Douglas (nephew of his victim the earl of Morton), who carried his head in triumph on the point of a spear through the country.

ARRAN, the largest island of the county of Bute, Scotland, at the mouth of the Firth of Clyde. Its greatest length, from the Cock of Arran to Bennan Head, is about 20m., and the greatest breadth—from Drumadoon Point to King's Cross Point—is 11m. Area 165sq m. Pop. (1921) 8,294.

The scenery of Arran is very fine, and the geological structure complex. The greatest elevations are found in the north,

where Goatfell reaches 2,866ft. The name of this hill is said to be a corruption of the Gaelic Goadh *Bhein,* "Mountain of the Winds." It belongs to the series of intrusive igneous rocks of Tertiary age—granites—which occupy most of the northern half of the island and form its grandest natural features. These rocks are partly surrounded by an incomplete ring of the oldest rocks in the island—slate, mica-schists, and grits—while in the south the rocks are mainly Triassic, the Sedimentary rocks, however, being metamorphosed or broken at many points by volcanic intrusions. Many beautiful glens, notably Glen Rosa and Glen Sannox, score the flanks of the mountains, and Loch Ranza, an inlet in the north, is one of the finest sea-lochs in Scotland. The streams or "waters," as they are called, are generally hill burns, and they and their small mountain-lochs carry trout. Blackcock and grouse are numerous, and there are a few red deer. Cattle and sheep are raised in considerable numbers. The sea fisheries, centring on Loch Ranza, are of some importance. Brodick is the chief village in Arran; most of the dwelling-houses have been built at Invercloy close to the pier. Three miles south is Lamlash, on a fine bay so completely sheltered by Holy Island as to form an excellent harbour. Four miles north lies the village of Corrie, taking its name from a rugged hollow in the hill of Am Binnein (2,172ft.) which overshadows it. Daniel Macmillan (1813–1857), the founder of the publishing firm of Macmillan and Co., was a native of Corrie. Steamers from Glasgow and Ardrossan communicate with Brodick, Lamlash, Whiting Bay, Corrie and Loch Ranza, especially in summer when the island receives many visitors.

About 1½m. east of Lamlash village lies Holy Island, 1¾m. long, nearly ¾m. wide, and its finely marked basaltic cone rises to a height of 1,030ft. St. Molios, a disciple of St. Columba, founded a church near the north-west point. In the saint's cave on the shore may be seen the rocky shelf on which he made his bed. Off the south-east coast, 1m. from Port Dearg, lies the pear-shaped isle of Pladda on which are a lighthouse and telegraph station from which the arrival of vessels in the Clyde is notified to Glasgow and Greenock.

Standing stones, cairns and other antiquities occur near Tormore, on Machrie Bay, Lamlash, and other places. The Norse raiders found a home in Arran for a long period until the defeat of Haakon V. at Largs (1263) compelled them to retire. Robert Bruce found shelter in the King's Caves on the western coast. From the point still known as King's Cross he crossed over to Carrick, in answer to the signal for the supreme effort. Ruins in Glen Cloy bear the name of Bruce's Castle, in which his men lay concealed. On the southern arm of Loch Ranza stands a picturesque ruined castle said to have been his hunting-seat.

ARRANGEMENT, DEED OF, an arrangement under written instrument by a debtor for the benefit of the general body of his creditors for the discharge of his liability. It is not binding on creditors who do not assent. Under the Deeds of Arrangement Act, 1914, such deeds must be registered at the supreme court within seven days of their execution. The majority of creditors must assent within 21 days after registration before a deed can be declared valid. The trustee must give and maintain security and furnish full periodical accounts. If the deed is not really for the benefit of the creditors, it may be avoided at any time. Provisions are included regarding the trustee and his office. As to composition or scheme of arrangement in bankruptcy, *see* BANKRUPTCY.

ARRANGEMENTS, in music: *see* TRANSCRIPTIONS.

ARRANT, a word at first used in its original meaning of wandering, as in "knight-errant" (Lat. *errare,* to wander); thus an arrant or itinerant preacher, an arrant thief, one outlawed and wandering at large; the meaning easily passed to that of self-declared, notorious, and by the middle of the 16th century was confined to words of opprobrium and abuse, an arrant coward meaning thus a self-declared, downright coward.

ARRAS, northern France, chief town of the department of Pas-de-Calais, 38 mi. N N E. of Amiens on the railway between that city and Lille. Pop. (1936) 31,410. Arras is situated on the right bank of the Scarpe, at its junction with the Crinchon, which skirts the town on the south and east.

Most of the town was destroyed by four years of bombardment during World War I. The Hôtel de Ville, the cathedral and the Abbaye de St. Vaast were among the ruins. For details of its military and strategic importance see ARRAS, BATTLE OF. During World War II also, heavy fighting and bombing took place in this area.

Its industrial establishments include oilworks, dyeworks and breweries, and manufactories of hosiery, railings and other ironwork, and of oilcake. For the tapestry manufacture formerly flourishing at Arras see TAPESTRY. The trade of the town is facilitated by the canalization of the Scarpe, the basin of which forms the port. It is the seat of a bishop and a prefect and has tribunals of first instance and of commerce as well as a chamber of commerce.

HISTORY

Before the Christian era Arras was the chief town of the Atrebates, from whose name the word Arras is derived. It became important under Roman rule, and shared the fortunes of north-east Gaul during the troubles of the 5th century. Its bishopric, promoted by St. Vedast (Vaast) was soon transferred to Cambrai, but brought back to its original seat about 1100. As the chief town of Artois, Arras passed to Baldwin I., count of Flanders, in 863. The woollen manufacture was established there at an early date, and a commune was founded early in the 12th century, but the earliest known charter only dates from about 1180; owing to the importance of Arras, this soon became a model for many neighbouring communes. When Philip Augustus, king of France, married Isabella, niece of Philip, count of Flanders, Arras came under the rule of the French king, who confirmed its privileges in 1194. As part of Artois it came in 1237 to Robert, son of Louis VIII., king of France, and in 1384 to Philip the Bold, duke of Burgundy, who promised to respect its privileges. Anxious to recover the city for France, Louis XI. placed a garrison therein after the death of Charles the Bold, duke of Burgundy, in 1477. This was driven out by the inhabitants, and Louis then stormed Arras, razed the walls, deported the citizens, whose places were taken by Frenchmen, and changed the name to Franchise. The successor of Louis, Charles VIII. restored the city to its former name and position, and as part of the inheritance of Mary, daughter and heiress of Charles the Bold, it was contended for by the French king and his rival, the German king, Maximilian I. The peace of Senlis in 1493 gave Arras to Maximilian, and in spite of attacks by the French, it remained under the rule of the Habsburgs until 1640. Taken in this year by the French, this capture was ratified by the peace of the Pyrenees in 1659, and henceforward it remained part of France. It suffered severely during the French Revolution, as well as during World Wars I and II.

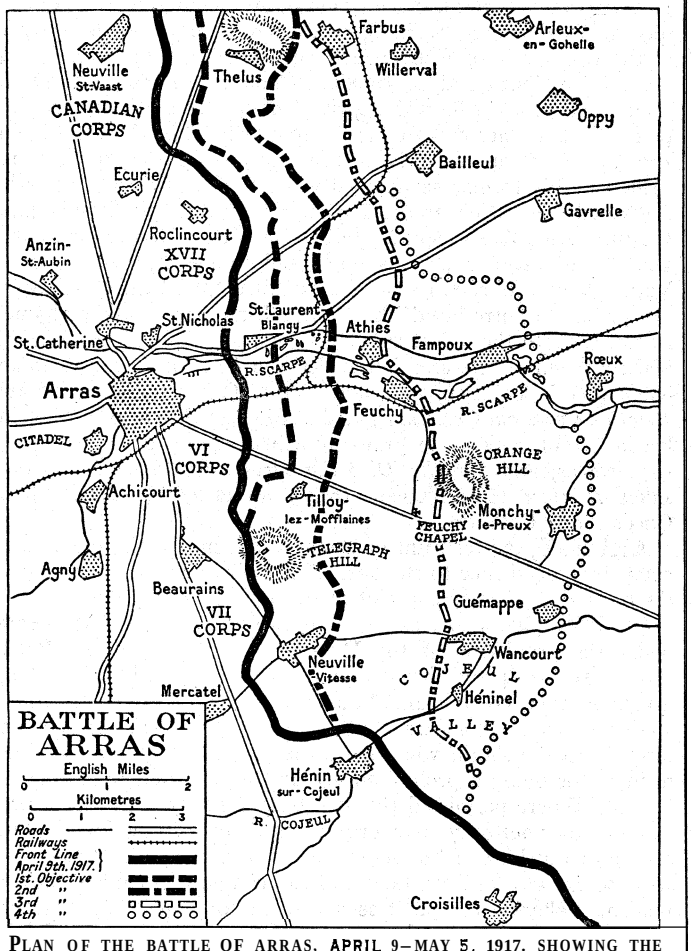
See E. Lecesne, *Histoire d'Arras jusqu'en 1789* (Arras, 1880); Arras *sous* la Rdvolution (Arras, 1882–83).

ARRAS, BATTLE OF. The great battles which opened the campaign of the Allies in 1917 on the Western Front were the direct outcome of two main causes; the first was the strategical position resulting from the battle of the Aisne in 1914, and the second the tactical position resulting from the battle of the Somme in 1916.

The former placed the bulk of the German forces in the West in the huge salient Nieuport–Noyon–Verdun, and the second *a* considerable portion of these forces in the smaller salient Arras–Gommecourt–Morval. The first offered considerable possibilities for the Allies to get in a right and left hand blow on Valenciennes and Mézières, the main centres of the German lateral communications, and the second of similar blows in the direction of Quéant against the northern and southern flanks of the German VI. and I. Armies. If it had been possible to bring off this last operation successfully, such a debacle of the German forces would have resulted that not only would the advance of the British armies have threatened Valenciennes, but the rush of German reserves to stop the gap would have withdrawn pressure from before the French about Reims, and would probably have enabled them to advance on Mézières.

Alternative Plans.—In June 1916 a plan, known as the Blaireville project, was prepared, the object of which was to strike at the Germans between Monchy-au-Bois and Beaurains

during the later stages of the battle of the Somme, but on account of the casualties sustained during the early stages of this battle this project was abandoned. In October the project was revived and its scope extended. A simultaneous offensive on all fronts was suggested, in which, whilst the main attack was to be made by the British, a subsidiary attack was to be carried out by the French in the neighbourhood of Reims. In October the British



PLAN OF THE BATTLE OF ARRAS, APRIL 9–MAY 5, 1917. SHOWING THE OBJECTIVES GAINED

This battle opened the Allied spring offensive in 1917. Although an appreciable advance was made on a front of 15 miles, and many important German positions taken, the cost of breaking through the strong German entrenchments was heavy. Trench defences had been perfected, and in addition to areas of barbed wira, the Germans had made strong points by erecting circular concrete huts, known as "pill-boxes," each armed with machine guns

plan included the following operations: At the earliest date possible (about March 15, 1917) the IV. and V. Armies were to reassume the offensive and the III. to strike between Beaurains and Arras, occupy Monchy-le-Preux, and by pushing south-east, deny to the Germans the Cojeul Valley as a line of retreat, and, if possible, that of the Sensée also. Meanwhile the I. Army was to attack north of the Scarpe and form a defensive flank.

In December General Nivelle, who had recently been appointed to the chief command of the French Armies, objected to the subsidiary part to be played by the French, and put forward a plan in which the decisive blow was to be delivered from the Aisne. The task of the British, according to this plan, was to deliver an offensive in Artois which would draw in large forces of the enemy, and so reduce opposition on the French front.

From October onwards vast preparations, which were impossible to disguise, were put in hand. Railways and roads were extended, dumps formed, gun emplacements built, aerodromes levelled and the greater portion of the underground quarries of Arras, St. Sauveur, and Ronville opened up and made ready in every detail to accommodate two divisions which were to reinforce the attack by passing underground. This sudden and unexpected reinforcing of the front was to be the surprise of the battle.

Preliminaries. — Meanwhile a hostile operation was begun which bid fair to filch from the British the tactical advantage won during the preceding summer. Towards the end of February it became apparent that the Germans intended to evacuate the Goinmecourt salient, and the recent construction of the Hindenburg line suggested a rounding off of the right angle between Arras and Craonne. If this could be successfully accomplished, not only could the tactical blow against the Gommecourt salient be avoided, but the strategical blows against Valenciennes and Mézières be impeded or delayed. The problem which now faced the Allies was a threefold one, namely, whether to hit at once, or recast their plan, or finish their preparations and carry it out as originally intended. As weather impeded the first and want of time the second, the third was adopted with the following modifications. The III. Army was now to play the leading part, and by attacking north and south of the river Scarpe with three corps, whilst holding one corps and the Cavalry Corps in reserve, was to penetrate the German defences and by advancing on Cambrai turn the Hindenburg line from Heninel and Marcoing. The I. and V. Armies were to operate on the left and right flanks of the III. Army.

The battle front, some 15m. in width, extended from just north of Croisilles to a little south of Givenchy-en-Gohelle, at the northern foot of the Vimy ridge. This ridge which rises to a height of 475ft. above sea level dominated the whole battlefield from the north. From its summit overlooking Lens the ground falls away to the river Scarpe, between which and the Cojeul river it is in nature undulating. In the forward zone of defence the Germans had dug three lines of trenches, each of which was heavily wired. Then four to five miles east of this system was dug the Drocourt–Quéant line, which at the date of the battle was still unfinished and but lightly wired.

At the beginning of April the German reserves numbered some 600,000 men, and consequently the success of the battle depended on the time it would take to penetrate the Drocourt-Quéant line. If this line could be broken within 48 hours of the initial attack, the intervention of these reserves might be avoided and so large a gap created that eventually great numbers would be drawn towards it and away from the French offensive in the south, where the main blow was to fall. This time could only have been gained by the employment of a considerable number of tanks, or by a preliminary bombardment of not more than 24 hours' duration. After denuding the training grounds of both France and England, only 60 tanks could be assembled. Therefore the only alternative was a hurricane bombardment, and though the III. Army for long suggested such an operation, G.H.Q. insisted on three weeks' systematic wire cutting, culminating in a general bombardment of several days' duration. During this period 2,700,000 shells were fired, and though the wire was destroyed all chance of surprise vanished.

Plan of Attack. — The final plan of attack was as follows: —

(a) III. Army (Gen. Allenby). The VI. and VII. Corps were to attack south of the Scarpe between Arras and Mercatel. Their objective contained two formidable lines of defence, namely, the Cojeul–Neuville Vitasse–Telegraph Hill–Tilloy-lez-Mofflaines lines, and the Feuchy Chapel-Feuchy line. South of these were some 3,000yd. of the Hindenburg line and east the strong position of Monchy-le-Preux, which dominated the whole of the surrounding country. The XVII. Corps was to continue the front of attack north of the Scarpe.

(b) I. Army (Gen. Horne). The Canadian Corps and the 13th Bde. of the 5th British Div. were to attack the Vimy heights, a position considered one of the strongest in France.

(c) V. Army (Gen. Gough). The Australian Corps and the V. Corps were to operate on the south of the III. Army. The position of this Army was a most difficult one, as the destruction of the roads and the bad weather had rendered it impossible to move forward much artillery, a *sine* qua *non* of the battles of this period.

(d) The whole of the above operations was to be considered as

a preliminary step to the advance of the Cavalry Corps and the XVIII. Corps south of the Scarpe. These corps were to break through at Monchy-le-Preux and advance eastwards through the Drocourt–Quéant line.

Opening of the Attack.—On April 9, at 5.30 A.M., the general attack was launched under cover of a magnificently timed creeping barrage, and within 40 minutes the whole of the German first line system, except a small portion of the Vimy ridge, was captured. About Tilloy-lez-Mofflaines and Telegraph Hill tanks accounted for a good many of the enemy and then proceeded eastwards to assist in the reduction of the Blue line and such parts of the Brown line as they were able to reach during daylight. By noon the greater part of the second objective had fallen and a number of hostile batteries were captured. By the close of the day practically the whole of the objectives north of the Scarpe had been taken, but south of this river the third objective had only been penetrated in places, and the fourth objective remained untouched.

During the night of the 9th–10th, the 37th Div., which had been held in reserve, advanced to the northern slopes of Orange Hill; and during the morning of the 10th this advance was followed by a general attack on the Brown line which enabled the 37th Div. to reach the outskirts of Monchy-le-Preux, which on the morning of the 11th was captured by this division assisted by tanks. Whilst these operations were in progress the Germans strongly reinforced their front, and so stubborn had become the opposition that to relieve the pressure on the VII. and VI. Corps fronts the V. Army was ordered to attack on the morning of the 11th from the direction of Bullecourt northwards. At 4.30 A.M. 11 tanks, followed by the 62nd Div. on the left and the 4th Australian Div. on the right, stormed the Hindenburg line, but on account of the width of the trenches and inadequate artillery support, only two tanks, co-operating with the Australians, were able to cross this line. These led the attack as far as Riencourt-lez-Cagnicourt when a strong German counter-attack drove the Australians back; meanwhile the attack of the 62nd Div. had been completely held up on the southern outskirts of the village of Bullecourt.

On the 12th, Heninel and Wancourt were captured by the 21st and 56th Div., and minor operations were carried out on the 13th and 14th when the main offensive of the III. and V. Armies terminated, 13,000 prisoners and 200 guns having been captured. Pressure, however, was not altogether relaxed, as on the 16th the French launched their grand offensive on the Aisne, and to assist in this operation it was considered necessary to hold the enemy. Though this attack proved a complete fiasco, pressure was maintained on the Arras Front, and the line pushed forward to include the villages of Guémappe, Gavrelle, and Arleux-en-Gohelle. On May 5 the battle of Arras was brought to a close. From April 14, 6,000 additional prisoners and some 50 guns were taken, but British casualties had been severe, totalling, between April 9 and May 5, no less than 132,000 officers and men killed, wounded, and missing.

Results of the Battle.—The failure of the Allied spring offensive may be traced to various causes, the most important being: The exhaustion of the French due to the battles of Verdun and the Somme in 1916, the total lack of surprise on both the British and French fronts; the distance apart of the two battlefields, and the comparative narrowness of the fronts attacked when compared with the strength of the German reserves.

(J. F. C. F.)

ARRAY, orderly arrangement, particularly the drawing up of an army in position of battle. From the 13th century onwards in England "commissions of array" issued from the King for the levy of military forces (*see* MILITIA). In English law the term is used for the setting in order, name by name, of the panel of a jury, which may be challenged as a whole, "to the array," or individually, "to the polls."

ARREARS, the whole or any part of a debt or other obligation which remains unpaid after the expiration of the time set for its payment. In financial matters it relates particularly to past dividends due on cumulative preferred stock, in which case it is the same as cumulated or accumulated dividends (*q.v.*) (*see* CUMULATIVE PREFERENCE SHARE).

ARREBOE, ANDERS-KRISTENSEN (1587–1637), Danish poet, was born in the island of Aeroc on Jan. 2, 1587, and died at Vordingborg, Zealand, on March 7, 1637. After studying at the University of Copenhagen he was appointed to preach at the Danish Court, and, in 1618, was nominated bishop of Drontheim; but in 1622 he was deprived of his bishopric by the Imperial Diet, on account of his dissipated habits. During his enforced retirement into private life Arreboe appears to have repented of his former scandalous way of life; he began to write a rhymed translation of the Psalms, which was published under the title, *David's Psalter Sangviis udsat* (Copenhagen, 1623 and 1662), and in 1626 he was appointed to be a priest again, in Vordingbord. Arreboe is sometimes called "the father of Danish poetry." He introduced the Alexandrine and double rhymed hexameter into the literature of his country, his best known work being a poem on the creation, called the *Hexaemeron rhythmico-danicum* (Copenhagen, 1641 and 1661). Other works of his are, *Relation i vers om Christian IV. des sejr over de Svenske* (Copenhagen, 1611), a poem in praise of Christian IV.'s victories over the Swedes, and *Sorgelig Digt om Dronning Annae Catharinae salige Hcnfart* (Copenhagen, 1612), an elegy on the death of Queen Anne Catherine.

ARREST, the restraint of a man's person, for the purpose of compelling obedience to the law. It is defined as the execution of the command of some court of record or officer of justice.

In Civil Cases.—Arrest in civil cases is now abalished save under the provisions of the Debtors Act 1869 and the Bankruptcy Act 1914 and for contempt of court. It is effected by attachment or committal. Attachment is appropriate for neglecting to do what a person was ordered to do, and the writ is directed to the sheriff who lodges the prisoner in gaol. Commitment is for doing a prohibited act and is executed by the court tipstaff. Where permitted the arrest must be by virtue of a precept or order out of some court, and must be effected by corporal seizing or touching of the defendant's body, or as directed by the writ, *capias et attachias*, take and catch hold of. And if the defendant make his escape it is a *rescous*, or rescue, and attachment may be had against him, and the bailiff may then justify the breaking open of the house in which he is, to carry him away.

Arrests on mesne process in any action before judgment obtained, were abolished by the Debtors Act 1869, s. 6; an exception, however, is made in cases in which the plaintiff proves, at any time before final judgment, by evidence on oath to the satisfaction of a judge of one of the superior courts, that he has a good cause of action to the amount of £50, that there is probable cause to believe that the defendant is about to quit the country, and that his absence will materially prejudice the plaintiff in prosecuting his action. In such cases an order for arrest may be obtained till security to the amount of the claim be found. Power is given by the Bankruptcy Act 1914 to arrest a debtor under certain circumstances where there is probable reason for believing he is about to abscond or remove his goods.

The following persons are privileged from arrest: (1) Members of the royal family and the ordinary servants of the king or queen regnant, chaplains, lords of the bedchamber, etc. This privilege does not extend to servants of a consort queen or dowager; (2) Peers of the realm, peeresses by birth, creation or marriage, Scottish and Irish peers and peeresses; (3) Members of the House of Commons during the session of parliament, and for a convenient time (40 days) before and after it. Members of Convocation appear to have the same privilege. (4) Foreign ambassadors and their "domestics and domestic servants." Temporary privilege from arrest in civil process is enjoyed by barristers travelling on circuit, by parties, witnesses or attorneys connected with a cause, and by clergymen whilst performing divine service. The arrest of any privileged person is irregular ab *initio*,

and the party may be discharged on motion. There is no privilege from arrest in the case of contempt of a criminal nature such as interference with the course of justice.

Civil arrest cannot be made on a Sunday, and if made it is void (Sunday Observance Act 1676); but it may be made in the night as well as in the day.

In Criminal Cases.—All persons whatsoever are, without distinction, equally liable to this arrest, save the Sovereign and a foreign sovereign. In spite of the assertions of writers on international law there is no diplomatic immunity from the criminal law. The statute of Anne of 1708 refers to civil matters. The privilege of sanctuary was abolished by a statute of James I., and although that statute was repealed in 1863, the privilege has not been revived.

Arrest may be made (1) without a warrant (a) by a peace officer, (b) by a private person, and (2) by warrant. As to (1) a private person and *a fortiori* a peace officer, if a felony is committed or attempted to be committed in his presence is bound to arrest the felon, and may also arrest without a warrant a person committing a breach of the peace. A peace officer would include justices of the peace, sheriffs, coroners and constables, besides other persons appointed under statutory powers. The personal po er of justices is confined to offences committed in their presence. The difference between other peace officers and a private person in their power of arrest without warrant in the case of a felony not committed in their presence lies in the fact that, whereas a peace officer may justify the arrest if he has a reasonable cause for believing that a felony has been committed and that the accused was guilty of that felony, in the case of a private person it must be shown that there has been a felony actually committed and that the private person had reasonable grounds to believe that the person arrested or given into custody committed that felony. These are their powers at common law, but under very many statutes power is given to private persons, but more generally to constables, to arrest without warrant. Instances are to be found in the Night Poaching Act 1828, the Malicious Damage Act 1861, under Coinage and Customs Acts, and more recently under the Criminal Law Amendment Act 1912 and the Dangerous Drugs Act 1920, but the tendency of modern legislation has been to confine this power of arrest to constables. In the case of misdemeanours there is no common law power of arrest without a warrant, although both peace officers and private persons have a right to arrest in the case of actual breach of the peace, and probably where such breach or its renewal is immediately apprehended. As to (2) a warrant for arrest granted by a justice of the peace may only be executed by a peace officer, and its execution is justified by its issue, whether the offence has been committed or not. The officer executing the warrant is entitled to break open doors and effect the arrest, which may be done at any time of the day or night, and certainly in the case of indictable offences and breaches of the peace can be executed on a Sunday, and, in arresting, he may use all reasonable and necessary force. Formerly there were local limits to a warrant except in the case of warrants issued by a metropolitan police magistrate, being executed by a metropolitan police officer, and "backing" by local justices was required; further, it was necessary for the constable to be armed with the warrant at the time of making the arrest. But now under the Criminal Justice Act 1925 s. 31 (3) any warrant lawfully issued by a justice for apprehension of a person charged with an offence punishable on summary conviction or on indictment may be executed in any county or place in England or Wales outside the jurisdiction of the justice by whom it was issued as if it had been originally issued by a justice having jurisdiction in that county or place, and the execution may be effected either by any person to whom the warrant was originally directed or by any constable of that county or place. Further, by s. 44 of the same Act, any warrant lawfully issued by a justice for apprehending any person charged with any offence may be executed by any constable at any time, notwithstanding that the warrant is not in his possession at the time; but the warrant, on the demand of the person apprehended, is to be shown as soon as practicable after his arrest. *(See* also BAIL.)

The old common law arrest by hue and cry has long since been abolished by statute, save in the case of the sheriff and *posse comitatus* under the Sheriffs Act 1887. By the Fugitive Offenders Acts 1881 and 1915 provision was made for the arrest in the United Kingdom of persons committing treason, and certain felonies, misdemeanours and crimes in any of the British colonies and protectorates and vice versa; as to the arrest of fugitives in foreign countries *see* EXTRADITION. The remedy for a wrongful arrest is by an action for false imprisonment.

For arrest of a ship *see* ADMIRALTY JURISDICTION. *(See* also ATTACHMENT.) (W. DE B. H.)

United States.—The law of arrest in the United States is the outgrowth of the English system and follows it very closely at most points.

In criminal cases arrests may be made with a warrant, by a peace officer without a warrant, or by a citizen without a warrant for felony actually committed. The right to arrest includes the right to search the person but not the premises where the arrest is made. The person arrested must be arraigned as prescribed in the warrant or, if arrested without a warrant, immediately before the nearest appropriate sitting magistrate. Diplomatic representatives of foreign powers, legislators, State and Federal, witnesses actually under subpoena, jurors, etc., are exempt from arrest in most instances. The power of the arresting officer is limited to the State or local boundary of his official district unless enlarged by legislation.

Civil Cases. While imprisonment for debt has been much limited in all jurisdictions the right in some form to enforce civil liability by imprisonment exists in nearly every State. Such remedy consists, usually, of (1) preliminary arrest, and (2) final arrest or execution against the person.

(1) The right to preliminary arrest ordinarily exists in such tort actions as involve injury to the person and fraud and contract actions where the breach of contract is accompanied by fraud or violation of a fiduciary relationship. Preliminary arrest may also be granted where, because of facts extrinsic to the cause of action, such as the intent of the debtor to leave the jurisdiction, the ultimate power of the court to enforce its mandates may be imperilled.

(2) Final arrest or execution against the person may generally issue in a case where the right to preliminary arrest existed.

In order to obtain preliminary arrest in a civil case an application must be made to the court upon affidavit or petition, governed by the provisions of the statute of the particular jurisdiction, and upon a bond or undertaking to indemnify the defendant if the arrest proves unauthorized or the cause of action not sustained. The order of arrest or warrant issued upon it must be directed to an appropriate officer such as the sheriff or marshal. Final arrest is not bailable except to the jail limits but in civil cases may be discharged by payment of the judgment. Commitment for contempt of court, or disobedience to court order is not strictly an arrest, although in some instances, as the enforcement of alimony orders, it is used substantially as an execution against the person. The defendant may move to vacate the order as improperly granted or give bail in accordance with the order. (B. RE.)

ARRESTMENT, in Scots law, the process by which a creditor detains the goods or effects of his debtor in the hands of third parties till the debt due to him shall be paid. It is divided into two kinds: (1) Arrestment in security, used when proceedings are commencing, or in other circumstances where a claim may become, but is not yet, enforceable; and (2) Arrestment in execution, following on the decree of a court, or on a registered document, under a clause or statutory power of registration, according to the custom of Scotland. By the process of arrestment the property covered is merely retained in place; to realize it for the satisfaction of the creditor's claim a further proceeding called "furthcorning" is necessary. By old practice, alimentary funds, *i.e.,* those necessary for subsistence, were not liable to arrestment. By the Wages Arrestment Limitation (Scotland) Act, 1870, as amended by the Small Debt (Scotland) Act, 1924, the wages of all labourers, farm-servants, manufacturers, artificers, and work-people are not arrestable except (1) in so far as they exceed 35 shillings per week; but the expense of the arrest,

ment is not to be charged against the debtor unless the sum recovered exceed the amount of the said expense; or (2) under decrees for alimentary allowances and payments, or for rates and taxes imposed by law.

ARRETIUM (mod. AREZZO), ancient city, Etruria, upper valley of Arno, on the Via Cassia, 50m. S.E. of Florentia. The hill top, enclosed by a wall, was the site of the ancient city and the mediaeval citadel, as so often in Italy. Etruscan tombs have been found in the lower part of the modern town, which appears to be on the Roman site. Vitruvius and Pliny speak of the strength of its walls of bricks, and remains have been found belonging, at the earliest, to the 4th century B.C., and probably destroyed by Sulla in 81 B.C. The bricks measured 1½ by 1 Roman foot and ½ foot thick. Many Roman buildings have been found, and the amphitheatre is still visible in the south angle. Arretium aided the Tarquins after their expulsion. It opposed Rome at the end of the 4th and beginning of the 3rd century B.C., but soon sought for help against the Gauls, against whom it was almost a frontier fortress. It was an important Roman base during the Hannibalic Wars, and in 205 B.C. furnished Scipio with quantities of arms and provisions. In 187 B.C. the high road was extended as far as Bononia. Arretium took the part of Marius against Sulla, and the latter settled some of his veterans there as colonists. A considerable contingent from Arretium joined Catiline, and in 49 B.C. Caesar occupied it. C. Maecenas was perhaps a native of Arretium. Its fertility was famous in ancient times, and still more famous was its red pottery (*see* POTTERY AND PORCELAIN: *Roman Pottery*). The museum contains a fine collection of vases and of their moulds and of mediaeval majolica. (See *Studi Etruschi*, I. [1927], 99–127.)

ARRHENIUS, SVANTE AUGUST (1859–1927), one of the founders of the modern science of physical chemistry, was born on Feb. 19, 1859, at the castle of Wijk, near Uppsala in Sweden. The family name derives from the property of Arena. As a young child he showed an extraordinary facility in calculating, and at school distinguished himself by his mathematical ability. At the age of 17 he entered the University of Uppsala, devoting himself to physics in particular, but, finding that the practical instruction in physics there left something to be desired in those days, in 1881 he went to study under Edlund at Stockholm. In 1884 he took his doctor's degree at Uppsala with a thesis entitled *Recherches sur la conductibilité galvanique*. This thesis, which later earned for Arrhenius the Nobel prize, was awarded the lowest "note" which could be granted without a definite refusal. It is divided into two parts, the first dealing with the experimental determination of the electrical conductivity of extremely dilute solutions, and the second with the theory of electrolytic conductivity. This second part expounds his theory of electrolytic dissociation and activity co-efficients (*see* ELECTRICITY, CONDUCTION OF: *Liquids;* and ELECTROLYSIS). It contains some ideas which later investigations have shown to require modification, but forms the foundation upon which all subsequent theories of conductivity of solutions have been built. The revolutionary nature of the theory, which required, for instance, that free sodium ions should exist in a solution of sodium chloride, prevented its being speedily accepted, and it may be said that it was neglected rather than actively opposed.

Arrhenius himself has put on record an anecdote which throws light on the attitude towards his views when they were new: "I came to my professor, Cleve, whom I admired very much, and I said, 'I have a new theory of electrical conductivity as a cause of chemical reactions.' He said, 'This is very interesting,' and then he said. 'Good-bye.' He explained to me later that he knew very well that there are so many different theories formed, and that they are almost all certain to be wrong, for after a short time they disappeared; and therefore, by using the statistical manner of forming his ideas, he concluded that my theory also would not exist long."

In 1887 he published a much revised, extended and consolidated version of his theory of electrolytic dissociation, entitled "Über die Dissociation der in Wasser gelosten Stoffe" in the *Zeitschrift fur physikalische Chemie,* which had just been founded. Arrhenius' first thesis had won him the support of Ostwald (*q.v.*), in whose institution he worked in 1886, and in 1887 he entered into an intimate friendship with van't Hoff (*q.v.*). The theories of van't Hoff on osmotic pressure and of Ostwald on the affinity of acids accorded admirably with the views of Arrhenius, and these three friends fought together in unselfish alliance for the new doctrines, which ultimately won general acceptance. Arrhenius had a genius for friendship, and in the 40 years between 1887 and his death met practically all the great men of science, and won their affection no less than their regard.

In 1891 Arrhenius declined a professorship at Giessen and was appointed lecturer at the Stockholm university: in 1895 he was elected to a professorship there. From 1887 to 1902 he also fulfilled the office of rector of the university. During this time he was occupied in extending the application of the doctrine of electrolytic conductivity to a variety of problems of chemical action, and also, on the supposition that in certain conditions air conducts electrolytically, to the phenomena of atmospheric electricity. In 1900 he published his *Lärobok i teoretisk electrokemi* (Treatise on theoretical electrochemistry) which was translated into German and English and his *Lehrbuch der kosmischen Physik* (Treatise on Cosmic Physics) appeared in 1903. In the same year he was awarded the Nobel prize for chemistry.

Arrhenius was a man of very wide interests, and about this time he began to turn his attention to problems of the chemistry of living matter. In 1904 he delivered at the University of California a course of lectures designed to illustrate the applications of the methods of physical chemistry to explaining the reactions of toxins and antitoxins. These lectures were published in 1907 under the title *Immunochemistry,* and in 1915 he published further contributions to exact biochemistry under the title *Quantitative Laws* in *Biological Chemistry,* in which he again devoted much attention to toxins. He was also much occupied with problems of cosmogony. In his *Worlds in the Making* (1908), an English translation of *Das Werden der Welten* (1907), he combated the generally accepted doctrine that the universe is tending to what Clausius termed *Warmetod* (death of heat) through exhaustion of all sources of heat and motion, and suggested that by virtue of a mechanism which maintains its available energy it is self-renovating, energy being degraded in bodies which are in the solar state, but elevated or raised to a higher level in bodies which are in the nebular state. He further put forward the conception that life is universally diffused, constantly emitted from all habitable worlds in the form of spores which traverse space for years or ages, the majority being ultimately destroyed by the heat of some blazing star, but some few finding a resting-place on bodies which have reached the habitable stage. He was one of the first to stress the important part which the pressure of light must play in cosmic physics, and pointed out that the repulsion of the tails of comets from the sun could be explained by this pressure. Astronomical problems, especially the question of the habitability of Mars, are discussed in his *Destinies of the Stars* (1918).

With the Nobel prize in 1903 Arrhenius may be said to have received universal recognition as one of the great men of his time. In 1905 he refused a full professorship and private laboratory in Berlin, and was appointed director of the Nobel Institute for Physical Chemistry at Experimentalfaltet, just outside Stockholm, a post which he held until his death on Oct. 1, 1927. In 1910 he was made a foreign member of the Royal Society, and in the course of his later career he received numerous honorary doctorates in both the old and new world, as well as the Davy medal of the Royal Society and the Faraday medal of the Chemical Society. He delighted both to visit his colleagues abroad and to receive his contemporaries and students at his home. A genial humour characterized both his discourses and his private conversation, and few men more than Arrhenius were welcome at scientific discussions in any land.

Besides the books mentioned above Arrhenius wrote *Theories of Solution* (1912). He also published, in 1926, *Erde und Weltall,* a combined and revised reissue of *Das Werden der Welten* and *Der Lebenslauf der Planeten.* A German translation of his original thesis on Galvanic Conduction in Electrolytes was published as

No. 160 of *Ostwald's Klassiker* in 1907. A study of the life and work of Arrhenius, written by Ostwald, appeared in the *Zeitschrift fur physikalische Chemie* in 1909, and there is much about him in Professor Ernst Cohen's study, *Jacobus Henricus van't Hoff*, published in Leipzig in 1912. (E. N. DA C. A.)

ARRHYTHMIA: *see* HEART, DISEASES OF THE.

ARRIA, in Roman history, the wife of Caecina Paetus. When her husband was implicated in the conspiracy of Scribonianus against the Emperor Claudius (A.D. 42) and condemned to death, she resolved not to survive him. She accordingly stabbed herself with a dagger, which she then handed to him with the words, "Paetus, it does not hurt" *(see* Pliny, *Epp.* iii. 16; Martial i. 14; Dio Cassius lx. 16). Her daughter, also called Arria, was the wife of Thrasea Paetus. When he was condemned to death by Nero, she would have imitated her mother's example, but was dissuaded by her husband. She was sent into banishment (Tacitus, *Annals* xvi. 34; Pliny, *Epp.* iii. 11; ix. 13).

ARRIAGA, MANOEL JOSÉ D' (1839–1917), Portuguese politician, was born in Horta, in the Azores, July 8 1839. Educated at the University of Coimbra, he was graduated in law in 1866. Arriaga early showed signs of his Republican sympathies, with the result that his father, an ardent royalist, disinherited him; and as a student he was obliged to support himself by coaching his juniors. He had a distinguished scholastic career, among his appointments being the rectorship of the University of Coimbra, and a professorship at the Lyceum in Lisbon. His political career opened in 1882, when he was elected Republican deputy for Funchal. From 1890 to 1892 he represented Lisbon. During the revolution of 1910 *(see* PORTUGAL) he was a prominent figure on the Republican side; and on Aug. 24 1911, he was elected first constitutional president of the Portuguese Republic. The royalist risings of 1911 and 1912 taxed his strength; and in 1915, feeling no longer able to cope with the difficulties of the situation particularly in face of the coup d'état of May 14, he resigned May 27. He died March 5 1917. His full name was Manoel José d'Arriaga Brun da Silveira e Peyrelongue.

ARRIAM (FEAVIUS ARRIANUS), of Nicomedia in Bithynia, Greek historian and philosopher, was born about A.D. 96, and lived during the reigns of Hadrian, Antoninus Pius and Marcus Aurelius. He was greatly esteemed by Hadrian, who appointed him governor (*legatus*) of Cappadocia (131–137), where he distinguished himself in a campaign against the Alani. This is the only instance before the 3rd century in which a first-rate Roman military command was given to a Greek. Arrian spent a considerable portion of his time at Athens, where he was archon 147–148. In his declining years, he retired to his native place, where he devoted himself to literary work. He died about 180. His biography, by Dio Cassius, is lost.

When young, Arrian was the pupil and friend of Epictetus. He took verbatim notes of his teacher's lectures, which he subsequently published under the title of *The Dissertations* (Διατριβαί), in eight books, of which the first four are extant and constitute the chief authority for Stoic ethics, and *The Encheiridion* (*i.e.*, Manual) *of Epictetus*, a handbook of moral philosophy; this was adapted for Christian use by St. Nilus of Constantinople (5th century), and Simplicius (about 550) wrote a commentary on it which we still possess. The most important of Arrian's original works is his *Anabasis of Alexander*, containing the history of Alexander the Great from his accession to his death. Arrian's chief authorities were, as he tells us, Aristobulus of Cassandreia and Ptolemy, son of Lagus (afterwards king of Egypt), who both accompanied Alexander on his campaigns. Arrian's is the most complete and trustworthy account of Alexander that we possess. Other extant works of Arrian are: *Zndica*, a description of India in the Ionic dialect, including the voyage of Nearchus, intended as a supplement to the *Anabasis; Acies Contra Alanos*, a fragment of importance for the knowledge of Roman military affairs; *Periplus of the Euxine*, an official account written (131) for the Emperor Hadrian; *Tactica*, attributed by some to Aelianus, who wrote in the reign of Trajan; *Cynegeticus*, a treatise on the chase. supplementing that of Xenophon; the *Periplus of the Erythraean Sea*, attributed to him, is by a later compiler. Amongst his lost works may be mentioned: Τὰ μετ' Ἀλέξανδρον, a history of the period succeeding Alexander, of which an epitome is preserved in Photius; histories of Bithynia, the Alani and the Parthian wars under Trajan; the lives of Timoleon of Corinth, Dion of Syracuse and a famous brigand named Tilliborus.

BIBLIOGRAPHY.—Complete works ed. F. Duebner (1846); *Anabasis*, C. Abicht (1889); with notes, C. W. Krueger (1835), C. Sintenis (1867), C. Abicht (1875); *Scripta Minora*, R. Hercher and A. Eberhard (1885); A. J. Roos, i., containing the *Anabasis* (Teubner series, 1907). English translations: *Anabasis*, Rooke (1812); *Anabasis* and *Indica*, E. J. Chinnock (1893); *Voyage of Nearchus* with the spurious *Periplus*, W. Vincent (1807), J. W. M'Crindle (Calcutta, 1879); *Periplus of the Euxine*, W. Falconer (1805); *Cynegeticus* (W. Dansey) (1831). *See* also E. Bolla, *Arriano di Nicomedia* (1890); E. Schwartz in Pauly-Wissowa's *Realencyklopadie der classischen Altertumswissenschaft* (1896); H. F. ARROL, SIR WILLIAM (1839–1913), British engineer, was born at Houston, Renfrewshire, Feb. 13 1839. In his boyhood he was apprenticed to a smith at Paisley, and worked through several engineering shops until, in 1868, he was able to set up as a boiler-maker. In 1872 he took up construction in steel, and started the Dalmarnock ironworks, becoming an expert in bridge-building.

The Caledonian Railway bridge at Glasgow, the reconstructed Tay bridge (1882–87), Forth bridge (1882–89), the Tower bridge, London, and the Nile bridge at Cairo were among his principal achievements. He was knighted in 1890. He sat in the House of Commons for Ayrshire (S.) as a Unionist member from 1895 to 1906. He died at Ayr Feb. 20 1913.

See Sir Robert Purvis, *Sir William Arrol* (1913).

ARRONDISSEMENT (from Fr. *arrondir*, to make round), in France, an administrative subdivision of a department. It comprises within itself the canton and the commune. It is merely an administrative division and not a complete legal personality with power to acquire and possess. It is the electoral district for the chamber of deputies, and is a judicial district having a court of first instance. It is under the control of a sub-prefect. There are 362 arrondissements in the 87 departments. Each arrondissement has a council, with as many members as there are cantons, whose function is to subdivide among the communes their *quota* of the direct taxes charged to the arrondissement by the general council of the department. *(See* FRANCE.) The cities of Paris and Lyons are divided into local administrative units also termed arrondissements.

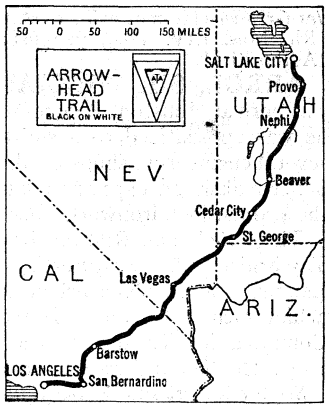
France is also subdivided, for purposes of defence, into five *maritime* divisions, termed arrondissements. They are under the direction of maritime prefects, who, by a decree of 1875, must be vice-admirals in the navy.

BY COURTESY OF WILD FLOWER PRESERVATION SOCIETY

THE COMMON ARROW-HEAD (SAGITTARIA LATIFOLIA), WHICH GROWS IN SHALLOW WATERS OF NORTH AMERICA

ARROW-HEAD *(Sagittaria)*, a group of perennial aquatic or marsh herbs of the water-plantain family *(Alismataceae)*, so named because the leaves of the best known species are characteristically arrow-shaped. The scapes, which rise from tuber-bearing or fleshy knotted root-stocks, are mostly erect though sometimes decumbent and more rarely floating. Though borne on partly submerged stalks, the strongly nerved leaves usually rise conspicuously above the water. The flowers, arranged in whorls of three at the top of the scapes, have three broad white petals alternating with three small green sepals; the fruit is a dense head of small achenes. There are about 30 species, native to temperate and tropical regions, but chiefly American. The common Old-World arrow-head *(S. sagittifolia)*, found in ditches in England and Ireland, is very widely distributed in Europe and Asia. It grows 3ft. to 4ft. high and bears showy white flowers and orbicular achenes. Many profusely

blooming and double-flowered varieties are cultivated in lily ponds and bog gardens. The similar broad-leaved arrow-head (*S. latifolia*), with sharply beaked achenes, grows in shallow water throughout North America except in the Arctic region. Its large starchy tubers, called *wappato*, are used for food by the American Indians. In the lower San Joaquin and Sacramento valleys in California this arrow-head is known as "tule potato," and is often cultivated for food by the Chinese of the district in a manner similar to the cultivation for its starchy tubers of *S. chinensis* (which by most botanists is reduced to the widespread *Sagittaria sagittifolia*) in China. The giant arrow-head (S. montevidensis) sometimes grows 6 ft. tall, with leaf blades 2 ft. long, and bears showy white flowers from 2 in to 3 in. across, blotched with brownish-purple at the base. This handsome species is native in South America from Peru and Chile to Brazil and Argentina, and was first introduced into cultivation in 1883 from seeds sent to England from Buenos Aires. It is now planted in water gardens in the warmer parts of the U.S. and has run wild in slow streams in California and the south Atlantic states.



ARROWHEAD TRAIL, a scenic highway extending from Salt Lake City, Utah, to Los Angeles, California, is 725 mi. long. It not only connects two of the nation's favourite playgrounds, but traverses sections of unusual natural beauty and great historical interest. The Grand Canyon of the Colorado is accessible over one of its branches.

ARROWROOT. A large proportion of the edible starches obtained from the rhizomes or root-stocks of various plants are known in commerce under the name of arrowroot. Properly the name should be restricted to the starch yielded by two or three species of Maranta (fam. Marantaceae), the chief of which is M. *arundinacea;* and when genuine or West Indian arrowroot is spoken of it is understood that this is the variety meant. *M. arundinacea* is probably a native of Guiana and western Brazil but it has long been cultivated in the West Indies and has now spread to most tropical countries. The plant is a herbaceous perennial with a creeping root-stock which gives off fleshy cylindrical tubers, covered with pale brown or white scales and afterwards ringed with their scars. When these tubers are gorged with starch, immediately before the season of rest, it is ripe for use. In addition to about 25% of starch, the tubers contain woody tissue, protein, and salts. The arrowroot may be separated on a small scale by peeling the root and grating it in water, when the starch falls to the bottom. The liquor is then drained off and the starch purified by repeated washings. On a large scale the manufacture of arrowroot is conducted with special machinery.

Arrowroot is distinguished by the granules agglomerating into small balls, and by yielding with boiling water a fine, transparent, inodorous, and pleasant-tasting jelly. In microscopic structure the granules present an ovoid form, marked with concentric lines, similar to potato starch, but having the hilum at the thick extremity of the granule instead of at the thin end. In addition to the West Indian supplies, arrowroot is cultivated in Brazil, the East Indies, Australia, and South Africa. The slender much-branched stem is 5 or 6ft. high and bears numerous leaves with long narrow sheaths and large spreading ovate blades, and a few short-stalked white flowers.

Tous-les-mois or Tulema arrowroot, also from the West Indies, is obtained from species of Canna, a genus allied to Maranta and cultivated in the same manner. The granules of tous-les-mois are very large. East India arrowroot is obtained from the root-stocks of species of *Curcuma* (fam. Zingiberaceae), chiefly C. *angustifolia,* a native of central India. Brazilian arrowroot is the starch of the cassava plant (Manihot *utilissima*), which when agglutinated on hot plates forms tapioca. Tacca or Otaheite arrowroot is the product of Tacca *pinnatifida,* the pia plant of the South Sea islands. Portland arrowroot was formerly prepared on the Isle of Portland from the tubers of the common cuckoo-pint, *Arum maculatum.* Various other species of the arum yield valuable food-starches in hot countries. Under the name of British arrowroot the farina of potatoes is sometimes sold., The chief use, however, of potato-farina is for adulterating more costly preparations. This falsification can be detected by microscopic examination. Arrowroot contains about 82% of starch, and about 1% of proteid and mineral matter.

THE ARROWROOT PLANT (MARANTA ARUNDINACEA), CULTIVATED IN TROPICAL COUNTRIES BECAUSE OF THE EDIBLE STARCH IT YIELDS

Middle figure shows upper part of flowering stem. Right figure shows base of flowering stem and young branch of rhizome. Below is part of the mature rhizome containing starch from which arrowroot is prepared

ARROWSMITM, the name of an English family of geographers. The first of them, Aaron Arrowsmith (1750–1823), made himself famous by his large chart of the world on Mercator's projection (1700). Four years later he published another large map of the world on the globular projection, with a companion volume of explanation. He left two sons, Aaron and Samuel, the elder of whom was the compiler of the Eton Comparative *Atlas,* of a Biblical atlas, and of various manuals of geography. They carried on the business in company with John Arrowsmith (1790–1873), nephew of the elder Aaron. In 1834 John published his London Atlas, the best set of maps then in existence. He followed up the atlas with a long series of elaborate and carefully executed maps, those of Australia, America, Africa and India being especially valuable.

ARROYO, the channel of a stream where the water flows only at certain seasons of the year, a term used in U.S.A. for a gully with bed of loose earth.

ARSACES, a Persian name, which occurs on a Persian seal, where it is written in cuneiform characters. The most famous Arsaces was the chief of the Parni, one of the nomadic Scythian or Dahan tribes in the desert east of the Caspian sea. A later tradition, preserved by Arrian, derives Arsaces I. and Tiridates from the Achaemenian king Artaxerxes II., but this had evidently no historical value. Arsaces, seeking refuge before the Bactrian king, Diodotes, invaded Parthia, then a province of the Seleucid empire, about 250 B.C. (Strabo **xi.** p. 515, cf. Arrian p. 1, Müller, in Photius, Cod. 58, and Syncellus p. 284). After two years (according to Arrian) he was killed, and his brother Tiridates, who succeeded him and maintained himself for a short time in Parthia, during the dissolution of the Seleucid empire by the attacks of Ptolemy III. (247 et seq.), was defeated and expelled by Seleucus II. (c. 238). But when this king was forced, by the rebellion of his brother, Antiochus Hierax, to return to the west, Tiridates came back and defeated the Macedonians (Strabo xi. p. 513, 515; Justin xli. 4; Appian, Syr. 65; Isidorus of Charax 11). He was the real founder of the Parthian empire, which was of very limited extent until the final decay of the Seleucid empire, occasioned by the Roman intrigues after the death of Antiochus IV. Epiphanes (165 B.C.), enabled Mithridates I, and his successors to conquer Media and Babylonia. Tiridates adopted the name of his brother Arsaces, and after him all the other Parthian kings (who by the historians are generally called by their proper names), amounting to the number of about 30, officially bear only the name Arsaces. With very few exceptions, only the name ΑΡΣΑΚΗΣ (with various epithets) occurs on the coins of the

Parthian kings, and the obverse generally shows the seated figure of the founder of the dynasty, holding in his hand a strung bow. The Arsacid empire was overthrown in A.D. 226 by Ardashir (Artaxerxes), the founder of the Sassanid empire, whose conquests began about A.D. 212. The name Arsaces of Persia is also borne by some kings of Armenia, who were of Parthian origin (see PERSIA and PARTHIA).

ARSENAL, an establishment for the construction, repair, receipt, storage and issue of warlike stores. The word "arsenal" appears in various forms in Romanic languages (from which it has been adopted into Teutonic), *i.e.*, Italian *arzanale*, Spanish arsenal, etc.; Italian also has *arzana* and darsena, and Spanish a longer form atarazanal.

ARSENIC, a hard, steel-grey, metallic element occurring widely in various ores. The oxide known as white arsenic is mentioned by the Greek alchemist, Olympiodorus, who obtained it by roasting arsenic sulphide. These substances were all known to the later alchemists who used minerals containing arsenic to give a white colour to copper. Albertus Magnus was the first to state that arsenic contained a metal-like substance, although later writers considered it to be a bastard or semi-metal, and frequently called it *arsenicum rex*. In 1733 G. Brandt showed that white arsenic was the calx (oxide) of this element which has the symbol **As,** atomic number 33, and atomic weight 74.96.

Arsenic occurs in the uncombined condition in various localities, but more generally in combination with other metals and sulphur, in the form of more or less complex sulphides. Native arsenic is usually of a dull grey colour, owing to surface tarnish; only on fresh fractures is the colour tin-white with metallic lustre. The hardness is 3.5 and the specific gravity 5·63–5·73. Crystals of arsenic belong to the rhombohedral system; natural crystals are, however, of rare occurrence, and are usually acicular in habit. Native arsenic occurs usually in metalliferous veins in association with ores of antimony, silver, etc., the silver mines of Freiberg in Saxony, St. Andreasberg in the Harz, Norway, Borneo, United States, Chile and the province Echizen in Japan being well-known localities.

Arsenic is a constituent of the minerals realgar, As_2S_2; orpiment, As_2S_3; arsenical pyrites or mispickel, FeAsS; cobaltite, CoAsS; smaltite, $CoAs_2$; cobalt bloom, $Co_3(AsO_4)_2,8H_2O$; pharmacolite $(CaHAsO_4)_2,5H_2O$; and mimetisite $(Pb[Pb_3(AsO_4)_2]_3)F_2$, whilst it is also met with in small quantities in nearly all specimens of iron pyrites. The ordinary commercial arsenic is either the naturally occurring form, which is, however, more or less contaminated with other metals, or is the product obtained by heating arsenical pyrites, out of contact with air, in earthenware retorts fitted with a roll of sheet iron at the mouth, and an earthenware receiver. By this method of distillation the arsenic sublimes into the receiver, leaving a residue of iron sulphide in the retort. For further purification, it may be sublimed, after having been previously mixed with a little powdered charcoal, or it may be mixed with a small quantity of iodine and heated. It can also be obtained by the reduction of white arsenic (arsenious oxide) with carbon.

Arsenic exists in more than one form and in this display of allotropy (*q.v.*) it resembles phosphorus, with which it is allied. (See PERIODIC LAW.)

In its stable form arsenic possesses a steel-grey colour, and a decided metallic lustre; it crystallizes in rhombohedra, isomorphous with those of antimony and tellurium. It is very brittle. It is volatile at temperatures above 100°C, and rapidly vaporizes at a dull red heat. When heated to 450°C, under atmospheric pressure solid arsenic volatilizes without passing through the liquid phase, but it liquefies when heated under increased pressure, and its melting point lies between 830° and 860°C. By sublimation an amorphous variety is obtained in addition to rhombohedral arsenic. The vapour of arsenic is of a golden yellow colour, and has a garlic odour. The vapour density is 10·6 (air=1) at 564°C, corresponding to a tetratomic molecule As_4; at a white heat the vapour density shows a considerable lowering in value, due to the dissociation of the complex molecule.

When arsenic vapour is cooled suddenly below 0°C, yellow arsenic is produced which is soluble in carbon disulphide and crystallizes therefrom in cubic crystals. Even at 60°C it begins to change into the metallic form. Arsenic heated in a current of oxygen burns with a pale lavender-coloured flame, forming arsenious oxide. It is easily oxidized to arsenic acid by heating with concentrated nitric acid. It burns in an atmosphere of chlorine to form the trichloride; it also combines directly with bromine and sulphur on being heated, while on fusion with alkalis it forms arsenites.

Arsenic alloys with most metals and is frequently present as an impurity in commercial alloys. A small proportion (0·3 to 0·6%) added to molten lead facilitates the formation of truly spherical pellets when the liquid metal is poured down a shot-tower. Electro-deposition of arsenic is employed to give a dark oxidized finish to brass; the depositing bath contains potassium cyanide, sodium phosphate and arsenious oxide, to which a nickel salt is sometimes added to produce a darker effect.

Detection. — Arsenic and most of its soluble compounds are very poisonous, and consequently the methods used for the detection of arsenic are important. The usual methods are: (a) *Reinsch's* test. A piece of clean copper is dipped in a solution of an arsenious compound, which has been previously acidified with pure hydrochloric acid. A grey film is produced on the surface of the copper, probably due to the formation of a copper arsenide. The reaction proceeds better if the solution is heated. On removing, washing and gently drying the metal and heating it in a glass tube, a white crystalline sublimate is formed on the cool part of the tube; under the same conditions antimony does not produce a crystalline sublimate.

(b) *Fleitmann's* test depends on the fact that arsenic and its compounds, when present in a solution in which hydrogen is being generated, are converted into arseniuretted hydrogen, or arsine AsH_3, which can be readily detected either by its action on silver nitrate solution or by its decomposition on heating. The solution containing the arsenious compound is mixed with pure potassium hydroxide solution and a piece of pure zinc or aluminium foil dropped in and the whole then heated. A piece of absorbent paper, moistened with silver nitrate, is held over the mouth of the tube, and if arsenic be present a grey or black deposit is seen on the paper, due to the silver nitrate being reduced by the arseniuretted hydrogen. Antimony gives no reaction under these conditions, so that the method can be used to detect arsenic in the presence of antimony, but the test is not so delicate as either Reinsch's or Marsh's method.

(c) Marsh's Test. — The solution containing the arsenious compounds is mixed with pure hydrochloric acid and placed in an apparatus in which hydrogen is generated from pure zinc and pure sulphuric acid. The arseniuretted hydrogen produced is passed through a tube containing lead acetate paper and soda-lime, and finally through a narrow glass tube, constricted at various points, and heated by a very small flame. As the arseniuretted hydrogen passes over the heated portion, it is decomposed and a black deposit formed. Instead of heating the tube, the gas may be ignited at the mouth of the tube, and a cold surface of porcelain or platinum placed in the flame, when a black deposit is formed on the surface. This may be distinguished from the similar antimony deposit by its ready solubility in a solution of sodium hypochlorite. A blank experiment should always be carried out in testing for small quantities of arsenic, to ensure that the materials used are quite free from traces of arsenic. The presence of nitric acid interferes with Marsh's test, and if the arsenic is present as an arsenic compound it must be reduced to the arsenious condition by the action of sulphurous acid.

(d) *Gutzeit's Test.*—The acidified solution to be tested is treated with zinc, in the presence of stannous and ferrous salts, and the gas, passed through lead acetate solution to remove hydrogen sulphide, and then passed over paper soaked in mercuric chloride; a dark stain is due to arsenic. The stain becomes much more distinct when viewed in ultra-violet light.

Arsenious oxide and arsenites, acidified with hydrochloric acid, give a yellow precipitate of arsenic trisulphide on the addition of sulphuretted hydrogen; this precipitate is soluble in solutions of

the alkaline hydroxides, ammonium carbonate and yellow ammonium sulphide. Under like conditions arsenates only give a precipitate on long-continued boiling.

Estimation. — Arsenic is usually estimated either in the form of magnesium pyroarsenate, $Mg_2As_2O_7$, or as arsenious sulphide As_2S_3. For the pyroarsenate method it is necessary that the arsenic should be in the quinquevalent condition; if necessary this can be effected by heating with nitric acid; the acid solution is then mixed with 'magnesia mixture" and made strongly alkaline by the addition of ammonia. After twenty-four hours the precipitate is filtered, washed with dilute ammonia, dried, ignited to constant weight and weighed, the filter paper being incinerated separately after moistening with nitric acid.

In the sulphide method, the arsenic should be in the tervalent form. Sulphuretted hydrogen is passed through the liquid until it is thoroughly saturated, the excess of sulphuretted hydrogen is expelled from the solution by a brisk stream of carbon dioxide, and the precipitate is filtered on a Gooch crucible and washed with water containing a little sulphuretted hydrogen and dried at 100°C; it is then well washed with small quantities of pure carbon disulphide to remove any free sulphur, again dried and weighed. Arsenic can also be estimated by volumetric methods; for this purpose it must be in the tervalent condition, and the method of estimation consists in converting it into the quinquevalent condition by means of a standard solution of iodine, in the presence of a cold saturated solution of sodium bicarbonate.

INORGANIC COMPOUNDS

Arsenic **Hydrides.**—The dihydride As_2H_2 is a brown velvety unstable powder formed when sodium or potassium arsenide is decomposed by water. Arsenic trihydride (arsine or arseniuretted hydrogen) AsH_3 is formed by decomposing zinc arsenide with dilute sulphuric acid, by the action of nascent hydrogen on arsenious compounds, and by the electrolysis of solutions of arsenious and arsenic acids; it is also a product of the action of organic matter on many arsenic compounds. It is conveniently prepared by dropping water on to aluminium arsenide, obtained by a modified thermite process. It is a colourless gas of unpleasant smell, excessively poisonous, very slightly soluble in water. It easily burns, forming arsenious oxide if the combustion proceeds in an excess of air, or arsenic if the supply of air is limited; it is also decomposed into its constituent elements when heated. It liquefies at −40°C and becomes solid at −118·9°C (K. Olszewski). Metals such as tin, potassium and sodium when heated in the gas form arsenides with liberation of hydrogen; and solutions of gold and silver salts are reduced by the gas with precipitation of metallic gold and silver. Chlorine, bromine and iodine decompose arsine readily.

Halide Derivatives of Arsenic. — Arsenic forms compounds of the type AsX_3 with fluorine, chlorine, bromine and iodine; there is also a lower iodide, As_2I_4, and a higher gaseous fluoride, AsF_5 (b.p.−53°C, m.p.−80°C). Arsenious chloride, a colourless oily liquid of specific gravity 2·205, boils at 130°C and is prepared by distilling arsenious oxide with strong hydrochloric acid. It is also obtained by direct combination of arsenic and chlorine or by heating arsenious oxide with sulphur chloride $As_4O_6+6S_2Cl_2=4AsCl_3+3SO_2+9S$. Arsenious bromide (m.p. 35°C), soluble yellowish white crystals, and arsenious iodide (m.p. 146°C), red hexagonal crystals, are both used in medicine.

Oxides and **Oxyacids of** Arsenic. — Arsenious oxide (white arsenic), As_4O_6, occurs in an amorphous or vitreous condition and also in two crystalline modifications which are found as minerals, arsenolite in octahedra (cubic system), and claudetite of the monoclinic system, the latter being converted into the former when boiled in water. At 193°C arsenious oxide sublimes without fusion, although it can be melted under pressure. It is sparingly soluble in water, the solution being acid to test papers.

Arsenious oxide is used in glass-making as an oxidizing agent to remove the colour produced by the lower oxides of iron. It is employed in the manufacture of arsenic acid, pigments, enamels, sheep dips and arsenical soaps. It enters into the composition of germicides, insecticides and rat poisons. It also finds employment in calico printing, in the fixation of aniline colours, and as Fowler's solution (potassium arsenite) in medicine. Arsenious oxide arises as a volatile by-product in many smelting operations for the extraction of metals, and in this form has been known from the earliest times, being called Huttenrauch (furnace smoke) by Basil Valentino. It occurs as an impurity or adulterant in many commercial products, having been found in caustic soda, glucose, cosmetics and in certain wines. In 1900 an outbreak of "peripheral neuritis" with various skin affections occurred in Lancashire and was traced to beer made from glucose and invert sugar, in the preparation of which arsenical sulphuric acid had been used.

On concentration, an aqueous solution of arsenious oxide deposits the anhydrous oxide and not arsenious acid, H_3AsO_3. But although this acid has not been isolated its salts are well known. Sodium arsenite and the other alkali arsenites are soluble in water. Silver arsenite, Ag_3AsO_3, is a yellow precipitate soluble in acid or ammonia. Cupric arsenite, $CuHAsO_3$, Scheele's green, is a green powder formerly used extensively for wallpapers and for calico printing. Schweinfurt green, also known as imperial green or emerald green, is a mixed copper metarsenite and acetate, $3Cu(AsO_2)_2,Cu(C_2H_3O_2)_2$, employed as a pigment for wallpapers. By the combined action of damp and moulds, paper tinted with this pigment evolves a peculiar odour said to be due to diethylcacodyl oxide $(As[C_2H_5]_2)_2O$ (Biginelli, 1900).

Arsenic pentoxide, As_2O_5, is manufactured by oxidizing white arsenic (arsenious oxide) with nitric acid (sp. gravity 1·35). The solution on concentration yields crystalline ortho-arsenic acid $H_3AsO_4,\frac{1}{2}H_2O$. At 160°C this substance loses water and passes into the pentoxide, As_2O_5, a deliquescent crystalline solid which at red heat evolves oxygen and reverts to the lower oxide. Arsenic acid was formerly employed in the manufacture of magenta (*see* DYES, SYNTHETIC).

Sodium arsenate, used in calico printing, is prepared by adding sodium carbonate to aqueous arsenic acid or by heating sodium arsenite with sodium nitrate. This salt, which crystallizes as $Na_2HAsO_4,12H_2O$, is isomorphous with the corresponding phosphate (*see* CRYSTALLOGRAPHY.)

Soluble arsenates and phosphates have many properties in common; they both yield colourless crystalline precipitates with ammoniacal solutions of ammonium and magnesium chlorides, and with ammonium molybdate they furnish similar yellow precipitates (arsenomolybdate and phosphomolybdate), but with silver nitrate arsenates give a reddish-brown precipitate, whilst from phosphates a yellow precipitate results.

Sulphides of Arsenic.—Three sulphides are known, two occurring native, yellow orpiment (*auripigmentum*), As_2S_3, in yellow prisms and realgar, As_2S_2, in reddish orange prisms, whereas the pentasulphide is produced artificially either by heating together the trisulphide and sulphur or by acidifying a cold solution of thioarsenate. The tri- and penta-sulphides are insoluble in water but dissolve in alkali sulphides to give alkali thioarsenites and thioarsenates respectively.

Realgar and orpiment are used as pigments and in pyrotechny; they have been produced artificially for these purposes by heating white arsenic with appropriate amounts of sulphur.

Pharmacology and Therapeutics.—Of arsenic and its compounds, arsenious oxide and Fowler's solution (potassium arsenite) are in very common use. The iodide of arsenic is one of the ingredients of Donovan's solution (see MERCURY); and iron arsenate, or a mixture of ferrous and ferric arsenates with some iron oxide, is of great use in certain cases. An iron and arsenic injection is widely employed in anaemic conditions and constitutes one of the few treatments which are effective in such circumstances. Sodium arsenate is somewhat less commonly prescribed.

Externally, arsenious oxide is a powerful caustic when applied to raw surfaces, though it has no action on the unbroken skin. Internally, unless the dose be extremely small, all preparations are severe gastro-intestinal irritants. This effect is the same however the drug be administered, as, even after subcutaneous injection, the arsenic is excreted into the stomach after absorption, and thus sets up gastritis in its passage through the mucous membrane. In

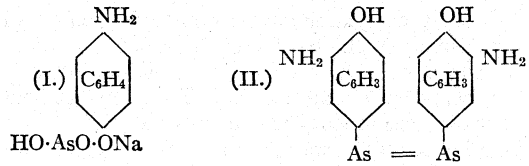
minute doses it is a gastric stimulant, promoting the flow of gastric juice. It is quickly absorbed into the blood, where its presence can be demonstrated especially in the white blood corpuscles. In certain forms of anaemia it increases the number of the red corpuscles and also their haemoglobin content. None of these known effects of arsenic is sufficient to account for the profound change that a course of the drug will often produce in the condition of a patient. It has some power of affecting the general metabolism, but no wholly satisfactory explanation is forthcoming. According to Binz and Schultz its power is due to the fact that it is an oxygen-carrier, arsenious acid withdrawing oxygen from the protoplasm to form arsenic acid, which subsequently yields up its oxygen again. It is thus vaguely called an alterative, since the patient recovers under its use. It is eliminated chiefly by the urine, and to a less extent by the alimentary canal, sweat, saliva, bile, milk, tears, hair, etc., but it is also stored up in the body, mainly in the liver and kidneys. Arsenic is administered on account of its tonic effects on the general and nervous systems. It is also considered by many authorities to have an antiperiodic action as in malaria and it is known to be effective in various chronic skin affections.

Externally arsenious oxide has been much used by quack doctors to destroy morbid growths, etc., a paste or solution being supplied, strong enough to kill the mass of tissue, thus making it slough out quickly. But accidents have resulted from the arsenic being absorbed, the patient being thereby poisoned. Internally it is useful in certain forms of dyspepsia, but as some patients are quite unable to tolerate the drug, it must always be administered in very small doses at first, the quantity being slowly increased as tolerance is shown. Children as a rule bear it better than adults. It should never be given on an empty stomach, but always after a full meal. It is the routine treatment for pernicious anaemia and Hodgkin's disease, though here again the drug may be of no avail. For the neuralgia and anaemia following malaria, for rheumatoid arthritis, for chorea and also asthma and hay fever, it is constantly prescribed with excellent results. Certain skin diseases, as psoriasis, pemphigus and occasionally chronic eczema are much benefited by its use, though sometimes a too prolonged course will produce the very lesion for which in other circumstances it is a cure. Occasionally, as among the Styrians, individuals acquire the habit of arsenic-eating, which is said to increase their weight, strength and appetite, and to clear their complexion. The probable explanation is that an antitoxin is developed within them, but definite proof is not at present forthcoming. Arsenic-eating is also found in Salzburg and the Tirol.

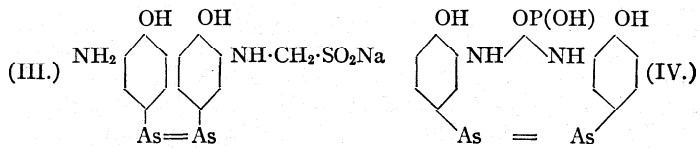
ORGANIC DERIVATIVES OF ARSENIC

Aliphatic Compounds. — The first organometallic material, a fuming liquid, was discovered by L. C. Cadet de Gassicourt in 1760 on heating together white arsenic and potassium acetate. The product was subsequently shown by R. W. Bunsen (1837–43) to consist principally of the substance $(As[CH_3]_2)_2O$ for which the name cacodyl oxide was proposed by J. Berzelius. The inflammability of the liquid was due to the presence of a small amount of cacodyl itself $(CH_3)_2As{\cdot}As(CH_3)_2$. Many cacodyl derivatives were described by Bunsen, who also oxidized the oxide to cacodylic acid $(CH_3)_2AsO{\cdot}OH$, a colourless crystalline solid readily soluble in water or alcohol. Although cacodyl compounds are very toxic, cacodylic acid is comparatively innocuous and its salts are employed medicinally. Sodium cacodylate has been given both by the mouth and intravenously in tuberculosis, diabetes, leprosy, psoriasis and syphilis. Another arsenical salt, sodium methyl arsinate, $CH_3{\cdot}AsO(ONa)_2,H_2O$ (Arrhenal, new cacodyl), prepared by warming an alkaline solution of sodium arsenite with methyl iodide and alcohol, has been employed in the treatment of the foregoing diseases.

Aromatic Compounds. — Greater success has attended the introduction of aromatic derivatives of arsenic. By heating aniline arsenate at 180° Béchamp in 1863 first obtained a substance of acidic character, the sodium salt of which was long afterwards shown by P. Ehrlich and A. Bertheim (1907) to be sodium p-arsanilate or *p*-aminophenyl-arsinate (I.).

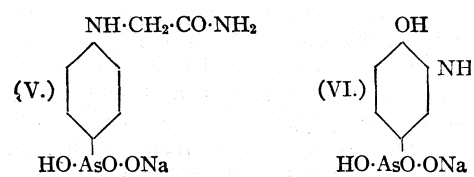


When introduced into medicine, sodium p-arsanilate was found to be forty times less toxic than sodium arsenite (Fowler's solution) and hence received the name "atoxyl." It became extensively employed in the treatment of diseases of protozoal origin such as syphilis and trypanosomiasis. Continued use of the drug was, however, sometimes attended by unpleasant secondary effects, *e.g.*, disturbance of vision followed by atrophy of the optic nerve, and accordingly Ehrlich instituted a search for an organic arsenical in which the ratio between curative dose and lethal dose would be as small as possible. This search culminated in the discovery of salvarsan (3:3′-diamino-4:4′-dihydroxyarsenobenzene dihydrochloride) which is sometimes referred to as "606" in allusion to the circumstance that Ehrlich and his collaborators examined 605 other substances before they obtained the optimum result with salvarsan. The hydrochloride has several other synonyms, arsenobenzol, kharsivan, arsenobillon. Before being administered intravenously, the aqueous solution of the hydrochloride is very carefully neutralized with sodium hydroxide so that the actual drug is the base indicated in formula (II.). Since the preparation of the perfectly neutral solution of salvarsan base suitable for intravenous injection is a process requiring considerable care, another drug was introduced under the name of neosalvarsan (synonyms: neokharsivan, novarsenobenzol, novarsenobillon) which dissolved to a neutral solution without chemical treatment. This substance (III.) is produced by condensing salvarsan dihydrochloride with sodium-formaldehyde-sulphoxylate, $HO{\cdot}CH_2{\cdot}SO_2Na$, whereby a methyl sulphinate group becomes attached to one of the basic groups of salvarsan.



This neutral sodium salt is more popular than salvarsan because of its ease of administration. The German Pharmacopoeia (1926) describes five modifications of salvarsan. In England salvarsan and neosalvarsan come within the scope of the Therapeutic Substances Act (1925). Standard preparations are kept in the National Institute of Medical Research at Hampstead, and biological tests and stability tests are applied to commercial samples. Salvarsan and neosalvarsan are remarkable antisyphilitic remedies and are very widely used for this purpose. Variants have been suggested, such as combinations of salvarsan with silver. French practice has favoured the use of galyl (IV.), a phosphoric acid derivative of salvarsan, and of luargol, a complex co-ordination compound of salvarsan containing silver bromide and an antimony1 group $(C_{12}H_{12}O_2N_2As_2)_2,AgBr,SbO(H_2SO_4)_2$.

It will be noticed that salvarsan and its allies are organic substances containing tervalent arsenic, and until recently substances with arsenic in the lower state of oxidation have been most favoured in therapeutics, but medical opinion is veering round in favour of compounds containing quinquevalent arsenic of which atoxyl was the forerunner. Tryparsamide (V.) or sodium *N*-phenylglycinamide-*p*-arsinate, has had considerable vogue in the treatment of sleeping sickness, having only $\frac{1}{20}$ the toxicity of salvarsan.



Stovarsol (Sodium acetylaminohydroxyphenylarsinate, VI.) has been used extensively in the treatment of amoebic dysentery both alone and in conjunction with auramine, emetine and iodine, the complex drug being termed auremetine. These medicaments have been used in yaws, and in early treatment of syphilis.

A diethylamine salt of stovarsol known as acetylarsan has been used for injections, and a precipitation compound with bismuth has been employed in syphilis and yaws.

Toxicology and Forensic Medicine.—The commonest source of arsenical poisoning is arsenious oxide or white arsenic, which in one form is white and opaque like flour, for which it has been mistaken with fatal results. Moreover, as it has little taste and no colour it is easily mixed with food for homicidal purposes. When combined with potash or soda it is used to saturate flypapers, and strong solutions can be obtained by soaking these in water; this fact has also been used with criminal intent. Copper arsenite (or Scheele's green) used to be much employed as a pigment for wall-papers and fabrics, and toxic effects have resulted from their use. Metallic arsenic is probably not poisonous, but as it usually becomes oxidized in the alimentary canal the symptoms of arsenical poisoning follow its ingestion.

In acute poisoning the interval between the reception of the poison and the onset of symptoms ranges from ten minutes or even less, if a strong solution be taken on an empty stomach, to twelve or more hours if the drug be taken in solid form and the stomach be full of food. The usual period, however, is from half an hour to an hour. In a typical case a sensation of heat developing into a burning pain is felt in the throat and stomach. This is soon followed by uncontrollable vomiting and later by severe purging, the stools being first of all faecal but later assuming a rice-water appearance, and often containing blood. The patient suffers from intense thirst, which cannot be relieved, as drinking is immediately followed by rejection of the swallowed fluid. There is profound collapse, the features are sunken, the skin moist and cyanosed. The pulse is feeble and irregular, and respiration is difficult. The pain in the stomach is persistent, and cramps in the calves of the legs add to the torture. Death may be preceded by coma, but consciousness is often maintained to the end. The similarity of the symptoms to those of cholera is very marked, but if suspicion arises it can be cleared up by examining any of the secretions for arsenic. More rarely the poison attacks the nerve centres, and gastro-intestinal symptoms may be almost or quite absent. In such cases the acute collapse occurs in company with both superficial and deep anaesthesia of the limbs, and is soon followed by coma terminating in death. In criminal poisoning repeated doses are usually given, so that such cases may not be typical, but will present some of the aspects of acute and some of chronic arsenical poisoning. As regards treatment, the stomach should be washed out with warm water by means of a soft rubber tube, an emetic being also administered. Then, if available, freshly precipitated ferric hydrate should be given, which can be prepared by adding a solution of ammonia to one of iron perchloride. The precipitate is strained off, so that the patient may swallow it suspended in water. While this is being obtained, magnesia, castor oil or olive oil can be given; or failing all these, copious draughts of water. The collapse should be treated with hot blankets and bottles, but medical aid should be summoned for the administration of subcutaneous injections of brandy, ether or strychnine, and for injections of morphia to lessen the pain.

Arsenic may be gradually absorbed into the system in very small quantities over a prolonged period, the symptoms of chronic poisoning resulting. The commonest sources used to be wall-papers, fabrics, artificial flowers and toys: also certain trades, as in the manufacture of arsenical sheep-dipping. But cases arising from these causes now occur very rarely. The earliest symptoms are slight gastric disorders, loss of appetite and general malaise, followed later by colicky pains, irritation of eyelids and skin eruptions. But sooner or later peripheral neuritis develops, usually beginning with sensory disturbances, tingling, numbness, formication, and usually cutaneous anaesthesia. Later the affected muscles become exquisitely tender, and then atrophy, while the knee-jerk or other reflex is lost. Pigmentation of the skin may occur in the later stages. Recovery is very slow, and in fatal cases death usually results from heart failure.

After acute poisoning, the stomach at a *post-mortem* presents signs of intense inflammation, submucous haemorrhages are usually present, but perforation is rare. The rest of the alimentary canal exhibits inflammatory changes in a somewhat lesser degree. After chronic poisoning a widely spread fatty degeneration is present. Arsenic is found in almost every part of the body, but is retained in largest amount by the liver, secondly by the kidneys. After death from chronic poisoning it is found present even in the brain and spongy bone. The detection of arsenic in criminal cases is effected either by Reinsch's test or by Marsh's test, the urine being the secretion analysed when available.

Production and Exploitation of Arsenic.—In 1926 the production of arsenic in the United States, Canada and Mexico was about 16,000 tons, whereas the output from the Old World, including Belgium, England, France, Germany, Greece and Japan, was about 11,000 to 12,000 tons. These data are somewhat less than the estimates of the previous year (1925). The United States maintains its lead in both the production and consumption of arsenical compounds. Among the latter are the well-known insecticides, calcium arsenate and lead arsenate, which are employed extensively. Arsenical compounds are also employed as wood preservatives or as clearing agents in glass manufacture.

ARSENHUS (c. 354–450), an anchorite, said to have been born of a noble Roman family. He was appointed by Theodosius the Great, tutor of the young princes Arcadius and Honorius; but at the age of 40 he retired to Egypt, where for 40 years he lived in monastic seclusion at Scetis in the Thebais, under the spiritual guidance of St. John the Dwarf. He died at the age of 95 at Troe near Memphis. His biography by Simeon Metaphrastes is largely fiction.

Of his writings, two collections of admonitory maxims are extant: see Fr. Combefis in *Auctarium biblioth. patr. novissim.* (1672), pp. 301 et seq.; and Cotelerius, *Eccl. graec, monum.*, 1677, i. pp. 353–372.

ARSENIUS AUTORIANUS (13th century), patriarch of Constantinople, lived about the middle of the 13th century. He received his education in Nicaea at a monastery of which he later became the abbot, though not in orders. Subsequently he led a life of solitary asceticism in a Bithynian monastery. From this seclusion he was called by Theodore II. Lascaris in A.D. 1255 to the position of patriarch at Nicaea, and four years later, on the death of Theodore II. became joint guardian of his son John. His fellow-guardian Georgios Mouzalon was immediately murdered by Michael Palaeologus, who assumed the position of tutor. Arsenius then took refuge in the monastery of Paschasius. In 1261 Michael, having recovered Constantinople, induced Arsenius to undertake again the office of patriarch, but Arsenius excommunicated the emperor for having ordered the young prince John to be blinded.

He was banished to Proconnesus, where some years afterwards (according to Fabricius in 1264; others say in 1273) he died. He declined to remove the sentence of excommunication which he had passed upon Michael, and after his death, when the new patriarch Josephus gave absolution to the emperor, the quarrel was carried on between the "Arsenites" and the "Josephists." The "Arsenian schism" lasted till 1315, when reconciliation was effected by the patriarch Niphon *(see* Gibbon, *Decline and Fall* of *the Roman Empire*, ed. J. B. Bury, 1898, vol. vi. 467 et seq.).

Arsenius is said to have prepared a summary of ecclesiastical laws under the title *Synopsis Canonum.* This was published (Greek original and Latin version) by G. Voel and H. Justel in *Bibliotheca Jur. Canon. Vet.* (1661), 749 et seq. Some hold that the *Synopsis* was the work of another Arsenius, a monk of Athos *(see* L. Petit in Cacant's *Dict. théol. cathol.*, i. col. 1,994); the ascription depends on whether the patriarch Arsenius did or did not sojourn at Mt. Athos.

BIBLIOGRAPHY.—See Georgius Pachymeres ii. 15, iii. *passim*, iv. 1–16; Nicephorus Gregoras iii. I. iv. I.; for the will of Arsenius *see* Cotelerius, *Monumenta* ii. 168.

ARSES, king of Persia, the youngest son of Artaxerxes III., was raised to the throne in 338 B.C. by Bagoas (q v.), who had murdered his father and all his brothers.

But when the young king tried to make himself independent. Bagoas killed him too, with all his children, in the third year of his reign (336 B.C.).

ARSINE, ARSENIURETTED HYDROGEN, also known as arsenic trihydride, is a colourless, neutral gas mith a disagreeable smell, having the formula AsH_3. (See also ARSENIC.)

ARSINOE, the (Greek) name of four Egyptian princesses of the Ptolemaic dynasty. The name was introduced into the Ptolemaic dynasty by the mother of Ptolemy I. This Arsinoe was originally a mistress of Philip II. of Macedon, who presented her to a Macedonian soldier a short time before Ptolemy was born. It was, therefore, assumed by the Macedonians that the Ptolemaic house was really descended from Philip (see PTOLEMIES). .

1. Daughter of Lysimachus, king of Thrace, first wife of Ptolemy II., Philadelphus (285–247 B.C.). Accused of conspiring against her husband, who perhaps already contemplated marriage with his sister, also named Arsinoe, she was banished to Coptos, in Upper Egypt. Her son Ptolemy was afterwards king under the title of Euergetes [see BERENICE (A. 3)].

2. Daughter of Ptolemy I. Soter and Berenice. Born about 316 B.C., she married Lysimachus, king of Thrace. To secure the succession for her own children she brought about the murder of her stepson Agathocles. Lysandra, the wife of Agathocles, took refuge with Seleucus, king of Syria, who made war upon Lysimachus and seized his kingdom (281). After her husband's death Arsinoe fled to Ephesus and afterwards to Cassandreia in Macedonia. Seleucus was murdered in 281 by Ptolemy Ceraunus (half-brother of Arsinoe), who thus became master of Thrace and Macedonia. To obtain possession of Cassandreia, he oifered his hand in marriage to Arsinoe, and being admitted into the town, killed her two younger sons and banished her to Samothrace. Escaping to Egypt, she became the wife of her full brother Ptolemy II., the first instance of the practice of the Greek kings of Egypt of marrying their sisters. She was a woman of a masterful character and won great influence. Her husband, though she bore him no children, was devoted to her and paid her all possible honour after her death in 271.

3. Daughter of Ptolemy III. Euergetes, sister and wife of Ptolemy IV. Philopator. She seems to be erroneously called Eurydice by Justin (xxx. 2), and Cleopatra by Livy (xxvii. 4). Her presence encouraged the troops at the battle of Raphia (217), in which Antiochus the Great was defeated. Her husband put her to death to please his mistress (between 210 and 205). She was worshipped as Thea philopatōris; she and her husband as Theoi philopatores (Polybius v. 83, 84; xv. 25–33).

4. Youngest daughter of Ptolemy XIII., Auletes, and sister of the famous Cleopatra. During the siege of Alexandria by Julius Caesar (48) she was recognized as queen by the inhabitants; her brother, the young Ptolemy, being then held captive by Caesar. Caesar took her with him to Rome as a precaution, but after his triumph she was allowed to return to Alexandria. After the battle of Philippi she was put to death by order of Mark Antony, at the request of Cleopatra (Dio Cassius xlii. 39; Caesar, *Bell. civ.,* iii. 112; Appian., Bell. *civ.,* v. 9).

BIBLIOGRAPHY.—For general authorities see article PTOLEMIES. The article "Arsinoe" in Pauly-Wissowa's Realencyklopadie contains a full list of those who bore the name, and also of the numerous towns which were called after the various princesses.

ARSINOITHERIUM (from the Egyptian queen Arsinoe), a gigantic horned mammal from the Middle Eocene beds of the Fayum, Egypt, representing a sub-order of Perissodactyla called Barypoda. The skull carries a huge pair of horn-cores above the muzzle, which seem to be the enlarged nasal bones, and a rudimentary pair farther back; the front horn-cores, like the rest of the skull, consist of a mere shell of bone, and were probably clothed in life mith horny sheaths. The teeth form a continuous even series, the small canines being crowded between the incisors and premolars; the crowns of the cheek-series are tall (hypsodont), with a distinctive pattern. Although the brain is relatively larger, the bones of the limbs, especially the short, five-toed feet, approximate to those of the Amblypoda and Proboscidea (*qq.v.*); but in the articulation of the astragalus with both the navicular and cuboid *Arsinoitherium* is nearer the former than the latter.

It is probable, however, that these resemblances are mainly due to parallelism in development, and are in all three cases adaptations necessary to support the enormous weight of the body. On the other hand, the marked resemblance of the structure of the tarsus is probably indicative of descent from nearly allied condylarthrous ancestors (see PXENACODUS).

See C. W. Andrews, Descriptive Catalogue of the Tertiary *Vertebrata* of the Fayum, British *Museum* (1906).

ARSON, a crime which has been described as the malicious and voluntary burning of the house of another (3 Co. *Inst.* 66). At common law and by statute it is an offence of the degree of felony. The common-law offence of arson (which has been greatly enlarged by statute) required some part of the house to be actually burnt; neither a bare intention nor even an actual attempt by putting fire in or towards it will constitute the offence, if no part was actually burnt, but the burning of any part, however trifling, is sufficient, and the offence is complete even if the fire is put out or goes out of itself. The burning must be malicious and wilful, otherwise it is only a trespass. If a man by wilfully setting fire to his own house burn the house of his neighbour also, it will be a felony, even though the primary intention of the party was to burn his own house only. The word house, in the definition of the offence at common law, extends not only to dwelling-houses, "but to all outhouses which are parcel thereof, though not adjoining thereto." Barns with corn and hay in them, though distant from a house. are within the definition.

The varieties of the offence are specified in the British Malicious Damage Act 1861. The following crimes are thereby made felonies: (1) setting fire to any church, chapel, meeting-house or other place of divine worship; (2) setting fire to a dwelling-house, any person being therein; (3) setting fire to a house, out-house, manufactory, farm-building, etc., with intent to injure or defraud any person; (4) setting fire to buildings appertaining to any railway, port, dock or harbour; or (5) setting fire to any public building. In these cases the act provides that the person convicted shall be liable, at the discretion of the court, to be kept in penal servitude for life, or for any term not less than three years, or to be imprisoned for any time not exceeding two years, with or without hard labour, and, if a male under 16 years of age, with or without whipping. Setting fire to other buildings, and setting fire to goods in buildings under such circumstances that, if the building were thereby set fire to, the offence would amount to felony, are subject to the punishments last enumerated, with this exception that the period of penal servitude is limited to 14 years. The attempt to set fire to any building, or any matter or thing not enumerated above, is punishable as a felony. In R. v. *Manning,* 1872 (L.R. 1 C.C.R. 338), it was held that an unfinished house was a building within the meaning of the act. The setting fire to crops of hay, grass, corn, etc., is punishable by penal servitude for any period not exceeding 14 years, but setting fire to stacks of the same, or any cultivated vegetable produce, or to peat, coals, etc., is regarded as a more serious offence, and the penal servitude may be for life. For the attempt to commit the last two offences penal servitude is limited to seven years. Setting fire to mines of coal, anthracite or other mineral fuel is visited with the full measure of penalty, and in the case of an attempt the penal servitude is limited to 14 years. By the Dockyards, etc., Protection Act 1772 it is a felony punishable by death wilfully and maliciously to set fire to any of His Majesty's ships or vessels of war, or any of His Majesty's arsenals, magazines, dockyards, rope-yards, victualling offices or buildings therein, or any timber, material, stores or ammunition of war therein or in any part of His Majesty's dominions. If the person guilty is subject to naval discipline, he is triable by court-martial, and if found guilty, a sentence of capital punishment may be passed. The Malicious Damage Act 1861, s. 43,

also includes as a felony the setting fire to any ship or vessel, with intent to prejudice any owner or part owner of the vessel, or of any goods on the same, or any person who has underwritten any policy of insurance on the vessel, or any goods on board the same.

In Scotland the offence equivalent to arson in England is known by the more expressive name of fire-raising. (X.)

United States.—In the United States arson is now a statutory crime in most jurisdictions. Some statutes have enlarged it to include the burning of all sorts of property, in some jurisdictions to include the burning of any building of any nature whatsoever. The usual definition when enlarged by statute includes the burning of a dwelling, house, barn, stable, store, outhouse, shop, office, warehouse, steamboat, vessel, canal boat, church, meeting-house. school-house, public building, water-craft or railroad car. These are the more serious offences, the lesser usually being the burning of any fences, woods, stacks of hay, grain or straw or growing crops. The penalty of the greater offences is regulated by the statutes, anywhere from one to 20 years' imprisonment, the lesser offences usually less than one year or fine or both. The statutes sometimes make "an attempt to commit the crime" equal to the crime of arson, which is another deviation from the common law. Some statutes make it arson for the owner to burn his own building or property for the purpose of defrauding another, *e.g.*, to collect insurance. (J. P. EA.)

ARSOT, a forest near Belfort, eastern France. Area, about 1,500 acres. It is almost encircled by a small stream, the Eloie, and is about 1,400ft. above the sea. It is continued east by the forest of Denney. The lakes and woodlands, associated with cold tertiary clays, are typical of the Trou de Belfort.

ARS-SUR-MOSELLE, a town of Moselle, France, a terminus 5 mi. S. of Metz on the railway to Novéant. It has a handsome Roman Catholic church and extensive foundries; in the vicinity are the remains of a Roman aqueduct. Pop. (1936) 3,109.

ARSUF, a town on the coast of Palestine, 12m. N.N.E. of Jaffa, famous as the scene of a victory of the crusaders under Richard I. of England over the army of Saladin (third Crusade). After the capture of Acre on July 12, 1191, and the departure for home of Philip of France, the army of the crusaders, under Richard Coeur-de-Lion and the duke of Burgundy, opened their campaign for the recovery of Jerusalem by marching southward towards Jaffa, from which place it was intended to move direct upon the holy city. The march was along the seashore, and, the forces of Saladin being in the vicinity, the army moved in such a formation as to be able to give battle at any moment. Richard thus moved slowly, but in such compact order as to arouse the admiration even of the enemy. The right column of baggage and supplies, guarded by infantry, was nearest the sea, the various corps of heavy cavalry, one behind the other, formed the central column, and on the exposed left flank was the infantry, "level and firm as a wall," according to the testimony of Saracen authors. The crusaders maintained for many days an absolutely passive defence, and could not be tempted to fight; Richard and his knights made occasional charges, but quickly withdrew, and on Sept. 7 this irregular skirmishing, in which the crusaders had scarcely suffered at all, culminated in the battle of Arsuf. Saladin had by now decided that the only hope of success lay in compelling the rear of the Christians' column to halt—and thus opening a gap, should the van be still on the move. Richard, on the other hand, had prepared for action by closing up still more, and as the crusaders were now formed a simple left turn brought them into two lines of battle, infantry in first line, cavalry in second line. Near Arsuf the road entered a defile between the sea and a wooded range of hills; and from the latter the whole Muslim army suddenly burst forth. The weight of the attack fell upon the rear of Richard's column, as Saladin desired. The column slowly continued its march, sufferingheavily in horses, but otherwise unharmed. The first assault thus made no impression, but a fierce hand-to-hand combat followed, in which the Hospitallers, who formed the rear of the Christian army, were hard pressed. As Richard gave the signal for the whole line to charge, the sorely pressed Hospitallers rode out upon the enemy on their own initiative. At once the whole of the cavalry followed suit. The head (or right wing) and centre were not closely engaged. and their fleeter opponents had time to ride off, but the rear of the column carried all before it in its impetuous onset, and cut down the Saracens in great numbers. Their loss was more than tenfold that of the Christians, who lost but 700 men. The army arrived at Jaffa on Sept. 10, unopposed, for Arsuf had broken the spirit of the Saracen army. The harvest—Jerusalem—was not reaped, owing to the internal dissensions of the crusaders.

See C. W. C. Oman, *Hist. of the Art of War in the Middle Ages,* **vol.** i. 305–318 (1924).

ART is defined in the article following and under AESTHETICS. There are articles on PAINTING; LANDSCAPE PAINTING; PORTRAIT PAINTING, etc. Technical methods are described under ART: Far *Eastern Methods*; DRAWING; ENGRAVING; ETCHING; LITHOGRAPHY; MEZZOTINT, etc.; CARICATURE; ILLUSTRATION, etc.

The article PERIODS OF ART is supplemented by CHINESE PAINTING; INDIAN AND SINHALESE ART AND ARCHAEOLOGY; JAPANESE PAINTING AND PRINTS, etc.

Artists have full biographies: APELLES; BOTTICELLI; CONSTABLE, etc.

Aspects of Art are treated under BRONZE AND BRASS ORNAMENTAL WORK; IRON IN ART; SILVERSMITHS' AND GOLDSMITHS' WORK, etc.; COSTUME DESIGN; DRESS. etc.; ENAMEL; JEWELLERY; SEALS, etc.; GLASS; INTERIOR DECORATION; LANDSCAPE ARCHITECTURE; MOTION PICTURES; POTTERY AND PORCELAIN; SCULPTURE; TEXTILES AKD EMBROIDERY; THEATRE, and many more.

There are special articles on ARTS AND CRAFTS; ART TEACHING; FINE ARTS; SCHOOLS OF ART; SOCIETIES OF ART, etc.

Many have full cross references and bibliographies.

ART. In any attempt to arrive at a clear and comprehensive definition of the meaning of art it is necessary to disregard all philological or etymological derivations which, in the past, have led to much confusion of thought and to an expansion of the human activities embraced by this term, which oversteps the limitations imposed upon it by the modern conception of its meaning. We are not concerned with the meaning attached to the word Art, or its Greek, Latin and German equivalents, in the past, which was so vague that almost all attempts to define it led to contradictory and often diametrically opposed conclusions, but with the more restricted and purely aesthetic interpretation put upon it by modern thinkers.

The old meaning, in its widest sense, of the Greek τέχνη, the Latin ars, the German *Kunst* (derived from *Können*), implied skill and ability, acquired through patient practice and directed towards a definite end, whether this end be aesthetical, ethical or useful. According to their aim the arts would thus be divided into Fine Arts, Arts of Conduct, and Liberal Arts, the Fine Arts being concerned with the attainment of the beautiful, the Arts of Conduct with the good, and the Liberal Arts with the useful.

In the modern and more restricted sense the term art applies only to those human activities which tend towards an aestheticism —in other words, the Fine Arts—and although, in a figurative way, we speak of the art of cooking, the art of the chase, the art of living, the art of war, and so forth, neither cooking, nor hunting, nor living, nor warfare would ever be seriously included in a list of the arts which embraces the static arts—architecture, sculpture and painting, with their subdivisions—and the dynamic arts—music, poetry and the drama (rhetoric).

Many attempts have been made to explain the essential nature of art, the quality which distinguishes art from all other manifestations of human activity, but most of them lack clearness, do not cover the whole field, or are capable of being extended to non-artistic activities. A number of writers on aesthetics, from Plato and Schiller to K. Lange, recognizing the non-utilitarian, immaterialistic character of art, explain it as a form of play—a theory which cannot be reconciled with the now generally accepted notion that superstitious fear of the unknown forces of nature is one of the main springs of artistic creation in primitive man who, by the productions of his art, tries to placate the mysterious hostile powers or to create symbols of stability and rest in the bewildering turmoil of the universe.

Equally unsatisfactory, in the light of modern speculation,

is the *Einfühlung* (empathy, *q.v*) theory, first advanced by Herder and elaborated, among others, by Vernon Lee, which, whilst throwing valuable light on the true nature of aesthetic enjoyment, does not supply a complete solution of the problem presented by the investigation of the basic constitution of art. Neither is this solution to be found in Croce's equation of art and intuition, nor in Santayana's "objectified pleasure"; less still in the entirely fallacious popular definition of art being nature seen through a temperament. Tolstoy came nearer the truth in insisting upon emotional impulse as indispensable to all artistic expression, but went sadly astray in the elaboration of his theory.

It is scarcely necessary to insist upon the fallacy of such popular notions as the identifications of art with the representation of nature, or, worse still, of the beautiful in nature. Art is not representation, but interpretation; and it is not too much to say that art begins where the artist departs from strict imitation of nature, imposing upon her a rhythm of his own creation, according to his own sense of fitness. Nature is the artist's inexhaustible source of inspiration, but the laws which govern the work of art are wholly independent from the laws of nature. If the Pastoral Symphony is a sublime work of art, it is because Beethoven, far from imitating the sounds of nature in the manner of "programme music" (which more often than not is but remotely connected with art), expressed the emotions awakened in him by intimate communion with nature in terms of abstract rhythm dictated to him by his inspiration and controlled by that perfect craftmanship which is essential to the creation of a work of art.

ART ANDNATURE

It is true that the arts of painting and sculpture, less abstract than the art of music, necessitate a higher degree of verisimilitude to nature; but it is equally certain that the aesthetic appeal of the painter's or sculptor's work, though enhanced by the pleasure of recognition and association with familiar visual experience, is based on abstract qualities akin to the qualities of music, the difference being merely the medium—sound in the one case, form and colour in the other. But whereas our ears are trained to be susceptible to the rhythmic combination of sounds and to accept the musical work of art without probing into the representational meaning of these sounds, the aesthetic education of our eyes has been comparatively neglected. Instinctively we turn to the painting or piece of sculpture with a feeling of curiosity as to its meaning. Instinctively we compare it with our own experience of natural appearance and are apt to make its verisimilitude the criterion of its artistic merit, disregarding, at first sight at least, the abstract rhythm of form and colour which distinguishes the work of art from the mechanical imitation of nature. The associations of the subject are apt to blind us to the essential art qualities. If the Japanese painter looks at a landscape through his straddling legs with his head lowered to the level of his knees, it is because, through seeing his subject upside down, he is not led astray by the associations of the various "incidents" that constitute the landscape, and his attention is riveted upon the pure pattern of colours and forms. For the same reason many Western painters, in the course of their work, at times turn their canvas upside down in order to be able to concentrate on the abstract qualities of the design, which are obscured by "life-like" representation.

If representational truth were the criterion of the work of art, a good photograph would have a better claim to this title than an Egyptian statue, a torso by Michelangelo, the Primavera of Botticelli, or a landscape by Claude or by Cézanne. Yet photography has no place among the arts, even though the photographer may, by his tact in selection, give evidence of a good deal of artistic taste. It does not rank among the arts, because it has to accept nature uncontrolled and unmodified. And it is just that power of control and purposeful modification—vide the broad simplification and relations of planes in the Egyptian statue; the amplified muscles and heightened vitality of the Michelangelo torso; the graceful arabesque line of Botticelli's decorative painting; the orderly classic arrangement of the features in Claude's landscape; the deliberate architectural building up and accentuation of volumes in the Cézanne—that constitute the artistic significance of these works.

The function of art is the creation of beauty. Indeed, it may be said that there is no beauty outside art, or, to be more exact, no beauty that has not been revealed by art. Nothing in nature is either beautiful or ugly, for beauty and ugliness are not positive attributes of matter, but matter is invested with these attributes by the artist's emotional reactions to some outside stimulus Beauty thus resolves itself into objectified aesthetic emotion. The artist has the power to make this emotion visible or audible to others, and to make them partake of his pleasurable excitement We become aware of beauty and acquire the habit of transferring it from the work of art to the aspect of nature which was the source of its inspiration. We learn to see beauty in a tree, in a mountain, and even in things which, before the artist had opened our eyes, left us cold or even repelled us. A toothless old hag becomes beautiful under Rembrandt's magic touch, because he saw his subject emotionally and taught us to see it in the same way. It is doubtful if anybody found anything but dinginess and "ugliness" in the mist and fog of the Thames-side in London before Whistler, by the work of his brush and the poetic imagery of his "Ten o'clock Lecture," invested the murky London atmosphere with permanent beauty.

To go farther back, it is extremely doubtful whether the otherwise highly cultured anthropocentric Greek mind that evolved the ideal type of human proportions, which to this day remains the standard of perfection, was capable of discerning any beauty in the inanimate world. The Greek artist aimed at a perfection of symmetry and rhythm which was beyond the reach of nature. When, therefore, he borrowed any farms from nature, he evolved from them a stylistic formula representing the ideal type of these forms—an ideal which has no counterpart in actual existence. Greek ornament, architectural and otherwise, owes its origin to this attitude.

Until the dawn of the Renaissance in Italy the beauty of mountain scenery was a closed book to the mediaeval mind. A mountain was a thing to be shunned, an impediment to traffic, a source of danger and fatigue. Even a poet of the stamp of Petrarch found it necessary, in a long letter, to plead, as an excuse for his eccentricity in undertaking an unnecessary mountain expedition—an almost unheard-of adventure in his days—the example of Philip of Macedonia, who had ascended Mount Haemus in a similar spirit of enterprise. But this letter, which fills ten printed pages, whilst containing much information about the hardships, dangers and fatigue of the expedition, and theoretical reflections which might as well have been penned at the desk in his study, includes no hint of emotional response to nature in her most majestic moods, no description, no word of aesthetic appreciation. Petrarch in this proved himself the child of his time. Mountains only became beautiful in the eyes of mankind after Giotto and his followers had introduced them into their pictures to replace the traditional gold backgrounds of early mediaeval art. Art had then once more fulfilled its educational mission.

That beauty is not an attribute of nature, but of art, or of the artist's mind, need scarcely be demonstrated. If it were not so, it would be an immutable value, not subject to fluctuations. Yet, not only does the ideal of baauty change with successive generations, but it varies with races and individuals. It is only the beauty values set up by art that remain permanent, and their appreciation is largely a matter of artistic education. To define art as the attainment of the beautiful would, therefore, only be substituting one term for another, and would necessitate the even more elusive definition of the beautiful. Clive Bell's "significant form" as the determining factor of all art does not take us any further, for this "significant form" is only beauty in a new disguise. It would be as difficult to establish where exactly form becomes significant or where beauty begins.

Beauty, although the aim of art, has thus to be eliminated from any plausible and receptable definition of art. To find such a definition it is necessary to trace the common denomination of

the infinitely varied manifestations of human activity which legitimately come under the heading of art, the peculiar characteristic which distinguishes the work of art both from the product of natural forces and of purely industrial activity. What is there in common between, say, a Gothic cathedral, a Beethoven symphony, a Greek vase, a Rembrandt etching, a Giotto fresco, a Shakespeare sonnet, the Ludovisi "Throne of Venus," the stained glass windows of Chartres cathedral, a Benin bronze, an Ispahan carpet, and a Euripedes tragedy, to explain their being accounted as works of art, whilst no such claim could be advanced for a coloured photograph, a cast of the human figure from life, the tawdry mantel ornament of factory production, a piece of doggerel verse, or a rubbishy ballad?

THE PLACE OF CRAFTSMANSHIP

The degree of expressional power acquired by the mastery of craftsmanship, the greater or lesser intensity of the emotional urge, and the varying skill in adjusting the rhythmic relations of lines, colours, forms, sounds or words, distinguish the masterpiece from the inferior artistic production. It is for this reason that Leonardo da Vinci and Michelangelo and Rembrandt stand for all time as supreme masters, whilst their imitators, notwithstanding all their executive skill, are relegated to a comparatively insignificant position in the hierarchy of art. The mysterious smile of the Mona Lisa becomes a meaningless smirk when perpetuated in innumerable versions by apt pupils of the stamp of Gianpietrino. The muscular accentuation and amplification of Michelangelo's heroic sculpture assume an almost ludicrous aspect in Bandinelli and other Italian sculptors of the mid-16th century, because the generation that stood under the spell of the master's genius annexed—and often distorted to the verge of caricature—his forms without having experienced the emotional impulse to which these forms owed their existence. Their relation to Michelangelo finds a counterpart in the attitude of the early 19th century pseudo-classic sculptors to Pheidias and Praxiteles.

Craftsmanship is the handmaiden of art, but is, in the popular mind, often confused with art. Innumerable pictures are produced, year by year, by painters who are endowed with a certain amount of technical skill, but who lack the power of expression because they have nothing to express—copies of nature, painstaking or careless, as the case may be, but devoid of the three elements of art: emotion, expression and rhythm. Such pictures are no more entitled to be reckoned as works of art than the rows of featureless, ill-proportioned brick houses in the working quarters of a modern manufacturing town can claim to be regarded as examples of architectural art.

The function of art is almost as difficult to define as the meaning of art. The main purpose of art is to give pleasure; and for this reason art is held by many to be a useless luxury for the idle. From a materialistic point of view art certainly is useless, in so far as it produces nothing of a strictly utilitarian character.

Yet art is, and has always been, an indispensable need of humanity. It is implanted in the soul of the child, as in that of primitive man. It is as necessary as articulate speech. It is indispensable to civilization. It is the art of each race that gives its civilization its distinct character and rhythm. It reflects, if it does not actually condition, the whole manner of life of a nation or period. Life and art are closely, inseparably interwoven, but life passes—the life of individuals and the life of nations—and art remains. It is the only thing that is permanent; and our knowledge of the past, of civilizations that have flourished and disappeared, is derived almost entirely from the fragmentary relics of their art. It is not from printed books that we visualize and form our estimate of the life, culture and character of ancient Egypt, Assyria, Greece or Rome, but from the ruined buildings, carved stones, half-decayed bronzes, fragments of pottery, frescoed walls, personal adornments and household objects dug out of the ground by the excavator's spade, which are of far greater and more lasting significance than the transitory effects of great wars and revolutionary political changes. History becomes a living reality to us through art. Without it, it would be a dead letter. Above all, art brings pure pleasure into the humblest life. It is a source of exaltation that raises us above the sordid realities of everyday existence. Without art, life would be intolerable, inconceivable. The human imagination requires fcod as imperiously as the human body, and art is the inexhaustible spring from which our imagination draws sustenance.

PRINCIPLES OF ART

Man, since the earliest period of which there is knowledge, has striven to give his impressions form and meaning. At times, as in the great fifth century in Greece or in the European Renaissance, he has produced work after work astonishingly excellent; and even when culture seemed nearly dormant, as in the early Middle Ages, the urge to represent the impressions and creations of his mind continued in the individual.

A feeling of pleasure is evident on the countenance of a child who has made marks, signifying nothing, in sand. Soon his marks represent familiar objects: a crude circle indicates the sun, an oval supported by straggling lines a dog, and the human form appears with a circle for the head, an inverted Y for the body and legs, and a cross-line for the arms. (See DRAWING.) These figures are crude, for not only does the child lack skill but his models are imperfect memories of his impressions. In a similar way, prehistoric man would seem to have begun to carve and draw on stone, wood, bone and whatever other materials were available, slowly developing his art until it culminated in the figurines and cave-paintings found in Europe.

The desire to incorporate movement in such figures follows their first representation closely. Life itself is movement; even plant life moves, as the Chinese artist who studies the aspiring quality of grass knows; bodies without this movement are dead and uninspiring. In the minds of savages, movement is associated with life so vitally that to them animals may not seem themselves unless moving in a characteristic way. A snake, for instance, is represented by a wavy or zigzag line; often there is no attempt to indicate the more static details; the movement alone suffices.

Rhythm is almost a necessary element of movement. In the line representing a snake curve follows curve. In cave-paintings animals in groups are often inclined upward and downward to indicate movement. Rhythm was soon used simply to create pleasing movement in the relation of various figures, one to another. No one knows what may have been the development of the rhythmical motives which through countless generations have been built up in the minds of the American Indians, the natives of the Pacific islands and other primitive peoples. Such symbolism as adheres to them is often conflicting and vague. The rhythm counts for itself alone. It is satisfying and beautiful.

Once man began to decorate the handles of his weapons, a wall space, skins or his utensils, composition began and proportion was born. If in Europe a prehistoric man wished to carve a reindeer on a dart-thrower, he confined the scope of his work within definite limits and had to evolve a ratio between the length and height of

the reindeer and the length and breadth of the dart-thrower. In time, simple direct proportions became tiresome, more involved relationships formed more intricate compositions, and from the application of an already pleasing quality of art to a given area or form, another pleasing quality, valuable in itself, resulted. Later this was highly developed until, in such works as the sculpture-filled tympana in the pediments of the Parthenon or Leonardo's "Last Supper," the artist utilized his minor figures, each in itself exquisite, to enhance the one on which he wanted attention focused, seeking variety for the individual figures but unity for the whole composition. Often in the history of the arts — though rarely in the East, for the Eastern artist holds tenaciously to fundamental principles in art and is not easily led astray by a new phase — men, becoming interested in other means of making their work beautiful and pleasing, have lost sight of the possibilities in composition. Composition, in a sense, is related to movement and to rhythm, for identical arrangements of lines located differently in given frames produce very different movements, and rhythm can be set up between the structural lines of a composition, or between a structural line and a boundary.

No other important principle in art appeared until the European Renaissance. Meanwhile, the grace of prehistoric carving had been forgotten and sculpture had taken on the stiffer forms of Egypt and Western Asia, whence it came to Greece and flourished in the human form idealized; architecture, in Greece and mediaeval Europe, on the basic structural principles of the post and lintel and the masonry arch, had developed compositions with rhythm, movement and proportions still unequalled; poetry, beginning with the folk-song, had assumed the epic, then shorter, more conventional forms; in Greece the drama had risen to great heights of character portrayal and expression but only its form continued to grow during the period of Imperial Rome, and even that withered during the Middle Ages; and music, in the early days always allied closely with religion, had found in Christianity an energy that ever drove men to seek new ways of using its enchantments to glorify their destiny. In these arts, it will be seen, representation, movement, rhythm, composition and proportion, govern, as in painting.

In the fifteenth century men in Italy attained an efficient knowledge of perspective. Painting achieved a new dimension, depth, and the impetus given to the art was like that given to literature by the invention of printing, to music by Bach's system of equal temperament enabling it to move freely in all keys, or to architecture by steel-skeleton construction. People could now look *into* a picture. Painters tried to grasp not only the outline of the object portrayed but its three-dimensional mass. They strove not so much for the appearance of the object as to portray it as they knew it to exist. On the other hand, they found reason to portray much that they saw but knew to be untrue. It might be argued that the road as it penetrated the distance maintained a constant width; the painter could reply that it looked as though it were growing narrower. Enthusiasm for the possibilities of representing three-dimensional form continues even among modern painters, artists like Cézanne seeking to realize on canvas the basic relationships between solids. Perspective is not essential to enjoyment of a work of art. A picture can be beautiful if painted in the manner of the East, perhaps without perspective. Movement, rhythm, composition and proportion, the elements that from childhood up the race has learned instinctively to watch for and to want, yield most enjoyment in the arts.

With the breaking down of the restraint imposed by mediaeval Christianity, men's minds were freed to realize, unhampered by tradition, their pagan heritage. Equally important, finding again the joy of mental conquest, they sought all forms of knowledge with almost unbelievable persistence. Often, artists were inventors, too. Science entered inextricably the tangled skein of forces influencing srt. Its ever-widening field has since continuously fed the artist with more accurate knowledge of the nature of the objects that he represents, better materials and tools with which to execute his work and, through its agencies, a larger audience. Research has revealed the elements of sound. From the machine, architects and sculptors have learned new harmonies in form and line. The resources of modern invention enhance the drama.

Poetry that expresses the beauties of modern science in exquisite language and form may well capture such beauty and artistic truth as has been rarely known. But the application of scientific principies in art can best be seen in painting. Leonardo da Vinci, himself a scientist, understood that as the subject in question recedes from the eye delicate changes in illumination and hue call for reproduction. Study of chiaroscuro continued, but, although Newton first explained the dispersion of light in 1666, the significance of his discovery for painting was not fully realized until the time of Monet, in the nineteenth century. Monet, understanding that white light is made up of many colours, and that two colours may blend to form a third, achieved his effects by amassing small patches of different colours in close juxtaposition, to be blended by the eye of the observer to produce the colours that he wished to represent; his work carries broken colour to extremity.

Behind all art lie certain fundamental causes. **A** work of art, whether it is a symphony, a poem or a painting, requires of its creator broad and deep understanding of the elements represented, fused with extraordinarily skillful technique by an impelling and emotional urge to create. Whether artistic understanding is inherited or acquired is hardly ascertainable. Technique can be achieved through study, but the physical attributes of the individual artist, such as the hearing of a musician or the eyesight of a painter, affect his facility according to their degree of excellence.

That emotional urge which spurs civilized men to create art has at different times and in different individuals been caused by different influences, but it is safe to say that, analyzed, it may be resolved into a will either to represent nature, as in the early Chinese artists, or to idealize its forms, as in Greece; into a will to escape from this life by exalting symbols of the world to come, by fashioning guardians against its evils, or by propitiating spirits, as in Egypt and in mediaeval Europe; or into a will to exalt an individual or group, as in Imperial Rome and in Renaissance Europe. To-day each of these is present. **(A.** DEW.)

FAR EASTERN METHODS

The art of the Far East aims to depict the spirit, rather than the semblance, of a thing. So the mission of an oriental artist is not necessarily to represent, but to interpret, the inner meaning of his subject. Vain, indeed, is an attempt to reproduce with paint a phenomenon of Nature. **A** picture of a wild flower, for example, may be true to form and colour, but where are the inherent purity and the fragrance of the blossom? Realizing the utter impossibility of imitation, the eastern painter seeks, instead, to express the impression which he has gained through admiration of nature or to give form to an ideal, by means of his brush, even as the poet expresses himself in words. The mood of the artist, then, is one of self-forgetfulness, since he is merely an interpreter of the beautiful and the mysterious in nature.

It has been said that "art is a tryst," for in the joy of it maker and beholder meet. In the West, this epigram is explained as the reproduction, on the part of the beholder, of the artist's mood at the time of his conception of a work of art. But this dual process, when applied to the art of the Far East, assumes a deeper significance; for in the East art becomes a whole only when the beholder's imagination co-operates with the suggestion conveyed by the artist in his work. The aesthetic nature of the oriental first

seeks intrinsic beauty and then evolves extrinsic completeness. The function of a picture, therefore, is not to display but to suggest; the beautiful is present but it is concealed. After all, a painted twig is important in that it invites one to reconstruct, by exercise of the imagination, a towering tree through which the joy of life flows, and a painted figure is interesting if it depicts the inner nature with its striving for the highest. Hence, the suggestive quality of the art of China and Japan is a vital factor; the more emphatic the suggestion on the part of the artist, the more profound the appeal to the beholder.

It is true that in the pictorial art of the Far East there are various schools or styles, as in the art of the West: idealistic, impressionistic, romantic, realistic, etc.; then, too, the subjects treated by eastern artists include all things religious and secular, animate and inanimate. Yet, taken as a whole, one may note that oriental paintings are distinct, not only in aesthetic expression, but also in technical achievement. In creating a picture, the Far Eastern artist, before all else, grasps the spirit of his subject, then conveys this mood to the brush. He paints, not what he sees, but what he feels. This does not mean an occult treatment of the theme, for in presenting it an intelligible delineation of the subject is demanded. Broadly speaking, the external form is but a mask under which reality hides and this reality the artist attempts to reveal. The importance of the embodiment of soul in a picture was mentioned in China as early as the 4th century; emphasis on this point, however, may be said to date from the 5th century when Hsieh Ho laid down his celebrated "Six Canons of Painting," which have been the basis of art criticism in the Far East throughout the subsequent centuries. The canons, translated freely, are (1) life-motion engendered by spiritual harmony; (2) use of the brush in rendering bone-structure; (3) delineation of forms in conformity with the objects; (4) application of colours appropriate to the kinds; (5) spacing based on proper planning; (6) copying of classic pictures, thereby preserving tradition. A masterpiece should exemplify all six points. It is to be noted that spiritual expression, or life-quality, in art is the prime requisite of the canons. Turning to the remaining five canons, all of which refer to technique, it will be seen that the use of the brush is placed before imitative accuracy in form and colour, composition or tradition; for "brush-strokes" are considered in the light of the bodily structure of that which encases the spirit, while "form" and "colour" are but the flesh and the skin. The term "spacing" means embellishment of the design, and "copying" refers to the transfusion of principles established by past masters. But brush-strokes are more than bone-structure; they are the nerve system as well, for they suggest force, in that they invoke living motion. Motion being durative in nature is best conveyed in uninterrupted lines made by a feeling hand. The strokes, therefore, are more than mere outlines or spots indicating shapes or areas; by their very vigour, they express the life-quality of the subject pictured. Brush-strokes at the same time are an index to the character of the individual who made them, the more inspired the artist, the more spontaneous their response. If the painter is noble-minded, the spiritual expression in his handwork is abundant, and if the spiritual expression is abundant, the picture causes life-motion; otherwise, mere dexterity in brush-manipulation is but the skill of an artisan.

Use of Brush and Ink-tones. — The Far Eastern artist, accordingly, is trained to perceive and to feel that which is beautiful and interesting in nature and to put his conception into execution. His early training is devoted to copying repeatedly model works by his master, consisting of simple drawings effected in broad and vigorous strokes. He begins by grinding "China ink" on an ink-slab, and with a large brush he drams on paper with a view to reproducing the exact order and strength of each stroke of the model. The brush is held perpendicular to the paper, almost at right angles to the hand and is firmly grasped, at a considerable distance from the point, by the thumb, index and middle fingers. During the process of drawing, the fingers remain almost immobile, for the work is done by the arm unsupported, with barely the point of the hair touching the paper. Constant practice in manipulation of the brush in this manner makes the arm alert and flexible, so that lines of even and continuous strength, some swift and some gentle, may be produced through proper control of the nerves of the arm. Only when drawing extremely delicate lines does the hand make use of the wrist as a support.

Ordinarily an oriental artist does not use an easel when painting or drawing, since he works seated with paper or silk spread before him. As he paints, his head is bent down, the shoulders supported by the left arm, of which the hand rests on the table or floor. By long and unceasing practice in handling the brush, he becomes efficient in producing strokes thin or heavy, light in touch or abrupt in force. The brush-strokes in a painting are often compared to those employed in the calligraphy of China and Japan. In fact, in the matter of the use of the brush there exists but little distinction between the two arts. That much attention has been paid to brush-strokes in the Far East is evidenced by careful studies of various types of brush-marks which have been made by great and old masters. There are collections of strokes used in delineating figures, rocks, water, trees, etc., which are referred to as either "wrinkles" or "touches." For drawing and painting the manifold contours of mountains and rocks, there are 16 (or 18) kinds of strokes, each of which is known by a fancy name such as rain-drops, scattered brushwood, alum crystals, demon skin, large axe, horse's teeth, folded belt, hemp fibres, lotus leaf veins, unravelled rope, bullock hair, eddying water, etc. Again, in drawing figures, especially their draperies, there are "touches" known as "harp string," "moving cloud and flowing water," "rat-tail," "willow leaf," etc. These have always been useful guides to painters, and have served to deter beginners from attempting crude and meaningless styles. It must be understood, however, that over-emphasis on classification of this sort and strict adherence to it is detrimental to initiative.

Having acquired a certain amount of facility in manipulation of the brush, the student is next taught the value of ink-tones. The ink used in Far Eastern painting is a mixture of lampblack or pine soot with glue, moulded into cake form. Upon a slate-like slab with a depression at one end to hold a small amount of liquid, the cake of ink is rubbed, with an admixture of water, until the latter becomes a solid black. This process takes place just before painting. When light shades of black are desired, the liquid ink is mixed with water by means of the brush, in a white porcelain saucer, according to the requirement. The much-valued lustre of the ink when dry on paper or silk depends largely upon the quality of the ink itself, as well as upon the stone employed for grinding. It is said that an artist who thoroughly understands the proper use of ink is able to ascertain the shade immediately upon dipping his brush without testing it on the white saucer or on paper.

Like the quality of the brush-strokes themselves, the quality of the ink-tones differs according to the painter, and determines his artistic ability. It is important that a good painting in ink should show proper relation of light and dark tones varying from lustrous black to delicate grey. Satisfactory results demand that various shades be applied in harmonious order, so that there may be no violent break in gradual tone-scales. Indeed, a correct use of ink produces a sense of natural colours, and atmospheric perspective, colours being after all but intermediaries between black and white, and differences in distance but degree of visibility. It must be pointed out that dark ink does not necessarily suggest strength, nor light ink weakness, nor does a heavy stroke always indicate vitality or a thin stroke lack of it. A proper combination of brush-power and ink-tone creates life-motion in a picture. The duration of an inspired mood is but temporary; hence the transference of this mood into ink with the brush must be relatively spontaneous.

There are, roughly, two types of brush-strokes--one broad and often massive, which in itself forms a component part of a picture; the other thin and crisp which is used in the nature of an outline. On both alike, the technical demand of expressiveness is imposed. The brushes used naturally differ in size, but because all except the flat varieties, are so made, of the hair of a deer, goat, fox, badger or rabbit, as to possess needle-like points when wet, and because generally the tips only touch the surface for

painting, a small drawing may be made with a comparatively large brush. It may be remarked in passing that painters of certain schools use almost the entire length of the hair when it is desired to reproduce an effect of light and shadow in a single stroke. First the brush is allowed to absorb a light shade of ink; then, after touching the tip of the hair to the thick black, a leaf, for example, is immediately painted, the brush being used sidewise and a little pressure being exerted as the drawing is made. The running of the dark ink into the light automatically results in gradation producing in a single stroke the effect of chiaroscuro. A variety of paper which absorbs ink very quickly is used in practising manipulation of the brush, which includes making strokes and producing ink-tones. Because of the bibulous nature of this paper and of the ink used, blurring is likely to occur, unless the amount of ink held on the brush is carefully gauged and the brush-marks made swiftly. The paper admits of no erasing or retouching, thus compelling the pupil to be certain of his every movement prior to actual execution of a picture. Having been instructed in proper use of the brush and in quality of ink-tones, the pupil is allowed to study and sketch from nature.

Sketching and **Colouring.**—Generally speaking, in the art of the Far East sketching from actual objects does not mean working from a model so much as training an artist in the observation of that which is real. According to the Chinese idea, the spirit of all phenomena originated in Heaven and was formed into shape on earth; every phenomenon is endowed with spirit and is a worthy subject for a picture; each is an inspiration for a painter who, by searching inquiry into its peculiar nature, may succeed in grasping its very spirit. Thus an artist is urged to examine every significant feature of his subject and to imagine himself to be it before delineating it. By this means and this alone may he be able to express its spirit. So a sketch-book of an artist may be a jumble of unrelated and incomplete parts of all kinds of plants, landscapes, figures, etc. Useful though these actual sketches are, their importance is insignificant in comparison to the deep mental notes which he has made. For example, a bamboo under different atmospheric conditions, in wind or in rain, in sunlight or in moonlight—how preserve the impression except by mental notes? A great master, in painting a bamboo leaf, though it hang downward, would still indicate its longing to point to the sky; and a story is told of a Chinese painter who, finding that his sketch of caged insects did not adequately picture them, freed the insects in their natural haunts, and himself lying on the ground for purposes of close observation, succeeded in catching the spirit of his subject. Indeed, orientals doubt the desirability of employing, for the sake of anatomical correctness, an ordinary man as a model for a picture of a king. For painting a horse trotting, a study of an animal in a stall is of little value; accordingly, the artist of the Far East tries to delineate his impression of the appearance the horse presented when in motion. It is said that a good picture must needs be truthful, but in reality an attempt at faithful reproduction in paint and with brush is futile; so a painter's aim should be to create a picture which will make on the beholder a deeper impression than the original itself.

The same observations apply to the use of colour. It is true that all visible phenomena have shape and colour, but in making pictures of them, a painter is not concerned with the idea of reproduction. If he were, a sculpture in the round with appropriate colouring would be the ideal medium for his purpose. For this reason, the art of the Far East considers colour but an accessory which adds a certain decorative value to a picture. In introducing colours the artist merely intends to approximate the colour-aspect of the object depicted. Some Eastern connoisseurs argue that since "China ink" correctly used creates a sense of chromatic beauty and the presence of pigments in a painting suggests artificiality, the latter are therefore detractive to the minds of those who love purity. In any case, the palette of the eastern artists is limited, the colouring materials being drawn chiefly from mineral, earth and vegetable substances compounded with fine glue. The medium is water, which fact contributes toward the free movement of the brush, a rigid requirement in order to illustrate motion at the sacrifice of realism.

Conception and Composition,—In their pictures, the artists of the Far East attempt to present a certain space and time within a comparatively small area. Oriental painters seek first to grasp the essential attributes of their subjects and then to depict them with the utmost economy of brush-strokes. Landscapes provide the subjects most often treated. The artist feels that a landscape shows Nature with her manifold mysteries and that therefore it is worthy to be his pictorial theme. He considers it his mission, as well as his privilege, to interpret and present this large subject in a small space, so that both he and the beholder may enjoy and admire nature in her varied forms. Majestic mountain peaks, rambling brooks, gnarled trees shrouded in mists, a solitary hermit —all may be brought to one's home by the artist. In order to represent such a vast scene, it is not possible to depict every detail, so there are suggestions for the right proportions of component parts: "In painting a landscape, make the mountain ten feet high, the tree one foot, the house one-tenth of a foot and the human figure the size of a pea." Then there are conventions which show the oriental attitude toward perspective (*q.v.*). "A mountain at a distance shows no ledge-marks; water at a distance, no waves; a man at a distance, no eyes. Not that these things are absent, but they appear as if they were absent." In executing a painting, the idea of perspective is indicated by three successive planes, one above the other, nearest objects being represented in the lowest plane. The general tones of ink or colour also indicate variations in distance—dark tones for the foreground, light for the far distance and medium tones for the intermediate spaces. The effect, therefore, is not linear but aerial perspective. Instructions in landscape painting deal, not with methods whereby to copy real scenery, but with suggestions how to compose such a picture. As the oriental conception of a landscape is "mountains accompanied by water," the artist who attempts such a theme cannot escape from introducing water in some phase, be it a river, a lake or a waterfall. He selects interesting parts from several scenes for his landscape, and then groups them to form complete unity, thereby creating an entirely new world. However, there should always be a clear distinction between the principal and the subordinate parts. Essays on the subject of landscape speak further of the general characteristics to be associated with scenery in the different seasons: "Mountains in spring should appear as if smiling; in summer as if freshly bathed; in autumn, bedecked; in winter, as if sleeping."

In the Far East, trees, plants, fruits, animals, insects and even fish are often included in the category of "Flower-and-Bird" paintings. The mode to follow in treating these motives is, first, to observe the innocence or the elegance of the flowers, or the instincts of the birds and animals, and then to paint the character or spirit of the subjects. Attempts have been made to establish rules governing the order for making the component parts. Both in China and Japan there are guide-books for painting orchids, chrysanthemums, plum blossoms and bamboos which, because of their virtuous characteristics, are together called the Four Sages. Rules explain the general arrangement of compositions, in particular showing the relation between the *principal* (or guest) and the *subordinate* (or host). The former is the chief portion of the design and the latter its adjunct. Broadly speaking, by *principal* is meant that portion of the design which occupies the centre of attraction, larger in size and more abundant in details. The *subordinate*, which is small in proportion, supports the *principal* by maintaining proper balance in a composition. Balance, in this case, does not denote a symmetrical arrangement of parts, but agreeable spacing in relation to the shape of the paper or silk on which the painting is done. There are also instructions which prescribe the order of brush-strokes to be followed when developing the theme. In painting a picture of bamboo, for example, the main stalk is drawn first in light ink, from the bottom upward, in a few sections which are graduated in length, the lowest being the shortest. The next step is to make the joints with darker ink. Then follow strokes for the branches, in light ink, each drawn by starting from one of the joints. The leaves are painted next, and the artist must bear in mind that each one grows from a branch; they are executed in a variety of ink-tones, due attention being

paid to differences in distance, those nearer being drawn in dark ink. Among painters there are those who would define various arrangements or combinations of leaves by their resemblance to Chinese ideographs, a fact which proves the fastidious manner in which some rules have been formulated. In the main, it is important that a painter of bamboo or of other plants should always remember the natural order of growth, from the root gradually heavenward, and that he should follow in painting the same orderly process. Furthermore, the artist must strive to convey the characteristics of his subjects — the stern quality of the ever-bending but never-yielding bamboo, the courage of the plum which blossoms in winter, the purity of the orchid which unfolds its beauty in solitude and the nobility of the chrysanthemum which possesses the mind of a hermit. Likewise in painting birds, animals, etc., the artist must try to understand their special attributes — the beak and claws of an eagle, the plumage of a peacock, the horns of a deer, etc.; and he must emphasize their significance almost to the point of exaggeration.

Portrait and figure-painting have never attained, in China and Japan, a height corresponding to landscape or flower-and-bird subjects. Painting a figure merely for the sake of showing physical beauty, or a portrait from a model, has not been customary. On the other hand, portraying ideal or imaginary likenesses of historical or legendary persons has been common, which explains the existence of treatises on figure-painting. The latter, however, refer to types of features and facial expressions: an emperor should always look dignified; a general, brave; a recluse, noble; a lady, refined; a farmer, rustic; etc. In addition to this generalization, the essays discuss appropriate accessories to be included in these pictures — palaces, chairs, mountain-scenery, ponds, farms, etc. They also give scales of proportion for a figure: the height of a body in standing pose should be seven times the size of the head; the body when seated should be three times the size of the head; the size of the head itself should be twice the open palm of the subject's hand, etc. Further, the discussion covers varieties of brush-strokes to be used in depicting the draperies of figures, mention of which has already been made. Of course stress is laid upon the importance of revealing the soul of the subjects, but there is no reference to anatomical correctness. The absence of modelling in portraits, as in all subjects, is one of the peculiarities of oriental paintings. The contours of the face, the features and the muscles are indicated by lines. This linear treatment in two dimensions, though it fails to suggest a sense of relief, nevertheless produces a state of animation. In a composition, a figure or a tree often lacks indication of the ground on which it stands; the reason being that the artist, as well as the beholder, prefers that such an obvious element be disregarded entirely. A "filled-up picture" is wearisome, while an empty space allows the beholder's imagination to roam about. When asked what part of a painting is most difficult of execution, a Japanese painter replied: "The space which is to be left unpainted."

Far Eastern paintings are executed in ink and water-colours, usually on either paper or silk that has been sized with a thin solution of a mixture of transparent glue and alum. On the receptive surface of either paper or silk, the work of the artist is executed by one of three methods: (1) by painting immediately without any preliminary sketch; (2) by indicating in charcoal a skeleton of the design; or (3) by preparing a careful outline drawing of the design on a sheet of paper and tracing it upon the surface proper.

Copying and Tradition. — In the art of the Far East certain pictorial subjects frequently recur, each bearing a well-appointed title, usually somewhat fanciful and often poetic. Moreover, their treatment is similar, if not identical. The reason is not far to seek, for the artists of the Orient come of races which not only view the old with reverence, but always revert to the past for inspiration. It has been remarked that a pupil's training consists in copying and recopying his master's works and that there are model-books which show the proper methods of painting various subjects. So much stress upon tradition, at once a safeguard against radicalism and an obstacle to free development, naturally gave birth to pronounced school mannerisms and to restrictions which extend even to choice of subject and result in inevitable repetition. It may be added that artists of the East often select themes which cannot be studied from nature or observed at first hand; consequently, dependence upon old pictures for general guidance is necessary. It is probable, however, that the special reference in the "Six Canons" to copying old masters was not intended to mean mere copying; rather it should be interpreted as emphasizing the importance of preserving that part of tradition which ever lives as an eternal principle and of transmitting it to the next generation. A work of art may betray its maker's individuality, and however hard he may try, he cannot free himself from the influence of the past; so that orientals praise, rather than condemn, one who turns to classic pieces as models. A Chinese in the 4th century pointed out that the art of painting may be developed from copying old masters. There are four recognized methods of copying (1) tracing; (2) reproduction which consists in faithfully copying the original without resorting to the process of tracing; (3) interpretation, being a near copy of the design and characteristics of the original but embodying much of the copyist's personality; (4) reduction, which is usually sketchy in nature. The third method must have been the type of copying recommended by the formulator of the canons. Thereby the copyist preserves what is good of the past and develops it to meet his ideals as well as the conditions of his time. The art of the Far East has been evolving in this manner from the time of its inception.

ARTA (NARDA or ZARTA), a town in Greece, province of Epirus, on the site of the ancient Ambracia. The present name is derived from its river (anc. Arackthus) which enters the Gulf of Arta south of the town and was formerly the frontier between Greece and Turkey. There are a few old walls, a picturesque bridge, formerly neutral ground, a Byzantine castle on the ancient citadel; the palace of the Greek metropolitan; many mosques and churches. The population (8,446) manufactures woollens, cottons, Russia leather and embroidery, and there is trade in cattle, wine, tobacco, hemp, hides and grain. The neighbouring plain is fertile, and the town has gardens and orchards of orange, lemon and citron. As a Greek frontier post, Arta has often been in dispute. In 1083 it was taken by Bohemund of Tarentum; in 1449 by the Turks; in 1688 by the Venetians. In 1797 it was held by the French, but in 1798 Ali Pasha of Iannina captured it. During the Greek War of Independence it suffered severely; in 1854 it revolted; and in 1881 it was ceded to Greece. In 1897 the Greeks gained some successes at Arta, and after the war of 1912 the Greek annexation of southern Epirus changed Arta's circumstances altogether. Germany occupied Arta in 1941.

ARTA, GULF OF (anc. *Sinus Ambracius*), an inlet of the Ionian sea, 25m. long and 10m. broad, on the west coast of Greece. Its only important affluent, besides the Arta, is the Luro (anc. Charadra). The gulf abounds with mullets, soles, and eels. Around its shores are numerous ruins of ancient cities: Actium at the entrance, where the famous battle was fought in 31 B.C.; Nicopolis, Argos, Limnaea and Olpae.

The river ARTA (anc. Arachthus or *Aratthus*, in Livy xxxviii. 3, *Aretho*) is the chief river of Epirus, and is said to have been navigable in ancient times as far as Ambracia. Below this town it flows through a marshy plain, consisting mainly of its own alluvium; its total length is about 50 miles.

ARTABANUS (ahr″tà-bā′nus), the name of a number of Persian princes, soldiers and administrators. The most important are the following: —

1. Brother of Darius I., and, according to Herodotus, the trusted adviser of his nephew Xerxes. Herodotus makes him a principal figure in his dialogues; he warns Darius not to attack the Scythians (iv. 83; see also iv. 143), and predicts to Xerxes his defeat by the Greeks (vii. 10 et seq., 46 et seq.); Xerxes sent him home to govern the empire during the campaign (vii. 52, 53).

2. Vizier of Xerxes (Ctesias, Pers., 20), whom he murdered in 465 B.C. According to Aristotle (Pol., v. 1311b), he had previously killed Xerxes' son Darius, and was afraid that the father would avenge him; according to Ctesias (Pers., 29, Justin iii. 1, Diod. xi. 69), he killed Xerxes first, and then pretended that Darius had murdered him, and instigated his brother Artaxerxes to avenge the parricide. At all events, during the first months of the reign of Artaxerxes I. he was the ruling power in the State (therefore the chronographers wrongly reckon him as king, with a reign of seven months), until Artaxerxes, having learned the truth about the murder of his father and his brother, overwhelmed and killed Artabanus and his sons in open fight.

3. A satrap of Bactria, who revolted against Artaxerxes I., but was defeated in two battles (Ctesias, *Pers.*, 31).

The name was borne also by four Parthian kings. The Parthian king Arsaces, who was attacked by Antiochus III. in 209, has been called Artabanus by some modern authors without adequate reason.

4. ARTABANUS I., successor of his nephew Phraates II. about 127 B.C., perished in a battle against the Tochari, a Mongolian tribe, which had invaded the E. of Iran (Justin xli. 2). He is perhaps the Artabanus mentioned in Trogus, Prol. xlii.

5. ARTABANUS II. (*c.* A.D. 10–40), son of an Arsacid princess (Tac., *Ann.*, ii. 3), lived in the E. among the Dahan nomads. He was raised to the throne by those Parthian grandees who would not acknowledge Vonones I., whom Augustus had sent from Rome. The war between the two pretenders was long and doubtful; but at last Artabanus defeated his rival completely and occupied Ctesiphon; Vonones fled to Armenia, where he was acknowledged as king, under the protection of the Romans. But when Artabanus invaded Armenia, Vonones fled to Syria, and the Emperor Tiberius thought it prudent to support him no longer. Germanicus, whom he sent to the E., concluded a treaty with Artabanus. Armenia was given (A.D. 18) to Zeno, the son of the king of Pontus (Tac., Ann., ii. 3 et seq., 58; Joseph., Ant., 18. 24).

Artabanus II., like all Parthian princes, was much troubled by the opposition of the grandees. To strengthen his power he killed all the Arsacid princes whom he could reach (Tac., Ann., vi. 31). Rebellions of the subject nations may have occurred also. We learn that he intervened in the Greek city Seleucia in favour of the oligarchs (Tac., Ann., vi. 42, 44), and that two Jewish brigands maintained themselves for years in Neerda in the swamps of Babylonia, and were acknowledged as dynasts by Artabanus (Jos., Ant., 18. 9). In A.D. 35 he tried anew to conquer Armenia, and to establish his son Arsaces as king there. A war with Rome seemed inevitable. But that party among the Parthian magnates which was hostile to Artabanus applied to Tiberius for a king of the race of Phraates. Tiberius sent Phraates' grandson, Tiridates III., and ordered L. Vitellius (the father of the emperor) to restore the Roman authority in the East. Vitellius succeeded completely, and Artabanus, deserted by his followers, fled to the East. Tiridates, who was proclaimed king, could no longer maintain himself, because he appeared to be a vassal of the Romans; Artabanus returned from Hyrcania with a strong army of Scythian (Dahan) auxiliaries, and was again acknowledged by the Parthians. Tiridates left Seleucia and fled to Syria. But Artabanus was not strong enough for a war with Rome; he therefore concluded a treaty with Vitellius, in which he gave up all further pretensions (A.D. 37). A short time afterwards Artabanus was deposed again, and took refuge with his vassal, the king Izates of Adiabene, who induced the Parthians to restore him once more to the throne (Jos., *Ant.*, 20. 3). Shortly afterwards Artabanus died, and was succeeded by his son, Vardanes, whose reign was still more turbulent than that of his father,

6. ARTABANUS III. reigned a short time in A.D. 80 (on a coin of this year he calls himself Arsaces Artabanus) and the following years, and supported a pretender who rose in Asia Minor under the name of Nero (Zonaras xi. 18), but could not maintain himself against Pacorus II.

7. ARTABANUS IV., the last Parthian king, younger son of Vologaeses IV., who died A.D. 209. He rebelled against his brother Vologaeses V. (Dio Cass. vii. 12), and soon obtained the upper hand, although Vologaeses V. maintained himself in a part of Babylonia till about A.D. 222. The Emperor Caracalla, wishing to make use of this civil war for a conquest of the East, attacked the Parthians in 216. He crossed the Tigris, destroyed the towns and spoiled the tombs of Arbela; but when Artabanus advanced at the head of an army, he retired to Carrhae. There he was murdered by Macrinus in April 217. Macrinus was defeated at Nisibis and concluded a peace with Artabanus, in which he gave up all the Roman conquests, restored the booty, and paid a heavy contribution to the Parthians (Dio Cass. lxxviii. 26 et seq.). But at the same time, the Persian dynast Ardashir (q.v.) had already begun his conquests in Persia and Carmania. When Artabanus tried to subdue him his troops were defeated. The war lasted several years; at last Artabanus himself was vanquished and killed (A.D. 226), and the rule of the Arsacids came to an end.

See further PERSIA: *History,* Ancient, and works there quoted.

(ED. M.)

ART AND PART, a term used in Scots criminal law; in contradistinction to "actor," and denoting guilt of the crime by accession before or concomitant with the fact. For practical purposes the distinction between the guilt of an actor, and guilt art and part, in the perpetration of a crime, was abolished by the Criminal Procedure (Scotland) Act 1887. Accession after the fact does not infer guilt of the crime.

ARTAPHERNES or, probably more correctly **ARTAPHRENES,** brother of Darius Hystaspes, and satrap of Sardis. It was he who received the embassy from Athens sent probably by Cleisthenes (*q.v.*) in 507 B.C., and subsequently warned the Athenians to receive back the tyrant Hippias. Subsequently he took an important part in suppressing the Ionian revolt (see IONIA; ARISTAGORAS; HISTIAEUS), and after the war compelled the cities to make agreements by which all differences were to be settled by reference. He also measured out their territories in parasangs and assessed their tributes accordingly (Herod. vi. 42). In 492 B.C. he was superseded in his satrapy by Mardonius (Herodotus v. 25, 30–32, 35, etc.; Diod. Sic. x. 25). His son, of the same name, was appointed (490 B.C.), together with Datis, to take command of the expedition sent by Darius to punish Athens and Eretria for their share in the Ionian revolt. After the defeat of Marathon he returned to Asia. In the expedition of Xerxes, ten years later, he was in command of the Lydians and Mysians (Herod. vi. 94, 119; vii. 74; Aesch., Persae, 21).

Aeschylus in his list of Persian kings (Persae, 775 et seq.), which is quite unhistorical, mentions two kings with the name Artaphrenes. who may have been developed out of these two Persian commanders.

ARTAXERXES, a namd representing Persian Artakhshatra, "he whose empire is well-fitted" or "perfected," Heb. *Artakh*shasta, Bab. Artakshatsu, Susian *Irtakshashsha* (and variants), Gr. *'Αρταξέρξης, 'Αρτοξέρξης,* and in an inscription of Tralles (Dittenberger, *Sylloge,* 573) *'Αρταξέσσης*; Herodotus (vi. 98) gives the translation *μέγας ἀρήιος,* and considers the name as a compound of Xerxes, showing thereby that he knew nothing of the Persian language; the later Persian form is Ardashir, which occurs in the form Artaxias (Artaxes) as the name of some kings of Armenia. It was borne by three kings of the Achaemenian dynasty of ancient Persia.

1.—ARTAXERXES I., surnamed *Macrocheir,* Longimanus, "Longhand," because his right hand was longer than his left (Plut. drtax. i.). He was the younger son of Xerxes, and was raised to the throne in 465 B.C. by the vizier Artabanus, the murderer of his father. After a few months he became aware of the crimes of the vizier, and slew him and his sons in a hand-to-hand fight in the palace. His reign was, on the whole, peaceful; the empire had

reached a period of stagnation. Plutarch (*Artax.* i.) says that he was famous for his mild and magnanimous character, Nepos (de Reg. i.) that he was exceedingly beautiful and valiant. From the authentic report of his cup-bearer Nehemiah we see that he was a kind, good-natured, but rather weak monarch, and he was undoubtedly much under the baneful influence of his mother Amestris (for whose mischievous character cf. Herod, ix. 109 et seq.) and his sister and wife Amytis. His reign was disturbed by several insurrections. At the very beginning the satrap Artabanus raised a rebellion in Bactria, but was defeated in two battles. More dangerous was the rebellion of Egypt under Inarus (Inarōs), which was put down by Megabyzus only after a long struggle against the Egyptians and the Athenians (460–454 B.C.). Out of it sprang the rebellion of Megabyzus, who was exasperated because, though he had persuaded Inarus to surrender by promising that his life would be spared, Artaxerxes, yielding to his wife Amytis, who wanted to avenge the death of her brother Achaemenes the satrap of Egypt, had surrendered Inarus to her for execution.

In 448 the war with Athens was terminated by the treaty concluded by Callias (see CALLIAS and CIMON), by which the Athenians left Cyprus and Egypt to the Persians, while Persia gave up nothing of her rights, but promised not to make use of them against the Greek cities on the Asiatic coast. In the Samian and the Peloponnesian wars, Artaxerxes remained neutral. During the reign of Artaxerxes I. the Jewish religion was definitely sanctioned by law in Jerusalem, on the basis of a firman granted by the king to the Babylonian priest Ezra in 458 B.C., and the appointment of Nehemiah as governor of Judaea in 445 B.C. Artaxerxes I. died in Dec. 425, or Jan. 424 (Thuc. iv. 50). To his reign must belong the famous quadrilingual alabaster vases from Egypt (on which his name is written in Persian, Susian and Babylonian cuneiform characters and in hieroglyphics), for Artaxerxes II. and III. did not possess Egypt. A great many tablets, dated from his reign, have been found in Nippur (published by H. von Hilprecht and Clay The Babylonian Expedition of the University of *Pennsylvania,* series A, Vol. ix.), and a few others at other places in Babylonia. Inscriptions of the king himself are not extant; his grandson mentions his buildings in Susa. For the suggested identification of Artaxerxes I. with the Biblical Ahasuerus see AHASUERUS.

2.—ARTAXERXES II., surnamed Mnemon, the eldest son of Darius II., whom he succeeded in the spring of 404. According to Ctesias (Pers. 57; Plut. *Artax.* i.) he was formerly called Arsaces or Arsikas, whereas Dinon (Plut. *Artax.* i.) calls him Oarses. This is corroborated by a Babylonian tablet with observations of the moon (Brit. Mus. Sp. ii. 749; *Zeitsch.* f. Assyriologie, vii. 223), which is dated from the 26th year of "Arshu, who is Artakshatsu," *i.e.,* 379 B.C. (cp. Ed. Meyer, *Forschungen zur alten Geschichte,* ii. 466 ff.). When Artaxerxes II. mounted the throne, the power of Athens had been broken by Lysander, and the Greek towns in Asia were again subjects of the Persian empire. But the original force of the Persians had been exhausted, and the king, though personally brave and good-natured, was quite dependent upon his favourites and his harem, and especially upon his mother Parysatis. In the beginning of his reign falls the rebellion of his brother Cyrus, who was secretly favoured by Parysatis and by Sparta. Although Cyrus was defeated at Cunaxa, this rebellion was disastrous because it opened to the Greeks the way into the interior of the empire, and demonstrated that no oriental force was able to withstand well-trained Greek soldiers. Greek mercenaries became indispensable not only to the king but also to the satraps, who thereby gained the means for attempting successful rebellions, into which they were provoked by the weakness of the king, and by the continuous intrigues between the Persian magnates. The reign is, therefore, a continuous succession of rebellions. Egypt soon revolted anew and could not be subdued again. When in 399 war broke out between Sparta and Persia, the Persian troops in Asia Minor were quite unable to resist the Spartan armies. The active and energetic Persian general Pharnabazus succeeded in creating a fleet by the help of Evagoras, king of Salamis in Cyprus, and the Athenian commander Conon, and destroyed the Spartan fleet at Cnidus (Aug. 394). This victory enabled the Greek allies of Persia (Thebes, Athens, Argos, Corinth) to carry on the Corinthian war against Sparta, and the Spartans had to give up the war in Asia Minor. But it soon became evident that the only gainers by the war were the Athenians, who in 389, under Thrasybulus, tried to found their old empire anew (see DELIAN LEAGUE). At the same time Evagoras attempted to conquer the whole of Cyprus, and was soon in open rebellion. The consequence was that, when in 388 the Spartan admiral Antalcidas (*q.v.*) came to Susa, the king was induced to conclude a peace with Sparta by which Asia fell to him and European Greece to Sparta. After the peace, Evagoras was attacked. He lost his conquests, but had to be recognized as independent king of Salamis (380 B.C.). Two expeditions against Egypt (385–383 and 374–372) ended in complete failure. At the same period there were continuous rebellions in Asia Minor; Pisidia, Paphlagonia, Bithynia and Lycia threw off the Persian yoke and Hecatomnus, the satrap of Caria, obtained an almost independent position. Similar wars were going on against the mountain tribes of Armenia and Iran, especially against the Cadusians on the Caspian sea. In this war Artaxerxes is said to have distinguished himself personally (380 B.C.), but got into such difficulties in the wild country that he was glad when Tiribazus succeeded in concluding a peace with the Cadusian chieftains.

The peace of Antalcidas (387 B.C.) was an indication of Persian predominance in Greek affairs; and in the following wars all parties, Spartans, Athenians, Thebans, Argives continually applied to Persia for a decision in their favour. After the Theban victory at Leuctra, when the power of Thebes was founded by Epaminondas (*q.v.*), Pelopidas went to Susa (367) and restored the old alliance between Persia and Thebes. The Persian supremacy, however, was not based upon the power of the empire, but only on the discord of the Greeks. Shortly after the edict by which the king had proclaimed his alliance with Thebes, and the conditions of the general peace which he was going to impose upon Greece, his weakness became evident, for since 366 all the satraps of Asia Minor (Datames, Ariobarzanes, Mausolus, Orontes, Artabazus) were in rebellion again, in close alliance with Athens, Sparta and Egypt. The king could do little against them; even Autophradates, satrap of Lydia, who had remained faithful, was forced for some time to unite himself with the rebels. But every one of the allies mistrusted all the others; and the sole object of every satrap was to improve his condition and his personal power, and to make a favourable peace with the king, for which his neighbours and former allies had to pay the costs. The rebellion was at last put down by a series of treacheries and perfidious negotiations. Some of the rebels retained their provinces; others were punished, as opportunity offered. Mithridates betrayed his own father Ariobarzanes (who was crucified), and murdered Datames, to whom he had introduced himself as a faithful ally. When the long reign of Artaxerxes II. came to its close in the autumn of 359 the authority of the empire had been restored almost everywhere.

Artaxerxes himself had done very little to obtain this result. In fact, in the last years of his reign he had sunk into a perfect dotage. All his time was spent in the pleasures of his harem, the intrigues of which were further complicated by his falling in love with and marrying his own daughter Atossa (according to the Persian religion a marriage between the nearest relations is no incest). At the same time, his sons were quarrelling about the succession; one of them, Ochus, induced the father by a series of intrigues to condemn to death three of his older brothers, who stood in his way. Shortly afterwards, Artaxerxes II. died.

In this reign an important innovation took place in the Persian religion. Berossus (in Clemens Alex. *Protrept.* i. 5. 65) tells us that the Persians knew of no images of the gods until Artaxerxes II. erected images of Anaitis in Babylon, Susa, Ecbatana, Persepolis, Bactra, Damascus, Sardis. This statement is proved correct by the inscriptions; all the former kings name only Auramazda (Ahuramazda), but Artaxerxes II. in his building inscriptions from Susa and Ecbatana invokes Ahuramazda,

Anahita and Mithra. These two deities belonged to the old popular religion of the Iranians, but had until then been neglected by the true Zoroastrians; now they were introduced into the official worship much in the way in which the cult of the saints came into the Christian religion. About the history of Artaxerxes II. we are comparatively well informed from Greek sources; for the earlier part of his reign from Ctesias and Xenophon (*Anabasis*), for the later times from Dinon of Ephesus, the historian of the Persians (from whom the account of Justin is derived), from Ephorus (whose account is quoted by Diodorus) and others. Upon these sources is based the biography of the king by Plutarch.

3.—ARTAXERXES III. is the title adopted by Ochus, the son of Artaxerxes II., when he succeeded his father in 359. The chronographers generally retain the name Ochus, and in the Babylonian inscriptions he is called "Umasu, who is called Artakshatsu." The same form of the name (probably pronounced Uvasu) occurs in the Syrian version of the canon of Ptolemy by Elias of Nisibis (Amos).

He was a cruel but an energetic ruler. To secure his throne he put to death almost all his relatives. In 356 he ordered all the satraps to dismiss their mercenaries. Most of them obeyed; Artabazus of Phrygia, who tried to resist and was supported by his brothers-in-law, Mentor and Memnon of Rhodes, was defeated and fled to Philip of Macedon. Athens, whose general Chares had supported Artabazus, was by the threatening messages of the king forced to conclude peace, and to acknowledge the independence of its rebellious allies (355 B.C.). Then the king attempted to subjugate Egypt, but two expeditions were unsuccessful and, in consequence, Sidon and the other Phoenician towns, and the princes of Cyprus, rebelled against Persia and defeated the Persian generals. After great preparations the king came in person, but again the attack on Egypt was repelled by the Greek generals of Nectanebus (346). One or two years later Artaxerxes at the head of a great army, began the siege of Sidon. The Sidonian king Tennes considered resistance hopeless, and betrayed the town to the Persian king, assisted by Mentor, who had been sent with Greek troops from Egypt to defend the town. Artaxerxes repressed the rebellion with great cruelty and destroyed the town. The traitor Tennes was put to death, but Mentor rose high in the favour of the king, and entered into a close alliance with the eunuch Bagoas, the king's favourite and vizier. They succeeded in subjecting the other rebels, and, after a hard fight at Pelusium, and many intrigues, conquered Egypt (343); Nectanebus fled to Ethiopia. Artaxerxes used his victory with great cruelty; he plundered the Egyptian temples and is said to have killed the Apis. After his return to Susa, Bagoas ruled the court and the upper satrapies, while Mentor restored the authority of the empire everywhere in the west. He deposed or killed many Greek dynasts, among them the famous Hermias of Atarneus, the protector of Aristotle, who had friendly relations with Philip (342 B.C.). When Philip attacked Perinthus and Byzantium (340), Artaxerxes sent them support, by which they were enabled to withstand the Macedonians; Philip's antagonists in Greece, Demosthenes and his party, hoped to get subsidies from the king, but were disappointed.

In 338 Artaxerxes III., with his older sons, was killed by Bagoas, who raised his youngest son Arses to the throne. Artaxerxes III. is said never to have entered the country of Persia proper, because, being a great miser, he would not pay the present of a gold piece for every Persian woman, which it was usual to give on such occasions (Plut. *Alex.* 69). But we have a building inscription from Persepolis, which contains his name and genealogy, and invocations of Ahuramazda and Mithra.

For the relations of Artaxerxes I.–III. with the Jews (see JEWS, §§ 19–21). For bibliographical references (see PERSIA: *Ancient* History).

The name Artaxerxes was adopted by Bessus when he proclaimed himself king after the assassination of Darius III. It was borne by several dynasts of Persis, when it formed an independent kingdom in the time of the Parthian empire (on their coins they call themselves Artakhshathr; one of them is mentioned by Lucian *Macrobii,* 15), and by three kings of the Sassanid dynasty, who are better known under the modern form Ardashir (*q.v.*). ARTAYGA, the patrician families of the Hadāreb Arabs in the vicinity of Suakin.

See H. A. MacMichael, History of the Arabs in the Sudan. (1922).

ARTEMIDORUS. (1) A geographer of "Ephesus" who flourished about 100 B.C. His large work on general geography (Τὰ γεωγραφούμενα) in 11 books, much used by Strabo and others, is lost, but we possess many small fragments and larger fragments of an abridgment made by Marcianus of Heracleia (5th century), which contains the periplus of the Euxine and accounts of Bithynia and Paphlagonia.

(2) (A. Daldianus.) A soothsayer and interpreter of dreams who flourished during the reigns of Hadrian and the Antonines. His Ονειροκριτικά, or interpretation of dreams, in four books, with an appendix, is extant and affords a valuable insight into ancient superstitions. It is mainly a compilation from the works of earlier authors. According to Suidas, Artemidorus also wrote on augurs and cheiromancy, but all trace of these works is lost. (Editions: Reiff, 1805; Hercher, 1864; translation and notes, Krauss, 1881; English translation by Wood, 1644, and later editions.)

(1856); (2) Artemidoro Daldiano *Librorum oneirocriticorum* auctore (1893); R. Dietrich, *Collectanea zu* Artemidorus *Daldianus* (1911).

ARTEMIS (ahr'tĕ-mĭs), one of the principal goddesses in Greek mythology, the counterpart of the Roman Diana (*q.v.*). In Homer, she is the daughter of Zeus and Leto, twin-sister and counterpart of Apollo. She is said to have been born a day before him (on the 6th of the month) and tradition assigns them different birthplaces—Delos to Apollo, Ortygia to Artemis. But the name Ortygia ("home of quails") applies still to Delos, and may well have been a synonym for that island.

Artemis is the goddess of chastity, the protectress of young men and maidens, who defies and contemns the power of Aphrodite. Like her brother, armed with bow and arrows, she deals death to mortals, sometimes gently and suddenly, especially to women, but also as a punishment for offences against herself or morality. With him she takes part in the combat with Python and with Tityus, in the slaughter of the children of Niobe, while alone she executes vengeance on Orion (*q.v.*). She is not only a goddess who deals death, but is also, like Apollo, a healing and a purifying divinity, Oulia ("the healer," cf. Apollo Oulios), *Luaia* ("purifier") and *Sōteira,* "she who saves from all evils." Her connexion with the prophetic art is doubtful, although mention is made of an Artemis Sibylla. To her association with Apollo are certainly to be referred the names Delphinia and Pythia, and titles referring to state and family life. It probably accounts for her appearance as a goddess of seafarers, the bestower of fair weather and prosperous voyages.

It is in the Arcadian and Athenian rites and legends, however, which are certainly earlier than Homer, that the original conception of the goddess is to be found. These tend to show that Artemis was first and foremost a nature goddess, whose cult shows numerous traces of totemism. As a goddess of fertilizing moisture, lakes, rivers, springs and marshy lowlands are brought into close connexion with her. Thus, she is *Limnaia* ("lady of the lake"), *Heleia* ("of marshes"), *Potamia* ("of rivers" especially of the Alpheus, whence her name *Alpheiaia*). Her influence is very active in promoting the increase of the fruits of the field, hence she is specially a goddess of agriculture. She drives away the mice (cf. Apollo Smintheus) and slays the Aloidae (*q.v.*), the corn spirits; she is the friend of the reapers, and requires her share of the first-fruits. Her character as a harvest goddess is shown in the legend of the Calydonian boar, sent by her to ravage the fields in resentment at not having received a harvest offering from Oeneus (see MELEAGER). As *Epimulios* and *Epiklibanios* ("presiding over the mill and the oven") she extends her protection over the further development of the grain for the use of man.

Artemis was naturally also a goddess of trees and vegetation. Near Orchomenus her wooden image stood in a large cedar-tree — an indication that her worship was originally that of the tree itself (Kedreatis, "the cedar goddess"); at Caryae there was an image of Artemis, *Karuatis* ("the nut-tree goddess"). Two curious epithets deserve notice, *Lugodesma* ("bound with withies"), derived from the legend that the image of Artemis Orthia ("upright") was found in a thicket of withies, which twined round it and kept it upright (*lugos* is the *agnus castus,* and points to Artemis in her relation to women); and *Apangchomenē* ("the suspended") probably a reference to the custom of hanging the mask or image of a vegetation-divinity on a tree to obtain fertility (cf. the *Aiōra,* "swing" festival of the Greeks and the oscilla of the Romans).

ARTEMIS FINISHING HER TOILET, AFTER A STATUE FOUND IN THE RUINS OF THE ROMAN CITY OF GABII

The functions of the goddess extended from the vegetable to the animal world, to the inhabitants of the woods and mountains. This is clearly expressed in the cult of Artemis *Laphria* (possibly connected with *laphura* "spoils"), at whose festivals all kinds of animals, both wild and tame, as well as fruits, were thrown together on a huge wood fire. Her general name in this connexion was Agrotera ("roaming the wilds"), to whom 500 goats were offered every year by the Athenians as a thanksgiving in commemoration of the victory at Marathon. It has been observed that she is rather the patroness of the wild beasts of the field than of the more agricultural or domestic animals, although the epithet, Hdmerasia ("the tamer"), seems to refer to her connexion with the latter. The bear was especially associated with her in Arcadia, and in her worship as Artemis Brauronia at Brauron in Attica. According to the legend, Callisto (*q.v.*), an Arcadian nymph, became by Zeus the mother of Arcas, the eponymous hero of the Arcadians. Zeus, to conceal the amour, changed Callisto into a she-bear; Hera, however, discovered it, and persuaded Artemis to slay Callisto, who was placed amongst the stars as Arktos ("the bear"). There is no doubt that Callisto is identical with Artemis; her name is an obvious variation of *Kallistē* ("most beautiful"), a frequent epithet of the goddess.

Closely connected with this legend is the worship of Artemis Brauronia. The accounts of its institution agree that it was intended to appease the wrath of the goddess aroused by the killing of a bear. A number of young girls, between five and ten years of age, wearing bear-skins (afterwards saffron-coloured robes) danced a bear dance, the girls themselves being called bears. In one account a maiden was ordered to be sacrificed to the bear Artemis, but a certain man who had a goat called it his daughter and offered it up in secret, just as at Munychium a fawn dressed up as a girl was sacrificed to the goddess. In place of the goat or fawn a bear might have been expected, but the choice may have been influenced by the animal totem of the tribe into whose hands the ritual fell. The whole is a reminiscence of earlier times, when the goddess herself was a bear, to whom human sacrifice was offered. Callisto was originally a bear-goddess, worshipped in Arcadia, identified with Artemis, when nothing remained of the original animal-worship but name and ritual. Various explanations have been given of the epithet Orthia: (1) that it refers to the primitive type of the "erect" wooden idol; (2) that it means "she who safely rears children after birth," or "heals the sick"; (3) that it has a phallic significance.

The protecting influence of Artemis was extended to man. She was especially concerned in the bringing up of the young. Boys were brought by their nurses to the temple of Artemis *Kourotrophos* ("rearer of boys") and there consecrated to her. At the Apaturia (*q.v.*), on the day called *Koureōtis,* boys cut off and dedicated their hair to her. Girls as well as boys were under her protection. Her function as a goddess of marriage is less certain, but her connexion with child-birth is clearly shown; in many places she is even called *Eilithuia* (goddess of child-birth), who in the earlier poets was regarded as distinct from her. Women in child-birth invoked her aid, and after delivery offered up their clothes or a lock of hair. As already noticed, in Homer Artemis appears as a goddess of death; closely akin to this is the conception of her as a goddess of war.

The idea of Artemis as a virgin goddess, the "queen and huntress, chaste and fair," which attained great prominence in early times, and seems inconsistent with her association with child-birth, is generally explained as due to her connection with Apollo, but it is suggested by Farnell that *Parthenos* originally meant "unmarried," and that "*Artemis* Parthenos originally may have been the goddess of a people who had not yet the advanced Hellenic institutions of settled marriage . . . and when society developed the later family system the goddess remained celibate, though not opposed to childbirth."

There is no trace of Artemis as a moon-goddess in the epic period, and the Homeric hymn knows nothing of her identification with Selene. The attribute of the torch will apply equally well to the goddess of the chase, and epithets such as "light-giving" although applicable, are by no means convincing. The idea dates from the 5th century, and was due to her connection with Hecate and Apollo (*q.v.*). When the latter came to be identified by philosophical speculation with the sun-god Helios, it was natural that his sister and counterpart should be identified with the moon-goddess Selene. But she is nowhere recognized in cult as such.

Various non-Hellenic divinities were identified with Artemis, and their cult gradually amalgamated with hers. The most important of these was Artemis of Ephesus who, like the Greek Artemis, was essentially a nature goddess. the great foster-mother of the vegetable and animal kingdom. Her chief festival, Ephesia or Artemisia, was held in the spring, at which games and various contests took place after the Greek fashion, although the ritual continued to be of a modified oriental, orgiastic type. This goddess is closely connected with the Amazons (*q.v.*), who are said to have built her temple and set up her image in the trunk of a tree. The Greeks of Ephesus identified her with their own Artemis and claimed that her birthplace Ortygia was near Ephesus, not in Delos. She has much in common with the oriental prototype of Aphrodite, and the Cappadocian goddess Ma, another form of Cybele. The usual figure of the Ephesian Artemis, which was said in the first instance to have fallen from heaven, is in the form of a female with many breasts, the symbol of productivity or a token of her function as the all-nourishing mother. From the waist to the feet her image resembles a pillar, narrowing downwards and sculptured all round with rows of animals (lions, rams and bulls).

Among the chief attributes of Artemis are: the hind, specially regarded as her sacred animal; the bear, the boar and the goat; the lion, one of her oldest animal symbols; bow and arrows, as goddess of the chase and death; a mural crown, as the protectress of cities; the torch, originally an attribute of the goddess of the chase or marriage, but, like the crescent (originally an attribute of the Asiatic nature goddesses), transferred to Artemis when she came to be regarded as a moon-goddess. The Greek Artemis was usually represented as a huntress with bow and quiver or torch in her hand, in face very like Apollo, her drapery flowing to her feet, or more frequently, girt high for speed. She is accompanied often by a deer or a dog. Perhaps the finest existing statue of her is the Diana of Versailles from Hadrian's Villa (now in the Louvre), in which she wears a short tunic drawn in at the waist and sandals on her feet; her hair is bound up into a knot at the back of her head, with a band over the forehead. With her left hand she holds a stag, while with the right she is drawing an arrow from the quiver on her shoulder. Another famous statue is one from Gabii, in which she is finishing her toilet and fastening the *chlamys* over her tunic.

In older times her figure is fuller and stronger, and the clothing more complete; certain statues discovered at Delos, imitated from wooden models (xoana), are supposed to represent Artemis; they are described as stiff and rigid, the limbs as it were glued to the body without life or movement, garments closely fitting, the

folds of which fall in symmetrical parallel lines. As a goddess of the moon she wears a long robe, carries a torch, and her head is surmounted by a crescent.

Harrison, 1890), and the same writer's *Histoire de la Sculpture grecque* (1892–97).

ARTEMISIA, daughter of Lygdamis, was queen of Halicarnassus and Cos about 480 B.C. She took part in the expedition of Xerxes against the Greeks, and fitted out five ships, with which she distinguished herself in the sea-fight near Salamis (480) (Hdt. vii. 99, viii. *87,* 88). According to Herodotus it was her advice which decided Xerxes not to risk another battle, but to retire at once from Greece. (For the legend of her love for Dardanus of Abydos, and her death by leaping from the Leucadian promontory, *see* Photius, *Cod.* 153a.)

ARTEMISIA, the sister and wife of Mausolus (or Maussollus), king of Caria, was sole ruler from about 353 to 350 B.C. She built for her husband, in Halicarnassus, the magnificent Mausoleum, which was one of the seven wonders of the world. There are statues of Mausolus and Artemisia in the British Museum.

See Vitruvius ii. *8*; Diodorus Siculus xvi. 36; Cicero, *Tusc.,* iii. **31**; Val. Max. **iv.** 6.

ARTEMISIA, a large genus of plants of the family Compositae (*q.v.*), comprising some 280 species, most abundant in arid regions, notably in the western United States, the Asiatic steppes, South Africa and South America. They are bitter-aromatic herbs or low shrubs, often with much divided leaves and with inconspicuous flowers borne in very numerous small heads. Several are grown for ornamental and medicinal purposes. Four species are found in Great Britain; 75 or more occur in the United States and Canada, chiefly from the Great Plains westward, and several Old World species have become widely naturalized. Here belong the wormwood, beach-wormwood, mugwort (*qq.v.*), southernwood and tarragon of the gardens and also the well-known sagebrush (*q.v.*) of western North America.

ARTEMON (fl. *c.* A.D. *230*), a prominent Christian teacher at Rome, who held Adoptianist *(see* ADOPTIANISM), or humanitarian, views of the same type as his elder contemporaries the Theodotians, though perhaps asserting more definitely than they the superiority of Christ to the prophets in respect of His supernatural birth and sinlessness. *(See* MONARCHIANISM.)

ARTEMOVSK (formerly Bakhmut), a town and railway junction in the Artemovsk province of the Ukrainian S.S.R. Lat. 48° 34' N.. long. 38° E. Population (1939) 55,165. Its salt springs and salt mines have been worked since the 17th century. Coal, alabaster and quicksilver are also mined, and steel rails manufactured.

ARTENA, village, province of Rome, Italy, at north-northwest extremity of Volscian Mountains; 36 mi. S.E. by rail, and 24 mi. direct from Rome. Pop. of the commune (1936), 6,343; town, 3,725. On the mountain above (2,073 ft.) are fine remains of a fortified city built in rough blocks of local limestone; within the walls are traces of buildings, and a massive terrace which supported some edifice of importance. The name of this city is quite uncertain; Ecetra is a possible suggestion.

See T. Ashby and *G.* J. Pfeiffer in *Supplementary* Papers *of the American School in Rome,* i. 87 *seq.,* for an account of the ruins.

ARTERIES, in anatomy, the elastic tubes which carry the blood away from the heart to the tissues. As, after death, they are always found empty, the older anatomists believed that they contained air, and to this belief they owe the name, which was originally given to the windpipe (*trachea*). Two great trunks, the aorta and pulmonary artery, leave the heart and divide again and again until they become minute vessels to which the name of arterioles is given. The larger trunks are fairly constant in position and receive definite names, but as the smaller branches are reached there is an increasing inconstancy in their position. Many arteries are tortuous, especially when they supply movable parts such as the face or scalp, but when one or two sharp bends are found they are generally due to the artery going out of its way to give off a constant and important branch. Small arteries unite or anastomose with others near them very freely, so that when even a large artery is obliterated a collateral circulation is carried on by the rapid increase in size of the communications between the branches coming off above and below the point of obstruction. Some branches, however, such as those going to the basal ganglia of the brain and to the spleen, are known as "end arteries" and these do not anastomose with their neighbours at all; thus, if one is blocked, arterial blood is cut off from its area of supply. As a rule, there is little arterial anastomosis across the middle line of the body near the surface, though the scalp, lips and thyroid body are exceptions.

The distribution of the pulmonary artery is considered with the anatomy of the lungs *(see* RESPIRATORY SYSTEM).

Aorta.—The *Aorta* lies in the cavities of the thorax and abdomen, and arises from the base of the left ventricle of the heart. It ascends forward, upward, and to the right as far as the level of the second right costal cartilage, then runs backward, and to the left to reach the left side of the body of the 4th thoracic vertebra, and then descends almost vertically. It thus forms the *aortic arch,* which has attached to its concave surface a fibrous cord, the *ductus arteriosus,* which connects it with the left branch of the pulmonary artery. The aorta continues downward close to the bodies of the thoracic vertebrae, then passes through an opening in the diaphragm (*q.v.*), enters the abdomen, and descends in front of the bodies of the lumbar vertebrae as low as the 4th, where it usually divides into two terminal branches, the common iliac arteries. Above and behind the angle of bifurcation, however, a long slender artery, called the *middle sacral,* is prolonged downward in front of the sacrum to the end of the coccyx.

Carotid System.—The branches for the head, neck and upper limbs arise, as three large arteries from the transverse part of the aorta; they are named *innominate, left common carotid* and *left subclavian.* The innominate artery is the largest and passes upward and to the right, to the root of the neck, where it divides into the right common carotid and the right subclavian. The carotid arteries supply the two sides of the head and neck; the subclavian arteries the two upper extremities. The *common carotid* artery runs up the neck by the side of the windpipe, and on a level with the upper border of the thyroid cartilage divides into the internal and external carotid arteries.

The *internal carotid* artery ascends through the carotid canal in the temporal bone into the cranial cavity. It gives off an *ophthalmic* branch to the eyeball and other contents of the orbit, and then divides into the *anterior* and *middle cerebral* arteries. The middle cerebral artery extends outward into the Sylvian fissure of the brain, and supplies the island of Reil, the orbital part, and the outer face of the frontal lobe, the parietal lobe, and the temporo-sphenoidal lobe; it also gives a choroid branch to the choroid plexus of the velum interpositum. The anterior cerebral artery supplies the inner face of the hemisphere from the anterior end of the frontal lobe as far back as the internal parieto-occipital fissure. At the base of the brain not only do the two internal carotids anastomose with each other through the *anterior communicating* artery, which passes between their anterior cerebral branches, but the internal carotid on each side anastomoses with the posterior cerebral branch of the basilar, by a *posterior communicating* artery. In this manner a vascular circle, the *circle of Willis,* is formed, which permits of freedom of circulation between the arteries on opposite sides of the mesial plane. The vertebral and internal carotid arteries, which are the arteries of supply for the brain, are distinguished by lying at some depth from the surface in their course to the organ, by having curves or twists in their course, and by the absence of large collateral branches.

The *external carotid* artery ascends through the upper part **of**

the side of the neck. and behind the lower jaw into the parotid gland, where it divides into the internal maxillary and superficial temporal branches. This artery gives off the following branches: *(a) Superior thyroid* to the larynx and thyroid body; *(b) Lingual* to the tongue and sublingual gland; *(c) Facial* to the face, palate, tonsil and submaxillary gland; *(d) Occipital* to the sterno-mastoid muscle and back of the scalp; *(e) Posterior auricular* to the back of the ear and the adjacent part of the scalp; *(f) Superficial temporal* to the scalp in front of the ear, and by its *transverse facial* branch to the back part of the face; *(g) Internal maxillary,* giving *muscular* branches to the muscles of mastication, *meningeal* to the dura mater, *dental* to the teeth, and other branches to the nose, palate and tympanum; *(h) Ascending pharyngeal,* which supplies the pharynx, palate, tonsils and dura mater.

Subclavian System.—The *subclavian* artery is the commencement of the great arterial trunk for the upper limb. It passes across the root of the neck and behind the clavicle, where it enters the armpit, and becomes the *axillary* artery; by that name it extends as far as the posterior fold of the axilla, where it enters the upper arm, takes the name of *brachial,* and courses as far as the bend of the elbow; here it bifurcates into the *radial* and *ulnar* arteries. From the subclavian part of the trunk the following branches arise:—(a) *Vertebral,* which enters the foramen at the root of the transverse process of the 6th cervical vertebra, ascends through the corresponding foramina in the vertebrae above, lies in a groove on the arch of the atlas, and enters the skull through the foramen magnum, where it joins its fellow to form the *basilar* artery; it gives off numerous branches in its course. The *basilar* artery extends from the lower to the upper border of the pons Varolii; it gives off *transverse* branches to the pons, *auditory* and *inferior cerebellar* branches and breaks up into four terminal branches; viz., two *superior cerebellar* and two *posterior cerebral; (b) Thyroid axis,* which immediately divides into the *inferior thyroid,* the *suprascapular,* and the *transverse cervical* branches; *(c) Internal mammary,* which supplies the anterior surface of the walls of the chest and abdomen, and the upper surface of the diaphragm; *(d) Superior intercostal,* which supplies the first intercostal space,,and by its deep *cervical* branch the deep muscles of the back of the neck.

The *axillary* artery supplies *thoracic* branches to the wall of the chest, the pectoral muscles, and the fat and glands of the axilla; an *acromio-thoracic* to the parts about the acromion; *anterior* and *posterior circumflex* branches to the shoulder joint and deltoid muscle; a *subscapular* branch to the muscles of the posterior fold of the axilla.

The *brachial* artery supplies *muscular* branches to the muscles of the upper arm; a *nutrient* branch to the humerus; *superior* and *inferior profunda* branches and an *anastomotic* to the muscles of the upper arm and the region of the elbow joint.

The *ulnar* artery extends down the ulnar side of the front of the fore-arm to the palm of the hand, where it curves outward toward the thumb, and anastomoses with the superficial volar or other branch of the radial artery to form the *superficial palmar arch.* In the fore-arm the ulnar gives off the *interosseous* arteries, which supply the muscles of the fore-arm and give *nutrient* branches to the bones; two *recurrent* branches to the region of the elbow; *carpal* branches to the wrist joint: in the hand it gives a *deep* branch to the deep muscles of the hand, and from the superficial arch arise *digital* branches to the sides of the little, ring, and middle fingers, and the ulnar border of the index finger.

The *radial* artery extends down the radial side of the front of the fore-arm, turns round the outer side of the wrist to the back of the hand, passes between the 1st and and metacarpal bones to the palm, where it joins the deep branch of the ulnar, and forms the *deep palmar* arch. In the fore-arm it gives off a *recurrent* branch to the elbow joint; *carpal* branches to the wrist joint; and *muscular* branches, one of which, named superficial volar, supplies the muscle of the thumb and joins the ulnar artery: in the hand it gives off a branch to the thumb, and one to the radial side of the index, *interosseous* branches to the interosseous muscles, *perforating* branches to the back of the hand, and *recurrent* branches to the wrist.

Visceral Branches.—The branches of the aorta which supply the viscera of the thorax are the coronary, the oesophageal, the bronchial and the pericardiac. The *coronary* arteries, two in number, are the first branches of the aorta, and arise opposite the anterior and left posterior segments of the semilunar valve, from the wall of the aorta, where it dilates into the sinuses of Valsalva. They supply the tissue of the heart.

The *oesophageal, bronchial* and *pericardiac* branches are sufficiently described by their names.

The branches of the aorta which supply the viscera of the abdomen arise either singly or in pairs. The single arteries are the coeliac axis, the superior mesenteric, and the inferior mesenteric, which arise from the front of the aorta; the pairs are the capsular, the two renal, and the two spermatic or ovarian, which arise from its sides. The single arteries supply viscera which are either completely or almost completely invested by the peritoneum, and the veins corresponding to them are the roots of the vena portae. The pairs of arteries supply viscera developed behind the peritoneum, and the veins corresponding to them are rootlets of the inferior vena cava.

The *coeliac axis* is a thick, short artery, which almost immediately divides into the gastric, hepatic and splenic branches.

The *superior mesenteric* artery gives off an *inferior pancreatico-duodenal* branch to the pancreas and duodenum; about twelve *intestinal* branches to the small intestines, which form in the substance of the mesentery a series of arches before they end in the wall of the intestines; an *ileocolic* branch to the end of the ileum, the caecum and beginning of the colon; a *right colic* branch to the ascending colon; and a *middle colic* branch to the transverse colon.

The *inferior mesenteric* artery gives off a *left colic* branch to the descending colon, a *sigmoid* branch to the iliac and pelvic colon, and ends in the *sztperior haemorrhoidal* artery, which supplies the rectum.

The *capsular* arteries, small in size, run outward from the aorta to end in the suprarenal capsules.

The *renal* arteries pass one to each kidney. Additional renal arteries are fairly common.

The *spermatic* arteries are two long slender arteries, which descend, one in each spermatic cord, into the scrotum to supply the testicle. The corresponding ovarian arteries in the female do not leave the abdomen.

Parietal Branches.—The branches of the aorta which supply the walls of the thorax, abdomen and pelvis, are the intercostal, the lumbar, the phrenic and the middle sacral.

The *intercostal* arteries arise from the back of the thoracic aorta, and are usually nine pairs. They run round the sides of the vertebral bodies as far as the commencement of the intercostal spaces, where each divides into a *dorsal* and a *proper inter-*

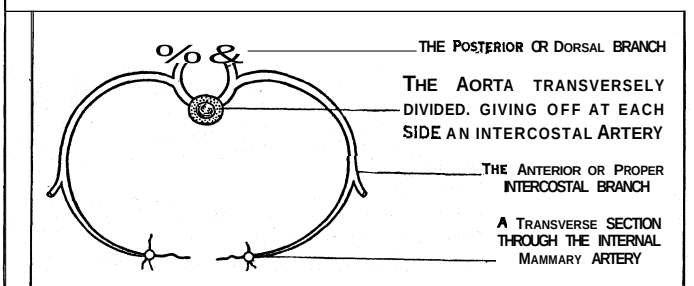

FIG. 1.—A PAIR OF INTERCOSTAL ARTERIES AND THEIR BRANCHES

costal branch; the dorsal branch passes to the back of the thorax to supply the deep muscles of the spine; the proper intercostal branch runs outward in the intercostal space to supply its muscles, and the lower pairs of intercostals also give branches to the diaphragm and wall of the abdomen. Below the last rib a subcostal artery runs.

The *lumbar* arteries arise from the back of the abdominal aorta, and are usually four pairs. They run round the sides of the lumbar vertebrae, and divide into a *dorsal* branch which supplies the deep muscles of the back of the loins, and an *abdominal*

branch which runs outward to supply the wall of the abdomen. The distribution of the lumbar and intercostal arteries exhibits a transversely segmented arrangement of the vascular system, like the transversely segmented arrangement of the bones, muscles and nerves met with in these localities, but more especially in the thoracic region.

The two *phrenic* arteries supply the under surface of the diaphragm.

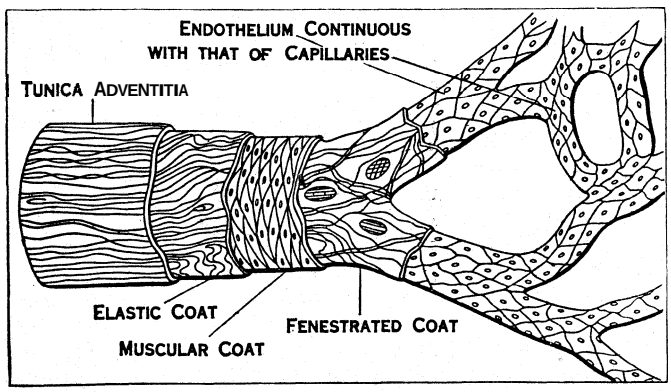

FIG. 2.—A DIAGRAM SHOWING THE STRUCTURE OF AN ARTERY

The *middle sacral* artery, as it runs down the front of the sacrum, gives branches to the back of the pelvic wall.

The arteries to the pelvis and hind limbs begin at the bifurcation of the aorta into the two common iliacs.

Iliac System.—The *common iliac* artery, after a short course, divides into the internal and external iliac arteries. The *infernal iliac* enters the pelvis and divides into branches for the supply of the pelvic walls and viscera, including the organs of generation, and for the great muscles of the buttock. The *external iliac* descends behind Poupart's ligament into the thigh, where it takes the name of *femoral* artery. The femoral descends along the front and inner surface of the thigh, gives off a profunda or deep branch, which, by its *circumflex* and *perforating* branches, supplies the numerous muscles of the thigh; most of these extend to the back of the limb to carry blood to the muscles situated there. The femoral artery then runs to the back of the limb in the ham, where it is called *popliteal* artery. The popliteal divides into two branches, of which one, called *anterior tibial*,

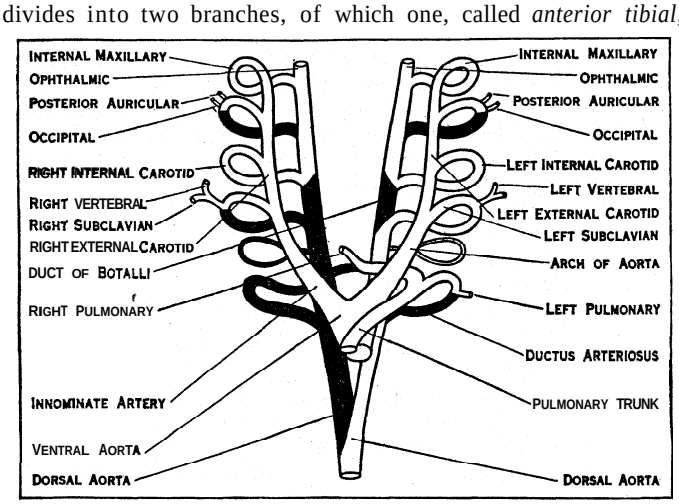

FIG. 3.— ARRANGEMENT OF THE ARTERIAL ARCHES

passes between the bones to the front of the leg, and then downward to the upper surface of the foot; the other, *posterior tibial*, continues down the back of the leg to the sole of the foot, and divides into the *internal* and *external plantar* arteries; branches proceed from the external plantar artery to the sides of the toes, and constitute the *digital* arteries. From the large arterial trunks in the leg many branches proceed, to carry blood to the different structures in the limb.

Structure of Arteries.—The wall of an artery consists of several coats (*see* fig. 2.). The outermost is the *tunica adventitia*, composed of connective tissue; immediately internal to this is the *yellow elastic* coat; within this again the *muscular* coat, formed of involuntary muscular tissue arranged transversely to the long axis of the artery; in the larger arteries the elastic coat is much thicker than the muscular, but in the smaller the muscular coat is relatively strong; the vaso-motor nerves terminate in the muscular coat. In the greater part of the aorta and arteries of the retina there is nc muscular coat. Internal to the muscular coat is the *elastic fenestrated coat*, formed of a smooth elastic membrane perforated by small apertures. Most internal of all is a layer of *endothelial cells*, which form the free surface over which the blood flows. The arteries are not nourished by the blood which flows through them, but by minute vessels, *vasa vasorum*, distributed in their external, elastic and muscular coats.

EMBRYOLOGY

The earliest appearance of the blood vessels is dealt with under VASCULAR SYSTEM. Here will be briefly described the fate of the main vessel which carries the blood away from the truncus arteriosus of the developing heart (*q.v.*). This ventral aorta, if traced forward, soon divides into two lateral parts, the explanation being that there were originally two vessels, side by side, which fused to form the heart, but continued separate anteriorly. The two parts run for a little distance toward the head of the

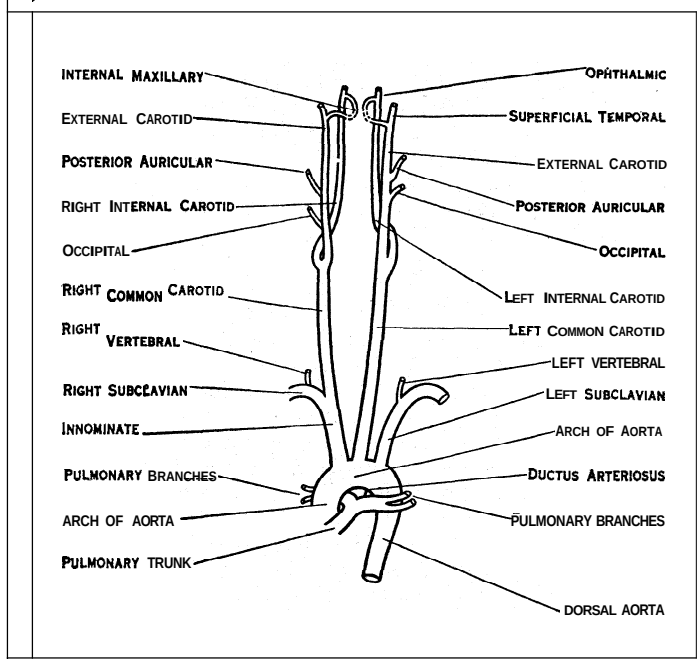

FIG. 4.— THE HUMAN AORTA. THE GREAT ARTERY WHICH CARRIES THE BLOOD FROM THE HEART TO ALL PARTS OF THE BODY EXCEPT THE LUNGS, AND ITS MAIN BRANCHES

embryo, ventral to the alimentary canal, and then turn toward the dorsum, passing one on either side of that tube to form the first aortic arch. Having reached the dorsum they turn backward toward the tail end and form the dorsal aortae. The anterior loop between the ventral and dorsal aortae already described as the first aortic arch is included in the *maxillary* or *first visceral* arch of the soft parts (*see* fig. 3, *1*). Later, four other well-marked aortic arches grow behind this in the more caudal visceral arches, so that there are altogether five arterial arches on each side of the pharynx, through which the blood can pass from the ventral to the dorsal aorta. Of these arches the first soon disappears, but is probably partly represented in the adult by the *internal maxillary* artery, one branch of which, the *infra-orbital*, is enclosed in the upper jaw, while another, the *inferior dental*, is surrounded by the lower jaw. Possibly the ophthalmic artery also belongs to this arch. The second arch also disappears, but the *posterior auricular* and *occipital* arteries probably spring from it, and at an early period it passed through the stapes as the transitory stapedial artery. The third arch forms the beginning

of the internal carotid. The fourth arch becomes the arch of the adult aorta, between the origins of the left carotid and left subclavian on the left side, and the first part of the right subclavian artery on the right. The apparent fifth arch on the left side (fig. 3) remains all through foetal life as the *ductus arteriosus,* and, as the lungs develop, the pulmonary arteries are derived from it. J. E. V. Boas and W. Zimmermann have shown that this arch is in reality the sixth and that there is a very transitory true fifth arch in front of it (fig. 3). The part of the ventral aorta from which this last arch rises is a single median vessel due to the same fusion of the two primitive ventral aortae which precedes the formation of the heart, but a spiral septum has appeared in it which divides it in such a way that while the anterior or cephalic arches communicate with the left ventricle of the heart, the last one communicates with the right (see HEART). The fate of the ventral and dorsal longitudinal vessels must now be followed. The fused part of the two ventral aortae, just in front of the heart, forms the ascending part of the adult aortic arch, and where this trunk divides between the fifth and fourth arches (strictly speaking, the sixth and fifth), the right one forms the innominate (fig. 3) and the left one a very short part of the transverse arch of the aorta until the fourth arch comes off (see fig. 4). From this point to the origin of the third arch is common carotid, and after that, to the head, external carotid on each side. The dorsal longitudinal arteries on the head side of the junction with the third arch form the internal carotids. Between the third and fourth arches they are obliterated, while on the caudal side of this, until the point of fusion is reached on the dorsal side of the heart, the left artery forms the upper part of the dorsal aorta, while the right entirely disappears. Below this point the thoracic and abdominal aortae are formed by the two primitive dorsal aortae which have fused to form a single median vessel. As the limbs are developed, vessels bud out in them. The subclavian for the arm comes from the fourth aortic arch on each side, while in the leg the main artery is a branch of the caudal arch which is curving ventralward to form the umbilical artery. From the convexity of this arch the internal iliac and sciatic at first carry the blood to the limb, as they do permanently in reptiles, but later the external iliac and femoral become developed, and, as they are on the concave side of the bend of the hip, while the sciatic is on the convex, they have a mechanical advantage and become the permanent main channel.

For further details see O. Hertwig, Handbuch der *vergleichenden und* experintentellen *Entwickelungslehre* der *Wirbeltiere* (Jena, 1905).

ARTERIES, DISEASES OF. Apart from their implication in neighbouring foci of disease, *e.g.,* abscess or new growth, arteries suffer from certain well-defined morbid processes whereby the character of their walls is affected and changes may be induced in the tissues they normally supply with blood and in the heart which pumps that blood along them. The chief of these processes are atheroma, arteriosclerosis, syphilitic endarteritis (endarteritis obliterans), embolism and thrombosis. In addition the normal diameter of the arteries may be altered by nervous causes as in shock, various paralytic states, Raynaud's disease (*q.v.*) and by surgical or accidental means as in ligature.

In *atheroma* a local proliferation of endothelial cells takes place in the arterial wall at the junction of the middle and inner coats and later undergoes fatty or caseous degeneration. The degenerated material may ultimately be discharged into the lumen of the vessel, an atheromatous ulcer being formed, or it may become infiltrated with calcium salts when its site is represented by a calcareous plaque in the wall of the artery. Atheroma is commonest in the aorta including the aortic valves and the incidence increases with age; it chiefly affects males and small innocuous patches are present in most men above the age of 50. The atheromatous ulcer may become the starting point of an aneurysm (*q.v.*) or of embolism from dislodgment of a fragment of fibrin deposited on the Aoor of the ulcer by the circulating blood. If the atheroma be so extensive that small as well as large arteries are involved, the calcareous process is likely to convert a vessel such as the radial or tibial into a rigid tube in which thrombosis (*q.v.*) occurs and leads to local gangrene. Where atheroma affects the aortic valves and leads to stenosis or regurgitation the heart reacts to the valvular condition by dilatation and hypertrophy (*q.v.*) as in similar non-atheromatous cases. Even extensive atheroma of the aorta does not introduce any factor modifying the work of the left ventricle unless at the same time the orifices of the coronary arteries be narrowed. Under the last mentioned condition nutrition of the cardiac muscle and endocardiac ganglia is impaired, fatty degenerative changes occur and anginal attacks are probable (see ANGINA PECTORIS). When calcareous atheroma affects extensively the smaller arteries, the rigidity and diminution of calibre introduce an obstacle in the peripheral resistance which the heart cannot overcome by increased work. Hence the left ventricle does not hypertrophy. Indeed the age of the patient and the general conditions are such that the heart in these cases is small, feeble and somewhat dilated.

In arterio-sclerosis the smaller arteries throughout the body become thickened and their lumen narrowed by the formation of an increased amount of fibrous tissue, and possibly of the muscular elements, in the middle coat. In the first instance, at all events, the inner and outer coats are unaffected. The condition leads to hypertrophy of the left ventricle owing to the increased peripheral resistance introduced by the narrowed, but still distensible arteries, and the general blood pressure rises. The arterioles of the kidney share in the general change and the organ shows the fibrotic and parenchymatous changes constituting chronic granular kidney (see KIDNEY, DISEASES OF). The clinical symptoms of arterio-sclerosis are therefore those of heightened arterial tension together with those of renal fibrosis, complicated later by the cardiac changes the hypertrophied heart undergoes when compensation fails (see HEART, DISEASES OF). Apart from these changes the altered blood vessels are, themselves, liable to undergo degenerative processes identical with or resembling those occurring in atheroma, and where relatively unsupported as in the lenticulostriate region of the brain, small aneurysms are often formed, one of which may rupture under the force of the ventricular systole and lead to cerebral haemorrhage (see APOPLEXY). Such so-called miliary or millet seed aneurysms are of pin-head size. Haemorrhage may also occur into the retina, the semi-circular canals and the intestinal mucosa. In the eye they lead to varying degrees of impaired vision according to their extent and situation and in the ear to Menibre's disease (*q.v.*). One feature of all these haemorrhages is that they are liable to be repeated owing to the permanent character of the underlying arterial and cardiac changes. In an autopsy upon a case of fatal cerebral haemorrhage evidence of earlier small haemorrhages into other parts of the brain is often found.

In syphilitic *endarteritis* or *endarteritis* obliterans the inner coat of the artery is the seat of a localized but often widespread inflammatory proliferation of endothelial cells with an admixture of lymphocytes. Such foci involve a portion of the circumference of the vessel and thus narrow the lumen and make it irregular in shape. They are avascular, and caseous degeneration early occurs with the result that the superficial endothelium dies and local thrombosis occludes the lumen completely. Affecting the large arteries the condition is highly diagnostic but rarely gives rise to symptoms. In arteries of small calibre, on the contrary, especially those of the brain, it is of grave importance; in young adults symptoms of "apoplexy" almost invariably are due either to syphilitic endarteritis with thrombosis or to embolism. What relation this form of endarteritis bears to atheroma is uncertain. In well-marked instances of syphilitic endarteritis soft flattened excrescences from the smooth inner lining of the arteries occur in numbers and distribution recalling those of widespread calcareous atheroma, and it may be that the latter condition is a late stage of the former. Indeed many cases of syphilitic endarteritis were described as "soft atheroma" before the Treponema pallidum was discovered.

Apart from rupture with its associated haemorrhage, aneurysm with its special pressure effects and liability to rupture, and arteriosclerosis with its associated renal and cardiac changes, disease of an artery is important mainly because of the thrombosis it provokes and the nutritive changes that its occlusion may induce in the tissues it supplies. As is shown elsewhere (see THROMBOSIS) the effects of occlusion depend upon whether the occluded vessel anastomoses freely or not and whether the condition is septic or aseptic.

The treatment of arterial diseases is mainly that of the condition upon which they depend or of the states to which they give rise. For the arterial condition itself no treatment is available except in some cases of aneurysm where thrombosis may be induced by ligature of the vessel. In arterio-sclerosis the ill effects of high arterial tension, renal inadequacy and the excessive work thrown on the heart are combated by eliminating as far as possible the external conditions that favour the occurrence of these ill effects. Thus, muscular exertion is reduced, diet is restricted, sleep is encouraged and, in order to relieve the kidneys, adequate action of the skin and intestines is promoted. In atheroma where gangrene occurs the treatment is that of the gangrene combined with such general treatment as is required by the age and cardiac weakness of the patient.

ARTERIOSCLEROSIS: *see* ARTERIES, DISEASES OF.

ARTERN, a town of Germany, in Prussian Saxony, on the Unstrut, at the influx of the Helme, at the junction of railways to Erfurt, Naumburg and Sangerhausen, 8 m. S. of the last named. Pop. 5,890. Its brine springs, known as early as the 15th century, are still frequented.

ARTESIAN WELLS, named after Artois, the ancient Artesium, a French province, where the method of boring was first adopted in Europe. A bore-hole is carried down into water-bearing strata, and the water, in certain formations, rises by hydrostatic pressure, or is pumped up. There is a well within the old Carthusian convent at Lillers which has been flowing since the 12th century. Traces of more ancient bored wells appear in Lombardy, in Asia Minor, Persia, China, Egypt, Algeria, and in the Sahara desert. Very big yields are often obtained; for instance, a set of eight wells at Camberwell, London, give a million and a half gallons per day. A large variety of tools is employed in the work of boring, some rotary, some percussive, and their operation is effected with hand plant, or by power. A derrick is erected on the spot to suspend the rods from, and carries the winding drum, and, in rotary plants, an engine for turning the rods. The diagram shows a percussive plant, with the chisel seen well into the water-bearing strata. Changes in tools have to be made according to the strata encountered; in some instances a rotary crown of diamonds, costing thousands of pounds, has to be used to bore through rock. Lining-tubes, which range from 3 in. to 24 in. or more in diameter are driven down as the bore progresses, while permanent lining-tubes are put in for the passage of the fluid. This is therefore only able to rise from the water-bearing strata, no surface percolations gaining access. The use of a continuous casing, or pipe, insures this. Depths reach to as much as 2,500ft. in some cases.

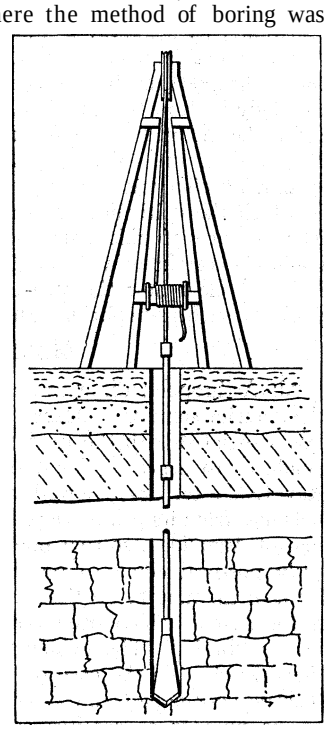

DIAGRAM SHOWING THE PROCESS OF BORING AN ARTESIAN WELL

Several kinds of pumps are applied to the duty of raising water, some being reciprocating, worked from a crankshaft at the top; and operating a bucket with flap or lift valves, in conjunction with a foot-valve. As the bucket rises the water is sucked up through the foot-valve, and as it descends the font-valve shuts, and those in the bucket open to pass the water upwards. The driving is done by belt, steam-engine, internal-combustion engine, or electric motor. Latterly multi-stage turbine pumps have been installed to an increasing extent, while the compressed-air method, forcing up the water without any moving mechanism below, is much utilized. The turbine pumps are driven in some instances direct by a vertical electric motor on the top end of the shaft, and this goes down through a tube jointed up in sections, with lignum-vitae bearings, which are lubricated by the water itself, as it flows through the tube to the delivery outlet at the top. (*See* PUMP; AIR LIFT.)

ARTEVELDE, JACOB VAN (*c.* 1290–1345), Flemish statesman, born at Ghent about 1290, sprang from one of the wealthy commercial families of the city. His brother John, a rich cloth merchant, took a leading part in public affairs during the first decades of the 14th century. Jacob, who according to tradition was a brewer by trade, made his first appearance as a political leader in the year 1337, when the outbreak of hostilities between France and England threatened the industrial welfare of his native town.

As the Flemish cities depended upon England for the supply of the wool for their staple industry of weaving, he proposed, at a great meeting at the monastery of Biloke, a scheme for an alliance of the Flemish towns with those of Brabant, Holland and Hainaut, to maintain an armed neutrality in the dynastic struggle between Edward III. and Philip VI. of France. His efforts were successful. Bruges, Ypres and other towns formed a league with Ghent, where Artevelde, with the title of captain-general, henceforth until his death exercised almost dictatorial authority. His first step was to bring about the conclusion of a commercial treaty with England.

The efforts of the Count of Flanders to overthrow the power of Artevelde by force of arms completely failed, and he was compelled at Bruges to sign a treaty (June 21 1338) sanctioning the federation of the three towns, Ghent, Bruges and Ypres, henceforth known as the "Three members of Flanders." This was the first of a series of treaties, made during the year 1339–40, which gradually brought into the federation many towns and provinces of the Netherlands. The policy of neutrality, however, proved impracticable, and the Flemish towns, under the leadership of Artevelde, openly took the side of the English king, with whom a close alliance was concluded.

Artevelde now reached the height of his power, concluding alliances with kings, and publicly associating with them on equal terms. Under his able administration trade flourished, and Ghent rose rapidly in wealth and importance. But the proposal of Artevelde to disown the sovereignty of Louis, count of Flanders, and to recognize in its place that of Edward, Prince of Wales (the Black Prince), gave rise to violent dissatisfaction. A popular insurrection broke out in Ghent, and Artevelde was murdered on July 24 1345.

See J. Hutton, *James and Philip van Artevelde* (London, 1882); *W. J.* Ashley, *James and Philip van Artevelde* (London, 1883); P. Namèche, *Les van Artevelde et leur époque* (Louvain, 1887); L. Vanderkindere, *Le Siècle des Arteveldes* (Brussels, 1879).

ARTEVELDE, PHILIP VAN (*c.* 1340–1382), youngest son of Jacob van Artevelde (*q.v.*), and godson of Queen Philippa, lived in retirement until 1381. The Ghenters had in that year risen in revolt against the oppression of the count of Flanders, and Philip, now 40 years of age, and without any military or political experience, was offered the supreme command. He defeated Louis de Mile, count of Flanders, before Bruges, entered that city in triumph, and was soon master of all Flanders. But France took up the cause of the Flemish count, and a splendid French army was led across the frontier by the young king Charles VI. in person. Artevelde's burgher army of some 50,000 Flemings was defeated with terrible loss at Roosebeke near Courtrai (Nov. 27, 1382), Philip himself being among the slain. His career is the subject of Sir H. Taylor's drama, *Philip van Artevelde.*

See James Hutton, *Jacob and Philip van Artevelde (1882)*; *W. J.* Ashley, *James and Philip van Artevelde (1883).*

ART GALLERIES: *see* MUSEUMS AND ART GALLERIES.

ARTH, a picturesque little town of Switzerland, situated at the southern end of Lake Zug. Its origin probably goes back to Roman times. Pop. about 5,000.

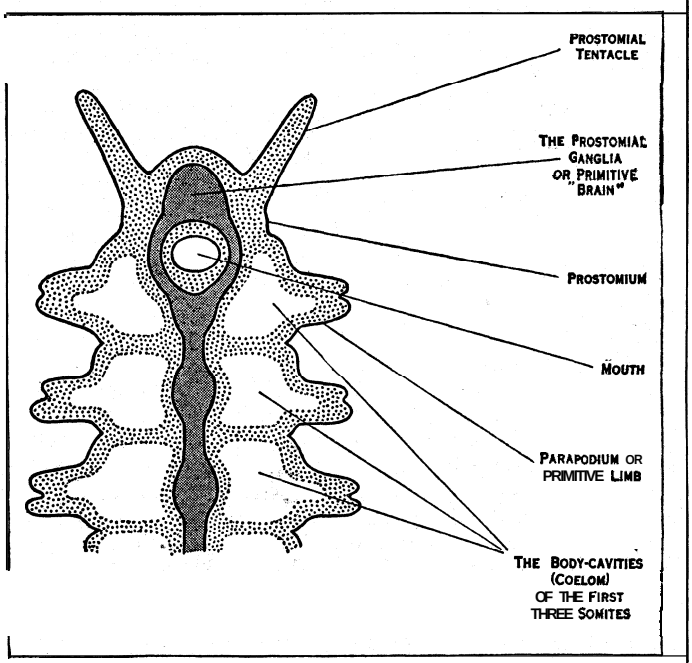
ARTHRITIS, inflammation of the joints, occurring in acute and in chronic forms as the result of injury or in the course of other diseases, *e.g.*, gout, rheumatism, gonorrhoea.

Arthritis may end in fixation of the joint and it sometimes is suppurative.

ARTHROPODA, a phylum of the animal kingdom, comprising animals with a segmented body enclosed in a firm integument or exoskeleton, provided with jointed limbs some of which are modified to serve as jaws. The group includes the classes Crustacea, Myriopoda, Insecta and Arachnida, together with several less extensive groups.

It corresponds to the class Insecta of Linnaeus. but that name has, by more than a century of usage, been restricted to one of its subdivisions.

The Arthropoda have many features in common with the Annelid worms *(see* ANNELIDA), from some primitive form of which, it can hardly be doubted, they have been derived. They agree with the Annelida in the segmented body, the segments or "somites" of which arise during development in regular order from front to rear, new somites being added in front of an unsegmented terminal region or "telson"; in the structure of the nervous system, consisting of a ventral double chain of segmentally arranged ganglia connected by a pair of cords which encircle the gullet with a pair of ganglia (the "brain") in front of the mouth; and in having segmental hollow appendages (parapodia, limbs) moved by muscles. They differ from the Annelida in having the external cuticle—which in the Annelida is a delicate membrane composed chiefly of a substance known as chitin—thickened and stiffened so as to form an exoskeleton, remaining thin and flexible only at the joints between the segments of the body and limbs; in having one or more pairs of appendages in the neighbourhood of the mouth converted into paired, laterally moving, jaws; and in having the apparent body-cavity (haemocoel) forming part of the blood-system communicating with the contractile dorsal vessel or heart by segmentally arranged valved openings or ostia, the true body-cavity (coelom) being almost obliterated.



AFTER GOODRICH

FIG. 1.—DIAGRAM OF HEAD AND ANTERIOR REGION OF AN ANNELID WORM. THE NERVOUS SYSTEM IS IN BLACK

The possession of a rigid exoskeleton, of which the segments form jointed levers moved by muscles, is associated with a much more complicated muscular system than is found in the Annelida and has rendered possible the development of elaborate mechanisms for carrying on the varied activities of life. The appendages are modified in an endless variety of ways for creeping, swimming or flying, for catching and killing prey, for biting or grinding food, for the support of sense-organs, for aiding the functions of reproduction or for protecting the eggs and young. Along with these developments, the nervous system and the organs of special sense, in particular the eyes, become correspondingly complex and efficient. The protection which the continuous cuticle affords to the underlying tissues has facilitated the transition, many times repeated in the evolution of the group, from aquatic to terrestrial life, in which the insects above all have been conspicuously successful.

With the body and limbs enclosed in a continuous and inextensible envelope, growth is only possible if the envelope is periodically shed and renewed, and this process of "moulting" or "ecdysis" is very characteristic of Arthropoda. In some, growth appears to continue at a diminishing rate throughout life, and ecdysis occurs at successively longer intervals. This is probably the case with most of the higher Crustacea. In the winged insects, however, growth ceases at the end of the larval stage and the adult insect does not undergo ecdysis. Although the geceral association of ecdysis with growth is obvious there are exceptions which forbid the assumption that the t o phenomena are causally connected. Thus in certain Decapod Crustacea (prawns) repeated ecdysis may occur without any perceptible increase in size, and in individuals subjected to starvation there may even be a shrinkage in bulk of the animal. On the other hand, certain parasitic Crustacea increase enormously in size without ecdysis, the cuticle, which remains thin and membranous, extending apparently by some process of interstitial growth.

A remarkable peculiarity, which is all but universal throughout the Arthropoda, is the absence of vibratile cilia from all parts of the body both in the larval and in the adult stages. In this character the Arthropoda differ from all other animals except the Nematode worms. The only Arthropoda known to possess actively moving cilia are certain species of *Peripatus* (Onychophora) in which the epithelium of the receptaculum seminis is ciliated. The absence of cilia from the external surface of the body is doubtless correlated with the development of a strong cuticle; but it is not clear how this can explain their absence from internal passages such as nephridial and genital ducts.

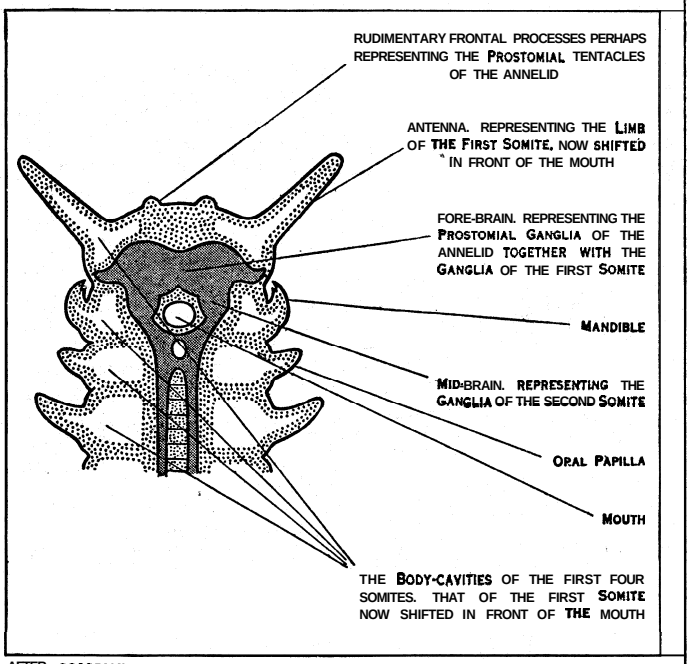
MORPHOLOGY

All Arthropoda differ from the Annelida in having some of the anterior somites coalesced to form the "head." This is doubtless associated with the modification of some of the anterior appendages to serve as jaws. Further, there has taken place, as Ray Lankester first showed, a backward shifting of the mouth-opening, from its primitive position on the first somite (peristomium of Annelida), so that one or more somites which were originally postoral come to be situated, with their appendages, in front of the mouth. At the same time the nerve-ganglia belonging to these somites have been moved forward to become incorporated in the "brain." The evidence for the forward shifting is particularly clear in the case of the antennae of the Crustacea and their nerve-ganglia (see CRUSTACEA).

The number of somites constituting the head differs in the classes of the Arthropoda but considerable difficulties are encountered in attempting to determine the actual numbers, and to compare the various classes with one another in respect of this character. Embryological study has shown that clearly marked somites may be present in the early stages which disappear in the course of development and that the number of appendages present in the adult does not always correspond to the number of somites originally present. Even where no such embryonic vestiges can be discovered it cannot safely be assumed that the cephalic appendages are serially homologous in widely different types of Arthropoda. The following comparison of the consti-

tution of the head in the different classes must be understood as subject to this reservation.

The structure of the head is simplest in the Onychophora *(Peripatus)* which in this, as in many other respects, occupy a very primitive and isolated position among existing Arthropoda. In the early embryo the first pair of mesoblastic somite-rudiments lie, at their first appearance, well behind the mouth, but



AFTER GOODRICH

FIG. 2. — DIAGRAM OF HEAD AND ANTERIOR REGION OF ONYCHOPHORA (PERIPATUS), A PRIMITIVE SPECIES OF ARTHROPODA

move forwards in the course of development until they are in front of the mouth. From these arise a pair of limb-buds which become the antennae of the adult. From the similar limb-buds on the second pair of somites arise the single pair of jaws and from those on the third somites the "oral papillae" of the adult. In all other Arthropoda there is evidence of more than one preoral segment. Even in the Arachnida, in which only one pair of appendages, the chelicerae, are in front of the mouth, a pair of pre-cheliceral somite-rudiments have been found in the embryo in spiders. In Crustacea there are three preoral somites, a pair of preantennular somite-rudiments being present in the embryo in front of those that carry the antennulae and antennae of the adult. In the Chilopoda (Myriopoda) there are also three preoral somites, transitory embryonic rudiments being found in front of and behind the antennae, which are the only preoral appendages of the adult. In insects also a preantennal somite has been demonstrated and there is stated to be some evidence of the existence of another somite in front of it; a transitory somite between antennae and mandibles completes the resemblance to Chilopods and Crustacea.

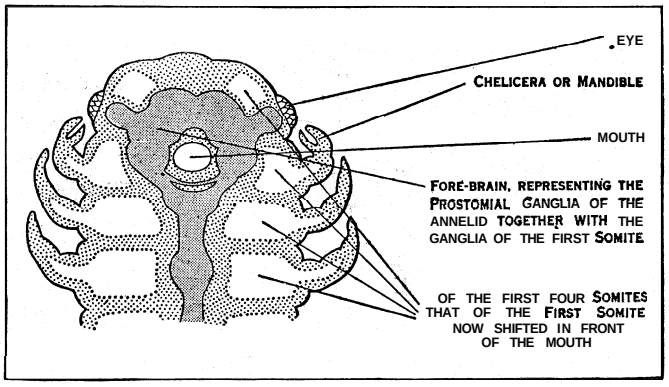
Subject to the reserves indicated above, the probable homologies of the anterior somites and their appendages in the chief classes of Arthropoda may be tabulated as follows (embryonic somites are indicated by italics):—

Peripatus.	Arachnida.	Crustacea.	Chilopoda.	Insecta.
Antenna.	*Pre-cheliceral somite.*	*Pre-antennular somite.*	*Pre-antenna1 somite.*	*Pre-antennal somite.*
Jaw . .	Chelicera	Antennule	Antenna	Antenna
Oral papilla .	Pedipalp	Antenna	*Pre-mandibular somite*	*Pre-mandibular somite*
1st leg .	1st leg	Mandible	Mandible	Mandible
and leg .	and leg	Maxillula	1st maxilla	Maxillula
3rd leg .	3rd leg	Maxilla	2nd maxilla	1st maxilla
4th leg .	4th leg	Maxilliped or 1st leg	Maxilliped	2nd maxilla (Labium)

The constitution of the head in the Diplopod Myriopoda (sometimes regarded as a class distinct from the Chilopoda) is not clearly ascertained, but for further details reference must be made to the articles dealing with the different groups.

The sensory organs of the Arthropoda present numerous and diverse complexities of structure many of which are clearly associated with the presence of a hard and often opaque cuticle. With the body and limbs so encased it may be supposed that the sense of touch would be very dull unless it were localized in special organs. These organs are provided by the hairs or "setae" which are scattered over the surface in all Arthropoda. They are hollow projections of the cuticle containing prolongations of the underlying cells of the hypodermis into which nerve-fibrils can be traced. At the base, the seta arises from a cup-shaped depression where the cuticle is thinned away to form a more or less movable joint, and movements caused by touching solid bodies will cause afferent impulses to be transmitted to the central nervous system. The finer setae are often furnished with secondary hairs set along their length like the barbs of a feather, and such setae, which are especially common in aquatic Arthropoda, can be seen to respond to movements in the water and even to the delicate vibrations caused by sound waves. Another modification of setae gives rise to organs of taste and smell or, more generally, of chemical sense. In these the cuticle of the setae is exceedingly thin, permitting diffusion of substances from the surrounding medium which thus reach the nerve-endings within.

The eyes of Arthropoda are very characteristic of the group, and here again the structure seems to be conditioned by the presence of a thick cuticle. Only in *Peripatus* (Onychophora) are the eyes of a type found in Annelida, consisting of a closed sack or vesicle, folded off from the skin and enclosing a lens that seems to be cuticular in origin. In all other Arthropoda the eyes are developed as pits in the ectoderm, the cavity of the pit being filled by a transparent thickening of the cuticle which acts as a lens, concentrating light on the receptive cells beneath. These receptive or retinal cells contain rod-like bodies (rhabdomes) perhaps also cuticular. The simpler types of eye consist each of a single pit with single lens overlying a group of retinular cells, or a number may be grouped together, leading to the remarkably complex "facetted" or "compound" eyes which are especially characteristic of crustaceans and insects. In these the transparent cuticle forming the cornea which covers the eye is divided into a number (often a very large number) of lenticular



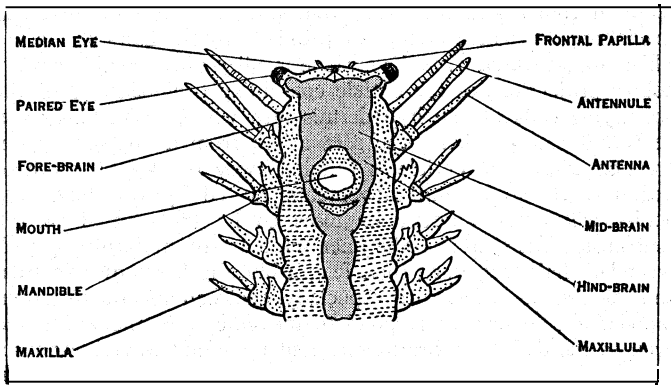
AFTER GOODRICH

FIG. 3. — DIAGRAM OF THE HEAD AND ANTERIOR REGION OF AN ARACHNID

facets each of which corresponds to a little group of retinular cells and usually an additional refractive body, the "crystalline cone." While there is considerable diversity in minute details of structure it should be emphasized that the agreement in general plan between the compound eyes of Crustacea and those of insects is remarkably close.

Respiration in aquatic Arthropoda is carried on by gills or, in the more minute forms, by the general surface of the body. The gills are plate-like or branching outgrowths from some of the limbs or from the surface of the body. The organs of respiration in air-breathing Arthropoda are more varied. The

characteristic "lung books" of many Arachnida are plainly derivable from the very similar "gill books" of the aquatic Xiphosura and their allies (see ARACHNIDA). The most common method of aerial respiration, however, is by tracheae. These are delicate tufted or branching tubules, opening to the exterior and filled with air. They are lined by a delicate continuation of the external cuticle, often strengthened by a spiral thickening. In the simpler forms the tracheae penetrate only a little way into

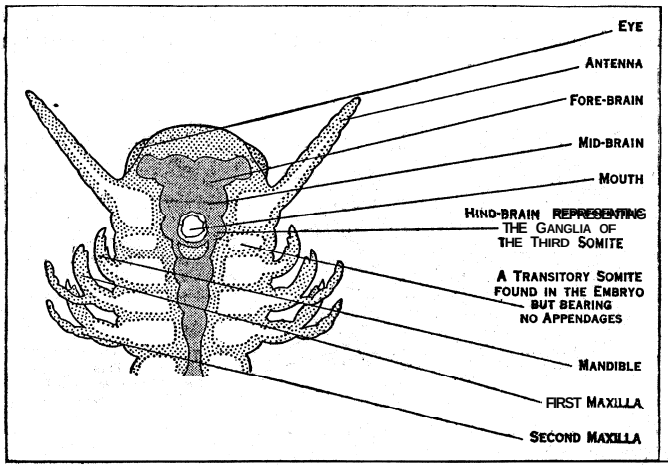


FROM LANKESTER, TREATISE ON ZOOLOGY, BY PERMISSION OF A. & C. BLACK

FIG. 4 — DIAGRAM OF HEAD AND ANTERIOR REGION OF A CRUSTACEAN

the body and the blood no doubt acts as intermediary in the respiratory exchange with the tissues. In more highly developed types, especially in insects, the tracheal tubules ramify throughout the whole body, carrying air into direct contact with the cells of the tissues and the respiratory function of the blood is almost or quite superseded. Tracheae are possessed by Onychophora, Myriopoda (Chilopoda and Diplopoda), Insecta, most terrestrial Arachnida, and even by the terrestrial Isopoda among Crustacea. Similar structures are said to occur in certain Coelenterata (Siphonophora) and Mollusca, but with these exceptions they are peculiar to the Arthropoda.

The structure of the heart has been already alluded to. In the more primitive forms it is a long dorsal tube running throughout the greater part of the body and lying in a chamber, the pericardium, which contains blood. From the pericardium the blood enters the heart by paired openings or ostia with valvular lips which permit blood to enter but prevent its egress. Typically



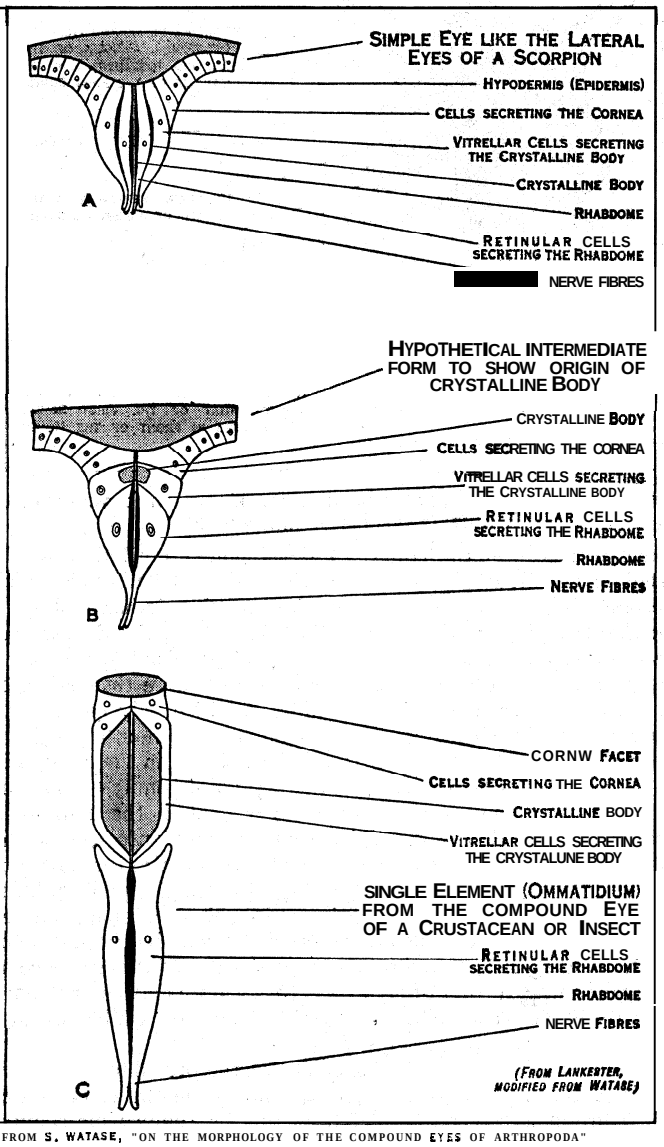
AFTER GOODRICH

FIG. 5.— DIAGRAM OF HEAD AND ANTERIOR REGION OF AN INSECT

there is a pair of ostia in each somite. The heart is rhythmically contractile and propels the contained blood towards the head where it may be discharged directly into the lacunae of the haemocoel or may pass through one or several arterial vessels before entering the lacunar system. In more specialized forms the heart-tube is shortened and the number of ostia is reduced and in some of the smaller Crustacea it forms a globular sack with a single pair of ostia. In many minute forms of Crustacea and Arachnida the heart is absent and the blood is simply driven hither and thither by movements of the body, limbs and alimentary canal.

PHYLOGENY

While the number and the importance of the characters which are common to all the classes composing the Arthropoda are such as to remove all reasonable doubt that the group is a "natural" or monophyletic one, it is not possible to say that the phyletic relations of the classes themselves have been clearly ascertained. No phylogenetic scheme has been suggested that does not involve the independent origin of similar features in different lineages. Thus, the possession of tracheae was formerly considered as clear evidence of common descent in the Onychophora, Myriopoda, Insecta, and Arachnida. The demonstration by Ray Lankester, however, of the close affinity between the air-breathing Arachnida and the gill-bearing Xiphosura and Eurypterida involved the conclusion that the tracheae of Arachnida must have arisen independ-



FROM S. WATASE, "ON THE MORPHOLOGY OF THE COMPOUND EYES OF ARTHROPODA"

FIG. 6.— DIAGRAMS ILLUSTRATING STRUCTURE OF EYES IN ARTHROPODA THE CUTICLE AND ITS DERIVATIVES ARE SHOWN IN BLACK

ently of those of the insects. The assumption of a simple phyletic series leading from the Onychophora through the Myriopoda to the Insecta became untenable when it was shown that the Chilopod Myriopods and the insects agreed closely with Crustacea in the segmentation of the head-region and that the similarity in structure of the compound eyes of insects and Crustacea was too close to be imagined as arising independently in the two groups. Again, the resemblance of the tracheae of terrestrial Isopod Crustacea to those of the other tracheate groups is not disposed of by calling them "pseudotracheae" and it is not seriously suggested that so specialized a group of Crustacea can have given rise to insects.

The suggestion that all the existing Arthropoda can have been derived from tracheate air-breathing ancestors, implying, as it does, the existence of a land-fauna in Pre-Cambrian times, cannot be considered seriously in the present state of our knowledge. The only conclusion that can be drawn, therefore, is that tracheae have been acquired at least four times in the evolution of the Arthropoda.

The fact that convergent evolution must be admitted in the case of a system of organs so characteristic as the tracheae demands a careful scrutiny of the other structural features on which classification may be based. Some uncertainties with regard to the constitution of the head have already been alluded to. Where there is a clear correspondence of somite for somite and appendage for appendage, as in the comparison of Xiphosura and Eurypterida with scorpions, a natural or phyletic relationship may be taken as proved. On the other hand, while the dismembering of the old group Myriopoda may be justified by the wide differences separating the Diplopoda and Chilopoda, it is not clear that the association of the Symphyla with the former can be sustained solely because of the anterior position on the genital openings.

The palaeontological record of Arthropoda gives some help towards understanding their phylogeny. Particularly interesting are the Trilobites, some of which are among the earliest known fossils and of which the structure is now known in considerable detail in several genera. It is clear that they are not far removed from a primitive stock which may well have given rise to the Crustacea and it is probable that the Eurypterida, and with them the Arachnida, may have come from the same source by way of the imperfectly known Cambrian Limulava. Of the origin of insects and of the Myriopod groups palaeontology has, as yet, nothing to tell us although Diplopod-like forms and probably insects occur in the Devonian.

The position of the Onychophora with respect to the other Arthropoda is quite obscure except that they must have diverged very early from the primitive stock and have acquired independently the features which they have in common with the other terrestrial groups such as tracheae and simple clawed limbs.

The Pycnogonida are another group which it is impossible, in the present state of knowledge, to link up with any of the larger groups of Arthropoda. Their traditional association with Arachnida encounters difficulties in the interpretation of the appendages and these difficulties have not been diminished by the discovery of genera which have five, instead of the usual four, pairs of legs.

The Tardigrada and Pentastomida (Linguatulida, *qq.v.*), are two small groups whose title to be regarded as Arthropoda is doubtful. If they are, the simplification of structure and the disappearance of connecting links has entirely obscured their relationships with the more normal members of the group.

It may be mentioned that, in point of size, the Arthropoda have a wider range than any of the other main groups of the animal kingdom. The same minimum of 1/100 inch (·25 mm.) is reached both among Crustacea (Cladocera) and among insects (Coleoptera). At the other extreme stands the Giant Japanese Crab *(Macrocheira* or *Kaempferia)* which can span 11ft. with its claws. Some of the extinct Eurypterida, reaching 7ft. in length of body, were probably still bulkier.

See ARACHNIDA; CRUSTACEA; INSECTS; MYRIAPODA; ONYCHOPHORA; PYCNOGONIDA; TRILOBITA. (W. T. C.)

ARTHUR, British king, and subject of the romance cycle, described below, *s.v.* Arthurian Legend. Our sources for the historical Arthur are the *Historia Britonum* of Nennius, the *Annales Cambriae,* and the *Gesta Regum* of William of Malmesbury. In Caradoc of Llancarfan and in Geoffrey of Monmouth the myth is already developed. Nennius (*fl.* 796) represents Arthur as a Christian warrior leading the kings of Britain against the Saxon kings of Kent. He enumerates 12 battles, of which the eighth battle was on the castle Guinnon, "wherein Arthur bore the image of St. Mary the ever-virgin upon his shoulder, and the pagans were turned to flight. . . . The twelfth battle was on the Mount of Badon, wherein fell 960 men in one day at a single onset of Arthur; and no one overthrew them but he alone, and in all the battles he came out victorious." There is no other record of the 12 battles, but Gildas (q *v.),* writing in 550, without speaking of Arthur, mentions the battle of Mount Badon as taking place on the day of his birth, which would be *c.* 516. We may conclude, then, that Arthur was born about the end of the 5th century, and that he was the general of royal armies fighting in South Britain. The compiler of the *Annales Cambriae* (written shortly after 956), and William of Malmesbury in his *Gesta Regum* (completed 1125), also connect Arthur with the battle of Mount Badon, the former adding that he fell with Medraut (Mordred) at the battle of Camlan (537). William further objects to the fables growing up around his name and shows that it had already been connected with Walwen or Gawain. (The famous Round Table appears as early as the *Geste des Bretons* [1155] of Maistre Wace.) Geoffrey of Monmouth, whose *Historia Britonum,* written in 1147, was one of the chief sources for later biographies, definitely introduces the mythical element by relating, among other events, the crowning of Arthur and his conquests abroad. Caradoc of Llancarfan, in his *Vita Gildae* (before 1156), has similar elaborations in his description of the quarrel between Arthur and Hueil, the brother of Gildas, and in his account of Arthur as the benefactor of Glastonbury. Glastonbury, as the hero's resting-place, is first mentioned by Giraldus Cambrensis in the first book of his De *Principis Instructione* (*c.* 1195), and the discovery of Arthur's body is first dated as 1191 by Ralph of Coggeshall in his *Chronicon Anglicanum.*

See W. Lewis Jones, *King Arthur in History and Legend* (1911): *E.* **K.** Chambers, *Arthur* of *Britain* (1927), and *Camb. Hist. of Eng. Lit.,* vol. i.

ARTHUR I. (1187–1203), duke of Brittany, was the posthumous son of Geoffrey, the fourth son of Henry II. of England, and Constance, heiress of Conan IV., duke of Brittany. The Bretons hoped that their young prince would uphold their independence, which was threatened by the English. Henry II. tried to seize Brittany, and in 1187 forced Constance to marry one of his favourites, Randulph de Blundevill, earl of Chester (d. 1232). Henry, however, died soon afterwards (1189). The new king of England, Richard Coeur de Lion, claimed the guardianship of the young Arthur, but in 1190 Richard left for the Crusade. Constance profited by his absence by governing the duchy, and in 1194 she had Arthur proclaimed duke of Brittany by an assembly of barons and bishops. Richard invaded Brittany in 1196, but was defeated in 1197 and became reconciled to Constance. On his death in 1199, the nobles of Anjou, Maine and Touraine refused to recognize John of England, and did homage to Arthur, who declared himself the vassal of Philip Augustus. In 1202 war was resumed between the king of England and the king of France. The king of France recognized Arthur's right to Brittany, Anjou, Maine and Poitou. While Philip Augustus was invading Normandy, Arthur tried to seize Poitou. But, surprised at Mirebeau, he fell into the hands of John, who sent him prisoner to Falaise. In the following year he was transferred to Rouen, and disappeared suddenly. It is thought that John killed him with his own hand. After this murder John was condemned by the court of peers of France, and stripped of his French fiefs.

See Ralph of Coggeshall, "Chronicon Anglicanum," in the *Monumenta Britanniae historica;* Dom Lobineau, *Histoire de Bretagne* (1702); Dom Morice, *Histoire de Bretagne* (1742–56); A. de la Borderie, *Histoire de Bretagne,* vol. iii. (1899); Bémont, "De la condamnation de Jean-sans-Terre par la Cour des Pairs de France," in the *Revue historique,* vol. xxxii. (1886).

ARTHUR III. (1393–1458), earl of Richmond, constable of France, and afterwards duke of Brittany, was the third son of John IV., duke of Brittany, and Joan of Navarre, afterwards wife of Henry IV. of England. His brother, John V., gave him his earldom of Richmond in England. From 1410 to 1414 he served on the side of the Armagnacs in the civil wars, and afterwards entered the service of Louis the dauphin, whose intimate friend he became. At Agincourt he was wounded and captured, and he remained a prisoner in England from 1415 to 1420. Released on parole, he persuaded his brother, the duke of Brittany, to conclude the treaty of Troyes, and was rewarded by Henry V. with the countship of Ivry.

In 1423 Arthur married Margaret of Burgundy, widow of the dauphin Louis, and thus became the brother-in-law of the regent, the duke of Bedford. Offended by Bedford's refusal to give him a high command, he broke with the English, and in March 1425 became constable of France.

He now threw himself with ardour into the French cause, and persuaded his brother, John V. of Brittany, to conclude the treaty of Saumur (Oct. 7 1425) with Charles VII. But he met with a whole series of reverses in the field; and at court, where his rough and overbearing manners made him disliked, his influence was overshadowed by that of a series of incompetent favourites. The peace concluded between the duke of Brittany and the English in Sept. 1427 led to his expulsion from the court. In June 1429 he joined Joan of Arc at Orleans, and fought in several battles under her banner, till the influence of La Trémoille forced his withdrawal from the army. On March 5 1432, Charles VII. concluded with him and with Brittany the treaty of Rennes; but it was not until June of the following year that La Trémoille was overthrown. Richmond now resumed the war against the English, and repressed the plundering bands of soldiers and peasants known as *routiers* or *écorcheurs*. On Sept. 20 1435, mainly as a result of his diplomacy, the treaty of Arras was signed between Charles VII. and the duke of Burgundy, to which France owed her salvation.

On April 13 1436, Richmond took Paris from the English; but it was not till May 1444 that the armistice of Tours gave him leisure to carry out the reorganization of the army. He now created the *compagnies d'ordonnance* and endeavoured to organize the militia of the *francs archers*. This reform had its effect in the struggles that followed. In alliance with his nephew, the duke of Brittany, he reconquered, during Sept. and Oct. 1449, nearly all the Cotentin; on April 15 1450, he gained over the English the battle of Formigny; and during the year he recovered for France the whole of Normandy, which for the next six or seven years he defended from English attacks. On the death of his nephew Peter II., Sept. 22 1457, he became duke of Brittany. He reigned little more than a year, dying Dec. 26 1458, and was succeeded by his nephew Francis II., son of his brother Richard, count of Étampes.

Duke Arthur was thrice married: (1) to Margaret of Burgundy, duchess of Guienne (d. 1442); (2) to Jeanne d'Albret, daughter of Charles II. of Albret (d. 1444); (3) to Catherine of Luxemburg, daughter of Peter of Luxemburg, count of St. Pol, who survived him. He left no legitimate children.

BIBLIOGRAPHY.—The main source for the life of Duke Arthur III. is the chronicle of Guillaume Gruel (c. 1410–74–82). Gruel entered the service of the earl of Richmond about 1425, shared in all his campaigns, and lived with him on intimate terms. The chronicle covers the whole period of the duke's life, but the earlier part, up to 1425, is much less full and important than the later, which is based on Gruel's personal knowledge and observation. In spite of a perhaps exaggerated admiration for his hero, Gruel displays in his work so much good faith, insight and originality that he is accepted as a thoroughly trustworthy authority. It was first published at Paris in 1622. Of the numerous later editions, the best is that of Achille le Vavasseur, *Chronique d'Arthur de Richemont* (Paris, 1890). *See* also E. Cosneau, *Le Connétable de Richemont* (Paris, 1886); G. du Fresne de Beaucourt, *Histoire de Charles VII.* (Paris, 1881, *et seq.*).

ARTHUR, CHESTER ALAN (1830–1886), 21st president of the United States was born in Fairfield, Vt., on Oct. 5, 1830. His father, William Arthur (1796–1875), when 18 years of age, emigrated from Co. Antrim, Ireland, and, after teaching in various places in Vermont and Lower Canada, became a Baptist minister. William Arthur had married Malvina Stone, an American girl who lived in Canada at the time of the marriage, and the numerous changes of the family residence afforded a basis for allegations in 1880 that the son Chester was born not in Vermont, but in Canada, and was therefore ineligible for the presidency. Chester entered Union college as a sophomore, and graduated with honour in 1848. He then became a schoolmaster, at the same time studying law. In 1853 he entered a law office in New York city, and in the following year was admitted to the bar. His reputation as a lawyer began with his connection with the famous "Lemmon slave case," in which, as one of the special counsel for the State, he secured a decision from the highest State courts that slaves brought into New York while in transit between two slave States were *ipso facto* free. In another noted case, in 1855, he obtained a decision that negroes were entitled to the same accommodations as whites on the street railways of New York city.

In politics Arthur was actively associated from the outset with the Republican Party. When the Civil War began he held the position of engineer-in-chief on Governor Edwin D. Morgan's staff, and afterwards became successively acting quartermaster general, inspector general, and quartermaster general of the State troops, in which capacities he showed much administrative efficiency. At the close of Governor Morgan's term, Dec. 31, 1862, Gen. Arthur resumed the practice of his profession, remaining active, however, in party politics in New York city. In Nov. 1871, he was appointed by President U. S. Grant collector of customs for the port of New York. The custom-house had long been conspicuous for the most flagrant abuses of the "spoils systems"; and though Gen. Arthur admitted that the evils existed and that they rendered efficient administration impossible, he made no extensive reforms. In 1877 President Rutherford B. Hayes began the reform of the civil service with the New York custom-house. A non-partisan commission, appointed by Secretary John Sherman, recommended sweeping changes. The president demanded the resignation of Arthur and his two principal subordinates, George H. Sharpe, the surveyor, and Alonzo B. Cornell, the naval officer, of the port. Gen. Arthur refused to resign on the ground that to retire "under fire" would be to acknowledge wrong-doing, and claimed that as the abuses were inherent in a widespread system he should not be made to bear the responsibility alone. His cause was espoused by Senator Roscoe Conkling, for a time successfully; but on July 11, 1878, during a recess of the Senate, the collector was removed, and in Jan. 1879, after another severe struggle, this action received the approval of the Senate. His business conduct of the office was not impugned, but, at that period, he was a political manager conspicuously hostile to civil service reform. However, in defence of his management, he issued a statement pointing out that the record of his immediate predecessors in the office showed seven times as many changes in appointments as he had made.

In 1880 Gen. Arthur was a delegate at large from New York to the Republican national convention. In common with the rest of the "Stalwarts," he worked hard for the nomination of Gen. U. S. Grant for a third term. Upon the triumph of James A. Garfield, the necessity of conciliating the defeated faction led to the hasty acceptance of Arthur for the second place on the ticket. His nomination was coldly received by the public; and when, after his election and accession, he actively engaged on behalf of Conkling in the great conflict with Garfield over the New York patronage, the impression was widespread that he was unworthy of his position. Upon the death of President Garfield, Sept. 19, 1881, Arthur took the oath as his successor. Coming at a period of intense factional controversy and following the assassination of Garfield, which had profoundly shocked the public mind, the accession of Arthur to the presidency created apprehensions. The widespread expressions of dismay in the press at the probable outcome of an administration in the hands of so confirmed a factionist and spoilsman as he was reputed to be, are said to have deeply wounded Arthur. But his inaugural address was clear, judicious and reassuring, and his expressed purpose, from which he never measurably deviated, to administer his office in a spirit devoid of factional animosity, established the confidence of the nation and won for him the approval of many of his severest critics. Contrary to the general expectation, his appointments as a rule were unexceptionable, and he earnestly supported the Pendleton law for the reform of the civil service. His use of the veto in 1882 in the cases of a Chinese immigration bill (prohibiting immigration of the Chinese for 20 years in contravention of the treaty of 1880) and a river and harbour bill (appropriating over $18,000,000 some of which was to be expended on insignificant streams) confirmed the favourable impression that had been made. The most important events of his administration were the passage of the Tariff Act of 1883 and of the Edmunds law prohibiting polygamy in the territories, and the completion of three great continental railways—the Southern Pacific, the Northern Pacific and the Atchison, Topeka and Santa Fe.
