ENCYCLOPEDIA BRITANNICA

VOLUME 2

ANNUAL REGISTER TO BALTIC SEA

ANNUAL REGISTER, the title of an annual periodical begun with a volume giving "a view of the history, politicks and literature of the years 1758," by R. Dodsley, with Edmund Burke as editor. Burke had £100 a year for his services, but never acknowledged his relation to the *Annual* Register, and the extent of his contributions remains uncertain; he is thought to have continued in charge till about 1788, and to have inspired his successors (Dr. Walker King, afterwards bishop of Rochester, and Dr. Richard Laurence, afterwards archbishop of Cashel) till his death. The *Annual* Register was published by Dodsley's firm till 1790, when the copyright of already issued volumes was bought by Rivington and the stock by Otridge and others. In the earlier volumes the historical section was basically little more than an abridgment of parliamentary debates, but since 1863 this has given place to a more continuous and comprehensive type of narrative.

ANNUALS, in botany, the name applied to plants which complete their life-cycle in one year, in contradistinction to biennials (*q.v.*), which require two years and perennials (*q.v.*), which live for an indefinite number of years.

ANNUITY, in the simplest sense of the word, denotes a payment made yearly The term is also applied to any series of periodical payments which fulfil the essential condition that they are made at regular fixed intervals. Thus an annuity may be payable yearly, half-ycarly, quarterly, monthly, or even more frequently. It is, however, the total sum payable in the year, sometimes called the annual *rent,* which is adopted for the purpose of describing the magnitude of the annuity. Hence a person in receipt of a quarterly payment of £25 is said to possess an annuity of £100 payable by quarterly instalments.

In technical terminology an annuity is said to be payable during a given status, this being a word equally appropriate when the annuity is payable for a definite term of years and when the duration is dependent upon some contingency. The most general definition of an annuity is therefore a series of payments made at regular intervals during the continuance of a given status.

The word annuity is sometimes used to denote an individual payment of a series, particularly in such phrases as "the first year's annuity." This usage, which has come into prominence in connection with the settlement of obligations contracted during the World War, is inaccurate and should be avoided.

There are two main classes of annuities: — annuities-certain, in which the payments are to continue during a fixed term of years, and **life** *annuities,* in which the duration of the payments is contingent upon the survivance of a given life or combination of lives. If the word annuity is used alone, unaccompanied by another word or qualifying phrase a life annuity generally is meant.

Within these two main classes there are various types of annuities to which special technical designations have been allotted. Unless otherwise stated, the first payment of an annuity is assumed to be made at the end of the first year in the case of a yearly annuity and at the end of the first interval in the case of an annuity payable by instalments. This form of annuity is called an immediate annuity. An annuity of which the first payment is made at the beginning of the first interval is called an *annuity-due;* if the annuity is not to be entered upon until the lapse of a certain number of years it is called a deferred annuity; if the payments are to continue for ever, it is called a perpetuity.

A continuous annuity is one which is assumed to be paid momently by infinitely small instalments. It would be impossible in actual experience to discover a series of payments precisely conforming to these conditions, but it is obvious that the value of such a series would not differ appreciably from that of a series of payments made daily or even weekly. The conception of continuous payments has permitted the application of the processes of the differential and integral calculus to the computation of annuity values. It has, therefore, been of great practical utility in facilitating the calculations of bodies, *e.g.,* industrial insurance companies, whose revenue and expenditure consist largely of numerous small daily or weekly payments.

The person to whom an annuity is payable is called the *annuitant,* and the life involved is called the nominee. A person who purchases an annuity on his own life is himself at once both annuitant and nominee.

Annuities-certain. — In an annuity-certain the status is a definite term of years, and thus the value of a given series of payments is dependent only upon the operation of interest.

The sum of the amounts of the successive payments accumulated to the end of the period during which the annuity is payable is technically called the *amount* of the annuity, and the sum of the present values of the successive payments is similarly termed the present *value* of the annuity.

The value of an annuity may be regarded as a loan or investment of money whereby the lender or investor becomes entitled

to receive a series of uniform payments consisting partly of interest and partly of repayment of capital. Such a transaction may be considered from two points of view. In the first instance the successive instalments of principal may be at once applied to diminish the amount outstanding at the end of each interval, which will thus be gradually reduced until with the final payment of the annuity the total capital invested is repaid. As the principal is repaid the interest diminishes and, since the combined annual payment is uniform in amount, the liquidation of the debt proceeds at an accelerating pace. Alternatively a uniform portion of each annuity payment may be regarded each year as interest on the original capital and the balance must be set aside and invested, together with all accumulations of interest on it, from time to time at the assumed rate in order that the proceeds may be available to replace the capital at the end of the period when the annuity expires. Such a sum, periodically applied to the redemption of capital, is called a *sinking fund.* If the sinking fund were invested at a rate lower than that assumed, its accumulations at the end of the period would not be sufficient to replace the invested capital. The periodical payments of the annuity are therefore sometimes calculated on the basis that the investor will obtain a specified rate of interest on his capital but will be able to replace the capital only by investing the instalments of sinking fund at a lower rate. The latter rate is technically known as the *reproductive rate,* and the rate realized as the *remunerative rate.* In periods of high income tax the distinction is of importance. The investor must be careful in arranging the transaction to secure that the reproductive rate is the net rate on which he can rely after deduction of tax.

Life Annuities. — A life annuity is a series of payments made during a status dependent upon the survivance of one or more nominees. Its value is governed by the combining of an interest and a mortality factor in each successive payment. If it could be shewn that the rate of mortality at successive ages followed a law which could be represented by means of a mathematical formula, the computation of the value of a life annuity could be effected by the direct application of mathematical processes. Attempts have been made by De Moivre, Gompertz, Makeham, and others to discover such a "law of mortality," hut no simple formula has been found capable of representing rates of mortality with sufficient accuracy. Recourse must, therefore, be had to a table of rates derived from the experience of the particular class of lives to which the nominee belongs.

The simplest form of life annuity, denoted a_x, is that in which a unit is payable at the end of each year so long as the nominee aged x survives. The value of a unit certainly payable at the end of n years is denoted v^n, and the probability of its being received by a person now aged x is ${}_np_x$ where ${}_np_x = \frac{l_{x+n}}{l_x}$, l_{x+n} being the number of survivors at age $x+n$ according to the mortality table out of the l_x persons of present age x. a_x is therefore the sum of the series $\frac{vl_{x+1}}{l_x} + \frac{v^2 l_{x+2}}{l_x} + \ldots$ etc. The computation of even a single value of this simple form of annuity clearly demands a considerable amount of arithmetical work. If, however, the numerator and denominator of each of the terms of the series be multiplied by v^x, $a_x = \frac{v^{x+1}l_{x+1}}{v^x l_x} + \frac{v^{x+2}l_{x+2}}{v^x l_x} + \ldots$ etc. the product $v^x l_x$ may be represented by the symbol D_x and in this notation $a_x = \frac{D_{x+1} + D_{x+2} + \ldots \text{ etc.}}{D_x} = \frac{N_x}{D_x}$. By the device of preparing columns of D and N, technically known as *commutation columns,* not only the derivation of the value of an annuity at one age, but also the construction of a complete table of annuity values is abbreviated and facilitated.

It is a popular misconception that the value of a life annuity is obtained by ascertaining the *expectation of life* of the nominee and calculating the value of an annuity-certain for the resulting term of years. This method is wrong in principle and can easily be shewn mathematically to yield too large a value. This result may, however, be explained thus: — If the expectation of life be n years, the annuity-certain is an annuity of n payments of 1 each, whilst the life annuity consists of a series of payments, ${}_1p_x$ at the end of the first year, ${}_2p_x$ at the end of the second year . . . etc. to the end of life, also amounting in the aggregate to n. In each case the total amount payable is on the average the same, but in the case of the life annuity the payments are spread over a longer period of time and consequently are more affected by discount and have a smaller present value.

It will be apparent as regards a life annuity that the lighter the mortality the greater will be the number of payments to be made and the greater the value of the annuity; similarly the lower the rate of interest the greater will be the discounted value of each payment, with the result that again the value of the annuity is increased.

The value of an annuity payable by instalments throughout the year is greater than that of a yearly annuity owing to the chance of one or more extra payments being received in the course of the year in which the life fails, and to the increased discounted value of the sums paid earlier than at the end of each year. By the Apportionment Act of 1870 all life annuities are *complete* or *apportionable,* i.e., a proportionate pnrt of the payment for the period between the last payment and the date of death is to be paid on that event occurring, unless a special stipulation to the contrary is inserted in the deed creating the annuity. The value of such an annuity therefore exceeds the value of the ordinary or *curtate* annuity, as it is technically called, by, on the average, the value of one-half of an instalment due at the moment of death.

There are numerous varieties of annuities involving more than one life. An annuity to continue so long as all of the nominees survive is called a *joint life annuity;* one to continue so long as any one survives is called a *last-survivor annuity;* one to commence on the failure of a specified life or status and to continue during the existence of another life or status is called a *reversionary or survivorship annuity.* There are also *compound survivorship annuities* payable in certain contingencies such as the failure of specified lives in an assigned order. *Annuities on successive lives* are sometimes required, *e.g.,* in the valuation of advowsons. In the valuation of pension funds and other problems an actuary has to employ annuities involving, in combination with interest and mortality, other elements such as withdrawal, retirement, remarriage, etc. The discussion of these special forms of annuity would introduce technicalities which are beyond the scope of the present article.

The earliest known reference to any estimate of the value of a life annuity arose out of the provisions of the Falcidian Law of the Roman empire; but the tables of values were the result of conjecture rather than of statistical investigation, and the element of interest was not taken into consideration.

Dr. Edmund Halley, in a paper read before the Royal Society of London in 1693, was the first to give an approximately accurate mortality table, and to shew how it should be applied to deduce the values of annuities.

The results of Halley's researches do not appear to have received general recognition, for conjectural annuity values were in general use until the publication of Dr. Price's Northampton Table in 1785. The basis and methods of construction of this and other tables are described elsewhere. (*See* LIFE TABLES.) Early in the 19th century actuarial science began to be developed, and improved methods of preparing and applying mortality tables have since been devised. In the present connection reference need be made only to those investigations which relate exclusively to annuitant lives.

Investigations of Annuitants' Mortality Experience. — By the Life Annuity Act of 1808 the British Government through the National Debt Commissioners were empowered to grant life annuities. The duration of the lives of nominees of both sexes was assumed to be correctly measured by the Northampton Table of mortality. This table, apart from the fact that it was practically the only one available, had been found to yield substantial profits in the case of the Equitable and other companies which had adopted it for life assurance business, but this fact, so far

from suggesting its unsuitability for granting annuities, only confirmed its reputation. John Finlaison, subsequently appointed actuary to the National Debt Commissioners, appears to have been the first to realize that the country was sustaining considerable loss by the use of the table for the grant of annuities and must inevitably incur further loss unless the mortality basis were altered. As a result of his representations the issue of annuities was suspended in 1828.

In 1829 a new scheme was introduced. The mortality tables adopted were those constructed by Finlaison from an observation up to the end of 1822 of the duration of the lives of Tontine and National Debt Office annuitants. This was the first investigation of the mortality of Government annuitants. Two main facts emerged from this investigation, and have been confirmed by subsequent experience — (a) that annuitants as a class are remarkable for their longevity and (b) that the vitality of females is appreciably superior to that of males, so that separate mortality tables must be prepared for each sex.

The second investigation of the mortality of Government annuitants was carried out by **A.** G. Finlaison and published in 1860. The variations between the old and the new tables were found to be so insignificant that the Treasury did not consider it necessary to alter the charges made for annuities.

The next investigation was made by A. J. Finlaison and published in 1883. The data consisted of the records relating to the annuities granted by the National Debt Commissioners from 1808 to 1875. This investigation is notable because of the fact that it was the first in which the effect of "selection" was taken into consideration in deducing the rate of mortality amongst annuitants. It may be assumed that an annuity will not be purchased on the life of a person known to be suffering from a disease likely to impair his vitality. This discrimination exercised by the purchaser must clearly influence the rate of mortality for several years after the date of purchase, in much the same way as the medical examination does in the case of assured lives, and allowance should be made for this fact in settling the selling price of annuities. A. J. Finlaison found that the effects of selection were discernible for four years following the date of purchase, and recommended that revised tables based on the resulting select rates of mortality should be adopted.

With the approval of Thomas Bond Sprague, then president of the Institute of Actuaries, whom the Treasury had consulted before sanctioning rates based on what was then a novel theory, the new tables were introduced in 1884, in substitution for those which had been in force since 1829.

In 1893 the Institute of Actuaries and the Faculty of Actuaries resolved to undertake the compilation of a new collective mortality experience of assured lives, and separately of annuity nominees, in the United Kingdom during the period 1863–93. Forty-three companies contributed to the experience of annuitants, and 9,700 contracts in respect of male lives and 24,300 in respect of female lives were brought under review, the whole constituting a more detailed and authoritative investigation of annuitants' mortality than any that had previously been attempted. The tables, officially designated O^{am} and O^{af} for males and females respectively, were published in 1902. In the construction of these tables the duration of selection was taken to be five years.

The fourth investigation of the experience of National Debt Office annuitants carried on the observations from 1875 to 1904, and was published in 1912. The methods adopted in the construction of the tables and the results of the investigation were very similar to those of the British Offices, O^{am} and Oaf tables. The vitality of both sexes was shown to have increased, the difference between the new and the previous tables being most marked in the case of females.

Shortly after the War investigations of the recent mortality experience, both of life office and Government annuitants, were undertaken. In each case the observations related to the years 1900–20, and the mortality of each of the three constituent periods 1900–7, 1907–14 and 1914–20 was also separately examined. The two investigations proceeded almost simultaneously, that of the life offices, however, being begun and completed several months in advance of the other.

The life office annuitants investigation was again carried out under the auspices of the Institute and Faculty. The numbers of contracts examined were 19,946 of males, and 51,892 of females. The first section of the report of Messrs. Elderton and Oakley, the actuaries in charge of the investigation, was published in 1923. This proved to be a document of first-class importance in the history of actuarial science. The authors discussed the question of selection in all its aspects and suggested, both on theoretical and on practical grounds, that its effects could be ignored after the first year following purchase. Even more notable was their recommendation that annuity values should be based not on the rates of mortality derived directly from the observed experience, but on these rates modified to allow for progressive future improvement in vitality. The principle of allowing for progressive decrease in the death-rate had been previously applied in special circumstances, such as the commutation of the life interests of incumbents under the Welsh Church act of 1914, but this was the first instance of its application to a general investigation the results of which were destined to be a recognized standard for many years. These recommendations were adopted by the Institute and Faculty, and the volume of tables which were officially designated a(m) and a(f) was published in 1925 and gave only "projected" rates of mortality and annuity values derived from them. These rates of mortality are naturally lighter than those recorded in any of the previous investigations and the values of annuities are correspondingly increased.

The examination of the mortality experience of Government life annuitants was carried out by Sir Alfred W. Watson, K.C.B., the Government actuary, and Mr. H. Weatherill, actuary to the National Debt Commissioners, whose report was published in 1924. On that occasion the scope of the investigation was extended to include not only the annuities granted directly by the National Debt Commissioners, but also those issued through the agency of Trustee Savings Banks and the Post Office Savings Bank. The number of contracts brought under observation was 23,230 in respect of males and 57,551 in respect of females. The mortality experienced during the period was found to be appreciably lighter in the case of both sexes than that of the 1875–1904 investigation, the decline being again more significant amongst women than amongst men. It was ascertained also that the mortality experience of the Savings Bank annuitants was lower than that of the lives concerned in the National Debt Office annuities. The difference is presumably due to the fact that annuities purchased under wills in circumstances in which there is no element of self selection are proportionately more numerous among transactions with the National Debt Office than with the Savings Banks. In an appendix to the report several questions of theoretical and practical importance were discussed at length. It was concluded that the effects of selection were traceable for at least five years, but as a measure of practical convenience it was decided to employ a select rate of mortality in respect of only the first year after the date of purchase, and to provide for the selection thus excluded by a subsequent adjustment of the annuity values. Progressive improvement in vitality was found to be exhibited not only in the experience of annuitant lives but also in that of other special classes of lives and of the population generally. To provide for its persistence in the future the actuaries, as a result of extensive experiments, recommended that appropriate selling prices for annuities granted in the immediate future would be the values of select annuities derived directly from the 1900–20 experience increased by 3% in the case of male lives and by 4% in the case of female lives.

Government Life Annuity Business. — Government life annuities were first granted in 1808. The scheme was revised in 1829 by the Act 10 Geo. iv., c. 24. The object of the scheme is the acceleration of the reduction of the National Debt (*q.v.*), by the substitution of terminable for perpetual annuities.

Annuity Values. — The following table gives specimen annuity values according to successive investigations. The differences in the principles and methods adopted in the construction of the several tables are briefly indicated in the headings of the columns.

SPECIMEN ANNUITY VALUES (a_x) AT 4% INTEREST

Age x	Northampton table. a_x (Selection ignored.)	Government annuitants to 1822. a_x (Selection ignored.)	Government annuitants 1808–75. $a[x]$ (Selection for 4 years.)	British offices annuitants 1863–93. $a[x]$ (Selection for 5 years.)	Government annuitants 1900–20. $a[x]$ (Full selection and allowance for future improvement.)	British offices annuitants 1900–20. $a[x]$ (Selection for one year, and allowance for future improvement.)

Life Office Annuity Business.—Almost all the offices transacting life assurance business in the United Kingdom grant annuities on lives, but in only a few cases does the annuity business attain any great magnitude or represent a significant proportion of the total financial liabilities of the office. The continuous improvement in vitality which has contributed so largely to the success of life assurance undertakings has operated in the opposite direction in the grant of annuities, and it is probable that this class of business so far from being a source of profit may not infrequently have resulted in actual loss.

The charges made by offices for the grant of annuities have generally been revised in conformity with the 1900–20 tables, and are consequently less favourable to purchasers than was formerly the case. The amount of business transacted has steadily increased. From 1906 to 1914 the average annual amount received by offices established within the United Kingdom for the purchase of immediate annuities did not greatly exceed £2,000,000. During the war period it fell, the minimum of £920,000 being reached in 1916. In 1919 the consideration money again exceeded £2,000,000, and after a decline to £1,500,000 in 1921 it increased to £3,000,000 in 1923, and remained at about that figure in each of the two following years. It is noteworthy that a considerable share of the annuity business transacted within the United Kingdom has been obtained by Dominion and Foreign companies. From 1910 to 1922 the average amount received annually by these offices was more than £400,000, in 1923 it approached £650,000, and has subsequently exceeded £1,000,000 a year. (P. G B.)

IN THE UNITED STATES

While annuities have generally been issued by life insurance companies in the United States, it is only in recent years that there has been a considerable demand for them. For example, in the year 1900 the considerations received for annuities by companies operating in New York State amounted to $6,600,000 which increased to $8,900,000 in 1920 and to $355,000,000 in 1937. Life annuities are not issued by the United States Government as they are by the British Government.

Until the publication of the McClintock table of mortality in 1899, the basis for the determination of premiums for annuities was a British experience. Emory McClintock, then actuary of the Mutual Life Insurance Company of New York, published the data on annuities issued throughout the world by the principal American companies.

In 1920 the writer of this article prepared an experience based on the material of 20 of the principal American companies under annuities issued in the United States. It is called the American Annuitants Table of Mortality and was used with various modifications as a basis of premiums by American companies until 1938. While the Combined Annuity Table was published in 1928 and the 1937 Standard Annuity Table in 1938, each of these was based on the American Annuitants Table, with allowances for decreases in mortality.

The rates of mortality of a British experience compiled for the years 1900–20, a(m) and a(f), are now compared with the 1937 Standard Annuity rates for quinquennial ages commencing with age 50, the average age at which annuities are issued in America being 63. The British rates are on an ultimate basis (excluding the experience of the first annuity year) and the American rates on an aggregate basis (including all annuity years).

Age	Males		Females	
	1937 Standard annuity	1900–20 a(m)	1937 Standard annuity	1900–20 a(f)
50	·00929	·00970	·00636	·00846
55	·01355	·01415	·00929	·01003
60	·01975	·02078	·01355	·01288

	·36212	·44129	·24806	·41042

The 1937 Standard Mortality for women was taken as five years younger than for men since actual experiences gave such results approximately and as this artifice saved a great deal of labour in calculating premiums.

It must not be inferred from the above table that the rate of mortality among annuitants is higher in Great Britain than in America. As vitality has shown a tendency to increase with calendar year the above tables represent an attempt to make allowance for this improvement. The British table is a forecast of the mortality to be experienced under issues of 1925 and the American table is an estimate of the improvement in mortality as of 1937. Most American companies made further allowance for a probably lower mortality by setting back the ages an additional year or two.

In order to develop annuitant mortality tables and keep in close touch with current experience, the Joint Committee on Mortality, consisting of representatives of the Actuarial Society of America and the Association of Life Insurance Medical Directors, commenced in 1936 to make a continuous mortality study, based on annuities issued in 1931 and subsequent years.

Twenty large companies are contributing their data to this study, which is published each year in the *Transactions* of the Actuarial Society of America.

The decreasing mortality among annuitants has led to a lower annuity in return for a given amount of purchase money. In addition the lowered yields on investments have accentuated this process. As a result several American companies are issuing participating annuities under which the guaranteed return may be increased by annual dividends. The great majority of the companies have continued to issue non-participating annuities under which a fixed yield is specified.

In addition to the ordinary annuities which are payable throughout life on an annual, semi-annual, quarterly or monthly basis and which cease at death, many American companies issue annuities providing for a return of the excess of the consideration over annuity payments made, if any, or for guaranteed payments over a specified period whether the annuitant dies or survives. Deferred annuities with payments to begin at a specified age are also commonly issued, and in event of death during the period of defer-

ment a return of premiums with or without interest may be granted.

A variation of this form gives the annuitant the privilege of electing a smaller annuity before the specified age in accordance with a table inserted in the policy. Premium rates distinguish between men and women applicants according to age last birthday and are adjusted to completed quarter-years of age.

One of the outstanding features since 1930 has been the develop ment of group annuities which cover an annuity payable at the retirement age. Reports of the life insurance companies transacting business in New York State showed 530 group annuity contracts on different employers or corporations on Dec. 31, 1937, covering more than 500,000 individual certificates and representing an annual income at maturity of more than $89,000,000.

The mortality is lower among annuitants than among holders of life insurance policies on account of the psychology which enters into the transactions. A man buying an annuity hopes to live long enough to receive in payments from the company more than the single premium paid by him and he therefore would not purchase the annuity if, in his own judgment, he were a poor risk. On the other hand, the applicant for a life insurance policy knows that his beneficiaries would have a larger return for the premiums if he died in the early rather than the later years of the policy. The lower experience among annuitants is largely the result of "self-selection" through the discrimination exercised by the purchaser. The mortality is partly due to the attractiveness of annuities compared with investments — the more remunerative the latter the greater the "self-selection" against the company — and partly due to the conditions in the various countries, such as that of leaving annuities to servants and to persons who are not able to look after their financial interests. The fact that the mortality among persons who take annuities ceasing at their death is distinctly lower than among those who apply for an annuity with a refund at death of the single premium less annuity payments is evidence of the power of "self-selection" among groups of individuals.

Under the 1936 regulations of the United States Internal Revenue Department a sum equal to 3% of the consideration paid is taxable income from an annuity; the excess above such 3% is excluded from gross income until the aggregate amounts excluded equal the consideration paid. All payments received thereafter are taxable as income for the year in which they are received.

BIBLIOGRAPHY.—The standard text-books are: R. Todhunter, *Compound Interest and Annuities-Certain* (rev. by *R.* C. Simmonds and T. P. Thompson) and E. F. Spurgeon, *Life Contingencies.* There are numerous papers of historical, theoretical and practical interest in the volumes of the *Journal of the Institute of Actuaries,* which was first published in 1850 as the *Assurance Magazine,* but has continued under the present name since 1866. The results of the British life offices annuitants investigations are contained in the volumes *British Offices Annuity Tables 1893, Mortality and Monetary Tables,* and *Mortality of Annuitants 1900–20.* The *Report on the Mortality Experience of Government Life Annuitants, 1900–1920,* appeared as a Stationary Office publication in 1924.

The following are among the more valuable papers on annuities published in the *Transactions* of the Actuarial Society of America: — R. W. Weeks. *Mortality on Annuitants in Anzerican Life Insurance Companies* (iv, 275); Emory McClintock, *Tables for the Estimation of Mortality Among Annuitants* (vi, 13); C. C. Ferguson, *Participating Annuities* (xv, 354); Arthur Hunter, *Mortality Anzong American Annuitants and Premiums Based Thereon* (xxi, 157); C. D. Rutherford, *An Annuity Table Complying with the Requirements of the New Canadian Valuation Standard* (xxviii, p. 54); F. D. Kinecke, *A New Annuity Mortality Table* (xxxix, p. 8); *Report of Joint Committee on Mortality Under Annuity Issues* (xxxviii, 221; xxxix, 111 and xl, 238). These are to appear yearly. Other papers on annuities may be found through the Index to the *Transactions.* The *Transactions* of *the Faculty of Actuaries,* and the *Record of the American Institute of Actuaries* also contain important papers. (A. HU.)

ANNULAR (ANNULATE), ringed. "Annulate" is used in botany and zoology in connection with certain plants, worms, etc. *(see* ANNELIDA). The word "annulated" is also used in heraldry and architecture. An annulated cross is one with the points ending in an "annulet" (an heraldic ring, supposed to be taken from a coat of mail), while the annulet in architecture is a small fillet round a column, which encircles the lower part of the Doric capital immediately above the neck or trachelium. The word "annulus" is itself used technically in geometry, astronomy, botany, etc., and the adjective "annular" corresponds. In botany among the fungi the term annulus is applied to the membranous ring that surrounds the stipe of certain agarics after the expansion of the cap, and in ferns to the thick-walled ring of cells that surrounds the sporangium and by contraction causes the rupture of the latter when mature. An *annular space* is that between an inner and outer ring. The *annular finger* is the ring finger. Certain nebulae having the form of a ring are also called "annular" *(see* NEBULA). For *annular eclipse see* ECLIPSE.

ANNUNCIATION, the announcement made by the angel Gabriel to the Virgin Mary of the incarnation of Christ (Luke i. 26–38). The Feast of the Annunciation in the Christian Church is celebrated on March 25. The first authentic allusions to it (apart from the Gelasian and Gregorian sacramentaries, in both of which it is mentioned) are in acts of the council of Toledo (656) and of the Trullan council (692). *(See* further, LADY *DAY.)*

ANNUNZIO, GABRIELE D', prince of Monte Nevoso (1863–1938), Italian novelist, poet and soldier, of Dalmatian extraction, was born at Pescara (Abruzzi) in 1863. While still at school he published *Primo Vere* (1879), a volume of verse nhich was highly praised by Giuseppe Chiarini. The young poet then went to Rome, where he was received as one of their own by the *Cronaca Bizantina* group. Here he published *Canto Nuovo* (1882), *Terra Vergine* (1883), *L'Intermezzo di Rime* (1884), *11 Libro delle Vergini* (1884), and the greater part of the short stories that were afterwards collected under the general title of *San Pantaleone* (1886).

Meanwhile Gabriele d'Annunzio joined the staff of the *Tribuna.* For this paper, under the pseudonym of "Duca Minimo," he did some of his most brilliant work. To this period of greater maturity and deeper culture belongs *Il Libro d'Isotta* (1886), a love poem, in which for the first time he drew inspiration adapted to modern sentiments and passions from the rich colours of the Renaissance.

D'Annunzio's first novel *Il Piacere* (1889), Eng. trans., *The Child of Pleasure* (1898), was followed in 1892 by *L'Innocente* (Eng. trans., *The Intruder,* 1899), and by *Giovanni Episcopo.* These three novels created a profound impression. His next work, *Il Trionfo della Morte* (1894), Eng. trans., *The Triumph* of *Death* (1896), was followed by *Le Vergini delle Rocce* (1896) and *Il Fuoco* (1900), which in its descriptions of Venice is perhaps the most ardent glorification of a city existing in any language. D'Annunzio's poetic work of this period, in most respects his finest, is represented by *Il Poema Paradisiaco* (1893), the *Cdi Navali* (1893), a superb attempt at civic poetry, and *Laudi* (1900).

During these years he began to write for the stage. *Il Sogno di un mattino di primavera* (1897) is a lyric fantasia in one act; *Città Morta* (1898), written for Sarah Bernhardt, has its scene laid in Mycenae, and is inspired by Greek tragedy. In 1898 he wrote his *Sogno d'un tramonto d'autunno* and *La Gioconda,* which provided Eleonora Duse with one of the most poignant of her rôles; in 1899 *La Gloria,* a contemporary political tragedy with many audacious personal and political allusions; and then *Francesca da Rimini* (1902), a magnificent reconstruction of mediaeval atmosphere and emotion. All of these, splendid as they are in texture and in the gorgeous imagery of the verse, miss great tragedy, perhaps because of the poet's excessive preoccupation with sensation, with colour and sound and movement. *La Figlia di Jorio,* a powerful peasant tragedy of his own wild home in the Abruzzi, rooted in the primitive fears, passions and superstitions of his countrymen, was published at Milan in 1904.

The years 1908–21 were of great importance in d'Annunzio's career, not only in the field of literature, but also in that of war and politics. In 1908 he produced *La Nave,* a vivid presentation of the early history of Venice, setting forth his aspiration for Italy's destiny as a great sea power and as the mistress of the Adriatic — a curious forecast of his future political action. The following year, *Fedra,* a classical drama, appeared; and in 1911 *Le martyre de St. Sébastien,* a dramatic mystery play in French

verse with musical interludes by Debussy, was first performed in Paris. Though a remarkable tour de force and appreciated as such by French critics, this play was hardly one of his greatest achievements. Other plays of this period were La *Pisanella* ou la *mort parfumée* (1914), written in French, and *Parisina* (1914), with music by Massenet. D'Annunzio did not, however, abandon the field of fiction, and in 1910 he published Forse *che si,* forse *che* no, a powerful, but somewhat long-winded novel, in which aviation played a considerable part. La Leda senza cigno (1913), consisting partly of essays and partly of fiction, originally appeared in the Corriere *della Sera,* and was afterwards issued in three volumes with a *licenza* in 1916. His purely poetic output was limited to the *Canzoni della* gesta *d'Oltremare* (1912), which dealt with the Libyan War and contained some admirable verse, as well as violent invectives against the Powers which were, in his opinion, hampering Italy in her Mediterranean policy.

On the outbreak of the World War d'Annunzio was living in France, having had to leave Italy on account of financial difficulties; but the moment the conflict began he became convinced of the necessity for Italy's intervention, in order to attain complete unity and to establish her sovereignty in the Adriatic. In the spring of 1915 he returned to Italy, and his addresses to the Italian people, full of eloquent and inspiring patriotism, were afterwards published in a volume Per la *più* grande *Italia* (1915). From the moment Italy declared war d'Annunzio's career became one of the most romantic of modern times; for the man who had hitherto been regarded merely as a sensuous aesthete and a decadent, and whose claim to distinction had been his exquisite sense of beauty and his mastery of the language, now proved himself to be a man of action and a politician who for many months defied powerful governments. He volunteered for active service. He served successively in the cavalry, the infantry and the navy; finally he joined the air service in the hope of achieving immortality even at the cost of his life. His exploits in the air were of the most fantastic nature. In one of his flights he lost an eye, in another was wounded in the wrist, and on several occasions his aeroplane was riddled with bullets. In Aug. 1918 he led a flight over Vienna, dropping propaganda pamphlets over the city. During the first period of the World War he published ten war poems, some of them of great beauty.

After the Armistice the attitude of the Allied Powers, and especially that of President Wilson towards Italy, aroused d'Annunzio's bitter indignation, and his letters and articles in this connection, collected in the volume *Contro* uno *è contro* tutti (1919), occupy a place in the literature of invective. The extreme violence of his language helped to embitter the relations between Italy and President Wilson. During the Nitti régime d'Annunzio personified the patriotic reaction against the Government's policy. The Fiume dispute symbolized in his mind the conflict between Italy's aspirations and the counter claims of her neighbours. When, as a result of the commission of enquiry into the anti-French riots at Fiume, it was decided considerably to reduce the Italian garrison and to police the town with Maltese or U. S. gendarmes, a movement was planned by Major Reina of the Granatieri brigade to re-occupy the town with regular troops and volunteers. D'Annunzio accepted the leadership of the expedition, and on the night of Sept. 11–12 he marched from Ronchi at the head of detachments of grenadiers and other troops triumphantly and re-entered Fiume.

For 15 months he defied the Italian Government, and, indeed, the whole of Europe with success. He assumed the style of ruler or commandant of Fiume and made of the town a new state. His "reign" was characterized by a picturesque mysticism, with Italian patriotism as the first article of his creed; and enthusiasts flocked to his standard. But his language and action became more exaggerated. When the Rapallo Treaty was concluded in 1920 he refused to recognize it, as he disapproved of its provisions regarding Fiume and Dalmatia. The Government was finally obliged to resort to force in order to carry out the Rapallo Treaty, and d'Annunzio, after vowing to hold Fiume to the bitter end, finally submitted in Jan. 1921, and left the city. He then went to live at Gardone on the lake of Garda.

In 1921 he published *Notturno,* an analysis of his sensations during the blindness which resulted from an aeroplane accident; and in 1924 the first volume of Le *faville* del Maglio appeared. While at Gardone he was seriously injured in the head by a fall. He was from the first a strong supporter of the Fascist movement, and helped to organize the Fascist seamen's federation. In the spring of 1925 the premier, Mussolini, spent three days with him at Gardone, a visit which aroused a good deal of curiosity. In 1924 the King conferred on him the title of prince of Monte Nevoso, in recognition of his successful efforts to secure Italy's new eastern frontier, of which that mountain is the highest point. In 1927 the Italian Government undertook the publication of a special edition of his collected works. He died on March 1, 1938.

For bibliography of d'Annunzio's earlier works see R. Forcella, *d'Annunzio 1863–83,* a Bibliography (1926). Appreciation of his literary work is to be found in a lecture by Prof. C. H. Herford, printed in 1920. Several of his plays, including The Child of Pleasure (1898), La Cittb Morta (1900), La Gioconda (1901) and Francesca da *Rimini* (1902), have been translated by A. Symons. For the Fiume adventure *see* FIUME.

ANOA, the small wild buffalo of Celebes island, Anoa de*pressicornis,* which is the most diminutive of all wild cattle. It is nearly allied to the larger Asiatic buffaloes. The horns are peculiar for their upright direction and comparative straightness, although they have the same triangular section as in other buffaloes. White spots are sometimes present below the eyes, and there may be white markings on the legs and back. In habits the animal resembles the Indian buffalo.

ANODE, the metallic conductor or electrode through which an electric current enters an electrolyte (*q.v.*). The direction of the current is considered that in which a positive charge would move, and is the opposite of the direction of travel of a stream of electrons, which are negative charges, in a rarefied gas. (*See* ELECTROLYSIS; and ELECTRICITY, CONDUCTION OF: *In* Gases.)

ANODYNE, anything which relieves pain. The term is commonly applied to medicines which lessen the sensibility of the brain or nervous system, such as morphia, etc.

ANOINTING, or greasing with oil, fat or melted butter, a process employed ritually in all religions and among all races, civilized or savage, partly as a mode of ridding persons and things of dangerous influences and diseases, and partly as a means of introducing into things and persons a sacramental or divine influence, a holy emanation, spirit or power. The Australian natives believed that the virtues of one killed could be transferred to survivors who rubbed themselves with his caul-fat. The Arabs of East Africa anoint themselves with lion's fat in order to gain courage and inspire the animals with awe.

From immemorial antiquity, among the Jews as among other races, kings were anointed or greased, doubtless with the fat of the victims which, like the blood, was too holy to be eaten by the common votaries. Butter made from the milk of the cow, the most sacred of animals, is used in the Hindu religion.

In the Christian religion, especially where animal sacrifices, together with the cult of totem or holy animals, have been given up, it is usual to hallow the oil used in ritual anointings with special prayers and exorcisms; oil from the lamps lit before the altar has a peculiar virtue of its own, perhaps because it can be burned to give light, and disappears to heaven in doing so. In any case oil has ever been regarded as the aptest symbol and vehicle of the holy and illuminating spirit.

The holy oil, chrism or μύρον, as the Orthodox call rt, was prepared and consecrated on Maundy Thursday. In various churches the dead are anointed with holy oil, to guard them against the vampires or ghouls which ever threaten to take possession of dead bodies and live in them. In the Armenian church, as formerly in many Greek churches, a cross is not holy until the Spirit has been formally led into it by means of prayer and anointing with holy oil. A new church is anointed at its four corners, and also the altar round which it is built; similarly tombs, church gongs, and all other instruments and utensils dedicated to cultural uses. In churches of the Greek rite a little of the old year's chrism is left in the jar to communicate its sanctity to that of the new.

ANOKA, a city of Minnesota, U.S.A., on the Mississippi river and federal highways 10, 52 and 169, 27 mi. N.W. of St. Paul; seat of Anoka county. It is served by the Great Northern, the Northern Pacific, and the Minneapolis, Anoka and Cuyuna Range (electric) railways.

The population was 4,851 in 1930 and 6,426 in 1940 by federal census.

Anoka is the trade centre of a farming region and the seat of the state hospital for the insane. Its manufactures include shotgun ammunition, sashes and doors, cheese, dried milk, flour, farm implements and fibre furniture.

The city was founded about 1844 and incorporated in 1878. At one time Anoka vied with Minneapolis as a candidate for becoming Minnesota's principal city, since it is well located at the junction of the Mississippi and Rum rivers, but it was superseded when water transportation became less important.

ANOMALY, in astronomy, is a technical term used in describing the position of a planet in its orbit. The true anomaly is the angle between the radii drawn from the sun to the planet and to the perihelion point—or the angle turned through by the line joining sun and planet since the planet was last in perihelion.

The *mean* anomaly is the angle which this line would have turned through in the time if the turning had been at a uniform rate corresponding to the period of revolution of the planet.

The eccentric anomaly is the same as the eccentric angle defined in elementary conics.

ANOMOEANS, a religious sect of the 4th century, one of the groups into which Arianism (see ARIUS) was divided. The Anomoeans, who believed that Christ was unlike God in essence, took their name from the Greek word ἀνόμοιος (unlike), and were opposed within the Arian sect by the Homoeans, who believed that the Father and the Son were alike.

Aetius (*q.v.*), the founder of the sect, reasoned that the doctrine of Arianism carried to its logical conclusion must mean that God and Christ could not be alike. Arianism held that the essential difference between Them was that God had always existed while Christ was created by God. Aetius therefore argued that ἀγεννησία (innascibility) was part of the essence of God and that Christ could not be like God because He lacked this necessary quality.

Aetius' chief convert and the second great leader of the Anomoeans was Eunomius (*q.v.*), after whom the Anomoeans are sometimes called Eunomians.

After his death (c. 393), however, the sect, which had been condemned in 381 by the first council of Constantinople was never again important and soon became defunct.

ANONYMOUS, usually abbreviated to ANON., a term to indicate unnamed authorship of any composition. The earliest published researches into the subject of anonymous literature were those of Fredericus Geisler (Leipzig, 1669). The first comprehensive work was that of Vincent Placcius (1642–69), developed by Matthias Dreyer into the *Theatrum anonymorum et pseudonymorum* (1708).

An immense advance was made by the French bibliographer Antoine-Alexandre Barbier in his *Dictionnaire* (1806–08), of which a new edition with over 23,000 entries was issued in 1822–27, and which in 1872–79 was made a continuation of the valuable *Superchéries littéraires* of Quérard. Nothing of value, except casual contributions to Notes and Queries, was done in England till in 1856 Samuel Halkett, keeper of the Advocates' library, Edinburgh, began the labours continued by John Laing (1882–88).

The most ambitious dictionaries of national literatures other than English and French are the Deutsches anonymenlexicon begun by M. Holzmann and H. Bohatta, of Vienna in 1902 and Gaetano Melzi's *Dizionario di opere anonime* e *pseudonime di scrittori italiani* (1848–59).

Religious tolerance, political liberty and social change have affected the motives of anonymity, but it remains common, partly because it is hoped in certain cases that anonymity will excite a profitable curiosity or lend weight to dogmatism which would not have any if the author's name were known. The commonest of those pseudonyms which are in effect anonyms in English has been "A Lady," about 1,000 works, "By A Lady" being on record. Anonymity and pseudonymity were astonishingly common in English literature between 1688 and 1800—Defoe, Chatterton, Macpherson, and earlier Dryden, being cases in point. Among modern English writers who have at least once resorted, or have been required by serial publications to resort, to these devices are Beddoes, Robert Bridges, Bulwer-Lytton, Samuel Butler, Hardy and Meredith.

See W. Cushing, Anonyms (1890); W. P. Courtney, Secrets of our National Literature (1908).

ANOPHELES, a genus of mosquitoes (*q.v.*), including the species that transmit malaria, yellow fever and other diseases. (See DIPTERA; ENTOMOLOGY: Medical.)

ANORTHITE, the calcium end member of the plagioclase (*q.v.*) group of felspars (from the Gr. ἀν, privative and ὀρθός, upright, in allusion to its oblique crystals). Anorthite crystallizes in the triclinic system, and has the chemical composition $CaAlSi_2O_8$. Perfectly pure anorthite is unknown in nature, but is readily synthesized. The name is usually reserved for those solid solutions ranging in composition from pure anorthite to a mixture containing 10% of the albite molecule. Such anorthite occurs in some gabbros and basalts, and also in contact metamorphosed limestones.

ANORTHOCLASE, the name given by Rosenbusch in 188; to include triclinic potash-soda felspars having cleavage angles varying but slightly from 90° (87°–89° 30′). The form development is variable, like that of orthoclase (*q.v.*), but the best known crystals have a characteristic habit in which only the forms (110), (1$\bar{1}$0) and ($\bar{2}$01) are developed, giving rise to lozenge or rhomb-shaped individuals. Anorthoclase is probably to be regarded as a solid solution of the molecules $NaAlSi_3O_8$ and $KAlSi_3O_8$ with small amounts of $CaAlSi_2O_8$, in which the sodium compound predominates. Most crystals fall within the composition limits Or_2Ab_3 and Or_1Ab_6 (Or=orthoclase Ab=albite).

Like the plagioclases, anorthoclase is twinned on the Carlsbad, albite and pericline laws, but in the case of the multiple twins the lamellae are characteristically very narrow. Optically anorthoclase is distinguished by its moderate optic axial angle ($2V=43°-53°$), and is separated from all plagioclases but albite by its low refractive indices, and from albite by its optically negative character. The mineral is confined to alkaline igneous rocks; in the larvikites and foyaitic rocks of Norway and Madagascar, and as a prominent constituent of the rhomb-porphyry lavas of Norway, of the alkaline lavas of the island of Pantelleria (south of Sicily), in the Kenyte lavas of Mt. Kenya (British East Africa) and Mt. Erebus (Antarctica). (C. E. T.)

ANOSMIA is lack of the sense of smell. This deficiency may be due to nasal obstruction or to disease of the nerves concerned in smelling. It is sometimes a manifestation of hysteria. In the first category, the common cold in the head is the most usual cause. Other frequent causes are adenoids, deviated septum and inflammation of the nasal passages.

Of nervous diseases causing anosmia brain tumours are the most frequent. Any nasal obstruction or brain lesion must be on both sides of the cortex in order completely to obliterate the sense of smell.

ANOXAEMIA is a general term comprising those conditions of the body under which the tissues are starved of oxygen. There are three main types: (1) The anoxic type, in which the blood going to the tissues carries oxygen at too low a pressure and consequently the haemoglobin is only partially charged with oxygen. (2) The anaemic type in which though the haemoglobin is fully charged there is too little of it, and hence the capacity of the blood to carry oxygen is too low. (3) The ischaemic type in which the blood is or may be normal but in which the quantity of blood running through the organ is too small.

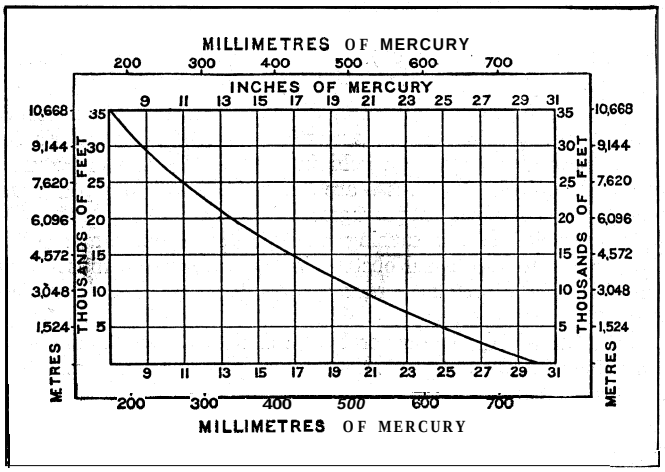
There are some other conditions, less common, which may or may not be regarded as forms of anoxaeniia. Such, for instance, is cyanide poisoning. In this the supply of oxygen is adequate but the mechanism in the tissues for acquiring and using it is faulty.

(1) Anoxic Anoxaemia.—Apart from cases of disease the conditions under which anoxic anoxaemia is most frequently met with are in high aeroplane ascents and on high mountains. Between the two there is this distinction—the aviator reaches the rare air suddenly; the mountaineer gradually. Moreover, the aviator reaches it without effort to himself, the mountaineer usually as the result of considerable muscular effort. For these reasons the symptoms from which the two classes suffer are different.

The airman loses his faculties if he goes too high. The loss may amount merely to a loss of judgment, or a loss in manipulative power, or it may extend to complete loss of consciousness. Because the brain symptoms are the first and the most baffling. the British air force direct not that an aviator should commence breathing oxygen when he reaches an altitude at which he judges himself to need it (by that time his judgment may be impaired) but if he is going to a high altitude he is directed to breathe oxygen from the start. (See AVIATION.)

The mountaineer suffers from a somewhat different train of symptoms which comprise the condition known as "mountain sickness," or in the Andes "Seroche." In the case of a person travelling by train up to the mining districts about Cerro de Pasco, or up Pike's Peak in Colorado (both 14,000–15,000ft.), the symptoms usually appear some hours after arrival not improbably during the night. They are generally a selection from the following: (1) symptoms of the brain—headache, lassitude, fatigue, sleeplessness, visual and auditory impairment; depression; (2) cardiac symptoms—pain in the chest, palpitation, sinus arrhythmia; (3) circulatory symptoms—cold hands and feet, blueness, throbbing; (4) respiratory symptoms—shortness of breath, periodic breathing, sighing; (5) gastro-intestinal symptoms—nausea, vomiting. anorexia. After a residence of two to three days these symptoms usually pass off in their acute form, but no amount of acclimatization makes the human frame at 14,000ft. as efficient as at the sea level. Exercise induces undue breathlessness and quickening of the heart; mental fatigue follows upon severe intellectual work; and the lack of oxygen makes for depression and irritability. The severest work performed at high altitudes falls far short of what could be done at sea-level.

The hurtful results of ascent to high altitudes whether on the mountain or in aircraft are governed by the condition of the blood. The processes of oxidation on which life and health depend take place within the tissues of the actual organs concerned —the heart, the brain, the muscles, the glands. etc. Of these undoubtedly the most vulnerable is the brain. It not only carries



BY COURTESY OF THE CONTROLLER OF H.M. STATIONERY OFFICE

FIG. 1.—CHART SHOWING MEAN ATMOSPHERIC PRESSURE AT DIFFERENT ALTITUDES

The ordinate and abscissa are given both in the metric system and in feet and inches. Ordinate is altitude. Abscissa is atmospheric pressure

out the processes of thought, but governs the condition of the rest of the body, *e.g.*, the rate of the pulse, the depth of respiration and so forth Therefore the study of the conditions which produce trouble at high altitudes resolves itself into a study of the adequacy of the oxygen supply of the brain.

Oxygen is transported from the lungs to the brain by the blood. The haemoglobin or red pigment has the power of forming a loose compound with oxygen. Of each 100gram. of haemoglobin which leave the lung, the number of grammes which transport oxygen depends upon the pressure of oxygen in the air cells of the lung. which in turn depends upon the pressure of oxygen in in the air. As this latter at any altitude is 21% of the local atmospheric pressure, it follows that the higher the subject ascends the lower will be the oxygen pressure in the air cells of his lung. At ordinary pressures there is a margin, the air pressure being more than enough to saturate his haemoglobin sufficiently. Fig. 2, A, shows the percentage of the total haemoglobin leaving the lung, which would be charged with oxygen at different altitudes if the subject made no alteration in the rate and depth of his respiration.

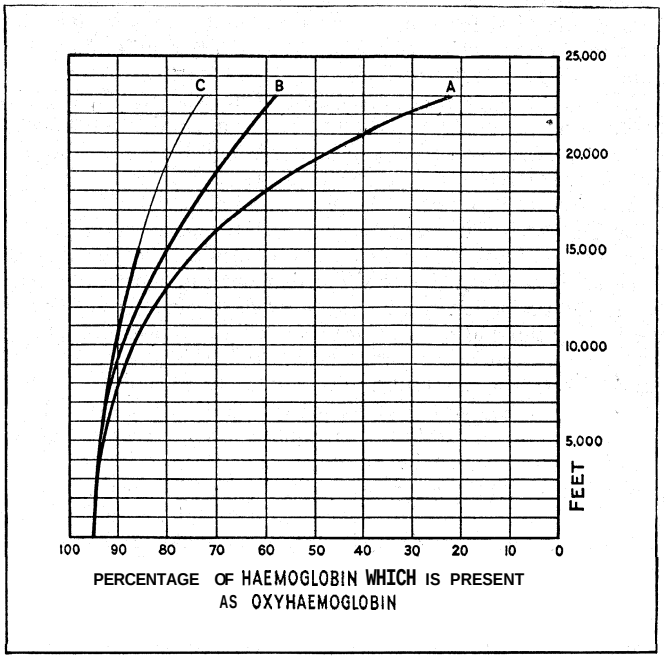


FIG. 2.—CHART SHOWING THE EFFECT OF THE COMBINATION OF THE TWO FORMS OF ACCLIMATIZATION

A. Theoretioal effect if deeper respiration is not made with increasing altitude

B. Probable maximal degree to which blood can be charged with oxygen on deeper respiration, as altitude rises

C. Greater adaptability to atmospheric conditions of people born and living in high altitudes

During the ascent of mountains a certain amount of acclimatization takes place almost from the start, the subject tends to breathe more deeply and to pass more air through the lungs in a given time; this process raises the quantity of oxygen in the air cells (alveoli) of the lung to a higher percentage than it would otherwise attain; the mountaineer at a given height, therefore, has more oxygen in his lungs that the aviator. Curve B fig. 2 shows the probable maximal degree to which the blood can become charged with oxygen as the result of the increase of lung ventilation occurring at the altitudes indicated. These figures are the results of measurement, made by expeditions to the Andes (Cerro de Pasco) and the Alps (Monte Rosa) and Everest.

Somewhere in between curves A and B would be the oxygen in the blood of the airman according to his individual idiosyncrasy. The airman reaches a high altitude in a time measured in minutes. Experiments carried out by Schneider and his associates on 7,000 aviators for the American Government show that there is little or no increase in the amount of air passed through the lungs until oxygen pressures are reached which correspond to 4,000 feet. At higher altitudes different persons respond in different degrees. In more than 50% of all men examined the first respiratory response occurred at from 580 to jzomm pressure and in 25% the change took place at an even lower percentage. while a few gave no evidence of an increase up to the time of uncon-

sciousness. Most physiologists believe that increased pulmonary ventilation is almost the only form of acclimatization of which persons exposed to high altitudes for short times only are capable. Dr. J. S. Haldane and his school regard the lungs as having in addition a special power of secreting oxygen into the blood.

The mountaineer can claim a much higher degree of acclimatization than the aviator, several factors becoming modified in his favour: (1) His pulmonary ventilation increases as already stated. (2) The number of red corpuscles in each cubic millimetre of his blood increases almost in proportion to the altitude. The following figures are given by Maj. Hingston I.M.S. (*1924 Everest* Expedition) for the natives of the Pamir plateau:

Altitudes in thousands of feet .	·7	8	12	15·6	18·2
Corpuscles in millions per cubic mm. of blood	4.5	6·0	6.8	7.8	8.3

The increase in the number of corpuscles is associated with a corresponding increase in the quantity of haemoglobin. At first probably the increase is wrought by some sort of emergency mechanism, such as the abstraction of some water from the blood, the contraction of the spleen and so forth. Shortly there is evidence of increased blood formation, a type of immature cell known as the reticulated corpuscle being formed in the blood. The whole quantity of haemoglobin in the body is increased as was found by the Pike's Peak expedition of 1911. (3) Less well attested is the character of the change in the nature of the corpuscles described by the 1921–22 expedition to Cerro de Pasco. They found that the haemoglobin in the red corpuscle acquired an increased chemical affinity for oxygen such as would occur if the interior of the corpuscle became more alkaline. The effect of this alteration superimposed on the increased ventilation is shown in fig. 2 curve C.

Fig. 2 therefore represents the effects of the combined effect of the two forms of acclimatization which affect the limiting maximal quantity of oxygen which the blood in the arteries can acquire as compared with what the same blood could unite with at the sea level. This limit is perhaps not quite reached, but it is most nearly attained when the subject is at rest. The more active the exercise the greater is the discrepancy between the oxygen actually in the arterial blood, and the limiting value as shown in the figure., The handicap of exercise looms very large at the highest altitudes to which man climbs, as in Everest, for exercise is the only way of securing warmth. In the aeroplane heat is obtained by electrical appliances.

(2) Anaemic **Anoxaemia.**—Entailing too small a quantity of functional haemoglobin in each cubic millimetre of blood. The most obvious form is anaemia in which the actual quantity is too small (see ANAEMIA). Three important forms exist in which the haemoglobin present is temporarily put out of action. Of these the two most important are carbon monoxide (or coal gas) poisoning and methaemoglobin poisoning.

Coal gas contains percentages of carbon monoxide which range from about 7% to about 20% in Great Britain. In the United States the percentage is often greater owing to the large admixture of water gas which is legally possible. Carbon monoxide has the advantage of giving a clear hot flame and therefore is an efficient constituent whether the object of this gas is to heat mantles, to cook or to provide power. Owing to the great precautions taken by the gas companies and the general intelligence of the public accidental cases of coal-gas poisoning are singularly rare.

Very small quantities of carbon monoxide are, however, capable of producing fatal results if breathed for a long enough time. Fig. 3, based on the observations of Haldane shows the percentage of carbon monoxide in the air which if breathed indefinitely is capable of saturating the blood to any given degree. The effect on different persons varies greatly but speaking in very rough terms a saturation of 30–40% means a headache afterwards, 50–60% means unconsciousness and 75% is probably fatal.

Carbon monoxide in the blood is gradually eliminated when air free from it is breathed and eliminated at a much greater rate if pure oxygen is inhaled. Best of all is a mixture of oxygen and carbon dioxide. The latter causes panting which tends to wash out the poison from the blood.

Carbon monoxide is met with in many other places besides coal gas. It is a frequent source of danger in mines galleries, both of coal and of other mines. To discover the presence of the gas, advantage is taken of the fact that small warm-blood creatures, such as mice, rats and canaries succumb to it much more rapidly than man. If these, therefore, be taken into a suspect atmosphere they will drop while as yet man has time to escape. Indeed, it is the time factor which saves man from being asphyxiated in small concentrations of carbon monoxide. In order to lose consciousness over half of all the haemoglobin in his body must be united with

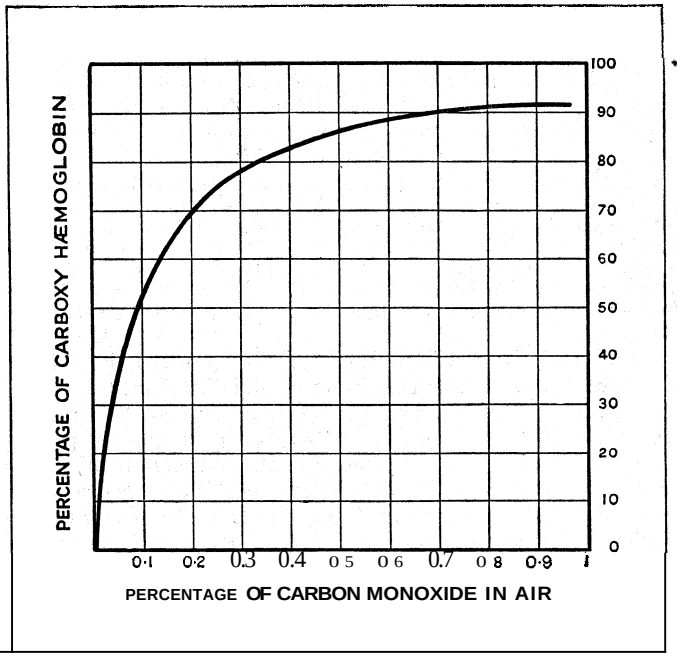

FIG. 3.—CHART SHOWING EFFECTS OF CARBON MONOXIDE SATURATION
Curve shows the percentage of carbon monoxide in the air which, if breathed indefinitely, is capable of saturating the blood to any given degree. The effect on different persons varies, but it may be said generally, that a saturation of 30–40% means headache; 50–60% means unconsciousness; and 75% is probably fatal

carbon monoxide—that can be accomplished in a concentration of less than 0·1% of the gas in the atmosphere but it requires the absorption of an absolute volume, about 500c.c. of CO, which would require perhaps 100 minutes.

The incompletely combusted gas which comes from the exhaust of internal combustion engines has been a cause of numerous fatalities. A 20 h.p. automobile engine is estimated as being capable of emitting a cubic foot (28 litres) of carbon monoxide per minute. "This is sufficient to render the atmosphere of a single car garage deadly within five minutes if the engine is run while the garage doors are closed." (Y. Henderson.)

Methaemoglobin poisoning is another condition in which a part of the haemoglobin is thrown out of action. The simplest form is such as is produced by the inhalation of aniline volatile nitrites, nitrobenzene, etc., causing a conversion of oxyhaemoglobin into methaemoglobin (which has no respiratory value) within the blood, with injury to the corpuscles. The conversion is only temporary if the impure air ceases to be inhaled and if the poisoning is not too severe. Some other drugs such as chlorates and bromates in addition to producing methaemoglobin in the blood, cause an actual destruction of corpuscles—a much graver condition.

(3) Ischaemic **Anoxaemia.**—This may be general or local. If general it may result from very different. causes: (1) In cases of heart disease the heart may be unable to pump the blood round the body at the required rate; or again back-pressure may prevent the blood circulating as it should. (2) After severe bleeding there may not be enough blood left in the body adequately to supply its needs. Under such circumstances the body makes the effort to maintain the blood supply to the brain, and for that purpose other organs are in a measure denied their share. The body is not, however, without resources from which to draw in case of severe

haemorrhage. One store of blood is in the spleen. This organ is ordinarily distended, but when the organism makes a call for an extra supply of blood the spleen contracts and expels considerable quantities into the circulation. (3) Following on severe abdominal wounds, or surgical operations which have entailed considerable exposure of the internal organs, a condition known as surgical shock may supervene. This condition appears to be due to a decrease in the quantity of blood plasma so great that the blood no longer properly fills the vessels. The blood pressure therefore falls and the organs are starved of blood. Light was shed on the cause of surgical shock during World War I by the researches of Dale, Richards and Laidlaw, which indicate that it is due to poisoning by a particular material shed into the body by damaged tissue. The material is called "histamine" or β-iminazolylethylamine. This poison, among other things, makes the walls of the blood capillaries much more permeable to fluid. The plasma of the blood therefore oozes out through them.

ANQUETIL, LOUIS PIERRE (1723-ISOS), French historian, was born in Paris Feb. 21 1723, and died Sept. 6 1808. He became director of the seminary at Reims, where he wrote his *Histoire civile et politique de Reims* (3 vol., 1756–57), perhaps his best work. He was then director of the college of Senlis, where he composed his *Esprit de la Ligue ou histoire politique des troubles de la Fronde pendant le XVIe et le XVIIe siècles* (1767). During the Reign of Terror he was imprisoned at St. Lazare; there he began his *Précis de l'histoire universelle*, afterwards published in nine volumes. The *Histoire de France* (14 vol., 1805), written in collaboration with de Mézeray and P. F. Velly, has little value, but is, nevertheless, better known than his more serious work. It is said to have been undertaken at the instance of Napoleon.

ANQUETIL-DUPERRON, ABRAHAM HYACINTHE (1731–1805), French orientalist, brother of Louis Pierre Anquetil, the historian, was born in Paris. He was educated for the priesthood in Paris and Utrecht, but his taste for Hebrew, Arabic, Persian and other languages of the East, developed into a passion, and he discontinued his theological course to devote himself entirely to them. With the idea of reaching India to search for the works of Zoroaster he enlisted as a private soldier, on Nov. 2 1754, in the Indian expedition which was about to start from the port of L'Orient. His friends procured his discharge, and he was granted a free passage, a seat at the captain's table, and a salary, the amount of which was to be fixed by the governor of the French settlement in India. After a passage of six months, Anquetil landed, on Aug. 10 1755, at Pondicherry. Here he remained a short time to master modern Persian, and then hastened to Chandernagore to acquire Sanskrit.

War began between France and England, Chandernagore was taken, and Anquetil-Duperron returned to Pondicherry by land. He found one of his brothers at Pondicherry, and embarked with him for Surat; but, with the idea of exploring the country, he landed at Mahé and proceeded on foot. At Surat he succeeded, by perseverance and address in his intercourse with the native priests, in acquiring a sufficient knowledge of the Zend and Pehlevi languages to translate the liturgy called the *Vendidad Sade* and some other works. Thence he proposed going to Benares, to study the language, antiquities, and sacred laws of the Hindus; but the capture of Pondicherry obliged him to quit India.

Returning to Europe in an English vessel, he spent some time in London and Oxford, and then set out for France. He arrived in Paris on March 14 1762, in possession of 180 oriental manuscripts. In 1763 he began to arrange for the publication of the materials he had collected during his eastern travels. In 1771 he published his *Zend-Avesta*, containing collections from the sacred writings of the fire-worshippers, a life of Zoroaster, and fragments of works ascribed to him. In 1778 he published at Amsterdam his *Législation orientale*. His *Recherckes historiques et géographiques sur l'Inde* appeared in 1786, and formed part of Thieffenthaler's *Geography of India*. The Revolution seems to have greatly affected him. During that period he abandoned society, and lived in voluntary poverty on a few pence a day. He died in Paris on Jan. 17 1805.

See the *Biographie universelle;* Sir William Jones, *Works* (vol. x., 1807); and the *Miscellaaies* of the Philobiblon Society (vol. iii., 1856–57). For a list of his scattered writings *see* Quérard, *La France lltteratre. See* also his *Oupanishads* (1804).

ANSA, in astronomy, one of the apparent ends of the rings of Saturn as seen in perspective from the earth; so-called because, in the earlier telescopes, they looked like handles projecting from the planet. In anatomy the word is applied to nervous structures which resemble loops. In archaeology it is used for the engraved and ornamented handle of a vase, which has dften survived when the vase itself, being less durable, has disappeared.

ANSBACH, a town in Bavaria, Germany, originally Onolzbach, 27 mi. S.W. of Niirnberg by rail. Pop. (1939) 25,838. The palace of the margraves is celebrated for its fine gardens. In 1791 the last margrave sold his principality to Prussia and in 1806 it was transferred to Bavaria. In Gumbertus Kirche are the graves of members of the local 15th century order of the Swan. Kaspar Hauser died here. Cardboard, buttons, brushes, combs, mats, carts and motors are made.

ANSDELL, RICHARD (1815–1885), English painter, was born in Liverpool. He was a popular painter of genre, chiefly animal and sporting pictures. His "Stag at Bay" (1846), "The Combat" (1847), and "Battle of the Standard" (1848), represent his best work.

ANSELM (1033?–1109), who has been called the greatest thinker that ever adorned the throne of Canterbury, was born at Aosta in Piedmont. At an early age he crossed the Alps, and finally settled in the famous abbey of Bec where in 1056 he was elected prior, and in 1078, abbot. Under his rule Bec became the first seat of learning in Europe, a result due not more to his intellectual powers than to the great moral influence of his noble character and kindly discipline. It was during these quiet years at Bec that Anselm wrote the dialogues on Truth and Freewill, and the two celebrated treatises, the *Monologion* and *Proslogion.*

Anselm several times visited England, where his convent had great estates, and had so won the love of the people that they expected him to succeed Lanfranc in the see of Canterbury. But when Lanfranc died (May 28 1089) William Rufus seized the possessions and revenues of the see, and made no new appointment. In 1093, William fell ill and thinking his death near at hand, in a fit of remorse forced Anselm to accept the vacant see. After his consecration, Anselm demanded of the king, as the conditions of his retaining office, that he should give up all the possessions of the see, accept his spiritual counsel, and acknowledge Urban II. as pope in opposition to the anti-pope, Clement. The last involved him in a serious difficulty. It was a rule of the church that the consecration of metropolitans could not be completed without their receiving the *pallium* from the hands of the pope. Anselm, accordingly, insisted that he must proceed to Rome to receive the pall. But William would not acknowledge Urban, and maintained his right to prevent any pope being acknowledged by an English subject without his permission. A council of churchmen and nobles, held to settle the matter, advised Anselm to submit to the king, but Anselm remained firm. The matter was postponed, and William meanwhile privately sent messengers to Rome, who acknowledged Urban and prevailed on him to send a legate to the king bearing the archiepiscopal pall. A partial reconciliation was then effected, and the matter compromised. The pall was not given by the king, but was laid on the altar at Canterbury, whence Anselm took it.

Little more than a year after, fresh trouble arose with the king, and in October 1097 Anselm set out for Rome to consult the pope. William immediately seized on the revenues of the see, and retained them to his death. Anselm was received with high honour by Urban, and at a great council held at Bari, he was put forward to defend the doctrine of the procession of the

Holy Ghost against the representatives of the Greek Church. But Urban would not embroil himself with the king of England, and Anselm withdrew from Rome to the village of Schiavi, where he finished his treatise on the atonement, *Cur Deus Homo,* and then retired to Lyons.

In 1100 William was killed, and Henry, his successor, at once recalled Anselm. But Henry demanded that he should again receive from him in person investiture in his office of archbishop. Now, the papal rule in the matter was plain; all homage and lay investiture were strictly prohibited. The long dispute that followed continued until 1107, when the king resigned his formal rights. The remaining two years of Anselm's life were spent in the duties of his archbishopric, He died on April 21 1109. He was canonized in 1494 by Alexander VI.

Anselm's works, which contrast with the elaborate syntheses of some of his successors, exhibit that recognition of the relation of reason to revealed truth, and that attempt to elaborate a rational system of faith, which form the special characteristics of scholastic thought. But in Anselm, as in all Scholastics writing previous to the introduction of the works of Aristotle and the Arabians into the West, there is no sharp distinction between natural and revealed theology. For him, the starting-point of all theological speculation must be faith, *Credo ut intelligam.* "He who does not believe will not experience, and he who has not experienced will not understand." And once confirmed in faith it is our duty to demonstrate by reason the truth of that which we believe.

The groundwork of Anselm's theory of knowledge is contained in the tract *De Veritate,* in which, from the consideration of truth as in knowledge, in willing, and in things, he rises to the affirmation of an absolute truth, in which all other truth participates. This absolute truth is God Himself, who is therefore the ultimate ground or principle both of things and of thought. The notion of God comes thus into the foreground of the system. The demonstration of God's real existence is the substance of the *Monologion* and *Proslogion.* In the first of these, the proof rests on the ordinary grounds of realism, and the Platonic notion that the use of a common predicate to cover a number of instances can only be justified if that predicate refers to an identical nature which is exhibited in all the instances. Things, Anselm says, are called good in a variety of ways and degrees; this implies some absolute standard, some good in itself, in which all relative goods participate. Similarly with such predicates as great, just, they involve a certain greatness and justice. The very existence of things is impossible without some one Being, by whom they are. This absolute Being, this goodness, justice, greatness, is God.

In the *Proslogion,* as the author himself tells us, the aim is to prove God's existence by a single argument. This argument is the celebrated ontological proof. God is that Being than whom ncne greater can be conceived. Now, if that than which nothing greater can be conceived existed only in the intellect, it would not be the absolutely greatest, for we could add to it existence in reality. It follows, then, that the Being than whom nothing greater can be conceived, *i.e.,* God, necessarily has real existence. This reasoning, in which Anselm partially anticipated the Cartesian philosophers, has rarely seemed satisfactory. It was opposed at the time by the monk Gaunilo, in his *Liber pro Insipiente,* on the ground that we cannot pass from idea to reality. The same criticism is made by Aquinas, and in substance by Kant. Anselm replied to the objections of Gaunilo in his *Liber Apologeticus.* Finally, in his greatest work, *Cur Deus Homo,* he undertakes to make plain, even to iniidels, the rationall necessity of the atonement. The theory rests on three positions: that satisfaction is necessary on account of God's honour and justice; that such satisfaction can be given only by the peculiar personality of the God-man; that such satisfaction is really given by the voluntary death of this infinitely valuable person. The demonstration is, in brief, this: All the actions of men are due to the furtherance of God's glory; if, then, there be sin, *i.e.,* if God's honour be wounded, man of himself can give no satisfaction. But the justice of God demands satisfaction; and as an insult to infinite honour is in itself infinite, the satisfaction must be infinite, *i.e.,* it must outweigh all that is not God. Such a penalty can only be paid by God Himself, and, as a penalty for man, must be paid under the form of man. Satisfaction is only possible through the God-man. Now this God-man, as sinless, is exempt from the punishment of sin; His passion is therefore voluntary, not given as due. The merit of it is therefore infinite; God's justice is thus appeased, and His mercy may extend to man.

Anselm's speculations did not receive, in the middle ages, the respect and attention justly their due. This was probably due to their unsystematic character, for they are generally tracts or dialogues on detached questions, not elaborate treatises like the great works of Albert, Aquinas and Erigena. They have, however, a freshness and philosophical vigour, which more than make up for their want of system, and which raise them far above the level of most scholastic writings.

BIBLIOGRAPHY.—The best edition of St. Anselm's complete works is that of Gerberon (1675), reprinted 1721 and incorporated in Migne's *Patrologia Latina,* v. 158–9. Migne's reprint contains many errors. The *Cur Deus Homo,* the *Monologion,* the *Proslogion,* the *Liber pro Insipiente* and the *Liber Apologeticus* have been translated into Eng. by S. N. Deane (Chicago, 1903).

The main sources for the history of St. Anselm and his times are the *Vita Anselmi* and *Historia Novorum* by Eadmer, Anselm's chaplain. These were edited by M. Rule in the *Rolls Series* (1884). Also Dean Church, *St. Anselm,* and M. Rule, *Life and Times of St. Anselm (1883).*

The best expositions of Anselm's philosophy are to be found in Domet de Vorges, S. *Anselme* (1901); A. Daniels, *Quellenbeitriige und Untersuchungen zur Geschichte der Gottesbeweise* (1909); J. Fischer, *Die Erkentnisslehre Anselms* v. *Canterbury* (1911); F. Baemker, *Die Lehre Anselms v. Canterbury über den Willen* (1912); C. C. J. Webb, *Studies in the History of Natural Theology* (1915); M. Grabmann, *Dze Grundgedanken d. hl. A. uber Seele u. Gott* (1916); C. Folliatre, *La Philos. de S. Anselme* (1920); C. Boyer, *La Vérité dans S. Anselme* (1921). *See* Überweg, *Grundriss der Geschichte der Philosophie,* Teil ü. (1928).

ANSELM, of Laon (died 1117), French theologian, was born of very humble parents at Laon before the middle of the 11th century. He is said to have studied under St. Anselm at Bec. About 1076 he taught with great success at Paris, where, as the associate of William of Champeaux, he upheld the realistic side of the scholastic controversy. Later he removed to Laon, where his school for theology and exegetics became famous. His greatest work, an interlinear gloss on the Scriptures, was one of the great authorities of the middle ages. Other commentaries apparently by him have been ascribed to various writers, principally to the great Anselm. A list of them, with notice of Anselm's life, is contained in the *Histoire littéraire de la France,* x. 170–89.

See for his collected works Migne's *Patrologia Latina,* tome 162; some unpublished *Sententzae* were edited by G. Lefèvre (1894).

ANSELME (Father Anselme of the Virgin Mary) (1625–94), French genealogist, was born in Paris in 1625, and died on Jan. 17 1694 at the Couvent des Petits Pères, Paris. As a layman his name was Pierre Guibours. He entered the order of the barefooted Augustinians in 1644. Honoré Caille, seigneur du Fourny (1630–1713), persuaded him to publish his *Histoire généalogique de la maison royale de France, et des grands officiers de la couronne* (1674, 2 vol.); after Father Anselme's death, Honoré Caille collected his papers, and brought out a new edition of this highly important work in 1712.

The task was taken up and continued by two other friars of the Couvent des Petits Pères, Father Ange de Sainte-Rosalie (François Raffard, 1655–1726), and Father Simplicien (Paul Lucas, 1683–1759), who published the first and second volumes of the third edition in 1726. This edition consists of nine volumes folio; it is a genealogical arid chronological history of the royal house of France, of the peers, of the great officers of the crown and of the king's household, and of the ancient barons of the kingdom. The notes were generally compiled from original documents, references to which are usually given, so that they remain useful to the present day. The work of Father Anselme, who spent his whole life in the study of genealogy, his collaborators and successors, is even more important for the history of France than is Dugdale's *Baronage of England* for the history of England.

ANSON, GEORGE ANSON, BARON (1697–1762), British admiral, was born April 23 1697. His mother was the sister-in-law of Lord Chancellor Macclesfield. George Anson entered the Navy in Feb. 1712, and received rapid promotion. He commanded the squadron which was sent to attack the Spanish possessions in South America in 1740. Anson's squadron sailed later than had been intended, and was very ill-fitted. It consisted of six ships, which were reduced by successive disasters to his flagship the "Centurion." The lateness of the season forced him to round Cape Horn in very stormy weather, and the navigating instruments of the time did not allow of exact observation.

By the time Anson reached the island of Juan Fernandez in June 1741, his six ships had been reduced to three, while the strength of his crews had fallen from 961 to 335. In the absence of any effective Spanish force on the coast he was able to harass the enemy, and to capture the town of Paita Nov. 13–15 1741. He was compelled at last to collect all the surviving personnel of the squadron in the "Centurion." He rested at the island of Tinian, and then made his way to Macao in Nov. 1742. After considerable difficulties with the Chinese, he sailed again with his one remaining vessel to cruise for one of the rich galleons which conducted the trade between Mexico and the Philippines, and captured an immensely rich prize, the "Nuestra Señora de Covadonga," which was met off Cape Espiritu Santo June 20 1743. Anson took his prize back to Macao, sold her cargo to the Chinese, keeping the specie, and sailed for England, which he reached by the Cape of Good Hope on June 15 1744.

To the world at large Anson is known as the commander of the voyage round the world, in which success was won by indomitable perseverance, unshaken firmness, and infinite resource. But he was also the severe and capable administrator who during years of hard work at the Admiralty did more than any other to raise the Navy from the state of corruption and indiscipline into which it had fallen during the first half of the 18th century. As subordinate under the duke, or Lord Sandwich, and as first lord himself, Anson was at the Admiralty with one short break from 1745 till his death in 1762. The naval administration was thoroughly overhauled. The dockyards were brought into far better order, and though corruption mas not banished, it was much reduced. The Navy board was compelled to render accounts. A system of regulating promotion to flag rank, which has been in the main followed ever since, was introduced. The Navy Discipline act was revised in 1749, and remained unaltered till 1865. Courts martial were put on a sound footing; inspections of the fleet and the dockyards were established, and the corps of marines was created in 1755. The progressive improvement which raised the Navy to the high state of efficiency it attained in later years dates from Anson's presence at the Admiralty.

In 1747 he, without ceasing to be a member of the board, commanded the Channel fleet which on May 3 scattered a large French convoy bound to the East, and West Indies, in an action off Cape Finisterre. In society Anson seems to have been cold and taciturn. The sneers of Horace Walpole, and the savage attack of Smollett in *The Adventures of an Atom,* are animated by personal or political spite. His title of Baron Anson of Soberton was given him in 1747, but became extinct on his death. There is a fine portrait of the admiral by Reynolds. He died June 6 1762.

See a life of Lord Anson, inaccurate in some details but valuable and interesting, published by Sir John Barrow in 1839. The standard account of his voyage round the world is that by his chaplain Richard Walter (1748), often reprinted. A share in the work has been claimed on dubious grounds for Benjamin Robins, the mathematician. Another and much inferior account was published in 1745 by Pascoe Thomas, the schoolmaster of the "Centurion."

ANSON, SIR WILLIAM REYNELL, BART. (1843–1914), English jurist, was born in Walberton, Sussex, son of the second baronet. Educated at Eton and Balliol College, Oxford he became in 1874 Vinerian reader in English law at Oxford, a post which he held until he became in 1881 warden of All Souls College. He identified himself both with local and university interests, becoming an alderman of the city of Oxford (1892), chairman of quarter sessions for the county (1894), vice-chancellor of the university (1898–99), and chancellor of the diocese of Oxford (1899). In that year he was returned, without opposition, as M.P. for the university in the Liberal Unionist interests, and consequently resigned the vice-chancellorship.

In Parliament he preserved an active interest in education, being a member of the newly created consultative committee of the board of education in 1900, and in 1902 he became parliamentary secretary. He took an active part in the foundation of a school of law at Oxford, and his volumes on *The Principles of the English Law of Contract* (1884), and on *tlze Law and Custom of the Constitution* in two parts, "The Parliament" and "The Crown" (1886–92, pt. i. vol. ii.) are standard works.

ANSONIA, a city of New Haven county, Conn., U.S.A., at the foot of the Berkshire hills, on the Naugatuck river, immediately north of Derby, and about 10 mi. N.W. of New Haven. It is served by the New York, New Haven and Hartford railroad. The land area is about 5·4 sq. miles. The population in 1930 was 19,898, in 1940, 19,210 by the federal census. The city has extensive manufactures, including heavy machinery, electric supplies, brass and copper products, eyelets and eyelet machinery and novelties. Ansonia, Derby and Shelton form one of the important industrial communities of the State. Ansonia was settled in 1840. and named in honour of the merchant and philanthropist, Anson Green Phelps (1781–1853). Originally it was part of the township of Derby. It was chartered as a borough in 1864 and as a city in 1893.

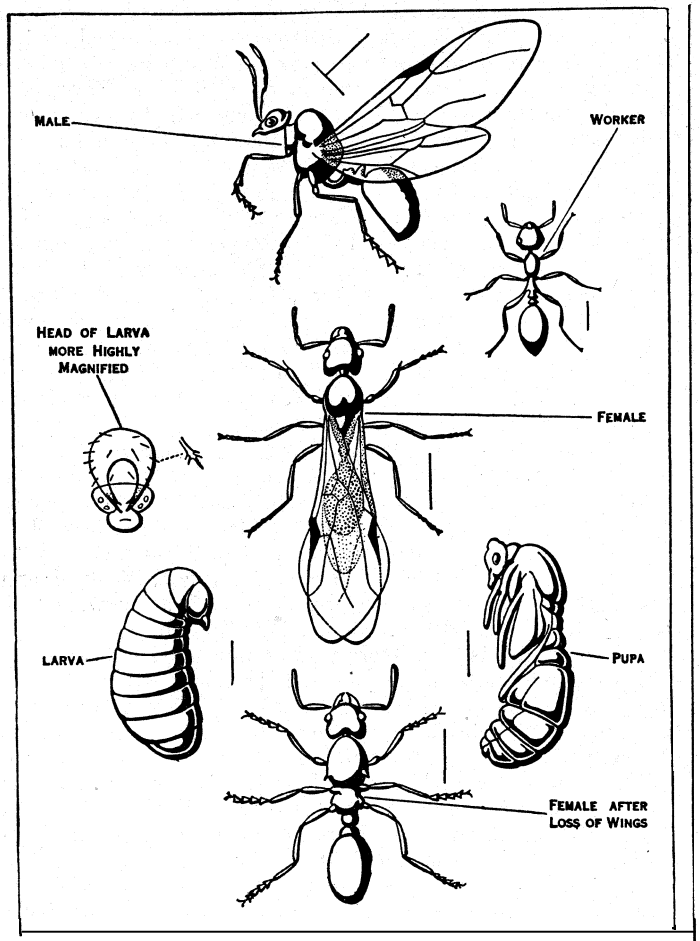
ANSTEY, CHRISTOPHER (1724–180j), English poet, was born at Brinkley, Cambridgeshire, on Oct. 31, 1724. He was educated at Eton and King's College, Cambridge, where he distinguished himself for his Latin verses and became a fellow of his college (1745). Anstey belonged to the school of satirical and social verse founded by Swift and Gray. *The New Bath Guide* or *Memoirs of the B . . . r . . . d (Blunderhead) Family . . .*, a series of rhymed letters published in 1766, had immediate success, and was enthusiastically praised for its original kind of humour by Walpole and Gray. The *Election Ball, in Poetical Letters from Mr. Inkle at Bath to his Wife at Gloucester* (1776) sustained the reputation won by the Guide. Anstey died on Aug. 3, 1805.

His Poetical Works were collected in 1808 (2 vols.) by the author's son John (d. 1819), himself author of ***The Pleader's Guide*** (1796), in the same vein as the *New Bath Guide.*

ANSTRUTHER (locally pronounced *Anster),* seaport, Fifeshire, Scotland. It comprises the royal burghs of Anstruther Easter (pop. in 1931, 682), Anstruther Wester (593), and part of Kilrenny (2,357), and lies gm. S S.E. of St. Andrews, having a station on the L.N.E.R. The town's chief industries include coast and deep-sea fisheries, manufactures of shipping and gear, shipbuilding, the making of cod-liver oil and fish-curing. The two Anstruthers are divided by a small stream called Dreel Burn. James Melville (1556-1614), a nephew of the more celebrated reformer, Andrew Melville, who was minister at Kilrenny, has given in his *Diary* a graphic account of the arrival at Anstruther of a weather-bound ship of the Armada, and the tradition of intermixture of Spanish and Fifeshire blood still survives. Little more than a mile to the west lies the royal and police burgh of Pittenweem (Gaelic for "the hollow of the cave"), a quaint old fishing town (pop. 1938, 1,703) with remains of a priory. About two miles still farther westward is the fishing town of St. Monan or Abercromby (pop. 1938, 1,671), with a fine Gothic church, picturesquely placed on the rocky shore.

ANSWER: *see* PRACTICE AND PROCEDURE.

ANT. In the zoological sense ants are a very natural group of insects which forms the superfamily *Formicoidea* of the order HYMENOPTERA (*q.v.*). They are easily recognized by the elbowed antennae, the conspicuous "waist" formed by a constriction of the abdomen where it unites with the thorax, and generally by the absence of wings. Ants live in societies which inhabit nests of varied kinds: each society consists of numerous wingless, sterile, worker individuals together with males and egg-laying females The fertile males and females are commonly winged and they eventually leave the nest, often in great swarms: mating takes



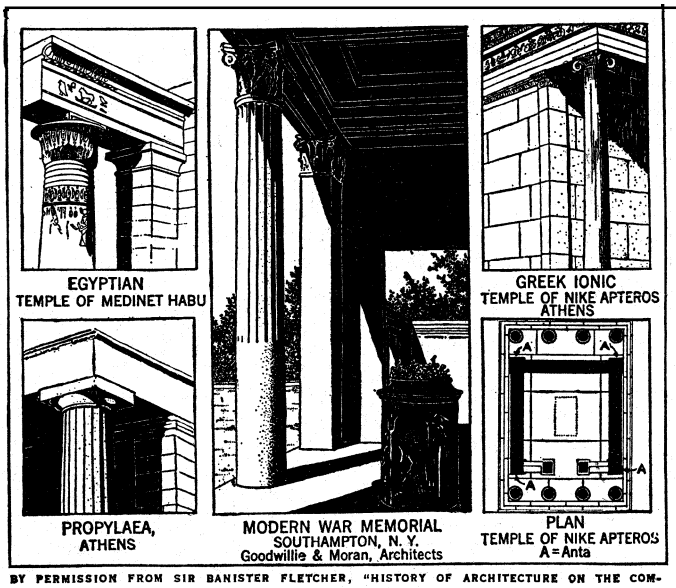
AFTER MORLATT

METAMORPHOSES AND CASTES OF THE ANT (TETRAMORIUM CESPITUM)

place in the open, and the fertilized females (queens) cast their wings and proceed to found new colonies. Ants exhibit a great variety of food preference: many are carnivorous, others feed upon nectar and honey-dew, some gather in seeds, etc., and some live on fungi which they cultivate. (See SOCIAL INSECTS.)

ANTACIDS, medicines which cure acidity by decomposing or neutralizing, and therefore eliminating, an excess of free acid. Those most generally used are salts, *e.g.,* sodium bicarbcnate.

ANTAE (singular, anta), in architecture, the slightly projecting pilaster strips at the extremity of walls which flank a porch or part of a porch in the temples of ancient Greece. They are masonry developments from early wooden structural posts, used, as in the Heraeum at Olympia, to reinforce the brick walls. The term is also used in modern work to describe any pilaster whose detail resembles that of a true anta. Columns set between antae are termed "in antis." (See GREEK ARCHITECTURE.)



BY PERMISSION FROM SIR BANISTER FLETCHER, "HISTORY OF ARCHITECTURE ON THE COMPARATIVE METHOD," EIGHTH ED. (1928), BATSFORD; BUHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF & HELBURN)

ANTAEUS, in Greek mythology, a giant of Libya, the son of Poseidon and Ge. He compelled all strangers who were passing through the country to wrestle with him, and as, if thrown, he derived fresh strength whenever he touched his mother earth, he proved invincible. Heracles, in combat with him, discovered the source of his strength, and lifting him up from the earth, crushed him to death. His tomb was shown at Tingis (Tangier).

ANTALCIDAS (ăn-tăl-kē-dăs), Spartan soldier and diplomatist. In 393 (or 392) B.C. he was sent to Tiribazus, satrap of Sardis, to undermine the friendly relations then existing between Athens and Persia by offering to recognize Persian claims to the whole of Asia Minor. The Athenians sent a counter-embassy under Conon. Tiribazus, who was favourable to Sparta, threw Conon into prison, but Artaxerxes II. (Mnemon) disapproved and recalled his satrap. In 388 B.C. Antalcidas, then commander of the Spartan fleet, accompanied Tiribazus to the Persian court and secured the assistance of Persia against Athens. The success of his naval operations in the neighbourhood of the Hellespont was such that Athens was glad to accept terms of peace (the "Peace of Antalcidas"), by which (1) the whole of Asia Minor, with the islands of Clazomenae and Cyprus, was recognized as subject to Persia, *(2)* all other Greek cities—so far as they were not under Persian rule—were to be independent, except Lemnos, Imbros, and Scyros, which were to belong, as formerly, to the Athenians. The terms were announced to the Greek envoys at Sardis in the winter 387–386, and were finally accepted by Sparta in 386 B.C. Antalcidas continued in favour with Artaxerxes until the annihilation of Spartan supremacy at Leuctra diminished his influence. A final mission to Persia, probably in 367 B.C., was a failure, and Antalcidas, deeply chagrined and fearful of the consequences, is said to have starved himself to death. (See SPARTA.)

ANTANANARIVO, the capital of Madagascar, situated about 90m. from the eastern coast of the island, in 18° 55′ S., 47° 30′ E. It is 135m. W.S.W. of Tamatave, the principal seaport of the island, with which it is connected by railway. The town, picturesquely built on a basaltic ridge which rises to 690ft. above the fertile rice plain of the Ikopa to the west (4,060ft. above sea-level), owes its importance to its defensive site and to its rich environs. For long only the principal village of the Hova chiefs, Antananarivo advanced in importance as those chiefs made themselves sovereigns of the greater part of Madagascar, until it became a town of some 80,000 inhabitants. Until 1869 all buildings within the city proper were of wood or rush, but it possesses several timber palaces which crown the summit of the central portion of the ridge; and the largest palace, 120ft. high, with its lofty roof and towers, is the most conspicuous object from every point of view. Since the introduction of brick and stone, and especially since the French conquest (1895), handsome public buildings, including the French residency, the royal palaces, the Anglican and Roman Catholic cathedrals, schools and comfortable houses of brick or stone have been erected alongside indigenous huts of straw or wood. Excellent avenues have been made and flights of steps constructed up the steeper hill-slopes. Antananarivo also possesses a library, an experimental garden and an observatory. Water is obtained from springs at the foot of the hill and from the river Ikopa, which skirts the capital to the south and west. The population, including that of the suburbs, is 119,800 (1936). Two forts on hills, east and south-west, guard the city.

ANTARAH IBW SHADDĀD, Arabian poet and warrior of the 6th century, was famous both for his poetry and his adventurous life. His chief poem is contained in the Mo'allakdt. His father, Shaddād, was a soldier, and his mother, Zabiiba, a negro slave. He took part in the great war between the related tribes of Abs and Dhubyān, which began over a contest of horses and was named after them the war of Dāhis and Ghabrā. He died in a fight against the tribe of Ṭai.

His poems, which are chiefly concerned with fighting or with his love for Abla, were edited by Muhammad-al-'Inānī (1911); they are also included in W. Ahlwardt's *The Diwans of the six ancient Arabic Poets* (1870). As regards their genuineness, *cf.* W. Ahlwardt's *Bemerkungen uber die Aechtheit der alten arabiscken Gedichte* (Greifswald, 1872) *50 seq.* ***The*** *Romance of 'Antar* (Sīrat 'Antar ibn Shaddād), a work which was long handed down by oral tradition only, has grown to immense proportions and has been published in 32 volumes at Cairo, 1307 A.H. (A.D. 1889), and in 10 volumes at Beirūt, 1871. It was partly translated by Terrick Hamilton under the title *'Antar, a kedoueen Romance* (4 vol., 1820), and there is a French translation by L. Marcel Devic (2nd ed., 1878).

For an account of the poet and his works *see* H. Thorbeckes, *Antarah ein vorislamischer Dichter* (Leipzig, 1867), and *cf.* the *Book of Songs (see* ABULFARAJ), vol. vii., p. 148–153.

ANTARCTIC, the epithet applied to the region, including both the ocean and the lands, round the South Pole (Gr. *ἀντί*, opposite, and *ἄρκτος*, the Bear, the northern constellation of *Ursa Major)*. The Antarctic circle is drawn at 66° 30′ S., but polar conditions of climate, etc., extend considerably north of the area thus enclosed. (See ANTARCTIC REGIONS.)

ANTARCTIC REGIONS. The remoteness of the antarctic regions from the centres of civilization delayed their exploration until comparatively modern times. The existence of zones of climate similar to those in the northern hemisphere had been predicted by the Greek philosophers, but it was not until Prince Henry the Navigator began in 1418 to encourage the penetration of the torrid zone in the effort to reach India by circumnavigating Africa that the exploration of the southern hemisphere began. Successive explorations set a southern limit to the great known continents without approaching the true antarctic regions. The rounding of Africa by Bartholomew Diaz, in 1487; of South America by Magellan, in 1520, and of Tierra del Fuego by Schouten and Lemaire in 1615 established the main objects of the day by finding routes to the east, and there was, therefore, no inducement to further search towards the south. Nevertheless, the geographers of the time sketched in imagination a vast southern continent just beyond these known routes, and the history of further exploration is largely that of the diminution of this great south land by minor discoveries, until Captain Cook's voyage led the world to the opposite extreme of doubting whether there was any south land at all.

HISTORICAL

The search for this great south land or third world was a leading motive of explorers in the 16th and the early part of the 17th centuries, and no illusion ever died a harder death. Voyagers round the Horn frequently met with contrary winds and were driven southward into snowy skies and ice-encumbered seas; but so far as can be ascertained none of them before 1770 reached the Antarctic Circle, or knew it, if they did. It may safely be said that all the navigators who fell in with the southern ice up to 1750 did so by being driven off their course and not of set purpose. An exception is the determined effort on the part of the French naval officer, Pierre Bouvet, to discover the south land, which resulted in the discovery of Bouvet island in 54" 10′ S., and in the navigation of 48" of longitude of ice-cumbered sea in 55° S. in 1739. In 1771 Yves Joseph Kerguelen-Trémarec sailed from France with instructions to proceed south from Mauritius in search of "a very large continent." He lighted upon a land in 50° S. which he called South France, and believed to be the central mass of the southern continent. He was sent out again to complete the exploration of the new land, and found it to be only an inhospitable island which he renamed in disgust the Isle of Desolation; posterity has recognized his courageous efforts by naming it Kerguelen Land.

James Cook.—Sailing in 1772, under the orders of the British Admiralty, with the "Resolution," a vessel of 462 tons, under his own command, and the "Adventure," of 336 tons, under Captain Tobias Furneaux, Cook first searched in vain for Bouvet island, then sailed for 20° of longitude to the westward in lat. 58° S., and then 30° eastward for the most part south of 60° S., a higher southern latitude than had ever been voluntarily entered before by any vessel. On Jan. 17, 1773, the Antarctic Circle was crossed for the first time in history and the two ships reached 67" 15′ S. in 39° 35′ E., where their course was stopped by ice. There Cook turned northward to look for South France, of the discovery of which he had received news at Cape Town, but from the rough determination of his longitude by Kerguelen, Cook reached the assigned latitude 10° too far east and did not see it. He turned south again and was stopped by ice in 61° 52′ S. and 95° E. and continued eastward nearly on the parallel of 60° S. to 147° E., where on March 16 the approaching winter drove him northward for rest to New Zealand and the tropical islands of the Pacific. In Nov. 1773 Cook left New Zealand, having parted company with the "Adventure," and reached 60° S. in 177° W., whence he sailed eastward keeping as far south as the floating ice allowed. The Antarctic Circle was crossed on Dec. 20 and Cook remained south of it for three days, being compelled after reaching 67° 31′ S. to stand north again in 135° W. A long detour to 47° 50′ S. served to show that there was no land connection between New Zealand and Tierra del Fuego, and turning south again Cook crossed the Antarctic Circle for the third time in 109° 30′ W., and four days later his progress was blocked by ice in 71° 10′ S., 106° 54′ W. This point, reached on Jan. 30, 1774, was the farthest south attained in tile 18th century. In Nov. 1774 Cook started from New Zealand and crossed the South Pacific without sighting land between 53" and 57° S. to Tierra del Fuego; passing Cape Horn on Dec. 29 he discovered the Isle of Georgia and Sandwich Land, the only iceclad land he had seen, and crossed the South Atlantic to the Cape of Good Hope between 55° and 60° S., thereby exploding the myth of a habitable southern continent. Cook's most southerly discovery of land lay on the temperate side of the 60th parallel, and he convinced himself that if land lay farther south it was practically inaccessible and of no economic value.

Soon after Cook's return sealers set out on voyages to South Georgia both from England and America. In Feb. 1819, William Smith of the brig "Williams," rounding the Horn with a wide sweep to the south, saw land in 62° 40′ S. Repeating the voyage in October he saw the land distinctly, and named it New South Shetland. The "Williams" was chartered by the British naval commander on the Pacific station, and in 1820 Edward Bransfield, master, R.N., surveyed the group and went as far as 64° 30′ among the islands. Meanwhile American sealers from Stonington, Conn., had begun operations on the newly discovered land, and one of these, N. B. Palmer, discovered the mountainous archipelago still farther south which bears his name. In 1821–22 George Powell, apparently a British sealer, discovered and surveyed the South Orkney islands which, though typical antarctic lands, lie outside the Antarctic Circle.

Bellingshausen.—A voyage only second in importance to that of Cook was planned in Russia and sent out by the emperor, Alexander I., under the command of Fabian von Bellingshausen in the "Vostok," with Lieutenant Lazareff in the "Mirni" in company, both vessels being about 500 tons. The object of the expedition was to supplement that of Cook by circumnavigating the antarctic area, taking care to keep as far south as possible in those longitudes where Cook had made his northward detours. Bellingshausen entered on his exploring work by sighting South Georgia at the end of Dec. 1819, discovered the Traverse islands, sighted the Sandwich group and met a solid ice-pack in 60° S., to get round which he made a wide detour, sailing east to the south of Cook's tract, and getting south of the 60th parallel in 8" W. On Jan. 26 he crossed the Antarctic Circle in 3" W. and by Feb. 1 had reached 69° 25′ in 1" 11′ W., a latitude which has never been surpassed on that meridian. Being stopped by ice, Bellingshausen turned northward and then continued to the east well to the south of Cook's track, getting south again as the ice permitted and reaching 69° 6′ S. in 18° E. On this occasion he was able to sail for 3" of longitude within the circle before being forced north of it by a succession of heavy gales. He still kept eastward south of 65° S. and crossed the circle once more in 41° E., where the number of birds seen suggested the proximity of land, and, in fact, Enderby Land was not very far off, though out of sight. A storm of unexampled violence drove the ships

northward, but they still held to the east south of 60° S. as far as 87° E., having followed the edge of the ice through those meridians south of Kerguelen Land where Cook had made a great detour to the north. Bellingshausen now made for Sydney, and there heard of the discovery of the South Shetlands; leaving early in November, he reached the 60th parallel a month later in long. 143° W., and sailing eastward kept south of that parallel through 145° of longitude during 65 days, never out of sight of the ice, keeping close along the pack edge through the great gap ieft by Cook south of New Zealand. He managed to cross the circle three times more, in 164° 30' W., in 120° W. and in 92° 10′ W., where he reached 69° 52′ S., the culminating point of the voyage. On Jan. 22, 1821, the day after reaching his highest Latitude, Bellingshausen sighted the first land ever seen within the Antarctic Circle, the little island named after Peter I. A week later another and larger land, named after Alexander I., was seen at a distance of 40m. and sketches made of its bold outline in which the black rock stood out in contrast to the snow. Bellingshausen then made for the South Shetlands, where he met the American sealers, and thence returned to Russia.

Weddell, Biscoe and Balleny.—During the next few years, several determined attempts were made to penetrate farther to the south. Most of these had as their first object the discovery of areas suitable for whaling or sealing, and must be intimately connected with the name of the famous firm of Enderby of London, which was always ready to encourage their whaling and sealing masters to take every opportunity that offered for exploration. In 1823 James Weddell, a retired master, R.N., in command of the "Jane," a brig of 160 tons, with the cutter "Beaufoy," of 65 tons, sailed into the sea which now bears his name and on Feb. 20 he reached the highest latitude yet attained, 74° 15′ S. in 34" 17 W. In 1830 John Biscoe, R.N., in command of one of the Enderby brigs, sailed to the eastward from the South Sandwich islands and found himself forced to coast along the impenetrable ice-pack, until he crossed the Antarctic Circle in 1° E. He remained south of the circle for over four weeks, and was rewarded by the discovery of land in 49° 18' E., which he saw, but was unable to reach. This land is now known as Enderby Land. Biscoe recruited his crews in Tasmania and New Zealand, and again sailed for the south, crossing the whole of the southern Pacific in a high latitude in Feb. 1832, and discovering the islands and main land south of South America, since known as the Biscoe islands and Graham Land. In 1833 another of the Enderby captains, named Kemp, reported the discovery of land about 10° E. of Enderby Land, while in 1839 John Balleny, sailing south from New Zealand, crossed the Antarctic Circle in 178° E., and discovered the Balleny islands, one of which rises to a height of 12,000 feet.

Dumont **d'Urville.**—About 183j the importance of obtaining magnetic observations in the far south, and the scientific interest of the study of the south polar regions led to plans being put forward for expeditions in the United States, France and Great Britain. The French were first in the field; an expedition, equipped in the frigates "Astrolabe" and "Zelée" under Jules Dumont d'Urville for ethnological research in the Pacific islands, was instructed to make an attempt to surpass Weddell's latitude in the South Atlantic ocean, and this d'Urville tried to do with conspicuous ill-success; he never reached the Antarctic Circle. Two years later. after fulfilling the main purpose of his expedition in the Pacific, d'Urville resolved for the glory of France to attempt to reach the magnetic pole. He left Hobart Town on Jan. 1, 1840, and on the 20th he crossed the 66th parallel in 140° E. and discovered land 3,000 or 4,000ft. high, which he named Adélie Land. Ten days later in 64" 30′ S. d'Urville cruised westward along a high ice-barrier, which he believed to be connected with land, from longitude 131° E. and he named it the Clarie coast. A few days later he left the Antarctic regions for the Pacific.

Wilkes.—As early as 1836 the United States Congress had authorized an American exploring expedition in the programme of which antarctic exploration had a leading place. Lieutenant Charles Wilkes was appointed to command the expedition of five vessels in Aug. 1838, and his instructions, dated in that month, required him amongst other things (1) to follow Weddell's route as far as possible; (2) to visit the most southerly point reached by Cook in the antarctic; and (3) to make an "attempt to penetrate within the antarctic region, south of Van Diemen's Land, and as far west as long. 45° E., or to Enderby Land." In spite of great difficulties Wilkes fulfilled his programme. In following Weddell's route Wilkes, in March 1839, fared no better than d'Urville in the previous year, but the "Flying Fish," of 96 tons, under Lieutenant Walker reached 70° S. in 105° W., thus nearly reaching Cook's position of 1774. The third item of the antarctic programme was made the subject of the most strenuous endeavour. Wilkes sailed from Sydney in the "Vincennes" on Dec. 26, 1839, accompanied by the "Peacock," the "Porpoise" and the "Flying Fish." They went south to the west of the Balleny islands, which they did not see, and cruised westward along the ice-barrier or as near it as the ice-pack allowed towards Enderby Land nearly on the Antarctic Circle. The weather was bad with fogs, snowstorms and frequent gales, and although land was reported (by each of the vessels) at several points along the route, it was rarely seen distinctly. There can be no doubt that Wilkes saw land along the line where Adélie Land, Kemp Land and Enderby Land are known to exist, even if the positions he assigns are not quite accurate. It seems no more than due to a gallant officer, who did his best in most difficult circumstances, to leave the name of Wilkes Land on the map of the region he explored.

Ross.—Unlike the other two expeditions, that equipped by the British Government in 1839 was intended solely for antarctic exploration and primarily for magnetic surveys in the south polar seas. There were two ships, the "Erebus," of 370 tons, and the "Terror," of 340, stoutly built craft specially strengthened for navigation in the ice. Captain J. Clark Ross, R.N., was in command of the "Erebus" and of the expedition; Commander F. R. M. Crozier of the "Terror." A young surgeon, J. D. Hooker, joined the royal navy in order to go on the expedition, and he lived to take a keen interest in every subsequent antarctic expedition down to that of Captain Scott in 1910. Ross had intended to make straight for the meridian of the magnetic pole, but, finding that d'Urville and Wilkes had already entered on those seas; he determined to try to make a high latitude farther east, and leaving Hobart Town on Nov. 12, 1840, he crossed the Antarctic Circle on Jan. 1, 1841, and entered the pack ice on the 5th in 174° E., which they penetrated in five days and reached open water. Sailing towards the magnetic pole they found a chain of great mountains rising from a coast which ran due south from a prominent cape (Cape Adare) in 71° S. The continent was taken formal possession of for Queen Victoria by landing on Possession island, the mainland being inaccessible, and the ships continued southward in sight of the coast of Victoria Land, where the loftiest mountain was named Mt. Melbourne after the prime minister, until the twin volcanoes, named Erebus and Terror, were sighted in 78° S. on Jan. 28. From Cape Crozier, at the base of the mountains, a line of lofty cliffs of ice ran eastwards, the great ice-barrier, unlike any object in nature ever seen before, rising perpendicularly from the water to the height of 200 or 300ft. and continuing unbroken for 250 miles. Along the barrier the highest latitude of 78" 4′ S. was attained, and the farthest point to the east was 167° W., whence Ross turned to look for a winter harbour in Victoria Land, being desirous to winter near the south magnetic pole. As he could not reach the land on account of ice extending out from it for 1j or 16m., after sighting the Balleny islands at a great distance, on March 2 the ships returned to Hobart. For striking discoveries this was the most remarkable antarctic voyage ever made.

In Nov. 1841 the "Erebus" and "Terror" returned to antarctic waters, steering south-east from New Zealand and entering the ice-pack in about 60° S. and 146° W., the idea being to approach the great barrier from the eastward. After much severe weather the barrier was sighted on Feb. 22, 1842, and the ships reached, 78" 10′ S. in 161° 27′ W., the highest latitude attained for ***60*** years. To the eastward the barrier surface rose to a mountainous

height, but although Ross believed it to be land, he would only treat it officially as "an appearance of land," leaving the confirmation of its discovery as King Edward Land to the next century. No more work was done in this quarter; the "Erebus" and "Terror" turned the edge of the pack to the northward and on getting into clear water sailed eastward to Cape Horn.

After wintering in the Falkland islands, Ross made his third and last attack on the southern ice, and for six weeks he cruised amongst the pack off Joinville island and Louis Philippe Land trying in vain to reach the Antarctic Circle. Failing in this attempt he turned to follow Weddell's route and skirted the pack eastward in 65° S., crossing Weddell's track on Feb. 14, 1843, more than a degree farther south than d'Urville in his attempt four years before, but on the edge of an equally impenetrable pack. Coasting it eastward to 12° W. the "Erebus" and "Terror" at last rounded the pack and found the way open to the south, crossing the circle on March 1. Four days later the pack was met with again and the ships were forced into it for 27m. to lat. 71° 30′ S. in 14° 51′ W., 19° east of Weddell's farthest south.

"Challenger."—No further attempt at south polar exploration was made for nearly 30 years, except a short cruise by Tapsell in the "Brisk," one of Enderby's ships which in Feb. 1850, after passing the Balleny islands, proceeded eastward to 143° E. at a higher latitude than Wilkes without sighting land. The first steamer to cross the Antarctic Circle was H.M.S. "Challenger," on Feb. 16, 1874; she penetrated only to 66° 40′ S., in 78° 30′ E., south of Kerguelen Land; but she continued her course to Australia for some distance in a high latitude, passing within 15m. of the position assigned to Wilkes's Termination Land without seeing any sign of land. Her dredgings and soundings yielded evidence as to the nature of the unknown region farther south. Sir John Murray believed that the soundings showed a general shoaling of the ocean towards the antarctic ice, indicating the approach to a continent. By collecting and analysing all samples of deep-sea deposits which had been secured from the far south, he discovered a remarkable symmetry in the arrangement of the deposits. The globigerina ooze, or in deeper waters the red clay, carpeting the northern part of the southern oceans, merges on the southward into a great ring of diatom ooze, which gives place in turn, towards the ice, to a terrigenous blue mud. The fine rock particles of which the blue mud is composed are such as do not occur on oceanic islands, and the discovery of large blocks of sandstone dropped by icebergs proved the existence of sedimentary rocks within the Antarctic Circle.

Lamen.—A Norwegian sealer, the "Jason," Captain Larsen, visited those seas in 1892; the captain landed and collected fossils at several points north of 65° S. In 1893–94 the "Jason," accompanied by two other Norwegian vessels, the "Hertha" and the "Castor," returned to the antarctic and entered the ice-laden waters in November at the very beginning of summer. Captain Larsen in the "Jason" made his way as far south as 68° 10′ in 60° W. on the eastern side of Graham Land, but several miles from the coast, which was bordered by a high ice-barrier. The "Hertha," Captain Evensen, reached the South Shetlands on Nov. 1, 1893, and worked her way southward along the west side of Palmer Land and past the Biscoe islands reaching the Antarctic Circle on Nov. 9 without meeting ice. This was the first time the Antarctic Circle had been crossed since the "Challenger" did so 20 years before. Captain Evensen sighted Alexander Land, and without experiencing any trouble from ice-floes he reached his farthest south, 69" 10′ S. in 76° 12′ W. (*Mitteilungen* der *Geographischen Gesellschnft*, Hamburg, 1895, pp. 245–304.)

In 1894 the well-known Norwegian whaler, Svend Foyn, sent out one of his vessels, the "Antarctic," Captain Christensen, to try his luck off the coast of Victoria Land. The "Antarctic" sailed from Melbourne in September, having on board Carstens Egeberg Borchgrevink, a young Norwegian resident in Australia. The "Antarctic" entered the pack in 62° 45′ S, 171° 30' E., on Dec. 8, 1894. The Balleny islands were sighted on Dec. 14, and Cape Adare on Victoria Land two days later. On Jan. 22, 1895, the farthest point was reached at Coulman island in 74" S.; the sea was then easily navigable to the south. On Jan. 23 a small party, including the captain and Borchgrevink, landed on the mainland near Cape Adare, the first people to set foot on the Antarctic continent.

Gerlache: **"Belgica."**—Efforts had been made from time to time by Prof. Georg von Neumayer in Germany and by Sir John Murray and others in Great Britain, to induce learned societies to inaugurate a new era of scientific antarctic research under Government or at least under national auspices. In 1895 Sir Clements Markham, as president of the Royal Geographical Society and of the International Geographical Congress, also took the matter up, and interest in the antarctic regions began to be aroused in every civilized country. Captain Adrien de Gerlache organized and led a Belgian expedition, for which he raised the funds with difficulty. Their ship was named the "Belgica," and amongst the members of the expedition were Roald Amundsen and Dr. F. A. Cook. The "Belgica" crossed to the west of Graham Land and made surveys of the archipelago there. It finally penetrated the pack as far south as 71" 30′, where it had the misfortune of being frozen in. For more than a year the ship drifted with the ice, and although scientific work of great importance was carried out, the members suffered severely from depression and one member died. Though it made few discoveries of land, its scientific collections were of unique value, and it was one of the first antarctic expeditions to have its results published in a suitable form.

Borchgrevink.—The first expedition to spend a winter on the antarctic continent was that of Borchgrevink, which left England in 1898, and landed a party at Cape Adare, the north-east point of Victoria Land. The choice of headquarters was an unlucky one, as no sledge journeys to the south were possible, but the land party made observations and collections of considerable value during their stay, though they had the misfortune to lose their biologist. Before returning, Borchgrevink sailed south to the Ross barrier and discovered that the edge of the ice was considerably farther south than it had been when visited by Ross in 1842.

Discovery.—In the autumn of 1901 three well-equipped expeditions left Europe for antarctic exploration. The British national antarctic expedition was organized by a joint committee of the Royal Society and the Royal Geographical Society, and equipped under the superintendence of Sir Clements Markham. For this expedition a new departure was taken, in that a ship, named "Discovery," was specially built for the work. She was of 700 tons register, and was made entirely non-magnetic amidships. The expedition sailed under the command of Commander R. F. Scott, R.N., and included in the expedition were Lieutenant Shackleton, R N R., and Dr. E. A. Wilson. It mas decided that the ship should remain south for one winter in the ice, for which purpose Scott, after cruising along and surveying the edge of the Ross barrier, selected McMurdo sound at the south-west corner of Ross sea, as his headquarters. Before laying up for the winter, he cruised to the eastward of the farthest point reached by Ross, and discovered land of a continental character, which he named King Edward Land.

The winter quarters proved to be suitable, but it was some time before the party were able to develop a technique for their sledging journeys and commence a series of explorations from their base. The expedition initiated a new phase of exploration in the antarctic in working from a settled base. Symptoms of scurvy appeared during the winter, but with early spring a series of sledging journeys were commenced. The main journey was that of Captain Scott, with Shackleton and Wilson, who travelled with dogs over the surface of the barrier towards the south, in which journey, after many vicissitudes, caused chiefly by the failure and death of the dogs, they reached, on Dec. 30, their farthest south in 82° 17' S. During the return march Shackleton broke down and had to be invalided home in the relief ship which visited the "Discovery" in the summer. Meanwhile, Armitage had pioneered a route to the plateau to the west of the headquarters. By the end of the summer it was obvious that the "Discovery" would not be able to get clear of the ice, and it was determined to spend a second winter in the south.

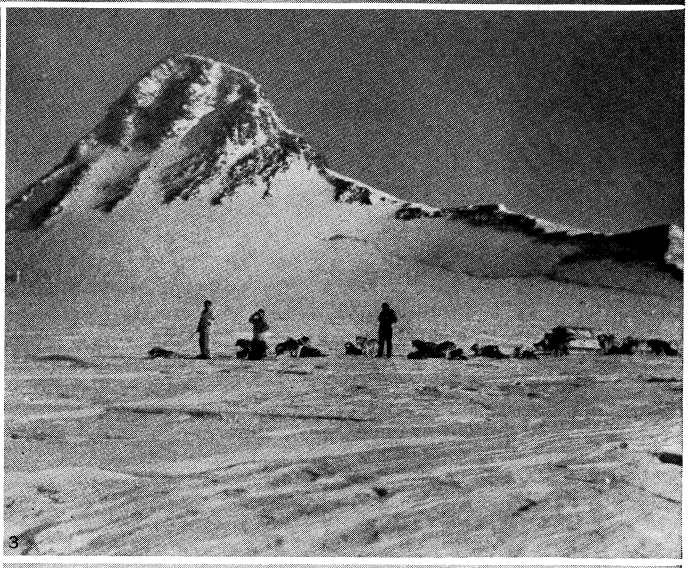
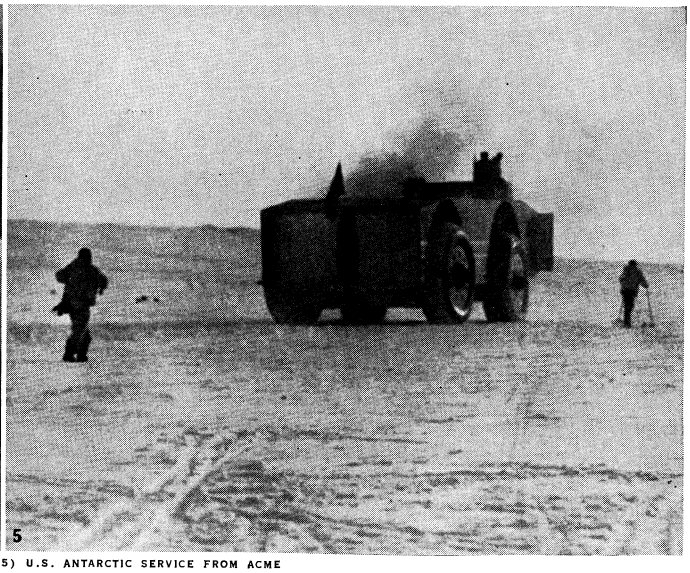
SCENES IN THE FROZEN ANTARCTIC REGIONS

1. Mount Lister, **12,995** feet high, in south Victoria Land
2. The grave of Sir Ernest Shackleton, the Antarctic explorer, at Grytviken, on South Georgia island. His death occurred in January, 1922, off South Georgia island, on his third Antarctic expedition.
3. Mount Erebus, approximately **13.000** feet high, on Ross island, in the Ross sea, photographed at a distance of 16 miles. The birds in the foreground are penguins

ANTARCTIC REGIONS





BYRD'S EXPEDITIONS TO LITTLE AMERICA

1. Mount Helen Washington in the Edsel Ford range, seen from one of the expedition's planes on a fiight from Little America
2. View of Little America
3. Dog team, with Edsei Ford mountains in background
4. Admiral Byrd conferring at Little America with the men who made the aeroplane flights of exploration over the Antarctic during the second expedition (1933–35)
5. Giant snow cruiser rolling over the snow wastes of Little America during the third expedition, begun in 1939

The second year's work was chiefly remarkable for a great journey led by Scott, in which without dogs he reached a point 300m. west of the ship having penetrated over 250m. inland and finding it to be a high plateau averaging 8,000ft. above sea level. The ship was reached again on Dec. 25, and on Jan. 5 the "Morning" arrived accompanied by a larger vessel, the "Terra Nova," sent out by the Admiralty with orders to Captain Scott to abandon the "Discovery" and return at once. Fortunately, although all the stores and collections had been transferred to the relief ships, the "Discovery" broke out of the ice on Feb. 16, 1904, and Captain Scott had the satisfaction of bringing her home in perfect order. The relief ships had provided so little coal that a most promising voyage to the westward of the Balleny islands had to be abandoned in 155° E.; but it showed that the land charted by Wilkes east of that meridian did not exist in the latitude assigned.

Drygalski: "Gauss."—Simultaneously with the "Discovery" expedition and in full co-operation with it as regards simultaneous meteorological and magnetic observations, the German Government equipped an expedition in the "Gauss" which was specially built for the occasion. The expedition was under the charge of Prof. Erich von Drygalski. A supplementary expedition set up a station for simultaneous observation on Kerguelen Land. The "Gauss" crossed the parallel of 60° S. in 92" E. early in Feb. 1902 and got within 60m. of the charted position of Wilkes's Termination Land, where a depth of 1,730 fathoms was found with no sign of land. The pack made it necessary to turn south-westward and land was seen to the eastward on Feb. 1902 on the Antarctic Circle in the direction of Termination Land. Soon afterwards the "Gauss" was beset and spent the winter in the ice. Land of considerable extent was seen to the south and was named Kaiser Wilhelm II. Land; the most conspicuous feature on it was a hill of bare black rock with an elevation of about 1,000ft., which was called the Gaussberg, and was situated in 67° S., go° E. This was the only bare land seen, and its neighbourhood was thoroughly investigated by sledge parties, but no distant journey was undertaken.

Nordenskjold and Bruce.—Two private expeditions organized by men of science were in the antarctic region simultaneously with the British and German national expeditions, and the synchronous meteorological and magnetic observations added to the value of the scientific results of all the parties. Dr. Otto Nordenskjold, nephew of the discoverer of the north-east passage, led a Swedish party in the "Antarctic," with Captain C. A. Larsen in command of the ship, and reached the South Shetlands in Jan. 1902. The "Antarctic" succeeded in penetrating the pack in the Weddell sea almost to the circle in jo° W., where d'Urville and Ross had failed to get so far south. A second winter was spent at the base on Snow Hill island, and, the ship having been lost in the ice on her way to take them off, the party was rescued by a brilliant dash of the Argentine gunboat "Uruguay," under Captain Irizar, before the relief ship sent from Sweden arrived.

Meanwhile Dr. W. S. Bruce equipped a Scottish expedition in the "Scotia," with Captain Thomas Robertson in command of the ship, and a large scientific staff. The "Scotia" made valuable oceanographical investigations in the Weddell sea in 1903 and returning again the next summer she sighted the land now known as Coats Land. In addition to her very thorough exploration of the eastern side of the Weddeil sea her oceanographical work throughout the southern ocean was of very great value in the solution of a number of disputed points.

Charcot.—In Jan. 1904 Dr. Jean B. Charcot, a man of science and an accomplished yachtsman, left the Fuegian archipelago for the antarctic in the "Français," in commdnd of a French exploring expedition equipped at his own instance. He cruised along the western side of Graham Land to 67° S. A mishap to this ship caused him to return from this point but he returned again in 1908 in the "Pourquoi Pas" wintering in 1909 on Petermann Island, 65° S. In the next summer he pushed further south and west and established the continuity of Graham Land with Alexander Land and its general trend to the westward to more thnn half the distance from Graham Land to King Edward Land

Shackleton.—After his return invalided from the "Discovery," Lieutenant Shackleton planned a fresh expedition, and started in the small whaler "Nimrod" from Lyttelton, New Zealand, on Jan. 1, 1908, being towed by a steamer to the Antarctic Circle, in order to save coal. The expedition established itself at Cape Royd on Ross island, some 2om. north of Scott's winter quarters of 1904, a hut being built and the ship returning to New Zealand for the winter. A new departure in antarctic sledging was initiated by the use of Manchurian ponies. Before the winter set in a party under Prof. T. W. E. David reached the summit of the active volcano, Mt. Erebus. In the succeeding summer the same leader made a very notable sledge journey to the south magnetic pole, situated in lat. 72° 25′ S., 155° 16′ E. at an altitude of over 7,000 feet.

The greatest achievement of this remarkable expedition was the journey made by Shackleton himself with three companions who reached the latitude of 88" 23′ S., discovering a route on to the plateau by way of the gigantic Beardmore glacier, and pioneering the way to the Pole itself. This must rank as the greatest sledge journey ever made without the help of supporting parties. The party narrowly escaped disaster from causes somewhat similar to those which destroyed the Scott party four years later, but it reached the ship just in time and the whole expedition returned without losing a man.

Scott.—Captain R. F. Scott left England in 1910 with a new expedition, promoted by his own exertions, in the "Terra Nova," manned by a carefully selected crew and a large scientific staff. The main objects of the expedition were a journey to the South Pole and a very comprehensive programme of scientific investigation of the Ross sea area. The main party established itself on the west side of Ross island between Scott's former winter quarters and Cape Royd. A subsidiary party of six men, led by Lieutenant Campbell, were sent to the east in the ship to establish a base in King Edward Land. Steaming along the face of the barrier, carrying out a survey the party entered a deep bay and were amazed to find the "Fram" of north-polar fame, with a Norwegian party under Captain Roald Amundsen. This expedition, intended for the north-polar regions, had changed its plans and decided to attempt to reach the South Pole instead. Secrecy was deemed necessary and the "Fram" made an extraordinary voyage from Madeira to Ross sea without calling at any port, landed the party and returned for the winter to Buenos Aires.

Amundsen relied entirely on his dogs and after some very successful depot-laying journeys he set out on Oct. 20, 1911, for the Pole, accompanied by four companions on ski with 52 dogs. They found a new route up to the polar plateau by way of the Axel Heiberg glacier in 85° S. and reached the Pole on Dec. 14. The return journey took but 38 days and they arrived at their winter quarters with 12 dogs and ample food supply in hand. No attempt was made at any serious scientific work by the expedition, but it performed the journey at by far the fastest rate of any sledge party yet in the antarctic, the dogs doing all the transport work.

Meanwhile Scott had sent his subsidiary party to Cape Adare where they wintered in the hut of Borchgrevink's expedition of 1899–1900. They were compeiled to make a hazardous land journey of 300m. back to Cape Evans along the coast of Victoria Land, wintering on the way with improvised equipment. A very remarkable winter journey to Cape Crozier was carried out by Dr. E. A. Wilson, Lieutenant Bowers and Cherry-Garrard in conditions of unprecedented severity, and unique specimens of the eggs of the emperor penguin were secured. The Pole party started from Cape Evans on Oct. 24, 1911, in three divisions using respectively motor-sledges, ponies and dogs. The motors broke down before the journey was well begun, the last of the ponies was shot before reaching 83" 30′ S., here also the dog-teams were sent back to the base, and on Dec. 10 Scott with 11 others began the ascent of the Beardmore glacier, following Shackleton's route of 1909, with three man-hauled sledges. On Dec. 21 four men with one sledge were sent back from 85° 7′ S., and on the 31st the last supporting party of three under Lieutenant E. R. G. R. Evans returned from 86° 56′ S. and reached the base after narrowly escaping death from scurvy.

The Polar party — Scott, Wilson, Bowers, Captain Oates and Petty-Officer Edgar Evans — with one sledge and equipment originally designed for four men, reached the Pole on Jan. 18, 1912, where they found a tent left by Amundsen. All were tired out by their 69 days' march and bitterly disappointed to find that they had been forestalled. The weather on the return journey was worse than it had ever been known before, and disasters followed one another. Edgar Evans broke down on the Beardmore glacier and after delaying the march died on Feb. 17. Oates, at the end of his strength, and resolved not to be a burden, sacrificed himself on March 17 in 79° 50′ S., by walking out into the blizzard. The supply of fuel oil at the last depot had been deficient and 20m. remained, to reach the next. The three survivors struggled on heroically for 10m., raised their tent for the last time and, being bound to their camp by a blizzard which lasted for nine days, nothing remained but to await death with quiet fortitude. Lieutenant Evans, the second in command, had been invalided home on the "Terra Nova," and the search parties sent out to meet Scott had been unfortunate, so that it was not until after another winter that Dr. Atkinson, then in command at the base, found the tent with the frozen bodies on Nov. 12, 1912.

Douglas Mawson. — Dr. Douglas Mawson organized the Australian antarctic expedition which set out in the "Aurora" in Dec. 1911. The main base was established in Adélie Land and a wireless mast erected. Here Mawson with 17 companions built a hut on the shore of Commonwealth bay (67° S., 142° 4′ E.) while the ship under the command of Captain J. K. Davis proceeded 1,500m. to the westward where Queen Mary Land was discovered and Frank Wild landed with a party of seven men and a hut to form the western base in 66° S., 94° E. His climatic observations are quoted below in the section on climate. Sledge parties started from the main base in Nov. 1912, diverging to explore inland towards the magnetic pole and eastward and westward near the coast. The sledge parties made their way for 300m. or more from the base. All got back without disaster except the leader, whose two companions, B. B. S. Ninnis and X. Mertz, perished, leaving him with scant stores 100m. from Commonwealth bay. He reached the hut on Feb. 10, 1913, by an effort of almost superhuman endurance and found that the "Aurora" had just sailed to relieve Wild, leaving a volunteer rescue party with whom he awaited the return of the ship in Dec. 1913. Sir Douglas Mawson was knighted in 1914. He revisited the Antarctic, rediscovering Kemp Land (reported in 1833) in December 1929, and making further discoveries in Enderby Land region (1929–31).

Shackleton. — Sir Ernest Shackleton planned the Imperial Trans-Antarctic expedition in 1914, intending to cross the antarctic continent from the Weddell sea to the Ross sea by way of the South Pole. On board the "Endurance" he entered the ice-pack in the Weddell sea early in Dec. 1914 and worked his way in adverse climatic conditions southward between 15° and 20° west. He discovered the Caird coast between Coats Land and Luitpold Land on Jan. 11, 1915, but he found no landing-place. The ship, beset in the ice on Jan. 18, drifted northward. She was crushed in a terrific ice pressure and abandoned on Oct. 27, in 69° 5′ S., and the 28 men camped on the ice-floe, which continued to move northward until April 9, 1916, when the floe broke up in 62° S., 54° W. after a drift of 457 days. The party took to their three small boats and landed six days later after extraordinary hardships on Elephant island where they camped on a narrow beach below vertical ice cliffs. Shackleton with five men succeeded in reaching South Georgia, 750m. distant, in a 22ft. boat and after three unsuccessful attempts to return to Elephant island through the ice-floes he succeeded with the Chilean trawler "Yelcho" in rescuing all his men on Aug. 30, 1916. The expedition had a section in Ross sea for the purpose of laying depots for the transcontinental party. This party, under Captain Macintosh, executed their task but the ship "Aurora" was carried off in the pack ice in which she drifted for 315 days before getting free. The leader and two others perished.

Sir Ernest Shackleton's last expedition sailed on the "Quest," a small and defective vessel, in Sept. 1921 to explore the Enderby quadrant of the antarctic (0° to 90° E.). The leader died at South Georgia on Jan. 5, 1922, but Frank Wild, second in command, carried on the voyage as far as the lateness of the season permitted. He reached 69° 17′ S. in 17° E., in spite of great difficulties, and got important soundings in a little-known area.

The royal research ship "Discovery" was commissioned in 1925 by the Colonial Office with funds supplied by the Falkland islands Government to study the life history of whales with a view of regulating and perpetuating the industry in sub-antarctic waters and returned in 1927. (See CETACEA; WHALE FISHERIES.)

Later Exploration. — Results of exploration since the beginning of the century have been the attainment of the South Pole, the discovery of the general configuration of the antarctic continent and the perfecting of methods of polar travel and residence.

During the summer of 1928 two aeroplane expeditions to the Antarctic were planned. Commander Byrd proposed to form a base on the Ross barrier due south of New Zealand and to explore by aeroplane to the south and east, seeking to discover the course of the great mountain ranges which border the Ross sea and to reach the South Pole. Sir Hubert Wilkins planned to start from the same base and to fly eastward about 3,000 miles over entirely unknown parts of the ice-sheet of Antarctica to Graham Land due south of Cape Horn. Sir Hubert Wilkins arrived at his base on Deception island, Nov. 7, and made a successful flight a fortnight later. Commander Byrd later established a base in the region about 165° W., which he named Little America, and made successful explorations. On Nov. 28, 1929, Byrd set out in the tri-motored plane "Floyd Bennett" for the South Pole with Bernt Balchen, Captain A. C. McKinley and Harold June, successfully reached the pole and returned to his base on Nov. 29, using the sun compass and completing the flight in slightly under 19 hours. On a second expedition, 1933–34, Byrd extended his explorations over what he called Marie Byrd Land, wintering alone at a post 123 miles south of his base. His third expedition (1939–41) was under the auspices of the U.S. Antarctic service.

NATURE OF ANTARCTIC REGIONS

The Antarctic region is roughly that part of the globe encircled by the 60th south parallel, which for reference purposes is customarily divided into quadrants, reckoned eastward from Greenwich meridian under the names Enderby, Victoria, Ross and Weddell. More useful to the reader, if less precise, is the division into African, Australian and American sectors respectively according to the continents below which each sector lies.

Contrast Between Northern and Southern Regions. — Considering the 60th parallel as a boundary we are at once impressed with a marked contrast between the amenities of the northern and southern polar regions. Within the area poleward of 60° north latitude live more than 1,000,000 human inhabitants and countless land animals. Some of the largest and most valuable timber forests are north of 60°, and not a few industries connected with lumber, mining and fishing flourish. In the similar area in the southern hemisphere, there is not a single permanent human inhabitant, nor a single land animal larger than an insect. There are no trees and very few plants of any kind at all. The sole industry which can be said to exist in the antarctic regions is that of whaling, which is now carried on during a few months in each year in the American and Australian sectors. These contrasts naturally depend largely upon temperature. The explorations of the 20th century have shown us that the south polar region, again in complete contrast to the north, is largely occupied by a continent of more than 5,000,000 sq.m. in extent, that is to say, equivalent in size to Australia and Europe without Russia. The South Pole is placed centrally in this continent, which, though far from being symmetrical, may for general purposes be considered as bounded by the 70th parallel.

Characteristics of Antarctica. — The most noticeable feature about the continent is its unique isolation. It is possible to traverse all the other continents without crossing more than about 60m. of shallow sea, but to reach the antarctic continent one must voyage over at least 600m. of practically oceanic depths and that across the roughest seas exposed to the fiercest winds in the world. Between 55° and 65° S. lat. there is no land to interfere with the west to east circulation of sea and air, and that zone

is therefore the home of the permanent west winds, the westerly drift and the wandering albatross, all of which encircle the antarctic continent ceaselessly. There are, in short, none of the interchanges of warm and cold air and water between temperate and polar regions which in the northern hemisphere lead to such curious anomalies as an almost ice free Spitsbergen in 79° N. and an almost ice-bound Labrador coast 20° farther south.

In this fact we have an explanation of the contrasts in climate, and consequently in habitability, between the opposite polar regions, and the remainder of the explanation is forthcoming when we consider the relief of this vast deserted continent. The South Pole itself is situated on a plateau nearly 10,000ft. in height, and there is every reason to suspect that the greater part of the continent is continuous plateau. Allowing for the incomplete nature of the data we can with some fairness compute the average height of the continent as of the order of 6,000 feet, which is just twice as high as Asia, the next in order of magnitude. When we add to this conception of a high and isolated continent the fact that, of its 5,000,000 sq.m. probably less than 100 sq.m. is free from a permanent covering of ice we can well understand that here there is no attraction for man or beast or plant. The continent is thus in the grip of an ice age, more rigorous than that which has left its marks upon Europe and North America, and naturally the study of such a region resolves itself largely into a study of its manifold ice forms.

Of these the least known and the most impressive is the ice-cap, whose lateral dimensions are those of the continent itself and which supplies the myriad glaciers which everywhere fringe the coast, sometimes in ice-worn valleys, but more often as a continuous glacier-front running down into the sea for hundreds of miles along the coasts. The thickness of the inland ice is probably not so great as its extent would suggest. No direct measurements have been made, but from an examination of the outlet glaciers it appears unlikely that the sheet is ever more than 2,000ft. thick except in basins, and in general is much thinner, a conclusion which is confirmed by the fact that many hundreds of miles inland from the coast the ice sheet appears to follow closely the form of the underlying ground.

The Barrier. — The general features of the antarctic ice-cap are reproduced on a smaller scale in Greenland, but the floating ice sheets which are to some extent derivatives of the ice-cap are met with nowhere else in the world. When Ross in 1841 first penetrated the pack ice into the ice-free Ross sea he sailed due south until he was brought up in about 77" S. by an ice wall from 50 to 200ft. high, barring his way to the south. He sailed along the greater part of its 400m. seaward face. The Ross barrier, as it is now called, is the greatest of these floating ice sheets, but is typical of many others to be met with in the antarctic. It is roughly the size of France and consists of a sheet of ice varying from 500 to 1,500ft. in thickness, the outer end being open to the ocean and the inner end held fast to the continent by the glaciers which act as feeders and by being aground close to the actual coast. Its surface is smooth, and it forms the easiest approach to the Pole itself, since it reaches to within 300m. of that spot. The tabular icebergs so typical of the southern hemisphere, with their flat tops and stratified appearance, are obviously derived from this and similar barriers, and their immense size, up to 30m. in length of side, is only natural considering the size of the parent masses. Each summer, when the break up of the winter sea ice has allowed the full force of the ocean swell to reach the face of the barriers, large fragments are broken off, or "calved," and these float away to the northward until they reach warmer and stormier waters where they disintegrate.

Sea Ice. — The sea ice itself is comparatively temporary. It begins to form in sheltered bays as early as the end of January and by the beginning of March any ship is liable to be frozen in unless its harbour is a windy one. There are large variations from year to year in the area of sea solidly frozen over, since strong winds, and such are very irequent, will prevent sea ice from forming, or will blow out any which is not of considerable thickness, but in sheltered bays the ice will continue to increase in thickness until October or November, by which time it will be anything up to 7ft. through. This will begin to break up and float northward from the beginning of December onwards, but the innermost bays may not lose their ice until late in February, or occasionally not at all for two years in succession. The belt of drifting pack ice which rings the continent is made up of the ice from this summer break-up.

The Continent. — The continent, thus hidden or protected, is formed for the most part of old rocks amongst which the most prominent are of Permo-Carboniferous age and bear coal, which is found in the Australian sector up to within 300m. of the Pole. In this sector the rocks have been above sea level since Palaeozoic times, except where the Ross sea area has broken and sunk below it, giving rise to a series of volcanic centres, of which the largest, the Ross island group, still has an active volcano, Mt. Erebus, 13,000ft. high. Palaeozoic rocks have not been discovered so far in this region, although a graptolite fossil, probably of Ordovician age, shows that they occur in the South Orkneys. Mesozoic rocks have been found in various parts of the archipelago, a very rich Jurassic fossil flora of ferns, conifers and cycads having been studied by Nordenskjold, some of the genera found being represented also in the rocks of South America, South Africa, India and Australia. Cretaceous ammonites have also been found, and Tertiary fossils, both of land and of marine forms, bring the geological record down probably to Miocene times, the fauna including five genera of extinct penguins. Raised beaches show an emergence of the land in Quaternary times, and there is evidence of a recent glacial period when the inland ice on Graham Land was 1,000ft. higher than it is now. The most prominent features of the scenery are due to eruptive rocks, which have been identified as belonging to the eruptive system of the Andes, suggesting a geologically recent connection between South America and the antarctic lands. Volcanic activity is not yet extinct in the region. As regards Kaiser Wilhelm II. Land, the Gaussberg is a volcanic cone mainly composed of leucite-basalt, but its slopes are strewn with erratics presumably transported from the south and these include gneiss, mica-schist and quartzite, apparently Archaean.

Much more is known as to the geology of Victoria Land, which has been visited by four well-equipped expeditions. From Cape North (71° S.) to 86° S. *a* grand mountain range runs south curving to south-eastward, where it vanishes into the unknown in lat. 86" S.; it is built up of gneiss and granite, and of horizontal beds of sandstone and limestone capped with eruptive rock, the peaks rising to heights of 8,000, 10,000 and even 15,000ft., the total length of the range so far as known being at least 1,100 miles. This range rises abruptly from the sea, or from the ice of the Great Barrier, and forms a slightly higher edge to the vast snow plateau. About 78° S. the archipelago of volcanic islands, of which Ross island, with the active Mt. Erebus is the largest, rise from the sea in front of the range, and at the northern extremity the volcanic peaks of the Balleny islands match them in height. The composition of the volcanic rocks is similar to that of the volcanic rocks of the southern part of New Zealand. The oldest rocks of Victoria Land are apparently banded gneiss and gneissic granite, which may be taken as Archaean. Older Palaeozoic rocks are represented by greenish-grey slates from the sides of the Beardmore glacier and by radiolarian cherts; but the most widespread of the sedimentary rocks occurring in vast beds in the mountain faces is that which Ferrar named the Beacon sandstones, which are of Permo-Carboniferous age. The coast-line appears to be of the Atlantic, not the Pacific type, and may owe its position and trend to a great fault, or series of faults, in the line of which the range of volcanoes, Mt. Melbourne, Mt. Erebus and Mt. Discovery, stands. Boulders of gneiss, quartzite and sandstone have been dredged at so many points between the Balleny islands and the Weddell sea that there can be no doubt of the existence of similar continental land along the whole of that side, at least within the Antarctic Circle.

Climate. — A vast mass of meteorological observations has now been accumulated so that for the parts of the continent most visited, that is to say, the South American and the Australian sectors, it is possible to summarize the climate with some degree

of certainty. The mean temperature appears to be about 5°F. lower in the southern latitudes than in the corresponding northern ones, and the phenomenon of rain is practically unknown within the Antarctic Circle. The lowest temperature yet recorded is that of −77°F., but since this was experienced within a few miles of the sea it is probable that the inland plateau temperatures in the winter are considerably lower. Later expeditions have confirmed the indications of earlier ones that the pressure of the atmosphere increases from the polar circle to the Pole itself, though it is clear that this is due in some part to the form of the continent itself. It has also been made clear by the work of Dr. G. C. Simpson that the weather experienced on the outskirts of the continent is the result of the passage of pressure waves and the turbulent motion due to them.

Such pressure distribution, together with the shape of the land, produces the most prominent feature of the antarctic climate, excessively strong winds, which when accompanied by snow or thick drift are known as blizzards. The most windy spots appear to be on the coast near the circle itself. Phenomenal records of wind velocity were recorded at Mawson's headquarters in Adélie Land, where not only was the mean annual velocity the surprising figure of 50m. an hour, but on occasions there were prolonged winds of considerably over 100m. per hour. The winds experienced in Graham Land and in the Ross were less extraordinary but still excessive. The frequency and strength of these winds has the effect of preventing the formation close to the coast of permanent ice, which is continually being blown off shore, and besides being responsible for the perilous drifts of the "Endurance," "Aurora" and other ships, they cause the dense belt of pack ice which circumscribes the continent in the spring and early summer. There are no reliable figures for the amount of precipitation in the form of snow, but it appears probable that even in favoured parts the net precipitation on a surface at sea level is little more than a foot of snow per annum. A small calculation shows further that the net addition of snow to the ice-cap must be very much less than that.

Flora and Fauna. — Recent expeditions have discovered that, despite the low temperature of the summer, in which no month has a mean temperature appreciably above the freezing point, there are on the exposed antarctic land patches of ground with a sparse growth of cryptogamic vegetation consisting of mosses, lichens, fungi and fresh-water algae. No flowering plants occur within the Antarctic Circle or in the immediately adjacent lands.

The marine fauna is very rich and abundant. All the expeditions obtained many new species, and the resemblance which occurs between many of the forms and those which inhabit the arctic seas has given rise to the hypothesis that certain species have been able to pass from one frigid zone to the other. Bird life on sea and land is fairly abundant, the most common forms being the skua gull, snow petrels and the various species of penguins. The penguins are specially adapted for an aquatic life, and depend for their food entirely on marine animals. The largest species, the emperor penguin, inhabits the most southerly coast known on the edge of the Great Barrier, and there it breeds at mid-winter, very interesting specializations of structure and habit making this apparently impossible feat practicable. The social organization and habits of the various species of penguins have been carefully studied, and show that these birds have arrived at a stage of what might almost be called civilization worthy of the most intelligent beings native to their continent. The only mammalian life in the antarctic is marine, in the form of various species of whales (but not the "right whale"), and a few species of seals which live through the winter by keeping open blow-holes in the sea ice. There is no trace of any land animal except a few species of minute wingless insects of a degenerate type.

Products of the Continent. — Since there are no land animals or flowering plants the resources of the region are limited to the products of the sea. Of these the most striking are the various species of penguins, which inhabit all zones of the region. Fortunately for the preservation of such harmless and delightful birds their blubber-coated skins do not possess a marketable value. The seals also, not being of the fur-bearing kind, are more or less immune from human exploitation. There remain the whales which in large numbers frequent antarctic seas to feed on the minute animals there to be found which in their turn ultimately depend for their food upon diatoms, the typical marine plants of the region, microscopic in size but so countless in number as to colour the sea ice. The rorqual, the humpback and the huge blue whale are now all hunted in these seas by modern methods and the annual value of the products obtained exceeds £3,000,000 sterling. (See WHALES AND WHALING.) Until the rise of the whaling industry the antarctic can be said to have had no political significance, but since the beginning of the century the territorial waters of the continent, if not the land itself, have acquired a value and, as will be seen from the map, two sectors are now portions of the British empire and are known as the Ross dependency, administered by New Zealand, and the Falkland islands dependency, administered by the Falkland islands.

ANTARES, *a* Scorpii (*a* Scorpionis), the brightest star in the Constellation Scorpio (*q.v.*), is of a reddish hue and appears at the heart of the Scorpion. It is a giant star of low density, having a diameter of 360,000,000 miles, according to measurements taken on Mt. Wilson.

ANTE, the name of a stake in certain card games. (See FANTAN; POKER.)

ANT-EATER, a term applied to several mammals that live mainly upon ants. For the Cape ant-eater, see AARD-VARK; for scaly ant-eater, *see* PANGOLIN; for banded ant-eater, see MARSUPIALIA, and for spiny ant-eater see MONOTREMATA and ECHIDNA.

The great ant-eater or ant-bear (*Myrmecophaga jubata*) is the largest representative of the tropical American family *Myrmecophagidae* (see also EDENTATA). It measures 4 ft in length, exclusive of the long bushy tail, which is usually carried bent over the back, and reaches a height of 2 ft. at the shoulder.

It inhabits the swampy savannas and humid forests of S. and Central America, but is nowhere common. Characteristic features are the long, tapering snout and the strong curved claws on the fore feet. With the latter it not only defends itself effectively but also tears holes in the dwellings of ants and termites, capturing the inhabitants by means of its long, sticky tongue. The female produces a single young at a birth. The tamandua ant-eaters, typified by Tamandua tetradactyla, are smaller and arboreal, inhabiting the primeval forests of S. and Central America. Also arboreal is the little or two-toed ant-eater (Cyclopes *didactylus*) of the same region, about the size of a rat and yellowish in colour.

THE GREAT ANT-EATER (MYRMECOPHAGA JUBATA), OF SOUTH AND CENTRAL AMERICA, WHOSE STRONG CLAWS ENABLE HIM TO PLUNDER ANTHILLS

ANTE-CHAPEL, the term given to that portion of a chapel which lies on the western side of the choir screen. In some of the colleges at Oxford and Cambridge the ante-chapel is carried north and south across the west end of the chapel, constituting a western transept or narthex. This model, based on Merton college chapel (13th century), of which only chancel and transept were built though a nave was projected, was followed at Wadham, New and Magdalen colleges, Oxford, in the new chapel of St. John's college, Cambridge, and in Eton college. In Jesus college, Cambridge, the transept and a short nave constitute the ante-chapel; in Clare college an octagonal vestibule serves the same purpose; and in Christ's, Trinity and King's colleges, Cambridge, the ante-chapel is a portion of the main chapel.

ANTE-FIXAE, in architecture, the vertical blocks terminating, at the eaves, each row of the covering tiles of a roof in a classic building, and forming a cresting along the cornice. They were often decorated with the anthemion (*q.v.*) ornament, and made of either tile or marble.

VARIOUS EXAMPLES OF PAINTED AND CARVED ANTE-FIXAE

ANTELOPE, a zoological name which was applied by the earlier English naturalists, and afterwards by Buffon, to the Indian blackbuck, which is thus entitled to rank as *the* antelope. No true antelopes are American, the prongbuck (Antilocapra), which is commonly called "antelope" in the United States, representing a distinct group; while the Rocky mountain or white goat stands on the borderland between antelopes and goats.

FIG. 1.—THE LELWEL HARTEBEEST (BUBALIS LELWEL), ONE OF THE SEVERAL SPECIES OF LARGE ANTELOPE CONFINED TO AFRICA

The first group or subfamily, the *Bubalinae,* includes four distinct genera, *Bubalis* the hartebeests, *Damaliscus* the hirola or Hunter's hartebeest, bontebok, blesbok, sassaby, and tiang, *Connochaetes* the gnu, and *Gorgon* the brindled gnu or blue wildebeest. The subfamily is confined to Africa; the members of this group are large antelopes, with horns in both sexes. The hartebeests are characterized by their long faces, ungainly bodies, and high horn-pedicle; the horns, which are ringed, lyrate and more or less strongly angulated, rise almost vertically from the cylindrical pedicle. The neck is unmaned and the tail is moderately long; the height of the withers (43 to 54in.) greatly exceeds that of the hindquarters. Eight species of hartebeest are now recognized, the most important of which are the following: the bubal hartebeest (B. *buselaphus*) from north Africa, the western hartebeest (B. major) from west Africa, Coke's hartebeest (B. cokci) from east Africa, the Cape hartebeest (B. caama), the lelwel hartebeest (B. *lelwel*) (fig. 1) from west and east Africa, and Lichtenstein's hartebeest (B. *lichtensteini*) from south-central and east Africa. In *Damaliscus,* the bastard hartebeests, the withers are generally less elevated and the horns arise directly from the head. The hirola or Hunter's hartebeest (D. *hunteri*) has a white chevron-like marking on the forehead; it is found only on the north side of the Tana valley in Jubaland, east Africa. The bontebok (D. *pygargus*) and blesbok (D. *albifrons*) are two closely allied south African species which once existed in countless thousands, but are now reduced to a few herds preserved on various farms in south Africa. The sassaby, or tsesebe (D. *lunatus*), originally from Cape Colony, where it is now extinct, is distributed over a large area of south-eastern Africa, from the Orange river to northern Rhodesia and Nyasaland. The gnu or black wildebeest (Connochaetes gnu) (fig. 2) differs from the hartebeests and their allies in the presence of tufts of hair on the face, a well-developed mane, a horse-like tail, and a very broad muzzle. The horns are smooth, not ringed, and the teats four in number, not two as in the hartebeests. As a truly wild animal this species no longer exists; formerly it was widely distributed over the plains of Cape Colony and the Orange Free State. The brindled gnu or blue wildebeest (*Gorgon taurinus*) may be distinguished from the typical gnu by the smaller hindquarters and higher withers, and the horns, instead of curving forwards over the face as they do in Connochaetes, spread out laterally. The various races of brindled gnu range over a large part of Africa from Kenya Colony to south of the Zambezi.

FIG. 2.— WHITE-TAILED GNU South African antelope known to the Boers as the black wildebeest

The second group, the subfamily *Cephalophinae,* contains the duikers, or duikerboks, of Africa; the species, which are very numerous, are all of small or medium size and are characterized by their spike-like horns, which are generally present in both sexes,

their naked muzzles, large face glands, and well-developed lateral hoofs; the female has four teats. The subfamily includes three genera: (1) *Cephalophus,* the forest duikers, distinguished by the short, comparatively stout horns and the uniform colour of the coat. The majority of the species and subspecies, some 34 of which are now recognized, inhabit the great equatorial forests. This genus contains the largest members of the group, the yellow-backed duiker (C. sylvicultrix) and Jentink's duiker (C. jentinki), both of which stand about 30 to 34in. at the shoulder; otherwise the species are of medium size (height 16–24in.). (2) Guevei, the blue duikers, are the smallest members of the subfamily, and have very small horns, usually present in both sexes. The colour of the coat varies from grey to dark brown. About 16 different forms have received names, and they inhabit the same forests as the forest duikers. (3) *Sylvicapra,* the bush duikers, have long and slender horns, directed upwards so as to form an obtuse angle with the line of the face. The genus contains a single species (S. *grimmia*), which is widely distributed over south, central, east and west Africa.

The third subfamily, Oreotraginae, the klipspringers, contains but a single genus and species (Oreotragus oreotragus), distinguished from all other antelopes by the coarse, pithy hair, and by the narrow and cylindrical hoofs. The horns, usually present only in the males, are short and spike-like, rising almost vertically above the eyes. The various races are widely distributed over the more mountainous parts of Africa, from Abyssinia southwards to Cape Colony.

The fourth subfamily is the Neotraginae, which contains six distinct types of antelope, the oribis (Ourebia), the grysbok (Nototragus), the steinboks (Raphicerus), the sunis (*Nesotragus*), the pygmy antelopes (*Hylarnus*), and the royal antelope (*Neotragus*). The subfamily is widely distributed over a great part of Africa, from Cape Colony to Abyssinia, and from Kenya Colony to Liberia and Gambia. The oribis have a bare, glandular patch beneath each ear; lateral hoofs are present and the horns are slender and ringed in the basal half. The grysbok (*Nototragus* melanotis) and remaining members of the subfamily are distinguished from the oribis by the absence of the bare patches below the ears. The grysbok is further characterized by the presence of small lateral hoofs and a speckled coat. Typically from Cape Colony, the grysbok extends as far north as the Zambezi and Mozambique. The steinbok (Raphicerus *campestris*) is very similar to the grysbok but differs in the absence of lateral hoofs. The members of this genus are found over a large part of south Africa, and spread as far north as Mount Elgon. The three groups of dwarf antelopes are all very closely allied; the sunis (Nesotragus) stand about 13 or 14in. at the shoulder and possess relatively long (3 to 5in.) and strongly ringed horns. The various species and races are confined to east Africa and Zanzibar. In the pygmy antelopes (*Hylarnus*) the shoulder height is about equal to that of the sunis, but the horns are smaller and nearly smooth; the genus is confined to west and equatorial Africa. The royal antelope (*Neotragus pygmaeus*), the only member of the genus, is only about 10in. high, being the smallest of all true ruminants; the horns are very small and unringed. This species inhabits the west coast from Liberia to southern Nigeria.

The fifth subfamily, the Madoquinae, contains three genera, the dik-diks, representing two distinct types, *Madoqua* and *Rhynchotragus,* and the beira, the sole member of the genus *Dorcotragus.* The dik-diks are distinguished from the last subfamily and the beira by a more or less marked elongation of the muzzle and the presence of a tuft of long hair on the crown. The various species are confined to east Africa, from Abyssinia to Tanganyika Territory, with the exception of one isolated form from Angola and Damaraland. The beira (D. melanotis), which was formerly considered to belong to the subfamily Antilopinae, is considerably larger than the dik-diks (which stand only 13 or 14in. at the shoulder), measuring about 23in. in height. The ears are of great size, and the horns, which are spike-like and ringed basally, measure from 4 to 5in. in length. This species is found only in Somaliland and Abyssinia.

In the sixth subfamily, the *Reduncinae,* we again meet with antelopes of large size; the five types constituting the group are as follow: waterbucks (Kobus), lechwes (*Onotragus*), kobs (Adenota), reedbucks (Redunca), and the Vaal rhebok (Pelea). Horns are present only in the male sex and the muzzle is naked. The waterbucks, lechwes and kobs, the largest members of the subfamily, may be distinguished by their long, lyrate horns, the absence of a bare patch below the ears, and the full development of the lateral hoofs. The typical waterbuck (K. *ellipsiprymnus*) is found over a large area of east Africa from Somaliland to Lake Ngami. The lechwes (*Onotragus*) are intermediate in size between the waterbucks and kobs; they range over south-central, central and east Africa as far north as the Sudan, whereas the kobs inhabit equatorial Africa, the Sudan and Rhodesia. The reedbucks (*Redunca*) are distinguished by their short tails, small lateral hoofs, and the presence of a bare patch of skin below each ear. The shoulder height varies from 28 to 37in., and the species is widely distributed over the greater part of Africa south of the Sahara. The Vaal rhebok (Pelea *capreolus*) is distinguished by its upright, spike-like horns and woolly hair; it is essentially a south African animal. The dibatag (Ammodorcas *clarkei*) is now considered as related to the waterbucks and impala as well as to the gazelles and gerenuk; its exact systematic position is not yet determined. In general shape this animal resembles a long-necked gazelle, with horns rather like those of a reedbuck; it is found only in Somaliland.

The seventh subfamily, the Aepycerotinae, contains the impala, or palla (Aepyceros melampus), characterized by the lyrate horns of the males and the absence of lateral hoofs. It ranges over a considerable part of Africa, as far north as Angola in the west and Kenya Colony in the east.

The *Saiginae,* the eighth subfamily, contains the saiga (*Saiga* tartarica) of the Kirghiz steppes; it is a sheep-like antelope with a curiously inflated and trunk-like nose with the nostrils opening downwards.

Closely allied to the saiga is the chiru (*Pantholops* hodgsoni), the only living representative of the ninth subfamily, *Pantholopinae*; this species is remarkable for its long, graceful horns, which are strongly ringed on their front surfaces. The chiru is confined to the plateau of Tibet.

The tenth subfamily, the Antilopinae, contains the typical antelope or blackbuck (*Antilope* cervicapra), the gazelles (*Gazella*), the gerenuk (Lithocranius *walleri*), and the springbuck (Anti*dorcas marsupialis*). The blackbuck, confined to the Indian peninsula, is easily recognized by its long, spirally twisted horns, which are normally developed only in the male sex. The gazelles are widely distributed over western and central Asia, peninsular India and northern and eastern Africa. Horns are usually present in both sexes, but certain Asiatic gazelles have hornless females. Some of the African species, such as Grant's gazelle (G. granti) and Soemmerring's gazelle (*G. soemmerringi*) are of fairly large size, standing 34 to 35½in. at the shoulder. The springbuck is distinguished from the gazelles by the presence on the middle line of the loins of an evertible pouch lined with long white hairs capable of erection. The range includes south Africa, as far north as the Zambezi and Mossamedes. The gerenuk is at once distinguishable from the other members of the subfamily by the great elongation of the neck and limbs. This species is found only in Somaliland and adjacentparts of east Africa.

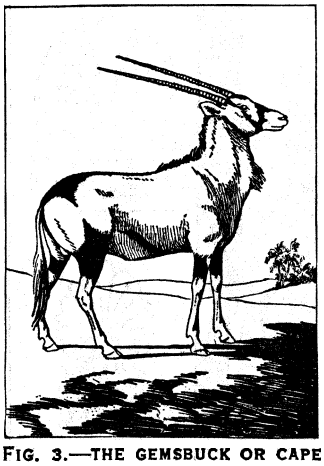

FIG. 3.—THE GEMSBUCK OR CAPE ORYX (ORYX GAZELLA), AN ANTELOPE WITH ALMOST STRAIGHT HORNS, FOUND ONLY IN THE MOUNTAINS OF SOUTH AFRICA

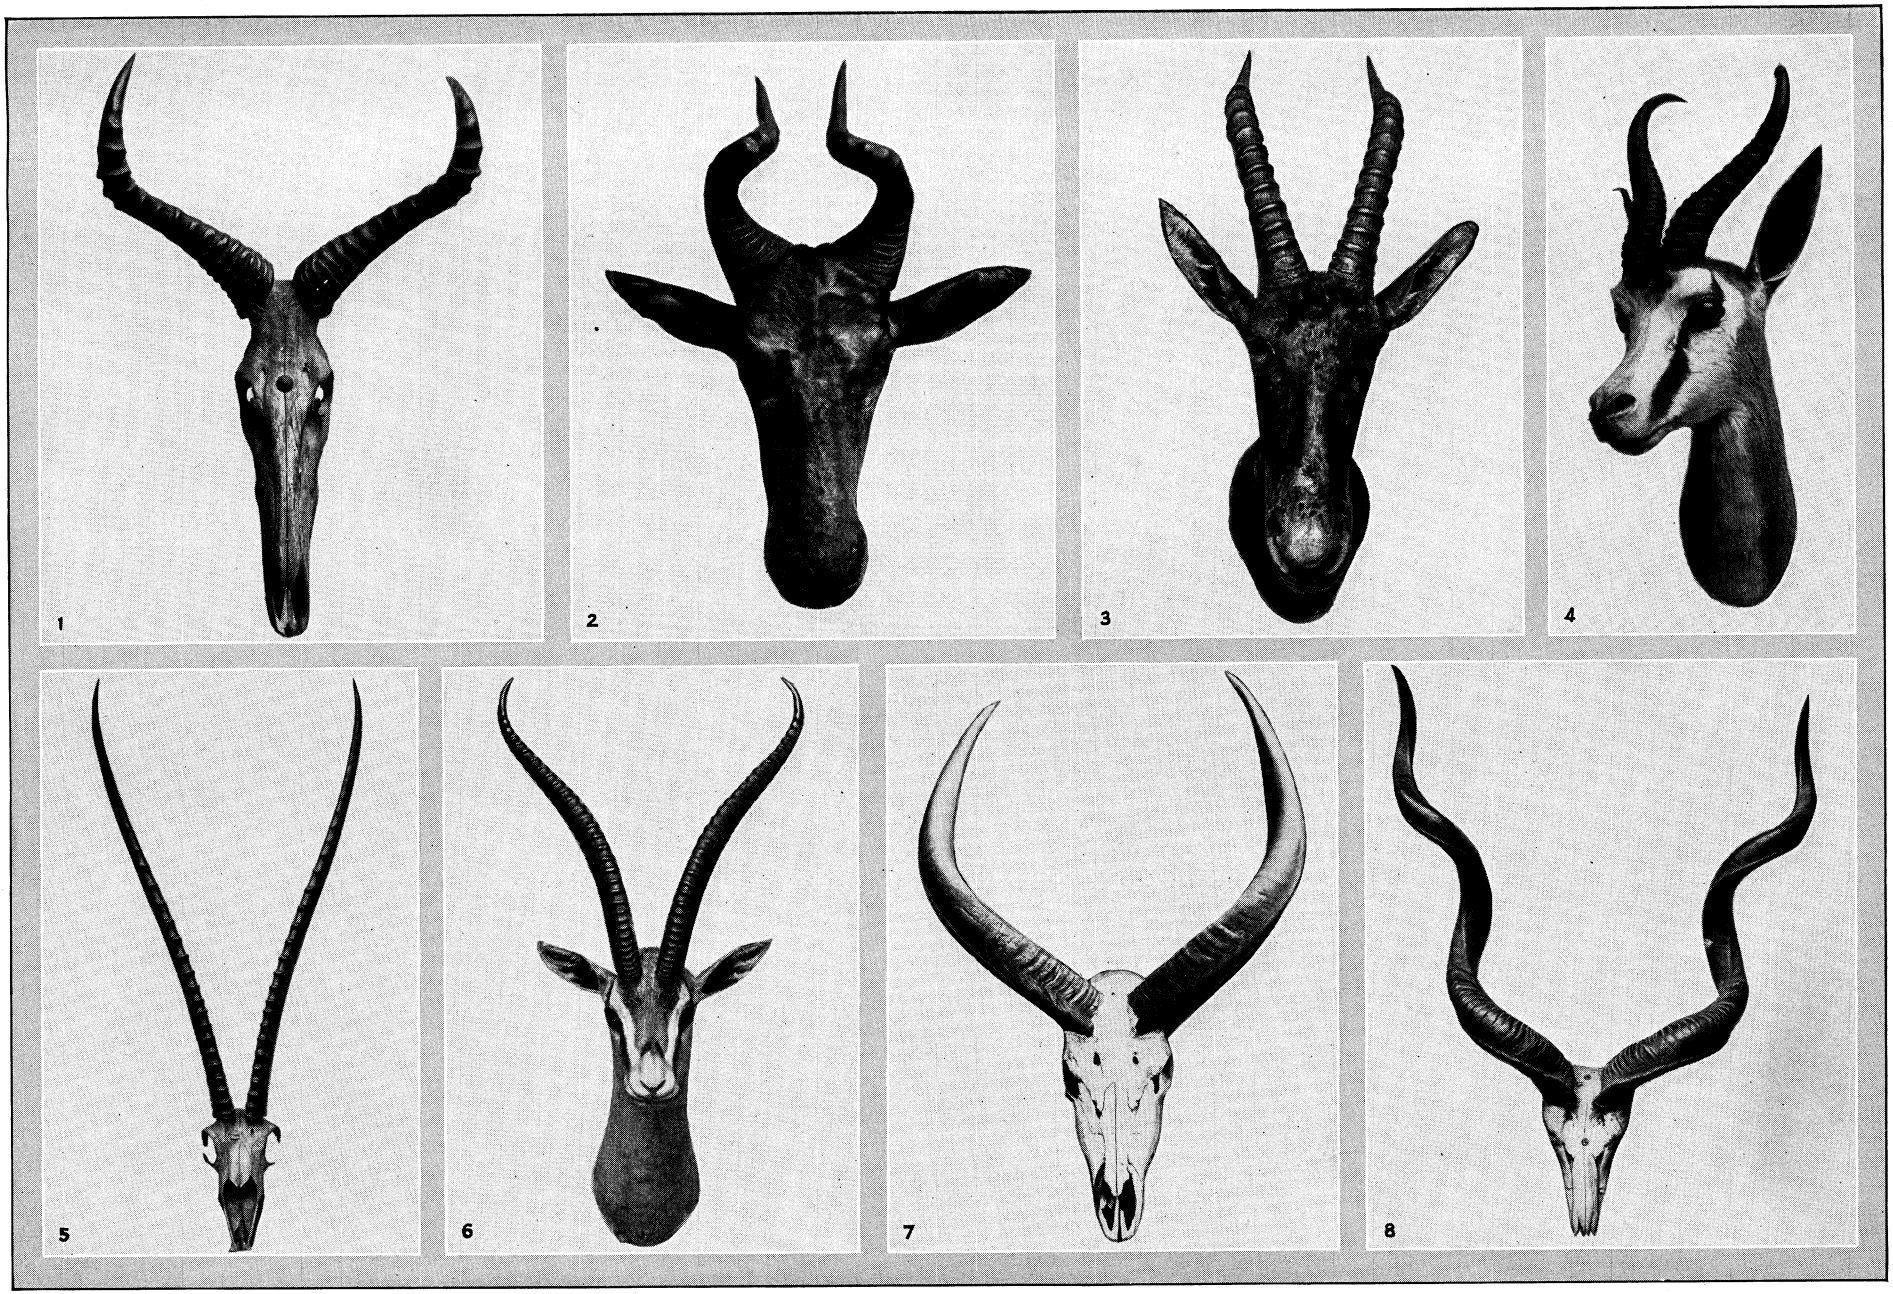
The eleventh subfamily, the Oryginae, is composed of a series of large antelopes which have long, either straight, backwardly curved, or spirally twisted horns, which are present in both sexes.



ANTELOPES

1. Tora hartebeest (*Bubalis tora*)
2. Lichtenstein's hartebeest (*Bubalis lichtensteini*)
3. Tiang hartebeest (*Damaliscus jamela tiang*)
4. Springbuck (*Antidorcas marsupialis*)
5. Tibetan antelope (*Pantholops hodgsoni*)
6. Grant's gazelle (*Gazella granti*)
7. Mountain Nyala (*Tragelaphus buxtoni*)
8. Kudu (*Strepsiceros*)

Three genera are distinguishable, Oryx including the gemsbuck, beisa, white oryx, and Arabian oryx; *Hippotragus* including the extinct blaaubok, the roan antelope, and the sable antelope; and *Addax* with but a single species, the addax. The horns are nearly straight in the gemsbuck (*O. gazella*) (fig. 3), the beisa (0. beisa) and Arabian oryx (0. leucoryx); in the white oryx (O. *algazel*) they bend backwards in a sabre-like sweep. The gemsbuck inhabits south-west Africa and Angola, while the beisa is found in the country from Suakin, on the Red sea, southwards through Somaliland to Kilimanjaro. The white oryx ranges across the desert from west Africa to the eastern Sudan, and the Arabian oryx extends from southern Arabia to Mesopotamia. In the genus Hippotragus the horns rise nearly vertically above the eyes, after which they sweep backward in a bold scimitar-like curve. The roan antelope (H. equinus) is a very large species, with stout and comparatively short horns. Roan antelopes are widely distributed over the greater part of Africa south of the Sahara, excluding the equatorial forest zone. The sable antelope (*H. niger*) is rather smaller, but the horns are sometimes of great size, in the Angolan race the record horn-length being as much as 64 inches. The range includes a large part of south, south-central and east Africa. The addax is easily distinguished by its long, spirally twisted horns; it is distributed over the deserts of northern Africa as far south as Senegal in the west and Dongola in the eastern Sudan.

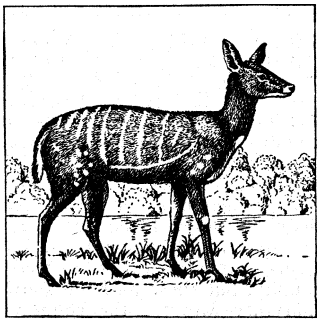


FIG. 4.— BUSHBUCK (TRAGELAPHUS SCRIPTUS), FEMALE. AFRICA, DIFFERING FROM MALE IN LESS BRILLIANT MARKINGS AND NO HORNS

The twelfth and last subfamily of the antelopes is the Tragelaphinae, which includes the bushbucks (Tragelaphus), situtungas (Limnotragus), kudus (Strepsiceros), bongo (*Boöcercus*), elands (*Taurotragus*), four-horned antelope (*Tetracerus*), and nilgai (Boselaphus). The members of this group are large, medium or small-sized antelopes with the horns, except in the bongo and elands, present only in the males. The harnessed antelopes, or bushbucks, are frequently brilliantly coloured, the body being bright rufous or orange, with a white nasal chevron, and longitudinal and transverse stripes on the body. The true bushbucks (T. *scriptus*) (fig. 4) are widely distributed over south, central, east and west Africa. The nyala (T. angasi) is a much larger species with larger horns. The male nyala is slaty grey in colour, while the female is bright chestnut with the white markings of a bushbuck. The distributional area is restricted to south-east Africa. The mountain bushbuck (*T.* buxtoni) is the largest member of the genus, standing nearly as high as the kudu. This fine species hails from the Sahatu mountains in Gallaland. The situtungas (L. spekei) are about equal to the nyala in general dimensions; they are distinguished by their elongated hoofs, a special adaptation to enable them to walk on the soft mud. The range extends throughout a large area of south-central and central Africa to as far north as the Sudan, and westwards through the Congo to west Africa. The kudus are represented by two very distinct species, S. strepsiceros, the greater kudu (fig. 5), standing nearly 5ft. at the shoulder and possessing exceptionally fine, spirally twisted horns, and the lesser kudu (S. *imberbis*) which is only 41in. in height, and carries much smaller horns. The former is widely distributed over the greater part of Africa south of the Sahara, while the latter is restricted to Abyssinia, Somaliland, Kenya Colony and Tanganyika Territory. The bongo (B. *euryceros*) is a large antelope and has very massive horns. It is bright chestnut in colour, with from ten to thirteen white vertical stripes on the body. The distributional area includes a large part of equatorial Africa, spreading southwards to Katanga. The elands are the largest of all the antelopes, adult bulls standing nearly six feet at the shoulder. Two well-marked species can be distinguished, T. oryx, the common eland, and T. *derbianus*, Lord Derby's eland. The latter is distinguished by the larger and heavier horns and the broader ears. *T.* oryx is distributed over the greater part of Ethiopian Africa, while T. derbianus spreads across Africa from Senegambia to the Sudan and southwards to the Congo. The four-horned antelope, or chousingha (T. *quadricornis*), is distinguished from all other antelopes by the presence of two pairs of horns in the males, of which the front pair are the smaller; it is found only in peninsular India. The nilgai (B. tragocamelus) is easily recognized by the bluish-grey tint of the adult bulls and the single pair of comparatively small horns; the range is confined to peninsular India.

FIG. 5.—GREATER KUDU (STREPSICEROS STREPSICEROS), MALE, NEARLY 5 FEET HIGH AT SHOULDERS, WITH FINE TWISTED HORNS

Extinct Antelopes — Only a few lines can be devoted to extinct antelopes, the earliest of which apparently date from the European Miocene. An antelope from the Lower Pliocene of northern India known as *Bubalis,* or Damaliscus palaeindicus, indicates the occurrence of the hartebeest group in that country. Kobus also occurs in the same formation, as dues likewise *Hippotragus*. Palaeoryx from the corresponding horizon in Greece and Samos is to some extent intermediate between Hippotragus and Oryx. Gazelles are common in the Miocene and Pliocene of both Europe and Asia. Elands and kudus appear to have been represented in India during the Pliocene; the European Palaeoreas of the same age seems to be intermediate between the two, while *Protragelaphus* is evidently another European representative of the group.

BIBLIOGRAPHY.—P. L. Sclater and O. Thomas, *The* Book of *Antelopes* (1894–1900); R. Lydekker and J. G. Dollman, *The Game Animals of India* (1924) and *The Game Animals* of *Africa (1926).*

(J. G. D.)

ANTEMNAE, ancient village of Latium, west of the Via Salaria, 2m. north of Rome, where the Anio falls into the Tiber. It is said that Romulus took it after the rape of the Sabine women, and that it helped the Tarquins. Certainly it soon lost its independence, and in Strabo's time was a mere village. The site is very strong; traces of outer walls and huts, wells and a cistern have been found.

ANTENATAL CLINICS. The first clinic in Great Britain providing supervision and advice for expectant mothers with a view to securing normal health during pregnancy and safe delivery of a healthy child was established by Dr. J. W. Ballantyne at the Royal Maternity Hospital, Edinburgh, in 1902. Other hospitals and maternity centres followed suit; by 1915 antenatal clinics were recognized as an important factor in the prevention of infant and maternal mortality, and under the Maternity and Child Welfare Act, 1919, such measures became a responsibility of local authorities, whose public health departments have increasingly met the need. Clinics now form part of all maternity hospitals and of the maternity and child welfare programs of practically every local authority.

The part played by antenatal care in the reduction of maternal mortality is now generally recognized, and in 1932 the departmental committee on maternal mortality, after consideration of 5,000 deaths, estimated that its lack was a primary factor in maternal mortality. Many departures from a normal physical condition, if discovered in time, can be remedied before child-birth is due, and both the physical and mental health of mother and unborn child are largely affected by such matters as diet, sleep, exercise, fresh air, and other general conditions of life during pregnancy.

The actual service provided by an antenatal clinic is therefore twofold, medical and social. Every clinic is attended by a fully qualified medical practitioner, whose function is to make a physical examination, to continue physical observation as needed, and to

advise upon and arrange for any special treatment that may be necessary; a midwife, if engaged in the case, usually assists the doctor by visiting the woman and keeping her under observation.

The social side is generally the province of the health visitor of the local authority. She, or sometimes the midwife, gives talks on cradles, baby clothes, maternity garments, etc., and on hygiene and management of pregnancy, and satisfies herself that suitable arrangements have been made for the confinement and that the necessary equipment is available. Provision is made for the supply of either milk or meals, or both, free or at low cost to necessitous mothers and also, in many cases, for dental treatment, frequently much needed at this time. In an increasing number of districts maternal supervision is completed by medical examination at a postnatal clinic.

Traditions of shyness and reticence are not easily overcome, and many mothers still hesitate to accept the help and advice offered; but the increasing appreciation of the antenatal clinics is indicated by the following figures supplied by the Ministry of Health:

Year	No. of Clinics	Women Attending
1917	No information	No information
1927	869	No information
1930	1,101	170,606
1937	1,701	337,672
1938	1,796	384,865

United States.—In the United States the first antenatal work, or prenatal as it is known there, was begun in June, 1907, by the Association for Improving the Condition of the Poor in connection with the Caroline rest and pediatric department of the New York outdoor medical clinic. As early as 1901, however, the Visiting Nurses association of Boston had begun to instruct expectant mothers in suitable care and hygiene, and the Visiting Nurses association of Chicago in 1906 was also definitely engaged in the same task. In 1909 the Women's Municipal league of Boston sponsored the first antenatal measures deliberately designed to decide their effect upon supervised mothers and their children.

The Federal children's bureau came into existence in April, 1912, but at first antenatal clinics organized under its direction were merely sporadic. Realization that many of the 23,000 estimated deaths in childbirth in 1918 were preventable led to the introduction in 1919 of the Act which has done more to establish antenatal clinics in the United States than anything else, "An Act for the promotion of the Welfare of Maternity and Infancy." It was modelled closely upon the English Maternity Act and, after two attempts, was passed in 1921 with the weight of public opinion behind it created by the National League of Women Voters, the General Federation of Women's Clubs, the National Congress of Mothers and Parent-Teachers associations, some 15 other national agencies and many State and local organizations. It is popularly known as the "Sheppard-Towner Act" after the senator and congressman who respectively introduced it. (*See* MATERNITY AND INFANT WELFARE.) The funds released by this Act made possible permanent antenatal clinics. The number conducted at the end of the fiscal year 1927 by the Federal Bureau, in co-operation with the various States was about 290, of which 205 were combined prenatal and child health centres. Despite the increase in the number of prenatal clinics conducted throughout the United States, maternal mortality statistics from 1915 to 1929 show a very definite rise This is probably due to the fact that the earlier returns were very incomplete; only 12 States reported in 1915, following which there was a gradual increase to 46 in 1929. It can be assumed that the more progressive States, tfiat is those which had prenatal stations, were among the ones reporting in 1915 to 1929.

That prenatal care is a definite factor in the reduction of maternal mortality is well illustrated by the reports of various clinics. As an example, the privately supported Maternity Center Association, New York City, which was established in May 1918 in response to a call issued by the Commissioner of Health to various official and other representatives, reported a maternal mortality rate of 24 per 10,000 live births in a group of 5,000 women, as compared with 62 per 10,000 live births for a similar number of patients, in a similar environment, who failed to receive any prenatal care. Furthermore, the Cleveland Child Health Association, which is also one of the earliest prenatal clinics formed in this country, reports a rate of 7·7 maternal deaths per 10,000 live births or 2 deaths in a group of 2,595 women who received prenatal care. The city of Cleveland had a maternal mortality rate of 38 per 10,000 live births or five times that of the prenatal clinic. The State of Maryland in 1928 established prenatal clinics in as many counties as possible. In the year 1935, 949 women who had received prenatal care in these clinics were delivered with a maternal mortality rate of 0 as compared with the

Maternal Mortality (United States Birth Registration Area)

Year	Deaths, per 10,000 live births	States reported	Year	Deaths, per 10,000 live births	States reported	Year	Deaths, per 10,000 live births	States reported
1915	61	12	1923	67	32	1931	66	46
1916	62	13	1924	66	35	1932	63	47
1917	66	22	1925	65	34	1933	62	48
1918	92	22	1926	66	36	1934	59	48
1919	74	24	1927	65	41	1935	58	48
1920	80	25	1928	69	44	1936	57	48
1921	68	29	1929	70	46	1937	49	48
1922	66	32	1930	67	46	1938	43.5	48

rate, for the State as a whole, of 50 per 10,000 live births. These reports demonstrate that supervised prenatal care had a great influence in reducing maternal mortality.

In 1935 the Federal Government included in the Social Security Act of that year the provision for the establishment of prenatal clinics throughout the country, the funds of which were to be administered by the individual states. By Nov. 1936 plans had been approved for the establishment of prenatal clinics in all 48 States. The reduction of maternal mortality in the years 1936 to 1938 definitely showed the effect of this act—1936, 57 maternal deaths per 10,000 live births; 1938, 43.5 deaths per 10,000 live births. The figures for the year 1939 were not (in 1940) as yet available in totality, but those on hand showed a further decrease in the maternal mortality rate for the country as a whole. Due to the fact that most large communities had established prenatal clinics prior to the passage of the Social Security Act, it must be assumed that this legislation had great influence in rural communities where little or no prenatal facilities had previously been available.

ANTENNA, a device for radiating or absorbing radio waves. There are two general classes of antennae, the condenser and the coil. The condenser type consists of an elevated horizontal aerial, together with a connection to the ground or to a network of wires near the ground, called a counterpoise. The coil type consists of a few turns of wire wound around a vertical frame which, for broadcast reception, may be 2 or 3ft. square.

ANTENNA RESISTANCE, in radio transmission, an effective resistance which is numerically equal to the average power in the entire antenna circuit divided by the square of the effective current at the point of maximum current. Antenna resistance includes radiation resistance, ground resistance, radio-frequency resistance of conductors in antenna circuit, equivalent resistance due to corona, eddy currents, insulator leakage, dielectric loss and so on.

ANTENOR, an Athenian sculptor, of the latter part of the 6th century B.C. He was the author of the group of the tyrannicides Harmodius and Aristogeiton, set up by the Athenians on the expulsion of the Peisistratidae, and carried away to Persia by Xerxes. A basis with the signature of Antenor, son of Eumares, has been shown to belong to one of the dedicated female figures of archaic style which have been found on the Acropolis of Athens.

See E. A. Gardner's *Handbook of Greek Sculpture,* i. p. 182.

ANTENOR, in Greek legend, head of the peace-party in Troy during the Trojan War. Because of this, he was spared when the city fell. A late legend makes him betray the city. Afterwards, he either rebuilt Troy or settled at Cyrene, or became the founder of Patavium.

Homer, *Iliad* iii. 148, vii. 347; Horace, *Epp.* i. 2, 9; Livy i. 1; Pindar, *Pythia,* v. 83; Virgil, *Aen.* i. 242.

ANTEQUERA (anc. *Anticaria*), a city in southern Spain, province of Malaga. Pop. (1930) 32,974. A fortress town of the Muslim period, taken by the Christians in 1410, it occupies a commanding position overlooking the structural depression followed by the river Guadalhorce (*see* ANDALUSIA). The Sierra de las Torcales, on the south side of this depression, is celebrated for its scenery and is quarried for marble: the Peña de los Enamorados, or "Lovers' Rock," a crag rising from the flat of the *vega,* owes its name to the legend adapted by Robert Southey in his *Laila and Manuel.* In the east suburbs of Antequera is the

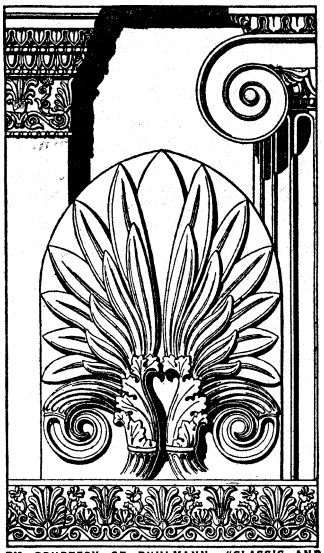
Cueva de Merja, one of the most important dolmens of the Peninsula. Woollen fabrics are manufactured, and the sugar industry (est. 1890) employs several thousand hands.

ANTEROS, pope for some weeks at the end of 235. He died on Jan. 3 236. According to the *Liber Pontificales,* he was martyred for having ordered a collection of the acts of the martyrs to be made, and included in the archives of the Church. His original epitaph was discovered in the Catacombs in 1854.

ANTHELION, the luminous ring or halo sometimes seen in Alpine or polar regions surrounding the shadow of the head of an observer cast upon a bank of cloud or mist. The halo diminishes in brightness from the centre outwards, and is probably due to the diffraction of light. Under favourable conditions four concentric rings may be seen round the shadow of the observer's head, the outermost, which seldom appears, having an angular radius of 40°.

ANTHELMINTICS are remedies used either to kill or to cause the expulsion of intestinal worms, in the former case being known as vermicides, in the latter as vermifuges. Cathartics, since they cause the expulsion of worms, are vermifuges. Used alone, however, they are rarely wholly effective, it being necessary to weaken, narcotize or kill the parasite first. For this purpose the vermicides are used. The chief characteristic of the latter drugs is that they have a more profound effect on the parasite than on the host, since they are absorbed only very slowly by the intestinal canal. The vermicides produce their best results when taken on a fasting stomach, preceded by purgation and a very light diet and followed by thorough purgation within a few hours to remove the dead or weakened worms. Drugs frequently used in the treatment of hookworm are chenopodium oil, thymol and carbon tetrachloride; in the treatment of tapeworm, aspidium and pelletierine; in the treatment of roundworm, santonin and spigelia.

ANTHEM, derived from the Gr. *ἀντίφωνα,* through the Saxon *antefn,* a word which originally had the same meaning as antiphony (q *v.).* It is now, however, generally restricted to a form of church music, particularly in the service of the Church of England, in which it is appointed by the rubrics to follow the third collect at both morning and evening prayer, "in choirs and places where they sing." It is just as usual in this place to have an ordinary hymn as an anthem, which is a more elaborate composition than the congregational hymns. Anthems may be written for solo voices only, for the full choir, or for both, and according to this distinction are called respectively *Verse, Full,* and *Full with Verse.* Though the anthem of the Church of England is analogous to the *motet* of the Roman Catholic and Lutheran Churches, both being written for a trained choir and not for the congregation, it is as a musical form essentially English in its origin. Tallis, Tye, Byrd and Farrant in the 16th century; Orlando Gibbons, Blow, and Purcell in the 17th, and Croft. Boyce, James Kent, James Nares. Benjamin Cooke, and Samuel Arnold in the 18th were composers of anthems. *(See* also NATIONAL ANTHEMS)



BY COURTESY OF BUHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE (NEFF & HELBURN); ARCHITEKTORISCHEN ORDNUNGEN DER GRIECHEN UND ROMERN (ERNST UND KORN); SIR BANISTER FLETCHER, "HISTORY OF ARCHITECTURE ON THE COMPARATIVE METHOD"

ANTHEMION (pl. ANTHEMIA). a conventional design consisting of a number of radiating petals, developed by the Greeks from the Egyptian and Asiatic form known as the lotus palmette. One of the most fertile sources of decorative ornament, it was not only used widely by the Greeks and Romans but occurs also in Byzantine and Romanesque examples and is common in modern work. Used first by the Greeks as a decoration on painted pottery, it was later combined into bands painted on architectural mouldings, and in the 5th century B C. these painted forms came to be carved in relief. It is used especially in bands as a decoration for the cymatium of a cornice and singly for acroteria *(see* ACROTERIUM), ante-fixae (*q.v.*) and the top of vertical stele (*q.v.*).

ANTHEMIUS, son of Stephanus of Tralles, Greek mathematician and architect. He produced, under the patronage of Justinian, the original and daring plans for the church of St. Sophia in Constantinople. The building was finished in 537, but in 558, after the death of Anthemius, it had to be restored, owing to the collapse of the dome. Anthemius wrote a treatise on burning glasses, where in the course of constructions for surfaces to reflect to one and the same point, (1) all rays in whatever direction passing through another point, (2) a set of parallel rays, he assumes a property of an ellipse not found in Apollonius (the equality of the angles subtended at a focus by two tangents drawn from a point), and (having given the focus and a double ordinate) he uses the focus and directrix to obtain any number of points on a parabola—the first instance on record of the practical use of the directrix.

A fragment of the treatise, entitled *Περὶ παραδόξων μηχανημάτων,* was published by L. Dupuy (1777) and in *Hist. de l'Acad. des Inscr.,* vol. xlii. (1786); revised ed. by A. Westerman, *Scriptores rerum mirabilium Graeci* (1839). On Anthemius generally *see* Procopius, *De Aedific.* i. 1; Agathias *Hist.* v. 6–9. Gibbon's *Decline and Fall* chap. xl.; Bury, *Later Roman Empire* (1923) p. 98 ff.

ANTHESTERIA, one of the four (or five) Athenian festivals in honour of Dionysus, held annually for three days (11th–13th) in the month of *Anthesterion* (Feb.-March). Its object was to celebrate the maturing of the wine stored at the previous vintage, and the beginning of spring. On the first day, called *Pithoigia* ("opening of the casks"), libations were offered from the newly opened casks to the god of wine, all the household joining in the festivities. The rooms and the drinking vessels in them were adorned with spring flowers, as were also the children over three years of age. The second day, named *Choës* ("feast of beakers"), was a time of merry-making. The people dressed themselves gaily, some in the disguise of the mythical personages in the suite of Dionysus, and paid a round of visits to their acquaintances. Others poured libations on the tombs of deceased relatives. On the part of the State, this day was the occasion of a peculiarly solemn and secret ceremony in one of the sanctuaries of Dionysus in the Lenaeum, in which the *basilinna,* wife of the *archon basileus* ("king-archon"), went through a ceremony of marriage to the wine god. The days on which the *Pithoigia* and *Choes* were celebrated were both regarded as ill-omened, necessitating expiatory libations; on them the souls of the dead came up from the underworld and walked abroad; people chewed leaves of whitethorn and smeared their doors with tar to protect themselves from evil. The third day was named *Chutroi* (feast of pots), a festival of the dead. Cooked pulse was offered to Hermes, in his capacity of a god of the lower world, and to the souls of the dead. It is uncertain whether the name is connected with Gr. *anthos,* flower.

ANTHIM THE IBERIAN, a notable figure in the ecclesiastical history of Rumania. A Georgian by birth, he came to Rumania early in the second half of the 17th century, as a simple monk. He became bishop of Rbmnicu in 1705, and in 1708 archbishop of Wallachia. Taking a leading part in the political movements of the time, he came into conflict with the newly appointed Greek hospodars, and was exiled to Rumelia. But on his crossing the Danube in 1716 he was thrown into the water and drowned, as it is alleged, at the instigation of the prince of Wallachia. He was a man of great talents and spoke and wrote many Oriental and European languages. He acquired a thorough knowledge of Rumanian, and helped to introduce that language into the church as its official language.

He was a master printer and an artist of the first order. He cut the wood blocks for the books which he printed in Tîrgovishtea, Râmnicu, Snagov and Bucharest. He was also the first to introduce Oriental fonts of type into Rumania, and he printed there the first Arabic missal for the Christians of the east (Râmnicu, 1702). He also trained Georgians in the art of printing, and cut the type with which under his pupil Mihail Ishtvanovitch they printed the first Georgian Gospels (Tiflis, 1709). Some of his pastoral letters are models of style and of language as well as of exact and beautiful printing. He also completed a whole *corpus* of lectionaries, missals, gospels, etc.

See M. Gaster, *Chrestonzathie roumaine* (1881), and "Gesch. d. ruinanischen Litteratur," in Groeber, *Grundriss* d. *rom. Philologie,* vol. ii. (1899); and E. Picot, *Notice sur Anthim d'Ivir* (Paris, 1886).

ANTHOCYANINS AND ANTHOXANTHINS. The term anthocyanin has been employed to denote all the water-soluble pigments of flowers, fruits and leaves, but with new knowledge of the chemical nature of these colouring matters a more exact classification has become possible and the expression is now applied to particular substances which are responsible for the red, blue, mauve, purple and violet colours of flowers. The anthoxanthins are a chemically related class of water-soluble yellow or orange pigments possessing relatively feeble tinctorial power. The bright yellow, orange and green colours in plants are usually due to the presence of one or other of the plastid pigments (carotenols or xanthophyll, carotene, chlorophyll, etc.), insoluble in aqueous media but soluble in fats and oils. These do not occur, as do the anthocyanins, in the cell-sap, and there is no visible chemical link connecting the plastid and anthocyanin pigments.

The water-soluble pigments are largely responsible for much of the spring colouring of buds and young shoots, and the fall colouring of leaves, especially the purples and purple-reds. These are unmasked when the green chlorophyll decomposes with the approach of winter. Intense light and low temperatures favour the development of anthocyanin pigments.

It has been suggested that these pigments may act as oxygen carriers in the physiology of the plant, since they are easily oxidized and reduced. They may also serve to protect some plants from injurious ultraviolet radiation, as it has been observed that alpine plants are highly coloured. When grown at lower altitudes, much of the colour is lost. Distinction between cause and effect is often difficult in such cases. Absorption of radiant energy from sunlight by these pigments may raise the internal temperature of the leaf several degrees.

Some leaves normally lose anthocyanins on reaching maturity and others gain in pigment content during development. Often an excess of sugars exists in leaves when anthocyanins are abundant. Injury to individual leaves may be instrumental in such cases.

The development of characteristic colourations in parts of plants is often useful in the diagnosis of mineral deficiencies in the plant nutrient supply. This is particularly true for phosphorus, potassium, magnesium and boron deficiencies. Insufficient phosphorus supply induces a pronounced development of purple colouration in the leaves and stalks of those strains of corn which possess the genetic factors which are also necessary for this pigment production. Development of brown, bronze, red, or purple areas in leaves is characteristic of potassium deficiencies in potato, cotton, cabbage, apple, and orange plants. Boron deficiency causes development of a red colouration in alsike and alfalfa leaves. Magnesium deficiency in cotton gives rise to the production of leaves which are coloured a beautiful purplish-red between the veins, which remain dark green. These changes are due to the production of large quantities of anthocyanin pigments, probably followed by destruction of chlorophyll. An early symptom may be an unusual darkening of the normal green appearance.

One of the most interesting and obvious properties of the anthocyanins is the change of colour which they exhibit when treated with acids or alkalis. It is said that Yorkshire children turn bluebells red by placing them in anthills; the formic acid produced by the insects is responsible for this curious result. In 1664 Robert Boyle wrote "Take good Syrrup of Violets, Impraegnated with the Tincture of the flowers, drop a little of it upon a White paper . . . and on this Liquor let fall two or three drops of Spirit either of Salt or Vinegar, or almost any other eminently Acid Liquor and upon the Mixture of these you shall find the Syrrup immediately turn'd Red. . . . But to improve the Experiment, let me add what has not been hitherto observ'd, namely, that if instead of Spirit of Salt, or that of Vinegar, you drop upon the Syrrup of Violets a little Oyl of Tartar per *Deliquium* or the like quantity of Solution of Potashes, and rubb them together with your finger, you shall find the Blew Colour of the Syrrup turn'd in a moment into a perfect green."

It is probable that the green colour resulted from the production of a bright yellow colour by the action of the alkali on an anthoxanthin in solution, the anthocyanin retaining its blue colour. Many colourless flowers, for example jasmine and *Antirrhinum,* develop bright yellow colourations in ammonia. A typical anthocyanin is bluish-red in acid solution, violet in neutral solution and blue in alkaline solution. Thus the blue cornflower, the bordeaux-red cornflower, the deep red dahlia, and the red rose contain one and the same anthocyanin, the variation in colour being simply due to the different degrees of acidity and alkalinity of the cell-sap. More than one anthocyanin may be present in a flower or blossom, and the colours of many flowers are due to the presence of both anthocyanins and plastid pigments in the tissues. Yellow wallflowers contain a plastid pigment and an anthoxanthin that coniributes very little to the total tinctorial effect; the different shades of red wallflowers are due to varying proportions of anthocyanin and plastid colouring matters. Moreover, very small changes, botanically, in varieties or species may be associated with the development of different anthocyanins.

Colour in flowers is often inherited according to single-factor Mendelian inheritance laws. In more complicated cases, factors for both enzymes and chromogens are necessary for colour development.

In 1905, Molisch demonstrated the existence of anthocyanin crystals in the living plant, and showed that crystals of these pigments could be readily prepared on a small scale by simple methods. For example, petals of the scarlet pelargonium are flattened and bruised on a glass surface, covered with a few drops of 75% acetic acid and then with a cover-glass and the whole placed under a clock-glass to ensure slow evaporation. At the edges of the cover-glass or round the petals, crystals gradually make their appearance. Grafe, a few years later, carried out this experiment on a larger scale and for the first time isolated an anthocyanin pigment in quantity and in a fairly pure condition. Our knowledge of the chemistry of the anthocyanins is, however, chiefly due to Willstatter who, in a series of masterly researches, opened and all but completed a new chapter of organic chemistry. In 1913, Willstatter and Everest published an account of an investigation of the pigment of the blue cornflower. They found that the colouring matter "cyanin" exists in the plant as its blue potassium salt, but that the substance can also combine with acids to form red salts and that advantage may be taken of this property in the isolation of the pure substance. In this case the work involved was difficult, the dried blue cornflower petals contained only 0.75% of their weight of colouring matter. It was later found that dried, deep red dahlia petals contain 20% of their weight of the same colouring matter and about 50% of this may be readily isolated in the following manner. The fresh flowers were extracted with acetic acid and methyl-alcoholic hydrochloric acid. One and a half volumes of ether were then added. This precipitated the chloride, which is insoluble in ether, and the salt was then separated and re-crystallized from a solution in 7% hydrochloric acid. It should be added that this process is unusually simple and straightforward owing to the high percentage of colouring material in the flowers. The work of the florists in developing garden flowers rich in pigment content has been extraordinarily successful.

Cyanin chloride has the composition $C_{27}H_{31}O_{16}Cl$ and, like all the other anthocyanins yet examined, contains sugar in a combined form. This is readily detached by the action of boiling 20% hydrochloric acid, leaving a salt, termed cyanidin chloride, which tinc-

torially and in many other properties closely resembles cyanin chloride. The sugar so detached is glucose, $C_6H_{12}O_6$, each molecule of cyanin chloride giving rise to one of cyanidin chloride and two of glucose:

$$C_{27}H_{31}O_{16}Cl + 2H_2O = C_{15}H_{11}O_6Cl + 2C_6H_{12}O_6$$

Cyanin chloride is thus a diglucoside of cyanidin chloride. Mecocyanin chloride from the poppy (*Papaver rhoeas,* purple scarlet variety) has the same composition as cyanin chloride and, like it, is degraded to cyanidin chloride and glucose (2 molecules). The solution of cyanin in aqueous sodium carbonate is blue, whereas that of mecocyanin is violet, and there are other divergencies. The explanation must be sought in the different mode of the molecular attachment of the cyanidin and glucose complexes in the two substances. Chrysanthemin, the pigment of the deep red garden chrysanthemum, resembles mecocyanin, but its molecule gives rise to only one molecule of glucose to each molecule of a cyanidin salt; it is monoglucosidic. One of the pigments of the aster very closely resembles chrysanthemin, while the colouring matters of the sweet cherry and of the sloe are apparently allied to mecocyanin, but contain rhamnose as one of the sugar components. Very careful treatment of mecocyanin with hydrochloric acid causes the loss of only one glucose molecule, and the result is chrysanthemin chloride. It will be observed that several anthocyanins may be regarded as derived from cyanidin and that their differences may be traced to the varying nature of the sugars, to the number of sugar molecules attached to one of cyanidin, and to the position of such attachment.

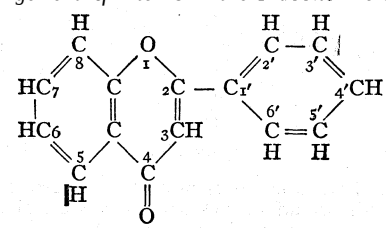
The further work of Willstatter and his colleagues brought to light the curious fact that, despite the existence in nature of a range of colour unrivalled by art, the number of fundamental sugar-free pigments of the type of cyanidin chloride, termed *anthocyanidins,* is very limited.

Glucosides derived from pelargonidin chloride, $C_{15}H_{11}O_5Cl$, have been found in many plants, for example in *Pelargonium zonale,* the purple-red summer aster, scarlet-red dahlia, the scarlet *Salvia,* and in the skins of radishes. Glucosides and complex glucosides derived from delphinidin chloride, $C_{15}H_{11}O_7Cl$, occur in the wild purple larkspur *(Delphinium consolida)* and in the viola. The anthocyanin of the peony, peonin, is a diglucoside of peonidin, which is simply related to cyanidin and may be converted into it. Peonidin chloride has the composition $C_{16}H_{13}O_6Cl$, that is, CH_2 more than cyanidin chloride, and the action of hydriodic acid on peonidin, furnishes CH_3I and cyanidin iodide. Similar derivatives of delphinidin chloride are obtained by decomposition of the anthocynnins from the bilberry, wild mallow, grape-skins, the petunia and *Primula hirsuta.* These all contain one or more $-OCH_3$ groups instead of the $-OH$ groups of delphinidin chloride. Apart from these cases, in which the molecules are slightly modified, there are but three known fundamental anthocyanidins, and these in turn have been found to be built upon one and the same molecular plan. Before considering this, however, it is necessary to pay some attention to the anthoxanthins, the main features of the chemistry of which were well established before any real insight into the nature of the anthocyanins had been obtained. The anthoxanthins are also glucosides, diglucosides or rhamnoglucosides, although owing to the processes of extraction and isolation adopted, they are frequently decomposed and obtained in the sugar-free condition. These substances are more widely distributed in different plants and in different parts of plants than are the anthocyanins. They have a limited but definite utility as mordant dyestuffs, giving in many cases bright, fast dyeings owing to their capacity for the formation of lakes with certain metallic oxides. A typical anthoxanthin is quercitrin, $C_{21}H_{20}O_{11}$, which is found in quercitron bark, an extract of which was introduced by Bancroft as a colouring matter in 1775. This hark is derived from a species of oak, *Quercus velutina,* a native of the middle and southern United States. The colouring matter is deposited in the inner bark and may be obtained by extraction with dilute ammonia. On boiling the solution with hydrochloric acid the quercitrin is hydrolyzed to the products quercetin, $C_{15}H_{10}O_7$, and the sugar, rhamnose, $C_6H_{12}O_5$. Quercetin is a bright yellow, feebly acid substance; it combines with strong acids to form orange salts, but these are not very stable and are readily dissociated by water. Nevertheless, this property of salt formation in a non-nitrogenous substance is a weaker manifestation of the basic character exhibited by the anthocyanins, and it is due to a structural peculiarity common to both types. Quercetin is a strong polygenetic mordant dyestuff. On wool, with a chromium mordant it gives a reddish-brown shade, with an aluminium mordant a brownish-orange shade, with a tin mordant a bright orange shade and with an iron mordant an olive-black shade. Many representatives of this group have been isolated and closely investigated by A. G. Perkin, St. von Kostanecki and others. As with the anthocyanins, different glucosides yield the same fundamental colouring matter, and moreover the $-OH$ groups are sometimes replaced by $-OCH_3$. Derivatives of quercetin have been obtained from rue, capers, buckwheat, clover flowers, *Eucalyptus macrorhyncha,* cotton flowers, onion skins, Persian berries, wallflowers, tea leaves, may blossom, horse chestnut, bark of the apple tree, and also from wings of certain insects and many other sources. Although significance must be attached to this remarkably wide distribution of quercetin, it is to be noted that nature provides more variety among the anthoxanthins than among the anthocyanidins. They are already a numerous clan and fresh representatives are constantly being discovered.

Among the better known of these colouring matters the following may be mentioned (in all cases, excepting possibly chrysin, the substances occur in the plant in combination with sugars). Chrysin, $C_{15}H_{10}O_4$, is contained in the leaf buds of the poplar; apigenin, $C_{15}H_{10}O_5$, in the leaves, stem and seeds of parsley, and also in camomile flowers; galangin, $C_{15}H_{10}O_5$, in galanga root; luteolin, $C_{15}H_{10}O_6$, in weld. This latter dried herbaceous plant, *Reseda luteola,* an extract of which formed the oldest known European dyestuff, is said to have been used by nations north of the Alps in the time of Julius Caesar. Weld gives a beautiful and fast yellow on silk mordanted with alumina and still finds a limited application in the dyeing of certain materials used in military uniforms. Kaempferol, also $C_{15}H_{10}O_6$, occurs in *Delphinium consolida;* and a third isomeride, fisetin, is the colouring matter of the wood of *Rkus cotinus* which comes into commerce as "young fustic." Old fustic is the wood of the tree *Chloroplzora tinctoria* and contains morin, $C_{15}H_{10}O_7$, which is the most important of the natural dyestuffs of this group. Myricetin, $C_{15}H_{10}O_8$, is found in the box-myrtle of China and in numerous other plants; its isomerides, gossypetin and quercetagetin, are the colouring matters of cotton flowers and the African marigold respectively.

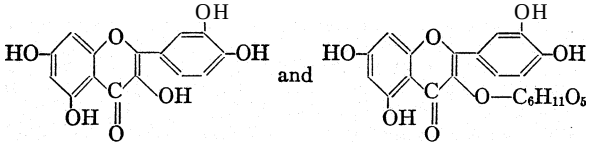
Constitutional Relationships.—The results of the investigations made with the object of unravelling the molecular structure of these substances have demonstrated that they are all based on a single type, and actually the molecules of each of these colouring matters can be constructed from those of a substance called flavone, $C_{15}H_{10}O_2$, by replacing one or more hydrogen atoms by hydroxyl (—OH) groups. This fact was recognized in some of the above cases at a time when flavone itself was unknown, and on account of the interest attaching to the simplest representative of an important group of naturally occurring compounds, Kostanecki prepared it artificially in 1898. Muller in 1915 made the remarkable discovery that the "meal" or "farina" of *Primula pulverulenta* and *P. japonica* consisted largely of flavone identical with the synthetic preparation of Kostanecki. The atoms in the molecule of flavone are connected in the manner shown in the annexed figure and the various anthoxanthins are substances the molecules of which may be imagined to be derived from those of flavone by replacing a number of the hydrogen atoms (H) by —OH groups, sometimes by $-OCH_3$ groups and then attaching sugar molecules through some of the —OH groups.

Arrangement of Atonzs in the Flavone Molecule

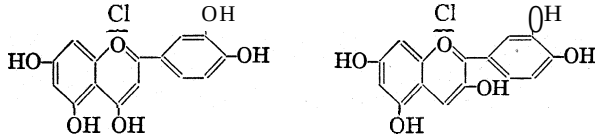


Two of the rings in the flavone molecule are benzene rings and the third, containing an oxygen atom, is a pyrone ring. (The precise mode of linkage between carbon atoms is irrelevant to the present discussion.) The various positions in the flavone nucleus are denoted by numerals, and the positions of hydroxyl groups in some of the above-mentioned anthoxanthins are as follows:—chrysin, 5:7; apigenin, 4′:5:7; galangin, 3:5:7; luteolin, 3′:4′:j:7; kaempferol, 4′:3:5:7; fisetin, 3′:4′:3:7; quercetin, 3′:4′:3:5:7; morin, 2′:4′:3:5:7; myricetin, 3′:4′:5′:3:5:7. The nine representatives just cited and several others have been synthesized by methods such as to leave no doubt in regard to their molecular constitution, and in all cases the natural and synthetic products have been found by careful comparison to be identical. The occurrence of a hydroxyl group in position 3 has a considerable influence on the properties of the colouring matters; those that contain it are called "flavonols" and are usually characterized by more powerful tinctorial properties and greater strength as bases than isomerides not hydroxylated in this position. It has been found that

the sugar molecules are usually attached through oxygen atoms in positions 3 or 7. Thus quercetin and quercitrin (see above) have the following respective structural formulae.

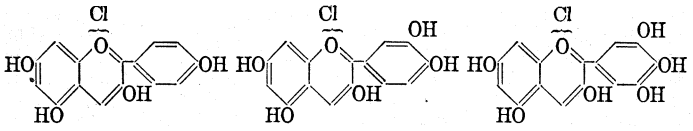


These were determined by modifying the free —OH groups in quercitrin, subsequently detaching the sugar group and detecting the situation of the free —OH groups thus produced. A comparison of the composition of the flavones and flavonols with that of the anthocyanidins, discloses a simple relation. Cyanidin chloride, $C_{15}H_{11}O_6Cl$, is just HCl more than luteolin, $C_{15}H_{10}O_6$. Cyanidin chloride is not, however, luteolin hydrochloride, although the relation between the substances is very close, and on treatment with hot aqueous alkali, cyanidin and luteolin give identical fission products. These have the benzene rings intact so that cyanidin and luteolin, if the former is based on the flavone ring system, can differ only in the pyrone ring portion of the molecular structure. In accordance with modern conceptions, the formation of ammonium chloride from ammonia and hydrogen chloride involves the passage of the positively-charged hydrogen atom (proton) to the ammonia forming a positively-charged complex. This leaves a negatively-charged chlorine atom and the process may be represented by the scheme: NH_3 and $\overset{+-}{H}Cl \rightarrow \overset{+}{N}H_4 \; \} \; \bar{C}l$. Similarly, the pyrone salts are formed by the proton of the acid passing to an oxygen atom, and we can formulate luteolin hydrochloride on the probable assumption that the proton combines with oxygen in position 4.



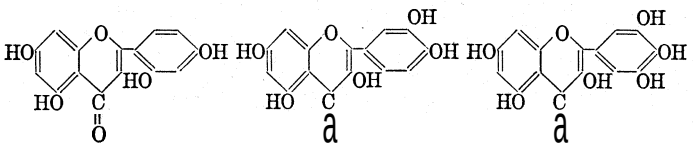
Luteolin hydvochloride — *Cyanidin* chloride

The constitution figured for cyanidin chloride was suggested by, rather than deduced from, these facts, but it has been conclusively proved to be correct by synthesis in several different ways. Pelargonidin chloride is similarly constructed, but lacks the —OH group in position 3′, while delphinidin chloride is cyanidin chloride with an additional —OH group in position 5′. Pelargonidin chloride and delphinidin chloride have also been artificially prepared. The formulae of the three anthocyanidins (chlorides) are given below.



Pelargonidin chloride — *Cyanidin* chloride — *Delphinidin* chloride

These may be compared with certain flavonols expressed similarly.



Kaempferol — Quercetin — Myricetin

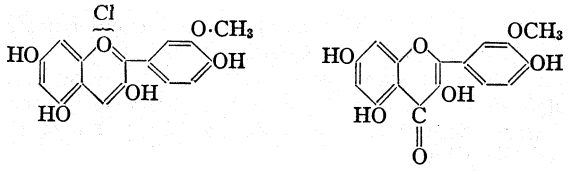
Evidently if we were able to remove the oxygen in position 4 in presence of HCl it would be possible to convert the flavonols into the anthocyanidins as shown in the example -

$$\underset{\text{Quercetin}}{C_{15}H_{10}O_7} + HCl + H_2 = \underset{\textit{Cyanidin}\text{ chloride}}{C_{15}H_{11}O_6Cl} + H_2O$$

and thus the close relationship of the individuals in the two groups would be established. Actually the transformation is most difficult to effect, and although numerous workers claim to have been successful, the experimental control has not always been satisfactory. The authentic example is furnished by the work of Willstätter and Mallison, who converted quercetin into cyanidin chloride by means of magnesium in methyl-alcoholic aqueous hydrochloric acid solution. The yield was very poor, since most of the quercetin underwent a different transformation. Nature may have at command a more effective method of reduction, anthocyanins being produced in the plant by deoxygenation (reduction) of the anthoxanthins, considered to be the primary products.

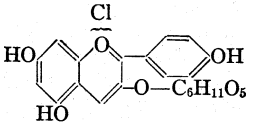
Against this hypothesis, it seems equally probable that the anthocyanins and anthoxanthins represent end-products obtained by divergent processes from a common parent. It is the exception rather than the rule to find the most closely related anthocyanins and anthoxanthins occurring together in a plant. Thus Delphinium *consolida* gives kaempferol and a delphinidin derivative, and there is no evidence that the facile changes in anthocyanin production in passing from one garden variety to another are echoed by changes in the anthoxanthins. Furthermore the range of anthocyanidins is much more restricted than that of anthoxanthins.

In favour of the hypothesis may be counted the circumstance that, so far as we know at present, the groups such as $—OCH_3$ and sugar groups that are attached to the fundamental nuclei occupy corresponding positions in the anthoxanthins and anthocyanins. We may compare, for example, the formulae of peonidin chloride, the anthocyanidin from the peony and isorhamnetin from yellow wallflowers. Both have been synthesized.



Peonidin chloride — iso*Rhamnetin*

The sugar residue of monoglycosides is frequently attached to position 3 in both anthoxanthins and anthocyanins. The second sugar residue of the dimonogiycosides usually occupies position 5. It is generally recognized that the diglycosides in both series contain disaccharide units. That is, the attachment involves only one hydroxyl group of the anthocyanidin. One anthocyanin has been artificially prepared, namely, callistephin from the aster, and in this substance the sugar is beyond question in position 3.



Callistephin chloride

Betanin, responsible for the red colour of beets, is an unusual anthocyanin in that it contains nitrogen, probably as ornithine or some similar nitrogenous base. This basic group is attached to the anthocyanidin molecule in addition to a sugar group. Such pigments are very unstable when extracted.

Some characteristic properties of the anthocyanins are the following:

Chemical Reactions. — Amy1 Alcohol-Dilute Hydrochloric Acid Distribution Ratio. — The anthocyanidins, the monoglycosidic anthocyanins and the diglycosidic anthocyanins can be roughly distinguished by their behaviour in presence of a mixture of amyl alcohol and very dilute hydrochloric acid. The anthocyanidins pass completely to the amyl alcohol layer; the diglycosidic anthocyanins remain largely in the aqueous layer, unless one of the sugar groups is rhamnose, when the behaviour tends to be monoglycosidic; the monoglycosides distribute themselves more evenly between the two layers.

Ferric Chloride Reaction. — Anthocyanins or anthocyanidins with free —OH groups in positions 3′ and 4′ (*e.g.*, cyanidin, delphinidin) give an intense blue colouration in alcoholic solution on the addition of ferric chloride. The colour becomes violet on the addition of water. The fact that all the anthocyanins derived from cyanidin exhibit this reaction proves that the sugar is not attached to positions 3′ and 4′ in any of them. Characteristic colour reactions have been developed for both anthocyanins and anthoxanthins.

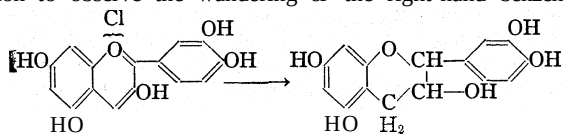
Colour Bases and Pseudo-bases. — In most cases the addition of sodium acetate to an aqueous solution of an anthocyanin (idin) produces a violet or purple precipitate of a colour base. Again, the addition of water to an alcoholic solution of cyanidin chloride causes the slow separation of the colour base in a form exhibiting a characteristic green colour. Addition of acid reproduces the cyanidin salt. These colour bases have been more closely investigated in other related series and have a quinonoid nature. They absorb water, giving colourless compounds also convertible by acids to the anthocyanin salts, and these so-called pseudo-bases are often formed on the great dilution of the aqueous or alcoholic solutions of the anthocyanin salts. Decolourization of the solutions of natural pigments and subsequent reappearance of the colour was a puzzling phenomenon encountered by some of the earlier workers in the group.

Cyanidin colour-base (Deep violet) — *Cyanidin* pseudo-base (*Colourless*)

It remains to be added that anthocyanins and anthoxanthins have a close relation to certain colourless plant constituents, and among

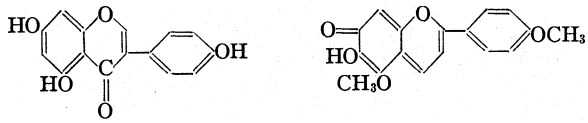
these catechin occupies an important position. Freudenberg has shown that both quercetin and cyanidin on treatment with hydrogen and a catalyst yield one of the naturally occurring catechins shown below.

In the course of his experiments on catechin, Freudenberg has had occasion to observe the wandering of the right-hand benzene ring



Cyanidin chloride *dl-Epicatechin*

from position 2 to position 3. It is therefore interesting to notice that genistein, an anthoxanthin of dyers broom, has been definitely proved to have the following structure.



Genistein *Carajurin*

The blue colour of some flowers is not due to the effect of alkaline cell sap on anthocyanins but to the presence of a colourless or slightly coloured co-pigment as an addition compound. Tannins and flavones often act in this capacity. The principal chemical factors affecting the colours in cell sap are: (1) the nature and concentration of anthocyanins, (2) the state of aggregation of the anthocyanins, which is affected by the pH and by protective colloids such as pentosans, (3) the presence of co-pigments, and (4) possibly the presence of alkaloids and metallic complexes.

The chemistry of anthocyanin pigments is of considerable practical importance in the canning industry. Anthocyanins of fruits form insoluble salts of tin and iron, after these metals are made available by corrosion of the cans initiated by fruit acids. Thus, high anthocyanin content may greatly increase the corrosion over that which could be attributed to the acid alone. Fruit quality is thereby lowered.

Finally, it may be remarked that carajurin, a crystalline constituent of "carajura," is related to the anthocyanin group. Carajura, a bright red pigment, is prepared by the Indians of the Rio Meta and Orinoco for use as a flesh paint, since it is a very effective colouring agent.

(R. ROB.; F. P. Z.)

ANTHOLOGY, a term literally denoting a garland or collection of flowers (Gr. *ἀνθολογία,* Lat. *florilegium*), hence a collection of short pieces or extracts, especially in verse, and in particular:

The Greek Anthology.— The art of occasional poetry had been cultivated in Greece from an early period, especially for short inscriptions *(epigrammata)* of all kinds. These must necessarily be brief, and Greek taste prescribed that they should also be well expressed and pointed. The term *epigram* was soon extended to any piece by which these conditions were fulfilled, and the favourite metre for such compositions was the elegiac couplet. The transition from the monumental to the purely literary epigram was favoured by the conditions of the Alexandrian era *(see* ALEXANDRIAN SCHOOL). About 60 B.C. the sophist and poet, Meleager of Gadara, made an important collection, drawing on various earlier ones. This he entitled *The Garland,* and in an introductory poem each poet is compared to some flower. The arrangement of his collection was alphabetical, according to the initial letter of each epigram.

In the age of the emperor Tiberius (or Trajan, according to others) the work of Meleager was continued by another epigrammatist, Philippus of Thessalonica, who first employed the term *anthologia.* His collection, which included the compositions of thirteen writers subsequent to Meleager, was also arranged alphabetically, and contained an introductory poem. Somewhat later, under Hadrian, another supplement was formed by the sophist Diogenianus of Heracleia (2nd century A.D.), and Straton of Sardis compiled or composed his Μοῦσα Παιδική, *Musa Puerilis.* No further collection is recorded until the time of Justinian, when epigrammatic writing experienced a great revival at the hands of Agathias of Myrina, the historian, Paulus Silentiarius, and other classicizers. Agathias then drew up a new anthology, entitled *The Circle;* it was the first to be divided into books and arranged with reference to the subjects of the pieces.

These, and other collections made during the middle ages, are now lost. The partial incorporation of them into a single body, classified according to the contents in 15 books, was the work of a certain Constantinus Cephalas, (before 917). He appears merely to have made excerpts from the existing anthologies, with the addition of selections from Lucillius, Palladas, and other epigrammatists, whose compositions had been published separately. His arrangement, to which further reference will be made, is founded on a principle of classification, and nearly corresponds to that adopted by Agathias. This collection more or less corresponds to the contents of a ms. formerly the property of the Elector Palatine, now partly at Heidelberg, partly at Paris. It is often called the *Palatine Anthology.* The last anthology is the *Planudean,* named after its editor, Maximus Planudes (1320), who not merely grievously mutilated the anthology of Cephalas by omissions, but disfigured it by interpolating verses of his own. We are, however, indebted to him for the preservation of the epigrams on works of art, which seem to have been accidentally omitted from the Palatine ms.

The Planudean anthology (in seven books) was first published at Florence, by Janus Lascaris, in 1494. It long continued to be the only accessible collection, for although the Palatine ms. was discovered and copied by Saumaise (Salmasius) in 1606, it was not published until 1776, in Brunck's *Analecta Veterum Poetarum Graecorum.* Brunck's edition was superseded by that of Friedrich Jacobs (1794–1814, 13 vols.), the text of which was reprinted in a more convenient form in 1813–17. The best edition for general purposes is still that of Diibner and Cougy (Didot, 1864–92; 3 vols.), which contains the Palatine Anthology, the epigrams of the Planudean anthology not comprised in the former, an appendix of pieces derived from other sources, notes, and Latin versions. The best edition of the Planudean anthology is the splendid one by van Bosch and van Lennep (1795–1822). There is also an incomplete text by Stadtmiiller in the Teubner series.

Arrangement.— The Palatine ms., the archetype of the present text, was transcribed by different persons at different times, and the actual arrangement of the collection does not correspond with that signalized in the index. It is as follows: Book 1. Christian epigrams; 2. Christodorus's description of certain statues; 3. Inscriptions in the temple at Cyzicus; 4. The prefaces of Meleager, Philippus, and Agathias to their respective collections; 5. Amatory epigrams; 6. Votive inscriptions; 7. Epitaphs; 8. The epigrams of Gregory Nazianzen; 9. Rhetorical and illustrative epigrams; 10. Ethical pieces; 11. Humorous and convivial; 12. Strato's *Musa Puerilis;* 13. Metrical curiosities; 14. Puzzles, enigmas, oracles; 15. Miscellanies. The epigrams on works of art, as already stated, are missing from the *Codex Palatinus,* and must be sought in an appendix of epigrams only occurring in the Planudean anthology.

Style and Value.--One of the principal claims of the anthology to attention is derived from its continuity, its existence as a living and growing body of poetry throughout all the vicissitudes of Greek civilization. Four stages may be indicated:— 1. The Hellenic proper, of which Simonides of Ceos (c. 556–469 B.C.), the real or supposed author of most of the sepulchral inscriptions on those who fell in the Persian wars, is the characteristic representative. This is characterized by simple but impressive phraseology, suited to a real inscription. 2. The Alexandrian era, when epitaphs and votive inscriptions were composed on subjects often imaginary. Point, wit, and ingenuity—in short, the qualities we call epigrammatic—often joined to genuine emotion, mark these compositions. The great exponents are Callimachus, Leonidas of Tarentum, a contemporary of Pyrrhus, and, later, Antipater of Sidon, about 140 B.C. 3. The later Hellenistic, or Roman period, of which Meleager himself is an excellent representative. A less severe taste in style, occasional grossness in subject, and a lavish, often very happy, use of epithet mark him and his imitators. At a later period of the empire another *genre,* hitherto comparatively in abeyance, was developed, the

satirical. Lucillius, who flourished under Nero, and Lucian (perhaps Lucian of Samosata) have left us a number of witty lampoons and pasquinades on persons real or imaginary. Palladas, an Alexandrian grammarian of the 4th century, may be taken as closing this epoch. 4. The fourth or Byzantine style of epigrammatic composition was cultivated by the *beaux-esprits* of the court of Justinian. To a great extent this is merely imitative, but the circumstances of the period operated so as to produce a species of originality. The writers, moreover, were men of genuine poetical feeling, ingenious in invention, and capable of expressing emotion with energy and liveliness; the colouring of their pieces is sometimes highly dramatic.

While it contains a certain amount of dull, puerile, or indecent trash, mostly late, the value of the Greek Anthology is high on the whole, both as literature and for the light it throws on Greek life, thought, and feeling during some 1900 years. Its influence on modern European literatures is enormous.

Translations, Imitations, **etc.**—The best versions of the Anthology ever made are the Latin renderings of select epigrams by Hugo Grotius. They are most easily accessible in the Didot edition and in Dr. Wellesley's *Anthologia Polyglotta* (1849). The best literal and complete English translation is that in the Loeb series (W. R. Paton); a few pieces, however, are rendered into Latin, for obvious reasons. Of selections with prose or verse translations may be mentioned J. W. Mackail, *Select Epigrams from the Greek Anthology,* 1890, revised 1906; Graham R. Tomson (Mrs. Marriott Watson), *Selections from the Greek Anthology* (1889); W. H. D. Rouse, *Echo of Greek Song* (1899); *L.* C. Perry, *From the Garden of Hellas* (New York, 1891); W. R. Paton, *Love Epigrams* (1898); *H.* Macnaughten, *Little Masterpieces from the Anthology* (1924); Humbert Wolfe, *Others Abide* (1927). For critical discussion besides the histories of Greek literature, we may mention J. A. Symonds, *Studies of the Greek Poets* (3rd ed., 1893).

The Latin Anthology. — A modern collection of fugitive Latin verse, from the age of Ennius to about A.D. 1000. Nothing corresponding to the Greek Anthology is known to have existed among the Romans. The first general collection was Scaliger's *Catalecta veterum Poetarum* (1573), succeeded by the more ample one of Pithoeus, *Epigrammata et Poemata e Codicibus et Lapidibus collecta* (1590). Numerous additions, principally from inscriptions, continued to be made, and in 1759–73 Burmann digested the whole into his *Anthologia veterum Latinorum Epigrammatum et Poematum.* This, occasionally reprinted, was the standard edition until 1869, when Alexander Riese commenced a new and more critical recension. The first volume (in two parts) appeared in 1869–70; the second volume, *Carmina Epigraphica* (in two parts), in 1895–97, edited by Biicheler. An *Anthologiae Latinae Supplementa,* in the same series, followed. A new edition (Riese-Biicheler-Lommatzsch: Teubner 1894–1926) has now replaced it. (R. G.; H. J. R.)

Modern Anthologies. — The representative modern anthology is, in intention at least, a critical selection designed to give the reader the very best in the verse or prose of a particular literature; the earlier, however, are mostly miscellanies with less critical ambition, like the numerous English compilations of the 16th and early 17th centuries. Among the most notable of these last are: *Tottel's Miscellany* (1557), rich in Wyatt and Surrey; *The Paradise of Dainty Devices* (1576); *The Phoenix Nest* (1593), containing a dozen till then unpublished pieces by Lodge; the popular ill-selected *England's Parnassus* (1600); *England's Helicon* (1602), representing Sidney, Spenser, Greene among others; Davison's *Poetical Rhapsody* (1602). Percy's *Reliques of Ancient English Poetry* (1765) had an immense influence on the poets of the next generation, and Allan Ramsay's *Tea-table Miscellany* (1724–40) gave Burns models. Later selections of verse include Southey's *Select Works of the British Poets* (1831); Campbell's *Specimens of the British Poets* (1841); *F.* T. Palgrave's *Golden Treasury* (1861), a classic; Locker-Lampson's *Lyra Elegantiarum* (1867, revised 1891); T. H. Ward's *English Poets* (1883); Quiller-Couch's *Oxford Book of English Verse* (1900); *W.* B. Yeats's *The Oxford Book of Modern Verse* 1892–1935 (1936). English prose has never been anthologized with great success, but the works, edited by Craik, Saintsbury, Galton, and Quiller-Couch's *Oxford Book of English Prose* may be mentioned.

Noteworthy American anthologies include:

The Columbian Muse (1794); Edmund Clarence Stednian, *An American Anthology, 1787–1899* (Boston, 1900); Walter Cochrane Bronson, *American Poems, 1625–1892* (Chicago, 1916); Harriet Monroe and Alice Corbin Henderson, *The New Poetry: An Anthology* (1917); Louis Untermeyer, *Modern American Poetry* (1919, revised and enlarged 1936); James Welden Johnson (ed.), *The Book of American Negro Poetry* (1922); Marguerite Ogden Wilkinson, *Contemporary Poetry* (1923); Bliss Carman (ed.), *The Oxford Book* of *American Verse* (1927); Conrad Aiken, *American Poetry* (1929); Alfred Kreymborg, *Lyric America* (1930); Louis Untermeyer, *American Poetry from the Beginning to Whitman* (1931); H. H. Clark, *Major American Poets* (1936).

Of foreign anthologies may be noted: For French, E. Crepet, *Poètes français* (4 vols., 1861), and G. Walch, *Anthologie des poètes français contemporains* (5 vols., 1906, etc.); for German, the works edited by Bartsch, Goedeke and Tiltmann (1867–83), H. Fiedler; for Italian, the works by Carducci and Mamiani; for Spanish, the anthologies of Menéndez y Pelayo. Oriental anthologies are very numerous but mostly uncritical.

ANTHON, CHARLES (1797–1867), American classical scholar, was born in New York city Nov. 19 1797. After graduating with honours at Columbia college in 1815, he began the study of law, and in 1819 was admitted to the bar, but never practised. In 1820 he was appointed assistant professor of Greek and Latin in his old college and later full professor, becoming also headmaster of the grammar school attached to the college, which post he held until near the end of his life. He died at New York July 29 1867. He produced for use in colleges and schools annotated editions of many classical works, which delighted the students by the assistance they afforded and various classical handbooks.

ANTHONY, SAINT (c. A.D. 250–350), the first Christian monk, was born in middle Egypt. At the age of 20 he began to practise an ascetic life, and after 15 years of this life, he withdrew for solitude to a mountain by the Nile, called Pispir, now Der el Memum, opposite Arsinoe in the Fayum. In the early years of the 4th century, he emerged from his retreat to organize the monastic life of the monks who imitated him. After a time, he again withdrew to the mountain by the Red sea, where now stands the monastery that bears his name (Der Mar Antonios). Shortly before his death, he ventured to Alexandria to preach against Arianism.

Anthony is noted for his combats with the hosts of evil. Athanasius tells us that he was first tempted by thoughts of family joys and duties, and of the difficulty of his chosen life, but the devil finding argument of no avail, and hoping to arouse in him the pride of success, appeared as a cringing black boy admitting that he had been defeated by the saint. At other times he appeared under the guise of a monk bringing him bread during his fasts, or under the form of wild beasts, women or soldiers, sometimes beating the saint and leaving him as dead.

Anthony is also recognized as the father of Christian monachism. The monastic rule which bears his name was not written by him, but was compiled from writings and discourses attributed to him in the *Life* and the *Apophthegmata Patrum.* The rule is still observed by a number of Coptic Syrian and Armenian monks. (*See* MONASTICISM.)

BIBLIOGRAPHY.—The Greek *Vita* is among the works of St. Athanasius; for the almost contemporary Latin trans. *see* Rosweyd's *Vitae Patrum* (Migne, *Patrol Lat.* lxxiii.); English trans. in the Athanasius volume of the "Nicene and Post-Nicene Library." Accounts of St. Anthony are given by Card. Newman, *Church of the Fathers* (Historical Sketches) and Alban Butler, *Lives of the Saints* (Jan. 17). Discussions of the historical and critical questions will be found in E. C. Butler, *Lausiac History of Palladius* (1898, 1904), part i., pp. 197, 215–228; part ii., pp. 9–12; and Contzen, *Die Regel des hl. Antonius* (Melten, 1896).

ANTHONY, SUSAN BROWNELL (1820–1906), American reformer, was born at Adams (Mass.), on Feb. 15, 1820. After being a school-teacher for 15 years she organized in 1852 the first woman's state temperance society in America, and in 1856 became the agent for New York state of the American

Anti-slavery Society. After 1854 she devoted herself almost exclusively to the agitation for woman's rights. From 1868 to 1870 she was the proprietor of a weekly paper, The Revolution, published in New York, edited by Mrs. Elizabeth Cady Stanton, and having for its motto, "The true republic—men, their rights and nothing more; women, their rights and nothing less." She was vice-president-at-large of the National Woman Suffrage Association from the date of its organization in 1869 until 1892, when she became president. For casting a vote in the presidential election of 1872, as, she asserted, the 14th Amendment to the Federal Constitution entitled her to do, she was arrested and fined $100, but she never paid the fine. In collaboration with Mrs. Elizabeth Cady Stanton, Mrs. Matilda Joslyn Gage, and Mrs. Ida Husted Harper, she published The History of Woman *Suffrage* (4 vols., New York, 1884–87). She died at Rochester (N.Y.), on March 13, 1906.

See Mrs. Ida Husted Harper's Life and Work of *Susan* B. *Anthony* (Indianapolis, 1898–1908).

ANTHONY OF PADUA, ST. (1195–1231), Franciscan monk and saint, was born at Lisbon Aug. 15 1195. In his 15th year he entered the Augustinian order, and joined the Franciscans in 1220. He taught theology at Bologna, Toulouse, Montpellier and Padua, and won a great reputation as preacher throughout Italy. He was the leader of the rigorous party in the Franciscan order against the mitigations introduced by Elias, general of the order. His death took place at the convent of Ara Coeli, near Padua, June 13 1231. He was canonized by Gregory IX. in the following year, and his festival is kept on June 13. He is regarded as the patron saint of Padua and of Portugal.

BIBLIOGRAPHY.—The most trustworthy modern works are by A. Lepitre, St. *Antoine* de Padoue (Paris, 1902, in Les Saints series: good bibliography; Eng. trans. by Edith Guest, London, 1902), and by Léopold de Chérancé, St. Antoine de Padoue (Paris, 1895; Eng. trans., London, 1896). His works, consisting of sermons and a mystical commentary on the Bible, were published in an appendix to those of St. Francis, in the Annales *Minorum* of Luke Wadding (Antwerp, 1623), and are also reproduced by Horoy, Medii aevi bibliotheca *patristica* (1880, vi. pp. 555 et seq.); see art. "Antonius von Padua" in Herzog-Hauck, *Realencyklopädie.*

ANTHOZOA (*i.e.*, "flower-animals"), a group of animals belonging to the phylum Coelenterata (*q.v.*). Many of them form a strong skeleton known as "coral" (*q.v.*). The term "coral" is applicable to the hard parts of any Coelenterate which secretes a firm skeletal support, but most of these forms are Anthozoa, and amongst them the term "true coral" is applied to the group Madreporaria only. The flower-like shape and brilliant colouring of the soft parts of many of these creatures has attracted attention for hundreds of years, and the discovery that they are indeed animals instead of being plants, minerals, or intermediate organizations, did not gain acceptance for some time after it was first made, in connection with the precious red coral of commerce, by J. A. de Peyssonel in 1727.

Not all the Anthozoa produce a skeleton. A hard support is quite lacking in the Sea Anemones, and among the other kinds of Anthozoa although it is present more often than not it does not necessarily form a mass sufficiently compact to retain its shape after the death of the soft parts.

An Anthozoan may consist of a single polyp (this term is defined in the article COELENTERATA), as it does in the case of a Sea Anemone; but more frequently a colony is formed, containing a number of polyps permanently united together; and it is the skeletons built up by certain of these colonies which constitute the most characteristic "coral."

The Anthozoa as a class are distinguished from the other groups of the Coelenterata not only by the structure of the individual polyps, but also by the fact that none of them at any time during their life-history assumes the form of medusae ("jellyfish," see COELENTERATA). The Anthozoan individual or colony therefore corresponds to the polyp-generation of any Coelenterate which exhibits both polyp and medusa alternately during its life-cycle. The Anthozoan polyps themselves, though often small, tend to be more muscular and substantial than those of other Coelenterates. They are characterized by the possession of a body which is in principle a cylinder, closed in above and below by two discs of tissue. The upper disc or peristome is encircled by a corona of hollow tentacles, and is perforated in the centre by a more or less slit-shaped mouth. Leading inwards from the mouth is a flattened tube, the throat, which opens directly into the main cavity of the body (coelenteron). The latter cavity is partially subdivided into alcoves by a series of radially arranged membranous partitions, the mesenteries, some or all of which are inserted along the upper part of their inner edge into the outer wall of the throat. The mesenteries bear along their free edge a marginal thickening of epithelium known as the *mesenterial filament*, and also carry reproductive organs and muscles. The number and arrangement of the mesenteries as well as the structure of throat, mesenteries, and filaments, varies from one group of Anthozoa to another.

The symmetry of the Anthozoan body presents to the casual observer a radial appearance, in common with that exhibited by the Coelenterata in general. Underlying this radial symmetry, there becomes revealed on closer inspection a fundamental bilateral symmetry, which is so definite that it is actually possible to divide a polyp into two perfectly equivalent halves along one plane of cleavage only. Much discussion has been aroused by this fact since there is no obvious reason why such a symmetry should exist at all. The probable explanation of the matter is that the Anthozoa were not always the sedentary radially arranged creatures which they are to-day. There may have been a phase in their history when they were small creeping animals with definite head and tail ends, upper and lower sides, and general bilateral symmetry. When such animals adopted a sedentary life and assumed a radial symmetry in correlation therewith, the former bilateral condition would remain as a vestige of the former state of affairs. The bilateral arrangement of parts is very prominent during the early development of a polyp.

An important fact in the development of many Anthozoa is that the wall of the cylindrical body appears to become marked out after the early stages are passed, into vertical strips of which some are zones in which active differentiation of new parts takes

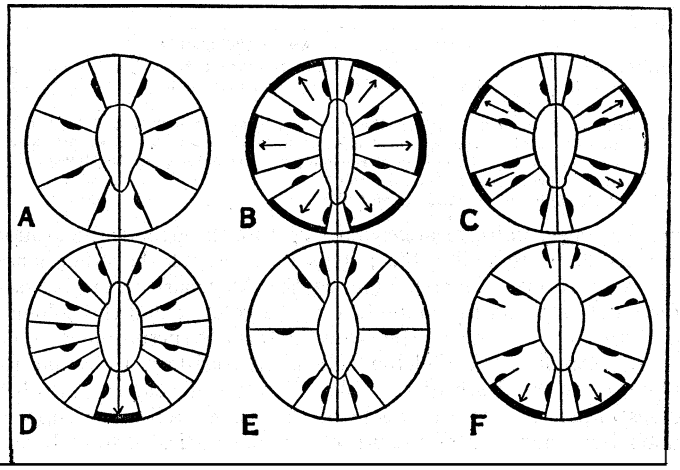

FIG. 1.— ARRANGEMENT OF THE MESENTERIES AND OF THE ZONES OF GROWTH IN VARIOUS ANTHOZOA

Each diagram represents a transverse section of a polyp. The outer circle is the body-wall, the central oval the throat, with siphonoglyphs indicated as small bays. The radiating lines are the mesenteries, the black thickening of each being its retractor. The vertical line in the centre on each figure in the illustration represents the axis of symmetry, and growth-zones on the body-wall are indicated by thick black lines. A. An Alcyonarian; B. An ordinary Sea Anemone; C. An Endocoelactid; D. A Cerianthid; E. An Antipatharian; F. A Zoanthid

place, others being zones in which, after a stated amount of structure has been formed, no new parts are added (fig. 1). In various groups of Anthozoa the arrangement of the mesenteries in the adult polyp depends on the relationship which the zones of active growth in the body-wall bear to those in which only a certain amount of differentiation of parts will take place. In other cases no new growth takes place after the early stages, and here a simpler plan of structure consequently prevails.

The axis of symmetry sometimes possesses a distinct significance with regard to the regeneration of parts of an adult polyp

which have been separated from the whole. In the Sea Anemones this axis coincides with a non-growing zone, and if in a suitable anemone a fragment of reasonable size be cut away from the edge of the animal's base, in such a way that the lower ends of the two "directive" mesenteries which flank the axis lie in its centre, the piece will in many cases regenerate an animal with two heads instead of one. A similar piece containing no directives will regenerate an ordinary one-headed adult.

The living Anthozoa fall into six principal series, the Alcyonaria, Actiniaria, Madreporaria, Zoanthinaria, Ceriantharia, and Antipatharia. These sub-classes are distinct from one another. Space forbids consideration of the three last groups mentioned, which contain relatively few and aberrant representatives. The three large groups will now be described.

I. ALCYONARIA

The Alcyonaria contrast sharply with the two other main groups (Actiniaria and Madreporaria). Alcyonarians almost invariably construct colonies. Their polyps are usually small and

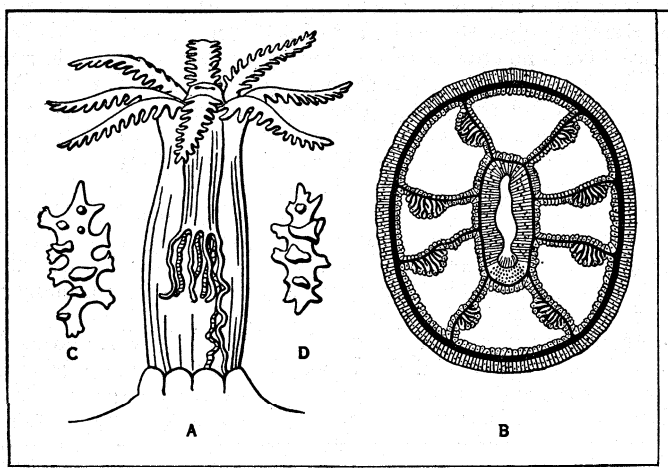

FIG. 2.—THE STRUCTURE OF AN ALCYONARIAN POLYP

B. Transverse section of polyp showing the throat in centre and bodywall outside, each comoosed of three layers. The 8 mesenteries are also visible, the thickenings on these being the retractors. At the lower end of the throat is the siphonoglyph

C. and D. Spicules, greatly magnified

are extremely uniform in general structure throughout the group; in this they are unlike the polyps of either of the other large series of forms. Diversity among the Alcyonaria therefore affects not so much the individual as the colony; and the colonies constructed vary most extensively in form, structure, and mode of development. A skeleton sufficiently resistant to retain its shape after the death of the colony is often developed; in other cases either part or the whole of the colony relies for support upon large numbers of minute calcareous bodies, which abound in its tissues, and which are known as *spicules*. Thus the Alcyonaria include a number of creatures which produce "coral." They are a group of corals which in the main inhabit the shore and the coastal waters down to 550 fathoms. Speaking generally the great depths of the sea as well as considerations of temperature and salinity limit their occurrence. Their centre of distribution is the Indo-Pacific littoral and they form an important element in coral-reefs.

A typical Alcyonarian polyp (fig. 2) is simpler in structure, as well as being less variable from one genus to another than that of most other Anthozoa. It possesses eight, and only eight, tentacles, and these are feathered by the presence of a paired series of lateral branches on each; *i.e.*, they are *pinnate*. Down one angle of the flattened throat runs a groove lined by strongly ciliated epithelium. This is the *siphonoglyph*, and it creates a downward current of water into the coelenteron of the polyp. There are eight mesenteries, which alternate in position with the eight tentacles. These mesenteries possess each a special strip of muscle down one side, the fibres in the strip being supported by ridges or lamellae of mesogloea and running in a longitudinal direction. The whole strip of muscle is known as a *retractor*. By their contraction these muscles pull the upper parts of the polyp downwards and inwards during the act of retraction. Each mesentery also possesses a filament; but the filaments of all the mesenteries are not alike. Those which belong to the tw6 mesenteries farthest away from the siphonoglyph are very long.. Each has a groove along its free edge, lined by cells with long cilia; it is Y-shaped in a transverse section. The function of these filaments is circulatory. The filaments of the other six mesenteries are shorter and consist of an epithelial cord containing many glandular cells; these filaments are digestive organs. The six last-mentioned mesenteries also contain concentrations of sex-cells *(gonads)*.

The eggs of Alcyonaria usually develop into free-swimming planulae *(see* COELENTERATA) which in due course settle down, either upon a hard support or in sand or mud, become transformed into polyps and by budding begin to construct a colony. The process of budding has this peculiarity, however, that no bud is produced direct from a polyp itself; the polyps give off hollow root-like structures, lined by endoderm *(see* COELENTERATA) and known as *solenia*, and from these the new buds arise.

The Alcyonaria offer almost the only examples to be found among the Anthozoa of that phenomenon known as *polymorphism*, which is discussed in the articles COELENTERATA and HYDROZOA. In certain Alcyonarian colonies there are two kinds of polyps; the ordinary ones such as those already described, and another kind known as *siphonozooids*. These latter are polyps whose parts are more or less reduced, with the exception of the siphonoglyph, which is large and strongly ciliated. These individuals act as creators of water-currents which circulate through the system of solenial canals penetrating the colony. In cases where a single original polyp becomes transformed into the axis of a colony this constitutes a further differentiation of individuals.

The Alcyonaria are divided into three orders, and since the structure and mode of formation of the colonies, in which rests the main interest of the group, is different in the three cases, it will be convenient from this point onwards to consider them separately.

Order 1. Alcyonacea.—The numerous Alcyonaria which belong to this class possess this in common; that although the

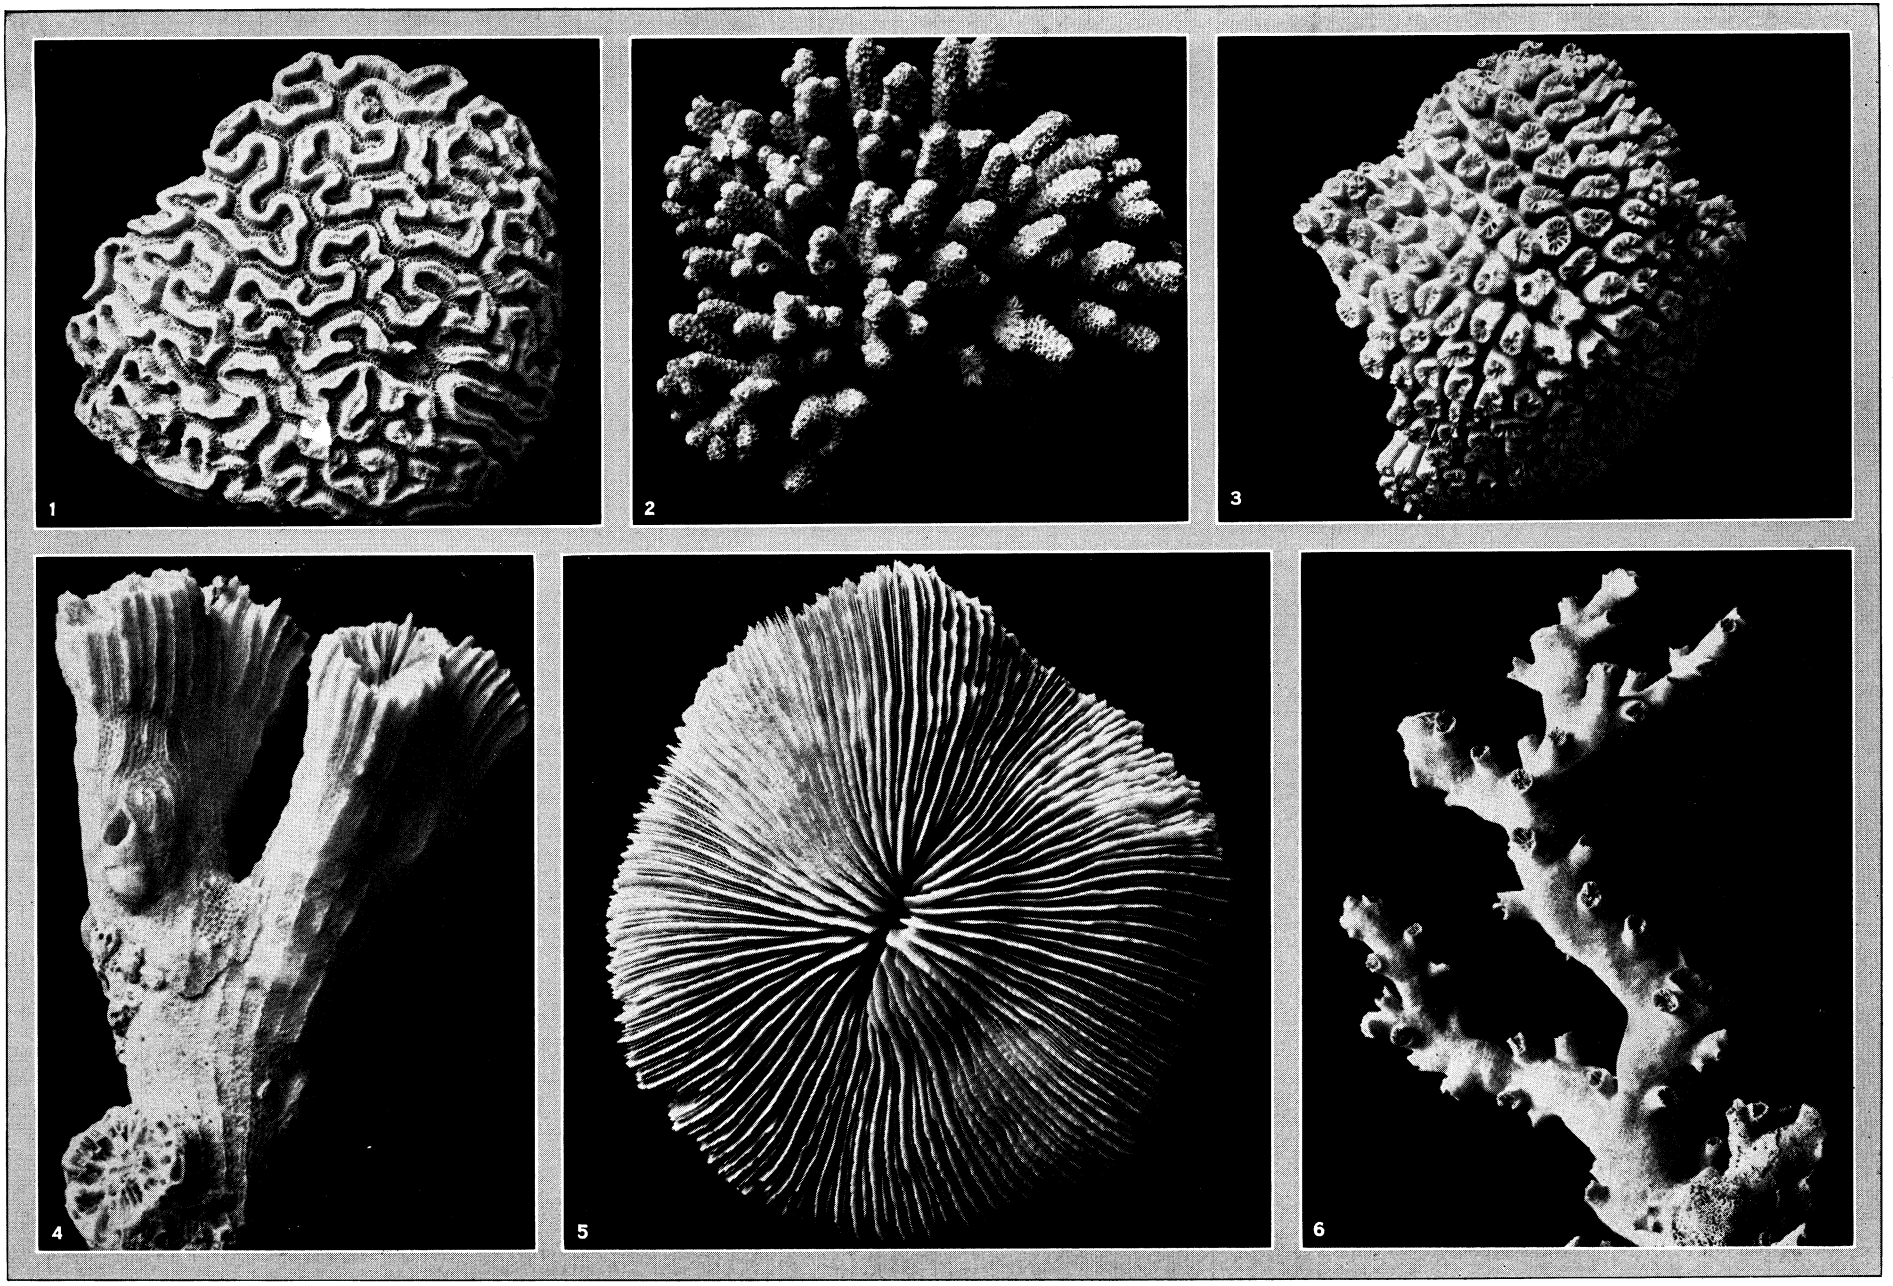
FIG. 3.—DIAGRAM OF A COLONY OF HICKSONIA OR TUBIPORA

The polyps are represented as if seen in longitudinal section but their mesenteries are omitted. The internal cavities of the polyps are continuous with the system of fine canals (shown as a network of black lines) which penetrate the common flesh of the colony

colonies which they form are extremely various, there is never an axial skeleton forming a central support. A conception of the colony-forming activities of the polyps can be gained only by the study of a series of actual colonies. Figs. 3–5 will serve to illustrate the following remarks.

In the simplest colonies the polyps are attached to a foreign surface and connected with one another simply by a few creeping rootlets (solenia) arising from their bases. Such a condition exists in *Cornzrlaria*. Somewhat more elaborate are colonies such as those of certain species of *Clavularia* in which the meshes of

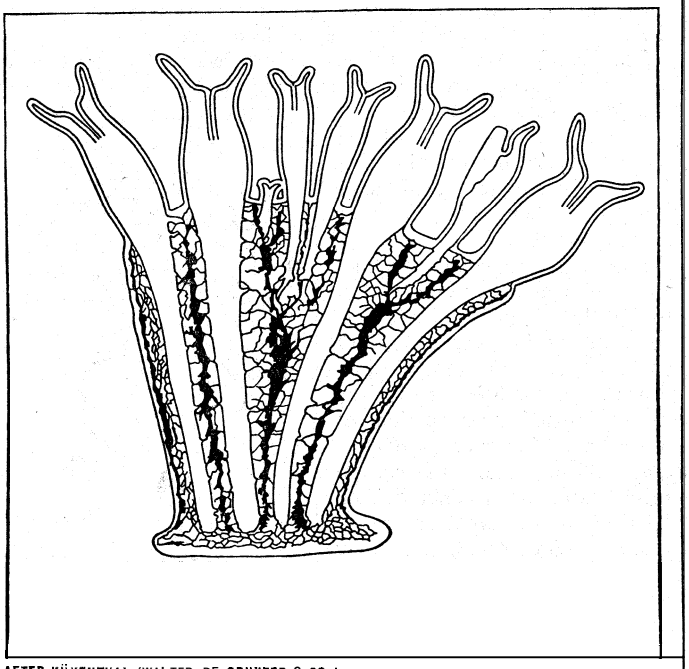


SKELETONS OF SOME TYPICAL SPECIES OF MADREPORE CORALS

1. Meandra cerebrum (brain coral) of the West Indian seas
2. Acropora, a genus of many species, found in all tropical seas
3. *Galaxea* cespitosa, of the eastern seas
4. *Eusmilia* fastigiata, a West Indian species
5. Fungia patella, found only in the Pacific and Indian oceans
6. *Dendrophyllia*, a genus of various species, widely distributed

the network of solenia have been filled up by solid mesogloea, and the network of rootlets has so been converted into a continuous mat, with ramifying endodermal tubes inside it, and covered externally both above and below by ectoderm. In neither of these colonies is there any firm skeleton; the support consists simply of an external horny layer covering the rootlets and the lower parts of the polyps *(Cornularia)* or of spicules *(Clavularia)*.

A different grade of organization appears in certain genera whose polyps tend to grow very tall, and are at the same time not



AFTER KÜKENTHAL (WALTER DE GRUYTER & CO.)

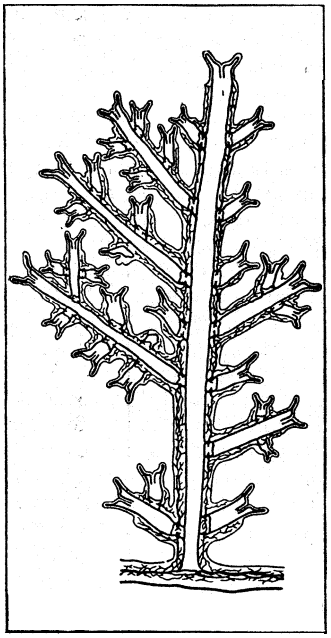
Similar in general principle to Alcyonium described in the text. See also fig. 3

unduly close to one another. In such a case bridges containing solenia may grow across from one polyp to another well above the level of the bases of the polyps *(Hicksonia)*. This process goes a stage farther in *Tubipora*. In this the polyps become inordinately long and narrow and diverge from one another as they grow up; and instead of throwing out isolated bridges across the gaps between them they develop a series of plate-like horizontal platforms which run at stated intervals one above the other across the colony. These platforms consist of mesogloea containing solenia, and are covered externally by ectoderm. From each successive platform new polyps arise. The original polyps grow upwards until a considerable number of platforms have been formed; they then stop, the other polyps continuing the colony. *Tubipora* produces a skeleton composed of firmly compacted spicules, which lies in the mesogloea of the polyps and platforms during life and is therefore truly internal. The tentacles of the polyps are bright green, the skeleton is crimson; and after the death of the soft parts it remains as a brightly coloured mass of tubes, often of considerable size, and is known as "Organ-pipe coral."

Colonies of different type are formed by other genera possessing long polyps. In *Alcyonium* for instance there is formed a massive colony with a small number of stout, unwieldy lobes. Each lobe consists of a number of polyps which are inordinately elongated vertically; but here, instead of producing platforms, the polyps have filled in the whole space between them with solid mesogloea, so that only the head-end of each polyp projects beyond the general mass. Consequently ectoderm occurs only on the exposed parts of the polyps and on the external surface of the mass connecting these; the inner parts consist of mesogloea with solenia ramifying through it and connecting the deeper parts of the polyps with each other. New polyps arise from solenia at various levels between the old ones, as the colony grows. In this instance the skeleton consists entirely of scattered spicules; these occur not only in the mesogloea of the massive portion of the colony but also in the projecting upper ends of the polyps, which are retractile into the solid part. The common British *Alcyonium* is known as "Dead Men's Fingers" from the suggestive appearance presented by the colony when removed from the water or stranded by the tide, suspended from the undersides of overhanging rocks. Its appearance when under water with the transparent glassy polyps fully expanded is as delicate and beautiful as its retracted state is repulsive.



AFTER KUKENTHAL (WALTER DE GRUYTER & CO.)

FIG 5 — DIAGRAM OF A COLONY OF TELESTO

The tree-like branching colonies of other Alcyonacea may be produced in more than one way. In *Telesto* for example, lateral polyps are budded off from solenia lying in the walls of single original polyps, which become extremely elongated. Since each secondary polyp grows out at an angle from its parent, and itself produces further lateral polyps, it constitutes in time a branch of the main stem formed by the original polyp. A number of such branching systems may be connected with one another by basal stolons.

Lastly in *Heliopora*, the Blue Coral of tropical Indo-Pacific shores, a massive calcareous skeleton is produced.

Order **2. Gorgonacea.**—In these animals the skeleton, except in a few unusual genera which appear to be transitional in status between a mat-like colony and a tree-like one, forms a definite axis running up the centre of a tree-like colony. The soft tissues by which the axis is surrounded contain spicules.

A typical example of the Gorgonacea is *Gorgonia verrucosa*, one of the Sea Fans (fig. 6). This forms a tree-like colony attached by a narrow base and with slender twig-like branches. Each branch has an axis of blackish horny skeleton, clothed on all sides by bright pink flesh containing solenia, and studded with numerous small translucent pink polyps. In certain relatives of *Gorgonia* the horny skeleton contains calcareous inclusions.

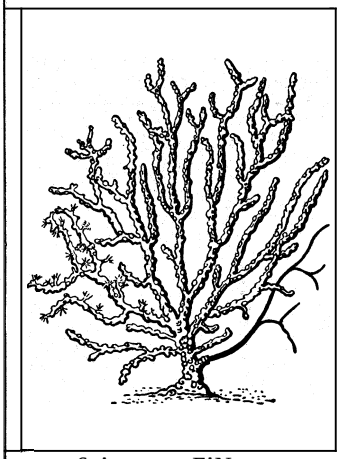


FIG. 6.—A SEA FAN, GORGONIA VERRUCOSA

A tree-like Alcyonarian. In the branch on the right the flesh of the colony has been removed revealing the dark twig-like skeleton

In *Corallium*, the well known Precious Coral of commerce, the "coral" is an axial skeleton similar to that of *Gorgonia*, but in this case it is stouter and less twig-like, and is formed by the fusion of innumerable spicules into a solid calcareous mass. In *Corallium rubrum* the flesh of the colony as well as the axis is scarlet, but the polyps are white.

The skeleton of the Gorgonacea, although it varies considerably in structure from one form to another, is secreted by cells of ectodermal origin which are either embedded in the mesogloea or form a distinct layer round the axis itself; this is a communal internal skeleton and does not represent an elongated axial polyp. The colony is started by a polyp which gives rise to solenia in the basal part of its body and from these new polyps arise.

Order **3. Pennatulacea.**—The colonies included in this group are of a nature very unlike anything hitherto described, and in-

clude those animals popularly known as Sea Pens. In a typical case (Pennatula) (fig. 7) the colony possesses a straight central axis developed from the body of a single greatly attenuated original polyp. This axis is complicated in structure and contains a supporting rod of calcified horny material. It bears laterally-arranged leaflets each consisting of a row of close-set polyps, and is itself provided with siphonozooids. The latter occur in a number of cases among the Alcyonacea and rarely among Gorgonacea; but among Pennatulacea they are universal. Moreover the Pennatulacea are not attached at the base to a firm support, but possess a contractile lower portion which anchors the colony in sand or mud.

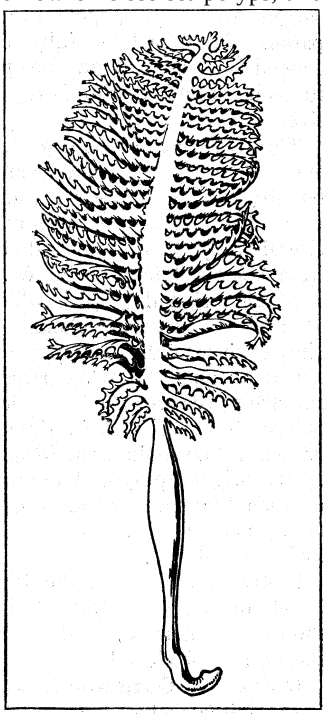

FIG. 7.—A SEA PEN, PENNATULA PHOSPHOREA
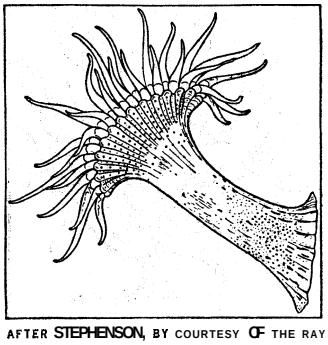
An Alcyonarian with a stem which is buried, during life, in sand or mud

In other Pennatulids the form of the colony varies. In *Kophobelemnon*, instead of lateral leaflets the stem bears large isolated polyps; in *Virgularia* leaflets are present but reduced in size; in *Umbellula* a few large polyps occur in a rosette at the top of a long stem which is otherwise bare; whilst in *Renilla* the basal peduncle is succeeded by a flat kidney-shaped expansion bearing radially-arranged polyps on its upper side.

General Note on the **Skeleton.**—Alcyonaria as a whole provide an extremely good example of the diversity which may exist in the skeleton within the limits of a single group Instances have been quoted of both internal and external skeletons; of horny covering skeletons, horny axial skeletons, tubular skeletons, and solid ones; skeletons formed of diffused spicules, of interlocked spicules, and of fused spicules; cases in which spicules and a solid skeleton co-exist, and in which horny and limy material co-exist in the skeleton, not to mention the massive calcareous support of *Heliopora*. Whatever the nature of the skeleton however, it is formed either by the ectoderm (Cornularia), or by cells of ectodermal origin which have penetrated the mesogloea.

II. ACTINIARIA

The Actiniaria or Sea Anemones (fig. 8) constitute a large and varied group of Anthozoa which are closely related to the true corals (Madreporaria) but which contrast with the latter in a number of ways. No sea anemone forms any skeleton; none produces a colony, so that the polyp which results from the development of an egg remains a single individual all its life except when it undergoes fission (see below). The polyps are of very variable dimensions, but the average order of size is relatively large, and certain giant species in which the individual may reach two feet in diameter are the largest Anthozoan polyps in existence.

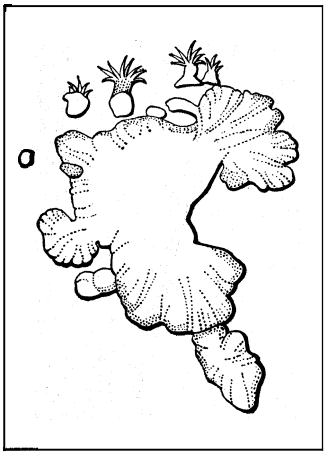


AFTER STEPHENSON, BY COURTESY OF THE RAY SOCIETY
FIG 8.—A TYPICAL SEA ANEMONE

The life of an anemone is rarely completely sedentary and the animal, although spending periods of varying length attached by its base to a foreign support, can readily creep away; or by inflating itself with water it becomes buoyant, and is moved elsewhere by the motion of the sea No other series of Coelenterata, taken as a whole, offers a parallel to this creeping habit of the anemones

The general build of many anemones is stronger and more muscular than that of most other Anthozoan polyps, and in particular the retractor muscles of the mesenteries and the circular muscle of the body-margin (sphincter) frequently attain a high degree of development. The variation in the external form of the polyp is very wide; but even greater is that of the internal organs. The number of mesenteries, their arrangement, their relation to one another with respect to size, and the degree of specialization of their musculature, vary to such an extent that within limits imposed by certain fundamental principles, almost any combination may be represented among them. No anemones possess the characters of Alcyonarian polyps, however.

The distribution of anemones is worldwide. They occur at very varying levels from the littoral zone to depths such as 2,900 fathoms. None occurs in fresh water, but a few are able to colonize brackish areas. Little is known of their geological range except that they must be of very great antiquity.



FROM STEPHENSON, MONOGRAPH ON ANEMONES," BY COURTESY OF THE RAY SOCIETY
FIG. 9.—A SEA ANEMONE IN PROCESS OF LACERATION
An anemone which had attached itself to a piece of glass, seen through the glass from below the base. Islands of tissue are becoming separated from the edge of the base. Some of these have acquired tentacles and become small anemones

Since sea anemones do not form colonies, one would expect to find that the habit of budding, so prevalent in some groups of Coelenterata, is not much in evidence here. Such is actually the case. Asexual reproduction of other kinds, however, is of frequent occurrence. In certain species rapid longitudinal division (fission) of the whole anemone into two more or less equal parts is a regular habit; the animal literally tears itself in two, the throat being cleft as well as the other parts; and by the regeneration of a new piece of tissue at the torn edge a new individual is formed from each half. In other species fission of another kind takes place. Here a small fragment becomes separated from the edge of the parent's base (sometimes as the result of an actual tear, sometimes as the more gradual product of a process of constriction) and this, although it contains no tentacles, peristome or throat, develops into a perfect new anemone (fig. 9). In a few species the direction of fission is transverse.

The classification of anemones is complicated, and the quotation of it in this connection would be uninstructive.

III. MADREPORARIA

The Madreporaria, zoologically known as "true corals," form a large group of Anthozoa which are characterized by their power of secreting a massive limy skeleton. The formation of a skeleton is not absolutely universal among them, but the number of species which have no hard parts is extremely small. The Madrepores contrast with the other Coelenterata which secrete a massive calcareous skeleton, in that although the actual size of individual polyps varies greatly, the average order of size is large; moreover the structure of the polyps is distinctive. The Madreporaria tend to form colonies containing few or many polyps; but in addition to the colonial species there is a large number of solitary forms in which a single polyp produces a single coral skeleton.

The polyps are similar in general build to Sea Anemones; but in their finer structure are recognizably different from the latter. Moreover, their life is necessarily a purely sedentary one since after they have once secreted a skeleton they are permanently anchored to it, and in correlation with this fact and with other of their characteristics, they are less muscular than anemones and exhibit in particular a less marked development of the retractor muscles. The variation of structure among coral-polyps is wide; but it hardly parallels the extraordinary diversity found among

the anemones. In the latter, diversity of the individual reaches its height, whereas in the colonial corals equally great diversity affects the relations of the polyps to one another, and consequently the form of the colony which they build up.

Corals are widely distributed in the seas of the world and both solitary and colonial forms may occur either on shore or in deep water. The true reef-building corals, however, which are in the main colonial forms, are restricted to the tropical and sub-tropical zones; they flourish best in shallow water and their depth-limit is about 50 metres. It is significant that rapid deposition of calcium by marine animals is favoured by high temperatures.

The Madreporaria are an ancient group geologically, dating from Triassic times, and vast numbers of fossil forms are known. Many other corals which may or may not have been ancestral to them (the Tetracorallia, etc.) are known from much earlier times. Corals form the largest bulk of fossils belonging to the Coelenterata and some limestones are composed almost entirely of their remains. In certain past epochs reef-corals had a far wider distribution than is now the case, their remains being plentiful in latitudes at which they cannot now maintain themselves.

The skeleton of a solitary coral-polyp such as *Caryophyllia* (a genus represented even in Great Britain by C. *smithii*, the "Devonshire Cup-coral") is illustrated in fig. 10. It consists of a number of parts which together build up a shape definitely related to the soft parts which have secreted it. There is a basal plate attaching the whole structure to the substratum, a circular wall (theca) arising from this, and a number of radially arranged vertical partitions (septa) which project inwards from the inner surface of the theca towards the centre, and which partially subdivide its cavity. The septa are not all equal but belong to definite grades of size, which alternate regularly.

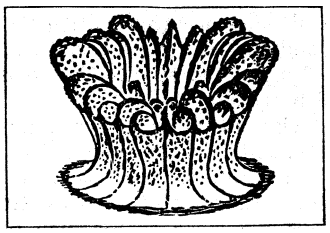


FIG. 10.—SKELETON OF A SIMPLE CORAL

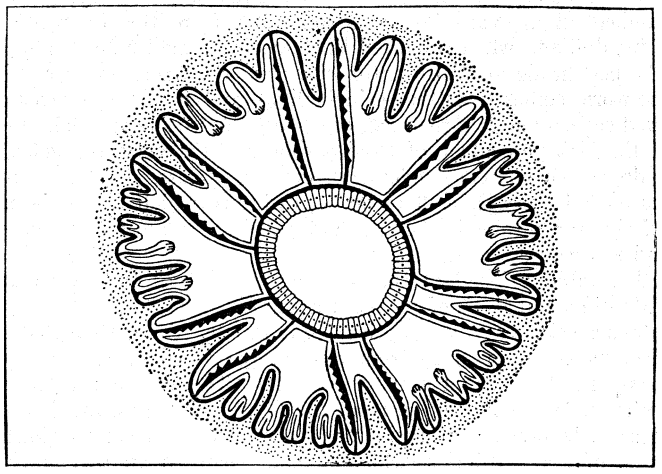
A cup-like formation containing vertical partitions, the septa, radially arranged within it

The polyp is seated in the cup of skeleton, and during life its body extends well above and beyond the latter, overlapping also down the outside of the theca. If the polyp desires to swallow any considerable mass of food, it must necessarily extend itself above the skeleton in order to make room in its coelenteron for the food. The tissues of its column and base line the skeletal cup, and its mesenteries alternate with the septa; the septa, however, merely push the whole thickness of the polyp's column-wall inwards, they nowhere penetrate into the coelenteron and are entirely external to the tissues of the animal. It will thus be understood (fig. 11) that although there is deep inter-penetration between skeleton and soft parts, morphologically speaking the skeleton is entirely an external structure. The skeleton is produced as a secretion of cells known as calicoblasts, which are formed by the ectoderm of the base and sides of the polyp.



AFTER DUERDEN

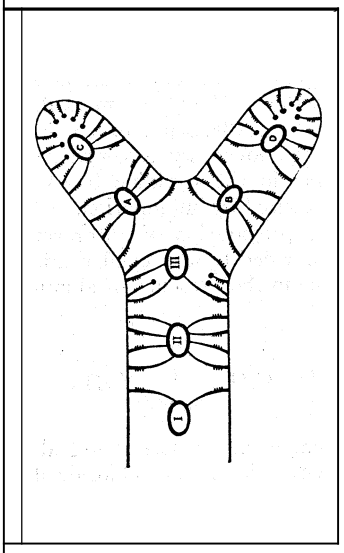
FIG. 11.— TRANSVERSE SECTION OF A CORAL POLYP

In the centre lies the throat, and radiating from this are six pairs of mesenteries (the N. and S. pairs being the directives). Round the edge are smaller mesenteries which do not reach the throat, and alternating with both these and the large mesenteries are septa. The stippled part represents the region occupied by the skeleton and the figure illustrates the relation between skeleton and soft parts

The eggs of corals develop into planulae which attach themselves after a time to a foreign surface, assume the form of miniature polyps and begin to build up a skeleton, which first appears between the base of the polyp and its support. A few corals lie unattached and are anchored simply by the weight of their skeleton.

For an account of the formation of coral-reefs see CORAL **REEFS**. Some idea of the variety which the skeletons exhibit may be derived from the Plate. It must be understood that the growth of a colony is due to the continued deposition of calcareous material by the polyps, and as more and more is added the skeleton must necessarily increase in size, growing upwards or outwards or both. The form which any skeleton assumes is dictated by a number of factors affecting the polyps—by the way in which new polyps arise with relation to those already in existence; by their rate of formation and growth; by the relation between growth in height and growth in width; by the angle and plane of divergence between the polyps as the colony grows; by the presence or absence of a secretion of skeleton in the intervals between the polyps, and similar considerations. Each species of coral has inherent within its polyps the ability to develop in a given manner, and the form of the colony is also affected by the degree of its exposure to wave-action.

Little is known about the details of colony-formation from actual observation, although measurements of the growth-rate, affecting increase in size of the colony regarded as a whole, have been taken. The older accounts concerning the processes by which the polyps increase in number should be read with reserve, since the ideas in vogue on this subject have until recently been largely speculative, and theories of colony-formation have been too much based on the study of the skeleton. It is obvious that the skeleton is merely an imperfect if permanent record of the activities of the polyps, and study of the latter reveals the fact that in some cases at least conclusions as to the manner of growth, drawn from the skeleton, may be entirely erroneous. A recent study by Matthai of the soft parts of a number of corals from which the calcareous matter had been dissolved away, leads to the conclusion that in the cases investigated (and probably in the group in general) polyps are formed in two ways.



FROM MATTHAI, BY COURTESY OF THE ROYAL SOCIETY

FIG. 12.— INTRA-TENTACULAR BUDDING

Structure of part of a compound coral-polyp which is in the process of intra-tentacular budding. I-III and A-D are throats. The outside line represents the body-wall and stretching between this and the various throats are mesenteries. C and D are the throats last formed

I. Intra-tentacular **Budding.**—By this method a polyp itself becomes compound. It has originally one mouth and throat surrounded by a peristome and a circlet of tentacles, and within the ring of tentacles, at given points on the peristome one or more new mouths and throats arise. The outline of a polyp with two or more mouths will become modified, and this process may reach an extraordinary degree of development, ending up in one or several branching polyps each with a number of mouths arranged in a linear row and producing the type of colony illustrated in Plate, fig. 2, and in text-fig. 12. The skeleton in such a case consists of a series of winding ridges

alternating with valleys containing septa, and is known as a *meandriform* coral. In other colonies formed by intra-tentacular budding, portions of the growing polyps, each containing a newly-formed mouth, become separated from the rest of the polyp as growth proceeds; but this process is to be distinguished from true fission, which involves the cleavage of a polyp through its original mouth and throat, and not the gradual separation of a portion of its tissues associated with a newly-developed throat.

II. Extra-tentacular Budding. — By this method a new polyp is formed de *novo* from tissues lying entirely outside the circlet of tentacles of any pre-existing polyp. The polyps in such colonies have each one mouth, and are therefore relatively easily recognized as entities. Extra-tentacular budding sometimes takes place at the periphery of colonies in which the other method is the characteristic one; and in colonies formed by extra-tentacular budding occasional polyps with two throats may arise by the opposite method.

The classification of Madreporaria is a vexed question. The vital parts of the organisms are the polyps, and as yet too little is known of the structure and potentialities of these throughout the group to make possible the construction of a satisfactory system.

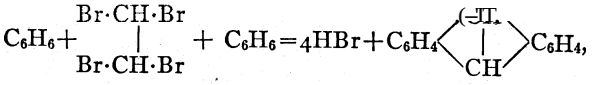
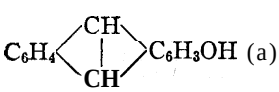
ANTHRACENE, $C_{14}H_{10}$, a hydrocarbon obtained from the fraction of the coal-tar distillate boiling between 270° and 400° C. (from the Greek ἄνθραξ, coal). This high boiling fraction is allowed to stand for some days, when it partially solidifies. It is then separated in a centrifugal machine, the more fusible impurities are removed by means of hot water, and the residue is finally hot-pressed. The crude anthracene cake is purified by treatment with the higher pyridine bases, the operation being carried out in large steam-jacketed boilers. The whole mass dissolves on heating, and the anthracene crystallizes out on cooling. The crystallized anthracene is then removed by a centrifugal separator and the process of solution in the pyridine bases is repeated. Finally the anthracene is purified by sublimation.

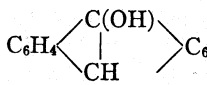
Many synthetical processes for the preparation of anthracene and its derivatives are known. It is formed by the condensation of acetylene tetrabromide with benzene in the presence of aluminium chloride:—



and similarly from methylene dibromide and benzene, and also when benzyl chloride is heated with aluminium chloride to 200° C. Anthracene crystallizes in colourless monoclinic tables which show a fine blue fluorescence. It melts at 213° C. and boils at 351° C. It is insoluble in water, sparingly soluble in alcohol and ether, but readily soluble in hot benzene. It unites with picric acid to form a picrate, $C_{14}H_{10}\cdot C_6H_2(NO_2)_3\cdot OH$, which crystallizes in needles, melting at 138° C. On exposure to sunlight a solution of anthracene in benzene or xylene deposits para-anthracene $(C_{14}H_{10})_2$, which melts at 244° C. and passes back into the ordinary form. Chlorine and bromine form both addition and substitution products with anthracene; the addition product, anthracene dichloride, $C_{14}H_{10}Cl_2$, being formed when chlorine is passed into a cold solution of anthracene in carbon bisulphide. On treatment with potash, it forms the substitution product, monochlor-anthracene, $C_{14}H_9Cl$. Nitro-anthracenes are not as yet known. The mono-oxyanthracenes (anthrols), $C_{14}H_9OH$ or



(a) and (β), resemble the phenols, whilst



(γ) (anthranol) is a reduction product of anthraquinone. β-anthrol and anthranol give the corresponding amino compounds (anthramines) when heated with ammonia.

Numerous sulphonic acids of anthracene are known, a monosulphonic acid being obtained with dilute sulphuric acid, whilst concentrated sulphuric acid produces mixtures of the anthracene disulphonic acids. By the action of sodium amalgam on an alcoholic solution of anthracene, an anthracene dihydride, $C_{14}H_{12}$, is obtained, whilst by the use of stronger reducing agents, such as hydriodic acid and amorphous phosphorus, hydrides of composition $C_{14}H_{16}$ and $C_{14}H_{24}$ are produced.

Methyl and phenyl anthracenes are known; and β-methyl anthracene has been identified in tar produced by low-temperature carbonisation. Oxidizing agents convert anthracene into anthraquinone (*q.v.*); the production of this substance by oxidizing anthracene in glacial acetic acid solution, with chromic acid, is the usual method employed for the estimation of anthracene. See E. de B. Barnett, Anthracene and *Anthraquinone,* 1921.

ANTHRACITE. The word "Anthracite" is derived from the Greek ἄνθρακες used in connection with the first mention of coal about 371 B.C., when Theophrastus, a pupil of Aristotle, mentions in his treatise "On Stones" fossil substances (λιθός ἄνθρακος) "that are called Coals which kindle and burn like wood coals. . . . These are found in Liguria and in Elis, in the way to Olympias over the mountains; they are used by the smiths."

The word is now applied to that class of coal which contains the highest percentage of fixed carbon, and belongs to the division **A** (1) in the classification adopted by the International Geological Conference held at Toronto, Canada, in the year 1913 (see COAL AND COAL-MINING); a class of coals the mean composition of which is:

Carbon	93 to 95%
Hydrogen	2 to 4%
Oxygen and nitrogen	3 to 5%

with a calorific value ranging from 14,500 to 15,000 B.T.U. or 8,000 to 8,330 calories.

Anthracite is usually a hard compact coal having a sharp conchoidal fracture, in colour black with a brilliant lustre, and, unlike other coals, except cannel, does not usually soil the fingers when handled. Some varieties differ somewhat from this description, being dull and when fractured breaking into small cubical lumps. The best grade of Welsh anthracite (and the finest anthracite in the world comes from that principality) contains 93% or over of fixed carbon and less than 8% of volatile hydrocarbons. The fact of the high percentage of fixed carbon and the very low volatile hydrocarbon content renders the coal smokeless. For the same reason it is very difficult to ignite, owing to which fact it is unsuitable for burning in the open grate and for steam raising unless under forced draught.

The table at head of the opposite page gives the proximate and ultimate analysis of some anthracites.

The specific gravity of anthracite is usually higher than that of bituminous coal, ranging from 1·36 to 1·84 as compared with 1·2 to 1·5 in the case of bituminous coal. The calorific value of anthracite is, as is evident from the figures already quoted, very high. A high-class anthracite may, for instance, have a calorific value of 8,624 calories, which is equivalent to an evaporative power of 16·06 lbs., that is to say, 16·06 lbs. of water would be evaporated by the combustion of 1 lb. of such anthracite. The volatile hydrocarbon in anthracite, including under that term semi-anthracites, as well as pure anthracite, ranges from 12 to 4%.

Taking the ratio $\frac{\text{C}}{\text{Vol. H.C.}}$: 1 the proportion in the case of semi-anthracite is from 12:1 to 8:1; hard dry anthracite from 5:1 to 10:1.

Origin of Anthracite. — It was generally considered by geologists that anthracite was metamorphosed bituminous coal, that is, coal from which the greater part of the volatile hydrocarbon had been driven off by heat, occasioned by the pressure resulting

from earth movements or due to the proximity of intrusive igneous rocks. But of late some doubt has been thrown on this as the only explanation of the low volatile content. One has seen, *e.g.,* in Natal and Zululand, anthracite which has resulted from the action of the heat derived from neighbouring intrusions of igneous rock, baking the coal and reducing the volatile contents. One consequential effect of this action of heat is the increase in percentage of the ash content as compared with the unindurated coal. But in the South Wales field, where we find bituminous coal seams in the east of the field in their passage westwards graduating into steam coals, dry steam coals, and finally into anthracite, not only does the ash content not increase but it actually diminishes. So it is very doubtful whether heat generated by the somewhat more intensified folding to which the seams to the west have been subjected, as compared with the same seams in the east, is the sole cause, if even a partial cause, of the disappearance of a great part of the volatile hydrocarbons from the coal. The folding was probably a slow process, continuing over years, and the heat would be dissipated without greatly affecting the coal. The more probable explanation is that the effect is the outcome of bacterial action on the vegetation which was of a somewhat different kind from that in the lower lying surface, though continuous therewith, and was longer above water than the latter, allowing of more extensive bacterial action. *(See* COAL AND COAL-MINING: *Origin and Occurrence.)*

For information relative to the available resources of anthracite in the world, by continents, the reader is referred to COAL AND COAL-MINING: *The World's Coal Reserves, Output, Consumption,* etc., from which it will be seen that in this respect Asia stands first. Seventy-five % of the anthracite of Asia is contained in thr province of Shansi, south-west of Peking, China, and there is probably in the small coal-field near Tongking in French Indo-China as much anthracite as there is in Pennsylvania. Of the European fields, that of Donetz, in South Russia, contains most anthracite. The coal-fields of the U.S.A. contain 19,684 millions of tons of anthracite, the Canadian resources amounting to only 2,185 millions of tons.

Chief Supplies.— The chief producers of anthracite in the world are Great Britain and the U.S.A. The output from the former has been steadily on the increase of late years, in 192j reaching 6,184,191 long tons, whereas the tendency of the output of this class of coal in the U.S.A. has been downwards. In the year 1917 it reached the enormous figure of 88,939,117 tons as against 83,338,401 tons for 1923; 78,506,217 tons for 1924; and for 1925 (a strike year) 55,193,883 tons.

In America the use of anthracite as a fuel for domestic use is much more in favour than in Great Britain. Some American cities enjoy a beautifully clear atmosphere owing to the smokelessness of the fuel, though of late bituminous coals have come more and more into vogue because of their cheapness. Were the people of Great Britain wishful of imitating their American cousins in this respect, many more anthracite mines than at present exist in South Wales, and, to some extent, Scotland, would have to be opened out, and the available resources, which are greatly less than those of the more bituminous coal, would be rapidly exhausted. In Great Britain an open and "flaming" fire is most popular, and anthracite stoves are used only for central heating. Besides the domestic consumption, which is the chief use to which anthracite is applied, it is largely used for malting purposes and for the drying of hops, where a steady heat is required, for which purpose the anthracite must be free from arsenic. It has been and still is used to some small extent (though not in Great Britain) for iron-smelting. There is also a growing consumption in the production of producer gas.

Of the production of anthracite in Great Britain, 60% is exported, her market being chiefly France and Scandinavia; but latterly Canada, whose import requirements are variable—between 3,000,000 and 4,000,000 tons per annum— has become a customer, though her demands are chiefly met from Pennsylvania. The higher quality, however, of the best Welsh anthracite and the water carriage from Swansea and Llanelly to Montreal are points which are beginning to tell strongly in favour of South Wales anthracite.

Anthracite is of all coals that which undergoes most classification for the purposes of marketing. To take a characteristic example from a modern Welsh anthracite mine the coal is divided by screening and working into the following brands or classes, viz.:—

	Per cent. of output.		Per cent. of output.
X B Large. . .	8·98	Washed peas . .	6.45
Special . . .	..	Small peas and grains	1·j6
Rockvein. . .	2·59	Duff. . . .	18·89
M/M/cobbles . .	12·99	Breaker duff . .	10·48
Screened . . .	0·39	Culm . . .	9·18
French nuts . .	4.68	Slurry . . .	0·10
Stove nuts. . .	10·90	Shale . . .	0·27
Washed beans . .	12·54		

In some American anthracite mines the division of the output is carried out to a still greater extent, even to 30 classes or more.

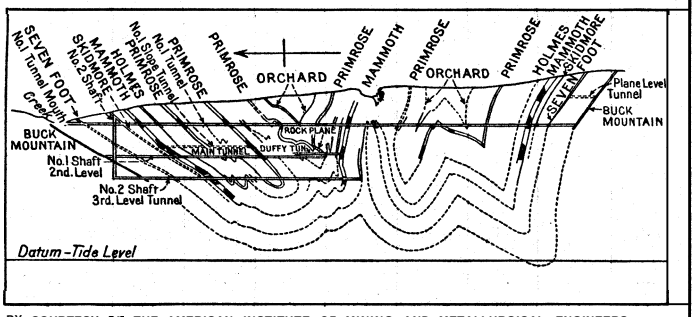
(R. R.)

UNITED STATES

According to the classification of coal adopted by the United States Geological Survey the ratio of fixed carbon to volatile matter for anthracite should equal or be above ten. It would appear that anthracite may degenerate in the process of geologic time

and absorb moisture. M. R. Campbell of the United States Geological Survey has called such coal "super-anthracite" as expressing increased metamorphosis rather than improved quality and more desirable characteristics. This super-anthracite is found in Rhode Island. It burns with the greatest of difficulty and has a low calorific value, all of which keeps it from having, at present, any extensive sale.

The definition of anthracite as coal having a fuel ratio above ten is not the same as that for class A1, which was evidently



BY COURTESY OF THE AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS

FIG. 1. —CROSS SECTION OF THE NESQUEHONING TUNNEL

intended for anthracite when adopted by the twelfth international geological congress in 1913. There the lower limit was 12. Consequently it may be stated that the designation used in the United States is somewhat broader than that of class A1. That congress also designated a class A2 which was evidently intended to constitute semi-anthracite. Its fuel ratio ran between 7 and 12 whereas the United States geological survey's practice is to limit semi-anthracite by the ratios 5 and 10. In coal trade the word anthracite has had a broad meaning, those producing and selling what is known as semi-anthracite objecting to the use of any qualifying term in describing their product. Consequently coal with a fuel ratio as low as five, or even slightly less, is sometimes quoted as anthracite.

Distribution.— Disregarding the Rhode Island coal there are only four areas in the United States containing marketable quantities of anthracite. These are (1) a part of the so-called "anthracite region" of north-eastern Pennsylvania, (2) a small area at Fioresta, Gunnison county, Colo., and areas in the (3) Bering river and (4) Matanuska regions of Alaska.

The first of these three districts is by far the most important. The entire area, including both anthracite and semi-anthracite, covers 484sq.miles. The Sullivan county field around Bernice, Pa., produces semi-anthracite, as does the Lykens valley end of the southern coalfield. Some of the northern anthracite field is close to the border line of semi-anthracite. However, there are parts of the southern field which contain the most highly anthracitized beds. In general the northern coalfield is but gently folded. The principal disadvantage under which it is worked is the presence of the Wyoming "buried valley" which is filled with glacial drift. This valley imposes upon the measures below it a burden of as much in places as zooft. of unconsolidated sand and gravel. Furthermore, the bottom is scored with pot holes which were formed under the ice during the glacial period. Heavy, lacking strength and filled with water, these glacial deposits make the mining of the measures--especially where they are relatively shallow—quite hazardous. The eastern middle and southern fields are badly contorted and faulted. Because of this contortion the coal is dense and hard, and has a high fuel ratio.

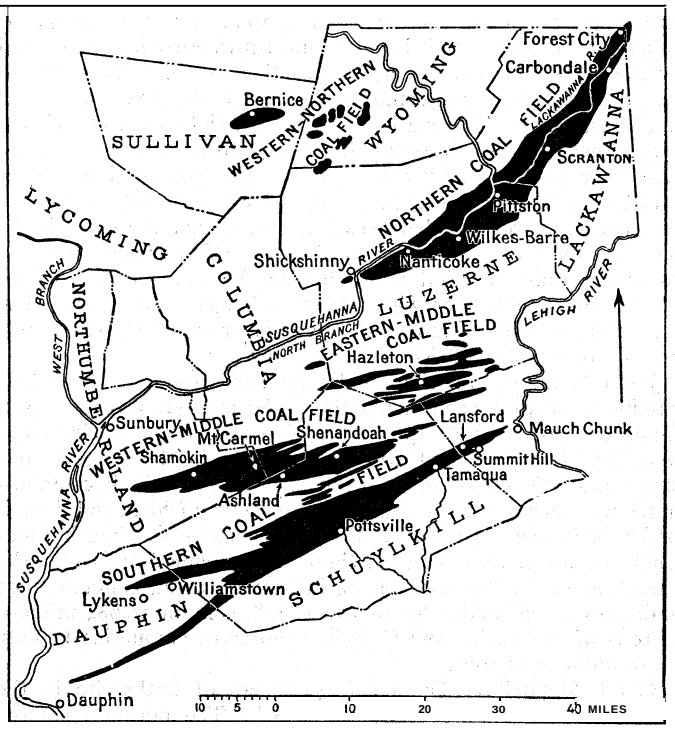
The coal of the Pennsylvania anthracite region is of the Carboniferous era though the correlation between the coals of the region and those of the bituminous fields in other parts of Pennsylvania is by no means satisfactory and the names used for the various beds are not the same.

The seams of coal are of all thicknesses from 114ft. downward. This extreme thickness was found in Nesquehoning slope No. 9 of the Lehigh Coal and Navigation Company. Some coal as thin as 18in. has been mined and much of the coal operated is under 3ft. thick. According to F. G. Tryon and M. H. Schoenfeld, U.S. Bureau of Mines, the average coal thickness of United States anthracite is 80in. and of all British coal 50in., basing the latter figure on the 1925 report of the royal commission. Most of the coal is drilled and blasted out of the solid. Undercutting machines are successfully used, where the inclination of the coal bed is not too great, but the proportion is small. Shaking conveyors are used, especially in the thin seams and in seams pitching so gently that the dislodged material cannot be chuted from face to gangway. In thin flat seams the coal is often dragged to the roadway by small scoops of a capacity of about 1,000 pounds. These scoops, which are bottomless and have one open end, are dragged by ropes through the pile formed by the coal shot from the face or pillar to a chute at the roadway, where the coal they contain is discharged into the mine cars.

Gas.—Few if any mines are more gassy than those in the Wilkes-Barre region. Fortunately, with ventilation such as is provided, the area which becomes filled with an explosive quantity of gas is rarely large. In consequence there have been no explosions involving as many victims as the larger ones in the bituminous regions where the coal dust has extended some disasters and even initiated others. Anthracite dust is not absolutely inert in an explosion but it has almost no explosive effect. However, N. H. Darton, writing as of 1912, declared that "The volume of methane issuing from three mines at Wilkes-Barre is 9,000,000cu.ft. a day, a volume equal to that of the illuminating gas from a plant supplying a city of 300,000 inhabitants."

Fires.--When anthracite beds are ignited the combustion is extinguished with great difficulty and many extensive fires have occurred. Many still burn and notable among these is a fire at Summit Hill, one in the Red Ash bed near Wilkes-Barre and one at Carbondale.

Reserves.—Marius R. Campbell has estimated that the original quantity of anthracite and semi-anthracite in the Pennsylvania



FROM "ANTHRACITE MINING AND PREPARATION"

FIG. 2.— THE ANTHRACITE COAL FIELDS OF PENNSYLVANIA

Most of the American anthracite coal comes from an area of 484 sq.m. In Pennsylvania, divided geologically and geographically into 4 separate fields known as Northern, Eastern middle, Western middle and Southern

anthracite region was 19,056,300,000 metric tons. The total production to the end of 1938 was 3,874,819,000 metric tons. Doubling this for coal irremedially wasted underground and above ground the tonnage remaining will be 11,306,662,000 metric tons. Assuming that 50,000,000 net tons will be mined yearly and that by more careful methods the loss will be cut to one-half of the production, the yearly depletion will be about 75,000,000 metric

*From samples of coal as received or as fixed, extending usually over more than a year.

tons and the life of the anthracite field will be 150 years from the end of 1938, assuming that the various estimates quoted are at least approximately correct. Some of the measures have been but little explored and are none too well understood. Nor is it possible to form an adequate conception of the waste in the past or to predict the probable waste in the future. The annual tonnage may also increase or decline with the passage of years. Much of what was formerly wasted is being recovered but much has been lost beyond recovery through squeezes and fires, so the estimate of past waste has intentionally been made high.

The seams worked are becoming progressively lower and deeper, increasing the difficulty of operation. The shaft collar of the Auchincloss shaft No. 2 of the Glen Alden Coal Company, is 721·5ft. above sea-level. Its deepest working is 977ft. below the sea making a total depth of 1,698·5 feet. The West Brookside workings are probably deeper. The average depth of shafts in the shaft mines of the anthracite field is given by F. G. Tryon and M. H. Schoenfeld as 41jft. as against 1,023ft. for all mines of Great Britain. The figure for Great Britain is taken from the report of the royal commission (1925). Much coal, however, still comes in the anthracite region from shafts and drifts.

According to E. W. Parker: "The first authentic knowledge of the anthracite deposits in Pennsylvania was obtained in 1762 when it was discovered by Connecticut pioneers. The value of this discovery was made known by Obadiah Gore, a blacksmith, who set up a forge in 1770 or 1771 and used anthracite for heating iron. During the Revolutionary War some anthracite was floated down the Susquehanna river to a point near Harrisburg and thence hauled to Carlisle, where it was used for making munitions of war for the Continental army." In 1808 anthracite was first used in an open grate by Jesse Fell, of Wilkes-Barre, and in the same year Abijah Smith and Company shipped several arkloads to Columbia and other points on the Susquehanna river. Anthracite was first used in an iron furnace in Philadelphia in 1812.

Markets. — The market for American anthracite has gradually contracted in area and, of late years also, as to tonnage. Bituminous coal has displaced anthracite in the West due partly to restrictions during the World War. An effort was made to restore this market. In the East oil competition has been quite severe, owing partly to the low cost of fuel oil. As a result the output is no longer limited as before by strikes, local and general, and by physical inability to increase production. but by the variation of the market. The output in 1917 was 99,612,000 net tons; in 1927 it was 80,096,000 tons, and in 1937 was only 51,856,000 tons. There has been a great increase in the demand for small sizes. Formerly every size below chestnut was unsaleable; in 1937 48% of the sales is pea or smaller. Practically no lump is sold; in 1937 "broken" was 0.4% of the total tonnage; "egg," 5.4%; stove, 21.2%; chestnut, 25.2%; pea, 10.7%; buckwheat No. 1, 14.8%; buckwheat No. 2, or rice, 8.3%; buckwheat No. 3 or barley, 10.3%; buckwheat No. 4, 2.9%; all others, 0.8%. Care is taken in breaking down the larger and less saleable sizes such as "lump," "broken" and even "egg," not to make an unnecessary proportion of fine sizes which bring a price, at the breaker, below the cost of mining. The demand that has been stimulated for fine sizes by the development of the automatic stoker is satisfied partly by the rewashing of old piles of coal formerly rejected, which contain millions of tons of good fuel, some even larger than chestnut, and partly by dredging formerly discarded fines from the river bottoms.

Smaller anthracite occurrences are found at Cerrillos, N.M., due to the intrusion of an igneous sill 40ft. below the coal measure, also in Routt county, Colo ; Iron county, Utah; and Pierce county, Washington.

Semi-anthracite.—Other commercial bodies of coal, frequently marketed as anthracite, are found in Virginia and Arkansas. Strictly speaking these are semi-anthracite. When a coal falls into the semi-anthracite grouping that fact hardly makes it less desirable, for a little volatile matter will not make the coal smoky, but it will render it somewhat more free-burning and cause it to give a bright yellow flame, thus making it attractive as a grate fuel. Semi-anthracite also ignites more readily than anthracite. On the other hand, a furnace burning anthracite is more easily regulated than one burning the less matured fuel. The differences are small and the two types of coal are closely competitive, wherever they are so located as to enter the same markets.

The semi-anthracite of Virginia is of lower Carboniferous age and extends in a narrow band across the counties of Montgomery, Pulaski and Wythe. The principal bed runs from 4 to 20ft. in thickness. In these coals there is a large percentage of ash. The beds are quite severely contorted. The Arkansas semi-anthracite is found in Franklin, Johnson, Pope, Sebastian and Logan counties in thin beds. (R. D. H.; X.)

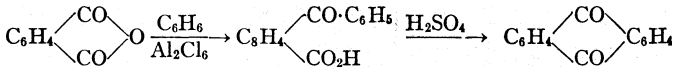
See H. S. Raushenbush, *Anthracite Question* (1924); *J. K.* Mumford, *Anthracite* (1925).

ANTHRACOTHERIUM (Gr. "coal-animal"), an extinct mammal whose jaws, bones and remains are occasionally found in lignite and coal in America, Asia and Europe. It had the typical dental formula of the artiodactyls, a group of animals whose toes are even in number and grow in pairs; a formula that is preserved in the hog. (See ARTIODACTYLA.)

ANTHRANOL: *see* ANTHRAQUINONE.

ANTHRAQUINONE, $C_{14}H_8O_2$, an important derivative of anthracene, first prepared in 1834 by A. Laurent. It is prepared commercially from anthracene by stirring a sludge of anthracene and water in horizontal cylinders with a mixture of sodium bichromate and caustic soda. This suspension is then run through a conical mill in order to remove all grit, the cones of the mill fitting so tightly that water cannot pass through unless the mill

is running; the speed of the mill when working is about 3,000 revolutions per minute. After this treatment, the mixture is run into lead-lined vats and treated with sulphuric acid, steam is blown through the mixture in order to bring it to the boil and the anthracene is rapidly oxidized to anthraquinone. When the oxidation is complete, the anthraquinone is separated in a filter press, washed and heated to 120°C. with commercial oil of vitriol, using about 2½ parts of vitriol to 1 of anthraquinone. It is then removed to lead-lined tanks and again washed with water and dried; the product obtained contains about 95% of anthraquinone which may be purified further by sublimation. The industrial synthesis of anthraquinone is gaining ground and 75% of the American production is stated to be synthetic (1927). A process, first discovered by A. Behr and W. A. v. Dorp (1874), consists in heating phthalic anhydride with benzene in the presence of aluminium chloride when orthobenzoyl-benzoic acid is produced which on treatment with sulphuric acid or other dehydrating agent yields another anthraquinone.



Phthalic anhydride — Ortho-benzoyl-benzoic acid — Anthraquinone

Dihydroxy- and tetrahydroxy-anthraquinones are obtained when metahydroxy- and dimeta-dihydroxybenzoic acids are heated with concentrated sulphuric acid in a similar way.

Anthraquinone crystallizes in yellow needles or prisms, which melt at 277° C. It sublimes easily, and is very stable towards oxidizing agents, but is readily attacked by reducing agents. With zinc dust in presence of caustic soda it yields the secondary alcohol, oxanthranol, $C_6H_4\langle^{CO}_{CH(OH)}\rangle C_6H_4$; with tin and hydrochloric acid, the phenolic compound, anthranol,

$$C_6H_4\langle^{CH}_{C'(OH)}\rangle C_6H_4;$$

and with hydriodic acid at 150° C. or on distillation with zinc dust, the hydrocarbon, anthracene, $C_{14}H_{10}$. When fused with caustic potash, it gives benzoic acid. It behaves more as a ketone than as a quinone, since with hydroxylamine it yields an oxime, and on reduction with zinc dust and caustic soda it yields a secondary alcohol, whilst it cannot be reduced by means of sulphurous acid. Various sulphonic acids of anthraquinone are known, as well as hydroxy-derivatives, for the preparation and properties of which see ALIZARIN; ANTHRACENE.

ANTHRAX (Syn.: splenic fever, malignant pustule, wool-sorters' disease). An acute, specific, infectious, virulent disease, caused by the *Bacillus anthracis,* in animals, chiefly cattle, sheep and horses, and sometimes occurring in workers in the wool or hair, as well as in those handling the hides or carcasses, of beasts, which have been affected. During the World War numbers of the British troops were infected by way of shaving brushes imported from Japan.

Animals. — Anthrax affects wild and domesticated animals over the world, and published writings on its nature, its peculiar characteristics and the injury it inflicts are innumerable. Regions notorious for its prevalence, are the marshes of Sologne, Dombes, and Bresse in France; certain parts of Germany, Hungary and Poland; in Spain the half-submerged valleys and the maritime coasts of Catalonia; the Romagna and other marshy districts of Italy; while it is epizootic, and even panzootic, in the swampy regions of Estonia, Livonia, Courland, and especially of Siberia. The records of anthrax go back to a very ancient date. Classical writers allude to anthrax as if it were the only cattle disease worthy of mention (see Virgil, Georg. iii). The oldest Anglo-Saxon manuscripts contain many fantastic recipes, charms and incantations for its prevention or cure. In the 18th and 19th centuries it sometimes spread like an epizootic over the whole of Europe, from Siberia to France. It was in anthrax that disease-producing germs (bacteria) were first discovered, in 1849, by Pollender of Wipperfiirth, and their real character afterwards verified by Davaine of Alfort in 1863; and it was in this disease that Toussaint, Pasteur and Chauveau first showed how to make the bacilli their own antidote. (See ANIMALS, EXPERIMENTS ON.)

The symptoms vary with the species of animal, the mode of infection, and the seat of the primary lesion, internal or external. Cattle, sheep and horses nearly always owe their infection to spores or bacilli ingested with their food or water, and pigs usually contract the disease by eating the flesh of animals dead of anthrax. Internal anthrax, of cattle and sheep, exhibits no premonitory symptoms that can be relied on. Generally the first indication of an outbreak is the sudden death of one or more of the herd or flock. Animals which do not die at once stagger and tremble; the breathing becomes hurried and the pulse very rapid; the internal temperature rises to 104° or 106° F.; blood oozes from the nose, mouth and anus, the visible mucous membranes are dusky or almost black. The animal becomes weak and listless, the temperature falls and death supervenes in a few hours, being immediately preceded by delirium, convulsions or coma. In some cases the animal rallies from a first attack and gradually recovers.

In the external or localized form, death may not occur for several days. Swellings may appear in any part of the body, being preceded or accompanied by fever. They are developed in the subcutaneous connective tissue where this is loose and plentiful, in the interstices of the muscles, lymphatic glands, in the mucous membranes of the mouth and tongue (cattle), pharynx and larynx (horses and pigs), and the rectum. At first they are small, circumscribed, warm, slightly painful and oedematous. In from two to eight hours they are large, cold, painless and gangrenous, and when incised a blood-stained gelatinous exudate escapes. General infection occurs and death ensues in a few hours. Anthrax of the horse usually begins as an affection of the throat or bowel. In the former there is rapid obstructive oedema of the mucous membrane of the pharynx and larynx with swelling, fever, salivation, difficulty in swallowing, noisy breathing, frothy discharge from the nose and threatening suffocation. General invasion soon ensues, and the horse may die in from four to 16 hours. The intestinal form is marked by high temperature, great prostration, small thready pulse, tumultuous action of the heart, laboured breathing and symptoms of abdominal pain with straining and diarrhoea. When moved the horse staggers and trembles. Profuse sweating, a falling temperature and cyanotic mucous membranes indicate the approach of death. The appearances after death are those of blood-poisoning and rapid putrefaction. The most notable feature, however, in the majority of cases is the enormous enlargement of the spleen, which often ruptures, while its tissue is changed into a violet or black fluid mass.

Man. — Two well-marked forms of this disease in man are recognized, "external" and "internal." In external anthrax the infecting agent is accidentally inoculated into some portion of skin, often the hand, arm or face. A minute swelling soon appears locally, and develops into a vesicle containing serum or bloody matter, seldom larger than a shilling. This vesicle speedily bursts and leaves an ulcerated or sloughing surface round which are numerous smaller vesicles which undergo similar changes, and the whole affected part becomes hard and tender, while the surrounding surface and the neighbouring lymphatic glands are also inflamed. This condition, termed "malignant pustule," is frequently accompanied by fever, delirium, sweating, great prostration and a tendency to death from septicaemia.

In internal anthrax, the spores or bacilli gain access to the system from the air, as in rooms where the contaminated wool or hair is unpacked or sorted. The symptoms usually observed are those of severe prostration, with inflammation of the lungs and pleura. Death from collapse may occur in a few hours or from blood poisoning in three or four days. Sometimes the symptoms are intestinal, and consist in severe exhausting diarrhoea, with vomiting and rapid sinking.

In all cases the course run by the disease depends upon inoculation of a susceptible animal with a bacillus capable of living and multiplying in the tissues. If the powers of resistance on the

part of the patient are sufficient to localize the disease and deal with the bacilli the patient has a chance of recovery; otherwise the bacilli invade the bloodstream directly or indirectly and death is probable as in any case of septicaemia. Treatment in animals is preventive, attenuated bacilli being inoculated as indicated by Pasteur. In man excision while the condition is local and external offers the best chance and administration of the specific antiserum may be of use. When the disease is internal or generalized no known treatment is of any avail. As preventive measures in manufactories disinfection of materials before handling and handling in a wet condition are indicated.

ANTHROPOCENTRIC PHILOSOPHY, a system of philosophy which treats man as the centre of interest. In this wide sense of the term the philosophy of Socrates (who was only interested in problems of human conduct), the philosophy of Protagoras (who regarded man as the measure of all things) and his modern disciples, the Pragmatists and Hominists (or so-called Humanists), may be described as anthropocentric. The philosophy of Kant likewise is essentially anthropocentric inasmuch as it limits all so-called knowledge to beliefs which originate in the nature and needs of man. Although Kant described his philosophy as Copernican in the sense that it reversed the dominant point of view of his predecessors in a way analogous to the Copernican reversal of the Ptolemaic astronomy, yet in another and deeper sense Kant's philosophy, in comparison, say, with that of Spinoza, is Ptolemaic rather than Copernican — for it looks at the universe from the point of view of man, whereas Spinozism looks at man from the point of view of the universe. There is an obvious kinship between geocentric astronomy and anthropocentric philosophy. One reason, perhaps the principal reason, why the earth was so long regarded as the centre of the world was because human conceit persisted so long in regarding man as the end of the universe. The pantheistic, cosmic (or non-anthropocentric) views of thinkers like Giordano Bruno, Spinoza and others were, on the other hand intimately connected with the larger conceptions of the universe introduced by the heliocentric astronomy which treated man's world, the Earth, as but one of the minor planets of the cosmos.

ANTHROPOGEOGRAPHY: see HUMAN GEOGRAPHY.

ANTHROPOID APES is the name given to the family *Simiidae,* because, of all the ape-world, they most closely resemble man. This family includes the gibbons of S E. Asia, the orangs of Borneo and Sumatra, the gorillas of W. Equatorial Africa, and the chimpanzees of W. and Central Equatorial Africa. In general structure they all resemble human beings, as in the absence of tails; in the shape of vertebral column, sternum and pelvis; in the adaptation of the arms for turning the palm uppermost at will; in the possession of a long vermiform appendix to the short caecum of the intestine; in the size of the cerebral hemispheres and the complexity of their convolutions. They differ in the proportion of the limbs, in the bony development of the eyebrow ridges, and in the opposable great toe.

Man differs from them in the absence of a hairy coat; in the development of a large lobule to the external ear; in his fully erect attitude; in his flattened foot with the non-opposable great toe; in the straight limb-bones; in the wider pelvis; in the marked sigmoid flexure of his spine; in the perfection of the muscular movements of the arm; in the delicacy of hand; in the smallness of the canine teeth and other dental peculiarities; in the development of a chin; and in the small size of his jaws compared to the relatively great size of the cranium. Together with man and the baboons, the anthropoid apes form the group known to science as Catarrhini, those, that is, possessing a narrow nasal septum, and are thus easily distinguishable from the flat-nosed monkeys or *Platyrrhini.* The anthropoid apes are arboreal and confined to the Old World. (See PRIMATES.)

See Huxley's *Man's Place in Nature;* Darwin's *Descent of Man;* Haeckel's *Anthropogeny* (Leipzig, 1874, 1903; Paris, 1877; Eng. ed., 1883); W. H. Flower and Rich. Lydekker, *Mammals Living and Extinct* (London, 1891); C. F. Sonntag, *Morphology and Evolution of the Apes and Man* (1924).

ANTHROPOLOGICAL ARTICLES. In addition to the general articles ANTHROPOLOGY; ANTHROPOLOGY, APPLIED; ANTHROPOMETRY, etc., the reader will find special articles on subdivisions of anthropological science, such as discussions of BRACHYCEPHALIC; MESATICEPHALIC; DOLICHOCEPHALIC; AVUNCULATE; MATRIARCHY; SORORATE, etc. For anthropological purposes continents, after a general introductory treatment, are divided into areas, each receiving its special ethnologic attention. In countries where a mixture of races is found a special section for anthropology is included, and the reader requiring such information in respect of any area should first look up the name of the territory. There are numerous small articles treating of Races and Tribes individually under their separate names.

It is impossible to enumerate here all the articles falling within the section ANTHROPOLOGY AND ETHNOLOGY, but as examples of the more important articles the following may be mentioned: AGE GRADES; ANIMATISM; ANIMISM; BASKET; BEAD; BLOW-GUN; BOOMERANG; CANNIBALISM; CASTE; DANCE; DEATH; DIVORCE; DUAL ORGANIZATION; ENDOGAMY; EXOGAMY; FAMILY; FIRE; GERONTOCRACY; GROUP MARRIAGE; MEAD-HUNTING; INFANTICIDE; KINSHIP; LYCANTHROPY; MAGIC; MANA; MARRIAGE and MARRIAGE CLASSES; MIGRATIONS; NAME; NOMAD; OATH; ORDEAL; POLYANDRY; POLYGYNY; RACES OF MANKIND; RELATIONSHIP SYSTEMS; SECRET LANGUAGES; SECRET SOCIETIES; SUPERSTITION; TABU, and TOTEMISM.

These articles are supplied with complete bibliographies.

ANTHROPOLOGICAL SOCIETIES: *see* ETHNOGRAPHICAL AND ANTHROPOLOGICAL SOCIETIES.

ANTHROPOLOGY, that branch of natural history which deals with the human species (from Gr. *anthropos,* man; logos, theory). It is thus part of biology, the science of living things in general. Indeed, it was the development of biological studies during the 19th century, chiefly due to the stimulus afforded by research into the origin of species, that brought anthropology into being in its modern form. Of course the Greeks, from whom the whole scientific outlook of the western world is derived, were quite prepared to assign man a place in the animal kingdom, assuming him to be subject to natural law no less than any other organism. But, although they had the right spirit of disinterested inquiry, together with an imaginative genius that gave birth to the most ingenious speculations — so that Anaximander, for instance, actually anticipated the modern theory of the evolution of life, — yet the Greeks were without the facts on which a universal science of mankind could be built. Theirs was a very narrow world, and a few years back or a few miles away brought them to the unknown.

The 19th century, on the other hand, found civilized man not only able to explore the entire face of the globe, but also eager to occupy and exploit it. Again, onwards from the earliest years of the same century, when Denmark got to work on its prehistoric shell-heaps, archaeological research had been amassing evidence of the high antiquity of man; so that by the middle of it — in fact, just before Darwin published his Origin of *Species* — clear proof had been obtained that a cave-man, the contemporary of the cave-bear, had existed untold millennia before the so-called "ancient" civilizations, such as Egypt or Babylon, had begun to flourish. Thus the time was at length ripe for a world-wide, age-long survey of the human record.

Evolutionary Method. — It remained to devise the most scientific way of handling so vast a subject. Now science may be defined as common sense controlled by method. The question, then, was how best to introduce method, that is, unity of aim and consequent thoroughness of procedure, into a study embracing a diversity of matters hitherto considered disconnectedly and therefore without much profit. At this juncture Darwin revolutionized biology, and his theory of the struggle for existence — suggested to him in the first instance by Malthus's treatment of a human problem, namely, how population is to be adjusted to food-supply — immediately served to supply the new science of man with a plan of campaign. If there is a struggle for existence not only between the human species and the other forms of life, but also within the species itself, it ought to be possible to show, by reference to the facts of history taken as a whole, what is the relative value of different kinds of behaviour.

and of the physical and mental powers involved in such behaviour, as they severally affect survival. This central interest pervading and unifying all anthropological studies may be termed "evolutionary," because life-process in general can be represented as the evolution or "unfolding" of certain powers at the expense of others that are gradually eliminated. If, however, the word is for any reason disliked, the more colourless expression "genetic" may be substituted, signifying that attention is concentrated on genesis, that is, the mode of birth, or becoming.

Factors in Survival. — Given human survival, then, as the prime object of anthropological study, its attainment through superiority in adaptation to the conditions of life can be treated as a problem involving three factors, namely, environment, race and culture. Correspondingly, anthropology has three branches, anthro-geography, physical anthropology, and cultural anthropology, which deal with these three principles singly. A fourth division considers the three in one, that is, correlates results, and is known as ethnology (q.v.). Derived from the Gr. *ethnos*, "people," it compares peoples or "ethnic types" in respect to their effectiveness as agencies of survival, Though survival is in the last resort an affair between individuals, it is only in so far as the individual conforms to some ethnic type that his chances of survival lend themselves to an anthropological estimate. Habitat, race and culture alike help to create an ethnic type, though at different stages in human history they exert influence in varying degree, culture, for instance, counting for little at the start, but later playing a prepotent part in the shaping of peoples.

Divisions of the Subject. — So much, then, for the scheme of topics that will be followed here. It would seem to be the only system that will directly subserve explanatory purposes; whereas other ways of breaking up the subject, based on practical rather than logical considerations, cut across the real connexions of the facts — in a word, do not carve at the joints. Thus nothing could be more arbitrary than to divorce from each other the prehistoric man, the modern savage and the civilized man, as if, because there were specialized methods of studying each, they were not equally subject to the same biological laws. Or, again, culture comprises languages, arts and crafts, and social institutions, with which comparative philology, comparative technology and social anthropology can deal to some extent separately; yet nothing but a superficial and one-sided treatment will result unless the nature and function of culture in general be constantly borne in mind. In short, a man is not an anthropologist merely by reason of the fact that his studies have some bearing on the history of man; for most studies have that. To be worthy of the name he must try to see human history as a whole; and its interpretation in terms of vital loss and gain must be the ultimate aim to which his work, however special, is directed.

THE STUDY OF ENVIRONMENT

Environment may be regarded as on the whole the passive condition, while race and culture are the active conditions, of survival through superior adjustment. Though the surroundings to which the human species must adapt itself include the rest of living nature, intelligence, which is the measure of genuine activity, is mostly on the side of man at present, though this was less markedly so in very early times. Forces such as climate and the formation of the earth's surface operate blindly, that is, in a purely physical way; whereas life in proportion as it is intelligent tempers necessity with a certain freedom of choice. A region, let us say, becomes colder or drier. The vegetation struggles in vain to resist the change, and shrinks. The animals hardly put up a better fight. Man, however, as he advances in civilization, can, within limits, make a successful stand by adopting fresh arts; or, if alternatively, he decides to remove to a more suitable place, he has the advantage over the plant or the beast in knowing where to go and how to get there.

Oscillations of Climate. — The farther we delve into the past, however, the signs of human intelligence decrease; so that it may be plausibly assumed that in the unknown foretime when the species was barely emergent — not less, say, than half a million years ago — the geographical control bore on man in much the same way as on the rest of the animal creation. If by this time he differed from the apes in having acquired a decided preference for a meat diet, his association with certain food-animals would be all the closer. When, therefore, the Pleistocene Ice Age began — the point of time from which it is fairly practicable to date man's story — great oscillations of climate set the biological world swaying in such concert as it could manage; and we must picture man pushed backwards and forwards, together with such other land animals as could last the pace, along whatever natural highways the geography of the moment could provide.

Land-bridges. — It is, indeed, essential to note that the distribution of land and water was changing all the while, as well as the climate; so that some paths led as it were over draw-bridges that permitted no return. America, for instance, once had a land connexion with north-eastern Asia that was then interrupted so as to leave only a precarious passage by way of the sea-ice; and so again the bridge from Africa into Europe by way of Malta broke down completely. If we could place with any certainty the cradle-land of the species — always supposing that it is one species and not an amalgamation of several that originated in as many distinct regions — we might try to calculate in terms of climatic pulsation the successive outward thrusts along the available avenues leading to more favoured spots. If, further, we could assume this cradle-land, whether because of its sheer position at the cross-roads, or because it periodically provided optimum conditions to which the species must return in order to be rejuvenated, to keep on sending out fresh editions of man, we might expect the chances of survival for an earlier, and presumably inferior, edition, to improve in direct ratio with its distance from the focus of evolutionary activity. Wiped out or at least buried deep at the centre of the human world, the relics of bygone dispensations would nevertheless occur on or near the surface anywhere round its circumference.

Theory of a Cradle-land. — On such lines Griffith Taylor, following up the work of Ellsworth Huntington and others on the climatic factor, conceives the field of human distribution on a tri-peninsular basis, with its centre somewhere near Turkistan — in fact, not far north of the legendary situation of the Garden of Eden; while Tasmania, Tierra del Fuego, and the Cape of Good Hope mark the dead ends in this three-cornered scheme. He goes on to postulate eight racial types succeeding one another — Neanderthal, Negrito, Australian, Negro, Iberian, Nordic, early Alpine, late Alpine; and tries to show that their present distribution falls into concentric zones, with the earliest races towards the fringe; while conversely, if the archaeologist digs down for their remains, the earliest will furnish the lowest stratum. Put forward as it is without dogmatism, this scheme may be cited as an instructive attempt to view human history as a whole from the angle of the anthropo-geographer. After all, it applies to man a method of zoning which the biologist has applied to the distribution of all the other forms of life with considerable success.

Culture v. Geographical Control. — The weak point in such a method as extended to man, however, is that man alone has culture; and when culture is sufficiently advanced, it becomes truer to say that man controls his environment than that his environment controls him. Race without culture must respond to a physical stimulus in a quasi-physical way; so that, for instance, so long as man was the land-animal which, so to speak, nature intended him to be, he must foot it together with the other land-animals along the existing bridges and corridors, and had virtually no choice in the matter. Given a boat, however, he became amphibious; he could to that extent make free with geography, as for example, by crossing the "zoological divide" into Australia — an impracticable water-jump for the other developed mammals, but a mere ferry for man with his attendant dog. Or, again, let the art of navigation be elaborated, and the British Isles, hitherto a geographical fastness, become the gate of the Atlantic. Cultural anthropology, therefore, since it is especially concerned with the creative efforts of the human intelligence, must largely supply the key to the ethnology of the modern world.

Areas of Relative Habitability. — On the other hand, much is to be learned from the study of environment in relation to

every phase of history. Now, the ground-plan of the principal land-masses has probably — despite picturesque theories about lost continents — not greatly altered within human times; some sagging at the south-eastern corner of Asia and to a larger extent at the north-western edge of Europe being responsible for the most noteworthy changes. Again, no striking upheavals in the way of mountain-building have occurred in the same period; though the violent disturbance of the Tertiary epoch may have done much to stimulate biological evolution and, in particular, to shape the career of our pre-human ancestor. Thus the anthropo-geographer can afford to concentrate on climate, treating flora and fauna, and even avenues of migration, as dependent subjects. Calculating temperatures, rainfall and so on for given regions as the climate varies, he can proceed to map out areas of relative habitability, suiting man more or less closely according to his degree of culture. Desert and dense forest are the extremes; between them — anywhere, in fact, between open steppe and parkland — lies the happy mean, not only for the hunters but likewise for the food-raising peoples. More especially inhospitable is the arid type of desert, more so even than the frozen type or tundra; lack of rain being the physical scourge that man has to fear most. Nay, as a cause of migration on a grand scale desiccation is perhaps more effective than any cultural influence, such as commercial enterprise or colonial expansion. It is, on the other hand, precisely in the inhospitable parts of the earth — or else in out-of-the-way places, such as islands, mountain-valleys or swamps, which may be inhospitable as well as isolated — that the broken peoples are likely to be met with, battered vessels seeking harbour where they can. Thus the study of environment teaches the anthropologist where to look alike for the strong and for the weak among the human candidates for survival. Geographical considerations will not suffice to explain the full conditions of the struggle between ethnic types; but whoever aspires to understand human history as a whole must at least acquire the map-making, map-reading faculty at the start.

THE STUDY OF RACE

Race means breed. It stands for all that we are by heredity as contrasted with experience. Thus it amounts to no more than an abstraction, because we can at best separate only in thought what a man owes to his parentage from what he owes to his acquired habits. More especially does it become difficult when habit is no longer the result mainly of individual experience, as with the other animals — when it is more likely to reflect the native bent — but is the result of culture, that is, conforms to the accumulated experience of all and sundry. Yet in a rough-and-ready way we are all accustomed to distinguish between a man's natural aptitudes and the education that he has received. Science aspires to do this in more exact fashion, but cannot be said to have discovered very trustworthy tests so far.

Mental v. Bodily Characters. — The mental characters would appear to have the greater survival value. Size and strength, for instance, count for less in the struggle for existence as waged to-day than once they did when life was more an affair of tooth and claw. It may be added that never, apart from the aid of a superior intelligence, could man have outfaced the more formidable of his animal competitors. A gorilla, indeed, is a powerful beast, but there is no reason to suppose that man's direct ancestor inclined so far as the gorilla from a line that led on the whole towards mind rather than muscle. Certainly, a Neanderthal man could no more have stood up to a gorilla bare-handed than an Australian native to the Neanderthal man whom he resembles rather in feature than in frame. On the other hand, among inheritable physical traits immunity from disease undoubtedly continues to be a race-making influence of great importance. Nevertheless, mental capacity is the birthright on which a man may reckon most.

Difficulty of Testing Intelligence. — Unfortunately, this is just the side of the subject on which the study of race is least illuminating at present. Thus physical anthropology can classify skulls with reference to their brain-capacity, and by taking an endo-cranial cast can even attempt to take shape as well as size into consideration when the brain is no longer there; or, if it be available for inspection, the arrangement of the cerebral processes can by physiological methods be studied comparatively. Yet, to discriminate the born genius from the born fool by such means has hitherto proved impossible; and it is highly doubtful whether the average intelligence could be calculated in the case of a group of similar skulls or brains known to be related by pedigree. Experimental psychology, again, has not invented very satisfactory tests of natural ability, and little has been done to apply such tests to the world's very various stocks, so as to compare them on that basis.

A Race-making Period. — In the meantime the study of the race-factor has produced more tangible results on the side concerned with the external features of the body; and, although these may be of less practical account as civilization develops, their interest from the scientific standpoint is considerable as enabling the major movements of early history to be traced. Walter Bagehot's hypothesis of a "race-making period" of human development should be borne in mind. He assumes that, so long as culture remained backward, the stress of natural selection was bound to fall mainly on the body. If the slightest physical advantage was of help in the struggle between ethnic types — a dark colour or a thick skull, let us say, as a protection against the sun — then its happy possessor would forge ahead.

Physical Race-marks. — Certain physical characters, then, we may be sure, were deeply impressed on the competing stocks of the early world, and the question is how to recognize them. Though theoretically the anthropologist should take note of all characters constituting the hereditary element, he is compelled, by the vastness of the statistical field to be covered, to work with a few, and naturally seeks among possible race-marks for the most constant and enduring. No biological trait, however, is in a strict sense invariable. The plasticity of organic life pervades all its parts. Yet some human characters undergo alternative modifications that, once acquired, are reproduced with a high degree of regularity. Head-form, hair-texture and skin-colour are instances in point, not to mention many minor features of great persistency such as eye-colour, or the shape, and especially the breadth, of the nose. None of the rest, however, can compete in utility with head-form, seeing that, apart from the high degree of invariability that it manifests — one, probably, at least as high as that displayed by any other single trait — it can be applied, unlike the tests of hair and colour, to the skeleton no less than to the living man; and is thus in particular the archaeoiogist's chief stand-by. It is therefore incumbent on physical anthropology to provide adequate standards by which differences in head-form can be compared; and all that need be said on the subject here is that the usual test of the cranial index, giving the ratio of extreme breadth to extreme length, is, although convenient, exceedingly rough. It is perhaps fairly safe to trust to it so long as the other criteria of race are in fair agreement. If, however, the head-measurements of two existing types are alike, but one is black and the other white, or one is woolly-haired and the other straight-haired, the racial connection is more open to doubt.

Head Form and Intelligence. — Not to go further into technical questions more suitable for a special article, it only remains to add that it would be especially interesting if head-form, as being by far the most carefully registered of the physical traits of man, could be correlated with intelligence. If it could be shown that a long head could not accommodate the most developed type of brain as effectively as a round one, we should be on the way to a much needed method of comparing ethnic types in terms of body and mind taken together. At present, however, all the methods in use to determine race are precarious, and their provisional findings must be accepted with the utmost caution. At most it may be said that the signs of the times point to a great development of such studies in view of the urgency of what are known to the politician as race problems.

THE STUDY OF CULTURE

The subject of culture as it bears on survival may be considered under three heads: language, material culture (arts and

crafts), and moral culture (social institutions). It is necessary to realize at the outset that, although these aspects of culture are often studied apart because of the special methods involved, they form one whole for the anthropologist, who contrasts them in their entirety with the race-factor as representing another kind of inheritance, not born with us, but acquired by tradition. Culture is indeed sometimes described as a "social heredity"; but it is fair to describe culture as an inheritance, since we speak of inheriting the acquisitions of our forbears no less than of inheriting their features. Culture is communicable intelligence. Intelligence being mind viewed in its directive and purposive capacity, the meanings that we communicate essentially relate to purposes that we wish to share. Communication is a two-sided process, taking in being just as important as giving out; so much so, indeed, that the tragedy of history may be said to consist in the fact that the nations have so often failed to interpret what their men of genius sought to express. For, strictly speaking, each man's experience is locked up in his own bosom. If the other man's mind is to be made to respond, a medium of communication, always of a physical kind, must be used; such as a gesture, a sound, or a piece of paper with marks on it. Thereupon the other party to the communication can share in the purpose suggested just in so far as he can translate the outward sign into terms of his own consciousness. Now the other animals have no culture worthy of the name, because their powers of intelligent intercourse are slight, and in particular are confined to those alive and present together. Man, however, through his culture can defy time and space. taking counsel with the dead and gathering in wisdom from the ends of the earth.

Language. — Articulate speech, is, perhaps, the very root of culture. It is a wonderful fact that there is no people now existing or known to history that is without a language such as is not only intelligible to themselves, but likewise intelligible to any other man who takes the trouble to master it. There lies humanity's chance of eventually acting together, namely, in this power of talking out its difficulties and so getting its cross-purposes straightened out. So much, indeed, is articulate speech our human prerogative that it is simplest to couple the pre-linguistic with the pre-cultural and to treat both together as the marks of the pre-human. The suggestion sometimes made, on the strength of certain differences in the make of the jaw-bone, that Neanderthal man could not articulate properly is, apart from physiological objections, very unconvincing, if only because his culture was by that time already more than rudimentary. It is almost inconceivable that he could not distinguish by names the very various implements that he chipped so carefully out of flint; or that he buried his dead according to a silent tradition and with a wordless lament. Indeed, lack of words is in language as we can actually observe it, no test of primitiveness, since, on the contrary, savages, otherwise very low in the scale of culture, often employ what to us seems a quite unnecessary number of terms to distinguish things to our view very much alike. Thus in the vocabulary of the Eskimo every shade in the taste of putrid blubber calls for a designation of its own in the bill of fare. Their language, in short, reflects a mental state in which particularization runs a long way ahead of generalization; so that it is almost as if they gave a personal name to everything that struck their senses. On the other hand, a logical arrangement of their thoughts, as revealed more especially in syntax, is far less in evidence. A corollary is that a backward people in contact with a higher culture will far more readily borrow its words than its power of using them connectedly.

Popular Origin of Language. — It should be added, however, that language, even as at present developed, remains curiously unsusceptible to the influence of logic, and retains all the marks of a popular, not to say primitive, origin. Gender, for instance, instead of conforming to biological fact, still follows the obsolete vagaries of mythological fancy. Or, again, sheer economy of effort, vocal and even mental, is responsible for phonetic and grammatical changes that blur and twist the elements of speech without regard to their function as vehicles of meaning. The most that can be said for this irresponsiveness to conscious control on the part of human language is that it implies the claim of all men to have a share in the making of it. Just because all help to create it does it seem not to be made at all, but rather to grow of itself. The most ancient and precious of the rights of man is the right to talk, a right carrying with it the corresponding duty of occasionally listening to what others say. Unfortunately, since tricks of talk are catching, from mere accent up to vocabulary and grammar, every petty group rejoices in its own dialect; wherefore the curse of Babel rests upon mankind unto this day.

Value of Common Tongue. — There is no use in language except to render intelligence more communicable. Unless a people wished to conceal its thoughts, it would be ill-advised to exchange a world-wide tongue for a local one. On the other hand, nothing counts for more in the struggle for existence between ethnic types than the advantage of common speech. Language is a poor test of race, but an excellent measure of culture in its bearing on survival. Collinguals are cousins whatever their pedigree, and, no less naturally than they talk, are inclined to share sympathies and ideas. A common language, however, implies a common education such as can maintain it, as against that tendency to sink back into a confusion of tongues which is latent in every civilization and becomes active with the first symptoms of decline. Thus the Roman empire did much to impose a uniform mode of official and polite speech on the Mediterranean world, and, had it not taken a bilingual form, the political seclusion between West and East, reflected later on in the history of the Christian Church, might have been largely averted.

MATERIAL AND MORAL CULTURE

Turning to the subject of material culture, that is, of arts and crafts as manifested in such appliances and products as are of a physical nature and, so to speak, can find a place in a museum, one may first note that natural objects embody culture just in so far as they bear the impress of human intelligence, and can communicate it to others. Thus the cathedral builder, as it were, spiritualizes the stone and thereby converts it into a medium of religious rapture. The ape that hurls a casual missile communicates a throwing impulse to his imitative companions; but a material culture has not come into being until a somewhat more intelligent animal selects his stick or his stone and keeps it by him for individual or collective use; or perhaps goes on to adapt it to his grasp by actual trimming such as involves some attempt at design. At this stage art has definitely begun, and presently makes another forward stride when the composite implement is contrived; stone and stick no longer serving severally in something like the shape that nature gave them, but being artificially combined by somehow fixing stone to stick so that they work together. Thenceforward it is but a question of selecting, shaping and combining the raw materials with ever-increasing ingenuity; and forthwith man's relation to the physical environment is so revolutionized that, instead of its slave, he becomes its master. History viewed from this angle is the history of great inventions; and, even when culture is considered as a whole, they are of outstanding importance, since with them can be closely correlated the chief stages in the economic life of mankind. Thus the mere food-collector, scattered about the waste, has little more than fire and hand-tools of wood, stone or bone to help him. Food-raising implies the domestication of animals and plants and involves the use of many devices peculiar to the pastoral or the agricultural life — conditions which alike enable men to live closely together and so cause them to need one another more. With metal-working dawns the age of conquest, navigation, commerce; and to support such vastly extended communications the art of writing is developed.

Practical and Liberal Arts. — It must not, however, be supposed that all material culture subserves the economic side of life in particular. The arts can be divided broadly into two main classes: those that help man to live, and those that help him to live well. Practical and liberal or useful and decorative, are terms sometimes used to express this distinction. Thus in the former class would be reckoned such arts as relate to food, clothing, shelter, fighting, trading and transport; in the second, those con-

cerned with fine art, science and religion, together with various lighter interests that may be summed up under the head of amusements. Indeed, it might be also said of the savage in regard to some of his habits, as, for instance, his manner of dress, that, if he can only have the luxuries he will dispense with the necessaries. The same tendency to sacrifice convenience to charm is not unknown among the civilized, and with all the less reason, seeing that the charm in their case has aesthetic significance only, whereas for the savage it may well have a magical or religious value as well, as when his necklace of teeth or shells is ornament and amulet in one. There is always a psychological as well as a sociological side to every institution, the inward meaning providing in the last resort the key to the outward form. There must be organization, and there must be a reason for it; though often the reason is implicit, and those concerned have no clear notion of what they are about. Indeed, with the savage, custom is a blind king. It is rare that any explanation of its decrees is forthcoming; or, suppose one to be given, it has all the appearance of an afterthought or excuse. After all, the principle, "Act first and justify afterwards," pervades all our actions far more than we are aware.

Imitation. — The psychological bond of society is, and always has been, imitation; but imitation is a process that becomes more intelligent as it develops. The outward sign by which mind communicates with mind must be interpreted, and man becomes a better thought-reader as a larger store of suggestions is accumulated, partly by means of language, partly through material culture as it incorporates meaning and purpose in wood and stone. At first, however, man has to rely mostly on imitating the bodily movements of his group-fellows, and such a primitive method of communication is more successful in propagating emotions than ideas. "Pull, pull together" is the burden of the primitive chorus; and, after all, that is more than half the battle of life. The moral element involved in all moral culture consists precisely in a sense of common effort directed towards a common end. Moreover, throughout human history the sentiment of community has been more important, because more widely shared, than the intellectual apprehension of the nature of the end. Every crowd must have a leader; and it is for the leader in particular to have the end in sight, whereas the rest can afford to attend chiefly to making the work go with a swing. The primitive leader of society at least knows better what he is about than his average follower; though his ideas come to him mainly as dream-like shapes that baffle his mental grasp because the means of fixing and defining them are wanting.

Inarticulate Intelligence. — Slowly does language gain the power of representing thoughts accurately; and in the meantime the primitive man of ideas has to fall back on pantomime, helped out as it is with every kind of material accompaniment, paint or feather, mask or image, bull-roarer or drum, that may assist the dramatization of his meaning.

In judging the degree of intelligence at work in early society, one must be careful to get past the letter to the spirit — in other words, to make sure that one can translate the savage symbol into the sense it is meant to bear. In their concrete-minded way, primitive folk get to understand each other very well so long as they remain in actual contact. Their difficulty is to extend the limits of effective organization beyond the range of voice and eye, that is, spatially speaking, beyond the radius of the camp or, at most, beyond that of a tribal boundary that can be reached in a few days' walk.

The Savage Pre-eminently Religious. — Primitive man is pre-eminently religious in his way of life. He puts the unseen before the seen as his object of strictly practical attention. One might, in fact, say that the hunter judges success to be more a matter of luck than skill, and therefore concentrates on getting the luck. This, however, would be to take rather a superficial view of the case. It would go nearer to the root of the matter if one expressed it rather thus: that in hunting, faith seems to count far more than skill or anything else. What precisely such faith should be in, for its efficacy to be greatest, is a problem that man is still engaged in working out. Considered anthropologically, that is, from the human end, religious faith is man's faith in himself. He believes in powers that he can somehow evoke from within himself, or else invoke from some mysterious source outside, simply by willing to take life seriously. By so doing, certain values such as the true, the beautiful and the good are, as it were, consecrated, that is, separated from the ordinary concerns of life, and lifted up into an ideal heaven whence they shine timelessly like stars. This, however, is more a description of the direction taken by advanced religion — so far, at least, as it interests itself in life, shaking off a somewhat morbid preoccupation with death — than of the outlook of primitive religion. The inferiority of the primitive religion can be summed up by saying that it is imperfectly moralized. It does not see so far as advanced religion into the moral significance of its symbols. Thus one might say, very roughly, that the lower religions conceive the divine nature as power; the middle religions as justice; and the higher religions as love. If truth, beauty and goodness meet anywhere, it is surely in love.

Comprehensiveness of Primitive Religion. — On the other hand, primitive religion, though devoid of insight into its own deeper meaning, has a certain advantage over religion as an element in modern civilization, in that, if less coherent, it is more comprehensive. All the values of life, utilitarian and humane, from food to sculpture and painting, from the study of plants and beasts to the study of the heavens, are primarily viewed by the savage as religious interests. After all, he lives in such a little world that he has in some way a better chance of seeing the various institutions of society in their entirety as a way of life than can a modern man who, to get a grip on his moral universe, must take so much more into consideration. Thus, economics and religion being alike aspects of one process of culture, that is, self-cultivation, there can be no gap between them in the good man's consciousness if he be sufficiently enlightened.

Need of Moral Education. — The vaster organizations of today are apt to reduce the individual to a cog in the social mechanism; and, the control of intelligence being correspondingly reduced, the inevitable end must be collapse, unless moral education by deepening and widening the sense of common purpose can come to the rescue. Many of the fundamental institutions of modern civilization, marriage, for instance, and religion itself, work none too well, and the reason is the difficulty of keeping them true to the central purpose of getting more and ever more out of life, not only as to be lived under supernatural conditions, but as lived under natural conditions here and now. For the anthropologist, indeed, whose business is but to observe the course of history, there is no saying why moral evolution should be desirable. He simply notes that it results from trying to survive in proportion as such trying becomes intelligent, that is, chooses its way in the light of a conscious purpose. Whole literatures deal with the various aspects of moral culture taken separately. Here, instead of running through the history of institutions chapter by chapter, it must suffice to insist that the anthropologist, seeking to view the development of human life as a whole, has somehow to bring the love of food and the love of God into one moral scheme. Indeed, everything that man has done or suffered is relevant to his subject; with this important qualification, that he studies the "how," not the "why," of an evolutionary process whereby life appears to be granted in fullest measure to those for whom it has come to have most meaning.

THE COMPETITION BETWEEN ETHNIC TYPES

The factors in the human struggle for existence having been stated, a final task must be to note briefly the manner of their joint working. Whatever the future may have in store, man has not hitherto faced his environment as a single community, united alike racially and culturally so far as interbreeding and mutual understanding can bring it about. If this were possible, such elimination of the unfit as would still be necessary might be applied directly to the individual by a stern system of eugenics or in such other ways as the wisdom of the age might devise; though whether with success it is impossible to say. Man's actual history reveals as yet no approach to such a consummation.

Relative Importance of Race in Early Times.—In the early race-making period, indeed, organization and culture in general presumably counted for less, and we may imagine that a succession of good seasons would send out swarm after swarm of semi-bestial folk hardly differing in their habits any more than so many different flocks of sheep, until inbreeding in conjunction with a fresh habitat produced a new strain in the stock. Neanderthal man, for instance, is held in the light of the latest research to have experienced two glaciations in Europe, together with a long intervening period when it may have been warmer than it is at present. Also, if we may connect with him the Talgai specimen from Australia and the Rhodesian specimen from Africa, he spread from some unknown centre—possibly indicated most nearly by the Galilee specimen—over a large part of the globe. There is no reason to suppose that culture rather than race was yet the decisive factor in the struggle for existence, so little do his cultural habits seem to vary at whatever time or place we take them. Thus he had fire, no doubt, to protect him against an oncoming glaciation; but we may guess that the natural fur on his back grew a good deal shaggier.

Value of Culture in Early Times.—Yet possibly one is apt to underrate the value of culture, even in its first known beginnings. After all, the Talgai man must have used a boat and thereby improved his chance of life, since once in Australia he was pretty safe among the blameless marsupials. Or again, the pygmy is physically not much of a man, but, as we find him now, is usually given to ingenious devices, using the bow, poisoning his arrows and so on. His present distribution in Africa and at the foundered south-eastern corner of Asia—not to speak of his possible relationship to the Grimaldi specimens from Mentone—suggests a very early origin for a racial type which from the first must have had to contend with a physical handicap, and thus may well have had to rely on its culture as soon as ever a stouter breed of human beings crossed its path. Not to multiply examples, as the primitive peoples, prehistoric or modern, rise in the scale of historic importance and of the power to last, their self-identity seems more and more to consist in a highly individualized culture, while their race, on the contrary, is ever more mixed and harder to differentiate from that of their less successful neighbours.

Decreasing Importance of Habitat.—Habitat, too, comes to count for less. The racial cradle-land or cradle-lands of man—and there may well have been several, seeing that what might be almost called a warm fauna and a cold fauna can be recognized among existing human stocks—must be thought of as some area of intenser struggle and hence of intenser activity which, as it were, set its mark once for all on the kind of man produced there, in respect to his heredity. If he went forth to conquer, the chances were that, reaching some less stimulating environment, he would degenerate. A cultural cradle-ground, on the other hand, would be a fallacious notion. True, culture is sometimes diffused from the same centre, wave after wave, because a people has developed a high and lasting individuality, out of all comparison with that of its neighbours; and the latter consequently live on its charity, nay, may be so utterly pauperized as to lose such initiative as they previously possessed. History provides abundant instances of a contrary process by which the borrower of culture trades on the capital thus acquired to outmatch in the end the fortune of the willing or unwilling lender. Culturally it is always possible for one nation to beat another at its own game. The condition of success in such a case is not so much natural talent—which represents the racial element—as taking pains to learn intelligently, that is, not by rote but by making the thing taught one's own. Modern Japan has shown how a radical change in culture can by intelligent self-adaptation be effected within a single generation. The case is all the more instructive because the ethnic type remains as individual as before, or perhaps more truly might be said to have become enriched in quality, while almost certainly increasing its survival-value.

Culture Must Be Supported by Race.—Not to labour the point further, the prepotency of the cultural factor is so well-marked a feature of the later phases of human evolution that it might even be doubted whether the modern tendency is not to exalt it unduly at the expense of the race-factor. Culture depends on education, and educability is at least partly a matter of hereditary ability. If the average individual is to survive by participating in some ethnic type of superior survival-value, he cannot afford to extend such participation to the born fool; or at least he can prevent him from being born. Such matters lie somewhat outside the province of the anthropologist, who as a man of science and a historian merely unfolds and interprets the record of the past.

Pure and Applied Anthropology.—With an applied anthropology, as it is sometimes termed, the present article is not concerned. The study of human development can, indeed, help the statesman in many ways. Nay, even if anthropology be taken in the all too narrow sense of the study of primitive man, there is much that the administrator and the missionary can learn from it that will be of practical help to them in their work. Anthropology as a pure science aims at the same goal as all the rest of the pure sciences, namely, the enlargement of the mind through knowledge. Have we the courage to seek to know ourselves as truly we have been and now are—whatever else we may aspire to become? If so, then anthropology may go forward.

ANTHROPOLOGY, APPLIED. In Great Britain, public recognition of the advantages to be gained by the practical application of anthropological knowledge had scarcely begun before the World War, and naturally suffered a severe setback from which it only slowly recovered. There were administrators who recognized the native point of view, and were even prepared to study

the sociology of their charges and, in a few cases, recorded the results of their observations; yet nowhere was there any general official recognition that the acquisition of such knowledge should be part of an administrative officer's duties, and adequacy in native affairs is even now not generally regarded as necessary for promotion. Nevertheless a healthy spirit is abroad even if performance at times lags behind the demands of both theory and common sense.

Applied Anthropology has two main aspects: (1) Cultural (or in the broader sense psychological). (2) Physical, embracing especially the great problems of racial characters both physical and mental, miscegenation, immunity and so forth.

CULTURAL

Practical Considerations. — While every people presents its special problem, all these are but different aspects of the greater problem of adaptation, which must be worked out afresh in many instances if the widest range of physical and cultural types are to be given their best chance of survival and development within the conditions besetting them. From the practical standpoint it must be realized that there is no possible future for the few scattered remains of the hunting peoples that still exist; nor in certain instances is the white man responsible for their disappearance, for at the time of the European colonization of the tropics superior "native" cultures were, in a number of instances, destroying these humbler groups as effectively, if more slowly, than ourselves. With regard to the agricultural peoples but recently in the Stone Age, it is yet too early to speak with confidence, for although the natives of the smaller islands of the Pacific have been blotted out or exist only as degenerate remnants it is permissible to hope that under considered efforts those of the larger islands (such as New Guinea) may not only survive but even enjoy a measure of happiness.[1]

Methods. — As to method, there is little to guide us in the past, for though culture contact is no new thing in history, the economic needs of to-day present conditions differing from those of the past, and entirely new. Moral ideas have also changed, and it is no longer possible to enslave or exterminate all peoples unable or unready to adopt or adapt to a higher civilization. Yet in spite of these apparently favourable factors there has been nothing before comparable with the persistence and energy with which the higher race is imposing itself on the backward peoples.

For practical purposes, then, we can only be guided by the knowledge gained during comparatively few years, backed by the experience of our more successful administrators, the whole tempered by a quality of prevision and a capacity to "think Black," which experience has not shown to be unduly common.

Use of Existing Knowledge. — What then are the means by which the store of knowledge we already possess may be used, and how far is a practical rather than theoretic interest in native peoples likely to introduce new methods of acquiring knowledge, or eliminate methods known to be of scientific value? Nothing suggests that the practical or applied outlook makes, or should make, any change in the method of the field worker. For if it be urged that attention to any particular theory is likely to distract the observer from a fair all-round study of facts, the reply is obvious that theory can only stimulate the field worker to fresh observations, which should neither limit his area of outlook nor discourage him from seeking the fullest knowledge of the folk he is investigating in their present and past environment. The more complete the apparatus of the observer, whether government official, missionary or professional anthropologist, the more likely is he to form a complete picture of a people in which due weight is given to the activities both mental and physical of its members, enabling the administrator to foresee their behaviour as individuals, as members of a family, or of a larger social group.

Unity and Complexity of Social Life in the Lower Cultures. — Ethnic and historical connections naturally are important, but stress must be laid from the practical point of view on the interaction of existing ideas and customs. It is impossible to understand the ideas regulating inheritance and bride price — two most important matters with which the administrator is concerned — without at the same time inquiring into the religion, sociology and economics of his people. Unforeseen and undesired ends have resulted from arbitrary interference with native custom. It cannot be too strongly urged that the native has a point of view of his own, and before sweeping away seemingly objectionable customs, the white man with knowledge of anthropology should seek to preserve the driving force which runs through native life, while changing those features which are anti-social according to civilized ideas even though they instigate much praiseworthy social activity. One of the best examples that can be cited is offered by head-hunting, a widespread habit which white civilization cannot tolerate. Yet its suppression was regarded by W. H. R. Rivers as one of the main factors in the depopulation of Melanesia.

This example demonstrates the interlocking of departmental activities, as a white man might be tempted to call them, in native life, and it furnishes the very type of practice which no white administration can permit. The *impasse* seems absolute, yet in Sarawak, where almost the same necessity for head-hunting exists, the difficulty has been overcome by sympathetic officials who have themselves taken charge of some of the old skull trophies of the people, and thereafter when the demand for the ceremonial use of a skull arose one of the old skulls was lent to the community, the whole transaction being put on a business footing by the careful recording of skulls "in" and "out." Again, in an inland district of Papua, where no man could hope to marry unless he had taken a skull, the officer in charge was able to persuade the tribe that the killing of a wild boar offered at least as good a test of pluck and skill, and so was able to substitute the taking of a boar's head for that of a man (often a woman or child).

Importance of Ceremonial. — No one doubts the close relationship between social organization, ceremony, morals, economics and even ethics among ourselves; everyone recognizes the psychological value of display, ceremonial and sport; yet in the administration of the backward races this common knowledge is too frequently ignored. What government at home would presume to stop royal processions, the Oxford and Cambridge boat-race or public football matches? Yet the corresponding expressions reproduced by natives in dances, initiation ceremonies and public feasts are frequently suppressed by the influence either of the administrator or the missionary, long before it is determined whether they are harmful or not. Active teaching is needed, now as much as ever, that the interests of people cannot be cut off with impunity, and the substitution of harmless for anti-social features in savage ritual and institutions is sound social psychotherapy.

Positive Interference. — Frequently new regulations are introduced that undermine the native social structure of which administrators have remained entirely in ignorance.

As to the difficult subject of missionary work as it affects the simpler pagan societies, it seems obvious that instruction in the social side of anthropology equal at least to that given to Colonial Civil Servants should be provided for missionaries by teachers who have themselves had field experience. Though short courses of lectures are now given at various missionary training schools in Great Britain, it does not appear that any central body has yet organized a co-ordinated scheme of instruction. Official authority, far-reaching though it may be, is simple compared to the complexity of influence exerted on native peoples by missions, for, in the intimate affairs of life some missionaries exercise such strong and constant pressure that members of their flock, and even individuals outside it, are deterred from following habits and customs which are in no sense forbidden by the civil administration. Moreover, the pressure exerted by many missions is so great that appeals to the civil authority are relatively rare, however much the native may feel aggrieved. Naturally missionary effort is largely directed to the "reform" of the sexual life of the native, *i.e.* not to any great extent against perversions or abnormalities — for these are too rare to bulk largely in the life of most primitive peoples — but especially against polygyny (polygamy), which,

[1] The outlook as it presents itself to the three generations living in a Maori village is vividly presented by G. H. Lane-Fox Pitt-Rivers in *The* Clash *of* Culture (1927), chap, xii

whether it be advantageous or disadvantageous in a biological sense, is regarded as essentially evil and attacked in every possible manner. Even though the Church feels bound to maintain this attitude it may be doubted whether it is wise or beneficial for the Government to exert its influence against polygamy among relatively untouched natives. For instance in Papua (British New Guinea) no one having more than one wife may be appointed "village policeman." Obviously this excludes the majority of headmen, individuals whose authority is most easily exerted and most readily obeyed, from holding the very office in which they could be of most use alike to the Government and to their own people. Many missionaries have recognized the incompatibility of Christian monogamy with the social structure of some well organized pagan societies. But, while it is necessary to recognize the complications and difficulties introduced by missionary effort, not all missions are equally rigid, while it would be difficult to overrate the scientific and administrative value of the work of such men as the Rev. H. A. Junod, whose *Life* of a *South African Tribe* is an outstanding example of the sympathetic and understanding attitude.

Priest-kings and Magic.—In other instances trouble has been caused by ignorance of the fact that a chief may belong to that exalted class of beings called by Frazer "Divine Kings," or if not actually of this order, be at least of semi-divine nature, and responsible for rain and generally for the prosperity of the land. Here it may be wise to recognize frankly the hierarchical superiority of the priest-king, and to appoint under him an administrative government chief; indeed, besides the priest-king there are often one or more men recognized by the tribe as executive officers in everyday affairs. Nor can the administrator ignore magic and sorcery, and it is useless for him to affirm that the British Government cannot countenance a belief in sorcery; magic may be a fiction, but the belief in it is a potent reality in all the ruder cultures, and is not extinct in higher cultures. Cases of death alleged to be caused by magic or by poison—the two often being synonymous—are continually brought before administrators, yet rarely is evidence produced against the magician which on the white man's laws of evidence can lead to conviction. In parts of Melanesia it is doubtful whether there is any authentic evidence for the use of poisons by a sorcerer; yet folk undoubtedly die as the result of his machinations; they die from no other ostensible cause, and their death is ascribed to magic. The sorcerer is not convicted, but if the people take the law into their own hands and kill him the Government steps in and punishes the slayers, who according to their peers have performed a public duty. It is small wonder then that many natives believe that the Government encourages sorcery; indeed, the relative immunity of the sorcerer from all vengeance in certain instances may actually produce this result.

Another factor which greatly adds to the difficulty of dealing reasonably and justly with sorcery and witchcraft is that generally speaking the darker races are far more suggestible than ourselves; unfortunately, space is lacking to elaborate this statement or to set out a tithe of the evidence on which it is based.

As a general system of treatment, probably an ordinance of the kind in force in Papua is useful, in which it is stated that though there is really no such thing as sorcery yet the practice is so harmful that it is treated as criminal. At any rate, the administrator is not the only person in a dilemma; witness the plaint of one Tata Ko, a well-known sorcerer, to Capt. Barton, then Governor of Papua: "If a man falls sick his family come to me and ask me to make him well. If I don't do something for him they say, 'Tata Ko, the sorcerer, desires to kill our brother,' and they are angry and will perhaps try to kill me. If I do give them something they insist on paying me well for it; should I refuse to take their presents they would not understand it and they would think I was trying to kill their friend, but when I do take what they give me, you arrest me on a charge of sorcery blackmail."

Magicians not Charlatans.—In most instances magicians are not charlatans; though they may impose upon the credulity of their clients they do believe in their own power; they have inherited the gift and perfected their craft by means of hard training. Though legislation may be useful, magic cannot be disposed of by law, for every death except perhaps of the very old is attributed to magic, and it is only when a man has some appreciation of the natural causes of death and the benefits of medicine that he relies less upon magic. Missionaries have long been aware that their best weapon is the hospital; administrators should start clinics shortly after administrative posts, as in the case of the splendidly fitted hospital ship, with its medical officer and orderlies, placed by the Sudan Government in 1922 for service on the White Nile and its tributaries. Yet, however perfect administration, magic cannot die a sudden death; and this has its advantages, for magic has its social as well as its anti-social side.

White magic will persist, and in Melanesia, for instance, its benefits are seen in connection with the Kula. In the Trobriand Islands the specialists in magic are experts in the various crafts, in gardening and canoe building, etc., and it is under their auspices that the good traditions of gardening and building are maintained. Though no canoe could sail unless the appropriate magic had been performed at each stage of its construction good magic would never be used to counteract the effects of bad material or bad workmanship. Thus, the continual magical observances guarantee a careful selection and tests of material, and are an incentive to good work. A successful trading expedition is the result of good magic, and just as magic is the most important regulator of the Kula, so is it of prime importance in garden work. The islanders, like most natives, are notoriously unthrifty, and it is doubtful if any native would cultivate sufficiently for his needs if left to individual responsibility. For man does not live by bread alone, and a garden which will make a fine display and be much talked of appeals to the mass of the population more than the knowledge of a supply against famine.

Practical Suggestions.—In order to save the backward races from extinction and enable them to adapt to new circumstances two courses seem advisable: (a) that all government servants, and others—especially missionaries—coming into direct contact with natives should take as part of their preparatory studies a course in anthropology; *(b)* that every government should appoint trained anthropologists, in order to make detailed investigations and to act, when needed, as advisers to the administration. Each of these plans has its definite sphere of usefulness, and calls for further consideration.

Training.—Apart from a degree in anthropology, which as matters stand at present it is idle to expect more than a small minority to possess, the preparatory course in anthropology may be of two kinds: a six to twelve months' course at one of the universities—usually three academic terms—in which, besides the social anthropology which is of prime importance from the administrative standpoint, a certain amount of technology and physical anthropology will also be taught. Such a course, if due stress be laid upon practical difficulties and details, is no doubt excellent in those few instances in which a man has already a strong, almost a "natural" interest in anthropology; but this plan yields disappointing results when applied as hitherto to men who have had no foreign experience.

The British Colonial Office has a syllabus for the preliminary training in native modes of thought of the men selected as African civil servants, in law, accounts, tropical products, hygiene, engineering, and sanitation, ethnology and the principles of African languages. In the past this scheme has produced good results and experience shows that a certain small number of men will be sufficiently interested to study the tribes they live among and to record their habits and customs, or at least to keep in touch with their teachers.

A further development is for the Colonial Government to pay the expenses (fees and sustenance allowance) of men with administrative experience who are keen enough to spend two to four months' leave working intensively at anthropology at one of the universities. Experience has already shown that this scheme is likely to prove of the utmost value both administratively and scientifically, one feature of special importance being that such students have a knowledge of at least some native language, and

so are in a position to apply the technical knowledge they have gained directly on their return to Africa.

In France, the *Institut d'Ethnologie* and the *Facultés et Établissements Publics d'Enseignement Supérieur* of the University of Paris provide instruction in the various branches of ethnography and linguistics, having special regard to the French colonies. Instruction is given in the languages of the native populations of the French possessions, Arabic, Berber, the Sudanese languages, Malagasy, as well as the more important languages of the Far East, Siamese, Annamese and Cambodian. The social, family and religious organization of Islam and the social habits and religious beliefs of the natives of the French colonies are described and compared by a band of experts of European reputation. In Holland there is a special faculty embracing ethnology, custom and law of the East Indies, Netherland law, Colonial economics, etc., in the Universities of Leyden and of Utrecht. Every candidate for the Colonial Civil Service must pass a preliminary and a doctoral (*doctorandus*) examination, after which he may become a full "Doctor" on presenting a thesis. In Austria, instruction in languages and, to a lesser degree, in ethnology, is given to missionaries at the Missionary college of St. Gabriel, near Vienna.

Professional Anthropologists. — The appointment of professional anthropologists stands on a different footing. No arguments need be employed in favour of their administrative and scientific value. The ordinary official has neither the leisure nor the training, even if he has the desire, to make intensive investigations, and as time goes on and means of communication improve, and his journeys take place increasingly by car, he will have less and less opportunity of meeting his people unofficially and studying them at first hand. A further difficulty that stands in the way of the administrative official is that the native knows that his attitude to many customs such as human sacrifice, cannibalism and black magic must be hostile, and however sympathetic he may be he is still regarded as the man in authority. The anthropologist stays at native villages remote from government headquarters, and, once he has been able to gain the confidence of the people and let them know that his only object is to learn, one of the chief obstacles to obtaining reliable information will be removed. Anthropology as a profession presents a vicious circle. There are few men ready to become government anthropologists, though the machinery for training them exists at our unirersities. Men are not trained because there are no prospects; and then, when opportunities offer, there are insufficient candidates available. Should it be possible to anticipate a regular demand the, men would soon be forthcoming.

Encouragement to anthropological research has been given by the Sudan Government; the Gold Coast and Nigeria have appointed as anthropologists officers who had qualified by taking courses in anthropology. There is a trained government anthropologist in Papua, and chairs in Anthropology have been founded in the Union of South Africa and at Sydney, where special training is provided for administrative officers in Papua. Such action shows the trend of enlightened opinion, but the advantages that anthropological knowledge offers are appreciated only in minute proportion in comparison with needs and opportunities. All governments have their experts in geology, botany, agriculture and zoology in its many branches; it is a strange paradox that so often man alone should be unstudied.

PHYSICAL

It may be useful to recall the old saying, "God made the white man, God made the black man, but the devil made the mulatto," if only to consider how far this proverb embodies a truth, and, if it does, how the facts are to be faced in practice. There arc broadly two types of racial combination. In the first, the races coming together are so far apart as to make hybridization a real breaking down of the inherent characters of each, while in the second the fewer differences present offer only a moderate variability as a basis for recombination and selection which may be desirable. This latter type, socially constituting the "melting pot," is perhaps best represented in history, and can best be appreciated anthropologically, by a study of the *Völkerwanderungen,* with the broad result that an outburst of vigour and capacity is found tc follow the mixture of peoples belonging to the same great racial groups. From the political standpoint this form of miscegenation has become of increased significance since the opening of the 20th century, but its importance from the standpoint of applied anthropology is in our present state of knowledge relatively limited.

Widely Divergent Unions. — In considering the interbreeding of widely divergent races it must be realized that the above proverb is intended to apply to moral values, and that the children of such unions are almost invariably relegated to the inferior race (in practice, the mother's) for their upbringing, and so are socially and morally at a grave disadvantage, except where a sufficient number of mixed marriages occur, when a hybrid community, with its own social habits and values, is established, allowing a fair estimate to be formed of the physical and mental qualities of its members. The only all-round study of such a community is that of Prof. Eugen Fischer of the Reheboth community of south-west Africa (*Die Reheboth Bastards und das Bastardierungsproblem beim Menschen* [Jena, 1913]). This consists of the descendants, some 150 in number, through five or more generations, of the hybrid offspring of a group of trek Boers and Hottentot women, and includes the offspring of a number of unions with members of the parent races. The genealogies are not always easy to follow, but the Reheboth Bastaards show extreme variability, and are divided into "European," "Hottentot" and "Intermediate" groups. They are a strong, healthy and fruitful people, taller than either parent race, *i.e.,* they show a common indication of hybrid vigour. Physically there is no predominance of heritage from either race, but the inheritance of facial characters and colour is described as alternate, and in spite of the three groups there is no special tendency for the inheritance of groups of characters the unit elements of which are combined in either parent race. Psychologically the most important observation is that the Hottentot mentality predominates; there is neither European energy nor steadfastness of will. Further, though several subjects show a fairly high degree of intelligence, the Bastaards live entirely in the present; they are typically *Augenblickmenschen,* while this character is not compensated by any special power of imagination or proficiency in the arts and crafts, in which they are distinctly weak.

Other Groups. — As instances of other hybrid groups, with their own adequate social organization, certain Arab tribes of the Sudan carrying much black blood, the mixed European-Chinese population of the Straits Settlements, and the negro-Amerind hybrid population of Guiana may be added. Owing to lack of precise knowledge of the building up of these groups little of importance can be said on the physical side, for terms having no precise connotation are used; *e.g.,* it is obvious that there is a vast difference genetically and socially between the tall dolichocephalic Dinka and the short mesaticephals of the Bahr-el-Ghazal, though both would be classed as "negro" by Arabs and Europeans; while with regard to the Arab stocks there can be no certainty whether any particular strain carries Armenoid blood. The members of these tribes appear to have adapted themselves admirably to their mode of life, which is predominantly Arab, socially, economically and religiously, and the majority of individuals appear to present an intermediate type with regard to two of the most easily observed characters, namely skin colour and breadth of nose, though striking individual variations occur, *e.g.,* a "black" skin may be associated with a face and nose almost typically Caucasian. Further, darkness of skin tends to be predominant, and there are certain families in which this tendency is so marked that it would perhaps be fair to speak of these as exhibiting dominance in the true Mendelian sense. Mentally and morally these tribes are Arab, not negro; thus socially and morally the inferior stock may be said to have been improved by the mixture. How far the Arab has suffered must remain an open question, and whether the improvement may not be in part due to the direct influence of Islam. The reconquests of the Sudan demonstrated the truth of an observation made years before in Arabia by Robertson Smith, namely that not the pure Arab but the mixed Arab-negro population exhibits the quaiity of religious fanaticism.

In both the other two examples quoted, whatever the physical

differences between the races concerned, they stand on equal or more nearly equal level. The mental and physical alertness of the mixed Chinese-White population of Singapore is striking, and they form a definite social class furnishing many highly efficient civil servants and clerks. Generally, Mongolian traits of feature predominate and it appears that the Mongolian eye, at least in the F.I. generation, is dominant, as it is in Malay-Melanesian matings observed in New Guinea. It may indeed be found that Mongolian-White matings give particularly interesting, and perhaps desirable, combinations. In one Japanese-White marriage the children (all female) exhibited a high degree of hybrid vigour, considerable artistic ability, and in type approximated to Polynesian; unfortunately, they passed out of observation before maturity, and it can be stated as a matter of experience that five other children, the result of two Japanese-White matings, did not reproduce this type.

With regard to the negro-Amerind mixture of Guiana, there seems no doubt that a definite type has been produced which has largely taken to a special mode of life as boatmen on the rivers. for which it is well fitted, and that this hybrid population exhibits much of the physical efficiency of the negro without his laziness and excitability. For books on the subject see the Bibliography to the article ANTHROPOLOGY and the works quoted in the text, *The* Clash of Culture (Pitt-Rivers) being specially important.

(C. G. S.)

ANTHROPOMETRY. Anthropological science aims at the establishment of man's position in nature, the discovery of the extent of human variation, the ordination of the fundamental facts concerning the growth of the individual, and the bearing on human evolution of the evidence drawn from comparisons of the existing human types with one another, or of each in turn with their prehistoric precursors. Such enterprises entail both the collection and the apportionment of evidence. And when comparisons have to be made, the advantages of numerical modes of expression over those which are purely descriptive are manifest.

NUMERICAL DATA IN SCIENTIFIC STUDIES

The measuring rod and the balance, instruments of precision, exemplify the means of collecting quantitative data, the foundations of much of the superstructure of modern science. But in the domain of biology the very texture of living matter seems opposed to exact measurement. To this obstacle there must be added that which is set up by the unceasing metabolic mutability of protoplasm. Some there are who plead for the freedom of biological research from adverse criticism should rigid numerical methods be discarded in its prosecution. Anthropometry constitutes one of the testing-grounds of those methods.

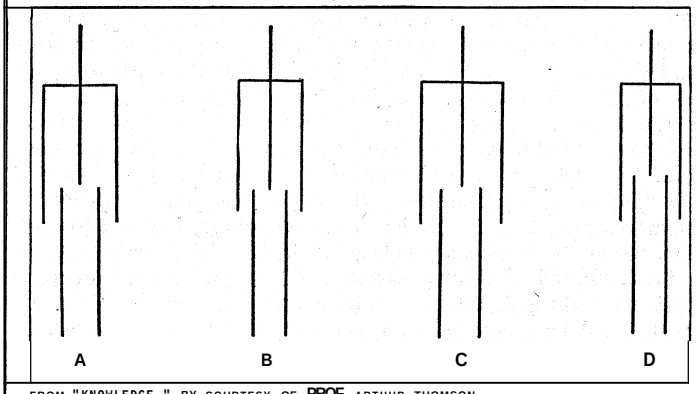
The history of anthropometry is retraceable far backwards in time. From the very dawn of graphic representation in the historic period, it has claimed the notice of artists. These, though they may not have collected data with scientific precision, or on a definitely systematic basis, can claim credit for attempts to interpret the various details they observed. But the scientific treatment of data representative of measurements based on a predetermined scheme, and collected systematically and consistently, is a matter of comparatively recent development. Anthropometry is still far from maturity. The measurements, the instruments of research, the methods of interpretation, all alike are subject to periodical revision, with a view to the correction of errors.

The numerical data of anthropometry are evidently susceptible to investigation statistically, although their range of distribution (in other words, their diversity) is notoriously great, as may be remarked in the variations of stature and weight among the individual members of an adult population.

Quetelet.—But the whole subject of anthropometrical research is influenced, if not actually governed, by the consideration that in spite of apparent irregularity the variations exhibit a distribution conforming to a rule termed the Law of Frequency of Error. This law "was excogitated for the use of astronomers and others who are concerned with extreme accuracy of measurement, and without the slightest idea, until the time of Quetelet (1833), that it might be applicable to human measures." The achievement has proved to include not merely anthropometric records but biological data of many kinds. Quetelet himself stated: —

"Should the type be absent, and should men differ not by reason of accidental causes but because there were no laws really applicable to them, one could measure them, as, for instance, in respect of stature, but without finding that the various individual measurements presented any particular characteristic, or any definite numerical relations.

"If, on the contrary, all human beings have been cast in the same mould, whence they have emerged with purely accidental



FROM "KNOWLEDGE," BY COURTESY OF PROF. ARTHUR THOMSON

FIG. 1.— AVERAGE BODILY PROPORTIONS OF ADULT MALES

differences, then the groups will not be formed as above in disorderly fashion, but their numerical values obeying the theory of probabilities will be subject to pre-established laws so completely that the numbers representative of the several groups could be predicted in advance. For this particular instance, then, there exists a characteristic feature by means of which one realizes that the individuals are referable to the same type, and that their differences are assignable to fortuitous causes only.

"Another consequence of this theory is that the larger the number of observations the more completely do the effects of the fortuitous causes cancel each other, thus permitting of the predominance of the general type which they tended to mask previously. Thus in the human species, and having regard to individuals only, all varieties of stature are met with, at least within certain limits. Those nearest the average figure are the most numerous; those which are furthest removed from the average are the least frequent: and the several groups succeed each other in numerical sequence according to a law capable of formulation in advance. (In data found to be ordinated nearly in accord with this law, the aggregation near the median is so great that a comparatively small number of individuals will provide a sample serving to give reliable information. Beyond this number, increase in the total number does not give much greater reliability to the result.)

"Now this law holds good for mankind, not merely in regard to stature in its entirety, but in respect of its several components: the same applies to records of weight, to those of physical strength, and, in short, to any character that is measurable and reducible to numerical expression. . . .

"This discovery of the applicability of the law of accidental causes to human phenomena, no matter from what point of view humanity is regarded, is now a fact firmly established in science. I consider its correctness proved by the large number of instances available. . . ."

Quetelet illustrated regularity in gradation by reference to the distribution of stature in adult males, selecting for this purpose data provided by no fewer than 10,000 individuals. When these are ordinated according to the gradual increase of their stature, the arrangement is found to be capable of graphic representation by a curve. The curve assigned by Quetelet (and shown on p. 17 of his memoir) corresponds to that known as the curve of frequency of error (an alternative name is "normal probability curve"). It is symmetrical and unlimited in either direction.

As to the course of growth in stature from infancy to maturity Quetelet states that from the age of five years to about 15 years, the annual increments of growth are regular. This conclusion seems generally to have been accepted, and even now the sequence of records taken at intervals of a year does not serve to modify it. But the true progress of growth to maturity is not revealed unless the records are repeated more frequently. The lapse of so long as 12 months actually masks the important alternatives of periods of greater activity with others of relative relaxation. Quetelet himself was aware of variability in the rate of growth, and he agrees that in the development of a particular individual there present themselves almost invariably periods of arrest as well as those in which growth is more or less rapid. But Quetelet deprecated laying stress upon such varying rates of progress, and herein he failed to realize the full meaning of his data. The real significance of these alternations is that the regularity with which they succeed each other constitutes a characteristic feature of growth-changes. The realization of this detail will probably prove to have a very practical economic application.

Galton's Work.—The work of Francis Galton extends and expands that of his precursor. Galton was interested from the first in the problems of heredity. Both researchers soon realized the need for collecting reliable and suitable data on a large scale, and both turned their attention to the phenomena of human growth from infancy to maturity, and, discontented with physical measurements only, both brought physiological and intellectual manifestations within the domain of measurement.

Galton's outlook on the variability exhibited by the individuals of a human society is well expressed in his Herbert Spencer lecture where he likens such variability to Proteus in the old fable, in that it can be "seized, securely bound and utilized." As comment on the accuracy of the application of the law of frequency to the particular example of human stature he observed that "the statistical variations of stature are extremely regular, so much so that their general conformity with the results of calculations based on the abstract law of frequency of error is an accepted fact by anthropologists." (British Association for the Advancement of Science. Report 1885. Presidential Address Section H. p. 1209.) Nevertheless not all human measurements give such close approximation to theory as those of stature do. The theory seemed, in fact, to be limited in its range, and Galton propounded a means of bringing some of the aberrant instances within the scope of the latter. He subjected all parts of his data and methods to a keen scrutiny. His most important and more particularly personal contributions can be summed up in the words "regression" and "correlation." Regression is a feature of populations and has reference to the fact that, on the whole, the (adult) offspring must be more mediocre than their parents. Galton illustrated regression by reference to the stature of the (adult) offspring compared with that of the parents. and succeeded in measuring the amount of regression. At first he was concerned to compare the stature of a generation of parents with that of the succeeding offspring. Subsequently he extended the scope of the investigation, and published the results of studies in which the offspring were compared (inter se).

Galton discovered that the amount of regression was remarkably constant in certain instances. Taking stature as the test and comparing the "mid-filial" deviation from the average with the "mid-parental" deviation, he found that the former was on the average two-thirds of the latter. And two-thirds consequently represents the ratio of "filial regression."

Three important points emerge here. In the first place, the ratio, measuring the deviation of offspring as compared with that of parent, might be used as a test of evolution, or at least of progress. For if it were repeated in successive generations, and found to vary, the inference of progress would be quite reasonable.

In the second place, this discovery marks a stage in the construction of a theory of ancestral contributions in heredity, and the evidence of the stature was considered to indicate the similarity of the successive contributions to a series in which the terms were $\frac{1}{2}$..., $\frac{1}{4}$..., $\frac{1}{16}$.., each ancestor making a contribution however small. This is one of the aspects of anthropology in which the work of Galton stands confronted with that of Mendel, since in the light of Mendelian research certain ancestors may contribute nothing at all. (There is, in fact, on p. 13 j of Natural Inheritance, a remarkable instance of inheritance, which is possibly an example of the operation of Mendelian laws.)

The third point arises in connection with the extension of the comparisons in which evidence of regression might be manifest At first the term was used to denote the relative degree of abnormality of parent and offspring. But in the guise of correlation the term acquired a much wider significance and the extensions constitute what is perhaps the most conspicuous landmark in Galton's life-work. In the words of Karl Pearson "Galton created the subject of Correlation," and again, "Galton, starting from the organic relationship between parent and offspring . . . passed to the idea of a coefficient measuring the correlation of all pairs of organs, and thence to the organic relationship of all sorts of factors." The importance of the achievement is unquestioned, even though there be reservation of opinion as to the precise formulae to be employed. And the practical side of the study of correlation in human measures may be illustrated as follows. There is very general agreement as to the influence of such factors as (1) Heredity and (2) Environment on the final constitution of the individual. As to the relative magnitude of the parts played by these factors, no opinion is possible until shares are assigned in just, *i.e.,* in real proportion. But again, no division of responsibility can be satisfactory until expressions of number and quantity are available 'for use. And the index of correlation (even if its probable error has to be appended) sums up in itself the process of attempted measurement. Finally the progress of evolution itself may ultimately prove capable of expression in terms of a particular coefficient of correlation.

Karl Pearson.—The pages of *Biometrika* edited by Prof. Karl Pearson, constitute a massive literary memorial of Galton. In an early study (1897), before the appearance of Biometrika, Prof. Pearson investigated the variability of the two sexes in respect of their skulls, demonstrated the application of scientific methods of measuring the degree of variability manifested in different series of skulls, and brought under consideration skulls of both sexes from all parts of the world, and of prehistoric antiquity as well as of modern date. He assumed that variations constitute the raw material of the process of evolution. He found that although he was unable to point to a measure of variation really significant of progressive evolution, nevertheless the coefficient of variation employed in his research indicated little or no excess of variability in either sex over the other. His data point to a greater variability of the races of modern times, so that their structural details are still providing opportunities for further modifications should the process of evolution lay them under contribution. The contributions to Biometrika include the refinement of measures of variability and of degrees of correlation, and tests applicable to curves representing the distribution of measured characters, such as provide a means of gauging the significance of two or more peaks of frequency on a given curve. Where the curve in question represents the distribution of some particular character (such as stature) in a population, the tendency to infer the co-existence of as many distinct "elements" in the population as there are distinct peaks on the curve, is strong and reasonable, but justifiable only if confirmed by an appropriate test. The admixture of elements, whether "racial," or other is not the only possible explanation of the occurrence. The alternatives include the possibilities (a) that the total number of records available is inadequate, (b) that individuals of the two sexes are mingled in the same group, and (c) that individuals of different ages are aggregated therein. These evidently demand close scrutiny.

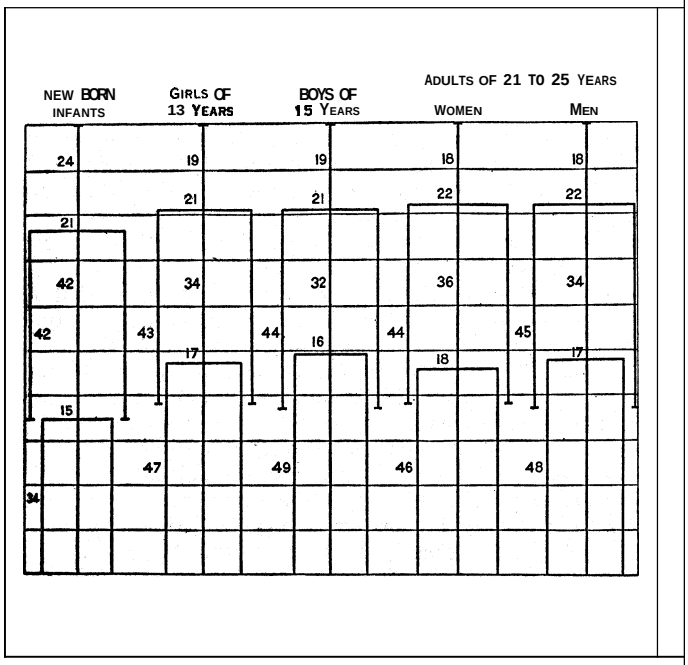
With the progress of statistical research the instruments mill be improved or even replaced, and the existing methods will be regarded as no longer adequate. Already the very premises of Prof. Pearson, regarding the extent to which statistical methods are strictly applicable to the elucidation of biological data, have been called in question.

APPLICATIONS OF ANTHROPOMETRY

One of the earliest statistical accounts of the physique of children employed in factories appeared in 1833, containing observations made at Manchester and Stockport. Records are given of the stature and weight of 1,492 boys and girls. Out of that number 1,062 were engaged in factories, although some of the children were only nine years old. The factory hands exhibit inferiority both of height and weight, but the inferiority is not marked until the 16th year in respect of height and the 14th in respect of weight.

Nearly 75 years later a similar contrast was established when "neglected" boys were compared with those of the whole community employed as "controls." The contrast is much more definite at 13 to 14 years of age than at five to six years; but it does not apply quite equally to both sexes, for though the girls exhibit the contrast in more marked degree than the boys at the earlier stage, they are not as sharply contrasted at the later age.

Child-life in Scotland. — An exhaustive investigation into the child-life of urban and rural districts, carried out under the general supervision of the Scottish committee for child-life investigation and the particular direction of Prof. Noel Paton, and published in 1926, contains a wealth of statistical data. Anthropometric observations lead to the conclusion that "up to between the first and second years the child of the agricultural labourer is on the average apparently growing more quickly than the urban child. After this, there is a striking parallelism" (p. 101). Again (p. 104), "while there is apparently some delay in the rate of growth of the average town child between birth and 18 months, after that date the growth proceeds as rapidly in the town as in the country child." Chart IX. where "urban" boys (Glasgow) are compared with "rural" boys (Forfarshire, Island of Lewis, Ayrshire), shows that the stature of the urban boys is consistently lower than that of rural boys in the period under observation (5 to 15 years).



FROM "DER MENSCH ALLER ZEITEN," BY COURTESY OF JOSEF HABBEL

FIG. 2 — THE PROPORTIONS OF PARTS IN BOTH SEXES FROM BIRTH TO MATURITY. THE STATURE IN EACH CASE BEING REPRESENTED AS 100
The figures show the increase in some parts accompanied by relative decrease in others. It is of interest to notice that the lower limbs attain their greatest relative length before the maximum stature is reached and earlier in the female (13 yrs.) than in the male (15 yrs.)

Instead of parallel lines of development it shows a divergence indicative of a temporary arrest of growth in the "urban" boys from 10 to 12 years of age. This arrest interrupts the parallelism which would otherwise exist, and though the years of incidence do not tally exactly, this interruption recalls the contrast disclosed by Greenwood's comparison of "neglected" boys of 13 to 14 years of age with the general stock at that age. In the Scottish investigations the "urban" girls exhibit the same sort of contrast with the "rural" girls as do the two groups of boys; but in the girls the divergence appears rather earlier. In respect of weight, the indication of a corresponding contrast is not altogether lacking, but is much less distinct than in regard to stature. Where the "deviation" occurs, an indication exists of a temporary arrest of growth-activity. Such a temporary arrest implies a periodic alternation of an active with a resting phase; and that such periodicity actually obtains, seems to have been fairly proved.

Munich Children. — Observations of large numbers of the school children at Munich were repeated over a series of years with somewhat fluctuating results. It appeared that the measures actually recorded (of stature and of weight respectively) manifested first (as in 1921) a reduction when compared with the data for years previous to 1914. Then, in 1924, the children who in that year attained the age of eight exceeded in stature those who reached that age a year previously by as much as 3·2mm. (2.64%) for boys, and 2.8 (2·34%) for girls. The respective weights showed a corresponding contrast. Prof. Rudolf Martin noted the improvement in physique thus revealed in the year 1924, and attributed this amelioration to improvements in the conditions of life at Munich. Anthropometry thus provided the data, and a correct interpretation is particularly important in view of the political bearing of the results announced in this investigation.

In a second research made by Prof. Martin, the children of "school age" at Munich were again the subjects of investigation, and on this occasion were compared with those of corresponding age at Chicago. For each of the ages represented by the years 6, 7, 8 . . . 13, the Bavarian children (Munich) fell short of the American children in respect of stature and of weight. Likewise, in each of the eight years in question save the first, the American children showed an extension of variation beyond the uppermost limit of the Munich children.

Physical Types and Disease. — The relation of disease to the physical conformation of the patient has been investigated by many authorities, among whom Dr. Shrubsall, in 1904, published evidence that different types make different contributions to the sum of inmates of a general hospital. The association of disease with physical type was shown to be more definite in respect of complexion (the blonde and brunette types respectively) than of a more definitely measurable character such as stature. Nevertheless, there is an association of blondness or brunette-ness with correspondingly contrasted varieties of stature, so that the relation of disease to stature is not negligible. Dr. Shrubsall laid stress on indications that the conditions of life in respect of hygiene exercise a sort of selection of particular types to the disadvantage of one and the advantage of another. He added that "to determine whether these phenomena are peculiar to London, or even true, for I have only been able to make some 50,000 observations, an anthropometric survey of the whole country is imperative, and its results would doubtless serve as a basis for any measures of public hygiene which might serve to restore the balance of power, should it be found wanting." That survey has still to be made.

Evidently the extension of such investigations would introduce anthropometric methods into the preparation of data eventually illustrating the significance of the death-rate in various regions. As regards expectation of life, the influences of profession and occupation are acknowledged already; nevertheless the reminder (p. 196) that morbidity is much greater than mortality is very apposite here.

Davenport has employed anthropometric data to distinguish various types of conformation which he terms "build." He devised an index based upon the factors of (*a*) weight and (*b*) stature conjointly, and he found that this index could be used to denote the characteristic "build" of a particular individual He proceeded to study the association of the various types of "build" with diseases, and the observations relate to juvenile as well as adult subjects. The results confirm a popular impression They exhibit prevalence of respiratory diseases in the class of individuals described as "slender" (with an index of "build" averaging 28).

Vascular troubles afflict more usually the very "fleshy" individuals, whose mean or average index of build works out at 48. The data collected by Davenport and his colleagues indicate that "fleshy" individuals prove more prolific than those of "slender" build. Moreover, the character or quality of fleshiness seems slightly to dominate that of slenderness in inheritance.

A more circumscribed type of enquiry involving the use of anthropometric data in the investigation of disease is exemplified in a report by Dr. Berry and Mr. Porteus, who investigated the dimensions of the head in mentally defective children, and in order to secure the means of comparison, carried out a most extensive survey of normal individuals, including school children, university students, and aged persons, to the number of over 6,000. The research was conducted in Australia, and as an interesting, but entirely accessory "control", about 60 aborigines were also measured. In reporting on the data, the authors admit that they can only consider the marked deviations from the normal as possessing diagnostic value, so effective are the sources of error. With this reservation (and their claims are not invalidated by the statement made by Prof. Karl Pearson in *Biometrika,* vol. v. p. 105, as to the low degree of correlation between head-measurements and intelligence), they claim that the volume of the brain, calculated from the dimensions of the head as actually measured, differs significantly in the mentally defective from what it is in the normal groups of corresponding age used for purposes of control. Not only so, but besides these mentally defective children, the deaf and dumb children subjected to investigation, as well as the reformatory inmates and the aboriginal natives, all fail to present evidence of brains of the volume shown by the controls to be appropriate to comparable individuals of normal intelligence. The data illustrate these conclusions. The volume of the brain expressed in cubic centimetres, was estimated, and average values for several groups of boys or youths provided a sequence that may be represented as follows:

	cu. cm.
Mentally defective boys at 13 years	1,292
Deaf and dumb boys at 13 years	1,307
Normal public school boys at 13 years	1,352
Reformatory youths at 20 years	1,344
Normal youths at 20 years	1,483

A detail brought out rather strikingly in the preparation of the normal data for use is the definite transient phase of arrest which appears at least twice in the progress of brain-growth to its full amount. These periods of arrest affect the brain in boys and girls alike, and in the same years, namely from 11 to 12 and again from 13 to 14. In the girl a third resting stage is indicated more definite than either of those which precede it, and distinctive of the years from 16 to 18. Subsequently the female brain completes its growth to the extent of 2% of the whole amount. The calculation of the volume of the brain involved the use of a formula which had been worked by Dr. Lee under the supervision of Prof. Karl Pearson.

Dietary **Investigations.**—A memoir was published by Dr. Corry Mann in 1926 on the acquisition of "a numerical value for a basic diet, of poor quality, but adequate physiological value, in terms of nutrition, and to assess, similarly, the value of certain items of food when these are supplied as additional rations to such a basic diet." Anthropometric data (of stature and weight) were employed, for frequent records were made of weight and height. Boys of school age, with a low rate of sickness, living in an institution near London, were the subjects of the investigation. Sixty-one boys who received only the basic diet gained an average of 3·85 lb. per boy and grew an average of 1·84in. per boy during 12 months. Forty-one boys who received in addition to the basic diet a ration of fresh cow's milk, pasteurized and homogenized, one pint, 388 calories daily. gained an average of 6.98 lb. per boy and grew an average of 2·63in. per boy during 12 months. The relative values of several diets, as measured by gains of height and weight, are exhibited graphically in figs. 3 and 4 of the reports. Besides illustrating the predominant effects of milk, these figures bring out a curious point in regard to the effects of (a) watercress and (b) casein when added to the basic diet. The effect on weight is very definite and indeed considerable when water-cress is introduced, but the effect on stature is negligible. (The actual numerical data would by themselves suggest that water-cress is deterrent to the attainment of the stature that would take place in its absence. But this conclusion should not be drawn without close scrutiny of the figures. The influence of a "random sampling" may be accountable, and the more probable conclusion is that the effect of water-cress is negligible in respect of stature.) Casein in these experiments seems to produce no significant effect on either weight or stature, despite the very marked addition it provided to the amount of protein in the diet (almost doubling it) and to the number of calories (increased from 61 to 91).

The duration of the experiment, the number of individuals under observation, the number and minuteness of the analyses confer an exceptional importance upon Dr. Corry Mann's work. It affords guidance as to the fundamental requisites for such enquiries, including the necessity for exhaustive analyses of the diets employed.

Racial Characters.— In some of the preceding instances the element of "race" or "type" may evidently need consideration as a possible factor in determining diiferences detected by anthropometry in the survey of a population. Anthropoinetric methods must therefore be applied to the study of the several divisions of mankind, and the wider aspects of the subject include the prehistoric as well as the existing members of the Hominidae. Moreover, the scrutiny must be extended from mankind to the monkeys, and to any other animals whose general anatomical structure proclaims them nearly akin to these.

In a survey of what may be termed "Racial Anthropometry" the living subject and the absolute dimensions of the body evidently claim the first place; but from the first also regard must be had to the skeleton. The bones alone are available as the vehicle of information concerning prehistoric man; and the same is true of more than one recent type of humanity, *e.g.,* the Tasmanians, the Mori-ori and the Caribs, who have become extinct within the last few centuries, or even within the memory of persons still living.

Anthropometric observations of living persons include measurements of weight and of linear dimensions. The latter may bc rectilinear, as in the case of stature, or curvilinear, and two-sub-varieties, viz., arcs and circumferences, are to be distinguished as coming within the latter description. Linear measurements of diameters or circumferences provide the means of calculating volume or capacity, and finally angular measurements constitute a separate category which has representatives in nearly every scheme and schedule.

Range of Stature and Weight
(Extreme Instances)

Stature.				
	Males.		Females.	
	mm.	in.	mm	in.
Norwegian Lapps	1,523	59·7	1,450	57·2
Nilotic Sara tribe	1,817	71·02	1,676	66.2
Weight.				
	Males.		Females.	
	kgm.	lb.	kgm.	lb.
Bush natives	40·4	89·0	36·7	81·0
Iroquois Indians	73·8	162·6	no record	no record

The highest average weight recorded in Dr. Martin's list for females is that of south Russian Jemesses, and amounts to 63.5 kgm. (140 lb.). The erratic character of such data is shown by the fact that these women provide a greater average number than do the male south Russian Jews. This paradox is probably due to the greater obesity of the females. Among all human types individual variations are considerable, amounting among the Bush natives of South Africa to a range of from 30kgm. to jgkgm. in males and 30kgm. to 4 jkgm. in females.

Such examples exhibit an extraordinary range of diversity. Their study raises a fundamental question as to its significance, and that question still lacks a final answer. As to the local diversity of human stature, no doubt exists, and it is easy to proclaim the racial distinction of the Scandinavian from the Laplander, even though their territories lie adjacent the one to the other. Yet the gap can be bridged, and the intermediate examples are so numerous and so diverse as to establish a complete gradation between the extremes.

But the question remains, is mankind a single stock with an almost infinite number of sub-varieties, or are a limited number of fundamentally distinct types now linked together? The bonds of linkage would be such factors as admixture of types (with intermediate characters in the offspring of such matings), local conditions affecting growth favourably or the reverse, and other factors as yet imperfectly known. Kollmann postulated the original coexistence of certain distinct "types." But there is no demonstrative proof on either side. Against such "original diversity" the supporters of an "original unity" of human ancestry can still proffer their arguments, reopening the old problem of polygeny versus monogeny. This is so closely connected with the mode and precise path of human evolution from the immediately pre-human stages that its temporary loss of vogue as a subject of debate is bound to be succeeded by a renewal of interest. (See MONOGENISTS.)

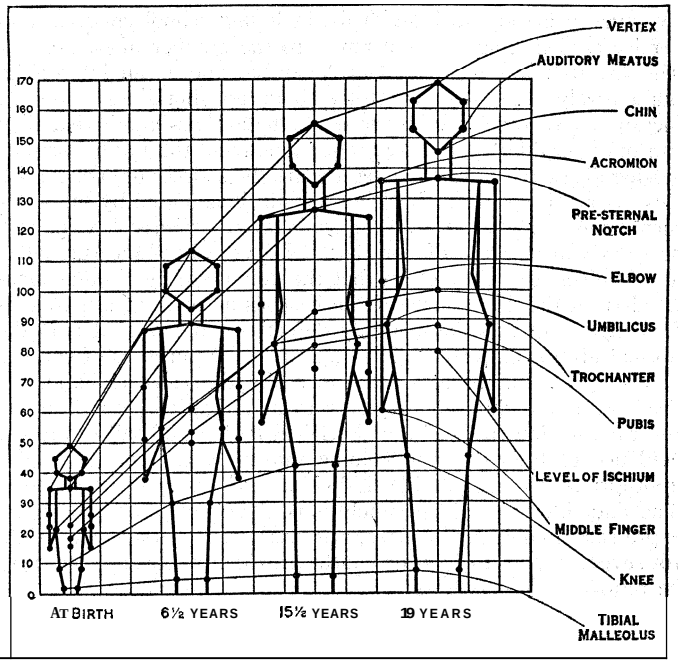
Although stature is naturally related to body-weight, the correlation of the two characters is not complete; the taller of two individuals need not necessarily be the heavier. Thus among the south Russian Jews, the women weigh on the average more than the men, though the men are notably taller (1,651mm. as against 1,536mm.). And again, the geographical distribution of those human beings who are at once among the tallest and heaviest of their kind is capricious. They preponderate in areas so widely separated as Scotland, Montenegro, Rajputana, Sumatra, the Marquesas islands and Patagonia, with African groups in the Bahr-el-Gaze1 and Zululand. The last-mentioned come, curiously enough, into close relation with a remnant of the pygmy Bush natives of South Africa. Again the tall men of Galloway are set off by the diminutive weavers of Spitalfields, the interval separating them being almost equal to that of the extremes provided by the whole range of humanity. But the range of pygmies is almost equally extensive and as certainly interrupted and discontinuous. To the pygmies of the Kalahari desert in South Africa there succeed those of the Congo State; but other representatives of pygmy size are found in Lapland, the Andaman islands, the Malay peninsula, the Philippine islands and New Guinea. Latitude and longitude alike seem devoid of relation to such apparently fortuitous dispersals. (See PYGMY, and the appropriate sections in the articles on the places named.)

	Average stature	Average weight
Zulus (men)	172 (approx.)	?
Bush natives (men) . . .	155 (approx.)	89 lb.
Galloway (men)	179 (appro.;.)	173 lb.
Spitalfields (men)	155 (approx.)	100 lb.

But even if it be admitted that the measure of stature is not a sure indicator of body-weight, yet the taller individuals seem on an average to possess heavier brains.

Prehistoric Man.—In the present connection, the stature and bulk of the prehistoric representatives of humanity claim attention. The evidence comes necessarily from the skeleton, and consequently estimates of body-weight are very liable to error in determination. Kor are estimates of stature derived from the bones by any means free from this drawback. Where skeletons have been found intact and extended "at length," direct measurements have been sometimes practicable as the specimen lay exposed to observation, and before it was disturbed in any other way. Such a measurement will differ notably from the stature of the individual in life; yet it will evidently furnish a useful control of estimates based upon the measurements of separate bones and the employment of formulae devised for the purpose of reconstructing stature from such measurements.

Calculation is the only method available when the remains are fragmentary. Imperfections in the limb-bones will necessarily be detrimental to an estimate of stature based on their dimensions, and certain corrections have to be made, *e.g.*, according to the sex of the skeleton. Should the estimate have to be made from the femoral length, it seems an easy proceeding, in view of the statement at one time current that the femoral length is 25% of the stature; but this rule needs amendment if the length of the femur is markedly above, or below the average. Correction will be needed if the bone is part of the skeleton of a negro and not of European



BY COURTESY OF THE CAMBRIDGE PHILOSOPHICAL SOCIETY

FIG. 3.— DIAGRAMMATIC REPRESENTATION OF INCREASE IN STATURE, IN CENTIMETRES. FROM BIRTH TO MANHOOD. 19 YEARS

The rate of growth is greatest in the first 6½ years, when the stature is approximately doubled

origin; and until evidence is adduced to the contrary, the need for correction must be assumed if the skeleton is of prehistoric antiquity and not modern. In the case of prehistoric Europeans, the amount of the addition or subtraction may, however, be assumed to be very moderate. Thus by the employment of suitable formulae, a fairly close estimate of stature can be made upon data provided by single bones.

To judge by such skeletons as have been recorded so far, the stature of prehistoric man was by no means uniform, and in general it presents little difference from that of the modern inhabitants of the same areas. Examples of the extremes of variation present themselves in the skeleton from Cro-Magnon, for despite the advanced age assigned to this individual, he is supposed to have measured 1,820mm. in height (Boule), while at the other end of the scale the skeleton from Chancelade of comparable antiquity denotes a stature of 1,550mm. only (Boule). Comparison with the range of averages quoted above for modern men is not justifiable, and yet the diversity of stature in prehistoric times is rendered sufficiently evident. Both these examples (Cro-Magnon and Chancelade) represent mankind in the so-called Palaeolithic period, and from the same period there are forthcoming other individuals so characterized as to fall between the two just mentioned in respect of stature. These data can be tabulated as follows:—

1. Les Eyzies. Old man of Cro-Magnon
   (Upper Palaeolithic)
   Boule's estimate of stature, 1,820mm.
   Manouvrier's estimate of the same, 1,736mm.
2. Man of the Neanderthal
   (Middle Palaeolithic)
   Pearson's estimate of stature, 1,629mm.

3. Man of Chancelade
(Contemporary with Cro-Magnon)
Rahon's estimate of stature, 1,592mm.
Testut's estimate of stature, 1,550mm.

In dimensions, at least, the man of the Palaeolithic period does not support the view that in prehistoric times primitive brutality was associated with gigantic bulk. Even beyond the confines of Europe, the prehistoric Rhodesian man with a stature of 1,830mm., tall though he may have been, does not notably exceed individuals among the existing inhabitants of the region. In China, again, the precursors of the modern inhabitants of Fengtien and Honan in the Aeneolithic period show no very outstanding difference in point of stature from the existing inhabitants.

Body Ratios. — The stature of mankind is related to the body-weight sufficiently closely to serve as a means of estimating the latter; and in view of the possibility of forming an estimate of the brain-weight from the dimensions of the skull, it appears that if there be available from a skeleton the skull and one of the thigh-bones these remnants suffice for making these two estimates. (The thigh-bone can be used in estimating first the stature, and subsequently the body-weight of the individual.) The ratio of brain-weight to body-weight has been termed the index of cephnlization. Its value. is approximate to $\frac{1}{50}$ in normal healthy adult men. This may be taken as a distinctive human character with which to compare the ratio exhibited by an adult male gorilla, viz., $\frac{1}{200}$. Estimates based on the dimensions of the appropriate parts of prehistoric human skeletons present no startling contrasts with such as modern humanity provides. An exceptionally interesting index is that derived from the skull-cap and the femur of the Javanese fossil *Pithecanthropus erectus,* for the value assigned to the index is in this instance $\frac{1}{70}$, and it assigns to the fossil form a place intermediate between mankind and the higher apes. Thus the values of the ratio of brain-weight to body-weight are: — (I) Normal adult man, $\frac{1}{50}$; (2) *Pithecanthropus erectus* (Java), $\frac{1}{70}$; *(3)* Hylobates, small anthropoid ape, $\frac{1}{90}$; (4) Gorilla, large anthropoid ape, $\frac{1}{200}$.

The numerical value of the human ratio testifies to the abundant provisioa of brain-material in mankind as compared even with closely allied mammals. But the ratio or index presents such a wide range of value in various animals as to require comment. Thus, for instance, the human figure $\frac{1}{50}$, though well in advance of that for the gorilla, does not actually head the Iist. In this respect man falls behind many birds. At the other end of the scale come gigantic animals such as the hippopotamus, the whale and certain fishes. Some correction is thus seen to be necessary, and among the more obvious factors that of absolute size is evidently important. The birds most favourably placed (index about $\frac{1}{35}$) are small, *e.g.,* small finches. For a whale there has been calculated an index represented by $\frac{1}{14,000}$ (Wilder). The same influence is manifestly active during the lifetime of the human individual, for as an infant he owns at birth the "superhuman" ratio of $\frac{1}{6}$. Allowance for absolute dimensions must needs be made before any inference regarding cerebral endowment can be drawn from the figures; and in the above instances the human being, the Javanese Pithecanthropus and the gorilla are in this respect comparable, while the small anthropoid ape represents the general standard for such apes handicapped as generously as possible, by reason of the relatively diminutive size of this particular species. Even so, it fails to attain the human standard.

The "Canon" Error. — A fundamental error underlies many "systems of proportion," namely the assumption that a particular part of the body bears precise numerical relations to all the rest. Such an assumption is almost universal in artistic schemes, and is, in fact, implicit in the selection of many units or moduli, such as the finger, the foot, the cubit, the head or the vertebral column. That this matter should be disposed of once and for all is the more important since a definite "canon" is still commended as the basis of the comparison of one human type with another, an application wholly to be condemned. According to Duval, the works of the ancient sculptors present precisely the same variations as are met with in nature. In fact the rule was by no means obeyed by all or in every detail, and freedom from slavery to an artificial system resulted in the production of contrasted forms. Some of these are still in existence, so that contrasts can be drawn between such examples as the Running Fighter (Louvre) and the Antinous.

The anthropometric method of investigation recognizes no authority in the shape of a modulus or canon. The latter is the outcome of an assumption that remains unproved. In this respect, it invites comparison with the theoretical "archetype," a concept in morphological anatomy which enjoyed a transient vogue in the 18th and part of the 19th centuries.

Standards Required. — But while recognition of a pre-determined form of representation is refused, this does not imply rejection of all forms of representation. Anthropology willingly recognizes a standard of proportion which is the outcome of actual observations, and represents the mean of measurements made on many individuals with unvarying precision. Such a standard is indispensable when human beings are being compared with each other, or even when the human form is brought into account with those of the higher apes; and in certain instances the standard may usefully take the rigid form of what mechanics colloquially term a "jig." Thus Dr. Percy Stocks (Annual Report of the Chief Medical Officer of the Board of Education, 1936, p. 105), reporting on "Goitre in the English School-child," recommends the employment of a "standard gauge" for thyroid-breadth. By its use, the number and proportionate frequency may be learned of those children possessed of a thyroid gland exceeding the standard breadth of 42mm.

Schematic Representation. — In the accompanying figures (1 and 2) there will be observed indications of the respective lengths and widths of particular parts of the body. The stature of all is reduced to a common measure so that contrasts in the relative proportion of parts may be facilitated. For the construction of such diagrams, particular measurements, of which a list is appended, were made on a number of individuals. And from the collected data, certain averages or mean values have been derived.

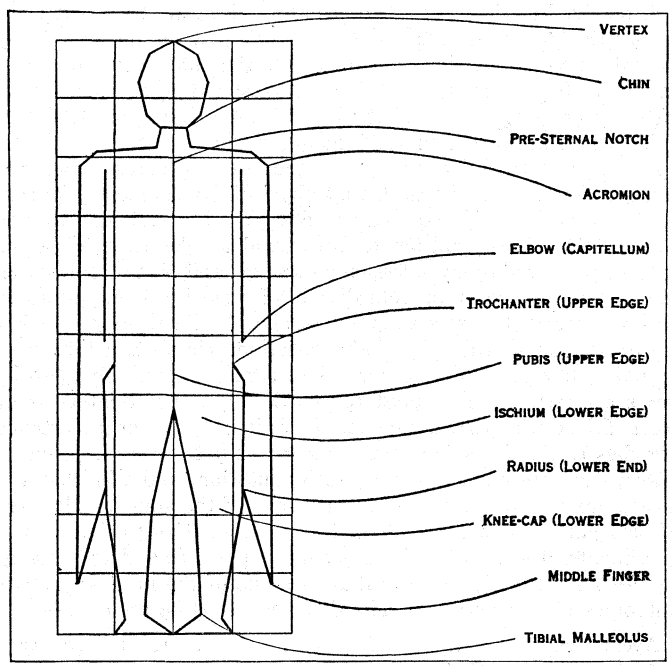


FIG. 4. — SCHEMATIC OUTLINE OF ANTHROPOID APE (GORILLA)
The stature being taken as 100, the other parts are represented proportionately and show contrasts with the corresponding parts of the human figure outlined in preceding illustrations

Comparisons and contrasts need consideration in respect of the male and female (fig. 2); next in turn the immature stages call for consideration (fig. 3); and finally there are added schematic outlines of an anthropoid ape (fig. 4) depicted in the same way as the foregoing figures. The contrast between the newly born infant and the adult in respect of the proportionate weight of the

brain has been the subject of comment in an earlier paragraph. Here the contrast affects the proportionate length of the limbs. The difference in respect of the relative lengths of the upper and the lower limb is a matter of common knowledge and is in the present instance capable of expression in a numerical manner. Observations on a large anthropoid ape (gorilla) have been used in the preparation of the schematic figure with which to compare the adult human form. But in this matter, again, contrasts are much more impressive than similarities. These contrasts include (a) the relation of the length of the torso to the stature as a whole, (b) that of the span of the outstretched arms to the stature, *(c)* that of the upper limb to the lower limb, and (d) that of the forearm to the upper arm. The differences are very strongly marked, and the other anthropoid apes would serve to illustrate them almost as well as the gorilla; in certain particulars they would provide an even more decided contrast. Thus the apes present a very considerable diversity and are themselves the subjects of a gradation in characters, the line of which in some details is directed towards and continuous with that of human types.

Growth.—Anthropometry is also the mainstay of many important investigations involving the study of the growing individual, particularly the details of the normal process, since these provide the "control" necessarily employed and indispensable in researches upon the factors influencing development such as those mentioned above. Among the various paths of research there must be recognized that followed by artists such as Dürer, whose work on the proportions of the human figure includes reference to infants and adolescents. Records have been kept by certain parents of the dimensions (whether of stature or weight) of their own children, *e.g.*, the data collected in the 17th and 18th centuries by M. Guéneau de Montbeillard, and the illustrious Comte de Buffon, who inaugurated the method which, after a long interval, received a wider recognition and application. Quetelet, combining the measurements quoted by Buffon with those made by himself, points out the sudden acceleration of growth manifest at the 15th year in boys, and the corresponding acceleration in girls a year or two below that age. Without attempting to detect evidence of any other marked change during the period covered by the record, Quetelet repeats that the rate of progress is, in fact, subject to variation. He adds that physical development, like that of the moral side of human nature, advances in a series of bounds. But despite his recognition of occasional acceleration, he seems to have preferred to lay stress on a more general phenomenon, viz., the apparently constant retardation of velocity from an early period onwards. It was reserved for Dr. Godin to make further discoveries of the rule of periodic variation. He observed during a period of five years a large number of adolescents (from 13 to 18 years of age). He measured 100 of these youths at intervals of six months during that period, and he claims that great importance attaches to the facts (a) that the same subjects were kept under observation throughout the years in question, and (*b*) that the measurements were repeated frequently. Of the abundant harvest of data gathered by Dr. Godin, the figures relating to the average increments of stature of his subjects at 14, 15, 16 and 17 years of age respectively will serve to illustrate one of the most important outcomes of the research. The data may thus be set out:—

Average age	*14*	*15*	*16*	*17*
Average stature: Godin	46	57	46	35
,, ,, Quetelet	48	46	44	41
,, ,, Carlier.	51	62	**51**	12

The sudden augmentation of the increment at the 15th year is the point on which stress is laid. Quetelet's figures fail to exhibit this local increase, perhaps owing to the selection deliberately made by Quetelet of his subjects. However, in respect of rhythmic variation in the rate of growth, Dr. Godin's figures, supported by those of Carlier and others, represent the actual sequence of events more faithfully than do Quetelet's, and the details are wonderfully illuminating. In the six months between 1 j and 15½ years, the lower limb contributes to the augmented growth in a characteristic and distinctive fashion. Thus out of a total increment of 56, the lower limb provides 19 in the following proportion:— the thigh, 12; the leg, 6; and the foot (instep), 1. To realize the peculiar and distinctive nature of such a combination, the increments for the other half-years must be considered, and the whole series as set out in the memoir may be given as follows.—

Age.	*13½–14.*	*14–14½.*	*14½–15.*	*15–15½.*
Meas. thigh	9	4	8	12
Leg.	2	9	0	6
Foot (instep)	**3**	0	**3**	1
Minm. circum. of leg	6	2	6	2

Age.	*15½–16.*	*16–16½.*	*16½–17.*	*17–17½.*
Meas. thigh		3	3	0
Leg.	4	10	*3*	1
Foot (instep)	2	0		0
Minm. circum. of leg	**5**	**2**	**3**	**0**

Proportional Growth.— The essential feature (viz., the alteration of the activity in thigh and leg respectively) is sufficiently evident. But at one epoch, viz., that from 1 j to 15½ years, the two segments for once combine forces and though the leg contributes relatively little, still a certain combination does exist, and the result is the very marked augmentation of stature just noted.

But the tabulation reveals more than this. The contribution of the arch of the foot is at this critical epoch at a very low level, though in other periods it is of appreciable amount. Thus in the lower limb alone contributions are made by at least three distinct "elements" and usually in a sequence involving alternate phases of activity and restfulness. Moreover, the alternatives are themselves alternate with those of the neighbouring segment of the limb.

Another point is that while a given segment, for instance the leg, is making a small or even negligible increase in length, such inactivity does not affect the growth of this part in its entirety. Evidently the limb may be increasing in some other direction at this period. Reference to the tabulated data relating to the growth of the circumference of the leg will leave no doubt on this point, for the active periods of growth in length alternate with comparable phases of activity in respect of the thickness of the limb. There is a suggestion of a similar relation in the records of length and circumference measured on the forearm. And the conclusion thus formed regarding the limb as a whole applies not improbably to the bones which form its framework.

A final result of the observation is the indication that at the age of 15½ years (in the type of youths measured) the thigh has nearly completed its growth in length. Here the observation of Carus (1854), confirmed by Humphry in 1858, relating to the proportionate length of the lower limb as a whole at the 15th year, is recalled appropriately to mind.

The changing rate of growth, and the alternate activity in adjacent parts of the body detected by Dr. Godin, constitute a periodicity requiring comment from another point of view. The sum total of such phenomena has been compared to those presented by certain chemical reactions, and having regard to the admitted variation in the rate of progress of some reactions, and to the chemical analogies, if not the identity, of the metabolic processes at the base of animal growth, the comparison does not seem inappropriate. In one particular comparison there are brought together (1) The rate of growth of the individual, and (2) The rate of change in a chemical reaction of the kind in which that velocity attains its maximum when just halfway towards its completion. To bring the progress of zoological development into line with this, the rate of change should be shown to be most active when the animal under consideration has just attained one half of the bulk it will eventually assume. Dr. Robertson has published observations on such a comparison since 1911. In 1924 attention was redirected to his work by Dr. Cruickshank and Mr. Miller in their report to the Medical Research Council (Special Report Series No. 86) on the estimation of foetal age. The investigations are relevant to the last-mentioned subject, since if the periodicity of growth were fully known, estimates of foetal age based upon the data of weight and body-length could be made more closely approximate to the real value by the employment of more suitable corrections than are at present available. Consequently the subject has practical bearings in addition to its theoretical interest. Dr. Robertson

found some evidence in support of the view identifying the phenomena of growth with those of the particular kind of chemical action referred to above; yet the agreement does not appear to amount to identity, for reference is made to several phases of activity in the progress of human development, alternations which do not necessarily appear in the chemical reaction. The whole of this side of the subject requires fuller investigation.

Roberts' Work.—Roberts drew attention to the stress laid by Quetelet upon the distinction of the "average" man from the "mean," *i.e.*, the most frequent observation or event of the series. But he dissented from Quetelet's deliberate opinion that so small a number as 30 individuals suffice for the establishment of an anthropological type, for he disputed the premise of that conclusion, namely the belief that the human type is so uniform that a small sample will represent the whole mass of humanity. Roberts proclaimed the necessity for renewing enquiry into variations, and for studying their frequency, their several degrees, and their possible causes. He pointed out the fact overlooked by Quetelet and first observed by Bowditch (in 1877) that at the ages of 13 and 14 years, the young girls in Great Britain and in the United States exceed in both their height and weight the boys of the corresponding ages; and he remarked upon the contrast between urban and rural populations recorded by Quetelet for Belgium, inasmuch as the greater stature assigned by Quetelet to the town-dwellers is the exact opposite of the conditions obtaining in Great Britain. He insisted upon the importance of collecting large numbers of observations for the establishment on a wide basis of the relative height and weight of individuals for each year of age. He called attention to the remarkable range of variety in respect of such a dimension as height when a large number of observations are available for comparison.

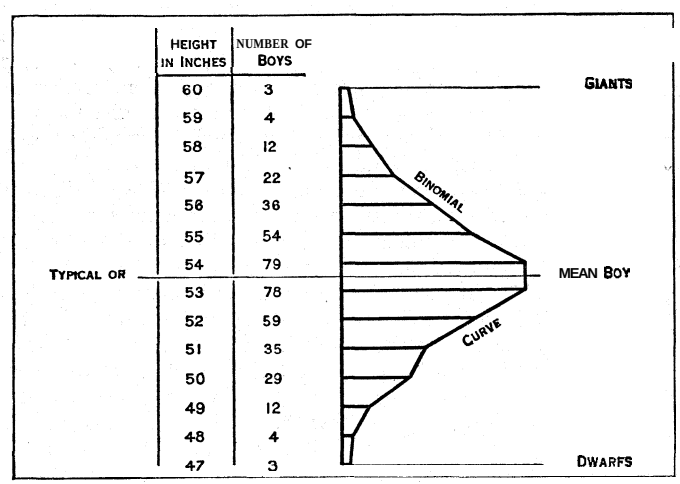
More recent researches distinguish two particular periods of growth-activity in respect of stature, namely from 5 to 7 years, and from 13 to 16 years respectively. With these two periods alternate others when circumferential growth is predominant. Hammond has published figures which indicate a comparable alternation in the parts of other animals. The comparison of the growth-curves of Japanese and New Britain children and adolescents with those of European children shows the earlier age at which the female (in the non-European races) first surpasses the male in stature, the corresponding recovery by the male being made at the 13th year by Japanese, while in New Britain that event is actually delayed to the commencement of the 17th year, *i.e.*, beyond its arrival in Europeans.

Heredity and Head Form.—Another group of investigations relates to facts of heredity, including illustrations provided by the proportions of the head. The well-known contrast between heads of rounded form (brachy-cephalic) and long heads (dolicho-cephalic) is usually expressed numerically by the percentage proportion of the width in terms of the length. This "cephalic index" gives a convenient means of comparing heads of contrasted proportions, and in regard to its indications, its values in excess of 80 denote heads of definitely rounded form, while the long heads own values below 7j. The rule or order of inheritance in respect of the parental characters has not been very extensively investigated as yet. It has been suggested that suitable posing of the infant in a cot may be a potent factor in determining the final proportions (round head if the child lies habitually on its back, and long head if it lies on the side). Without accepting this pronouncement, the possibility that such influences are by no means entirely negligible should be kept in mind. Direct evidence as to the comparison of parent with offspring in respect of head proportions distinguishes the researches of Puccioni, who shows that the contrast between the two parents is repeated, though with slightly diminished emphasis, in the children, the evidence of blending being very slight. Puccioni's family yields numerical values of the index as follows:

Parents:	father	78·1
	mother	86.7
Children:	elder	82.3 (10 years)
	younger	76·6 ($7\frac{1}{2}$ years)

These figures are of interest from several points of view. For instance, both children are boys and the mother would seem to have transmitted characteristic head proportions to one but not to the other. The latter does not merely differ from his mother herein, but has accentuated the distinguishing head form of his father. In this connection, notice should be taken of the youth ($7\frac{1}{2}$ years) of this individual and of the consequent possibility that maturity may effect changes, among which further accentuation of long-headedness is very probable. Again, it appears that although in regard to the maternal index the offspring provide some evidence of regression, nevertheless even such evidence appears only when the mean value of the children's indices is recorded without reference to the increased long-headedness of the younger child, which constitutes the most striking feature of the record. Nor does any support emerge for the "melting-pot" theory of F. Boas (1911), in which environmental factors hold a prominent place, since in the present instance the environment was unchanged. As to the Mendelian aspect of the inheritance of the form of the head, discussed by Frets (192j), on the basis of an investigation of over 3.000 persons, it was found that the cephalic index (expressive of the form of the head) is hereditary, though modifying factors affect this general tendency. Frets lays stress on the difference between large and small heads in respect of this tendency. For instance, where heads are large, that of brachy-cephalic proportions is dominant over that of dolicho-cephalic proportions; but among small heads that of dolicho-cephalic proportions is the dominant. In submitting two alternative schemes to account for the actual sequences disclosed by the records collected by him, Frets remarks that the dominance of brachy-cephaly is stronger in the female parent, whereas that of dolicho-cephaly is stronger in the male.

Work in the British Isles.—Very remarkable extensions of Roberts' work have been made by the committees appointed by the British Association for the Advancement of Science (1875–83), by the London School Board (1904), and by the London County Council (1909). These extensions comprise the collection of measurements representing the height and weight of school children. Roberts' tables record measurements representative of the physique of individuals at each year of age from the 5th to the 23rd in succession, and thereafter discontinuous data carry them



FROM ROBERTS, "MANUAL OF ANTHROPOMETRY"

FIG. 5.—COMPARATIVE HEIGHTS OF BOYS OF 11–12 YEARS OF AGE
This distribution *of* heights is based on the stature of 430 boys. The curve binding the ends of **the horizontal lines together resembles the binomial curve, but the two halves are not quite symmetrical**

on to the 50th year. The collection of information relating to the years subsequent to the "school age" necessitates recourse from schools to universities, the public services and institutions, or to factories. First among the university sources, Cambridge commenced contributions in 1833, when the average stature of 80 students is recorded as 1,768mm., and the corresponding weight as about 10 stone (after making necessary corrections). About half a century later, the collection of data was revived at the instance of Galton, and on the basis of about 2,000 observations, it appeared that the average stature was approximately 1,750mm.

The collection of statistical data made at Cambridge during the middle period mentioned above, was undertaken by a committee

of the Philosophical Society of that university at a time when an anthropometric laboratory was opened at South Kensington under the supervision of Galton himself. The information collected at Cambridge included observations of a physiological kind such as those relating to eyesight and muscular and respiratory energy. Among the measurements were comprised those of the three principal dimensions of the head, and in 1888 the late Dr. Venn drew upon these in the preparation of a very striking comparison. Combining the measurements in question so as to furnish a single numeral expressive of the size of the head, he enquired into the size thus presented by various groups of students distinguished not only by differences of age but by their proficiency in examinations. Over 1,000 individuals were available for the purposes of the enquiry, and the striking feature of the comparison may be stated as follows. The scholars, grouped with men distinguished in examination tests, revealed at the commencement of their residence heads with dimensions distinctly greater than those of their associates. The latter nevertheless acquired during residence a remarkable compensation for this initial handicap; for while the heads of all increased in size during the period in question, the smaller heads grew so much more vigorously than those of the first group that the original margin of superiority was reduced by at least one half.

Valuable work of a corresponding nature is being carried on by Dr. A. H. Mumford, Medical Officer of Manchester Grammar school.

Work in America. — In the University of Pennsylvania, the director of the department of physical education sets an example of systematic thoroughness. In the preparation of records, the needs of the individual are kept in mind, in view of the contingency that he may seek or need advice regarding the state of his health, or the selection of a particular form of athletic recreation. But while the student may receive benefits, he also incurs liability under that system; and the status accorded to it by the authorities is summed up in the director's remark that "It is quite possible for a student to have his degree withheld because he has not fulfilled his requirements in physical education."

Measurements of Recruits and Prisoners of War. — In the combatant services of States, recruiting necessarily involves the practice of anthropometry, if only for the purpose of securing uniformity, or of determining graduation or rejection. Conscription makes available a large amount of material in the form of youths called up for service year by year. Such material has been studied in various countries, but the World War naturally led to a vast extension of recruiting and conscription. In Great Britain it caused the anthropometric study of an enormous number of individuals; and by reason of the prolongation of the war, the scrutiny affected an ever-increasing range of years. The Report to the Ministry of National Service, vol. i. (1920) surveys the results up to 1919. The "Grades" into which the subjects were divided are well known, as is also the revelation of a large proportion of individuals of poor physique in certain districts. The actual observations include measurements of height, weight and chest-circumferenie; and while the results show the need for remedial action, it does not appear that the state of affairs indicates a recent or rapid deterioration (Shrubsall, 1924). Considerations based on the anthropometry of Cambridge undergraduates played an important part in determining the principles actually employed in graduating the individuals according to their physique.

A remarkable side-issue of the war was the anthropometric examination of prisoners. An example had been set already by Japan, where Prof. Koganei published in 1903 the results of his anthropometric study of Chinese soldiers, taken prisoner in the war against that country. In Great Britain Prof. Parsons reported on some of the captured Germans, while in Austria a large and systematic investigation was made of Russian prisoners, who represented a considerable number of ethnic types. Since the cessation of hostilities in 1918, the extensive anthropometry of which they were the occasion has likewise come to an end in some countries. On the Continent conscription persists, and in Switzerland the survey of recruits has proceeded without interruption. Judging by recent reports, the survey is becoming less mechanical. Interest increases progressively in the actual history of the recruit during his engagement. The employment of particular measures or combinations of measures expressive of the general condition of each individual is intimated by the most frequent references to "indices" of fitness, such as Pignet's. And even though it be necessary to admit the shortcomings of some of the coefficients proposed, the very fact that they owe their origin to an attempt to increase the significance of the recorded data should be taken into account and set against those weaknesses. But not all coefficients are open to such adverse criticism, and alternative methods of employing the data may yield valuable results. Thus the methods devised by Prof. Dreyer for assessing physical fitness seem to be proving their value, and receive confirmation of their reliability as the area of their employment extends.

Gaol Population. — The inmates of prisons provide another source of information regarding physical development, and from this Quetelet drew some of the statistics used by him in 1835. At a later date, Bertillon advised and used anthropometric methods for the identification of habitual cffendersand, indeed, of any person under arrest. Such methods together with the descriptive records of the complexion, hair colour and eye colour are accessory to the practice of dactyloscopy or study of fingerprints.

PRACTICE AND SCHEDULES

The instruments of anthropometry include measuring-rods of different sizes. Of these the smaller are commonly fitted with arms, and are called calipers. A flexible measure (for circumferential measurements) and a weighing-machine complete the outfit for the greater number of the records usually made. But special instruments are required for certain measurements of the head, as also for the estimation of muscular power, and again for the measurement of "lung-capacity." Descriptions of the various instruments, with illustrations and directions as to their use, appear in various manuals among which may be cited the Report of the British Association Committee for 1908, or again, Martin's *Anthropometrie* (1925) or *Richtlinien für Körpermessungen* by the same author (1924).

The list of measurements of admitted utility has increased considerably since the schedule included the primary measures of stature and weight. The latter still retain their value and, in fact, constitute the sole basis of many schemes still in progress, but the additions are numerous. The British Association Committee of 1875 dealt with four measurements properly so-called, viz., height, weight, girth of chest and span of arms; but to these data observations on the colour of hair and eyes, visual acuity, heating capacity and strength of arm were added. In 1888 Dr. Venn reported observations on Cambridge students, with data from a list comprising stature and weight, together with three head-measurements, and others relating to visual acuity, breathing capacity and strength of arm. In 1902 a committee appointed by the British Association (in succession to that of 1875) to advise on anthropometric investigation in the British Isles, opened enquiries which led in 1908 to the publication of a report approving of 80 specified measurements. This report includes sections on physiological and psychological measurements as well as the methods of recording photographic data. A recent critic (1924) describes the report as crude, and in certain respects it is evidently capable of improvement. During the period of its preparation, efforts were made to secure some degree of international consistency in regard to these matters, and two reports, published in succession, the first in 1906 and the second in 1912, exhibit the extent to which agreement had then progressed. These reports are not in entire agreement with the British Association's report of 1908, though the amount of divergence is not great. The international agreement itself might be again revised with advantage to all concerned.

The last few years have seen the birth and growth of an entirely novel extension of anthropometry, viz., to a matter previously physiological in nature, termed comparative serology. As the name suggests, the object of comparative study is the blood-serum. Moreover, the practical application involves the pitting of one serum against another, and the outcome of the encounter confers distinct "grades" on the competitors. Tests carried on in large

numbers in various localities (mostly in Central Europe) point to variations in frequency of the possessors of different grades of blood-serum, and the confirmation of these results will be very welcome.

ANTHROPOMORPHISM, the attribution of human form, or the character or qualities of humanity, to objects believed to be above humanity in the scale of being, and in particular to God or the gods. The word is also used in a wider sense to signify the attribution of human qualities to anything impersonal or nonrational or below humanity in the scale of being, as when reference is made to the "vision" of molluscs, or the "reasoning powers" of lower animals, or, generally, when the actions of animals are interpreted after the analogies of human nature. Anthropomorphism may be a form of poetic metaphor, as in many passages in the Hebrew Scriptures; thus, Pusey, commenting on the saying "Thou didst walk through the sea with Thine horses" (Habb. iii. 15), observes that "such anthropomorphisms have a truth which men's favourite abstractions have not" (Minor Prophets, 433).

We are here concerned with the development of anthropomorphism as a factor in the interpretation of religion, and with special reference to the doctrine of Deity. We may distinguish three stages: (i) Physical anthropomorphism: the belief that Deity has human form. This is found in all levels of religious development, from that of the Fuegians to that of the ancient Greeks.[1] (ii) Mental and moral anthropomorphism: here the belief in a Deity of limited bodily form, or any kind of material nature, is abandoned, and stress is laid on qualities of thought, feeling, and will, in monotheistic religion believed to be possessed by Deity without their human limitations: "the Wrath of God," "the Wisdom of God," "the Love of God." (iii) Spiritual anthropomorphism: the belief that our experience of the highest developments of human nature and their ideal possibilities, adequately interpreted, provides an insight into the nature of Deity: "God is the Truth in all that is true, the Beauty in all that is beautiful, the Goodness in all that is good."

It thus appears that to abandon every kind of anthropomorphism is to abandon theism for agnosticism. This was seen clearly and stated by Herbert Spencer:

"It seems strange that men should suppose that the highest worship lies in assimilating the object of their worship to themselves. . . . It is true that from the time when the rudest savages imagined the causes of all things to be creatures of flesh and blood like themselves, down to our own time, the degree of assumed likeness has been diminishing. But though a bodily form and substance, similar to that of man, has long ceased among cultivated races to be a literally conceived attribute of the Ultimate Cause,—though the grosser human desires have also been rejected as unfit elements of the conception,—though there is some hesitation in ascribing even the higher human feelings, save in greatly idealized shapes,—yet it is still thought not only proper, but imperative, to ascribe the most abstract qualities of our nature. To think of the Creative Power as in all respects anthropomorphous is now considered impious by men who yet hold themselves bound to think of the Creative power as in some respects anthropomorphous; and who do not see that the one proceeding is but an evanescent form of the other" (First Principles, pt. i.).

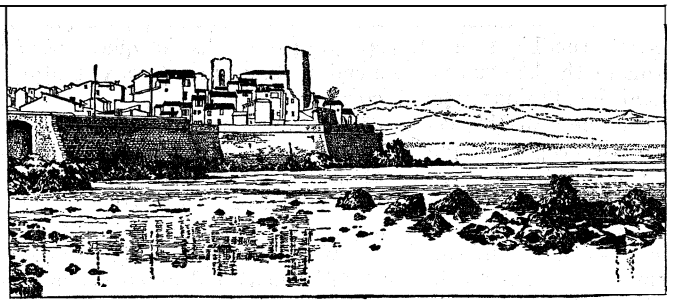
Theistic philosophy has dealt with this argument by contending that when we regard our ideals of truth, beauty, goodness, as affording interpretative insight into the nature of the Creative Power, this is not an evanescent form of the anthropomorphism of savages, but an anthropomorphism which is capable of growing in depth and critical power with the growth of human nature. In religion, it is maintained, our intelligence is confronted by an Object which is immeasurably above it in its own line, and therefore not inconceivable and unthinkable but the realization of our highest ideal of spiritual excellence.

Anthropomorphism may be studied as a factor in the history of religions; and again as leading to the fundamental problem of the philosophy of theism. The student can only be referred to works on these subjects; but the following will serve as introductions to the subject on its philosophical side: Mellone. The Price of Progress (1924), especially ch. vii., on "Symbolism"; Pringle-Pattison, *Man's* Place *in* the Cosmos (2nd ed. 1902), pp. 61, 206, 287 ff.; and The Idea *of* God (1920), ch. viii.; Streeter, Reality (1926), ch. iv., v.; Martineau, Essays *and* Addresses, vol. iv., "Science, Nescience, and Faith"; and on the negative side; Spencer, First Principles, later editions, pt. i.; Bertrand Russell, Philosophical Essays, ch. ii., "The Free Man's Worship" (cf. same writer, "The Essence of Religion," Hibbert Journal (1912–13), vol. xi., p. 46, and A. S. Pringle-Pattison, "The Free Man's Worship," ibid. (1913–14), vol. xii., p. 47. (S. H. M.)

ANTI or **CAMPA,** a tribe of Arawakan stock, inhabiting the forests of the upper Ucayali basin, on the east of the Andes, south Peru. They gave their name to the eastern province of Antisuyu, and were ferocious cannibals. They are of fine physique and wear a robe with holes for the head and arms. Their long hair hangs down over the shoulders, and round their necks a toucan beak or a bunch of feathers is worn as an ornament.

ANTI-AIRCRAFT, the term applied to the several means of, and personnel for, action against aircraft in war, commonly abbreviated to A-A. Thus *A–A.* Gun, *1st A–A.* Brigade, Royal *Artillery.* See ARTILLERY: Anti-aircraft Artillery.

ANTIBES, resort city of southern France, department of the Alpes-Maritimes (formerly in that of Var, but transferred after Alpes-Maritimes was formed in 1860 out of the county of Nice). Pop. (1936) 15,857. Antipolis, named from its position "facing the city" (of Nice), is said to have been founded about 340 B.C.



FROM "LA CÔTE D'AZUR," BY COURTESY OF THE P. L. M. RY.

THE RAMPARTS OF ANCIENT **ANTIBES** WHERE **FESTIVALS** WERE HELD IN ROMAN DAYS. THE TOWN IS NOW A CENTRE FOR SPORT OF ALL KINDS AND CAP D'ANTIBES IS A WINTER AND SUMMER RESORT

by colonists from Marseille and remained important in Roman times. It was the seat of a bishopric from the 5th century to 1244, when the see was transferred to Grasse. It is on the east side of the Garoupe peninsula on the Gulf of Nice. The town was formerly fortified, but all the ramparts (save the Ft. Carré) have been demolished, and a new town has arisen on their site. There is a large lighthouse on the cape. Dried fruits, salt fish and oil are exported. There is air service to Ajaccio.

ANTICATHODE, the target inserted in an X-ray tube on which the high-speed electrons, or cathode rays (*q.v.*), are directed. In tubes with a separate anode the anticathode is

[1] In the Christian Church, simple minds have believed in the corporeal nature of God. Gibbon and other writers quote from John Cassian the tale of the poor monk who, being convinced of his error, exclaimed "You have taken away my God! I have none left now whom I can worship!"

generally connected electrically, and outside the tube, to the anode (*q.v.*). In a Coolidge tube the anticathode acts also as the anode. On the impact of a sufficiently swift electron (*q.v.*), it gives forth an X-radiation characteristic of the material of which it is composed. (See RÖNTGEN RAYS: Applications; and ATOMIC NUMBER.)

ANTICHRIST. The earliest mention of the name Antichrist, which was probably first coined in Christian eschatological literature is in the Epistles of St. John (I. ii., 18, 22, iv. 3; II. 7), and it has since come into universal use. The conception, paraphrased in this word, of a mighty ruler who mill appear at the end of time, and whose essence will be enmity to God (Dan. xi. 36; cf. II. Thess. ii. 4; ὁ ἀντικείμενος), is older, and traceable to Jewish eschatology. Its origin is to be sought in the first place in the prophecy of Daniel, written at the beginning of the Maccabean period. The historical figure who served as a model for the "Antichrist" was Antiochus IV. Epiphanes, the persecutor of the Jews, and he has impressed indelible traits upon the conception. Since then ever-recurring characteristics of this figure (cf. especially Dan. xi. 40, etc.) are, that he would appear 'as a mighty ruler at the head of gigantic armies, that he would destroy three rulers (the three horns, Dan. VII. 8, 24), persecute the saints (vii., 25), rule for three and a half years (vii. 25, etc) and subject the temple of God to a horrible devastation βδέλυγμα τῆς ἐρημώσεως). When the end of the world foretold by Daniel did not take place, but the book of Daniel retained its validity as a sacred scripture which foretold future things, the personality of the tyrant who was God's enemy disengaged itself from that of Antiochus IV., and became merely a figure of prophecy, which was applied now to one and now to another historical phenomenon. Thus for the author of the Psalms of *Solomon* (c. 60 B.C.), Pompey, who destroyed the independent rule of the Maccabees and stormed Jerusalem, was the Adversary of God (cf. ii. 26, etc.); so too, the tyrant whom the Ascension of *Moses* (c. A.D. 30) expects at the end of all things, possesses besides the traits of Antiochus IV., those of Herod the Great. A further influence on the development of the eschatological imagination of the Jews was exercised by such a figure as that of the emperor Caligula (A.D. 37–41) who is known to have given the order, never carried out, to erect his statue in the temple of Jerusalem. In the little Jewish Apocalypse, the existence of which is assumed by many scholars, which in Mark xiii. and Matt. xxiv. is combined with the words of Christ to form the great eschatological discourse, the prophecy of the "abomination of desolation" (Mk. xiii. 14ff) may have originated in this episode of Jewish history. Later Jewish and Christian writers of apocalypses saw in Iiero the tyrant of the end of time. The author of the Syriac Apocalypse of Baruch (or his source), cap. 36–40, speaks in quite general terms of the last ruler of the end of time. In 4 Ezra v. 6 also is found the allusion: *regnabit* quem non sperant.

The roots of this eschatological iancy are to be sought perhaps still deeper in a purely mythological and speculative expectation of a battle at the end of days between God and the devil, which has no reference whatever to historical occurrences. This idea has its original source in the apocalypses of Iran, for these are based upon the conflict between Ahura-Mazda (Auramazda, Ormazd) and Añgrō-Mainyush (Ahriman) and its consummation at the end of the world. This Iranian dualism is proved to have penetrated into the late Jewish eschatology from the beginning of the 1st century before Christ, and did so probably still earlier. Thus the opposition between God and the devil already plays a part in the Jewish groundwork of the Testaments of the Patriarchs, which was perhaps composed at the end of the period of the Maccabees. In this the name of the devil appears besides the usual form (σατανᾶς, διάβολος) especially as Belial (Beliar, probably, from Ps. xviii. 4, where the rivers of Belial are spoken of, originally a god of the underworld), a name which also plays a part in the Antichrist tradition. In the Ascension of Moses, we already hear, at the beginning of the description of the latter time (x., i.); "And then will God's rule be made manifest over all his creatures, then will the devil have an end" (cf. Mt. xii. 28; Lk. xi. 20; Joh. xii. 31, xiv. 30, xvi. 11). This conception of the strife of God with the devil was further interwoven, before its introduction into the Antichrist myth, with another idea of different origin, namely, the myth derived from the Babylonian religion, of the battle of the supreme God (Marduk) with the dragon of chaos (Tiamāt), originally a myth of the origin of things, which, later perhaps, was changed into an eschatological one, again under Iranian influence. Thus it comes that the devil, the opponent of God, appears in the end often also in the form of a terrible dragon-monster; this appears most clearly in Rev. xii. Now it is possible that the whole conception of Antichrist has its final roots in this already complicated myth, that the form of the mighty adversary of God is but the equivalent in human form of the devil or of the dragon of chaos. In any case, however, this myth has exercised a formative influence on the conception of Antichrist. For only thus can we explain how his figure acquires numerous superhuman and ghostly traits, which cannot be explained by any particular historical phenomenon on which it may have been based. Thus the figure of Antiochus IV. has already become superhuman, when in Dan. viii. 10, it is said that the little horn "waxed great, even to the host of heaven; and cast down some of the host and of the stars to the ground." Similarly Pompey, in the second psalm of Solomon, is obviously represented as the dragon of chaos, and his figure exalted into myth. Without this assumption of a continual infusion of mythological conceptions, we cannot understand the figure of Antichrist. Finally, it must be mentioned that Antichrist receives, as least in the later sources, the name originally proper to the devil himself.

From the Jews, Christianity took over the idea. It is present quite unaltered in certain passages, specifically traceable to Judaism, *e.g.* (Rev. xi.). "The Beast that ascendeth out of the bottomless pit" and surrounded by a mighty host of nations slays the "two witnesses" in Jerusalem, is the entirely superhuman Jewish conception of Antichrist. Even if the beast (ch. xiii.) which rises from the sea at the summons of the devil, be interpreted as the Roman empire, and, especially, as any particular Roman ruler, yet the original form of the malevolent tyrant of the latter time is completely preserved.

A fundamental change of the whole idea from the specifically Christian point of view, then, is signified by the conclusion of ch. ii. of the Second Epistle to the Thessalonians. There can, of course, be no doubt as to the identity of the "man of sin, the son of perdition" here described with the dominating figure of Jewish eschatology (cf. ii. 3, etc., b ἄνθρωπος τῆς ἀνομίας *i.e.*, Beliar [?] ὁ ἀντικείμενος—the allusion that follows to Dan. xi. 36). But Antichrist here appears as a tempter who works by signs and wonders (ii. g) and seeks to obtain divine honours; it is further signified that this "man of sin" will obtain credence, more especially among the Jews, because they have not accepted the truth. The conception, moreover, has become almost more superhuman than ever (cf. ii. 4, "showing himself that he is God"). The destruction of the Adversary is drawn from Isaiah xi. 4, where it is said of the Messiah: "with the breath of His lips shall He slay the wicked." The idea that Antichrist was to establish himself in the temple of Jerusalem (ii. 4) is very enigmatical, and has not yet been explained. The "abomination of desolation" has naturally had its influence upon it; possibly also the experience of the time of Caligula (see above). Remarkable also is the allusion to a power which still retards the revelation of Antichrist (II. Thess. ii. 6, etc., τὸ κατέχον, b κατέχων), an allusion which, in the tradition of the Fathers of the Church, came to be universally, and probably correctly, referred to the Roman empire. In this then consists the significant turn given by St. Paul in the Second Epistle to the Thessalonians to the whole conception, namely, in the substitution for the tyrant of the latter time who should persecute the Jewish people of a pseudo-Messianic figure, who, establishing himself in the temple of God, should find credence and a following precisely among the Jews. And while the originally Jewish idea led straight to the conception, set forth in Revelation, of the Roman empire or its ruler as Antichrist, here on the contrary, it is probably the Roman empire that is the power which still retards the reign of Antichrist.

With this, the expectation of such an event at last separates itself from any connection with historical fact, and becomes purely ideal In this process of transformation of the idea, which has become of importance for the history of the world, is revealed probably the genius of Paul, or at any rate, that of the young Christianity which was breaking its ties with Judaism and establishing itself in the world of the Roman empire.

This version of the figure of Antichrist, who may now really for the first time be described by this name, appears to have been at once widely accepted in Christendom. The idea that the Jews would believe in Antichrist, as punishment for not having believed in the true Christ, seems to be expressed by the author of the fourth gospel (v. 43). The conception of Antichrist as a perverter of men, leads naturally to his connection with false doctrine (I. John ii. 18, 22; iv. 3; II. John 7). The Teaching of the Apostles (xvi. 4) describes his form in the same way as II. Thessalonians (*καὶ τότε φαινήσεται ὁ κοσμοπλανὴς ὡς υἱὸς θεοῦ καὶ ποιεῖ σημεῖα καὶ τέρατα*). In the late Christian Sibylline fragment (iii. 63, etc.) also, "Beliar" appears above all as a worker of wonders, this figure having possibly been influenced by that of Simon Magus. Finally the author of the Apocalypse of St. John also has made use of the new conception of Antichrist as a wonder-worker and seducer, and has set his figure beside that of the "first" Beast which was for him the actual embodiment of Antichrist (xiii. 11, etc.). Since this second Beast could not appear along with the first as a power demanding worship and directly playing the part of Antichrist, he made out of him the false prophet (xvi. 13, xix. 20, xx. 10) who seduces the inhabitants of the earth to worship the first Beast, and probably interpreted this figure as applying to the Roman provincial priesthood. (See APOCALYPSE.)

In proportion as the figure of Nero again ceased to dominate the imagination of the faithful, the wholly unhistorical, unpolitical and anti-Jewish conception of Antichrist, which based itself more especially on II. Thess. ii., gained the upper hand, having usually become associated with the description of the universal conflagration of the world which had also originated in the Iranian eschatology. On the strength of exegetical combinations, and with the assistance of various traditions, it was developed even in its details, which it thenceforth maintained practically unchanged. In this form it is in great part present in the eschatological portions of the Adv. Haereses of Irenaeus, and in the de *Antichristo* and commentary on Daniel of Hippolytus. In times of political excitement, during the following centuries, men appealed again and again to the prophecy of Antichrist. Then the foreground scenery of the prophecies was shifted; special prophecies, having reference to contemporary events, are pushed to the front, but in the background remains standing, with scarcely a change, the prophecy of Antichrist that is bound up with no particular time. Thus at the beginning of the *Testamentum Domini,* edited by Rahmani, there is an apocalypse, possibly of the time of Decius, though it has been worked over (Harnack, ibid. ii., 514 etc.). In the 3rd century, the period of Aurelianus and Gallienus with its wild warfare of Romans and Persians, and of Roman pretenders one with another, seems especially to have aroused the spirit of prophecy. To this period belongs the Jewish apocalypse of Elijah (ed. Buttenwieser) of which the Antichrist is possibly Odaenathus of Palmyra, while *Sibyll.* xiii., a Christian writing of this period, glorifies this very prince. It is possible that at this time also the Sibylline fragment (iii. 63 etc.) and the Christian recension of the two first Sibylline books were written. To this time possibly belongs also a recension of the Coptic apocalypse of Elijah, edited by Steindorff (*Texte und Untersuchungen* N.F. ii. 3). To the 4th century belongs, according to Kamper (Die deutsche Kaiseridee, 1896, p. 18) and Sackur (Texte *und* Forschungen, 1898, p. 114 etc), the first nucleus of the "Tiburtine" Sibyl, very celebrated in the middle ages, with its prophecy of the return of Constans, and its dream, which later on exercised so much influence, that after ruling over the whole world he would go to Jerusalem and lay down his crown upon Golgotha. To the 4th century also perhaps belongs a series of apocalyptic pieces and homilies which have been handed down under the name of Ephraem. At the beginning of the Mohammedan period, then, we meet with the most influential and the most curious of these prophetic books, the *Pseudo-Methodius,* which prophesied of the emperor who would awake from his sleep and conquer Islam. From the *Pseudo-Methodius* are derived innumerable Byzantine prophecies (*cf.* especially Vassiliev Anecdota *Graeco-Byzantina*) which follow the fortunes of the Byzantine emperors and their governments. A prophecy in verse, adorned with pictures, which is ascribed to Leo VI. the Philosopher (Migne, Patr. *Graeca,* cvii. p. 1,121, etc.) tells of the downfall of the house of the Comneni, and sings of the emperor of the future who would one day awake from death and go forth from the cave in which he had lain. Thus the prophecy of the sleeping emperor of the future is very closely connected with the Antichrist tradition. There is extant a Daniel prophecy which, in the time of the Latin empire, foretells the restoration of the Greek rule. In the East, too, Antichrist prophecies were extraordinarily flourishing during the period of the rise of Islam and of the Crusaders. To these belong the apocalypses in Arabic, Ethiopian and perhaps also in Syrian, preserved in the so-called Liber *Clementis discipuli* S. Petri (Petri *apostoli apocalypsis* per *Clementem*), the late Syrian apocalypse of Ezra (Bousset, *Antichrist,* 45, etc.) the Coptic (14th) vision of Daniel (in the appendix to Woide's edition of the Codex *Alexandrinus;* Oxford 1799) the Ethiopian *Wisdom* of the Sibyl, which is closely related to the Tiburtine Sibyl (see Basset, Apocryphes *éthiopiennes,* x.); in the last mentioned of these sources long series of Islamic rulers are foretold before the final time of Antichrist. Jewish apocalypse also awakes to fresh developments in the Mohammedan period, and shows a close relationship with the Christian Antichrist literature. One of the most interesting apocalypses is the Jewish History of Daniel, handed down in Persian.

This whole type of prophecy reached the West above all through the *Pseudo-Methodius,* which was soon translated into Latin. Especially influential, too, in this respect, was the letter which the monk Adso in 954 wrote to Queen Gerberga, De *ortu* et *tempore Antichristi.* The old Tiburtine *Sibylla* went through edition after edition, in each case being altered so as to apply to the government of the monarch who happened to be ruling at the time. Then in the West the period arrived in which eschatology and above all the expectation of the coming of Antichrist, exercised a great influence on the world's history. This period, as is well known, was inaugurated, at the end of the 12th century by the apocalyptic writings of the abbot Joachim of Floris. Soon the word Antichrist re-echoed from all sides in the embittered controversies of the West. The pope bestowed this title upon the emperor, the emperor upon the pope, the Guelphs on the Ghibellines and the Ghibellines on the Guelphs. In the contests between the rival powers and courts of the period, the prophecy of Antichrist played a political part. It gave motives to art, to lyrical, epic and dramatic poetry. Among the visionary Franciscans, enthusiastic adherents of Joachim's prophecies, arose above all the conviction that the pope mas Antichrist, or at least his precursor. From the Franciscans, influenced by Abbot Joachim, the lines of connection are clearly traceable with Milič of Kremsier (Libellus *de Antichristo*) and Matthias of Janow. For Wycliffe and his adherent John Purvey (probably the author of the *Commentarius* in *Apocalypsin* ante *centum annos editus,* edited in 1528 by Luther), as on the other hand for Hus, the conviction that the papacy is essentially Antichrist is absolute. Finally, if Luther advanced in his contest with the papacy with greater and greater energy, he did so because he was borne on by the conviction that the pope in Rome was Antichrist. And if in the Augustana the expression of this conviction was suppressed for political reasons, in the Articles of Schmalkaiden, drawn up by him, Luther propounded it in the most uncompromising fashion. This sentence was for him an *articulus stantis et cadentis ecclesiae.* To write the history of the idea of Antichrist in the latter middle ages, would be almost to write that of the middle ages. (W. B.)

See Bousset, *Antichrist,* etc., 1895 (Eng. trans. A. H. Keane 1896); Bousset, *Die Religion des Judentums,* etc. (3 Auf. herausg. H. Gressmann 1926), p. 254 ff; H. Preuss, *Die Vorstellungen vom Antichrist im* spat. *Mittelalter,* etc. (1906); Hastings Encyc. *Rel. Eth. s.v.; Encyc. Biblica s.v.* Commentaries to 1 & 2 John, 2 Thess., etc.

ANTICLIMAX (*i.e.*, the opposite to "climax"), in rhetoric, an abrupt declension (either deliberate or unintended) on the part of a speaker or writer from the dignity of idea which he appeared to be aiming at; as in the following well-known distich:—

The great Dalhousie, he, the god of war,
Lieutenant-colonel to the earl of *Mar*.

An anticlimax can be intentionally employed only for a jocular or satiric purpose. It frequently partakes of the nature of antithesis, as:—

Die and endow a college or a cat.

It is often difficult to distinguish between "anticlimax" and "bathos"; but the former is more decidedly a relative term. A whole speech may never rise above the level of bathos; but a climax of greater or less elevation is the necessary antecedent of an anticlimax.

ANTI-CORN-LAW LEAGUE, a body formed at Manchester in 1838 to oppose the Corn Laws. It was led by Cobden, Bright and Villiers, formed branches throughout the country, and became a very powerful political force. It was dissolved upon the attainment of its object in the repeals of 1846–49. (*See* CORN LAWS.)

ANTICOSTI, island province of Quebec, Canada, in the Gulf of St. Lawrence, 49° to 50° N., 61° 40′ to 64° 30′ W., length 13½ mi., breadth 30 mi. Pop. (1941) 424, chiefly lighthouse-keepers. The coast is dangerous, and the harbours, Ellis bay and Fox bay, are poor. Its main wealth is timber. Anticosti was sighted by Jacques Cartier in 1534, and named Assomption. In 1763 it was ceded by France to Britain, and in 1774 became part of Canada. Wild animals, especially bears, are numerous, but fish and game had been almost exterminated when, in 1896, Anticosti and the shore fisheries were leased to M. Menier, the French chocolate manufacturer, who converted the island into a game preserve. In 1926 the Anticosti Corporation of pulp and paper manufacturers bought the island from Senator Menier, who has retained his residence and sporting rights.

See Logan, Geological Survey of Canada, Report of Progress from its Commencement to *1863* (Montreal, 1863–65); E. Billings, Geological Survey of Canada: *Catalogue* of the Silurian Fossils of *Anti*costi (Montreal, 1866); J. Schmitt, Anticosti (Paris, 1904).

ANTICYCLONE, a name first proposed by F. Galton for an atmospheric system opposite to a cyclone (*q.v.*). In an anticyclone the barometric pressure is high, seldom less than 1,01½ m.bars, or 30 inches, and there is a steady decrease from the centre; in a well-marked anticyclone the isobars are usually circular or oval curves. Certain parts of the earth, notably large parts of the latitude belts about 30° N. and 30° S., also continental areas in winter in mid latitudes, are characterized by high pressures and are termed anticyclonic regions. At the surface the air tends to flow outwards in all directions from the central area and is deflected on account of the earth's rotation (see FERREL'S LAW) so as to give a spiral movement, in the direction of the hands of a watch-face, upwards in the northern hemisphere and in the opposite direction in the southern hemisphere. Anticyclones are usually regions of calms or light winds with little or no rainfall; these conditions are best seen in the desert regions of the globe; in temperate zones there is more variety of weather, *e.g.*, in Britain they are usually accompanied by dull, cheerless, foggy weather in winter and by bright, hot weather in summer.

ANTICYRA, the ancient name of three cities of Greece. (1) (Mod. *Aspraspitia*), in Phocis, on the bay of Anticyra, in the Corinthian gulf; some remains are still visible. It was a town of considerable importance, famous for its black hellebore, a herb regarded as a cure for insanity. (2) In Thessaly, on the right bank of the river Spercheios, near its mouth. (3) In Locris, on the north side of the entrance to the Corinthian gulf, near Naupactus.

ANTIDOTES, remedies for counteracting poisons. The following antidotes for special poisons are sometimes given in case of emergency usually following and followed by an emetic, and whenever possible under the supervision of a physician. In general, antidotes for acid poisons are: ammonia (a teaspoonful to half a pint of water) or lime-water, plaster, magnesia or chalk. For alkali poisons, antidotes are vinegar, dilute acetic acid or lemon juice. For an unidentified poison, the general rule is to give eggs, salad oil (except in phosphorus poisoning), flour and water or lime-water (except for alkaline poisons), preceded by large draughts of water or milk, and to induce vomiting by placing the finger in the throat or by an emetic. Kitchen soap and water may be used several times repeated. The antidote is only one part of the treatment which may include first an emetic and is often followed by stimulants such as strong black coffee.

ANTIDOTES FOR SPECIAL POISONINGS

Lead: Epsom salts in large doses, 2 tablespoonfuls to a glass of water, bland liquors, castor-oil, milk or eggs.

Phosphorus: magnesia in water, potassium permanganate 1 to 1,000 solution in water, copper sulphate (bluestone in water), repeated V. gr. doses to cause vomiting, turpentine, a half teaspoonful in a glass of milk or water. Do not give oils or fats.

Prussic acid: peroxide of hydrogen internally, lime-water, kitchen soap or soda.

Plant Poisoning: Plant poisons in general do not require an antidote, being treated by induced vomiting, stimulants and brisk purge, like castor-oil.

Hydrochloric (*muriatic*), nitric (aqua fortis), oxalic, acetic, *sulphuric* (vitriol) acids: weak alkaline drinks at once, ammonia (8 teaspoonfuls in half a pint of water), baking soda, magnesia, chalk, lime, whitewash from walls, plaster, given in water, soap and water or tooth-powder. (No emetic.)

Carbolic acid (creosote, guaiacol, creosol): soluble sulphates, such as magnesium sulphate, sodium sulphate (Epsom and Glauber's salts), dilute alcohol, raw eggs, flour and water, milk, castor- or sweet oil. (No emetic.)

Alkalis: dilute acids, vinegar one glass to quart of water, dilute acetic acid, 2–3 per cent, lemon juice, soothing fluid, oils, melted fat, milk, cream. (No emetic.)

Silver preparations (*silver* nitrate, lunar caustic): large drinks of salt water, soap, draughts of milk, baking soda.

Mercury (corrosive sublimate or bichloride of mercury, blue ointment, oxide of mercury, black wash, yellow wash, cinnabar vermilion): raw eggs or milk repeated after meals, soap, castor-oil, flour and water. Emesis absolutely necessary after antidote has been down for 5–10 minutes. Mercury becomes free in intestines.

Arsenic (Fowler's *solution, Paris* green, *Scheele's* green, *Schweinfurt* green, arsenical dyes in papers and candies): precipitate form from magnesium (three tablespoons in a glass of water), iron sulphate (two fluid ounces in a glass of water), then mix, or ferric chloride precipitated by sodium bicarbonate; the rust scraped from iron stirred up in water and given, magnesia, follow with castor-oil.

Copper (blue vitriol or bluestone, verdigris): milk, eggs, soap, flour and water.

Antimony (Tartar emetic, *wine* of antimony): same as for mercury. Strong coffee or tea, teaspoonful of tannic acid in half glass of water followed by eggs or milk.

Iodine: starch and water.

Formaldehyde: bland drinks, milk and oils.

Opium: no antidote (emetics and stimulants used). Artificial respiration if breathing stops. Keep victim moving; repeated doses of caffeine.

Chloral (chloralamide, *chloralose,* chloral camphor): no antidotes (treatment similar to opium treatment).

Veronal, trional, *sulphonal,* ammonal: no antidote (stimulants).

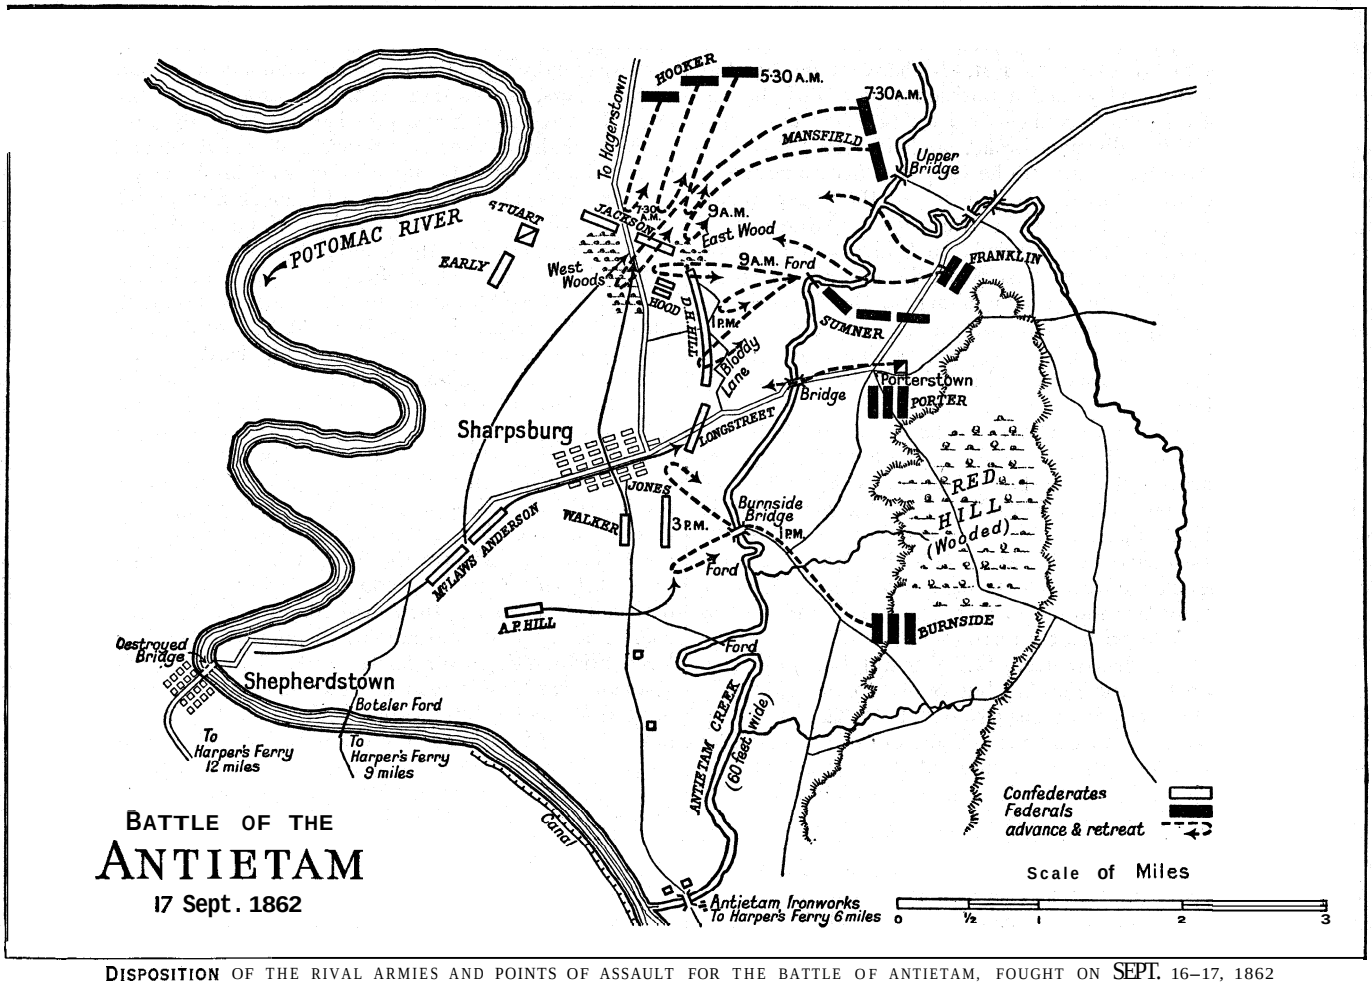
Ptomaine (poison from decayed meats, fish, vegetables, contaminated canned foods): (after emetic) castor-oil, Epsom salts or other rapidly acting cathartic, enema of warm soap-suds with a teaspoon of turpentine to the pint or two teaspoons of glycerine.

Aconite: no antidote (induced vomiting and stimulant).

Belladonna: no antidote (induced vomiting and stimulant).

Strychnia (nux vomicu): no antidote (emetic and quiet). In extreme poisoning inject solution magnesium sulphate into spinal canal. Person in semi-sitting position during and after injection.

(W. R. R.)



DISPOSITION OF THE RIVAL ARMIES AND POINTS OF ASSAULT FOR THE BATTLE OF ANTIETAM, FOUGHT ON SEPT. 16–17, 1862
This battle was one of the most severe in the American Civil War, the Federals losing 12,000 killed and wounded, the Confederates slightly less. The Federal forces were greatly superior, but McClellan's refusal to throw in his reserves destroyed his chances of victory. Lee, on the other hand, bringing every man and gun into action, was able to withstand the piecemeal attacks launched against him at five different points at five different hours. On the morning following the battle Lee prepared to renew the struggle but McClellan allowed him to recross the Potomac unmolested

ANTIENT CONCERTS, the name of a famous series of London concerts, started in 1776 and continued without a break till 1848. The founders of the concerts were a body of aristocratic amateurs, who were supported by all the best musicians and cultivated music-lovers of the period. The programmes were devoted to the finest music, orchestral and vocal, of the day, or more strictly speaking of the past, for it was one of the rules that no music less than 20 years old was admissible. From the keen interest taken in them by George III. the concerts acquired the secondary title of "the king's concerts" and this tradition of court patronage was maintained when the Prince Consort "directed" one of them in 1847 at which Mendelssohn was the soloist.

ANTIETAM, THE BATTLE OF THE. The Antietam flowing south into the Potomac above Harper's Ferry gives its name to the battle fought (Sept. 17, 1862) between the Federals under McClellan and the Confederates under R. E. Lee. After his incursion into Maryland Lee with three divisions had retreated from South Mountain behind the Antietam (Sept. 15), where he awaited the arrival of six divisions under Jackson from Harper's Ferry, which had capitulated at 8 A.M. that day. Jackson rejoined with three next morning. That afternoon McClellan, who following slowly in pursuit had only reached the Antietam late on the 15th, sent the I. Corps (Hooker) across by the bridge highest up the stream. About dusk Hooker came into collision with Hood's two brigades on the Confederate left. The XII Corps (Mansfield) crossed at 11:30 P.M., and encamped a mile in Hooker's rear. McClellan's plan was to make his main attack upon the Confederate left with the I, XII. and II (Sumner) Corps, supported if necessary by the VI. Corps (Franklin), whilst Burnside with the IX. Corps was "at least to create a diversion with the hope of something more by assailing the enemy's right." When one or both of these movements were "fully successful," he intended to launch his reserve—V. Corps (Porter)—against Lee's centre.

Lee's position was fairly strong, extending over three miles from "the Burnside bridge" over the Antietam to a bend in the Potomac. In the West Woods outcropping ledges of limestone provided excellent cover. But the line of retreat to the Boteler Ford below Shepherdstown, where alone the Potomac could be crossed, ran parallel to the right flank, itself somewhat "in the air." On the extreme left *Stuart's* cavalry occupied a ridge overlooking the Potomac; Jackson with two divisions held the turnpike and the woods on either side, with Hood's brigades in reserve; *D. H.* Hill's division continued the line southwards, and Longstreet's seven brigades stretched from Sharpsburg to "the Burnside bridge." Two cavalry regiments guarded the bridge below. Jackson's third division (Walker) was at first held in reserve behind the right flank.

Hooker's attack began at 5:30 A.M. on the 17th and was over two hours later. His corps was already retiring, when Mansfield's Corps advanced. Its attack ended about 9 A.M. One division had established itself in the West Woods; Walker's division had reinforced Jackson. A little later Sumner with Sedgwick's division charged through the West Woods, but was taken in flank by *McLaws's* division, which with Anderson's had only that morning arrived from Harper's Ferry, and by Walker's, and was driven back with a loss of over 2,000 men. By 10:30 A.M. the fighting on Jackson's front was over and the Confederates had regained possession of the West Woods.

Further south French and Richardson of Sumner's Corps attacked D. H. Hill, who was reinforced by *Anderson.* Here the fighting lasted from 10 A.M. to 1 P.M. Richardson on the left drove back *Anderson* and gained a position from which he enfiladed "the Bloody Lane," a sunken road which Hill was holding against French. Hill's division broke, and if McClellan had allowed Franklin to advance across the turnpike, Lee's line might have been cut in two. Burnside only received the order to advance some hours after Hooker's battle began. After a prolonged struggle the IX. Corps carried the bridge about 1 P.M. Two hours later it advanced against Sharpsburg, which was defended by one division only. It was rolling up the Confederate line and had reached the outskirts of Sharpsburg, when about 4 P.M. *A.* P. Hill's division, after a forced march from Harper's Ferry, came up from the Potomac and striking its left flank drove it back to the bridge.

With the defeat of the IX. Corps the battle of the Antietam ended. McClellan had fully 70,000 men on the field, but he kept one-third of his army out of the battle. The V. Corps remained in reserve all day; only one of Franklin's brigades was seriously engaged. Federal casualties numbered over 12,000. *Lee* lost between a fifth and a quarter of his army, less than 40,000 strong. Despite his losses Lee offered battle next day, but McClellan, though reinforced by two more divisions, allowed *Lee* to recross the Potomac that night without interruption.

The historian Ropes has written, "Of General Lee's management of the battle there is nothing but praise to be said." He might have added, it has been suggested "of McClellan's management there is nothing but censure." The Northern commander made no adequate reconnaissance to find out the Confederate position or where the creek could be forded. The attack, instead of being simultaneous along the whole front, was made piecemeal; there were, in fact. five separate attacks at different hours. This is the more remarkable as one of the maps preserved in the official records shows that McClellan was in signal communication with his corps commanders' headquarters. Had the Federal

ANTIFEBRIN, a name commonly employed for acetanilide (*q.v.*), an organic compound present in various headache powders.

ANTI-FEDERALISTS, the name given in the political history of the United States to those who, after the formation of the Federal Constitution of 1787, opposed its ratification by the people of the several States. The "party" (though it was never regularly organized as such) was composed of "statesrights," particularist, individualist and radical democratic elements; that is, of those persons who thought that a stronger government threatened the sovereignty and prestige of the States, or the special interests, individual or commercial, of localities, or the liberties of individuals, or who fancied they saw in the government proposed a new centralized, disguised "monarchic" power that would only replace the cast-off despotism of Great Britain. In every State the opposition to the Constitution was strong, and in two—North Carolina and Rhode Island—it prevented ratification until the definite establishment of the new government practically forced their adhesion. The individualist was the strongest element of opposition; the necessity, or at least the desirability, of a bill of rights was almost universally felt. Instead of accepting the Constitution upon the condition of amendments—in which way they might very likely have secured large concessions—the Anti-Federalists stood for unconditional rejection, and public opinion, which went against them, proved that for all its shortcomings the Constitution was regarded as preferable to the articles of confederation. After the inauguration of the new government, the composition of the Anti-Federalist Party changed. The Federalist (*q* v.) Party gradually showed "broad-construction," nationalist tendencies; the Anti-Federalist Party became a "strict-construction" party and advocated popular rights against the alleged aristocratic, centralizing tendencies of its opponent, and gradually was transformed into the Democratic-Republican party, mustered and led by Thomas Jefferson, who, however, had approved the ratification of the Constitution and was not, therefore, an Anti-Federalist in the original sense of that term.

See O. *G.* Libby, *Geographical Distribution of the Vote . . . on the Federal Constitution, 1787–1788* (University of Wisconsin Bulletin, 1894); S. B. Harding, *Contest over the Ratification of the Federal Constitution in . . . Massachusetts* (Harvard University Studies, 1896); and authorities on political and constitutional history in the article UNITED STATES.

ANTI-FREEZE, a substance which is added to the water used in cooling systems of automobiles or similar machines to lower its freezing point For use in automobile radiators. the anti-freeze material should not contain anything which is an electrolyte, since this would corrode the metal. The material used should be of low molecular weight so that a given weight will have a greater effect on the freezing point. It should not be volatile at normal operating temperatures nor should it increase the viscosity of the liquid too much.

A great many organic compounds have been used as anti-freeze substances Glucose, honey, molasses and sugar have found some use. Glycerine and alcohol have found the most general application. Ethylene glycol has become available in commercial quantities and is being widely adopted.

ANTI-FRICTION METALS. In a theoretically perfect bearing the load should be carried on a film of oil between the axle and bearing, and the nature of the bearing metal should therefore be immaterial. In actual practice, however, such perfection is not attained and it becomes necessary to select a metal which will minimize as far as possible the inevitable mechanical errors of adjustment and alignment. The properties which a good bearing metal should possess are, first, a low coefficient of friction and, secondly, sufficient plasticity to allow the axle to bed down combined with sufficient compressive strength to carry the total load. In early days lead was commonly used as a bearing metal, but it was too soft, and it was soon discovered that the alloys of lead and tin with additions of other metals were far superior.

One of the earliest of these was introduced by Isaac Babbitt and contained approximately 83% of tin, 11% of antimony and 6% of copper. So successful was this alloy that it soon became the standard for all bearing metals and was named, after its inventor, "Babbitt metal." Numerous imitations were then introduced under the same name so that it became necessary to distinguish genuine Babbitt metal from other compositions and at the present time the expression is so loosely used that in the United States it comprises practically all the white bearing metals of any composition. In fact the expression "Babbitt metal" is synonymous

with the British expression "anti-friction metal," and the American Standard Specifications are drawn up for "White Bearing Metal Alloys, known commercially as Babbitt Metal."

Although anti-friction metals had been successfully employed for many years, it was not until Charpy published the results of his classical research in 1898 that the real nature of the alloys was properly understood. Charpy demonstrated that they possessed one essential feature, namely, a conglomerate structure consisting of particles of hard material embedded in a soft matrix. Such structures can be obtained by the addition of other metals which combine to produce hard compounds with the softer metal to which they are added.

Five Groups of Bearing Metals.—The bearing metals commonly in use may be divided into five groups, viz.:—

(1.) Tin base alloys consisting essentially of tin and contain; ing compounds of tin and antimony and tin and copper.

(2.) Lead base alloys consisting of lead and containing a compound of tin and antimony.

(3.) Copper base alloys or bronzes containing compounds of copper and tin, and sometimes of copper and phosphorus.

(4.) Copper base alloys similar to the foregoing but containing considerable quantities of lead.

(5.) Zinc base and miscellaneous alloys.

In the alloys of Group (1), of which a typical composition may be taken as 87% tin, 7½% antimony and 3% copper, the antimony combines with a part of the tin to form hard, well defined cubes corresponding to the formula Sn Sb, while the copper combines with a further portion of the tin to form the compound Sn Cu_3 which separates in characteristic needle-shaped crystals.

The alloys of Group (2) are, of course, cheaper than those of Group (1) and, although they have not the same compressive strength, they are quite suitable for many purposes, especially where loads are not great and speeds high. In these alloys the hard constituent is the compound Sn Sb, which is embedded in lead. For the best results the antimony should be between 10 and 18% and the tin not less than 10%, except for very light service.

The alloys of Group (3), although possessing the same characteristic structure as those already described, differ in some respects. In this case the hard compound is formed between copper and tin and corresponds to the formula Sn Cu_6, while in the case of phosphor bronze there is an additional hard compound, phosphide of copper, Cu_3P, which separates with the Sn Cu_6. But these compounds are embedded, not in copper, but in a solid solution of tin in copper which is harder than copper and very much harder and stronger than the soft metals, tin and lead, of the two previous groups. Owing to the great strength of these alloys they are adapted for all purposes where very heavy loads at comparatively slow speeds have to be dealt with. The percentage of tin should not be less than 9 and for ordinary purposes not more than 15, while, if phosphorus is added, this should be from ½ to 1 per cent.

The alloys of Group (4) are similar to those of Group (3), except that they contain an amount of lead up to 30 per cent. This lead does not alloy with the copper but remains free in the form of globules scattered throughout the metal. This free lead does not greatly reduce the compressive strength of the alloy, but appears to act as a lubricant and improves the antifrictional properties.

In Group (5) may be included all the miscellaneous alloys which have been employed for special purposes. Perhaps the most important of these are the zinc base alloys which are used for hard work and occasionally under water. It is impossible to deal with all the alloys which have been suggested as bearing metals, but mention must be made of a recent development in the use of lead alloys containing barium either alone or with calcium. These alloys were introduced during the World War, when economy in the use of tin was essential, and they are said to possess properties very similar to those of the tin base alloys although sufficient experience has hardly been gained yet to enable a decided view to be expressed. They contain from 2 to 4% of barium and the remainder lead, or if calcium is added, 1% of calcium replaces 2% of barium. (See BALL BEARINGS.)

(E. F. L.)

ANTIGO, a city of Wisconsin, U.S.A., about 160 m. N.W. of Milwaukee, the county seat of Langlade county. It is served by the Chicago and North Western railway. The population was 9,495 in 1940. Antigo is a supply-base for the summer resort-of north-eastern Wisconsin, and a shipping-point for large quantities of goldenseal and ginseng, seed grains, potatoes and dairy products. It has a large cheese factory, machine shops and wood-working plants. There are 103 lakes in the county, and over 700 m of trout streams.

Antigo was settled in 1880, and was chartered as a city in 1885. Its name is said to be part of an Indian word, neequee-nntigosebi, meaning "evergreen."

ANTIGONE: see OEDIPUS.

ANTIGONUS CYCLOPS or **MONOPMTMALMOS** (382–301 B.C.) so called from his having lost an eye—Macedonian king, son of Philip, was one of the generals of Alexander the Great. He was made governor of Greater Phrygia in 333, and in the division of the provinces after Alexander's death (323) Pamphylia and Lycia were added to his command. He incurred the enmity of Perdiccas, the regent, by refusing to assist Eumenes (*q.v.*) to obtain possession of the provinces allotted to him. In danger of his life he escaped to Greece where he obtained the favour of Antipater (*q.v.*), regent of Macedonia (321); and when, soon after, on the death of Perdiccas a new division took place, he was entrusted with the command of the war against Eumenes, who had joined Perdiccas against the coalition of Antipater, Antigonus, and the other generals. Eumenes was completely defeated, and a new army that was marching to his relief was routed by Antigonus. Polyperchon succeeding Antipater (d. 319) in the regency, to the exclusion of Cassander, his son, Antigonus resolved to set himself up as lord of all Asia, and, in conjunction with Cassander and Ptolemy of Egypt, refused to recognize Polyperchon. He entered into negotiations with Eumenes, but Eumenes remained faithful to the royal house and formed a coalition with the satraps of the eastern provinces. He was at last, through treachery, delivered up to Antigonus in Persia and put to death (316). Antigonus again claimed authority over the whole of Asia, seized the treasures at Susa, and entered Babylonia, of which Seleucus was governor. Seleucus fled to Ptolemy and entered into a league with him (315), together with Lysimachus and Cassander. Aiter the war had been carried on with varying success from 315 to 311, peace was concluded, by which the government of Asia Minor and Syria was provisionally secured to Antigonus. This agreement was soon violated on the pretext that garrisons had been placed in some of the free Greek cities by Antigonus, and Ptolemy and Cassander renewed hostilities against him. Demetrius Poliorcetes, the son of Antigonus, wrested part of Greece from Cassander in 306 and defeated Ptolemy in a naval engagement off Salamis, in Cyprus. On this victory Antigonus assumed the title of king and bestowed a similar title on his son, a declaration that he claimed to be the heir of Alexander. Antigonus now prepared a large army and a formidable fleet, the command of which he gave to Demetrius, and hastened to attack Ptolemy in his own dominions. His invasion of Egypt, however, proved a failure and he had to retire. Demetrius then attempted the reduction of Rhodes, which had refused to assist Antigonus against Egypt; but, meeting with obstinate resistance, he had to make a treaty upon the best terms that he could (304). In 302, although Demetrius was again winning success after success in Greece, Antigonus was obliged to recall him to meet the confederacy that had been formed between Cassander, Seleucus, and Lysimachus. A decisive battle was fought at Ipsus, in which Antigonus fell. in the 81st year of his age.

Akad.* **1898, p.** 835; *Cambridge Ancient History,* vol. vi. ch. xv., and the bibliography there given.

ANTIGONUS GONATAS (*c.* 319–239 B.C.), Macedonian king, was the son of Demetrius Poliorcetes, and grandson of Antigonus Cyclops (*q.v.*). On the death of his father (283), he

assumed the title of king of Macedonia, but did not obtain possession of the throne till 276, after it had been successively in the hands of Pyrrhus, Lysimachus, Seleucus, and Ptolemy Ceraunus. Antigonus repelled the invasion of the Gauls, and continued in undisputed possession of Macedonia till 274, when Pyrrhus returned from Italy, and (in 273) made himself master of nearly all the country. On the advance of Pyrrhus into Peloponnesus, he recovered his dominions.

He was again (between 263 and 255) driven out of his kingdom by Alexander, the son of Pyrrhus, and again recovered it. The latter part of his reign was comparatively peaceful, and he gained the affection of his subjects by his honesty and his cultivation of the arts.

ANTIGONUS OF CARYSTUS (in Euboea), Greek writer, flourished in the 3rd century B.C. at the court of Attalus I. (241–197) of Pergamum. His chief work was the *Lives of Philosophers,* drawn from his personal knowledge, of which considerable fragments are found in Athenaeus and Diogenes Laertius. His *Collection of Wonderful Tales,* chiefly extracted from the Θαυμάσια Ἀκούσματα attributed to Aristotle and the Θαυμάσια of Callimachus is still preserved.

ANTIGUA, an island in the British West Indies, forming, with Barbuda and Redonda, one of the five presidencies in the colony of the Leeward Islands. It lies 50m. E. of St. Kitts, in 17° 6′ N. and 61° 45′ W., and is 54m. in circumference, with an area of 108 square miles. There is no central range of mountains as in most other West Indian islands, but among the hills in the south-west an elevation of 1,328ft. is attained. Absence of rivers, paucity of springs, and almost complete deforestation make Antigua subject to frequent droughts, and although the average rainfall is 45·6in., the variations from year to year are great. The high rocky coast is much indented with excellent harbours, that of St. John being safe and commodious, but inferior to English Harbour, formerly a naval depot. The soil, especially in the interior, is very fertile. Sugar and molasses are the only important exports. Sweet potatoes, yams, maize and guinea corn are grown for local consumption. Antigua is the residence of the governor of the Leeward Islands, and the meeting place of the general legislative council. The Presidency has a local legislative council of 16 nominated members, half official and half unofficial. Until 1898, when the Crown Colony system was adopted, the council was partly elected, partly nominated. Elementary education is compulsory. Some agricultural training is provided by the Government, and the Cambridge local examinations and those of the University of London are held annually. Antigua is the see of a bishop of the Church of England, the members of which predominate, but Moravians and Wesleyans are numerous. There is a small volunteer defence force.

The island has direct steam communication with Great Britain, the United States and Canada, and is served by the submarine cable. St. John (population about 10,000), the capital, situated in the north-west, is built on an eminence overlooking one of the most beautiful harbours in the West Indies. The trade (imports £253,291, exports £266,368) is, since the institution of Imperial Preference, principally with England and Canada. The dependent islands of Barbuda and Redonda (*qq.v.*) have an area of 63 square miles. Population of Antigua (1939) 34,527.

Antigua was discovered in 1493 by Columbus, who is said to have named it after a church in Seville, Santa Maria la Antigua. It remained uninhabited until 1632, when a body of English settlers took possession, and in 1663 a further settlement was made under the direction of Lord Willoughby, to whom the island was granted by Charles II. It was raided by the French in 1666, but was soon after reconquered by the British and formally restored to them by the Treaty of Breda.

ANTIGUA, the ancient capital of Guatemala, Central America, and now the centre of the growing of the finest grades of coffee of that country. Antigua was partially destroyed by an earthquake in 1773, and the capital was thereafter removed to the present site of Guatemala city, 27 mi. E.N.E. Antigua has about 12,300 inhabitants and is far from a ruin, although what were some of the most imposing churches and monasteries of America stand in imposing ruins there. The ancient palace of the captain general is still intact, and many substantial houses have been built from the lower story of palaces wrecked in the earthquake. Antigua is reached by automobile from Guatemala city over a broad highway usually in good condition. Antigua is situated in a flat, confined valley (elevation 5,000 ft.) at the foot of the Volcan del Agua ("Volcano of Water"), and is one of the most beautiful sites in Central America.

ANTPLEGBMENA (ἀντιλεγόμενα, contradicted, disputed), an epithet used by the early Christian writers to denote those books of the New Testament which, although sometimes publicly read in the churches, were not for a considerable time admitted to be genuine, or received into the canon of Scripture; and applied later to those New Testament books having but a doubtful place in the Canon *(see* BIBLE: *New Testament,* 1. *Canon).*

ANTILIA or **ANTILLA** or Island of the Seven Cities (Portuguese *Isla das Sete Cidades),* a legendary island in the Atlantic ocean. The oldest etymology (145j) connects it with Plato's Atlantis (*q.v.*), others with Latin *anterior* (*i.e.,* the island that is reached "before" Cipango), or with the *Jezirat al Tennyn,* "Dragon's Isle," of Arab geographers. Antilia is marked in an anonymous map, dated 1424, in the grand-ducal library at Weimar; in the maps of the Genoese B. Beccario (1435), and of the Venetian Andrea Bianco (1436), and again in 1455 and 1476. In most of these it is accompanied by smaller *insulae de novo repertae,* "newly discovered islands," Royllo, St. Atanagio and Tanmar. The Florentine Paul Toscanelli, in letters to Columbus and the Portuguese court (1474), takes Antilia as the principal landmark for measuring the distance between Lisbon and the Island of Cipango or Zipangu (Japan). On the globe made at Nuremberg in 1492 *(see* MAP: *History)* the geographer Martin Behaim relates that in 734—probably a misprint for 714—after the Moors had conquered Spain and Portugal, the island of Antilia or "Septe Cidade" was colonized by Christian refugees under the archbishop of Oporto and six bishops, and that a Spanish vessel sighted the island in 1414. In older Portuguese tradition each leader founded and ruled a city, free from the disorders of less Utopian states. Later Portuguese tradition localized Antilia in the largest of the Azores, St. Michael's. This legend may commemorate some imperfectly recorded discovery or may embody the idea of a western elysium like the Isles of the Blest, or Fortunate Islands.

ANTILLES, a term of obscure origin, now employed, especially by foreign writers, as synonymous with "West India Islands." It dates traditionally from a period anterior to the discovery of the New World by European navigators, being the name assigned to semi-mythical lands indicated in mediaeval charts sometimes as an archipelago, sometimes as a continent of varying size, uncertainly located in mid-ocean between the Canaries and India. It came to be identified with the lands discovered by Columbus. When these were found to consist of a vast archipelago, *Antilia* assumed its present plural form *Antilles,* which was applied to this whole group.

A distinction is made between the Greater Antilles (Cuba, Jamaica, Haiti-San Domingo and Porto Rico) and the Lesser Antilles, comprising the rest of the islands.

ANTILOCHUS, in Greek legend, son of Nestor, king of Pylos. One of the suitors of Helen, he accompanied his father to the Trojan War, and distinguished himself as acting commander of the Pylians. He was an intimate friend of Achilles, to whom he was commissioned to announce the death of Patroclus. When his

father was attacked by Memnon, he saved his life at the sacrifice of his own (Pindar, *Pyth.*, vi. 28), thus fulfilling the oracle which had bidden him "beware of an Ethiopian." According to other accounts, he was slain by Hector (Hyginus, *Fab.*, 113), or by Paris in the temple of the Thymbraean Apollo together with Achilles (Dares Phrygius 34).

ANTIMACASSAR, a protective covering thrown over the back of a chair or the head or cushions of a sofa, named from *Macassar*, a hair-oil in general use in the 19th century. The original antimacassars were made of stiff, white crochet-work, but later soft coloured materials. embroidered in wools or silks, were used. In the 20th century the use of antimacassars which, in better class homes, at least, had died out, was revived in the form of strips of elaborately patterned lace.

ANTIMACHUS, of Colophon or Claros, Greek poet and grammarian, flourished about 400 B.C. His chief works were: a lengthy epic *Thebais*, an account of the expedition of the Seven against Thebes and the war of the Epigoni; and an elegiac poem Lydd, so called from the poet's mistress. These poems, though not popular, were praised by Plato. (Cic., *Brut.*, 191; Plutarch, *Consol. ad Apoll.* 9; Athenaeus xiii. 597.) He was the founder of "learned" epic poetry, and the forerunner of the Alexandrian school, whose canon allotted him the next place to Homer. He also prepared a critical recension of the Homeric poems (mentioned 12 times in the Venetian Scholia).

See Fragments, ed. Stoll (1845); Bergk, *Poetae Lyrici Graeci (1882)*; Kinkel, *Fragmenta epicorum Graecorum* (1877).

ANTI-MASONIC PARTY, an American political organization which had its rise after the mysterious disappearance, in 1826, of William Morgan (c. 1776–*c.* 1826), a freemason of Batavia (N.Y.) who had become dissatisfied with his Order and had planned to publish its secrets. When his purpose became known to the freemasons, Morgan was subjected to frequent annoyances, and finally in Sept. 1826, he was seized and surreptitiously conveyed to Ft. Niagara, whence he disappeared. Though his ultimate fate was never known, it was generally believed at the time that he had been murdered. The event created great excitement, and led many to believe that freemasonry and good citizenship were incompatible. Opposition to freemasonry was taken up by the churches as a sort of religious crusade, and it also became a local political issue in western New York, where early in 1827 the citizens in many mass meetings resolved to support no freemason for public office. In New York at this time the National Republicans, or "Adams men," were a very feeble organization, and shrewd political leaders at once determined to utilize the strong anti-masonic feeling in creating a new and vigorous party to oppose the rising Jacksonian Democracy. In this effort they were aided by the fact that Jackson was a high freemason and frequently spoke in praise of the Order. In the elections of 1828 the new anti-masonic party proved unexpectedly strong, and after this year it practically superseded the National Republican Party in New York. In 1829 the hand of its leaders was shown, when, in addition to its antagonism to the freemasons it became a champion of internal improvements and of the protective tariff. From New York the movement spread into other middle States and into New England. A national organization was planned as early as 1827, and in 1831 the party at a national convention in Baltimore nominated as its candidate for the Presidency William Wirt of Maryland. In the election of the following year it secured the seven electoral votes of the State of Vermont. This was the high tide of its prosperity, for by 1836 most of its members had united with the Whigs.

The growth of the anti-masonic movement was due to the political and social conditions of the time rather than to the Morgan episode, which was merely the torch that ignited the train. Under the name of "anti-masons" able leaders united those who were discontented with existing political conditions. The fact that William Wirt, their choice for the Presidency in 1831, was not only a freemason, but even defended the Order in a speech before the convention that nominated him, indicates that simple opposition to freemasonry soon became a minor factor in holding together the various elements of which the party was composed.

See J. D. Hammond, *History of Political Parties in the State of New York* (Albany, 1842); the *Autobiography of Thurlow Weed* (Boston, 1884); A. G. Mackey and W. R. Singleton, *The History of Freemasonry*, vol. vi. (1898); and Charles McCarthy, *The Anti-masonic Party: A Study of Political Anti-Masonry in the United States, 1827–1840*, in the Report of the *American Historical Association for 1902* (1903).

ANTIMONY, a bluish-white, exceedingly brittle metal. In its naturally occurring sulphide (stibnite) it has been known from very early times, more especially in Eastern countries, reference to it being made in the Old Testament. Basil Valentine alludes to stibnite in his *Triumphal* Car of *Antimony* (*c.* 1600), and at a later date describes the preparation of the metal.

Native mineral antimony occurs occasionally, and as such was first recognized in 1748. It is usually found in lamellar or granular masses, with a tin-white colour and metallic lustre, in limestone or in mineral veins often in association with ores of silver. Distinct crystals are rarely met with; these are rhombohedral and isomorphous with arsenic and bismuth. Hardness 3–3½, specific gravity 6·65–7·72. Sala in Sweden, Allemont in Dauphiné, and Sarawak in Borneo may be mentioned as some of the localities for this mineral. Antimony, however, occurs chiefly as the sulphide, stibnite; to a much smaller extent it occurs in combination with other metallic sulphides in the minerals wolfsbergite, boulangerite, bournonite, pyrargyrite, etc. For the preparation of metallic antimony the crude stibnite being readily fusible (m.p. 540°C) is first liquated, to free it from earthy and siliceous matter, and is then roasted in order to convert it into oxide. After oxidation, the product is reduced by heating with coal, care being taken to prevent any loss through volatilization by covering the mass with a layer of some protective substance such as potash, soda or glauber salt, which also aids in refining. For rich ores the method of roasting the sulphide with scrap-iron is sometimes employed; carbon, salt and sodium sulphate being used to slag the iron. The crude antimony is fused with stibnite to remove iron and then with a flux of potash and antimony sulphide (potassium thioantimonite) to remove sulphur in the form of thioantimoniate. By these operations pure antimony is obtained. Antimony has an atomic weight of 121·77 (Symbol Sb, atomic number 51, isotopes 121–123) and is included in the same natural family of elements as nitrogen, phosphorus, arsenic and bismuth.

Antimony combines readily with many other metals to form alloys, some of which find extensive application in the arts. Type-metal (*q.v.*) is an alloy of lead with antimony and tin, to which occnsionally a small quantity of copper or zinc is added. An alloy of tin and antimony forms the basis of Britannia-metal (*q.v.*), small quantities of copper, lead, zinc or bismuth being added. For the linings of brasses, various white metals are used, these being alloys of copper, antimony and tin, and occasionally lead.

Antimony is a silvery white, crystalline, brittle metal, and has a high lustre. Its specific gravity varies from 6.7 to 6.86; it melts at 630·5°C (Heycock and Neville), and boils at about 1,500°C. Its specific heat is 0·0523 (H. Kopp). The vapour density of antimony at 1,j72°C is 10·74, and at 1,640°C 9.78 (V. Meyer), so that the antimony molecule is less complex than the molecules of the elements phosphorus and arsenic. An amorphous modification of antimony can be prepared by heating the metal in a stream of nitrogen, when it condenses in the cool part of the apparatus as a grey powder of specific gravity 6.22, melting at 614°C and containing 98–99% of anlimony (F. Hérard, 1888). Another form of the metal, known as explosive antimony, was discovered by G. Gore (1858), on electrolysing a solution of antimony trichloride in hydrochloric acid, using a positive pole of antimony and a negative pole of copper or platinum wire. It has a specific gravity of 5.78 and always contains some unaltered antimony trichloride (from 6 to 20%, G. Gore). It is very unstable, a scratch causing it instantaneously to pass into the stable form with explosive violence and the development of much heat (*see* ALLOTROPY).

Pure antimony is quite permanent in air at ordinary temperatures, but when heated in air or oxygen it burns, forming the trioxide. It decomposes steam at a red heat, and burns in chlorine. Dilute hydrochloric acid is without action on it, but on warming

with the concentrated acid, antimony trichloride is formed; it dissolves in warm concentrated sulphuric acid, the normal sulphate $Sb_2(SO_4)_3$ being formed. Nitric acid oxidizes antimony, the oxide obtained depending on the temperature and concentration of the acid. It combines directly with sulphur and phosphorus, and is readily oxidized when heated with metallic oxides (such as litharge, mercuric oxide, manganese dioxide, etc.).

Detection and Estimation. — Antimony and its salts may be readily detected by the orange precipitate of antimony sulphide which is produced when sulphuretted hydrogen is passed through their acid solutions, and also by the Marsh test (see ARSENIC), in which the black stain of antimony produced is not soluble in bleaching powder solution. Antimony compounds when heated on charcoal with sodium carbonate in the reducing flame give brittle beads of metallic antimony, and a white incrustation of the oxide. The antimonious compounds are decomposed on addition of water, with formation of insoluble basic salts, soluble in solutions of tartaric acid. Antimony may be estimated quantitatively by conversion into the sulphide; the precipitate obtained is dried at 100° C and heated in a current of carbon dioxide, or it may be converted into the tetroxide by nitric acid. It may also be determined volumetrically by titrating an antimonious salt, in the presence of an excess of sodium bicarbonate as a buffer, with a standard solution of iodine.

Inorganic **Compounds.**—Antimoniuretted hydrogen or stibine, SbH_3, may be prepared by the action of hydrochloric acid on an alloy of antimony and zinc, by the action of nascent hydrogen on antimony compounds or by dropping water on to aluminium antimonide. As prepared by the first two methods it contains a relatively large amount of hydrogen, from which it can be freed by passing through a tube immersed in liquid air, when it condenses to a white solid. It is a poisonous colourless gas, with a characteristic offensive smell. In its general behaviour it resembles arsine, burning with a violet flame and being decomposed by heat into its constituent elements. With silver nitrate solution it gives a black precipitate of silver antimonide, $SbAg_3$; it is decomposed by the halogen elements and also by sulphuretted hydrogen.

Oxides and Acids. — There are three known oxides of antimony, the trioxide Sb_4O_6 which is capable of combining with both acids and bases to form salts, the tetroxide Sb_2O_4 and the acidic pentoxide Sb_2O_5. Antimony trioxide occurs as the minerals valentinite and senarmontite, and can be artificially prepared by burning antimony in air, by decomposing antimony trichloride with an aqueous solution of sodium carbonate, or by the action of dilute nitric acid on the metal. It is a white powder, almost insoluble in water, and when volatilized condenses in two crystalline forms, either octahedral or prismatic. It is insoluble in sulphuric and nitric acids, but is readily soluble in hydrochloric and tartaric acids and in solutions of the caustic alkalis. Antimony tetroxide, formed by strongly heating in air either the trioxide or pentoxide or by oxidizing the metal with nitric acid and afterwards igniting to redness, is a non-volatile white powder, insoluble in water and almost so in acids — concentrated hydrochloric acid dissolving a small quantity. It is decomposed by a hot solution of potassium bitartrate. Antimony pentoxide, a pale yellow powder, is obtained by repeatedly evaporating antimony with nitric acid and heating the resulting antimonic acid to a temperature not above 275° C. On being heated strongly it gives up oxygen and forms the tetroxide. It is insoluble in water, but dissolves slowly in hydrochloric acid. It possesses a feebly acidic character, giving metantimoniates when heated with alkaline carbonates.

Orthoantimonic acid, H_3SbO_4, obtained by the decomposition of its potassium salt with nitric acid (A. Geuther), or by the addition of water to the pentachloride, is a white powder almost insoluble in water and nitric acid, and when heated is first converted into metantimonic acid, $HSbO_3$, and then into the pentoxide Sb_2O_5. Pyroantimonic acid, $H_4Sb_2O_7$ (the metantimonic acid of E. Frémy), is obtained by decomposing antimony pentachloride with hot water, and drying the precipitate so obtained at 100° C. It is a white powder which is more soluble in water and acids than orthoantimonic acid. It forms two series of salts, of the types $M_2H_2Sb_2O_7$ and $M_4Sb_2O_7$. Metantimonic acid, $HSbO_3$, obtained by heating orthoantimonic acid to 175° C, is a white powder almost insoluble in water, but slowly hydrated into the ortho-acid.

Halogen Compounds. — Compounds of antimony with all the halogen elements are known, one atom of the metal combining with three or five atoms of the halogen, except in the case of bromine, where only the tribromide is known. The majority of these halide compounds are decomposed by water, with the formation of basic salts. Antimony trichloride ("Butter of Antimony"), $SbCl_3$, is obtained by burning the metal in chlorine, by distilling antimony with excess of mercuric chloride, or by fractional distillation of antimony tetroxide or trisulphide in hydrochloric acid. It is a colourless deliquescent solid of specific gravity 3·06; it melts at 73·2° C to a colourless oil; and boils at 223°. It is soluble in alcohol, and also in a small quantity of water; but with an excess of water it gives a precipitate of various oxychlorides, known as powder of algaroth (*q.v.*). The trichloride is used in the preparation of tartar emetic, as a bronzing solution for gun barrels and as a caustic in medicine. Antimony pentachloride, $SbCl_5$, prepared by heating the trichloride in a current of chlorine, is a nearly colourless fuming liquid of unpleasant smell, which can be solidified to a mass of crystals melting at −6° C. It dissociates into the trichloride and chlorine when heated. Antimony trifluoride, SbF_3, is obtained by dissolving the trioxide in aqueous hydrofluoric acid or by distilling antimony with mercuric fluoride. The double compound $SbF_3,(NH_4)_2SO_4$ known as "antimony salts" is used in dyeing. The pentafluoride SbF_5 results when metantimonic acid is dissolved in hydrofluoric acid and it forms an amorphous gummy mass, which is decomposed by heat. Tartar emetic, potassium antimonyl tartrate, $C_4H_4O_6(SbO)K\frac{1}{2}H_2O$, made from the trioxide and cream of tartar, is used medicinally and as a mordant in dyeing although for the latter purpose it is partly superseded by the double oxalate or lactate. On precipitating antimony trichloride or tartar emetic in acid solution with sulphuretted hydrogen, an orange-red precipitate of the hydrated trisulphide is obtained, which turns black on being heated to 200° C. The trisulphide heated in a current of hydrogen is reduced to the metallic state; it burns in air forming the tetroxide, and is soluble in concentrated hydrochloric acid, in solutions of the caustic alkalis, and in alkaline sulphides. By the union of antimony trisulphide with basic sulphides, livers of antimony are obtained. These thioantimonites are usually prepared by fusing their components together, and are dark powders which are less soluble in water the more antimony they contain. They are used in the vulcanizing of rubber and in the preparation of matches. The so-called golden sulphide consists mainly of Sb_2S_4 obtained together with sulphur by acidifying solutions of alkali thioantimonates. It is doubtful whether antimony pentasulphide, Sb_2S_5, prepared by precipitating a solution of the pentachloride with sulphuretted hydrogen, by decomposing "Schlippe's salt" (*q.v.*) with an acid, or by passing sulphuretted hydrogen into water containing antimonic acid, is a chemical entity or merely a mixture of tri- and tetra-sulphide with sulphur. It forms a fine dark orange powder insoluble in water, but readily soluble in aqueous solutions of the caustic alkalis and alkaline carbonates. This so-called pentasulphide is employed in the vulcanization of rubber.

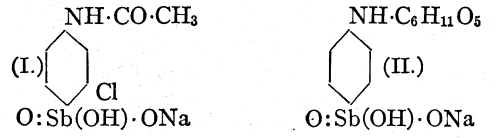
Organic Compounds. — Many organic compounds containing antimony are known. By distilling an alloy of antimony and sodium with methyl iodide, mixed with sand, trimethylstibine, $Sb(CH_3)_3$, is obtained; this combines with excess of methyl iodide to form tetramethylstibonium iodide, $Sb(CH_3)_4I$, which on treatment with moist silver oxide gives the corresponding tetramethylstibonium hydroxide, $Sb(CH_3)_4OH$, a strong base obtained in deliquescent crystals, of alkaline reaction, and absorbing carbon dioxide readily. The Grignard (*q.v.*) reaction has facilitated the production of organo-antimonials (H. Hibbert, 1906). Methyl magnesium iodide and antimony trichloride yield trimethylstibine which combines with bromine, forming trimethylstibine dibromide. On heating, this dibromide loses methyl bromide and gives rise to dimethylstibine bromide $(CH_3)_2SbBr$. This product absorbs bromine forming a tribromide

which undergoes demethylation on gentle heating so that it yields methylstibine dibromide. By this progressive demethylation derivatives of primary and secondary stibines have been obtained (G. T. Morgan and G. R. Davies, 1926). Corresponding antimony compounds containing the ethyl group are known, as is also a triphenylstibine, $Sb(C_6H_5)_3$, which is prepared from antimony trichloride, sodium and monochlorbenzene. See G. T. Morgan, Organic Compounds of Arsenic and Antimony (1918).

ANTIMONY IN MEDICINE

So far back as Basil Valentine and Paracelsus, antimonial preparations were in great vogue as medicinal agents, and came to be so much abused that a prohibition was placed upon their employment by the Paris parliament in 1566. Metallic antimony was utilized to make goblets in which wine was allowed to stand so as to acquire emetic properties, and "everlasting" pills of the metal, supposed to act by contact merely, or by slight solution, were administered and recovered for future use after they had fulfilled their purpose. Antimony compounds act as irritants both externally and internally. Tartar emetic acts directly on the wall of the stomach, producing vomiting, and continues this effect by its action on the medulla. It is a powerful cardiac depressant, diminishing both the force and frequency of the heart's beat. It depresses respiration, and in large doses lowers temperature. It depresses the nervous system, especially the spinal cord. It is excreted by all the secretions and excretions of the body. Thus as it passes out by the bronchial mucous membrane it increases the amount of secretion and so acts as an expectorant. On the skin its action is that of a diaphoretic, and being also excreted by the bile it acts slightly as a cholagogue. The medicinal uses of the older forms of antimony compounds may be summed up in the words diaphoretic, febrifuge, parasiticidal and emetic. Antimony trioxide or potassium antimonyl tartrate are employed for the first two purposes, whereas the synonym, tartar emetic, for the latter salt indicates that antimony compounds are of value in certain cases of poisoning.

It has long been known that antimony has medicinal properties similar to those of arsenic, and modern scientific developments in therapeutic chemistry have tended to produce antimonial substitutes of the phenylarsonic acid and arsenobenzol types in order to obtain remedies of greater utility. The antimony analogue of arsenobenzol has been made, but clinical experience has proved it to be of little value. Compounds of the nature of urea-stibamine (urea and *p*-aminophenylstibinic acid) have been used in kala-azar. Other analogous aromatic stibinates also employed intravenously are sodium metachloro-para-acetylaminophenyl-stibinate (I.), a drug of low toxicity and high parasitotropic value, and stibamine glucoside (II.) which, under the name of neostam, is a very efficacious remedy used extensively against kala-azar, especially in Assam.



Interesting results have attended the modern use of tartar emetic and the allied sodium antimony1 tartrate in bilharziasis, and the affection of a similar type known as schistosomiasis. The compound is given on the recommendation of J. B. Christopherson (1919) intravenously in these affections. The important point is that these drugs kill the ova in addition to the worm. These two compounds have been used successfully in various forms of Leishmania infection, such as kala-azar, oriental sore and American Leishmaniasis, together with many other tropical affections. These diseases have also been treated with promising results by injections of a glycerin solution of antimony trioxide.

Toxicology. — In acute poisoning by antimony the symptoms are almost identical with those of arsenical poisoning, which is much commoner (see ARSENIC). The post-mortem appearances are also very similar, but the gastro-intestinal irritation is much less marked and inflammation of the lungs is more commonly seen. If the patient is not already vomiting freely the treatment is to use the stomach-pump, or give sulphate of zinc (gr. 10–30) by the mouth or apomorphine (gr. $\frac{1}{20}$–$\frac{1}{10}$) subcutaneously. Frequent doses of a teaspoonful of tannin dissolved in water should be administered, together with strong tea and coffee and mucilaginous fluids. Stimulants may be given subcutaneously, and the patient should be placed in bed between warm blankets with hot-water bottles. Chronic poisoning by antimony is very rare, but resembles in essentials chronic poisoning by arsenic. For medicinal uses of antimony see W. H. Martindale and W. W. Westcott, The Extra Pharmacopoeia, 19th ed. vol. i. 1928.

PRODUCTION AND EXPLOITATION OF ANTIMONY

In 1929 China contributed 71% of the world's output of antimony, which was about 35,000 short tons. In 1929 North and South America contributed less than 20% of the world's output. In 1937 China supplied 43% and North and South America about 45%, chiefly from Mexico; which produced three times as much antimony in 1937 as in 1929. Prior to the World War the principal producers of antimony were Austria-Hungary, Asia Minor, Borneo, France, and since 1900, China. During the war belligerent governments bought large quantities of antimony for the manufacture of shrapnel, shells, and bullets, which require about 12% antimony in the antimonial lead. Antimony also serves as a retarding agent in priming caps. In peace time the chief uses of antimony include antimonial lead for storage batteries, and covering for telephone cables, and uses in alloys (v. supra). Antimony oxide finds extensive use in enamels and pigments; the sulphide is employed in rubber manufacture.

ANTINOMIANISM, an interpretation of the antithesis between law and gospel, recurrent from the earliest times (Gr. ἀντί against νόμος, law). Christians being released, in important particulars, from conformity to the Old Testament polity as a whole, a real difficulty attended the settlement of the limits and the immediate authority of the remainder, known vaguely as the moral law. Indications are not wanting that St. Paul's doctrine of justification by faith was, in his own day, mistaken or perverted in the interests of immoral licence. Gnostic sects approached the question in two ways. Marcionites, named by Clement of Alexandria *Antitactae* (revolters against the Demiurge) held the Old Testament economy to be tainted throughout by its source; but they are not accused of licentiousness. Manichaeans, again, holding their spiritual being to be unaffected by the action of matter, regarded carnal sins as being, at worst, forms of bodily disease. Kindred to this latter view was the position of sundry sects of fanatics during the Reformation period, who denied that regenerate persons sinned, even when committing acts in themselves gross and evil (see ANABAPTISTS).

During the Commonwealth period Antinomianism was found in England among the high Calvinists who maintained that an elect person, being predestined to salvation, is absolved from the moral law and is not called upon to repent. In less extreme forms, Antinomianism is a feature of those forms of Christianity which lay stress on justification by faith (see Fletcher's *Checks* to *Antinomianism*, 1771).

ANTINOMY, literaliy the mutual incompatibility, real or apparent, of two laws. The term acquired a special significance in the philosophy of Kant, who used it to describe the contradictory results of applying to the universe of pure thought the categories or criteria proper to the universe of sensible perception (phenomena). These antinomies are four — two mathematical, two dynamical — connected with (1) the limitation of the universe in respect of space and time, (2) the theory that the whole consists of indivisible atoms (whereas, in fact, none such exist), (3) the problem of freedom in relation to universal causality, (4) the existence of a universal being — about each of which pure reason contradicts the empirical, as thesis and antithesis. Kant claimed to solve these contradictions by saying that in no case is the contradiction real, however seriously it has been intended by the opposing partisans, or must appear to the mind without critical enlightenment. It is wrong, therefore, to impute to Kant, as is often done, the view that human reason is, on ultimate subjects, at war with itself, in the sense of being impelled by equally strong arguments towards alternatives contradictory of each other. The difficulty arises from a confusion between the spheres of phenomena and noumena. In fact no rational cosmology is possible.

ANTINOÜS, a beautiful youth of Claudiopolis in Bithynia was the favourite of the emperor Hadrian, whom he accompanied on his journeys. He committed suicide by drowning himself in the Nile (A.D. 130). After his death Hadrian caused the most extravagant respect to be paid to his memory. He was raised to the rank of the gods; temples were built for his worship in Bithynia, Mantinea in Arcadia and Athens; festivals celebrated in his honour, and oracles delivered in his name. The city of Antinoopolis was founded on the ruins of Besa, where he died (Dio Cassius lix. 11; Spartianus, Hadrian). A number of statues, busts, gems, and coins represented Antinoiis as the ideal type of youthful beauty, often with the attributes of some special god. A colossal bust is in the Vatican; a bust in the Louvre, a bas relief from the Villa Albani, a statue in the Capitoline museum, another in Berlin, another in the Lateran, and many more exist.

ANTIOCH (Mod. *Antākiyah*), the name of many ancient cities, the most famous of which was Ἀντιόχεια ἡ ἐπὶ Δάφνῃ (Pliny, Antiochia Epidaphnes) situated on the left bank of the Orontes about 20m. from the sea in a fertile plain which separates the Lebanon ranges from the spurs of the Taurus. The physical disposition of the surrounding country which forced the main streams of north- and south-bound traffic into one channel in the Orontes valley, thereby determined that a city hereabouts would be in a favourable position to sift the trade of Asia Minor and the Upper Euphrates, of Egypt and Palestine.

History. — Antigonus was the first to recognize the strategic importance of the neighbourhood. He began to build a city, Antigonia, a few miles farther north on the Kara-su (307 B.C.). On his defeat and death at Ipsus at the hands of his rival Seleucus Nicator (301), the latter after selecting a site with military advantages under Mons Silpius founded Antioch and made use of Antigonia as quarry for his building. To the original city laid out in imitation of the plan of Alexandria with two great colonnaded streets intersecting in the centre, other walled quarters were added on the east side by Antiochus I., on the north on an island by Seleucus II. and Antiochus III. Finally Antiochus IV. (Epiphanes) added a fourth quarter, thus giving rise to the name Tetrapolis. Happy in its situation Antioch flourished exceedingly, developed into a mighty centre of trade and by the 4th century A.D. had a population of nearly a quarter of a million. To the west about 4m. off was Daphne (mod. *Beit* el-Mi'), a delightful pleasure resort of shady groves and running waters in the midst of which rose a great temple to the Pythian Apollo founded by Seleucus I. The precincts of Daphne were endowed with the right of asylum and it became the haunt of society's outcasts (Tacitus, *Ann.* 360). Its beauty and lax morals (*Daphnici* Mores) passed into a proverb in the western world and Antioch shared the fame and the infamy.

Under Antiochus I. (280–261 B.C.) Antioch became the capital of the western section of the Seleucid empire and soon after the residence also of the Seleucid emperors. It enjoyed a great reputation for letters and the arts (Cicero, pro Arch. 3) but there seems to have been little real intellectual life. The Antiochenes were turbulent, fickle and notoriously dissolute. They rose against Alexander Balas in 147 B.C. and Demetrius II. in 129. In 83 B.C. they turned against the weak Seleucids and opened the gates to Tigranes of Armenia. They tried to depose Antiochus XIII. (65 B.C.) and petitioned Rome successfully against his restoration. With Syria it passed to Rome (64 B.C.) but remained a civitas *libera.* Antioch was magnificent as its epithet "Golden" implies, but earthquakes to which the district has been peculiarly liable played havoc with its magnificence from time to time. The first recorded occurred in 148 B.C., doing immense damage, and as recently as 1872 a violent shock destroyed a large part of the old walls.

Although the Romans expressed freely their contempt for the Antiochenes, their emperors favoured the city as a worthy capital for their eastern empire. Caesar visited it in 47 B.C. and confirmed its freedom. Octavian, Tiberius, Trajan, Antoninus Pius and Hadrian adorned and equipped it with temple, theatre, colonnade, circus, bath, aqueduct, all the architectural features and embellishments of a Roman metropolis. Diocletian built a vast palace on the island and Constantine a fine church. At Antioch Germanicus died (A.D. 19) and his body was buried in the forum. Titus set up the Cherubim taken from the Jerusalem Temple, over one of its gates. Cornmodus had Olympic games celebrated here. In A.D. 266 the town was suddenly raided by the Persians who slew many in the theatre. In 387 it lost its metropolitan status owing to the revolt against a new tax levied by Theodosius. Zeno restored many of its public buildings and renamed it *Theopolis* only to see it ruined by an earthquake soon afterwards (526). And Chosroes completed the destruction (538).

Rise **sf Christianity.**—Antioch was an early home of Christianity and its Church became in a special sense the mother of the Gentile churches. After the fall of Jerusalem it became the real metropolis of Christianity. It was the scene of the early evangelizing work of Paul and Barnabas and the home church whence they set forth on their missionary journeys and to which they returned to report results. Peter visited Antioch (Gal. ii. 11) and, basing its claim on a tradition that he remained there for a time as head of its Church, Antioch was accorded by the Council of Nicaea the place of honour after Alexandria and Rome. It was at Antioch that the term "Christian" was first given to converts to the new faith (Acts xi. 26), as some maintain, in derision. So well was Christianity received there that by the end of the 4th century, its adherents were reckoned by Chrysostom at about 100,000. In 50 years (A.D. 252–300) as many as ten assemblies of the Church were held in Antioch. The favour shown by Julian to Jewish and pagan rites provoked the populace and the closing of its great church of Constantine led to the burning down of the temple of Apollo at Daphne. Antiochene lampoons against Julian were countered by him in his satiric apologia, still extant, called *Misopogon* (c. A.D. 362). The church was reopened by his successor, Valens, but shared the fate of the city when the Sassanid Chosroes I. destroyed it (538) and carried off part of the inhabitants to New Antioch in Assyria. The hermit Simeon Stylites lived on his pillar in the district (40m. E.) at the beginning of the 5th century and his body was brought to Antioch for burial. The Arabs took the city in 638 when they overran Syria, but Damascus made a greater appeal to them as a capital city, and as Damascus advanced Antioch declined. It passed into the possession of the Crusaders in 1098 after a bitter siege of nine months the end of which was hastened by an earthquake and betrayal. Assigned to Bohemund, prince of Tarentum, it remained the capital of a

Latin principality for nearly two centuries. In 1517 it passed into Turkish hands. It fell before the onslaught of the troops of Mohammed 'Ali of Egypt on their march towards Constantinople (1840), but was restored to Turkish possession soon after. In October 1918 it was occupied by the Egyptian Expeditionary Force, in 1920 by France under the League mandate. In 1939, with the Hatay, it was ceded to Turkey.

Dogma.—Several heresies had their origin in Antioch. One of its bishops, Paul (of Samosata) advocated (*c.* 260) a form of Rlonarchianism maintaining that Christ was a mere man but so endowed as to rise gradually to divine dignity. Arius was here a pupil of Lucian the presbyter, text-critic and martyr (d. 311) and Nestorius was a monk of Antioch. Antioch in time gave its name to a school of Christian thought the chief representatives of which were the bishops Diodorus (Tarsus, d. 394), John Chrysostom (Constantinople, d. 407), Theodore (Mopsuestia, d. 429) and Theodore (Cyrrhus, d. 457). It was anti-mystic in trend. It stressed the human element, making it rather than the divine the starting point of its enquiry, focussed attention on the historical Christ, and advocated direct and immediate interpretation of Scripture. It saw in the Incarnation the accomplishment of man's destiny rather than a means to deliver him from the consequences of sin.

Synods.—More than 30 synods were held at Antioch in ancient times, the first three of which (264–269) discussed the errors of Paul of Samosata and condemned him, but only with the eclipse of his patroness Zenobia of Palmyra (272) could the decree of expulsion be made effective. The most celebrated synod was that of 341 at which about roo bishops were present. It passed 25 canons and promulgated three creeds in an endeavour to displace the Nicene. Power was vested mainly in the metropolitan (archbishop) and in synods to be held twice a year (5th Canon of Nicaea). The relations between dioceses were regulated; bishops were enjoined to exercise strict guardianship over Church property and were forbidden to name their successors. These canons, formed an elementary ecclesiastical law for both east and west, and likewise formed part of the *Codex Canonum* used by the Council of Chalcedon (451). They were twenty-five in number and their authenticity, previously much disputed, was substantially proved by Hefele. One of the most interesting of their provisions was that which in increasing the powers of the metropolitan deprived the country bishops (*chorefiscopi*) of direct recourse to the emperor. The synod is commonly called *in encaeniis* (Cv *ἐγκαινίοις*) or in *dedicatione,* its occasion being the dedication of the Basilica.

Modern.—Pop. (1935) 28,000 (4,000 Christians) with language mainly Turkish; from 1919 to 1939 in Syria, the town was ceded in 1939 with Alexandretta to Turkey. The position it once occupied as the chief city of north Syria has passed to Aleppo.

The valley of the Orontes is growing in wealth and productiveness with the draining of the central lake. The cultures include tobacco, maize and cotton. There is a large olive grove and the mulberry tree is cultivated for the silk industry. There are several soap factories where the oils of the *ghār* (bay) and the olive are mixed to produce a perfumed and highly esteemed soap. Other manufactures are shoes and knives, and exports include hides and liquorice.

The Americans have a mission school and there is a British vice-consul.

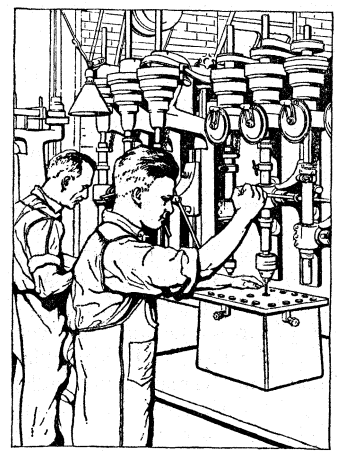
ANTIOCH COLLEGE, an institution of higher education at Yellow Springs (O.). The college is governed by a board of 20 trustees, the president of the college being *ex officio* president of the board, and was opened in 1853, Horace Mann being its first president. As reorganized in 1921, by Arthur E. Morgan then president, Antioch entered upon a distinctive career that has attracted widespread attention both on the part of the general public and of educators. The enrolment is limited to about joo The course for undergraduates commonly requires five or six years, and leads to the B S. or B.A. degree.

In choosing students, consideration is given to reports on required physical examinations. secondary school records, intelligence tests, life sketches by the applicants, and reports of references The traditional dominant purpose of the American college is the '[stimulation and development of those gifts of intellect with which nature has endowed the student." Antioch has endeavoured to restate the proper purpose of the college. According to its philosophy, that purpose is nothing less than the integration of life and its symmetrical development.



BY COURTESY OF ANTIOCH COLLEGE

STUDENTS AT ANTIOCH COLLEGE SECURING PRACTICAL EXPERIENCE IN A LOCAL MACHINE SHOP

In America the college and university, including the technical school, are becoming recognized as providing the chief and almost the only ordered means for preparing intelligent young people for life. Students should be concerned, not with scholarship or technical skill alone, but with learning what life means and how to make the most of it. Antioch holds that there is no single faculty, not even intelligence, which is the chief element of human excellence, or which chiefly needs systematic development.

The work of the college falls under four main heads; required physical education, a required liberal curriculum, technical or professional training, and part-time practical economic work. The required courses include two years of English and literature; four years of history, economics, and government; one year each of mathematics, chemistry, physics, biology, earth science (a combination of physiography, geology, and astronomy); psychology; and a study of scientific method. A year of philosophy is required; and a year of "applied aesthetics."

In the autumn of 1928, Antioch adopted a system of "autonomous study," for all students above the sophomore year. Under the new plan upperclass students are not required to attend classes. The work for an entire term is outlined and the student then is left to master the subject in his own way, coming to the instructor only for necessary help, for discussion, and for inspiration.

To develop traits not easily reached by class-room work, such as initiative, self-reliance, responsibility, courage, and adaptability, and to help practical adjustment to life, both men and women students spend half their time at college and half in practical economic occupations, in alternate five-week shifts. Each working position is continuously filled, one student working while his or her alternate studies. These "co-operative" students work over a radius of 1,000m., with zoo employers, in a wide variety of callings; the positions being chosen because of their educational value to the particular students. Self-support is incidental, but the students, to a large degree, themselves meet college expenses.

(A. E. M.)

ANTIOCH IN PISIDIA, an ancient city, the remains of which lie close to the modern Yalovach, in the vilayet of Hamidabad in Turkey. It was situated on the lower southern slopes of the Sultan Dagh, on the right bank of a stream, the ancient

Anthius, which flows into the Hoiran Geul. It was founded on the territory of a Phrygian sanctuary, by Seleucus Nicator, before 280 B.C. and was made a free city by the Romans in 189 B.C. It was a thoroughly Hellenized, Greek-speaking city, in the midst of a Phrygian people, with a mixed population that included many Jews. Before 11 B.C. Augustus made it a colony, with the title Caesarea, and it became the centre of civil and military administration in south Galatia, the romanization of which was progressing rapidly in the time of Claudius, A.D. 41–54, when Paul visited it (Acts xiii. 14, xiv. 21, xvi. 6, xviii. 23). In 1097 the Crusaders found rest and shelter within its walls. The ruins are interesting, and show that Antioch was a strongly fortified city of Hellenic and Roman type. There are many inscriptions in Greek and Latin, including fragments of a Latin copy of the Res Gestae of Augustus.

ANTIOCHUS, the name of 13 kings of the Seleucid dynasty in nearer Asia. ANTIOCHUS I. SOTER (281–262 B.C.) was the son of Seleucus, a general of Alexander the Great and founder of the dynasty Upon his father's assassination (281 B.C.) he succeeded to the difficult task of holding the Seleucid empire together He turned back an invasion of Gauls from the north, fought the Ptolemies of Egypt over the possession of Palestine. and endeavoured to check the growing power of Pergamum. His son, ANTIOCHUS II. THEOS (262–247 B.C.), made peace with Egypt by his marriage with the daughter of Ptolemy Philadelphus, but was tyrannical and unpopular with his people. Antiochus III., surnamed The Great (223–187 B.C.), and most famous of the line, was a nephew of Antiochus Theos. By wars in the East, in Asia Minor, and against Egypt he extended the Seleucid empire almost to its original bounds. In an invasion of Greece he was, however, disastrously defeated by the Romans at the Pass of Thermopylae and forced to retire into Asia Minor. The Roman army under command of the brothers Scipio crossed the Hellespont and again defeated him at Magnesia, destroying his army. The defeat stripped Antiochus of all his former conquests in Asia Minor. ANTIOCHUS IV, EPIPHANES (176–164 B.C.), defeated Egypt's attempt to reconquer Palestine and invaded and occupied Egypt until later driven out by the Romans. He is also known for his attempt to suppress Judaism by force, his persecutions resulting in the Maccabaean rebellion. Antiochus VII. Sidetes (138–129 B.C.) was the last strong ruler of the dynasty. He conquered Jerusalem and died fighting the Parthians.

The name was also borne by the kings of Commagene (69 B.C.–A.D. 72), whose house was affiliated to the Seleucid ANTIOCHUS I. of Commagene, who without sufficient reason has been identified with the Seleucid Antiochus XIII. Asiaticus, made peace on advantageous terms with Pompey in 64 B.C. Subsequently he fought on Pompey's side in the Civil War, and later still repelled an attack on Samosata by Marcus Antonius (Mark Antony). He died before 31 B.C. and was succeeded by one Mithridates I. This Mithridates was succeeded by an ANTIOCHUS II., who was executed by Augustus in 29 B.C. After anotlier Mithridates we know of an ANTIOCHUS III., on whose death in A.D. 17 Commagene became a Roman province. In 38 his son ANTIOCHUS IV. EPIPHANES was made king by Caligula, who deposed him almost immediately. Restored by Claudius in 41, he reigned until 72 as an ally of Rome against Parthia. In that year he was deposed on suspicion of treason and retired to Rome. Several of his coins are extant.

On all the above *see* "Antiochos" in Pauly-Wissowa's *Realencyklopadie der classischen Altertumswissenschaft,* i. part ii. **(1894).**

ANTIOCHUS OF ASCALON (1st century, B.C.), Greek philosopher who attempted to reconcile the doctrines of his teachers Philo of Larissa and Mnesarchus the Stoic. Against the scepticism of Philo, he held that the intellect has in itself a sufficient test of truth; against Mnesarchus, that happiness, though its main factor is virtue, depends also on outward circumstances. This electicism is known as the Fifth Academy (see ACADEMY, GREEK). His writings are lost, and we owe our information to Cicero (Acad *Pr.,* ii. 43), and Sextus Empiricus (Pyrrh. *hyp.,* i. 235). Antiochus lectured also in Rome and Alexandria.

See R. Hoyer, *De Antiocho Ascalonita* (Bonn, **1883).**

ANTIOCHUS OF SYRACUSE, Greek historian, flourished about 420 B.C. He wrote a History of Sicily from the earliest times to 424, which was used by Thucydides, and the Colonizing of Italy, frequently referred to by Strabo and Dionysius of Halicarnassus.

See Miiller, *Fragmenta Historicorum Graecorum,* i.; Wolfflin, *Antiochos von Syrakus* **(1872).**

ANTIOPE. (1) In Greek legend, the mother by Zeus of Amphion and Zethus. Her beauty attracted Zeus, who, assuming the form of a satyr, took her by force. She ran away from her father and married Epopeus, king of Sicyon. Thereupon her father killed himself, first bidding his brother Lycus punish her. Lycus (who in some accounts was her former husband) killed Epopeus, brought Antiope back, and imprisoned and tormented her (or his wife Dirce did so, out of jealousy). On the way back, or after escaping from prison, she bore twins, Amphion and Zethus, who were brought up by herdsmen. Long after, she escaped and joined her sons; they recognized her, killed Lycus, and bound Dirce to the horns of a wild bull. For this, Dionysus, to whose worship Dirce had been devoted, visited Antiope with madness, which caused her to wander restlessly all over Greece till she was cured and married by Phocus of Tithorea, on Mt. Parnassus, where both were buried in one grave (Ovid *Metam.* VI, III.; Apollodorus III., 42–44; Hyginus, Fab.; 7, 8; Pausanias, IX. 17, 6).

(2) Daughter of Ares, sister of Hippolyte, queen of the Amazons, the wife of Theseus (*q.v.*).

ANTIOQUIA, an interior department of the republic of Colombia, lying south of Bolivar, west of the Magdalena river, and east of Cauca. Area. 25,409 sq mi.; pop. (census 1896) 648,190, (census 1938) 1,188,587. The greater part of its territory lies between the Magdalena and Cauca rivers and includes the northern end of the central Cordillera. The country is covered with valuable forests, and its mineral wealth renders it one of the most important mining regions of the republic. The capital, Medellin—with population (census 1902) 53,000, (1938) 143,952—is a thriving mining, commercial and manufacturing centre, 4.822 ft. above sea level, and 125 mi. from Puerto Berrio on the Magdalena. Other important towns are Antioquia, the old capital, on the Cauca; and Puerto Berrio on the Magdalena, connected by a railway with the capital.

ANTIPAROS (anc Oliaros), a Greek island in the modern eparchy of Naxos, separated by a narrow strait from the west coast of Paros; 7 mi. long by 3 mi. broad. Pop. 612, mostly in Kastro, on the north coast, employed in agriculture and fishing. Formerly piracy was common. The only remarkable feature in the island is a stalactite cavern on the south coast, reached by a dangerous descent with the aid of rope-ladders; the grotto is about 150 ft. by 100, and 50 ft. high.

See J. P. de Tournefort, *Relation d'un voyage* au *Levant* (1717); Engl. ed., **1718,** vol. i. **p. 146.**

ANTIPAS: see ANTIPATCR.

ANTIPATER (398?–319 B.C.), Macedonian general, and regent of Macedonia during Alexander's Eastern expedition (334–323). He had previously (346) been sent by Philip as ambassador to Athens and negotiated peace after the battle of Chaeroneia (338). About 332, while he was dealing with a rebellion in Thrace, the Spartan king Agis (*q.v.*) rose against Macedonia. Having settled affairs in Thrace as well as he could, Antipater hastened south and, near Megalopolis (331), gained a complete victory over the insurgents (Diodorus xvii. 62). His regency was troubled by the ambition of Olympias, mother of Alexander, and he was nominally superseded by Craterus. But on the death of Alexander, in 323, he was, by the first partition of the empire, left in command of Macedonia, and in the Lamian War at the battle of Crannon (322) crushed the Greeks, who had attempted to re-assert their independence. Later in the same year, hearing that Perdiccas contemplated making himself sole master of the empire, Antipater and Craterus prepared for war against him and allied themselves with Ptolemy, the governor of Egypt. Antipater crossed to Asia in 321, and while still in Syria he heard that Perdiccas had been

murdered by his own soldiers. Craterus fell in battle against Eumenes (Diodorus xviii. 25–39). Antipater, then sole regent, having quelled a mutiny of his troops and commissioned Antigonus to continue the war against Eumenes, returned to Macedonia, where he arrived in 320 (Justin xiii. 6). In 319 he fell ill and, passing over his son Cassander, appointed the aged Polyperchon regent, a measure which gave rise to much confusion and ill-feeling (Diodorus xvii., xviii.).

See *Cambridge Ancient History* vol. vi., chaps. xiv. and xv., with bibliographies there given.

ANTIPATHY is a permanent emotional attitude of dislike and aversion felt toward both people and things, an attitude usually originating in some sort of conflict, real or imagined, between the person feeling the antipathy and the object toward which the antipathy is felt. If one person has been compelled to comply with another, against his will, he is apt to feel a lasting antipathy toward his victorious antagonist. In many cases people forget the names or titles of persons toward whom they feel antipathy, not realizing that such lapses of memory are merely expressions of their secret aversions. Some people experience very unpleasant antipathies upon sight of mice, spiders, snakes or insects such as cockroaches; or when the tips of the fingers are rubbed over cotton, or when cloth is placed in the mouth. These antipathies may possibly originate in childhood. (W. M. M.)

ANTIPHANES (*c.* 408–334 B.C.), the most important writer of the Middle Attic Comedy with the exception of Alexis. He was apparently a foreigner who settled in Athens, where he began to write about 387. More than 200 of the 365 (or 260) comedies attributed to him are known to us from the titles and considerable fragments preserved in Athenaeus.

BIBLIOGRAPHY.—Fragments in Koch, *Comicorum Atticorum Fragmenta* (1884) ii.; *see* also Clinton, *Phzlological Museum* (1832) i.; Meineke, *Historia Critica Comicorum Graecorum* (1839).

ANTIPHILUS, a Greek painter, of the age of Alexander. He worked for Philip of Macedon and Ptolemy I. of Egypt. The descriptions of his works extant show that he excelled in light and shade, in *genre* representations and in caricature.

See Brunn, *Geschichte der grieclzischen Kunstler,* ii. p. 249.

ANTIPHON, of Rhamnus in Attica, the earliest of the "ten" Attic orators, was born in 480 B.C. He was largely responsible for the establishment of the Four Hundred in 411 *(see* THERAMENES); on the restoration of the, democracy he was accused of treason and condemned to death (Thuc. viii. 68). He was a professional speech-writer for other litigants, and never addressed the people himself except when he defended his policy at his trial. Fifteen of his speeches are extant: twelve are school exercises, divided into tetralogies, each consisting of two speeches for prosecution and two for defence; three refer to actual legal processes. All deal with cases of homicide (φονικαὶ δίκαι). Antiphon is also said to have composed a Τέχνη or art of Rhetoric.

See edition, with commentary, by Maetzner (1838); text by Blass (1881); Jebb, *Attzc Orators;* Plutarch, *Vitae X. Oratorum;* Philostratus, *Vit. Sophistarum,* i. 15; van Cleef, *Index Antiphonteus,* Ithaca, N.Y. (1895); P. Hamberger in *Die nednerische Disposition in der alten* Τέχνη ῥητορική (Paderborn, 1914)—deals with Antiphon's style. *See* also RHETORIC.

ANTIPHONY, a species of psalmody in which the choir or congregation, being divided into two parts, sing alternately in a manner suggested by the derivation of the word (Gr. ἀντὶ, and φωνή, a voice). The peculiar structure of the Hebrew psalms renders it probable that the antiphonal method originated in the service of the ancient Jewish Church. According to the historian Socrates, its introduction into Christian worship was due to Ignatius (d. A.D. 11j) who in a vision had seen the angels singing in alternate choirs. In the Latin Church it was not practised until more than two centuries later, when it was introduced by Ambrose, bishop of Milan. The antiphonary still in use in the Roman Catholic Church was compiled by Gregory the Great (A.D. 590).

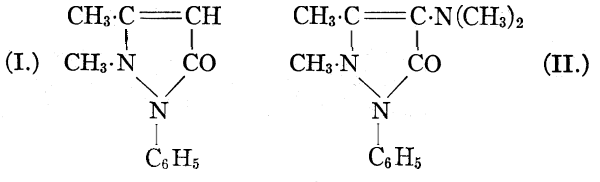
ANTIPODES, a term applied strictly to any two people or places on opposite sides of the earth, so situated that a line drawn from the one to the other passes throuqh the centre of the globe and forms a globe diameter. (Gr ἀντὶ, opposed to, and πόδες, feet.) Any two places having this relation—as London and, approximately, Antipodes Island, near New Zealand—must be distant from each other by 180° of longitude, and the one must be as many degrees to the north of the equator as the other is to the south, in other words, the latitudes are numerically equal, but one is north and the other south. At the antipodes the seasons and day and night are rexerscd but in calculation of days and nights, midnight on the one side may be regarded as corresponding to noon either of the previous or the following day.

ANTIPOLO, a municipality in the highlands of the province of Rizal, in Luzon, in the Philippine Islands, about 20 mi. from Manila. Pop. (1939), 6,135, of whom 3,113 were males; there were 3 whites. It is in the midst of a rich agricultural district which supplies various medicinal waters. In the Roman Catholic church is housed the image of the celebrated "Virgin of Antipolo" whose annual fiesta attracts large crowds. A small meteorological station is also there. There were 3,542 parcels of land declared for taxation in 1938, with 2,123 owners; the assessed valuation of agricultural lands was 465,100 pesos. There were also 6,366 hectares of nonagricultural lands, of which 2,255 were pasture lands and 4045 forest and uncultivated. (C. S. L.)

ANTIPYRETICS are agents used to reduce the temperature in fever. They may be classified under two headings, namely, chemical and physical. Cntil about 1885 the chief chemical antipyretic was quinine, which was used most successfully in malaria. Soon after that numerous other drugs were introduced and it is mainly to them that the name of antipyretics is applied. Of them antipyrin, acetanilid and phenacetin have survived longest and even they are now looked upon with some suspicion because their use is so often accompanied by ill effects. Their action seems to be a specific effect on the heat regulating centre, situated somewhere in the brain. Through it they are thought to decrease the production of heat in the body and thereby lower temperature. Salicylates, such as aspirin, have a much more favourable and comparatively safe antipyretic action in fever. They cause dilatation of the peripheral blood vessels and sweating, and consequently a more rapid loss of heat from the body. The physical means of controlling unduly elevated temperature would seem the more satisfactory. They are cold baths, ice packs, alcohol sponges, and similar measures The danger is slight and the results, although often only temporary, are sometimes quite striking.

ANTIPYRINE, a colourless and slightly bitter alkaloidal substance derived from coal tar, used in medicine as an antipyretic and analgesic, called also phenazonum and analgesine. It melts at 113° C. is soluble in 1·3 parts of water and dissolves even more readily in alcohol. It reduces the temperature of fevers and pyrexia of pneumonia, pleurisy and phthisis It relieves locomotor ataxy, facial neuralgia and rheumatism. Administered hypodermically it is beneficial in lumbago, sciatica and angina pectoris. A skin rash has been observed after its use, poisonous effects have been noticed with injudicious usage, and it has even been employed homicidally. The safe dose is ·03 grams (5 grains). In aqueous solution it has a mild anaesthetic action when painted on the mucous membrane.

Antipyrine was first prepared (1884) by L. Knorr. In studying the condensation of aceto-acetic ester (*q.v.*) with phenylhydrazine, this investigator obtained phenylmethylpyrazolone, a substance which has since proved useful as an intermediate for certain azo-dyes *(see* DYES, SYNTHETIC). Methylation of this pyrazolone derivative led to phenyld methyl*iso*pyrazolone (I. antipyrine).



The success attending the use of antipyrine in therapeutics led to many researches in the pyrazolone series, and out of these the most important drug obtained was *Pyramidon* or *Dimethylaminoantipyrine* (formula II.) which had similar uses to antipyrine but was efficacious in smaller doses and of special effect in sciatica. In its preparation, antipyrine was converted into the green nitroso-

antipyrine by the action of nitrous acid. Reduction with zinc dust and acetic acid led to aminoantipyrine (yellow needles, m.p. 109° C) which was methylated with methyl iodide in methyl-alcoholic potash. Pyramidon is a white powder melting at 108°, soluble in nine parts of water. Both antipyrine and pyramidon are used in combination with other drugs. Salipyrine (antipyrine salicylicum) is antipyrine salicylate, employed in acute rheumatic fever, sciatica and chronic rheumatism. Acetopyrine (antipyrine acetosalicylate), an analgesic and antipyretic, is used in sciatica, influenza, etc. Amidopyrine acetosalicylate and veramon (amido-antipyrine diethylbarbiturate) are salts of pyramidon with aspirin and veronal respectively, used in headache and neuralgia.

(*G.* T. M.)

ANTIQUARY, a person who devotes himself to the study of ancient learning and "antiques"; *i.e.,* ancient objects of art or science. In 1572 a society was founded by Bishop Matthew Parker, Sir Robert Cotton, William Camden, and others for the preservation of national antiquities, and existed till 1604, when it was abolished by James I. on account of its alleged political character. Papers read at its meetings are preserved in the Cottonian library and were printed by Thomas Hearne in 1720 under the title *A Collection of Curious Discourses, a* second edition appearing in 1771. In 1707 a number of English antiquaries began to hold regular meetings for the discussion of their hobby and in 1717 the Society of Antiquaries was formally reconstituted, finally receiving a charter from George II. in 1751. Its headquarters are now at Burlington House, Piccadilly.

The Society of Antiquaries of Scotland was founded in 1780. and manages a large national antiquarian museum in Edinburgh. In Ireland a society was founded in 1849 called the Kilkenny Archaeological Society, holding its meetings at Kilkenny. In 1869 its name was changed to the Royal Historical and Archaeological Association of Ireland, and in 1890 to the Royal Society of Antiquaries of Ireland, its office being transferred to Dublin. In France *La Société Nationale des Antiquaires de France* was formed in 1814 by the reconstruction of the *Académie Celtique,* which had existed since 1805. The American Antiquarian Society mas founded in 1812, with its headquarters at Worcester, Massachusetts. It has a library of upwards of 100,000 volumes and its transactions have been published half-yearly since 1849. In Germany the *Gesamtverein der Deutschen Geschichts- und Altertumsvereine* was founded in 1852. La *Société Royale des Antiquaires du Nord* at Copenhagen is widely known.

ANTIQUE, belonging to former times, venerable. The term is applied to the remains of ancient art, such as sculptures, gems, etc., principally to those of Greek or Roman origin; to furniture of an early period, and to anything out of date or old-fashioned.

ANTIRRHINUM: *see* SNAPDRAGON.

ANTI-SALOON LEAGUE, an American temperance organization founded on May 24, 1893, at Oberlin, O. The forerunner of the Anti-Saloon League was the Oberlin Temperance Alliance founded at Oberlin on March 20, 1874. The Metcalf law of 1882, granting local option to all Ohio college towns, and the Beatty Township Local-option law of 1888, gave impetus to the meeting held in the Spear library, Oberlin, on May 24, 1893, which resulted in the formation of the Ohio Anti-Saloon League. The next important step in the temperance movement was the founding of the Anti-Saloon League of the District of Columbia, on June 22, 1893, followed on December 18, 1895, by the National Anti-Saloon League—later called the Anti-Saloon League of America—in the Sunday school section of Calvary Baptist Church, U'ashington. Its basic organization was the same as that of the Ohio Anti-Saloon League. Subsequently all the states were organized into leagues, on the same plan as, but subordinate to, the National League.

The Anti-Saloon League of America is non-partisan and interdenominational in character. The League is pledged to maintain an attitude of strict neutrality on all questions of public policy not directly and immediately concerned with the traffic in strong drink "The object of this League is the extermination of the beverage liquor traffic, for the accomplishing of which the alliance of all who are in harmony with this object is invited." The program of the Anti-Saloon League has always been "agitation (including education), legislation and law enforcement." The departments of the League are executive or administrative, legal legislative, publicity, together with a new department of education, publicity and research established January 1, 1928. These departments are located at Westerville, 0 , and Washington, D.C. In legislation its policy has been to secure progressive legislation against the liquor traffic backed by a sound public sentiment. Shortly after its organization a vigorous campaign was launched for municipal local option, and this was paralleled by a continuous drive for complete national prohibition. The latter goal was nominally attained by the adoption of the 18th Amendment to the United States Constitution. During the Prohibition Era the society sought to make the restrictive laws more effective, and through its legal department defended them against attack in all tribunals including the Federal Supreme Court. But the repeal of the Amendment in 1933 threw the League, as it were, on the defensive, obliging it to put all its strength into an endeavour to check the extension of legalized liquor traffic where it was still forbidden, and to secure the inclusion of the local option clause at least in laws which might be passed for regulating the sale of intoxicants.

ANTI-SEMITISM, a religious, political, and social agitation against the Jews, which played a conspicuous part in the political struggles of the concluding quarter of the 19th century and which' manifested itself again in Germany after the advent of Hitler in 1933. The Jews contend that anti-semitism is a mere atavistic revival of the Jew-hatred of the middle ages. The extreme section of the anti-semites declare that it is a racial struggle, and that the anti-semites are engaged in an effort to prevent what is called the Aryan race from being subjugated by a Semitic immigration. There is no essential foundation for either of these contentions. Religious prejudices reaching back to the dawn of history have been reawakened by the allti-semitic agitation, but they did not originate it, and they have not entirely controlled it. The alleged racial divergence is, too, only a linguistic hypothesis on the physical evidence of which anthropologists are not agreed (Topinard, *Anthropologie,* p. 444; Taylor, *Origins* of *Aryans,* cap. i.). Moreover, the Jews have been Europeans for over 1,000 years, during which their character has been in some respects transformed.

The movement took its rise in Germany and Austria, very largely as a consequence of the widespread ruin brought about by the financial crisis of 1873. In that year an obscure Hamburg journalist, Wilhelm Marr, published a sensational pamphlet entitled *Der Sieg des Judenthums über das Germanenthum* ("The Victory of Judaism over Germanism"). The book fell upon fruitful soil. It applied to the ancient prejudices a theory of nationality which, under the great sponsorship of Hegel, had seized on the minds of the German youth, and to which the stirring events of 1870 had already given a deep practical significance. It also supplied the sufferers from the *Krach* with a welcome scapegoat. It was, however, in the passions of party politics that the new crusade found its chief sources of vitality. The enemies of the *bourgeoisie* at once saw that the movement was calculated to discredit and weaken the school of Manchester Liberalism, then in the ascendant. Agrarian capitalism seized the opportunity of paying off old scores. The clericals, smarting under the *Kulturkampf,* which was supported by the whole body of Jewish liberalism, joined eagerly in the new cry. The agitation gradually swelled, its growth being helped by the sensitiveness of the Jews themselves, who contributed much to newspaper publicity.

Towards the end of 1879 it spread with sudden fury over the whole of Germany. The secret springs of the new agitation were more or less directly supplied by Prince Bismarck, who, after his desertion by the national liberals under the leadership of the Jew, Lasker, began to recognize in anti-semitism a means of "dishing" the liberals. Marr's pamphlet was reprinted, and within a few months ran through nine further editions. The historian Treitschke gave the sanction of his great name to the movement. The conservative and ultramontane press rang with the sins of the Jews, and in October an anti-semitic league was founded in Berlin and Dresden.

The leadership of the agitation was now definitely assumed by a man who combined with social influence, oratorical power, and inexhaustible energy a definite scheme of social regeneration and an organization for carrying it out. This man was Adolf Stocker, one of the court preachers. He had embraced the doctrines of Christian socialism, and he had formed a society called "The Christian Social Working-man's Union." He was also a conspicuous member of the Prussian diet, where he sat and voted with the conservatives. Under his auspices the years 1880–81 became a period of bitter and scandalous conflict with the Jews. The conservatives supported him, partly to satisfy their old grudges against the liberal *bourgeoisie* and partly because Christian socialism, with its anti-semitic appeal to ignorant prejudice, was likely to weaken the hold of the social democrats on the lower classes. The Lutheran clergy followed suit, in order to prevent the Roman Catholics from obtaining a monopoly of Christian socialism, while the ultramontanes readily adopted anti-semitism, partly to maintain their monopoly, and partly to avenge themselves on the Jewish and liberal supporters of the *Kulturkampf*. In this way a formidable body of public opinion was recruited. Violent debates took place in the Prussian diet. A petition to exclude the Jews from the national schools and universities and to disable them from holding public appointments was presented to Prince Bismarck. Jews were boycotted and insulted. Duels between Jews and anti-semites, many of them fatal, became of daily occurrence. Even unruly demonstrations and street riots were reported. Pamphlets attacking every aspect of Jewish life streamed by the hundred from the printing-press. On their side the Jews did not want for friends, and it was owing to the strong attitude adopted by the liberals that the agitation failed to secure legislative fruition. The crown prince (afterwards Emperor Frederick) and crown princess boldly set themselves at the head of the party of protest. The crown prince publicly declared that the agitation was "a shame and a disgrace to Germany." A manifesto denouncing the movement as a blot on German culture, a danger to German unity and a flagrant injustice to the Jews themselves was signed by a long list of illustrious men, including Herr von Forckenbeck, Professors Mommsen, Gneist, Droysen, Virchow, and Dr. Werner Siemens (*Times*, Nov. 18, 1880).

The first severe blow suffered by the German anti-semites was in 1881, when, to the indignation of the whole civilized world, the barbarous riots against the Jews in Russia and the revival of the mediaeval Blood Accusation in Hungary (see *infra*) illustrated the liability of unreasoning mobs to carry into violent practice the incendiary doctrines of the new Jew-haters. From this blow anti-semitism might have recovered had it not been for the divisions and scandals in its own ranks. Some of the extremists among the racial anti-semites began to extend their campaign against Judaism to its offspring, Christianity. In 1879 Prof. Sepp, arguing that Jesus was of no human race, had proposed that Christianity should reject the Hebrew Scriptures and seek a fresh historical basis in the cuneiform inscriptions. Later Dr. Eugen Duhring, in several brochures, notably *Die Judenfrage als Frage des Rassencharakters* (1881, 5th ed., Berlin, 1901), had attacked Christianity as a manifestation of the Semitic spirit which was not compatible with the theological and ethical conceptions of the Scandinavian peoples. The philosopher, Friedrich Nietzsche, had also adopted the same view. With these tendencies the Christian socialists could have no sympathy, and the consequence was that when in March 1581 a political organization of anti-semitism was dttempted, two rival bodies were created, "Der Deutsche Volksverein." under the conservative auspices of Herr Liebermann von Sonnenberg and Herr Förster, and "Der Soziale Reichsverein," led by the racial and radical anti-semites, Ernst Henrici and Otto Böckel. In 1886, at an anti-semitic congress held at Cassel, a reunion was effected under the name of "Der Deutsche anti-semitische Verein," but this lasted only three years. In June 1889 the anti-semitic Christian socialists under Stocker again seceded.

During the subsequent ten years the movement became more and more discredited. The financial scandals connected with Forster's attempt to found a Christian socialist colony in Paraguay, the conviction of Baron von Hammerstein, the anti-semitic conservative leader, for forgery and swindling (1895–96), and several minor scandals of the same unsavoury character, covered the party with the very obloquy which it had attempted to attach to the Jews. At the same time, the Christian socialists who had remained with the conservative party also suffered. After the elections of 1893, Stocker was dismissed from his post of court preacher. The following year the emperor publicly condemned Christian socialism and the "political pastors," and Stocker was expelled from the conservative party for refusing to modify the socialistic propaganda of his organ, *Das Volk*. Another blow to anti-semitism came from the Roman Catholics. They had become alarmed by the unbridled violence of the demagogues, and in 1894 the ultramontane *Germania* publicly washed its hands of the Jew-baiters (July 1, 1894). Thus gradually German anti-semitism became stripped of every adventitious alliance; and at the general election of 1903 it managed to return only nine members to the *Reiclzstag*.

More serious were the effects of the German teachings on the political and social life of Russia. Here mediaeval anti-semitism was still an integral part of the polity of the empire. The Jews were cooped up in one huge ghetto in the western provinces, "marked out to all their fellow-countrymen as aliens, and a pariah caste set apart for special and degrading treatment" (*Persecution of the Jews in Russia*, 1891, p. 5). Their activity or ('exploitation," as it was called, was exaggerated and resented by the landowners who had been ruined by the emancipation of the serfs. Besides this, a nationalist and reactionary agitation, originating like its German analogue in the Hegelianism of a section of the lettered public, had manifested itself in Moscow. After some early vicissitudes, it had been organized into the Slavophil party, which, under Ignatiev and Pobêdonostsev, became paramount in the government, with a policy based on absolutism, orthodoxy and the racial unity of the Russian people. This was the situation on the eve of Easter 1831. The hardening nationalism above, the increasing discontent below, the economic activity of the Hebrew heretics, and the echoes of anti-semitism from over the western border were combining for an explosion.

A scuffle in a tavern at Elisabethgrad in Kherson sufficed to ignite this combustible material. The scuffle grew into a riot, the tavern was sacked, and the drunken mob, hounded on by agitators who declared that the Jews were using Christian blood for the manufacture of their Easter bread, attacked and looted the Jewish quarter. The outbreak spread rapidly. Within a few weeks the whole of western Russia, from the Black Sea to the Baltic, was smoking with the ruins of Jewish homes. Scores of Jewish women were dishonoured, hundreds of men, women and children were slaughtered, and tens of thousands were reduced to beggary and left without a shelter. Murderous riots or incendiary outrages took place in no fewer than 167 towns and villages, including Warsaw, Odessa and Kiev. Europe had witnessed no such scenes of mob savagery since the Black Death massacres in the 14th century. As the facts gradually filtered through to the western capitals they caused a thrill of horror everywhere. An indignation meeting held at the Mansion House in London, under the presidency of the lord mayor, was the aignal for a long series of popular demonstrations condemning the persecutions, held in most of the chief cities of England and the Continent. The tsar's ministers, ardent Slavophils, were not slow to recognize in the outbreak an endorsement of the nationalist teaching of which they were the apostles, and, while reprobating the acts of violence, came to the conclusion that the most reasonable solution was to aggravate the legal disabilities of the persecuted heretics. To this view the tsar was won over, partly by the clamorous indignation of western Europe, which had wounded his national *amour propre* and partly by the strongly partisan report of a commission appointed to enquire into the "exploitation" alleged against the Jews, the reasons why "the former laws limiting the rights of the Jews" had been mitigated, and how these laws could be altered so as "to stop the pernicious conduct of the Jews" (Rescript of Sept. 3, 1881). The result of this report was the drafting of a "Temporary Order concerning the Jews" by the minister of the interior, which received the assent of the tsar

on May 3, 1882. This order had the effect of creating a number of fresh ghettos within the pale of Jewish settlement. The Jews were driven into the towns and their rural interests arbitrarily confiscated, with the result that their activities were completely paralysed, and they became a prey to unparalleled misery. As the gruesome effect of this legislation became known, a fresh outburst of horror and indignation swelled up from western Europe. It proved powerless.

The Russian May laws were the most conspicuous legislative monument achieved by modern anti-semitism. They were an experimental application of the political principles extracted by Marr and his German disciples from the metaphysics of Hegel, and as such they afford a valuable means of testing the practical operation of modern anti-semitism. Their immediate result was a ruinous commercial depression which was felt all over the empire and which profoundly affected the national credit. The Russian minister of finance was soon at his wits' ends for money. Negotiations for a large loan were entered upon with the house of Rothschild, and a preliminary contract was signed, when, at the instance of the London firm, M. Wyshnigradski, the finance minister, was informed that unless the persecutions of the Jews were stopped the great banking-house would be compelled to withdraw from the operation. Deeply mortified by this attempt to deal with him de *puissance à puissance*, the tsar peremptorily broke off the negotiations and ordered that overtures should be made to a non-Jewish French syndicate. In this way anti-semitism, which had already so profoundly influenced the domestic politics of Europe, set its mark on the international relations of the Powers, for it was the urgent need of the Russian treasury quite as much as the termination of Prince Bismarck's secret treaty of mutual neutrality which brought about the Franco-Russian alliance (Daudet, *Hist. Dipl.* de *l'Alliance Franco-Russe,* pp. 259 *et. seq.).*

A new era of conflict dawned with the great constitutional struggle towards the end of the century. The conditions, however, were very different from those which prevailed in the '80s. The May laws had avenged themselves with singular fitness. By confining the Jews to the towns at the very moment when Count Witte's policy of protection was creating an enormous industrial proletariat they placed at the disposal of the disaffected masses an ally powerful in numbers and intelligence, and especially in its bitter sense of wrong, its reckless despair, and its cosmopolitan outlook and connections. As early as 1885 the Jewish workmen, assisted by Jewish university students, led the way in the formation of trade unions. They also became the *colporteurs* of western European socialism, and they played an important part in the organization of the Russian Social Democratic Federation which their "Arbeiter Bund" joined in 1898 with no fewer than 30,000 members. The Jewish element in the new democratic movement excited the resentment of the government, and under the minister of the interior, M. Sipiaguine, the persecuting laws were once more rigorously enforced. They were not abolished until the revolution of 1917.

The only other country in Europe in which there has been legalized anti-semitism is Rumania. In the old days of Turkish domination the lot of the Rumanian Jews was not conspicuously unhappy. It was only when the nation began to be emancipated and the struggle in the East assumed the form of a crusade against Islam that the Jews were persecuted. Rumanian politicians preached a nationalism limited exclusively to indigenous Christians. Thus, although the Jews had been settled in the land for many centuries, they were by law declared aliens. This was done in defiance of the Treaty of Paris of 1856 and the convention of 1858, which declared all Rumanians to be equal before the law, and also in violation of the Treaty of Berlin under which Rumania agreed to abolish religious disabilities. It was not until 1919 that they were finally swept away.

In Austria-Hungary the anti-semitic impulses came almost simultaneously from the North and East. Already in the '70s the doctrinaire anti-semitism of Berlin had found an echo in Budapest. Two members of the diet, Victor Istoczy and Geza Onody, together with a publicist named Georg Marczianyi, busied themselves in making known the doctrine of Marr in Hungary. In 1880 Istoczy tried to establish a "Kichtjuden Bund" in Hungary, with statutes literally translated from those of the German anti-semitic league. The movement, however, made no progress. The news of the uprising in Russia and the appearance of Jewish refugees on the frontier had the effect of giving a certain prominence to the agitation of Istoczy and Onody and of exciting the rural communities, but it did not succeed in impressing the public with the pseudo-scientific doctrines of the new anti-semitism. It was not until the agitators resorted to the Blood Accusation — that never-failing decoy of obscurantism and superstition — that Hungary took a definite place in the anti-semitic movement. The outbreak was short and fortunately bloodless, but while it lasted its scandals shocked the whole of Europe. In April 1882 a Christian girl named Esther Sobymossi was missed from the Hungarian village of Tisza Eszlar, where a small community of Jews was settled. The rumour got abroad that she had been kidnapped and murdered by the Jews, but it remained the burden of idle gossip and gave rise to neither judicial complaint nor public disorder. At this moment the question of the Bosnian Pacification credits was before the diet. The unpopularity of the task assumed by Austria-Hungary, under the Treaty of Berlin, which was calculated to strengthen the disaffected Croat element in the empire, had reduced the government majority to very small proportions, and all the reactionary factions in the country were accordingly in arms. The government was violently and unscrupulously attacked on all sides. On May 23 there was a debate in the diet when M. Onody, in an incendiary harangue, told the story of the missing girl at Tisza Eszlar and accused ministers of criminal indulgence to races alien to the national spirit. In the then excited state of the public mind on the Croat question, the manoeuvre was adroitly conceived. All the anti-liberal elements in the country became banded together in this effort to discredit the liberal government, and the Hungarian anti-semites found themselves at the head of a powerful party. Fifteen Jews were arrested and thrown into prison. No pains were spared in preparing the case for trial. Perjury and even forgery were freely resorted to. The son of one of the accused, a boy of 14, was taken into custody by the police and by threats and cajoleries prevailed upon to give evidence for the prosecution. He was elaborately coached for the terrible *rôle* he was to play. The trial opened at Nyiregyhaza on June 19, and lasted till Aug. 3. It was one of the most dramatic *causes célèbres* of the century. Under the brilliant cross-examination of the advocates for the defence the whole of the shocking conspiracy was gradually exposed. The public prosecutor thereupon withdrew from the case, and the four judges — the chief of whom held strong anti-semitic opinions — unanimously acquitted all the prisoners.

Meanwhile, a more formidable and complicated outburst was preparing in Austria itself. Here the lines of the German agitation were closely followed, but with far more dramatic results. It was exclusively political — that is to say, it appealed to anti-Jewish prejudices for party purposes while it sought to rehabilitate them on a pseudo-scientific basis, racial and economic. At first it was confined to sporadic pamphleteers. By their side there gradually grew up a school of Christian socialists, recruited from the ultra-clericals. For some years the two movements remained distinct, but signs of approximation were early visible. In 1891 the German Radical Nationalists under Schönerer, who had joined hands with the anti-semitic leagues, formed an alliance with the feudal Christian socialists. During the elections of that year Prince Liechtenstein came forward as an anti-semitic candidate and the acknowledged leader of the united party. The elections resulted in the return of 15 anti-semites to the *Reichsrat,* chiefly from Vienna.

Although Prince Liechtenstein and the bulk of the Christian socialists had joined the anti-semites with the support of the clerical organ, the *Vaterland,* the clerical party as a whole still held aloof from the Jew-baiters. The events of 1892–95 put an end to their hesitation. The Hungarian government, in compliance with long-standing pledges to the liberal party, introduced into the diet a series of ecclesiastical reform bills providing for civil marriage, freedom of worship, and the legal recognition of Judaism on an equality with other denominations. These proposals gave a great

impulse to anti-semitism and served to drive into its ranks a large number of clericals. In Oct. 1894 the magnates adopted two of the ecclesiastical bills with amendments, but threw out the Jewish bill by a majority of six. The Crown sided with the magnates and the ministry resigned. An effort was made to form a clerical cabinet, but it failed. Baron Banffy was then entrusted with the construction of a fresh liberal ministry. The announcement that he would persist with the ecclesiastical bills lashed the clericals and anti-semites into a fury, and the agitation broke out afresh. The pope addressed a letter to Count Zichy encouraging the magnates to resist, and once more two of the bills were amended and the third rejected. The papal nuncio, hfgr. Agliardi, thought proper to pay a visit to Budapest, where he allowed himself to be interviewed on the crisis. This interference in the domestic concerns of Hungary was deeply resented, and Baron Banffy requested Count Kalnoky, the imperial minister of foreign affairs, to protest against it at the Vatican. Count Kalnoky refused and tendered his resignation to the emperor. Clerical sympathies were predominant in Vienna, and the emperor was induced for a moment to decline the count's resignation, but he soon retraced his steps. Count Kalnoky's resignation was accepted, the papal nuncio was recalled, a batch of new magnates were created, and the Hungarian ecclesiastical bills passed.

Simultaneously with this crisis another startling phase of the anti-semitic drama was being enacted in Vienna itself. Encouraged by the support of the clericals, the anti-semites resolved to make an effort to carry the Vienna municipal elections. So far the alliance of the clericals with the anti-semites had been unofficial, but on the eve of the elections (Jan. 1895) the pope, influenced partly by the Hungarian crisis and partly by an idea of Cardinal Rampolla that the best antidote to democratic socialism would be a clerically controlled fusion of the Christian socialists and anti-semites, sent his blessing to Prince Liechtenstein and his followers. The elections resulted in a great triumph for the Jew haters. The new municipal council was, however, immediately dissolved by the government, and new elections were ordered. These only strengthened the position of the anti-semites, who carried 92 seats out of a total of 138. A cabinet crisis followed, and the premiership was entrusted to the Statthalter of Galicia, Count Badeni, who assumed office with a pledge of war to the knife against anti-semitism. In October the new municipal council elected as burgomaster of Vienna Dr. Karl Lueger, a vehement anti-semite, who had displaced Prince Liechtenstein as leader of the party. The emperor declined to sanction the election, but the council repeated it in face of the imperial displeasure. Once more a dissolution was ordered, and for three months the city was governed by imperial commissioners. In Feb. 1896 elections were again held, and the anti-semites were returned with an increased majority. The emperor then capitulated. The growing anarchy in parliament at this moment served still further to strengthen the anti-semites, and their conquest of Vienna was speedily followed by a not less striking conquest of the *Landtag* of Lower Austria (Nov. 1896). After that a reaction of sanity slowly but surely asserted itself. In 1908 the anti-semites had governed Vienna 12 years, and, although they had accomplished much mischief, the millennium of which they were supposed to be the heralds had not dawned. On the contrary, the commercial interests of the city had suffered and the rates had been enormously increased (*Neue Freie Presse*, March 29, 1901), while the predatory hopes which secured them office had only been realized on a small and select scale. The spectacle of a clerico-anti-semitic tammany in Vienna had strengthened the resistance of the better elements in the country, and anti-semitism soon ceased to be a political force.

The last country in Europe to make use of the teachings of German anti-semitism in its party politics was France. The anti-clericalism of the *bourgeois* republic and its unexampled series of financial scandals, culminating in the Panama "Krach," afforded obvious opportunities for anti-semitism.

Nevertheless, it was not until 1882 that the movement was seriously heard of. Paul Bontoux, who had formerly been in the employ of the Rothschilds, but had been obliged to leave the firm in consequence of his disastrous speculations, had joined the legitimist party, and had started the Union Générale with funds obtained from his new allies. Bontoux promised to break up the alleged financial monopoly of the Jews and Protestants and to found a new plutocracy in its stead, which should be mainly Roman Catholic and aristocratic. The bait was eagerly swallowed. For five years the Union Générale, with the blessing of the pope, pursued an apparently prosperous career, but in Jan. 1882 it failed, with liabilities amounting to 212,000,000 francs. The cry was at once raised that the collapse was due to the manoeuvres of the Jews, and a strong anti-semitic feeling manifested itself in clerical and aristocratic circles. In 1886 violent expression was given to this feeling in a book since become famous, La *France juive*, by Edouard Drumont. The author illustrated the theories of German anti-semitism with a *chronique scandaleuse* full of piquant personalities, in which the corruption of French national life under Jewish influences was painted in alarming colours. The book was read with avidity by the public, who welcomed its explanations of the growing debauchery. The Wilson scandals and the suspension of the Panama Company in the following year, while not bearing out Drumont's anti-semitism, fully justified his view of the prevailing corruption. Out of this condition of things rose the Boulangist movement, which rallied all the disaffected elements in the country, including Drumont's following of anti-semites. It was not, however, until the flight of General Boulanger and the ruin of his party that anti-semitism came forward as a political movement.

The chief author of the rout of Boulangism was a Jewish politician and journalist, Joseph Reinach, formerly private secretary to Gambetta and one of the ablest men in France. He was a Frenchman by birth and education, but his father and uncles were Germans, who had founded an important banking establishment in Paris. Hence he was held to personify the alien Jewish domination in France, and the ex-Boulangists turned against him and his co-religionists with fury. The Boulangist agitation had for a second time involved the legitimists in heavy pecuniary losses, and under the leadership of the marquis de Morès they now threw all their influence on the side of Drumont. An anti-semitic league was established, and with royalist assistance branches were organized all over the country. In 1892 Drumont founded a daily anti-semitic newspaper, *La Libre Parole*. With the organization of this journal a regular campaign for the discovery of scandals was instituted. At the same time, a body of aristocratic swashbucklers, with the marquis de Morès and the comte de Lamase at their head, set themselves to terrorize the Jews and provoke them to duels. Anti-semitism was most powerful in the army, which was the only branch of the public service in which the reactionary classes were fully represented. The republican law compelling the seminarists to serve their term in the army had strengthened its clerical and royalist elements, and the result was a movement against the Jewish officers, of whom 500 held commissions. In 1894, a prominent Jewish staff officer, Capt. Alfred Dreyfus was arrested on a charge of treason. From the beginning the hand of the anti-semite was flagrant in the new sensation. Anti-semitic feeling was now thoroughly aroused. Panama had prepared the people to believe anything; and when it was announced that a court-martial, sitting in secret, had convicted Dreyfus, there was a howl of execration against the Jews from one end of the country to the other. Dreyfus was degraded and transported for life amid unparalleled scenes of public excitement. The Dreyfus case registers the climax not only of French, but of European anti-semitism. It was the most ambitious and most unscrupulous attempt yet made to prove the nationalist hypothesis of the anti-semites, and in its failure it afforded the most striking illustration of the dangers of the whole movement by bringing France to the verge of revolution. By a series of amazing accidents it was soon discovered that the whole case against Dreyfus rested on a tissue of forgeries and even worse crimes. Nevertheless, the authorities, supported by parliament, declined to reopen the Dreyfus case. It now became clear that nothing short of an appeal to public opinion and a full exposure of all the iniquities that had been perpetrated would secure justice at the hands of the military chiefs. On behalf of Dreyfus, Émile Zola, the eminent novelist, formulated the case against the general staff of the army in an open letter to the president of the republic,

which by its dramatic accusations startled the whole world. The letter was denounced as wild and fantastic even by those who were in favour of revision. Zola was prosecuted for libel and convicted, and had to flee the country; but the agitation he had started was taken in hand by others, notably M. Clemenceau, M. Reinach and M. Yves Guyot. In Aug. 1898 their efforts found their first reward. A re-examination of the documents in the case by M. Cavaignac, then minister of war, showed that one at least was undoubtedly forged. (Esterhazy and Col. Henry, of the war office intelligence department — who cut his throat when under arrest — were the real culprits.)

In spite of this damaging discovery the war office still persisted in believing Dreyfus guilty and opposed a fresh enquiry. It was supported by three successive ministers of war and apparently an overwhelming body of public opinion. By this time the question of the guilt or innocence of Dreyfus had become an altogether subsidiary issue. As in Germany and Austria, the anti-semitic crusade had passed into the hands of the political parties. On the one hand the radicals and socialists, recognizing the anti-republican aims of the agitators and alarmed by the clerical predominance in the army, had thrown in their lot with the Dreyfusards; on the other, the reactionaries, anxious to secure the support of the army, took the opposite view, denounced their opponents as *sans patrie,* and declared that they were conspiring to weaken and degrade the Army in the face of the national enemy. The controversy was, consequently, no longer for or against Dreyfus, but for or against the Army, and behind it was a life-or-death struggle between the republic and its enemies. The situation became alarming. Rumours of military plots filled the air. Powerful leagues for working up public feeling were formed and organized; attempts to discredit the republic and intimidate the government were made. The president was insulted; there were tumults in the streets, and an attempt was made by M. Déroulède to induce the military to march on the Elysée and upset the republic.

The government now resolved to strike at the root of the mischief by limiting the power of religious orders, and with this view a drastic Associations bill was introduced into the chambers. This anti-clerical move provoked the wildest passions of the reactionaries, but it found an overwhelming support in the elections of 1902 and the bill became law. The war thus definitely reopened soon led to a revival of the Dreyfus controversy. The nationalists flooded the country with incendiary defamations of "the government of national treason," and Dreyfus on his part loudly demanded a fresh trial. It was clear that conciliation and compromise were useless. Early in 1905 M. Jaurès urged upon the chamber that the demand of the Jewish officer should be granted if only to tranquillize the country. The necessary *faits nouveaux* were speedily found by the minister of war, General André, and having been examined by a special commission of revision were ordered to be transmitted to the court of cassation for final ajudication. On July 12, 1906, the court, all chambers united, gave its judgment. After a lengthy review of the case it declared unanimously that the whole accusation against Dreyfus had been disproved, and it quashed the judgment of the court-martial *sans renvoi.* Nothing was left undone to repair the terrible series of wrongs which had grown out of the Dreyfus case. Nevertheless, its destructive work could not be wholly healed. For over ten years it had been a nightmare to France, and it now modified the whole course of French history. In the ruin of the French Church, which owed its disestablishment very largely to the Dreyfus conspiracy, may be read the most eloquent warning against the demoralizing madness of anti-semitisrn.

During the World War of 1914–18, which gave rise to a widespread revival of national consciousness, anti-semitism of the Marr type made a fresh appeal to German and Russian public opinion, largely under the influence of a Germanized Englishman, Houston Stewart Chamberlain, the son-in-law of Richard Wagner. The Bolshevist revolution in Russia, which was erroneously pictured as the work of the Jews, helped this new phase of the movement. and for a time a strange theory of a Jewish conspiracy founded on a secret Jewish teaching and aiming at the overthrow of Christian civilization obtained a certain vogue. In 1919 an effort was made in Germany to bolster up this superstition by re-publication of a book, *Protocols of the Elders* of *Zion* (Eng. edit. 1920), alleged to be the minutes of a secret Zionist congress at which this teaching was set forth. The book at first commanded a great deal of undeserved attention, but in 1921 it was discovered by the *Times* to be an impudent forgery, the work of a former member of the *Ochrana* or Russian secret police. This was a crowning discomfiture of anti-semitism in Western Europe. (L. W.)

For the fanatical recrudescence of anti-semitism in National-Socialist Germany, see GERMANY.

The publication of a manifesto on July 14, 1938, by a group of Italian professors who urged prohibition of Aryan-Jewish marriages was the signal for a new anti-semitic program by the Italian Government, less violent, however, than that of Germany. In Sept. 1938, official decrees ordered the emigration of foreign Jews who had entered Italy since 1919 and the expulsion of Jewish teachers and students from all schools. After the partition of Czechoslovakia, anti-semitism in Europe gained a fresh momentum which culminated in the violent German riots of Nov. 1938. (X.)

BIBLIOGRAPHY.—The most comprehensive works on anti-semitism are *Israel among the Nations,* by A. Leroy-Beaulieu (1895) and *L'Anti-sémitisme, son histoire et ses causes,* by Bernard Lazare (1894). A good list of books relating to Jewish ethnology will be found at the end of M. Isidor Loeb's valuable article, "Juifs," in the *Dictionnaire universe1 de gtographie* (1884). To these should be added, Adolf Jellinek, *Der Jüdische Stamm* (1869); Chwolson, *Die semitischen Völker* (1872); Nossig, *Materialien zur Statistik* (1887); Jacobs, *Jewish Statistics* (1891); and Andree, *Zur Volkskunde der Juden* (1881). A bibliography of the Jewish question from 1875 to 1884 has been published by Mr. Joseph Jacobs (1885). During the period since 1885 the anti-semitic movement has produced an immense pamphlet literature. Some of these productions have already been referred to; others will be found in current bibliographies. The most valuable collection of facts relating to the Russian persecutions of 1881–82 are to be found in the *Feuilles Jaunes* (52 nos.), compiled and circulated for the information of the European press by the Alliance Israelite of Paris. Complete collections are very scarce. For the subsequent struggle *see* the publications of the *Bund* (Geneva; Imprimerie Israelite); Semenoff, *The Russian Government and tlze Massacres,* and *Quarterly Review,* Oct. 1906. On the Rumanian question, *see* Bluntschli, *Roumania and the Legal Status of the Jews* (London, 1879); Sincerus, *Juifs en Rounzanie* (London, 1901); Dehn, *Diplonzatze u. Hochfinanz in der rumanischen Judenfrage* (1901); on Hungary and the Tisza Eszlar Case, *see* (besides the references in Jacobs) Nathan, *Der Prozess von Tisza Eszlar* (Berlin, 1892). On this case and the Blood Accusation generally, *see* Wright, "The Jews and the Malicious Charge of Human Sacrifice," *Nineteenth Century,* 1883; Strack, *The Jew and Human Sacrifice* (1909). The origins of the Austrian agitation are dealt with by Nitti, *Catholic Socialism* (1895), but the most valuable source of information is the *Österreichische Wochenschrift,* ed. Dr. Bloch. The case of the French anti-semites is stated by E. Drumont in his *France juive* and other works; the other side by Isidor Loeb, Bernard Lazare, Leonce Reynaud, etc. Of the Dreyfus case there is an enormous literature; *see* especially the reports of the Zola and Picquart trials, the revision case before the Court of Cassation, the proceedings of the Rennes court-martial, and the final judgment of the Court of Cassation printed in full in the *Figaro,* July 15, 1906; also Reinach, *Histoire de l'affaire Dreyfus* (1908). On the history of the anti-semitic movement generally, *see* Wolf, *Notes on the Diplomatic History of the Jewish Question* (1919); *The Peace Conference, Paris 1919, Report of the Delegates of the Jews of the British Empire* (1920); Wolf, *The Myth of the Jewish Menace in World Affairs* (1921). (L. W.)

ANTISEPTICS and **ASEPSIS.** Antiseptics are substances used for the prevention of bacterial development in animal or vegetable matter. Some are true germicides, capable of destroying the bacteria, whilst others merely inhibit their growth. The antiseptic method of treating wounds *(see* SURGERY) was introduced by the late Lord Lister, and was an outcome of Pasteur's germ theory of putrefaction. The standardization of antiseptics has been effected in many instances, and a water solution of carbolic acid of a certain fixed strength is now taken as the standard with which other antiseptics are compared. The more important of those in use to-day are carbolic acid, the perchloride and biniodide of mercury, iodoform, formalin, salicylic acid, etc. Among the more recently introduced antiseptics, chinosol, a yellow substance freely soluble in water, and lysol, another coal-tar derivative, are much used. But every antiseptic, however good, is more or less toxic and irritating to a wounded surface. Hence antiseptics are nowadays used mainly for the dis-

infection of instruments, apparatus, the field of operation on the patient's skin and the surgeon's hands, and in cases which are already septic (see SEPSIS). Where an incision is to be made into healthy skin or tissues antisepsis has been replaced by asepsis, which relies on keeping free from the invasion of bacteria rather than destroying them when present.

During recent years the study of antiseptics has gone mainly along two lines—to produce more efficient antiseptics for use in the ordinary way by external application, and to elaborate chemical substances which can be injected into the circulation and destroy the infecting microbes. At the same time many studies have been made on the natural antiseptics by which the body rids itself of infection.

Natural Antiseptics.— These exist in greater or less degree in almost every cell of the human body, as well as in most of the secretions. Mechnikov showed that some cells (phagocytes), and especially the white corpuscles of the blood, could ingest and digest microbes, and Wright discovered that this ingestion or phagocytosis only took place after the microbes had been acted on by the blood fluids. The blood fluids also have a considerable power of destroying or restraining the growth of many pathogenic bacteria (see IMMUNITY). Fleming showed in 1922 that the cells and secretions of the human body have a remarkable antiseptic power toward certain microbes by virtue of their containing a ferment which has been called "Lysozyme." Of all the secretions the tears are the richest in this ferment, and it has been shown that human tears, even when diluted six million times, have a markedly destructive action on some of the microbes found in the air—obviously a natural means of protection against infection.

Chemical Antiseptics.— Research has been directed to the action of these on the natural defences of the body, and the body cells are, in general, found to be much more susceptible to the action of these chemicals than are bacteria. If an ordinary chemical antiseptic, *e.g.*, carbolic acid, is added to blood infected with staphylococci or streptococci (the ordinary microbes of suppuration) the following instructive series of events may be observed. The normal blood itself has such a power of killing these microbes that with a moderate implantation some 95 to 99% are destroyed; but when the concentration of carbolic acid in the blood reaches 1 in 600 the whole of the natural antiseptic power of the blood is lost and every microbe implanted survives and multiplies. Of course, more concentrated solution of the chemical will, in addition to killing the blood cells, inhibit or destroy the bacteria and so exert an antiseptic action, but this is only manifest after the natural defences against infection have been destroyed.

Chemotherapy.— The ideal method of using an antiseptic for the treatment of a bacterial infection is to introduce it into the circulation so that it reaches every portion of the infected focus and destroys the microbes. For ordinary bacterial infections this ideal has not yet been attained, but remarkable advances have been made in this direction in certain infections. In 1910 Ehrlich prepared an organic arsenical product which, when injected into the body, rapidly destroyed the microbe of syphilis, and this product, salvarsan, together with the more recently introduced substances of similar constitution, has revolutionized the treatment of this disease (see VENEREAL DISEASES). Following Ehrlich, Morgenroth prepared a quinine derivative (Optochin) which had a remarkable affinity for the pneumococcus (the microbe which causes pneumonia), while it had little action on other microbes; but unfortunately this substance had certain toxic qualities which rendered it unsuitable in practice. In some other infections, also, drugs have been found which can destroy the infecting agent without exercising any serious toxic action on the human body; notable among these are Emetine in amoebic dysentery (see DYSENTERY), and "Bayer 205" in sleeping sickness. The fact that drugs can be prepared which have a very specific action on one microbe offers some hope that in the near future there will be produced chemicals which will destroy the ordinary disease-producing bacteria without damaging the tissues.

Chemical Antiseptics and Wounds.—Prior to the World War the use of antiseptics in surgery had been largely discarded in favour of aseptic methods which aimed at preventing the access of microbes to the wound. During the war, however, it was found that all the wounds were infected with septic microbes, and many antiseptic methods were employed in the hope of destroying these microbes. Briefly, the results obtained were these: none of the antiseptics was able rapidly to sterilize a wound; most of them were without any evident effect on the bacterial infection; those which have appeared to have some influence on the course of the infection had, in addition to their "antiseptic" action on the bacteria, a stimulant effect on the infected tissues, and this probably contributed largely to their success. The popular pre-war antiseptics, such as carbolic acid, iodine and the salts of mercury, were found to be without effect on the progress of an infection, although outside the body these are powerful bactericidal agents.

Chlorine derivatives obtained great popularity in the form of eusol (hypochlorous acid), sodium hypochlorite (Dakin's fluid) or chloramine-T, a more complicated organic derivative, and this type of antiseptic is still in common use under various trade names. Some of the aniline dyes also are used as antiseptics, and outside the body these are probably the most powerful of all the chemical bactericidal agents. Gentian violet, brilliant green and acriflavine have been largely used, but in all these cases the action on the bacteria is slow and the dyes are rapidly absorbed by the tissues and dressings of the wound. Acriflavine differs from almost all other antiseptics in that it has a more powerful action in blood serum than it has in water, and it was hoped from this that it would prove very effective in killing bacteria embedded in the tissues; this hope, however, has not been fulfilled, although the dye still obtains some popularity in the treatment of certain infections.

Another method of using an antiseptic is to fill the wound with an almost insoluble substance which slowly gives off an antiseptic substance. A good example of this is iodoform, and although this in itself has no power of killing microbes it slowly breaks down in contact with the body fluids and liberates small quantities of iodine, to which the antiseptic action of the iodoform is attributed. This substance, iodoform, used to be very popular in the treatment of septic infections, but it possesses a very penetrating odour and has been largely given up on this account. In addition to its direct antiseptic action, it possesses, in common with some of the chlorine antiseptics, the power of inducing a large flow of lymph from the wound and so aiding the natural defensive mechanism of the body.

Sterilization.— While antiseptics have not been very successful in killing bacteria in infected tissues in the body, they are invaluable in sterilizing apparatus, instruments and infected matter of many kinds outside the body. An infected water supply can be efficiently and economically sterilized by the use of a small quantity of chlorine (see WATER PURIFICATION); the infective excreta from cases of typhoid fever and similar diseases can be rendered harmless by treating them with carbolic acid or other similar antiseptic; catgut for use in surgical operations can only be sterilized by the use of chemical antiseptics, and there are innumerable other ways in which these chemicals fulfil their function of destroying bacteria. (4. FL.; W. S. L.-B.)

ANTI-SLAVERY SOCIETY. The Anti-Slavery and Aborigines Protection Society is a fusion of two societies, founded in 1837 and 1839 respectively. The Aborigines Protection Society was formed mainly through the efforts of Thomas Hodgkin and Thomas Fowell Buxton, as the outcome of a select parliamentary committee appointed to consider measures for securing justice for the natives in British possessions. The British and Foreign Anti-Slavery Society, which succeeded other similar organizations established during the long struggle, aimed expressly at the universal extinction of slavery and the slave trade, Thomas Clarkson being its first president. As time went on, it was found that some

degree of overlapping in the work of the two societies was unavoidable, owing particularly to the growth of labour systems hardly distinguishable from slavery, and they were united in 1909.

Slavery in Recent Times.—The objects of the society's work in the second half of the last century were many and various. They included the abuses of coolie indentured labour and the Kanaka and similar labour systems in the South Seas, slavery and the slave-trade in Egypt and the Sudan (upon which the Anti-Slavery Society was in close touch with Gen. Gordon); slave-dealing in Morocco and the southern Sahara, native labour in South Africa, domestic slavery in many parts of Africa, labour conditions in the New Hebrides, and the scandalous "contract labour" system from the interior of Portuguese Angola to the cocoa islands of S. Thomé and Principe.

The Brussels Conference of 1889–90, and the General Act which followed, opened the way to fighting African slavery more effectively. Towards the end of the century the question of slavery in Zanzibar was predominant, and the society sent out its own commissioner to East Africa more than once to investigate conditions.

While slavery and the slave trade are now universally reprobated by civilized States, they still persist in outlying regions. The Slavery Commission of the League of Nations in 1925 reported that the slave trade and "similar acts" prevail in 19 political areas, including Abyssinia, China and Liberia. The more subtle forms of modern slavery, however, are those connected with the increasing demand for tropical and semi-tropical produce; *e.g.*, rubber, cotton, sugar, palm oil, etc.; which cannot be gathered by white workers. This means a tendency to exploit unwilling labour.

Other forms of modern slavery are debt slavery, or peonage, as illustrated by the horrors disclosed, largely owing to the society's efforts in 1911–12, in the remote Putumayo region of the Upper Amazon. The society laboured successfully for the abolition of the *Mui Tsai* system in Hongkong, another form of slavery disguised under the name of "adoption" of children. The society keeps in frequent communication with the League of Nations.

ANTISTHENES (*c.* 444–*c.* 365 B.C.), the founder of the Cynic school of philosophy, was born at Athens of a Thracian mother. In his youth he studied rhetoric under Gorgias, perhaps also under Hippias and Prodicus. He came under the influence of Socrates, and became a devoted pupil. So eager was he to hear the words of Socrates that he used to walk daily from Peiraeus to Athens, and persuaded his friends to accompany him. He founded a school of his own in the Cynosarges. Thither he attracted the poorer classes by the simplicity of his life and teaching. He wore a cloak, and carried a staff and a wallet, and this costume became the uniform of his followers. Diogenes Laertius says that his works filled ten volumes, but of these fragments only remain. Aristotle speaks of him as uneducated and simple-minded, and Plato describes him as struggling in vain with the difficulties of dialectic. His work represents one great aspect of Socratic philosophy, and should be compared with the Cyrenaic and Megarian doctrines. (See CYNICS.)

For his philosophy *see* CYNICS, and for his pupils, Diogenes and Crates, see articles under these headings.

ANTISTREPTOCOCCUS SERUM is the serum obtained from an animal (usually a horse) which has been repeatedly injected with streptococcus. Such serum is prepared for use in the prevention and treatment of streptococcus infections in man, and is valuable on account of the antibodies contained in it which have been produced by the animal against the streptococcus and its poisons. This micro-organism is a very common one and is responsible for a great variety of diseases in man. However, antistreptococcus serum has been found to be beneficial in only two of these, namely, scarlet fever and erysipelas. Its value in the former disease has been definitely established by clinical experience, and in the case of the latter most reports indicate that it is often of benefit if given early in the disease. The results of its use in puerperal fever and septicaemia have, on the other hand, been disappointing. The streptococcus of scarlet fever and that of erysipelas belong to different strains, as is shown by failure of erysipelas anti-serum to be of any value in scarlet fever and vice versa.

ANTISTROPHE, the portion of an ode which is sung by the chorus in its returning movement from west to east, in response to the strophe, which was sung from east to west. It is of the nature of a reply, and balances the effect of the strophe. Thus, in Gray's ode called "The Progress of Poesy," the strophe, which dwelt in triumphant accents on the beauty, power and ecstasy of verse, is answered by the antistrophe, in a depressed and melancholy key:

> Man's feeble race what ills await,
> Labour, and Penury, the racks of Pain,
> Disease and Sorrow's weeping Train,
> And Death, sad refuge from the storms of Fate. . . .

When the sections of the chorus have ended their responses, they unite and close in the epode, thus exemplifying the triple form in which the ancient sacred hymns of Greece were composed, from the days of Stesichorus onwards.

ANTITHESIS (the Greek for "setting opposite"), in rhetoric, the bringing out of a contrast in the meaning by an obvious contrast in the expression, as in the following:—"When there is need of silence, you speak, and when there is need of speech, you are dumb; when present, you wish to be absent, and when absent, you desire to be present; in peace you are for war, and in war you long for peace; in council you descant on bravery, and in the battle you tremble." The force of the antithesis is increased if the words on which the beat of the contrast falls are alliterative, or otherwise similar in sound, as—"The fairest but the falsest of her sex." Among English writers who have made the most abundant use of antithesis are Pope, Young, Johnson, and Gibbon.

ANTITOXIN, a principle in the blood serum which combats the bacteria causing a disease. When the blood of the patient is deficient in antitoxins, serum containing the appropriate antitoxin is injected. (See DIPHTHERIA; SCARLET FEVER; and MEDICAL RESEARCH.)

ANTITYPE, the correlative of "type," to which it corresponds either as the stamp to the die or as the die to the stamp (Gr. ἀντίτυπος). It is used in the New Testament in Heb. ix. 24, I. Peter iii. 21, translated "figure" (A.V) and "pattern" or "likeness" (R.V.). So, theologically, it denotes the reality behind the symbol or copy; *e.g.*, Christ the antitype, of which the Jewish ritual is the type. In the Greek Fathers (*e.g.*, Irenaeus, Gregory Nazianzen) the bread and wine in the Eucharist are called antitypes.

ANTIUM (mod. Anzio), ancient Volscian city, on the coast of Latium, about 33m. S. of Rome. The legends are fanciful. Antium, Ardrea, and Circeii Lavinium appear as under Roman protection in the treaty with Carthage in 348 B.C. In 341 it lost its independence after rising with Latium against Rome, and the beaks (*rostra*) of six captured Antiatine ships decorated and gave their name to the orators' tribunal in the Roman forum. From late Republican times wealthy Romans including the Julian and Claudian emperors frequently visited it; both Caligula and Nero were born there. The latter founded a colony of veterans and built a new harbour, the projecting moles of which are still extant. In the middle ages it was deserted in favour of Nettuno. The harbour was restored at the end of the 17th century, but is frequently silted up. Remains of Roman villas occur along the shore, both east and north-west of the town, and many of them have tanks for pisciculture. That of Nero is generally placed at the so-called Arco Muto. Many works of art have been found, also the only known example of a Roman calendar previous to the Julian era, painted on a wall. Of the famous temple of Fortune mentioned by Horace no remains are known. The sea is encroaching slightly at Anzio, but some miles farther north-west the old Roman coast-line now lies slightly inland (see TIBER). The Volscian city stood on higher ground and was defended by a deep ditch, which can still be traced, and by walls. The modern place is a summer resort and between it and Nettuno, 2 m. to the east, are numerous villas.

ANTIVARI (Montenegrin BAR), so called by the Venetians from its position opposite Bari, in Italy, a seaport of Montenegro, Turkish until 1878. Pop. (1931) 5,544. The old town is built inland, hidden among dense olive groves, and overshadowed by the peak of Rumija (5,226 ft.). It is a ruinous walled village with the shell of an old Venetian fortress, surrounded by mosques and bazaars, and containing the residence of the Roman Catholic archbishop. The fine bay of Antivari, with Prstan, its port, is about 3 mi. distant through barren country shut in by mountains. It is commanded by the fortress of Spizza (Austrian till 1918) on the northern horn of the bay. In the centre of the shore is a royal villa. The harbour works (begun in 1906) afford accommodation for 200 large vessels, and include dockyards, warehouses, a customs house, dispensary, electric lighting, telephone, and wireless installation. The only railway runs from Virpazar to Antivari, but there is a good coast road, and a service of steamers coastwise and to Bari. Fishing, olive oil refining, and tobacco growing are the main industries, but there are iron and phosphate deposits in the neighbourhood, and probably valuable bauxite ones at Spizza. The civil population successfully resisted Italian occupation in 1919, but in 1941 the town was occupied by Italy, after the rapid German conquest of the Balkans.

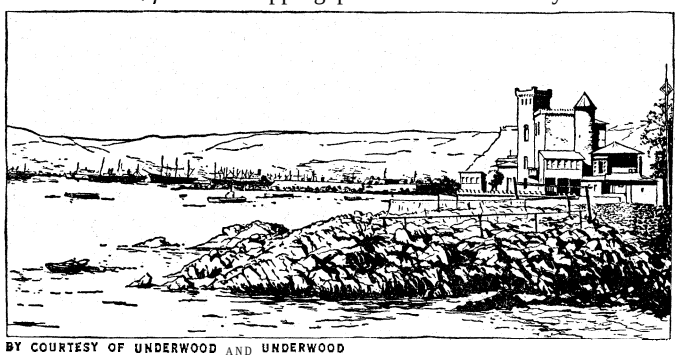
ANTLERS, the name given to the bony outgrowths on the heads of deer, which are shed and renewed each year. For details see DEER.

ANT-LION, the name given to neuropterous insects of the family Myrmeleonidae, with relatively short and apically clubbed antennae and four narrow densely reticulated wings which are usually marked with brown or black. The perfect insects are mostly nocturnal and are believed to be carnivorous. The best-known species, Myrmeleon formicarius, which may be found adult in the late summer, occurs in many European countries, though like the rest of this group it does not occur in England. Strictly speaking, however, the term ant-lion applies to the larval form on account of its peculiar and forbidding appearance and its skilful and unique manner of entrapping prey by means of a pitfall. The sandy-grey abdomen is oval and beset with warts and bristles; the prothorax forms a mobile neck for the large squsre head, which carries a pair of long and powerful toothed mandibles.

In dry and sandy soil the ant-lion lays its trap. Having marked out the chosen site by a circular groove, it starts to crawl backwards, using its abdomen as a plough to shovel up the soil. By the aid of one front leg it places consecutive heaps of loosened particles upon its head, then with a smart jerk throws each little pile clear of the scene of operations. Proceeding thus it gradually works its way from the circumference towards the centre. When this is reached and the pit completed, the larva settles down at the bottom, buried in the soil with only the jaws projecting above the surface. Since the sides of the pit consist of loose sand they afford an insecure foothold to any small insect that ventures over the edge. Slipping to the bottom the prey is immediately seized by the lurking ant-lion; or if it attempts to scramble again up the treacherous walls of the pit, is speedily checked in its efforts and brought down by showers of loose sand which are jerked at it from below by the larva. By means of similar head jerks the skins of insects sucked dry of their contents are thrown out of the pit. A full-grown larva digs a pit about 2 in. deep and 3 in. wide at the edge.

The larva makes a globular case of sand stuck together with fine silk spun, it is said, from a slender spinneret at the posterior end of the body. In this it remains until the completion of the transformation into the sexually mature insect, which then emerges from the case, leaving the pupal integument behind. In certain species of *Myrmeleonidae,* such as *Dendroleon pantheormis,* the larva, although resembling that of *Myrmeleon* structurally, makes no pitfall, but seizes passing prey from any nook or crevice in which it shelters. In the United States, 58 species are recognized, and the ant-lion is locally known as doodlebug.

ANTOFAGASTA, a town and port of northern Chile, and capital of the Chilean province of the same name, situated about 768m. N. of Valparaiso in lat. 23° 38' 39" S. and long. 70° 24' 39" W. of Greenwich. Population (estimated 1902) 16,084; (1942) 60,000. Antofagasta is the seaport for a railway running to Oruro, Bolivia, and is the only available outlet for the trade of the south-western departments of that republic. The smelting works for the neighbouring silver mines are here, and a thriving trade with the inland mining towns is carried on. The town was founded in 1870 as a shipping port for the recently discovered



BY COURTESY OF UNDERWOOD AND UNDERWOOD

THE HARBOUR AT ANTOFAGASTA, THE PRINCIPAL PORT OF CHILE

silver mines of that vicinity, and belonged to Bolivia until 1879, when it was occupied by a Chilean military force.

The province of ANTOFAGASTA has an area of 47,511 sq.mi. lying within the desert of Atacama and between the provinces of Tarapacá and Atacama. Its population in 1940 was 145,147. It is rich in saline and other mineral deposits, the important Caracoles silver mines being about 90m. north-east of the port of Antofagasta. Like the other provinces of this region, Antofagasta produces for export copper, silver, silver ores, lead, nitrate of soda, borax and salt. Iron and manganese ores are also found. Besides Antofagasta the principal towns are Taltal, Mejillones, Cobija (the old capital) and Tocopilla. Up to 1879 the province belonged to Bolivia, and was known as the department of Atacama, or the Litoral. It fell into the possession of Chile in the war of 1879–82, and was definitely ceded to that republic in 1885.

ANTOINE, ANDRÉ (1851–), French actor-manager, was born at Limoges, and in his early years was in business. But he was an enthusiastic amateur actor, and in 1887 he founded in Paris the Théâtre Libre, in order to realize his ideas as to the proper development of dramatic art. In this undertaking he had the support of Zola, who championed Antoine's efforts for the replacement on the Parisian stage of the "well-made play" for something nearer the actualities of life. Many other writers backed the campaign, and Antoine began to produce the great series of plays by Brieux, Curel and Porto-Riche, which made his theatre famous. Mr. A. B. Walkley, in introducing M. Antoine to an English audience in 1922 justly said of him: "The great thing about the Théâtre Libre was the spirit, courage and indomitable energy of its founder." Great as was its importance in Paris and in France, it was perhaps still greater in other countries. The Freie Bühne of Berlin, the Independent Theatre in London and other institutions of the kind, descended from it. For an account of his work, which had enormous influence on the French stage, see DRAMA: England. In 1894 he gave up the direction of this theatre, and became connected with the Gymnase, and later (1896) with the Odéon. His resignation from the Odéon in 1914 was universally regretted.

See S. M. Waxman, Antoine and the *Théâtre Libre* (1926).

ANTONELLI, GIACOMO (1806–1876), Italian cardinal, was born at Sonnino April 2, 1806. Created cardinal (June 11, 1847), he was chosen by Pius IX to preside over the council of state entrusted with the drafting of the constitution. On March 10, 1848, Antonelli became premier of the first constitutional ministry of Pius IX. Upon the fall of his cabinet Antonelli created for himself the governorship of the sacred palaces in order to retain constant access to and influence over the pope. After the assassination of Pellegrino Rossi (Nov. 15, 1848), he arranged the flight of Pius IX to Gaeta, where he was appointed secretary of State. Notwithstanding promises to the powers, he restored

absolute government upon returning to Rome (April 12 1850) and violated the conditions of the surrender by wholesale imprisonment of Liberals. In 18 jj he narrowly escaped assassination. As ally of the Bourbons of Naples, from whom he had received an annual subsidy, he attempted, after 1860, to facilitate their restoration by fomenting brigandage on the Neapolitan frontier. To the overtures of Ricasoli (*q.v.*) in 1861, Pius IX., at Antonelli's suggestion, replied with the famous *"Non possumus,"* but subsequently (1867) accepted, too late, Ricasoli's proposal concerning ecclesiastical property. After the September Convention (1864) Antonelli organized the legion of Antibes to replace French troops in Rome, and in 1867 secured French aid against Garibaidi's invasion of papal territory. Upon the reoccupation of Rome by the French after Mentana (1867), Antonelli again ruled supreme, but upon the entry of the Italians in 1870 was obliged to restrict his activity to the management of foreign relations. Me wrote, with papal approval, the letter requesting the Italians to occupy the Leonine city; *i.e.,* the district of Rome in which the Vatican is situated, and obtained from the Italians payment of the Peter's pence (5,000,000 lire) remaining in the papal exchequer, as well as 50,000 *scudi*—the first and only instalment of the Italian allowance (subsequently fixed by the Law of Guarantees, March 21 1871) ever accepted by the Holy See. At Antonelli's death (Nov. 6 1876) the Vatican finances were found to be in disorder, with a deficit of 45,000,000 lire. His activity was devoted almost exclusively to the struggle between the papacy and the Italian *Risorgimento,* the history of which is comprehensible only when his unscrupulous influence is fully taken into account.

ANTONEELO DA MESSBNA (c. 1430–1479), Italian painter, was probably born at Messina about the beginning of the 15th century. He spent some time in the Netherlands studying the methods of the disciples of Jan Van Eyck; returned with his secret to Messina about 1465; probably visited Milan; removed to Venice in 1472, where he painted for the Council of Ten; and died there in the middle of Feb. 1479 (see Venturi's article in Thieme-Becker, Kzinstlerlexikon, 1907).

His style is remarkable for its union—not always successful—of Italian simplicity with Flemish love of detail. There are extant —besides a number more or less dubious—zo authentic productions, consisting of renderings of "Ecce Homo," Madonnas, saints, and half-length portraits, many of them painted on wood. The finest of all is said to be the nameless picture of a man in the Berlin museum. The National Gallery, London, has three works by him, including the "St. Jerome in his Study." Antonello exercised an important influence on Italian painting by the transmission of Flemish tendencies.

ANTONINI ITINERARIUM, a valuable register, still extant, of the stations and distances along the various roads of the Roman empire. The original edition probably dated from the beginning of the 3rd century while the extant portion is assigned to the time of Diocletian. If it is to be ascribed to the initiative of one of the emperors, Antoninus Caracalla would be the most likely name. Editions were published by Wesseling in 1735, Parthey and Pindar in 1848. The portion relating to Britain was published as *Iter Britanniarum* by T. Reynolds in 1799.

ANTONINUS, ST. (ANTONIO PIEROZZI, also called DE FORCIGLIONI) (1389–1459), archbishop of Florence, was born in that city March 1 1389. He entered the Dominican order in his 16th year, and was consecrated archbishop of Florence in 1446, and won the esteem and love of his people, especially by his energy and resource in combating the effects of the plague and earthquake in 1448 and 1453. He died on May 2 1459, and was canonized by Pope Adrian VI. in 1523. Antoninus sat as papal theologian at the council of Florence (1439).

See Bolland, *Acta Sanctorum,* i., and U. Chevalier, *Rép.* des s. *hist.* (1905), pp. 285–286.

ANTONINUS LIBERALIS, Greek grammarian, probably flourished about A.D. 150. He wrote a collection of 41 tales of mythical metamorphoses (Μεταμορφώσεων Συναγωγή), chiefly valuable as a source of mythological knowledge.

BIBLIOGRAPHY.—See Westermann, *Mythographi* Graeci (1843); Oder, De *Antonino* Liberali (1886).

ANTONINUS PIUS (Titus Aurelius Fulvus Boionus Arrius Antoninus) (A.D. 86–161), Roman emperor 138–161, the son of Aurelius Fulvus, a Roman consul whose family had originally belonged to Nemausus (Nimes). He was brought up by his grandfather, Arrius Antoninus, a friend of the younger Pliny. He was consul in 120, was next chosen as one of the four consulars for Italy, and won distinction as proconsul of Asia. On Feb. 25 138, he was adopted by the Emperor Hadrian as his successor, on condition that he himself adopt Marcus Annius Verus, nephew of his wife Faustina, and Lucius, son of Aelius Verus (afterwards the Emperors Marcus Aurelius and Lucius Aelius Verus). A few months afterwards, on Hadrian's death, he became emperor. Antoninus was experienced and intelligent, and sincerely desired the welfare of his subjects. One of his first acts was to beg the senate in person to decree divine honours to Hadrian (this gained him his name of Pius), and this foreshadowed his policy, for throughout his reign he sought to increase the dignity of the senate, consulting it in person on matters of State, and giving back Italy to its management. He discouraged informers (delatores), and when conspiracies occurred showed great clemency. With the help of his council of skilled jurists, he made legal reforms tending to greater simplicity and humanity. In Italy he promoted art and science, built baths and aqueducts, and expanded the system of provision for orphans. Under his personal care the provinces prospered; their burdens (*e.g.* the imperial post) were lightened, and liberal relief was granted to distressed cities. The peace of his reign was broken only by insurrections of the Moors (152), Egyptians (153), Jews and Brigantes, and these were easily put down. The one military result of interest to us now is the building in Britain of the wall of Antoninus from the Forth to the Clyde. Antoninus died of fever at Lorium in Etruria, probably March 7 161. His one surviving child married the Emperor Marcus Aurelius.

The only account of his life handed down to us is that of Julius Capitolinus, one of the Scriptores *Historiae* Augustae. See Bossart-Muller, *Zur* Geschichte des Kaisers A. (1868); Lacour-Gayett, *A.* le Pieux et son Temps (1888); Bryant, The *Reign* of *Antonine* (Camb. Hist. Essays, 1895); P. B. Watson, *Marcus* Aurelius *Antoninus* (1884), chap. ii.; for a general account of social conditions, Rostovtzev, Economic History of the Roman *Empire under* the Flavians and *Antonines* (1926).

ANTONIO (1531–95), claimant of the throne of Portugal, known as the Prior of Crato, was a grandson of King Emanuel the Great and son of Luis, duke of Beja, by a Jewess, Yolande Gomez. On the death of King John III. (1557) he claimed the Portuguese throne, to which Philip II. of Spain was also a claimant. He obtained some support from France and England for political reasons, but the small force which he raised in Portugal was easily routed by the duke of Alva at Alcantara (Aug. 25 1580).

Antonio fled to France, where Catherine de' Medici, who regarded him as a useful instrument against Philip II., connived at the fitting out of a fleet manned by Portuguese exiles and English and French adventurers. This fleet was defeated by the Spanish admiral Santa Cruz (July 27 1582). Driven from France by the attention of Philip II.'s agents, Antonio found refuge in England. In 1589, the year after the Armada, an English expedition under Drake and Norris, financed partly by Elizabeth and partly by private persons, set out to invade Portugal and establish Antonio as king. The expedition was a disastrous failure, costing thousands of lives. Antonio spent the rest of his life in exile, dying in Paris Aug. 26 1595. He was the author of a cento of the Psalms, *Psalmi* Confessionales (Paris, 1592), which was translated into English under the title of *The* Royal Penitent by Francis Chamberleyn (London, 1659), and into Germbn as *Heilige Betrachtungen* (Marburg, 1677).

BIBLIOGRAPHY.—Antonio is frequently mentioned in the French, English and Spanish State papers of the time. A life of him, attributed to Gomes Vasconcellos de Figueredo, was published in a French translation by Mme. de Sainctonge at Amsterdam (1696). A modern account of him, *Un prétendant* portugais au *XVIe siècle,* by E. Fournier (Paris, 1852), is based on authentic sources. See also Dom Antonio Prior de *Crato—notas* de *bibliographia,* by J. de Aranjo (Lisbon, 1897).

ANTONIO, NICOLAS (1617–1684), Spanish bibliographer, was born at Seville on July 31, 1617, and died at Madrid in the spring of 1684. His Bibliotheca Hispana nova, dealing with the works of Spanish authors who flourished after 1500, appeared in Rome in 1672; the Bibliotheca Hispana *vetus,* a literary history of Spain from the time of Augustus to the end of the 11th century, was revised by Manuel Martí and published by Antonio's friend, Cardinal José Saenz de Aguirre in Rome in 1696. A fine edition of both parts, with additional matter found in Antonio's manuscripts, and with supplementary notes by Francisco Perez Bayer was issued in Madrid in 1787–88. This great work, incomparably superior to any previous bibliography, is still unsuperseded and indispensable.

Of Antonio's miscellaneous writings the most important is the posthumous *Censura de historias fabulosas* (Valencia, 1742), in which erudition is combined with critical insight. His *Bibliotheca Hispana rabinica* has not been printed; the manuscript is in the national library at Madrid.

ANTONIO DE LEBRIJA (ANTONIUS NEBRISSENSIS) (1444–1522), Spanish scholar, born at Lebrija in the province of Andalusia, studied at Salamanca and at Bologna. After holding the professorship of poetry and grammar at Salamanca, he was transferred to the university of Alcalá de Henares, where he lectured until his death in 1522. His services to the cause of classical literature in Spain have been compared with those rendered by Valla, Erasmus and Budaeus to Italy, Holland and France.

BIBLIOGRAPHY.—MacCrie, *The Reformation in Spain in the Sixteenth Century* (1829); Antonio, *Bibliotheca Hispana Nova,* i. 132 (1888); Prescott, *History of Ferdinand and Isabella,* i. 410 (note).

ANTONIUS, the name of a large number of well-known citizens of ancient Rome, of the gens Antonia. The following are important:—

(1) MARCUS ANTONIUS (143–87 B.C.), one of the most distinguished Roman orators of his time, was quaestor in 113, and praetor in 102 with proconsular powers, the province of Cilicia being assigned to him. He was consul in 99, censor 97, and held a command in the Marsic War in 90. An adherent of Sulla, he was put to death by Marius and Cinna in 87. His reputation for eloquence rests on the authority of Cicero, none of his orations being extant. He is one of the chief speakers in Cicero's De *Oratore.*

See Velleius Paterculus ii. 22; Appian, *Bell. Civ,* i. 72; Dio Cassius xlv. 47; Plutarch, *Marius,* 44; Cicero, *Orator,* 5, *Brutus,* 37; Quintilian, *Instit.* iii. 1, 19; O. Enderlein, *De* M. *Antonio oratore* (1882).

(2) MARCUS ANTOXIUS, nicknamed CRETICUS in derision, elder son of the above, and father of the triumvir. He was praetor in 74 B.C., and received an extraordinary command to clear the sea of pirates. He failed in the task and made himself unpopular by plundering the provinces (Sallust, *Hist.,* iii., fragments ed. B. Maurenbrecher, p. 108; Velleius Paterculus ii., 31; Cicero, In *Verrem,* iii., 91). He attacked the Cretans, who had made an alliance with the pirates, but was totally defeated. Diodorus Siculus (xl. 1) states that he only saved himself by a disgraceful treaty. He died (72–71) in Crete. All authorities are agreed as to his avarice and incompetence.

(3) GAIUS ANTONIUS, nicknamed HYBRIDA from his half-savage disposition (Pliny, *Nat. Hist.* viii. 213), second son of Marcus (1) and uncle of the triumvir. Despite a bad reputation, he held the consulship in 63, with Cicero, and was subsequently appointed to Macedonia. There he made himself so detested that he left the province, and was accused in Rome (59) both of having taken part in the Catilinarian conspiracy and of extortion in his province. In spite of Cicero's eloquent defence, Antonius was condemned and went into exile at Cephallenia. He seems to have been recalled by Caesar, since he was present at a meeting of the senate in 44, and was censor in 42.

See Cicero, *In Cat.* iii. 6, *pro Flacco,* 38; Plutarch, *Cicero,* 12; Dio Cassius xxxvii. 39, 40; xxxviii. 10. On his trial *see* article Pauly-Wissowa's *Realencyklopädie.*

(4) MARCUS ANTONIUS, commonly called MARK ANTONY, the Triumvir, grandson of (1) and son of (2), related on his mother's side to Julius Caesar, was born about 83 B.C. In 54 he was with Caesar in Gaul. Raised by Caesar's influence to the offices of quaestor, augur, and tribune of the plebs, he supported the cause of his patron, and was expelled from the senate-house when the civil war broke out. He was deputy-governor of Italy during Caesar's absence in Spain (49), second in command in the decisive battle of Pharsalus (48), and again deputy-governor of Italy while Caesar was in Africa (47). In 46 he seems to have taken offence because Caesar insisted on payment for the property of Pompey which Antony had appropriated. But the breach was soon healed, for we find Antony meeting the dictator at Narbo the following year, and refusing when Trebonius suggested that he should join in the conspiracy. In 44 he was consul with Caesar. After the murder of Caesar on March 15 Antony determined to make himself sole ruler. At first he seemed disposed to treat the conspirators leniently, but at the same time he so roused the people against them by the publication of Caesar's will and by his eloquent funeral oration that they were obliged to leave the city. He forced the senate to transfer to him the province of Cisalpine Gaul, which was then held by Decimus Junius Brutus, one of the conspirators. Brutus refused to surrender the province and Antony set out to attack him in Oct. 44.

But at this time Octavian, whom Caesar had adopted, arrived in Italy and claimed the inheritance of his "father." Octavian obtained the support of the senate and of Cicero; and the veteran troops of the dictator flocked to his standard. Antony was denounced as a public enemy and Octavian was entrusted with the command of the war against him. Antony was defeated at Mutina (43), where he was besieging Brutus. The senate became suspicious of Octavian, who, irritated by its treatment of him, entered Rome at the head of his troops and forced the senate to grant him the consulship (Aug. 19). Meanwhile, Antony escaped to Cisalpine Gaul, effected a junction with Lepidus, and marched towards Rome with a large force. Octavian came to terms with Antony and Lepidus. The three leaders met at Bononia and adopted the title *Triumviri reipublicae constituendae* as joint rulers. Gaul was to belong to Antony, Spain to Lepidus, and Africa, Sardinia, and Sicily to Octavian. The arrangement was to last for five years. A reign of terror followed; proscriptions, confiscations, and executions became general, and Cicero, among others, fell a victim to Antony's revenge. In the following year (42) Antony and Octavian proceeded against the conspirators, and by the two battles of Philippi annihilated the senatorial and republican parties. Antony proceeded to Greece and thence to Asia Minor. On his passage through Cilicia in 41 he fell a victim to the charms of Cleopatra, in whose company he spent the winter at Alexandria. At length he was aroused by the Parthian invasion of Syria and the news that his wife Fulvia and his brother were at war with Octavian. On arriving in Italy he found that Octavian was already victorious; on the death of Fulvia, a reconciliation was effected between the triumvirs and cemented by the marriage of Antony with Octavian's sister. In the new division of the Roman world made at Brundusium Antony received the east. Returning to his province, he made several attempts to subdue the Parthians, without any decided success. In 39 he visited Athens, where he behaved in a most extravagant manner, assuming the attributes of the god Dionysus. In 37, after meeting Octavian in Italy and renewing the triumvirate for five years, he returned to Syria and Cleopatra. The way in which he disposed of kingdoms and provinces in her favour alienated his supporters, and in 32 the senate deprived him of his powers and declared war against Cleopatra. After two years spent in preparations, Antony was defeated at the battle of Actium (Sept. 2, 31). He followed Cleopatra, who had escaped with 60 ships, to Egypt and there, pursued by his enemies and deserted by his troops, committed suicide in the mistaken belief that Cleopatra had already done so (30 B.C.). Antony had been married in succession to Fadia, Antonia, Fulvia, and Octavia, and left a number of children.

See ROME, *History,* ii. "The Republic" (ad *fin.*); Caesar, *De Bello Gallico, De Bello Civili;* Plutarch, Lives of *Antony, Brutus, Cicero, Caesar;* Cicero, *Letters* (ed. Tyrrell and Purser) and *Philippics;* Appian, *Bell. Civ.* i.–v.; Dio Cassius xli–liii. In addition to the standard histories, *see* V. Gardthausen, *Augustus und seine Zeit* (1891–1904); W. Drumann, *Geschichte Roms* (2nd ed. P. Groebe), i. pp. 46–384 (1899); article by Groebe in Pauly-Wissowa's *Realencyklopädie;* and a short but vivid sketch by de Quincey in his *Essay on the Caesars.*

(5) LUCIUS ANTONIUS, youngest son of (2), and brother of the triumvir. In 44, as tribune of the people, he brought forward a law authorizing Caesar to nominate the chief magistrates during his absence from Rome. After the murder of Caesar, he supported his brother Marcus. He proposed an agrarian law in favour of the people and Caesar's veterans and took part in the operations at Mutina (43). In 41 he was consul, and had a dispute with Octavian, which led to the so-called Perusian War, in which he was supported by Fulvia (Mark Antony's wife). He was compelled to surrender to Octavian at Perusia. His life was spared, and he was sent by Octavian to Spain as governor. Nothing is known of his death.

See Appian, *Bellum Civile,* v. 14 **ff.;** Dio Cassius xlviii. 5–14.

(6) GAIUS ANTONIUS, second son of (2) and brother of the triumvir. He supported Caesar against Pompey, and in 44 was urban praetor. On his way to his province of Macedonia he fell into the hands of M. Junius Brutus, who at first kept him as hostage but ultimately put him to death (42).

See Plutarch, *Brutus,* 28; Dio Cassius xlvii. 21–24. On the whole family, *see* the articles in Pauly-Wissowa's *Realencyklopadie* i. pt. 2 (1894).

ANTONOMASIA, in rhetoric, the Greek term for a substitution of any epithet or phrase for a proper name; as "the author of *Paradise Lost*" for Milton.

ANTRAIGUES, EMMANUEL HENRI LOUIS ALEXANDRE DE LAUNAY, COMTE D' (1755?–1812), French publicist and political adventurer, was a nephew of François Emmanuel de Saint-Priest (1735–1821), one of the last ministers of Louis XVI. During the emigration he was the secret agent of the Comte de Provence (Louis XVIII.) at different courts of Europe, and at the same time received money from the courts he visited. At Venice, where he was attaché to the Russian legation, he was arrested in 1797, but escaped to Russia. Sent as Russian attaché to Dresden, he published a violent pamphlet against Napoleon I., and was expelled by the Saxon Government. He then went to London, and it was universally believed that he betrayed the secret articles of the Treaty of Tilsit to the British Cabinet, but his biographer, Pingaud, contests this. In 1812, he and his wife Madame Saint-Huberty, an operatic singer, were assassinated by a servant whom they had dismissed.

See H. Vaschalde, *Notice bibliographique sur Louis Alexandre de Launay, comte d'Antraigues, sa vie et ses oeuvres;* Léonce Pingaud, *Un Agent secret sous la révolution et l'empire, le comte d'Antraigues* (Paris, 1893); Edouard de Goncourt, *La Saint-Huberty et l'opéra au XVIIIe siècle.*

ANTRIM, RANDAL MACDONNELL, 1ST MARQUESS OF (1609–1683), son of the 1st Earl of Antrim, was born in 1609 and educated as a Roman Catholic. He married the widow of the 1st Duke of Buckingham. On the outbreak of the Scottish war, in 1639, he made a scheme to attack Argyll in Scotland, which came to nothing. From that time onwards he was engaged in various schemes for the assistance of Charles I. against the parliament—all of them abortive. He was at various times arrested as a suspect. The papers found on him at his capture in 1643 informed the parliamentary leaders of a plan for a rising by Montrose in Scotland to be supported from Ireland. On Jan. 26, 1644, Antrim was created a marquess. He was employed on various missions in Ireland and on the Continent until 1647, when he ceased to support the king's cause. In 1649 he entered into communications with Cromwell, for whom he performed various services, though there appears no authority to support Carte's story that Antrim was the author of a forged agreement for the betrayal of the king's army by Lord Inchiquin. Subsequently he joined Ireton and was present at the siege of Carlow. He returned to England in Dec. 1650, and in lieu of his confiscated estate received a pension of £500 and later of £800, together with lands in Mayo. At the Restoration, Antrim was excluded from the Act of Oblivion on account of his religion and, on presenting himself at court, was imprisoned in the Tower, subsequently being called before the lords justices in Ireland. In 1663 through the influence of the queen mother he obtained a pardon, his estates being restored to him by the Irish Act of Explanation in 1665. Antrim died on Feb. 3, 1683. He is described by Clarendon as of handsome appearance but "of excessive pride and vanity and of a marvellous weak and narrow understanding."

T.* Gilbert (1882–91); *Aphorismical Discovery* (Irish Archaeological Society, 1879–80); *Thomason Tracts* (Brit. Mus.), *E* 59 (18), 149 (12), 138 (7), 153 (19), 61 (23); *Murder will out, or the King's Letter justifying the Marquess of Antrim* (1689); *Hist. mss. Comm. Series mss. of Marq. of Ormonde.*

ANTRIM, a county in Ulster, Northern Ireland. It is bounded north and east by the narrow seas separating Ireland from Scotland, the Atlantic ocean and Irish sea, south by Belfast lough and the Lagan river dividing it from Down, west by Lough Neagh, dividing it from Armagh and Tyrone, and by the River Bann dividing it from Londonderry. Land area, 1,098 sq.mi. Pop. (excluding Belfast) 197.266. The hilly district to the east shows north to south trend lines. There are some outstanding peaks, such as Knocklayd (1,695ft.), Slieveanorra (1,676ft.), Trostan (1,817ft.), Slemish (1,457ft.), and Divis (1,567ft.); but the basalt which covers the greater part of the area has been largely weathered into a low plateau often covered by peat. The basalt reaches the sea along the north coast in steep cliffs; *e.g.,* the perpendicular columnar basalt of Giant's Causeway. Fair Head is another rocky eminence of dolerite, backed by gneiss and schistose grits. A narrow zone of Jurassic, Triassic, and Cretaceous rocks separates the basalt from the consequently milder east coast, which has low headlands and wide bays backed by the higher interior. Triassic and Cretaceous rocks also bound the basalt on the south-east and Trias is important near the lower Lagan. Lough Neagh occupies an irregularity in the surface of the basaltic plateau due probably to faulting in Pliocene times. It is bounded by basalt rocks on the north and by Pliocene deposits on the south. The plateau of the east slopes down gradually to the valley of the Bann, beyond which the basalt is found again in the hills of east county Londonderry.

Early History.—The evidences of palaeolithic life in Ireland are scanty and have led to diversity of opinion. There is considerably more data for the neolithic period. In Antrim there are traces of the beach 25ft. above the present sea-level which was probably formed in the period of the Littorina sea in north Europe, and in which are found the earliest certain human relics. The coast of Antrim was doubly important in neolithic times. Its proximity to Scotland makes it possible that it received some of the earliest immigrants into Ireland. Further, its chalk deposits, protected from excessive erosion by a capping of basalt, were rich in flint which was in great demand for the manufacture of weapons. It is rich in rude stone monuments. Amber beads suggest that Antrim remained in contact with north Europe via Scotland during the bronze age, and spiraliform designs may have reached bronze age Ireland from north or from south Europe.

The Romans did not land in Ireland. The civilizing influence of the Continent was felt, however, even in remote Antrim. St. Patrick is said to have been brought back among the prisoners after an Irish raid on the coasts of Britain. He became a swineherd on the western slopes of Slemish. Later he studied on the Continent and returned as a bishop, founding many churches in north-east Ireland.

During the period of Scandinavian influence, Norwegians, followed by Danes, penetrated along the lower Bann and also Belfast lough, and from these made raids into the surrounding country. To this period have been attributed the earlier round towers found in Ireland, examples of which may be seen at Antrim and Armoy and on Ram island in Lough Neagh.

Antrim's position in the far north delayed its conquest by the Normans. Henry II., however, authorized John de Courcy to go into Ulster. He marched north, defeated MacDonlevy and took his kingdom, consisting of modern Antrim and Down. Ruins of castles may be seen perched on basalt crags fringing the coast from Carrickfergus to Dunluce and Dunseverick. The first-named has a commanding position of strategic importance and was occupied by Edward Bruce during his expedition to Ireland in 1315. During Tudor times there was a considerable infiltration of Scots into Antrim which, therefore, has a mixed population, althcugb

it was not included in the territory partitioned during the plantation of Ulster. It was a recognized division before the general establishment of shires.

Economic Survey. — The chief centres of population in later times are in the lowlands and along the coastal fringe. With the exception of Belfast (*q.v.*) and possibly of Larne, there is no large port around the coasts of Antrim. The numerous bays, however, afford shelter for small fishing villages and holiday resorts. Larne has passenger communication with the Scottish ports of Stranraer and Ayr. The fisheries of the Bann and of Lough Neagh are not only attractive to sportsmen but are also of commercial value, the chief centre being Toome.

The plateaux of east Antrim consist of heathery moorland with a few scattered peat deposits. They provide pasturage for sheep but are sparsely populated, most of the villages being in the valleys. The more recent deposits of the valleys of the Bann and the Lagan, and also of the lowlands around Lough Neagh, form the richest agricultural areas. Oats, potatoes and flax are the principal crops. The production of flax increased considerably during the World War but has been on the decrease since. The peasants of Antrim and of Ulster in general depend largely on the potato crop and have suffered so much in bad seasons that attempts are being made to encourage home industries and to organize resources scientifically. The cultivation of fruits is being encouraged and extended. The valley of the Lagan provides rich pasturages which are famous as cattle-fattening centres.

The great linen and ship building industries of Antrim centre on Belfast (*q.v.*) which is the metropolis of the area. Other centres of the linen industry are Lisburn on the Lagan, and Ballymena on the Braid. The former probably owes its importance to skilled Huguenot weavers who settled there after the revocation of the Edict of Nantes. Industry in Antrim has been handicapped by absence of local supplies of coal and iron, but it has grown in Belfast to which such supplies can easily be brought by water, chiefly from Scotland. Some coal for local needs is mined at Ballycastle. There are a few minor activities which should be noted. Whisky distilling is carried on at a few centres. Bushmills in the north has several paper mills. Rock salt some 80ft. thick is mined near Carrickfergus. The Keuper clays yield material for bricks. Bauxite, which is believed to be derived from the decay of lavas, is found between Glenarm and Broughshane, in association with iron-ores, both these materials being worked commercially. Bauxite occurs also near Ballintoy.

With the exception of the Great Northern railway line from Belfast to the south and west, with a branch from Lisburn to Antrim, the principal lines of communication are those of the L.M.S.R. The railway network depends largely on the physical features of the county. From Belfast there is a line up the fertile Lagan valley with connections to Antrim and Ballymena and thus along the west of the main mountain area to Coleraine. Another line from Belfast skirts the important north shore of Belfast lough, through Carrickfergus to Larne. Valley routes have been utilized to give this packet station inland connections with Ballymena and also with a line connecting Antrim and Belfast lough. Two other routes across the mountains of the east may be mentioned. From Ballymena a line runs some distance beyond Parkmore; from Ballymoney there is a branch to Ballycastle. Along the east coast the absence of important towns and the narrowness of the coastal plain have hindered development of communication, the chief centres being linked, as already stated, with inland towns rather than directly with one another along the coast.

The county is divided into nine urban districts and nine rural districts and into seven poor law unions. It returns seven members to the parliament of Northern Ireland and two members to the parliament of Great Britain and Northern Ireland.

ANTRPM, a town, County Xntrim, Northern Ireland, in a valley half a mile from Lough Neagh. Pop. **(1926)** 1,979. Near the town is one of the most perfect of the round towers of Ireland, 93ft. high and 50ft. in circumference at the base, which may perhaps have been a protection against the Scandinavians who made Lough Neagh one of their bases. Antrim Castle also testifies to the strategic advantages of the site, which in more peaceful times led to the rise of a small market town, with manufactures of paper, linen and woollen cloth, commanding important routes. The town now has railway communications with Belfast, Larne, Coleraine and other important centres.

ANTRUM, a chamber or recess. When applied to the human body, the unqualified term usually refers to the antrum of Highmore or maxillary sinus. This is an air space situated in the cheek bone on either side of the nasal orifice. It is the largest of the bony sinuses which communicate with the nasal cavity. It is lined with mucous membrane, and opens into the nasal cavity by a small hole at the highest point on its inner wall. During the course of a cold its lining membrane is usually inflamed like that of the rest of the nose, and if its opening becomes closed by a plug of mucus or by swelling of the mucous membrane, pus may accumulate in the cavity and give rise to fever and pain. On account of the position of its opening, natural drainage is poor, and sometimes it is necessary to make an artificial opening at a lower level, to facilitate irrigation and drainage. Other antra are: the pyloric antrum, the lower third of the stomach between the large fundus and the narrow pyloric canal; the duodenal antrum or duodenal bulb, a dilatation in that part of the duodenum continuous with the stomach; the tympanic or mastoid antrum, a small air space in the mastoid bone leading from the middle ear to other air spaces in the mastoid.

ANTRUSTION, the name of the members of the military household of the Merovingian kings. Any one desiring to enter the body of antrustions had to present himself armed at the royal palace, and there, with his hands in those of the king, take a special oath in addition to the oath of fidelity sworn by every subject at the king's accession. In return for the services to which he was bound the antrustion became specially entitled to the royal assistance and protection, and his *wergeld* was three times that of an ordinary Frank. The antrustion was always of Frankish descent, and only in certain exceptional cases were Gallo-Romans admitted into the king's bodyguard. The antrustions, belonging as they did to one body, had strictly defined duties towards one another; thus one antrustion was forbidden to bear witness against another under penalty of 15 *solidi.*

The antrustions seem to have played an important part at the time of Clovis. Afterwards, their rôle became less important. For each of their expeditions, the kings raised an army of citizens in which the Gallo-Romans mingled more and more with the Franks; they only kept one small permanent body which acted as their bodyguard, some members of which were from time to time told off for other tasks, such as that of forming garrisons in the frontier towns. The institution seems to have disappeared during the anarchy with which the 8th century opened.

ANT-THRUSH: *see* **PITTA.**

ANTUNG, a treaty port in eastern south Manchuria on the Korean frontier (39° 59' N. 124° 30' E.). It lies at the mouth of the Yalu river and is the natural outlet of its basin, which drains the tangled forested mountain country of east Manchuria and west Korea. Its importance as a timber market, especially significant by reason of the generally treeless character of north China, is a result of this position. Antung has had long-standing trading relations with Chefoo in the silk trade in which Antung has long been tributary to Chefoo but which she now threatens to supplant. The modern importance of Antung, however, is bound up essentially with its position as a frontier station through which the railway from Korea, whose communications are closely linked with those of Japan, passes into south Manchuria, across a long bridge over the Yalu. This railway connection is particularly significant in view of the Japanese direction of the development of south Manchuria. Japan in fact monopolizes the foreign import trade of Antung and takes one-half of its exports of raw silk and bean products. At the beginning of the present century

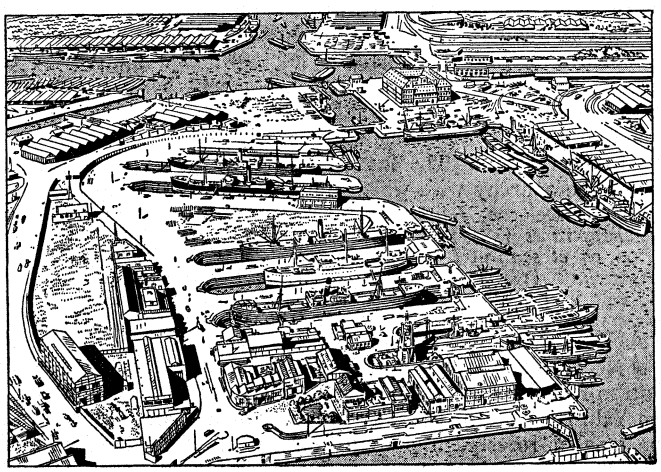
timber was the most important export of Antung, but it has since given place to silk and to bean products. The volume of trade has risen steadily since 1907, when the port was opened to foreign trade. In 1938 total exports amounted to $12,890,621; imports totalled $24,334,841. Population (1938), 315,242.

ANTWERP, the most northern of the nine provinces of Belgium, conterminous with the Dutch frontier on the north. Malines, Lierre and Turnhout are among its towns, but the chief one is the commercial metropolis of Belgium. It is divided into districts (*arrondissements*), viz., Antwerp, Malines, Lierre, Turnhout and Boom. These are subdivided into 23 cantons and 154 communes. Area 1,104 sq.mi. Pop. (est. 1938) 1,254,242 or 1,136.1 per sq.mi.

ANTWERP (ANTWERPEN, French Anvers), a fortified city in Belgium on the right bank of the Schelde. It is the capital of the province of the same name and Belgium's commercial centre.

In the 4th century Antwerp was mentioned as one of the places in the second Germany, and in the 11th century Godfrey of Bouillon was for some years best known as marquis of Antwerp Antwerp was the headquarters of Edward III during his early negotiations with van Artevelde, and his son Lionel, earl of Cambridge, was born there in 1338. At the end of the 15th century, with the closing of the Zwyn, the foreign trading gilds or houses were transferred from Bruges to Antwerp, and the building assigned to the English is mentioned in 1510. In 1560, the highest point of its prosperity, six nations, viz., Spaniards, Danes and Hansa together, Italians, English, Portuguese and Germans, mere named and over 1,000 foreign merchants were resident. Guicciardini, the Florentine merchant, described the activity of the port, into which 500 ships sometimes passed in a day, and as evidence of the extent of its land trade he mentioned that 2.000 carts entered the city each week. Venice had fallen from its first place in European commerce, but still it was active and prosperous. Guicciardini, in explaining the importance of Antwerp, stated that there was as much business done there in a fortnight as in Venice in a year.

The religious troubles that marked the second half of the 16th century broke out in Antwerp as in every other part of Belgium excepting Liége. In 1576 the Spanish soldiery plundered the town during what was called "the Spanish Fury," and 6,000 citizens were



PIX PROM PUBLIX

THE PORT OF ANTWERP IS THE TERMINUS OF THE BELGIAN RIVER AND CANAL SYSTEM AND SERVES BOTH INLAND AND OCEAN NAVIGATION

massacred. Eight hundred houses were burned down, and over two millions sterling of damage was wrought in the town on that occasion.

In 1585 a severe blow was struck at the prosperity of Antwerp when Parma captured it after a long siege and sent all its Protestant citizens into exile. The recognition of the independence of the United Provinces by the Treaty of Miinster in 1648 carried with it a severe blow to Antwerp for it stipulated that the Schelde should be closed to navigation. This impediment remained in force until 1863, although the provisions were relaxed during French rule from 1795 to 1814, and also during the time Belgium formed part of the kingdom of the Netherlands (1815 to 1830). Antwerp had reached the lowest point of its fortunes in 1800, and its population had sunk under 40,000, when Napoleon, realizing its strategical importance, assigned two millions for the construction of two docks and a mole.

In 1830 the city was captured by the Belgian insurgents, but the citadel continued to be held by a Dutch garrison under Gen.

ANTWERP IS NOT ONLY ONE OF THE WORLD'S BUSIEST PORTS BUT HAS A PROFOUND HISTORIC AND ARTISTIC INTEREST. THE CATHEDRAL, THE BEST EXAMPLE OF GOTHIC CHURCH ARCHITECTURE IN BELGIUM. WAS BEGUN IN 1352. IT HAS A BEAUTIFUL TOWER 400 FT. HIGH AND CONTAINS MANY PAINTINGS BY FLEMISH MASTERS AND A HEAD OF CHRIST ATTRIBUTED TO LEONARDO DA VINCI

ChassC. For a time this officer subjected the town to a periodical bombardment which inflicted much damage, and at the end of 1832 the citadel itself was besieged by a French army. During this attack the town was further injured. In Dec. 1832, after a gallant defense, Chassé made an honourable surrender.

Between 1878 and 1914 it was converted from a fortress to a fortified position by construction of an outer line of forts 5 to 11 mi. from the city, but none of these had been completed when war was declared in Aug. 1914. The Belgian government left Brussels for Antwerp on Aug. 17, 1914; and three days later the Belgian army took up a position behind the fortified lines. The bombardment began on Sept. 28 and on Oct. 9 the city surrendered.

On May 18, 1940, during World War II, the Germans again occupied Antwerp in their drive toward the channel ports. The fall of the city endangered the whole Belgian army, which surrendered at the command of King Leopold III ten days later.

Antwerp is finely laid out with broad avenues along the first enceinte. Long streets and terraces of fine houses belonging to merchants and manufacturers testify to its prosperity, and recall the 16th century distich that Antwerp was noted for its moneyed men ("Antwerpia nummis"). Despite war and disturbances it still preserves many memorials of its early grandeur, notably its

fine cathedral, begun in the 14th century, but not finished till 1518. Its tower of over 400 ft. is seen from afar over the flat country. A second tower was planned but never erected. The proportions of the interior are noble, and in the church are hung three of the masterpieces of Rubens, viz , "The Descent from the Cross," "The Elevation of the Cross" and "The Assumption." St. James is far more ornate than the cathedral, and contains the tomb of Rubens, who devoted himself to its embellishment.

The old Bourse or Exchange (1531) was destroyed by fire in 1858 and was replaced by a new one in 1872. Fire has also destroyed several other old buildings in the city, notably in 1891 the house of the Hansa League on the northern quays. The Maison Plantin, the house of the great 15th century printer C. Plantin (*q.v.*) and his successor Moretus, stands exactly as it did in the time of the latter. The new picture gallery close to the southern quays is a fine building divided into ancient and modern sections. The collection of old masters is very fine, containing many splendid examples of Rubens, Van Dyck, Metsys and the chief Dutch masters.

Antwerp, famous in the middle ages and in the 20th century for its commercial enterprise, enjoyed in the 17th century a celebrity not less distinct or glorious in art for its school of painting, which included Rubens, Van Dyck, Jordaens, Bruegel, the two Teniers and many others.

Commerce+ — In1863 Dutch rights to levy toll were redeemed by purchase and Antwerp thereafter grew rapidly in shipping tonnage. World War I made a complete break, but after the war trade rapidly surpassed prewar achievements, with a tonnage of 15,050,182 in 1922, rising steadily to more than 20,000,000 in the 1930s. Docks were built progressively before 1914, and included (1) the little or Bonaparte dock, (2) the Willem dock, also of Napoleon's time, (3) the Junction dock, (4) the Kattendijk, built 1860, enlarged 1881, (5) the Wood dock, (6) the Kempische dock, (7) the Asia dock linked by canal with the Meuse, as well as the Schelde, (8) the Lefebvre dock, (9) the America dock, opened 1905. Extensions after 1918 included construction of a canal dock over three miles long which stretches from the old wet dock No. 3 to the bend of the Schelde at Kruisschans, where it ends in a maritime lock approximately 886 ft. long and 115 ft. wide, with a depth ranging from 33 to 48 ft.

The dock itself is maintained at a depth of about 39 ft., and is connected with the other docks in the harbour by a channel about 440yd. long and 110yd. wide. Further schemes of extension included the construction of wet docks adjoining the canal dock and in 1925 the building of two wet and three dry docks was undertaken. The complete plan was designed to give the port a total dock water area of 1,334ac. and a quayage length of 28 miles. The necessary railway extensions bring the length of the port railway system up to 500 miles. The improvements at Antwerp are not confined to the construction of new docks. The quays flanking the Schelde, 3½m. in length, are of granite, with hydraulic cranes, warehouses, etc. The construction of river boats for export to Africa was resumed after 1918, and this industry rapidly approached its former importance. Shipbuilding proper showed but little prosperity; ship-repairing is done. In 1927 the port obtained the right to export Alsatian potash to the amount of 150,000 tons per annum and storage buildings for this are being built.

Limits and Population. — At the time of the declaration of Belgian independence Antwerp's defence was its citadel and an enceinte of about 2½ miles. In 1859, in a general reorganization of Belgian defence, the old enceinte and the citadel with the exception of the Steen, now a historical museum, were removed. A new enceinte of 8m. was devised which is now being demolished to allow of further extensions. In May 1927 the area controlled by the municipality was increased by growth north ards to the extent of 3,500 hectares, with absorption of five villages. Napoleon thought the left bank of the Schelde was the most natural line of expansion of Antwerp and there have been projects of a tunnel under the river but nothing has yet been done.

In 1800 the population did not exceed 40,000 In 1846 it was 88,487; in 1851, 95,501; in 1880, 169,100; in 1900, 272.830; in 1904, 291,949 or, with two incorporated suburbs, 361.723; in 1930, 284,373; in 1938 (est.), 273,317.

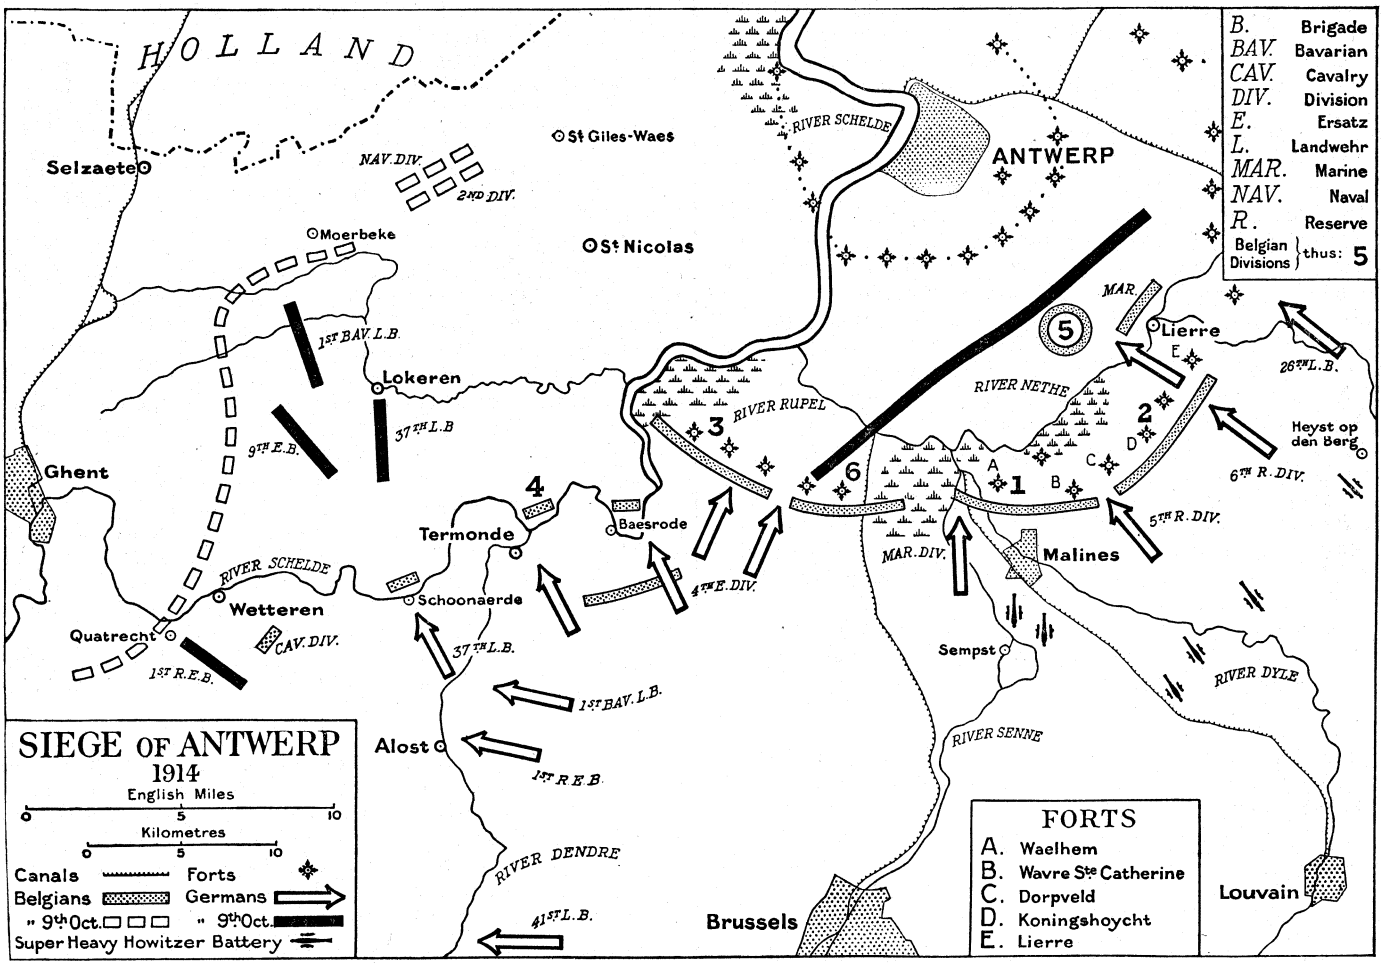
ANTWERP, SIEGE OF, Sept.–Oct. 1914. This was the preliminary move of the Germans' second bid for victory in the World War, after their opening sweep through Belgium and Northern France had been foiled in the Battle of the Marne. In rear of the Meuse the natural line of defence for the Belgian Army against an adversary from the east is the Schelde and the entrenched camp of Antwerp. As a commercial metropolis Antwerp was an obvious centre for arsenals, hospitals and stores of munitions and provisions, and it became the army's base of operations. By reason of its situation the fortress was also a refuge, if only a temporary one; and it was an excellent fiank position for use against the lines of communication of the German Armies operating in the north of France. Through Ostend and Zeebrugge, Antwerp had easy means of communication with England. Under the shelter of Antwerp and the Schelde, British troops could safely land in Flanders, operate in liaison with the Belgian Army, protect the Pas-de-Calais coast with its sea traffic, vital to England, and prevent the Allied left wing from being turned and enveloped.

The Defences Described. — The entrenched camp of Antwerp, as it was in 1914, was the result of two distinct undertakings, the first carried out between 1859 and 1870 under the direction of Brialmont, and comprising a line of detached forts placed about two to three miles from the agglomeration of buildings, and a polygonal enceinte on the outskirts of the city; the second, aiter 1906, which provided a principal line of defence, at a distance of 5 to 11m. from the city proper, composed of 17 forts about 3m. apart, with permanent redoubts in the intervals. Forts and redoubts were constructed entirely of ordinary concrete, with vaults 2·50 metres thick at the crown and surrounded by wet ditches, 33ft. wide. The old fort line mas about to be transformed into an *enceinte de sûreté,* the forts being organized for small weapons and connected by concrete redoubts and a grille.

These extensive works had necessarily to be spread over several years and on the outbreak of hostilities in 1914, not one of the forts planned in 1906 was completed. No equipment for fire observation and no observation posts existed and the necessary survey work for firing by the map was incomplete. The substructures and the armouring, constructed to resist the 21-cm. mortar, were not calculated to face 30·5- or 42-cm. projectiles. The total perimeter was 60m. of which 6m. were protected by inundations. The defence force numbered only 40,000 men, most of whom had seen no military service for ten years. The staff was entirely inadequate for the duties.

Operations Begin — The retreat of the Belgian Army behind the Nethe on Aug. 20 (*see* BELGIUM, INVASION OF [1914]), was temporary. When the German I. Army wheeled through and past Brussels on its way to France, it dropped the III. Res. Corps under von Beseler, and three Landwehr brigades, to face northward as a flankguard against the Belgian Field Army in Antwerp. Von Beseler took up his position on the line Grimberghen-over-de-Vaert-Aerschot. On Aug. 25 and again on Sept. 9 the Belgians, in co-operation with the Allied attacks on the frontiers and the Marne, made sorties from Antwerp and attacked his lines. On the second of these occasions his situation was at one time critical. A third sortie was being prepared toward Sept. 20, when reports began to come in of important German movements and of a quantity of very heavy artillery on the roads in the region north of Brussels. Falkenhayn, acting as chief of the general staff, had given the order to carry the fortress and the powerful *matériel,* which had laid in ruins the forts of Liége, Namur and Maubeuge, was being established in position between the Senne and the Grande Nethe, from Sempst to Heyst. The total artil-



MAP SHOWING STAGES IN THE ATTACK OF THE GERMAN ARMY ON THE FORTIFICATIONS OF ANTWERP IN 1914

Antwerp, with its double ring of forts from which sorties could be made, became a menace to the right flank of the German army during its advance toward Paris in 1914. The Germans, therefore, decided to carry the fortress by means of the heavy artillery, which had already laid in ruins the forts of Liége, Namur and Maubeuge. The bombardment by 186 pieces of field artillery, among which were 13 super-heavy howitzers of 30.5 and 42 cm., began on Sept. 28, and continued for 4 days with clocklike regularity. The outer ring of forts was destroyed, and the Belgians compelled to evacuate them on Oct. 4. To save Antwerp itself from a destruction which would have been without military advantage, the civil authorities capitulated on Oct. 10. The plan marks the various stages of the attack which, as will be seen, followed Napoleon's principle of striking always at the weakest spots with superior foroe

lery strength of the Germans before Antwerp was 186 pieces of field artillery, 48 long guns of 10, 13, and 15 cm., 120 howitzers of 15 and 21 cm. and 13 super-heavy howitzers of 30·5 and 42 cm.

Von Beseler's army group comprised at that time the 37th Landwehr Bde. between Alost and Termonde, where it had served in flank guard since Sept. 14; the 4th Res. Div. between Termonde and the Willebroeck Canal; the Marine Div. between this canal and the Dyle about Malines; the III. Res. Corps from the Dyle to the Antwerp-Aerschot railway and the 26th Landwehr Bde. north of Aerschot, with a group furnished by the III. Res. Corps further to the right front of Westerloo.

On Sept. 27 the Belgian Field Army was distributed as follows: The 1st and and Divs. between the Senne and the Nethe, from Willebroeck to Lierre, with the 5th Div. in reserve north of the Nethe; the 6th and 3rd Divs. between the Senne and the Schelde; the 4th Div. at Termonde and the Cavalry Div. about Alost-Wetteren to cover the communications between Antwerp and the sea.

The German Bombardment.--On the morning of the 28th the German bombardment was let loose along the whole front between Termonde and Lierre. It at once became clear that the attack was being concentrated on the south front of the fortress. Von Beseler had not the necessary forces to prosecute a siege on another side while still covering the communications through Brussels against a sortie. Trusting in the proved powers of his weapons of attack which, installed beyond the range of the Belgian gun, could fire as deliberately as on an experimental range, he decided to spare his infantry, to destroy the forts and throw into confusion the lines of defence by gunfire, controlled by aircraft. These results attained, he proposed cautiously to advance his infantry and gain a footing in the shattered forts and pulverized lines of defence.

The bombardment was continued for four days with clocklike regularity. It was directed against four forts (Waelhem, Wavre Ste. Catherine, Koningshoycht and Lierre) and the spaces between them. The concrete was inferior in quality to that of Liége and Namur, and galleries were pierced, men's quarters destroyed, cupolas razed, jammed or made inaccessible; powder magazines blew up, fires broke out and the air in the shelters became unbreathable. Forts and trenches had been reduced to rubbish heaps by the time that the enemy, on Oct. 1 at 5 P.M., delivered his assault. Resistance was offered everywhere except at Wavre Ste. Catherine, where the garrison had been driven away by the flames.

The bombardment recommenced on Oct. 2, increasing in precision, and the inevitable happened. The Dorpveld redoubt and Fort Waelhem, which had been reduced to the last extremity, now surrendered. The Tallaert redoubt blew up; the Koningshoycht and Lierre forts, which had been ruined, were evacuated. On the night of Oct. 2–3, and on Oct. 4, all the defence troops were transferred to the north of the Nethe from Waelhem to Lierre. The Belgian troops now began seriously to be disheartened. For a fortnight past the race to the sea had been in progress in France, the battle front had reached Arras and Béthune and fresh German masses were traversing Belgium in a westerly direction. The question was, would the Allies win the

race in time to join hands with the Belgians on the Schelde? This junction was essential, even if it entailed the abandonment of the fortress. The king was strongly in favour of holding the fortress until the last extremity, in order to keep occupied the German troops and material now concentrated before it, and also to gain time for the formation of a Franco-British-Belgian front on the Dendre or on the Schelde, leaning on the Dutch frontier.

Assistance from Britain. — Mr. Winston Churchill, at that time First Lord of the Admiralty, fully realized the rôle of the fortress as the bulwark of the Pas-de-Calais. When he heard that the Belgian Government was to leave the city he came to take stock of the situation. The king informed him personally of the task he proposed for the Belgian Army on the extreme left of the Allies. Entirely in agreement, Mr. Churchill returned to London to push forward the dispatch of English and French reinforcements to Antwerp and, above all, to Ghent.

The immediate result of Mr. Churchill's intervention was the arrival at Antwerp on the evening of Oct. 3 of a brigade of 2,000 nien of the British Royal Naval Division. The appearance of these, the first Allies the Belgian soldiers had set eyes on during the two months of the War, roused enthusiasm, but unfortunately this assistance could be no more than a moral stimulus. Meantime, von Beseler was bringing up his heavy batteries to crush Fort Kessel, while his infantry was making its way slowly into Lierre, being held up on the northern boundary of that town by the fire of the marine brigade on the 5th. To the south of the town four German battalions crossed the Nethe under cover of the bombardment and on the night of Oct. 5–6 the 5th Belgian Division made what, in the circumstances, was a gallant attempt to push them back into the river.

This counter-attack, with bayonets fixed and unloaded rifles, reached the Nethe at one point and caused the enemy serious alarm for a moment, but the fatigue of the attacking troops and the superiority of the German artillery rendered any permanent success impossible. It was essential to save the Belgian Army from being surrounded, and the king decided that the field troops should cross the Schelde on the night of Oct. 6–7 and march to join the British 7th and 3rd Cavalry Divs. then landing at Zeebrugge and Ostend, which were to move to Ghent in conjunction with a brigade of French marines. The decision came just in time, for on Oct. 7 the Germans forced the Schelde at Schoonaerde and pushed on toward Lokeren.

The **City** Abandoned. — The continuation of the defence was entrusted to Gen. Deguise with the garrison troops, the 2nd Division and the British Naval Division, which had been brought up to 10,000 men. The general placed these two divisions on the line of forts 1 to 8, where throughout the days of the 7th and 8th they stoically endured the usual bombardment. An attempt to intimidate the governor by the bombardment of the city had no effect. The departure of the field army, on the other hand, did affect the morale of the population and the fortress troops. The British Admiralty did not want the Naval Division to be surrounded and telephoned for it to be withdrawn, whereupon Deguise decided to withdraw the 2nd Division also, to abandon the city and to continue the defence on the left bank. But the fortress troops had now reached the limit of their endurance and the general, knowing the Germans to be near Lokeren, authorized officers and units to leave the fortress and rejoin the field army. Meanwhile the civil authorities, seeing the city empty of troops and threatened with destruction by the fires which had been started by the bombardment, sent a deputation to von Beseler to save the city from a disaster which could have no military advantage. The fortress was empty, the works out of action; on Oct. 10 the governor signed the capitulation. (See BELGIUM, INVASION OF.)

ANU, a Babylonian deity, who, as the first figure in the triad Anu, Enlil and Ea, came to be regarded as the father and king of the gods. Anu is prominently associated with the city of Erech in southern Babylonia, but the cult was transferred to this place in prehistoric times from Der east of the Tigris. At Erech he was closely associated with the worship of his daughter, the heaven goddess Innini-Ishtar. The name signifies the "high one" and he was probably a god of the atmospheric region above the earth—perhaps a storm god like Adad (*q.v.*). In the old Babylonian period; *i.e.,* before Hammurabi, Anu was regarded as the god of the heavens and his name became in fact synonymous with the heavens, so that in some cases it is doubtful whether, under the term, the god or the heavens is meant. To Anu was assigned the control of the heavens, to Enlil the earth, and to Ea the waters. The summing up of divine powers manifested in the universe in a threefold division represents an outcome of speculation in the schools attached to the temples of Babylonia, but the selection of Anu, Enlil and Ea for the three representatives of the three spheres recognized, shows that each of the three must have been regarded in his centre as the most important member in a larger or smaller group, so that their union in a triad marks also the combination of the three pantheons into a harmonious whole.

In the astral theology of Babylonia and Assyria, Anu, Enlil and Ea became the three zones of the ecliptic, the northern, middle and southern zone respectively. The purely theoretical character of Anu is thus still further emphasized, and in the annals and votive inscriptions as well as in the incantations and hymns, he is rarely introduced as an active force to whom a personal appeal can be made. His name becomes little more than a synonym for the heavens in general and even his title as king or father of the gods has little of the personal element in it. A consort Antum (or as some scholars prefer to read, Anatum) is assigned to him, on the theory that every deity must have a female associate, but Antum is a purely artificial product and is really a title of Ishtar as queen of heaven. Anatum became the special name of Ishtar as "lady of battle." She was identified with the Western Asiatic *Ashratum. Anu* and *A-an-turn* occur in the Hittite treaties of the 16th-14th centuries, but it is not certain that the Syrian-Canaanite war goddess *'Anat* was borrowed from Babylonian Antum or Anatum. Egyptian war goddess *'Anat* is an Asiatic importation.

ANUBIS: *see* EGYPT: *Religion.*

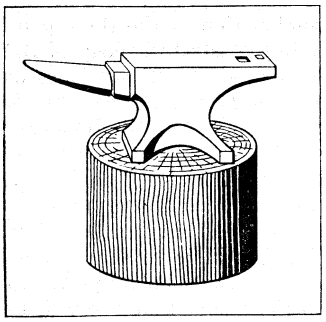
ANURA, the name for that division of the Amphibia (*q.v.*) which includes the frogs and toads (*qq.v.*); it is characterized by the absence of a tail and the elongation of the hind legs.

ANURADHAPURA, the second and most famous capital of the ancient Sinhalese kings. It is the administrative capital of the North Central province of Ceylon, and is the resort of many Buddhist pilgrims. It was established in the jth century B.C., and was the seat of government at the time of the conversion of its king and his people to Buddhism by Mahinda, a son of Asoka. It suffered much during the earlier Tamil invasions, and was evacuated by the Sinhalese in A.D. 760 in favour of Polonnaruwa. It Is situated in the close neighbourhood of the tno huge artificial reservoirs of Tissa Wewa and Nunara Wewa. Of its archaeological remains the most remarkable are its huge pyramidal *dagobas,* constructed of small sun-dried bricks; its *pokunas,* or bathing-pools; and the foundations of monastic buildings and palaces. The city contains the famous Bo-tree, believed to be originally a branch of the very tree under the shade of which Gautama attained to Buddhahood, miraculously transported from India in 245 B.C. It is the oldest tree in existence of which we have any historical record. The city was completely abandoned to the jungle until it was rediscovered and opened up by the British government in the middle of the 19th century. It is on the main line of railway from Polghawela to Mannar, Jaffna and Trincomalee. Population (census 1931), town, 8,975; province, 97,365.

ANUS, the terminal aperture of the intestinal tract. This is not to be confused with the rectum, of which it is the final portion. In the embryo the anus is closed by a membrane which normally ruptures shortly before birth. Encircling the anal canal are the muscle fibres which control the evacuation of faeces, When contracted they throw the skin and mucous membrane into folds, giving a wrinkled appearance. The common disorder called haemorrhoids or piles is due to dilated veins which project from the anus and often bleed. Cancer of the rectum or anus may also cause bleeding.

ANVARI (Auhad ad-din Anvari), Persian poet, born in Khorasan early in the 12th century, enjoyed the especial favour of the sultan Sinjar, whom he attended in all his warlike expeditions. Anvari died at Balkh towards the end of the 12th century. The *Diwan,* or collection of his poems, consists of a series of long poems, and a number of simpler lyrics. His longest piece, The Tears of Khorassan, was translated into English verse by Captain Kirkpatrick.

ANVIL, a mass of iron on which material is supported while being shaped under the hammer. The blacksmith's common anvil is made of wrought iron, often in America of cast iron, with a smooth working face of hardened steel. It has at one end a projecting conical beak or bick for use in hammering curved pieces of metal; occasionally the other end is also provided with a bick, which is then partly rectangular in section., There is also a square hole in the face, into which tools, such as the anvil-cutter or chisel, can be dropped, cutting edge uppermost. For power hammers the anvil proper is supported on an anvil block of great massiveness, sometimes weighing over 200 tons for a 12-ton hammer, and this again rests on a strong foundation of timber and masonry or concrete. (See FORGING.)



THE ANVIL. AN IMPLEMENT DATING FROM THE EARLIEST ATTEMPTS OF MAN TO WORK IN METAL

ANVILLE, JEAN BAPTISTE BOURGUIGNON D' (1697–1782), perhaps the greatest geographical author of the 18th century, was born at Paris on July 11 1697. One of D'Anville's main objects was to reform geography by putting an end to the blind copying of older maps, by testing the commonly accepted positions of places through a rigorous examination of all the descriptive authority, and by excluding from cartography every name inadequately supported. Vast spaces, which had before been covered with countries and cities, were thus suddenly reduced almost to a blank.

D'Anville's historical method was useful in his 1743 map of Italy, which first indicated numerous errors in the mapping of that country, and was accompanied by a valuable memoir (a novelty in such work) showing in full the sources of the design. A trigonometrical survey which Benedict XIV. soon after had made in the papal States strikingly confirmed the French geographer's results. In his later years D'Anville did service to ancient and mediaeval geography; he mapped afresh all the chief of the pre-Christian civilizations (especially Egypt), and wrote *Mémoire* et *abrégé* de *géographie ancienne et générale* and Etats *formés* en Europe *après la* chute *de l'empire* romain en *occident* (1771). His last employment consisted in arranging his collection of maps, plans and geographical materials. It was the most extensive in Europe, and had been purchased by the king, who, however, left him the use of it until his death, which occurred in Jan. 1782, after he had been for two years in a state of mental and bodily decay.

D'Anville's published memoirs and dissertations amounted to 78, and his maps to 211. A complete edition of his works was announced in 1806 by de Manne in 6 vols. quarto, only two of which had appeared when the editor died in 1832. *See* Dacier's *Éloge de d'Anville* (1802). Besides the separate works noticed above, d'Anville's maps executed for Rollin's *Histoire ancienne* and *Histoire romaine,* and his *Traité des mesures anciennes et modernes* (1769), deserve special notice.

ANWEILER or **ANNWEILER,** a town in the Bavarian palatinate, Germany, on the river Queich, 8m. W. of Landau. Pop. (1933) 4,267. A well-known red sandstone is quarried in the picturesque neighbouring hills of the Haardt, here called the Palatinate Switzerland. On the Sonnenberg (1,600ft.) is the ruined castle of Trifels, where Richard Coeur de Lion was imprisoned (1193). Industries include cloth-weaving, tanning, dyeing and saw-milling, and trade is in wine.

ANXUR: see TERRACISA.

ANZENGRUBER, LUDWIG (1839–89), Austrian dramatist and novelist, was born at Vienna, Nov. 29 1839, and died there on Dec. 10 1889. He earned a precarious livelihood by journalism, then became a clerk in the police department until 1870, when he made a hit with his anti-clerical play, "Der Pfarrer von Kirchfeld." Anzengruber made his greatest successes with plays of Austrian peasant life. Der *Meineidbauer* (1871) is a gloomy picture, but Die *Kreuzelschreiber* (1872), Der *G'wissenswurm* (1874) and *Doppelselbstmord* (1875) are gay and witty comedies. Das vierte Gebot (1877) is a problem play, and has affinities with Ibsen's *A* Doll's House. Anzengruber also wrote a novel, Der *Schandfleck* (1876; remodelled 1884); and various short tales of village life collected under the title Wolken *und Sonn'schein* (1888).

Anzengruber's collected works, with a biography, were published in 10 vols. in 1890 (3rd ed., 1897); his correspondence has been edited by A. Bettelheim (1902). *See* A. Bettelheim, *L. Anzengruber* (1890); *L.* Rosner, *Erinnerungen an* L. *Anzengruber* (1890); *H.* Sittenberger, *Studien zur Dramaturgie der Gegenwart* (1899); S. Friedmann, *L. Anzengruber* (1902).

ANZIN, a suburb of Valenciennes, north France, department of Nord, on the Scheldt. Pop. (1936) 14,804. It is the centre of the French "house-coal" region, mining going back to 1717. Metallurgical industries include iron and copper founding and the manufacture of steam engines, machinery, chain-cables and a great variety of heavy iron goods. There are also glass-works and breweries. The region was much damaged during World War I.

ANZOÁTEGUI, a northeastern state of Venezuela, between the Caribbean sea and the Orinoco river, bounded east by the states of Sucre and Monagas and west by the states of Guarico and Miranda. Pop. (1941) 157,030. The state includes some of the oldest settlements in Venezuela. Its principal productions are coffee, sugar and cacao, and—less important—cotton, tobacco, coco-nuts, timber, indigo and dye-woods. Its most important town is the capital, Barcelona.

AONIA, a district of ancient Boeotia containing the mountains Helicon and Cithaeron, and thus sacred to the Muses.

AORIST, the name given in Greek grammar to certain past tenses of verbs (first aorist, second aorist). (Gr. ἀόριστος, indefinite.) Corresponding tenses in Sanskrit are also called aorist.

AORNOS, SIEGE OF (326 B.C.). Two natural fortresses bearing the name of Aornos are mentioned in the campaigns of Alexander the Great. One has been identified as Tashkurghan, and the other as Pir-sar north of the Buner river. The name is a corruption of the Sanskrit *avarana* which means "enclosure," or "fortress"; the Greeks interpreting this word by sound as meaning "the place to which no bird can rise." The Aornos at Pir-sar was a natural stronghold with a flat summit consisting of arable ground and containing a supply of water. Alexander attempted to take it by occupying a ridge overlooking it and separated from it by a ravine. Failing, he constructed a mound from the mountain side to a small hill on a level with Aornos. The tribesmen took alarm and suggested a truce over the terms of which they argued, as their plan was to gain sufficient time to evacuate the rock secretly. Alexander discovering their intention allowed them to begin their retirement, then he fell upon them, slaughtered a large number and captured the stronghold. (J. F. C. F.)

AORTA, the main systemic artery arising from the heart. It receives the blood, which has been aerated in the lungs, from the

left ventricle of the heart, and starts it on its way to all parts of the body. From the left ventricle the aorta arches first upward, then to the left and backward, and finally descends on the left of the spinal column through the thorax and abdomen to the fourth lumbar vertebra where it divides into two main branches, the common iliac arteries. From the aorta also arise the great arteries which supply the head and arms, and smaller arteries to the thoracic and abdominal organs. The diseases most commonly affecting it are arteriosclerosis and syphilis. By weakening its wall these diseases may cause an out-pouching of the aorta, called an aneurism, which sometimes ruptures, causing fatal haemorrhage.

AORTIC VALVE, a valve separating the left ventricle of the heart and the aorta. It consists of three semicircular, pocket-like folds, whose free edges are directed away from the heart. Blood flows into the aorta with each beat of the heart, but between beats the blood is prevented from flowing backward by the valve leaflets. The pockets fill with an eddying current of blood and their free edges meet exactly. When this valve is affected by certain diseases, notably, rheumatic fever and syphilis, the delicate leaflets become shrunken and thick and no longer perform their function. The valve leaks, thus imposing an extra burden on the heart which sometimes leads to symptoms of heart failure. The aortic valve is second only to the mitral in the frequency with which it becomes diseased.

AOSTA, EMANUELE FILIBERTO, DUKE OF (1869–1931), Italian general. was born Jan. 13 1869, the eldest son of Prince Amedeo of Savoy, duke of Aosta, and thus a cousin of Victor Emmanuel III. He adopted a military career, but this was interrupted by a serious illness, and when World War I began he was on the retired list. Later, however, he was appointed to the command of the 3rd Army. After the war the City of Naples gave him the Palace of Capodimonte, which had been ceded to it by the King, and it was there that he fixed his residence. He was for some years president of the Opera Nazionale Dopolavoro, an institution for providing recreation and instruction to the working classes after the day's work was over. In June 1926 he was created marshal.

AOSTA (anc. *Augusta Praetoria Salassorum*), town and episcopal see, Piedmont, Italy, province of Aosta, 80 mi. N N.W. by rail from the town of Turin, and 48 mi. direct; 1,910 ft above sea-level at the confluence of the Buthier and Dora Baltea. and at the junction of the Great and Little St. Bernard routes. Pop. (1936) 13,466 (town); 23,641 (commune). The cathedral, reconstructed in the 11th century, was much altered in the 15th and 17th; it has a rich treasury including an ivory diptych of 406 with a representation of Honorius. The church of St. Orso, founded 425 and rebuilt in the 12th century, has good cloisters (1133), and there is a picturesque 15th-century priory.

The valley of Aosta fell to the Burgundian kings; and, after many changes, came under Count Humbert I. of Savoy (Biancamano) in 1032. The privilege of holding the assembly of the states-general was granted in 1189. An executive council was nominated from it in 1536, and continued until 1802. After restoration of the rule of Savoy this was reconstituted by Charles Albert, king of Sardinia, at the birth of his grandson Prince Amedeo, who was created duke of Aosta. Aosta was the birthplace of Anselm. For ancient remains *see* AUGUSTA PRAETORIA SALASSORUM.

See P. Toesca, *Aosta* (1911).

APACHE, an aggregation of tribes or bands, forming with the Navaho the southernmost offshoot of the great Athabascan family of North American Indians, and noted for a ferocity, wiliness and raiding disposition which have made their name a by-word. In general physical type they resemble the other south-western Indians on the basis of anthropometric observations, but display a distinctive physiognomy which is perhaps to be interpreted as the reflection of their habits of mind and life. They never possessed national unity and were scarcely even organized into definite tribes, but since known have consisted of bands which variously separated, merged or shifted their location. Two main divisions are distinguishable: a group east of the Rio Grande, mostly in the mountains at the edge of the Great Plains, known to the Spaniards as *vaqueros* (buffalo hunters) and *llaneros* (plainsmen) and comprising the modern Jicarilla, Mescalero and Lipan; and a group about the headwaters of the Gila in southern New Mexico and Arizona, which included the Chiricahua, Coyotero, Pinaleño, Arivaipa and others, The former took on certain customs of the Plains tribes; both groups have also absorbed religious and other cultural traits from the Pueblo, although remaining essentially non-agricultural, unsettled and predatory. The eastern group was found in its historic range by the Spaniards in 1540; the western may not yet have arrived in Arizona by that date. It is probable that Apache and Navaho were an undifferentiated people not many centuries ago, but that the latter, on occupying the San Juan drainage between the several branches of the Pueblo, absorbed more culture from closer contact with these relatively advanced peoples, and gradually came to prosper and increase. The Apache were not so much brave as extremely skilled in raiding and guerrilla fighting. They terrorized the south-west, the western Plains and Texas and northern Mexico. The Chiricahua were not finally subdued until 1886 after many years of intermittent and often dramatic warfare under Cochise, Victorio and Geronimo against American and Mexican troops. The total population in 1903 was 6,000—probably as great as at any time in their history.

In Paris, the name Apache is given to a class of criminals to describe whom in America the name thug was borrowed from India.

APALACHEE, a tribe of North American Indians of Muskhogean stock. They have been known since the 16th century, and formerly ranged the country around Apalachee Bay, Florida. The name is apparently Choctaw, meaning "people on the other side." About 1600 the Spanish Franciscans founded a successful mission among them, but early in the 18th century the tribe suffered defeat at the hands of the British, the mission churches were burnt, the priests killed, and the tribe practically annihilated, more than one thousand of them being sold as slaves.

See *Handbook of American Indians,* ed. *F. W.* Hodge (Washington, 1907).

APALACHICOLA, a city of Florida, U.S.A.; a port of entry and the county seat of Franklin county; on the Gulf of Mexico, about 1 jom. S.E. of Pensacola, at the mouth of the Apalachicola river and on a bay of the same name. It is served by river and coasting steamers, and by the Apalachicola Northern railroad, which connects at Port St. Joe with Gulf and trans-Atlantic steamers, and at River Junction with the Atlantic Coast Line, the Seaboard Air Line, and the Louisville and Nashville railways. In 1930 the population was 3,150 by federal census; in 1940 it was 3,268. The bay is well protected by several islands, and before the development of railways in the Gulf states Apalachicola was one of the principal centres of trade, ranking third among the Gulf ports in 1835.

Oysters and shrimps, fish, resin and turpentine are the principal commodities handled.

APAMEA (APAMEIA), the name of several towns in western Asia.

1. A treasure city and stud-depot of the Seleucid kings in the valley of the Orontes, so named by Seleucus Nicator, after Apama, his wife. Destroyed by Chosroes II in the 7th century A.D., it was partially rebuilt and known as *Famia* by the Arabs; and overthrown by an earthquake in 1152.

See R. F. Burton and T. Drake, *Unexplored Syria;* E. **Sachau,** *Reise in Syrien* (1883).

2. A city in Phrygia, founded by Antiochus Soter and named after his mother; near, but on lower ground than, Celaenae. Here the Marsyas leaves the hills to join the Maeander, and it became a seat of Seleucid power, and a centre of Graeco-Roman and Graeco-Hebrew commerce. There Antiochus the Great collected the army with which he met the Romans at Magnesia, and there two years later the treaty between Rome and the Seleucid realm was signed. After Antiochus' departure for the East, Apamea lapsed to the Pergamenian kingdom and thence to Rome in 133, but it was resold to Mithridates V., who held it till 120. After the Mithridatic wars it became a great centre for trade carried on by Italians and by Jews. In 84 Sulla made it the seat of a

conventus of the Asian province, and it long claimed primacy among Phrygian cities. Disorganization in the 3rd century A.D. led to decline, and though the city was the seat of a bishop it did not revive because trade routes were diverted to Constantinople. The Turks took it first in 1070, and from the 13th century onwards it was always in Muslim hands. An earthquake completed its ruin. The site is now partly occupied by Dineir (*q.v.*), also called Geikler, which is connected with Smyrna by railway; there are considerable remains, including a great number of important Graeco-Roman inscriptions.

See W. M. Ramsay, *Cities and Bishoprics of Phrygia,* vol. ii.; G. Weber, *Dineir-Celènes* (1892); D. G. Hogarth in *Journ.* Hell. *Studies* (1888); O. Hirschfeld in *Trans. Berlin Academy* (1875).

3. A town on the left bank of the Euphrates, at the end of a bridge of boats (*zeugma*); the Til-Barsip of the Assyrian inscriptions, now Birijik (*q.v.*).

4. The earlier Myrlea of Bithynia, now Mudania (*q.v.*), the port of Brusa. The name was given it by Prusias I., who rebuilt it.

5. A city mentioned by Stephanus and Pliny as situated near the Tigris, the identification of which is still uncertain.

6. A Greek city in Parthia, near Rhagae.

APARRI, a municipality of the province of Cagaybn, Luzon, Philippine Islands, on the Cagayán river near its mouth, about 55 mi. N. of the capital, Tuguegarao. Population (1939), 26,409, of whom 13,149 were males; there were 36 whites. It was visited in 1572 by Gov. Guido de Lavezares and somewhat later by Luis Pérez Dasmariiias. In 1898 Filipino insurgents under Col. Daniel Tirona landed at the port; but in 1901 civil government under the United States was established. It has an administrative centre and 10 barrios (wards), a meteorological station and is a port of entry, the only free port in northern Luzon. It is the northernmost in location of the larger municipalities and is the inlet and outlet of the Cagayán valley which, with its short dry season, is one of the largest tobacco producing regions in the Philippines. Other agricultural products are palay (rice), corn, sugar and coco-nuts. Fishing and cattle raising are also leading industries. The Christian inhabitants are mainly Ilocanos and Ibanags. Literacy, based on ages from 10 years up, was 52.3% in 1939. The number of parcels of land declared for taxation in the municipality in 1938 was 3,445. (C. S. L.)

APARTMENT **HOUSE.** In Great Britain, the term "apartment house" would be understood to mean a house let off in tenements or "lodgings." A British domestic dwelling erected for the specific purpose of providing separate dwellings, each with its separate entrance, is termed a block of "flats" and each of its separate dwelling places is called a "flat." In the United States, on the other hand, a building specially built to form a group of separate dwellings is known as an apartment house. This is one of many striking illustrations of the different uses of the same English word in Great Britain and America, for whereas in New York an "apartment" means a separate dwelling, and sometimes a very highly rented one, in London it means a poor type of accommodation without a separate entrance in a lodging house, or tenement house in a poor quarter.

Apartment Houses in American Cities.—Formerly apartment houses were features exclusively of large cities such as New York and Chicago. The few in other cities were exceptions standing in sharp contrast to the general character of residences. These were largely houses in which a single family lived, or in neighbourhoods of some cities two-family houses. In recent years, however, there has been a widespread definite trend from this long-prevailing condition to apartment-house life. As officially defined, an apartment house is any building arranged for three or more families living independently of one another and doing their own cooking on the premises. Actually, the great number of apartment houses contain a multitude of families the number of which may range from a dozen to 66 and to more in some of the extremely large buildings.

An outgrowth of the tenement house, the apartment house is only a higher-class application of the same plan of domiciling many families in a single building. Until recent times, this massing was considered wholly as the special lot of the poor in the congested districts of certain large cities. That families should live in such a state, tier above tier, was looked upon as an odious existence and as a sure proof of their low standing. Possession of a private house gave a distinct prestige, and even after the apartment house evolved from the tenement the general sentiment favouring the idea of a house for a family was long dominant. But either by choice or necessity the attitude of a considerable part of the American people toward apartment-house life has undergone a great change. Apartment-house life is now accepted as normal by all classes up to the multi-millionaire.

Apartment houses differ from tenements in the character of building and equipment. The tenement barrack is the cheapest and ugliest form in which families are grouped. Lower types of apartments retain some of the defects of the tenement as, for instance, the need of walking up many flights of stairs. On the other hand, they are better designed, have generally more light and air, are furnished with better conveniences and present a more inviting appearance. In the varying upper grades of apartment houses elevator and other service is supplied. The final stage of apartment houses is reached in the costly places occupied by the very rich, with their elaborate suites of spacious rooms having every facility to minister to luxurious desires and gratify social ambitions.

Spread of the Apartment Movement.—The greatest and most impressive change in the residential composition of American cities was shown by the results of a questionnaire on housing sent early in 1927 by the U.S. Bureau of Labor Statistics. In the list were more than three hundred American cities having a population of 25,000 or more. Full reports received from 294 cities showed that of the total expenditures for building construction of all kinds in the year 1926 a little over a fourth—a j 9%—was spent for one-family dwellings. But the next highest expenditure was for apartment houses; the proportion—21.9%—almost approached that for one-family houses. In 1921 the construction of apartment houses was nearly two and a half times less than that of one-family dwellings—54,814 to 130,873. But year after year apartment-house building gained until in 1926, with a record of 209,742, it much exceeded the 188,074 one-family dwellings built. The year 1926 marked the turning point. It was the first year in which, in 257 American cities, apartment-house construction predominated over that of one-family houses. In that year apartment-house construction accounted for almost one-half of all the money spent for family habitations in those cities considered as a whole.

The widespread transition to apartment houses was further shown by the total percentages of families provided for by housing construction in the 257 cities during the six-year period. The percentage for one-family houses decreased from 58.3 in 1921 to 40·7 in 1926 and that for two-family houses from 17·3 to 13·9. The percentage for apartment houses almost doubled, rising from 24·4 to 45.4. During the six years nearly 848,000 apartment houses were built.

Commenting upon these significant figures the report declared that they tended to show that Americans were becoming a race of cliff dwellers. In the period from 1921 to 1926 there had been an increase of 105·8% in the number of families provided for by the building of all classes of dwellings. The number of families accommodated in apartment houses had increased 282.6%. Shrinking percentages revealed the lessening number of families seeking homes in one and two-family houses. The increase in the case of one-family houses was a fraction more than 43%, and in that of two-family houses a shade over 65%.

Effects in Various Cities.—The movement to apartments differedgreatly in particular cities. There are in the United States fourteen cities of more than 500,000 population each. New York city has always been regarded as the leader in constant apartment-house building. But the returns showed that Boston, in 1921, provided for more families by apartment-house construction than any other city in the United States. In that year 54% of all the families accommodated in up-to-date dwellings in Boston took rooms in apartments. San Francisco and Chicago each erected, in 1921, a relatively larger number of apartment units than did New York city. In 1925, however, New York regained the lead in the building of apartment houses; nearly

61% of all families provided for were accommodated in new dwellings of the apartment type, and this proportion increased in 1926 to more than 71%.

The wide differences in apartment building were exemplified in the cases of Los Angeles and San Francisco. In the former city fully half of the total families provided for in the years 1921, 1925 and 1926 by new housing construction went into single-family dwellings. San Francisco, on the other hand, showed a larger proportion of families provided for in apartment houses than in one-family dwellings.

The proportion of families provided for by new apartment-house construction in various cities was as follows: New York led with 71 6%, Chicago closely following with 69 3%. Then came St. Louis with 58 4; Washington 56 3; San Francisco 53 3; Boston 42 6; Los Angeles 39 8; Detroit 35; Cleveland 28·9; Pittsburgh 24 3; Buffalo and Milwaukee 19 3% each.

Philadelphia and Baltimore have retained their traditional character as cities of private homes. Although Philadelphia has grown greatly in the last decade, it still has few apartments as compared with other cities. In 1926 about 80% of Philadelphia families lived in private houses. In Baltimore, where but a small number of apartments have been built, the proportion was considerably larger. Less than 20% of Chicago's population live in private houses; in Boston about 26%, and in the borough of Manhattan, New York City, less than 4%.

Tendency to Fewer Rooms.—According to the Tenement House Department of New York City the movement of both rich and poor is to apartment life. The servant problem has been forcing even the rich and well-to-do to abandon city private homes. Many of the rich also have seaside or country mansions to which they can go at will. Paying $20,000 to $30,000 yearly rentals for sumptuous apartments they find in them a superior service; and although they have personal servants the number is many less than that required for a large private house.

The highly expensive apartments on Park avenue and on Fifth avenue, New York City, usually contain from nine to 16 sound-proof rooms, frequently arranged in duplex or triplex style. The larger apartments include a number of chambers and dressing rooms, ample cupboards, a commodious living room, a dining room, a library and a foyer, a kitchen, several rooms for maids and a number of baths.

Apart from the rich, the overwhelming general tendency has been toward living in fewer rooms. The records of the New York City Tenement House Department show that since 1902 the average number of rooms in apartments for the whole city has decreased from 4 69 to 3·56. The three-room apartment is now the established unit in demand. To an extent, this has become increasingly true of other cities.

One reason is increased rents due to high building and living costs and to mounting taxation. Other influential factors are the opportunities afforded by the automobile and by other means for out-of-door enjoyment. So much time is spent out of the apartment that only rooms for actual living needs are considered essential.

This process has been hastened by the spread of apartment hotels with their average two-room apartments and by the prevalent practice of many members of servantless households eating their meals in restaurants or in other public hostelries. Even among high-class apartment renters there has been a pronounced tendency to smaller apartments. Not long ago seven to nine-room apartments on Riverside drive, New York City, were in fashionable demand. In recent years renting them has become so difficult that the owners converted many of the buildings into smaller apartments.

Co-operative Apartments.— These are houses in which the tenant owns his own apartment by buying outright or by instalment purchase. Beginning about the year 1920 this movement made considerable progress, appealing both to the very rich and to persons of moderate means. By 1927 the majority of apartments in at least 150 co-operative apartment-buildings in New York City had been sold. Sums paid varied from $750 to $20,000 a room, the price depending upon the building's position and character, and the apartment's space, style and arrangement. In Chicago, Washington, D.C., and Los Angeles the co-operative apartment movement has been conspicuously successful. In various other cities the movement is passing through its initial stages. *See* FLAT.

APATHY. In the history of moral philosophy the term apathy indicates the negative side of an ideal of life that is characterized positively by peace of mind and the rational guidance of conduct, and negatively by the absence of passions and emotional excitement. Such an ideal is characteristic of eastern philosophy generally, also of ancient Stoicism, and even of certain forms of ancient Epicureanism. Of modern philosophies Spinozism is frequently identified with this ideal of life. Certainly Spinoza identified human bondage with the dominance of the passions, which man must master in order to be free. But one must not exaggerate the unemotional side of Spinozism so far as to lose sight of its highest ideal of life—the intellectual *love* of God.

In psychology and in popular usage the term apathy denotes merely an absence of feeling or of interest, and is sometimes synonymous with listlessness, or absence of emotional sensibility. In this sense apathy may be a symptom of certain pathological mental conditions, such as melancholy.

APATITE, a widely distributed mineral, which, when found in large masses, is of considerable economic value as a phosphate. It was named from the Greek *ἀπατᾶν,* to deceive, because it had previously been mistaken for other minerals, such as beryl, tourmaline, chrysolite, amethyst, etc. Two chemical varieties of apatite are to be distinguished, namely a fluor-apatite $(CaF)Ca_4P_3O_{12}$, and a chlor-apatite $(CaCl)Ca_4P_3O_{12}$. Apatite frequently occurs as beautifully developed crystals, sometimes a foot or more in length, belonging to that class of the hexagonal system in which there is pyramidal hemihedrism. In this type of symmetry, of which apatite is the best example, there is only one plane of symmetry, which is perpendicular to the hexad axis.

In its general appearance, apatite exhibits wide variations. Crystals may be colourless and transparent or white and opaque, but are often coloured, usually some shade of green or brown, occasionally violet, sky-blue, yellow, etc. Hardness 5, specific gravity 3·2.

With regard to its mode of occurrence, apatite is found under a variety of conditions. In igneous rocks of all kinds it is invariably present in small amounts as minute acicular crystals. The extensive deposits of chlor-apatite near Kragero and Bamle, near Brevik, in southern Norway, are in connection with gabbro, the felspar of which has been altered, by emanations containing chlorine, to scapolite, and titanium minerals have been developed. The apatite occurring in connection with granite and veins of tin-stone is, on the other hand, a fluor-apatite. Special mention may be made here of the beautiful violet crystals of fluor-apatite which occur in the veins of tin-ore in the Erzgebirge, and of the brilliant bluish-green crystals encrusting cavities in the granite of Luxullian in Cornwall. Another common mode of occurrence of apatite is in metamorphic crystalline rocks, especially in crystalline limestones; in eastern Canada extensive veins of apatite occur in the limestones associated with the Laurentian gneisses.

(L. J. S.)

APATURIA, an ancient Greek festival which was held annually by nearly all of the Ionian towns (Herodotus i. 147). At Athens it took place in the month of *Puanepsion* (Oct.–Nov.), and lasted three days, on which occasion the various phratries (*i.e.,* clans) of Attica met to discuss their affairs. The name probably means the festival of "common relationship." On the first day, called *Dorpia,* banquets were held towards evening at

the meeting-place of the phratries or in the private houses of members. On the second, Anarrhusis, a sacrifice of oxen was offered at the public cost to Zeus Phratrios and Athena. On the third day, *Koureōtis,* children born since the last festival were presented by their fathers or guardians to the assembled *phratores,* and, after an oath had been taken as to their legitimacy, their names were inscribed in the register. It was the custom also for boys still at school to declaim poetry, and to receive prizes.

APE, the English name, until the 16th century, for animals of the monkey tribe, and now applied specifically to the tailless representatives of the group. These comprise the great or anthropoid apes of the family *Simiidae,* which include the orang-utan, of Borneo and Sumatra, and the chimpanzee and gorilla, of central Africa, and also the much smaller gibbons (family Hylobatidae), of which about 12 species, all tree-dwellers, are found in south-eastern Asia and the larger East India islands. *See* PRIMATES: *Anthropoid* Apes; CHIMPANZEE; GIBBON; GORILLA; ORANG-UTAN.

APELDOORN, town in the province of Gelderland, Holland, and a junction station, 26½ mi. by rail east of Amersfoort. It is connected by canal north and south with Zwolle and Zutphen respectively. Pop. (1900) 25,834; (1940) 71,158. At Kootwijk (3 mi. away) is a well known radio station.

APELLA, the title of the assembly at Sparta, corresponding to the Ecclesia in other Greek States. Every full citizen who had completed his 30th year was entitled to attend the monthly meetings. The presiding officers were at first the kings, but later the ephors, and the voting was conducted by shouts; in case of doubt the votes were counted. Lycurgus had ordained that the apella must simply accept or reject the proposals submitted to it. The actual debate was confined to the kings, elders, ephors and perhaps the other magistrates. The apella voted on peace and war, treaties and foreign policy in general: it decided which of the kings should conduct a campaign and settled questions of disputed succession to the throne: it elected elders, ephors and other magistrates, and voted on legal proposals.

See G. Gilbert, Constitutional Antiquities of *Sparta* and Athens (Eng. trans., 1895); L. Whibley, Companion to Greek Studies (3rd ed., 1916), with useful bibliography.

APELLES (4th century B.C.), probably the greatest painter of antiquity. He lived in the time of Philip of Macedon and his son Alexander. He was of Ionian origin but became a student at the celebrated school of Sicyon, where he worked under Pamphilus. He thus combined the Dorian thoroughness with the Ionic grace. He became the recognized court painter of Macedon, and his picture of Alexander holding a thunderbolt ranked with the Alexander with the spear of the sculptor Lysippus. Other works of Apelles had a great reputation, such as the portraits of the Macedonians Clitus, Archelaus, and Antigonus, the procession of the high priest of Artemis at Ephesus, Artemis amid a chorus of maidens, a great allegorical picture representing Calumny, and the painting representing Aphrodite rising out of the sea. Of none of these works have we any copy, unless indeed we may consider a painting of Alexander as Zeus in the house of the Vettii at Pompeii as a reminiscence of his work. We are told that he attached great value to the drawing of outlines, practising every day. The tale is well known of his visit to Protogenes, and the rivalry of the two masters as to which could draw the finest and steadiest line. The power of drawing such lines is conspicuous in the decoration of the red-figured vases of Athens. Apelles allowed the superiority of some of his contemporaries in particular matters: according to Pliny he admired the *dispositio* of Melanthius, ie., the way in which he spaced his figures, and the *mensurae* of Asclepiodorus, who must have been a great master of symmetry and proportion. Apelles was also noted for improvements which he introduced in technique. He had a dark glaze, called by Pliny *atramentum,* which served both to preserve his paintings and to soften their colour.

APELLXCON, a wealthy native of Teos, afterwards an Athenian citizen, a famous book collector. He not only spent large sums on his library, but stole original documents from the archives of Athens and other cities of Greece. Being detected, he fled, but returned when Athenion (or Aristion), an opponent of the Romans, had made himself tyrant of the city with the aid of Mithradates. He died a little later, probably in 84 B.C.

Apellicon purchased from the family of Neleus of Scepsis in the Troad manuscripts of the works of Aristotle and Theophrastus (and their libraries), which Theophrastus himself had given to his pupil Neleus. They had been concealed in a cellar and were in a dilapidated condition. Apellicon filled in the lacunae, and brought out a new, but faulty, edition. In 84 Sulla removed Apellicon's library to Rome (Strabo xii. p. 609; Plutarch, *Sulla,* 26). Here the mss. were handed over to the grammarian Tyrannion, who took copies of them, on the basis of which the peripatetic philosopher Andronicus of Rhodes prepared an edition of Aristotle's works. Apellicon's library contained a remarkable old copy of the Iliad.

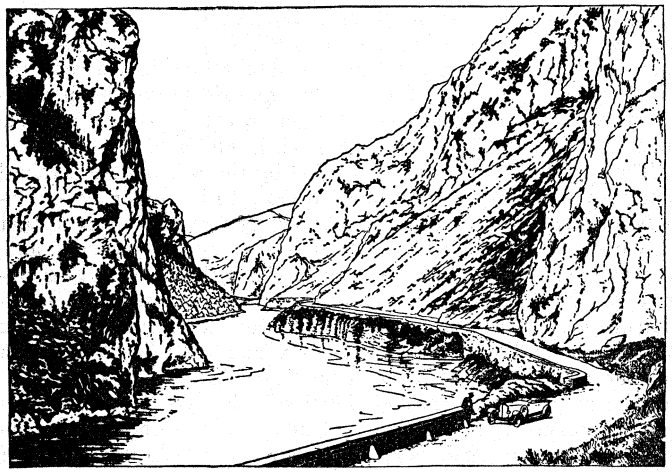
APENNINES, a range of mountains traversing peninsular Italy, forming the backbone of the country (Gr., Ἀπέννινος, Lat. *Appenninus*—in both cases used in the singular). The name probably derives from Celtic pen, a mountain top: it originally belonged to the northern part, from the Maritime Alps to Ancona. Polybius probably first applied it to the whole chain, extending the name as far as Marseille. Classical authors use the name for the whole. The total length is some 800m. and the maximum width 70 to 80m.

Divisions.--Modern geographers divide the range into three parts, northern, central and southern. 1. The Northern Apennines stretch from the Maritime Alps at the Bocchetta dell'Altare, some 5m. W. of Savona on the high road to Turin. They are divided into Ligurian, Tuscan and Umbrian Apennines. The Ligurian Apennines extend as far as the pass of La Cisa in the upper valley of the Magra (anc. *Macra*) above Spezia; at first they follow the curve of the Gulf of Genoa, and then run south-east parallel to the coast. On the north and north-east the Ligurian Apennines give rise to Scrivia (Olubria), Trebbia (*Trebia*) and Taro (*Tarus*), feeders of the Po. The Tanaro (Tanarus), though largely fed by tributaries from the Ligurian Apennines, itself rises in the Maritime Alps. The south side rises steeply from the sea, is fertile and highly cultivated, and has favourite winter resorts (see RIVIERA). Monte Bue reaches 5,915ft. Railways cross from Savona to Turin, from Genoa to Ovada and Asti, the main lines from Genoa to Arquata Scrivia, the junction for Turin and Milan (both the latter pass under the Monte dei Giovi, the ancient Mons Ioventius, by which the ancient Via Postumia ran from Genoa to Dertona), and (a long way farther south-west) that from Spezia to Parma under the pass of La Cisa. All traverse the ridge by long tunnels. The Ligurian Apennines have many hydro-electric plants, and arrangements have been made for interchange between them and the Alpine plants as required.

The Tuscan Apennines extend from the pass of La Cisa to the sources of the Tiber. The main chain continues to run east-south-east across the peninsula. Many streams run north and north-east into the Po, including the Secchia (*Secia*) and Panaro (*Scultenna*); farther east, most of the rivers feed the Reno (anc. Rhenus). The Ronco (Bedesis) and Montone (*Utis*), which flow into the sea together east of Ravenna, were also tributaries of the Po; and the Savio (*Sapis*) and the Rubicon seem to be the only streams from this side of the Tuscan Apennines that ran directly into the sea in Roman days. From the south-west side the Arno (*q.v.*) and Serchio run into the Mediterranean. Railways cross from Pistoia to Bologna and from Florence to Faenza. and a direct line extends from Prato to Bologna. A direct road from Florence to Bologna over the Futa pass is Roman. Monte Cimone reaches 7,103ft. The so-called Alpi Apuane (the *Apuani* were an ancient people of Liguria), a detached chain south-west of the valley of the Serchio, rise to a maximum height of 6,100ft. They contain the famous marble quarries of Carrara. Tuscany, however, is taken up by lower hills, divided from the Apennines by the Arno, Chiana (Clania) and Paglia (*Pallia*). Towards the west they are rich in minerals and chemicals which the Apennines proper do not produce.

The Umbrian Apennines extend from the sources of the Tiber to about the pass of Scheggia near Cagli, where the ancient Via Flaminia crosses the range. Monte Nerone reaches 5,010ft. The

chief river is the Tiber. The Foglia (Pisaurus), Metauro (*Metaurus*) and Esino (anc. Aesis, the boundary of Italy proper, 3rd and 2nd centuries B.C.) run north-east to the Adriatic. The railway crosses from Foligno to Ancona. 2. The Central Apennines stretch as far as the valley of the Sangro (*Sangrus*). To the north are the Monti Sibillini, with highest point Monte Vettore (8,128ft.). Of three parallel chains farther south, the Monti Sabini to the west



THE **CANDIGLIANO RIVER** GORGE NEAR FLORENCE, ONE OF THE PICTURESQUE SPOTS OF THE APENNINES THAT CAN BE REACHED BY MOTOR CAR

has Monte Viglio (7,075ft.), the central chain has Monte Terminillo (7,260ft.), and, to this, Monte Velino (8,160ft.), the eastern chain has the Monte Maiella (M. Amaro 9,170ft.) and the highest summit of all, Gran Sasso d'Italia (9,560ft.). Between the western and central ranges are the plain of Rieti, the valley of the Salto (Himella), and the Lago Fucino; between the central and east the valleys of Aquila and Sulmona. The chief western rivers are the Nera (*Nar*) and Anio, both feeding the Tiber. On the east small rivers flow about 25m. or less to the Adriatic. The Pescara (*Aternus*) and Sangro are more important. Railways cross from Rome to Castelammare Xdriatico via Avezzano and Sulmona: from Orte to Terni and Foligno via the Nera valley; from Terni and the plain of Rieti to Aquila and the valley of the Aterno to Sulmona. The Via Salaria, Via Caecilia and Via Claudia Valeria all ran from Rome to the Adriatic coast. The volcanic mountains of the province of Rome are separated from the Apennines by the Tiber, and the Monti Lepini, or Volscian mountains, by the Sacco and Liri. 3. In the Southern Apennines, south of the Sangro valley, the three parallel chains break into small groups; including the Matese, with Monte Miletto (6,725ft.). The chief rivers on the south-west are Liri or Garigliano (anc. Liris), with tributary the Sacco (Trerus), Volturno (*Volturnus*), Sebeto (Sabatus), Sarno (Sarnus), on the north Trigno (*Trinius*), Biferno (Tifernus), and Fortore (*Frento*). Monte Gargano on the east is completely isolated, and so are the volcanic groups near Naples. Railways cross from Sulmona (N.W.) to Benevento and on to Avellino (S.E.), and from Caianello (S.W.) via Isernia to Campobasso and Termoli (N.E.), from Caserta to Benevento and Foggia, and from Nocera and Avellino to Rocchetta S. Antonio, the junction for Foggia, Spinazzola (for Barletta, Bari, and Taranto) and Potenza. Roman roads followed the same lines, the Via Appia from Capua to Benevento, whence the older road went to Venosa and Taranto and so to Brindisi, while the Via Traiana ran nearly to Foggia and thence to Bari.

The Ofanto (*Audfidus*) reaching the Adriatic near Barletta, is the northern end of the first range of the Lucanian Apennines (now Basilicata), which runs from east to west, while south of the Sele (W.) and Basento (E.), with the railway from Battipaglia via Potenza to Metaponto, the second range runs due north and south to the plain of Sibari (Sybaris). Monte Pollino reaches 7,325ft. The chief western rivers are Sele (Silarus), joined by Negro (Tanager) and Calore (Calor); Bradano (*Bradanus*), Basento (*Casuentus*), Agri (*Aciris*), Sinni (*Siris*) on the east flow into the Gulf of Taranto. South of this the land is too narrow for large streams. The railway south from Sicignano to Lagonegro, up the valley of the Negro, extends to Cosenza, along the line of the Via Popilia, which beyond Cosenza reached the west coast of Terina and thence followed it to Reggio. The Via Herculia, a branch of the Via Traiana, rail from Aequum Tuticum to the ancient Nerulum. On the east the plain of Sibari with the Coseile (Sybaris) and Crati (Crathis) rivers extends half across the peninsula at its narrowest. A railway (with branches north to Castrovillari and south to Cosenza and the Sila) crosses the isthmus to Paola. Here the limestone Apennines proper cease and the granite mountains of Calabria (anc. *Bruttii*) begin. The first group of the granite Apennines beyond this is the Sila with the Botte Donato (6,330ft.). Its forests supplied Greeks and Sicilians with timber for shipbuilding. The railway from Santa Eufemia to Catanzaro and Catanzaro Marina crosses the isthmus, and an ancient road may have run from Squillace to Monteleone. The second group, the southern end of Italy, culminates in the Aspromonte (6,420ft.), in the Sila range east of Reggio di Calabria.

Character. — The forests were probably larger of old. (Pliny mentions especially pine, oak and beech woods); serious attempts at reafforestation have been made but much remains to be done. Summer pasture occurs especially in the Abruzzi: Pliny praises the cheese of the Apennines. In the forests wolves were frequent, and still are found, the flocks being protected by large sheepdogs; bears, known in Roman times, have alinost entirely disappeared, wild goats called rotae, named by Varro, do not occur now.

Snow lies long on the highest Apennines. There are no ininerals but a considerable number of good mineral springs, some thermal (Bagni di Lucca, Montecatini, Monsummano, Porretta. Salsomaggiore, Sila, Telese, etc.), others cool (Nocera, Sangemini, Chianciano, Fiuggi, etc.). (T. A.)

GEOLOGY

The Apennines form a part of the Alpine-Himalayan group of mountains (see ALPS). The exact correlation of the individual units in this south-western section is still uncertain. According to Termier (1911), the Apennines, with the Atlas mountains form a system distinct from and lying between the Alpine and the Dinaride branches. Kober (1923) considers them (Apennine-Atlas) as part of the Dinaride branch, separated from the Alpine by the Corso-Sardinian Massif (Tyrrhenis), an exposed part of an Hercynian Range ("Between Mountains"). According to Argand (1924), the Pennine Zone extends as far south as the Tuscan coast, the rest of the Apennines belonging to the Dinaride branch. There is also a difference of opinion regarding the application of the theory of exotic overthrusts in the Apennines, some authorities considering that a straightforward *in situ* explanation is the more legitimate.

The Apennines consist almost entirely of Triassic, Jurassic, Cretaceous, Eocene and Miocene beds, like the outer zones of the Alps. Remnants of older rocks may be seen in the Calabrian peninsula, Cape Circeo and the island of Zannone, in the Apuan Alps, in the islands off the Tuscan coast and in the Catena Metallifera. These remnants do not all belong to the Apennines. In the south the deposits from the Trias to middle Eocene consist mainly of limestones, and were laid down, with a few interruptions, upon a quietly subsiding sea-floor. Toward the end of the Eocene, the folding which gave rise to the existing chain became marked. The sea grew shallow, the deposits became conglomeratic and shaly, and volcanic eruptions began. Folding and elevation went on until the close of the Miocene period, when a considerable subsidence took place and the Pliocene sea overspread the lower portions of the range. Subsequent elevation, without folding, has raised the Pliocene beds in some cases to over 3,000ft. and they now lie almost undisturbed upon the older folded beds. The last elevation led to the formation of numerous lakes, now filled by Pleistocene deposits. Both volcanic eruptions and movements of elevation continue to the present day around

the shores of the Tyrrhenian sea. In the Northern Apennines the elevation appears to have begun earlier, for here the upper Cretaceous consists largely of sandstones and conglomerates. In Calabria the chain consists chiefly of crystalline and schistose rocks; it is the Mesozoic and Tertiary zone which has here been sunk beneath the sea. Similar rocks are found beneath the Trias farther north in some of the valleys of the Basilicata. Glaciers no longer exist in the Apennines, but Post-Pliocene moraines have been observed in Basilicata.

BIBLIOGRAPHY.—For relations with the Alpine-Himalayan chain *see* ALPS. For detailed Geology see C. S. du Riche Preller, *Italian Mountain Geology* (1924) in which numerous refs. to papers, etc., are given. (J. I. P.)

APEX, the Latin word (pl. apices) for the top, tip or peak of anything. The diminutive, "apiculus," is used in botany of a very small point or tip.

APEX, SOLAR, the point of the heavens towards which the sun's motion relative to the mean of the stars is directed. Its position was indicated approximately by Sir William Herschel in 1783. It is near right ascension 18^h declination $+30°$, not far from Vega, but the position varies considerably according to the class of stars chosen for reference. The speed of the sun's motion is approximately 20 kilometres per second.

APHANITE, a name given to certain igneous rocks which are so fine-grained that their component minerals are not detected by the unaided eye. Although a few authorities still recognize the aphanites as a distinct class, most systematic petrologists have now discarded it and regard these rocks as merely structural facies of other species. Any rock which is compact, crystalline, and fine grained is frequently said to be *aphanitic*.

APHASIA[1], a term used to denote various defects in the comprehension and expression of both spoken and written language which result from lesions of the brain. Aphasic disorders may be classed in two groups: first, receptive or sensory aphasia, which comprises (a) inability to understand spoken language (auditory aphasia), and (b) inability to read (visual aphasia, or *alexia*); second, emissive or motor aphasia, under which category are included (a) inability to speak (motor vocal aphasia, or *aphemia*), and (b) inability to write (motor graphic aphasia, or agraphia). It has been shewn that each of these defects is produced by destruction of a special region of the cortex of the brain, in right-handed people, situated in the left cerebral hemisphere; this is the reason why aphasia is so commonly associated with paralysis of the right side of the body.

Auditory Aphasia. — The auditory speech centre is situated in the posterior part of the first and second temporo-sphenoidal convolutions on the left side of the brain. Hearing is unimpaired but spoken language is quite unintelligible.

Visual **Aphasia** or **Alexia.**—The visual speech centre, which is located in the left angular gyrus, is connected with the two centres for vision which are situated one in either occipital lobe. The individual is not blind, he sees the words and letters perfectly, but they appear to him as unintelligible cyphers. When the visual speech centre is destroyeci, the memories of the visual images of words are obliterated and interference with writing results. On the other hand, when the lesion is situated deeply in the occipital lobe, and does not implicate the cortex, but merely cuts off the connections of the angular gyrus with both visual centres, agraphia is not produced, for the visual word centre and its connection with the graphic centre are still intact.

Motor Vocal Aphasia or **Aphemia.**—The centre for motor vocal speech is situated in the posterior part of the third left frontal convolution and extends on to the foot of the left ascending frontal convolution (Broca's convolution). Complete destruction of this region produces loss of speech, although often a few words, such as "yes" and "no," and, it may be, emotional exclamations such as "Oh, dear!" are retained. In most cases of motor vocal aphasia there is associated agraphia, which is perhaps to be explained by the proximity of the graphic centre. When the lesion is situated below the cortex of Broca's convolution but destroys the fibres which pass from it towards the internal capsule, agraphia is not produced.

Agraphia.—Those who favour the separate existence of a graphic centre locate it in the second left frontal convolution. It may be, however, that the anatomical relationship between the graphic centre and that for the fine movement of the hand is so close that a lesion in this situation which produces agraphia must at the same time cause a paralysis of the hand.

The speech centres are all supplied by the left middle cerebral artery. When this artery is blocked close to its origin by an *embolus* or *thrombus,* total aphasia results It may be, however, that only one of the smaller branches of the artery is obstructed, and, according to the region of the brain to which this branch is distributed, one or more of the speech centres may be destroyed. Occlusion of the left posterior cerebral artery causes extensive softening of the occipital lobe and produces visual aphasia. Further, a tumour, abscess, haemorrhage or meningitis may be so situated as to damage or destroy the individual speech centres or their connecting commissures. The amount of recovery to be expected in any given case depends upon the nature, situation and extent of the lesion, and upon the age of the patient. Even after complete destruction of the speech centres, perfect recovery may take place, for the centres in the right hemisphere of the brain are capable of education. This is only possible in young individuals. In the great majority of instances the nature of the lesion is such as to render futile all treatment directed towards its removal.

APHELION, in astronomy, that point of the orbit of a planet at which it is most distant from the sun. Apogee, apocentre, aposaturnium, etc. are terms applied to those points of the orbit of a body moving around a centre of force — as the earth or Saturn — at which it is farthest from the central body.

APHEMIA, in pathology, the loss of the power of speech *(see* APHASIA).

APHIDES (pl. of *aphis*), minute insects, often known as plant-lice, blight, or green-fly, belonging to the family *Aphididae* of the order Hemiptera (q.v.). They are characterized by long antennae and legs, two-jointed tarsi with paired claws and a long rostrum ensheathing the mouth-parts. Both winged and wingless forms occur, the wings being transparent with few veins and the hind pair much the smaller. There is usually a pair of abdominal tubes or cornicles through which a waxy secretion is exuded; these insects also secrete "honey-dew," a sweet substance that is voided through the anus and much sought after by ants. Aphides generally pass their life on young shoots and foliage, more rarely on roots, and feed by sucking up the sap through their needle-like mouth-parts. Their life-cycle and reproduction are of a remarkable nature which, briefly, is as follows: The winter is passed as eggs which are laid by the fertilized females; they hatch in spring into wingless females which reproduce by parthenogenesis and bring forth living young. Winged females soon appear which behave likewise and, during the whole summer generation after generation of aphides are produced, all of which are females reproducing living young without the intervention of males. It is only towards the end of the season that males and egg-laying females occur and fertilization takes place. The winged forms are migrants which seek out fresh plants, thus dispersing the species. In some aphides the whole life-cycle is spent on one species of host plant; hut in others definite migration occurs

[1] In 1906 Pierre Marie of Paris expressed views *(La Semaine médicale,* May 23 and Oct. 17 and elsewhere) upon the question of aphasia which are in many respects at complete variance with the classical conception which has been represented in the present article. According to Marie, Broca's convolution plays no special rôle in the function of speech, there are no sensory images of language, and motor aphasia is nothing more than a combination of sensory aphasia and anarthria. These conclusions have been vigorously attached, more especially by Dejerine of Paris (La *Presse mddicale,* July 1906 and elsewhere).

towards autumn, when the aphides leave their summer, or intermediate, host and pass to the winter host upon which the eggs are laid. The bean aphis (*Aphis rumicis*), for example, utilizes the spindle tree as its chief winter host, while in May and June it flies to broad beans, dock, sugar beet, etc., which serve as its intermediate hosts. See also PARTHENOGENESIS and CYTOLOGY.

Considering their sap-sucking habit, capacity for migration and enormous powers of reproduction, it is scarcely remarkable that aphides rank as serious plant pests. Thus, the woolly aphis or American blight, Eriosoma *lanigerum,* is an enemy of apple in many parts of the world, producing gall-like growths on the branches and roots; *Aphis gossypii* is a widely spread pest of cotton and of plants of the cucumber and melon tribe; the hop-damson aphis, Phorodon *humuli,* attacks the hop in summer and the plum and damson in autumn and spring; while the grain aphis, Toxoptera *graminum,* is a severe pest of various cereals in both Europe and North America. Wherever possible, aphides are best controlled by sprays containing nicotine and soft soap, which need to be applied when these insects first appear (see ENTOMOLOGY : *Economic*).

The group *Phylloxerinae* differs from true aphides in that egg-laying is not confined to the fertilized females but is the rule in the parthenogenetic generations also. The *Phylloxera* (q.v.) of the vine and species of *Chermes* (Adelges), with their allies, are well known examples. In *Chermes* the life-cycle is passed on conifers and there are two parallel series of forms differing in habits. One series infests spruce and its cycle is completed in a year, while the other series extends over two years and occurs partly on spruce and partly on larch, pine or fir. (A. D. I.)

APHIS, see APHIDES.

APHONIA, or loss of voice, is a symptom of disease of the larynx or interference with the nervous mechanism which controls its muscles. Of causes in the larynx itself, the commonest is acute catarrhal laryngitis, in the course of a cold, or after overuse of the voice. More serious diseases of the larynx are diphtheria, tuberculosis, syphilis, and cancer, each of which may produce hoarseness or loss of voice when it attacks the vocal cords. Causes outside the larynx are masses pressing on the laryngeal nerves, such as tumours of the thyroid gland and aneurisms of the aorta, and disorders in the brain giving rise to spasm or paralysis of the laryngeal muscles. Aphonia may be a manifestation of hysteria.

APHORISM, a principle expressed tersely in a few telling words or any general truth conveyed in a short and pithy sentence, in such a way that when once heard it is unlikely to pass from the memory. The name was first used in the *Aphorisms* of Hippocrates, a long series of propositions concerning the symptoms and diagnosis of disease and the art of healing and medicine. The term came to be applied later to other sententious statements of physical science, and later still to statements of all kinds of principles. Aphorisms have been especially used in dealing with subjects to which no methodical or scientific treatment was applied till late, such as art, agriculture, medicine, jurisprudence and politics. The *Aphorisms* of Hippocrates form far the most celebrated as well as the earliest collection of the kind. The first aphorism, perhaps the best known of all, which serves as a kind of introduction to the book, runs as follows: — "Life is short, art is long, opportunity fugitive, experimenting dangerous, reasoning difficult: it is necessary not only to do oneself what is right, but also to be seconded by the patient, by those who attend him, by external circumstances." Another famous collection of aphorisms is that of the school of Salerno in Latin verse, in which Joannes de Meditano, one of the most celebrated doctors of the school of medicine of Salerno, has summed up the precepts of this school. The book was dedicated to a king of England. It is a disputed point as to which king, some authorities dating the publication as at 1066, others assigning a later date.

Another collection of aphorisms, also medical and also in Latin, is that of the Dutchman Hermann Boerhaave, published at Leyden in the year 1709; it gives a terse summary of the medical knowledge prevailing at the time, and is of great interest to the student of the history of medicine.

APHRAATES (a Greek form of the Persian name Aphrahat or Pharhādh), a Syriac writer belonging to the middle of the 4th century A.D., who composed a series of 23 expositions or homilies on points of Christian doctrine and practice. The first ten were written in A.D. 337, the following twelve in 344, and the last in 345. The author was early known as *hakkīmā phārsāyā* ("the Persian sage"), was a subject of Sapor II., and was probably of heathen parentage and himself a convert from heathenism. He seems at some time in his life to have assumed the name of Jacob, and is so entitled in the colophon to a ms. of A.D. 512 which contains 12 of his homilies. Hence he was already, by Gennadius of Marseille (before 496), confused with Jacob, bishop of Nisibis; and the ancient Armenian version of 19 of the homilies has been published under this latter name. But (1) Jacob of Nisibis, who attended the Council of Nicaea, died in A.D. 338; and (2) our author, being a Persian subject, cannot have lived at Nisibis, which became Persian only by Jovian's treaty of A.D. 363. That his name was Aphrahat or Pharhādh we learn from comparatively late writers — Bar Bahlul (10th century), Elias of Nisibis (11th), Bar-Hebraeus, and 'Abhd-īshō.' According to a marginal note in a 14th-century ms. (B.M. Orient. 1017), he was "bishop of Mar Mattai," a famous monastery near Mosul; but it is unlikely that this institution existed so early. From the frequency of his quotations, Aphraates is a specially important witness to the form in which the Gospels were read in the Syriac church in his day; Zahn and others have shown that he — mainly, at least — used the Diatessaron.

See the ancient Armenian version of 19 homilies edited, translated into Latin, and annotated by Antonelli (1756); editions by W. Wright (1869), and J. Parisot (with Latin translation 1894). Besides translations of particular homilies by G. Bickell and E. W. Budge, the whole have been translated by *G.* Bert (Leipzig, 1888). Cf. also C. J. F. Sasse, *Proleg. in Aphr. Sapientis Persae sermones homileticos* (Leipzig, 1879); J. Forget, De Vita et *Scriptis* Aphraatis (Louvain, 1882); F. C. Burkitt, Early Eastern Christianity (1904); I. Labourt, *Le Christianisme dans l'empire Perse* (1904); J. Zahn, *Forschungen* I.; "Aphraates and the Diatessaron," vol. ii. pp. 180–186 of Burkitt's Evangelion *Da-Mepharreshe* (Cambridge, 1904); articles on "Aphraates and Monasticism," by R. H. Connolly and Burkitt in Journal *of Theological Studies* (1905), pp. 522–539; (1906), pp. 10–15.

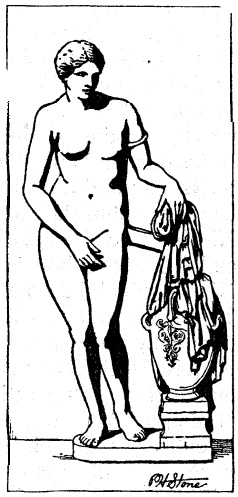
APHRODISIAC, any food, drink or drug which stimulates sexual desire and power. Popularly, but with slight justification, this property is ascribed to stout, red pepper, oysters, hard-boiled eggs and other foods. Several genuine aphrodisiacs are known to medicine, some of which are habitually used in the East, *e.g.,* ginseng; but the preparation and use of the effective aphrodisiacs. such as cantharides and strychnine, is in most western countries the subject of restrictive legislation when not entirely forbidden.

APHRODITE, known as the Greek goddess of love and beauty, the counterpart of the Roman Venus. Although her myth and cult were essentially Semitic, she soon became hellenized and was admitted to a place among the deities of Olympus. Some mythologists hold that there already existed in the Greek system an earlier goddess of love, of similar attributes, who was absorbed by the Asiatic importation; and one writer even altogether denies the oriental origin of Aphrodite. No satisfactory etymology of the name has been given; although the first part is usually referred to aphros ("the sea foam"), it is equally probable that it is of Eastern origin.

Among the Semitic peoples (with the notable exception of the Hebrews) a supreme female deity was worshipped under different names — the Assyrian Ishtar, the Phoenician Ashtoreth (Astarte), the Syrian Atargatis (Derketo), the Babylonian Belit (Mylitta), the Arabian Ilat (Al-ilat). Roscher holds that all these were originally moon-goddesses. This view, however, is not generally accepted on the ground that, in Semitic mythology, the moon is always a male divinity; and that the full moon and crescent, found as attributes of Astarte, are due to a misinterpretation of the sun's disc and cow's horns of Isis. On the other hand, there is some evidence in ancient authorities (Lucian, De Dea Syria, 4) that Astarte and the moon were considered identical.

This oriental Aphrodite was worshipped as the bestower of all animal and vegetable fruitfulness, and under this aspect especially as a goddess of women. This worship was degraded by repulsive

practices (*e.g.*, religious prostitution, self-mutilation), which subsequently made their way to centres of Phoenician influence, such as Corinth and Mount Eryx in Sicily. In this connexion may be mentioned the idea of a divinity, half male, half female, uniting in itself the active and passive functions of creation, a symbol of luxuriant growth and productivity. Such was the bearded Aphrodite of Cyprus, called Aphroditos by Aristophanes according to Macrobius. (Saturnalia, iii. 8.2; see also HERMAPHRODITUS.)



APHRODITE AT THE BATH. AFTER A COPY OF THE ORIGINAL BY PRAXITELES, IN THE VATICAN MUSEUM, ROME

The oriental Aphrodite was closely related to the sea and the element of moisture; in fact, some consider that she made her first appearance on Greek soil rather as a marine divinity than as a nature-goddess. According to Syrian ideas, as a fish-goddess, she represented the fructifying power of water. Her connexion with the sea may be explained by the influence of the moon on the tides and the idea that it came up from the ocean. (See ANADYOMENE.) She is connected with the lower world, and came to be looked upon as one of its divinities. Thus, Ishtar descends to the kingdom of Ilat the queen of the dead, to find the means of restoring her favourite Tammuz (Adon, Adonis) to life. During her stay, all animal and vegetable productivity ceases, to begin again with her return to earth. This legend, which strikingly resembles that of Persephone, probably refers to the decay of vegetation in winter, and the re-awakening of nature in spring (see HYACINTHUS). The lunar theory connects it with the disappearance of the moon at the time of change or during an eclipse.

Another aspect of her character is that of a warlike goddess, armed with spear or bow, sometimes wearing a mural crown, as sovereign lady and protectress of the locality where she was worshipped. Her attributes were the ram, the he-goat, the dove, certain fish, the cypress, myrtle and pomegranate, the animals being symbolical of fertility, the plants remedies against sterility.

The worship of Aphrodite was introduced at an early date into Cyprus, Cythera and Crete by Phoenician colonists, whence it spread over the whole of Greece, and as far west as Italy and Sicily. In Crete she has been identified with Ariadne, who, according to one story, was put ashore in Cyprus, where she died and was buried in a grove called Ariadne-Aphrodite. Cyprus was regarded as her true home by the Greeks, and Cythera was one of the oldest seats of her worship. In both these islands there lingered a definite tradition of a connexion with the cult of the oriental Aphrodite Urania.

In the Iliad, Aphrodite is the daughter of Zeus and Dione, a name by which she herself is sometimes called. In the Odyssey, she is the wife of Hephaestus, her place being taken in the Iliad by Charis, the personification of grace and divine skill. Her amour with Ares, by whom she became the mother of Harmonia, the wife of Cadmus, is famous (Od. viii. 266). From her relations with these acknowledged hellenic divinities it is argued that there once existed a primitive Greek goddess of love. Few traces remain of direct relations of the Greek goddess to the moon, although such possibly survive in her epithets *Pasiphaēs* ("shining on all"), Asteria ("starry") and Urania ("heavenly").

Aphrodite as the goddess of all fruitfulness in the animal and vegetable wcrld is especially prominent. In the Homeric hymn to Aphrodite she is described as ruling over all living things on earth, in the air, and in the water, even the gods being subject to her influence. She is the goddess of gardens, especially worshipped in spring near lowlands and marshes favourable to the growth of vegetation. Her character as a goddess of vegetation is clearly shown in the cult and ritual of Adonis (q.v.) and Attis (qv.). In the animal world she is the goddess of sexual impulse; amongst men, of birth, marriage and family life. Farnell points out that this cult of Aphrodite, as the patroness of married life, is probably a native development of the Greek religion, the oriental legends representing her by no means as an upholder of the purer relations of man and woman. As the goddess of the grosser form of love she inspires both men and women with passion, or the reverse. Upon her male favourites (Paris, Theseus) she bestows the fatal gift of seductive beauty, which generally leads to disastrous results in the case of the woman (Helen, Ariadne), and acts as an intermediary for bringing lovers together. Naturally, a personality invested with such charms was regarded as the ideal of womanly beauty, but it is remarkable that the only probable instance in which she appears as such is as Aphrodite *Morphō* ("the shapely") at Sparta. The function of Aphrodite as the patroness of courtesans represents the most degraded form of her worship as the goddess of love, and is certainly of Phoenician or [Eastern origin. In Corinth there were more than a thousand of these prostitutes or *hierodouloi* ("temple slaves") and wealthy men dedicated their most beautiful slaves to the service of the goddess.

Like her oriental prototype, the Greek Aphrodite was closely connected with the sea. Thus, in the Hesiodic account of her birth, she is represented as sprung from the foam (*aphros*) which gathered round the mutilated member of Uranus, and her name has been explained by reference to this. Further proof may be found in many of her titles—Anadyomend ("rising from the sea") *Euploia* ("giver of prosperous voyages"); *Galēnaia* ("goddess of fair weather") in the attribute of the dolphin, and the veneration in which she was held by seafarers. Aphrodite Aineias, the protectress of the Trojan hero, is probably also another form of the maritime goddess of the East, which originated in the Troad. The title *Ephippos* is connected with the legend of Aeneas, who is said to have dedicated to his mother a statue that represented her on horseback. Remembering the importance of the horse in the cult of the sea-god Poseidon, it is natural to associate it with Aphrodite as the sea-goddess, although it may be explained with reference to her character as a goddess of vegetation, the horse being an embodiment of the corn-spirit (J. G. Frazer, The *Golden* Bough, ii., p. 281, 1900).

Like Ishtar, Aphrodite was connected with the lower world. Thus, at Delphi there was an image of Aphrodite *Epitymbia* ("Aphrodite of the tomb"), to which the dead were summoned to receive libations; the epithets *Tymbōrychos* ("grave-digger"), *Muchia* ("goddess of the depths"), *Melainis* ("the dark one"), the grove of Ariadne-Aphrodite at Amathus, and the myth of Adonis, point in the same direction.

The cult of the armed Aphrodite probably belongs to the earlier period of her worship in Greece, and down to the latest period of Greek history she retained this character in some of the Greek states. The cult is found not only where oriental influence was strongest, but in places remote from it, such as Sparta, where she was known by the name of Areia ("the warlike"). It is possible that the frequent association of Aphrodite with Ares is to be explained by an armed Aphrodite early worshipped at Thebes, the most ancient seat of the worship of Ares.

The most distinctively oriental title of the Greek Aphrodite is Urania, the Semitic "queen of the heavens." It has been explained by reference to the lunar character of the goddess, but more probably signifies "she whose seat is in heaven." Her cult was first established in Cythera, probably in connexion with the purple trade, and at Athens it is associated with the legendary Porphyrion, the purple king. At Thebes, Harmonia (who has been identified with Aphrodite herself) dedicated three statues, of Aphrodite Urania, Pandemos, and Apostrophia ("averter"). There is no doubt that *Pandemos* was originally an extension of the idea of the goddess of family and city life to include the whole people, the political community. Hence the name was supposed to go back to the time of Theseus, the reputed author of the reorganization of Attica and its demes. Aphrodite *Pandemos* was held in equal regard with Aphrodite Urania; she was called *Semnē* ("holy") and was served by priestesses upon whom strict chastity was enjoined. In time, however, the meaning of the term underwent a change, probably due to the philosophers and moral-

ists, by whom a radical distinction was drawn between Aphrodite *Urania* and Aphrodite Pandemos. According to Plato (Symposium, 180), there are two Aphrodites, "the elder, having no mother, who is called the heavenly Aphrodite—she is the daughter of Uranus; the younger, who is the daughter of Zeus and Dione—her we call common." But there is no doubt that the cult of Aphrodite was on the whole as pure as that of any of the other divinities, and although a distinction may have existed in later times between the goddess of legal marriage and the goddess of free love, these titles do not express the idea. Aphrodite *Urania* was represented in Greek art on a swan, a tortoise or a globe; Aphrodite *Pandemos* as riding on a goat, symbolical of wantonness.

To her oriental attributes the following may be added: the sparrow and hare (productivity), the wry-neck (as a love-charm, of which Aphrodite was considered the inventor), the swan and dolphin (as a marine divinity), the tortoise (explained by Plutarch as a symbol of domesticity, but connected by Gruppe with the marine deity), the rose, the poppy, and the lime tree.

In ancient art Aphrodite was at first represented clothed, sometimes seated, but more frequently standing; then naked, rising from the sea, or after the bath. Finally, all idea of the divine vanished, and the artists merely presented her as the type of a beautiful woman, with oval face, full of grace and charm, languishing eyes and laughing mouth, which replaced the dignified severity and repose of the older forms. The most famous of her statues in ancient times was that at Cnidus, the work of Praxiteles, which was imitated on the coins of that town, and subsequently reproduced in various copies, such as the Vatican and Munich. Of existing statues the most famous is the Aphrodite of Melos (Venus of Milo), now in the Louvre, which was found on the island in 1820 amongst the ruins of the theatre; the Capitoline Venus at Rome and the Venus of Capua, represented as a goddess of victory (these two exhibit a lofty conception of the goddess); the Medicean Venus at Florence, found in the porticus of Octavia at Rome and (probably wrongly) attributed to Cleomenes; the Venus stooping in the bath, in the Vatican; and the Callipygus at Naples, a specimen of the most sensual type.

BIBLIOGRAPHY.—For the oriental Aphrodite see E. Meyer, article "Astarte" in W. H. Roscher's Lexikon der Mythologie, and Wolf Baudissin, articles, "Astarte" and "Atargatis" in Herzog-Hauck's Realencyklopadie fur protestantische Theologze; for the Greek, articles in Roscher's Lexikon and Pauly-Wissowa's Realencyklopadie and supplement, i. 1903; M. Collignon, Manual of Mythology, translated and enlarged by J. E. Harrison, 1890; L. Preller, Griechische Mythologie (4th ed., C. Robert); L. R. Farnell, Cults of the Greek States, ii. (1896); O. Gruppe, Griechische Mythologie und *Religionsgeschichte*, ii. (1906); A. Enmann, Kypros und der *Ursprung* des Aphrodite-Kults (1886); A. Fairbanks, A Handbook of Greek Religion (New York, 1910), The Mythology of Greece and Rome (New York, 1907); J. E. Harrison, Protegomena to the Study of Greek Religion (3rd ed. 1922). For Aphrodite in art, see J. J. Bernoulli, Aphrodite (1873); W. J. Stillman, Venus and *Apollo* in Painting and Sculpture (1897); A. Furtwängler, Meisterwerke der Griechischen Plastik (1893), Eng. trans. E. Sellers (1895); M. Collignon, *Histoire* de la Sculpture Grecque (1892–97).

APHTHONIUS, of Antioch, Greek sophist and rhetorician, flourished in the second half of the 4th century A.D., or even later. We possess by him Προγυμνάσματα, an introductory textbook on rhetoric, with exercises, written in a pure and simple style. The book maintained its popularity as late as the 17th century, especially in Germany. A collection of 40 fables by Aphthonius, after the style of Aesop, is also extant.

Spengel, Rhetores Graeci, ii.; Finckh, *Aphthonii* Progymnasmata (1865); Hoppichler, De *Theone*, Hermogene, Aphthonioque *Progymnasmatum Scriptoribus* (1884), H. Rabe (Leipzig, 1926); edition of the fables by Furia (1810).

APHTHOUS FEVER: see FOOT AND MOUTH DISEASE.

APHTHOUS STOMATITIS: see THRUSH (disease).

A PIACERE (Ital., at pleasure), a musical term having the same significance as ad *libitum* (*q.v.*).

APICIUS, the name of three celebrated Roman epicures. The second of these, M. Gavius Apicius, who lived under Tiberius (Seneca, *Consol.* ad *Helviam,* 10), invented various cakes and sauces, and is said to have written on cookery. The extant De Re *Coquinaria* (edited by Schuch, 1874), a collection of receipts, ascribed to Caelius Apicius, is founded on Greek originals, and belongs to the 3rd century A.D. It is probable that the real title was Caelii Apicius, Apicius being the name of the work (cf. Taciti Agricola), and De Re Coquinaria, a sub-title.

APICULTURE: see **BEE-KEEPING.**

APION, Greek grammarian and commentator on Homer, born at Oasis in Libya. He was head of the school at Alexandria and led a deputation sent to Caligula (in A.D. 38) by the Alexandrians to complain of the Jews (see Philo, head of the Jewish deputation, Legatio ad *Gaium*). The charges which he brought in his books against the Jews were answered by Josephus in his Contra *Apionem*. He settled at Rome and taught rhetoric till the reign of Claudius. The story of Androclus and the lion, preserved in Aulus Gellius, is from his Αἰγυπτιακά; fragments of his Γλῶσσαι Ὁμηρικαὶ are printed in the *Etymologicum Gudianum*, ed. Sturz (1818).

APIS or **HAPI** (the Bull), a god of the ancient Egyptian Pantheon. His chief centre of worship was Memphis and he was supposed to be the image of the soul of Osiris. He is occasionally represented as a man with the head of a bull. He was also regarded as the reincarnation (or the son) of Ptah—except by Greek writers—and from his posthumous name of Osiris-Apis is derived his other name, Serapis.

APLANATIC REFRACTION, refraction of light, resulting in the occurrence of no spherical aberration. (See OPTICS.)

APLERBECK, a town in the Arnsberg district of Germany, incorporated in 1929 into the city of Dortmund. Pop. was 10,942. Coal-mining is the chief industry.

APLITE, in petrology, the name given to intrusive rock in which quartz and felspar are the dominant minerals. Aplites are usually very fine-grained, white, grey, or flesh-coloured, and their constituents are visible only with the help of a magnifying lens. Dykes and threads of aplite are very frequently to be observed traversing granitic bosses; they occur, also, though in less numbers, in syenites, diorites, quartz-dolerites, and gabbros. Without doubt they have usually a genetic affinity to the rocks they intersect. The aplites of granite areas, for example, are the last part of the magma to Crystallize and correspond in composition to the quartzo-felspathic aggregates which fill up the interspaces between the early minerals in the main body of the rock. They bear a considerable resemblance to the eutectic mixtures which are formed on the cooling of solutions of mineral salts and remain liquid till the excess of either of the components has separated out, finally solidifying en *masse* when the proper proportions of the constituents and a suitable temperature are reached. They show a close relationship to the pegmatites (*q.v.*).

ABNOEA or APNCEA, is a suspension of breathing. A person may voluntarily hold his breath for a limited length of time, as in swimming under water. Respiration stops during swallowing, by a protective reflex which prevents food from entering the windpipe. Other stimuli, such as severe pain, may cause a reflex inhibition of respiration. True apnoea, however, as defined by physiologists, is a standstill of respiration brought about by overventilation of the lungs. The carbon dioxide content of the blood thereby becomes lower than usual and there is no impulse to breathe until it returns to normal. In certain diseases respiration may be irregular, intervals of apnoea alternating with intervals of over-breathing.

APOCALYPSE. The book called the Apocalypse (or "Revelation") of John is the last book in the New Testament Canon as received both in East and West, with the exception of the Syriac-speaking Church, which has never officially accepted it. It professes to be the revelation of Jesus Christ to His servant John in Patmos "to shew . . . the things which must come to pass shortly (Cv τάχει)," and this note of urgency is kept up all through the book. Its date, authority, value, all depend directly upon the view taken of the nature of its composition: it will therefore be convenient to begin by considering the history of its reception and some account of the views about it that have been held in the past.

What effect the Apocalypse had on the Asian Churches to which it was originally addressed we cannot say: in any case Ephesus, Smyrna and Philadelphia remained flourishing centres of Christianity during the 2nd century. Justin Martyr (Dial. 81), a little after 150, quotes our Apocalypse by name as an authority for the thousand years' reign of the Saints with Christ on earth. Irenaeus (Hacr. v. 29), has an extended discussion about the Number of the Beast: already (*i.e.*, A.D. 180) the doctrine that the Day of the Lord is a thousand years has come in, so that Irenaeus has room for regarding the book as referring to a not quite immediate future. The Alexandrians, on the other hand, made some effort to interpret the book allegorically, but even Swete, who describes Origen's interpretations as "often noble and helpful," is obliged to characterize them as "arbitrary." Tyconius the Donatist (about 390) tried an intermediate course: the apocalyptist has sometimes in mind the eternal principle, sometimes the immediate concrete instance, so he passes without indication from "Jerusalem" to the Church, from "Babylon" to the hostile world. A few critics, like Dionysius of Alexandria (247–265), rejected the Apocalypse altogether, mainly on grounds of style, and the impossibility of supposing that it could be by the same author as the Gospel of John. But for the most part Christian interpreters, both before and after the Reformation, saw in the Apocalypse a cryptic history of the past and future of the Christian Church, though they differed fundamentally in details. In modern times the attempt to find real future history in the Apocalypse has been given up; it is realized that the book would have been pointless to those for whom it was written, unless it was meant to predict the then immediate future. The explanation of the imagery has to be found in 1st century conditions.

But even so it is not always easy to explain what is meant. If, for example. ch. xii. (about the Woman clothed with the Sun and her doings) is to be explained as signifying the flight of the Christians of Jerusalem to Pella, or ver. 14 to be an anticipation of the *Disciplina* arcani (so Swete, p. 155), then all that can be said is that the imagery is highly incongruous and inappropriate. On the other hand, ch. xvii. is a vision of imperial Rome on the Seven Hills, the Beast who was and is not, but will be the eighth (*ver.* 11), is surely Nero Redivivus: here the imagery is as clear as anywhere in Apocalyptic literature. There is therefore an element of cryptic history in our book, but that key does not explain everything.

It will be convenient to lay down a few axioms here which justify themselves on simple perusal.

(a) The Apocalypse is full of immense conviction and enthusiasm.

(*b*) It very clearly declares that it is occupied with the things that must shortly come to pass.

(*c*) The vision of the glorified Jesus (i. 9ff.), and many other word-pictures in the book, read like visions or dreams actually experienced—whether they were veridical "revelation" or hallucination.

(d) The use of the Old Testament (many paragraphs are a mosaic of O.T. phrases and images) and the careful workmanship of passages like ch. xvii. show that the book is also partly a literary construction, *i.e.*, almost certainly an interpretation of former apocalyptic pictures, canonical or non-canonical. It should be added further:

(e) The writer feels his word-pictures intensely, but does not realize them pictorially at all: hence extreme "inconsistencies" and mixture of symbolism. "That the right hand (i. 16, 17) holds seven stars does not hinder it from being laid on the Seer for the whole representation is symbol and not art" (Swete, p 19).

(f) There is little progress in the Visions: the *ordo temporum* is *not* preserved. Hence repetitions (as in a dream). The scene shown goes round and round, like the heavenly bodies.

What (c) means in practice to the expositor is that certain images and combinations may have no accessible "explanation." The Apocalyptist had had a vivid picture before his consciousness, and such-and-such a detail in it may have come to him neither from his store of biblical nor of secular images, but from the untraceable sources of true "imagination." (d), on the other hand, means that inasmuch as the original visions were carefully elaborated and meditated upon, the expositor may reasonably investigate probable or demonstrable "sources."

One hitherto neglected source has been brought forward by Franz Boll of Heidelberg in his epoch-making little book called Aus der *Offenbarung Johannis,* published in 1914, viz., the Graeco-Roman Astrology current in the 1st century. Previous expositors, especially Gunkel (1894) and Bousset (1896), had detected an apocalyptic "tradition" coming down from remote Babylonian mythological ideas, but what *conscious* inheritance had an Asiatic Christian of the 1st century from pagan Babylonia? Prof. Boll, who was the leading authority on the astronomical and astrological lore of the post-Alexandrian civilization, may perhaps have had too much confidence in his method, but he proved once for all that contemporary astrological ideas are one of the sources used by "John."

For instance, in vi. 9 "the altar" is mentioned without explanation: "under" it are the souls of the Martyrs, impatient at the delay. They are not merely seen as martyrs' blood, for to each is given a white robe. All this, too, seems to take place in "heaven." Boll answers that it is in heaven, the altar is the constellation Ara in the Milky Way, low down, and the souls are still lower down, nearer the horizon: it is not yet time for them to mount up, but that the Milky Way is the place for pious souls was the teaching of the Stoics (see, *e.g.*, the Somnium *Scipionis*, much the same teaching was afterwards adopted by the Manichees). The most brilliant example of Boll's method is his treatment of ch. xii. What is the Woman clothed with the Sun and the Moon at her feet? Boll answers that it is actually described as a great sign in heaven (ver. 1), and as the sun and moon never leave the Zodiac it must be one of the twelve, *i.e.*, it must be Virgo. Below Virgo is the Dragon, *i.e.*, Hydra. Further, what we call Virgo and the Semites the "Ear of Corn" (*i.e., Spica*) was to the Alexandrians Isis with Horus, and the Hydra-dragon is Typhon, the Nile-Crocodile. So in vv. 15–16, when the scene is transferred to earth and the Dragon makes war with the Woman, his peculiar method is to drown her with a river-flood, which fails because—still more peculiar—the earth swallows the flood. Why? Because, says Boll, we are still dealing with Isis and Typhon, and the Nile-flood, Typhon's weapon, is swallowed by the Egyptian earth.

An objector may say, "Yes, this accounts more or less for the actual imagery of ch. xii., but what has all this heathen mythology to do with Christian doctrine?" We may imagine the reply might be that however much the heathen stories may be corrupted or inadequate they may nevertheless teach true "gnosis" to the Seer, for the Stars themselves have been set in their places by God, doubtless for the edification of the Saints. And the gnosis which the Seer here puts before us is nothing less than the Birth of the Messiah in heaven, before ever the world was. Things were then even as they are now: even in heaven the Adversary was attempting to destroy the foreordained Son of God, but deliverance comes in time and He is kept in safety by God's Throne (where indeed Enoch saw Him, see Enoch xlvi. 1). What happened in heaven is happening now in earth, as the Sign in heaven and the heathen tale tell us. The heavenly Mother of Christ and the Saints ("Holy Spirit" is too technical a term) is now on earth, still persecuted by the Adversary; but all will be well, God will rescue His own in time. This heavenly birth of the heavenly Christ before history began is a stage in the process of thought that led ultimately to the doctrine of the eternal generation of the Son of God. What view the Apocalyptist took, or even what information he had, about the earthly career of Jesus does not appear, except that He was crucified in Jerusalem (xi. 8), and that He died and rose again. He is further called in xiii. 8 "the Lamb slain from the foundation of the world," which seems to indicate' a heavenly career, of which the earthly one was in some sense a mirror, in some sense a fulfilment.

All this may sound fanciful and far-fetched, but at least Boll's way of looking at the text gives a meaning to the actual words

used in ch. xii., words which hitherto had seemed quite meaningless.

We are then to think of the Apocalyptist John as a Christian with a great knowledge of the Scriptures, and some knowledge of heathen astrology, who was sure he had had a vision of Christ, the purpose of which was to exhort his fellow-believers in Asia Minor to hold firm to their faith and hope, for their now long-expected Lord would soon come, there would be no more delay (χρόνος, x. 6). For a short time there would be frightful catastrophes, but they would mostly fall on the persecuting world-power, now as we see in ch. xvii. centred in Rome. He tells us his Visions and gives his Message, but no doubt many a detail is not a reminiscence of his dream, but inserted because it was so written in the oracles which he knows so well by heart.

The difference between ancient and modern expositions is that we must recognize that the expectation did not come true as John had anticipated; and, further, if we accept the general principles of Prof. Franz Boll, we must believe that some of the "signs of the times" from which John drew his inferences were not events of mundane history, but the configuration of the heavens and the astrological lore that men had come to connect with that configuration.

It is noteworthy that while "John" shows on every page familiarity with the wording of the Canonical Books (particularly the Prophets, including Daniel), he does not show great familiarity with the series of Jewish Apocalypses—Enoch, Baruch, Ezra, etc.—which have been so much studied of late years. His quotations from the Bible are not always from the LXX. (see the list in Swete, p. cxxxv. ff., *e.g.*, iii. 7, the key of David, where lxx. of Isa. xxii. 22 has the glory); this may be due to the use of another Greek translation.

The Greek of the Apocalypse is very peculiar. "The Apocalypse of John stands alone among Greek writings in its disregard of the ordinary rules of syntax, and the success with which syntax is set aside without loss of perspicuity or even of literary power" (Swete, p. cxx.). It does not appear to be merely the result of an unlettered Jew trying to write Greek. Many phrases (*e.g.*, i. 4 ἀπὸ ὁ ὢν καὶ ὁ ἦν καὶ ὁ ἐρχόμενος) are quite unparalleled elsewhere: perhaps they were acceptable as ἄρρητα ῥήματα (see 2 Cor. xii. 4).

Be this as it may, the power and attractiveness of the "Book of Revelation" are undeniable. There is in it a personal note that differentiates it from all the other Apocalypses. It is no Seer of ancient times that is speaking, but "I, John, your brother and companion in tribulation": here we have the new voice of Christian inspiration, confident that all the counsel of God has not yet been codified by the great men of old time. And nowhere else among the apocalyptists is there the same direct and pastoral concern for the immediate needs of here and now, that palpitates through the messages to the Seven Churches. So the Christian Apocalypse renews its youth in the hearts of fresh generations of readers, notwithstanding that the clearly taught thousand-year Reign of Christ on earth was rejected by the Church of the 3rd century, and that we in our Copernican world are not expecting "the holy city Jerusalem coming down out of heaven," of which the length and the breadth and the height are equal.

Note on the Number of the Beast.—In Rev. xiii. 18 the Number of the Beast, which certainly in some way typifies the World-Power (*i.e.*, Rome), is given as 666. Codex C and some early Latin texts, including some known to Irenaeus, read 616. This latter number, being less symmetrical, is likely to be the more original. Probably the Number was first associated with Caligula (who wished his statue to be set up in the Temple at Jerusalem, to the horror of pious Jews), for the letters of ΓΑΙΟC ΚΑΙCΑΡ make up 616. Caligula died, and more than a quarter of a century afterwards Nero must have seemed to the persecuted Christians like Antichrist, and (*with* the number 616 already given) it may have been discovered that if you write "Nero Caesar" in Hebrew letters you get 616, or with the name spelt "Neron Caesar" you get 666 (נרון קסר) It should be noted, however, that the spelling in Jewish documents is קיסר. Other Jewish Christians during the horrors of the siege of Jerusalem in 70 may have felt that Titus must be the Antichrist. His name cannot be made to fit, but they may have thought that perhaps it was only a form of the ancient demonic Titans, and TEITAN does make 666. This last name (Teitan) is the solution preferred by Irenaeus (Haer. v. 30). A peculiar explanation given by Beatus (ed. Florez, p. 440), almost certainly from Tyconius, is that the Sign and Number of the Beast in itself signifies Antichrist, for the Monogram of Christ is ☧, and as anti means "opposite" the Monogram of Antichrist will be ⸸, a figure made up of Χ = 600, I = 10, and C = 6, the last being an early form of the *Epistemon*.

BIBLIOGRAPHY.—H. B. Swete, The *Apocalypse* of St. John (1906; very valuable for linguistic study, and for Patristic exegesis); R. H. Charles, *A* Critical and Exegetical Commentary *on the* Revelation of St. John (1920, the fullest and latest English commentary). Dr. Charles sees consistency of thought and a regular sequence of ideas in the book, except that from xx. 4 onward an unintelligent "editor" has produced chaos (see Review by M. R. James in the J. Theol. Studies xxii. [July 1921], pp. 384–390); W. Bousset, Die *Offenbarung* Johannis (Gottingen, 1896); and above all, F. Boll, *Aus* der *Offenbarung* Johannis (Hellenistische Studien *zum* Weltbild der Apokalypse) (Leipzig-Berlin, 1914). (F. C. B.)

APOCALYPTIC LITERATURE. In the present survey we shall limit ourselves to the great formative periods in this literature—in Judaism from 200 B.C. to A.D. 100, and in Christianity from A.D. 50 to 350 or thereabouts.

The transition from prophecy to Apocalyptic was gradual and already accomplished within the limits of the Old Testament. Apocalyptical elements disclose themselves in the prophetical books of Ezekiel, Joel, Zechariah, while in Isa. xxiv.–xxvii. and xxxiii. we find well-developed Apocalypses; but it is not until we come to Daniel that we have a fully matured example of this class of literature.

We shall now consider (I.) Apocalyptic, its origin and general characteristics; (II.) Old Testament Apocalyptic; (III.) New Testament Apocalyptic.

I. APOCALYPTIC—ITS ORIGIN AND GENERAL CHARACTERISTICS

1. Sources of Apocalyptic.—The origin of Apocalyptic is to be sought in (a) unfulfilled prophecy and in (b) traditional elements drawn from various sources.

(a) The origin of Apocalyptic is to be sought in *unfulfilled* prophecy. Of prime importance here was the non-fulfilment of the greatest of all prophecies—the advent of the Messianic kingdom. Thus, though Jeremiah had promised that after 70 years (xxv. 11, xxix. 10) Israel should be restored to their own land (xxiv. 5, 6), and then enjoy the blessings of the Messianic kingdom under the Messianic king (xxiii. 5, 6), this period passed by and things remained as of old. Haggai and Zechariah explained the delay by the failure of Judah to rebuild the temple, and so generation after generation the hope of the kingdom persisted, sustained most probably by ever-fresh reinterpretations of ancient prophecy, till in the first half of the 2nd century the delay is explained in the Books of Daniel and Enoch as due not to man's shortcomings but to the counsels of God. The 70 years of Jeremiah are interpreted by the angel in Daniel (ix. 25–27) as 70 weeks of years, of which 69½ have already expired, while the writer of Enoch (lxxxv.–xc.) interprets the 70 years of Jeremiah as the 70 successive reigns of the 70 angelic patrons of the nations, which are to come to a close in his own generation.

But the above periods came and passed by, and again the expectations of the Jews were disappointed. Presently the Greek empire of the East was overthrown by Rome, and in due course this new phenomenon, so full of meaning for the Jews, called forth a new interpretation of Daniel. The fourth and last empire which, according to Dan. vii. 19–25, was to be Greek, was now declared to be Roman by the Apocalypse of Baruch (xxxvi.–xl.) and 4 Ezra (x. 60–xii. 35). Once more such ideas as those of "the day of Yahweh" and the "new heavens and a new earth" were constantly re-edited with fresh nuances in conformity with their new settings. Thus the inner development of Jewish Apoca-

lyptic was always conditioned by the historical experiences of the nation.

(b) Another source of Apocalyptic was primitive mythological and cosmological traditions in which the eye of the seer could see the secrets of the future no less surely than those of the past. Thus the six days of the world's creation, followed by a seventh of rest, were regarded as at once a history of the past and a fore-

AFTER AN ENGRAVING BY H. S. BEHAM IN 1539 FOR THE 14TH CHAPTER OF THE REVELATION OF ST. JOHN

GOD IS SITTING UPON A CLOUD WHILE ON EARTH ONE ANGEL IS REAPING AND OTHERS ARE GATHERING GRAPES WHICH THEY CARRY TO THE LAKE UNTIL "BLOOD CAME OUT OF THE WINEPRESS, EVEN UNTO THE HORSE BRIDLES"

casting of the future. As the world was made in six days its history would be accomplished in six thousand years, since each day with God was as a thousand years and a thousand years as one day; and as the six days of creation were followed by one of rest, so the six thousand years of the world's history would be followed by a rest of a thousand years (II. Enoch xxxii., II.–xxxiii. 2).

ii. Object and Contents of Apocalyptic.—The object of this literature in general was to solve the difficulties connected with the righteousness of God and the suffering condition of His righteous servants on earth. In this the Apocalyptists were concerned both with the nation and the individual; and the way in which they solved the difficulty was by teaching that the righteous as a nation should yet possess the earth, even in this world the faithful community should attain its rights in an eternal Messianic kingdom on earth, or else in temporary blessedness here and eternal blessedness hereafter; and that though the individual might perish amid the disorders of this world, he would not fail to attain through resurrection the recompense that was his due in the Messianic kingdom or in heaven itself. Apocalyptic thus forms the indispensable preparation for the religion of the New Testament.

iii. Form of Apocalyptic.—The form of Apocalyptic is a literary form; for we cannot suppose that the writers experienced the voluminous and detailed visions we find in their books. On the other hand the reality of the visions is to some extent guaranteed by the writer's intense earnestness and by his manifest belief in the divine origin of his message. How is this apparent contradiction to be explained? It has in part been explained by Gunkel, who has rightly emphasized that the writer did not freely invent his materials but derived them in the main from tradition, as he held that these mysterious traditions of his people were, if rightly expounded, forecasts of the time to come. Furthermore, the visionary, who is found at most periods of great spiritual excitement, was forced by the prejudice of his time, which refused to acknowledge any inspiration in the present, to ascribe his visionary experiences and reinterpretations of the mysterious traditions of his people to some heroic figure of the past. Moreover, there will always be a difficulty in determining what belongs to his actual vision and what to the literary skill or free invention of the author, seeing that the visionary must be dependent on memory and past experience for the forms and much of the matter of the actual vision.

iv. Apocalyptic as Distinguished from Prophecy.

(a) In *the Nature* of Its Message.—The message of the prophets was primarily a preaching of repentance and righteousness if the nation would escape judgment; the message of the Apocalyptic writers was of patience and trust for that deliverance and reward were sure to come.

(b) By Its Dualistic Theology.—Prophecy believes that this world is God's world and that in this world His goodness and truth will yet be vindicated. Hence the prophet prophesies of a definite future arising out of and organically connected with the present. The Apocalyptic writer, on the other hand, despairs of the present and directs his hopes absolutely to the future, to a new world standing in essential opposition to the present. Here we have essentially a dualistic principle, which shows itself clearly at first in the conception that the various nations are under angelic rulers who are in a greater or less degree in rebellion against God, as in Daniel and Enoch; it grows in strength with each succeeding age, till at last Satan is conceived as "the ruler of this world" (John xii. 31) or "the god of this age" (II. Cor. iv. 4). Under the guidance of such a principle the writer naturally expected the world's culmination in evil to be the immediate precursor of God's intervention on behalf of the righteous, and every fresh growth in evil to be an additional sign that the time was at hand.

(c) By Pseudonymous Authorship.—We have already touched on this characteristic of Apocalyptic. The prophet stood in direct relations with his people; his prophecy was first spoken and afterwards written. The Apocalyptic writer could obtain no hearing from his contemporaries, who held that, though God spoke in the past, "there was no more any prophet." This pessimism and want of faith limited and defined the form in which religious enthusiasm should manifest itself, and prescribed as a condition of successful effort the adoption of pseudonymous authorship.

(d) By Its *Comprehensive* and Deterministic Conception of History.—Apocalyptic took an indefinitely wider view of the world's history than prophecy. Thus, whereas prophecy had to deal with temporary reverses at the hands of some heathen power, Apocalyptic arose at a time when Israel had been subject for generations to the sway of one or other of the great world-powers. Hence to harmonize such difficulties with belief in God's righteousness, it had to take account of the rôle of such empires in the counsels of God, the rise, duration and downfall of each in turn, till finally the lordship of the world passed into the hands of Israel, or the final judgment arrived. These events belonged in the main to the past, but the writer represented them as still in the future, arranged under certain artificial categories of time definitely determined from the beginning in the counsels of God and revealed by Him to His servants the prophets. Determinism thus became a leading characteristic of Jewish Apocalyptic, and its con. ception of history became severely mechanical.

II. OLD TESTAMENT APOCALYPTIC

i. Canonical:—

Isa. ~xi~.–xxv,iixxxiii.; xxxiv.–xxxv. (Jer. xxxiii. 14–26?); Ezek. ii. 8; xxxviii.–xxxix.; Joel iii. 9–17; Zech. xii.–xiv.; Daniel All these are probably pseudepigraphic except the passages from Ezekiel and Joel. Of the remaining passages and books Daniel belongs unquestionably to the Maccabean period, and the rest possibly to the same period, approximately.

ii. Extra-canonical:—

(a) Palestinian (200–100 B.C.): Book of Noah; I. Enoch vi.–xxxvi.; lxxii.–xc.; Testaments of the XII. Patriarchs. (100 B.C. to 1 B.c.): I. Enoch i.–v.; xxxvii.–lxxi.; xci.–civ.; Testaments of the XII. Patriarchs, *i.e.*, T. Lev. x.; xiv–xvi.; T. Jud. xxi. 6–xxiii.; T. Zeb. ix.; T. Dan. v. 6. 7. Psalms of Solomon (A.D. 1–100

and later): Assumption of Moses, Apocalypse of Baruch, 4 Ezra, Greek Apocalypse of Baruch, Apocalypse of Zephaniah, Apocalypse of Abraham, Prayer of Joseph, Book of Eldad and Modad, Apocalypse of Elijah.

(b) Hellenistic: II. Enoch, Oracles of Hystaspes, Testament of Job, Testaments of the III. Patriarchs. Sibylline Oracles (excluding Christian portions).

Book of Noah.—This book has in large measure been incorporated in the Ethiopic Book of Enoch, and can in part be reconstructed from it. The Book of Noah is mentioned in Jubilees x. 13, xxi. 10. Chapters lx., lxv.–lxix. 25 of the Ethiopic Enoch are without question derived from it.

The Hebrew Book of Noah, a later work, is printed in Jellinek's Bet ha-Midrasch, iii. 155–156, and translated into German in Ronsch, Das Buch der *Jubiläen*, 385–387. It is based on the part of the above Book of Noah which is preserved in the Book of Jubilees. The portion of this Hebrew work which is derived from the older work is reprinted in Charles's Ethiopic Version of the Hebrew Book of Jubilees, p. 179.

I. Enoch or the Ethiopic Book of **Enoch.**—This is the most important of all the Apocryphal writings for the history of religious thought. Like the Pentateuch, the Psalms, the Megilloth, and the Pirke Aboth, this work was divided into five parts. The various elements of the book were written by different authors at different dates. vi.–xxxvi. was written before 166 B.C., lxxii.–lxxxii. before the Book of Jubilees, *i.e.*, before 120 B C. or thereabouts, lxxxiii.–xc. about 166 B.C., i.–v., xci.–civ. before 95 B C., and xxxvii.–lxxi. before 64 B.C. There are many interpolations drawn mainly from the Book of Noah.

Testaments of the **XII.** Patriarchs.—This book, in some respects the most important of Old Testament Apocryphs, has only recently come into its own. It is acknowledged by Christian and Jewish scholars alike to have been written in Hebrew in the 2nd century B.C. The Testaments were written about the same date as the Book of Jubilees. These two books form the only Apology in Jewish literature for the religious and civil hegemony of the Maccabees from the Pharisaic standpoint. The ethical character of the book is of the highest type, and its profound influence on the writers of the New Testament is yet to be appreciated. (See TESTAMENTS OF THE XII. PATRIARCHS)

Psalms of Solomon.—The ascription to Solomon is due solely to the copyists or translators, for no such claim is made in any of the psalms. On the whole, Ryle and James are no doubt right in assigning 70–40 B.C. as the limits within which the psalms were written. The authors were Pharisees. Since the Psalms were written in Hebrew and intended for public worship in the synagogues. it is most probable that they were composed in Palestine. (See SOLOMON, THE PSALMS OF.)

The Assumption of Moses.—This book was written between 4 B C. and A.D. 7. As for the author, he was no Essene, for he recognizes animal sacrifices and cherishes the Messianic hope; he was not a Sadducee, for he looks forward to the establishment of the Messianic kingdom (x); nor a Zealot, for the quietistic ideal is upheld (ix), and the kingdom is established by God Himself (x.). He is therefore a Chasid of the ancient type, and glorifies the ideals which were cherished by the old Pharisaic party, but which were now being fast disowned in favour of a more active rôle in the political life of the nation. He pours his most scathing invectives on the Sadducees, who are described in vii. in terms that recall the anti-Sadducean Psalms of Solomon. His object, therefore, is to protest against the growing secularization of the Pharisaic party through its adoption of popular Messianic beliefs and political ideals. (See also MOSES, ASSUMPTION OF.)

Apocalypse of Baruch—The **Syriac.**—This Apocalypse has survived only in the Syriac version. The book treats of the Messiah and the Messianic kingdom, the woes of Israel in the past and the destruction of Jerusalem in the present, as well as of theological questions relating to original sin, free will, works, etc. The views expressed on several of these subjects are often conflicting. We must, therefore, assume a number of independent sources put together by an editor or else that the book is on the whole the work of one author who made use of independent writings but failed to blend them into one harmonious whole. In its present form the book was written soon after A.D. 70. For fuller treatment see BARUCH.

IV. Ezra.—This Apocryph is variously named. Most Latin mss. designate it IV. Ezra; a more appropriate title would be the Ezra Apocalypse and it is usually referred to as such. It is of great importance on account of its very full treatment of the theological questions rife in the latter half of the 1st century of the Christian era. In its present form it was composed A.D. 80–100. For fuller treatment see EZRA.

Apocalypse of Baruch—The Greek.—This book survives in two forms, in Slavonic and Greek. The Slavonic is only of secondary value, as it is merely an abbreviated form of the Greek. As the original work presupposes II. Enoch and the Syriac Apocalypse of *Baruch* and was known to Origen, it was written between A.D. 80 and 200, and nearer the earlier date than the later, as it would otherwise be hard to understand how it came to circulate among Christians. (See BARUCH.)

Apocalypse of Abraham.—This book is found only in the Slavonic, a translation from the Greek. It is of Jewish origin, but in part worked over by a Christian reviser.

Lost Apocalypses: Prayer of Joseph.—An obviously anti-Christian work. (See Schurer[3], iii. 265–266.)

Book of **Eldad** and Modad.—This book was written in the name of the two prophets mentioned in Num. xi. 26–29. It is of minor importance.

Apocalypse of **Elijah.**—This Apocalypse is of Jewish origin, and probably known to St. Paul. (See Schiirer[4], iii. 361–366.)

Apocalypse of Zephaniah.—Possibly of Jewish origin, but its present form is Christian. (See Schdrer, iii. 367–369)

2. Enoch, or the **Slavonic** Enoch, or the Book of the Secrets of **Enoch.**—This new fragment of the Enochic literature was recently brought to light through five mss. discovered in Russia and Servia. The book in its present form was written before AD. 70 in Greek by an orthodox Hellenistic Jew, who lived in Egypt. For a fuller account see ENOCH.

Oracles of **Hystaspes.**—*See* under N. T. Apocalypses, below.

Testament of Job.—M. R. James, *Apocrypha* Anecdota, ii. pp. lxxii.–cii, 104–137, holds that the book in its present form was written by a Christian Jew in Egypt on the basis of a Hebrew Midrash on Job in the 2nd or 3rd century A.D. (See Schurer, iii. 406–407.)

Testaments of the **III.** Patriarchs.—This work was written in Egypt, according to James, and survives also in Slavonic, Rumanian, Ethiopic and Arabic versions. It deals with Abraham's reluctance to die and the means by which his death was brought about. James holds that this book is referred to by Origen (*Hom.* in *Luc.* xxxv), but this is denied by Schiirer, who also questions its Jewish origin. With the exception of ch. x–xi., it is really a legend and not an Apocalypse. The Testaments of Isaac and Jacob are still preserved in Arabic and Ethiopic (see James, *op. cit.* 140–161).

Sibylline Oracles.—Of the books which have come down to us the main part is Jewish, and was written at various dates. iii. 97–829, iv.–v. are decidedly of Jewish authorship, and probably xi.–xii., xiv. and parts of i.–ii. The oldest portions are in iii, and belong to the 2nd century B C.

BIBLIOGRAPHY.—The more important of these works are published in English in *Apocrypha and Pseudepigrapha* of *the O.T.*, vol. ii., ed. by R. C. Charles (1913). Most of them are published separately in the S.P.C.K. *Translations* of *Early Documents*, ed. *by* Oesterley and Box.

III. NEW TESTAMENT APOCALYPTIC

When we pass from Jewish literature to that of the New Testament we enter into a new and larger atmosphere at once recalling and transcending what had been best in the prophetic periods of the past. Again the heavens had opened and the divine teaching come to mankind, no longer merely in books bearing the names of ancient patriarchs, but on the lips of living men, who had taken courage to appear in person as God's messengers before His people. But though Christianity was in spirit the descendant of

ancient Jewish prophecy, it was no less truly the child of that type of Judaism which had expressed its highest aspirations and ideals in pseudepigraphic and Apocalyptic literature.

Early Christianity had a special fondness for this class of literature. It was Christianity that preserved Jewish Apocalyptic, when it was abandoned by Judaism as it sank into Rabbinism, and gave it a Christian character either by a forcible exegesis or by a systematic process of interpolation. Moreover, it cultivated this form of literature and made it the vehicle of its own ideas; its essential teaching was, as that of its Founder, that both worlds were of God and that both should be made God's.

(i.) Canonical:—Apoc. in Mark xiii. (Matt. xxiv., Luke xxi.), 2 Thess. ii., Rev.

(ii.) Extra-Canonical:—Apoc. of Peter, Test. of Hezekiah, Test. of Abraham, Oracles of Hystaspes, Vision of Isaiah, Shepherd of Hermas, V. Ezra, VI. Ezra, Christian Sibyllines, Apocalypses of Paul, Thomas and Stephen, Apocalypses of Esdras, Paul. John, Peter, The Virgin, Sedrach, Daniel, Revelations of Bartholomew, Questions of Bartholomew.

Apocalypse in Mark **xiii.**—According to the teaching of the Gospels the second advent was to take the world by surprise. Only one passage (Mark xiii.—Matt. xxiv.—Luke xxi.) conflicts with this view, and is therefore suspicious. This represents the second advent as heralded by a succession of signs which are unmistakable precursors of its appearance, such as wars, earthquakes, famines, the destruction of Jerusalem and the like. Our suspicion is justified by a further examination of Mark xiii. For the words "let him that readeth understand" (ver. 14) indicate that the prediction referred to appeared first not in a spoken address but in a written form, as was characteristic of Apocalypses. Again, in ver. 30, it is declared that this generation shall not pass away until all these things be fulfilled, whereas in 32 we have an undoubted declaration of Christ: "Of that day or of that hour knoweth no one, not even the angels in heaven, neither the Son, but the Father." On these and other grounds verses 7, 8, 14–20, 24–27, 30, 31 should be removed from their present context. Taken together they constitute a Christian adaptation of an originally Jewish work, written A.D. 67–68, during the troubles preceding the fall of Jerusalem. The Apocalypse consists of three acts: Act i. consisting of verses 7, 8, enumerating the woes heralding the parusia; Act ii. describing the actual tribulation, and Act iii. the parusia itself. (See Wendt, *Lehre* Jesu, i. 12–21; Charles, Eschatology, 325 sqq.; H. J. Holtzmann, N.T. *Theol.*[2] i. 398–405, with literature there given; Canon B. H. Streeter, The Four *Gospels*, 491–494.)

II Thessalonians **ii.**—The earliest form of Pauline eschatology is essentially Jewish. He starts from the fundamental thought of Jewish Apocalyptic that the end of the world will be brought about by the direct intervention of God when evil has reached its climax. But under the influence of the great formative Christian conceptions he parted gradually with the eschatology he had inherited from Judaism, and entered on a progressive development, in the course of which the heterogeneous elements were for the most part silently dropped.

Revelation.—Since this book is discussed separately we shall content ourselves here with indicating a few of the conclusions now generally accepted. The Apocalypse was written about AD. 96. Its object, like other Jewish Apocalypses, was to encourage faith under persecution; its burden is not a call to repentance but a promise of deliverance. It is derived from one author, who has made free use of a variety of elements, some of which are Jewish and consort but ill with their new context. The question of the pseudonymity of the book is still an open one.

Apocalypse of Peter.—The complete text of this book first came to light in 1910. It contains visions in which Christ shows Peter the righteous in heaven and the wicked in hell, where the different grades of sinners endure torment in their respective spheres. It was written between A.D. 100–140, probably in Jerusalem, and is of importance for the history of early Christianity, as it shows the influence of oriental-hellenistic ideas about heaven and hell upon Christian thought.

Testament of **Hezekiah.**—*See* ISAIAH, ASCENSION OF.

Testament of Abraham.—The original form of this book was probably in Hebrew. It belongs to the 1st century A.D., and contains indications of having been written by an Alexandrian Jew. It tells of the archangel Michael taking Abraham to the abodes of the departed; he intercedes for the wicked, who are in consequence pardoned. In the description of Abraham's death the testamentary part is absent; presumably it must have found a place in the book originally.

Oracles of **Hystaspes.**—These now lost oracles were in all probability originally Jewish, and subsequently re-edited by a Christian.

Vision of Isaiah.—This writing has been preserved in its entirety in the Ascension of Isaiah, of which it constitutes ch. vi.–xi. (See ISAIAH, ASCENSION OF.)

Shepherd of Hermas.—This work consists of three parts: Visions concerning the Church; *Commandments* as to what the true Christian should do and not do; *Similitudes*, or parables, mainly of an eschatological character. It was written in Rome between A.D. 130–150. It gives important details about the early Christian community in Rome.

V Ezra.—This book falls obviously into two parts. The first (i. 5–ii. 9) contains a strong attack on the Jews, whom it regards as the people of God; the second (ii. 10–47) addresses itself to the Christians as God's people and promises them the heavenly kingdom. In its present form it may have been written before A.D. 200, though James and other scholars assign it to the 3rd century. Its tone is strongly anti-Jewish.

VI Ezra.—This work consists of ch. xv.–xvi. of IV. Ezra. Its contents relate to the destruction of the world through war and natural catastrophes—for the heathen a source of menace and fear, but for the persecuted people of God one of admonition and comfort. The date of the book is quite uncertain, though several scholars have ascribed it to the 3rd century.

Christian Sibyllines.—It is practically agreed that vi.–viii. are of Christian origin. As for i.–ii., xi.–xiv. most writers are in favour of Christian authorship. A portion of ii. is taken from the Apoc. of Peter, late 2nd or early 3rd century A.D.

Apocalypses of Paul, Thomas and Stephen.—The first is not to be confounded with the Apocalypse mentioned two sections later.

Apocalypse of Esdras.—This Greek production resembles the more ancient fourth book of Esdras in some respects. The book is a poor imitation of the ancient Jewish one. It may belong, however, to the 2nd or 3rd centuries of the Christian era.

Apocalypse of Paul.—This work contains a description of the things which the apostle saw in heaven and hell. Internal evidence assigns it to the time of Theodosius, *i.e.*, about A.D. 388. Where the author lived is uncertain.

Apocalypse of John contains a description of the future state, the general resurrection and judgment, with an account of the punishment of the wicked, as well as the bliss of the righteous. It appears to be the work of a Jewish Christian. The date is late, for the writer speaks of the "venerable and holy images," as well as "the glorious and precious crosses and the sacred things of the churches" (xiv.), which points to the 5th century, when such things were first introduced into churches. It is a feeble imitation of the canonical Apocalypse.

Arabic Apocalypse of Peter contains a narrative of events from the foundation of the world till the second advent of Christ. It is a late production; for Ishmaelites are spoken of, the Crusades and the taking of Jerusalem.

The Apocalypse of the Virgin.—"A late and dreary production" (M. R. James).

Apocalypse of **Sedrach.**—This late Apocalypse, which M. R. James assigns to the 10th or 11th century, deals with the subject of intercession for sinners and Sedrach's unwillingness to die. See James, Texts and Studies, ii. 3. 127–137.

Apocalypse of Daniel.—See Vassiliev's *Anecdota* Graeco-*Byzantina* (1893), pp. 38–44; Uncanonical Books of the Old Test*ament* (Venice, 1901), pp. 237 sqq, 387 sqq.

The Revelations of Bartholomew.—After narrating the pardon obtained by Adam, it is said that the Son, ascending from

Olivet, prays the Father on behalf of His apostles; who consequently receive consecration from the Father, together with the Son and Holy Spirit — Peter being made archbishop of the universe. The late date of the production is obvious.

Questions of St. Bartholomew. — See Vassiliev, *Anec. Graeco-Byzantina* (1893), pp. 10–22. The introduction, which is wanting in the Greek ms., has been supplied by a Latin translation from the Slavonic version (see pp. vii.–ix.). The book contains disclosures by Christ, the Virgin and Beliar and much of the subject-matter is ancient. (R. H. CH.; W. O. E. O.)

APOCATASTASIS, a Greek word used by Aristotle, meaning "re-establishment," used as a technical scientific term for a return to a previous position or condition.

APOCENTRE, the point in any orbit which is farthest from the centre of attraction.

APOCRYPHAL LITERATURE. The word "Apocrypha" comes from the Greek *apocryphos,* "hidden," which is the equivalent of a Hebrew term derived from a root meaning "to store up" (ganaz); it means also "to store up in secret," and in the technical sense, used in reference to books, it meant "to withdraw from use." But the books in reference to which this term was used by the Jewish religious leaders were such as contained heretical teaching; they never used it in reference to the books of the Bible or of our Apocrypha; when they applied the word to any of these it was not to the book as such, but to the particular copy of it, because it happened to be worn by use, or damaged in some way, and therefore was unfit to be used in public service. The Greek word *apocryphos* was originally used of books the contents of which were kept hidden, or secret, because they embodied the special teaching of religious or philosophical sects; it was only the members of these sects who were initiated into the secrets of this teaching. So that both these terms were used in reference to books, which, for different reasons, were withheld from public use. Origen (he died in A.D. 254) was the first to apply the word "apocryphal" to books used by the Church; he says that he borrowed his terminology from the Jews, and his use of *apocryphos* entirely corresponds with the Jewish use of *ganaz.* Both used these terms, respectively, not to the books of the Bible nor to those of the Apocrypha, but to what we call Pseudepigrapha, *i.e.,* largely apocalyptic books, but also many others. It was not until the time of Jerome (he died in AD. 420) that the word "apocryphal" was used in a new sense; he was the first to apply it to the books of our Apocrypha. The term was an unfortunate one to use in reference to these books, and it did not at first command general approval. But by degrees, owing to his great authority on the subject of sacred literature, Jerome's nomenclature was adopted in the Western Church; and this has continued ever since. Thus it has happened that we call the sacred books of the second rank the "Apocrypha," though there is not, nor ever has been, anything "hidden" about them or their teaching.

OLD AND NEW TESTAMENT APOCRYPHAL BOOKS

We shall now proceed to enumerate the apocryphal books; first the Apocrypha Proper, and next the rest of the Old and New Testament apocryphal literature.

1. The *Apocrypha* Proper, or the apocrypha of the Old Testament as used by English-speaking Protestants, consists of the following books: I. Esdras, II. Esdras, Tobit, Judith, Additions to Esther, Wisdom of Solomon, Ecclesiasticus, Baruch, Epistle of Jeremy, Additions to Daniel (Song of the Three Holy Children, History of Susannah, and Bel and the Dragon), Prayer of Manasses, I. Maccabees, II. Maccabees. Thus the Apocrypha Proper constitutes the surplusage of the Vulgate or Bible of the Roman Church over the Hebrew Old Testament. Since this surplusage is in turn derived from the Septuagint, from which the old Latin version was translated, it thus follows that the difference between the Protestant and the Roman Catholic Old Testament is, roughly speaking, traceable to the difference between the Palestinian and the Alexandrian canons of the Old Testament. But this is only true with certain reservations; for the Latin Vulgate was revised by Jerome according to the Hebrew, and, where Hebrew originals were wanting, according to the Septuagint. Furthermore, the Vulgate rejects III. and IV. Maccabees and Psalm cli., which generally appear in the Septuagint, while the Septuagint and Luther's Bible reject IV. Ezra, which is found in the Vulgate and the Apocrypha Proper. Luther's Bible, moreover, rejects also III. Ezra. It should further be observed that the Vulgate adds the Prayer of Manasses and III. and IV. Ezra after the New Testament as apocryphal.

It is hardly possible to form any classification which is not open to some objection. In any case the classification must be to some extent provisional, since scholars are still divided as to the original language, date- and place of composition of some of the books which must come under our classification. We may, however, discriminate (i.) the Palestinian and (ii.) the Hellenistic literature of the Old Testament, though even this distinction is open to serious objections. The former literature was generally written in Hebrew or Aramaic, and seldom in Greek; the latter naturally in Greek. Next, within these literatures we shall distinguish three or four classes according to the nature of the subject with which they deal. Thus the books of which we have to treat will be classed as (a) Historical, (b) Legendary (Haggadic), (c) Apocalyptic, (d) Didactic or Sapiential.

FROM HANS HOLBEIN "HISTORIARUM VETERIS INSTRUMENTI ICONES" 1538

JUDITH WITH THE HEAD OF HOLOFERNES. WHOM SHE SLEW AS HE SLEPT AFTER A BANQUET DURING HIS SIEGE OF THE JEWISH CITY BETHULIA. (BOOK OF JUDITH)

The Apocrypha Proper then would be classified as follows: —

i. Palestinian Jewish Literature: —
Historical: 1 (3) Ezra, I. Macc. Legendary: Baruch, Judith. Apocalyptic: 2 (4) Ezra. *Sapiential:* Ecclesiasticus.

ii. Hellenistic Jewish Literature: —
Historical and Legendary: Additions to Daniel, Additions to Esther, Ep. of Jeremy, II. Macc., Prayer of Manasses. Sapiential: Wisdom.

Since all these books are dealt with in separate articles, they call for no further notice here.

2 (a). *Other* Old Testament Apocryphal Literature: —

(a) Historical: Hist. of Johannes Hyrcanus. (b) Legendary: Bk. of Jubilees. Paralipomena Jeremiae, or the Rest of the Words of Baruch. Martyrdom of Isaiah. Pseudo-Philos Liber Antiquitatum. Bks. of Adam. James and Jambres. Joseph and Asenath. (c) Apocalyptic (see APOCALYPTIC LITERATURE). (d) *Sapiential:* Pirke Abôth.

(a) Historical. — The History of Johnnnes *Hyrcanus* is mentioned in I. Macc. xvi. 23–24, but no trace has been discovered of its existence elsewhere. It must have early passed out of circulation, as it was unknown to Josephus.

(b) Legendary. — The Book of *Jubilees* was written in Hebrew by a Pharisee between the year of the accession of Hyrcanus to the high-priesthood in 135 and his breach with the Pharisees some years before his death in 105 B.C. Jubilees was translated into Greek and from Greek into Ethiopic and Latin. It is preserved in its entirety only in Ethiopic. Jubilees is the most advanced pre-Christian representative of the midrashic tendency, which was

already at work in the Old Testament 1 and 2 Chronicles. As the chronicler rewrote the history of Israel and Judah from the basis of the Priests' Code, so our author re-edited from the Pharisaic standpoint of his time the book of Genesis and the early chapters of Exodus. His object is to prove the everlasting validity of the law, which, though revealed in time, was superior to time. Writing in the palmiest days of the Maccabean dominion, he looked for the immediate advent of the Messianic kingdom. This kingdom was to be ruled over by a Messiah sprung not from Judah but from Levi, that is, from the reigning Maccabean family. This kingdom was to be gradually realized on earth, the transformation of physical nature going hand in hand with the ethical transformation of man. (For a fuller account see JUBILEES, BOOK OF.)

Paralipomena Jeremiae, or the Rest of the Words of Baruch. (See BARUCH.)

Martyrdom of Isaiah.—This Jewish work has been in part preserved in the Ascension of Isaiah. To it belong i. 1, 2^a, 6^b–13^a, ii. 1–8, 10; iii. 12; v. 1^c–14 of that book. It is of Jewish origin, and recounts the martyrdom of Isaiah at the hands of Manasseh. (See ISAIAH, ASCENSION OF.)

Pseudo-Philo's Liber Antiquitaturn **Biblicarum.**—Though the Latin version of this book was thrice printed in the 16th century (in 1527, 1550 and 1599), it was practically unknown to modern scholars till it was recognized by Conybeare and discussed by Cohn in the Jewish Quarterly Review, 1898, pp. 279–332. It is an Haggadic revision of the biblical history from Adam to the death of Saul. Its chronology agrees frequently with the LXX. against that of the Massoretic text, though conversely in a few cases. The Latin is undoubtedly translated from the Greek. Greek words are frequently transliterated. While the LXX. is occasionally followed in its translation of Biblical passages, in others the Massoretic is followed against the EXX., and in one or two passages the text presupposes a text different from both. On many grounds Cohn and James infer a Hebrew original. The eschatology is similar to that taught in the similitudes of the Book of Enoch. In fact, Eth. En. li. 1 is reproduced in this connection. Prayers of the departed are said to be valueless. The book was written after A.D. 70; for, as Cohn has shown, the exact date of the fall of Herod's temple is predicted.

Life of Adam and Eve.—Writings dealing with this subject go back undoubtedly to a Jewish basis, but in some of the forms in which they appear at present they are christianized throughout. The oldest and for the most part Jewish portion of this literature is preserved to us in Greek, Armenian, Latin and Slavonic. The titles of these writings are: "Book of Adam and Eve," also called "The Conflict of Adam and Eve with Satan" (Ethiopic); "The Treasure-cave," *i.e.,* the cave in which the treasures of Paradise are preserved (Syriac); this is closely related to the preceding: "The Testament of Adam" (Syriac); "The Apocalypse of Moses" (Greek), this title is misleading as the book deals entirely with Adam and Eve and their children; largely identical with this is the "Life of Adam and Eve" (Latin). In addition to these there are Slavonic, Armenian and Coptic books dealing with the same subject.

Jannes and Jambres—These two men are referred to in II. Tim. iii. 8 as the Egyptian magicians who withstood Moses. The book may go back to pre-Christian times. (See Schürer[4], iii. 404–405; Ency. Biblica, ii. 2327–2329.)

Joseph and **Asenath.**—The statement in Gen. xli. 45, 50 that Joseph married the daughter of a heathen priest naturally gave offence to later Judaism, and gave rise to the fiction that Asenath was really the daughter of Shechem and Dinah, and only the foster-daughter of Potipherah. The Christian legend, which is no doubt in the main based on the Jewish, is found in Greek, Syriac, Armenian, Slavonic and mediaeval Latin. It is not earlier than the 3rd or 4th century.

(d) *Sapiential.*—The *Pirke Abôth,* a collection of sayings of the Jewish Fathers, are preserved in the 9th Tractate of the Fourth Order of the Mishnah. They are attributed to some 60 Jewish teachers, belonging for the most part to the years A.D. 70–170, though a few of them are of a much earlier date. The book holds the same place in rabbinical literature as the Book of Proverbs in the Bible. The sayings are often admirable. Thus in iv. 1–4, "Who is wise? He that learns from every man. . . . Who is mighty? He that subdues his nature. . . . Who is rich? He that is contented with his lot. . . . Who is honoured? He that honours mankind." (See further PIRKE ABÔTH.)

2 (b). New Testament *Apocryphal* Literature:—

(a) Gospels:—Uncanonical sayings of the Lord in Christian and Jewish writings. Gospel according to the Egyptians. Gospel according to the Hebrews. Protevangel of James. Gospel of Nicodemus. Gospel of Peter. Gospel of Thomas. Gospel of the Twelve. Gnostic gospels of Andrew, Apelles, Barnabas, Bartholomew, Basilides, Cerinthus and some seventeen others.

(b) Acts and Teachings of the Apostles:—Acts of Andrew and later forms of these Acts. Acts of John. Acts of Paul. Acts of Peter. Preaching of Peter. Acts of Thomas. Teaching of the Twelve Apostles. Apostolic constitutions.

(c) Epistles:—The Abgar Epistles. Epistle of Barnabas. Epistle of Clement. "Clement's" 2nd Epistle of the Corinthians. "Clement's" Epistles on Virginity. Clement's Epistles to James. Epistles of Ignatius. Epistle of Polycarp. Pauline Epp. to the Laodiceans and Alexandrians. 3 Pauline Ep. to the Corinthians.

(d) *Apocalypses:* see under APOCALYPTIC LITERATURE.

(a) **Gospels.**—*Uncanonical* Sayings of the Lord in Christian and Jewish Sources.—Under the head of canonical sayings not found in the Gospels only one is found, *i.* e., that in Acts xx. 35. Of the rest the uncanonical sayings have been collected by Preuschen (Reste der *ausserkanonischen* Evangelien, 1901, pp. 44–47). A different collection will be found in Hennecke, *NTliche* Apok. 9–11. The same subject is dealt with by Resch (Agrapha; *aussercanonische Schriftfragmente,*[2] 1906).

To this section belongs also the *Fayum* Gospel Fragment and the Logia published by Grenfell and Hunt. The former contains two sayings of Christ and one of Peter, such as we find in the canonical gospels, Matt. xxvi. 31–34, Mark xiv. 27–30. The papyrus, which is of the 3rd century, was discovered by Bickell among the Rainer collection, who characterized it (Z. f. kath. *Theol.,* 1885, pp. 498–504) as a fragment of one of the primitive gospels mentioned in Luke i. 1. On the other hand, it has been contended that it is merely a fragment of an early patristic homily. (See Zahn, Gesch. *Kanons,* ii. 780–790; Harnack, Texte und *Untersuchungen,* v. 4; Preuschen, *op. cit.* p. 19) The Logia (*q.v.*) is the name given to the sayings contained in a papyrus leaf by its discoverers, Grenfell and Hunt. They think the papyrus was probably written about A.D. 200. According to Harnack, it is an extract from the Gospel of the *Egyptians.* All the passages referring to Jesus in the Talmud are given by Laible, Jesus *Christus im* Talmud, with an appendix, "Die talmudischen Texte," by G. Dalman, 2nd ed. (1901). The first edition of this work was translated into English by A. W. Streane, Jesus *Christ* in the Talmud (1893). In Hennecke's *NTliche* Apok. *Handbuch* (pp. 47–71) there is a valuable study of this question by A. Meyer, entitled Jesus, *Jesu Jünger* und das *Evangelium im* Talmud und *verwandten jüdischen Schriften,* to which also a good bibliography of the subject is prefixed.

Gospel According to the Egyptians.—This gospel circulated among various heretical circles; among the Encratites, Naassenes and the Sabellians. Only three or four fragments survive which show that it was a product of pantheistic Gnosticism. With this pantheistic Gnosticism is associated a severe asceticism. The distinctions of sex are one day to come to an end; the prohibition of marriage follows naturally on this view. Hence Christ is represented as coming to destroy the work of the female (Clem. Alex. *Strom.* iii. 9. 63). Lipsius and Zahn assign it to the middle of the 2nd century. It may be earlier.

Protevangel of James.—This title was first given in the 16th century to a writing which is referred to as The Book of James by Origen. The narrative extends from the Conception of the Virgin to the Death of Zacharias. The author had at his disposal two distinct groups of legends about Mary. One of these groups is certainly of non-Jewish origin, as it conceives Mary as living in

the temple somewhat after the manner of a vestal virgin or a priestess of Isis. The other group is more in accord with the orthodox gospels. The book appears to have been written in Egypt, and in the early years of the 2nd century. For, since Origen states that many appealed to it in support of the view that the brothers of Jesus were sons of Joseph by a former marriage, the book must have been current about A.D. 200. From Origen we may ascend to Clem. Alex. who (*Strom.* vi. 93) shows acquaintance with one of the chief doctrines of the book — the perpetual virginity of Mary. Finally, as Justin's statements as to the birth of Jesus in a cave and Mary's descent from David show in all probability his acquaintance with the book, it may with good grounds be assigned to the first decade of the 2nd century.

Gospel of Nicodemus.—This title is first met with in the 13th century. It is also called The Acts of Pilate. The work gives an account of the Passion (i.–xi.), the Resurrection (xii.–xvi.), and the *Descensus ad Inferos* (xvii.–xxvii). Chapters i.–xvi. are not earlier than the 4th century; xvii.–xxvii. probably about a century later.

Gospel According to the Hebrews. — According to the most recent investigation this Gospel was current among the Nazarenes and Ebionites as early as 100–125, since Ignatius was familiar with the phrase "I am no bodiless demon" — a phrase which, according to Jerome (Comnz. in Is. xviii.), belonged to this Gospel.

The name "Gospel according to the Hebrews" cannot have been original; for if it had been so named because of its general use among the Hebrews, the Hebrews themselves would not have used this designation. It may have been known simply as "the Gospel." The language was Western Aramaic, the mother tongue of Jesus and his apostles. Two forms of Western Aramaic survive: the Jerusalem form of the dialect, in the Aramaic portions of Daniel and Ezra; and the Galilean, in isolated expressions in the Talmud (3rd century), and in a fragmentary jth century translation of the Bible. The quotations from the Old Testament are made from the Massoretic text.

This gospel must have been translated at an early date into Greek, as Clement and Origen cite it as generally accessible, and Eusebius recounts that many reckoned it among the received books. The gospel is synoptic in character and is closely related to Matthew, though in the Resurrection accounts it has affinities with Luke. Like Mark, it seems to have had no history of the birth of Christ, and to have begun with the baptism. (For the literature see Hennecke, *NTliche Apok. Handbuch*, 21–23.)

Gospel of Peter. — Before 1892 we had some knowledge of this gospel. Thus Serapion, bishop of Antioch (A.D. 190–203) found it in use in the church of Rhossus in Cilicia, and condemned it as Docetic (*Eusebius. H. E. vi. 12*). Again, Origen (*In Matt. tom.* xvii. 10) says that it represented the brethren of Christ as his half-brothers. In 1885 a long fragment was discovered at Akhmim, and published by Bouriant in 1892, and subsequently by Lods, Robinson, Harnack, Zahn, Schubert, Swete.

Gospel of Thomas. — This gospel professes to give an account of our Lord's boyhood. This gospel was originally still more Docetic than it now is, according to Lipsius. Its present form is due to an orthodox revision which discarded, so far as possible, all Gnostic traces. Lipsius (Smith's Dict. of Christ. Biog. ii. 703) assigns it to the latter half of the 2nd century, but Zahn (Gesch. Kan. ii. 771), on good grounds, to the earlier half. The latter scholar shows that probably it was used by Justin (Dial. 88). At all events it circulated among the Marcosians (Irenaeus, Haer. i. 20) and the Naasenes (Hippolytus, Refut. v. 7); and subsequently among the Manichaeans, and is frequently quoted from Origen downwards (Honz. I. in Luc.). If the stichometry of Nicephorus is right, the existing form of the book is merely fragmentary compared with its original compass. For literature see Hennecke, *NTliche Apokryphen Handbuch*, 132 seq.

Gospel of the Twelve.—This gospel is not to be identified with the Gospel according to the Hebrews. The only surviving fragments of it have been preserved by Epiphanius (Haer. xxx. 13–16, 22; see Preuschen, *op. cit.* 9–11). It began with an account of the baptism. It was used by the Ebionites, and was written, according to Zahn (*op. cit.* ii. 742), about A.D. 170.

Other Gospels Mainly Gnostic and Almost All Lost. — *Gospel of Andrew.* — This is condemned in the Gelasian Decree, and is probably the gospel mentioned by Innocent (*I. Ep.* iii. 7) and Augustine (*Contra advers. Leg. et Proph. i. 20*).

Gospel of Apelles.—Mentioned by Jerome in his Prooem. ad Matt.

Gospel of Barnabas. — Condemned in the Gelasian Decree (see under BARNABAS ad fin.).

Gospel of Bartholomew. — Mentioned by Jerome in his Prooem. ad Matt. and condemned in the Gelasian Decree.

Gospel of Basilides.—Mentioned by Origen (*Tract. 26 in Matt. xxxiii. 34, and in his Prooem in Luc.*); by Jerome in his Prooem in Matt. (See Harnack i. 161; ii. 536–537; Zahn, Gesch. Kanons, i. 763–774)

Gospel of Cerinthus.—Mentioned by Epiphanius (*Haer. li. 7*).

Gospel of the Ebionites.—A fragmentary edition of the canonical Matthew according to Epiphanius (*Haer.* xxx. 13), used by the Ebionites and called by them the Hebrew Gospel.

Gospel of Eve. — A quotation from this gospel is given by Epiphanius (*Haer. xxvi. 2, 3*) which shows that it was the expression of complete pantheism.

Gospel of James the Less. — Condemned in the Gelasian Decree.

Wisdom of Jesus Christ. — This third work contained in the Coptic ms. referred to under Gospel of Mary gives cosmological disclosures and is presumably of Valentinian origin.

Apocryph of John. — This book, which is found in the Coptic ms. referred to under Gospel of Mary and contains cosmological disclosures of Christ, is said to have formed the source of Irenaeus' account of the Gnostics of Barbelus (*i. 29–31*). Thus this work would have been written before 170.

Gospel of Judas Iscariot.—References to this gospel as in use among the Cainites are made by Irenaeus (*i. 31. 1*); Epiphanius (*xxxviii. 1. 3*).

Gospel, The Living (*Evangelium Vivum*).—This was a gospel of the Manichaeans. See Epiphanius, Haer. lxvi. 2; Photius, Contra *Manich.* i.

Gospel of Marcion. — On this important gospel see Zahn, Gesch. Kanons, i. 585–718.

Descent of Mary. — This book was an anti-Jewish legend representing Zacharias as having been put to death by the Jews because he had seen the God of the Jews in the form of an ass in the temple (Epiphanius, Haer. xxvi. 12).

Questions of Mary (Great and Little). — Epiphanius (*Haer.* **xxvi.** 8) gives some excerpts from this revolting work.

Gospel of Mary.—This gospel is found in a Coptic ms. of the 5th century; it gives disclosures on the nature of matter and the progress of the Gnostic soul through the seven planets.

Gospel of Matthias. — Condemned by the Gelasian Decree.

Gospel of Perfection (*Evangelium perfectionis*). — Used by the followers of Basilides and other Gnostics. See Epiphanius, Haer. xxvi. 2.

Gospel of Philip. — This gospel described the progress of a soul through the next world. It is of a strongly Encratite character and dates from the 2nd century.

Gospel of Thaddaeus.—Condemned by the Gelasian Decree.

Gospel of Thomas. — Of this gospel only one fragment has been preserved in Hippolytus, *Philos. v. 7, pp. 140 seq.* See Zahn, op. *cit.* i. 746 seq.; ii. 768–773; Harnack ii. 593–595.

Gospel of Truth. — This gospel is mentioned by Irenaeus i. 11. 9, and was used by the Valentinians. See Zahn i. 748 sqq.

(b) Acts and Teachings of **the** *Apostles.* — *Acts of Andrew.* — These Acts, which are of a strongly Encratite character, have come down to us in fragmentary condition. They belong to the earliest ages, for they are mentioned by Eusebius, H. E. iii. 25; Epiphanius, *Haer.* xlvii. 1; lxi. 1; lxiii. 2; Philaster, Haer, lxviii., as current among the Manichaeans and heretics. For a complete discussion of the various documents see Lipsius, Apokryphen Apostelgesclzickte, i. 543–622; also James in Hastings' Bible *Dict.* i. 92–93; Hennecke, NT. Apokryphen, in *loc.*

Acts of John.—Written in the 2nd century. The text has been edited most completely by Bonnet, *Acta Apostol. Apocr.*, 1898, 151–216. The contents might be summarized with Hennecke as

follows: Arrival and first sojourn of the apostle in Ephesus (xviii.–lv.); return to Ephesus and second sojourn (history of Drusiana, lviii.–lxxxvi.); account of the crucifixion of Jesus and His apparent death (lxxxvii.–cv.); the death of John (cvi.–cxv.). There are manifest gaps in the narrative.

Acts of Paul.—The author was, according to Tertullian (De Baptism. 17), a presbyter in Asia, who out of honour to Paul wrote the Acts, forging at the same time 3 Corinthians. Thus the work was composed before 190, and, since it most probably uses the martyrdom of Polycarp, after 155. The object of the writer is to embody in St. Paul the model idea of the popular Christianity of the 2nd century. His main emphasis is laid on chastity and the resurrection of the flesh. The tone of the work is Catholic and anti-Gnostic. For the bibliography of the subject see Hennecke, NT. *Apok.* 358–360.

Acts of Peter.—These acts were written not later than A.D. 200; the language (Greek) is modelled on that of the Acts of John. The author was probably a resident in Asia Minor.

Preaching of Peter.—This book (*πέτρου κήρυγμα*) gave the substance of a series of discourses spoken by one person in the name of the apostles. Clement of Alexandria quotes it several times as a genuine record of Peter's teaching. Heracleon had previously used it (see Origen, In Evang. *Johann.* t. xiii. 17). It is spoken unfavourably of by Origen (De Prin. Praef. 8). It was probably in the hands of Justin and Aristides. Hence Zahn gives its date as 90–100 at latest; Dobschutz, as 100–110; and Harnack, as 110–130. The extant fragments contain sayings of Jesus, and warnings against Judaism and Polytheism.

Acts of Thomas.—This is one of the earliest and most famous of the Gnostic Acts. It has been but slightly tampered with by orthodox hands. These Acts were used by the Encratites (Epiphanius, Haer. xlvii. 1), the Manichaeans (Augustine, Contra Faust. xxii. 79), the Apostolici (Epiphanius lxi. 1) and Priscillianists. The work is divided into 13 Acts, to which the Martyrdom of Thomas attaches as the 14th.

The more important of the works so far dealt with are published in English by M. R. James, *The Apocryphal New* Testament (1924). See THOMAS, SAINT.

Teaching of the Twelve Apostles (Didache).—This important work was discovered by Philotheos Bryennios in Constantinople and published in 1883. Since that date it has been frequently edited. The bibliography can be found in Schaff's and in Harnack's editions. The book divides itself into three parts. The first (i.–vi.) contains a body of ethical instruction which is founded on a Jewish and probably pre-Christian document which forms the basis also of the Epistle of Barnabas. The second part consists of vii.–xv., and treats of church ritual and discipline; and the third part is eschatological and deals with the second Advent. The book is variously dated by different scholars: Zahn assigns it to the years A.D. 80–120; Harnack to 120–165; Lightfoot and Funk to 80–100; Salmon to 120. (See Salmon in Dict. of Christ. Biog. iv. 806–815, also article DIDACHE.)

Apostolical Constitutions.—For the various collections of these ecclesiastical regulations—the Syriac Didascalia, Ecclesiastical Canons of the Holy *Apostles, etc.*—*see* separate article.

(c) Epistles.—The Abgar Epistles.—These epistles are found in Eusebius (HE. i. 3), who translated them from Syriac. They are two in number, and purport to be a petition of Abgar Uchomo, king of Edessa, to Christ to visit Edessa, and Christ's answer, promising after his ascension to send one of his disciples, who should "cure thee of thy disease, and give eternal life and peace to thee and all thy people." Lipsius thinks that these letters were manufactured about the year 200. (See *Dict.* Christ Biog. iv. 878–881, with the literature there mentioned.) The above correspondence, which appears also in Syria, is inwoven with the legend of Addai or Thaddaeus. The best critical edition of the Greek text will be found in Lipsius, *Acta Apostolorum* Apocrypha, 1891, pp. 279–283. (See also ABGAR.)

Epistle of Barnabas.—The special object of this epistle was to guard its readers against the danger of relapsing into Judaism. The date is placed by some scholars as early as 70–79, by others as late as the early years of the emperor Hadrian, 117. The text has been edited by Hilgenfeld in 1877, Gebhardt and Harnack in 1878, and Funk in 1887 and 1901. In these works will be found full bibliographies. (See further BARNABAS.)

Epistle of Clement.—The object of this epistle is the restoration of harmony to the church of Corinth, which had been vexed by internal discussions. The epistle may be safely ascribed to the years 95–96. The writer was in all probability the bishop of Rome of that name. He is named an apostle and his work was reckoned as canonical by Clement of Alexandria (Strom. iv. 17. 105), and as late as the time of Eusebius (H.E. iii. 16) it was still read in some of the churches. Critical editions have been published by Gebhardt and Harnack, Patr. Apost. *Op.*, 1876, and in the smaller form in 1900, Lightfoot,[2] 1890, Funk,[2] 1901. The Syriac version has been edited by Kennett, *Epp.* of St. Clement to the Corinthians in Syriac, 1899, and the Old Latin version by Morin, *S. Clementis* Romani ad *Corinthios epistulae* versio Latina *antiquissima*, 1894. Greek text and English transl. by Kirsopp Lake in Laeb's Classical Library.

"Clement's" *2nd Ep.* to the Corinthians.—This so-called letter of Clement is not mentioned by any writer before Eusebius (H.E. iii. 38. 4). It is not a letter but really a homily written in Rome about the middle of the 2nd century. The writer is a Gentile. Some of his citations are derived from the Gospel to the Egyptians. Kirsopp Lake, op. *cit.*

"Clement's" Epistles *on* Virginity.—These two letters are preserved only in Syriac which is a translation from the Greek. They are first referred to by Epiphanius and next by Jerome. Critics have assigned them to the middle of the 2nd century. They have been edited by Beelen, Louvain, 1856.

Clement's Epistles to James.—On these two letters which are found in the Clementine Homilies, see Smith's Dict. of Christian *Biography*, i. 559, 570, and Lehmann's monograph, Die *Clementi*schen Schriften, Gotha, 1867, in which references will be found to other sources of information.

Epistles of *Ignatius*.—There are two collections of letters bearing the name of Ignatius, who was martyred between 105 and 117. The first consists of seven letters addressed by Ignatius to the Ephesians, Magnesians, Trallians, Romans, Philadelphians, Smyrneans and to Polycarp. The second collection consists of the preceding extensively interpolated, and six others of Mary to Ignatius, of Ignatius to Mary, to the Tarsians, Antiochians, Philippians, and Hero, a deacon of Antioch. The latter collection is a pseudepigraph written in the 4th century or the beginning of the 5th. The authenticity of the first collection also has been denied, but the evidence appears to be against this contention. The literature is overwhelming in its extent. See Zahn, Patr. Apost. Op., 1876; Funk,[2] Die apostol. *Väter*, 1901; Lightfoot,[2] Apostolic *Fathers*, 1889. Kirsopp Lake, op. *cit.*

Epistle of *Polycarp*.—The genuineness of this epistle stands or falls with that of the Ignatian epistles. See article in Smith's Dictionary of Christian Biography, iv. 423–431; Lightfoot, Apostolic Fathers, i. 629–702; Kirsopp Lake, op. *cit.*, also POLYCARP.

Pauline Epistles to the Laodiceans and tfze Alexandrians.—The first of these is found only in Latin. This, according to Lightfoot (see *Colossians*,[8] 272–298) and Zahn, is a translation from the Greek. Such an epistle is mentioned in the Muratorian canon. (See Zahn, *op. cit.* ii. 566–585) The Epistle to the Alexandrians is mentioned only in the Muratorian canon. (See Zahn ii. 586–592.)

For the Third Epistle of Paul to the Corinthians, and Epistle from the Corinthians to Paul, see under "Acts of Paul" above.

(R. H. CH.; W. O. E. O.)

APOCYNACEAE, the dog-bane family, a numerous group of dicotyledonous plants, composed chiefly of tropical twining shrubs but including also various trees and perennial herbs, all with a milky often poisonous juice. The leaves are simple, entire and usually opposite; the flowers are regular, sympetalous, with the parts in fours or fives and are borne either singly or clustered in cymes or panicles. The anthers are arrow-shaped and pointed, and the granular pollen is often glutinous; the ovary is mostly superior, with two or more carpels. There are about 180 genera and 1,400 species, comparatively few of which are found in cool

temperate regions. In the British Isles the family is represented by the greater and the lesser periwinkle (Vinca major and V. minor). the latter of which has run wild in the eastern United States. Of some 60 species representing the family in North America, only about six are found as far north as New York and adjacent Canada. The best known of these are the American dog-bane (*Apocynum androsaemifolium*) and the Indian hemp (A. cannabinum). Several tropical genera yield rubber (Landlophia, Cardopinus, Funtumia, Urceola, Willoughbya, etc.); others are source of drugs (*Aspidosperma, Strophanthus, Alstonia, Allamanda,* etc.). Some are exceedingly poisonous, notably the ordeal-tree (Tanghinia), of Madagascar; the manghas-tree (*Cerbera*), of tropical Asia; and the Bushman's poison (*Acocanthera*), of South Africa. Other widely known plants of this family are the oleander (Nerium oleander); the temple-tree or frangipani (*Plumeria acuminata*); the crape-jasmine (*Tabernaemontana* coronaria); the star-jasmine (*Trachelospermum jasminoides*); and the Chilian jasmine (*Mandevilla suaveolens*). The Natal-plum (Carissa *grandiflora*) and several other species produce edible fruits and many are showy ornamental plants. (See DOG-BANE; INDIAN HEMP; OLEANDER; PERIWINKLE.)

APOCYNUM is the dried root of Apocynum *cannabinum,* also known as American hemp, Canadian hemp and dogbane. The only official preparation for use as a drug is the fluid extract prepared from the powdered root. The dose is five minims (0·3cc.) for therapeutic purposes. Its action in this dosage is to stimulate directly the heart muscle and the constricting muscles of the blood-vessels, thus producing a stronger and slower heart beat and a rise in blood pressure. It also increases the output of urine in certain conditions, notably cardiac dropsy. In larger doses it is a powerful gastro-intestinal irritant, producing vomiting and purging. It closely resembles digitalis in its effect, except that it is not accumulated in the body as is digitalis. Its use is limited to cases of cardiac dropsy where digitalis has failed or has produced undesirable effects.

APODICTIC, a logical term, applied to judgments which are necessarily true, as of mathematical conclusions. The term in Aristotelian logic is opposed to dialectic, as scientific proof to probable reasoning. Kant contrasts apodictical with problematic and assertorical judgments. The apodictic judgment has the form "S must be P." It does not really express greater certainty than the assertorical judgment ("S is P") or the problematic judgment ("S may be P"), as Kant thought, but indicates a closer connection with other beliefs already entertained by the assertor. Hence its frequent use to express a judgment inferred from other judgments that imply it.

APOGEE, in astronomy, that point in the orbit of the moon which is farthest from the earth, the distance being 253,000 miles. (See MOON.)

APOLDA, a town in the *land* of Thuringia in central Germany, 9 mi. E.N.E. of Weimar. Pop. (1939) 27,789. Christian Zimmermann (1759–1842) introduced hosiery and cloth manufacture and the town has an important wool and silk industry. It has also dye-works, bell foundries and manufactures of engines, bicycles, cardboard and food products. It also trades in grain, leather, horses and cattle, and in woollen yarn.

APOLPSTAS, a tribe or small group of tribes of South American Indians, regarded as forming an independent linguistic stock. The Apolistas lived in the first half of the 19th century, near Apolo in the province of Caupolican, in Bolivia. on the eastern slopes of the Andes in the latitude of the northern end of lake Titicaca. Their original home is unknown. They have been so long under the influence of the missions, that even in the early 19th century, nothing of their original culture survived.

See A. D'Orbigny, *L'Homme Americain* (Paris, 1839); N. Armentia, *Relacion historica* de *las Misiones* Franciscanas de *Apolobamba* (La Paz, 1903); E. Nordenskiold, *Beiträge zur Kenntnis einiger Indianerstämme des Madre* de *Dios* Gebietes (Ymer, 1905, vol. xxv., pp. 265–312).

APOLLINARIS, "the Younger" (died A.D. 390), bishop of Laodicea in Syria. He collaborated with his father, Apollinaris the Elder, in reproducing the Old Testament in the form of Homeric and Pindaric poetry, and the New Testament after the fashion of Platonic dialogues, when the Emperor Julian had forbidden Christians to teach the classics. In his eagerness to combat Arianism he went so far as to deny the existence of a rational human soul in Christ's human nature, this being replaced in Him by a prevailing principle of holiness, to wit the Logos.

It was held that the system of Apollinaris was really Docetism (see DOCETAE). The position was accordingly condemned by several synods and in particular by that of Constantinople (A.D. 381). Apollinaris had a considerable following, which after his death divided into two sects, the more conservative taking its name (Vitalians) from Vitalis, bishop of Antioch, the other (Polemeans) adding the further assertion that the two natures were so blended that even the body of Christ was a fit object of adoration. The Apollinarian type of thought persisted in what was later the Monophysite school.

Although Apollinaris was a prolific writer, scarcely anything has survived under his own name. But a number of his writings are concealed under the names of orthodox Fathers, long ascribed to Gregory Thaumaturgus. These have been collected and edited by Hans Lietzmann.

Apollinaris must be distinguished from the bishop of Hierapolis who bore the same name, and who wrote one of the early Christian "Apologies" (c. 170).

BIBLIOGRAPHY—*See* A. Harnack, History *of* Dogma, vols. iii. and iv. passim; R. L. Ottley, The Doctrine of the Incarnation; G. Voisin, *L'Apollinarisme* (Louvain, 1901); H. Lietzmann, *Apollinaris von* Laodicea *und* seine *Schule* (Tuebingen, 1905).

APOLLINARIS, SULPICIUS, a grammarian of Carthage, who flourished in the 2nd century A.D. He taught Pertinax and Aulus Gellius, who speaks of him in the highest terms (iv. 17). He is the reputed author of the metrical arguments to the Aeneid and to the plays of Terence and (probably) Plautus (J. W. Beck, De *Sulpicio* Apollinari, 1884).

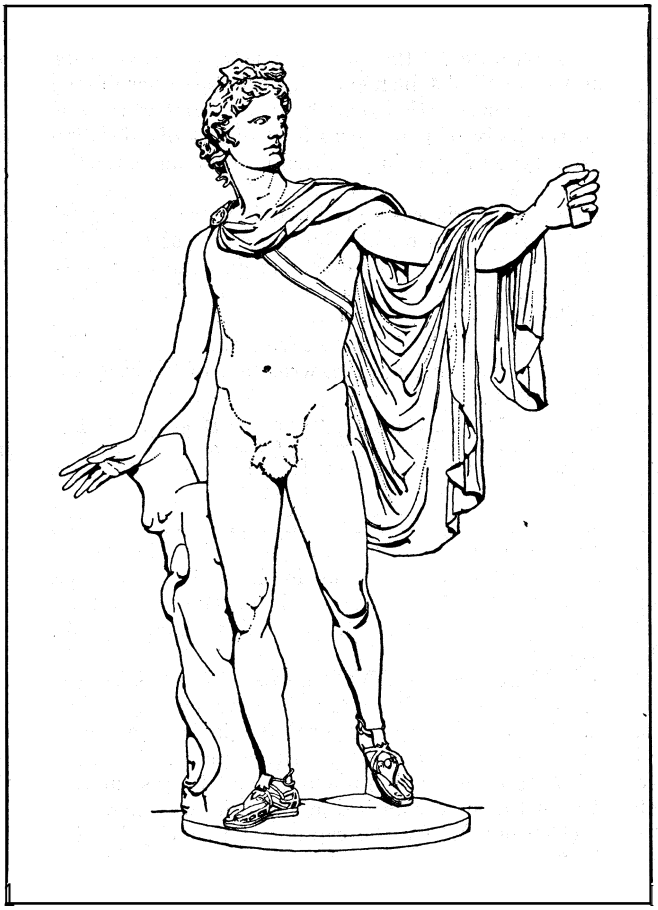
APOLLINARIS SIDONIUS, GAIUS SOLLIUS (c. 430–487 or 488), Christian writer and bishop, was born in Lyons about A.D. 430. He married (about 452) Papiania, the daughter of Avitus, who was consul and afterwards emperor. He enjoyed the favour of Majorianus and Anthemius, and in 472, more for his political than for his theological abilities, he was made bishop of Arverna (Clermont). On the capture of that city by the Goths in 474 he was imprisoned; but he was afterwards restored to his bishopric by Euric, king of the Goths. He died in A.D. 487 or 488. His extant works are his Panegyrics on different emperors (in which he draws largely upon Statius, Ausonius and Claudian); and nine books of Letters and Poems, whose chief value consists in the light they shed on the political and literary history of the 5th century. The Letters, which are very stilted, reveal Apollinaris as a man of genial temper, fond of good living and of pleasure. The best edition is that in the *Monumenta Germaniae Historica* (Berlin, 1887), which gives a survey of the manuscripts.

Apollinaris Sidonius (the names are commonly inverted by the French) is the subject of numerous monographs, historical and literary. S. Dill, *Roman Society in the Last Century of the Western Empire* (1899), and T. Hodgkin, Italy and Her Invaders, vol. vii. (2nd ed. 1899), contain interesting sections on Apollinaris.

APOLLO, in Greek mythology, one of the most important and many-sided of the Olympian divinities. The least improbable etymology of the name (Ἀπόλλων, Ἀπέλλων) is perhaps that of Usener, who connects it with an obsolete Greek verb meaning "to drive away" (evil or disease; *cf.* Lat. *pellere*). Roscher's derivation of all the functions assigned to him from the idea of a single original light or sun god has not found general acceptance, although no doubt some features of his character can be readily explained in this manner.

According to the legend, Apollo was the son of Zeus and Leto The latter, pursued by the jealous Hera, after long wandering found shelter in Delos, where she bore a son, Apollo, under a palm-tree at the foot of Mt. Cynthus. Before this, Delos had been a barren, floating rock, but now became stationary, being fastened down by chains to the bottom of the sea. Apollo was born on the seventh day of the month, and this day and the 20th, the days of the new and full moon, were ever afterwards held sacred to him.

In Homer Apollo appears only as the god of prophecy, the sender of .plagues, and sometimes as a warrior. Elsewhere he is the god of agriculture and of vegetation generally. He was called Smintheus, generally explained as "destroyer of mice," to which epithet, however, some modern enquirers attach a totemistic significance. Valleys and groves were under his protection, and certain trees and plants, especially the laurel, were sacred to him.



BY COURTESY OF THE VATICAN MUSEUM, ROME

THE APOLLO BELVEDERE, DISCOVERED IN THE RUINS OF ANTIUM IN A.D. 1485

This famous statue, a little larger than life sire, represents the god as a being of perfect physical beauty. The left hand and right forearm have been restored

As the god of agriculture and vegetation he is naturally connected with the course of the year and the arrangement of the seasons, so important in farming operations, and becomes the orderer of time (*Horomedōn,* "ruler of the seasons"), and frequently appears on monuments in company with Horai.

Apollo is also the protector of cattle and herds and is himself spoken of as a keeper of flocks, to which point the legends of his service as a herdsman with Laomedon and Admetus. Here probably also is to be referred the epithet Lukeios, which, formerly connected with λυκ ("shine") and used to support the conception of Apollo as a light-god, is now generally referred to lukos ("wolf") and explained as he who keeps away the wolves from the flock. In accordance with this, the epithet *lukēgenēs* will not mean "born of" or "begetting light," but rather "born from the she-wolf," in which form Leto herself was said to have been conducted by wolves to Delos. The consecration of the wolf to Apollo is probably the relic of an ancient totemistic religion.

With the care of the fruits of the earth and the lower animals is associated that of the highest animal, man, especially the youth on his passage to manhood. As such Apollo was *kourotrophos* ("rearer of boys") and patron of the palaestra. In many places gymnastic contests formed a feature of his festivals, and he himself was proficient in athletic exercises. Thus he was supposed to be the first victor at the Olympic games; he overcame Hermes in the foot-race, and Ares in boxing.

The transition is easy to Apollo as a warlike god; in fact, the earlier legends represent him as engaged in strife with Python, Tityus, the Cyclopes, and the Aloidae (*q.v.*). He is Boedromios ("the helper"), Eleleus ("god of the war-cry") and the paean was said to have been originally a song of triumph composed by him after his victory over Python. In Homer he frequently appears on the field, like Ares and Athene, bearing the aegis (*q.v.*) to frighten the foe. This aspect is confirmed by the epithets Argurotoxos ("god of the silver bow"), and Hekatebolos ("the shooter from afar"), and his statues are often equipped with the accoutrements of war, whence some have derived his name from apollunai as the god of "destruction" (Apollyon).

The fame of the Pythian oracle at Delphi, connected with the slaying of Python by the god immediately after his birth, gave especial prominence to the idea of Apollo as a god of prophecy. Python, always represented in the form of a snake, is the symbol of the old earth divinity whose home was the place of "enquiry" (*puthesthai*). When Apollo Delphinios with his worshippers from Crete took possession of the earth-oracle Python, he received in consequence the name Pythios. That Python was no fearful monster, symbolizing the darkness of winter which is scattered by the advent of spring, is shown by the fact that Apollo was considered to have been guilty of murder in slaying it and compelled to wander for a term of years and expiate his crime by servitude and purification. In the solar explanation, the serpent is the darkness driven away by the rays of the sun. (On the Delphian cult of Apollo and its political significance, see AMPHICTYONY, DELPHI, ORACLE.) Apollo's oracles, which he did not deliver on his own initiative, but as the mouthpiece of Zeus, were infallible; but the human mind was not always able to grasp their meaning, hence he was called *Loxias* ("crooked, ambiguous"). To certain favoured mortals he communicated the gift of prophecy (Cassandra, the Cumaean sibyl, Helenus, Melampus, and Epimenides). Although his favourite method was by word of mouth, yet signs were sometimes used; thus Calchas interpreted the flight of birds; burning offerings, sacrificial barley, the arrow of the god, dreams and the lot, all played their part in communicating the will of the gods.

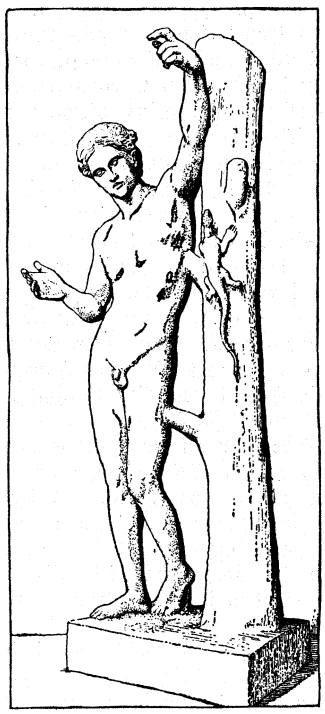
Closely connected with the god of oracles was the god of the healing art, the oracle being frequently consulted in cases of sickness. These two functions are indicated by the titles Iatromantis ("healer and seer") and Oulios, probably meaning "health-giving," rather than "destructive." This side of Apollo's character does not appear in Homer, where Paieon is mentioned as the physician of the gods. Here, as in the case of Aristaeus (*q.v.*), the question arises whether Paean (or Paeon) was originally an epithet of Apollo, subsequently developed into an independent personality, or an independent deity merged in the later arrival. Apollo is further supposed to be the father of Asclepios (Aesculapius), whose ritual is closely modelled upon his. The healing god could also prevent disease and misfortune of all kinds; hence he is alexikakos and *apotropaios* ("averter of evil"). Further, he is able to purify the guilty and to cleanse from sin. Such a task could be fitly undertaken by him, since he himself underwent purification after slaying Python.

The same element of enthusiasm that affects the priestess of the oracle at Delphi produces song and music. The close connection between prophecy and song is indicated in Homer (Odyssey, viii. 488), where Odysseus suggests that the lay of the fall of Troy by Demodocus was inspired by Apollo or the Muse. The metrical form of the oracular responses at Delphi, the important part played by the paean and the Pythian nomos ("strain") in his ritual, contributed to make Apollo a god of song and music, friend and "leader of the Muses" (*Mousagetēs*). He plays the lyre at the banquet of the gods, and causes Marsyas to be flayed alive because he had boasted of his superior skill in playing the flute, and the ears of Midas to grow long because he had declared in favour of Pan, who contended that the flute was a better instrument than Apollo's favourite lyre.

A less important aspect of Apollo is that of a marine deity, due to the spread of his cult to the Greek colonies and islands. As such, his commonest name is Delphinios, the "dolphin god," in whose honour the festival Delphinia was celebrated in Attica.

This cult probably originated in Crete, whence the god in the form of a dolphin led his Cretan worshippers to the Delphian shore, where he bade them erect an altar in his honour. He is *Epibatērios* and *Apobatērios* ("embarker" and "disembarker"), and *Nasiōtas* ("the islander") These maritime cults of Apollo are probably due to his importance as the god of colonization, who accompanied emigrants on their voyage.

As *Aguieus* ("god of streets and ways"), in the form of a stone pillar with painted head, placed before the doors of houses, he let in the good and kept out the evil, and as *Prostatērios* he "stands before the house" as its protector. Lastly, as the originator and protector of civil order, Apollo was regarded as the founder of cities and legislation. Thus, at Athens, Apollo *Patrōös* was known as the protector of the Ionians, and the Spartans referred the institutions of Lycurgus to the Delphic oracle.



AFTER A MARBLE COPY IN THE LOUVRE
THE APOLLO SAUROCTONUS (LIZARD KILLER,, ONE OF THE MOST NOTABLE OF THE WORKS OF THE ANCIENT GREEK SCULPTOR, PRAXITELES

As to Roscher's derivation of all Apollo's functions from the conception of an original light and sun god it cannot be shown that on Greek soil Apollo originally had the meaning of sun god; in Homer, Aeschylus and Plato, the sun god Helios is distinctly separated from Phoebus Apollo; the constant epithet Phoebus, usually explained as the brightness of the sun, may equally well refer to his physical beauty or moral purity; *lukēgenēs* has already been noticed. It is not until the beginning of the 5th century B.C. that the identification makes its appearance. The idea was taken up by the Stoics, and in the Roman period generally accepted. But the fact of the gradual development of Apollo as a god of light and heaven, and his identification with the foreign sun gods, is no proof of an original Greek solar conception of him.

The most usual attributes of Apollo were the lyre and the bow; the tripod especially was dedicated to him as the god of prophecy. Among plants, the bay, used in expiatory sacrifices, and also for making the crown of victory at the Pythian games, and the palm-tree under which he was born in Delos, were sacred to him; among animals and birds, the wolf, the roe, the swan, the hawk, the raven, the crow, the snake, the mouse, the grasshopper and the griffin—a mixture of the eagle and the lion, evidently of Eastern origin. The swan and grasshopper symbolize music and song; the hawk, raven, crow and snake have reference to his functions as the god of prophecy.

The chief festivals held in honour of Apollo were the Carneia, Daphnephoria, Delia, Hyacinthia, Pyanepsia, Pythia, and Thargelia *(see* separate articles).

Among the Romans the worship of Apollo was adopted from the Greeks. There is a tradition that the Delphian oracle was consulted as early as the period of the kings during the reign of Tarquinius Superbus. In 430 B.C. a temple was dedicated to Apollo on the occasion of a pestilence, and during the second Punic War (in 212 B.C.) the *Ludi Apollinares* were instituted in his honour. But it was in the time of Augustus, who considered himself under the special protection of Apollo and was even said to be his son, that his worship developed and he became one of the chief gods of Rome. After the battle of Actium, Augustus enlarged his old temple, dedicated a portion of the spoil to him, and instituted quinquennial games in his honour. He also erected a new temple on the Palatine hill and transferred the secular games, for which Horace composed his *Carmen Saeculare,* to Apollo and Diana.

Apollo was represented more frequently than any other deity in ancient art. As Apollo *Aguieus* he was shown by a simple conic pillar; the Apollo of Amyclae was a pillar of bronze surmounted by a helmeted head, with extended arms carrying lance and bow. There were also rude idols of him in wood *(xoana),* in which the human form was scarcely recognizable. In the 6th century B.C., his statues of stone were naked, stiff and rigid in attitude, shoulders square, limbs strong and broad, hair falling down the back. In the riper period of art the type is softer, and Apollo appears in a form which seeks to combine manhood and eternal youth. His long hair is usually tied in a large knot above his forehead The most famous statue of him is the Apollo Belvedere in the Vatican (found at Antium, 1485), an imitation, belonging to the early imperial period, of a bronze statue representing him, with aegis in his left hand, driving back the Gauls from his temple at Delphi (279 B C); or, according to another view, fighting with the Pythian dragon. In the Apollo Citharoedus or Mousagetes in the Vatican, he is crowned with laurel and wears the long, flowing robe of the Ionic bard, and his form is almost feminine in its fulness; in a statue at Rome of the older and more vigorous type he is naked and holds a lyre in his left hand; his right arm rests upon his head, and a griffin is seated at his side. The Apollo Sauroctonus (after Praxiteles), copied in bronze at the villa Albani in Rome and in marble at Paris, is a naked, youthful, almost boyish figure, leaning against a tree, waiting to strike a lizard climbing up the trunk. The gigantic statue of Helios (the sun-god), "the Colossus of Rhodes," by Chares of Lindus, celebrated as one of the seven wonders of the world, is unknown to us. Bas-reliefs and painted vases reproduce the contests of Apollo with Tityus, Marsyas, and Heracles, the slaughter of the daughters of Niobe, and other incidents in his life.

APOLLODORUS, an Athenian painter, who flourished at the end of the 5th century B.C. He is said to have introduced great improvements in perspective and chiaroscuro.

APOLLODORUS, of Carystus in Euboea, one of the most important writers of the New Attic comedy, who flourished at Athens between 300 and 260 B.C. He is to be distinguished from an older Apollodorus of Gela (342–290), also a writer of comedy, a contemporary of Menander. He wrote 47 comedies and obtained the prize five times. Terence borrowed his *Hecyra* and *Phormio* from the Ἑκυρά and Ἐπιδικαζόμενος of Apollodorus.

BIBLIOGRAPHY.—Fragments in Koch, *Comicorum Atticorum Fragmenta,* ii. (1884); *see* also Meineke, *Hzstorza Critica Comicorum Graecorum* (1839).

APOLLODORUS *(c.* 144 B.C.), an Athenian grammarian, pupil of Aristarchus and Panaetius the Stoic. There is extant under his name a treatise on the gods and the heroic age, entitled Βιβλιοθήκη, a valuable authority on ancient mythology. Modern critics are of opinion that, if genuine, it is an abridgment of a larger work by him (Περὶ θεῶν)

BIBLIOGRAPHY.—Edition, with commentary, by Heyne (1803); text by Wagner (1894) *Mythographi Graeci,* vol. i. (Teubner series); text and Eng. trans. by Sir J. G. Frazer (Loeb series, 1921). Amongst other works by him of which only fragments remain, collected in Müller, *Fragmenta Historicorum Graecorum,* may be mentioned: Χρονικά, a work on chronology from the fall of Troy to 144 B.C. (Diels, in *Rhein. Mus.,* xxxi. 1f), Περιήγησις, a gazetteer written in iambics; Περὶ Νεῶν, a work on the Homeric catalogue of ships (B.

Niese in *Rhein Mus.*, xxxii. 306) and a work on etymology (Ἐτυμολογίαι). *See* Schwarz in Pauly-Wissowa pp. 2857–75; also F. Jacoby, Apollodors Chronik (1902); J. Nicole, *Le Procès de Phidias (d'après un papyrus inédit)* (Geneva, 1910).

APOLLODORUS, of Damascus, a famous Greek architect, who flourished during the 2nd century A.D. He was a favourite of Trajan, for whom he constructed the stone bridge over the Danube (A.D. 104–05). He also planned a gymnasium, a college, public baths, the Odeum and the Forum Trajanum, within the city of Rome; and the triumphal arches at Beneventum and Ancona. The Trajan column in the centre of the Forum is the first triumphal monument of the kind. On the accession of Hadrian, Apollodorus was banished, and, shortly afterwards, being charged with imaginary crimes, put to death (Dio Cassius lxix. 4). He also wrote a treatise on *Siege Engines* (Πολιορκητικά), which was dedicated to Hadrian.

APOLLONIA, the name of more than thirty cities of antiquity. The most important are the following: (1) Apollonia κατ' Ἐπίδαμνον or πρὸς Ἐπιδάμνῳ, now Pollina, on the right bank of the Aous in Illyria, founded by the Corinthians and Corcyraeans. It soon became prosperous as the most convenient link between Brundusium and northern Greece, and later as one of the starting-points of the Via Egnatia. Towards the close of the Roman republic it was a seat of literature and philosophy. Here Augustus was being educated when the death of Caesar called him to Rome. It seems to have sunk with the rise of Aulon, and few ruins remain. (2) A Thracian city on the Black sea (afterwards Sozopolis, and now Sizeboli), colonized by Milesians, and famous for its colossal statue of Apollo by Calamis, which Lucullus removed to Rome.

APOLLONIUS, surnamed ὁ δύσκολος ("the Crabbed"), a grammarian of Alexandria, who lived in the reigns of Hadrian and Antoninus Pius. He was the founder of scientific grammar and is styled *grammaticorum princeps* by Priscian, who based his own work on that of Apollonius. Four of his works are extant: *On Syntax,* ed. Bekker (1817); and three smaller treatises, on *Pronouns, Conjunctions,* and *Adverbs,* ed. Schneider (1878).

Grammatici Graeci, i. in Teubner series; Egger, *Apollonius Dyscole* (1854).

APOLLONIUS, surnamed "the Effeminate," a Greek rhetorician of Alabanda in Caria, who flourished about 120 B.C. Among his pupils was Mark Antony.

APOLLONIUS, surnamed "the Sophist," of Alexandria, a grammarian, who probably lived towards the end of the 1st century A.D. He was the author of a Homeric lexicon (Λέξεις Ὁμηρικαί), the only work of the kind we possess. His chief authorities were Aristarchus and Apion's Homeric glossary.

BIBLIOGRAPHY.—Edition by Villoison (1773), I. Bekker (1833); Leyde, *De Apollonii Sophistae Lexico Homerico* (1885); E. W. B. Nicholson on a newly discovered fragment in *Classical Review* (Nov. 1897).

APOLLONIUS MOLON (flourished *c.* 70 B.C.), a Greek rhetorician, who settled at Rhodes. He twice visited Rome as an ambassador, and Cicero and Caesar went to Rhodes to take lessons from him. He endeavoured to moderate the florid Asiatic style and cultivated an "Atticizing" tendency. He wrote on Homer, and, according to Josephus, attacked the Jews.

BIBLIOGRAPHY.—*See* C. Mueller, *Fragmenta Historicorurn Graecorum,* iii.; *E.* Schuerer, *History of the Jewish People,* iii. (Eng. trans. 1886).

APOLLONIUS OF PERGA (PERGAEUS), Greek geometer of the Alexandrian school, was probably born some twenty-five years later than Archimedes, *i.e.* about 262 B.C. He flourished in the reigns of Ptolemy Euergetes and Ptolemy Philopator (247–205 B.C.). His treatise on *Conics* gained him the title of the Great Geometer, and is that by which his fame has been transmitted to modern times. All his numerous other treatises have perished, save one, and we have only their titles handed down, with general indications of their contents, by later writers, especially Pappus. After the *Conics* in eight Books had been written in a first edition, Apollonius brought out a second edition, considerably revised as regards Books i.–ii., at the instance of one Eudemus of Pergamum; the first three books were sent to Eudemus at intervals, as revised, and the later books were dedicated (after Eudemus's death) to King Attalus I. (241–197 B.C.). Only four Books have survived in Greek; three more are extant in Arabic; the eighth has never been found. Books v.–vii. were translated into Latin by Giacomo Alfonso Borelli and Abraham Ecchellensis from the free version in Arabic made in 983 by Abu'l Fath of Ispahan and preserved in a Florence ms. But the best Arabic translation is that made as regards Books i.–iv. by Hilal b. Abi Hilal (d. about 883), and as regards Books v.–vii. by Thâbit b. Qurra (826–901). Halley used the latter version for his translation of Books v.–vii., but the best ms. (Bodl. 943) is still unpublished except for a fragment of Book v., published by L. Nix with German translation (Drugulin, Leipzig, 1889). Halley added in his edition (1710) a restoration of Book viii.

The degree of originality of the *Conics* can best be judged from Apollonius's own prefaces. Books i.–iv. form an "elementary introduction," *i.e.* contain the essential principles; the rest are specialized investigations in particular directions. For Books i.–iv. he claims only that the generation of the curves and their fundamental properties in Book i. are worked out more fully and generally than they were in earlier treatises, and that a number of theorems in Book iii. and the greater part of Book iv. are new. That he made the fullest use of his predecessors' works, such as Euclid's four books on Conics, is clear from his allusions to Euclid, Conon and Nicoteles. The generality of treatment is indeed remarkable; he gives as the fundamental property of all the conics the equivalent of the Cartesian equation referred to *oblique* axes (consisting of a diameter and the tangent at its extremity) obtained by cutting an oblique circular cone in any manner, and the axes appear only as a particular case after he has shown that the property of the conic can be expressed in the same form with reference to any new diameter and the tangent at its extremity. On the basis of the form of the fundamental property (expressed in the terminology of the "application of areas") Apollonius called the curves for the first time by the names *parabola, ellipse, hyperbola.* Books v.–vii. are clearly original. Apollonius's genius takes its highest flight in Book v., where he treats of normals as minimum and maximum straight lines drawn from given points to the curve (independently of tangent properties), discusses how many normals can be drawn from particular points, finds their feet by construction, and gives propositions determining the centre of curvature at any point and leading at once to the Cartesian equation of the evolute of any conic.

The other treatises of Apollonius (each in two Books) mentioned by Pappus are—1st, Λόγου ἀποτομή Cutting off a Ratio; and, Χωρίου ἀποτομή Cutting off an Area; 3rd, Διωρισμένη τομή Determinate Section; 4th, Ἐπαφαί Tangencies; 5th, Νεύσεις Inclinations; 6th, Τόποι ἐπίπεδοι Plane Loci.

An Arabic version of the first was found towards the end of the 17th century in the Bodleian library by Dr. Edward Bernard, who began a translation of it; Halley finished it and published it with a restoration of the second (1706). A restoration of the third was given by Robert Simson, *Opera quaedam reliqua* (Glasgow, 1776).

Tangencies embraced the following general problem:—Given three things (points, straight lines or circles) in position, to describe a circle passing through the given points, and touching the given straight lines or circles. The most difficult case, and the most interesting historically, is when the three given things are circles. This problem, which is sometimes known as the Apollonian Problem, was proposed by Vieta in the 16th century to Adrianus Romanus, who gave a solution by means of a hyperbola. Vieta himself solved it by elementary methods and restored the whole treatise of Apollonius in *Apollonius Gallus* (Paris, 1600); an interesting account of the problem is given by J. W. Camerer in *Apollonii Pergaei de tactionibus quae supersunt, ac maxime Lemmata Pappi in hos Libros, cum Observationibus, etc.* (Gothae, 1795.) A restoration of the fifth has been given by Samuel Horsley (1770), and one of the sixth by Robert Simson (Glasgow, 1749).

Other works of Apollonius are referred to by ancient writers,

vix. (1) Περὶ roil πυρίου *On the Burning-Glass,* where the focal properties of the parabola probably found a place; (2) Περὶ τοῦ κοχλίου On *the Cylindrical Helix* (mentioned by Proclus); (3) a comparison of the dodecahedron and the icosahedron inscribed in the same sphere; (4) Ἡ καθόλου πραγματεία, perhaps a work on the general principles of mathematics in which were included Apollonius's criticisms and suggestions for the improvement of Euclid's *Elements;* (5) Ὠκυτόκιον (quick bringing-to-birth), in which, according to Eutocius, he showed how to find closer limits for the value of π than the 33 and $3\frac{10}{71}$ of Archimedes; (6) an arithmetical work (as to which *see* PAPPUS) on a system of expressing large numbers in language closer to that of common life than that of Archimedes' *Sand-reckoner,* and showing how to multiply such large numbers; (7) extensions of the theory of irrationals expounded in Euclid, Book x. *(see* extracts from Pappus's comm. on Eucl. x., preserved in Arabic snd published by Woepcke, 1856). Lastly, in astronomy he is credited by Ptolemy with an explanation of the motion of the planets by means of epicycles and eccentric circles; he also made researches in the lunar theory, for which he is said to have been called Epsilon (ϵ).

The editions of the Conics include, besides Halley's monumental edition of all seven Books (Oxford, 1710), Commandinus's Latin Translation (1566), and Barrow's edition (1675), of the first four Books, and Heiberg's definitive text of the same Books, with Eutocius's commentary, etc. (Leipzig, 1891–93). There is a German translation by H. Balsam (1861), and an edition in modern notation, with introduction, etc., by T. L. Heath (Cambridge, 1896); *see* also *H.* G. Zeuthen, *Die Lehre von den Kegelschnitten im Altertum* (Copenhagen, 1886 and 1902). (T. L. H.)

APOLLONIUS OF RHODES (RHODIUS), a Greek epic poet and grammarian, of Alexandria, who flourished under the Ptolemies Philopator and Epiphanes (222–181 B.C.). He was the pupil of Callimachus, with whom he subsequently quarrelled. In his youth he composed the work for which he is known, *Argonautica,* an epic in four books on the legend of the Argonauts. In 196, Ptolemy Epiphanes appointed him librarian of the museum, which office he probably held until his death. As to the *Argonautica,* Longinus' *(De Sublim.,* p. 54, 19) and Quintilian's (*Instit., x.* 1, 54) verdict of mediocrity seems hardly deserved; it possesses a certain simplicity and contains some beautiful passages. There is a valuable collection of scholia. The work, highly esteemed by the Romans, was imitated by Virgil *(Aeneid,* iv.), Varro Atacinus, and Valerius Flaccus. Marianus (about A.D. 500) paraphrased it, in iambic trimeters. Apollonius also wrote epigrams; grammatical and critical works; and Κτίσεις ("the foundations of cities").

BIBLIOGRAPHY.—*Editio princeps* (1496); Merkel-Keil (with scholia, 1854); Seaton (1900). English translations: Verse, by Greene (1780); Fawkes (1780); Preston (1811); Way (1901). Seaton (Loeb series, 1912). Prose by Coleridge (1889); *see* also Couat, *La Poésie alexandrine;* Susemihl, *Geschichte der griech. Lit. in der alexandrinischen Zeit.*

APOLLONIUS OF TRALLES (in Caria), a Greek sculptor, who flourished in the 2nd century B.C. With his brother Tauriscus, he executed the marble group known as the Farnese Bull, representing Zethus and Amphion tying the revengeful Dirce to the horns of a wild bull.

FROM "PHILOSTRATE DE LA VIE D'APOLLONIUS THIANEEN," 1599

APOLLONIUS OF TYANA. THE NEO-PYTHAGOREAN PHILOSOPHER AND MYSTIC

APOLLONIUS OF TYANA, a Greek philosopher of the Neo-Pythagorean school, born a few years before the Christian era. He studied at Tarsus and in the temple of Asclepius at Aegae, where he devoted himself to the doctrines of Pythagoras and adopted the ascetic habit of life. He travelled through Asia and visited Nineveh, Babylon and India, imbibing oriental mysticism. The narrative of his travels given by his disciple Damis and reproduced by Philostratus is so full of the miraculous that many have regarded him as an imaginary character. On his return to Europe he was received with reverence as a magician. He himself claimed only the power of foreseeing the future; yet in Rome it was said that he raised from death the body of a noble lady. In the halo of his mysterious power he passed through Greece, Italy and Spain. It was said that he was accused of treason both by Nero and by Domitian, but escaped by miraculous means. Finally he set up a school at Ephesus, where he died, apparently aged 100. The work of Philostratus is generally regarded as a religious work of fiction.

See F. C. Baur, *Apollonius von Tyana und Christus,* ed. Ed. Zeller (Leipzig, 1876—an attempt to show that Philostratus's story is merely a pagan counterblast to the New Testament history); J. Jessen, *Apollonius v. Tyana und sein Biograph Pkilostratos* (Hamburg, 1885); D. M. Tredwell, *Sketch of the Life of Apollonius* of *Tyana* (New York, 1886); J. Gottsching, *Apollonius von Tyana* (1889); *B.* L. Gildersleeve, *Essays and Studies* (New York, 1890); J. A. Froude, *Short Studies,* vol. iv.; *G.* R. S. Mead, *Apollonius of Tyana* (1901); Philostratus's *Life of Apollonius* (Eng. trans. New York, 1905); M. Wundt, *Apollonius von Tyana—Prophetic und Mythenbildung* (1906); *O.* de B. Priaulx, *The Indian Travels of Apollonius* (1873); F. W. G. Campbell, *Apollonius of Tyana* (1908). Translations by J. S. Phillimore (1912) and F. C. Conybeare (1912) (Loeb series). *See* also NEO-PYTHAGOREANISM.

APOLLONIUS OF TYRE, a mediaeval tale supposed to be derived from a lost Greek original. The earliest mention of the story is in the *Carminn* (Bk. vi. 8, ll. 5–6) of Venantius Fortunatus, in the second half of the 6th century, and the romance may well date from three centuries earlier. It bears a marked resemblance to the *Antheia and Habrokomes* of Xenophon of Ephesus. The story relates that King Antiochus, maintaining incestuous relations with his daughter, kept off her suitors by asking them a riddle, which they must solve on pain of losing their heads. Apollonius of Tyre solved the riddle, which concerned Antiochus's secret. He returned to Tyre, and, to escape the king's vengeance, set sail in search of a place of refuge. In Cyrene he married the daughter of King Archistrates, and presently, on receiving news of the death of Antiochus, departed to take possession of the kingdom of Antioch, of which he was, for no clear reason, the heir. On the voyage his wife died, or rather seemed to die, in giving birth to a daughter, and the sailors demanded that she should be thrown overboard. Apollonius left his daughter, named Tarsia, at Tarsus in the care of guardians who proved false to their trust. Father, mother, and daughter were only reunited after 14 years' separation and many vicissitudes. The earliest Latin ms. of this tale, preserved at Florence, dates from the 9th or 10th century. The pagan features of the supposed original are by no means all destroyed. The ceremonies observed by Tarsia at her nurse's grave, and the preparations for the burning of the body of Apollonius's wife, are purely pagan. The riddles that Tarsia propounds to her father are obviously interpolated. They are taken from the *Enigmata* of Caelius Firmianus Symposius. The many inconsistencies of the story seem to be best explained by the supposition (E. Rohde, *Der griechische Roman,* 2nd ed., 1900, pp. 435 et seq.) that the Antiochus story was originally entirely separate from the story of Apollonius's wanderings, and was clumsily tacked on by the Latin author. The romance kept its form through a vast number of mediaeval re-arrangements, and there is little change in its outlines as set forth in the Shakespearian play of *Pericles.*

BIBLIOGRAPHY.—The Latin tale is preserved in about 100 mss., and was printed by M. Velser (Augsburg, 1595), by J. Lapaume in *Script. Erot.* (Didot, Paris, 1856), and by A. Riese in the *Bibl. Teubneriana* (1871, new ed. 1893). The most widespread versions in the middle ages were those of Godfrey of Viterbo in his *Pantheon* (1185), uhere it is related as authentic history, and in the *Gesta Romanorunt* (cap. 153), which formed the basis of the German folk-tale by H. Steinhöwel (Augsburg, 1471), the Dutch version (Delft, 1493), the French in *Le Violier des histotres romaines* (Paris, 1521), the Fnglish, by Laurence Twine (London, 1576, new ed. 1607), also of the Scandinavian, Czech, and Hungarian tales.

In England a translation was made as early as the 11th century (ed. B. Thorpe, 1834, and J. Zupitza in *Archiv fur neuere Sprachen,* 1896); there is a Middle English metrical version (J. O. Helliwell, *A New Boke about Shakespeare,* 1850), by a poet who says he was vicar oi Wimborne; John Gower uses the tale as an example of the seventh deadly sin in the eighth book *of* his *Confessio Amantis;*

Robert Copland translated a prose romance of *Kynge Apollyne of Thyre* (Wynkyn de Worde, 1510) from the French; *Pericles* was entered at Stationers' Hall in 1607, and was followed in the next year by George Wilkins's novel, *The Painfull Adventures of Pericles, Prynce of Tyre* (ed. Tycho Mommsen, Oldenburg, 1857), and George Lillo drew his play *Marina* (1738) from the piece associated with Shakespeare. *See* A. H. Smyth, *Shakespeare's Pericles and Apollonius of Tyre* (Philadelphia, 1898); Elimar Klebs, *Die Erzahlung von A. aus Tyrus* (Berlin, 1899); S. Singer, *Apollonius von Tyrus* (Halle, 1895).

APOLLBS, an Alexandrian Jew, came to Ephesus, where he expounded in the synagogue the Messianic prophecies of the Old Testament. He was versed in the Scriptures and had been in touch with the movement inaugurated by John the Baptist. Priscilla and Aquila convinced him that the predictions had been fulfilled in Jesus (Acts xviii.). Perhaps, like the followers of John in xix. 1–5, he then received Christian baptism. This interpretation assumes that the writer of Acts, who says that Apollos taught "the things concerning Jesus," means "the things concerning the Christ." Strictly interpreted the phrase seems to imply that Apollos knew the teaching of Jesus, with which he may have been in contact in Galilee, but not its consummation in the Resurrection faith of the early Church. Encouraged by the Christians of Ephesus he went to Corinth, where he proclaimed with vigour and success that the Messiah was Jesus. One of three (or four) parties which developed in the Corinthian Church claimed him as its founder (I. Cor. i. 10–12). Paul recognized his work generously. Apollos had watered his plant (iii. 6). It is a natural deduction from the origin of Apollos and his distinctive teaching that he had affinities with the Alexandrian school of Judaism represented by Philo. Some scholars have supposed that he wrote the anonymous Epistle to the Hebrews, which has similar affinities, but this is a guess and improbable. From I. Cor. xvi. 12 we learn that he returned to Ephesus and was there with Paul. (W. K. L. C.)

APOLLYON. In Job. xxvi. 6; xxviii. 22; the Hebrew word *Abaddon* (destruction) is coupled with Sheol (the grave) and death. In Rev. ix. 11, a wicked angel presides over all the powers of the abyss, and is called Abaddon. The Greek name Apollyon (Ἀπολλύων, destroyer) is the equivalent.

APOLOGETICS seeks to state grounds for faith in God, in Christ, in the Bible and in the Church; although Protestantism seriously lowers the importance of Church teaching ("General Councils may err and sometimes have erred," say the Anglican Articles); and modern apologists—from a convergence of reasons—propose a more moderate estimate of the Bible also. Again, the basis of apologetics may be placed in reason, or in conscience, or in experience, or (in some sense) in authority—or in a combination of several factors; even the most authoritarian of Churches, the Roman Catholic, claims to build on the foundation of reason and conscience. Historically, the apologetic debate has meant, first, the elaboration of an appeal to miracle, and, later, the subordination of that appeal to something possibly vaguer but more inward. On one side there is the impression made by the unique figure of Jesus Christ; on the other side there are the experiences of the religious life. This two-fold appeal is held to be conclusive.

Apologetics and Philosophy.—It would be odious, at least for Protestants, to affirm one type of philosophy to be orthodox and to condemn all others. Yet certain types of philosophy can only by a *tour* de force be combined with religious belief—*e.g.*, materialism, where materialism is seriously maintained, or the blend of materialism with agnosticism known as naturalism. Briefly Christianity postulates a spiritual philosophy. On the other hand, a philosophy which lays down the law concerning all things human and divine is a dangerous ally for faith. Not infrequently apologetics are treated with contempt in journalism; the same attitude is observable in Albrecht Ritschl himself, whom critics in England tend to regard as the apologist par excellence and to blame correspondingly. The facts are summarized in the present writer's Albrecht Ritschl and his School, chap. i. None the less, the apologist regards his task as sacred—"*by* demonstration of the truth, commending himself to every man's conscience in the sight of God."

Apologetics in the Christian Scriptures.—The Old Testament does not argue in support of its beliefs, unless when the Wisdom literature seeks to rebut moral difficulties (cf. T. K. Cheyne, Job and Solomon; A. S. Peake, Problem of *Suffering* in the Old Testament). The New Testament supplies materials for the apologist (*e.g.*, references to "mighty works" in the words of Jesus), but its own appeal is predominantly that of the preacher or prophet. The identification of Christ with the Logos foreshadowed in Paul and in Heb. i. 2, and clinched in the Johannine prologue (John i. 1. etc.), afforded an important clue to the Greek-Christian mind. Quite as important for later thinking (*e.g.*, Thomas Aquinas) has been the "Natural Theology" of Rom. i. 20. Again, what might almost be called the "Natural Religion" of Rom. ii. 14 repudiates in advance the conception of mind as—prior to experience—a tabula *rasa;* moral law is inscribed there "by nature." Also the "great word conscience" is as characteristic of Paul as of Hebrews. Perhaps there are touches of Stoicism in these Pauline utterances; certainly there are hints of a spiritual philosophy. E. F. Scott's important Apologetic of the New Testament gives a wide extension to the term.

The Early Apologetic Period.—The young Christian Church stood face to face with Greek philosophy—past its prime, but still immensely strong. Friendship was inevitable; and the Church borrowed, as Harnack has observed, mainly from Platonism in doctrine and in ethics mainly from Stoicism. (Very early, too, libertarian free-will came to be asserted against the Gnostics.) Justin Martyr, the leading apologist, had before his conversion belonged in turn to each of these schools. Inevitably there arose a tendency to stress the contacts between Christianity and the higher Hellenism while ignoring differences; some modern censures of this tendency are unduly severe. "Logos" was the watchword both of Justin and of the "Christian Platonists of Alexandria," Clement and Origen; though in the end, having done its work as a friendly intermediary between Christianity and Hellenism, Logos was bowed out of the great creeds. During this period the appeal to miracle was hampered (it has been suggested) by the prevalent belief in magic—supernatural happenings could be discounted, if they were so common. The appeal to prophecy—*i* e., to fulfilled predictions, and therefore to a miracle of foreknowledge—is stated by the very greatest minds (*e.g.*, Athanasius) with an unhesitating confidence that impresses every modern reader as naive. The conquest of the civilized world by Christianity was certainly not exclusively due to its arguments; nor could Christians wish it to have been so; but neither as historians nor as Christians can we undervalue such a figure as Origen. The brilliant but harsher figure of Tertullian has several peculiarities: the (Stoical) appeal from philosophy to the plain man, the tendency to paradox (Credo *quia* impossibile; the quotation, if inexact, does Tertullian no injustice), and, in a different vein, the assertion of the anima *naturaliter* Christiana. Occasionally, the "natural immortality" of the soul is displaced by the thought that eternal life even physically is God's supernatural gift; *e.g.*, in the lay apologist Arnobius. Until the Church's triumph, apologetic work other than evidential was very necessary for refutation of slanders and in protest against persecution. Even afterwards, when the Christianized empire was suffering from barbarian inroads, Orosius, Salvian and Augustine (The City of God) found it needful to argue, on different lines, that Christianity had not brought disaster, but had mitigated it or redeemed from it.

The Middle Period.—During the whole of the middle ages, Western Christendom was dominated, though incompletely, by the superb genius of Augustine. Apologetically, as well as doctrinally, he is hard to reduce to a unity. A thread, if not of scepticism, at least of authoritarianism, has been detected in him (Ego vero evangelio *non* crederem nisi me catholicae ecclesiae commoveret *auctoritas*). Further he is the heir, in a more positive sense, of (neo)Platonism with its intellectual appeal; and his experience of sin and grace revives Pauline Christianity, if it hardens still further the grim doctrine of predestination and practically nullifies free will. The Christian Church, so recently persecuted, was not long enthroned before it began to persecute in its turn. For this new departure, also, Augustine unhappily accepted a share of responsibility.

How could there be living apologetics in centuries which

appealed not to reason or conscience, but to force? For one thing, the Jew remained anti-Christian. For another, Mohammed launched a non-Christian religion of immense power upon the Eastern world. Jew and Muslim had to be met in argument (*e.g.*, the Pugio Fidei of Raymond Martini, *c.* 1280). For another thing still. the paganism of antiquity was never entirely forgotten; Abelard (d. 1142) wrote a Dialogue between a Jew, a Philosopher and a *Christian.* Yet, while three religions were "at daggers drawn," there was an immense movement pervading all three in favour of the philosophy of Aristotle. This is one of the most extraordinary features in the history of the human mind; and its apologetic and theological consequences could not but be great. It is easy to underestimate the activity of thought during the flowering times of the middle ages (cf. R. L. Poole, Illustrations of the History of *Mediaeval* Thought and Learning, ed. 2); perhaps because outsiders interpret the Catholic ethos too narrowly, perhaps because moderns ascribe the conditions of their own day to earlier and freer generations. Anselm (d. 1109), one of the fathers of Scholasticism, throws himself into the problems both of Theism and of Christian doctrine with the air of a man determined on making new discoveries; and he thanks God at the end for what he believes to be new and also true results.

The mediaeval world studied the problem of the relations between philosophy and theology as a problem concerning "faith" and "reason." Augustine, and after him Anselm, quoting Isa. vii. 9, in the Latin translation derived from the LXX. reading — "If ye will not believe, ye shall not know" — proclaimed an absolute harmony of the two, on *the* condition that assent to authoritative teaching came first, whereupon reason was sure to confirm it in every detail. Aquinas (d. 1274), following his master Albert the Great, took a different line. To his own mind, probably, the new positions constituted a better way of harmonizing reason and faith; whether that claim is correct or is baseless, the positions were new. Rational argument (but not Anselm's ontological proof; its ingenuities were too wiredrawn for the sober mind of Aquinas) demonstrates God and immortality. The characteristic contents of revelation are supernatural mysteries — undiscoverable beforehand by reason, and never fully intelligible even as revealed. There are all the materials here for later developments; *e.g.,* for the systematic separation of the truths regarded as demonstrable by reason (God, Freewill, Immortality) under the name Natural Theology (used in this technical sense perhaps only from Christian Wolff, 1679–1754, onwards); and yet, Aquinas has not affirmed that all "revealed" doctrines are in the special sense mysterious. Again, there are materials in Aquinas for isolating "miracles" and "prophecies" as the Christian evidences proper; but it did not enter into any mediaeval mind to summarize the evidences so coldly. That remained for a later and less dogmatic period. Still further, Aquinas has something besides argument to proclaim. Faith is a virtue, and exists as such in two forms—*acquisita,* which rests upon conditions of human effort, and infusa, which is the higher gift of God. This is an Augustinian thought. It may be transformed into an appeal away from bare argument to religious and moral experience; or it may imply submission to mere authority. Either way, it constitutes a noteworthy supplement to argumentative apologetics. An earlier mediaeval writer, Alexander of Hales (d. 1245), quoted by R. Franks in History of the Doctrine of the Work of Christ, I. pp. 228–29, expresses a similar thought in almost startling terms: "There are reasons for the things to be believed which are strong and apparent, such as those showing in what ways God is and is one and is omnipotent, which the philosophers prove by many reasons; and there are reasons for things which are to be believed which are not apparent but weak according to human reason, such as . . . Anselm introduces in Cur Deus Honto. . . . Nevertheless, reasons of this kind when informed through faith infused by God . . . appear necessary." According to C. R. S. Harris, Duns Scotus, the great rival and critic of Aquinas, practically concurred with the Dominican's views concerning the basis of belief. Other interpreters had attached more importance to the critical elements in Duns, whose tendency at least is to fall back upon Church authority as a remedy against rational doubt; this tendency passes on from Realist Duns to William of Occam and other Nominalist schoolmen. Its climax is a doctrine of "two truths." A thing may be false in philosophy, true in theology. Only one obscure churchman of the second rank, Robert Holkot, is said to have definitely recommended this refuge of lies; Pomponazzi, who repeated the suggestion, was a Renaissance sceptic. In modern times, the Vatican Council (1870) definitely adopted the main theses of Thomist apologetics.

Modern Period. — At the Reformation the appeal of religion displaced, for a generation or more, evidential inquiries; while the counter-Reformation exhibits a religious rallying to the principle of authority. The implicit logic of early Protestantism found expression in the somewhat later formula, *e.g.,* Westminster Confession of Faith, 1647, which defines the ultimate ground of belief as the "inward" witness of the Holy Spirit "with the Word of God." We may paraphrase as follows: A spiritual experience, notably the experience of forgiveness, is generated by the Bible and commends the Bible for acceptance in all its parts. This formulation is directed not against rationalism, but against the subordination of the Bible to the Church. It did not yet occur to orthodox Protestantism that religion permits — still less, that it requires — a distinction between the letter and the spirit.

In the post-Reformation Church of Rome we meet with a world-genius in Apologetics, as in other fields, in Blaise Pascal (1623–62). His *Pensées,* published posthumously, seems to have been meant for a systematic treatise, but it has come to us in fragments. It borrows its material (as industrious editors have shown) from very few sources — the *Pugio* Fidei, M. de Montaigne, P. Charron. Ideas as well as learning are largely Montaigne's. The latter's cheerful man-of-the-world scepticism is transfigured in Pascal to a deep distrust of human reason, in part, perhaps, from anti-Protestant motives. Further it is fallen man whom he pursues with his fierce scorn; his view of man's nature — intellect as well as character — is to be read in the light of his unflinching Augustinianism. Once again, Pascal, unlike most apologists, belongs to the small company of saintly souls. This philosophical sceptic is full of humble joy in salvation. Pascal earned great admiration from Calvinists; in his own communion he belonged to a section of opinion which was authoritatively condemned.

In the Dutchman, Hugo Grotius, one of the founders of International Law, rational apologetics disentangle themselves from the deeper or vaguer appeals of early Protestantism (De *Veritate Christianae* Religionis, 1627).

It did not follow from the success of the Protestant movement in several great countries that persecution, even in these countries, was at an end. Its major forms became rarer; but minor disabilities remained for nonconforming elements of society. Moreover, the wars of religion constituted another unhappy form of the appeal to force, the peace of Westphalia terminating 30 years of barbarism in an illogical geographical compromise; while in England what is known as the Great Rebellion, with its afterpiece the Revolution of 1688, provoked a similar recoil from religious zeal. The change by which the phrase "Natural Religion" — invented apparently on the Continent as a reproachful designation for the teaching of Lord Herbert of Cherbury, father or grandfather of Deism — came into use on the Christian side as a term of praise foreshadows significantly the temper of the 18th century. Doctrinal emphasis was to slacken: argument was to become clear and definite: and the age of Reason — as it styled itself — was at least to witness the triumph of pedestrian common sense. While on the Continent G. W. Leibnitz (1646–1716), representing the Platonizing inheritance (while quoting Trinity and Eucharist as "mysteries"), had raised anew the problem of Theodicy, and had sought to solve it by asserting that the evil of the finite universe must have been reduced to the lowest practicable dimensions — Leibnitz believed in hell! — by the wisdom and goodness of God, Locke's empiricism was much more congenial to the age. He dealt directly with theology in his *Reasonableness* of Christianity (1695) — a favourite and often repeated thesis. While Locke is prepared to admit mysteries, the illustration which he names is the nature

of angels; what can the human mind know of such beings, apart from revelation? When an unwelcome deistic admirer of Locke (Toland) proclaims that Christianity is Not Mysterious (1696), and plainly enough if indirectly—it was still unsafe to be outspoken—attacks the doctrine of the Trinity, a new edge is put upon Locke's theses.

Frequently, deism served as a mask for more thorough-going rejection of religious belief; although the deists of genius, Voltaire and J. J. Rousseau (who both visited England), were in their different ways sincere; as also was the formidable agitator Tom Paine. In France on Lockian principles, Materialism (de la Mettrie) and Atheism (Holbach, 1723–89) came to find advocates. And already from the start of the deistic controversy in England, every apologetic position had been challenged. Thomas Woolston (1669–1731), taking a leaf out of the Church's book, allegorized: but he allegorized away the miracles. Antony Collins (1676–1729), the friend of Locke, eulogized *Freethinking*, allegorized the prophecies, had doubts about freewill, and about the natural immortality of souls; David Hume (1711–76) found miracles "incredible" (R. C. Trench) if Spinoza had proclaimed them "impossible"; John Toland (1670–1722). a ragged scholar, announced that *Christianity* was Not *Mysterious;* Matt. Tindal, an Oxford don (1657?–1733), that Christianity was as Old as *the* Creation (was in fact neither more nor less than deism); and Dodwell the younger, with a sneer, that Christianity was Not Founded *upon* Argument (1741). Apart from lesser apologists, individual points were handled by William Law (1686–1761), the brilliant and saintly non-juror (The Case of Reason—surely your boasted reason has failed! if we are in so evil a plight); by Bp. Berkeley the philosopher (*Alciphron*); by the great scholar Bentley; by Samuel Clarke. The really classical reply, however, was by Bp. Joseph Butler (1692–1752). It is interesting to study in detail which deistic positions Butler deems worthy of notice, and which he simply ignores. He is as clumsy as Pascal was graceful, but his personality has charm. In a few incidental words he has perfectly described himself as one who writes "with simplicity and in earnest." The three Sermons *on Human* Nature (1726), while not easy to classify as a piece of philosophy, revived the ethic of duty; to be revived again by Immanuel Kant (1724–1804), and later still by Thomas Carlyle (1795–1881), who—along with the anti-Christian "Exodus from Hounsditch" of Sartor Resartus—stood for a vague but intense moral Theism, which had powerful effects. Part I. of Butler's Analogy (1736) restates Natural ("or essential") Religion as necessarily including divine punishment, on the analogy of present facts. Here, perhaps, Butler is weightiest of all, and also—in that age of easy-going optimism—is most isolated. He might have said, with Ps. cxix., "My flesh trembleth for fear of Thee, and I am afraid of Thy judgments." The formal evidences of Christianity (Analogy part II. chap. 7) are conceived by Butler very much as by his contemporaries—miracles, prophecy ("Prophecy is history written beforehand"), and some vaguer supplements. Unfortunately (writing of course before Hume) Butler blunderingly denies that there is need of specially good evidence if we may reasonably hope to vindicate a miracle narrative. The same error is repeated, in reply to Hume, by George Campbell of Aberdeen (1719–96); the theory of probabilities is full of traps which have caught many an acute mind. The error of Butler and Campbell is corrected, with moderation and good taste, in J. S. Mill's Logic (1843); and, from him or from others, the correction has been accepted by later orthodox apologists. (See DEISM.)

Valuable work in scholarship was done, with an apologetic interest, in the Arian or Unitarian Nathaniel Lardner's credibility of the Gospel History (1727–55). Considerably later than either Butler or Lardner, Archdeacon William Paley restates the traditional apologetic neatly and clearly, but with no really fresh insight. In his Natural *Theology* (1802) he concentrates on the design argument. In *Moral* Philosophy (1785) he stands for a theological utilitarianism. In the Evidences of *Christianity* (1794) he stresses the honest testimony of the apostles to Christ's resurrection.

Yet, long before Paley wrote, the spirit of the age of common sense had begun to flag. In the Evangelical revival, for much good and for some evil, "enthusiasm" had come back to the world. Influenced by Thomas Erskine (1788–1870) and by the evangelical Quaker Joseph John Gurney (1788–1847), Thomas Chalmers (1780–1847)—leader of the evangelical revival in Scotland—stated Internal alongside of External Evidences for Christianity. This was a repetition, with whatever changes, of the doctrine of the testimony of the Holy Spirit; and it was an anticipation of modern appeals to religious experience. The process of disparaging miraculous ("external") evidence had begun; Bible miracles, great and small, were still unhesitatingly accepted as facts. So long as evangelical religion continued to be, what Jean Ingelow once called it, "as the river of God" in England—the solitary great spiritual force—its prestige carried with it (along with a sharply-cut doctrine of penal atonement) the attitude which S. T. Coleridge's posthumous Confessions of an *Inquiring* Spirit (1840) stigmatized as "bibliolatry."

The recoil from the 18th century might demand a deeper type of reason. Here Coleridge (1772–1834) was conspicuous; if strong evangelical elements were also present in him. F. D. Maurice (1805–72) was powerfully influential within somewhat narrower limits; Charles Kingsley called him "master," and R. H. Hutton was inspired by him. Bp. B. F. Westcott (1825–1901) reveals markedly the critical and scholarly interest, and his apologetic concern never slumbers; if obscure in thought, he was saintly in character. The supreme modern representative of Platonizing philosophies was the great German thinker G. W. F. Hegel (1770–1831), who inspired new orthodoxies but also inspired D. F. Strauss and helped to inspire the radical New Testament criticism of F. C. Baur (1792–1860) of Tiibingen, and—more than once and in more than one direction—has told upon the theology of the English-speaking world.

Again, the recoil from the 18th century might make for greater recognition of Church authority—in the Church of Rome, Ultramontanism, heralded by Bonald and de Maistre, which has achieved such triumphs; in Anglicanism, the Oxford Movement of John Keble (1792–1866), J. H. (afterwards Cardinal) Newman (1801–90) and E. B. Pusey (1800–82) etc.; its waves of influences pervade the Anglican communion and extend well beyond it. A. M. Fairbairn (Catholicism, Roman *and* Anglican, ch. v.; and elsewhere) and E. A. Abbott (Philomythus, and elsewhere) suspect Newman of a sceptical leaven and extend the criticism to Butler's doctrine of "probability." Another of the Oxford converts to Rome, W. G. Ward (1812–82), made vigorous contributions to natural theology.

Fresh Issues.—In the 19th century, Agnosticism was added to the list of non-Christian theories. It owes something to the negative side of Kant's critical philosophy. Sir Wm. Hamilton, and Dean Mansel (Limits of *Religious Thought,* 1858) took it up as a Christian apologetic; a similar apologetic is much more attractively stated in Tennyson's poem In Memoriam (1849). Herbert Spencer's First Principles (1862), quoting Mansel at some length, detached the system from its supposed Christian affinities; and finally the word agnostic was coined by the brilliant champion of Darwinism, T. H. Huxley (1825–95). There are differences between Huxley's agnosticism and Spencer's; yet, while shrinking from saying "There is no God," both alike say not merely "I do not know" but "I know that no human mind ever can know." If this is not dogmatism, what is? (See AGNOSTICISM.)

Huxley also carried on a vigorous polemic against the Christian miracles in detail, while refusing to join in wholesale a *priori* rejection such as Hume's, or such as underlies Strauss's "mythical" theory in his Life of *Jesus* (1835–36 and later). R. C. Trench (Notes *on the* Miracles, 1846; in the Introduction) made the telling criticism that Strauss has sentenced every narrative before hearing the evidence, though his excuses for rejection vary from time to time. An apologetic, which is to claim the right so to criticize assailants, must in fairness be prepared to view some—perhaps many—Gospel tales of wonder as legendary accretions. More sweeping rejection of miracles occurs again in a brief but emphatic footnote to T. H. Green's (longer) *Introduction* to Hume (1874)—reiterating Hume's thesis, while rebuking Hume's

sophistical philosophy for its failure to vindicate in earnest the thought of unalterable natural law. A longer footnote in A. v. Harnack's (larger) History of *Dogma* (1885, vol. i. of Eng. Trans. from 2nd ed. 1894, p. 65), with a partial admission that there is evidential value in the gospel healings, pleads eloquently for dissociating Christianity from reliance on miracle. A. Ritschl's school book, Unterricht in der Christlichen Religion (1875) had affirmed that "he who is conscious of miracle in his own experience will not be troubled by its appearance in others." The close of Hume's Essay *on* Miracles strikes a similar note—with a sneer; the Christian writer is profoundly in earnest. And probably Christians will do well to hesitate before banishing "miracle" from the vocabulary of religion. John Wendland's new theory of the miraculous (Eng. Trans. Miracles and Christianity) as "God's originality"—so **A.** E. Garvie sums it up—may be viewed as a theological interpretation of "emergent" evolution. It perhaps vindicates the thought of Incarnation as what has been termed "the Crown of science"; it gives less promise of rescuing individual miracle narratives. Contemporary criticisms of the idea of natural law—conspicuous in James Ward's Naturalism and Agnosticism (1899) and *The Realm* of *Ends* (1911)—raise their own difficulties; and they do not appear to have been exploited in defence of the miraculous. Perhaps the last occasion upon which a first-rate Protestant mind repeated the old Thomist apologetic was in J. B. Mozley's Bampton Lecture of 1865 On Miracles. Mozley's view of revelation is set aside by A. B. Bruce in ***The*** Chief End of Revelation (1881) as "the doctrinaire theory," and during a whole generation Bruce's writings, not without traces of an internal development, held the field as a statement of the Christian apology.

Modern Apologetics **and** Philosophy,—Superficially regarded philosophy ebbs and flows, whatever progress the debate may reveal to speculative insight. Some notes may be added on a few special points. (a) Freewill is generally assumed on the Christian side (R. C. Church; Scottish philosophy; H. Lotze; J. Martineau; W. G. Ward. Not in a libertarian sense; Leibnitz. New and obscure issues raised by Kant). But there is no continuous tradition or steady trend of discussion. (b) Personal immortality is affirmed as philosophically certain by the Church of Rome and by many Protestant writers. Others teach "conditional immortality." Others base the hope upon faith in the resurrection of Christ. (c) Theodicy—the tradition of Leibnitz—is preserved (on libertarian lines) by Martineau (A Study of Religion, 1883). See abo F. R. Tennant's Origin *and* Propagation of Sin (1902). Others (especially P. T. Forsyth, passim) find in the gospel of redemption the true theodicy.

Apologetics **and** Physical Science.—(a) Copernicanism has won its battles even in the Church of Rome; books which had long occupied a place in the Index have been removed from it. It is not certain that the shock of Copernicanism on supernatural Christianity is exhausted. (b) Geology has also won its battles, and few now try to harmonize it with Genesis, although the celebrated W. E. Gladstone, for whom The Impregnable Rock continued to be Holy Scripture, praised the careful work (R.C.) of Reusch. (c) Evolution came down from the clouds when C. Darwin and A. R. Wallace succeeded in displacing the naive conception of special creation by belief in the origin of species out of other species through a process of natural law. This gave immense vogue to wider and vaguer theories of evolutionary process, notably to H. Spencer's grandiose cosmic formula in terms of mechanism. Here the apologist may himself seek, following John Fiske, to philosophize evolution as a re-statement of natural theology, hinting at personal immortality. Similarly, Tennyson's *In* Memoriam blends with its agnosticism a hopeful view of evolution—"one God, one law, one element and one far-off divine event."

As far as pure science goes, the inference from science in favour of materialism has visibly lost much of its plausibility, and Protestant apologists would probably be prepared to accept in advance all verified discoveries as belonging to a different region from that of faith. Roman Catholic apologetic prefers to negotiate in detail.

Apologetics **and** History.—History brings us nearer the heart of the Christian position. (a) Old Testament criticism won startling victories towards the end of the 19th century. It blots out much supposed knowledge, but throws a vivid light on the reconstrued process of history. Most Protestants accept the general scheme of criticism; those who hang back make not a few concessions. The Roman Catholic Church again prefers an attitude of reserve. (b) New Testament criticism raises even more delicate issues. Positively it may be affirmed that the recovered figure of the historical Jesus is the greatest asset in the possession of modern Christian theology and apologetics. The "Lives" of Christ, Roman Catholic and Protestant, "critical" (D. F. Strauss, **A.** Renan, etc., etc.) and "believing," imply this at least. Negatively, "unchallenged historical certainties" are becoming few in number; though the Tiibingen criticism of F. C. Baur and his school—important as the first scientific attempt to conceive New Testament conditions and literature as a whole—has been abandoned. The synoptic gospels are now treated with respect in responsible quarters. But not all quarters are responsible; and in the effort to grasp scientifically, *i.e.,* accurately, the amazing facts of Christ and primitive Christianity, every imaginable hypothesis is canvassed. "Modernism" appeared within the Church of Rome—where authority condemned it—as well as in Protestantism; it tends to transform some or many doctrines into symbols. The criticism of the Fourth Gospel remains full of uncertainties; but there is less and less tendency to maintain literal authorship by the son of Zebedee. (c) New Testament history. The apologist must maintain (1) that Jesus of Nazareth is a real historical figure—a point never doubted by Strauss although denied by some modern advocates of a mythical theory; (2) that Jesus is knowable (not one "of whom we really know very little"—B. Jowett) in His teaching, example, character, historical personality; and that He is full of moral splendour. On the other hand, faith has no special interest in claiming that we can compose a biographical study of the development of Jesus. Certainly no early writer thought of providing material for such use. Yet the fascination of the subject will always revive the attempt. If it succeeds, there will be a new line of communication along which that great personality will tell on men's minds and hearts. If it fails—there are other channels; character can be known and trusted even when we are baffled by a thing necessarily so full of mystery as the development of a personality. **(3)** Apologists maintain that Jesus "claimed" Messiahship. There are speculative constructions of gospel history which eliminate that claim; and no doubt apologetics could restate its position in a changed form if the paradox of to-day became accepted as historical fact to-morrow. The central apologetic thesis is the uniqueness of the "only-begotten"; perhaps here "the supernatural" passes into the substance of Christian faith. And most probably the description of Jesus as thus unique will continue to be associated with the allegation—He told us so; He claimed Messiahship and "died for the claim." (See preface to 5th ed. of Ecce Homo.) Nor did so superhuman a claim crush Him, or deprive His soul of its balance. He imparted to the title a grander significance out of the riches of His personality. (4) In the light of this the "argument from prophecy" is reconstructed. It ceases to lay much stress upon coincidences between Old Testament predictions or "types" and events in Christ's career. It becomes the assertion: historically, providentially, the expectation of a unique religious figure arose—"the" Messiah; and Jesus gave Himself to be thought of as that great figure. (5) It is also claimed as certain that Jesus had marvellous powers of healing. More reserve is being shown towards the "nature miracles."

In view of the claims of Jesus, different possibilities arise. (i.) The evangelists impute to Him a higher claim than He made. This may be called the rationalistic solution; with sympathy for Christ's ethical teaching, there is relief at minimizing His great claim. So, brilliantly, Wellhausen's Gospel commentaries and *Introduction,* or K. Lake and Foakes Jackson. (ii.) The claim was fraudulent (Reimarus; apparently hinted also in Renan). This is a counsel of despair. (iii.) He was an enthusiastic dreamer, expecting the world's end. Here we have the central clue to

Jesus's teaching, according to Joh. Weiss; but more so in edition I. of his epoch-making *Die Predigt Jesu vom Reiche Gottes*, 1892, than in his later, also important, writings. The eschatological idea becomes the clue to Jesus's whole personality in A. Schweitzer's brilliant *Von Reimarus zu Wrede*, Eng. trans. *Quest of the Historical Jesus;* both these writers were personally Christians of the radical school. This the apologist will recognize as the most plausible hostile alternative. He is bound to admit an element of illusion in Christ's vision of the future; but he will contend that the apocalyptic form did not destroy the spiritual content of Christ's revelations—nay, that it was itself the vehicle of great truths. So he will argue as the essence of the matter that (iv.) He who has occupied Christ's place in history, and won such reverence from the purest souls, was what He claimed to be, and that His many-sidedness comes to focus and harmony when we recognize Him as the Christ of God and the Saviour of the world.

To a less extent, similar problems and alternatives arise in regard to the Church:—Catholicism a compromise between Jewish Christianity and Pauline or Gentile Christianity (F. C. Baur, etc.); Catholicism a Hellenizing of Christianity (A. Ritschl, E. Hatch, A. Harnack); the Catholic Church for good and evil the creation of St. Paul (P. Wernle, H. Weinel); the Church supernaturally guided (R. C. apologetic; in a modified degree High Church apologetic); essential—not necessarily exclusive—truth of Paulinism, essential error in first principles of Catholicism (Protestant apologetic).

BIBLIOGRAPHY.—The classics of apologetic literature and the leading representative men of different periods have been named above. The best modern theology generally reveals the apologetic interest without being technically a contribution to apologetics; but it is too extensive for enumeration here. The following historical works, however, may be mentioned: J. Oman, *Problem of Faith and Freedom;* F. W. Macran, *English Apologetic Theology*. For the 18th century *see* Mark Pattison in *Essays and Reviews* and Leslie Stephen, *English Thought in the Eighteenth Century;* for the 19th century, V. F. Storr, *The Development of English Theology in the Nineteenth Century*. (*See* also THEOLOGY.) (*R.* MA.)

APOLOGUE, a short fable or allegorical story, meant to serve as a pleasant vehicle for some moral doctrine or to convey some useful lesson. One of the best known is that of Jotham in the Book of Judges (ix. 7–15); others are "The City Rat and Field Rat," by Horace, "The Belly and its Members," by the patrician Menenius Agrippa in the second book of Livy, and perhaps most famous of all those of Aesop. The term is applied more particularly to a story in which the actors or speakers are taken from the brute creation or inanimate nature. But an apologue is distinguished from a fable in that there is always some moral sense present, which there need not be in a fable. It is generally dramatic, and has been defined as "a satire in action." Martin Luther thought so highly of apologues as counsellors of virtue that he edited and revised Aesop and wrote a characteristic preface to the volume. The origin of the apologue is extremely ancient and comes from the East. Veiled truth was often necessary in the East, particularly with the slaves, who dared not reveal their minds too openly. It is noteworthy that the two fathers of apologue in the West were slaves, namely Aesop and Phaedrus. La Fontaine in France, Gay and Dodsley in England, Gellert, Lessing, and Hagedorn in Germany; Tomas de Iriarte in Spain, and Krilov in Russia are leading modern writers of apologues. Length is not an essential matter in the definition of an apologue. Those of La Fontaine are often very short, as for example, "Le Coq et la Perle." On the other hand, in the romances of Reynard the Fox we have mediaeval apologues arranged in cycles and attaining epical dimensions.

A work by P. Soullé, *La Fontaine et ses devanciers* (1866), is a history of the apologue from the earliest times until its final triumph in France.

APOLOGY, in its usual sense, an expression of regret for something which has been wrongfully said or done; a withdrawal or retraction of some charge or imputation which is false. For the legal significance of this *see* LIBEL AND SLANDER.

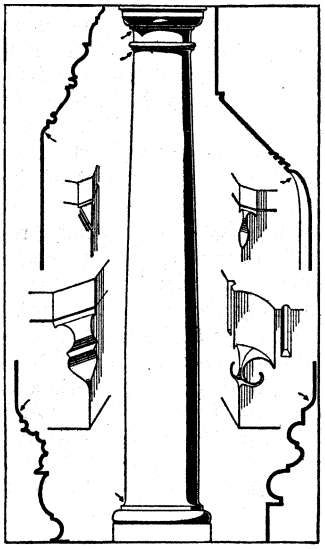
The word "apology" or "apologia" is also used in the sense of defence or vindication, the only meaning of the Greek ἀπολογία, especially of the defence of a doctrine or system, or of religious or other beliefs, etc., *e.g.,* Justin Martyr's *Apology* or J. *H.* Newman's *Apologia pro vita sua. (See* APOLOGETICS.)

APOMORPHINE is used chiefly as an emetic. Its action is on the vomiting centre in the brain and not as a local irritant in the stomach. It works rapidly and should be given by hypodermic injection. The dose is about five milligrams ($\frac{1}{12}$ grain). After injection there is almost immediate nausea followed in about five minutes by vomiting. It is most often used in acute alcoholism and after the ingestion of poisons. The symptoms of an overdose are depression, weakness and respiratory paralysis.

APONEUROSIS, in anatomy, a membrane separating the muscles from each other.

APOPHOROMETER. This apparatus is used for the identification of minerals by means of sublimation (*q.v.*) and has the advantage over the ordinary blowpipe (*q.v.*) tests. It consists of an electrically-heated platinum ribbon, on which the substance under examination is spread, enclosed between two watch glasses. The whole may if necessary be placed in *vacuo* or surrounded by an inert gas.

APOPHTHEGM, a short and pointed utterance. Such sententious remarks as "knowledge is power" are apophthegms. They become "proverbs" by age and acceptance. Plutarch made a famous collection in his *Apophthegmata Laconica.*



BY COURTESY OF VIOLLET LE DUC, "DICTIONNAIRE RAISONNE DE L ARCHITECTURE FRANÇAISE"; BUHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF & HELBURN)

ARROWS INDICATE THE APOPHYGE

APOPHYGE, in architecture, the outward concave sweep sometimes found at the top and bottom of the shaft of a column; also any similar form in a wall or vase, etc.

APOPHYLLITE, a mineral often classed with the zeolites, since it behaves like these when heated before the blowpipe and has the same mode of occurrence; it differs, however, from the zeolites proper in containing no aluminium. It is a hydrous potassium and calcium silicate, $H_7KCa_4(SiO_3)_8+4\frac{1}{2}H_2O$.

Apophyllite always occurs as distinct crystals, which belong to the tetragonal system. The form is either a square prism terminated by the basal planes, or an acute pyramid. A prominent feature of the mineral is its perfect basal cleavage, on which the lustre is markedly pearly, presenting, in white crystals, somewhat the appearance of the eye of a fish after boiling, hence the old name fish-eye-stone or ichthyophthalmite for the mineral. On other surfaces the lustre is vitreous.

Apophyllite is a mineral of secondary origin, commonly occurring, in association with zeolites, in amygdaloidal cavities in basalt and melaphyre. Magnificent groups of greenish and colourless tabular crystals, the crystals several inches across, were found, with flesh-red stilbite, in the Deccan traps of the western Ghâts, near Bombay, during the construction of the Great Indian Peninsular railway. Groups of crystals of a beautiful pink colour have been found in the silver veins of Andreasberg in the Harz and of Guanajuato in Mexico. (L. J. S.)

APOPHYSIS, in anatomy, a bony protuberance; also a botanical term for the swelling of the spore-case in certain mosses.

APOPLEXY, a sudden loss of consciousness, of sensibility, and of movement without any essential modification of the respiratory and circulatory functions, occasioned by some brain disease. The commonest causes are haemorrhage from rupture of a large cerebral artery, or its blockage by a clot formed elsewhere in the circulation (embolism) or local clotting due to disease of the vessel wall itself. A characteristic apoplectic attack presents the following phenomena: the individual falls down suddenly and lies without sense or motion, except that his pulse keeps beating and his

breathing continues. He appears to be in a deep sleep, from which he cannot be roused; the breathing is laboured and stertorous, and is accompanied with puffing out of thr cheeks; the pulse may be beating more strongly than natural, and the face is often flushed. The reflexes are abolished. Although apoplexy may occur without paralysis, and paralysis without apoplexy, there is in most cases definite evidence of paralysis atfecting usually one side of the body in addition to the coma Thus the pupils are unequal; there may be asymmetry of the face, or the limbs may be more rigid or flaccid on one side than on the other. These signs of localized disease enable a distinction to be made from the coma of narcotic poisoning and alcoholic intoxication. It must be borne in mind that a person smelling strongly of liquor and found lying in the street in a comatose state may be suffering from apoplexy, and the error of sending a dying man to a police cell may be avoided by this knowledge. If the fit is only moderately severe, the reflexes soon return, and the patient may in a few hours show indications of returning consciousness by making some movements or opening his eyes when spoken to, although later it may be found that he is unable to speak, or may be paralysed or mentally afflicted (see PARALYSIS). In severe cases the coma deepens and the patient dies, usually from interference with the breathing, or, less commonly, from arrest of the heart's action. Apoplexy may be rapidly fatal but very seldom is instantly fatal.

Treatment.— The patient should be placed in the recumbent position with the head and shoulders slightly raised. He should be moved as little as possible from the place where the attack occurred. The medical man who is summoned will probably give the following directions: an ice-bag to be applied to the head; a few grains of calomel or a drop of croton oil in butter to be placed on the tongue, or an enema of castor oil to be administered. He may find it necessary to draw off the water with a catheter. The practice of blood-letting, once so common in this disease, is seldom resorted to, although in some cases, where there is very high arterial tension and a general state of plethora, it might be beneficial. Depletives are not employed where there is evidence of failure of the heart's action, indeed the cautious administrations of stimulants may be necessary, either subcutaneously or by the mouth (if there exist a power of swallowing), together with warm applications to the surface of the body.

APOROSE, a biological term meaning imperforate, or not porous: there is a group of corals called Aporosa.

APOSIOPESIS, a rhetorical device by which the speaker or writer stops short and leaves something unexpressed, but yet obvious, to be supplied by the imagination. The unfinished first sentence in "As for the clergy ——No; if I say a word against them, I'll be shot" (*Tristram Shandy*) is an example.

APOSTASY, a term generally employed to describe a complete renunciation of the Christian faith, or even an exchange of one form of it for another, especially if the motive be unworthy. In the first centuries of the Christian era, apostasy was most commonly induced by persecution, and was indicated by some outward act, such as offering incense to a heathen deity or blaspheming the name of Christ. In the Roman Catholic Church the word is also applied to the renunciation of monastic vows (apostasis a *monachatu*), and to the abandonment of the clerical profession for the life of the world (apostasis a *clericatu*).

A POSTERIORI: see A PRIORI AND A POSTERIORI.

APOSTIL or **POSTIL,** properly a gloss on a scriptural text, particularly on a gospel text, hence any explanatory note on other writings. The word is also applied to a general commentary, and also to a homily or discourse on the gospel or epistle appointed for the day. The word in Mediaeval Latin was *postilla,* and this has been taken to represent post *illa* sc. verba *textus, i.e.,* "after these words of the text."

APOSTLE (one sent on a mission, an envoy, as in Isa. xviii. 2), a term used in the New Testament and in Christian literature generally, in an increasingly technical sense, for a special envoy of Jesus Christ. In its first and simplest form, the idea is present already in Mark iii. 14 f., where from the general circle of his disciples Jesus "made twelve that they should be with him, and that he might from time to time send them forth (ἵνα ἀποστέλλῃ) to preach and to have authority to cast out demons." Later on (vi. 6 ff.) Jesus begins actually to "send forth" the Twelve, two by two: and it is relative to this mission (vi. 30) they are for the first time described as "apostles" or missionary envoys. Matthew (x. 1 ff.) blends the calling of the Twelve with their actual sending forth, while Luke (vi. 13) makes Jesus himself call them "apostles" (see Luke xi. 49, "prophets and apostles," where Matt. xxiii. 34, has "prophets and wise men and scribes," cf. xiii. 34, "those sent on mission"). But it is doubtful whether Jesus ever used the term for the Twelve any more than for the "seventy others" whom he "sent forth" later (Luke x. 1). The Fourth Gospel never so describes them. It simply has "a servant is not greater than his lord, neither an apostle (envoy) greater than he that sent him" (xiii. 16); and applies the idea of "mission" alike to Jesus (cf. Heb. iii. 1, "Jesus, the apostle . . . of our profession") and to his disciples, generally, as represented by the Twelve (xvii. 18, with 3, 6 ff.). But while ideally all Christ's disciples were "sent" with the Father's Name in charge, there were different degrees in which this applied in practice; and so we find "apostle" used in several senses.

In the Apostolic age itself, "apostle" often denoted simply an "envoy," commissioned by Jesus Christ to be a primary witness and preacher of the Messianic Kingdom. This sense was shown by Lightfoot (commentary on Galatians) to exist in the New Testament, *e.g.,* in I. Cor. xii. 28 f., Eph. iv. 11, Rom. xvi. 7, Rev. ii. 2; and his view has since been emphasized by the discovery of the Teaching of the Twelve Apostles (see DIDACHĒ), with its itinerant order of "apostles." These together with "prophets" (cf. Eph. ii. 20, iii. 5) and "teachers," constituted a *charismatic* and unordained ministry of the Word, in some part of the Church (in Syria?) even during the early sub-apostolic age. Paul, our earliest witness, also (I. Cor. xv. 5 ff.) seems to quote the language of Palestinian tradition, in saying that Christ "appeared to Cephas; then to the Twelve; then . . . to James; then to the apostles one and all (τοῖς ἀποστόλοις πᾶσι); and last of all . . . to me also." The appearance to "all the Apostles" must refer to the final commission given by the risen Christ to certain assembled disciples (Acts i. 6 ff., cf. Luke xxiv. 33), including not only the Twelve and the Lord's brethren (i. 13 f.), but also some of the Seventy. Of this inner circle of personal disciples during Jesus's earthly ministry, we get a further glimpse in the election of one from their number to fill Judas's place among the Twelve (i. 21 ff.), as the primary official witnesses of Messiah and his resurrection. Many of the 120 then present (Acts I. 1 j) must have been disciples who by recent commission had been made "apostles." Among such were Judas Barsabbas and Silas (Acts xv. 22, cf. i. 23), if not also Barnabas (I. Cor. ix. 6) and Andronicus and Junias or Junia (Rom. xvi. 7). If Junia be correct, a woman might be an "apostle" or primary missionary.

So far, we gather that the original Palestinian type of apostleship meant simply (a) personal mission from the risen Christ (cf. I. Cor. ix. 1), following on (b) personal intercourse with Jesus in his earthly ministry. It was pre-eminence in the latter qualification that gave the Twelve their special status among apostles (Acts i. 26, ii. 14, vi. 2; in Acts generally they are simply "the apostles"). Conversely, it was Paul's lack in this respect which lay at the root of his difficulties as an apostle.

It is possible, though not certain, that even those Judaizing missionaries at Corinth whom Paul styles "false-apostles" or, ironically, "the superlative apostles" (II. Cor. xi. 5, 13; xii. 11), rested part of their claim to superiority over Paul on (b), possibly even as having done service to Christ when on earth (II. Cor. xi. 18, 23). There is no sign in II. Cor. that they laid claim to (a). If this be so, they were "Christ's apostles" only indirectly, "through men" (as some alleged touching Paul, cf. Gal. i. 1), *i.e.,* as sent forth on mission work by certain Jerusalem leaders with letters of introduction (II. Cor. iii. 1).

The Twelve.—When Jesus selected an inner circle of disciples for continuous training by personal intercourse, his choice of 'twelve" had direct reference to the tribes of Israel (Matt. xix. 28; Luke xxii. 30). This gave them a symbolic or representative character as a closed body (cf. Rev. xxi. 14), marking them off

as the primary leaders and authority (cf. Acts ii. 42, "the apostles' teaching") among the "disciples" or "brethren," when these began to assume the form of a community or church. Naturally, then, they took the lead, collectively—in form at least though really the initiative lay with one or two of their own number, Peter in particular. The process of differentiation from their fellow-apostles was furthered by the concentration of the Twelve, or at least of their leaders (*cf.* Gal. i. 19), in Jerusalem, for a considerable period (Acts viii. 1, cf. xii. 1 seq.; an early tradition specifies twelve years). Other apostles soon went forth on their mission to "the cities of Israel" (Matt. x. 23, cf. Acts ix. 31 seq.), and so exercised but little influence on the central policy of the Church. Hence their shadowy existence in the New Testament, though Matt. x. 5–42, read in the light of the *Didachē,* may help us to conceive their work in its main features.

"Pillar" Apostles.—But differentiation between apostles existed among the Twelve also. There were "pillars," like Peter and John (and his brother James until his death), who often determined matters of grave moment, as in the conference with Paul in Gal. ii. g. Such pre-eminence was but the sequel of personal distinctions rooted in the preparatory days of discipleship; and it warns against viewing the primitive facts touching apostles in the official light of later times.

The same lesson emerges when we note that one such apostolic "pillar" stood outside the Twelve altogether, viz., James, the Lord's brother (Gal. ii. g, cf. i. 19); and further, that "the Lord's brethren" seem to have ranked above "apostles" generally, being names between them and Peter (in I. Cor. ix. 5). That is, they too were apostles, with the addition of a certain personal distinction.

Such personal pre-eminence has left its marks on the lists of the Twelve in the New Testament. Thus Peter, James, John, Andrew, always appear as the first four, though the order varies, Mark representing relative prominence during Christ's ministry, and Acts (i. 13) actual influence in the Apostolic Church (cf. Luke viii. 51, ix. 28).

Paul, the "Apostle of the Gentiles."—So far apostles are only of the Palestinian type, taken from among actual hearers of the Messiah and with a mission primarily to Jews—apostles "of the circumcision." Now, however, emerges a new apostleship; that to the Gentiles (Gal. ii. 7–9). With the change of mission goes also some change in the type of missionary or apostle. Of this type Paul was the first, and he remained its primary, and in some senses its only, example. Though he could claim, on occasion, to satisfy the old test of having seen the risen Lord (I. Cor. ix. 1, cf. xv. 8), he himself laid stress not on this, but on the revelation within his own soul of Jesus as God's Son, and of the Gospel latent therein (Gal. i. 16). Here lay both his qualification and his credentials, once the fruits of the divine inworking were manifest in the success of his missionary work (Gal. ii. 8 seq.; I. Cor. xi. 1 *seq.;* II. Cor. iii. 2 seq., xii. 12). But this new criterion of apostleship was capable of wider application, one dispensing altogether with vision of the risen Lord—which could not even in Paul's case be proved so fully as for the original apostles—but appealing to the "signs of an apostle" (I. Cor. ix. 2; II. Cor. xii. 12), the tokens of spiritual gift visible in work done, and particularly in planting the Gospel in fresh fields (II. Cor. x. 14–18). It may be in this wide charismatic sense that Paul uses the term in I. Cor. xii. 28 f., Eph. ii. 20, iii. 5, iv. 11. That he used it in senses differing with the context is proved by I. Cor. xv. g, where he styles himself "the least of apostles," although in other connections he claims the very highest rank, co-ordinate even with the Twelve as a body (Gal. ii. 7 seq.), in virtue of his distinctive Gospel.

This poict of view was not always shared even in circles appreciative of his actual work. To many he seemed but a fruitful worker within lines determined by "the twelve apostles of the Lamb" as a body (Rev. xxi. 14). So we read of "the plant (Church) which the twelve apostles of the Beloved shall plant" (*Ascension* of Isaiah, iv. 3); "those who preached the Gospel to us (especially Gentiles) . . .; unto whom He gave authority over the Gospel, being twelve for a witness to the tribes" (Barn. viii. 3, cf. v. g, cf. *The* Preaching of Peter in Clem. Alex.). Later on, however, his own claim told more and more on the Church's mind, and his epistles were read in church as a collection styled simply "the Apostle."

As the primary medium of the Gentile Gospel (Gal. i. 16, cf. i. 8, ii. 2) Paul had no peers, unless it were Barnabas, who shares with him the title "apostle" in Acts xiv. 4, 14—possibly with reference to the special "work" on which they had recently been "sent forth by the Spirit" (xiii. 2, 4).

In the sub-apostolic age, the class of "missionaries" enjoying a charisma conceived to convey apostolic commission through the Spirit, soon became distinguished from "apostles" (cf. Hermas, Sim. ix. 15. 4, "the apostles and teachers of the message of the Son of God," so 25. 2; in 17. 1 the apostles are reckoned as twelve). The title became confined by usage to the Twelve as a body, or to them and Paul (*e.g.,* in Clement and Ignatius), as reverence for these latter grew in connection with their story in the Gospels and in Acts. Thus Eusebius describes as "evangelists" (cf. Philip the Evangelist in Acts xxi. 8, also Eph. iv. 11, 2 Tim. iv. 5) those who "occupied the first rank in the succession to the Apostles" in missionary work (*Hist.* Eccl. iii. 37, cf. v. 10). Yet the adjective "apostolic" was applied to men like Polycarp and even to a certain Alexander, martyred at Lyons in A.D. 177 (Eus. v. 1).

The *authority* attaching to apostles was essentially spiritual in character and in the conditions of its exercise. Anything like officialism among his followers was alien to Jesus's own teaching (Matt. xxiii. 6–11). All Christians were "brethren," and the basis of pre-eminence among them was service. But the personal relation of the original apostles to Jesus himself gave them a unique fitness as authorized witnesses, from which flowed naturally, by spiritual influence, such special forms of authority as they came gradually to exercise in the early Church. "There is no trace in Scripture of a formal cominission of authority for government from Christ Himself" (Hort., *Chr.* Eccl. p. 84) given to apostles, save as representing the brethren in their collective action. Even the "resolutions" (*dogmata*) of the Jerusalem conference were not set forth by the apostles present simply in their own name. They expressed "a claim to deference rather than a right to be obeyed" (Hort, *op. cit.* 81–85). Such was the kind of authority attaching to apostles, whether collectively or individually. It was not a fixed notion, but varied in quantity and quality with the growing maturity of converts. This is how Paul conceives the matter. The exercise of his spiritual authority is not absolute, lest he "lord it over their faith"; consent of conscience or of "faith" is ever requisite (II. Cor. i. 24; cf. Rom. xiv. 23). But the principle was elastic in application, and would take more. patriarchal forms in Palestine than in the Greek world. So the notion of formal or constitutional authority attaching to the apostolate, in its various senses, is an anachronism for the apostolic age. The tendency, however, was for their authority to be conceived more and more on formal lines, and finally as absolute.

This change of conception fostered the notion of a devolution of apostolic powers to successors, constituted by act of ordination. "The doctrine of Apostolic Succession," says Dr. Sanday (The Primitive Church *and* Reunion, 1913, p. 81) "represents a real continuity, expressed in the relative and symbolical form appropriate to the time." In its earliest form it meant re-emergence in others of the apostolic spirit of missionary enthusiasm (Euseb. iii. 37, v. 10). Of apostolic succession in grace conferred by ordination, there is no suggestion before Irenaeus. Clement of Rome (xliv. 2) refers simply to the succession of one set of men to another in an office of apostolic institution. Nor is there even in Irenaeus any idea of sacerdotal grace attaching to the succession in apostolic truth. But once the idea of supernatural grace going along with office as such arose in connection with successio ab apostolis, the full development of the doctrine was but a matter of time. (See C. H. Turner, The Early History of the *Church* and the *Ministry,* ed. Swete, 1918.)

Individual Apostles.—Here the striking thing is the little known of most of the Twelve after the opening of Acts: which suggests doubts as to their ex *officio* influence and authority qua apostles (cf. Rev. xxi. 14).

Andrew (a Greek name): brother of Simon Peter, of Bethsaida on the Lake of Galilee. He had been a disciple of John the Baptist, through whom he first met Jesus (John i. 35–44). After his definite call he lived for a time with Peter and their fishing partners James and John (Luke v. 10), at Capernaum (Mark i. 16 ff. 29). In the gospel story he is present on some important occasions as one of an inner circle among the Twelve (Mark xiii. 3; John vi. 8, xii. 22). In the Fourth Gospel he appears in close association with Philip, his fellow-townsman (vi. 8, xii. 22), whose friendly human spirit he may have shared. After the fall of Jerusalem he seems to have gone with John to the region of Ephesus (Mur. Canon). Later traditions make him preach in Scythia, and suffer crucifixion at Patras in Achaea, on a cross of the form called *decussata* (X) and commonly known as "St. Andrew's cross." His Acts and Gospel were declared apocryphal by the Decretum *Gelasii.* His festival is Nov. 30.

Bartholomew: In the New Testament he appears only in the lists of apostles, always after Philip. This suggests that the name, "son of Tolmai," describes him who is called in John i. 45 ff. Nathanael, who was Philip's special friend, and reappears in xxi. 2, while "Bartholomew" is absent from this Gospel. The legends touching him are various and confused (see Eus. v. 10, Lipsius in Dict. of Chr. Biog. *s.v.,* and M. R. James, *The* Apocryphal N.T., which last may also be consulted for his Gospel). His festival is Aug. 24.

James, Son of Zebedee: Elder brother of John, since he stands before him in the Gospels, save in Luke viii. 51, ix. 28 (cf. Acts i. 13)—where James' early martyrdom (Acts xii. 2) probably affects the perspective. If their mother Salome (Mark xv. 40, Matt. xxvii. 56) was a sister of Mary the mother of Jesus (*cf.* John xix. 25), they were his cousins; and this would suit her requesting special privileges for them in the Messianic Kingdom (Matt. xx. 20 f.) as well as her ministering to Jesus and the Twelve (Mark xv. 40 f., Luke vii. 3) of her means. Perhaps one of them was the companion of Andrew in John i. 35–40. For what was common to him and his brother, including the sobriquet "Boanerges," see JOHN. From his being singled out by Herod Agrippa for martyrdom (in A.D. 44, Acts xii. 2) we may infer that his zealous spirit (Luke ix. 52 ff.) made him a marked leader in the early Jerusalem Church. The legends touching him are not to be trusted (cf. Hastings' *Dict.* of *the* Bible).

James, Son of Alphaeus, as distinct from the last: otherwise unknown. Can he have been brother to the "Levi, son of Alphaeus" of Mark ii. 14 (cf. Matt. x. 3, where "Matthew [= Levi] the Tax-collector" immediately precedes "James the son of Alphaeus")? (cf. JAMES.)

John: see special article.

Judas, Son of James, in Luke's lists (vi. 16, Acts i. 13), instead of Thaddaeus, both probably being names of the same man. Perhaps = "Judas, not Iscariot" in John xiv. 22. In the Edessene Abgar legend (Eus. i. 13) "Judas, who also is Thomas" (see below) sends as envoy ("apostle") Thaddaeus, "one of the Seventy[n]—perhaps a way of removing Thaddaeus from the Twelve in favour of Lebbaeus, whom the "Western" text substituted.

Judas Iscariot: see special article.

Matthew: see special article.

Nathanael (see above "Bartholomew"): in John xxi. 2 he is described as of Cana in Galilee.

Peter: see special article.

Philip: the fifth in all lists (Matt. x. 3; Mark iii. 18; Luke vi. 14; Acts i. 13). He is a mere name in the Synoptics, but rather prominent in the Fourth Gospel. There he is "of Bethsaida, the city of Andrew and Peter"; like them he first meets Jesus when a disciple of the Baptist "beyond Jordan"; and at once he introduces Nathanael to Jesus (John i. 43–45; cf. 28). His close association with Andrew continues in this Gospel (xii. 21 seq., cf. vi. 5, 8). Philip is also one of the few interlocutors in John xiv. (8 seq.). The character suggested by all these passages is one marked by quick and large human sympathies, a friendly man. Some see in the similarity of characteristics between him and Philip the Evangelist in Acts proof that the picture of the Apostle in the Fourth Gospel has been coloured by confusion with the latter, who seems to have been a prominent figure in the region where this Gospel took shape. Such confusion arose later on (see Eus. iii. 31, 39, v. 24, cf. Clem. Alex. Strom. iii. 6), and may make the Apostle's residence in Asia Minor doubtful (yet see Lightfoot, Coloss. 45 seq.); but hardly warrants the inference as to the Fourth Gospel (*cf.* the two "Johns" s.v. JOHN). Philip appears in various late apocryphal writings (see *e.g.* M. R. James, The Apocryphal N.T.), probably with no historical basis.

Simon, the Cananaean = "the Zealot" (as Luke vi. 15, Acts i. 13) in Aramaic, a name borne by those burning with patriotic anger against the Roman domination and inclined to a policy of force. Whether Simon had actually been one of them is not clear. If so, his fidelity to Jesus is a tribute to his Master's spiritual power.

Thaddaeus: perhaps the Greek name (? = Theudas, so Dalman, *Words* of *Jesus,* p. 50) of "Judas (son) of James" (above). In legend he is the missionary of Edessa (Eus. i. 13): see above "Judas."

Thomas: interpreted in John xi. 16, xx. 24, xxi. 2 by "Didymus" or "Twin," and there playing a significant part as a type of serious minded loyalty in the face of hard daunting facts. In John xiv. 22 Syr. Sin. reads Thomas for Judas, possibly with reference to his questioning mind (xx. 24 seq.), cf. Judas above. For his story outside the New Testament, see THOMAS, ST.

BIBLIOGRAPHY.—In England the modern treatment of the subject dates from J. B. Lightfoot's dissertation in his Commentary on Galatians, to which F. J. A. Hort's The Christian Ecclesia added elements of value; see also T. M. Lindsay, The Church and The *Ministry,* and arts. in Hastings' *Dict. of the Bible* and the *Encyc. Biblica;* H. Monnier, La Notion de Papostolat, des origines *à Irenée* (Paris, 1903); A. Harnack, The Constitution and Law of the Church (1910); The Early History of the *Church* and *the Ministry,* ed. H. B. Swete (1918); C. Gore, *The Church and the Ministry* (1919). The later legends and their sources are examined by Lipsius, Die Apok. Apostelgeschichten (1881–), and T. Schermann, *Propheten- und Apostellegenden* (Leipzig, 1907), cf. F. Haase, Apostel u. *Evangelisten in* dem Orient (Miinster, 1922). (J. V. B.)

APOSTLE SPOONS, a set of spoons, usually of silver or silver gilt, with the handles terminating in figures of the apostles, each bearing their distinctive emblem. They were common baptismal gifts during the 15th and 16th centuries. See C. G. Rupert, Apostle Spoons (Oxford. 1929)

A SILVER-GILT APOSTLE SPOON OF THE 15TH CENTURY

The figure is that of St. Peter and is topped by an eagle seal

APOSTOLIC CANONS, a collection of 85 rules for the regulation of clerical life, appended to the 8th book of the *Apostolical Constitutions.* The canons may be a little later in date than the preceding Constitutions, but they are evidently from the same theological circle. (See APOSTOLIC CONSTITUTIONS.)

APOSTOLIC CONSTITUTIONS, a collection of ecclesiastical regulations in eight books, the last of which concludes with the 85 Canons of the Holy Apostles, in Greek, Διαταγαί or Διατάξεις τῶν ἁγίων ἀποστόλων διὰ Κλήμεντος τοῦ Ῥωμαίων ἐπισκόπου τε καὶ πολίτου. Καθολικὴ διδασκαλία. By their title the Constitutions profess to have been drawn up by the apostles, and to have been transmitted to the Church by Clement of Rome; sometimes the alleged authors are represented as speaking jointly, sometimes singly. From the first they have been very variously estimated; the *Canons,* as a rule, more highly than the rest of the work. The most extravagant estimate of all was that of Whiston, who calls them "the most sacred standard of Christianity, equal in authority to the Gospels themselves, and superior in authority to the epistles of single apostles, some parts of them being our Saviour's own original laws delivered to the apostles, and the other parts the public acts of the apostles." (Historical preface to Primitive Christianity *Revived,* pp. 85–86.) Others, however, real-

ized their composite character from the first, and by degrees some of the component documents became known. Bishop Pearson was able to say that "the eight books of the Apostolic Constitutions have been after Epiphanius's time compiled and patched together out of the didascaliae or doctrines which went under the names of the holy apostles and their disciples or successors" (Vind. *Ign.*, i., cap. 5); whilst a greater scholar still, Archbishop Usher, had already gone much further. Writing in 1644, and forestalling the results of modern critical methods, he had concluded that their compiler was none other than the compiler of the spurious Ignatian epistles (*i.e.*, the epistles in the longer of the two Greek versions). The Apostolical Constitutions, then, are spurious, and they are one of a long series of documents of like character.

These documents are the outcome of a tendency which is found in every society, religious or secular, at some point in its history. The society begins by living in accordance with its fundamental principles. By degrees these translate themselves into appropriate action. Difficulties are faced and solved as they arise; and when similar circumstances recur they will tend to be met in the same way. Thus there grows up by degrees a body of what may be called customary law. Plainly, there is no particular point of time at which this customary law can be said to have begun. To all appearances it is there from the first in solution and gradually crystallizes out; and yet it is being continually modified as time goes on. Moreover, the time comes when the attempt is made, either by private individuals or by the society itself, to put this "customary law" into writing. Now when this is done, two tendencies will at once show themselves. (a) This "customary law" will at once become more definite: the very fact of putting it into writing will involve an effort after logical completeness. There will be a tendency on the part of the writer to fill up gaps; to state local customs as if they obtained universally; to introduce his personal equation, and to add to that which is the custom that which, in his opinion, ought to be. (b) There will be a strong tendency to fortify that which has been written with great names, especially in days when there is no very clear notion of literary property. This is done, not with any really deliberate consciousness of fraud, but rather to emphasize the importance of what was written, and the fact that it was no new invention of the writer's. In a non-literary age fame gathers about great names; and that which, ex hypothesi, has gone on since the beginning of things is naturally attributed to the founders of the society. Then come interpolations to make this ascription more probable, and the prefixing of a title, then or subsequently, which states it as a fact. This is precisely the way in which the Apostolical Constitutions and other kindred documents have come into being. They contain evidence of the greatest value as to the order of the Church in early days; evidence, however, which needs to be sifted with the greatest care, since the personal preferences of the writer and the customs of the local church to which he belongs are continually mixed up with things which have a wider prevalence. The earliest collections of this kind, which are known to us, are the *Didachē* or Teaching of the Twelve Apostles, itself compiled from earlier materials, and dating from about 120 (see DIDACHĒ); *The* Apostolic *Church* Order dating from about 300 and containing older fragments of Church law, including parts of the *Didachē;* and the Didascalia *Apostolorum,* originally written in Greek, but known through a Syriac version and a fragmentary Latin one published by Hauler. It is of the middle of the 3rd century—in fact, a passage in the Latin translation seems to give us the date A.D. 254. It emanates from Palestine or Syria, and is independent of the documents already mentioned; and upon it the Constitutions themselves very largely depend (see also under HIPPOLYTUS, CANONS OF).

The Constitutions fall into three main divisions. (1) The first of these consists of books i.–vi., and throughout runs parallel to the Didascalia. (2) Then follows book vii., the first 31 chapters of which are an adaptation of the *Didachē,* while the rest contain various liturgical forms of which the origin is still uncertain. (3) Book viii. is more composite and falls into three parts. The first two chapters, *περὶ χαρισμάτων,* may be based upon a lost work of St. Hippolytus, otherwise known only by a reference to it in the preface of the Verona Latin Fragments; and an examination shows that this is highly probable. The next section, cc. 3–27, *περὶ χειροτονιῶν,* and cc. 28–46, *περὶ κανόνων* is twofold, and is evidently that upon which the writer sets most store. The apostles no longer speak jointly, but one by one in an apostolic council, and the section closes with a joint decree of them all. They speak of the ordination of bishops (the so-called Clementine Liturgy is that which is directed to be used at the consecration of a bishop, cc. 5–15), of presbyters, deacons, deaconesses, sub-deacons and lectors, and then pass on to confessors, virgins, widows and exorcists; after which follows a series of canons on various subjects, and liturgical formulae. The third section consists of the Apostolic Canons already referred to, the last and most significant of which places the Constitutions and the two epistles of Clement in the canon of Scripture, and omits the Apocalypse. They are derived in part from the preceding Constitutions, in part from the canons of the councils of Antioch, 341, Nicaea, 325, and possibly Laodicaea, 363.

Who, then, is the author of the Constitutions, and what can be inferred with regard to him? (1) By separating off the sources which he used from his own additions to them, it at once becomes clear that the latter are the work of one man: the style is unmistakable, and the method of working is the same throughout. The compiler of books i.–vi. is also the compiler of books vii. and viii. (2) As to his theological position, different views have been held. He betrays a strong subordinationist tendency, together with a denial of a human soul to Christ, and the like, which suggest not indeed Arianism but an inclination towards Arianism; and his polemic is directed against the dying heresies of the 3rd century. All this points to the position of a "conservative" or semi-Arian of the East, one who belongs, perhaps, to the circle of Lucian of Antioch and writes before the time of Julian. It is hard to think of any other time or circumstances in which a man could write like this. (3) The indications of *time* have been held to point to a different conclusion. In the cycle of feasts occur the names of several which are probably of later date—*e.g.*, Christmas and St. Stephen, which were introduced at Antioch c. A.D. 378 and 379 respectively; and Epiphanius (*c.* A.D. 374) appears to be unacquainted with it; he still quotes from the Didascalia, and elaborately explains it away where it is contrary to the usages of his own day. But as regards the former point, it is possible that the Apostolical Constitutions gave rise to these festivals; or, on the other hand, that the two passages were subsequently introduced either by the writer himself or by some other hand, when the last book of the Constitutions was being used as a law-book. And as regards the latter, the fact that Epiphanius does not use the Constitutions is no proof that they had not yet been compiled. (4) As to the region of composition there is no real doubt. It was clearly the East, Syria or Palestine. Many indications are against the latter, and Syria is strongly suggested by the use of the Syro-Macedonian calendar. Moreover, the writer represents the Roman Clement as the channel of communication between the apostles and the Church. This fact both supplies him with the name by which he is commonly known, Pseudo-Clement, and also furnishes corroboration of his Syrian birth; since the other spurious writings bearing the name of Clement, the Homilies and Recognitions, are likewise of Syrian origin.

It seems clear, then, that the compiler was a Syrian, and that he also wrote the spurious Ignatian epistles; he was likewise probably a semi-Arian of the school of Lucian of Antioch. His date is given by Harnack as A.D. 340–360, with a leaning to 340–343; by Lightfoot as the latter half of the 4th century; by Brightman, 370–380; by Maclean, 375; and by Funk as the beginning of the 5th century.

Const.*, bk. viii., is included in Clark's "Ante-Nicene Christian Library."

APOSTOLIC FATHERS, a term used to distinguish those early Christian writers who were believed to have been the per-

sonal associates of the original apostles. While the title '(Fathers" was given from at least the beginning of the 4th century to church writers of former days, as being the parents of Christian belief and thought for later times, the expression "Apostolic Fathers" dates only from the latter part of the 17th century. Here already appears the doubt as to how many writers can claim the title, a doubt which has continued ever since, and makes the contents of the "Apostolic Fathers" differ so much from editor to editor.

The degree of historic claim which these various writings have to rank as the works of Apostolic Fathers varies greatly on any definition of "apostolic." Originally the epithet was meant to be taken strictly, viz., as denoting those whom history could show to have been personally connected, or at least coeval, with one or more apostles; so that editions tended to vary with the historical views of editors. But the convenience of the category "Apostolic Fathers" to express not only those who might possibly have had some sort of direct contact with apostles—such as "Barnabas," Clement, Ignatius, Papias, Polycarp—but also those who seemed specially to preserve the pure tradition of apostolic doctrine during the sub-apostolic age, has led to its general use in a wide and vague sense.

Conventionally, then, the title denotes the group of writings which, whether in date or in internal character, are regarded as belonging to the main stream of the church's teaching during the period between the apostles and the apologists (*i.e.,* to *c.* A.D. 140), and which therefore represent the momentous process of transition from the type of teaching in the New Testament to that which meets us in the early Catholic Fathers, from the last quarter of the 2nd century onwards. The oldest writings in the group, those which are best entitled to their name in any strict sense, are epistles, and in this respect also akin to apostolic writings. The authors (especially Ignatius and Polycarp) are conscious of the gulf between themselves and apostles like Peter and Paul in claim to authority; thus Polycarp, in explaining that he writes to exhort the Philippians only at their own request, adds, "for neither am I, nor is any other like me, able to follow the wisdom of the blessed and glorious Paul" (iii.2). The *Epistle of Clement* conforms more to the elaborate and treatise-like form of the *Epistle to the Hebrews,* on which it draws so largely; and the same is true of "Barnabas." But one and all are influenced by study of apostolic epistles, and witness to the impression which these produced on the men of the next generation. Unconsciously, too, they correspond to the apostolic type of writing in another respect, viz., their occasional and practical character. They are evoked by pressing needs of the hour among some definite body of Christians and not by any literary motive. They are veritable "human documents," with the personal note running through them. They are personal expressions of Christianity, in which are discernible also specific types of local tradition. To such spontaneous actuality, a large part of their interest and value is due.

Nor is this quality really absent even from the writing which is least entitled to a place among Apostolic Fathers, the *Epistle to Diognetus.* This beautiful picture of the Christian life as a realized ideal, and of Christians as "the soul" of the world, though in form addressed to an individual, is in spirit so personal a testimony to what the Gospel has done for the writer and his fellow Christians, that it is akin to the piety of the Apostolic Fathers as a group.

If thus related to the apologists of the middle of the 2nd century, the *Epistle to Diognetus* has also points of contact with one of the most practical and least literary writings found among our Apostolic Fathers, viz., the homily originally known as the *Second Epistle of Clement (see* CLEMENTINE LITERATURE). In all probability we have here the earliest extant sermon preached before a Christian congregation, about A.D. 120–140. Homily passes into allegory and recorded vision in the *Shepherd of Hermas,* which as a literary whole dates from about A.D. 140, but probably represents a more or less prolonged prophetic activity on the part of its author, the brother of Pius, the Roman bishop of his day (*c.*139–154). The prophetic and apocalyptic note, which characterizes Hermas among the Apostolic Fathers is a genuinely primitive trait and goes far to explain the vogue which the *Shepherd* enjoyed in the generations immediately succeeding, as also the influence of its disciplinary policy, which is its prophetic "burden" *(see* HERMAS, SHEPHERD OF).

We come finally to the anonymous *Teaching of the Twelve Apostles* and Papias's *Exposition of Oracles of the Lord,* so far as this is known to us. The former, besides embodying catechetical instruction in Christian conduct (the "Two Ways"), which goes back in substance to the early apostolic age and is embodied also in "Barnabas," depicts in outline the fundamental usages of church life as practised in some conservative region about the last quarter of the 1st century and perhaps even later. The whole is put forth as substantially the apostolic teaching (*Didachē*) on the subjects in question. This is probably a bona fide claim. It expresses the feeling common to the Apostolic Fathers and general in the sub-apostolic age, at any rate in regions where apostles had once laboured, that local tradition, as held by the recognized church leaders, did but continue apostolic doctrine and practice *(see* DIDACHĒ).

The question of external form passes readily over into that of the *internal character and spirit.* As Lightfoot points out, however, personality, with its variety of temperament and emphasis, largely colours the Apostolic Fathers, especially the primary group. Clement has all the Roman feeling for duly constituted order and discipline; Ignatius has the Syrian or semi-oriental passion of devotion, showing itself at once in his mystic love for his Lord and his over-strained yearning to become His very "disciple" by drinking the like cup of martyrdom; Polycarp is, above all things, steady in his allegiance to what had first won his conscience and heart, and his "passive and receptive character" comes out in the contents of his epistle. Of the rest, whose personalities are less known to us, Papias shares Polycarp's qualities and their limitations, the anonymous homilist and Hermas are marked by intense moral earnestness, while the writer to Diognetus joins to this a profound religious insight.

When, however, we examine the doctrinal contents of these writings, we find that the perspective of the Gospel was seriously changed and its most distinctive features obscured. This was specially the case with the experimental doctrines of grace. Here the central glory of the Cross as "the power of God unto salvation" suffered some eclipse, although the passion of Christ was felt to be a transcendent act of Divine Grace in one way or another. But even more serious was the loss of an adequate sense of the contrast between "grace" and "works" as conditions of salvation.

In attempting a final estimate of their *value for the historian to-day,* we may sum up under these heads: ecclesiastical, theological, religious. *(a)* As a mine of materials for reconstructing the history of church institutions they are invaluable, and that largely in virtue of their spontaneous character, with no view to the public generally or to posterity. *(b)* Theologically, as a stage in the history of Christian doctrine, their value is as great negatively as positively. Impressive as is their witness to the persistence of the apostolfc teaching in its essential features, amidst all personal and local variations, perhaps the most striking thing about these writings is the degree in which they fail to appreciate certain elements of the apostolic teaching as embodied in the New Testament. This negative aspect has a twofold bearing. Firstly, it suggests the supernormal level to which the apostolic consciousness was raised at a bound by the direct influence of the Founder of Christianity, and justifies the marking-off of the apostolic writings as a canon, or body of Christian classics of unique religious authority. To this principle Marcion's Pauline Canon is a witness, though in too one-sided a spirit. Secondly, it means that the actual development of ecclesiastical doctrine began, not from the apostolic consciousness itself, but from a lower level, that of the inadequate consciousness of the sub-apostolic church. This theological "retrogression" is of much significance for the history of dogma. *(c)* On the other hand, there is great religious and moral continuity, beneath even theological discontinuity, in the life working below all conscious apprehension of the deeper ideas involved (E. von Dobschiitz, *Christian Life in the Primitive Church,* 1905). There is continuity in character; the Apostolic Fathers strike us as truly good men, with a goodness

raised to a new type and power. This is what the Gospel of Christ aims chiefly at producing as its proper fruit; and the Apostolic Fathers would have desired no better record than that they were themselves genuine "epistles of Christ."

BIBLIOGRAPHY.—The most useful edition for ready reference, containing texts and translations, is that of Kirsopp Lake in the *Loeb Classical Library* (1912); and Lightfoot's one-volume edition, *The Apostolic Fathers* (1891) is still useful. The most important complete editions in modern times are those of Funk (1901); Lightfoot (1885 ff.); and Gebhardt, Harnack, and Zahn (jointly, 1875 ff.).

APOSTOLICI, APOSTOLIC BRETHREN. This name has been applied to certain sects which sought to imitate the manner of life of the Apostles of Christ. The first of these were celibate communists in Asia Minor during the 4th and 5th centuries. They professed an ascetic rigidity of morals (Epiphanius, *Haereses*, 61) and are also called *Apoctactites* or *Renuntiatores*. The name is also applied to sects with Manichean principles which appeared in western Germany and France in the 12th century. More properly, the name is applied to the *Order of Apostles* or *Apostolic Brethren* which appeared in the second half of the 13th century in Italy.

This was a product of the mystic fermentation which proceeded from exalted Franciscanism and from Joachimism *(see* FRATICELLI and JOACHIM OF FLORIS). The order of the Apostles was founded about 1260 by a young workman from the environs of Parma, Gerard Segerelli (or Segalelli), who had been barred from the Franciscan order. He attempted to imitate the external aspects of Christ's life, and was followed by a throng of men and women, peasants and mechanics. They lived in absolute poverty, chastity, and idleness, begging, and preaching repentance. They were condemned by the Second Ecumenical Council of Lyons (1274) and by Pope Honorius IV (1286). The Council of Chichester (1289) took measures against the *Apostles* of England. In 1290 Pope Nicholas IV fulminated a new bull against them. Repressions followed and on July 18, 1300, Segerelli was finally burned at the stake in Parma.

They had had close relations with the dissident Franciscans, but the Spirituals often disavowed them, especially when the sect, which in Segerelli's time had had no very precise doctrinal character, became with Dolcino frankly heterodox. Dolcino of Novara was brought up at Vercelli, and had been an "Apostle" since 1291. Thrice he fell into the hands of the Inquisition, and thrice recanted. But immediately after Segerelli's death he gave himself out as an angel sent from God to elucidate the prophecies. Soon he founded an *Apostolic congregation* at whose head he placed himself. He taught almost the same principles of devotion as Segerelli, but the Messianic character which he attributed to himself, the announcement of a communistic millennia1 kingdom, and, besides, an aggressive anti-sacerdotalism, gave to Dolcino's sect a clearly marked character, analogous only to the theocratic community of the Anabaptists of Munster in the 16th century. On June 5, 1305, Pope Clement V., recognizing the impotence of the ordinary methods of repression, issued bulls for preaching a crusade against the Dolcinists. But four crusades, directed by the Bishop of Vercelli, were required to reduce the little army of the heresiarch, entrenched in the mountains in the neighbourhood of Vercelli. Not till March 23, 1307, were the sectaries definitively overcome. The Catholic crusaders seized Dolcino in his entrenchments on Mt. Rubello. At Vercelli he suffered a horrible punishment. He was torn in pieces with red-hot pincers—the torture lasting an entire day. Dante mentions Dolcino's name *(Inferno*, c.xxviii.), and his memory is not yet completely effaced in the province of Novara. The "Apostles" continued their propaganda in Italy, Languedoc, Spain and Germany. They were constantly attacked by the Inquisition; but the movement lingered on to the beginning of the 15th century.

APOSTOLIC MAJESTY, a title borne by the kings of Hungary. In A.D. 1001 it was conferred by Pope Silvester II. upon St. Stephen (975–1038), the first Christian king of Hungary, in return for his zeal in seeking for the conversion of the heathen. It was renewed by Pope Clement XIII. in 1758 in favour of the Fmpress Maria Theresa and her descendants, and borne by the emperors of Austria as kings of Hungary until 1918.

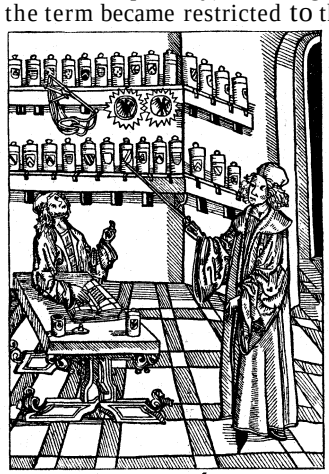
APOSTOLIUS, MICHAEL (died *c.* 1480), a Greek theologian and rhetorician of the 15th century. When, in 1453, the Turks conquered Constantinople, his native city, he fled to Italy, and there obtained the protection of Cardinal Bessarion. He afterwards retired to Crete, where he earned a scanty living by teaching and by copying manuscripts. Many of his copies are still to be found in the libraries of Europe. One of them, the *Icones* of Philostratus at Bologna, bears the inscription: "The king of the poor of this world has written this book for his living."

Of his numerous works a few have been printed: Παροιμίαι (Basel, 1538), now exceedingly rare; a collection of proverbs in Greek, of which a fuller edition appeared at Leyden, "Curante Heinsio," in 1619; "Oratio Panegyrica ad Fredericum III." in Freher's *Scriptores Rerum Germanicarum*, vol. ii. (Frankfort, 1624); Georgii Gemisthi Plethonis et Mich. Apostolii, *Orationes funebres duae in quibus de Immortalitate Animae exponitur* (Leipzig, 1793); and a work against the Latin church and the council of Florence in Le Moine's *Varia Sacra*.

APOSTROPHE, the name given to an exclamatory rhetorical figure of speech; it means also the sign (') for the omission of a letter or letters, *e.g.*, in "don't" (Gr. ἀποστροφή, turning away). In physiology, "apostrophe" is used more precisely in its literal meaning of "turning away," *e.g.*, for movement away from the light.

APOTACTITES or **APOTACTICI,** a sect of early Christians, who renounced all their worldly possessions (Gr. ἀποτακτός set apart). *(See* APOSTOLICI *ad init.*)

APOTHECARY, by derivation, a warehouseman (ἀποθήκη, a store or repository). During the middle ages the application of the term became restricted to those who prepared and sold drugs, and is employed in that sense today in America, Scotland and on the Continent. In England, however, the apothecary has become a general medical practitioner. The Apothecaries' Society of London by royal charters and acts of parliament exercises the power of granting licences to practise medicine.



FROM "LE JARDIN DE SANTÉ," C. 1510
A DOCTOR OF THE MIDDLE AGES IN HIS LABORATORY

From early records we learn that the different branches of the medical profession were not regularly distinguished in England till the 16th century when separate duties were assigned to them, and peculiar privileges were granted to each. In 1518 the physicians of London were incorporated, and the Company of Barber-Surgeons incorporated originally in 1461 but without disciplinary powers, were reincorporated in 1540 and given these powers. But, independently of the physicians and surgeons, there were a great number of irregular practitioners, who were more or less molested by their legitimate rivals, and it became necessary to pass an Act in 1543 for their protection and toleration. As many of these practitioners kept shops for the sale of medicines, the term "apothecary" was used to designate their calling.

For the next two centuries the status of apothecaries underwent gradual consolidation and they acquired additional powers until in 1815 the Society of Apothecaries was given powers of examination by act of Parliament. Armed with these the society insisted on courses of medical study in candidates for its licence to practise. In common with all other licensing bodies the curriculum it imposes and the examination3 it conducts are subject to scrutiny and approval by the General Medical Council.

The Apothecaries' Society is governed by a master, two wardens and 21 assistants. The members are divided into three grades, yeomanry or freemen, the livery, and the court. The hall of the society, situated in Water Lane, London, and covering about three-quarters of an acre, was acquired in 1632. It was destroyed by the Great Fire, but was rebuilt about ten years later, and enlarged in 1786. This is the only property possessed by the society. In 1673, the society established a botanic and physic garden at Chel-

sea, and in 1722 Sir Hans Sloane, who had become the ground owner, gave it to the society on the condition of presenting annually to the Royal Society 50 dried specimens of plants till the number should reach 2,000. This condition was fulfilled in 1774. Owing to the heavy cost of maintenance and other reasons, the "physic garden" was handed over in 1902, with the consent of the Charity Commissioners, to a committee of management, to be maintained in the interests of botanical study and research.

See C. *R.* B. Barrett, *The History of the Society of Apothecaries of London* (1905).

APOTHEOSIS, literally deification (Gr. ἀποθεοῦν, to make a god, to deify). The term properly implies a clear polytheistic conception of gods in contrast with men, while it recognizes that some men cross the dividing line. It is characteristic of polytheism to blur that line in several ways. Thus the ancient Greek religion was especially disposed to belief in heroes and demigods. Founders of cities, and even of colonies, received worship; the former are, generally speaking, mythical personages and, in strictness, heroes. But the worship after death of historical persons, such as Lycurgus, or worship of the living as true deities, *e.g.,* Lysander and Philip II. of Macedon, occurred sporadically even before Alexander the Great's (*q.v.*) conquests brought Greek life into contact with oriental traditions. It was inevitable, too, that ancient monarchies should enlist polytheistic conceptions of divine or half-divine men in support of the dynasties; "Seu deos regesve *canit deorum Sanguinem,*" Horace (Odes, iv. 2, ll. 13, 14) writes of Pindar; though the reference is to myths, yet the phrase is significant. Whatever part vanity or the flattery of courtiers may have played with others, or with Alexander, it is significant that the dynasties of the Seleucids (*q.v.*) and Ptolemies (*q.v.*), Alexander's successors, claim divine honours of some sort. Theocritus (Idyll 17) hails Ptolemy Philadelphus as a demigod, and speaks of his father as seated among the gods along with Alexander (on Alexander as a god, with reference to special political reasons, see *Camb. Anc. Hist.* VI.). Ancestor worship, or reverence for the dead, was a third factor. It may work even in Cicero's determination that his daughter should enjoy ἀποθέωσις as he writes to Atticus—or receive the "honour" of consecrntio (fragment of his De *Consolatione*). Lastly, we need not speak of mere sycophancy. Yet it was common; Verres was worshipped before he was impeached!

The Romans had, up to the end of the republic, accepted only one official apotheosis: the god Quirinus, whatever his original meaning, having been identified with Romulus. But the emperor Augustus carried on the tradition of ancient statecraft by having Julius Caesar recognized as a god (*divus Iulius*), the first of a new class of deities proper (divi). The tradition was steadily followed and was extended to some women of the imperial family and even to imperial favourites. Worship of an emperor during his lifetime, except as the worship of his *genius,* was in general confined to the provinces. Apotheosis, after his death, being in the hands of the senate, did not at once cease, even when Christianity was officially adopted. The Latin term is *consecratio,* the Greek ἀποθέωσις, probably a coinage of the Hellenistic epoch, and occasionally used in a weakened sense. The squib of the philosopher Seneca on the memory of Claudius (d. A.D. 54), *Apocolocyntosis* ("pumpkinification"), is evidence that, as early as Seneca's lifetime, apotheosis was in use for the recognition of a departed emperor as a god. It also indicates how much contempt might be associated with this pretended worship. The people, says Suetonius (*Jul. Caes.* c. 88), fully believed in the divinity of Julius Caesar, hinting at the same time that this was by no means the case with the majority of the apotheoses subsequently decreed by the senate. Yet we hear that Marcus Aurelius was..still worshipped as a household divinity in the 4th century, and was earlier believed to impart revelations in dreams (*Vit.* M. *Ant.* c. 18). Antinous, the favourite of Hadrian, was adored in Egypt a century after his death (Origen, Contra *Celsum,* iii. 36). The ceremonies attendant on an imperial apotheosis are very fully described by Herodianus (bk. iv. c. 2) on occasion of the obsequies of Severus, which he appears to have witnessed. The most significant was the liberation, at the moment of kindling the funeral pyre, of an eagle which was supposed to bear the emperor's soul to heaven. Sharp-sighted persons had actually beheld the ascension of Augustus (Suet. *August.* c. 100) and of Drusilla, sister of Caligula. Representations of apotheoses occur on several works of art; the most important are the apotheosis of Homer on a relief in the Townley collection of the British Museum, that of Titus on the arch of Titus, and that of Augustus on a magnificent cameo in the Louvre. (See ANCESTOR-WORSHIP.)

APPALACHIAN MOUNTAINS, the general name of a mountain system in North America, partly in Canada, but mostly in the United States, extending from Newfoundland, Gasp6 peninsula and New Brunswick, 1,500m. south-westward to Central Alabama. The whole system may be divided into three great regions: the northern, from Newfoundland to the Hudson river; the *central,* from the Hudson valley to that of New river (Kanawha), in Virginia and West Virginia; and the southern, from New river onwards. The northern region includes the Shickshock mountains and Notre Dame range in Quebec, scattered elevations in Maine, the White mountains and the Green mountains; the central comprises, besides various minor groups, the Valley ridges between the front of the Allegheny plateau and the Great Appalachian valley, the New York and New Jersey highlands and a large portion of the Blue ridge; and the southern consists of the prolongation of the Blue ridge, the Unaka range, and the Valley ridges adjoining the Cumberland plateau, with some lesser ranges. The Appalachian belt includes, with the ranges enumerated above, the plateaus sloping southward to the Atlantic in New England, and south-eastward to the border of the coastal plain through the central and southern Atlantic States; and on the north-west, the Allegheny and Cumberland plateaus declining toward the Great Lakes and the interior plains. A remarkable feature of the belt is the longitudinal chain of broad valleys—the Great Appalachian valley—which in the southerly regions divides the mountain system into two subequal portions, but in the northernmost lies west of all the Appalachian ranges, and separates them from the Adirondack group.

The mountain system has no axis of dominating altitudes, but in every portion the summits rise to rather uniform heights, and especially in the central region, the various ridges and intermontane valleys have the same trend as the system itself. None of the summits reaches the region of perpetual snow. Mountains of the Long range in Newfoundland reach heights of nearly 2,000feet. In the Shickshocks the higher summits rise to about 4,000ft. elevation. In Maine four peaks exceed 3,000ft., including Katahdin (5,273ft.); in the White mountains a number of summits rise above 5,000ft., including Mount Washington (6,293 ft.). In the Green mountains the highest point, Mansfield, is 4,406ft.; and a number of other heights exceed 3,000feet. The Catskills are not properly included in the system. The Blue ridge, rising in southern Pennsylvania and there known as South mountain, attains in that State elevations of about 2,000ft.; southward to the Potomac its altitudes diminish, but 30m. beyond again reach 2,000feet. In the Virginia Blue ridge the highest peaks are: Mary's rock, 3,523ft.; peaks of Otter, 4,001 and 3,875; Stony Man, 4,031; Hawks Bill, 4,066. In Pennsylvania the summits of the Valley ridges rise generally to about 2,000ft., and in Maryland Eagle rock and Dans rock are conspicuous points reaching 3,162ft. and 2,882ft. above the sea. In the southern region of the Blue ridge are Grandfather mountain (5,964ft.), with three other summits above 5,000 and a dozen more above 4,000. The Unaka ranges (including the Black and Smoky mountains) have 18 peaks higher than 5,000feet. In the Black mountains, Mitchell (the culminating point of the whole system) attains an altitude of 6,684 ft.; Hairy Bear, 6,681; Balsam Cone, 6,645; Black Brothers, 6,690 and 6,620; and Hallback, 6,403. In the Smoky mountains are Clingmans dome, 6,644 ft.; Guyot, 6,636; Alexander. 6,447; Leconte, 6.612; Curtis, 6,588, with several others above 6,000 and many higher than 5,000.

In the central regions the streams heading in the Allegheny plateau run south-eastward into the Atlantic, and cut through the ranges by great gorges that are popularly called "water-gaps"; but south of New river the Appalachian ranges are drained westward by the Cumberland and Tennessee rivers, finally reaching the Gulf of Mexico. In the northern section the water-parting lies on the inland side of the mountainous belt, the main lines of drainage running from north to south.

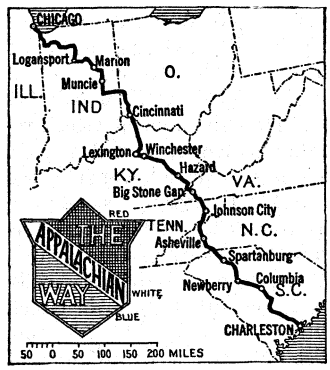
Geology.—The rocks of the Appalachian belt fall naturally into two divisions: ancient (pre-cambrian) crystallines, including marbles, schists, gneisses, granites and other massive igneous rocks, and a great succession of paleozoic sediments. The crystallines are confined to the portion of the belt east of the Great valley where paleozoic rocks are always highly metamorphosed and occur for the most part in limited patches, excepting in New England and Canada, where they assume greater areal importance, and are besides very generally intruded by granites. The paleozoic sediments, ranging in age from cambrian to permian, occupy the Great valley, the Valley ridges and the plateaus still farther west. They are rarely metamorphosed to the point of recrystallization, though locally shales are altered to roofing slates, sandstones are indurated, and coals, originally bituminous, are changed to anthracite in northern Pennsylvania and to graphite in Rhode Island. The most striking and uniformly characteristic geologic feature of the mountains is their internal structure, consisting of innumerable parallel, long and narrow folds, always closely appressed in the eastern part of any cross-section (Piedmont plateau to Great valley), less so along a central zone (Great valley and Valley ridges), and increasingly open on the west (Allegheny and Cumberland plateaus).

Folding of the rocks resulted from the operation of great compressive forces acting tangentially to the figure of the earth. Extensive and deep-seated crumpling was necessarily accompanied by vertical uplift throughout the zone affected, but once at least since their birth the mountains have been worn down to a lowland, and the mountains of to-day are the combined product of subsequent uplift of a different sort and dissection by erosion. The crosswise courses of the greater rivers result from the rivers being older than the mountains, which indeed have been produced by circumdenudation. The present longitudinal valleys were determined by the outcrop of soft shales or soluble limestones, and the parallel ridges upheld by hard sandstones or schists. Parallelism of mountain ridges and intervening valleys is thus attributable to the folding of the rocks, but the origin of the interior structure of the mountains is to be kept distinct from the origin of the mountains as features of topography.

Forests.—The region is well covered with forests yielding quantities of valuable timber, especially in Canada and northern New England. The most valuable trees for lumber are spruce, white pine, hemlock, cedar, white birch, ash, maple and basswood; all excepting pine, hemlock and poplar are ground into wood pulp for the manufacture of paper. In the central and southern parts of the belt, oak and hickory constitute valuable hardwoods, and certain varieties of the former furnish quantities of tan bark. The tulip tree produces a good clear lumber known as white wood or poplar, and is also a source of pulp. In the south both white and yellow pine abound.

Influence on History.—For a century the Appalachians were a barrier to the westward expansion of the English Colonies; the continuity of the system, the bewildering multiplicity of its succeeding ridges, the tortuous courses and roughness of its transverse passes, a heavy forest and dense undergrowth all conspired to hold the settlers on the seaward-sloping plateaus and coastal plains. The confinement of the Colonies between an ocean and a mountain wall led to the fullest occupation of the coastal border of the continent, which was possible under existing conditions of agriculture, conducing to a community of purpose, a political and commercial solidarity, which would not otherwise have been developed. In contrast to this complete industrial occupation, the French territory beyond the mountains was held by a small and very scattered population, its extent and openness adding materially to the difficulties of a disputed tenure, Bearing the brunt of the contests against the French as they did, the Colonies were undergoing preparation for the subsequent struggle with the home Government. In the War of Independence, the American armies fought toward the sea with the mountains at their back protecting them against Indians leagued with the British.

See Topographic maps and Geologic Folios of the **U.S.** Geological Survey; B. Willis, "The Northern Appalachians," and C. W. Hayes, "The Southern Appalachians," both in *National Geographic Monographs,* vol. i.; and chaps. iii., iv. and v. of E. C. Semple, *American History and its Geographic Conditions* (Boston, 1903).



APPALACHIAN WAY, a highway connecting Chicago, Illinois, with Charleston, South Carolina. It is about 650m. long and is for the most part paved or improved except in south-eastern Kentucky. It runs from the Great Lakes across the Ohio River valley, through the picturesque Appalachian mountains to the Atlantic ocean at Charleston. Cincinnati, Lexington, Big Stone Gap, Asheville, Spartanburg and Columbia are some of the cities that lie along its course.

APPANAGE or **APANAGE,** in its original sense the means of subsistence given by parents to their younger children as distinct from the rights secured to the eldest born by the custom of primogeniture. In its modern usage it is practically confined to the money endowment given to the younger children of reigning or mediatized houses in Germany and Austria, which reverts to the state or to the head of the family on the extinction of the line of the original grantee. In English history the system of appanages never played any great part, and the term is now properly applied only to the appanages of the crown: the duchy of Cornwall, assigned to the king's eldest son at birth, or on his father's accession to the crown, and the duchy of Lancaster. In the history of France, however, the appanage was a very important factor. The word denotes in very early French law the portion of lands or money given by fathers and mothers to their sons or daughters on marriage, and usually connotes a renunciation by the latter of any future inheritance; or it may denote the portion given by the eldest son to his brothers and sisters when he was sole inheritor. The word *apanage* is still employed in this sense in French official texts of some *Customs;* but it was in old public law that it received its definite meaning and importance. Under the kings of the third dynasty the division of the kingdom among the sons of the dead monarch, which had characterized the Merovingian and Carolingian dynasties, ceased. The eldest son alone succeeded to the crown; but at the same time a custom was established by which the king made territorial provision suitable to their rank for his other children or for his brothers and sisters; custom forbade their being left landless. Lands and lordships thus bestowed constituted the appanages, which interfered so greatly with the formation of ancient France. While the persevering policy of the Capets, which aimed at reuniting the great fiefs, duchies, countships, baronies, etc., to the domain of the crown, gradually reconstructed for their benefit a territorial sovereignty over France, the institution of the appanage periodically subtracted large portions from it. Louis XI., in particular, had to struggle against the appanaged nobles. The old law, however, never abolished this institution. The Edict of Moulins (1566) maintained it, as one of the exceptions to the inalienability of the crown-lands; only it was then decided that daughters of France should be appanaged in money, or that if, in default of coin, lands were assigned to them, these lands should be redeemable by the crown in perpetuity. The efforts of the kings to minimize this evil, and of the old jurisprudence to deal with the matter, resulted in two expedients: (1) the reversion of the appanage to the crown was secured as far as possible, being declared inalienable and transmissible only to male descendants in the male line of the person appanaged; (2) originally the person appanaged had possessed all the rights of a duke or count—that is to say, in the middle ages nearly all the attributes of sovereignty; the more

important of these attributes were now gradually reserved to the monarch, including public authority over the inhabitants of the appanage in all essential matters. However, it is evident from the letters of appanage, dated April 1771, in favour of the count of Provence, how many functions of public authority an appanaged person still held. The Constituent Assembly, by the law dated Nov. 22, 1790, decided that in future there should be no appanages in real estate, and that younger sons of monarchs, married and over 25 years of age, should be provided for by yearly grants (*rentes apanagères*) from the public funds. The laws of Aug. 13 and Dec. 21, 1790, revoked all the existing appanages, except those of the Luxembourg Palace and the Palais Royal. To each person hitherto appanaged an annual income of one million *livres* was assigned, and two millions for the brothers of the king. All this came to an end with the monarchy. Napoleon, by the *sénatus-consulte* of Jan. 30, 1810, resolved to create appanages for the emperor's princely descendants, such appanages to consist for the most part of lands on French soil. The fall of the Empire again annulled this enactment. The last appanage known in France was that enjoyed by the house of Orleans. Having been re-established, or recognized as still existing, by the Restoration, it was formally confirmed by the law of Jan. 15, 1825. On the accession of Louis Philippe it was united to the national property by the law of March 2, 1832.

See the Essai sur *les* apanages ou mtmoires *historiques de leur établissement,* attributed to Du Vaucel (c. 1780). (J. P. E.)

APPAREL (Fr. *appareil,* from Low Lat. *adpariculare,* to make fit or equal), equipment, outfit, things furnished for the proper performance of anything, now chiefly used of dress. The word is also applied to orphreys (q.v.).

APPARITIONS. An apparition, strictly speaking, is merely an appearance apprehended in perception when a stimulus acts on any of the senses. But in ordinary usage the word apparition denotes a perception (generally through the sense of sight) which cannot, as a rule, be shown to be occasioned by an object in external nature. We say "as a rule" because many so-called apparitions are merely illusions; *i.e.,* misinterpretations of actual objects, as when a person in a bad light sees a number of small children leading a horse, and finds, on nearer approach, that he sees two men carrying bee-hives suspended from a pole. Again, Sir Walter Scott's vision of Byron, then lately dead, proved to be a misinterpretation of certain plaids and cloaks hanging in the hall at Abbotsford, or so Sir Walter declared. Had he not discovered the physical basis of this illusion (which, while it lasted, was an apparition, technically speaking), he and others might have thought that it was an apparition in the popular sense of the word, a ghost. In popular phraseology a ghost is understood to be a phantasm produced in some way by the spirit of a dead person, the impression being usually visual, though the ghost, or apparition, may also affect the sense of hearing (by words, knocks, whistles, groans and so forth), or the sense of touch, or of weight, as in the case of the "incubus." In ordinary speech an apparition of a person not known to the percipient to be dead is called a wraith, in the Highland phrase, a spirit of the living. The terms *ghost* and wraith involve the hypothesis that the false perceptions are caused by spirits, a survival of the archaic animistic hypothesis (see ANIMISM), a hypothesis as difficult to prove as to disprove. Apparitions, of course, are not confined to anthropomorphic phantasms; we hear of phantom coaches (sometimes seen, but more frequently heard), of phantom dogs, cats, horses, cattle, deer, and even of phantom houses.

Whatever may be the causes of these and other false perceptions—most curious when the impression is shared by several witnesses—they may best be considered under the head of hallucination (*q.v.*). Hallucinations may be pathological; *i.e.,* the result of morbid conditions of brain or nerve, of disease, of fever, of insanity, of alcoholism, of the abuse of drugs. Again, they may be the result of dissociation, or may occur in the borderland of sleep or waking, and in this case they partake of the hallucinatory nature of dreams (*q.v.*). Again, hallucinations may, once or twice in a lifetime, come into the experience of the sane, the healthy, and, as far as any tests can be applied, of the wide-awake. In such instances the apparition (whether it take the form of a visual phantasm, of a recognized voice, of a touch, or what not) may be coincidental or non-coincidental. The phantasm is called coincidental if it represents a known and distant person who is later found to have been dying or in some other crisis at the moment of the percipient's experience. When the false perception coincides with nothing of the sort, it is styled non-coincidental. Coincidental apparitions have been explained by the theory of telepathy (*q.v.*), one mind or brain impressing another in some unknown way so as to beget an hallucinatory apparition or phantasm. On the evidence, so far as it has been collected and analysed, it seems that the mind which, on the hypothesis, begets the hallucinations, usually does so without *conscious* effort (see SUBLIMINAL SELF). There are, however, a few cases in which the experiment of begetting, in another, an hallucination from a distance, is said to have been experimentally and consciously made, with success.

If the telepathic theory of coincidental hallucinations be accepted, we have still to account for the much more common non-coincidental apparitions of the living who do not happen to be in any particular crisis. In these instances it cannot be demonstrated that telepathy has not been at work, as when a person is seen at a place which he thought of visiting, but did not visit. F. W. Myers even upheld a theory of psychorhagy, holding that the spirits of some persons have a way of manifesting themselves at a distance by a psychic invasion. This involves, as he remarked, paleolithic psychology, and the old savage doctrine of animism, rather than telepathy (see Myers, Human Personality). Of belief in coincidental hallucinations or wraiths among savages, records are scanty; the belief, however, is found among Maoris and Fuegians (see Lang, Making of Religions). The perception of apparitions of distant but actual scenes and occurrences is usually called clairvoyance (*q.v.*). The belief is also familiar under the name of second sight (see SECOND SIGHT), a term of Scots usage, though the belief in it, and the facts if accepted, are of world-wide diffusion. The apparitions may either represent actual persons and places, or may be symbolical, taking the form of phantasmic lights, coffins, skeletons, shrouds and so forth. Again, the appearances may either represent things, persons and occurrences of the past, or on the other hand of the present (clairvoyance), or of the future (see PREMONITION). When the apparitions produce themselves in given rooms, houses or localities, and are exhibited to various persons at various times, the locality is popularly said to be haunted by spirits, that is, of the dead, on the animistic hypothesis (see HAUNTINGS). Like the other alleged facts, these are of world-wide diffusion, or the belief in them is world-wide, and peculiar to no race, age, or period of culture. A haunted place is a centre of permanent possibilities of hallucinations, or is believed to be so. A distinct species of hauntings are those in which unexplained sounds and movements of objects, apparently untouched, occur. The German term Poltergeist (*q.v.*) has been given to the supposed cause of these occurrences where the cause is not ascertained to be sportive imposture. In the performances of modern spiritualists the Poltergeist appears, as it were, to be domesticated, and to come at the call of the medium.

An intermittent kind of ominous haunting attached, not to places, but to families, is that of the banshee (Celtic) or family death omen, such as the white bird of the Oxenhams, the Airlie drummer, the spectral rider of Clan Gilzean, the rappings of the Woodde family. These apparitions, with fairies and *djinns* (the Arab form of fairy), haunt the borderland between folk-lore and psychical research.

So far we have been concerned with spontaneous apparitions, or with the belief in them. Among induced apparitions may be reckoned the materialized forms of spiritual *séances,* which have a material basis of veils, false moustaches, wigs and the corpus vile of the medium. It is also possible that mere expectancy and suggestion induce hallucinatory perceptions among the members of the circle. That apparitions of a sort can be induced by hypnotic and post-hypnotic suggestion is certain enough (see HYPNOTISM). Savages produce apparitions in similar ways by sug-

gestion, accompanied by dances, fumigations, darkness, fasting, drugs, and whatever can affect the imaginations of the onlookers (see MAGIC). Both in savage and civilized life, some persons can provoke themselves into beholding apparitions usually fantastic, but occasionally coincidental, by sedulously staring into any clear deep water, a fragment of rock crystal, a piece of polished basalt or obsidian, a mirror, a ring, a sword blade, or a glass of sherry (see CRYSTAL GAZING). Indeed any object, a wall, the palm of the hand, the shoulder-blade-bone of a sheep, may be, and has been used to this end (see DIVINATION).

Almost all known apparitions may be classed under one or other of the categories given, whether they be pathological, coincidental or spontaneous, induced, permanently localized, or sporadic. (See SPIRITUALISM and PSYCHICAL RESEARCH.) (A. L.)

APPARITOR or **APPARATOR,** an attendant who executed the orders of a Roman magistrate; hence a beadle in a university, a pursuivant or herald; particularly, in English ecclesiastical courts, the official who serves the processes of the court and causes defendants to appear by summons.

APPASSIONATA (Ital., impassioned), a musical term which may apply either to the nature of a piece (*e.g.,* Beethoven's Sonata Appassionata, op. 57) or, in its adverbial form *appassionato*, to the required manner of its performance.

APPEAL. In the old English common law the term "appeal" was used to describe a process peculiar to English criminal procedure. It was a right of prosecution possessed as a personal privilege by a party individually aggrieved by a felony, a privilege of which the Crown could not directly or indirectly deprive him, since he could use it alike when the prisoner was tried and acquitted, and when he was convicted and pardoned. It was chiefly known in practice as the privilege of the nearest relation of a murdered person. In its usual modern sense the term appeal is applied to the proceeding by which the decision of a court of justice is brought for review before another tribunal of higher authority.

IN GREAT BRITAIN

During the middle ages full scope was afforded for appeals from the lower to the higher authorities in the church. In matters ecclesiastical, including those matrimonial, testamentary and other departments, which the church ever tried to bring within the operation of the canon law, there were various grades of appeal, ending with the pope. The claims of the church to engross appeals in matters trenching on the temporal rights of princes led to continual conflicts between church and State, terminated in England at the Reformation by the suppression in 1534 of appeals to Rome, which had previously been discouraged by legislation of Edward III. and Richard II.

In temporal, as distinct from spiritual matters, it became customary for ambitious sovereigns to encourage appeals from the courts of the Crown vassals to themselves as represented by the supreme judges, and Charlemagne usually enjoys the credit of having set the example of this system of centralization by establishing *missi dominici*. It is not improbable that his claim was suggested or justified by the practice of the Roman empire, to the sovereignty whereof he claimed to be successor.

When the royal authority in England grew strong as against that of the tenants in *capite*, the king's courts in England were more effectively organized, and their net swept wider so as to draw within their cognizance matters previously adjudged in courts baron or courts leet or in the county court, and they acquired authority to supervise and review the decisions of the inferior and local courts, to control and limit their claims to exercise jurisdiction, and to transfer causes from the local to the royal courts. The machinery by which this process was usually effected, under the common law, was not by what is now known as appeal, but by the process of certiorari or writs of error or prohibition. Recourse was also had against the decisions of the royal courts by appeal to the great council of the king, or to parliament as a whole. Since the reign of Henry VIII, the supremacy of the king's courts over all causes, as well ecclesiastical as civil, has been completely established and they have effectually asserted the power to regulate and keep within their proper jurisdiction all other tribunals within the realm Since that date the organization of judicial tribunals has gradually been changed and improved with the object (1) of creating a judicial hierarchy independent of executive control; (2) of ensuring that all decisions on questions of law shall be co-ordinated and rendered systematic by correction of the errors and vagaries of subordinate tribunals; and (3) of securing so far as possible uniformity in the judicial interpretation and administration of the law, by creating a supreme appellate tribunal to whose decisions all other tribunals are bound to conform.

Appeals from Justices of the Peace.—The decisions of justices of the peace sitting as courts of summary jurisdiction are subject to review on questions of law only by the High Court of Justice. This review is in a sense consultative, because it is usually effected by means of a case stated by the justices at the request of the aggrieved party, in which are set forth the facts as determined by the justices, the questions of law raised and their decision thereon, as to the correctness whereof the opinion of the High Court (in this case, the divisional court) is invited. A point of fact not taken before the justices cannot be taken on appeal. The procedure is equally open in criminal and civil matters brought before the justices. But when the justices decline to state a case for the opinion of the High Court, the latter, if review seems desirable, may order the justices to state a case, unless, indeed, the power to state a case is discretionary. And the High Court has also power to control the action of justices by prohibiting them from acting in a case beyond their jurisdiction, ordering them to exercise jurisdiction where they have improperly declined (mandamus), or bringing up for review and quashing orders or convictions which they have made in excess of jurisdiction, or in cases in which interested or biassed justices have adjudicated (certiorari). None of these regulative processes exactly corresponds to what is popularly known as an appeal, but in effect if not in form an appeal is thus given.

There is also another form of appeal, in the fullest sense of the term, from the decision of justices sitting as a court of summary jurisdiction to the justices of the same county sitting in general or quarter sessions, or in the case of a borough to the recorder as judge of the borough court of quarter sessions. This form of appeal is in every case the creation of statute: and even in text-books it is hardly possible to find a really complete list of the matters in respect of which such appeal lies. But as regards criminal cases there is an approximately general rule, given by s. 19 of the Summary Jurisdiction Act 1879, viz. that an appeal to quarter sessions lies from the conviction or order of a court of summary jurisdiction directing imprisonment without the option of a fine as a punishment for an offence, or for failing to do or to abstain from doing any act required to be done or left undone other than an order for the payment of money, or to End sureties or give security or to enter into a recognizance, or a conviction made on a plea of guilty or admission of the truth of the matter of complaint. The right of appeal to quarter sessions is extended by the Criminal Justice Administration Act 1914, s. 37 (1) to any person aggrieved by any conviction of a court of summary jurisdiction in respect of any offence, who did not plead guilty or admit the truth of the information. There is also a right of appeal where a person after pleading guilty or admitting the truth of the information is convicted (Criminal Justice Act 1925, s. 25).

As a general rule, subject to particular statutory exceptions, appeals of this kind are by way of re-hearing, *i.e.,* the actor or prosecutor must before the appellate tribunal call his witnesses and prove his case just as if no previous hearing had taken place (Halsbury, Laws of England, vol. xix. s. 1373). The only limit is that the appellant must confine himself to the grounds of appeal stated in the notice of appeal given by him. An appeal of this kind lies from any court of petty session, including of course, the court of a stipendiary magistrate.

Appeals from Justices in Quarter Sessions.—This tribunal has under the commission of the peace and under statute power to refer questions of difficulty arising before it for decision to the High Court. The old mode of exercising this power was by sending on to assizes indictments raising difficult questions which had

been presented at quarter sessions. The High Court has *ex officio* power to transfer such indictments where the nature of the case and the demands of justice call for such transfer. The quarter sessions had also power under statute on trying an indictment to refer to the court for Crown cases reserved (Crown Cases Act 1848, abolished by the Criminal Appeal Act 1907) questions of law which had arisen at the trial, and in all civil cases the quarter sessions has power of its own volition and subject to no direct compulsion to consult the High Court on legal questions of difficulty which have arisen. Cntil 1894 this jurisdiction was regarded as consultative only. It was and is exercised by stating the facts, of which the court of quarter sessions is the sole judge, and indicating the questions of law arising on the facts, and the view of quarter sessions thereon, and inviting the opinion of the High Court. Under the Judicature Act 1925 (by s. 25 [1]) every case stated is deemed to be an appeal and is to be heard and determined accordingly. In hearing the appeal, the divisional court may draw any inferences of fact which might have been drawn in the court of quarter sessions, and may give any judgment or make any order which ought to have been made, and may decide all questions of costs. When a court of quarter sessions has heard an appeal from a court of summary jurisdiction, either party, being aggrieved by the decision as being wrong in law, may call for a special case for the opinion of the High Court (Criminal Justice Act 1925, s. 20). If the court of quarter sessions refuses to state a case, it may be compelled to do so by the High Court.

Appeals from County Courts.—Any party to an action or matter in a county court who is dissatisfied with the determination or direction of the judge in law or equity, or upon the admission or rejection of any evidence, may appeal against the decision in the following cases: (1) if the amount of claim or counter-claim in the proceeding exceeds £20; or (2) in all equity matters or cases in which an injunction has been given; or (3) in actions to recover possession of land where questions of title are involved (County Courts Act 1888, s. 120). In the case of a claim below £20 no appeal lies except by the leave of the county court, and in such a case, the county court judge may give leave on the terms, *e.g.*, that the appellant shall in any event pay the respondent's costs of the appeal.

These appeals are heard in the king's bench division by a divisional court except in the case of appeals from judgments of a county court sitting in the exercise of admiralty jurisdiction, which are heard by two or more judges sitting in the probate, divorce and admiralty division, and in the case of an appeal from a county court judge sitting as arbitrator under the Workmen's Compensation Acts, when an appeal lies direct to the court of appeal. A divisional court usually consists of two judges, but the president of the division to which the court belongs may increase the number. Where there is a difference of opinion between two judges constituting a divisional court the junior judge sometimes withdraws his judgment and allows the judgment of his learned brother to overrule or affirm the judgment appealed from as the case may be. But the view has been expressed that in case there is a difference of opinion the judgment below should be allowed to stand. The chancery division has never sat to hear appeals from a county court exercising equity jurisdiction; but at times, by *prohibition* or certiorari has, in effect, reviewed or restrained excess of jurisdiction by county courts in equity matters.

The decision of the High Court on county court appeals is final unless an appeal to the court of appeal is brought by leave of that court or of the High Court (Judicature Act 1925 s. 31 [1] [f]). The application for leave to appeal may be made ex parte.

The appeal is by notice of motion which must state the grounds of the appeal, and must be given within 21 days from the date of the judgment or order complained of (Or. 59, r. 10). An appeal does not necessarily stay execution, but execution may be stayed if the value of the property affected by the judgment is secured. Security for the costs of an appeal may be ordered, but poverty is not of itself sufficient to justify an order for security if there are reasonable grounds for appealing.

The destination of appeals from county courts is controlled by various statutes. Appeals under the Workmen's Compensation Acts go direct to the court of appeal, while an appeal from a county court judge exercising his admiralty jurisdiction is heard by a divisional court in the admiralty division of the High Court. Appeals from county courts in bankruptcy are heard by a divisional court in the chancery division, whose decision is final unless leave is given to appeal either by that court or the court of appeal.

The judges of the king's bench have no power to review the decision of a county court judge on any question of fact unless, indeed, it can be said that he has misdirected himself as to certain evidence in which case a new trial may be ordered. This limitation of the right of appeal has often been made the subject of unfavourable comment, and has given rise to the suggestion that there is such a thing as "county court" as distinguished from "High Court" justice.

Appeals from Inferior Courts of Civil Jurisdiction.—Appeals from the local courts of record which still survive in certain cities, towns and districts are in a somewhat anomalous position. The general rule is that, unless a statute regulates such appeal, it may be brought in the king's bench division of the High Court on notice of motion in any case in which, before the Judicature Acts, the court of king's bench could have reviewed the decision of the inferior court by writ of error. The history of this question is dealt with in *Darlow* v. *Shuttleworth,* 1902, 1 K.B. 721.

In the case of the mayor's court of London, under the local and general statutes regulating that court an appeal lay to the king's bench division, but where there was "error" on the face of the proceedings of the mayor's court the appeal lay direct to the court of appeal as successor of the court of exchequer chamber. Now, however, the mayor's court having been abolished and merged in the mayor's and city of London court, appeals therefrom are dealt with as appeals from a county court. Appeals from the Liverpool court of passage and from the chancery courts of the duchies of Lancaster and Durham lie by statute direct to the court of appeal (Judicature Act 1925, s. 28).

An appeal from the decision of a master of the king's bench involving any question of practice or procedure lies to a judge in chambers, and from the judge in chambers (with leave) to the court of appeal. Where, however, a master in chambers gives judgment on an issue tried by him, whether by consent or by order, an appeal from his decision lies to a divisonal court, which tribunal may review his findings both on questions of law and on questions of fact.

Appeals from an official or special referee are regulated by Or. 59A of the Rules of the Supreme Court which gives an absolute right of appeal from an official referee to the judge in court in the chancery division, and to a divisional court in the king's bench and probate, etc., division. An appeal must be launched within six weeks, and the tribunal considering it may reverse or vary the finding of the official referee or send the matter back to him or to any other referee for further consideration.

Appeals in Criminal Cases Tried on **Indictment.**—Until 1907 it may be said that no appeal lay from a conviction upon indictment save that there was an appeal on questions of law arising at the trial. But the procedure was intricate and technical, being either (1) by writ of error, issued by the consent of the attorney-general (expressed by his *fiat*), to review errors of law appearing in the record of the trial, or (2) by special case, stated by the judge presiding at the trial, with respect to a question of law raised at the trial. These appeals were heard by the king's bench division. Meanwhile there had been a considerable development of public opinion in favour of the establishment of criminal appeal, which resulted in the Criminal Appeal Act which was passed in 1907. By this act a court is established consisting of the lord chief justice and eight judges of the king's bench division, the jurisdiction of the court for Crown cases reserved being transferred to the new court. The court to be duly constituted must consist of an uneven number of judges, not less than three. Its sittings are held in London unless special directions are given by the lord chief justice that it shall sit at some other place. The opinion of the majority of those hearing the case determines any question before the court, and judgment is pronounced by the president (who is the lord chief justice or senior member present), unless in questions of law, when, if it is convenient that separate

judgments should be pronounced by the members of the court, they may be so pronounced. The judgment of the court of criminal appeal is final, except where the decision involves a point of law of exceptional public importance, and a certificate must be obtained from the attorney-general to that effect. The court of criminal appeal is a superior court of record. An appeal may be made either against conviction or against sentence. A person convicted on indictment may appeal either on a question of law alone or of fact alone, or on a question of mixed law and fact. On a point of law a prisoner has an unqualified right of appeal, on a question of fact or of mixed law and fact there is a right of appeal only if leave be obtained from the court of criminal appeal or a certificate be granted by the judge who tried the prisoner that it is a fit case for appeal. The court may allow the appeal if they think that the verdict of the jury should be set aside because it is unreasonable, or because it cannot be supported having regard to the evidence, or that the judgment should be set aside on the ground of a wrong decision on any point of law, or that on any ground there was a miscarriage of justice. Power is given to the court to dismiss the appeal if they consider that no substantial miscarriage of justice has occurred, even though they are of opinion that the point raised in the appeal might be decided in favour of the appellant. If the appeal is against the sentence passed at the trial it may be quashed by the appeal court and such other sentence (whether more or less severe) warranted in law by the verdict substituted. Notice of appeal or notice of application for leave to appeal must be given within ten days of the date of conviction; where a conviction involves sentence of death or corporal punishment the sentence must not be executed until after the expiration of ten days, and if notice of appeal is given, not until after the determination of the appeal or the final dismissal of the application for leave to appeal. The act gives the court power to order any witnesses who would have been compellable witnesses at the trial to attend and be examined before the court, and to receive the evidence, if tendered, of any witness who is a competent but not compellable witness. Any question involving prolonged examination of documents or accounts or any scientific or local investigation may be referred to a special commissioner appointed by the court, and the court may act on the report of that commissioner. An appellant is given the right to be present on the hearing of his appeal, if he desires it, except where the appeal is on some ground involving a question of law alone, but rules of court may provide for his presence in such a case, or the court may give him leave. The act requires shorthand notes to be taken of the proceedings at the trial of any person, who, if convicted, would have a right to appeal under the act. Nothing in the act affects the prerogative of mercy, and the home secretary may, if he thinks fit, at any time refer a case to the court of criminal appeal. If the attorney-general certifies that a decision of the court of criminal appeal involves a point of law of exceptional public importance an appeal lies to the House of Lords at the instance of the prosecutor or the defendant. The necessary certificate must be applied for within seven days of the date of the decision (Criminal Justice Act 1925, s. 16).

Appeals from Judges of the King's Bench, Chancery and Probate, Divorce and Admiralty Divisions of the High Court. — Appeals from all the divisions of the High Court lie to the court of appeal, which, next to the House of Lords, is the most important tribunal of appeal from the purely British point of view. Its constitution is to be found in the Judicature Act 1925, ss. 6–8. It consists of certain ex *officio* judges and five ordinary judges, who are called lords justices of appeal. The *ex officio* members are the lord chancellor, who is president of the court, any ex lord chancellor, any lord of appeal in ordinary, who at the date of his appointment would have been qualified to be appointed an ordinary judge of the court of appeal, or who, at that date, was a judge of that court. The lord chief justice, the master of the rolls and the president of the probate division are also ex *officio* members of this tribunal. Any barrister of not less than 15 years standing and any judge of the High Court is qualified for appointment as a lord justice. The lord chancellor may request any judge of the High Court to sit in the court of appeal. Further he may ask, but, of course, cannot compel any retired lord justice or judge of the High Court to sit in the court.

Normally, the court of appeal sits in two divisions. The master of the rolls usually presides in the first court, and a senior lord justice in the second. Matters are generally so arranged that a court consisting of two common law and one equity lord justice hears appeals from the king's bench, while chancery appeals are heard and decided by two equity and one common law lord justice. For the decision of a case of great importance, the president will sometimes summon the whole court.

Sometimes judgment is given immediately upon the conclusion of the arguments. In important cases, however, the lords justices often reserve judgment and put their reasons into writing. When a large number of American lawyers visited this country in 1926, a distinguished American judge who had been listening to a case in the court of appeal was heard to express his astonishment at judgment being delivered orally immediately after the conclusion of the arguments. In his State of the Union, he said, to reserve judgment was the universal practice.

Jurisdiction of the Court of Appeal. — The jurisdiction of the court of appeal is as prescribed in the Judicature Act 1925, s. 26 et seq. It exercises all jurisdiction and powers formerly vested in the lord chancellor and the court of appeal in chancery when exercising appellate jurisdiction (s. 26 (2 a)) and all jurisdiction and powers formerly vested in the court of exchequer chamber (s. 26 (2 b)), which court considered writs of error from the old court of king's bench, the court of common pleas and the exchequer chamber. The court of appeal also hears appeals in admiralty (formerly heard by the privy council) and appeals from any order in lunacy made by the lord chancellor or any other person having jurisdiction in lunacy, which formerly lay to the king's council as a matter of prerogation (s. 26 (2) (c)). The court also has jurisdiction (under special statutes) to hear appeals (a) from any decision of the High Court upon cases stated under various tax acts, relating to trademarks, (b) from the railway and canal commissioners and (c) under the Workmen's Compensation and Agricultural Holdings Acts.

The principal function of the court is to hear appeals from "any judgment or order of any division of the High Court" (s. 27 (1)). All such judgments or orders can be appealed except any judgment of the High Court in any criminal cause or matter (s. 31 (1) (a)); an order allowing an extension of time for appealing from a judgment or order (ib. (b)); an order of a judge giving unconditional leave to defend; a decision of the High Court declared by statute to be final (ib. (d)); an order absolute for the dissolution or nullity of a marriage in favour of any party who having had time and opportunity to appeal from the decree *nisi* on which the order was founded has not appealed *(ib. (c))*. No appeal lies without leave of the divisional court or of the court of appeal from the determination by a divisional court of any appeal to the High Court, *e.g.*, an appeal from a county court (ib. (f)); without leave of the judge in chambers, or of the court of appeal from any order made in chambers (other than an order relating to practice or procedure) where no application has been made to discharge the order to the judge in court or to a divisional court (ib. (g)).

Again, no appeal lies without the like leave from an order made by consent or as to costs only which are left to the discretion of the court (ib. (h)). It will be seen that the legislature has absolutely prevented an appeal in a number of cases, and has allowed it, with leave, in others. Interest reipublicae *ut* sit *finis litium;* but it is obvious that there may be cases in which although the subject matter of the dispute is negligible or very small, some question of principle is involved. And this is often the case in appeals from county courts.

Appeals in Interlocutory Matters. — No appeal lies without the leave of the judge or of the court of appeal from any interlocutory order or interlocutory judgment made or given by a judge except in certain cases (to be mentioned presently). The question whether an order or judgment is interlocutory or final is for the court of appeal to decide (Judicature Act 1925, s. 68

(2)), but the test of finality is—Does it, as made, finally dispose of the rights of the parties? The principal exceptions (to be found in s. 31 (1) (2) of the Judicature Act 1925) are where the liberty of the subject or the custody of infants is concerned; where an injunction or the appointment of a receiver is granted or refused; in the case of a decree *nisi* in a matrimonial cause, or a judgment or order in an admiralty action determining liability; in the case of an order on a special case stated under the Arbitration Act 1889. With regard to decisions of the High Court in relation to election petition these cannot be appealed except with leave of the High Court. Finally, no appeal lies to the court of appeal from any decision of a divisional court on a point of law arising in any probate causes or matter.

Every motion for a new trial or to set aside a verdict in any cause or matter in the High Court in which there has been a trial thereof or of any issue therein with a jury falls to be heard in the court of appeal (Judicature Act 1875, s. 30 (1)). The court of appeal also hears appeals from convictions of indictment at common law in relation to the non-repair or obstruction of any highway, public bridge or navigable river (ib. s. 29).

In matters of practice and procedure every appeal from a judge comes before the court of appeal (Judicature Act 1925, s. 31 (3)). These appeals which are usually from a judge sitting in chambers are generally heard by two members of the court of appeal, and do not lie except with leave of the judge who made the order or of the court of appeal. To this, however, there is one notable exception, viz., that if a judge in chambers refuses unconditional leave to defend, the defendant may appeal without leave. On the other hand, if he does give unconditional leave to defend, his order is final. As to what are matters of "practice and procedure," the reader is referred to the Yearly Practice (1928).

Procedure on Appeals.—Procedure on appeal is regulated by rules of court (notably R.58). Notice of motion must be given, in interlocutory matters within 14 days, and in final matters within six weeks of the decision complained of. At the hearing the court may allow further evidence to be called, but this power is rarely exercised, and after a cause or matter has been heard on the merits, is admitted on special grounds only. The court will "jealously scrutinize" any point taken on appeal which was not taken in the court below. Upon hearing the appeal the court may order a new trial instead of reversing the judgment below. Provision is also made by the rules for a cross appeal by the respondent. The court may summon assessors who are experts on the matters of fact or science involved in the appeal., This power is often exercised in admiralty cases.

With a view to preventing a multiplicity of appeals, there is power to order security for costs of an appeal in certain cases. It will generally be ordered where an appellant is out of the jurisdiction, and where it is shown that the appellant, if unsuccessful, would be unable to pay costs (unless, indeed, the poverty of the appellant is due to the wrongful act of the respondent), but it will not be ordered where the liberty of the subject is in question.

The court of appeal may make any order which it deems just as to the costs of the whole or any part of an appeal, except possibly in the case of certain appeals in matters on the Crown side of the High Court, as to which some doubt still exists. In practice the costs follow the event, unless the court in a particular case makes an order to the contrary.

A decision of the court of appeal is final in appeals from the High Court in bankruptcy, unless leave be given to appeal to the House of Lords (Bankruptcy Act 1914, s. 108), and in divorce appeals, except where the decision either is upon the grant or refusal of a decree for dissolution or nullity of marriage, or for a declaration of legitimacy, or is upon any question of law on which the court gives leave to appeal (Supreme Court of Judicature Act 1925, s. 27 (2)); but no further appeal to the House of Lords lies, even with leave of the court of appeal, on appeals from the High Court sitting as a court of appeal from county courts in bankruptcy. With these exceptions there is now a right of appeal from every order of the court of appeal to the House of Lords.

The House of Lords.—The House of Lords has for centuries been the court of last resort, and is still the final court of appeal from the chief courts in England, Scotland and Northern Ireland The origin of the appellate jurisdiction of the House of Lords was undoubtedly of that partly feudal and partly popular character already alluded to, which made the suitor seek from the high court of parliament the justice denied elsewhere in the baronial courts or by the king's judges. The lords exercised the mixed function of jurymen and judges, and, as in judgments on impeachment, might be influenced by private or party considerations, debating and dividing on the question before the House. A revolution was silently accomplished, however, by which the function of reviewing the decisions of the courts fell entirely to the lawyers raised to the peerage, while the unprofessional lords only attended to give the sanction of a quorum to the proceedings, and the House has always had the right to invoke the assistance of the judges of the superior courts to advise on the questions of law raised by an appeal. The letters and memoirs, so late as Queen Anne's reign, show that party or personal influence and persuasion were employed to procure votes on appeals, as they have been in later times on railway or other local bills. The last instance probably in which a strong division of opinion was manifested among the unprofessional lords was the celebrated Douglas cause in 1769, when the House was addressed by the dukes of Newcastle and Bedford, but was led by the authoritative opinion of Lord Mansfield on the effect of the evidence—an opinion which was treated rather as that of a political partisan than of a judge. The case of Daniel O'Connell and others, brought up on writ of error from the queen's bench in Ireland in 1844, may be said to have finally established the precedent that the judgments of the House of Lords were to be given solely by the law lords.

By the Appellate Jurisdiction Act 1876 and an amending act of 1887, the appellate business of the House of Lords is conducted solely by the law lords, though lay peers may still sit (*Bradlaugh* v. *Clarke,* 1882, 8 App. Cas. 354). No appeal may be heard or determined except in the presence of not less than three of the following persons:—(1) the lord chancellor; (2) the lords of appeal, four of whom are appointed under the act from among persons who hold, or have held, high judicial office, or, at the date of appointment, have been in practice for not less than 15 years as barristers in England or Ireland, or as advocates in Scotland (see also the Appellate Jurisdiction Act 1913, providing for the appointment of two additional lords of appeal); (3) such peers of parliament as hold, or have held, high judicial office. By "high judicial office" is meant the office of lord chancellor of Great Britain or Ireland, lord of appeal in ordinary, paid judge of the judicial committee or member of that committee, or judge of one of the superior courts of Great Britain or Ireland.

An appeal lies to the House of Lords (1) from any order or judgment of the court of appeal in England except as above stated; (2) from a judgment or order of any court in Scotland or Northern Ireland from which error or an appeal to the House of Lords lay by common law or statute immediately before Nov. 1, 1876. As regards Southern Ireland, the right of appeal from the court of appeal in Ireland was taken away by the Government of Ireland Act 1920. Appeal now lies from that part of Ireland, by leave, to the privy council. Appeals are heard from the court of criminal appeal where the attorney-general has certified that a point of law of general public importance is involved. The House of Lords has an indirect power by standing orders to admit appeals from Scotland or Northern Ireland which under former law or practice could not be admitted (Appellate Jurisdiction Act 1876, s. 12). The proceedings are commenced by petition of appeal, which must be lodged with the clerk of the parliaments within one year from the date of the last judgment it appealed from. Security for costs (£200) must be given by bond or lodgment of the money, unless dispensed with by the House on the ground of poverty (act of 1893). Each party lodges a printed case signed and certified by counsel, containing a résumé of the matters to be discussed and of the contentions for or against the allowance of the appeal. The hearing is before three or more law lords, who may

call in nautical assessors in admiralty cases (acts of 1893 and 189.4). It is not public in the full sense of the term, as persons not concerned in the appeal can attend only by consent of the House. The House pronounces the judgment which in the opinion of the majority of the law lords should have been pronounced below, and has jurisdiction in the case of all appeals to give or refuse costs to the successful party. The costs of the appeal if given are taxed by the officers of the House. The jurisdiction as to costs does not directly arise under any statute (see West Ham *Guardians* v. Bethnal Green Churchwardens, 1896, A.C. 477).

The procedure adopted on the hearing of an appeal in the House of Lords is somewhat remarkable. Cases are heard in the chamber itself, the law lords being provided with small tables near the bar of the House, the lord chancellor, in his robes, usually presiding. The peers do not give judgments in the strict sense: they make speeches, after which the lord chancellor, proceeding to the woolsack, puts the question to the vote.

Appeals to the **King** in Council (The Privy Council).—The decisions of ecclesiastical courts when acting within the limits of their jurisdiction, and the decisions of courts in the king's dominions outside Great Britain, and of courts in foreign countries set up under the Foreign Jurisdiction Acts, cannot be dealt with by the House of Lords or any of the ordinary tribunals of any part of Great Britain. The power once claimed by the court of king's bench in England to control the courts of Ireland has lapsed, and its power to intervene in colonial cases is limited to the grant of the writ of *habeas* corpus to a possession in which no court exists having power to issue that writ or one of like effect (Habeas Corpus Act 1862). As regards all British possessions, the appeal to the king in council is in its origin and nature like that of the provincials unto Caesar, and flows from the royal prerogative to admit appeals. With the growth of the British empire it has been found necessary to create a comparatively constant and stable tribunal to advise the king in the exercise of this prerogative. For this purpose the judicial committee of the privy council was created in 1833. In 1851, and again in 1870, it was reorganized, and by acts of 1876, 1887, 1898, 1908 and 1913 it received its present form. The committee consists of the president of the council, and of the following persons, if privy councillors—the lord chancellor and ex-chancellors of Great Britain and of Ireland, the four lords of appeal in ordinary, the lords justices of appeal in England or retired lords justices of appeal in England, and persons who hold or have held the office (a) of judge of the High Court of Justice or the court of appeal in England or Ireland, or of the court of session in Scotland; (b) any person who is or has been chief justice or a judge of the Supreme Court of Canada or of a superior court of any province of Canada, of any of the Australian States (except Fiji and Papua), or of any other British possessions fixed by Order jn Council, or chief justice or justices of the High Court of Australia, or chief justice or judges of the Supreme Court of Newfoundland or the Supreme Court of South Africa. The number of persons of this class who may be members at once is limited to seven (Appellate Jurisdiction Act 1913, s. 3 (1)); (*c*) provision is also made for the payment of two privy councillors who have been judges in India who attend the privy council.

Numerous as are the members of the committee, the quorum is three. One or more of the lords of appeal in ordinary usually attend at every hearing, but the composition of the committee is very fluctuating. Appeals from the British dominions abroad lie in criminal as well as civil matters. The right of appeal is regulated as to most possessions by order in council, and in some cases is limited by imperial or colonial statute. Appeals are on fact as well as on law, but the committee rarely if ever disturbs the concurrent judgments on facts of two colonial courts. In the case of admiralty appeals from colonial or consular courts, naval assessors may be called in. The committee also hears (with the aid of ecclesiastical assessors) appeals from ecclesiastical courts. The judgment of the committee is in the form of a report and advice to the king, which is read by one of the members sitting, and no indication is given as to whether the members present are unanimous. Effect is given to the advice by Orders in Council dismissing or allowing the appeal, and giving direction as to the payment of costs and as to the further proceedings to be taken in the colonial courts.

The procedure of the committee is on the same lines as that on appeals to the House of Lords; no well-arranged code of practice existed however up to the end of 1908, and new rules were then being proposed on the subject. The appeal is commenced by a petition of appeal, and by the giving of security for costs. In colonial appeals printed cases are lodged containing a summary of the contentions of the parties, and with this a printed copy of the record of the proceedings and documents used in the courts appealed from. The hearing is in the privy council chamber and is not public. When an appeal is called on, the counsel and parties are summoned into the chamber, and when the arguments are concluded they are requested to retire. The appeals to the king in council from colonial States having a federal constitution, like Canada and Australia, stand in an exceptional position. The act creating the Supreme Court of Canada purports to make the decision of that court final. But it is still the practice to admit by special leave a prerogative appeal from the court, and to entertain appeals from courts of the provinces of Canada direct to the king in council, without requiring them to go to the Supreme Court. The constitution of the Australian Commonwealth contemplates (s. 73) the possibility of restricting appeals to the king in council from the supreme courts of Australia, and s. 74 forbids appeals to the king in council except by leave of the High Court of Australia from decision of that court on any question however arising as to the limits inter se of the constitutional powers of the commonwealth and those of any State or States, or as to the limits inter se of the constitutional powers of any two or more States. The exact effect of these enactments and of Australian legislation under s. 73 is a matter of controversy. **A** convenient list of the Statutory Rules and Orders which now regulate appeals from the various colonies and dominions will be found in the supplement to Halsbury's Laws of England (1928), p. 607. (W. V. B.)

IN THE UNITED STATES

The question of appeals in the United States is complicated by the fact that each of the 48 States is an independent judicial unit, each having its own system of courts and its own system of procedure. The court systems and the procedural rules of the States often differ radically. In addition the Federal Government has a system of courts, culminating in the Supreme Court of the United States, with special and unique features. Limitations of space prevent a full report on each separate system.

Court Structure.—The justice of the peace court to be found ordinarily in each township is the lowest trial court. Next above it in importance is the district or county court, whose jurisdiction usually covers one county. The highest trial court, that of unlimited jurisdiction, is commonly termed the "superior court," or "circuit court," although the name "supreme court" is used in New York. One such court is found sufficient in the smaller States. The larger States have several, each of which has a jurisdiction extending over several counties. In a number of States there is but one appellate court, ordinarily called the "supreme court," but many States have two or more appellate courts.

A litigant who is dissatisfied with the decision of a justice of the peace may remove his case to the proper district or county court where it is tried de novo; that is, his case is treated as if brought in the higher court in the first instance. From this court, the case may be appealed to the appellate court where the trial below is reviewed to ascertain if error was committed or injustice has resulted. Cases in the superior court may likewise be appealed to the appellate court.

Multiple Appellate Courts.—In the larger States a single appellate court has been found incapable of handling all the appeals docketed. Various means of reducing this burden have been adopted. Some States deny the right of appeal in unimportant cases by permitting appeals only when the amount involved exceeds a certain specified minimum. But this plan has met with strenuous opposition from those who believe that every litigant should have the right to have his cause passed upon by more than one judge. Other jurisdictions have set up a system of inter-

mediate courts. Each of these courts is generally called a "court of appeals," although in New York, this is the term given the court of last resort while the intermediate courts are termed "appellate divisions." There may be only one intermediate court, or several, each of which has jurisdiction over a county or other territorial subdivision of the State.

The question of allocating cases on appeal between the intermediate appellate courts and the court of last resort presents a difficult problem. Provisions are to be found making the decision of the intermediate court final in certain specified actions. Other cases go directly to the court of last resort without the intervention of the intermediate court. In New York, for example, an appeal from a sentence of death is taken from the court of original jurisdiction to the Court of Appeals. In many actions there is a double appeal, first to the intermediate court and then to the court of last resort. Some States provide that in case of a disagreement in the intermediate court, that court may certify the case to the higher court. And finally many States provide that the court of last resort may order a case transferred to it from the intermediate court, if it believes that the case contains questions of sufficient importance to deserve its attention.

This system of intermediate appellate courts is open to two objections. As it is very difficult to formulate rules for distributing appeals between the intermediate and the supreme court which will be free from obscurity and doubt, each court is forced to spend a disproportionate part of its time in deciding whether it has jurisdiction to hear the appeal. But perhaps a more serious objection is the possibility in almost every case of a double appeal. It has not been demonstrated that a better quality of justice is obtained by subjecting a cause to the review of two appellate courts. And it is apparent not only that litigation is unduly prolonged, but that the expenses of litigation to the individual parties and to the community are increased. Further, public esteem for the courts is lessened by frequent reversals of a lower appellate court by the supreme court.

Divisional Appellate Courts.—The system used in England for handling the burden of cases on appeal has been adopted with satisfactory results in some States. Under this system questions of jurisdiction are avoided by providing but one supreme court with various divisions. Thus a supreme court consisting of nine judges would be divided into three divisions of three judges each. Appeals may be allocated among the divisions by giving each jurisdiction over appeals from a certain territorial sub-division of the State. An alternative plan is to assign cases arbitrarily to each division as it finds its docket clear. There would be a double appeal only when a case is re-argued before the entire court. This ordinarily would happen only when an important constitutional problem is involved or a division of opinion occurs in one of the divisional courts.

Appellate Court Judges.—An interesting variation is found in the number of judges composing the different State supreme courts. The minimum number is three, which is found sufficient in five States. Twenty States have courts composed of five judges, two, of six judges, 15, of seven judges, and three, of eight judges. The courts of Oklahoma and Washington are composed of nine judges, but this number is required because these courts sit in divisions. The situation in New Jersey is unique. Its court of last resort, the Court of Errors and Appeals, is composed of sixteen judges, of whom ten are lawyers and six are laymen. (N.J. Const., Art. VI., Section II., Par. 1.)

The decision of the court is controlled by a majority vote; hence it is desirable that the court consist of an odd number of judges. It sometimes happens that, through sickness or other disability, the court is reduced to an even number. To meet such a situation power is given a few supreme courts to call a judge from one of the intermediate appellate courts, or from the highest trial court, to sit temporarily. And since vacancies on the supreme court bench are usually filled by members from these courts, this plan provides excellent training for future supreme court judges. Lacking such a provision there is a possibility that the supreme court will be evenly divided. In such a situation the judgment appealed from is affirmed but no principle is settled.

Procedure on Appeal.—In order to understand appeal procedure, it must be appreciated that courts of common law and courts of chancery were once (and still are in some States) separate entities. Each system of courts had different procedural devices for perfecting an appeal. A litigant, wishing to secure a review of an adverse judgment at common law, petitioned the proper appellate court for a writ of error. This writ commanded the lower court to transfer the record of the case to the higher court for examination. The appellate court then had the power to consider only errors of law appearing on the record proper. As the record proper consisted only of the summons and its return, the pleadings, the verdict and the judgment, the scope of the appellate court's review was necessarily extremely limited. But at an early date the procedural device known as the "bill of exceptions" was invented to provide a means of incorporating into the record proper the errors committed during the trial.

Equitable causes in chancery were reviewed by means of an "appeal in equity." This device was simpler and more efficient than a writ of error. The pleadings and other documents were removed to the appellate court for a rehearing of the case. The appellate court was not forced to confine its attention to the record proper. The facts found as well as the law propounded by the lower court could be examined. In fact, except for the rule that new evidence could not be given on appeal, the rehearing partook more of the nature of a trial *de novo* than of an examination merely for the detection of error.

In most non-code States, where law courts are still separate and distinct from the chancery courts, both the writ of error and the appeal in equity are to be found essentially in the form described above. In the code States, where the courts of law and courts of chancery have been blended into one, the tendency is to provide but one procedural process for the perfecting of an appeal. This process is in essence a compromise, having some features both of the writ of error and of the appeal in equity.

Other methods of obtaining a judicial review of a cause at early common law were by means of the prerogative writs of *certiorari, mandamus* and prohibition. In most States these writs are still employed. Each of these writs is issued upon a petition to an appellate court and each contains a command to a lower court. The writ of *certiorari* orders the cause transferred to the higher court for further proceedings. This writ can be used only when a writ of error could not be issued, as when an accidental destruction of the record proper prevents its certification to the appellate court. The writ of mandamus compels the performance of some act refused by the lower court. The writ of prohibition prevents a lower court from acting beyond its statutory jurisdiction. It should be noted that these three writs are issued only in the sound discretion of the court, whereas writs of error and appeals in equity are ordinarily matters of right to the litigants.

A further method of obtaining an appellate review is provided in some States by means of a "certified case." During the trial of an action, a difficult question of law may arise which, when answered, is decisive of the case. The trial judge may then "certify" the case to the supreme court by stating the question of law for its determination. All trial proceedings are stayed until the appellate court gives its answer. An analogous method is to permit the two opposing counsel at the trial to submit an agreed statement of facts to the supreme court. The court then decides the law applicable to these facts. Such a procedure will be used only when the facts are clear and the dispute centres on a question of law.

Procedural **Steps** on Appeal.—The steps which a party, by his attorney, must take to bring his case before the appellate court are many and technical. Under typical procedure the defeated party would proceed as follows: 1. File a written motion for a new trial with the trial judge. Many supreme courts will not hear an appeal unless the trial judge has first denied a motion for a new trial. 2. Give notice to the other party of his intention to prosecute an appeal. 3. Provide security for the costs on appeal in case the appeal should be unsuccessful. This security, ordinarily a bond with two sureties is required unless the appellant appeals *in forma pauperis*. To do this he must take

an oath that he is financially incapable of providing proper security. 4. Execute a supersedeas bond. In most States such a bond is required to prevent the execution of the judgment appealed from. By the bond the appellant binds himself to pay the full amount of such judgment as may be finally rendered against him. 5. Prepare a bill of exceptions. It is by means of this device that a review of errors occurring during the trial may be secured on a writ of error. In the bill of exceptions each error asserted and upon which he intends to rely on appeal is set out separately. Errors not assigned are disregarded by the appellate court. 6. Prepare a record or case on appeal. This record contains, in addition to the record proper, the bill of exceptions, and a report of the testimony given at the trial or so much of it as is relevant to the errors assigned. 7. Submit his record or case on appeal for the approval of the trial judge. The judge examines the record to ascertain whether it gives an accurate history of the trial. If so the papers are transmitted to the supreme court. If not the appellant must make the necessary revision. 8. Prepare a brief. The purpose of the brief is to assist the appellate court in reaching a decision by presenting in concise form the question in controversy with supporting arguments. The appellate court does not consider assigned errors not supported by arguments in the brief. The preparation of a brief often involves a great amount of labour. In the famous case of Willett v. Herrick, 258 Mass. 585, 1,595 pages of brief (printed quarto-size paper) were filed for the appellants and 1,107 pages for the appellees. 9. Present the case orally before the supreme court. The appellant is usually entitled to open and close the argument. If the appellate docket is crowded a time limit is placed on the argument. Thirty minutes for each side is a common provision. The appellate justices are privileged to ask questions of the attorneys regarding any point in the case.

The supreme court reaches its decision at a conference of its members, and one judge is assigned to write an opinion. If the court is divided, one or more dissenting opinions may be filed. In unimportant cases the decision may be announced without the writing of an opinion.

Reversals for Errors.—A trial judge in the course of a trial is called upon to make many decisions upon procedural matters. He must interpret the complicated and technical rules of evidence. Often his rulings must be made with little time for reflection. If the case is tried before a jury he must instruct it as to the substantive law of the case. It is a vain hope that a trial will be conducted without some error, no matter how learned the trial judge may be. Hence if the appellate court granted a new trial for every error committed by the trial court, litigation would never end. The following principles have been adopted by every appellate court to avoid such a situation: 1. The appellate court will consider only such objections as were raised in the lower court. This rule forces counsel to call the alleged error to the attention of the trial judge, thus giving him an opportunity to rectify the mistake without subjecting the parties to the expense and delay of an appeal. 2. The appellate court will not consider invited errors. Thus if the appellant requests the judge to give a certain instruction to the jury, he cannot complain if the instruction given proves erroneous. Without such a rule, clever counsel could intentionally lead a trial judge into error. 3. The appellate court will not reverse for an error which does not operate to the prejudice of some substantive right of the appellant. This so-called "harmless error" rule has now been enacted by statute in many States. As the word "prejudicial" cannot be limited as to degree, it is natural that the same error may be held harmless by one court and prejudicial by another. A striking instance of this has occurred. The Missouri supreme court took the narrow view that the omission of the word "the" from a criminal indictment was prejudicial and reversed the conviction. (State v. Campbell, 210 Mo. 202.) Other courts have held this error harmless.

A narrow view presumes all errors to be prejudicial until the appellee proves them harmless. But the modern and more liberal tendency of the courts is to regard all errors as harmless until the appellant affirmatively proves them prejudicial. It is doubtful if the situation of the famous case of Hopt v. Utah could now be repeated. Hopt committed a murder in the territory of Utah and was sentenced by the local court to be hanged. On appeal to the U.S. Supreme Court, the conviction was reversed because of a procedural error. Twice more the murderer was convicted and twice more the conviction was reversed on technical grounds. After the fourth trial had resulted in a conviction, the Supreme Court found the trial free from judicial error. It was seven years after the murder that Hopt finally paid the penalty for his crime. (See Hopt v. People of Utah, 104 U.S. 63; 110 U.S. 574; 114 U.S. 488; 120 U.S. 430.)

Suggested Reforms in Procedure.—In recent years many reforms have been suggested to meet the widespread criticism of appellate procedure in the United States. It is more than likely that revolutionary changes will appear in some of the States in the next few years. The procedural devices involved in perfecting an appeal could be made less complicated. More States might well abolish the distinction between the writ of error and an appeal in equity. The labour of preparing the record or case on appeal could be materially reduced. New evidence, either documentary or oral, could profitably be admitted on appeal. The whole object of appellate review should be changed from a proceeding mainly for the detection of error, to a rehearing of the cause with a view to its final disposition on its merits. Then the litigants and the community would be saved the expense of a new trial, and the pressure on the overcrowded trial courts would be relieved.

U.S. Supreme Court.—The Supreme Court of the United States, by reason of its dignity, the learning and prominence of its members, and the extent of the power it wields, is one of the world's most important tribunals. The founders of the republic foresaw that many delicate questions would arise regarding the balance of power between the States and the Federal Government. They also foresaw that disputes between States, and between citizens of different States, were inevitable. A tribunal was necessary to restrain the state legislatures and the Federal Congress from enacting statutes repugnant to the Federal Constitution. These various problems were largely judicial in nature. Accordingly the Federal Constitution provided that "the judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish." (Article III., Section 1.)

Justices of the United States Supreme Court.—The justices of the Supreme Court are appointed by the President, but his appointments must be confirmed by a two-thirds vote of the Senate. (Constitution, Article III., Section 2.) Sincere efforts are made to secure the best legal talent available. The appointments are kept singularly free from political considerations. While Chief Justice Taft was president, he appointed six justices, of whom three were Republicans and three Democrats. Of the five justices appointed by President Lincoln, only two were from his own party. A notable exception to this tendency was the case of President Jackson, who appointed five justices, all of whom were members of his party. Likewise the justices of the Supreme Court have been successful in excluding political considerations from their decisions. Many instances may be found where justices have held unconstitutional statutes sponsored by their own party. In one case, a justice voted to hold unconstitutional a bill which he as a cabinet officer had vigorously favoured. The justices of the Supreme Court hold office for life or during good behaviour. (U.S. Constitution, Article II., Section 1.) This is contrary to the situation in many States where judges are elected for comparatively short periods by popular vote. The security which each justice of the Supreme Court feels in his term of office is an important factor in inducing his freedom from political control.

Many States provide for the compulsory retirement of judges upon reaching a certain age. In New York judges must retire at the age of 70, often at the time when they are capable of rendering their greatest service to the community. (N.Y. Constitution, Article VI., Section 12.) Since the Federal Constitution provides that the justices of the Supreme Court shall hold office during good behaviour, an attempt by Congress to force compulsory retirement would be unconstitutional. But Congress in 1867 provided for voluntary retirement with full compensation

when the age of 70 is reached. (16 Statutes at Large, 45.) Ten justices have availed themselves of this provision.

A justice of the Supreme Court is removable only upon impeachment. The proceedings consist of a formal trial before the U 5. Senate, and a two-thirds vote is required for conviction. In the 140 years of the Supreme Court's existence, impeachment proceedings have been brought against only one justice, and his trial resulted in an acquittal.

During the first 100 years of the Supreme Court's existence each justice was required to preside over the local Federal courts. As the country developed westward, and as the amount of Federal litigation increased, this duty became more and more onerous. This system forced the justices to spend a disproportionate amount of their time in travel to the consequent neglect of their main function at Washington. Agitation against this practice of circuit riding finally resulted in its abandonment in 1891. At that time nine intermediate appellate courts known as the "Circuit Courts of Appeals" were established to hear appeals from the local district courts. (26 Statutes at Large, 826.)

Jurisdiction of the Supreme Court.—The Supreme Court hears cases on appeal from the final courts of the State and from the Federal courts. But it is not every case which may be appealed to the Supreme Court. As most of the State courts have difficulty in keeping up with their dockets, it is obvious that drastic limitations are necessary to prevent the one tribunal which hears cases from the entire country from being overwhelmed with litigation. The first limitation is imposed by the Federal Constitution. Article III., Section 2, provides that "the Supreme Court shall have appellate jurisdiction, both as to law and fact, with such exceptions, and under such regulations as the Congress shall make." This has been interpreted to mean that the Supreme Court has no appellate jurisdiction unless and until it is specifically granted by Congress. Jurisdiction has been granted by various acts of Congress. The Supreme Court hears appeals from (1) the State courts of last resort, (2) the Federal district courts, and (3) the Federal circuit courts of appeals and other special Federal courts such as the Court of Claims and the Court of Customs Appeals.

Appeals from State Courts.—The Supreme Court hears no appeals from State courts unless a Federal question is involved. Such is the case when there is involved: (1) the validity of a treaty or statute of the United States (2) the repugnancy of a State statute to the Federal Constitution or (3) "when any title, right, privilege or immunity specially set up by a party under the Constitution, or any treaty or statute of, or commission held or authority exercised under, the United States." Appeals are matters of right to the litigant in two situations only: (1) when a State court has held a treaty or statute of the United States invalid and (2) when, on the question of the repugnancy of a State statute to the Federal Constitution, the statute was held valid by the State court. In all other cases, which must be brought by petition for a writ of certiorari, the Supreme Court, may, in its discretion, refuse to hear the cause. (U.S. Code, Title 28, Section 344.)

Appeals from District Courts.—In 1925 the jurisdiction of the Supreme Court over appeals from the Federal district courts was greatly restricted. This jurisdiction is now limited to five narrow classes of cases arising under five Federal statutes. (U.S. Code, Title 28, Section 238.)

Appeals from the Circuit Courts of Appeals.—Likewise in 1925, appeal to the Supreme Court from the Circuit Courts of Appeals as a matter of right was limited to one situation only; when the Circuit Court of Appeals has held a State statute invalid as repugnant to the Federal Constitution. But a litigant may petition the Supreme Court for a writ of certiorari by which the cause will be removed from the Circuit Court of Appeals to the Supreme Court. A review on writ of certiorari is not a matter of right, but lies within the sound judicial discretion of the court. (U.S. Code, Title 28, Section 347.)

The tendency of recent years has been toward a decided reduction in the number of cases which can be appealed as a matter of right to the Supreme Court with a corresponding increase in its discretionary jurisdiction. As a result the number of appeals docketed now closely approximates the working capacity of the court. For the first time in years the court during its 1927 term was able to reach in course cases docketed for that term.

Constitutional Questions.—Problems of the greatest importance confront the Supreme Court when constitutional questions are raised. The exercise of the power to hold State or Federal statutes unconstitutional may profoundly affect the entire social structure. It has been the exercise or non-exercise of this power which has at times subjected the court to public criticism. This criticism becomes especially severe when the court holds a statute unconstitutional by a majority of only one vote as in the income tax case. (Pollock *v.* Farmers' Loan and Trust Co., 1j8 U.S. 601.) These five to four decisions have caused some agitation to require a vote by a majority larger than one to hold a statute unconstitutional. Ohio in its State Constitution provides that its supreme court shall hold no law unconstitutional if more than one judge dissents. (Article IV., Section 2. See Jones v. Zangerle, 159 N.E. 564.) The legislatures of Nebraska and North Dakota have adopted similar provisions, but similar legislation restricting the power of the Supreme Court of the United States has failed of adoption.

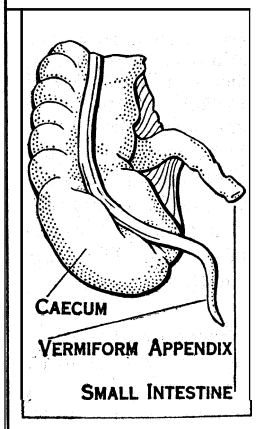
APPEARANCE, in law, the coming into court of either of the parties to a suit; the formal act by which a defendant submits himself to the jurisdiction of the court. (See PRACTICE AND PROCEDURE.)

APPENDICITIS, inflammation of that part of the intestine known as the "appendix." It has no single cause. Frequently its origin is quite obscure, but the starting point may be the impaction of a pin, shot-corn, tooth-brush bristle, or a fish-bone in the appendix. In many cases a patch of mortification with perforation of the appendix is caused by the presence of a hard faecal concretion, or "stercolith," which from its size, shape and appearance has been mistaken by a casual observer for a date-stone or cherry-stone. The condition is more often met with in the young than the old, and in boys rather than girls; and in some families there is a strange predisposition towards it. Inflammation started in the appendix is liable to spread to the peritoneum, and herein lie the gravity of the affection and the indication for treatment. The symptoms vary from "indigestion," and slight pain and sickness, which pass off in a few short days, to an exceedingly violent illness, which may cause death in a few hours. Pain is usually first felt in the belly, low down on the right side or across the region of the navel; sometimes, however, it is diffuse, and at other times it is scarcely complained of. There is some fever, the temperature rising to 101° or 102° F., with nausea, and very likely with vomiting. The abdomen is tender to pressure, and the tenderness may be referred to the spot mentioned above. Some swelling may also be made out in that region. The attack may last for two, three or four days, and then subside. There are, however, other cases less well defined, in which the mischief pursues a latent course, producing little more than a vague abdominal uneasiness, until it suddenly advances into a violent stage. In some chronic cases the trouble continues, on and off, for months or even for years.



THE LARGE INTESTINE, SHOWING POSITION OF THE VERMIFORM APPENDIX WHOSE INFLAMMATION IS TERMED APPENDICITIS

Many valuable lives are needlessly lost from appendicitis every year, chiefly due to ignorance and delay in diagnosis and treat-

ment. The significance of abdominal pain, especially in children, is not sufficiently recognized by the public. Time is wasted on purgatives and sedatives, both of which do much harm, for the former precipitate perforation and hasten the spread of the disease; and the latter, by relieving pain, mask the symptoms and often lead to fatal delay in treatment. No one can tell whether an attack is going to subside under medical treatment or proceed with great rapidity to a fatal issue. The risk of immediate operation is practically negligible, whereas that of waiting is great and uncertain. The experience of surgeons all over the world shows that there is practically no mortality from operations for appendicitis undertaken within 12 or even 24 hours of the onset of the attack, whereas the death-rate for operations delayed until the third or fourth day is about 10%.

Palliative Treatment. — When symptoms suggestive of acute appendicitis develop it is of vital importance to put the patient to bed and give him nothing but water until the diagnosis has been made and an operation can be performed. When, for some reason, an operation cannot be performed, complete rest and careful diet must be continued until the attack has subsided. Only liquids are given by the mouth, and purgatives and sedatives are entirely avoided; but local sedatives may be applied to the abdomen.

Operation. — It is a common mistake that the patient needs elaborate preparation for an operation for appendicitis, but fortunately this is not the case, and the rapid progress of an acute attack will not allow of it. A valvular incision, which should leave no weakness of the abdominal wall, is made over the site of the appendix; the latter is removed and the wound completely closed except in late cases, when abscess or peritonitis has developed, in which temporary drainage may be necessary. In very late grave cases with abscess formation, the surgeon has sometimes to be content with mere drainage, deferring the removal of the appendix to a later date. Appendicitis usually recurs with increasing frequency and severity, therefore it is generally agreed that when an attack has subsided it is wise to remove the appendix soon, in a quiet interval, in order to prevent the recurrence of a grave or fatal attack. It is, however, a foolish policy to defer operation when an opportunity offers of having it performed early in an attack.

APPENDICULATA, a zoological name introduced by E. Ray Lankester, and employed to denote the large group of animals comprising the Annelida, Arthropoda and Rotifera: all animals composed of a larger or smaller number of hollow rings, each ring possessing typically a pair of hollow lateral appendages, moved by intrinsic muscles and penetrated by blood-spaces. The group is also sometimes called the Annulata, but both terms are now obsolete.

APPENZELL, a canton of north-east Switzerland, entirely surrounded by that of St. Gall; both were formed out of the dominions of the prince abbots of St. Gall, whence the name Appenzell (abbatis *cella*). It belongs to the limestone zone on the north side of the main alpine lines. The culminating point is Santis, 8,216ft., in the south of the canton. It is watered mainly by two streams that descend from Santis, the Sitter and its tributary the Urnäsch. By the middle of the 11th century the abbots of St. Gall had established their power in the land later called Appenzell. But as early as 1377, this portion of the abbots' domains formed an alliance with the Swabian free imperial cities and adopted a constitution of its own. In 1411 Appenzell was placed under the "protection" of the Swiss Confederation, of which it became a member in 1513. Religious differences broke up the land after the Reformation into two portions. each called *Rhoden,* a term said to mean a "clearing." From 1798 to 1803 Appenzell, with the other domains of the abbot of St. Gall, was formed into the canton Santis of the Helvetic Republic, but in 1803, on the creation of the new canton of St. Gall, shrank back within its former boundaries.

The north and west portion (or *Ausser Rhoden*) has a total area of 94 sq.mi., with a population (1941 census) of 44,710, mainly German-speaking Protestants. Its political capital is Trogen, though the largest town is Herisau (1941, 12,737). Ausser Rhoden is divided into three administrative districts, comprising 20 communes, and manufactures cotton goods, muslins and embroidery. It sends one member (elected by the *Landsgemeinde*) to the federal *Ständerat* and three to the federal Nationalrat (elected by a direct popular vote).

The south or more mountainous portion of Appenzell (*Inner Rhoden*), has a total area of 67 sq.mi., with a population (1941 census) of 13,388, practically all German-speaking Roman Catholics. Its political capital is Appenzell (*q.v.*). It is largely pastoral with numerous summer pastures (see ALP). Inner Rhoden is extremely conservative, and has the reputation of always rejecting any federal *Referendum.* For similar reasons it has preserved many old customs and costumes. It sends one member (named by the Landsgemeinde) to the federal *Ständerat,* and one to the federal Nationalrat, while it forms but a single administrative district, though divided into six communes.

BY COURTESY OF THE SWISS FEDERAL R R.

A GIRL OF APPENZELL DRESSED IN FESTIVAL COSTUME

To the outer world the canton of Appenzell is best known by its institution of *Landsgemeinden,* or primitive democratic assemblies held in the open air. This institution is of immemorial antiquity, and the meetings in both portions are always held on the last Sunday in April. The Landsgemeinde is the supreme legislative authority. Various old-fashioned ceremonies are observed at the meetings and each member appears with his girded sword. The existing constitution of Inner Rhoden dates mainly from 1872, and that of Ausser Rhoden from 1876. The meeting for Inner Rhoden is held at Appenzell, that for Ausser Rhoden alternately at Hundwil (near Herisau) and at Trogen.

Raumberger, *"Juhu-Juuhu"—Appenzellerland und Appenzellerleut* (Einsiedeln, 1903); J. J. Tobler and A. Struby, *Die Alpwirthschaft im Knnt. App. Ausser Rhoden* (Soleure, 1900); W. Kobelt, *Die Alpwirthschaft im Kant. App. Inner Rhoden* (Soleure, 1899).

APPENZELL, political capital of the Inner Rhoden half of the Swiss canton of Appenzell, in a smiling green hollow on the left bank of the Sitter, formed by union of mountain torrents from the Säntis; by light railways 12½ mi. from St. Gall past Gais or 20½ mi. past Herisau. Pop. 4,893, mostly German-speaking Roman Catholics. It has a stately modern church (attached to a Gothic choir), a small but very ancient chapel of the abbots of St. Gall (whose summer residence was this village), and two Capuchin convents (one for men, founded in 1588, and one for women, founded in 1613). Among the archives, kept in the sacristy of the church, are banners captured by Appenzellers, among them one taken in 1406 at Imst, near Landeck, with the inscription Hundert *Teufel.* In the principal square the Landsgemeinde (or cantonal democratic assembly) is held on the last Sunday in April. Pastoral occupation and embroidery work employ the people. 2½ mi. by road and rail south-east of Appenzell is Weissbad, a goat's whey cure establishment, while 1½ hours above it is the quaint little chapel of Wildkirchli, built (1648) in a rock cavern, on the way to the Santis.

APPERCEPTION, in psychology, a term used to describe the presentation of an object, on which attention is fixed, in relation to the previous experiences of the mind as a whole. The word was first used by Leibniz, practically in the sense of the modern Attention (*q.v.*), by which an object is apprehended as "not-self" and yet in relation to the self. In Kantian terminology apperception is (1) *transcendental*—the perception of an object as

involving the consciousness of the pure self as subject, and (2) empirical—the cognition of the self in its concrete existence. In (1) apperception is almost equivalent to self-consciousness; the existence of the ego may be more or less prominent, but it is always involved. According to J. F. Herbart (*q.v.*) apperception is that process by which an aggregate or "mass" of presentations becomes systematized by the accretion of new elements, either sense-given or supplied by the inner workings of the mind. He thus emphasizes in apperception the connection with self as the result of all its previous experience. Hence in education the teacher should fully acquaint himself with the mental development of the pupil, in order that he may make full use of what the pupil already knows.

Apperception is thus a general term for all mental processes in which a presentation is brought into connection with already existent and systematized ideas, and is thus classified, explained, or, in a word, understood. Thus a new scientific phenomenon is usually assimilated to other phenomena already analysed and classified. The whole intelligent life of man is, consciously or unconsciously, a process of apperception, inasmuch as every act of attention involves the appercipient process.

See K. Lange, Ueber Apperception (6th ed. rev. Leipzig, 1899), trans. E. E. Brown (Boston, 1893); G. F. Stout, Analytic Psychology, bk. ii. ch. viii. 1st ed. (1896), later ed. (1902); E. N. MacQueen, The Distribution of Attention (1917).

APPERLEY, CHARLES JAMES (1777–1843), English sportsman and sporting writer, better known as "Nimrod," the pseudonym under which he published his works on the chase and the turf. The most important of his works are: Remarks on *the* Condition of *Hunters,* the *Choice* of Horses, etc. (1831); The *Chase,* the *Turf* and the Road (originally written for the *Quarterly* Review) (1837); Memoirs of the Life of the Late *John Mytton* (1837); Nimrod's Northern Tour (1838); Nimrod Abroad (1842); *The* Horse and the *Hound* (a reprint from the 7th edition of *The* Encyclopedia Britannica) (1842); Hunting Reminiscences (1843).

APPERT, FRANÇOIS (d. 1840), French inventor, discovered the method of preserving food by enclosing it in hermetically sealed tins, and wrote a book entitled Art de conserver *les* substances *animales* et *végétales.*

APPETITE, an emotion of distinctive conscious quality, accompanying the anticipation, acquisition and assimilation of food or other objects of desire. Physiologists have shown that the conscious experience of appetite is quite different from hunger, both with respect to the sensations involved and also with respect to the mechanisms involved in the genesis of the sensations (see HUNGER). A psychological view of appetite maintains that it is one of the two basic, compound emotions, the other being love. Appetite emotion is said to have two parts, or aspects: desire, or active appetite emotion; and satisfaction, or passive appetite emotion (see EMOTIONS, ANALYSIS OF). Desire consists of compliance with hunger pangs, and dominant drive for food. Satisfaction consists of successful dominance over hunger pangs, made possible by simultaneous compliance with the food eaten. Hunger pangs are regarded as the inherent stimulus mechanism which compels the brain and body to act in a certain way, and so build up the psychoneural pattern of appetite emotion in the brain centres. Once appetite emotion is learned, it is felt toward money, clothes and material possessions of all sorts.

See A. J. Carlson, The Control of Hunger in Health and Disease; W. M. Marston, Emotions of *Normal* People.

ABPIA, VIA, a high road from Rome to Campania and lower Italy, constructed 312 B.C. by the censor Appius Claudius Caecus. It first ran only to Capua (132m.) but was prolonged to Beneventum, Venusia, Tarentum and Brundisium, probably reaching the last-named place by 244 B.C. The original road was no doubt only gravelled (glarea strata); in 298 B.C. a footpath was laid saxo *quadrato* from the Porta Capena of Rome to the temple of Mars, about 1m. from the gate. Three years later, however, the whole road was paved with *silex,* from the temple to Bovillae, and in 191 B.C. the first mile from the gate to the temple was similarly treated. The first few miles are flanked by tombs, etc. (See L. Canina, *Via* Appia, Rome, 1853.) To Terracina it was almost straight, with steep gradients in the Alban hills. Aricia still has one of its fine embankments. At Forum Appii it entered the Pomptine marshes; that this portion (19m. long, hence called Decennovium) belonged to the original road was proved by the discovery at Ad Medias (Mesa) of a milestone of about 250 B.C. A still older road ran along the foot of the Volscian mountains, past Cora, Norba and Setia; this served as the post road until the end of the 18th century. At the time of Strabo and Horace, however, it was the practice to travel by canal from Forum Appii to Lucus Feroniae; Nerva and Trajan paved the road and repaired the bridges in this section. Theodoric in A.D. 486 made similar repairs, but in the middle ages it was impassable and was only renewed by Pius VI. The older road crossed the back of the hill at the foot of which Terracina stands. Beyond Fundi it passed through the mountains to Formiae, thence by Minturnae and Sinuessa (towns of the Aurunci which had been conquered in 314 B.C.) to Capua.

Between Capua and Beneventum (32m.) the road passed near the defile of Caudium. (See CAUDINE FORKS.) The modern high road follows the ancient line, and three well-preserved bridges still serve it. The part from Rome to Beneventum is described by Sir R. Colt Hoare, Classical *Tour* through Italy, p. 57 seq. (London, 1819). (See T. Ashby's *Mélanges* de *l'École Française* de Rome [1903], p. 375 seq.) From Beneventum to Brundisium by the Via Appia, through Venusia and Tarentum, was 202m. Hardly any traces of the ancient road are now to be seen. A shorter route, more fitted for mule traffic, though Horace drove along part of it,[1] ran by Aequum Tuticum, Aecae, Herdoniae, Canusium, Barium and Gnatia; it was made into a main road by Trajan, and took the name Via Traiana. There are important remains of bridges along it. (See T. Ashby and R. Gardner, Papers, British School, Rome viii. [1916], 104 seq.) The original road between Beneventum and Aeclanum (15m.) was restored by Hadrian. Under Diocletian and Maximian a road (the Via Herculia) was made from Aequum Tuticum to Pons Aufidi near Venusia, where it crossed the Via Appia and went on into Lucania, through Potentia and Grumentum, to join the Via Popilia near Nerulum. Though it must have lost much of its importance through the construction of the Via Traiana, the last portion from Tarentum to Brundisium was restored by Constantine about A.D. 315.

The Via Appia was the most famous of Roman roads; Statius calls it *longarum* regina *viarum,* the queen of long-distance roads. It was administered under the empire by a curator of praetorian rank, as were the other important roads of Italy. Milestones and other inscriptions about its repair are known.

APPIAN of Alexandria (Gr. *Ἀππιανός*), Roman historian, flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. He tells us that, after having filled the chief offices in his native place, he repaired to Rome, where he practised as an advocate. When advanced in years he obtained, by the good offices of his friend Fronto, the dignity of imperial procurator—it is supposed in Egypt. His work (*Ῥωμαικά*) in 24 books, written in Greek, is rather a number of monographs than a connected history. It gives an account of various people and countries from the earliest times down to their incorporation into the Roman empire. Besides a preface, there are extant 11 complete books and considerable fragments. In spite of its unattractive style, the work is very valuable, especially for the period of the civil wars.

Editio princeps, 1551; Schweighäuser, 1785; Bekker, 1852; Mendelssohn, 1878–1905. English translations: by W. B., 1578 (black letter); J. D[avies], 1679; H. White, 1899 (Bohn's Classical Library); bk. i. ed. by J. L. Strachan-Davidson, 1902.

APPIANI, ANDREA (1754–1817), the best fresco painter of his age, was born at Milan. He was made pensioned artist to the kingdom of Italy by Napoleon, but lost his allowance after the events of 1814 and fell into poverty. His best pieces, which are in the church of Santa Maria presso San Celso and the

[1] From Beneventum he followed the Via Appia to Aeclanium: thence, leaving the main road, he went to the left to Auscdlum ("quod versu dicere non est," *i.e.,* which will not go into a hexameter), the mod Ascoli Satriano, by a by-road, later called Via Aurelia Aeclanensis, and on to Herdoniae, where he joined the line of the later Via Traiana.

royal palace at Milan, almost rival those of his great master Correggio. He is known as "the elder," to distinguish him from his great-nephew Andrea Appiani (1817–65), an historical painter at Rome. Other painters of the same name were Niccolo Appiani (c. 1510) and Francesco Appiani (1704–1792).

APPIN, coast district, Argyllshire, Scotland, bounded west by Loch Linnhe, south by Loch Creran, east by Benderloch and Lorne districts, and north by Loch Leven. It measures 14 mi. N.E.—S.W. by 7 mi. in breadth. The coast is beautiful, and inland the country is rugged and mountainous. The streams Coe and Laroch flow into Loch Leven, Duror and Salachan into Loch Linnhe, and Iola and Creran into Loch Creran. The leading industry is slate and granite quarrying. Ballachulish, Duror and Appin are the principal villages. Ballachulish and Port Appin are ports of call for steamers, and the L.M.S. branch line from Connel Ferry to Ballachulish runs through the coast land. Appin was the country of a branch of the Stewarts.

APPLAUSE, the expression of approval by clapping of hands, or otherwise. Among civilized nations applause has been subject to certain conventions. The Romans had a set ritual of applause for public performances, expressing degrees of approval: snapping the finger and thumb, clapping with the flat or hollow palm, waving the flap of the toga, or a handkerchief. At the close of the play, the chief actor called out "Valete et plaudite!" and the audience chanted their applause. This was often organized and paid for. When Christianity became fashionable the customs of the theatre were transferred to the churches. Paul of Samosata encouraged the congregation to applaud his preaching by waving linen cloths. Applause of the rhetoric of popular preachers became an established custom destined to disappear under the influence of a more reverent spirit. The institution of the claque, people hired by performers to applaud them, discredited the custom, and indiscriminate applause has been felt as an intolerable interruption to serious performances.

APPLE, the domesticated form of *Malus* pumila with possible admixture of other Malus species, members of the pomoideae division of the family Rosaceae. It is the most widely cultivated and best known tree fruit of temperate climates.

The apple thrives in favourable localities and sites from approximately 30° to 60° latitude both north and south of the equator. It may be grown to a limited extent, but not very successfully, at high elevations closer to the equator than 30° north or south, but since it requires a considerable period of dormancy (generally a total of at least 1,200 hours per year under 45° F. or 7° C.) culture in areas lacking a distinct winter period is unsuccessful. Northward, culture is limited by low winter temperatures and shortness of the growing season. Temperatures of −40° F. will seriously injure or kill trees of most varieties. A period of approximately 100 days free of killing frost is required for even the hardiest, early maturing varieties to develop a crop.

History.—*Malus* pumila, the species from which cultivated varieties are mainly derived, is native in southeastern Europe and southwestern Asia. These apples were undoubtedly used for food by the earliest inhabitants, and improved selections had been made and varieties were recognized in Europe more than 2,000 years ago. Cato (3rd century B.C.) recognized seven different apple varieties. Apples were carried by the Romans throughout much of Europe, including Britain, and may in fact have been in many parts even earlier. Hundreds of varieties were recognized in Europe prior to the settlement of the Americas.

The earliest settlers in the new world took with them both seed and propagating wood of the better European varieties, and apple culture thus spread in those parts of America, where the fruit was adapted as rapidly as settlement occurred. The apple was also carried eastward into India, China and Japan long ago.

Sites for Apple Orchards.—Apples thrive best in a moderately deep, well-drained soil. It is important that the orchard be located so that the hazard of spring frosts and, in cold districts, unusually low winter temperatures, be avoided. For this reason, many of the important apple areas are located on the windward side of large bodies of water, or on the foothills of mountain ranges, and particularly to the south and east of mountain ranges which tend to give protection from cold north to northwest winds.

COURTESY OF THE BUREAU OF PLANT INDUSTRY, U.S. DEPARTMENT OF AGRICULTURE

PICKING APPLES IN A WESTERN U.S. ORCHARD. PICKING CONTAINERS ARE METAL WITH CANVAS BOTTOMS WHICH PERMIT EMPTYING WITH MINIMUM BRUISING OF FRUIT

Diseases and Insect Pests.—In all parts of the world, extensive spraying is required to produce high quality fruits free of blemishes caused by diseases and insect pests. The most serious insect pest in most parts of the world is the codling moth (*Carpocapsa* pomonella), the common apple worm. This insect causes loss wherever apples are grown. Spraying with arsenate of lead from once or twice in very cool districts to as high as 8 to 10 times in certain warm, dry. districts may be necessary to protect the fruit. Other serious insect pests include San Jose scale (*Aspidiotus perniciosus*) and several other scale insects, rosy aphis (*Anuraphis roseus*), woolly aphis, various species of mites or so-called red spiders, and a number of less important insect species. The most serious and widespread disease is apple scab (Venturia *inaequalis*) caused by a fungus that attacks the leaves and fruit; it is mainly controlled by spraying with various forms of sulphur. Various canker diseases affect apples in many parts of the world. Cedar rust (*Gymnosporangium juniperi-virginianae*) and bitter rot (Glomerella cingulata) are additional important apple diseases in parts of the United States. Brown rot (*Sclerotinia* fructigena) of apples is a serious disease in England and on the continent of Europe.

Characteristics of Production in Various Parts of the World.—Europe.—Central Europe, including France, Germany. Switzerland, northern Italy and the northern Balkan countries, is a region of heavy production, but with relatively few areas where intensive production practices are followed. Most of the trees are on land used for livestock pasture, and management is based mainly on pasture requirement rather than on the needs of the trees. Most of the orchards are unsprayed, and the fruit produced is seriously blemished by insects and diseases. Much of it is used for cider making, particularly in France. For the region as a whole, apples are largely consumed in the area where grown. A few districts have more intensive production practices, and pack and ship fruit out of the local area. The most important of these districts are in Switzerland, in the territory of Trentino (Tirol), Italy, and in the Danube basin in Yugoslavia. Rumania and Hungary. Extensive apple planting, with good quality varieties, is carried on in the Ukraine and North Caucasus regions of the U.S.S.R.

In England, Kent is by far the most important apple producing county. Great Britain as a whole produces less than half the apples it consumes. Belgium and the Netherlands produce some apples for export, although apples are also imported, particularly in late winter. For Europe as a whole, a large proportion of the apples—almost half—are of the cider varieties, and are used for making fermented beverages. In only a few areas are intensive production practices followed, similar to those prevailing in the principal producing areas of the United States, Canada, Australia, New Zealand and Argentina.

North America.—The United States produces about one-fourth to one-third of the world's apple crop. While commercial orchards occur in 42 of the 48 states, the most important areas of production are in the valleys of the Columbia river and its tributaries in Washington, Oregon and Idaho, in the areas lying south or east of the Great Lakes, in Michigan, Ohio, Pennsylvania and New York, and in the foothills of the Appalachian mountains, and adjacent valleys from Massachusetts southwestward to North Carolina, particularly in Pennsylvania, West Virginia and Virginia. Other important areas are in the Ohio and Missouri river valleys and in the coastal areas of central California. Principal Canadian production is in the valleys of the Columbia river and tributaries of British Columbia, and in Ontario and Nova Scotia in the east.

Asia.—Japan and Korea developed considerable apple production in the 20th century, all being used in those countries. No data are available on production in China and India, though production in certain areas reaches appreciable proportions.

Southern Hemisphere.—Important apple production occurs in Australia, New Zealand, Argentina and Chile, these countries exporting considerable quantities to northern markets, particularly Great Britain. The crop is harvested mainly in March and reaches northern markets when local supplies are largely exhausted. Principal production in Australia is in the southeastern provinces of Tasmania and Victoria. In Argentina, principal production is in the Rio Negro valley and on delta lands adjacent to Buenos Aires. The main apple production of Chile is near Santiago.

Varieties.—Apple varieties are all vegetatively propagated by budding or grafting. and do not reproduce true to type from seed. Most of them originated from chance seedlings possessing superior qualities. Extensive programs of breeding to develop varieties having superior qualities either in fruit or in disease resistance or hardiness of trees have been carried on especially in the United States, England, Germany, Sweden and U.S.S.R.

During the past 2,000 years, tens of thousands of seedling apples have been propagated and named as varieties throughout the apple growing countries of the world. More than 7,000 varieties have been recorded in the United States alone. Only a few of these have stood the test of time and become important in production. In any apple growing section, several varieties should be grown to provide for adequate cross-pollination of the bloom, and to provide for a succession in time of ripening. Leading varieties in some of the important apple producing countries are as follows:

United States: Western areas—Delicious, Winesap, Yellow Newtown, Rome Beauty, Jonathan, Gravenstein.
Northeastern areas—McIntosh, Baldwin, Rhode Island Greening, Northern Spy, Wealthy, Delicious.
Central Atlantic areas—York Imperial, Stayman Winesap, Winesap, Delicious, Rome Beauty, Ben Davis, Grimes Golden, Yellow Transparent.
Central states—Rome Beauty, Grimes Golden, Jonathan, Stayman Winesap, Delicious, Winesap, Ben Davis, Yellow Transparent.
Canada: British Columbia—McIntosh, Jonathan, Delicious, Wealthy, Yellow Newtown, Winesap, Rome Beauty.
Eastern Canada—Baldwin, Rhode Island Greening, Stark, Northern Spy, McIntosh, Ben Davis, Wealthy, King, Cox's Orange, Golden Russet.
Great Britain: Dessert varieties—Cox's Orange, Worcester Pearmain, Beauty of Bath, James Grieve, Blenheim, Allington Pippin, Gladstone.
Cooking varieties—Bramley Seedling, Newtown Wonder, Lane's Prince Albert, Lord Derby, Lord Grosvenor, Keswick, Bismark, Miller Seedling.
Australia: Sturmer Pippin, Scarlet Pearmain, Jonathan, Cleopatra, Cox's Orange, Rome Beauty, Dunn's Seedling, Granny Smith.
New Zealand: Sturmer Pippin, Jonathan, Delicious, Dunn's Favorite, Cox's Orange, Dougherty, Statesman, Cleopatra, London Pippin.
Italy: Kalterer Bohmer, Canada Reinette, Golden Winter Pearmain, Rosso Nobile, Gravenstein, Napoleon, White Winter Colville.
Switzerland: Boskoop, Golden Pearmain, Danzega, Kantapfel, Gravenstein.
U.S.S.R.: Extensive tests are being made of American varieties. Varieties most widely grown at present are as follows:
Crimea areas: Sinap, Sari-Sinap, Sudak-Sinap, Kara-Sinap, Kandil-Sinap, Reinette d'Orleans.
Central Asia (Turkestan): Champagner-Reinette, Golden Grim, Reinette d'Orleans, Reinette Simirenko.
Central Russia: Antonowka.
Argentina: In older orchards—Cara Sucia, Blanquita, Rayada, Mitre, Huidobro.
In young orchards—Delicious, Jonathan, King David.

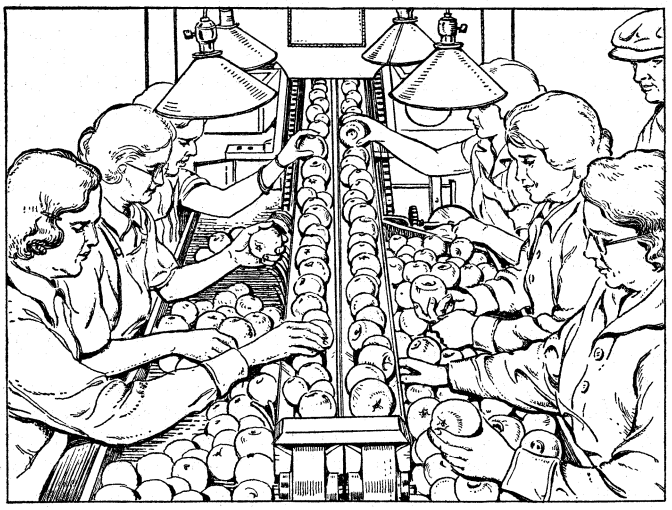
Storage and Handling.—Varieties ripening during late summer are generally of poor storage quality, and are consumed shortly after they mature. Varieties which ripen in late fall may be stored for periods ranging from six weeks to as long as nine months for the best keeping sorts handled by the best methods. For long holding, temperatures only slightly above the freezing point of the fruit (apples freeze at about 28.5° F. or −2° C.) are desirable for fruit from most sections. Thus such fruit generally holds best at temperatures of 30° to 32° F., in artificial cold storage. Fruit from some areas having a cool growing season, as in England and other similar areas, may develop breakdown if held near freezing, and holds better at 36° to 40° F. Most American apples are stored near 32° F. For home storage, apples should be kept as cool as possible, but above the point of freezing. When held at higher temperatures, apples ripen and soften rapidly, ultimately becoming mealy, and soon losing much of their characteristic flavour.

Wrapping apples in paper impregnated with mineral oil, or placing such paper in the packages in contact with the fruit, prolongs the holding season for most varieties through delaying the occurrence of a surface blackening or breakdown known as storage scald.

Utilization.—Apples are eaten fresh to a large extent, but also are adapted to a wide range of culinary uses. Apple pie, apple sauce and baked apples are favourite dishes in the United States. Apple juice (unfermented) is popular in America. Fermented juice (apple cider) utilizes an important part of European production. Apple butter and apple jelly are important both in the home and in commercial channels. Apple vinegar is another important product.

Apples are commercially canned and dehydrated to a large extent in the United States. Frozen apples are largely used in the baking and restaurant trade.

World Production.—During the decade prior to World War II, total apple production in the countries for which data were available ranged between a low of 374,000,000 bu. (1932) and a high of over 500,000,000 bu. (1937). These figures do not



COURTESY OF THE BUREAU OF PLANT INDUSTRY, U.S. DEPARTMENT OF AGRICULTURE

SORTING AND GRADING APPLES IN A MODERN PACKING HOUSE

include U.S.S.R., India and China, but do include all other important apple producing countries.

Average Annual Production of Apples in Leading Countries, 1931–37 inclusive (in bushels)

United States	161,833,000	Austria	8,668,000[2]
France—		Australia	10,261,000
cider varieties	81,282,000	England and Wales—	
dessert varieties	6,642,000	cider varieties	3,170,000
Germany	46,200,000	dessert varieties	8,461,000
Switzerland	19,034,000	Rumania	7,621,000[2]
Canada	13,427,000	Yugoslavia	5,782,000
Italy	12,712,000	Japan	5,449,000
Czechoslovakia	11,028,000	Spain	5,409,000
Poland	11,206,000[1]		

[1]Approximation. [2]Average of six years.

Countries having important apple production, but totalling less than those listed, include Argentina, Belgium, Chile, Korea, Estonia, Finland, Greece, Luxembourg, Mexico, Netherlands, New Zealand, Eire, Sweden and Norway. The U.S.S.R. has extensive apple production, estimated to be at least 50,000,000 bu. per year, though exact production figures were not available at the time of World War II. India and China also produce considerable quantities for local consumption.

(J. R. MAG.)

APPLEBY, municipal borough and county town of Westmorland, England, on the L.M.S.R. and a branch of the L.N.E.R. Pop. (1938) 1,575. It is placed in the richly-wooded valley of the Eden, flanked on the north-east by spurs of Milburn forest and Dufton and other fells, which rise to 2,600 ft. Appleby is not mentioned in any Saxon records, but after the Conquest it rose to importance as the head of the barony of Appleby which extended over the eastern portion of the present county of Westmorland. This barony formed part of the province of Carlisle granted by Henry I. to Ranulf Meschin, who erected the castle at Appleby and made it his place of residence. The castle, placed on a hill above the town, was rebuilt in the 17th century. It retains a fine Norman keep and is surrounded by a double moat, reminiscent of its position near the Border. Appleby is a borough by prescription; and the burgesses were given the customs of York by Henry II. The impoverishment caused by Scottish raids led to its decline in the later middle ages. Writers of the 16th and 17th centuries speak of it as a poor and insignificant village. The castle was held for the royalists in the civil wars by Sir Philip Musgrave, and was the residence of Anne, Countess of Pembroke, the last of the family of Clifford, which possessed great estates in this part of England. Incorporated in 1885, Appleby is a milk centre, though the principal trade is agriculture.' Area, 2.9 sq.mi.

APPLEGARTH, ROBERT (1834–1925), English trade union leader, was the son of a Sheffield quartermaster. After emigrating to the United States he returned to England and became the general secretary of the new Amalgamated Society of Carpenters and Joiners in 1862. He became the chief member of the group of officials, later called the "junta," which imposed a new structure and policy upon the British trade-union movement. Other prominent members were William Allan (engineers), Daniel Guile (ironfounders), and Edwin Coulson (bricklayers). The new unions, in direct contrast to the old, had high friendly benefits and high subscriptions, rising to one shilling a week in some cases. Almost absolute authority was granted to the central office, which was, for the first time, equipped with a regular staff, and a policy of conciliation and co-operation with the employers was pursued. In 1872, perceiving that the victory of his new principles was now assured, Applegarth resigned his office and entered business. But to the end of his very long life he retained an interest in Labour affairs and his advice was treated with great respect.

BIBLIOGRAPHY.—*See* A. W. Humphrey, *Robert Applegarth* (1913); S. and B. Webb, *History of Trade Unionism* (latest *edn.* 1920); R. W. Postgate, The *Builders' History* (1923).

APPLETON, DANIEL (1785–1849), U.S. publisher, was born Dec. 10, 1785, at Haverhill. Mass. He first sold dry goods in Haverhill. Boston and New York but a few years after he settled in New York began to import English books and to sell them in his store.

It was not long before the book trade had superseded his other merchandise altogether. and in 1831 he began to publish books, his first being *Crumbs from the Master's Table,* a small collection of religious essays. In 1838 he made his son William a partner and the firm became known as D. Appleton & Company. Appleton was a leader in the field of publication of juvenile books and of works in Spanish for sale in Latin America.

Appleton turned the business over to his son in 1848 and died in New York city, March 27, 1849.

APPLETON, NATHAN (1779–1861), American merchant and politician, was born in New Ipswich (N.H.), Oct. 6, 1779. He was educated in the New Ipswich academy, and in 1794 entered mercantile life in Boston, in the employment of his brother. Samuel (1766–1853), a successful and benevolent man of business, with whom he was in partnership from 1800 to 1809. He co-operated with Francis C. Lowell and others in introducing the powerloom and the manufacture of cotton on a large scale into the United States, a factory being established at Waltham (Mass.) in 1814, and another in 1822 at Lowell (Mass.), of which city he was one of the founders. He was a member of the general court of Massachusetts in 1816, 1821, 1822, 1824 and 1827, and in 1831–33 and 1842 of the national House of Representatives, in which he was prominent as an advocate of protective duties. He died in Boston, July 14, 1861.

His son, THOMAS GOLD APPLETON (1812–1884), who graduated at Harvard in 1831, had some reputation as a writer, an artist and a patron of the fine arts, but was better known for his witticisms, one of which, the oft-quoted "Good Americans, when they die, go to Paris," is sometimes attributed to Oliver Wendell Holmes. He published some poems, and, in prose, *Nile Journal* (1876), *Syrian Sunshine* (1877), *Windfalls* (1878), and *Chequer-Work* (1879).

See memoir of Nathan Appleton by R. C. Winthrop (1861); Susan Hale's *Life and Letters of Thomas Gold Appleton* (1885).

APPLETON, a city of Wisconsin, U.S.A., on the lower Fox river, about 90 mi. N.W. of Milwaukee, near Lake Winnebago, the largest and one of the most beautiful lakes of the state; the county seat of Outagamie county. It is on Federal highway 41, and is served by the Chicago and North Western, the Chicago, Milwaukee and St. Paul and the Soo Line railways; and by steamboats on the river, connecting with lake steamers at Green Bay.

The population was 25,267 in 1930 and 28,436 in 1940 by federal census.

The city is attractively laid out on high bluffs above the river. It is the centre of a rich livestock and dairy section, and has large paper mills and other factories, utilizing power developed from the Fox river.

Lawrence college (chartered 1847) occupies a campus of 6 ac. in the heart of the city. The college was founded in 1846 by a gift of $10,000 from Amos Adams Lawrence (1814–86), a merchant of Boston, to the local conference of the Methodist Episcopal Church, and was opened in 1849. In 1940–41 the enrolment was 673.

Appleton was settled in 1833 and incorporated as a village in 1853. The villages of Grand Chute and Lawesburg were consolidated with it to form a city, which was chartered in 1857. Appleton also, like the college, was named after a Boston merchant, Samuel Appleton, who owned part of the original town plot and contributed generously to the college library.

APPLIED MECHANICS: *see* POWER TRANSMISSION.

APPLIED PSYCHOLOGY is that branch of technical service in which the facts and methods of the science of psychology are applied to the practical affairs of life. Its boundary lines are vague because it merges imperceptibly into the realm of the pure science of psychology, and especially because the range of possible and actual applications is so extensive. In fact, just as everyone considers himself somewhat of a psychologist, so everyone considers himself somewhat of an applied psychologist. For these reasons applied psychology has suffered probably more than other applied sciences from the practices of pretenders and charlatans. The popular conception formed from these contacts is liable to be cheap and erroneous.

History of Applied **Psychology.**—The very beginnings of applied psychology are discoverable in the work of Charles Dar-

win, who, in the realm of organic life, sought out variations from individual to individual and from species to species, and emphasized the importance of these variations. Francis Galton extended the search for variation into the realm of mental life *(Inquiries into Human Faculty,* 1883), and found individual differences as interesting and as significant as those found by Darwin in physical forms and behaviour. The earliest differences pointed out by Galton had some practical bearing, although it remained for Cattell, Binet and their followers to seek and measure differences in human traits which have a more immediate practical application, such as the differences in intelligence, reaction time, judgment, etc.

The first clearly formed applications of psychology arose with the recognition that differences among individuals and among groups meant differences in adjustment to situations in everyday life. and that improvements in adjustment must come either through a control of environmental influences or through a modification of the individual or the group. Experimental laboratory methods were applied directly to the measurement of the sensory capacities, memory, attention and fatigue of school children in the field of education. As the inadequacies and limitations of these purely scientific procedures revealed themselves in the practical setting, methods were devised to meet practical needs more directly. Foremost among the pioneers were Binet and Simon, who developed tests for the measurement of intelligence by departing from traditional laboratory technique and building tests out of the experiences of the everyday life of the child *(The Development of Intelligence in Children,* 1905); and Cattell, who originated the order of merit method for the measurement of mental products (*The Psychological Researches of James McKeen Cattell,* 1914). Credit should be given also to the so-called efficiency engineers who analysed industrial tasks and measured the efficiency of different individuals to perform them. They have contributed largely to the development of applied psychology by their attitude toward practical problems.

The **Rôle of** Measurement **in** Applied Psychology. — The most outstanding characteristic of applied psychology is the part played by measurement, which takes two forms: (1) The tests or instruments for the measurement of individual, group, class, sex and race differences in capacity and achievement. (2) Statistical methods needed for the standardization and validation of the tests and for the analysis and synthesis of the variable products yielded by the tests. The construction of tests has become a highly technical task, and their proper administration and interpretation require special psychological training. The statistical methods of treating biological data have been modified and developed *(see* the works of Karl Pearson, Charles Spearman and T. L. Kelley) to meet the special requirements for the measurement of general tendencies of behaviour and their inter-relationships.

Divisions of Applied **Psychology.**—Certain arbitrary, but well-recognized divisions of the field of applied psychology have developed through the demands of practical life and through the expression of interests of investigators. This classification is neither logical nor complete, and will be reconstructed and expanded as the number of applied psychologists increases and as research data accumulate. The major divisions are *Educational Psychology, Vocational Psychology, Industrial Psychology, Business Psychology, Legal Psychology* and *Medical Psychology.* In addition to these there are other less well defined or less active divisions, such as the psychology of religion and the psychology of aesthetics. Then, there are the more highly specialized fields which do not readily fall into any of the above major or minor classes, such as the psychology of music, the psychology of athletics, the psychology of play, military psychology, the psychology of the deaf, the blind and the otherwise handicapped. Finally, there are innumerable special psychological problems growing out of the daily life of the individual which have significance for his success, and warrant systematic investigation, such as the psychology of suggestion, of morale, of automobile and aeroplane accidents, and the psychological effects of drugs and stimulants. The characteristics of the major divisions will be indicated.

Educational Psychology. — The field of education represents the first practical activity in which psychology was systematically applied. So numerous and important have these applications become that "the act of teaching is now generally recognized to be based primarily upon the science of psychology." It forced attention upon the individual as the unit for instruction, and impelled educators to adapt their methods of teaching to suit him. Furthermore, it brought about the analysis of such school subjects as arithmetic into a large number of simple processes and operations, each of which must be cared for in the programme of instruction.

Along with this recognition of the individual, there goes the need for facilitating his progress and for measuring the rate of his progress. The facts of learning especially are constantly being canvassed for means of improving the conditions for learning, and elaborate test instruments are being devised for the measurement of pupils' achievement. Such facts as distribution of learning time, amount to be learned at a given time, the use of recitations, and other aids to learning are known to every teacher. Almost as widespread is the use of the various handwriting, composition, drawing and other scales for measuring accomplishment of school children. *(See* EDUCATION: *Psychology and Ancillary Sciences.)*

Vocational Psychology is concerned with the selection and guidance of individuals with respect to the vocation for which they are best fitted. Guidance and selection, to be adequately administered, require the analysis of the various occupations to determine the qualities that are needed for success in them, and the construction of measuring instruments to test for the presence of these qualities in the individual. The greatest progress has been made in the direction of finding the amount of intelligence that is required for various vocations, and in measuring the degree of intelligence that a person possesses. It is possible at present to estimate with some assurance the minimum of intelligence required for success in college work, for success in the professions, and for success in some of the skilled and unskilled trades. Satisfactory tests have also been devised for more highly specialized capacities, such as musical ability, motor skills and executive ability. The measurement of the traits of character and temperament which are recognized to play a vital part in success in life offers more serious difficulties than the measurement of the intellectual traits, and little can be done for practical guidance in these respects at present. In a somewhat similar state is the effort to measure interest, although some progress is being made through the simple listing of interests in specific situations, and then weighing them empirically according to their prognostic value for a given vocation.

Vocational psychology should be credited with the demonstration of the inadequacy of many widely used vocational devices, such as the analysis of handwriting, physiognomy, interviews and letters of application.

Industrial Psychology embraces the problem of so fitting the worker to his work that the maximum of production shall be obtained with the least expenditure of energy. This branch of applied psychology has been influenced to a great degree by the efficiency engineers, and it is they who have set many of the problems which have engaged the interests of the psychologist. Foremost among these problems are the economies to bc gained by the analysis of work by means of time and motion studies. They reveal waste of motion through the improper placing of materials, improperly directed movements and the uneconomical routing of work generally. Laboratory and field studies have shown the economies of properly distributed work and rest schedules, and of the control of such environmental conditions as ventilation, illumination and distracting noises. The results of attention to such matters, when measured in terms of output of work, have shown surprisingly large percentages of increase. These changes have been found in most cases to produce their effects gradually, a period of six months being required in certain instances to attain the total benefit from a change of work schedule. Not all the changes introduced into working conditions by the efficiency engineer are justified on psychological grounds.

Too high a degree of specialization and standardization of function may lead to a monotonous routine that requires some corrective in the best interests of the worker. From the standpoint of the applied psychologist, more attention should be paid to the satisfaction to which the worker is entitled than is generally paid to that important matter *(see* INDUSTRIAL PSYCHOLOGY).

Business Psychology. — This branch of applied psychology should include all problems concerned with the distribution of goods. After deducting, however, all questions of selection of employés, and all questions of production, there remains primarily the task of acquainting the public with the goods that are available for distribution, namely, advertising and selling. Of these, advertising has received by far the major interest. This is primarily due to the fact that good advertising lends itself readily to study and analysis, both in the field and in the laboratory, while good selling remains a more intangible quality. The greatest contribution of psychology to advertising is to be found in the motivation of behaviour,—the fact that behaviour is determined by a series of causes, some of which are within the control of the advertiser. Thus, the desire for self-assertion, for protection, for comfort, etc., are played upon effectively in the sale of a great variety of commodities. All the facts of attention, perception, memory, feeling, belief and suggestion which have been accumulated over years of laboratory work are applicable directly to the problem of getting the attention of the reader, making a permanent impression upon him, and leading him to a favourable reaction toward a given product. Field studies of the reactions of people to such mediums as the *Saturday Evening Post* have revealed much valuable information concerning the manner in which the attitude of the reader may be affected by the use of colour, of large space, of unique illustrations, of so-called preferred positions on the page and in the medium itself. All the psychological principles which have been applied to advertising are equally applicable to the problems of selling, except that greater flexibility is possible because of the direct contact between salesman and customer *(see* PSYCHOLOGY OF ADVERTISING).

Legal Psychology. — Modern psychology, as the study of human behaviour, has many points of contact with the law, although relatively few of them have been developed. As far as prevention of crime is concerned, psychological analysis has thrown much light upon its determinants. Discarding the notion of responsibility as it is usually conceived, it has sought causes and contributing factors. Contrary to common opinion, such hereditary factors as defective intelligence are found to play a minor rôle, while social inheritance and environmental factors play a major part. Even among the environmental forces, poverty is of slight influence compared with defective discipline in the home. A psychological analysis of preventive measures at present in force shows their weaknesses and suggests methods for their improvement. The establishment of psychological clinics in connection with the courts and within the larger prisons furnishes the means of analysing causes of crime, and of determining a prison régime in accordance with the needs of the individual prisoner.

The most interesting applications of psychology to the law are to be found in the field of evidence. The great work of Wigmore *(Principles of Judicial Proof,* 1913) has shown the need of a sound conception of psychology in the interpretation of evidence. Every bit of evidence is definitely limited in its range and validity by the sensory capacity, the perceptual power, the ability to judge and remember on the part of the observer. Since these functions vary greatly from individual to individual, it follows that evidence must be evaluated upon a knowledge of the limitations of the individual who is giving it.

The use of various devices for detecting guilt or deception depends upon the influence of the consciousness of deception upon such psychological processes as blood pressure, breathing, psychogalvanic reaction and the speed of articulation. In laboratory tests of such methods a surprising degree of accuracy in the detection of deception is attained. The principles underlying these procedures have not yet attained sufficient scientific support to justify their use in the courts for the determination of guilt.

Medical Psychology. — Psychology and medicine have been closely associated for more than 50 years, and important contributions have been made in the field of mental diseases by both physicians and psychologists. In spite of this, there has grown up no body of information definitely labelled as medical psychology, nor a group of specialists similar to those in the fields of industrial and vocational psychology. There are the psychiatrists and psychopathologists, who are interested in mental and nervous diseases from the medical rather than from the psychological point of view, and there are the specialists in abnormal psychology, who are usually psychologists. There is no provision in most medical schools for training in general psychology which would create the psychological point of view, and bring the physician and psychologist into closer contact.

The elaborate system of psychoanalysis for the diagnosis and treatment of patients grew up without adequate contact with normal psychology, and many conflicts and misunderstandings have resulted therefrom. Numerous important contributions to theory and practice in relation to mental disease have been made by psychologists from time to time, while hospitals and research institutions are coming to recognize the significance of psychological tests, and in some cases have appointed psychologists upon their staffs.

Organizations and Publications. — A number of organizations have been established for the promotion of applied psychology, and for establishing contact between the psychologist and the problems of business and industry. Best known among these are the National Institute of Industrial Psychology (London), the Psychological Corporation and the Personnel Research Federation (New York city). The International Conference of Psychotechnics is a permanent organization which meets annually in different countries. As the name implies, it is truly international in scope, with German, French and English as the recognized languages for communication. In many countries there are institutions for promoting some special phase of applied psychology, as vocational guidance.

APPOGGIATURA, a musical term for a melodic ornament, a grace-note prefixed to a principal note and printed in small character (from Ital. *appoggiare,* to lean upon). The effect is to shorten the principal note, by taking away the time-value of the *appoggiatura* prefixed to it. There are two kinds, the long *appoggiatura,* now usually printed as played, and the short, where the suspension of the principal note is scarcely perceptible; the latter is now often called (not quite accurately) an *acciaccatura* (*q.v.*).

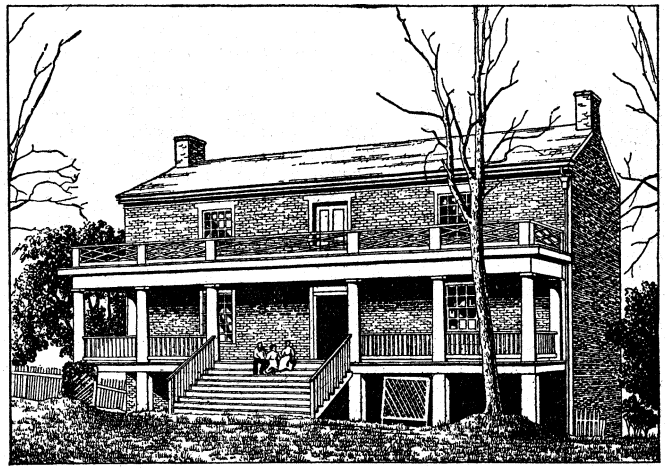
APPOINTMENT, POWER OF, in English law, an authority reserved by or limited to a person by a legal instrument, to dispose, either wholly or partially, either for his own benefit or

for that of others, of an interest in property which is not his own under that instrument. Such powers are either general or limited. A general power is one which the appointor may exercise in favour of any person he pleases. It is obvious that such a power is very nearly equivalent to ownership, and consequently the property involved shares the liabilities of ownership as regards execution of judgments, bankruptcy and death duties. A limited power is one which can only be exercised in favour of certain specified persons or classes, but by the Powers Amendment Act 1874 the donee of the power is no longer obliged to appoint a share to each object of the power.

By the Wills Act 1837 a will made pursuant to the requirements of that statute shall be a valid execution of a power of appointment by will, notwithstanding that some additional form or solemnity is required by the instrument creating the power (see WILL). As regards appointments by deed, the Law of Property Amendment Act 1859 enacts that a deed attested by two witnesses shall, so far as execution and attestation go, be a valid exercise of a power to appoint by deed. The courts of equity also will interfere in some cases of defective execution in order to carry out the intentions of the settlor where the defect is not of the essence of the power, but is a mere formality.

A power of appointment if exercised must be exercised bona *fide*, otherwise it will be void as fraudulent. Where an execution is partly fraudulent and partly valid the court will, if possible, separate the two and only revoke that which is fraudulent; if, however, the two parts are not separable the whole is void. By s. 157 of the Law of Property Act 1925 protection is given to a purchaser in good faith. The doctrine of Election applies to appointments under powers.

The appointment must in law be read into the instrument creating the power in lieu of the power itself. Thus an appointor under a limited power cannot appoint to any person to whom the donor could not have appointed by reason of the rule against perpetuities, but this is not so in the case of a general power, for there the appointor is virtually owner of the property appointed. In applying this rule to appointments a distinction arises between powers created by deed and will, for a deed speaks from the date of its execution but a will from the death of the testator. and



BY COURTESY OF THE REVIEW OF REVIEWS (NEW YORK)

THE HOME OF WILMER PCLEAN AT APPOMATTOX WHERE. ON APRIL 9, 1865, GEN. LEE AND LT.-GEN. GRANT SIGNED THE TERMS OF SURRENDER THAT ENDED THE CONFEDERACY AND BROUGHT THE CIVIL WAR TO A CLOSE. NEGOTIATIONS TOOK PLACE IN THE FRONT ROOM TO THE LEFT OF THE CENTRAL DOORWAY

so limitations bad when the will was made may have become good when it comes into operation. Since the Conveyancing Act 1881 (now Law of Property Act 1925, s. 155, 156) all powers may be released by the donees thereof, unless the power is coupled with a trust in respect of which there is a duty cast on the donee to exercise it; and this is so even though the donee gets a benefit by such release as one entitled in default of appointment, for this is not a fraud upon the power.

APPOMATTOX, a village of Appomattox county, Virginia, U.S.A., 25 mi. E. of Lynchburg. Population was 992, by 1940 federal census. It is served by the Norfolk and Western railway. The old village of Appomattox Court House, 3 mi. N.E., was the scene of the surrender of the Confederate Army of Northern Virginia under General Robert E. Lee to the Federal forces under Lieutenant General U. S. Grant on Sunday, April 9, 1865. The terms were: "the officers to give their individual paroles not to take up arms against the government of the United States until properly exchanged, and each company or regimental commander to sign a like parole for the men of their commands." Appomattox Court House, virtually deserted after removal of the county seat to the new town of Appomattox in 1892, was made a national historical monument in 1930; the national park service then began restoration of the village to its 1865 appearance.

APPONYI, ALBERT, COUNT (1846–1933), Hungarian statesman, the most distinguished member of an ancient noble family, dating back to the 13th century, and son of the chancellor Gyorgy Apponyi (1808–99) and the accomplished and saintly Countess Julia Sztáray, was born at Pest on May 29, 1846. Educated at the Jesuit seminary at Kalksburg and at the universities of Vienna and Pest, a long foreign tour completed his curriculum, and at Paris he made the acquaintance of Montalembert, a kindred spirit, whose influence on the young Apponyi was permanent. He entered parliament in 1872 as a liberal Catholic, attaching himself at first to the Deák party; but the feudal and ultramontane traditions of his family circle profoundly modified, though they could never destroy, his popular ideals. On the break up of the Deák party he attached himself to the conservative group which followed Baron Pál Senynyey (1824–88) and eventually became its leader. Until 1905 Count Albert was constantly in opposition, but in May of that year he consented to take office in the second Wekerle ministry. From 1906–10 he was Minister of Education in the Wekerle Cabinet. He succeeded Kossuth as president of the party of Hungarian Independence and advocated universal suffrage. At the outbreak of the World War he adopted the standpoint of a "truce of God" with regard to all internal dissensions. He retired into private life after the outbreak of the revolution of Oct. 1918. In 1919 he was elected as a non-party deputy to the National Assembly and was head of the Hungarian peace delegation in Paris. He became a member of the League of Nations Union and in 1924 and 1925 represented Hungary at the Assemblies of the League of Nations, where his magnetic oratory made a great impression. He stood above rather than outside party politics, and his authority as the "Grand Old Man" of the nation carried unusual moral weight. He died Feb. 7, 1933.

His published works include *Recollections of a Statesman* (1912); "Die rechtliche Natur der Beziehungen zwischen Osterreich und Ungarn" in the *Osterreichische Rundschau* (vol. 28); in Hungarian: *My Memoirs: 50 years*, vol. 1; *Youth, 25 years in Opposition* (1922). Two volumes of parliamentary speeches were published (1897) relating to the 25 years' activity mentioned in the first volume of the Memoirs.

APPORTIONMENT, distribution or allotment in proper shares; a term used in law in a variety of senses. (1) Sometimes it is employed roughly and with no technical meaning to indicate the distribution of a benefit (*e.g.*, salvage, damages under the Fatal Accidents Act 1846, s. 2), or liability (*e.g.*, general average contributions, or tithe-rent charge) or the incidence of a duty (*e.g.*, obligations as to the maintenance of highways). (2) In its strict legal interpretation apportionment falls into two classes "apportionment in respect of estate" and "apportionment in respect of time."

Apportionment in Respect of Estate may result either from the act of the parties or from the operation of law. Where a lessee is evicted from, or surrenders or forfeits possession of, part of the property leased to him he becomes liable at common law to pay only a rent apportioned to the value of the interest which he still retains. So where the person entitled to the reversion of an estate assigns part of it, the right to an apportioned part of the rent incident to the whole reversion passes to his assignee. The assignee of the reversion of part of demised premises could not, at common law, re-enter for breach of a condition, inasmuch as a condition of re-entry in a lease could not at common law be apportioned. But this has now been altered by statute both

in England (Law of Property Act 1925, s. 140), and in many colonies (*e.g.*, Ontario, Rev. Stats., 1914, c. 150; Barbados, No. 12 of 1891, s. 9; Nova Scotia, 210 R.S. of 1923; Victoria, 2733 of 1915, Stats. pt. vii; Manitoba, No. 2 of 1927). On the release from a rent charge of part of the land charged therewith, the lands not so released remain liable to a part only of the rent charge proportionate to their value unless the owners of such lands concur in the release of the rest of the lands originally liable, when the whole rent charge will be payable out of the lands not released (Law of Property Act, 1925 s. 70).

The Minister of Agriculture and Fisheries is now empowered to apportion rents of every kind, on the application of any persons interested in the lands and in the rents (ib. ss. 191, 192).

Apportionment by Operation of Law may be brought about where by act of law a lease becomes inoperative as regards its subject matter, or by the "act of God" (as, for instance, where part of an estate is submerged by the encroachments of the sea). To the same category belongs the apportionment of rent which takes place under various statutes (*e.g.*, the Lands Clauses Consolidation Act 1845, s. 119, when land is required for public purposes; the Agricultural Holdings Act 1923, s. 27, in case of a tenant from year to year receiving notice to quit part of a holding).

Apportionment in Respect of Time.—At common law, there was no apportionment of rent in respect of time. Such apportionment was, however, in certain cases allowed in England by the Distress for Rent Act 1737, and the Apportionment Act 1834, and is now allowed generally under the Apportionment Act 1870. Under the statute (s. 2) all rents, annuities, dividends, and other periodical payments in the nature of income, whether reserved or made payable under any instrument in writing or otherwise, are, like interest on money lent, to be considered as accruing from day to day and to be apportionable in respect of time accordingly. Persons entitled to apportioned parts of rent have the same remedies for recovering them when payable as they would have had in respect of the entire rent; but a lessee is not to be liable for any apportioned part specifically. The rent is recoverable by the heir or other person who would, but for the apportionment, be entitled to the entire rent, and he holds it subject to distribution (s. 4). The Apportionment Act 1870 does not extend to annual sums made payable in policies of insurance (s. 6). Apportionment under the Act can be excluded by express stipulation.

The apportionment created by this statute is "apportionment in respect of time." The cases to which it applies are mainly cases of either (A) apportionment of rent due under leases where at a time between the dates fixed for payment the lessor or lessee dies or some other alteration in the position of parties occurs; or (B) apportionment of income between the representatives of a limited owner and the remainder-man when the limited interest determines at a time between the date when such income became due.

(A) With regard to the former of these classes it may be noticed that although apportioned rent becomes payable only when the whole rent is due, the landlord, in the case of the bankruptcy of an ordinary tenant, may prove for a proportionate part of the rent up to the date of the receiving order (Bankruptcy Act 1914, Sched ii. r. 20); and that a similar rule holds good in the winding up of a company (in re *South Kensington* Co-Operative Stores 1881, 17 Ch.D. 161); and further that the Act of 1870 applies to the liability to pay as well as to the right to receive rent (in re Wilson [1893], 62 L.J.Q.B. 628, 632). Accordingly where an assignment of a lease is made between two half-yearly rent days, it has been held that the assignee is not liable to pay the full amount of the half-year's rent falling due on the rent day next after the date of the assignment, but only an apportioned part of that half-year's rent computed from the last mentioned date (*Glass* v Patterson, 1902, 2 Ir. R. 660).

(B) All dividends payable by public companies are apportionable, whether paid at fixed periods or not, unless the payment is, in effect, a payment of capital (s. 5).

(C) In deciding on the real character of the payment the Court has regard to all the circumstances under which it is made, and more especially the powers and intention of the company in making the distribution. Where stocks representing capital are sold with an accrued or accruing dividend, the Courts of Equity disregarded, except in special circumstances, the claims of persons entitled to income to have an apportionment of capital so realized made in their favour. The Act of 1870 has been held not to have altered this rule.

The Apportionment Act 1870 extends to Scotland and Ireland (but see IRELAND). It has been followed in many of the British colonies (Burge, Foreign and Colonial Laws, iv., Pt. II. by Bewes, 620).

An equitable apportionment apart from statute law arises, also, where property is bequeathed on trust to pay the income to a tenant for life, and the reversion to others, and the realisation of the property in the form of a fund capable of producing income is postponed for the benefit of the estate. In such cases there is an ultimate apportionment between the persons entitled to the income and those entitled to the capital of the accumulations for the period of such postponement.

See Stroud, ***Jud. Dict.***, *s.v.* "Apportion"; Bouvier, ***Law Dict.***, *s.v.* "Apportionment"; ***Ruling Cases***, tit. "Apportionment"; Foá, ***Landlord and Tenant*** (6th ed., 1924); Williams, ***Real Property*** (1926).

The term Apportionment is used in the United States to indicate the obligation of Congress to re-assign among the states the numbers of members of the House of Representatives to which they are entitled following each decennial census. Such an apportionment was not made on the basis of the census of 1920, being the first time Congress so failed to act following a census. It also is used to indicate the action of state legislatures in districting and re-districting congressional, legislative, judicial and other seats and of city councils and commissions in taking similar action on local offices. Often the term re-apportion is used, to distinguish from the apportionment already in effect.

APPORTIONMENT BILL, an act passed by the Congress of the Cnited States after each decennial census to determine the number of members which each State shall send to the House of Representatives. The ratio of representation fixed by the original constitution was 1 to 30,000 of the free population, and the number of the members of the first House was 65. As the House would. at this ratio, have become unmanageably large, the ratio was raised after each subsequent census through that of 1910 (see accompanying table). No reapportionment was made following the 14th census. But in 1929 a new system provided that the number of seats should be held at 433 and that the redistribution should be carried out mathematically.

Under	Census.		Apportionment Effective		Whole number of representatives.
	Year.	Population.	rear.	Ratio.	
Constitution			1789	30,000	65
First census	1790	3,929,214	1793	33,000	105
Second census	1800	5,308,483	1803	33,000	141
Third census	1810	7,239,881	1813	35,000	181
Fourth census	1820	9,633,822	1823	40,000	213
Fifth census	1830	12,866,020	1833	47,700	240
Sixth census	1840	17,069,453	1843	70,680	223
Seventh census	1850	23,191,876	1853	93,423	234
Eighth census	1860	31,443,321	1863	127,381	241
Ninth census	1870	38,558,371	1873	131,425	292
Tenth census	1880	50,155,783	1883	151,911	325
Eleventh census	1890	62,622,250	1893	173,901	356
Twelfth census	1900	75,568,686	1903	194,182	386
Thirteenth census	1910	91,972,266	1913	211,877	435
Fourteenth census	1920	105,710,620	.	..	435
Fifteenth census	1930	122,775,046	1933	279,712	435

If a State has received an increase in the number of its representatives and its legislature does not pass an apportionment bill before the next congressional election, the votes of the whole State elect the additional members on a general ticket and they are called "congressmen-at-large."

The same term is applied to the acts passed by the State legislatures for correcting and redistributing the representation of the

counties. Such acts are usually passed at decennial intervals, more often after the Federal census, but the dates may vary in different States. The State representatives are usually apportioned among the several counties according to population, not geographical position. The electoral districts so formed are expected to be equal in proportion to the number of inhabitants; but this method has led to much abuse in the past, through the making of unequal districts for partisan purposes. (See GERRYMANDER.)

APPOSITION, a grammatical term used of a noun when it is employed as complement to a preceding noun or noun clause. The word also signifies an oral examination; "Speech-day" at St. Paul's School, London is known as Apposition.

APPRAISER, one licensed to set a value upon real or personal property. In England, appraisers are usually auctioneers also, and the name itself has given place, to a great extent, to that of "valuer." One who exercises the calling of appraiser or valuer, and who makes any valuation chargeable with stamp duty, must take out an appraiser's licence, costing £2 per annum, unless he is licensed as an auctioneer or house-agent. (See VALUATION.)

In the United States appraiser is a term often used to describe a person specially appointed by a judicial or quasi-judicial authority to put a valuation on property or land. Appraisers of imported goods appointed by the customs court (formerly boards of general appraisers) have extensive functions in administering the customs laws of the United States. Merchant appraisers are sometimes appointed temporarily under the revenue laws to value where there is no resident appraiser without holding the office of appraiser (*U.S.* Rev. *Stats.* § 2609).

APPREHENSION, in psychology, a term applied to a mode of consciousness in which nothing is affirmed or denied of the object in question, but the mind is merely aware of ("seizes") it. "Judgment" (says Reid, ed. Hamilton, i. p. 414) "is an act of the mind specifically different from simple apprehension or the bare conception of a thing"; and again, "Simple apprehension or conception can neither be true nor false." This distinction provides for the large class of mental acts in which we are simply aware of or "take in" a number of familiar objects, about which we in general make no judgment unless our attention is suddenly called by a new feature. Or again two alternatives may be apprehended without any resultant judgment as to their respective merits. Similarly G. F. Stout points out that while we have a very vivid idea of a character or an incident in a work of fiction, we can hardly be said in any real sense to have any belief or to make any judgment as to its existence or truth. With this mental state may be compared the purely aesthetic contemplation of music, wherein apart from, say, a false note, the faculty of judgment is for the time inoperative. To these examples may be added the fact that one can fully understand an argument in all its bearings without in any way judging its validity.

Without going into the question fully, it may be pointed out that judgment and apprehension are distinguishable but not separable. Together with every apprehension there is judgment of some sort in a greater or less degree of prominence. Judgment and apprehension are in fact psychologically distinguishable merely as different, though connected, activities of consciousness. Professor Stout further investigates the phenomena of apprehension, and comes to the conclusion that "it is possible to distinguish and identify a whole without apprehending any of its constituent details." On the other hand, if the attention focuses itself for a time on the apprehended object, there is an expectation that such details will as it were emerge into consciousness. Hence he describes such apprehension as "implicit," and in so far as the implicit apprehension determines the order of such emergence he describes it as "schematic." A good example of this process is the use of formulae in calculations; ordinarily the formula is used without question; if attention is fixed upon it, the steps by which it is shown to be universally applicable emerge and the "schema" is complete in detail.

With this result may be compared Kant's theory of apprehension as a synthetic act by which the sensory elements of a perception are subjected to the formal conditions of time and space.

See **G.** F. Stout, *Analytic Psychology (1896)*; F. Brentano, *Psychologie* (bk. ii. ch. vii.), and *Vom Ursprung sittlicher Erkenntnis;* B. Titchener, *Outlines of Psychology* (1902), and text-books of psychology. Also *see* PSYCHOLOGY. (A. WO.)

APPRENTICESHIP. The idle or industrious apprentice, fed, clothed and lodged by his master, was learning his craft at least 100 years before 1383 when apprenticeship was first noticed in an act of parliament. In the 12th century the craftsmen of the towns were associated in gilds for their mutual protection, for the advancement of their crafts, and later to hinder competition from those who were not free of the town. The gild (*q.v.*), which was a form of the mediaeval corporation or *universitas,* consisted of masters and apprentices, the masters being those who were skilled in an art, a science or a craft, and the apprentices those who were learning its mysteries. Thus barristers were apprenticed to the law, *apprenticii* ad *legem,* just as the sons of freemen might be apprenticed to a slater, a carpenter or an armourer.

The **Gild** Apprentices.—The gilds concerned themselves closely with the enrolment and training of the apprentices. No master was allowed to take more apprentices then he could properly train, and the method of training was rigidly prescribed, even to the tools which should be used and the manner in which they should be handled. The period of apprenticeship was almost invariably seven years. When the full apprenticeship had been served the apprentice became a journeyman working for wages, or practised his craft as a master with his own journeymen and spprentices.

Having obtained certain privileges, including the exclusive right to practise a particular craft in a town or locality, the gilds began to use these privileges in an arbitrary and exclusive manner. As early as 1437 a statute was promulgated against the "unlawful and unreasonable ordinances" made by gilds "for their singular profit snd to the common hurt and damage of the people." To avoid the overstocking of a trade, or often to preserve their monopoly, the number and proportion of apprentices were definitely limited. At Newcastle, for example, a slater could not take a second apprentice until the first was in his last year, while the common practice was to allow one apprentice to every two or three journeymen. Difficulties were placed in the way of those who had served their apprenticeship and wished to become masters; and attempts were made to reserve the full freedom of the craft to those born in the gild. The result of these and other restrictive measures was the tendency which became marked at the end of the 15th and the beginning of the 16th centuries for journeymen to set up as masters outside the towns, free of all gild and municipal restrictions. The craft gilds' monopoly was further weakened by the growth of such new trades as the hardware, cutlery and textile trades in towns such as Birmingham, Sheffield and Manchester, which were under manorial control; by the rise of the merchant companies, and later by the confiscation of the gilds' religious property in the time of Henry VIII. and Edward VI. The decline of the gilds and the loosening of their authority brought about the Statute of Labourers and Apprentices in 1563.

Gild apprenticeship had already been regulated in part by successive Statutes of Labourers. The statute of 1563, so far as it was concerned with apprenticeship, gave statutory authority to a system which was beginning to break up, and at the same time substituted uniformity for a number of conflicting local variations. The statute, therefore, was primarily a consolidating enactment and produced no revolutionary changes. The act prescribed seven years at least as the period of apprenticeship, the term to extend until the apprentice was 24 years old; no boy could be apprenticed who was not a yeoman's son or had been engaged in agriculture; and no person might exercise a craft unless he had been apprenticed. Every master with three apprentices was compelled to keep at least one journeyman. Justices of the peace were bidden to administer the statute, and at first Elizabeth's attempt to perpetuate this gild apprenticeship seemed likely to be successful. The jolly pictures of apprentice life to be seen on the boards of the Southwark theatres, the ballads and rhymes of the apprentice who married his master's daughter, and the roystering apprentice mobs

of London during the Civil War represent the apprentice system as it existed, at least in London, during the 17th century. But the apprentice laws were not popular. The judges carefully limited their operation to the crafts named in the statute, or those existing in Elizabeth's time.

Decay of Gild Apprenticeship.—Gild apprenticeship, or as it might now be termed, domestic apprenticeship, rapidly declined during the 18th century. The introduction of machinery in the great new manufacturing industries which were outside the scope of the apprentice laws, the growing dislike of all restrictions under freedom of trade, and the rise of capitalism, led to the repeal in 1814 of the important parts of the statute of 1563. A man might now exercise any craft or trade be pleased, whether he had been an apprentice or not.

The Act of 1814 marked the end of compulsory apprenticeship, and (although it was not appreciated at the time) of domestic apprenticeship also. Long before 1814 in trades which were outside the scope of the apprenticeship laws a new kind of apprenticeship had come into being. The apprentice no longer lived without wages and under the personal control of his master, but served under a strict apprenticeship contract and lived with his parents and received wages. Despite the introduction of machinery and the increasing subdivision of labour, apprenticeship in its new form persisted as an important element in the industrial organization of the country. Although skilled handicraftsmen were no longer employed on all forms of productive work, there were still trades dependent for their existence on the individual skill of the craftsman. But at the end of the 19th and the beginning of the 20th centuries apprenticeship was threatened from another quarter. Employers became less willing to spend time and money on the training of apprentices which the specialization of processes and the speeding up of production had rendered more difficult and more expensive. The trade unions realizing that the employment of cheap juvenile labour needed protection, called in aid the time-honoured methods of the gilds and of the apprentice laws, and imposed restrictions on the number and proportion of apprentices and the conditions of their employment, which bear a curious resemblance to those which were imposed by the officers of the gild some six or seven hundred years before.

Effects of the World War.—The future of apprenticeship was in doubt when the outbreak of the World War seemed likely to sweep it away. The withdrawal of men from industry and the introduction of intensive specialization for increasing output at all costs enhanced the value of the journeymen's time and limited the field in which apprenticeship training could be given. In the engineering industry, for example, the proportion of boys and men employed increased between July 1914 and April 1917 from 14% to 21%. Again the high wages offered for repetition work of an apparently unskilled character prejudiced boys against apprenticeship with its low starting wages. At the end of the war period, therefore, the future of apprenticeship, and with it the future supply of skilled men was in the balance. Thousands of skilled men had been definitely lost to industry; the supply of apprentices had dwindled and boys had become accustomed to the higher economic standard of the young unskilled worker.

The period of industrial confusion which succeeded partially obscured the problems of apprenticeship, but the British Government saw that if industry was to regain the position which it held before the war every effort had to be made to secure a future supply of skilled men. With this end in view the interrupted apprenticeship scheme was launched, the main object of which was to bring back into the skilled trades those whose apprenticeships had been interrupted by the war. Most of these men were now above the normal age of apprenticeship and many had incurred family responsibilities and could not be expected to return to employment at apprentice wages. With the financial assistance granted by the Exchequer under the scheme employers were able to pay to these ex-service apprentices wages approximating to those which they would have received if their services had not been interrupted by the war. Directly or indirectly about 100,000 apprentices were prevented from drifting into unskilled or semi-skilled employment. Within the general scheme separate schemes for the various industries concerned were drafted by joint committees of employers and workers after useful enquiries into trade customs and practices. In Great Britain appreaticeship has now regained the place which it held before the war as the normal method of recruiting and training young workers for certain of the more important trades in the country, and is still playing an important part in the industrial life of the community.

Varieties of Apprenticeship in Great Britain.—Apprenticeship is the most usual method in Great Britain of recruiting and training the skilled worker in the engineering and allied industries, shipbuilding, building, electrical contracting, wood-working, printing, pottery, glass, scientific instrument making and the baking industries, as well as in the mercantile marine and in the manufacture and supply of electricity and gas. Girls are employed as apprentices mainly in the clothing and distributive trades. In other important industries, such as the textile industries, in which modern methods of manufacture require a comparatively short period of training, a second method of entry usually known as "learnership" is common. The difference between an apprentice and a learner is that in the case of the learner there is merely a tacit or implied understanding that the employer shall provide facilities for learning some branch of a particular trade; the employer does not undertake to teach or to retain the young worker for the whole of the period necessary for the learning of the trade. A third method of entry is termed "upgrading." In certain trades in which the introduction of machinery has reduced the amount of skill required, or in which men work in groups, unskilled men who have acquired some degree of skill by working in association with skilled men are in time "upgraded." In several industries two or three of these methods of entry to the ranks of the skilled men are to be found side by side in different occupations; in some industries skilled workers may be recruited by way either of apprenticeship or learnership. Often it is difficult to distinguish between the looser forms of apprenticeship and the stricter forms of learnership. It is estimated that about one-seventh of the youths under 21 in industrial occupations in Great Britain in 1928 were serving recognized apprenticeships, and probably about one-fifth were receiving a systematic training either as apprentices or as learners.

There are several different kinds of apprenticeship in common use. The ordinary apprentice is known as the "trade apprentice." The "pupil apprentice" has usually received a post-primary education and is given a wider training in order to qualify him for posts of responsibility. The "student apprentice" has received a full-time technical education at a university or technical institution or school and his training is designed to fit him for higher positions on the commercial or technical staff. Premiums are usually required by employers from pupil and student apprentices, but the custom of demanding premiums from trade apprentices has died out except in certain trades and districts.

Indentured Apprenticeship.—Apprenticeship under written agreements, and particularly indentures, is becoming increasingly infrequent, and this has given rise to some misunderstanding. It is often thought that there can be ne apprenticeship without a written document. In Great Britain, however, at the present time, most apprenticeships are based on verbal agreements. It is estimated that rather less than one-third of the youths receiving some form of systematic industrial training in Great Britain are apprenticed under indentures or formal agreements. Indentured apprenticeship is most frequently found in the printing and shipbuilding industries, in the mercantile marine, and in certain occupations in the glass and chemical industries. It is more common in southern than in northern districts.

Indentures, which are normally in the form of deeds, contain a number of provisions setting out in some detail the conditions of employment. They must contain an undertaking by the employer to train the apprentice, and on the part of the apprentice to serve the employer. It is usual to provide also for the term of apprenticeship, for the wages to be paid in each year of apprenticeship, and for the trade which the apprentice is to be taught, while the boy's parent or guardian is commonly bound as a third party to the agreement. In addition the apprentice may be re-

quired to attena specified technical classes, or restrained from working for another employer, or even prohibited from joining a trade union for industrial purposes. The indentures may also provide for the apprentice to be "stood off" with or without wages if the employer has no work for him, or for the binding of a fourth and independent party to secure the proper training of the apprentice. Written agreements which are not "indentures" are usually much simpler, and may contain nothing more than the undertaking of the employer to teach and of the apprentice to serve.

The age of entry into apprenticeship is from 14 to 16½, the usual age being from 15½ to 16½. In many cases there is thus a gap of a year and a half or more between the time of leaving school (boys leave the primary schools at the end of the term in which they attain the age of 14) and entry into apprenticeship, while boys who leave secondary schools at 16 or 16½ may find themselves too old to become apprentices in certain industries. The period of apprenticeships varies; it is usually from five to seven years, the shorter period being the more common. In a particular industry the period is often customary or traditional, and is not necessarily the time required to train a boy in a given occupation under modern conditions.

Wages of British Apprentices. — The wages paid to apprentices are based on the principle that in the first years of apprenticeship the apprentice is not an asset but a liability. Apprentices' wages vary widely from industry to industry and from district to district, but are always considerably below those of boys who are not employed under a definite system of training. In 1925 the average wage for the apprentice in his first year varied according to the industry and occupation, from 8s. 8d. to 12s. 4d., and in the last year from 19s. 9d. to 38s. 7d. There is usually a standard rate for each year of apprenticeship which is commonly a fixed proportion of the approved journeyman's rate.

Employers usually recruit their apprentices from among boys who apply at the works, preference being given to boys who are related to or are recommended by their workers, and particularly by their foremen. The actual selection is often left to the foreman. In some cases apprentices are selected from among the boys already employed on unskilled or semi-skilled work. Many employers are beginning to realize that it is worth their while to adopt more scientific methods based on vocational selection according to industrial fitness and promise, or involving educational or vocational tests. More attention is also being given to the training of apprentices. The traditional method is to place the boy under the care of a journeyman or the supervision of a foreman, or to employ him as a mate. But employers are appreciating more and more that the best kind of training is a judicious mixture of technical instruction and workshop training. An increasing number of employers are making use of the facilities provided by local education authorities. The "sandwich" system is sometimes adopted, under which the apprentice spends alternate periods at technical classes and in the works, or the apprentices may be released on one or two half days a week or allowed to leave work early in order to attend classes; or classes may be established in the works with or without the local education authority's help.

Joint Industrial Agreements. — In many industries the conditions of employment of apprentices is the subject of special consideration by employers' organizations and trade unions or of joint agreement between employers and workers. Employers' organizations are sometimes inclined to leave questions of apprenticeship to their individual members, but rules affecting apprenticeship or learnership are made by most trade unions whose members are engaged in the skilled occupations. These rules are often embodied in joint agreements. A number of joint industrial councils have concerned themselves with apprenticeship, and several trade boards (which have the power subject to the approval of the minister of labour to fix minimum rates of wages for apprentices and learners) have prepared schemes for the training of apprentices. It is sometimes thought that the rules of trade unions, whether or not they are embodied in joint agreements with employers' organizations, in so far as they tend to restrict the number of apprentices to journeymen that may be employed, have unduly limited the recruitment of apprentices, but it is doubtful whether in fact, except in certain cases, they have had this effect.

British Law Relating to Apprenticeship. — In order to make a contract of apprenticeship enforceable a written agreement is necessary if the period of apprenticeship is more than one year, but indentures are only necessary in exceptional cases where they are specifically required by statute. Indentures of apprenticeship, with certain statutory exceptions, are required to bear a stamp to the value of 2s. 6d. An infant cannot be bound without his own consent, but he can bind himself without his parents' consent. The validity of the contract depends upon whether it is on the whole beneficial to the apprentice. An agreement empowering the employer to stop work or withhold wages at his own option would probably not be regarded as beneficial. The apprentice must be taught the whole and not merely a branch of the trade to which he is bound. He cannot normally be dismissed for misconduct which is not of a gross character rendering the contract impossible of performance, unless he has given the employer by covenant a right to dismiss him for misconduct. An apprentice may be compelled to complete his apprenticeship, but if he fails to observe his part of the contract he cannot be sued for breach of the covenants. The parent or guardian, however, if he has bound himself as a party to the agreement, will be liable to be sued if the agreement is broken by the apprentice. A contract of apprenticeship may be dissolved by the mutual consent of all parties, and it may be determined by the permanent illness or death of the apprentice, or by the death of the employer. If the employer dies, the apprentice is not bound to serve the executors and the executors are not liable to the apprentice, unless the agreement expressly provides otherwise. The bankruptcy of the employer is a complete discharge of the indenture of apprenticeship upon notice in writing to that effect being given to the trustee, who may pay a reasonable sum to or for the use of the apprentice, or may on the application of the apprentice, transfer his indenture to another person. Disputes between employer and apprentice, in cases where no premium has been paid, or where the premium has not exceeded £25, are dealt with by courts of summary jurisdiction. Apprentices are afforded the protection given by the Factory and Workshop Acts and by the Workmen's Compensation Acts, and if they receive regular payments from their employers are insurable under the National Health Insurance and Unemployment Insurance Acts. Under the Trade Board Acts minimum rates of wages for apprentices have been fixed in certain trades, and payment at less than these rates renders the employer liable to prosecution.

APPRENTICESHIP IN OTHER COUNTRIES

British Dominions — In the Commonwealth of Australia apprenticeship is regulated by laws which vary from State to State. The conditions of apprenticeship in Victoria are fixed by wages boards elected by employers and employees, while in New South Wales and South Australia they are normally regulated by industrial awards or agreements. In Queensland an apprenticeship executive advises the minister of labour on matters of apprenticeship; there are advisory group apprenticeship committees for each trade group; a register of apprentices is kept by the director of labour; and conditions of apprenticeship are laid down in awards of the Board of Trade and Arbitration. In Western Australia the conditions are subject to awards issued by the court of arbitration, and apprentices are registered. In New Zealand the employment of apprentices is regulated either by special orders of the court of arbitration or by apprenticeship committees appointed by the court, composed of equal numbers of employers and workers with other persons interested. In the Union of South Africa the conditions of apprenticeship are regulated by the minister of labour in consultation with similar apprenticeship committees in those trades which decide to adopt the provisions of the Apprenticeship Act of 1924. Ministers have power to fix the number of apprentices in a given shop, the qualifications for apprenticeship, the period of apprenticeship, the

wages payable in each year of apprenticeship, and to determine the training classes to be attended. In South Africa, as in New Zealand, and certain of the Australian States, all apprenticeship contracts must be registered. In the Dominion of Canada apprenticeship is not regulated by Federal law, but certain provinces have laws bearing on the subject. A substantial number of apprenticeship schemes are in force, but these are normally instituted by individual firms or by groups of firms. (W. H. L. W.)

United States of America. — In the United States of America apprenticeship as understood in Europe has largely decayed, and questions of apprenticeship in industries where it still exists are usually determined by the custom of the trade or in accordance with the views of individual employers. Several States have no laws on the subject, others have repealed their apprenticeship laws or omitted them in later codifications of their laws. In Wisconsin, however, a system of apprenticeship under State supervision was established in 1915 under a revised apprenticeship law, and there are statutory provisions covering conditions and wages, while in the District of Columbia the conditions under which apprentices may be employed are regulated by the Act of 1911.

Schools may be classified under four heads: public schools; trade schools maintained by trades unions; trade schools maintained by employers' associations, and trade schools maintained by individual large employers. All these classes of schools frequently work in close co-operation with members of trade unions and also of employers' associations. As a rule the student enters at 16 to 18 years of age and remains from two to four years, according to the thoroughness of the schools and the difficulty of the craft in which he is being trained. In the public schools the technical training is supplementary to the general course of elementary education given, whereas in the typical trade schools a certain amount of general subjects, such as English, mathematics, etc., is given, but these are made supplementary to the study of the craft and are usually based directly on craft problems. A large number of the trade schools maintained both by unions and employers, either individual or association, put the student at part time work in the shop after he has spent a year or so at the fundamentals of the craft. In such cases it is usual to allow him a certain wage for his work, part of which is paid to him directly and part of which accumulates as bonus to be paid to him in a lump sum when he has completed his training and become a full-fledged journeyman. (X.)

See P. H. Douglas, ***American Apprenticeship and Industrial Education*** (1921).

Some Other Countries. — In Austria apprenticeship is closely controlled by the Industrial Act of 1907. In 1926 a further section was added to the code which gives an apprentice the right to be retained by his employer for three months after he has completed his apprenticeship. Again, in Denmark the Apprenticeship Act of 1921 governs the conditions under which apprentices are employed, and provides, among other things, that the minister of the interior, in agreement with the minister of commerce and the employers' and workers' organizations in the trade concerned, may decide that a test should be passed in certain trades before the apprenticeship can be regarded as completed. In France the contracts of apprenticeship are governed by a law of 1910 incorporated in the Labour Act. Shortage of skilled workers after the war led to another law, passed in 1919, which provides for the compulsory attendance of apprentices at professional courses of study at public expense. The Trade Councils Act of 1925 set up a professional crganization for recruiting apprentices from children leaving elementary schools, providing for the guidance of the children into the least crowded occupations, and for controlling the drawing up of contracts of apprenticeship and ensuring the proper performance by both parties of their obligations. In the same year an apprenticeship tax was imposed for carrying this act into effect. The tax is levied on practically all industrial and commercial establishments, with the exception of those already employing apprentices or participating in apprenticeship schemes. In Italy apprenticeship is not normally regulated by law, but there is some provision for the attendance of apprentices at State schools for industrial training. In Switzerland apprenticeship contracts are governed by the Civil Act; the regulation of apprenticeship is undertaken by the Cantonal and not by the Federal authorities, at the head of which is a Government department, commonly the Education Department, assisted normally by central district or local commissions which are usually in the nature of joint committees composed of persons nominated by employers' and workers' associations. The general conditions of apprenticeship in Germany are regulated by the Industrial Code, but the Vocational Education bill which has been drafted by the Federal Ministry of Labour substantially modifies the present system of regulation. The bill, among other things, confers on various autonomous joint trade bodies the statutory right to issue, in consultation with the appropriate public departments, detailed regulations governing the whole field of apprentice employment.

APPROACH, in military language the phase during which troops are moving forward from their assembly positions or concentration areas towards the enemy, and lasting until they deploy for battle. An alternative term is "approach march." With the smaller units, of course, in these days of long-range weapons, their own "approach" takes place on the battle-field, and only begins after the force of which they form part has deployed. In a broad sense, the "approach" covers all movements and manoeuvres before, and when out of, contact with the enemy. It is thus the province of strategy, just as the attack and the defence are the province of tactics. Under this definition a retreat which lures the enemy on to a chosen battlefield or gains time for a decisive blow elsewhere, is an "approach." The term may also, justly, cover measures by which the enemy's morale is undermined.

APPROPRIATION, the act of setting apart and applying to a particular use to the exclusion of all other. In ecclesiastical law, appropriation is the perpetual annexation of an ecclesiastical benefice to the use of some spiritual corporation, either aggregate or sole. In the law of debtor and creditor, appropriation of payments is the application of a particular payment for the purpose of paying a particular debt. When a creditor has two debts due to him from the same debtor on distinct accounts, the general law as to the appropriation of payments made by the debtor is that the debtor is entitled to apply the payments to such account as he thinks fit. In default of appropriation by the debtor the creditor is entitled to determine the application of the sums paid, and may appropriate them even to the discharge of debts barred by the Statute of Limitations. In default of appropriation by either debtor or creditor, the law implies an appropriation of the earlier payments to the earlier debts. In constitutional law, appropriation is the assignment of money for a special purpose.

APPROPRIATIONS IN AID. In the terminology of British Government finance, the money received by Government departments, in the course of their work, for certain fees, miscellaneous services, rents, etc. These receipts are in many cases not paid into the Exchequer, but "appropriated in aid" of the expenses of the departments which receive them, whence their name. When a Government department presents its estimate to the House of Commons, the appropriations in aid serve to diminish the sums demanded, and are accounted for in the figures given to Parliament.

APPROVED SOCIETIES. In pursuance of its policy of grouping the compulsorily insured population in voluntary institutions, the National Insurance Act of Great Britain, which became law in 1911, provides that any respectable thrift institution, or body of persons, may adapt itself or establish itself to carry out the work of health insurance. Under rule, such a body may be approved by the Ministry of Health and thus become an "approved society." The main conditions of approval are (1) that the society must not be carried on for monetary profit and (2) that it must be subject to the absolute control of its mem-

bers. Insured persons may choose to join any such approved society, but an approved society is given the right to reject any insured person applying for membership. Generally, the British friendly societies have become approved societies under the Act, and many trade unions and collecting societies have formed separate sections to avail themselves of the special provision enabling them to constitute such sections as approved societies (see NATIONAL INSURANCE: HEALTH).

APPURTENANCES, a legal term for what belongs to and goes with something else, the accessories or things usually conjoined with the substantive matter in question. By s. 6 of the Conveyancing and Law of Property Act, 1881 (now s. 62 of the Law of Property Act, 1925) a conveyance of land includes all visible and permanent things, easements, rights and advantages reputed to appertain to the land or at the time reputed to be appurtenant thereto or to be part or parcel thereof.

APRAKSIN, THEDOR MATVYEEVICH (1671–1728), Russian soldier who began life as one of the pages of Tsar Theodore III, after whose death he served the little tsar Peter in the same capacity. The playfellowship of the two lads resulted in a lifelong friendship. In his 21st year Apraksin was appointed governor of Archangel, then the most important commercially of all the Russian provinces, and built ships capable of weathering storms, to the great delight of the tsar. He won his colonelcy at the siege of Azov (1696). In 1700 he was appointed chief of the admiralty, in which post (1700 to 1706) his unusual technical ability was of great service. While Peter was combating Charles XII, Apraksin was constructing fleets, building fortresses and havens (Taganrog). In 1707 he was transferred to Moscow. In 1708 he was appointed commander-in-chief in Ingria, to defend the new capital against the Swedes, whom he utterly routed, besides capturing Viborg in Carelia. He held the chief command in the Black sea during the campaign of the Pruth (1711), and in 1713 materially assisted the conquest of Finland by operations from the side of the sea. In 1719–20 he personally conducted the descents upon Sweden, ravaging that country mercilessly, and thus extorting the peace of Nystad, whereby she surrendered the best part of her Baltic provinces to Russia. For these great services he was made a senator and admiral-general of the empire. His last expedition was to Reval in 1726, to cover the town from an anticipated attack by the British government, with whom the relations of Russia at the beginning of the reign of Catharine I were strained almost to breaking-point. Though frequently threatened with terrible penalties by Peter the Great for his incurable vice of peculation, Apraksin, nevertheless, contrived to save his head, though not his pocket, chiefly through the mediation of the good-natured empress, Catharine, who remained his friend to the last, and whom he assisted to place on the throne on the death of Peter. Apraksin was the most genial and kindhearted of all Peter's pupils. He is said never to have made an enemy. He died Nov. 10, 1728.

See R. Nisbet Bain, *The* Pupils of Peter the Great (London, 1897). (R. N. B.)

APRICOT, the fruit of Prunus armeniaca. Like the plum and the peach, the apricot is a stone fruit, cultivated generally throughout temperate regions and like those fruits it is used fresh for dessert, or preserved by canning and drying. In tree, fruit and flower characters, the apricot is somewhat intermediate between the plum and the peach. Trees are large and spreading and in this respect are more like the peach trees. The leaves are broad, heart shaped, dark green in colour, and held erect on the twigs. The flowers are white in full bloom, resembling those of the plum in colour, but are borne not in clusters but singly or doubly at a node on very short stems. The apricot is self-fruitful and sets fruit when its blossoms are self-pollinated. The pit is smooth, somewhat like that of the plum but broader, somewhat flatter, and more winged. The fruit is nearly smooth, round to oblong in some varieties, somewhat flattened, and in general more like the peach in shape, but with little to no pubescence when ripe. The flesh is typically an attractive yellow to yellowish orange. The kernels of some varieties are sweet.

The apricot was formerly considered a native of the Caucasus and Armenia, hence the species name armeniaca, but later studies suggest that China is its native home. The fruit is now cultivated in all of central and southeastern Asia and in parts of southern Europe and north Africa. It was, doubtless, among the fruits brought into southern California early in the 18th century by the mission fathers. The American Pomological society lists 11 varieties as grown in the United States in 1879. The apricot has been crossed with varieties of plum, particularly the Oriental plum. Some of the more promising of these crosses have been introduced under the group name, plumcot. No horticulturally satisfactory peach-apricot varieties have been reported. Apricots are propagated by budding on peach or apricot root stocks. The peach, plum, and apricot may be readily intergrafted. The apricot does well on peach stock, but the peach on apricot is not entirely satisfactory. The tree succeeds in a well drained, loamy soil, preferably light rather than heavy.

Production of this fruit in the United States is restricted to regions where climatic conditions are favourable. Most varieties will withstand winter cold as well as peaches, but the blossom buds, opening earlier than those of the peach, are frequently killed by late freezes. The trees are quite drought resistant and under favourable growing conditions are long-lived. Some trees have been found which are estimated to have lived 50 to 100 years or longer.

The commercial production of the apricot in the United States is confined largely to the Pacific coast and Intermountain states. The average total production of the commercial crop for the ten-year period 1932–41 was 236,420 tons. The average annual production for California alone for the same period was 223,800 tons with a farm value of $8,575,000. The bulk of the crop is marketed as dried fruit. In some years of large yields more than 70% of the crop has been dried. Approximately 58,605,000 pounds of dried and canned apricots from the western states were exported annually in the five-year period 1935–39. The United Kingdom is the largest user of the canned fruit.

Dried apricots have a high dietary food value, being an excellent source of iron and vitamin A. (F. P. C.)

APRIES, the name by which Herodotus (ii. 161), and Diodorus (i. 68) designate *Uehabrē*, Ὠαφρής (Pharaoh-Hophra), the fourth king (counting from Psammetichus I.) of the 26th Egyptian dynasty. He reigned from 589 to 570 B.C. (See EGYPT and AMASIS.)

APRIL, the second month of the ancient Roman and the fourth of the modern calendar, contains 30 days. The derivation of the name is uncertain. The traditional etymology from Lat. aperire, "to open," in allusion to its being the season when trees and flowers begin to "open," is supported by comparison with the modern Greek use of ἄνοιξις (opening) for spring. In Rome on the fourth day games (Ludi *Megalenses*) were celebrated in honour of Cybele; besides others, on the 21st—which was regarded as the birthday of Rome—the *Vinalia* urbana, when the wine of the previous autumn was first tasted; and on the 28th and four following days the riotous *Floralia*.

See Chambers's *Book* of Days; Grimm's Geschichte der deutschen *Sprache*, Cap. "Monate"; also APRIL-FOOLS' DAY.

APRIL-FOOLS' DAY or **ALL-FOOLS' DAY,** the name given to the 1st of April in allusion to the custom of playing practical jokes on friends on that day, or sending them on fools' errands. The origin of this custom has been much disputed; it is in some way a relic of those once universal festivities held at the vernal equinox, which, beginning on old New Year's Day, March 25, ended on April 1. In India, at the feast of Huli, the last day of which is March 31, the chief amusement is the befooling of people by sending them on fruitless and foolish errands. Though April 1 appears to have been anciently observed in Great Britain as a general festival, it was apparently not until the beginning of the 18th century that the making of April-fools was a common custom. In Scotland the custom was known as "hunting the gowk," *i.e.*, the cuckoo, and April-fools were "April-gowks," the cuckoo being there, as it is in most lands, a term of contempt. In France the person befooled is known as *poisson d'avril*.

A PRIORI AND A POSTERIORI. The literal meaning of these terms is prior and subsequent respectively; and the reference is usually to the relation of knowledge to experience. Generally speaking any knowledge or component of knowledge that is prior to experience of the facts in question is described as a *priori*, whereas any knowledge or cognitive constituent that is derived from experience of the facts concerned is said to be a posteriori. Both these terms have many different shades of meaning, the chief of which can be best appreciated by following their historical course.

The Aristotelian meaning of the terms was intimately connected with Aristotelian philosophy generally. According to this anything real is composed of a universal essence (or form) and matter. By nature the universal essence is prior to the matter. Hence any reasoning from the general nature (or essence) of things is argument from that which is by nature prior (*a*

priori), whereas any knowledge derived from experience of the materialized instances of that essence is obtained from that which is by nature subsequent *(a posteriori)*. The Aristotelian use of these terms has only survived in the much modified form according to which any knowledge derived from general principles, or from the general nature of the objects contemplated, is said to be *a priori,* whereas knowledge derived from observation is described as *a posteriori.* In this modified sense, a *priori* and *a posteriori* are almost equivalent to *deductive* and *inductive* respectively.

The Scholastic meaning of the terms, as used by Albert of Saxony in the 14th century, was restricted to the purely temporal distinction between them, and abstracted from the Aristotelian metaphysics of form and matter. As causes precede their effects, arguments from causes to effects were called a *priori,* those from effects to causes were called *a posteriori.*

The Rationalistic use of the terms was different again. Briefly whatever is derived from concepts, ideas, or reason as such is called *a priori;* whatever is learned from experience is called *a posteriori.* This usage was partly suggested already by Plato, and encouraged by Descartes and Herbert of Cherbury, but was brought into vogue mainly by Leibniz. Its chief importance consists in the fact that it paved the way for the new uses to which Kant put these terms.

The Transcendental use of the terms, as introduced by Kant, ignores the temporal distinction and emphasizes the *logical* difference between them. What Kant distinguishes by means of them is not two *kinds* of knowledge but two moments or *factors* in all knowledge. In all human knowledge, according to Kant, there is something which is not derived from experience, something in fact without which human experience would be impossible—this factor he calls the *a priori* element in knowledge. Such a *priori* elements are the forms of space and time, the categories of substance, cause, etc. These are inherent in the nature of the mind as such, and are not derived from experience. On the other hand there is in all knowledge a something, a manifold something, supplied by experience or through experience—this factor, this raw material as it were, is the a *posteriori* element which is transformed into an *orderly* experience with the help of the *a priori* forms and categories. The *a priori* elements, as conceived by Kant, though subjective in the sense that they are supplied by the percipient mind and not by the manifold of sensation (the external raw material of experience), are objective in the sense that they are not peculiar to any individual mind but are characteristic of, and valid for, all experience. Again, the *a priori* elements are not things of which the mind is explicitly conscious; as a rule they only manifest themselves in the way in which they shape experience.

The Evolutionary use of the terms, as we find it in Herbert Spencer, G. H. Lewes and others, attempts to mediate between the transcendental and the genetic interpretations of the factors in question. What seems a *priori* to the individual may nevertheless have been slowly acquired from experience in the long history of the human race. If so the difference between the *a priori* and the *a posteriori* is not absolute—what is *a posteriori* to one generation may become *a priori* for some future generation.

(A. Wo.)

APRON, originally "napron," but corrupted from "a napron" to "an apron" (O.Fr. *naperon,* dim. of *nape, nappe,* table-cloth). An article of dress worn to protect the front of the clothes. The apron is part of the ceremonial dress of Freemasons, and bishops and deans. The word is also used technically for the protecting ledge below the entrance to a dock, the strip of lead beneath a gutter, etc.

APRON STAGE, in theatre design, the portion of the stage projecting into the auditorium. In England, the Elizabethan platform stage developed during the Restoration period into the wide "apron" extending from the proscenium arch. The apron itself was level, whilst the stage behind it generally sloped slightly upwards. This form of stage was unknown on the continent of Europe in the 17th century, and was peculiar to the English theatre. Early in the 19th century, when the curtain came into use to mark the close of an act or of the play itself, the use of the apron was abandoned. It has been revived in the 20th century, but generally for the production of Elizabethan or Restoration plays, when a setting appropriate to the period has been desired.

See Allardyce Nicoll, *The Development of the Theatre* (1927).

APSARAS, in Indian Vedic mythology, a water-sprite. In the *Rig-veda* the sea-apsarases flow to Soma (*q.v.*). Though they are consorts of the Gandharvas (*q.v.*), they also wed mortals. They are also wives of Krishna Vāsudeva.

See A. A. Macdonell. *Vedic Mythology,* and *E. W.* Hopkins, ***Epic Mythology*** (Strasbourg, 1895 and 1915).

APSE, in architecture, primarily a semicircular recess covered by a half dome. Hence, through the use of such a form to terminate the choir in early churches the word is used, even when no vault is present, for any termination of a choir, a transept, an aisle or a chapel either circular or polygonal in plan.

In Roman work, where the apse first appears, it occurred chiefly as an enlarged niche (*q.v.*) to hold and give importance to the statue of a deity in a temple. From this original derivation the use of the form spread to other types of building, especially to the basilica as seen in the Imperial basilica in the palace of Domitian on the Palatine Hill *(see* illustration under *BASILICA).* The apse form thus used was, from the beginning, universally adopted by the early Christians as the climax of their churches. In the basil-

FIG. I.—THE VENTRAL VIEW OF A TYPICAL FEMALE THYSANURAN (MACHILIS MARITIMA)

icas of the time of Constantine, in the western part of the empire the apse always faced the west so that the rising sun might shine directly into the church. This was the orientation of the apse in old St. Peter's at Rome. During the 6th and 7th centuries, however, the usage in this matter gradually changed, so that churches in the west, like those in the east, had their apses toward the east and this has remained the custom ever since. The apse of the early Christian basilica was the place in which the clergy sat, the altar being situated between them and the rest of the church. This arrangement is still preserved in the apse of the cathedral at Torcello and in that of the church at Parenzo in Istria. In both cases there are semicircular benches of marble following the line of the apse and arranged in several stages, one above the other like the seats of an ancient theatre. In the centre, on the axis, was the bishop's throne, raised above the clergy benches and approached by a flight of steps. With the development of the choir as the place for the clergy seats, the old use of the apse naturally disappeared and the altar was pushed back into the apse until, in many Renaissance churches, it is against the back wall.

The apse was the place for the richest decoration in the church structure. It was sheathed with marble, frequently in elaborate patterns of light and dark, and the vault surface was covered with a glass mosaic in which some embodiment of the Godhead was the chief feature.

At the end of the 6th century, liturgical changes rendered necessary the addition of other apses besides the main choir apse. These were frequently placed at the end of the side aisles but occasionally, when there was a transept, at the ends of the transept (as in the basilica at Bethlehem and in many examples of Coptic churches).

By the time Romanesque design was developing in western Europe, apse chapels had also been added to the church plan. This at once gave a great opportunity for enriching exterior design, till then severely simple, and led eventually to the development of that complex and magnificent combination of main apse and apse chapels known as the chevet (*q.v.*). In Italy, however, where chapels were usually confined to other portions of the church, the apse remained simple in form and gained its richness from the use of wall arcading, cornices and buttresses.

The apse, because of its shape, enclosed on one side and open on the other, gives great dignity to any object, such as an altar or statue, placed in its centre. It is, therefore, an admirable form with which to terminate any vista or to end any large hall, and it is so used in much modern secular work. (T. F. H.)

APSE and **APSIDES,** in mechanics, either of the two points of an orbit which are nearest to and farthest from the centre of motion. They are called the lower or nearer, and the higher or more distant apsides respectively. The "line of apsides" is that which joins them. forming the major axis of the orbit.

APSIDIOLE, in architecture, a small apse, especially a minor apse attached to the exterior of the main apse of a church.

APSINES, of Gadara, a Greek rhetorician, (c. A.D. 190–250). He was the friend of Philostratus, the author of the *Lives of the Sophists,* who speaks of his accurate memory. Two rhetorical treatises by him are extant—a handbook of rhetoric largely taken from the *Rhetoric* of Longinus, and a smaller work on Propositions maintained figuratively.

Editions by Bake (1849); Spengel-Hammer in Rhetores Graeci ii. (1894); see also Hammer, De Apsine Rhetore (1876); Volkmann, Rhetorik der Griechen und Romer (1885).

APT, a town in France, in the department of Vaucluse, on the left bank of the Coulon, 41 mi. E. of Avignon by rail. Pop. (1936) 4,836. Apt was the chief town of the Vulgientes, destroyed by the Romans about 125 B.C. and restored by Julius Caesar, who named it Apta Iulia. Injured by the Lombards and the Saracens, its fortifications were rebuilt by the counts of Provence. The bishopric, founded in the 3rd century, was suppressed in 1790. The massive ancient walls have been replaced by boulevards; the streets are narrow and irregular. The church of Ste. Anne (once the cathedral) was begun about 1056 on the site of an older edifice, but was not completed until the 17th century. Roman remains have been found; the Pont Julien, spanning the Coulon, dates from the and or 3rd century. The chief manufactures are artistic pottery, cement, jam, and tiles; and there is a considerable trade in fruit, vegetables, silk, wool, grain, and cattle.

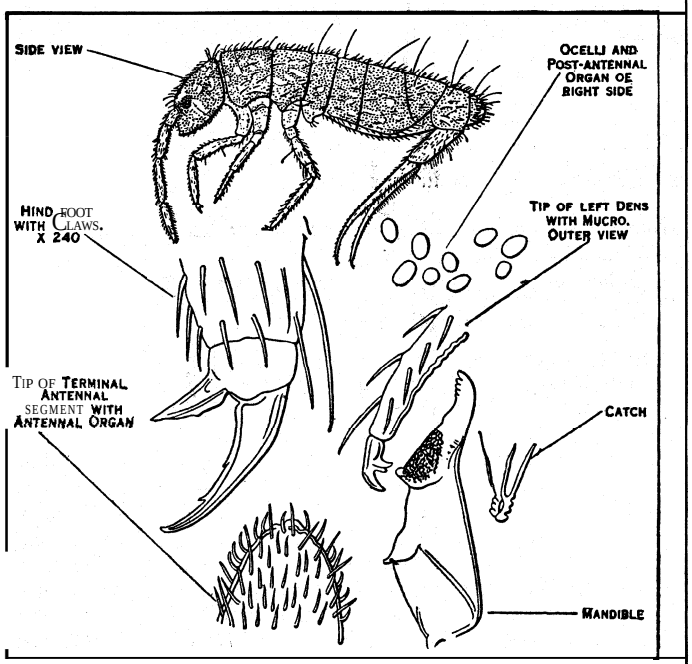
APTERA: see APTERYGOTA.

APTERYGOTA, the name given to the lower of the two subclasses into which the insects (*q.v.*) are divided and now used in preference to the older term Aptera, which has been discarded in modern zoological classification, The Apterygota are all wingless insects and there is every reason to believe that this wingless condition was inherited from primitive ancestors of the insects, long before the latter had acquired organs of flight. A second important feature is the fact that they undergo little or no metamorphosis and, unlike the higher insects (or Pterygota), they bear one or more pairs of abdominal appendages in addition to genitalia and cerci. Apterygota are universally distributed, but owing to their small size and concealed habits probably less than half the world's species have yet been discovered. Upwards of 1,200 species are known and these are classified into three well-defined orders:—(a) Thysanura, (b) Protura, and (c) Collembola.

The **Thysanura** (fig. 1) are popularly known as bristle-tails and include the most primitive of all insects. They are probably ancient survivals of a formerly more extensive group and persist to-day owing to their leading a concealed life in rotting wood, under stones, or in leaf-mould; a few also live in the nests of ants and termites. The mouth-parts are masticatory in function with well developed superlinguae, the antennae are many-jointed, and compound eyes may be present. The abdomen has 11 segments, the tenth usually carrying a pair of long bristle-like tail-feelers or cerci (fig. 1) and sometimes a median organ of the same character. It is to these feelers that the popular name is due. The abdomen also carries one to eight pairs of unjointed appendages, or styli, which are usually accompanied by protrusible sacs, possibly respiratory in function. They mainly breathe by means of tracheae and the spiracles vary in number from three pairs (*Campodea*) to 11 pairs (*Japyx*). Some of the species are clothed with scales like moths. Among the best known of the Thysanura

are the "silver fish," *Lepisma saccharina,* which occurs in buildings in Europe, North America, etc., where it is destructive to paper, book bindings, etc., and *Thermobia domestica,* which frequents the warmth of bakehouses and kitchens. *Machilis maritimus* (fig. 1) inhabits rocky coasts and *Campodea* spp. occur in soil and leaf-mould.

The Protura (or Myrientomata) are minute whitish creatures scarcely exceeding 2mm. in length and unlikely to be found



FROM CARPENTER. "STRUCTURE OF THE COLLEMBOLA" PROC. ROYAL DUBLIN SOC. XI

except by the expert collector, though they are not rare in certain types of moist soil, in peat, turf, or beneath bark. The order was first recognized by Silvestri in 1907 and only a small number of species have so far been described, but they have been found in Britain and other European countries, North America, and the Orient. Protura are elongate insects devoid of antennae and with piercing mouth-parts sunk into the head as in Collembola; superlinguae appear to be wanting. There are no eyes and the abdomen consists of 12 segments, the first three each bearing a pair of small footlike appendages. In the newly-hatched insect the abdomen is composed of nine segments, but during growth three more become added between the last two segments. This anamorphosis, or increase in the number of segments after emergence from the egg, is a feature shared with the Chilopoda and Diplopoda and is unique among insects. On account of this peculiarity some authorities, including Comstock and Berlese, maintain that these organisms form a separate class of their own—the Myrientomata. The balance of their characters, however, lends support to the view that they are a true, but somewhat anomalous, order of insects.

The Collembola (fig. 2) are popularly known as springtails. They are small insects rarely exceeding 5mm. in length and they occur in almost all situations, especially in decaying vegetable matter, under bark, on herbage, etc.; a few occur on the surface of fresh water and several inhabit the sea coast. The order is found in all regions from the poles to the tropics; a very wide distribution, extending over several continents and to remote islands, is also enjoyed by some of the genera and even by certain individual species. Collembola vary greatly in coloration, some being blue-black, others banded or white or even red, while those bearing scales have a metallic lustre. The mouth-parts are sunk into the head and are either biting or partly suctorial in function, and superlinguae are present. The antennae are never more than six-jointed and compound eyes are absent, simple eyes or lateral ocelli only being evident. Just behind each antenna is a peculiar sense-organ, the *post-antennal organ,* of very varied structure, whose function is obscure. The abdomen consists of six segments; the first of these carries a pair of fused appendages forming the *ventral tube,* one of whose functions appears to be that of an adhesive organ enabling the insect to climb smooth surfaces. The third abdominal segment usually carries small appendages which are partly fused to form the "catch" or *hamula,* whose function is to hold the "spring" in position when at rest. The "spring" or *furcula* is likewise formed of a pair of partly fused appendages and is borne by the fourth abdominal segment. The bases of these appendages are fused to form the *manubrium,* but distally they remain as separate rami or *dentes,* each bearing a *mucro* or claw at its apex. The spring enables Collembola to leap several inches, and the name springtail is due to this fact; in some genera, however, the spring is wanting or vestigial. Most Collembola have no tracheal system and breathe through the general body-surface; in the globular forms represented by *Sminthurus* and its close allies, tracheae are present and there is a single pair of spiracles placed on the anterior region of the prothorax, close to the head. Among well-known species of Collembola, the dark blue *Anurida maritima* is found on the Atlantic coasts of Europe and North America, where it is daily submerged by the tide. The minute purple-black *Bourletiella hortensis* is destructive to mangolds, and the green *Sminthurus viridis* is injurious to seedling clover in England as well as attacking lucerne in Australia.

Owing to their fragile structure but few Apterygota have been found preserved as fossils in the rocks. A number of Thysanura and Collembola occur, however, in Baltic amber of Oligocene date and a Lepismid is known from the Miocene of Florissant.

The embryonic development of several genera of Apterygota has been studied but the special features revealed in this subclass are better dealt with by comparison with other insects than here *(see* INSECTS).

BIBLIOGRAPHY.—The literature on Apterygota is technical, very scattered, and often difficult of access. Sir J. Lubbock's "Monograph of the Collembola and Thysanura," *Ray Society* (1873), is now out of date; for a useful recent handbook *see* C. Houlbert, "Thysanoures, Dermaptères et Orthoptères" in the *Encyclopédie Scientifique* (1924), which deals with the chief British and European species and has a good bibliography. V. Willem, "Recherches sur les Collemboles et Thysanoures," *Mem. Cour. Acad. Roy. Belg.* lviii. (1900) and W. Axelson, "Die Apterygotenfauna Finlands" in *Acta Soc. Scient. Fennicae,* xxsvii. and xl. (1907, 1912), are indispensable to the student. For the North American species J. E. Guthrie, *Collembola of Minnesota* (1903), and numerous papers by J. W. Folsom should be consulted. For the Protura the standard treatise is that of A. Berlese, "Monographia dei Myrientomata," *Redia,* vi. (1909). (A. D. I.)

APTERYX, the generic name of the kiwis *(q.v.)* of New Zealand, referring to the extremely reduced condition of the wings.

APUANIA, a town of Tuscany, Italy, capital of the province of Apuania, and located about 16 mi. S.E. of Spezia. It is composed of the communes of Massa, Carrara and Montignoso, which were merged in Dec. 1938, and renamed Apuania. Population of the three communes in the 1936 census was 103,682.

Since both Massa and Carrara were old cities, there are many mediaeval and Renaissance buildings in Apuania. The old Carrara cathedral (1272–1385) is a fine Gothic church dating from the period of Pisan supremacy. All the principal buildings of this part of Apuania are constructed of the local marble, for which Carrara was famous. Some of the quarries were worked in Roman times *(see* LUNA), but were abandoned after the downfall of the western empire, until the growth of Pisan art in the 12th and 13th centuries created a demand for the marble.

In the part which was formerly Massa is the Palazzo Ducale, erected in the 16th century by the Cybo-Malaspina family, who also built the old castle above the town.

The quarrying of marble is still important in the area.

APULEIUS, LUCIUS, Platonic philosopher and rhetorician, was born at Madaura, in Numidia, about A.D. 125. He was educated at Carthage and Athens, and then travelled in the east, principally in order to obtain initiation into religious mysteries. After practising as an advocate in Rome, he returned to Africa

and at Oea (Tripoli) met a rich widow, Aemilia Pudentilla, whom he later married. Her family disapproved and accused Apuleius of having won her affections by magic arts. His defense (*Apologia* or De Magia) before the proconsul. Claudius Maximus, is our chief authority for his biography. The remainder of his life was devoted to literature and philosophy.

The work on which the fame of Apuleius chiefly rests is the *Metamorphoses* or Golden Ass (the latter title seems not to be the author's own, but to have been bestowed in compliment), which was founded on a narrative in the Metamorphoses of Lucius of Patrae, a work extant in the time of Photius. From Photius's account (impugned, however, by Wieland and Courier), this book would seem to have been a collection of marvellous stories, related in perfect good faith. This particular narrative attracted the attention of Apuleius's contemporary, Lucian, who proceeded to work it up, adhering, as Photius seems to indicate, closely to the original, but giving it a comic and satiric turn. Apuleius followed Lucian's version, making it, however, the groundwork of an elaborate romance, and altering the *dénouement* to suit the religious revival of which he was an apostle.

The adventures of the young hero in the form of an ass are much the same in both romances, but in Apuleius he is restored to human shape by the aid of Isis, and finally becomes her priest. The book illustrates the contemporary reaction against a period of scepticism, and the influx of Oriental and Egyptian ideas into the old theology. It has also a well-marked literary aim, defined by Kretzschmann as the emulation of the Greek sophists, and the transplantation of their tours de force into the Latin language. The dignified, the ludicrous, the voluptuous, the horrible, succeed each other with bewildering rapidity; fancy and feeling are everywhere apparent, but not less so affectation and meretricious ornament. The Latinity has a strong African colouring, and is replete with obsolete words. The Golden *Ass* is invaluable as an illustration of ancient manners, and is full of entertainment. Don Quixote's adventure with the wine-skins, and Gil Blas's captivity among the robbers are borrowed from Apuleius, and several of the humorous episodes reappear in Boccaccio.

Of Apuleius's other writings, the Florida (probably meaning simply "anthology"), is a collection of excerpts from his declamations, ingenious but highly affected. The little tract *On the God of Socrates* expounds the Platonic doctrine of beneficent daemons, an intermediate class between gods and men. Two books on Plato (De *Platone* et *eius Dogmate*) treat of his life and his physical and ethical philosophy; a third, on logic, is considered spurious. The De Mundo is an adaptation of the Περὶ κόσμου wrongly attributed to Aristotle. Apuleius asserts that he also composed many poems and several works on natural history.

The place of Apuleius in literature is accidentally a more important one than his genius strictly entitles him to hold. He is the only extant example in Latin literature of an accomplished sophist in the best sense. The loss of other ancient romances has secured him a peculiar influence on modern fiction.

BIBLIOGRAPHY.—Complete works: *Editio princeps*, ed. Andreas (1469); Oudendorp (1786–1823); Hildebrand (1842); Helm (1905 *et seq.*); P. Thomas (vol. iii. 1908). *Metamorphoses*, Eyssenhardt (1869), van der Vliet (1897). *Psyche et Cupido*, Jahn-Michaelis (1883); Beck (1902). Apologia, I. Casaubon (1594); Kriiger (1864); (with the Florida), van der Vliet (1900), H. E. Butler (1909). Florida, Kriiger (1883). De Deo *Socratis*, Buckley (1844), Lütjohann (1878). *De Platone et eius Dogmate*, Goldbacher (1876) (including *De Mundo* and De Deo Socratis). See Rohde, *Kleine Schriften* (1901) ch. xxi. For the relation between Lucian's Ὄνος and the *Metamorphoses* of Apuleius, see Rohde, *Über Lucians Schrift Λούκιος* (1869), and Burger, De Lucio *Patrensi* (1887). On the style of Apuleius see Kretzschmann, *De Latinitate L. Apulei* (1865), Koziol, *Der Stil des A.* (1872), Medam, *La Latinité d'Apulée dans les Metamorphoses* (1926). There is a complete English translation of the works of Apuleius in Bohn's Classical Library. The translations and imitations of the Golden *Ass* in modern languages are numerous; in English, by Adlington (1566, revised by S. Gaselee in the Loeb library), and later editions (reissued in the Tudor translations and Temple Classics), Taylor (1822) (including the philosophical works), Head (1851). Of the Cupid and Psyche episode there are translations by Robert Bridges (1895), in verse, and Stuttaford (1903); and it is introduced by Walter Pater into his *Marius the Epicurean*. This episode has provided the subject of a drama by Thomas Heywood, and of narrative poems by Shakerley Marmion, Mrs. Tighe, and William Morris.

APULIA (Italian *Puglia*), a part of Italy once inhabited by the Apuli, a Samnite tribe (see SAMNITES) settled round Mt. Garganus on the east coast. They mingled with Iapygians who had come from Illyria, so the name Apulia reached to the border of ancient Calabria. Almost the only monument of Samnite speech from the district is the famous Tabula *Bantina* from Bantia, on the Lucanian border, one of the latest and most important monuments of Oscan, with some southern peculiarities. (See OSCAN.) Dating between 118 and 90 B.C., it shows that Latin had not even then spread over the district. (See LUCANIA.) Far older are coins from Ausculum and Teate (later known as Teanum Apulum), the earliest being 4th century B.C. Roman or Latin colonies were few, Luceria and Brundisium being the chief. The Romans developed the migration of flocks and the practice still continues; sheep-tracks (tratturi), 350 ft. wide, leading from the Abruzzi into the plain of Apulia, date at least from Roman times. Large-scale sheep farming was, however, detrimental to the towns, and risings occurred until the Social War. Teate was at first the chief town, then Luceria, a military post, then, under the empire, Canusium. Once winter grazing for a million sheep, the plain now supports half that number, mainly because of the spread of cultivation.

The old road system consisted of the Via Appia (see APPIA, VIA), the Via Traiana, and the coast road, more or less parallel east-southeast. The first, east from Beneventum, entered Apulia at Pons Aufidi, and ran to Venusia, Tarentum, and Brundisium. The second, northeast from Beneventum, turned east at Aecae, and ran through Herdoniae, Canusium, Butuntum, Barium and Gnathia to Brundisium. A short cut from Butuntum to Gnathia through Caelia, ran inland. The third parallel line ran north of the Via Traiana, entering Apulia near Larinum, and thence, keeping in the plain south of Mons Garganus, rejoined the coast at Sipontum (branch at Aecae through Luceria and Arpi to the Via Traiana). It then passed through Barduli (where it was joined by a road from Canusium by way of Cannae) to Barium, where it joined the Via Traiana. From Barium a road probably ran through Caelia, south-southeast to the Via Appia, some 25 mi. N.W. of Tarentum.

Barium was an important harbour, though less so than Brundisium, and Tarentum, which, however, belonged to Roman Calabria. Apulia with Calabria, formed the second region of Augustus. Hannibalic and later wars, Strabo says, destroyed the prosperity of the country; in imperial times we hear little or nothing of it. Both were governed by a corrector from Constantine onwards, but in 668 the Lombards conquered Calabria and Apulia, and then the former name was transferred to Bruttium, the meaning of the latter being extended to include Calabria also. In the 9th century the greater part of this territory was recovered by the Byzantine emperors, whose governor was called Κατα-πανός, a name which, under the corrupt form Capitanata, belonged to the province of Foggia till 1861. It was conquered by the Normans under William Bras-de-fer, who became count of Apulia: it was raised to a dukedom with Calabria by Robert Guiscard in 1059, and united to the Sicilian monarchy in 1127. Fine Romanesque cathedrals were constructed under the Normans and the Hohenstaufen. It became part of the kingdom of the two Sicilies in 1734, and was united with Italy in 1861.

Modern Apulia comprises the five provinces of Foggia, Bari, Brindisi, Taranto and Lecce (the last three roughly the ancient Calabria), and is often known as Le Puglie; it stretches from Monte Gargano to the southeastern extremity of Italy, with an area of 7,440 sq.mi. and a pop. (1936) of 2,637,022 (1,589,064 in 1881; 1,964,180 in 1901), bounded on the north and east by the Adriatic, southeast by the Gulf of Taranto, south by Basilicata, and west by Campania and the Abruzzi. Foggia province has mountains but is mainly a great plain, the Tavoliere (chessboard) di Puglia, with coastal lagoons. Bari province, east-southeast of Foggia and divided from it by the Ofanto (Aufidus), the only considerable river of Apulia, is hilly. with coastal towns. The lack of villages is especially noticeable.

Besides sheep, horses, cattle and swine are bred. A great modern aqueduct spreads the waters of the Sele, and cultivation is

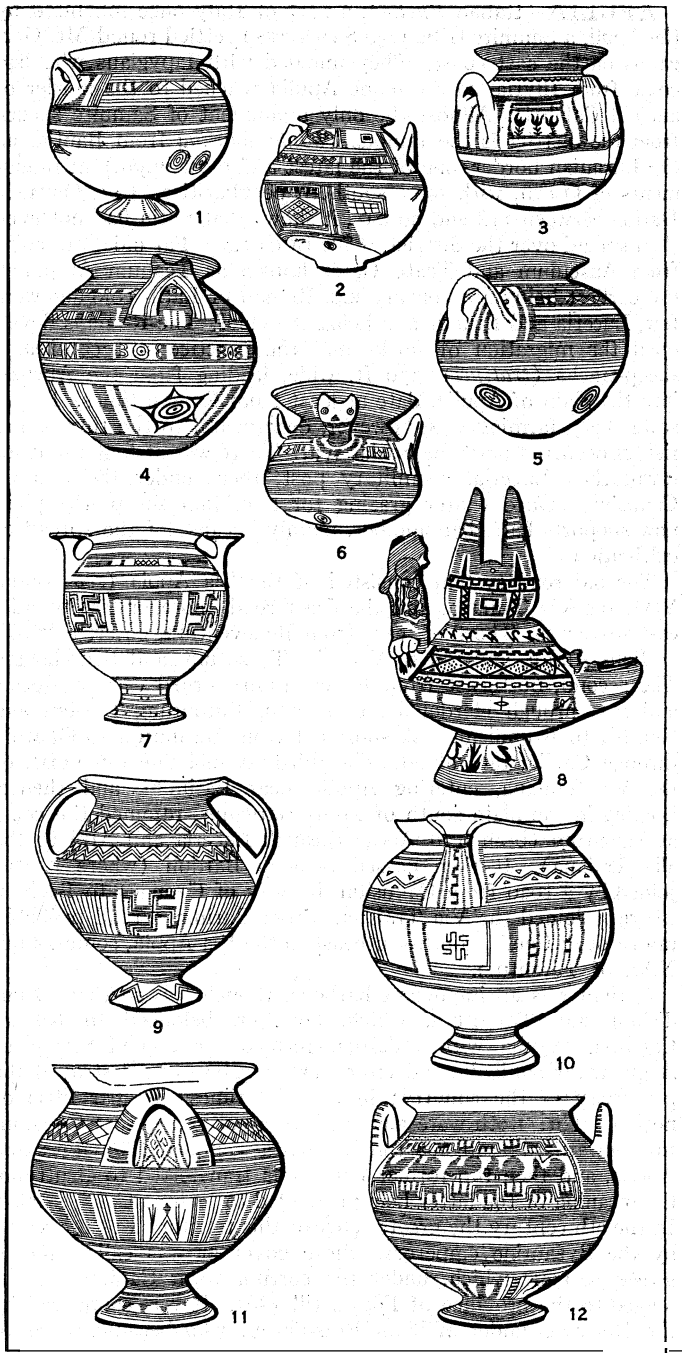

FIG. 1.—DAUNIAN AND PEUCETIAN GEOMETRIC POTTERY. THE PEUCETIAN WARE IS SIMPLE AND HARMONIOUS IN CONTRAST TO THE FANTASTIC RITUALISTIC DAUNIAN STYLE

1-8. Early Daunian Ware (600-450 B.C.). 1. Typical shape known in Picenum as early as 600 B.C. 2, 4 and 5, examples of round bottomed footless craters with side handles and plate-like rim; 3 and 5, products of Canosa; the thumbless human hand of 3 (see handle on right) was probably a talisman; 6, a characteristic double-storied jar, the handle representing a cat's head; 8, a ritual vase

9–12. Peucetian Ware (650–450 B.C.). 7, 9 and 10, the swastika sign will be noted on these specimens, which are of black and white pottery; 12, vase painted in red and black

active in Bari, where grain, wine, olives, almonds, lemons, oranges, tobacco, etc. abound; much olive oil is exported. The salt works of Margherita di Savoia produce large quantities of salt, and nitre is extracted near Molfetta. Chemical industries that draw their raw materials from these products are also developing rapidly. Seafishing is also an important industry.

The main railway from Bologna to Brindisi passes all through Apulia by way of Foggia, the main railway centre of Apulia, and Bari, with several branches; a steam tramway runs from Barletta to Bari via Andria.

The most important harbours of Apulia are Bari, Brindisi, Taranto; then follow Barletta, Molfetta and Gallipoli.

BIBLIOGRAPHY.—For prehistoric remains in Apulia *see* T. E. Peet, *The Stone and Bronze Ages in Italy* (1909); and M. Gervasio, *I dolmen e la civiltà del bronzo nelle Puglie* (Bari, 1913). For mediaeval architecture *see* E. Bertaux, *L'Art dans l'Italie meridionale*, I. (1904); A. Vinaccia, *Monumenti Mediaevali della Terra di Bari* (Bari, 1915); A. Haseloff, *Die Bauten der Hohenstaufen in Unter-Italien* (1920). (X.)

Apulian Geometric Pottery.— The archaeology of ancient Apulia has been exceedingly obscure until the last few years, and even now its obscurity is only illumined by flashes thrown on certain parts. The legitimate iron age sequel to the Neolithic and bronze age culture of Matera and Molfetta has not yet been discovered, and the pre-history of Daunia, Peucetia and Messapia begins to take shape as a coherent whole only with the 7th century. Even then our knowledge is almost confined to the pottery, but this offers a rich field for study.

The subject of the painted pottery has been put on a scientific basis by the intensive studies of Maximilian Mayer, who has identified and distinguished the products of the several provincial schools. and has established a scheme of dating which, with some slight rectifications and adjustments, due principally to Gervasio, may be considered as final. The division of schools corresponds very closely to the old pre-Roman distribution of the region into three sections. Of these the most northern is Daunia, extending from the promontory of Gargano to the most southern point in the course of the Aufidus; next to which is Peucetia, which for purposes of this classification may be said to begin at Bari and end at Egnazia. South of a line drawn from Egnazia to Taranto, the whole heel of Italy, with Lecce as its centre, is Messapia. Each of these regions has its own peculiar and well marked style in pottery. The chronology of all three is not precisely concurrent; actually the Daunian school is dated from about 600 to 450 B.C. and the Peucetian from 650 to 500 B.C. while the Messapian only begins at 500 B.C. and lasts for two centuries. Wholly distinct is a much later Daunian school confined to Canosa, which belongs to the fourth and third centuries and may be called late-Canosan.

This chronology excludes any connection with the Mycenaean. Actually no single example of Mycenaean ware has ever been discovered between the Alps and the Gulf of Taranto. But at two places in Apulia, Mattinata on the promontory of Gorgano and the Borgo Nuovo at Taranto geometric pottery of the very early iron age has been found. These two isolated discoveries, however, have yet to be explained; they stand apart from all other Apulian products and their proper connections have not been ascertained The pottery of Mattinata and of the Borgo Nuovo is apparently a foreign importation and its date is several centuries earlier than that of the regular Apulian schools now to be described.

Canosa and Ruvo have yielded the greatest quantity of early Daunian pottery, and were perhaps the principal, though not the only, centres for its production. It is found over the whole of Daunia from ito onto-in the south to Lucera and Teanum in the north, occasionally in Picenum, and even in Istria. In Campania also the site of Suessula has yielded several vases, produced apparently under Daunian influence.

There are four principal forms. The first is a round-bottomed footless crater with side handles and a plate-like rim (see fig. 1., nos. 3, 4, 5); the second is a similar crater on a pedestal. This latter (see no. 1) is the shape known in Picenum, where its occurrence at Novilara puts its date at least as early as 600 B.C. From the round-bottomed crater is evolved the most peculiar and characteristic product of Canosa, viz., the double-storied jar (no. 6). The plate-like rim has been developed into a deep bowl, which becomes more and more exaggerated during the 5th century until eventually it takes up nearly half the height of the entire jar. Strange fanciful additions are then made in the way of plastic ornament. To the ordinary ring handles are added a third and even a fourth, of increasingly fantastic kind. They may take the shape of an animal's face, most like a cat or an owl, or be formed like a thumbless human hand, which had probably some talismanic value. The fourth principal shape of pot is that which

is known in Greece as an *askos,* derived originally from an ordinary goatskin, and known at an early date over much of Sicily and Italy, but perhaps introduced by the Greeks.

Rarer, but extremely characteristic of the Daunians, are elaborate grotesque ritual vases (no. 8). Opposite to the spout is a female figure in ceremonial dress with a fillet on her brow, long plaits of hair hanging down on her shoulders, and circular discs covering her ears. Instead of human figures, other examples have strange creatures with birds'-heads upon necks like serpents. The wild sheep on the mountains which appear on the base and the upper zone of no. 8 are an unusual experiment in zoomorphism. Apart from an occasional drawing of this kind, always quite schematic, the decoration of all Daunian vases is purely geometric. Squares, lozenges and triangles are the usual motives, arranged in panels of varying length and separated by vertical lines. Most of the decoration is placed on the upper half of the vase. In the school of Ruvo the fashion was to place a hanging trapezoidal figure on the lower half, but Canosa preferred horizontal bands or concentric circles on this otherwise empty field. Almost all the Daunian pottery was made by hand, but in a few of the finest craters from Ruvo the wheel seems to have been used. The decorative designs were painted in two alternating colours, red and dark violet, generally but not always laid on a background of whitish slip.

Entirely different from the Daunian pottery, both in spirit and in choice of shape and subject, is the Peucetian. Fantastic ritual-vases are unknown in Peucetia; craters, bowls and jugs are the only forms permitted, and these are decorated in a style which is both simple and harmonious. There are two main classes of Peucetian ware, the one painted in red and black (see no. 12), contemporary with imported Corinthian vases and considerably influenced by them, the other in plain black and white with a more restricted range of motives (see 7, 9, 10, 11). There are four principal motives in the black and white, two of which, the swastika and the comb, overshadow the others. Swastikas began to appear at just the same period on pottery in the north of Italy, and are probably an imported conception from the Danube or the Balkans. The other chief motives are the festoon, and the zigzag. Cross-hatched lozenges are common to all these geometric schools but the Maltese cross, though only occasional, is peculiar to the Peucetians. This black and white ware goes back to 650 B.C. and has a range of about 150 years from that point downwards.

The sources of inspiration for the black and white class have been unsuccessfully sought in various places; and it seems fair to regard this ware as in the main an indigenous product. Daunians and Peucetians, dissimilar enough in all other respects, had each inherited a certain repertoire of geometric tradition which was widely current over the Mediterranean, but each converted it into a new style which expressed the particular temperament of an inventive and artistic race.

With the red and black ware. the permeating Corinthian influence is readily identified, and vases of this kind have been found actually associated in the same graves with Corinthian. Here also credit must be given to the Peucetian potters for their ability in adopting new motives and transmuting them without slavish copying.

The Messapian school shows far less originality than the other two. When it appears for the first time in the 5th century, the Messapian is already a mixed style, to a great extent Hellenized. Some traces of an earlier geometric tradition still survive, though overlaid and almost stifled by the foreign innovations. In the early 5th century clepsydra, lozenge and band, the old elements of the Italian geometric, are still in existence. But the uncontaminated geometric is very rare in Messapia; the native potter can hardly resist adding his zone of Greek ivy-leaves, a maeander, a rosette, or even a bird. The chief centres of manufacture for such ware (nos. 1–9 of fig. 2) were at Rugge, near Lecce, and at Egnazia, each originally a Rhodian colony. The strongest Greek influence came therefore from Rhodian sources, though others may have had some share. The hall-mark by which all Messapian pottery, except a little of the very earliest, can be detected, is

FIG. 2.— MESSAPIAN AND LATE-CANOSAN GEOMETRIC POTTERY

1–9. Messapian Ware (500–300 B.C.). The round disks at the tops and bottoms of the handles are peculiar to this school. Hence such forms have been nicknamed "torzelle." Beside these and simple bowls the only shapes in general employ were: 4 and 9, craters with handles, and 5 and 6, jug-like forms

10–15. Canosan Ware (300–200 B.C.). These are typical of the Renaissance period of Apulian art. The ornamental designs were no longer solely geometric, but show motives common on Greek pottery

the round disc about the size of a large coin at the top and bottom of each handle. This peculiarity has caused the nickname of "torzelle" to be given to such forms as nos. 1, 2, 3, 7, 8 (fig. 2). Besides these the only shapes generally employed are the crater with column or handles like 4 and 9, the jug like 5 and 6, and a simple kind of bowl.

Carefully to be distinguished from these three schools is the late-Canosan, which has nothing in common with the earlier Daunian school that also flourished at Canosa, except the shape of the vase as in nos. 10, 11, 13 (fig. 2). This survived simply because it was used for certain rituals which had not changed, but all the details of its decoration are different. The date of all the late-Canosan

pottery is 3rd and 4th century. The evidence of the tombs shows that Canosa became the centre of a brilliant Apulian renaissance in the 4th century, and during the third she was an important factor in the art-history of the Hellenistic world, becoming especially famous for large rococo works in polychrome terra-cotta, huge vases with centaurs and Cupids springing from the sides, surmounted very often by a Niobe, a Hermes, or some other statuette. At Naples there is a large collection of these, and of magnificent vases painted with scenes from Greek mythology and history. Documentary evidence proves that this collection, including the famous Darius vase and all the splendid examples from Canosa now at Munich, came from the same tombs as the humbler askoi twin-situlae and "sphagia," figured as nos. 11–15 in figure 2. If the decoration of these is examined it will be seen that the whole spirit of the late-Canosan is entirely changed from that of the earlier Daunian school. In place of the lozenge, band and triangle, the primitive motives of the geometric repertoire, there are maeanders, frets, vine-leaves and egg patterns, all designs appearing on the contemporary Greek pottery. The domination of Greek fashion is complete. But the irrepressible individuality of the Daunian, even at this late stage, breaks out in another place, finding its opportunity no longer in this minor pottery, but in the large statuettes, often of quite notable beauty, and in all the fanciful accessories of the large plastic compositions.

APURÉ, a river of western Venezuela, formed by the confluence of the Sarare and Uribante at 6° 45′ N. and 71° W., and flowing eastward across the Venezuelan llanos to a junction with the Orinoco at about 7" 40' N. and 66° 45' W. Its drainage area includes the slopes of both the Colombian and Venezuelan Andes. It has a sluggish course across the llanos for about 300m., and is navigable throughout its length. Its principal tributaries are the Caparro, Portuguesa and Guarico on the north, and the Caucagua on the south. Its lateral channels on the south mingle with those of the Arauca for many miles–forming an extensive district subject to annual inundations.

APURIMAC, an interior highland department of southern Perú. Area, 8,187 sq.mi.; population (1940) 280,213. The department was created in 1873 and comprises five provinces. Its physical features and productions are very similar to those of Ayacucho (*q.v.*), with the exception that sugar cane is cultivated with noteworthy success in the low valley of the province of Abancay. The capital, Abancay, 83 mi. S.W. of Cusco, which is only a village in size but is rich in historical associations, and Andahuaylas, in the northwest part of the department, are its principal towns.

APURIMAC, a river of central Perú, rising in the Laguna de Villafra in the western Cordilleras, seven miles from Caylloma, a village in the department of Arequipa, and less than 100 mi. from the Pacific coast. It flows first northeasterly, then northwesterly past Cusco to the mouth of the Perené tributary, thence east and north to its junction with the Ucayali at 10° 41′ S., and 73° 34′ W. It is known as the Apurimac only down to the mouth of the Mantaro tributary, 11° 45' S. and 1,325ft. above sea-level. Thence to the mouth of the Perené (984ft.) it is known as the Ené, and from that point to its junction with the Ucayali (859ft.) as the Tambo.

APYREXIA, in pathology, the normal interval or period of intermission in a fever.

'AQABA, GULF OF, the Sinus Aelaniticus of antiquity, the eastern of the two northern arms of the Red sea. Varying in width from 12 to 17m. it is 100m. long, penetrating into Arabia Petraea towards the north-north-east from 28° to 29° 32' north. The entrance is narrowed and made difficult by Tirān and other islands, while navigation is precarious owing to numerous coral-reefs and the sudden squalls which sweep down from the mountains on either side, many of which rise abruptly from the shore to 2,000 feet. It is a southward continuation of the Jordan-'Araba rift valley and raised beaches on the coast indicate a considerable fall in the sea-level. Dhahab on the western shore 33m. from the entrance is the only sheltered port in the gulf, near the head of which is Jazira Fir'ūn (mediaeval Isle de Graye), a rocky islet with ruins of a castle built by Baldwin I. (c. 1115). At the head of the gulf on the east side is 'Aqaba village with charming palm-groves, an excellent water supply and a mediaeval castle to protect pilgrims en route from Egypt to Mecca. It is the site of the biblical Elath (Eloth), one of the ports whence Solomon's fleet sailed to Ophir. The Romans called it Aelana, a military post with paved road up the valley of Wadi 'Itm to Ma'an and Petra. In the 10th century an Arab geographer described it (Haila or Ailat), as a great port of Palestine and the emporium of the Hejaz. Suffering at the hands of Saladin (12th century) it fell into decay until 1841 when Turkey recognized it as belonging with Sinai peninsula to Egypt owing to its regular use by Egyptian pilgrims. These later adopted the sea-route and in 1892 Turkey resumed possession of 'Aqaba. In 1906 the Turks occupied the neighbouring post of Taba, supposed to be the ancient port of Ezion-Geber. Great Britain intervened on behalf of Egypt and the Turks withdrew and agreed to the demarcation of a line joining the head of the Gulf of 'Aqaba to Rāfi'a on the Mediterranean as the Turko-Egyptian frontier. In 1917, during the World War, Col. Lawrence and the Hejaz army captured 'Aqaba by a brilliant *coup-de-main* from the land side whence no attack was anticipated by the garrison. From then till 1925 'Aqaba was administered together with Ma'ān, Petra and Shaubak as part of the Hejaz kingdom. King Husain took refuge there in Oct. 1924, after his abdication of the Hejaz throne in consequence of the Wahhabi invasion of his country. In July 1925, a Wahhabi attack being anticipated, Great Britain, as mandatory for Palestine, ejected King Husain (who retired to Cyprus) and occupied the 'Aqaba-Ma'ān province which has since been administered as part of Trans-Jordan. Ibn Sa'ud, as king of the Hejaz, maintains an attitude of protest against what he considers an act of usurpation, and the Hejaz–Trans-Jordan frontier remains undemarcated, though the de *facto* administrative frontier runs from south of 'Aqaba to Mudawwara on the Hejaz Railway.

'AQĪBA or **AKIBA BEN JOSEPH** (c. 50–132), Jewish Palestinian rabbi, of the circle known as *tanna* (*q.v.*). He became the chief teacher in the rabbinical school of Jaffa, where, it is said, he had 24,000 scholars. Whatever their number, it seems certain that among them was the celebrated Rabbi Meir, and that through him and others 'Aqiba exerted a great influence on the development of the doctrines embodied in the Mishnah. He sided with Bar Cocheba in the last Jewish revolt against Rome, recognized him as the Messiah, and acted as his sword-bearer. Being taken prisoner by the Romans under Julius Severus, he was flayed alive with circumstances of great cruelty, and met his fate, according to tradition, with marvellous steadfastness and composure. He is said by some to have been 120 years old at the time of his death. He is one of the ten Jewish martyrs whose names occur in a penitential prayer still used in the synagogue service. 'Aqiba was among the first to systematize the Jewish tradition, and he paved the way for the compilation of the Mishnah. From his school emanated the Greek translation of the Scriptures by Aquila.

AQUAE, a name given by the Romans to sites where mineral springs issued from the earth (Lat. for "waters."). Over roo can be identified, some declaring by their modern names their ancient use: Aix-les-Bains in Savoy (Aquae Sabaudicae), Aix-en-Provence (Aquae Sextiae), Aix-la-Chapelle or Aachen (Aquae *Grani*), etc. Only two occur in Britain: Aquae Sulis—less correctly Aquae Solis—at Bath (*q.v.*), in Somerset, which was famous, and Buxton (called Aquae simply).

AQUAE ALBULAE, springs, W. of Tibur, Latium, Italy, the water of which is bluish, strongly impregnated with sulphur and carbonate of lime, and rises at a temperature of about 75° Fahrenheit. Remains of a Roman thermal establishment exist near the principal spring, the so-called Lago della Regina. The baths are still frequented.

AQUAE CUTILIAE, a mineral spring in Italy, near modern Cittaducale, 9m. E. of Rieti. The lake near it, supposed by classical writers to be the centre of Italy, was renowned for floating islands

formed from partial petrification of plants by mineral substances in the water. Remains of baths may be seen; they were apparently resorted to by Vespasian and Titus who both died there.

AQUAE SEXTPAE, BATTLE OF: *see* AIX.

AQUA FORTIS, an early name for nitric acid (*q.v.*).

AQUAMARINE, a transparent variety of beryl (*q.v.*), having a delicate blue or bluish-green colour, suggestive of the tint of sea-water. It occurs at most localities which yield ordinary beryl, some of the finest coming from Russia.

AQUA REGIA, a mixture of one volume of concentrated nitric acid and three volumes of concentrated hydrochloric acid. It was originally given the name which it still retains, by the alchemists because of its power to dissolve gold—the king of metals.

When aqua regia dissolves gold, the metal is converted into auric chloride, $AuCl_3$, which combines with more hydrogen chloride to form aurichloric acid (chloroauric acid), $HAuCl_4$, which crystallizes from solution as $HAuCl_4$, $4H_2O$. Aqua regia also dissolves platinum, and on concentrating the solution with excess of hydrochloric acid, deliquescent crystals of platinichloric or chloroplatinic acid, $H_2PtCl_6,6H_2O$, are obtained. Evaporation of the aqua regia solution leads to the isolation of an intermediate nitrosoplatinic chloride, $PtCl_4,2NOCl$ or $(NO)_2PtCl_6$. Palladium is also readily dissolved by aqua regia, but the other four metals of the platinum group (iridium, osmium, rhodium and ruthenium) are less readily attacked by this solvent. (*See* PLATINUM METALS.)

In qualitative analysis aqua regia is also a useful solvent for certain of the less soluble sulphides: it attacks arsenious and mercuric sulphides with the production of the chlorides of arsenic, $AsCl_3$, and mercury, $HgCl_2$. It also dissolves the sulphides of cobalt and nickel, forming the corresponding chlorides, $CoCl_2$ and $NiCl_2$. The solvent action is due to an interaction between nitric and hydrochloric acids whereby chlorine is produced: $HNO_3+3HCl=Cl_2+NOCl+2H_2O$. On warming aqua regia the two gases (chlorine and nitrosyl chloride) are evolved, and if passed through concentrated sulphuric acid, chlorine escapes and nitrosyl chloride is absorbed as nitrosyl sulphate:

$$NOCl+SO_2(OH)_2=SO_2(OH)\cdot O\cdot NO.$$

When the solution of nitrosyl sulphate is dropped on to sodium chloride, pure nitrosyl chloride is generated as an orange-yellow gas with pungent suffocating odour, easily condensed in a freezing mixture to a red liquid, boiling at 5·6°C and solidifying at −60°C to a lemon-yellow solid. This gas has no action on gold although it attacks mercury. (G. T. M.)

AQUARELLE, the French term for water-colour, used in reference both to the technique and the resultant painting: *see* WATER-COLOUR PAINTING.

AQUARII, a name given to the Christians who substituted water for wine in the Eucharist. They were not a sect, for the practice was widely in vogue at an early time, even among the orthodox. (*See* EUCHARIST.)

AQUARIUM (plural *aquavia),* a name given to a receptacle or institution in which living aquatic animals and plants are kept. The term may be applied to a show-place exhibiting aquatic specimens with the object of entertaining or instructing the public, or it may be used to describe such a domestic toy as a bowl containing goldfish. Certain aquaria are purely scientific institutions designed for the study of physiological and biological problems. Of these the best known are those at Plymouth, England, and Naples, Italy, where, apart from numerous small tanks in laboratories for the use of research workers, there is in each case a public aquarium attached, in which the exhibits are at the disposal of the students for the purpose of observation and experiment. At the Marine Biological Station at Plymouth, which receives grants from the Government and the Fishmongers' Company, a number of biologists are definitely retained for the purpose of studying the habits and life histories of the marketable inhabitants of the ocean.

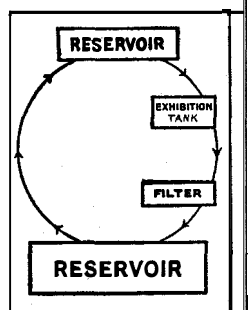

DIAGRAM ILLUSTRATING THE SYSTEM OF WATER CIRCULATION IN AN INLAND AQUARIUM

In the case of large aquaria situated near the shore, the water which can be continually replenished, is pumped from the sea in to reservoirs usually situated in the basements of the institutions After being allowed to settle, it is pumped direct into the tanks containing the specimens. Where, however, the aquaria are located inland, special care must be taken to keep the water pure and clear and to prevent the overflow from the tanks running to waste.

The most up-to-date inland aquarium is that of the Zoological Society of London in Regent's Park, which was opened in 1924. In the case of this institution, which, whilst encouraging the scientific study of aquatic life, caters for the entertainment of the public, the sea-water was brought from the Bay of Biscay. Both the fresh-and salt-water in the aquarium are prevented from becoming stagnant by a system of continual circulation, being pumped from the underground reservoirs, having in the case of the fresh-water a 60,000 gallon capacity, and in the case of the salt-water a 125,000 gallon capacity, to other reservoirs situated in the mountains of the Mappin Terraces, about 30 ft. above the exhibition tanks. From the high level reservoirs the water falls by gravity into the show tanks, the overflows passing through a series of sand filters before returning to the main storage reservoirs in the cellars of the building. The efficient oxygenation of the water is obtained by passing compressed air directly into the show tanks, and by discharging the water feeding these tanks with great force through a nozzle with a narrow aperture, the resulting bubbles producing the effect of a smoke cloud. The purity of the sea-water is also ensured by a discreet choice of the metals used in the manufacture of the piping and in the construction of the tanks. Should, for instance, copper or zinc come into contact with the sea-water of an aquarium the exhibits die speedily of metallic poisoning. The piping in the Society's aquarium is formed of chemically pure lead, or of iron lined with glass enamel. The exhibition tanks, the three largest of which hold 5,000 gallons, are constructed of slate or concrete, and are decorated with rocks. The thickness of the glass used for the fronts of the large tanks is $1\frac{1}{4}$ in. Aquatic animals are easily killed by sudden changes in temperature. The Zoological Society's aquarium has elaborate heating and refrigerating systems which keep the tanks in the temperate fresh-water and marine aquaria at a temperature of about 60°F. throughout the year. The majority of the tropical aquaria are kept at a uniform temperature of 75° to 80°F.

In an aquarium where it is not possible to replace the water continually, artificial aids must be sought to remove pollution, which, owing to the excess in number of fish per unit volume compared with the sea or river, cannot be coped with by natural means. In the Regent's park aquarium, before the water is cleaned by being passed through a series of filters, most rejected food, excrement, etc., which is easily detected on the sandy floors of the tanks, is removed daily by means of a suction pipe. Filtration is further responsible for the removal of suspended organic matter and phosphates. Aeration oxidizes ammonia and organic matter in solution. Storage in the dark kills the noxious bacteria.

Fish have been kept in captivity for hundreds of years. The ancient Romans for instance spared no expense in building huge ponds and reservoirs which they stocked with rare and expensive specimens, whilst the hobby of keeping ornamental fish in tanks has been in vogue with the Chinese since very early times. The public aquarium, however, is a comparatively modern innovation, the first to be established being the small one opened in 1853 in the Zoological Society's gardenain Regent's park. Although owing to its faulty construction it had but a short life as a fresh-water and marine aquarium, the building is still in existence and is now being used for the exhibition of wading and diving birds. The best equipped aquaria at the present day, apart from the one in Regent's park, are those at Amsterdam, Antwerp, Berlin, Brighton, Naples, New York, Honolulu, Madras and San Francisco. The Shedd Aquarium in Chicago, completed in 1931, is one of the largest and most fully equipped in the world. Its cost, including stocking, exceeded $3,500,000.

The guiding principles to be observed in the management of a large aquarium apply with equal force to the miniature home

aquarium. Anyone wishing to maintain a small aquarium stocked with suitable marine specimens should, apart from aerating the water, circulate and filter it. This may be effected by means of a syphon pipe emptying the water from a small high level tank into the exhibition tank likewise fitted with a syphon, which slowly empties the water into a low level tank after filtering through a flower pot filled with sand. When the lower tank is full the water it contains is emptied into the high level tank which should be of equal capacity. On the size of the syphon pipes depends the rate of the flow of the water, which can be controlled to last 10 or more hours according to the requirements of the specimens. In the event of the aquarist experiencing difficulty in obtaining water in sufficient quantity from the coast, there should be no difficulty in his manufacturing his sea-water at home. The fallowing formula has been tested in the Marine Biological Association's laboratories, and found to give satisfactory results:—Common salt, 45½ oz.; potassium chloride, 1¼ oz.; calcium chloride (dry), 2 oz.; magnesium chloride (crystals), 8¾ oz.; magnesium sulphate (crystals), 11½ oz.; bicarbonate of soda, ⅕ oz.

The above should be mixed with 10 gal. of soft water to which should be added, after mixing, ⅕ oz. of potassium nitrate, 10 grains of sodium phosphate, 5 grains of chloride of iron and ½ gal. of natural sea-water. The reason for adding a small quantity of natural sea-water is that sea-water contains a certain mysterious ingredient which has up to the present defied analysis, but may be considered analogous to what is known as vitamins in food. Its entire absence would result in the specimens in the aquarium developing disease in a comparatively short period.

An aquarium tank should present the greatest possible surface of water to the air in proportion to its size and depth. The popular goldfish bowl is to be condemned as admitting too little air for the well-being of its inhabitants. Square, metal-framed, slate bottom, glass-sided aquaria are best. With regard to size, the aquarist wishing to keep such comparatively hardy fish as goldfish, carp, tench, orfe, perch, etc., should allow one gallon of water to every inch of fish. Delicate forms such as trout require double that amount of water.

In setting up a small private aquarium, which should be so placed that. it receives not more than one hour of direct sunlight a day, the floor should be covered with about 2in. of well-washed gravel or sand before filling with water and planting. Plants are necessary for keeping the balanced fresh-water aquarium in a healthy condition, as they not only oxygenate the water but absorb the carbon dioxide given off by the fishes. The following plants are specially suitable for the aquarium:—Eel Grass (*Valisneria spiralis*), Arrowhead (*Sagittaria natans*), Swamp Grass (*Ludwigia palustris*), Fanwort (Cabomba caroliniana), Ditchmoss (Anacharis canadensis), Water Milfoil (*Myriophyllum verticillatum*) and Stonewort (*Nitella gracilis*). The small aquarium should have a light glass cover to keep out the dust and prevent the fishes from jumping out. If the aquarium receives daily attention the water need be changed only very rarely. Special care should be taken to ensure that any new water added is of the same temperature as the old. Fish should be transported from their native elements to the aquarium in receptacles that are broader than deep. In the case of trout which require much aeration a grid of perforated galvanized iron should be fixed in the travelling tank about 3in. from the bottom, forming a false bottom on which the fish can lie without the risk of clouding the water by the disturbance of excretory and other noxious products. On arrival at their destination the fish should not be immediately transferred to the aquarium, but the water in the carriers should be slowly replaced by the water of the exhibition tank. In the aquarium fresh-water fish are victims to various ailments. The most common is a very virulent and highly contagious fungoid disease, popularly known as salmon disease. This, which often results from sudden changes in the temperature of the water, is due to bacteria (*Saprolegnia* ferox) and first shows itself in the form of a whitish film which coats the outside of the fish. At a later stage it attacks the gills and causes the victim to die df asphyxiation. The victim may often be cured if treated in the early stages of the disease. The best remedy is to introduce common rock salt, or preferably sea-water, into the aquarium, a suitable quantity of salt being one oz. to each gallon of water. If sea-water is used, one part should be introduced for four parts of fresh-water. As the fish recovers, the strength of the solution should be very gradually reduced. It is important not to overfeed, and fish confined in small aquaria should always be on the alert for a meal. One meal a day suffices, care being taken not to introduce more food than can be devoured by the inhabitants in the course of an hour. With regard to the question of variety of foods, the majority of large fish should be supplied with bullocks', sheep's or horses' heart, liver, earthworms, prawns and shrimps. Small fish will flourish on a diet consisting of the crustacea *Gammarus* and Daphnia, enchytrae worms, the larvae of the common gnat, hard-boiled yolk of egg and fresh ants' eggs. Goldfish and other members of the carp family may be given biscuit and should also be provided with a small quantity of lettuce or other green food. Newly-born fish after the absorption of their yolk sac feed on infusoria which can easily be produced in a day or two by an infusion of vegetable matter. (E. G. Bo.)

The United States.—The principal public aquaria of the United States are at Boston, Chicago, Detroit, Honolulu, New Orleans, New York city, Philadelphia, San Francisco and Washington. The aquarium in New York is maintained by the city, its management being in the hands of the New York Zoological Society which provides all exhibits from its private funds. The Boston and Detroit aquaria are municipal institutions controlled by park departments. The aquarium in San Francisco, built with private funds and controlled by the California Academy of Sciences, is maintained by the city. The aquarium in New Orleans was privately built, is in a public park and is managed by a zoological society. The smaller aquarium in Washington is maintained by the Bureau of Fisheries in a Government building. It was long the custom of the national Bureau of Fisheries to operate excellent temporary aquaria at industrial expositions and these were highly successful. A few of the aquarium buildings were architecturally beautiful. At the world fairs of Chicago, Atlanta, St. Louis, Buffalo, Omaha, Charleston, Nashville and other cities the aquarium attracted more visitors than any other single exhibit. The larger permanent aquaria usually attract the attention of the people more than do zoological gardens or museums of natural history or art. The collections consist of living marine and fresh water animals. It is the character of the exhibits which determines the cost of maintenance. An aquarium with exhibition tanks requiring nothing more complicated than mere connections with a city water system, can obviously be operated at less expense than one requiring pumps for the circulation of sea water. It would be possible for any inland city not too remote from suitable collecting waters to maintain exhibits of fresh water fishes and amphibians at small cost as compared with marine forms requiring stored sea water. The flow of fresh water being automatic, the equipment for operation can be reduced to very simple terms.

For marine exhibits, the equipment and maintenance are far more costly. The piping, if for permanent use with salt water, is specially constructed of vulcanized rubber, lead or other non-rusting material, with valves and other fittings to match. An underground reservoir for the storage of sea water is necessary, together with rust-proof pumps of bronze for its circulation. Filters are required to clear the water flowing back to the reservoir. For pumps which must run night and day there is necessarily an increase in the number of employés, some of whom, such as mechanicians, require special compensation. For tropical forms of life water-heating equipment is required to insure their safety in winter. For northern forms of life cold water is equally necessary in summer. A large aquarium in the latitude of New York, for instance, requires a complicated equipment if its aquatic exhibits include both northern and tropical fresh-water and marine forms. The construction of a reservoir for pure sea water is imperative, even if the aquarium be located on the sea shore. Experience has shown that the water supply must be maintained in uniformly good condition, unaffected by storms, changes in salinity, winter and summer temperatures, and the im-

AQUEDUCT PIPES IN MANY PARTS OF THE WORLD

1. Riveted steel penstocks twelve feet, four inches in diameter which deliver water from Hetch-Hetchy reservoir, California, through a power plant at Moccasin Creek, to San Francisco. The distance covered by the pipes between the reservoir and San Francisco is 158 miles
2. Duplicate riveted steel pipes, six feet in diameter, with a total weight of 78,000 tons, used by the Tansa aqueduct, at Bombay
3. Welded steel, cement lined pipes, five feet in diameter, used in the construction of the additional pipe line of the Elan aqueduct, at Birmingham, England
4. Set of seven wooden stave pipes, nine and a half feet in diameter, serving the Humber Arm hydro-electric station in Newfoundland
5. Welded steel, high pressure pipe line, six feet in diameter, serving Maentwrog power station, Wales

purities of harbours. Unfavourable variations in the water supply cannot be avoided where water is pumped directly from the sea. The prime requisite for aquatic animals in captivity is a plentiful supply of their natural element, to which everything else is subordinate. The water supply must be pure and abundant, both for marine and for fresh water exhibits. The fresh water supply of most cities is good enough for aquarium purposes as it comes from the pipes, but during long continued rains or necessary alterations of the system the water may become murky and remain so for weeks. Suitable filters are therefore necessary to insure the clearness of water desirable for exhibition purposes. Filters for fresh water are installed to receive the water before it is delivered to exhibition tanks. In the case of permanently stored sea water, filters are also necessary, but they are installed so as to receive the drainage of the exhibition tanks and return the water to the reservoir clear and free from the impurities created by the feeding of animals. City waters that are treated with chlorine are not suitable for aquarium purposes.

All equipment tending to facilitate the distribution of stored water and to preserve its purity is desirable, because its vitiation, even in small degree, may result in serious losses of animal life. Lack of food can be long endured by aquatic animals but the impairment of their natural element is immediately fatal, whether from actual fouling or mere lack of oxygen. They may long survive overcrowding if the supply of water is abundant. The collecting of aquatic animals, with the exception of mammals, involves their transportation in weighty tanks of their natural element, which moreover must be kept pure in transit. Aquatic animals must reach their destination not merely alive, but able to endure the conditions of captivity, which are always more or less unfavourable to wild creatures.

The exhibits of a public aquarium are popularly supposed to consist chiefly of fishes, aquatic reptiles and some of the more conspicuous invertebrates, but this conception is a narrow one. The name aquarium admits of a much more comprehensive interpretation. The collections of an ideally equipped establishment for the exhibition of living aquatic forms might properly include representatives of the entire aquatic fauna and flora, so far at least as the forms selected are capable of living in shallow water.

AQUARIUS (the Water-bearer or Cup-bearer), in astronomy, the eleventh sign of the zodiac, situated between Capricornus and Pisces. Its symbol is ♒ representing part of a stream of water, probably in allusion to the fact that when the sun is in this part of the heavens (January, February), the weather is rainy. The constellation, though large, has no striking features, the brightest stars being of the third magnitude.

AQUATINT, a variety of etching (*q.v.*) in which effects are obtained by the action of acid through a porous ground of sand or some powdered resinous substance (Lat. aqua, water, and *tincta,* dyed). The plate is first covered with a ground over which the resinous powder or sand is evenly dusted by some mechanical process, the portions of the plate which are to appear white when printed being covered with stopping-out varnish. The plate is then covered with the mordant which bites into the interstices between the minute particles and produces a granulated surface. The process is repeated and the different tones obtained by the varied depths to which the different portions of the plate are bitten. In theory therefore aquatint is not capable of producing even graduations of tint, but may be compared in effect to a contour map where each particular elevation is indicated by a flat tint ending abruptly. In skilful hands, however, the series of bitings can be so manipulated as to make these contours almost invisible; the process can be used in conjunction with etching, drypoint, mezzotint and crayon.

The invention of aquatint is generally credited to Jean Baptiste Le Prince (1734–81), but there seems little doubt that some form of it was known and used almost 100 years earlier. A certain Jan van de Velde seems to have combined aquatint with roulette work in some of his portraits about 1658. In the hands of F. Janinet, P. L. Debucourt and other French artists of the end of the 18th century the process was brought to a technical perfection which has never been surpassed. It was used by them, with extraordinary skill and success, as a vehicle for printing in colour. In England in the last quarter of the 18th century and the first half of the 19th century the method was used by such artists as Paul Sandby, Thomas Malton, the Daniells, R. Pollard, J. C. Stadler for reproducing water-colour drawings. English aquatints were not printed in colours, but were usually coloured by hand. The process during the latter part of the 19th century fell into disuse but was revived and successfully employed by Sir Frank Short, Theodore Roussel, Oliver Hall, W. Lee Hankey, W. P. Robins and others. (*See* ETCHING.) (A. E. P.)

AQUAVIVA, CLAUDIO (1542–1615), fifth general of the Society of Jesus, the youngest son of the duke d'Atri, was born at Naples. He joined the Jesuits at Rome in 1567, and his administrative gifts marked him out for the highest posts. He was soon nominated provincial of Naples and then of Rome; and during this office he offered to join the Jesuit mission to England that set out under Robert Parsons (q.v.) in the spring of 1580. The following year, being then only 37 years old, he was elected by a large majority general of the society in succession to Mercurian, to the great surprise of Gregory XIII.; but the extraordinary political ability he displayed and the vast increase that came to the society during his long generalate abundantly justified the votes of the electors. He, together with Lainez, may be regarded as the real founder of the society as it is known to history. A born ruler, he secured all authority in his own hands, and insisted that those wha prided themselves on their obedience should act up to the profession. He successfully quelled a revolt among the Spanish Jesuits, which was supported by Philip II., and he made use in this matter of Parsons. A more difficult task was the management of Sixtus V., who was hostile to the society. By consummate tact and boldness Aquaviva succeeded in playing the king against the pope, and Sixtus against Philip. For prudential reasons, he silenced Mariana, whose doctrine on tyrannicide had produced deep indignation in France; and he also appears to have discountenanced the action of the French Jesuits in favour of the League, and was thus able to secure solid advantages when Henry IV. overcame the confederacy.

To him is due the Jesuit system of education in the book *Ratio atque institutio studiorum* (Rome, 1586). But the Dominicans denounced it to the Inquisition and it was condemned both in Spain and in Rome, on account of some opinions concerning the Thomist doctrines of the divine physical premotion in secondary causes and predestination. The incriminated chapters were withdrawn in the edition of 1591. In the fierce disputes that arose between the Jesuit theologians and the Dominicans on the subject of grace, Aquaviva managed, under Clement VIII. and Paul V., to save his party from a condemnation that at one time seemed probable. He died at Rome, Jan. 31 1615, leaving the society numbering 13,000 members in 550 houses and 15 provinces. The subsequent influence exercised by the Jesuits, in their golden age was due largely to the far-seeing policy of Aquaviva, who was undoubtedly the greatest general that has governed the society.

AQUEDUCTS. In the broad sense of the word, an aqueduct is an artificial channel for the conveyance of water. In a more restricted sense it is often understood to mean a bridge formed in a series of arches or spans for the conveyance of water across a valley. In the usual acceptance of the word in modern engineering an aqueduct is a primary channel or conduit for the conveyance of water from a source to the principal point of distribution or use, subsidiary distribution conduits being not generally classed as aqueducts.

Ancient Aqueducts. — There are records of the use of aqueducts for irrigation, extending back to very remote times in Babylonia, Assyria and Egypt, where the benefits of the practice of that art were no doubt taught by the annual overflow of the Nile. Extensive systems of canals in conjunction with storage reservoirs were in existence in the time of Rameses II. in the 14th century B.C.

Traces of remarkable aqueducts carried out by the Phoenicians have been found in Syria and in Cyprus, including tunnelling through rock and the construction of syphons across valleys for the conveyance of water to temples.

Jerusalem has from very early times been supplied by a series of conduits, the earliest of which probably date back to the times of the kings of Judah. The principal reservoir is formed by the Pools of Solomon from which two conduits delivered water to the city. The lower of the two, which is still complete, is about 20 miles long, and crosses the valley of Hinnom on arches.

In Europe the earliest aqueducts were made by the Greeks. Lake Copais in Boeotia was drained by a tunnel driven from 16 shafts, the deepest of which was 150ft. Eupalinus, a celebrated hydraulic engineer, carried out a water supply for Megara about 625 B.C. and later drove a tunnel 8ft. by 8ft. in section and 4,200ft. long through a hill to convey a water supply to Samos. Conduits involving less difficult work brought in water from Hymettus and Pentelicus to Athens. The Hadrian Aqueduct was constructed A.D. 134–40 to augment the supply to that town. It consists of over 15 miles of tunnel lined with brick and masonry arranged to tap underground water-bearing strata by means of subsidiary galleries, wells and drains. After long years of disuse and disrepair this aqueduct has again been made good and brought into service to supply about 2,500,000 gallons per day.

Roman Aqueducts. — In the year 312 B.C., Appius Claudius Caecus, the constructor of the Via Appia, brought in a supply of water from springs situated to the east of Rome. His aqueduct, known as the Appia, was built of squared masonry and formed a covered conduit or tunnel for practically the whole length of about 10·6 miles.

The second aqueduct, known as the Anio Vetus, was constructed 40 years later to convey water from a source on the river Anio in the Apennines. It was a work of some magnitude, having a length of about 41 miles, formed mainly a covered conduit, and was carried out by contract, the price being the spoils obtained from the defeat of Pyrrhus. The waterway was of rectangular form with pointed roof and had a height of 8ft. 1½in. and width of 3ft. 7in.

In 145 B.C. Marcius the praetor constructed the first high level aqueduct to convey water of fine quality from various springs including those near mile 38 on the Via Sublacensis where it emerged from caves into a pool of deep green hue. His aqueduct, known as the Marcia, had varying cross-sections, the internal dimensions at the upper end being about 8ft. 2in. high by 5ft. 9in. wide. Its length of about 58.4 miles included half a mile raised above ground on masonry walling, and about 63 miles on masonry arches mainly at the city end.

The construction of the fourth aqueduct, a comparatively small and short one, known as the Tepula, followed 18 years later in 127 B.C. Large use was made of concrete in its construction and for part of the way it was built on top of Marcia.

After an interval of 94 years Agrippa in 33 B.C. tapped another source near the 12th milestone on the Via Latina by the construction of the fifth aqueduct called the Julia which joined the Tepula and ran on top of it. Its waterway had a rectangular section about 4ft. 7in. high by 2ft. 4in. wide. Its total length was about 14·6 miles of which fully 6 miles were on arches. Near the Porta Tiburtina the aqueducts Marcia, Tepula and Julia were formed one above another on the same line of arches.

In 20 B.C., the sixth aqueduct, called the Virgo, about 13 miles long, was completed by Agrippa to convey water of excellent quality to Rome from a group of springs on the estate of Lucullus. The waterway was about 6ft. 7in. high by 1ft. 7in. wide and fully one mile was raised above ground on walling and arches.

The Alsietina was the seventh important aqueduct and was constructed by Augustus to bring in a low level supply of rather unpalatable water from the small lake Alsietina situated about 20 miles north-west of Rome. Its length was 21 miles, of which one-third of a mile only was on arches.

In A.D. 36 Caligula initiated the construction of two additional aqueducts known as Claudia (the eighth) and Anio Novus (the ninth) respectively, to cope with the increasing demands of the public services and private luxury. The former was completed by Claudius in A.D. 50, and conveyed water from some fine springs near milestone 38 on the Via Sublacensis. Its waterway was about 6ft. 7in. high by 3ft. 3in. wide and the whole length of about 44 miles; nine miles were carried on arches generally of 20ft. span with piers 8ft. thick in elevation.

The Anio Novus was completed in A.D. 86 and drew its water from the river Anio, at a point near the 42nd milestone on the Via Sublacensis. The waterway was variable, one section being about 8ft. oin. high by 3ft. 3in. wide. The whole length was about 55.6 miles and the last seven miles were formed on the top of Claudia on walling and arches having a maximum height of 109ft. It was constructed principally of concrete with brickwork facing. Some 36 years later the route of this aqueduct was shortened by driving a tunnel about 3 miles long under Mount Affliano.

Towards the close of the first century A.D. the aqueducts, now nine in number, came under the care of Sextus Julius Frontinus, who had record plans prepared showing the valleys and rivers crossed, the raised and arched portions, and the places on the hillsides where particular care was required in maintenance. He states in his work *De Aqueductibus Urbis Romae* that he thereby reaped the advantage of having the works in which he was concerned directly before him. That he appreciated the practical importance of his charge may be judged from his observation, "Will anybody compare the idle Pyramids, or those other useless though much renowned structures of the Greeks with these many indispensable aqueducts?" He found a number of practices in vogue which were inimical to public service. The aqueducts were surreptitiously bled en *route* by proprietors of adjacent lands. At the city the water was measured into distributing tanks by a few bronze meter orifices of large capacity and distributed out again by a large number of small orifices to the various purchasers. The watermen by making the inlet orifices larger than the nominal diameter and the outlet orifices smaller, were enabled to balance the quantities received and distributed while having a considerable actual surplus which they sold on their own account. Many of the citizens also were not averse to receiving water by illegal tapping of the State lead mains supplying the public institutions and fountains.

Based on his experience of the upkeep of the vast system of water supply conduits under his charge, developed by a succession of builders during a period of 400 years, he formed the opinion that the workmanship in the old aqueducts was better than in the new. The work of maintenance was heaviest on the above-ground portions of the aqueducts, particularly the arches and much less on the underground portions which were immune from the effects of heat and frost, but which on the other hand were liable to damage from penetration by the roots of trees. Major works of repair were usually undertaken on one aqueduct at a time, with the flow cut off, but were sometimes carried out without interruption of supply by erecting supports from the ground and by-passing the water in a lead trough.

The water supply system was further extended after the time of Frontinus by the construction of the Aqua Trajana in A.D. 109 which conveyed water from the springs near Lake Bracciano, 20 miles north-westwards from Rome and the Alexandrina in A.D. 226 which tapped some springs near the Via Praenestina about 14 miles from Rome.

Frontinus gives quantities of water delivered by the various aqueducts in "quinaria" but the equivalent discharge in modern measure is difficult to arrive at. A determination by Claudia di Fenigio is, one quinaria=0·48 litre per sec. which is equal to 9,400 imperial gallons per day. On this basis the total water delivered by the aqueducts in the time of Frontinus was about 130,000,000 gallons per day of which 92,000,000 gallons were used within the city.

The water supply per head in Rome was about twice as great as in Glasgow (in 1928), but allowing for the unavoidable loss from Rome's free flowing conduits, the utilizable supply to the two cities would be more nearly on a par.

What has been the fate of those great works? The Virgo and the Trajana were restored to use in 1570 and 1611 respectively. The ugly Acqua Felice, constructed by Sixtus V. in 1585 takes the place of the Alexandrina, though on a somewhat different line. The excellent waters from the springs which fed the old Marcia are once again being conveyed to Rome by a new aqueduct 33 miles long, known as the Pia Marcia, constructed in 1870. The upper half is formed as a rectangular masonry conduit with arched roof having a capacity of 27,000,000 gallons per day, while the lower half is a pressure conduit formed of a number of lines of 24in. cast iron pipe.

The most impressive remains are the stretches of arches which still stand, indicating in monumental fashion the vast extent of the ancient structures provided for the conveyance of the high level supply across the last broad depression of the campagna to the city of Rome.

Roman Aqueducts Outside Italy.—The following examples are specially noteworthy: (1) The Pont du Gard at Nimes, France, which is still standing, and for boldness and gracefulness of design is unrivalled. It was built by Agrippa possibly in A.D. 18. It has three tiers of arches in its height of 160ft., the lowest tier having six arches of 60ft. to 75ft. span, the middle tier 11 arches of 75ft. span, and the upper tier 35 small arches over which the waterway was constructed. (2) The aqueduct bridge at Segovia in Spain about 2,700ft. long and 102ft. high formed with 109 masonry arches in two tiers. The aqueduct, of which this splendid bridge forms part, is still in use.

Mediaeval Aqueducts.—The water supply to the cathedral city of Spoleto in central Italy is conveyed by a 7th century aqueduct about 700ft. long and 270ft. high. It is noteworthy for its light and graceful proportions and for the use of pointed arches, there being ten of about 66ft. span.

Several fine examples of arched construction exist on the conduit system of Constantinople, the most noteworthy being the aqueduct of Justinian which constitutes one of the most imposing monuments of its period. It is 720ft. long, 108ft. high and has two tiers of pointed arches with 55ft. spans in the lower story and 40ft. spans in the upper. The piers are buttressed and lightened by having small arches pierced through them at different heights.

MODERN CONSTRUCTION

In the ancient aqueducts, with few exceptions, the conveyance of the water was accomplished by forming the aqueduct as a free flowing channel, usually built of masonry, with a continuous slight fall in the direction of the delivery point. If it were necessary to cross a valley the channel was continued on its pre-determined level and gradient on a built masonry construction either of continuous walling or of piers and arches until the other side was reached when it again followed the contour of the ground. The advancement of engineering science has obviated the necessity for the use on a large scale of such constructions in modern aqueducts, where the water can be conveyed when required in large closed pipes flowing full under pressure, and arranged within limits to follow the depressions and elevations of the surface of the ground.

There are, therefore, two distinct methods of flow which may be used according to the circumstances. In the one case the water flows with a free surface in a channel having a regular gentle slope, corresponding to the case of natural flow in a river, in the other case the water completely fills the closed conduit in which it is confined and exerts pressure on the whole of the interior surface tending to burst the walls.

Free Flowing Conduit.—The principal types of construction used for free-flowing conduits are the following: (a) Open canal

formed in the earth, with or without an impervious Lining; (b) covered conduit built of brickwork, masonry or concrete; (c) tunnel, unlined or with a smooth lining of brickwork, masonry or concrete.

Free-flowing conduits take many shapes in cross-section such as rectangular, horse-shoe and circular. In the case of open canals the most usual form has a straight flat floor and sloping sides.

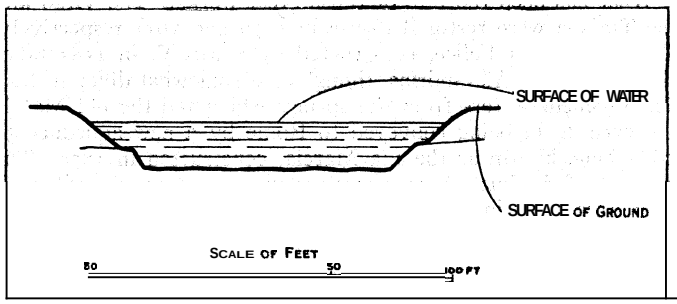

FIG. 1.— TYPICAL CROSS SECTION OF THE UNLINED HUMBER-ARM POWER CANAL FOR CONVEYANCE OF 5.000 CU. FT, OF WATER PER SECOND. TO HUMBER-ARM HYDRO-ELECTRIC STATION. NEWFOUNDLAND

Open Canals.--Open canals in Britain are not in favour for conveying domestic water supplies on account of their liability to contamination and interference. They are principally used on a large scale for conveying water to low head water power stations and for the irrigation of large cultivable areas in dry countries. When unlined the gradient must be fixed so that the velocity does not become great enough to cause erosion of the bed or banks, say from $2\frac{1}{2}$ to 5ft. per second according to the firmness and cohesion of the material. Considerable loss of water from leakage may be expected with unlined canals. In lined canals velocities up to 10ft. per second or more are possible.

An unlined canal at the Humber-Arm Hydro-Electric Works, Newfoundland, to convey a minimum water flow of 5,000 cusecs, has a bed width of 100ft. and water depth of 21ft. as shown in fig, 1. The gradient is 1 in 7,450 and the maximum velocity about 3ft. per second.

A concrete-lined (fig. 2) canal for conveying water to the low head power station at Beaumont-Monteux on the Basse-Isère, France, is 105ft. wide on the bottom with 15ft. maximum depth of water, side slopes of 1 to 1 and cement concrete lining 12in. thick on floor and sides, finished with a surface rendering of cement mortar $1\frac{1}{4}$in. thick. The lining is laid in sections with a

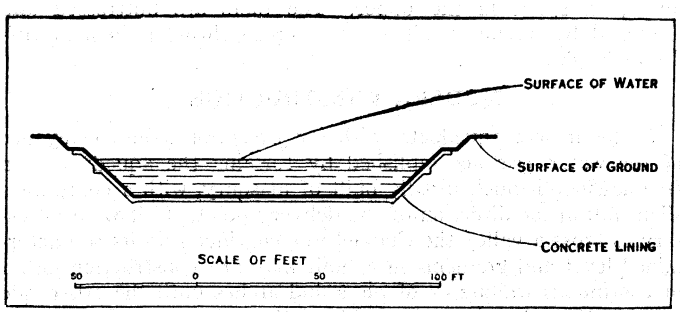

FIG. 2.— CROSS-SECTION OF BEAUMONT-MONTEUX POWER CANAL WITH SMOOTH CONCRETE LINING. FOR CONVEYANCE OF 10.000 CU. FT. OF WATER PER SECOND. TO POWER STATION ON THE BASSE-ISERE AT BEAUMONT-MONTEUX, FRANCE

transverse expansion joint every 23ft. The maximum flow is 10,000 cusecs and velocity $6\frac{1}{2}$ft. per second. The fall is 1 in 6,400.

Covered Conduits.—Built aqueducts for the conveyance of domestic water supplies in Britain are almost invariably roofed and covered over with earth. Numerous examples have been constructed in masonry and brickwork, but concrete is now generally preferred. Such conduits in suitable circumstances are more economical than pipes where the quantity of water is large, but are only applicable where a route can be located on the ground having the desired fall along a contour gradient tending in the direction of the point of delivery. Figs. 3 and 4 show typical cross-sections of the conduit for supply of 75,000,000 gallons per day from the Elan Valley to Birmingham and the Catskill conduit for water supply to New York respectively. The latter is one of the largest aqueducts ever constructed for conveyance of domestic water supply.

Tunnels.—Continued improvements in mechanical drilling, in the power and reliability of explosives, and in the methods of handling and transporting the excavations, have contributed to a decided increase in the speed and relative economy of tunnel construction during the first three decades of the 20th century. The result is that tunnelling is used in aqueduct-construction to a much larger extent than formerly. It may be the only way for conveying water from one valley to another through a ridge which cannot be circumvented, and in other cases it may be chosen in preference to covered conduit on account of shortening of the route, greater security, lessened maintenance cost, and obviation of surface damage. In very sound unfissured rock, lining of masonry, brickwork or concrete mav be dispensed with. but it is very seldom that lining of the 'invert is omitted; where reliability of service under determinate hydraulic conditions is essential, a smooth lining on the whole of the wetted surface should be provided.

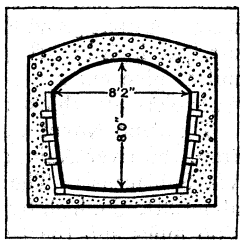

FIG. 3.—ELAN AQUEDUCT, BIRMINGHAM WATER SUPPLY
Cross-section of covered concrete conduit, with internal brick lining, for conveyance of 75,000,000 imperial gallons of water per day (140 cu. ft. per second)

The new Loch Katrine aqueduct of the city of Glasgow has about 19 miles of lined tunnel of horseshoe shape with a height of 9ft. and width at springing of roof arch of 10ft. It has a fall of $11\frac{1}{2}$in. per mile and a capacity of 76,000,000 gallons per day. Tunnelling on a very large scale has been used in America in aqueducts supplying certain of the large cities such as New York, San Francisco, and Los Angeles. A long concrete-lined tunnel on the Catskill aqueduct for New York has a capacity of 500 million U.S. gallons per day with a horseshoe shaped cross-section having a width of 13ft. 4in., a height of 17ft., and an effective waterway of 165 sq.ft. The gradient is ·37 per 1,000.

Pressure Conduits.— Conduits which are required to flow full under pressure are subject to strict limitations in the matter of shape and material of construction. The material must be capable

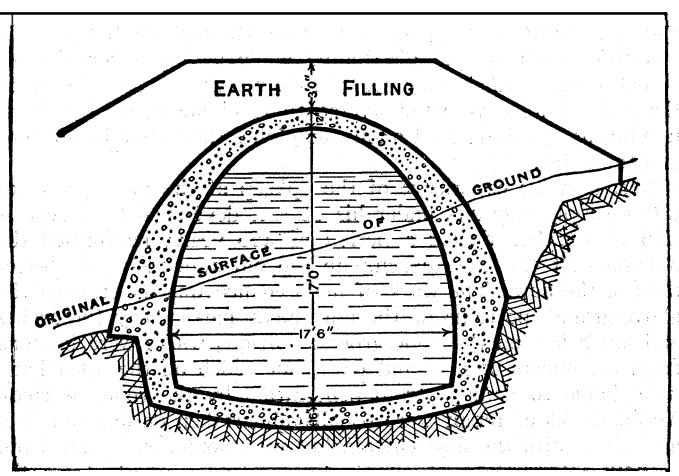

FIG. 4.— CATSKILL AQUEDUCT, NEW YORK CITY WATER SUPPLY

of resisting high tensile stresses and Is most effective when disposed in circular form. The most usual types of construction are: (a) Cast Iron Pipes, (b) Steel Pipes, (c) Wood Stave Pipes, (d) Reinforced concrete pipes or conduit, (e) Tunnel.

Cart *Iron* Pipes.—Cast iron pipes came into use about the beginning of the 19th century as an alternative to lead and wooden pipe, for the distribution of water in towns. With rapid development of the iron-founders' craft it became available for aqueducts and has been so used in sizes up to 54-in. diameter and over.

TABLE No. I. *Particulars of aqueducts for certain large towns in Great Britain*

Town	Scheme	Capacity of aqueduct Imp. gals. per day (000,000s omitted)	Length of aqueduct in miles: Tunnel	Cut and cover	Pressure pipes	Total length	Particulars of tunnels and built conduits	Particulars of pressure pipes
Glasgow	Loch Katrine Aqueduct No. 2	76	19¼	1¼	3	23½	Lined horseshoe tunnels 10ft. wide, 9ft. high. Fall ·18 per 1,000.	Two lines cast iron 48in. diam. Fall 1·0 per 1,000.
Birmingham	Elan Valley	75	13	23½	36½	73	Lined horseshoe sections from 7ft. 6in. wide by 8ft. high to 8ft. 2in. by 8ft. 6in. Falls ·25 to ·33 per 1,000.	*Six lines cast iron 41in. to 42in. diam. steel for pressures over 400 ft. Fall ·57 per 1,000.
Manchester	Thirlmere	50	14	37	45	96	Lined rectangular sections with arched roof, normally 7ft. 1in. by 7ft. 0in. Fall ·31 per 1,000.	†Three lines cast iron 48 in. diam. for part of length and 5 lines cast iron 36in. to 40in. diam. for remainder.
Liverpool	Vyrnwy	40	4	nil	64½	683	Unlined tunnel 7ft. diam Fall ·39 per 1,000.	Three lines cast iron pipes 39in. to 42in. diam. Fall ·85 to 1·3 per 1,000.

*The particulars give the installation originally contemplated. Steel pipes 60in. diameter have been used on sections of the third line of pressure pipes.

†The particulars relate to the installation originally contemplated. In the fourth line of pipes, welded steel, reinforced concrete and cast iron 54in. diam. have been used on separate sections.

Cast iron pipes are usually made in lengths of 9 to 13ft. with end joint of spigot and socket form made watertight with lead. Pipes with flanged ends to bolt together are also used. Pressure conduits of cast iron pipe may follow any irregular profile imposed by the route chosen, ascending here and descending there, and crossing summits and hollows provided always that none of the summits rise above the "hydraulic gradient" which for a pipe of uniform diameter is the straight line joining the inlet and outlet ends on the longitudinal profile. Should air collect at any of the summits the flow will be interfered with. Air valves are therefore installed on top of the pipe at such places and automatically discharge the air as it collects without allowing water to escape. Sluice valves fixed on scour branches at the bottom of the pipe are required at the lowest points of the pipe for the periodical discharge of any sediment which may collect there and restrict the flow. Should a burst occur on a large pipe great damage and loss of water may occur before the water can be cut off. Automatic valves for stopping the flow when a burst occurs are desirable at the upper end of an important pipe and also at the principal summits in the case of a long pipe, and commonly take the form of a circular disc valve on a horizontal axis which passes through glands in the walls of the pipe and is connected to hydraulic operating gear in a chamber formed over the pipe. The operating gear is set in motion by a valve connected to and controlled by a small paddle within the pipe. The flow of water in the pipe imposes pressure on the paddle, which becomes greater with increase of velocity, and matters are so adjusted that a definite increase of velocity above the normal will move the paddle, thereby setting the operating gear in motion and closing the main valve.

In Britain pipes are secure from the effects of frost if laid with a cover of 2ft. 6in. of earth, whereas in more severe climates greater cover up to 5 or 6ft. as a maximum may be necessary. Where the foundation is unsatisfactory or where exceptional loads have to be resisted or special forces dealt with as in changing direction at a bend, the pipe should be reinforced by bedding it on, or surrounding it with concrete. In normal circumstances cast iron pipe has long life and is generally more liable

TABLE No. II. Particulars of aqueducts for certain large towns in the United States

Town	Location of aqueduct	Capacity (millions of gallons per day)	Length of aqueduct in miles: Tunnel	Cut and cover	Pressure pipes	Total length (miles)	Particulars of tunnels and conduits	Particulars of pressure pipes
Los Angeles	Owens River Sierra Nevada Mountains	280	42·90	166·46	14·05	223·41	Tunnels driven through rock and soil. Lined with concrete. Horseshoe arch construction with steel reinforcing. World record for rock tunnel driving established at 1061·6ft. per month. Concrete lined and unlined conduits. Conduits covered through Mojave desert.	Concrete pipe used on heads up to 75 feet. Steel piping used above 75 feet. Largest steel section weighed 26 tons and was erected by use of incline railways and special hoists. Inverted siphons lined with cement used on valleys and canyons, part on surface and part buried.
San Francisco	"Hetch Hetchy" Sierra Nevada	400	84·90	None	70·90	155·80	Tunnels driven through rock and soil. Reinforced arch construction. Lined with concrete. No open canals or conduits in the entire system.	Riveted steel piping used throughout with submarine piping on the rivers, Siphons on short valleys lined with cement and laid on surface.
New York†	Catskill Mountains Supply	600	14·00	55·00	23·00	92·00	Tunnels driven through rock and soil. Arch construction with no reinforcing. Conduits lined with concrete and grounded with cement.	Riveted steel piping used for 6m., sunk below surface. Pressure tunnels of heavily reinforced concrete for 17 miles. Submarine piping used under rivers.

†Not including Shandaken Tunnel.

to deterioration inside than outside, so that some loss of capacity takes place with lapse of time.

Steel Pipes.—The advantages of steel are its lightness, reliability, watertightness, and security from cracking, and not least the fact that it can be used in much larger sizes than cast iron. Experience also shows that well coated steel pipes when buried in normal soil will endure for many years. Riveted pipe is suitable for moderate heads, a good example of such construction being the new pipe line from Lake Tansa for the Bombay water supply. The pipe has diameters from 57in. to 72in. and is formed of rings 7ft. 4in. long alternately in and out, each made from a single plate $\frac{3}{8}$in. thick, with the longitudinal joints double riveted and the circumferential joints single riveted. The pipes are uncovered and laid direct on the graded surface of the ground.

On the Catskill aqueduct of New York there are many miles of large riveted pressure pipe from 7ft. 4in. to 11ft. 3in. diameter. The pipes are made in ring courses of $7\frac{1}{2}$ft. alternately in and out with one or two plates to the circle according to the size. The thickness varies from $\frac{7}{16}$in. to $\frac{9}{16}$in. and the longitudinal joints are lapped for the thinner plates and butted and double strapped for the thicker. The pipes are surrounded with a casing of concrete having a minimum thickness of 6in. placed in position after the pipe had been tested and made watertight and while it was full of water under pressure. They were afterwards furnished with a smooth interior protective lining of cement mortar having a thickness of 2in.

In Britain and elsewhere there has been considerable development in the use of smooth welded steel pipes which have definite advantages over riveted pipes in that the weight is less for the same strength, the capacity is greater for the same size and installation in the field involves less work from the fewer number of joints required. Such pipes are formed of mild steel plates, heated and bent to circular form by means of large bending rolls and having the longitudinal joints lap welded by heating with water gas. The pipes are commonly made in lengths of 20 to 30ft. and one or two plates are required to form the circle according as the diameter is under 3ft. or between 3ft. and 6ft. Still larger pipes may be made with three plates to the circle. The steel used requires to be of extra mild ductile and weldable quality such that when allowance of about 90% efficiency for the welded joint is made a working tensile stress of about 5 tons per square inch is appropriate. Joints of welded pipes for water supply aqueducts are commonly formed with spigots and sockets, either close fitting. for riveting. or with an annular gap for filling with lead.

Considerable effort has been directed towards the application to metal pipes of a smooth interior lining of substantial thickness which will adhere permanently and prevent rusting, pitting and incrustation. Experience is being accumulated with two such linings, having portland cement and bitumen respectively as the basic material, which are applied by a process of centrifugal spinning. Protection of exterior surfaces of steel pipes is usually effected by a coating of bituminous material which may be reinforced by one or more wrappings of bitumen-impregnated hessian.

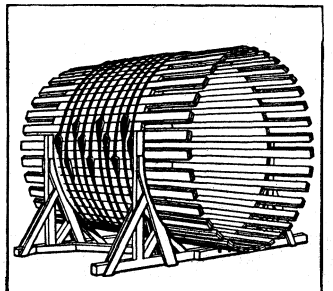

FIG. 5.—VIEW OF SPECIMEN LENGTH OF WOOD STAVE PIPE, SHOWING ELEMENTS OF CONSTRUCTION
The machined wood staves are bound with mild steel hoops

Wood Stave Pipes.—Wood stave pipes formed in the manner shown in fig. 5, with machined staves bound at close intervals with mild steel hoops, are economical for low heads in districts where suitable timber is abundant and cheap. At the Humber-Arm works, Newfoundland, there are seven lines of such pipe, 9ft. 6in. diameter, used for a maximum head of 167ft.

A wood stave pipe 16ft. diameter and 1,318ft. long to carry 3,000 cusecs was constructed in 1925 to serve the Hydro-Electric Plant No. 2 of the California-Oregon Power Co.

Reinforced Concrete Pressure Conduits.—Closely spaced hoops of steel, along with a system of longitudinal bars are contained in a cylindrical concrete shell and serve to prevent bursting and fracture. The chief advantages of this method arise from small cost of maintenance, security against collapse, and frequently saving in first cost as compared with other methods. For moderate diameters and pressures, pipes may be precast in lengths up to 12ft., transported to the site and connected together with joints of the "collar," "lockjoint," or other special type. On the Spavinaw aqueduct for the water supply to Tulsa, Oklahoma, there are 53 miles of reinforced concrete pressure conduit. Large conduits require to be manufactured in situ. Fig. 6 shows a cross-section of the huge conduit 19.7ft. diameter of the Drac-Romanche Hydro-Electric Development, near Grenoble, France, designed to carry 2,800 cusecs with a fall of 1 in 1,500 under a maximum head of 50ft.

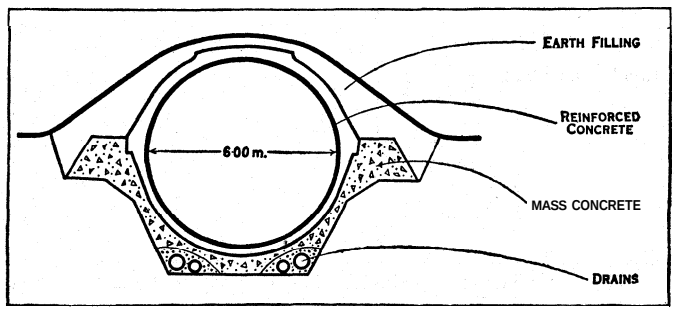

FIG. 6.— DRAC-ROMANCHE PRESSURE CONDUIT AT GRENOBLE, FRANCE
Cross-section of huge, reinforced concrete pressure conduit, 19.7 ft. in diameter, for conveyance of 2,800 ou. ft. of water per second, under a pressure of 50 feet

Pressure *Tunnels*.—Low pressure tunnels are largely used in mountainous districts to convey water from a reservoir or intake to the head chamber of a hydro-electric station. In hard, sound unfissured rock, such tunnels may be unlined, but a smooth lining of rich concrete in conjunction with sealing of fissured places by the injection of cement through drill holes is generally desirable.

Specially interesting examples of pressure tunnels exist on the Catskill aqueduct of New York. A concrete-lined pressure tunnel, about 4 miles long, is formed in shale deep down below the valley of the Wallkill river, thus obviating construction with pipes on the surface. It is 14ft. 6in. in diameter with a capacity of 500 million U.S. gallons per day and connects with free flowing conduit at each end by means of vertical shafts. Many miles of similar tunnel have been formed in rock at a depth of 500ft. below the streets of New York.

Aqueducts for City Water Supply.—The increasing distances from the place of use at which additional supplies have to be sought are well exemplified in the case of most of the larger towns of Britain, London being a notable exception. Glasgow, when its supply from the nearby Gorbals Water Works no longer sufficed, reached out into the Highlands 30 miles away and by tunnelling on a bold scale was enabled to obtain an abundant and pure supply from Loch Katrine. Birmingham had to go to the Elan Valley in the mountains of mid-Wales, a distance of 73 miles. Manchester went to Lake Thirlmere in Cumberland, a distance of 96 miles, to supplement the original supply obtained from Longendale, 18 miles east of the city. Liverpool has gone to the River Vyrnwy in North Wales, a distance of 683 miles. (J. WI.)

Some of the aqueducts for the supply of cities in the United States of America are colossal in comparison with the largest in Britain. Los Angeles obtains its water supply from the headwaters of the Owens River. The work was carried out in five years at a cost of about $23,000,000; later construction was begun on a 242-mile aqueduct, at an estimated cost of $220,000,000, to supply an additional 1,500 sec.-ft. of water to 13 cities in Southern California from the Colorado river. The Hetch Hetchy aqueduct, designed to carry 400,000,000 gallons per day from the Sierra Nevada to San Francisco, began delivering water in 1934.

New York city began work in 1937 on a $273,000,000 aqueduct to increase its water supply by 50%. The new project will

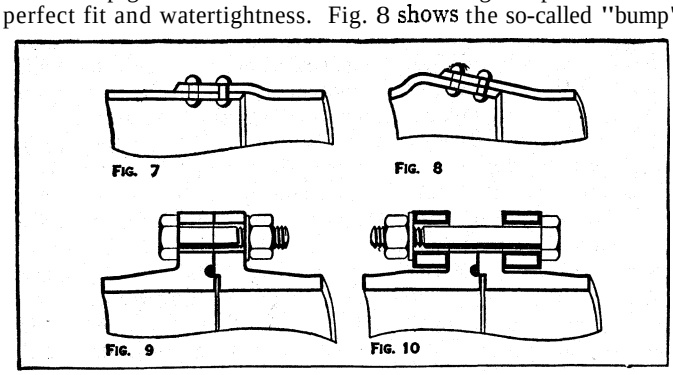
bring water from the Delaware river by a tunnel to the existing Croton and Kensico reservoirs. The Catskill aqueduct is capable of delivering 500 million gallons per day to New York city. (X.)

Modern Italy again furnishes one of the most remarkable water supply systems of the world in the Apulian aqueduct which conveys water from the moist western slopes of the Apennines to an area of 8,000 square miles of semi-arid territory in the south-eastern corner of the country. The intake is at the perennial Caposile springs so that, as in the case of the aqueducts of ancient Rome, a storage reservoir is not required. The main conduit, which has a capacity of about 110 million imperial gallons per day is carried through the ridge of the Apennines in a tunnel 9½ miles long and extends westwards and southwards for a distance of 152 miles, terminating at Taranto. Altogether some 67 miles of the conduit were formed in tunnel, a typical cross section having a horseshoe shape 8ft. gin. wide by gft. 5in. high. Water is delivered to a population of three millions in 266 communities by a system of 841 miles of main and branch pipes and 550 miles of distribution pipes.

Of surpassing interest in some respects is the aqueduct constructed in 1903 for supplying the gold mining centres of Coolgardie and Kalgoorlie in Western Australia with water. The source is near the western coast and the point of delivery is some 1,300ft. higher in the arid heart of the country 350 miles away. The aqueduct is formed as pressure pipe of the locking bar type, 30in. diameter with steel plate ¼in. thick. The water is forced up stage by stage by means of a series of eight pumping stations with balancing tanks at each station.

High Pressure Hydro-electric Pipes.--Of special importance are the aqueducts required to deliver water to hydro-electric stations utilizing high falls of from 400ft. to 5,000ft. or more. For such cases the fall is concentrated at the power station in as short a distance as possible. Welded steel pipe is almost exclusively used, either in single pipe lengths of 20 to 30ft. or in multiple lengths formed by welding two or three single pipes together. The joints are a vital part of the pipe line and the trend of development is to make them strong and rigid and to avoid the use of bolted, packed and expansion joints wherever possible. Pipes formed with close fitting spigot and socket ends joined together by single, double or treble riveting according to the pressure represent good power line practice for medium and large sizes.

Two forms of riveted joint are shown in figs. 7 and 8. Fig. 7 shows a spigot and socket form made to slight taper to ensure perfect fit and watertightness. Fig. 8 shows the so-called "bump"



ILLUSTRATING TYPES OF JOINT FOR HIGH PRESSURE PIPE LINES
Figs. 7 and 8. Forms of riveted joint, used for large welded pressure pipes. Figs. 9 and 10. Pressure pipes connected by bolting through fixed, and loose, flanges respectively

joint, with coned and swelled ends, connected by riveting. For the smaller sizes of pipe, flanged and bolted joints of various types are used, generally with a packing ring to ensure watertightness. Typical forms of two classes of flanged joint are shown in figs. 9 and 10. Where great strength is required, welded pipe, with weldless steel bands shrunk on at intervals, has been used.

Two contrasting methods of installation are in use, which may be designated the Swiss and the French method respectively. In the Swiss method a heavy concrete anchorage surrounding the pipe is provided at every bend, horizontal or vertical, the pipe* line being thus divided into a series of straight lengths, each of which is provided with an expansion joint near its upper end. The anchorages are designed to resist the maximum forces transmitted by the section of pipe-line attached thereto. In the French method main anchorages are provided at top and bottom only, there are no expansion joints, subsidiary intermediate anchorages are provided to hold the pipe in position and take care of the stresses produced by local variations of temperature and generally bends and elbows are left free to spring somewhat under extremes of temperature.

AQUEOUS HUMOUR, the clear watery fluid which fills the front part of the eyeball. It is enclosed by the cornea in front and the lens, suspensory ligament and ciliary body behind. The iris divides this small space into an anterior and a posterior chamber. The fluid is secreted in the latter chamber by the ciliary gland and circulates through the pupil to be absorbed slowly in the anterior chamber into the circular canal of Schlemm. When this absorption is interfered with, the pressure of the accumulating fluid increases, giving rise to the condition called glaucoma. Injuries of the cornea may cause escape of the aqueous humour but if infection does not supervene the wound usually closes and the fluid reaccumulates.

AQUIFOLIACEAE, a family of trees and shrubs, the best known members of which are the holly (*q.v.*) and the Paraguayan tea, both of the genus *Ilex.* This genus contains in excess of 450 recognized species.

See T. Loesener, Monographia Aquifoliacearum. Nova Acta Academiae Caesareae Leopoldino-Carolinae Naturae Curiosum vol. 78, pp. i-viii, 1–570, tables 1–5 (1901); vol. 89, pp. 1–313 (1908).

AQUILA (Ἀκύλας), (1) a Jew from Rome, who with his wife Prisca or Priscilla had settled in Corinth, where Paul stayed with them (Acts xviii. 2, 3). They became Christians and fellow-workers with Paul, to whom they seem to have shown their devotion in some special way (Rom. xvi. 3, 4). (2) A native of Pontus, celebrated for a very literal and accurate translation of the Old Testament into Greek. Epiphanius (*De* Pond. *et Mens.,* c. 15) preserves a tradition that he was a kinsman of the Emperor Hadrian, who employed him in rebuilding Jerusalem (Aelia Capitolina [*q.v.*]), and that he was converted to Christianity, but, on being reproved for practising pagan astrology, apostatized to Judaism. He is said also to have been a disciple of Rabbi 'Aqiba (d. A.D. 132), and seems to be referred to in Jewish writings as עקילס. Aquila's version is said to have been used in place of the Septuagint in the synagogues. The Christians generally disliked it, alleging that it rendered the Messianic passages incorrectly, but Jerome and Origen speak in its praise. Origen incorporated it in his *Hexapla.*

It was thought that no other copy of Aquila's version was extant, but in 1897 fragments of two codices were brought to the Cambridge University library. These have been published—the fragments containing I. Kings 7–17; II. Kings xxiii. 12–27 by F. C. Burkitt in 1897, those containing parts of Psalms xc. ciii. by C. Taylor in 1899. *See* F. C. Burkitt's article in the *Jewish Encyclopedia.*

AQUILA, Abruzzi, Italy, capital of a province, seat of an archbishop, 2,360 ft. above sea-level, 50 mi. N.E. of Rome, 145 mi. by rail; until 1937 known as Aquila degli Abruzzi. Pop. (1936) 20,573 (town), 54,722 (commune). It is on a hill in the valley of the Aterno, surrounded by mountains with the Gran Sasso d'Italia on the northeast. The railway from Terni to Sulmona runs through it and there is a branch line to Capitignano, 20 mi. to the northwest. A summer resort, it is cold and windy in winter. The highest part has the massive citadel (1535) of the Spanish viceroy Don Pedro de Toledo. The church of S. Bernardino di Siena (*q.v.*) containing his tomb (1454–72) has a fine

Renaissance façade by Nicolò Filotesio (commonly called Cola d'Amatrice). The church of S. Maria di Collemaggio, just outside the town, has a fine, simple Romanesque façade (1283–88) in red and white marble. S. Giusta, S. Silvestro, etc., have similar facades. Outside the town is a fountain with 99 jets along three walls, constructed in 1272. Conrad, son of Emperor Frederick II, founded Aquila about 1250, as a bulwark against the papacy. Destroyed by Manfred in 1259, it was rebuilt by Charles I of Anjou and its walls completed in 1316. It maintained itself as an almost independent republic until the Spaniards, masters of the kingdom of Naples from 1503, subdued it in 1521. It was seriously damaged by an earthquake in 1703, and twice sacked by the French in 1799.

See L. Serra, *Aquila Monumentale* (Aquila, 1912), well illustrated.

AQUILA, in astronomy, the "eagle," sometimes named the "vulture," a constellation of the northern hemisphere, traversed by a bright part of the Milky Way, which is here divided into two branches. The stars, β, α, γ (*See* ALTAIR), form a conspicuous group reminding us slightly of Orion's belt. Several Novae have appeared in this constellation; in particular Nova Aquilae III, discovered on June 8, 1918, attained a brightness only slightly inferior to Sirius.

AQUILEIA (med. *Aglar,* Slovene *Voglej),* a former city of the Roman empire and mediaeval western patriarchate, at the head of the Adriatic, 6 mi. inland, and 22 mi. W.N.W. of Trieste; it is now a village. Pop. (1936) 1,116 (town), 9,495 (commune).

Aquileia was founded by the Romans 181 B.C. to prevent the irruptions of barbarians along the narrow strip between the Alps and the Adriatic. Here the Postumian Way terminated; beyond, the roads branched out to Illyria, Pannonia and Noricum. Its situation soon made it a commercial and military centre of the first importance. It was connected by canal to the sea at Grado, which was joined by a causeway to the mainland, and here part of the Roman fleet was stationed. Its trade increased rapidly after Pannonia and Illyria became part of the Roman Empire. It was the capital of the province of Venetia, and the only city in Italy, beside Rome, which had the right of striking coins. Ausonius ranks it as the fourth Italian town, after Rome, Milan and Capua. Under Hadrian it had between 300,000 and 500,000 inhabitants.

In A.D. 452 it was taken by the Huns, after a three months' siege, and razed to the ground. The surviving inhabitants fled for safety to the neighbouring lagoons. The only importance left Aquileia was as an ecclesiastical centre. Aquileia had been the seat of a very old bishopric. Tradition ascribes its foundation to St. Mark, and its early incumbents included SS. Hermagoras, Hilarius and Valerian. In the jth and 6th centuries its diocese included all of north-east Italy, with Illyria, Noricum and Rhaetia, and it was thus the chief ecclesiastical power among the eastern Germanic tribes. Its bishop Macedonius (535–556) refused to acknowledge the conclusions of the 5th Oecumenical Council (553) and seceded from Rome at the head of the bishops of north Italy, Venetia and Istria, assuming in 557 the title of Patriarch, which had been accorded to him by the barbarians. Soon after, Italy was overrun by the Lombards, and the patriarch fled to Grado, six miles away. The Metropolitan Candidian of Aquileia (in Grado) made submission to the pope in 606, but his Lombard suffragan did not follow him and there were for long rival patriarchs of both Aquileia and Grado. But Poppo of Aquileia sacked Grado in 1024 and carried off its treasures to Aquileia, where he built the present cathedral (consecrated 1037). The Emperor Conrad supported him in the resultant war with Venice, granted him the fief of Istria, with the right to strike coins, and forced Pope John XX. to recognize him as metropolitan of all Italy, after Rome. From this time onward, the city was overshadowed by Venice, which finally deprived Aquileia of all territories bestowed on it by the Empire (1420). In 1438 the city itself was destroyed by an earthquake; the next patriarch acquiesced in the loss of his old power in return for an annual payment of 5,000 Venetian ducats (1445). Henceforward the patriarch resided at Udine, of which city he was to all intents bishop, and Venice claimed the sole right of appointing the incumbents. This right was disputed by the rulers of Austria, some of whose recently-acquired territories lay within the see of Aquileia. At last Pope Benedict XIV. was chosen as arbiter, and in 1748–49 abolished the patriarchate (then represented by its 109th incumbent, Daniel Delfino) altogether.

(C. A. M.)

AQUINAS, THOMAS (THOMAS OF AQUINO) (1225?–1274), the prince of scholastic philosophers, known as *Doctor Angelicus,* was born at the castle of Roccasecca, near Aquino in the province of Naples. Having received his elementary education at the abbey of Monte Cassino, in 1239 he went to study the seven liberal arts at the University of Naples. There, five years later, he entered the Order of St. Dominic, against the wishes of his family. From 1245–48 he studied in Paris under Albert the Great, and when Albert returned to Cologne in 1248 Thomas went with him. In 1252 he was again in Paris, where, in 1256, after composing the commentaries on the Bible and on the Sentences, he received the degree of Licentiate in Theology, and shortly afterwards that of Master in Theology. For the next few years he was engaged in teaching and defending the rights of his Order against William of St. Amour, the spokesman of the University of Paris. From 1259–68 he taught at the Pontifical Curia in Rome, and again in Paris from 1268–72, where he began his opposition to Siger of Brabant and the Latin Averroists, and to the Franciscan supporters of Augustinianism. In 1272 he was recalled to his native country, to teach at Naples. Like his friend, St. Bonaventure, he was summoned by Gregory X. to the General Council of Lyons (1274), which proposed to reconcile the differences between the Greek and Latin Churches, but while on his way to Lyons he died on March 7, 1274.

In spite of the condemnations of many of his doctrines by Stephen Tempier, bishop of Paris, and by Kilwardly, the Dominican archbishop of Canterbury, Thomas was canonized in 1323 by Pope John XXII., and in 1567 his festival was ranked by Pius V. with those of the four great Latin fathers — Ambrose, Augustine, Jerome and Gregory. No theologian, save Augustine, has had an equal influence on the theological thought of the Western Church, a fact strongly emphasized by Leo XIII. (*q.v.*) in his *Encyclical* of Aug. 4, 1879, which directed that the teachings of St. Thomas should be taken as the basis of theology. At least three further justifications for bestowing this honour upon the *doctor angelicus* could be suggested. Firstly, St. Thomas was a many-sided nature, as keenly interested in politics or mysticism as in metaphysics or theology. Secondly, he was the ideal scholar, persuading instead of denouncing his opponents, critical within reason, sober in judgment and proving all things while holding fast to that which is good. Thirdly, he was the producer of a most astounding synthesis of past philosophical thought *(see* SCHOLASTICISM).

All the many writings of St. Thomas are preparatory to his great work, the *Summa Theologica.* He began in 1254 with his *Commentary on the Sentences* of Peter the Lombard, a work in which the influence of Albert the Great and of the Augustinianism that he was to desert later, is very evident. Then came his deliverances upon speculative theological problems in some of his early *Quaestiones disputatae* and the *Quaestiones quodlibetales,* and his commentaries upon certain of the Scriptures. About the same time he was producing commentaries on Boethius, on the *De divinis nominibus* of pseudo-Dionysius, on the *Liber de Causis,* and on the following works of Aristotle: the *Physics, Metaphysics, De Anima, De Sensu, De Memom'a, Ethics, Politics, Posterior Analytics, Mefeors, Pem' Hermeneias, De Caelo* and the *De Generatione.* Most of the important doctrines of all these works and the later *Opuscula,* are set forth in a simplified manner in the two great *Summae,* the *Summa contra Gentiles,* and the *Summa Theologica.*

In the *Summa contra Gentiles* (1259–64), the chief work of the middle ages on natural theology, St. Thomas attempts to meet the views and objections of non-Christians by clearly distinguishing the spheres of natural reason and faith. Reason and faith, he thinks, are both concerned with the same object, but in different ways; the former starts from sense-data, and attains to a knowl-

edge of the existence, the unity, the goodness, the intelligence and the will of God; the latter rests on revelation and authority, and attains to a knowledge of God as a purely spiritual Being, *e.g.*, a Being with a Trinity of Persons. Each requires to take into account the knowledge arrived at by the other, and, on account of the difference in their methods, there need be no fear of contamination; they cannot be confused and they should not be isolated. Of the two, faith is the more important, because it bestows on man a knowledge which he could not ordinarily possess, and thus it is said to transcend reason. True reason and faith can never be contradictory, for they both come from the one source of all truth, God, the Absolute One.

After 1265, St. Thomas began his Summa Theologica, which he intended to be the sum of all known learning. It is divided into three parts, which may be said to treat of God, Man and the God-Man. The first and the second parts are wholly the work of the angelic doctor; but of the third only the first 90 questions are his; the rest of it was finished in accordance with his designs by Reginald of Piperno. Part I., after a short introduction upon the nature of theology, proceeds to treat of the existence of God, of His nature and attributes, of the Trinity, of the Creation, of problems pertaining to the angels and to man, and lastly, of the divine government of the world. Part II. includes the Prima *Secundae* and the Secunda Secundae, the former embracing general morality as founded on the ethics of Aristotle and including man's end, his will, the *passiones* of his soul, virtue in general, sin, the old law and the new law of grace — the latter dealing with special morality, including the theological and cardinal virtues which raise numerous practical issues, and the contemplative life (see ETHICS). In the third part of the Summa, St. Thomas discusses the Person, office and work of Christ, and had begun to discuss the sacraments when death ended his labours; additions to complete the scheme are appended as a *Supplementum* Terfiae *Partis.*

BIBLIOGRAPHY.—The best modern edition of the works of Aquinas is the Leo XIII. edition (Rome, 1882); 13 volumes have appeared. For works not yet in this edition, *see* the Vivès edition, 34 vols. (1872–80). The S. *Theologica*, the *S. c. Gentiles* and most of the *Quaestiones* also exist in practical editions produced by P. Marietti (Torino), and the first two have been translated into English by the Dominican Fathers.

For the life and works of St. Thomas consult Mandonnet, "Chronologie sommaire de la Vie et des Ecrits de S. Thomas," in *Rev. des Sciences Phil. et Thtol.*, p. 142 *seq.* (1920), and *Des Écrits Authentiques de S. Thomas d'Aquin* (Fribourg, 2nd ed. 1910); Grabmann, *Die echten Schriften des hl. Thomas* v. *Aquin* (Münster, 1920).

Of the innumerable works on the thought of St. Thomas—most of which have been listed in Überweg, *Grundriss der Geschichte der Philosophie* (1915), and in Mandonnet et Destrez, *Bibliographie Thomiste* (Bibliothkque Thomiste), vol. i., published by the *Rev. des Sciences Phil. et Théol.* (Le Saulchoir, 1921)—some of the most important are: *St. Thomas Aquinas: Being papers read at the sixth centenary celebrations* (Oxford, 1925); P. Duhem, *Le Système du Monde,* vol. v. ch. 12 (1917); E. Gilson, *Le Thomisme,* Eng. trans. by E. Bullough (1924), and *Saint Thomas d'Aquin* (a study of his ethics) (1925); M. Grabmann, *Thomas v. Aquin* (Munich, 1912); Guttmann, *Das Verhältnis des Thomas v. Aquin sum Judentum* (Gottingen, 1891); Mandonnet, *Siger de Brabant* (Louvain, 1911); Rohner, *Das Schöpfungsproblem bei Moses Maïmonides, Albertus Magnus u. Thomas v. Aquin* (Miinster, 1913); Rousselot, *L'Intellectualisme de Saint-Thomas* (2nd ed. 1924); J. Schwane, *Dogmengeschtchte der mittleren Zeit* (Freiburg i. B., 1882); A. D. Sertillanges, *S. Wicksteed, *Dante and Aquinas* (1913), and *The Reactions between Dogma and Philosophy illustrated from the works of St. Thomas Aquinas* (1920); de Wulf, *Mediaeval Philosophy illustrated from the System of St. Thomas Aquznas* (Harvard, 1922).

AQUINUM, ancient city of the Volsci, Italy, 7½m. N.W. of Cassino. Pop. (1936) 1,697 (town), 3,447 (commune). Birthplace of Juvenal and of the Emperor Pescennius Niger; S. Thomas Aquinas was born in Roccasecca castle, 5m. to the north. It retains portions of walls, so-called temples, basilica and amphitheatre as well as the gateway (Porta S. Lorenzo) by which the Via Latina entered it. The 11th century Romanesque basilica, S. Maria Libera, now roofless, has Roman inscriptions built into it and near by, south of the town, is a triumphal. arch with composite capitals. (See E. Grossi, *Aquinum* [Rome, 1907].)

AQUITAINE, the name of an ancient province in France, the extent of which has varied considerably from time to time. About the time of Julius Caesar the name Aquitania was given to that part of Gaul lying between the Pyrenees and the Garonne, and its inhabitants were a race, or races, distinct from the Celts. In keeping with the Roman policy of denationalization, the term Aquitania was extended, and under Augustus it included the whole of Gaul south and west of the Loire and the Aliier, and thus ceased to possess ethnographical importance. In the 3rd century A.D. this larger Aquitania was divided into three parts: Aquitania Prima, the eastern part of the district between the Loire and the Garonne; Aquitania Secunda, the western part of the same district; and Aquitania Tertia, or Novempopulana, the region between the Garonne and the Pyrenees, or the original Aquitania. The seats of government were respectively Bourges, Bordeaux, and Eauze; the province contained 26 cities, and was in the diocese of Vienne. Like the rest of Gaul, Aquitania absorbed a large measure of Roman civilization, and this continued to distinguish the district down to a late period. In the 5th century the Visigoths established themselves in Aquitania Secunda, and also in parts of Aquitania Prima and Novempopulana, but after the defeat of their king, Alaric II., by the Franks under Clovis in 507, Aquitaine passed under the nominal rule of the Merovingian kings and was frequently partitioned among them.

The first line of dukes began about 660 with one Felix, who, like his successor, Lupus, probably owed allegiance to the Frankish kings, and whose seat of government was Toulouse. About the end of the 7th century an adventurer named Odo, or Eudes, made himself master of this region. Attacked by the Saracens, he inflicted on them a crushing defeat, but when they reappeared he was obliged to invoke the aid of Charles Martel, who, as the price of his support, claimed and received the homage of his ally. Odo was succeeded by his son Hunald, who, after carrying on a war against the Franks under Pippin the Short, retired to a convent, leaving both the kingdom and the conflict to Waifer, or Guaifer. For some years Waifer strenuously carried on an unequal struggle with the Franks, but he was assassinated in 768, and with him perished the national independence, although not the national individuality, of the Aquitanians. In 781 Charlemagne bestowed Aquitaine upon his son, Louis, and the province is referred to during the Carolingian period as a kingdom. When Louis succeeded Charlemagne as emperor in 814, he granted Aquitaine to his son Pippin, on whose death in 838 the Aquitanians chose his son Pippin II. (d. 865) as their king. The emperor Louis I., however, opposed this arrangement and gave the kingdom to his youngest son Charles, afterwards the emperor Charles the Bald. Now followed a time of confusion and conflict, which resulted eventually in the success of Charles, although from 84j to 852 Pippin was in possession of the kingdom. In 852 Pippin was imprisoned by Charles the Bald, who soon afterwards gave to the Aquitanians his own son Charles as their king. On the death of the younger Charles in 866, his brother Louis the Stammerer succeeded to the kingdom, and when, in *877,* Louis became king of the Franks, Aquitaine was united to the Frankish crown.

A new period now begins in the history of Aquitaine. By a treaty made in 845 between Charles the Bald and Pippin II. the province had been diminished by the loss of Poitou, Saintonge and Angoumois, which had been given to Rainulf I., count of Poitiers. Somewhat earlier than this date the title of duke of the Aquitanians had been revived, and this was now borne by Rainulf, although it was also claimed by the counts of Toulouse. The new duchy of Aquitaine, comprising the three districts already mentioned, remained in the hands of Rainulf's successors until 893, when Count Rainulf II. was poisoned by order of King Charles III. Charles then bestowed the duchy upon William the Pious, count of Auvergne, the founder of the abbey of Cluny, who was succeeded in 918 by his nephew, Count William II., who died in 926. A succession of dukes followed, one of whom, William IV., fought against Hugh Capet, king of France, and another of whom, William V., called the Great, was able considerably to strengthen and extend his authority. William's duchy almost reached the limits of the Roman Aquitania Prima and Se-

cunda, but did not stretch south of the Garonne, a district which was in the possession of the Gascons. William died in 1030, and the names of William VI. (d. 1038), Odo or Eudes (d. 1039), who joined Gascony to his duchy, William VII. and William VIII. bring us down to William IX. (d. 1127), who succeeded in 1087, and became famous as a crusader and a troubadour. William X. (d. 1137) married his daughter Eleanor to Louis VII., king of France, and Aquitaine went as her dowry. When Eleanor was divorced from Louis and was married, in 1152, to Henry II. of England, the duchy passed to her new husband, who, having suppressed a revolt there, gave it to his son Richard. When Richard died, in 1199, it reverted to Eleanor, and on her death five years later, was united to the English crown and henceforward followed the fortunes of the English possessions in France. Aquitaine, as it came to the English kings, stretched, as of old, from the Loire to the Pyrenees, but its extent was curtailed on the south-east by the wide lands of the counts of Toulouse. The name Guienne, a corruption of Aquitaine, seems to have come into use about the 10th century, and the subsequent history of Aquitaine is merged in that of Gascony (*q.v.*) and Guienne (*q.v.*).

Desjardins, *Gkographie historique et administrative de la Gaule romaine* (1876, 1893); A. Luchaire, *Les Origines linguistiques de l'Aquitaine* (1877); A. Perroud, *Les Origines du premier duché d' Aquitaine* (1881).

ARA, a constellation of the southern hemisphere (ara, an altar). (See COXSTELLATION.)

ARABESQUE, a word meaning simply "Arabian," but technically used for a certain form of decorative design in flowing lines intertwined; hence comes the more metaphorical use of this word, whether in nature or in morals, indicating a fantastic or complicated interweaving of lines against a background. In decorative design the term is historically a misnomer. It is applied to the grotesque decoration derived from Roman remains of the early time of the empire, not to any style derived from Arabian or Moorish work. Arabesque is a term pretty well restricted to varieties of cinquecento decoration, which have nothing in common with any Arabian examples in their details, but are a development derived from Greek and Roman grotesque designs, such as we find them in the remains of ancient palaces at Rome, and in ancient houses at Pompeii. These were reproduced by Raphael and his pupils in the decoration of some of the corridors of the Loggie of the Vatican at Rome: grotesque is thus a better name for these decorations than arabesque. Pliny and Vitruvius give us no name for the extragavant decorative wall-painting in vogue in their time, to which the early Italian revivers of it seem to have given the designation of grotesque, because it was first discovered in the arched or underground chambers *(grotte)* of Roman ruins—as in the golden house of Nero, or the baths of Titus. What really took place in the Italian revival was in some measure a supplanting of the arabesque for the classical grotesque, still retaining the original Arabian designation, while the genuine Arabian art, the Saracenic, was distinguished as moresque or Moorish. So it is now the original arabesque that is called by its specific names of Saracenic, Moorish and alhambresque, while the term arabesque is applied exclusively to the style developed from the debased classical grotesque of the Roman empire.

There is still much of the genuine Saracenic element in Renaissance arabesques, especially in that selected for book-borders and for silver-work, the details of which consist largely of the conventional Saracenic foliations. But the arabesque developed in the Italian cinquecento work repudiated all the original Arabian elements and devices, and limited itself to the manipulating of the classical elements, of which the most prominent feature is ever the floriated or foliated scroll; and it is in this cinquecento decoration, whether in sculpture or in painting, that *arabesque* has been perfected.

In the Saracenic, as the elder sister of the two styles, which was ingeniously developed by the Byzantine Greek artists for their Arabian masters in the early times of Mohammedan conquest, every natural object was proscribed; the artists were, therefore, reduced to making symmetrical designs from forms which should have no positive meaning; yet the Byzantine Greeks, who were Christians, managed to work even their own ecclesiastical symbols, in a disguised manner, into their tracery and diapers; as the lily, for instance. The cross was not so introduced; this, of course, was inadmissible; but neither was the crescent ever introduced into any of this early work in Damascus or Cairo.

The Alhambra diapers and original Majolica (Majorca) ware afford admirable specimens of genuine Saracenic or Moorish decoration. A conventional floriage is common in these diapers; tracery also is a great feature in this work, in geometrical combinations, whether rectilinear or curvilinear; and the designs are rich in colour. These curves, angles or interlacings constitute the prominent elements of an Arabian ornamental design, combining also Arabic inscriptions. The Alhambra displays almost endless specimens of this peculiar work, all in relief, highly coloured, and profusely enriched with gold. The mosque of Tulun, in Cairo, A.D. 876, the known work of a Greek, affords the completest example of this art in its early time; and Sicily contains many remains of this same exquisite Saracenic decoration.

Such is the genuine arabesque of the Arabs, but a very different style of design is implied by the arabesque of the cinquecento, a purely classical ornamentation. This owes its origin to the excavation and recovery of ancient monuments, and was developed chiefly by the sculptors of the north, and the painters of central Italy; by the Lombardi of Venice, by Agostino Busti of Milan, by Bramante of Urbino, by Raphael, by Giulio Romano, and others of nearly equal merit. Very beautiful examples in sculpture of this cinquecento arabesque are found in the churches of Venice, Verona and Brescia; in painting, the most complete specimens are those of the Vatican Loggie, and the Villa Madama at Rome and the ducal palaces at Mantua. The Vatican arabesques, chiefly executed for Raphael by Giulio Romano, Gian Francesco Penni, and Giovanni da Udine, though beautiful as works of painting, are often very extravagant in their composition, ludicrous and sometimes aesthetically offensive; as are also many of the decorations of Pompeii. The main features of these designs are balanced scrolls in panels; or standards variously composed, but symmetrically scrolled on either side, and on the tendrils of these scrolls are suspended or placed birds and animals, human figures and chimeras, of any or all kinds, or indeed any objects that may take the fancy of the artist. The most perfect specimens of cinquecento arabesque are certainly found in sculpture. As specimens of exquisite work may be mentioned the Martinengo tomb, in the church of the Padri Riformati at Brescia, and the façade of the church of Santa Maria dei Miracoli there, by the Lombardi; and many of the carvings of the Chbteau de Gaillon, France.

ARABGIR or **ARABKIR,** a town of Turkey in Asia in the Malatia vilayet, situated near the confluence of the eastern and western Euphrates, but some miles from the right bank of the combined streams. Pop. about 30.000. It is connected with Sivas by a *chaussée,* prolonged to the Euphrates. The inhabitants are employed in the manufacture of silk and cotton goods, or in the production of fruit. The present town was built at a comparatively recent date; but about 2m. north-east is the old town, now called Eski-Shehr, given (c. 1021) to Senekherim of Armenia by the emperor Basil II.

ARABIA, a peninsula at the south-west extremity of Asia lying between 12° and 32° N. and 35° and 60° E., bounded west by the Red Sea, south by the Gulf of Aden and the Indian Ocean, east by the Gulf of Oman and the Persian Gulf, and north by 'Iraq and the mandated territory of Trans-Jordan The northern boundary starts in the east at a point near Fao at the head of the Persian Gulf and follows the 'Iraq–Kuwait boundary to Riqa'i, whence it runs (as laid down in detail in the Treaty of Muhammara, 1921) in a north-west direction to Jebal Anaza (intersection of 32° N. and 39° E.), whence the line is as described in the Treaty of Hadda (1925) to the intersection of 29° 35′ N. and 38° E. From this point

westward the boundary (undefined) runs through Mudawwara station on the Hejaz railway to a point immediately south of Aqaba and thence along the eastern shore of the gulf of that name. The Sinai peninsula, Palestine, Trans-Jordan, Syria and 'Iraq, though of predominantly Arab population, are thus excluded from Arabia, whose formerly uncertain land frontiers have at last acquired a certain amount of precision. In shape the peninsula forms a rough trapezium of a total area of about 1,000,000 sq.m. Its greatest length is 1,400m. from Aqaba to Aden, whence the distance to Ras Al Hadd is 1,250m. The other two sides are roughly 900m. to Fao and 750m. thence to Aqaba.

GEOGRAPHY AND EXPLORATION

General Features. — In general terms Arabia may be described as a plateau sloping gently eastward from a mountain range running along the whole length of its west side within an average of 10 or 15m. of the Red Sea littoral, from which it rises steeply to an average height of 5,000ft. The coastal plain rarely exceeds 30m. in width. The greatest height of the range is at the southern end where it rises to 9,000 or 10,000ft., and the plateau-slope is further divided into subsidiary slopes trending respectively north-east and south-east from a central watershed. At the south-east extremity the uniform character of the peninsula is disturbed by the lofty excrescence of the Jebal Akhdar range of Oman, 9,000 to 10,000ft. Outside Yemen, Oman and numerous scattered valleys in the western range Arabia is a country remarkable for its aridity and barrenness. The monsoon-rains that visit Abyssinia bring but little precipitation to Arabia and that only to the region of high mountains in the south-west. Elsewhere the country is true desert with numerous but widely scattered oases in the dry beds of torrents which on rare occasions each year come down in spate. There are no rivers and no forests and, so far as is known, only three groups of permanent pools (Hasa, Kharj and Aflaj) scarcely worthy to be called lakes. The peninsula falls naturally into three main divisions: a central core of hard desert with numerous valleys and oases supporting a considerable settled population; an almost complete circle of sand waste surrounding the above with bulges of enormous area to north and south; and an outer circle round the latter of steppe or mountain, in part bare and arid and in part more or less thickly populated and cultivated. The first is Nejd; the second comprises the northern Nefud, the Dahna and the Rub' Al Khali; and the last the Syrian Hamad, Midian, Hejaz, Asir, Yemen, Hadhramaut, Oman and Hasa. The highlands of Asir and Yemen with part of Hadhramaut constitute the *Arabia Felix* of old time imagination, enjoying a temperate climate, a reasonable rainfall and good soil. The same remarks apply to Oman, whose Batina coast, irrigated by the streams of Jebal Akhdar, is as productive as any other part of the peninsula. Outside these areas the desert predominates, dotted with oases, many of them of great fertility such as Medina, the Qasim and Hasa, to name but three. The Rub' Al Khali is empty and only visited by the Bedouins.

EXPLORATION

An account of the progress of exploration of Arabia up to the year 1904 has been given in detail by the late Dr. D. G. Hogarth in his *Penetration of Arabia.* Since then, and particularly during the World War, considerable additions have been made to European knowledge of the peninsula, though no professional survey work has been carried out in any part of the country excepting the Aden Protectorate and, to a less extent, on the northern fringe of Hejaz during the war. The coastline has been laid down with reasonable accuracy by the marine surveys of the Indian Government and the Admiralty, but the mapping of the interior is entirely based on the itineraries of explorers supported to an increasing extent by their astronomical and other observations. Maps of the greater part of the country on the international scale 1:1,000,000 have been published, and the general character of the peninsula is well enough known. Vast gaps, however, still remain-to be filled in in our detailed knowledge of Arabia, which in the Rub' Al Khali contains what is probably the largest and most important totally unexplored area in the two hemispheres. excluding the Polar regions.

Carsten Niebuhr.—Arabian exploration in the modern sense may be said to have begun with Carsten Niebuhr's expedition under the auspices of the Danish Government in 1761–64. After a year in Egypt and Sinai the party reached Jedda at the end of 1762 and after a short stay sailed to Luhaiya, a port on the coast of Yemen, the exploration of which was the main object of the mission. The party travelled *via* Bait al Fakih and Zabid to Mocha, then the great port of the coffee-trade, and thence up into the highlands which they reached at Udain in the coffee country. As they ascended eastwards to higher altitudes coffee gave way to wheat and barley and Jibla was reached amid mountains 10,000ft. high. Travelling south to Taizz, they returned to the Tihama (coastal plain) and reached Mocha *via* Hais and Zabid. Von Haven, the mission's archaeologist, having died, Taizz was revisited in June 1763, whence the party travelled to Sana, the capital of Yemen and the headquarters of its ruling Zaidi Imam, via Jibla and Yarim, where Forskal the botanist died, and Dhamar, a Zaidi university frequented by 500 students. Four days' march over a stony plateau dominated by bare sterile mountains brought the mission to Sana where it was cordially received by Mahdi 'Abbas, the Imam. Niebuhr describes the city as it was in his time in terms which substantially represent its main features at the present day, though recent Italian penetration may be expected to produce considerable changes in the near future. It had an encircling wall flanked with towers, a citadel at the foot of Jebal Nuqum which rises 1,000ft. above the plain and the fortress and palace of the Imams (now replaced by a Turkish hospital). The Jews' quarter and the suburb of Bir Al Azab with its scattered houses and gardens were prominent features of the city, a few miles to the north of which is the large village of Raudha in a fertile irrigated plain which Niebuhr likened to Damascus. Having spent ten days at Sana the mission returned to Mocha travelling along part of the present main road to Hodeida as far as the rich coffee district of Jebal Haraz and thence south. At Mocha they embarked for India and next year the death of his three remaining companions left Niebuhr the sole survivor. He then visited Oman at the south-eastern extremity of Arabia and various points on the shores of the Persian Gulf and, travelling via Basra, Syria and Palestine, reached Denmark in 1764 after an absence of four years. The results of Niebuhr's mission, published in 1772, gave the world its first comprehensive description not only of Yemen but of all Arabia. At the same time the localities actually visited were described with such fullness and accuracy of detail that little or nothing was left for later travellers to discover.

J. Halevy. — The next great name in the record of the exploration of south-west Arabia is J. HalCvy who went to the Yemen more than a century later. It was Halévy who in 1869 carried out the first exploration of Marib and its rock-cut inscriptions. Travelling south-east from Sana he reached Madid (5,000 inhabitants) and, after crossing a plateau, Mijzar at the foot of Jebal Yam on the borders of Jauf, whence he made his most important discoveries of Sabaean inscriptions. He explored Ma'in (ancient capital of Minaeans), Kamna (ancient Caminacum) and Khirbat Al Baidha (Pliny's Nesca), where the Romans under Aelius Gallus defeated the Sabaean army in 24 B.C. Passing northwards by Khabb and skirting the Great South Desert he reached the fertile district of Najran, where he spent several weeks with a colony of Jews at Makhlaf. Some miles to the east he discovered the ruins of Ptolemy's Nagra at Madinat Al Ma'hud and in June, 1870, he reached Marib, where he explored the ruins of Madinat Al Nahas (so named from its inscriptions engraved on brass plates). Two hours to the east he found the famous dam constructed by the Himyarites across the Wadi Shibwan, on which depended the water supply of their capital.

E. Glaser.—The next visitor to Marib was the Austrian archaeologist, E. Glaser (1855–1908), who under Turkish protection visited the spot in 1889 after an initial failure due to the hostility of the Hashid and Bakil tribes north-east of Sana, who turned him back from Khamr. He was able however to reconnoitre the plateau between the wadis Kharid and Hirran formerly covered with Himyarite settlements, and to trace these wadis to their junction at Al'Ish and thence to Jauf. On his second journey he reached

and spent 30 days at Marib collecting a large number of inscriptions. He was unable to penetrate further eastward and left the problem of the Jauf drainage and its connection with the Hadhramaut valley unsolved.

Wellsted, von Wrede, L. Hirsch, **J. T.** Bent,—Meanwhile in 1835 the first attempt had been made by Lieuts. J. R. Wellsted and C. Cruttenden of the "Palinurus," employed on the marine survey of the Arabian coast, to penetrate into the interior of the Hadhramaut. Among the ruins of Naqb Al Hajr and at Husn Ghurab near Mokalla they found Himyaritic inscriptions, the first record of ancient Arabian civilization in this province. They were unable to follow up their discoveries and it fell to Adolph von Wrede in 1843 to reach wadi Duwan, one of the main southern tributaries of the Hadhramaut valley. He reached the edge of the Great South Desert but was forced to return to Mokalla owing to the detection of his disguise as a pilgrim to the shrine of the prophet Hud. He had established the existence of the populous ,and fertile district of the main Hadhramaut valley reported to Wellsted and his failure to enter it was made good in 1893 by L. Hirsch travelling from Mokalla under the protection of the Qa'aiti Sultan, ruler of the whole province except Saihun and Tarim which belonged to the Kathiri dynasty. Reaching wadi Duwan, where he found ruins and inscriptions near Hajrain, he proceeded north-east to Hauta in the main valley and thence to Shibam. With a Kathiri escort he passed on through Saihun to Tarim, the former capital, whence after a short stay the hostility of the inhabitants compelled him to a hasty retreat via Shibam and wadis Ibn 'Ali and 'Adim to Mokalla, whence a few months later J. Theodore Bent and his wife with Imam Sharif, a surveyor lent by the Indian Government, travelled by the same track upwards, visiting many ruinous sites with Himyaritic remains and inscriptions and making a very valuable survey of the country. The hostility of the local Saiyids militated against adequate examination of the remains and much was left for future travellers. Oman, the south-eastern buttress of the Great South Desert, offers perhaps conditions more favourable for exploration than any other part of Arabia. Here as in Hadhramaut Wellsted was the pioneer of exploration as Niebuhr did not go inland from Muscat. In 1810 a British Indian expedition to the Pirate coast provided various opportunities of visiting the interior, but it was not till 1835 that Wellsted carried out the first proper exploration of the country. Landing at Sur near Ras Al Hadd he travelled south through Bani Bu'Ali country to the edge of the desert and thence north-west up wadi Baidha, a fertile, well-watered country running up to the southern fringe of Jebal Akhdhar. He was made welcome by the inhabitants, visiting 'Ibra, Samad and Nazwa, but the presence of Wahhabi outposts and raiding-parties prevented him exploring to the west and he returned to India after an excursion along the Batina coast to Sohar.

Miles.—His work was continued in 1876 by Col. S. B. Miles, who travelled from Sohar across the dividing range into the Dhahira, whose principal settlement, Buraima, he was the first to visit. In this district he found an industrious agricultural population with numerous settlements and he ascertained that the unexplored tract extending thence 250m. west to Qatar is a gravelly steppe shelving down to the salt marshes along the Persian Gulf.

The lure of the forbidden Mecca and Medina has made the Hejaz the best known province of Arabia. Its first European visitor was perhaps L. de Varthema, an Italian, who appears to have reached it by travelling from Damascus via wadi Sirhan early in the 16th century. Joseph Pitts, of Devon, was another early visitor and others are known to have reached Mecca in the disguise or semblance of pilgrims, but it was not till the beginning of the 19th century that the Hejaz was visited for the first time by an European explorer with a definite scientific object. This was the Spaniard, Badia y Leblich, who, under the name of 'Ali Bey and claiming to be the last representative of the 'Abbasid Califs, arrived at Jedda in 1807 and performed the pilgrimage to Mecca. Besides giving to the world the first accurate description of the holy city and the Hajj ceremonies, he was the first to fix the position of Mecca by astronomical observations and to describe its surroundings.

J. L. **Burckhardt.**—But the real pioneer of exploration in the Hejaz was J. L. Burckhardt, who had already won a reputation as the discoverer of Petra, and whose experience of Arabian travel and knowledge of Arab life enabled him to pass as a Muslim. He landed at Jedda in 1814, when the Wahhabi occupation of the Hejaz had been terminated and the troops of Mohammed 'Ali were preparing for an advance into Nejd. Having first visited Taif, he spent three months in Mecca performing the rites incumbent on a pilgrim. In Jan. 1815, he travelled to Medina by the western or coast route and, in spite of failing health, recorded all that he saw and experienced with the same accuracy that had marked his work at Mecca. He was forced however to curtail his wanderings and returned via Yanbu' to Cairo, where he died two years later. With Niebuhr, Burton and Doughty he must be reckoned among the greatest of Arabian explorers.

Richard Burton.—His successor in the Hejaz—sed longo *intervallo*—was perhaps one of the greatest explorers of the 19th century, and his work in Arabia, though confined to the Hejaz, has never been surpassed in its intensity, its accuracy and its comprehensiveness. Richard Burton, travelling as an Afghan pilgrim, reached Yanbu' after a long and arduous voyage from Suez in a sanbuk (native sailing-boat) with a crowd of pilgrims in 1854. Thence he visited Medina, where he amplified Burckhardt's description while confirming its accuracy. He then proceeded to Mecca by the eastern route, not traversed by any other explorer, running south-east from Medina and then south across the Harra lava-field, always keeping to the high plateau of the Nejd-Hejaz borderland. Lack of time and tribal unrest in the interior balked his scheme of travelling across the Great South Desert and it was not till 1877 that he was able to make further contributions to Arabian geography, being deputed by Khedive Ismail of Egypt to exainine the reported gold deposits of Midian (northern Hejaz). He found traces of ancient workings in several places and made many archaeological discoveries of value, while carrying out a valuable topographical survey of the country from Aqaba southward to wadi Hamdh, whose importance he was the first to recognize. His survey extended from the coast to the Hisma plain beyond the mountain barrier of Midian.

Snouck **Hurgronje.**—Two decades later the Hejaz and its holy cities were visited by another explorer worthy to be ranked among the greatest of the explorers of Arabia, Snouck Hurgronje, a Dutchman. The work of Snouck Hurgronje, published in German only, did not bring him the fame that his predecessors achieved, but this was in part due to the fact that for the most part he covered ground already well known. Nevertheless for fullness and accuracy his sojourn in the Hejaz marked a definite stage in the exploration of the country. The overthrow of the Wahhabi power by Ibrahim Pasha in 1818 marks the beginning of European penetration of the deserts of central Arabia. A number of European officers accompanied the Egyptian army but left no record of their experiences and observations, but it was to that expedition that the first visit of a British traveller to Nejd was directly due.

G. F. **Sadlier.**—The Indian Government, concerned to put down piracy in the Persian Gulf and desirous of obtaining a first hand report on the Arabian situation, deputed Capt. G. F. Sadlier to visit Ibrahim Pasha as de *facto* ruler of the Wahhabi country. Arriving at Hufuf he learned that Ibrahim had already left Dar'iya, but hoping to find him before he left Nejd, he followed up the Egyptian army's line of march to Rass in Qasim, where he heard that the pasha had gone on to Medina. Unable to obtain escort or safe-conduct back to the coast, Sadlier unwillingly accompanied the army to Medina where he met Ibrahim and was courteously received. Unable however to achieve any result from his interview he continued his journey to Yanbu', thus being the first European to cross the Arabian peninsula from sea to sea. He returned via Jedda to India and, though the political results of his mission were nil, the value of his journey was immense from the geographical standpoint and for the first time it became possible to locate some of the principal places in Arabia in something like their proper relative positions. It also showed that a considerable body of troops could cross the deserts of Nejd even in July and August. Sadlier's fame as an explorer appears to have been achieved with

considerable reluctance on his part if not positively in spite of his efforts to avoid it. The trail that had been blazed by Sadlier had left the province of Jebal Shammar untouched.

G. A. Wallin.—That province was the objective of the next journey into Arabia, made by G. A. Wallin in 1845 on behalf of Mohammed Ali, who desired information on the new situation in northern Nejd brought about by the rising power of Abdullah Ibn Rashid. Crossing the Damascus-Mecca route at Ma'an he travelled via wadi Sirhan to Jauf and thence, some months later, across the Nafud to Hail, already a flourishing town and capital of the Shammar principality embracing all northern Nejd from Qasim to the Syrian border. Enjoying every opportunity of observing the character of the country and its inhabitants as well as the hospitality and patriarchal justice of its chief, he returned to Egypt via Medina and Mecca. In 1848 he revisited Hail, travelling via Mowaila, Tabuk and Taima, and passed out of Arabia on the eastern side at Rarbala.

Carlo Guarmani.—Wallin's visit to Jauf was repeated in 1851 by an Italian Levantine, Carlo Guarmani, who in 1864 set out on a more ambitious expedition to buy stallions for the French emperor. Travelling through the Ruwala country he reached Taima without incident and was the first European to visit Khaibar, then under Ibn Rashid's rule, whence he proceeded to the Qasim. Abdullah, the son of Faisal Ibn Saud, was there on a raiding-expedition and sent him a prisoner to Anaiza, where Zamil, the Amir, befriended him and enabled him to proceed to Hail. He was well received there by the new ruler, Talal, and in due course returned with his successful purchases of horseflesh across the Nafud to Syria. The geographical results achieved by him were remarkable and to him belongs the credit of making the scientific cartography of central Arabia possible. His travels occasioned some scepticism but there is no reasonable doubt as to his general veracity, supported by compass bearings which have not been shaken by subsequent work in the same field.

W. G. Palgrave.—The same can scarcely be said of another and more famous traveller of the same period, W. G. Palgrave, who claimed to have visited Jauf, Hail, Buraida, Riyadh, Kharj, Aflaj and the Hasa during the years 1862–63 in company with one Barakat, a Syrian Christian priest who afterwards became a bishop. Palgrave published a remarkable narrative which has taken its place as a classic of Arabian travel. His intimate knowledge of Syria and the Arabic language and his unchallengeable knowledge of the history and politics of Arabia enabled him to paint a picture of Arab life of the greatest interest and charm, but the geographical value of his work is practically nil. This fact, emphasized by the fantastic nature of his geographical descriptions of the country, laid him open to a vigorous challenge by G. P. Badger, who, for want of full and accurate knowledge, failed however to establish his case. Yet it is strange that Doughty, visiting the country only 15 years later, should apparently have found no trace of him. Be that as it may, Palgrave's reputation survived until well into the 20th century, when it was subjected to a vigorous attack in detail by Philby, who had covered all the ground which he claimed to have traversed except Jebal Shammar. Palgrave was ably defended by Dr. D. G. Hogarth and again in 1924 by Cheesman, who had visited the Hasa and thought that, for all his inaccuracies, he must have been an eye-witness of the scenes described.

Pelly.—Col. Lewis Pelly, Political Resident in the Persian Gulf, headed a mission to the Wahhabi capital in 1865 and accomplished some work of great geographical value, visiting Sadus, where a column was seen in *situ* supposed to date from pre-Islamic days and now destroyed by Wahhabi fanaticism, and other places in the Sudair province. He established the basis of a British entente with Faisal Ibn Saud which has endured to our own times.

Doughty.—Charles Doughty, the next Englishman to visit northern Arabia, covered little new ground but saw more of the desert life and described it more faithfully and more artistically than any other explorer before or since. Travelling down from Damascus in 1875 with the Hajj caravan he stopped at Al Hajr to explore the rock-cut tombs of Madain Salih, drawings of which together with copies of the inscriptions thereon he sent to Renan in Paris before launching out on his wanderings in Arabia. Travelling with the Fuqara Bedouins he wandered all over the Nejd-Hejaz borderland, visiting Taima where he discovered the famous inscribed stone afterwards acquired by Huber for the Louvre. The following year he travelled to Hail and back to Khaibar where the negro governor and inhabitants ill-treated him and threatened his life. Returning to Hail in the absence of Mohammed Ibn Rashid, its great Amir, he was expelled thence and also later from Buraida, but eventually found the hospitable protection of Zamil at Anaiza, whence after many perils and an arduous journey with a butter-caravan bound for Mecca he reached the Hejaz and, narrowly escaping with his life from a mad Sharif, visited Taif and reached the coast at Jedda. A dozen years later he published his epic account of his experiences under the title of Arabia Deserta, which fell completely flat, but he lived to hear it acclaimed on all sides as a masterpiece just before and during and after the World War. As Khalil he is still remembered at Hail and Anaiza and many of his Arabian contemporaries still alive heard with regret of his death in Jan. 1926, full of years and honour.

The Blunts.—Three years later Mr. Wilfred and Lady Anne Blunt made their expedition to Jebal Shammar in company with a young sheikh of Palmyra, who was anxious to visit Nejd to seek a bride among his own folk. They travelled via Kaf and wadi Sirhan to Jauf, where the matrimonial object of the journey was successfully achieved, and thence across the Nafud to Hail, where they were hospitably entertained for a month by the Amir. Thence they accompanied the Persian pilgrim caravan returning to Karbala and Baghdad, taking with them the nucleus of what was to become the famous Crabbet Park stud of Arab horses. Their descriptions of the Nafud threw much new light on the whole problem of Arabian horse breeding and other matters in connection with native pastoral life.

Huber and **Euting.**—In 1883 the French traveller, C. Huber, accompanied by the archaeologist, J. Euting, travelled from Damascus to Hail by the same route as the Blunts. Euting's narrative of the journey, supplemented by the accounts of the Blunts and Doughty, furnishes as complete a picture as could be wished for of the social and political life of Jebal Shammar and of the general nature of the country. Huber's journal contains a vast array of topographical and archaeological material of the greatest scientific value and his notes are still the best available data (supplemented by those of A. Musil) for the mapping of northern Arabia. Besides copying many inscriptions between Hail and Taima he secured the famous Taima stone which ranks with the Moabitic stone of Diban amongst the most valuable of Semitic inscriptions. From Hail Huber followed Doughty's track to Anaiza and thence travelled to Jedda. A month later, in July, 1884, at the inception of another journey he was murdered by his guides at Rabigh. His body was buried in the cemetery at Jedda under a monument provided by the French Government in recognition of his service to science.

E. Nolde.—Mohammed Ibn Rashid still ruled at Hail when the next European visitor, Baron E. Nolde, reached it in 1893. The Amir's victory over the Wahhabi forces at Mulaida had now brought the whole of Nejd under his rule. Nolde crossed the Nefud to Haiyaniya and, finding the Amir absent from Hail, journeyed to his camp in the neighbourhood of Shaqra. He gives, however, little or no description of his route thither or of his return journey north by the Persian pilgrim route already covered by Huber in 1881. Thus, though he broke much new ground, his work, containing much of interest regarding the climate and animal life-especially the horses and camels—of central Arabia, is devoid of topographical value. He was the last of the 19th century pioneers of Arabian exploration who prepared the ground for the more detailed work awaiting the travellers of the first quarter of the 20th century. At the dawn of the latter the northern half of the Arabian peninsula above the line Mecca-Hufuf had been covered with a network of routes which made it unlikely that any important geographical feature had been overlooked. Below that line, except at Najran and Jauf, no European had penetrated 100m. in a direct line from the coast, and the whole of southern Nejd and Asir and the Great South Desert were virgin territory.

Exploration in the 20th Century.—The desert north of lat. 30 N. is now well known and the number of those who have contributed to this result is legion. Chief among the causes of our improved knowledge of this area are the activities of the British armies of Generals Allenby and Maude during the World War, the work of the Royal Air Force and the Nairn and other motor-transport companies since the war; and the projected scheme of a railway and oil pipe-line connecting 'Iraq and Palestine. Amid such a plethora of material it is impossible to single out the work of individuals, but no one man has contributed more to a correct idea of the topography of northern Arabia than Aloïs Musil, the results of whose many pre-war journeys are now being published in 7 volumes—two already issued on Northern Hejaz and Arabia Deserta with a case of maps. His work is a monument of skill and patience. Among others may be mentioned Lt. Col. G. E. Leachman who first drew attention to wadi Kharr and the route from 'Iraq to Syria via Jauf in 1910 and 1912 and was the first to travel from Jebal Shammar to Suq Al Shuyukh; Miss Gertrude Bell, who travelled from Damascus round the west fringe of the Nefud to Hail and thence to Najaf via Lauqa and who was one of the few women who can lay just claim to the title of explorer, having used instruments along the whole of her route; W. H. I. Shakespeare, who in 1914 crossed the peninsula from Kuwait to Suez via Sudair, Riyadh, Washm, Qasim, Hail and Jauf; Douglas Carruthers, who visited Taima in 1909; and Major A. L. Holt, who carried out much preliminary survey work for the railway above mentioned and, with Philby, travelled from Amman via Wadi Sirhan and Jauf to Karbala.

Central Arabia.—It is in Nejd and particularly in its southern parts that the most striking results have been achieved in the elucidation of the country's topography. Leachman came down from 'Iraq through Qasim and Washm to Riyadh and passed out of Arabia via the Hasa in 1912, his geographical results being disappointing owing to the speed of his marching often at night. In the same year Barclay Raunkiaer, a Dane, travelled from Kuwait to Qasim and returned via the Hasa, meeting with much hostility at Buraida. Shakespeare during a number of years carried out extensive journeys in the hinterland of Kuwait, ending up with the great journey across the peninsula already mentioned in 1914 and cementing the British entente with the Wahhabi ruler, Ibn Saud (*q.v.*), to whom he returned on the outbreak of the World War as British Representative. He was killed in Jan., 1915, at Jarrab in a battle between Ibn Saud and Ibn Rashid. Though he covered little ground that was absolutely new few travellers have added more than he to our knowledge of the topography of central Arabia. Major H. R. P. Dickson in 1921 did some excellent (still unpublished) mapping in the Hasa, whose topography was comprehensively studied in 1923–24 by Major R. E. Cheesman, who in addition gained well-deserved laurels by making the first visit of an European to the mysterious oasis of Jabrin on the edge of the Great South Desert, clearing up during his journey all the problems connected with this tract and confirming the existence of the Sahaba channel. Jabrin itself was found to be a dilapidated oasis and Major Cheesman heard of ruins named Magainma far out in the heart of the desert. The latest and completest explorations of the Great Central Desert were those of two Englishmen, Bertram Thomas in 1931–32, and H. St. John Philby in 1932–33.

In 1917–18 Philby had crossed the peninsula from sea to sea, a feat previously accomplished by only one other European, Capt. Sadlier in 1819, Philby's route being by way of Hufuf, Riyadh and Taif. In the Hufuf oasis the rainfall of a large area emerges at the surface and makes for great fertility. Beyond Riyadh he followed the great central pilgrim route to Mecca, a pioneer effort. Subsequently he explored southern Nejd, going 300m. southward from Riyadh to Dam and back, making valuable contributions to the map of this area. The oases of Nejd were found to comprise, usually, a nucleus town with scattered hamlets, with not more than a few square miles of cultivated land in each case, and populations not exceeding 10,000 save at Riyadh. That city has a great Wahhabi mosque and a palace of the Emirs and its population was from 12,000 to 15,000. In Aflaj and Kharj he discovered ruins spread over a wide area, suggesting burial mounds of an early era.

In both districts, the peculiar system of irrigation from natural reservoirs or deep well pits by means of subterranean channels, or *karez,* was unexpectedly found to prevail. At Umm al Jabal, just south of Laila, is a lake ¾m. by ¼m., possibly the largest sheet of permanent water in Arabia, and also a number of reservoirs of unusual size, one measuring 500 by 600 yards. In the Makran depression, south of Badia (lat. 22° N.), are other perennial pools of water surrounded by woods of well-grown trees. The oasis of Dam, locally known as "the wadi," consists of some 20 separate settlements with a total population of 9,000, mostly of negro origin or of the Dawasir tribe. It was found that the Nejd oases are not tropical paradises, that there is no chain of oases linking Nejd with either Asir or Yemen; and that there is no region of fertility between southern Nejd and Oman, nor any settled spot between it and either Oman or Hadhramaut.

Hejaz.—The determination in 1917 of the exact position of Maan and the observation of the longitude of a few stations to the south facilitated the adjustment of the inaccurately known alinement of the Hejaz railway. A tract 300m. long between Wajh and Rabigh and a smaller area south of Aqaba were explored during the World War, while a Turkish staff-map of the country within a 30m. radius of Medina added further useful data. A great part of the Hejaz can now therefore be mapped with fair accuracy. A. J. Wavell visited Mecca and Medina in the disguise of a Zanzibari pilgrim in 1908–09 and has left an admirable account of those cities and the pilgrimage ceremonies.

Asir and Yemen.—During the World War much information was collected by British officers about the tribes and localities of Asir, which, however, except for Sabiya and points along the coast, still remains totally unexplored, though the position of Ibha, its capital, is known. In Yemen on the other hand great progress has been made towards the acquisition of accurate knowledge of the country and the influx of Italians in recent years will certainly result in the solution of all its geographical and scientific problems in due course. Of pre-war visitors A. J. Wavell, who visited Sana in 1911 and gave the best description of the city since Manzoni (1884), stands out. A. J. Beneyton, a French engineer, did much survey work in 1909 in connection with a projected railway from Hodeida to Sana and Amran, much unexplored territory being mapped. And in 1912 G. Wyman Bury travelled from Hodeida to Sana and has thrown much light both on the topography and on the economic conditions of Yemen. Col. H. F. Jacob of the Aden residency made several journeys into Yemen before and since the war, publishing his results under the title *Kings* of Arabia in 1923. Three years later Sir Gilbert Clayton conducted a British political mission to the Imam Yahya at Sana and its failure to achieve any result led to the despatch of an Italian mission under Commendatore Gasparini in the same year, resulting in an Italo-Yemeni treaty of friendship.

Aden Protectorate.—In 1902–04 an Anglo-Turkish commission demarcated the boundary between the Protectorate and Yemen, which runs from a point opposite Perim north-eastwards to Qa'taba. This afforded full opportunity for the study of the topography of the region and in 1911 Bury penetrated the Kaur watershed north of the Yafa'i country, reached Yashbum (pop. 4,000) the capital of the Upper Aulaqi, where cotton and indigo are cultivated, and got as far as Baihan, 110m. inland from Shaqra and not distant from Marib.

The Red Sea Coast.—The naval patrol during the World War explored the intricate coast-line between Aqaba and Aden, exposing the numerous channels through the triple coral-reef which had hitherto limited navigation in these waters.

Oman and **Hadhramaut.**—Among the first and most notable explorers of the Oman province in the 20th century was Col. P. Z. Cox (later Sir Percy Cox, and Chief Political Officer of the Mesopotamian force and High Commissioner for 'Iraq), who added considerably to our knowledge in the course of several journeys while serving as Political Agent at Muscat. More recently a thorough geological investigation of part of the country has been made by an expedition organized by the Anglo-Persian Oil Company. Mr. B. S. Thomas and Capt. G. Eccles have also acquired much new and interesting information. In Hadhramaut

the only recent traveller of importance is Capt. W. H. Lee-Warner who covered some new ground and compiled a valuable report of conditions in the country. He reached wadi Duwan by a previously untraversed route (wadi Himam) and went on to Shibam.

TOPOGRAPHICAL DETAILS

Syrian Desert.—The Syrian desert or *Hamad* occupies the whole of northern Arabia above lat. 30° N. extending from the confines of Palestifie on the west to the edge of the Mesopotamia delta. For the most part this tract belongs politically to Palestine, Syria and 'Iraq, though it is a definite geographical unit clearly to be classified with Arabia rather than with its borderlands. On the west a tract of dark-coloured flint-desert separates the slopes of the Moab and Edom mountain-chain from the depression of wadi Sirhan and the volcanic ridges forming the southern continuation of Jebal Druz. From this upland an unbroken gravel plain slopes gently eastward to 'Iraq, scored by the channels of numerous wadis, of which the chief is wadi Hauran. The depression of wadi Sirhan runs south-eastward from the permanent spring-pools of Azraq at the edge of the Druz country through the "salt-villages" of Kaf, Ithra, etc., where a certain amount of palm-cultivation is carried on and salt-pans are largely exploited for the Syrian market, to the great oasis-depression of Jauf-Sakaka with the two towns of those names. Wadi Sirhan with its nearly uniform altitude of about 1,850ft. above sea-level appears to have been originally an inland sea. Brackish water is found in it at many points a few feet only below the surface. The town of Jauf has extensive rich palm-groves and a population of some 3,000 souls, while that of Sakaka (a collection of villages scattered among flourishing palm-groves rather than a town) is somewhat larger. Jauf is the original settlement of Daumat Al Jandal and its chief feature is the fine mediaeval castle of Marid. A short distance south of Jauf begins the Great Nafud, a vast expanse of billowy red sand-desert which with the Dahna, extending southward from its eastern extremity, the great south desert or Rub' Al Khali occupying the greater part of southern Arabia, and a series of lesser sand-strips on the west, forms the most characteristic feature of the peninsula—an almost continuous circle of sand enclosing the central core of Nejd.

The Northern **Nafud.**—The northern Nafud extends some 400m. from west to east and has an average width of 200 miles. Almost waterless throughout its whole extent, it is rich in pasture in any season of normal winter rainfall and during the spring season is the regular resort of the Bedouins and their herds of camels. The formation of sand-dunes is here exemplified on a large scale and longitudinal dunes of astonishing length are of frequent occurrence with valleys between them which it takes three or four hours to cross on a camel (about 10 to 12 miles). The most striking feature of this dune area is however the Falj pits of horse-shoe formation, studied in considerable detail by Blunt and Huber. Their floor is generally of hard soil bare of sand and their enclosing walls are of pure sand piled up to a considerable height at a steep angle of as much as 50°. The largest of these pits, which are of uniform appearance but vary greatly in size, was estimated by Huber at 1¼m. across and 99ft. deep. They appear to run in strings from east to west corresponding with their individual direction, the convex face of the *Falj* being towards the west, *i.e.*, the direction of the prevailing wind, and the cusps to leeward. In the south of this tract Huber found the pits turned towards the south, the prevailing wind being from that direction. These dunes, though subject to slight changes, appear to be practically permanent features. The general altitude of the Nafud is almost 3,000ft. above sea-level. Excrescences of rock are of frequent occurrence.

The **Dahna.**—Unlike the Nafud, the Dahna has an average width of only about 30m. and a length from north to south of some 400 miles. It consists of seven longitudinal bands of sand of varying width separated by shallow sandy valleys seldom more than a mile across. In the northern half of the Dahna sand-peaks of 200 or 300ft. in height and of pure red-sand without any sign of vegetation rise out of the longitudinal sand-ridges in groups or long lines, as many as 30 being visible together in some parts. Further south these peaks disappear as also to some extent the longitudinal arrangement of the ridges, the whole width of the barrier being a confused mass of low dunes and hollows without symmetry. South of the Riyadh-Hasa road the Dahna is unknown to Europeans, but the whole tract is, like the northern Nafud, covered with rich desert pasture in the winter and spring, when it is visited by the Bedouins. So far as is known the tract is entirely waterless.

The Rub' **Al Khali.**—The southern sand-desert or Rub' Al Khali is wholly unexplored and may contain considerable tracts of hard gravel or limestone desert in its vast inhospitable expanse. For the most part, however, it is probably a tract of sand-dunes generally similar to the northern Nafud and the Dahna. Its fringes have been viewed from afar at several points and it is reputed to contain the ruins of settlements of ancient times. The Al Murra and other tribes breed the famous *Umaniya* camel in its vast spaces, somewhere in whose recesses lies an area of salt-marshes or briny pools, of which the camels but not the human denizens of the desert drink. The latter subsist on camel's milk during their extended periods of sojourn with their flocks in this area, their permanent bases of operations being Jabrin, the southern districts of Nejd and the fringes of Oman, Hadhramaut and Yemen.

The western part of Nejd is separated from the Hejaz by various sand-strips, none of which have the importance of those already described and the most important of which is probably the Arq Al Subai lying athwart the main route between Riyadh and Mecca. A tract of firm desert parts its northern extremity from the southern extremities of the northern Nafud and provides the only unprotected entrance to Nejd.

Nejd.—Inside the sand-barrier above described lies the central province of Nejd, the fountain-head, as it were, of the Arab race. It is traversed by three main wadi-systems from west to east: wadi Rima in the northern part rising in the Khaibar Harra and traversing the Qasim district, where its continuity is broken by the sand-masses of that area and the Dahna, beyond which it resumes its course under the name of Al Batin to the neighbourhood of Zubair; wadi Sirra, which rises in the highlands of western Nejd and, breaking through the longitudinal barrier of the Jebal Tuwaiq plateau under the name of Sha'ib Birk, eventually joins wadi Hanifa at Yamama and, again changing its name to Al Sahba, cuts through the Dahna and eventually reaches the Persian Gulf near Al Qatar; and wadi Dawasir in the south which unites the three Asir and Yemen wadis of Ranya, Bisha and Tathlith at Al Hajla and, passing through the Dawasir and Sulaiyil settlements, loses itself south-eastward in the Rub' Al Khali. All three of these wadis carry floods on occasion, but wadi Rima more regularly than the others. Wadi Dawasir, which flows but seldom, experienced a flood of great magnitude in 1917. The floods of wadi Sirra are very local, though its affluent, wadi Hanifa flows almost every year and often more than once in a year.

The general slope of Nejd is from west to east in conformity with that of the peninsula as a whole. As already stated two of its chief "rivers" rise outside the province in the main mountain-range of the west. The third rises in a confused tract of mountains within the western frontier of the province, which are of granite and kindred formation and appear to be an offshoot of the main western range though separated from it by a wide interval. These mountains (Hadhb Dawasir, Damkh, the Ardh range, etc.) form an irregular mass scattered over the face of a vast sandy desert and rising at many points to an elevation of 5,000 or 6,000ft. above sea-level. They offer no impediment to progress, as the various ridges and massifs are separated by wide gaps through which run the main pilgrim-route from east to west and other caravan-tracks. Farther north lies the better known group of granite mountains collectively with the district dependent on them called Jebal Shammar. This group is also an offshoot of the main western range, merging westward in a plateau which extends continuously from the Khaibar Harra. It consists of two parallel ranges, Jebal Aja 10om. long from south-west to north-

east and rising to 4,600ft. above sea-level, and Jebal Salma, less high and to the east. The town of Hail, formerly the capital of the Ibn Rashid dynasty, and many flourishing villages with extensive palm and other cultivation depend on the floods of the wadis emanating from the twin ranges. The rest of the Jebal Shammar district is pastoral in character and the headquarters of the Shammar, one of the leading tribes of Arabia. Hail contains a population of some 15,000 souls. South of Jebal Shammar and separated from it by a steppe-desert lies the district of Qasim astride Wadi Rima—a district of sand-dunes with numerous oases scattered about its hollows. Most important of these are the vast oasis and town of Anaiza (15,000 inhabitants) and the important town of Buraida (20,000 inhabitants) with its extensive palm-groves. Continuing southward we come at the tail of Wadi Hanifa to the district of Kharj with its old capital of Yamama now choked with drifted sand and its modern capital of Dilam (5,000 inhabitants). Its chief feature is a series of unfathomed spring-fed pools still used for the irrigation of a considerable area through narrow channels cunningly constructed in the limestone rock and formerly a source of the great prosperity which gained for the district its now lost reputation of being the granary of Nejd. Here ancient ruins betoken the presence at one time of a race, perhaps the Persians, more skilled in irrigation and agriculture than the Arab inhabitants of to-day. Still further south in the heart of Tuwaiq is the Fara valley district with the two important settlements of Hauta and Hariq with 15,000 inhabitants between them: and the province of Aflaj partly in Tuwaiq and partly to the eastward of it, where is the largest surface of open water in all Arabia—the lake of Umm Al Jebal, which with half a dozen other spring-fed reservoirs formed the basis of an elaborate system of irrigation in former times and still serves, though to a reduced extent, the same purpose. Laila with 8,000 inhabitants is the capital of the district—a large and flourishing oasis like its neighbour, Saih. Other notable settlements here are Raudha and Badia with Ghail on its perennial stream in the hill tract.

El Hasa.—The eastern and western flanks of the great encircling sand-barrier are bordered by wide expanses of steppe-desert running north and south. That of the east sloping gently towards the Persian Gulf, from which it is parted by a sand-strip of an average width of 25m., comprises the Dibdiba and Summan of gravel and limestone respectively and contains one of the most prosperous districts of Arabia, El Hasa, famous for its many hot and cold spring-fed reservoirs, its irrigation channels, its rich vegetation—the *Khalas* date of its palm-groves is among the best dates in the world—and its two great towns of Hufuf (30,000 inhabitants) and Mubarraz (20,000). At some distance to southward lies the important but unprosperous oasis of Jabrin at the edge of the Great Desert, while 50m. east lies the rich and populous sea-port and oasis of Katif. South of the latter is Ukair, the ancient Gerra. Other settlements along the Gulf coast, are Kuwait furthest north, Jubail, Qatar and the Trucial coast ports.

Hejaz and Yemen. — The outer crust of Arabia on the north, west and south is formed by an almost continuous barrier of lofty mountains beginning in the north with the coastal granite range of Midian and the inner volcanic masses known as *Harra* (the most important of these are Harrat Uwairidh, Harra Khaibar and Harra Nawasif) forming a southern excrescence of the volcanic system of Jebal Druz. The mountain range is continued southward by limestone massifs increasing in height through the Taif hills and the uplands of Asir to the lofty mountains of Yemen. Turning eastward the range runs at a considerably lower elevation through the Hadhramaut district and peters out in the southern sands of the Great Desert. The highest point in the Harra tracts is probably Jebel Anz of 7,000ft. The peaks of Midian rise to even greater heights, while those of Yemen often exceed 10,000ft. Down to the southern border of the Hejaz (*q.v.*) this mountain system is the scene of rich though intermittent cultivation, containing the city and large oasis of Medina, the oases of Yanbu Al Nakhl and Taif and the city of Mecca (70,000 inhabitants). The highlands of Asir (*q.v.*) and Yemen (*q.v.*) are even more richly and continuously cultivated (coffee being an important item), while the valleys of Hadhramaut are rich in palms and tobacco. The mountain-range is supposedly rich in mineral deposits, gold having been worked formerly in Midian, where and further south in Asir (and the adjacent Farsan islands) there are indications of oil. Rock salt abounds in various localities. Sana (15,000 inhabitantsj is the capital of Yemen, and Abha (5,000) that of Asir. On the east and partly on the south the outer crust of the peninsula is formed by sand-ridges, but in the south-east the continuity of these is interrupted by the great mountain-mass of Oman (*q.v.*), rising to 10,000ft. above sea-level, with its capital at Muscat on the coast of the Gulf of Oman. This, like Yemen, is a tract of great fertility, its mountain valleys and oases on the sea coast maintaining a population of about a million. The range of Jebal Akhdar, the central feature of the district, plunges down abruptly on both sides to the sea and the Great Desert respectively.

Geology. — The geological structure of Arabia is very similar to that of Egypt. The oldest rocks consist of granite and schist with intrusive dykes, and on this foundation lie sedimentary deposits beginning with the Nubian sandstone of Petra, which outcrops at Jauf and runs along the Hejaz railway southward and is overlain by Cretaceous strata to the east. Later deposits are found in Wadi Sirhan and in the desert fringing 'Iraq. Jurassic formations have been found on the surface in the range of Jebal Tuwaiq, and the eastern desert belongs mainly to later epochs. The granite outcrops in Nejd at Jebal Shammar and in the western highlands. Over the Kubian sandstone and the older granite great sheets of lava have been poured and these. protecting the softer beds beneath from denudation, stand up as the high plateaux and hills called *Harra.* Volcanic cones are numerous and an eruption was recorded near Medina as recently as A.D. 1256. In southern Arabia the crystalline floor appears along the coast and in Oman, the geology of which has reckntly been studied by an expedition of the Anglo-Persian Oil Company. At Marbat Nubian sandstone overlies the granite, and marls showing Cenomanian fossils are in evidence, being overlaid by Cretaceous limestones with isolated patches of overlying Alveolina limestones. The greater part of southern Arabia seems, however, to be formed of Alveolina and nummulitic limestones of Tertiary age. An extinct volcano occurs at Aden and volcanic rocks are found near the Straits of Bab Al Mandab. Throughout Arabia the folding of the sedimentary beds is of the gentlest, but faults of considerable magnitude occur here and there. The Gulf of Aqaba is a case in point and the Red Sea itself is a great trough bounded by faults along each side. The occurrence of hot springs in Hasa and the deep spring-fed reservoirs of Kharj and Aflaj deserve careful further study in connection with the geological structure of the peninsula.

Climate.--Owing to its low latitude and general aridity Arabia must be classed among the hot regions of the earth, but is not comparable in the matter of high temperatures with such tracts as the Sind desert and Mesopotamia. The mean maximum summer temperature of Nejd probably seldom exceeds 112°, while frosts are not uncommon in the northern part of the province, where a temperature of 18° was registered (by Nolde) at Hail in Feb. 1893. The central desert tracts indeed may be said to enjoy a healthy climate at all times of the year owing to the dryness of the atmosphere which produces a feeling of great invigoration when the wind is from the north—the famous *Nasim* or zephyr of Nejd. With a south wind at whatever season of the year the climate tends to be relaxing. The same effects are experienced with the wind in the north and south respectively all along the coastal fringe, where an excessive humidity, coupled with maximum summer temperatures of over 90° on the Red Sea coast and over 100° in the Persian Gulf, has given the whole country an unsavoury reputation scarcely warranted by the facts. The high plateau and mountain-range of western Arabia and the massif of Oman enjoy a delightful climate without extremes of temperature at all times, though the Midian district experiences considerable falls of snow and low temperatures with chill winds from the east in winter. Except in Yemen, which lies within the monsoon-

belt and receives considerable precipitation in the later summer months (16in. were recorded from June to Sept. in 1902 at Dhala, 4,800ft., on the Aden Protectorate frontier), and Oman, which has a good rainfall and occasional snow, Arabia is a country of scanty and irregular rainfall. The average annual fall at Aden is only about 4in. and that of the Red Sea coast is scarcely more, precipitation, when it occurs, being of a torrential character and concentrated in only a few hours or days of the winter. In the centre and east of the peninsula the rainfall also occurs during the winter, though occasionally in the central and west-central districts there is a small fall in Aug. or Sept. Great areas of Arabia, especially in the west and south, experience long periods of drought, but on the whole the country gets enough rain to make the desert blossom in the spring and to foster the oasis cultivation of its valleys. The mountain districts of Hejaz are generally well favoured in this respect and Taif enjoys the distinction of being at the extreme limit of the monsoon area northwards,

In northern Arabia the prevailing winds alternate between east and west, the latter bringing the rain from the Mediterranean across the Palestine hills. Elsewhere north and south are the prevailing directions of the wind which alternates between those points in periodical bursts—the south wind being the harbinger of rain in the winter and of heat in the summer. Yemen receives the moisture of heavy mists sweeping up from the plains during the rainless season and elsewhere dew, in parts exceedingly heavy, plays the life-giving rôle of rain in more favoured countries.

Fauna.—The wild animals of Arabia are for the most part of the desert-loving type, the commonest of all being gazelles akin to the Persian gazelle. These roam the desert spaces in considerable numbers, though the advent of the high-velocity rifle has made them less numerous than formerly. Of the larger antelopes so common on the African side of the Red Sea only one is found in Arabia—the *Oryx beatrix* or wild cow of the Arabs, which is found in the northern Nafud and in the Rub' Al Khali. The Wal, a species of ibex, is found in the mountains of Yemen, Hejaz and Oman. Hares and foxes are common as also the Jarbu and a species of coney called Wabar. Monkeys of several species occur in Hejaz and Yemen, while wolves, hyenas and panthers are not uncommon. The wild cat is also found in the mountain districts. Of birds the greatest is the ostrich, not uncommon in the desert round Jauf and found also on the fringes of the Rub' Al Khali. Sand-grouse and Sisi are very plentiful in most parts of the peninsula, as also are doves and pigeons, but duck and snipe are by no means common visitors. Quail are found everywhere in small numbers and the bustard is fairly common in all desert-tracts. Much light has recently been thrown on the wild fauna of eastern Arabia by Major R. E. Cheesman, while that of Oman was intensively studied at the beginning of the century by Sir Percy Cox. Wyman Bury has studied the birds of Yemen, but much still remains to be done for the elucidation of the fauna of Arabia as a whole. This particularly applies in the realm of insects of which comparatively little is known, though Arabia would appear to be the meeting place of species characteristic of the three continents at the junction of which it lies. Many insects new to science have been found of recent years. Scorpions, centipedes, millipedes, spiders and ants are very common. Locusts frequently appear in great swarms, doing much damage to crops and providing the Bedouins with a welcome addition to their larder. Bee-keeping is a flourishing industry among the hill-folk of Hejaz, Yemen and Hadhramaut, the honey having a great local reputation though it has a peculiar taste. The domestic fauna of Arabia comprises camels, horses, sheep, goats, donkeys and, to a less extent, cows. Of these the most useful is the camel which is the sole stock-in-trade of the great Bedouin tribes. The Arabian camel has a single hump and is in general more aristocratic than his like in neighbouring countries. The best of the Arabian breeds, which differ from each other in appearance as widely as a race-horse from a cart-horse, is the Umaniya bred by the Al Murra tribe of the Rub' Al Khali. This, like most of the better Arabian breeds, is renowned for its endurance of long periods without water and long marches at a high average speed. But it is not suited to the carrying of great burdens; 300 lb. is a heavy load for an Arabian camel to carry over long distances or day after day, and eight miles an hour would seem to be as great a speed as it can maintain for any length of time continuously. In Jan. 1928, a large number of Bedouin entrants for a race between Jedda and Mecca failed to cover the distance of about 50m. in less than 69 hours. In the summer good camels will do without water for three or even four days' marching an average of 25m. a day, but in the spring pastures they will abstain from water for as long as a month at a time. Horse-breeding has of recent years suffered a set-back in Arabia partly owing to the introduction of the modern rifle, which has made them of less account in Bedouin warfare, and partly owing to the decline of the Bombay horse-market, once a good and regular customer of Arabia. Horse-breeding is still, nevertheless, a favourite hobby of the Arabian princes and Ibn Saud maintains a large stud in the Kharj district as the Ibn Rashid dynasty used to do at Hail. The best stud in Arabia at the present day is probably, however, that of Ibn Jiluwi, governor of Hasa. From it came "Romany," a horse of classic *Nejdi* type, which has recently made history in Egypt. The greater number of horses now marketed as Arabs in Egypt and India hail from Upper Mesopotamia and Trans-Jordan, where the partially settled or nomadic tribes still breed from an original *Nejdi* stock under more favourable conditions of pasture than obtain in its original home. Anaiza in the Qasim is still to some extent a clearing-house for horses destined for export to India via Kuwait.

Large white asses of excellent quality are bred in many places, the best being those of Hasa. This stock was formerly much exported to Mecca, where they are still bred and were much used for riding purposes until the recent advent of the motor-car. The gipsy tribe of Suluba breeds a hardy type of white ass capable of great feats of endurance in the matter of thirst and probably originally derived from the Hasa stock. Asses and camels are much used for well-traction throughout the country and cows also to a limited extent. The latter are small in stature and not numerous. The sheep and goats of Arabia are of excellent quality as regards the milk and meat they provide but inferior as regards their wool. The *Saman*, or clarified butter made from their milk, and their skins and fleeces are an important article of export capable of much development, while the goat's hair provides the material for the black booths of the Bedouins. Camel's hair is used for the weaving of the mantles worn by the better class Arabs.

Flora.—The flora of Arabia has been investigated by P. Forskal of Niebuhr's mission, P. E. Botta, G. Schweinfurth and A. Deflers. Their results and those of more casual collectors have been published in volumes 7 and 8 of the *Records* of *the Botanical Survey of India* by E. Biatter, to which the reader is referred for a compendious view of the matter. The most thoroughly investigated part of the peninsula in this respect is the mountain region of the south-west, but it may be said in general terms that the Arabian type has African rather than southern Asian affinities. Various species of fig, tamarind, carob and several kinds of cactiform *Euphorbia* occur in the higher regions, as also the juniper of which there are forests in Yemen, Asir and Midian. *Adenium obesum* with its bulb-like stems and red flowers occurs in Yemen. Some fine aloes are found and all over Arabia the *Zizyphus Jujuba* is common, often growing to large trees. The tamarisk or *Ithil* occurs everywhere in sandy tracts and is often planted (as in Qasim) in hedges to protect villages and cultivation from the encroachment of drift-sand. The date-palm flourishes everywhere, producing fruit of great excellence in many parts. Vines, peach, apricot, pomegranate and fig occur in most oases; quince and apple in the highlands only; and banana in favoured valleys of low altitude. Of cereals wheat and barley and the common millets, *Dhurra* and *Dukn*, occur commonly, while lucerne is a favourite fodder-crop. The water-melons of Manfuha enjoy a high reputation and both these and musk-melons are cultivated in the Hejaz and elsewhere. Radishes, pumpkins, cucumbers, onions and leeks grow freely. Roses grow at Taif and other highland localities, where *Itr* or attar of roses is extracted on a small scale. Thyme. jasmine, lavender and other aromatic plants are of frequent occurrence. Coffee is said to have been introduced from Abyssinia

in the 6th century A.D. and thrives on the seaward slopes of Yemen and Asir between 4,000 and 7,000 ft. Jebal Haraz is an important centre of its cultivation, it being planted here and elsewhere in terraces and protected from the sun by fringes of tamarind and fig. The plants are raised from seedlings, transplanted when six weeks old in rows 4 to 6ft. apart. They are watered from irrigation channels twice a month and bear fruit in two to four years. The berries are dried in the sun and sent down to Hodeida and Aden, whence they are exported in considerable quantities. The husks are used for making a beverage called *Qishr* in Yemen and southern Nejd. Another plant universally used as a stimulant in south-west Arabia is Kat (*Catha* edulis), which grows best around Taizz. It is a small bush grown from cuttings and stripped of its leaves after three years, except for a few buds which develop next year into young shoots sold in bunches as Kat Mubarak. The Kat Malhani or shoots of the succeeding year command a higher price. The bushes are then left for another three years and the same process repeated. The leaves are chewed and have a highly stimulating effect. Tobacco is grown on a considerable scale in Hadhramaut, the chief source of the *hummi* leaf smoked in the nargilas of the western coast. Gum-bearing acacias flourish in the desert, as also many other varieties of acacia, but there is little trade in gum. Myrrh is extracted at Suda, 60m. north-north-east of Sana by cupping the trunks and the balsam of Mecca is collected in the same way. The plants of the Nefud areas and the hard desert are legion.

Population.— The population of Arabia may be roughly estimated at 7,000,000, distributed as follows:—

Yemen and Asir	3,000,000
Hejaz	1,000,000
Oman and' Hadhramaut	1,000,000
Nejd, Hasa and the desert	2,000,000

According to an Arab proverb Yemen is the cradle and 'Iraq the grave of the Arab race, and this saying probably represents fairly accurately the facts of the peopling of the peninsula. Who the original denizens of the desert were and whence they came cannot even be conjectured, but there seems to be little doubt that the large Anaza tribe of northern Arabia came originally from the Yemen and their progress across the desert in a north-east direction can be traced in detail in the colonies of Anaza origin scattered over the face of the peninsula. The same is true of other tribal elements and the history of pastoral Arabia must ever have been the same, the displacement of one tribe by a stronger or larger treading on its heels. Cross and reverse currents of population have also doubtless played their part and Arab tradition insists that the Arab race is derived from two stocks—the pure Arabs of Qahtan, a descendant of Shem, with their original home in the highlands of south and west Arabia; and the Must'araba or naturalized Arabs descended from Ishmael. Both stocks are presumably of Semitic origin, while another important element of the Arabian population, found at the present day in every stage of assimilation to the aboriginal population, doubtless came from Africa across the Red Sea. As far north as Khaibar and the villages of Jebal Shammar and throughout the country south thereof to wadi Dawasir a negro element is found in the settlements side by side with settlers of Bedouin origin. This element has mixed freely with the Arabs producing in the process a large and homogeneous group of mixed origin known as Bani Khadhir. Another extraneous element in the population is represented by the curious gipsy tribe of Suluba, who claim a Christian origin and are despised by the Arabs as an inferior race. They are great hunters and enjoy a practical monopoly of various crafts in the service of the great tribes to whom they pay a tolerance fee. These Suluba are found mainly in east Arabia, whereas in the west their functions are performed by the remnants of a Jewish element which was once numerous, occupying Medina (Yathrib) in pre-Muslim times, but is now confined to a few localities in Yemen. The Jewish population of Sana numbers several thousands and there is also a small colony in Najran. These Jews possibly represent an unconverted remnant of one of the Must'araba reverse currents already referred to. Alternative traditions date this Jewish immigration to the reign of Solomon and to the capture of Jerusalem by Nebuchadrezzar. The pilgrimage prescribed by the Prophet has given Mecca, Medina and Jedda a cosmopolitan character, while the seaports of the Arabian coast have drawn their populations from the neighbouring countries—Indians, Persians and Baluchis at Muscat and the Gulf ports; Indians and others at Makalla and the Red Sea ports. Of the Arab population the Bedouin tribes are of pure descent with some negro infiltration, and these tribes take precedence among each other under a broad distinction between those that raise camels and horses (the aristocracy) and those that breed sheep and goats (the helots). Most of the princely houses of Arabia derive from the Anaza tribe, to which belongs Ibn Saud, the king of Hejaz and Nejd. But an important element of the aristocracy in the west comprises various groups of claimants to direct descent from the Prophet. Of these the most prominent section is the Ashraf of the Hejaz, who ruled in Mecca until the Egyptian invasion of 1814, and, after a century of comparative suppression under the Turks, recovered their dominant position by the revolt of King Husain in 1916. Their return to power was however short-lived as they were ousted in 1925 by the Wahhabi conquest of their country. The Imams of Sana claim descent from the Prophet and rule the Yemen in virtue of that fact. In that province and Hadhramaut many villages are exclusively occupied by a religious hierarchy of Saiyids and inland Oman is ruled by an Imam, who is in constant opposition to the temporal dynasty of the coast. In Asir the administration is also in religious hands, its rulers being the Idrisi family under a Wahhabi protectorate. During the last decade and a half the revived Wahhabi movement has coloured the texture of Bedouin society and the patriarchal system of tribal administration, with its democratic rule, its blood feuds and its *lex* talionis, is gradually giving way before the divine majesty of the Shar law of Islam. Zkhwan colonies have sprung up at numerous points like mushrooms and the ancient pastime of raid and counter-raid is discouraged by the new doctrine of universal brotherhood in the faith. Arabia is changing rapidly into the semblance of an organized state.

Communications.— In no respect is Arabia changing more rapidly than in the matter of its communications. At the beginning of the 20th century there were no railways in the whole country. During its first decade Medina was linked by the Hejaz railway via Maan (800km.) with Damascus and a survey made for an extension to Mecca, which has not yet materialized. About the same time a railway-survey was made of the country between Hodeida and Sana, though progress with the scheme was rendered impossible by the Turco-Italian War of 1913. During and since the World War a railway has been constructed between Aden and Lahaj and beyond, but the southern section of the Hejaz railway from Maan to Medina, seriously damaged by the operations of Lawrence and deprived of practically all its rolling stock in the interests of Syria and Palestine since the war, has only been in fitful operation during the last ten years. The Hejaz saw its first aeroplanes during the war and has maintained a number of them as part of its armament since then, though the foreign personnel employed by the Sharifian *régime* have disappeared and the machines have been relegated to a maintenance basis. The Imam of Yemen has recently received one or more of these machines as a present from the Italian Government, while early in the year 1928 squadrons of the Royal Air Force were posted at Aden where the military command is henceforth to be exercised by an Air officer. Finally, and also early in 1928, the Royal Air Force in 'Iraq conducted punitive operations against the *Ikhwan* raiders of the north-eastern frontier. The exploration of the Rub' Al Khali by air has also been frequently mooted of recent years but in general terms it may be said that air communications are still a thing of the future so far as Arabia is concerned. The same remark applies to wireless telegraphy, though there are wireless stations at a number of places in Hejaz (Jedda, Medina, etc.) and a station (1927) at Sana. A telegraph and telephone line connects Jedda with Mecca and is to be extended to Taif, while Jedda communicates with the outer world by a cable to Port Sudan, the joint property now of the Hejaz and Sudan Governments and maintained by the Eastern Telegraph

1. Arabs, camels and merchandise in front of the gate leading into the city of Jidda, in the province of Hejaz, Saudi Arabia
2. A narrow street in Jidda showing doors and windows in which the Moorish style predominates
3. General view of Muscat, the capital of Oman, on the southeast coast of Arabia
4. "Al Khazna" ("El Khazneh," "El Hazne"), the treasure house of the Pharaohs in Petra, Syria, sometimes called "the city of ruins"
5. Among the granite and limestone mountains of Oman, a nominally independent kingdom in southeastern Arabia, in part irrigated and fertile, in part arid desert

Company. In another direction astonishing progress has been made of recent years. Motor cars first came to the Hejaz during the World War but were sternly discouraged thereafter by King Husain except for limited personal and official use. Nejd and Hasa saw motor cars for the first time in 1919 or 1920. With the establishment of the Wahhabi régime in the Hejaz, however, motor transport was allowed in connection with the 1926 and subsequent pilgrimages, with the result that the number of cars in the country has increased from four to over 600 in two years. The journey between Jedda, Mecca and Medina is now regularly performed by car, while the road between Medina and Yanbu has recently been opened. Ibn Saud and his large camp following have also in two successive years performed the journey between Hejaz and Riyadh in the royal fleet of cars, from 25 to 30 vehicles. Motor transport is thus definitely established in Arabia.

At the end of 1927 the construction of a metalled road between Jedda and Mecca was begun but there are no other metalled roads in the whole country. Of the old caravan-routes one of the most important, that from Damascus to Medina, has been killed by the Hejaz railway, as the adoption of the sea route killed the pilgrim track along the coast from Aqaba to Yanbu and Mecca. Camel transport still holds its own, however, on the Hejaz pilgrim tracks and for goods, while it still enjoys the monopoly of the main north to south and east to west routes across the peninsula, as well as on all the feeder-routes.

There is regular steamship communication between Suez and Port Sudan and the Arabian ports of the Red Sea down to Aden, while in the pilgrim season Jedda receives numerous ships direct from Java, Singapore and India. Mokalla is in similar commercial communication with Bombay and Karachi, whence there are also regular sailings to the Persian Gulf ports. In addition to the above a great part of the Arabian coasting traffic is carried on by native sailing-boats.

Commerce.— For want of exact statistics in most of the ports concerned with the export and import trade of Arabia it is difficult to estimate the annual value of goods entering and leaving Arabia. The chief articles of export are coffee (from Aden, Hodeida and Mocha), hides, wool, *saman* (clarified butter), sheep (mainly from Wajh to Suez) and dates (from Hasa). Specie, mainly brought in by the pilgrims visiting the country, is exported in large quantities to make good the deficit between the small volume of exports and the heavy imports of the ordinary necessaries of life—piece-goods, rice, flour, sugar and tea. Of recent years motor cars and machinery of all kinds have formed a rapidly increasing part of the import trade of the country.

HISTORY

Arabia is a land of Semites, and is supposed by some scholars to have been the original home of the Semitic peoples. The dispersion of the early Arabian Semites is easy to imagine. The migration into Babylonia was simple, as there are no natural boundaries between it and north-east Arabia. That of the Aramaeans at an early period was likewise free from any natural hindrance. The connection with Palestine has always been close; and the Abyssinian settlement is probably as late as the beginning of the Christian era. Of these migrations, however, history knows nothing. Arabian literature has its own version of prehistoric times, but it is entirely legendary. In the 19th century the discovery and translation of numerous early Arabian inscriptions revealed the existence of a great civilization in Arabia for at least 1,000 years before the Christian era and stimulated the study of the materials in the Assyrian inscriptions, the Old Testament, and classical writings. All scholars are agreed that the inscriptions reach as far back as the 9th century B.C. and prove the existence of at least four civilized kingdoms during these centuries. These are the kingdoms of Ma'in (Minaean), of Saba (Sabaean), of Hadhramaut (Hadramut) and of Katabania (Katabanu). Of the two latter little is known.

Saba and Ma'in.—As to the Sabaean kingdom there is fair agreement among scholars. The inscriptions go back to 800 B.C. or earlier. A queen of this people (the "Queen of Sheba") is said (I. Kings x.) to have visited Solomon about 950 B.C. There is, however, no mention of such a queen in the inscriptions. The Sabaean rule is generally divided into periods indicated by the titles given to their rulers. In the first of these (between the 9th and the 6th century) ruled the Makarib, who seem to have been priest-kings. Their first capital was at Sirwah. The second period begins about 550 B.C. The rulers are known as "kings of Saba."

EARLY HIMYARITIC SCRIPT ON A BRONZE TABLET IN BAS RELIEF

The inscription is a dedication to the god Almakah, who was a Sabaean deity. The script used is developed from the so-called Phoenician of about the 8th century B.C.

Their capital was Ma'rib. Their sway lasted until about 115 B.C., when they were succeeded by the Himyarites. During this period they were engaged in constant strife with the neighbouring kingdoms of Hadramut and Katabanu. The great prosperity of south-west Arabia at this time was due in large measure to the fact that the trade from India with Egypt came there by sea and then went by land up the west coast, but this trade was lost when the Ptolemies established an overland route from India to Alexandria. The connection of Saba with the north, where the Nabataeans (*q.v.*) had existed from about 200 B.C., was now broken. The decay that followed caused a number of Sabaeans to migrate to other parts of Arabia.

The Minaean kingdom extended over the south Arabian Jauf, its chief cities being Karnau, Ma'in and Yathil. Some 25 kings are known from the inscriptions, and their history must cover several centuries. As inscriptions in the Minaean language are found in al-'Ula in north Arabia, it is probable that they had colonies in that district. With regard to their date opinion is much divided; some scholars maintaining that their kingdom existed prior to that of Saba, others that none of the inscriptions is earlier than about 800 B.C. and that the Minaean kingdom existed side by side with the Sabaean. It is curious that the Sabaean inscriptions contain no mention of the Minaeans, though this may be due to the fact that very few of the inscriptions are historical in content.

About 115 B.C. the power over south Arabia passed from the Sabaeans to the Himyarites, a people from the extreme south-west of Arabia; and about this time the kingdom of Katabanu came to an end. The title taken by the ne rulers was "king of Saba and Raidan." In this period the Romans made their one attempt at direct interference in the affairs of Arabia. But the expedition under Aelius Gallus was betrayed by its guides and lost in the desert. During the latter part of this time the Abyssinians, who had earlier migrated from Arabia to the opposite coast of Africa. began to flow back to the south of Arabia, and in the 4th century they became strong enough to overturn the Himyarite kings and establish a dynasty of their own. The Himyarites were, however, still active, and having accepted Judaism founded a Jewish Sabaean kingdom. The struggle between them and the Abyssinians now became one of Judaism against Christianity, and apparently for this reason Christian Abyssinia was supported from Byzantium in its attempts to regain power. These attempts were crowned with success in 525, but in 575 the Persians, who had been called in by the opponents of Christianity, succeeded in taking over the rule and in appointing governors over Yemen. (*See* further ETHIOPIA: *The Axumite Kingdom.*)

Hira, Ghassan and Kinds.-The kingdom of Hira (Hira) was established in the fertile boundary land between the Euphrates

and the Arabian desert. The chief town was Hira a few miles south of the site of the later town of Kufa. The inhabitants of this land are said in Ṭabari's history to have been of three classes: —(1) The Tanukh (Tnuhs), who lived in tents and were Arabs from the Tehama and Nejd, who had united in Bahrein to form a new tribe, and migrated from there to Hira about the beginning or middle of the 3rd century A.D. The Arabian historians relate their conflict with Zenobia. (2) The 'Ibad or 'Ibadites, who dwelt in the town of Hira in houses and so led a settled life. These were Christians, whose ecclesiastical language was Syriac, and language of intercourse Arabic. A Christian bishop of Hira is known to have attended a synod in 410. In the 5th century they became Nestorians. (3) Refugees of various tribes, who came into the land but did not belong to the Tanukh or the 'Ibad. There is no trustworthy information as to the earlier chiefs of this people. The dynasty of the Lakhmids, famed in Arabian history and literature, arose towards the end of the 3rd century and lasted until about 602. Although so many of their subjects were Christian, the Lakhmids remained heathen until Nu'mān, the last of the dynasty. The kingdom of Hira always stood in a relation of dependence on Persia. At the height of its power it was able to render valuable aid to its suzerain. Much of its time was spent in wars with Rome and Ghassan. Its revenues were derived from the neighbouring Bedouins as well as its own subjects. About 602 the Lakhmid dynasty fell, and the Persian Chosroes II. appointed as governor an Arab of the tribe of Ṭāi.

In the beginning of the 6th century A.D. a dynasty known as the Jafnids enter into the history alike of the Roman and Persian empires. They ruled over the tribe of Ghassan in the extreme north-west of Arabia, east of the Jordan, from near Petra in the south to the neighbourhood of Rosafa in the north-east. Of their origin little is known except that they came from the south. A part of the same tribe inhabited Yathrib (Medina) at the time of Mohammed. The first certain prince of the Jafnid house was Harith ibn Jabala, who, according to the chronicle of John Malalas, conquered Mondhir of Hira in 528. In the following year, according to Procopius, Justinian perceived the value of the Ghassanids as an outpost of the Roman empire, and as opponents of the Persian dependants of Hira, and recognized Harith as king of the Arabs and patrician of the Roman empire. He was thus constantly engaged in battles against Hira. In 541 he fought under Belisarius in Mesopotamia. After his death friendly relations with the West continued until about 583. The Ghassanid kingdom split into sections each with its own prince. Some passed under the sway of Persia, others preserved their freedom at the expense of their neighbours. At this point their history ceases to be mentioned in the western chronicles.

In the last decade of the 5th century a new power arose in central Arabia, the tribe of Kinda under the sway of the family of Aqil ul Murar, who came from the south. They seem to have stood in much the same relation to the rulers of Yemen, as the people of Hira to the Persians and the Ghassanids to Rome. Abraha in his invasion of the Hejaz was accompanied by chiefs of Kinda. Details of their history are not known, but they seem to have gained power at one time even over the Lakhmids of Hira; and to have ruled over Bahrein as well as Yemama until the battle of Shi'b ul Jabala, when they lost this province to Hira. The poet Amru'ul Qais was a member of the princely family of Kinda.

The Coming of Mohammed. — Apart from the powers mentioned above, Arabia in the 6th century was in a state of political chaos. Bahrein, inhabited chiefly by the Bani 'Abd Qais and the Bani Bakr, was largely subject to Persian influence near its coast, nnd a Persian governor, Sebocht, resided in Hajar, its chief town. In Oman the Arabs, who were chiefly engaged in fishing and seafaring, were Azdites mixed with Persians. The ruling dynasty of Julanda in their capital Suhar lasted on till the 'Abbasid period. On the west coast of Arabia the influence of the kingdom of Yemen was felt in varying degree according to the strength of the rulers of that land. Apart from this influence the Hejaz was simply a collection of cities each with its own government, while outside the cities the various tribes governed themselves and fought continual battles with one another. Thus at the time of Mohammed's advent the country was peopled by various tribes, some more or less settled under the government of south Arabia, Kinda, Hira and Ghassan, these in turn depending on Abyssinia, Persia and Rome (*i.e.*, Byzantium); others as in the Hejaz were ruled in smaller communities by members of leading families, while in various parts of the peninsula were wandering Arabs still maintaining the traditions of old family and tribal rule. To these may be

added a certain number of Jewish tribes and families deriving their origin partly from migrations from Palestine, partly from converts among the Arabs themselves. Mohammed appealed at once to religion and patriotism; the external conquests of the Arabs were the natural outcome of his ideas, but his own work was the unification of Arabia. It began with the formation of a party of men —the *Muhajirun* (Refugees or Emigrants) and the Ansar (Helpers or Defenders) — who accepted Mohammed as their religious leader. As the necessity of overcoming his enemies became urgent, this party became military. A few successes in battle attracted to him men who were willing to accept his religion as a condition of membership of his party, which soon began to assume a national form. The capture of Mecca (630) was not only an evidence of his growing power, which induced Arabs throughout the peninsula to join him, but gave him a valuable centre of pilgrimage. At his death in 632 Mohammed left Arabia practically unified.

Early Caliphs. — Abu Bekr (632–634), the first of his successors, was a man of simple life and profound faith. He understood the intention of Mohammed as to foreign nations, and as soon as he assumed office he sent out the army already chosen to advance against the Romans in the north. The successful reduction of the rebels in Arabia enabled him in his first year to send his great general Khālid with his Arab warriors first against Persians, then against Romans. Under the second caliph Omar (634–644) the

Persians were defeated at Kadesiya (Kadessia), 'Iraq was completely subdued, and the new cities of Kufa and Basra were founded (635). In the same year Damascus fell into the hands of the Arabs. In 636 Jerusalem fell and received a visit from the caliph. Three years later the fateful step was taken of appointing Moawiya (Mu'awiyya) governor of Syria. In 640 'Amr-ibn-el-Ass invaded Egypt, and the following year took Alexandria and founded Fostat (which later became Cairo). The victory at Nehavend in 641 over the Persians, the flight of the last Sassanid king and the capture of Rei or Rai in 643 meant the entire subjugation of Persia and crowned the conquests of Omar's caliphate. The reign of the third caliph Othman (644–656) was marked by the beginning of the internal strife which was to ruin Arabia; but the foreign conquests continued. In the north the Muslim arms reached Armenia and Asia Minor; on the west they were successful as far as Carthage on the north coast of Africa. After the murder of Othman, 'Ali (656–661) became caliph, but Moawiya, governor of Syria, soon rebelled on the pretext of avenging the death of Othman. After the battle of Siffin (657) 'Ali was deposed (658), and the Omayyad dynasty was established with its capital at Damascus.

During these early years the Arabs had not only made conquests by land, but had found an outlet for their energy at sea. In 640 Omar sent a fleet of boats across the Red Sea to protect the Muslims on the Abyssinian coast. The boats were wrecked. But Othman allowed a fleet from Africa to help in the conquests of the Levant and Asia Minor, and in 649 he sanctioned the establishment of a maritime service, on condition that it should be voluntary. Abu Qais, appointed admiral, showed its usefulness by the capture of Cyprus. In 652 Abu Sarh with a fleet from Egypt defeated the Byzantine fleet near Alexandria.

The first task of Abu Bekr had been to reduce the rebels who threatened to destroy the unity of Arabia even before it was fully established. At the end of the first year of his caliphate he saw Arabia united under Islam. The new national feeling demanded that all Arabs should be free men, so the caliph ordained that all Arab slaves should be freed on easy terms. The solidarity of Arabia survived the first foreign conquests. It was not intended that Arabs should settle in the conquered lands except as armies of occupation. Thus it was at first forbidden that Arabs should buy or possess land in these countries. Kufa was to be only a military camp, as was Fostat in Egypt. The taxes with the booty from conquests were to be sent to Arabia for distribution among the Muslims. Many of those who went forth acquired property and rank in the new lands. Kufa attracted chiefly men of south Arabia, Basra those of the north. Both became great cities, each with a population of 150,000 to 200,000 Arabians. Yet so long as the caliphs lived in Medina, the capital of Arabia was the capital of the expanding Arabian empire. To it was brought a large share of the booty. The caliphs were chosen there, and there the rules for the administration were framed. Thence went out the governors to their provinces. Omar was the great organizer of Arabian affairs. He compiled the Koran, instituted the civil list, regulated the military organization. He, too, desired that Mohammed's wish should be carried out and that Arabia should be purely Muslim. To this end he expelled the Christians from Nejran and the Jews from Khaibar. The secondary position that Arabia was beginning to assume in the Arabian empire is clearly marked during the caliphate of Othman. In his appointments to governorships and other offices, as well as in his distribution of spoil, Othman showed a marked preference for members of his own tribe the Koreish (Quraish) and his own family the Bani Omayya (Umayya). The other Arab tribes became increasingly jealous of the Koreish, while among the Koreish themselves the Hāshimite family came to hate the Omayyad, which now had much power, although it had been among the last to accept Islam and never was very strict in its religious duties. But the quarrels which led to the murder of Othman were fomented not so much in Arabia as in Kufa and Basra and Fostat. In Kufa a number of the Koreish had settled, and their arrogance became insupportable. The result was the murder of the caliph. Syria alone remained loyal to the house of Omayya. Arabia itself counted for little, though it was involved in the struggle which followed the election of 'Ali. Ayesha, Talha and Zobair, who were strong in Mecca, succeeded in obtaining possession of Basra, but were defeated in 656 at the battle of the Camel (see ALI). In the south of Arabia 'Ali succeeded in establishing his own governor in Yemen, though the government treasure was carried off to Mecca. But the centre of strife was not to be Arabia. When 'Ali left Medina to secure Basra, he abandoned it as the capital of the Arabian empire. With the success of Moawiya Damascus became the capital of the caliphate (658) and Arabia a mere province, though always of importance because of its possession of the two sacred cities, Mecca and Medina. The final blow to any political pretensions of Medina was dealt by the caliph when he had his son Yazid declared his successor, thus taking away any claim on the part of the citizens of Medina to elect to the caliphate.

The Omayyads and 'Abbasids.—The early years of the Omayyads were years of constant strife in Arabia. The Kharijites who had opposed 'Ali on the ground that he had no right to allow the appeal to arbitration, were defeated at Nahrawan or Nahrwan (658), but those who escaped became fierce propagandists against the Koreish, some claiming that the caliph should be chosen by the Faithful from any tribe of the Arabs, some that there should be no caliph at all, that God alone was their ruler and that the government should be carried on by a council. They broke up into many sects, and were long a disturbing political force in Arabia as elsewhere. On the death of 'Ali his house was represented by his two sons Ḥasan and Hosain (Ḥusain), Ḥasan soon made peace with Moawiya. On the accession of Yazid, Ḥosain refused homage and raised an army, but was slain at Kerbela (680). 'Abdallah ibn Zobair immediately stepped forward in Mecca as the avenger of 'Ali's family and the champion of religion. The two sacred cities supported him. Medina was besieged and sacked by the troops of Yazid (682) and Mecca was besieged the following year. The siege was raised in the third month on the news of the death of Yazid, but not before the Ka'ba had been destroyed. 'Abdallah remained in Mecca, recognized as caliph in Arabia, and soon after in Egypt and even a part of Syria. He defeated the troops of Merwan I., but could not win the support of the Khārijites. In 691 Abdalmalik ('Abdul-hlalik) determined to crush his rival and sent his general Ḥajjāj against Mecca. The siege was begun in March 692, and in October the city was taken and 'Abdallah slain. Abdalmalik was now supreme in Arabia and throughout the Muslim world. During the remaining years of the Omayyad dynasty (*i.e.*, until 750) little is heard of Arabia in history. The conquests of Islam in Spain on the one side and India on the other had little or no effect on it. It was merely a province.

The accession of Abul 'Abbas and the transference of the capital of the caliphate from Damascus to Kufa, then Anbar and soon after (in 760) to Baghdad meant still further degradation to Arabia and Arabs. From the beginning the 'Abbasids depended for help on Persians and Turks, and the chief offices of State were frequently filled with foreigners. In one thing only the Arabs conquered to the end; that was in their language. The study of Arabic was taken up by lexicographers, grammarians and poets with a zeal rarely shown elsewhere. The old Arabian war spirit was dying. Although the Arabians, as a rule, were in favour of the Omayyad family, they could not affect the succession of the 'Abbasids. They returned more and more to their old inter-tribal disputes.

The Carmathians.—Towards the close of the 9th century Arabia was disturbed by the rise of a new movement which during the next hundred years dominated the peninsula. In 880 Yemen was listening to the propaganda of the new sect of the Carmathians (*q.v.*) or followers of Hamdan Qarmat. Four years later these had become a public force. In 900 'Abu Sa'id al-Jannabi, who had been sent to Bahrein by Hamdan, had secured a large part of this province and had won the city of Kaṭif (Ketif) which contained many Jews and Persians. The Arabs who lived more inland were mostly Bedouin who found the obligations of Islam irksome, and do not seem to have made a very vigorous opposition to the Carmathians who took Hajar the capital of Bahrein in 903. From this they made successful attacks on Yemāma (Yamama), and attempts on Oman. In 906 the court at Baghdad learned that these

sectaries had gained almost all Yemen and were threatening Mecca and Medina. Abu Sa'id was assassinated (913) in his palace at Lahsa, which in 926 was fortified and became the Carmathian capital of Bahrein. His son Sa'id was deposed and succeeded by his brother Abu Ṭahir. His success was constant and the caliphate was brought very low by him. In Arabia he subjugated Oman, and swooping down on the west in 929 he horrified the Muslim world by capturing Mecca and carrying off the sacred black stone to Bahrein. In 939, however, the stone was restored and pilgrimages to the holy cities were allowed to pass unmolested on payment of a tax. So long as Abu Ṭahir lived the Carmathians controlled Arabia. After his death, however, they quarrelled with the Fatimite rulers of Egypt (969) and began to lose their influence. In 985 they were completely defeated in 'Iraq, and soon after lost control of the pilgrimages. Oman recovered its independence. Three years later Kaṭīf, at that time their chief city, was besieged and taken by a Bedouin sheikh, and subsequently their political power in Arabia came to an end. It was significant that their power fell into the hands of Bedouins. Arabia was now completely disorganized. Mohammed's attempt to unify it had failed. The country was once more split up into small governments, more or less independent, and groups of wandering tribes carrying on their petty feuds. Of their history during the next few centuries little is known, except in the case of the Hejaz. Here the presence of the sacred cities led writers to record their annals. The two cities were governed by Arabian nobles (*sherifs*), often at feud with one another, recognizing formally the overlordship of the caliph at Baghdad or the caliph of Egypt. Thus in 966 'Alyite took Possession of the Government of Mecca and recognized the Egyptian caliph as his master. About a century later (1075–94) the 'Abbasid caliph was again recognized as spiritual head owing to the success in arms of his protector the Seljuk Malik-Shah. With the fall of the Baghdad caliphate all attempts at control from that quarter came to an end. After the visit of the Sultan Bibars (1269) Mecca was governed by an amir dependent on Egypt. Outside the two cities anarchy prevailed and the pilgrimage was frequently unsafe owing to marauding Bedouins. In 1517 the Osmanli Turkish sultan Selim conquered Egypt, and, having been accorded the right of succession to the caliphate, was solemnly presented by the sherif of Mecca with the keys of the city and recognized as the spiritual head of Islam and ruler of the Hejāz. At the same time Yemen, which since the 9th century had been in the power of a number of small dynasties ruling in Zubed, San'ā, Sa'dā and Aden, passed into the hands of the Turk. Little more than a century later (1630), a Yemen noble, Khasim, succeeded in expelling the Turk and establishing *a* native imamate, which lasted until 1871.

For the history of Yemen during this period see H. C. Kay, *Omarah's History of Yaman* (1892), and S. Lane-Poole, The *Mahommedan* Dynasties, pp. 87–103 (1894).

Since the separation from the caliphate (before A.D. 1000) Oman had remained independent. For more than a century it was governed by five elected imāms, who were chosen from the tribe of al-Azd and generally lived at Nizwa. After them the Bani Nebhan gained the upper hand and established a succession of kings (maliks) who governed from 1154 to 1406. During this time the country was twice invaded by Persians. The "kings of Hormuz" claimed authority over the coast land until the beginning of the 16th century. In 1435 the people rose against the tyranny of the Bani Nebhan and restored the imamate of the tribe al-Azd. In 1508 the Portuguese under Albuquerque seized most of the east coast of Oman. In 1624 a new dynasty arose in the interior, when Nasir ibn Murshid of the Yariba (Ya'aruba) tribe (originally from Yemen) was elected imām and established his capital at Rustak. He was able to subdue the petty princes of the country, and the Portuguese were compelled to give up several towns and pay tribute for their residence at Muscat. About 1651 the Portuguese were finally expelled from this city, and about 1698 from the Omanite settlements on the east coast of Africa.

For the history of Oman from 661 to 1856 see G. P. Badger, *History* of *the* Imams *and* Seyyids of *Oman* by *Salil-ibn-Razik* (1871). (G. W. T.)

WAHHĀBI MOVEMENT

Modern Arabian history begins with the Wahhābi movement of the middle of the 18th century. Arabia was at the time parcelled out in a number of principalities or baronies, independent of each other and ever striving for existence and mastery. Of the central and eastern States those of the 'Arair house in Hasā, of Ibn Mu'ammar at 'Ayaina and of Ibn Da'ās at Manfiiha appear to have been the principal when the originator of the Wahhābi puritan revival, Muhammad Ibn 'Abdul Wahhāb, returned about 1750 to 'Ayaina, where he had been born at about the beginning of the 18th century, He had during a long period of absence studied at Basra and Damascus and visited Mecca for the pilgrimage, returning convinced of the backsliding of his fellows from the pure principles of the Muslim faith and determined to preach reform on puritanical lines, involving an uncompromising return to the practice and precepts of the Prophet. Rejected by the prince of 'Ayaina as a mischief-making busybody he sought and found hospitality at the court of the petty but ambitious baron of Dar'iya, Muhammad Ibn Sa'iid, who found himself hemmed in between the two fires of 'Ayaina and Manfūha. Within a few years Muhammad Ibn Sa'ūd, who died in 1765, had gathered a considerable army of fanatical Bedouins round his standard and effectually established his own supremacy throughout central and eastern Arabia. His son, 'Abd-ul-'aziz, extended his power far beyond the limits of Nejd and his attacks on the pilgrim caravans from 1780 onwards compelled the attention of the Ottoman sultan. In 1798 a Turkish force invaded Hasā but was compelled to withdraw, the Wahhiibis retaliating in 1801 by the capture and sack of the Shia' holy city of Karbala and capturing Mecca the following year. On both occasions they destroyed tombs and other objects of veneration and carried away all relics and treasure of value. In Oct. 1802, 'Abd-ul-'azīz fbn Sa'iid was murdered in the mosque at Dar'iya by a Shia' fanatic in revenge for the desecration of Karbala. Sa'iid, who had for many years commanded his father's armies in the field, celebrated his accession to the throne by the capture of Medina in 1804. The Wahhābi empire, which reached the confines of Oman and Yemen in the south, was now at its zenith and seemed destined to embrace the whole Arab race. The Ottoman sultan was, however, now roused to a sense of the dangerous situation which had arisen in Arabia, and at the same time the discipline accepted by the Bedouin tribes as the condition of their victorious and profitable progress through the length and breadth of Arabia began to be irksome in the circumstances of peace. Turkey was fully occupied with affairs in Egypt and, accordingly, the sultan deputed to Muhammad 'Alī, the viceroy of Egypt, the task of crushing the Wahhiibis. Sa'iid had set out on a campaign against Baghdad in 1811 when Tussiin, the pasha's son and only 16 years of age, landed with 10,000 men on the Hejāz coast. The Wahhābi ruler, turning west to meet the new danger, defeated Tussiin, but Mecca and Medina were occupied by the Egyptian forces in 1812. In 1813 Muhammad 'Ali himself took charge of the operations but without success, and in 1814 Tussiin suffered a defeat near Tāïf. The same year Sa'iid died and his son, 'Abdulltih attempted to negotiate, but the Egyptian pasha advanced in 1815 to Rass which was captured. Peace was then arranged and the Egyptians retired from Nejd, whereupon 'Abdulliih refused to carry out some of the conditions imposed on him. In 1816 the struggle was renewed, Ibrāhīm Pasha replacing his brother Tussiin in the Egyptian command. Having secured by presents the allegiance of the Harb and Mutair tribes he defeated 'Abdulliih at Wiya and advanced into Nejd. The four-months siege of Rass failed but Ibrāhīm, leaving it aside, captured 'Anaiza after a bombardment and occupied Buraida. The 'Ataiba and Bani Khālid having now joined his cause he captured Shaqra in Jan. 1818 after a regular siege and, sacking Huraimala on the way, began the siege of Dar'iya on April 14. On Sept. g the capital surrendered and 'Abdulltih was ignominiously beheaded at Constantinople. Dar'iya was razed to the ground and Egyptian garrisons were posted in several of the Nejd towns. The Wahhābi empire had collapsed incontinently and the Arabs recognized their inability to stand before disciplined troops, but the Egyptians found equal difficulty in retaining their hold on the turbulent interior.

In 1824 'Abdullāh's son, Turki, headed a rising and re-established the Wahhiibi State with his capital at Riyādh. Accepting the nominal suzerainty of Egypt and paying tribute, he consolidated his power on solid foundations till 1834 when he was murdered by his cousin, Mishārī. In 1836 his son and successor Feisul, refused tribute and an Egyptian force was sent to depose him. He was led away captive to Cairo, Khālid, of a collateral branch of the family, being installed in his place as amir. The Egyptian garrisons were, however, gradually withdrawn to support Muhammad 'Ali and Ibriihim in their conflict with Turkey for Syria. In 1842 Feisul, having escaped from prison, reappeared in Arabia and was universally accepted as ruler. The last remnants of the Egyptian troops were ejected and the Wahhābi State was once more independent of all foreign control. Oman, Yemen and Hejāz remained outside the pale and Bahrein, with British support, refused to return to the Wahhibi fold, but elsewhere Feisul re-established his writ within the old limits. The rest of his reign until his death in 1867 was spent in the consolidation of his central Arabian dominions, in strenuous efforts to keep the peace between his two eldest sons, 'Abdullāh and Sa'iid, and in constant watchfulness to ward off the challenge of a rival power which had arisen in the north during his Egyptian exile.

Owing to a feud between his family and the Ibn 'Ali, the premier house of the Shammar tribe, 'Abdullāh Ibn Rashīd, had migrated to Riyādh in 1830. Four years later he had rendered signal service to Feisul by helping him to recover Riyādh from the usurpation of his father's murderer. As a reward he was granted the governorship of Hāïl and by skilful and sympathetic administration of the Bedouins had by the time of Feisul's return from exile consolidated his position as a ruler independent in all but name. In 1843 he died and was succeeded by his son, Talāl, who, with the loyal assistance of his uncle, 'Ubaid, carried on the work of his father, fortified his capital and extended his jurisdiction to Khaibar, Taima and Jauf. "At the same time in spite of occasional alarums and excursions he maintained a proper attitude towards Feisul, while flirting alternately with the Turks and Egyptians. His death by his own hand in 1868 was the beginning of a long series of tragedies in the house of Rashīd. Leaving no children he was succeeded by his brother Mit'ab, who was soon after murdered by his nephews, the elder of whom, Bandar, became amir. Muhammad, the third son of 'Abdulliih, realizing, thanks to Hamūd, the son of 'Ubaid, that his life mas in danger, saved himself by slaying Bandar and seizing the Citadel. He then perpetrated a general massacre of the members of his family and thus, with blood on his hands, began a reign destined to be both long and distinguished in the annals of Arabia.

Muhammad Ibn Rashid.—Securely established in north and west Arabia Muhammad in 1872 found a suitable occasion for interference in the affairs of the south. 'Abdullāh, the son of Feisul, had after a reign of five years been ejected by his brother, Sa'ūd, and appealed to Muhammad who succeeded in ousting the usurper. In 1874, however, 'Abdullāh, once more deposed, found an asylum at Hāïl whence he appealed for assistance to Midhat Pasha, the Turkish governor at Baghdad. The latter, in spite of British protests, occupied Hasā in 1875 and established a new province under the title of Nejd with 'Abdullāh as its governor, thus reasserting the Turkish claim to suzerainty over central Arabia abandoned three decades earlier by the Egyptians. Nejd itself was, however, not occupied and 'Abdullāh was left to prosecute his quarrel with Sa'ūd, now ruler of Riyādh, as best he could. Turkey was too busy with the Russian war to attend to Arabian affairs though a few years later her attempt to occupy Bahrein was frustrated by a British gun-boat. Central Arabia reverted to a state of anarchy centring round the constant struggles of the two Wahhābi brothers for supremacy, while the astute ruler of Hāïl manoeuvred to establish his own power throughout the whole of Nejd. This menace from the north resulted in a loose coalition of the southern provinces under Zāmil, the famous amir of 'Anaiza, who protected Doughty in 1877. A long period of desultory skirmishing without result found the rival armies drawn up in line of battle for the final test at Mulaida in 1891. With Muhammad were his own Shammar and the Harb, while the Mutair and 'Ataiba followed the standard of the Wahhābi allies. Zāmil was in an impregnable position based on the sand-hills opposite Qara 'a while the enemy sought in vain all day to tempt him to open combat in the plain. Towards sunset his patience gave way and Ibn Rashīd's superior cavalry soon had the allies at their mercy. Zāmil and his eldest son were killed as also two of the Ibn Sa'ūd family. 'Anaiza and Buraida opened their gates to the victorious Muhammad, to whom Riyidh and its dependent provinces soon made their submission. For the six years of life which remained to him his writ ran unquestioned from Jauf to Wadi Dawāsir. The Wahhābi dynasty ceased to exercise any shred of authority in Arabia and the exiled remnants of the Ibn Sa'ūd family found scattered refuges at Kuwait and Bahrein and other localities on the Persian Gulf. To all appearances the Wahhābi power was finally at an end and the strong and stable Government of Muhammad Ibn Rashīd gained the praise and approbation of all who saw it. But fate was busy with other designs and only three years after his death in 1897 the house of Ibn Sa'iid was back in the saddle and only a quarter-century later Muhammad's own dynasty had ceased to exist. The wheel of fortune had come full circle.

'Abd-ul-'aziz **II. Ibn Sa'ūd.**—Muhammad, leaving no sons, was succeeded by his brother Mit'ab's son, 'Abd-ul-'aziz, who possessed none of the political acumen of his uncle and soon estranged the sympathies of the Wahhābi provinces. Meanwhile the growing power of Shaikh Mubārak of Kuwait was becoming a serious factor in the Arabian situation, and a still more serious factor, as events were to prove, was the young prince 'Abd-ul-'aziz Ibn Sa'ūd (*q.v.*), living in exile at Kuwait with his father, 'Abd-ul-rahmiin, the youngest of Feisul's four sons. The political training received by young 'Abd-ul-'aziz at the hands of Mubārak was destined to be a large factor in the history of the country during the first quarter of the 20th century, the first decade of which was a period of war and rumours of war in Arabia.

An unsuccessful attempt by 'Abd-ul-rahmān in 1900 to reassert Wahhābi claims in Arabia was followed next year by a bold and successful *coup-de-main* on the part of 'Abd-ul-'aziz, then a lad of 20. The attention of Hāïl, encouraged by Turkey, was concentrated on a quarrel with Mubārak against whom an expedition under Ahmad Faizi Pasha was equipped at Basra in 1901. Mubārak appealed to Great Britain and the Turkish design was duly frustrated. Kuwait was not formally placed under British protection, but it was officially announced by the Government on May 5, 1903, "that the establishment of a naval base or fortified port in the Persian Gulf by any other power would be regarded as a very grave menace to British interests which would certainly be resisted with all the means at its disposal." Meanwhile 'Abd-ul-'aziz Ibn Sa'ūd, having launched out into the desert with a mere handful of followers, succeeded in entering Riyādh by night and slaying the Rashidite governor. Having thus assumed the Amirate of the capital he busied himself during the next few years in recovering the outlying provinces of the south and Washm and Sudair on the north. Simultaneously Mubārak in alliance with Sa'diin Pasha of the 'Irāq Muntafik threatened Ibn Rashīd from the east and with their assistance Ibn Sa'iid in 1904 recovered the province of Qasim, inflicting two defeats on the Shammar forces. The Porte now came to the assistance of its protégé by sending out columns of troops from Medina and Basra, the latter again under Ahmad Faizi Pasha. The Qasim was occupied without difficulty but in 1904 an important battle took place between the Wahhābis under Ibn Sa'ūd himself, who was wounded, and the combined Turco-Shammar force at Bukairiya. No decisive result was achieved, but the Wahhābi claim to the victory is at least justified by the fact that the Turks withdrew their forces finally from central Arabian soil and the Qasim remained under the dominion of Ibn Sa'iid. This position was definitely crystallized in 1906 by the defeat and death in battle of 'Abd-ul-'aziz Ibn Rashīd at Raudhat al Muhanna. Since then the Shammar forces have never seriously threatened the Wahhābi dominions. From 1906 to 1908 a period of anarchy followed at Hāïl under a succession of short-lived amirs of the 'Ubaid branch until in the latter year Sa'ūd, the son of 'Abd-ul-'aziz, definitely emerged triumphant and remained on the throne until 1920, when he was assassinated. Apart from intermittent

struggles for suzerainty over Jauf and a somewhat desultory alliance with the Turks during the World War, the history of Hāïl since 1908 is that of a petty State eclipsed by the growing greatness of the rival Wahhābi State of the south, with which it became finally merged by the capture of Hāïl by Ibn Sa'iid in August 1921, and the removal of the surviving members of the Ibn Rashīd dynasty — including the last two reigning amirs, 'Abdullāh Ibn Mit'ab and Muhammad Ibn Talāl — to Riyādh. Jabal Shammar, for 87 years an independent State and during part of Muhammad's reign the capital of a central Arabian empire, thus ceased to exist except as a province of the Wahhābi power, in which status it has remained ever since.

The victory of Raudhat al Muhanna left Ibn Sa'iid in undisputed mastery of central and southern Nejd and free to concentrate on the consolidation of his State on firm foundations. The history of Arabia had taught him two lessons by which he was quick to profit with results visible in the Arabia of to-day. The first was that the centrifugal tribal organization of the mainly nomad population could be welded together under a suitable stimulus, such as religious revival, for the prosecution of a common cause whether defensive or offensive, but could not be held together in cold blood for purposes of peaceful development. The second was that a single great tribe could achieve great conquests under a leader of capacity, but could not administer its conquests except under the urge of a religious stimulus. The plan he formulated was nothing less than to break down the Bedouin constitution of his subjects under the stimulus of a new religious revival and to perpetuate that break-down for the purposes of administration under peace conditions by the creation of agricultural colonies wherever possible. Thus the Bedouins, tending to settle on the land in non-tribal groups based on agriculture rather than pasture, acquired a stake therein which could easily be used to advantage against their nomad brethren. "Back to the Koran and on to the land" became as it were the motto of the new *Ikhwān* movement, an ultra-puritan revival of the original Wahhābi movement, which Ibn Sa'iid incepted and financed at the desert wells of 'Artāwiya in 1912 — now a large walled city with nearly 10,000 inhabitants. The first adherents to the new movement were the Mutair under Faisal al Duwish, their leading sheikh, and since then over 50 *Ikhwān* settlements have come into existence in all parts of the country with a permanent population of not less than 50,000 souls — the nucleus of the standing army of the Wahhābi State. For five years the essential character and immense possibilities of this movement were not appreciated outside the limits of Nejd itself. Consciousness of it then began to dawn slowly on the world, which declined to take it seriously. And to-day its achievements are universally recognized and admitted. Ghatghat and 'Artāwīya are names to conjure with in all the border-lands, as many explorers have found to their advantage.

Having organized the nucleus of this movement, and warned by recent developments of the revival of Turkish interest in the direction of Nejd — the proposal to utilize Kuwait as the terminus of the Baghdad railway and the mission of Saiyid Tālib Pasha of Basra to Hasā were not the least of such indications — Ibn Sa'iid decided to strike a blow in vindication of his independence. Early in 1914 he descended suddenly on Hasā with a small force and captured Hufiif by a night-attack almost without resistance on the part of the Turkish garrison, which took refuge in the fort-like precincts of the Ibrāhīm Pasha mosque but surrendered next day. The Turkish troops were escorted to the coast, and with the garrisons of Qatif and 'Uqair, which likewise surrendered, were allowed to depart in peace by sea. And, before the Turks could avenge the loss of their eastern province, they were involved in the World War, as the result of which they ceased to exercise dominion in any part of Arabia.

The World War. — The co-operation of Ibn Sa'iid was sought by Great Britain at an early stage of the World War, Captain W. H. I. Shakespear of the Indian political department being deputed to get into touch with him. Ibn Sa'iid immediately began hostilities against Jabal Shammar which had declared for Turkey, and a battle was fought at Jarrāb in Jan. 1915, without decisive result. Unfortunately Shakespear was killed in this encounter and the British authorities abandoned the idea of further active co-operation with Ibn Sa'iid, with whom, however, a treaty of friendship was concluded at 'Uqair in Dec. 1915 by Sir Percy Cox. But for the purposes of the war the centre of Arabian gravity was now transferred to Hejāz (*q.v.*), where Sharif Husain Ibn 'Alī, amir of Mecca, raised the standard of revolt against the Turks in June 1916. His unauthorized assumption of the title of "King of the Arab Countries" was not viewed with favour by Ibn Sa'iid and created between the two rulers an ever-growing coolness which was only prevented from culminating in open hostilities during the war by the constant efforts of the British Government. This estrangement was exacerbated by a dispute over the village of Khurma on the Hejāz-Nejd border at the end of 1917, when the Philby mission visited Ibn Sa'iid on behalf of the British Government to re-focus his attention on an attack on Ibn Rashīd. In 1918 the Khurma affair developed in a series of crises and the village folk under their Sheikh, Khālid Ibn Luwai, were called upon to defend themselves against three attacks by the Sharifian forces. Meanwhile Ibn Sa'iid was engaged in an expedition which led him to the walls of Hāïl but achieved no solid result, and the World War ended leaving him still within his pre-war frontiers with a potential *casus belli* in Khurma in the west. In 1919 King Husain appealed for British intervention on this issue and in March Lord Curzon, deciding in his favour, authorized him to occupy Khurma and warned Ibn Sa'iid to relinquish it on pain of incurring the displeasure of the British Government and of losing his subsidy of £60,000 a year. In May the Hejāz forces under 'Abdullāh, the king's second son, camped at Turaba, 80m. from Khurma, and were attacked during the night by the Wahhābi army. 'Abdullāh's force was annihilated, though he himself escaped with a small following, and Tāïf was evacuated by its inhabitants for fear of a Wahhābi attack. But Ibn Sa'iid, content with the annexation of Turaba, withdrew to Riyādh and turned his attention to other fields of expansion. The upland districts of 'Asir with its capital, Ibha, were the first to fall to his sword in 1920. The following year Hāïl capitulated and the Wahhābi armies occupied Khaibar and Taima. In 1922 Jauf fell and the whole of inner Arabia was under Ibn Sa'iid's control, his outposts reaching to the confines of Oman and Yaman. The struggle with Hejāz was still to come and the British Government, having placed its nominees, the Sharifs Feisal and 'Abdullāh, on the thrones of Trans-Jordan and 'Irāq, endeavoured to compose the differences between the rival parties by convening a conference at Kuwait during the winter of 1923–24. The definite failure of this gathering to arrive at any arrangement by April resulted in its dissolution and in Sept. 1924, the capture and sack of Tāïf by the Wahhābi vanguard ushered in the final campaign against Hejāz. Mecca was occupied in October and Ibn Sa'iid made his formal entry into the holy city on Dec. 5. The siege of Jidda was immediately begun and somewhat later that of Medina. The fall of both cities in Dec. 1925 left Ibn Sa'iid master of Hejāz of which he was proclaimed king on Jan. 8, 1926. During the siege of Jidda Sir Gilbert Clayton visited Ibn Sa'iid in Wadi Fatima to negotiate the treaties of Bahra and Hadda, by which the boundaries of Nejd and Trans-Jordan were fixed and various questions between 'Irāq and Nejd settled. In May 1927 a further treaty was negotiated at Jidda by Sir Gilbert Clayton with Ibn Sa'iid in his dual character of king of Hejāz and Nejd and its dependencies, Nejd having been proclaimed a kingdom in Feb. 1927, when Ibn Sa'iid returned to Riyādh for his first visit since the beginning of the Hejāz campaign. By subsidiary treaties in 1921 and 1922 (negotiated at Muhammara and 'Uqair) various outstanding questions between Ibn Sa'iid on one side and 'Irāq and Kuwait on the other had been regulated, including the frontiers between Nejd and the two States mentioned. Late in 1927, however, the building of a police outpost by the 'Irāq Government at Busaiya in the neighbourhood of the frontier — by a protocol attached to the 'Uqair treaty the building of fortifications on desert wells near the frontier was forbidden — caused renewed trouble. In Sept. 1932 the kingdom of Hejaz and Nejd with its dependencies became known as the kingdom of Saudi Arabia; and in 1934 Asir was incorporated in this kingdom.

EUROPEAN INFLUENCE

Oman.—European influence, which has never penetrated far inland, was not felt in any part of Arabia until the 16th century after the discovery of the Cape route. In 1506 the Portuguese under Albuquerque seized Hormuz and occupied Maskat and the coast of Oman (*q.v.*) until 1650. The Persian occupation which succeeded the Portuguese lasted 100 years till 1759 when the Ghaffāri dyndsty, which has lasted ever since, was established by Ahmad Ibn Sa'id. In 1798 his son entered into treaty relations with the East India Company with the object of excluding the French from Oman, and the next ruler, Sa'id (1804–56) still further strengthened the British connection. For a while early in the 19th century Oman became subject to the Wahhābi empire but regained its independence in 1818. Meanwhile a British-Indian expedition had in 1810 destroyed the strongholds of the Jawāsimi pirates on the coast. Sa'id subsequently equipped a fleet and took possession of Socotra and even Zanzibar, as well as the Persian coast north of Hormuz to Gwadar on the east. On his death in 1856 his dominions were divided between his sons, Majid receiving Zanzibar while Thuwaini with British support established himself in Oman, whose independence was recognized in 1862 by Great Britain and France. Turki succeeded Thuwaini on his assassination in 1866 and, on his death in 1888, the British Government installed and subsidized Feisul on the condition that he should cede no part of his territory to any other Power. Great Britain has followed a similar policy of exclusive influence in a series of agreements with the petty States of the Trucial coast, the southern coast and the shores of the Persian Gulf up to Kuwait. Oman figures prominently in connection with the arms traffic question, in which French subjects were actively interested, early in the 20th century, while German and Russian interests were active at the same time in efforts to secure coaling-stations in the gulf. The World War helped to stereotype the de *jacto* position of Great Britain as warden of the south and east coasts of Arabia and of the adjacent seas, and this position finds expression in the various treaties or understandings in force between Great Britain on the one hand and the rulers of Kuwait, Bahrain, the Trucial States, Oman and Mukalla. Late in 1927 the Persian Government challenged this position in respect of Bahrain (*q.v.*) in a somewhat naïve protest to the League of Nations. For all practical purposes the "British lake" policy holds the field in the Persian Gulf to-day and the only section of its Arabian coast which is effectively independent is the Hasā shore of Ibn Sa'iid's dominions. Recently there has been talk of laying the route of the Cairo-Karachi air-mail along this coast, but no decision has yet materialized.

Yemen.—As in the Persian Gulf, so in the Red Sea the Portuguese were the first to show a European flag. In 1516 they failed in an attempt on Jidda, while the occupation of Yemen soon after by the Turks frustrated their designs in this direction. For a long period thereafter the Arabian coast of the Red Sea figured but little in international circles, but the opening of the overland route to India brought it into prominence. The Hejāz and Yemen were at this time held by Muhammad 'Ali as Viceroy of Egypt, though they reverted to direct Turkish rule about 1845. Meanwhile in 1839, after some years of trouble, the British had occupied Aden, which has remained in their possession ever since. In 1857 the island of Perim was similarly occupied. In 1872 the conquest of Yemen placed the whole of the Red Sea littoral (Midian was ceded to the Turks by 'Abbās Hilmi in 1892) under Turkish rule and during the period 1902–05 a joint Anglo-Turkish commission laid down the boundary between Turkish territory and that part of the mainland opposite Aden claimed as a British protectorate. The line runs from Shaikh Sa'id opposite Perim to a point in Wādī Bana 12m. N.E. of Qa'taba, and continues thence (undefined) in a north-easterly direction into the Great Desert. During 1892–93 Turkey was engaged in the suppression of a serious revolt in the Yemen headed by the Imām with his headquarters at Sa'da; but Ahmad Faizi Pasha's eventual success was followed by a period of general unrest and in 1904 another rebellion took place and, as a result, San'ā was cut off from communication with the coast. In 1905 the commander, 'Ali Ridha Pasha, surrendered and Ahmad Faizi Pasha was sent out from Constantinople with a large force to restore the situation, San'ā being recovered and the rebellion crushed. In 1911 'Asir staged a revolt against the Turks under Saiyid Muhammed al Idrisi who with Italian assistance succeeded in asserting his virtual independence in the Tihāma. In 1915 he allied himself with Great Britain but contributed little to the common cause, while the Imām of Yemen remained faithful to his Turkish allegiance, and early in the war some anxiety was caused to the authorities at Aden by the development of a Turkish menace to the Protectorate. From 1918, the Turks having surrendered all their Arabian interests, the Imām Yahya continued to rule independently from San'a, but Hudaida was occupied in 1920 by the Idrisi, relying on his treaty with Great Britain, after the failure of a British mission under Col. H. F. Jacob in late 1919 to get into touch with the Imām—it was forcibly detained at Bājil by the Quhra tribesmen. Subsequently the Imām established his authority at Hudaida and, Ibn Sa'ūd having occupied upland 'Asir, the Idrisi was left with only a small area in the Tihāma and was forced by circumstances in 1926—Saiyid Muhammad had been succeeded by his son, 'Ali, and the latter had been expelled by his uncle, Hasan, the present governor—to place himself under the Protectorate of Ibn Sa'ūd. Disputes relating to the Yemen-Asir and Yemen-Nejd frontier led in 1934 to hostilities between the Imām Yahya and king Ibn Sa'iid, in which the Yemen was defeated but received generous terms.

Hejāz.—In Hejāz European interests have long been represented by the consuls and agents of various Powers at Jidda and in 1916 the British authorities organized and supported the revolt of Sharif Husain against the Turks. Jidda and Wajh were captured with British naval assistance and the land operations of the Arabs against the Hejāz railway were actively supported by the Arab bureau of Cairo which was charged with the operation in this theatre. The capture of 'Aqaba by Lawrence in 1917 practically completed the defeat of the Turks in Hejāz, though they held out at Medina till Jan. 1919. The whole country was then left to King Husain to administer as an independent kingdom and, though he gave the British Government much trouble and many anxious moments by his reckless rule, no attempt was made to interfere with the local administration. Lawrence in 1921 failed to negotiate a treaty with Husain and in 1924 British intervention to adjust his difficulties with Ibn Sa'iid again failed at the Conference of Kuwait. During the Wahhābi invasion which followed Great Britain and the other Powers declared their neutrality and Husain, having abdicated the throne in 1924, retired to 'Aqaba, which, with Ma'ān, the British Government made an unsuccessful attempt in negotiation with King 'Ali to detach from the Hejāz in favour of Trans-Jordan. In July 1925, however, a favourable opportunity of achieving this object presented itself and, King Husain having been deported to Cyprus, the British Government annexed the territory in question down to the Haql-Mudawwara line. Ibn Sa'iid has steadily declined to recognize this annexation as being inconsistent with the declared neutrality of Great Britain during the war with Husain, and this area remains almost the only corner of Arabia where the relations of the Arabs and Europe have not been satisfactorily adjusted. A similar problem exists on the Aden Protectorate border where the Imām is in occupation of a small area south of the Anglo-Turkish boundary of 1905 *See* also IBN SA'UD (H. ST. J. B. P.)

ARCHAEOLOGY

Arabia lay between the still more ancient civilizations of Egypt and Mesopotamia, and mas exploited by its two neighbours from early days. Egyptian commercial enterprise in the Red Sea was fully developed before the V. Dynasty (c. 2743 B.C.) and brought gold and incense from East Africa and Arabia; whilst about 2600 B.C. Gudea of Lagash procured diorite and timber from Me-luḫ-ḫa, which seems then to have denoted a district in south Arabia, though the name was afterwards extended to East Africa. The evidence for this early penetration of Arabia has to be gathered from Egyptian, Sumerian and Akkadian records; no direct evidence is known to exist in Arabia itself. Mesopotamian influence passed down the Persian Gulf and, across south Arabia, where it evolved a local culture of which traces remain. At a later date the trade route from India to the Persian Gulf was extended along south Arabia and so to Egypt and Europe; many articles found in Arabia are connected with this trade route.

In south-west Arabia, the cultural centre, there were two great kingdoms, Minaea and Saba' but it is a matter of controversy whether they were contemporary or followed one another. About A.D. 244 they were replaced by Himyar. In 522 the Abyssinians conquered south Arabia, but towards the end of the 6th century the Persian empire spread down and absorbed all south Arabia. In 622 Mohammed established Islam as a secular power, and ancient conditions came to an end.

Inscriptions. — The first archaeological material obtained from Arabia was a very faulty copy of five inscriptions made by U. J. Seetzen in 1811. Scientific work dates from J. Halévy, who procured over 600 inscriptions in 1869. From time to time others were found, until E. Glaser, in three expeditions, in 1882–88, obtained 1,032 more, and on these our knowledge of pre-Islamic Arabia is mainly based. In them the two languages, Minaean and Sabaean, are clearly distinguished; a third variety, the Kattabanian, is only a dialect of Minaean. All are loosely classed as Himyaritic. The languages are Semitic, closely related to Akkadian (Babylonian-Assyrian) and to the Ethiopic of Abyssinia, which was colonized from Arabia about the 2nd century B.C., suggesting a culture drift, Mesopotamia–Arabia–East Africa. The modern dialects of Mahra (south Arabia) and Sokotra contain elements akin to these ancient languages.

The script used is developed from the so-called Phoenician of about the 8th century B.C. onwards, and is the direct parent of that still used in Abyssinia. Some inscriptions are adorned with figures of animals and plants, and these show very clearly the influence of late Assyrian art (cf. Brit. Mus. 48455, 48456).

Buildings. — The oldest temples and fortresses in Arabia are due to Graeco-Roman influence and occur mostly in the north. At Marib, the Sabaean capital, are ruins covering an area of about 500 metres in diameter, amongst them marble columns without capitals. Other such remains are scattered over south-west Arabia, but as yet have not been examined adequately, and it is impossible to say to what period they belong. West of Marib are the remains of the dam which figures so prominently in Arabic tradition. These show a very solid construction with several sluices. It was destroyed by a flood and restored about A.D. 447–450 by the Abyssinian governor, Abraha; the inscription recording this has been copied by E. Glaser (*Zwei Inschr. über d. Dammbruch von Marib,* in *M.V.G.* 1897); south-west of this is a building constructed of large blocks of hewn stone. At Aden are rock-hewn reservoirs (cleared in 1856); it is doubtful whether these are of the Minaean-Sabaean age or date from the Persian occupation.

In the 6th and 7th centuries Christianity spread over parts of Arabia, its centre being Nejran (north-north-east of Marib). The mosque at San'a was once a church, and Christian symbols occur in various parts. Possibly some of the ancient wells lined with masonry near Medain Salih were the handiwork of monks who brought Byzantine methods of engineering to Arabia and are celebrated in Arabic poetry as well-makers. Within the territory of the ancient Nabataean kingdom, suppressed by Trajan in A.D. 106, are found rock-hewn temples and sepulchres in the later Greek style, and similar monuments are reported by Doughty as far south as Medain Ṣaliḥ.

Coins, Sculptures, **etc.**—These finds connect with the ancient trade routes. Greek and Roman coins have been found, sometimes surcharged with Himyaritic letters, as well as native imitations of these types, *e.g.,* obverse, head of Athena, reverse owl, olive spray, crescent, letters often blundered. Later coins, head of Athena replaced by beardless male with curly hair copied from Ptolemaic coins (?), head of Arab king or god encircled by wreath (Seleucid?). Sculptures, including bronzes, of later Greek workmanship (cf. Brit. Museum, 43311), a very few possibly Egyptian or Assyrian.

Prehistoric Remains. — The prehistoric remains in Arabia are its least known antiquities. In 1926 Flight-Lieut. Maitland observed and photographed circles, forts or cattle-pens, on the Jebel Druze east of the Dead Sea (*Antiquity,* 1927, 197), and Doughty reports similar relics some 100m. farther south. Dolmens are scattered over areas east of Jordan, but no information is available as to how far they extend down into Arabia.

(D. L. O'L.)

Antiquities. — Much spade-work remains to be done before a complete picture of life in ancient Arabia can be pieced together. Systematic exploration of its antiquities has never been possible and our knowledge of the subject depends entirely on the reports and collections of explorers often not properly equipped for the task. In 1876 Doughty studied, sketched and copied the Nabataean rock-tombs and inscriptions at Madain Salih, which have since been studied by Peres Jaussen, Sevignac and others. Other Nabataean rock-tombs with inscriptions were studied in 1877 by Burton during his examination of the ancient gold-workings of Midian. Roman ruins have been found in or near the border of northern Hejaz. At Taima, Huber in 1883 secured the famous Semitic inscription now in the Louvre, and Doughty

recorded the existence of "flagstones set edge-wise" and "round heaps, perhaps barrows" during his wanderings between Khaibar and Hail. The monoliths mentioned by Palgrave at Uyun south of the latter place were not recorded by Huber or Leachman who visited the place later and must be held under suspicion pending verification. At Sadus in Nejd, Pelly found an ancient "Christian" column since destroyed by the Wahhabis. In wadi Sirhan are Roman and early Arab remains—basalt masonry with inscriptions. Near Taif, Doughty found a "prehistoric" sketch of a colossal human being and he and others have recorded the existence at Taif itself of two large shapeless stone idols worshipped by the ancients under the names of Lat and Uzza and broken up by the Wahhabis in 1925. The third idol of this group, Manat, possibly a prehistoric monolith, is said to exist somewhere south of Taif. The meteoric black stone of Mecca was doubtless an object of prehistoric veneration and superstition, and the well of Zamzam is certainly of great antiquity. "Eve's tomb" at Jedda did not apparently exist at the time of Varthema's visit (16th century) and has recently (1927) been demolished by the Wahhabi régime. On the other side of Arabia the puzzle of the exact locality of the ancient seaport of Gerra would seem to have been solved by the discovery by Cheesman of ruins at Ukair, whose name unquestionably preserves the ancient appellation of the city. In the provinces of Kharj and Aflaj, Philby found ruins in connection with the irrigation systems of these parts. They are perhaps comparable to the *tumuli* of Bahrein, examined and attributed to the Phoenicians by Bent, Prideaux and others. In Oman, B. W. Thomas has recently discovered ruins which may prove to be of importance. These and the reported buried cities of the Rub' Al Khali deserve investigation.

The parts of Arabia most exhaustively studied from the archaeological point of view are Yemen and Hadhramaut where considerable remains of the Sabaean and Minaean civilizations have been found. The ruins of Marib, the old Sabaean capital have been visited by Arnaud, Halévy, Glaser and others, who collected a number of inscriptions in the language of Minaea and Saba on bronze and limestone. Arnaud studied in detail the famous dam, on which the irrigation of the district depended and which are comparable to the well-known tank system of Aden. These are unquestionably of great antiquity and were repaired in the 5th and 6th centuries A.D. according to two long inscriptions published by Glaser. Another dam 150 yards long with three tanks above it was seen by W. B. Harris at Hirran in Yemen. The inscriptions above mentioned are in letters apparently derived from the Phoenician. Many of them are of votive character and those of a historical bearing are undated and therefore the subject of controversy. The range of possible dates seems to be from 800 B.C to the 6th century A.D. Among the remains (some in *situ* and others built into walls) are altars and statue-bases, the later stones being ornamented with designs of leaves, flowers, ox-heads, men and women. Some have designs of a sacred tree similar to those of Babylonia. Grave-stones and stelae as well as bronze castings of various animals also occur.

The Vienna Museum possesses a small number of seals of bronze, copper, silver and stone with Sabaean inscriptions and gems of later date with various figures and even Arabic inscriptions. Coins imitated from Greek models but with Sabaean inscriptions have been brought to Europe from Aden, Sana and Marib. (H. ST. J. B. P)

Ethnology.— As Arabia forms a single unit ethnologically with Asia Minor these two political areas are treated together under ASIA MINOR: Ethnology.

ARABIAN ART: see MOHAMMEDAN ART.

ARABIAN NIGHTS' ENTERTAINMENT: see THOUSAND AND ONE NIGHTS.

ARABIAN PHILOSOPHY. What is known as "Arabian" philosophy owed to Arabia little more than its name and its language. It was a system of Greek thought, expressed in a Semitic tongue, and modified by Oriental influences, called into existence amongst the Muslim people by the patronage of their more liberal princes, and kept alive by the intrepidity and zeal of a small band of thinkers, who stood suspected and disliked in the eyes of their nation. Their chief claim to the notice of the historian of philosophy comes from their warm reception of Greek philosophy when it had been banished from its original soil, and whilst western Europe was still too rude and ignorant to be its home (9th to 12th century).

Origin.— In the course of that exile the traces of Semitic or Mohammedan influence gradually faded away, and the last of the line of Saracen thinkers was a truer exponent of the one philosophy which they all professed to teach than the first. The whole movement is little more than a chapter in the history of Aristotelianism. That system of thought, after passing through the minds of those who saw it in the hazy light of an orientalized Platonism, and finding many laborious but narrow-purposed cultivators in the monastic schools of heretical Syria, was then brought into contact with the ideas and mental habits of Islam. But those in whom the two currents converged did not belong to the pure Arab race. Of the so-called Arabian philosophers of the East, al-Fārābī, Ibn-Sīnā and al-Ghazālī were natives of Khorasan, Bokhara and the outlying provinces of north-eastern Persia; whilst al-Kindi, the earliest of them, sprang from Basra, on the Persian Gulf, on the debatable ground between the Semite and the Aryan. In Spain, again, where Ibn-Bājja, Ibn-Tufail and Ibn Rushd rivalled or exceeded the fame of the Eastern schools, the Arabians of pure blood were few, and the Moorish ruling class was deeply intersected by Jewish colonies, and even by the natives of Christian Spain. Thus, alike at Baghdad and at Cordova, Arabian philosophy represents the temporary victory of exotic ideas and of subject races over the theological one-sidedness of Islam, and the illiterate simplicity of the early Saracens.

Islam had, it is true, a philosophy of its own among its theologians (see ISLAM). It was with them that the Muslim theology—the science of the word (*Kalām*)—first came into existence. Its professors, the *Mutākallimūn* (known in Hebrew as *Medabberim,* and as *Loquentes* in the Latin versions), may be compared with the scholastic doctors of the Catholic Church. Driven in the first instance to speculation in theology by the needs of their natural reason, they came, in after days, when Greek philosophy had been naturalized in the Caliphate, to adapt its methods and doctrines to the support of their views. They employed a quasi-philosophical method, by which, according to Maimonides, they first reflected how things ought to be in order to support, or at least not contradict, their opinions, and then, when their minds were made up with regard to this imaginary system, declared that the world was not otherwise constituted. The dogmas of creation and providence, of divine omnipotence, chiefly exercised them; and they sought to assert for God an immediate action in the making and the keeping of the world. Space they looked upon as pervaded by atoms possessing no quality or extension, and time was similarly divided into innumerable instants. Each change in the constitution of the atoms is a direct act of the Almighty. When the fire burns, or the water moistens, these terms merely express the habitual connection which our senses perceive between one thing and another. It is not the man that throws a stone who is its real mover: the supreme agent has for the moment created motion. If a living being die, it is because God has created the attribute of death; and the body remains dead, only because that attribute is unceasingly created. Thus, on the one hand, the object called the cause is denied to have any efficient power to produce the so-called effect; and, on the other hand, the regularities or laws of nature are explained to be direct interferences by the Deity. The supposed uniformity and necessity of causation is only an effect of custom, and may be at any moment rescinded. In this way, by a theory which, according to Averroes (*q.v.*), involves the negation of science, the Muslim theologians believed that they had exalted God beyond the limits of the metaphysical and scientific conceptions of law, form and matter; whilst they at the same time stood aloof from the vulgar doctrines, attributing a causality to things. Thus they deemed they had left a clear ground for the possibility of miracles.

But at least one point was common to the theological and the philosophical doctrine. Carrying out, it may be, the principles of the Neo-Platonists, they kept the sanctuary of the Deity

securely guarded, and interposed between Him and His creatures a spiritual order of potent principles, from the Intelligence, which is the first-born image of the great unity, to the Soul and Nature, which come later in the spiritual rank. Of God the philosophers said we could not tell what He is, but only what He *is not*. The highest point, beyond which strictly philosophical enquirers did not penetrate, was the active intellect, — a sort of soul of the world in Aristotelian garb — the principle which inspires and regulates the development of humanity, and in which lies the goal of perfection for the human spirit. In theological language the active intellect is described as an angel. The inspirations which the prophet receives by angelic messengers are compared with the irradiation of intellectual light, which the philosopher wins by contemplation of truth and increasing purity of life. But while the theologian incessantly postulated the agency of that God whose nature he deemed beyond the pale of science, the philosopher, following a purely human and natural aim, directed his efforts to the gradual elevation of his part of reason from its unformed state, and to its final union with the controlling intellect which moves and draws to itself the spirits of those who prepare themselves for its influences. The philosophers in their way, like the mystics of Persia (the Sufites) in another, tended towards a theory of the communion of man with the spiritual world, which may be considered a protest against the practical and almost prosaic definiteness of the creed of Mohammed.

Arabian philosophy, at the outset of its career in the 9th century, was able without difficulty to take possession of those resources for speculative thought which the Latins had barely achieved at the close of the 12th century by the slow process of rediscovering the Aristotelian logic from the commentaries and verses of Boëthius. What the Latins painfully accomplished, owing to their fragmentary and unintelligent acquaintance with ancient philosophy, was already done for the Arabians by the scholars of Syria. In the early centuries of the Christian era, both within and without the ranks of the Church, the Platonic tone and method were paramount throughout the East. Their influence was felt in the creeds which formulated the orthodox dogmas in regard to the Trinity and the Incarnation. But in its later days the Neoplatonist school came more and more to find in Aristotle the best exponent and interpreter of the philosopher whom they thought divine. It was in this spirit that Porphyry, Themistius and Joannes Philoponus composed their commentaries on the treatises of the Peripatetic system which, modified often unconsciously by the dominant ideas of its expositors, became in the 6th and 7th centuries the philosophy of the Eastern Church. But the instrument which, in the hands of John of Damascus (Damascenus), was made subservient to theological interests, became in the hands of others a dissolvent of the doctrines which had been reduced to shape under the prevalence of the elder Platonism. Peripatetic studies became the source of heresies; and conversely, the heretical sects prosecuted the study of Aristotle with peculiar zeal. The church of the Nestorians, and that of the Monophysites, in their several schools and monasteries, carried on from the 5th to the 8th century the study of the earlier part of the *Organon,* with almost the same means, purposes and results as were found among the Latin schoolmen of the earlier centuries. Up to the time when the religious zeal of the emperor Zeno put a stop to the Nestorian school at Edessa, this "Athens of Syria" was active in translating and popularizing the Aristotelian logic. Their banishment from Edessa in 489 drove the Nestorian scholars to Persia, where the Sassanid rulers gave them a welcome; and there they continued their labours on the *Organon.* A new seminary of logic and theology sprang up at Nisibis, not far from the old locality; and at Gandisapora (or Nishapur), in the east of Persia, there arose a medical school, whence Greek medicine, and in its company Greek science and philosophy, ere long spread over the lands of Iran. Meanwhile the Monophysites had followed in the steps of the Nestorians, multiplying Syriac versions of the logical and medical science of the Greeks. Their school at Resaina is known from the name of Sergius, one of the first of these translators, in the days of Justinian; and from their monasteries at Kinnesrin (Chalcis) issued numerous versions of the introductory treatises of the Aristotelian logic. To the *Isagoge* of Porphyry, the *Categories* and the *Hermeneutica* of Aristotle, the labours of these Syrian schoolmen were confined. These they expounded, translated, epitomized and made the basis of their compilations, and the few who were bold enough to attempt the *Analytics* seem to have left their task unaccomplished.

The energy of the Monophysites, however, began to sink with the rise of the Muslim empire; and when philosophy revived amongst them in the 13th century, in the person of Gregorius Bar-Hebraeus (Abulfaragius) (1226–1286), the revival was due to the example and influence of the Arabian thinkers. It was otherwise with the Nestorians. Gaining by means of their professional skill as physicians a high rank in the society of the Muslim world, the Nestorian scholars soon made Baghdad familiar with the knowledge of Greek philosophy and science which they possessed. But the narrow limits of the Syrian studies, which added to a scanty knowledge of Aristotle some acquaintance with his Syrian commentators, were soon passed by the curiosity and zeal of the students in the Caliphate. During the 8th and 9th centuries, rough but generally faithful versions of Aristotle's principal works were made into Syriac, and then from the Syriac into Arabic. The names of some of these translators, such as Johannitius (Hunain ibn-Ishāq), were heard even in the Latin schools. By the labours of Hunain and his family the great body of Greek science, medical, astronomical and mathematical, became accessible to the Arab-speaking races. But for the next three centuries fresh versions, both of the philosopher and of his commentators, continued to succeed each other.

To the Arabians Aristotle represented and summed up Greek philosophy, even as Galen became to them the code of Greek medicine. They adopted the doctrine and system which the progress of human affairs had made the intellectual food of their Syrian guides. From first to last Arabian philosophers made no claim to originality; their aim was merely to propagate the truth of Peripateticism as it had been delivered to them. It was with them that the deification of Aristotle began; and from them the belief that in him human intelligence had reached its limit passed to the later schoolmen *(see* SCHOLASTICISM). The progress amongst the Arabians on this side lies in a closer adherence to their text, a nearer approach to the bare exegesis of their author. and an increasing emancipation from control by the tenets of the popular religion.

Under the Caliphate. — Secular philosophy found its first entrance amongst the Saracens in the days of the early caliphs of the Abbasid dynasty, whose ways and thoughts had been moulded by their residence in Persia amid the influences of an older creed, and of ideas which had in the last resort sprung from the Greeks. The seat of empire had been transferred to Baghdad, on the highway of Oriental commerce; and the distant Khorasan became the favourite province of the caliph. Then was inaugurated the period of Persian supremacy, during which Islam was laid open to the full current of alien ideas and culture. The incitement came, however, not from the people, but from the prince: it was in the light of court favour that the colleges of Baghdad and Nishapur first came to attract students from every quarter, from the valleys of Andalusia as well as the upland plains of Transoxiana. Mansiir, the second of the Abbasids, encouraged the appropriation of Greek science; but it was al-Ma'mūn, the son of Hariin al-Rashid, who deserves in the Mohammedan empire the same position of royal founder and benefactor which is held by Charlemagne in the history of the Latin schools. In his reign (813–833) Aristotle was first translated into Arabic. Orthodox Muslims, however, distrusted the course on which their chief had entered, and his philosophical proclivities became one ground for doubting his final salvation.

In the eastern provinces the chief names of Arabian philosophy are those known to the Latin schoolmen as Alkindius, Alfarabius, Avicenna and Algazel, or under forms resembling these. The first of these, Alkindius *(see* KINDI), flourished at the court of Baghdad in the first half of the 9th century. His claims to notice at the present day rest upon a few works on medicine, theology, music and natural science. With him begins that encyclopaedic

character — the simultaneous cultivation of the whole field of investigation which is reflected from Aristotle on the Arabian school. In him too is found the union of Platonism and Aristotelianism expressed in Neoplatonic terms. Towards the close of the 10th century the presentation of an entire scheme of knowledge, beginning with logic and mathematics, and ascending through the various departments of physical enquiry to the region of religious doctrine, was accomplished by a society which had its chief seat at Basra, the native town of al-Kindi. This society — the Brothers of Purity or Sincerity (Ikhwān us Safā'i) — divided into four orders, wrought in the interests of religion no less than of science; and though its attempt to compile an encyclopaedia of existing knowledge may have been premature, it yet contributed to spread abroad a desire for further information. The proposed reconciliation between science and faith was not accomplished, because the compromise could please neither party. The 51 treatises of which this encyclopaedia consists are interspersed with apologues in true Oriental style,' and the idea of goodness, of moral perfection, is as prominent an end in every discourse as it was in the alleged dream of al-Ma'mūn. The materials of the work come chiefly from Aristotle, but they are conceived in a Platonizing spirit, which places as the bond of all things a universal soul of the world with its partial or fragmentary souls. Contemporary with this semi-religious and semi-philosophical society lived Alfarabius (see FARĀBĪ), who died in 950. His paraphrases of Aristotle formed the basis on which Avicenna constructed his system, and his logical treatises produced a permanent effect on the logic of the Latin scholars. He gave the tone and direction to nearly all subsequent speculations among the Arabians. His order and enumeration of the principles of being, his doctrine of the double aspect of intellect, and of the perfect beatitude which consists in the aggregation of noble minds when they are delivered from the separating barriers of individual bodies, present at least in germ the characteristic theory of Averroes. But al-Farābī was not always consistent in his views; a certain sobriety checked his speculative flights, and although holding that the true perfection of man is reached in this life by the elevation of the intellectual nature, he came towards the close to think the separate existence of intellect no better than a delusion.

Avicenna.—Unquestionably the most illustrious name amongst the Oriental Muslims was Avicenna (980–1037) (*q.v.*). His rank in the mediaeval world as a philosopher was far beneath his fame as a physician. Still, the logic of Albertus Magnus and succeeding doctors was largely indebted to him for its formulae. In logic Avicenna starts by distinguishing between the isolated concept and the judgment or assertion; from which two primitive elements of knowledge there is artificially generated a complete and scientific knowledge by the two processes of definition and syllogism. But the chief interest for the history of logic belongs to his doctrine in so far as it bears upon the nature and function of abstract ideas. The question had been suggested alike to East and West by Porphyry, and the Arabians were the first to approach the full statement of the problem. Farābī had pointed out that the universal and individual are not distinguished from each other as understanding from the senses, but that both universal and individual are in one respect intellectual, just as in another connection they play a part in perception. He had distinguished the universal essence in its abstract nature, from the universal considered in relation to a number of singulars. These suggestions formed the basis of Avicenna's doctrine. The essences or forms — the *intelligibilia* which constitute the world of real knowledge — may be looked at in themselves (metaphysically), or as embodied in the things of sense (physically), or as expressing the processes of thought (logically). The first of these three points of view deals with the form or idea as self-contained in the principles of its own being, apart from those connections and distinctions which it receives in real (physical) science, and through the act of intellect. Secondly, the form may be looked at as the similarity evolved by a process of comparison, as the work of mental reflection, and in .that way as essentially expressing a relation. When thus considered as the common features derived by examination from singular instances, it becomes a universal or common term strictly so called. It is intellect which first makes the abstract idea a true universal. In the third place, the form or essence may be looked upon as embodied in outward things, and thus it is the type more or less represented by the members of a natural kind. It is the designation of these outward things which forms the "first intention" of names; and it is only at a later stage, when thought comes to observe its own modes, that names, looked upon as predicables and universals, are taken in their "second intention." Logic deals with such second intentions. It does not consider the forms before their embodiment in things, *i.e.*, as eternal ideas — nor as immersed in the matter of the phenomenal world — but as they exist in and for the intellect which has examined and compared. Logic does not come in contact with things, except as they are subject to modification by intellectual forms. In other words, universality, individuality and speciality are all equally modes of our comprehension or notions; their meaning consists in their setting forth the relations attaching to any object of our conception. In the mind, *e.g.*, one form may be placed in reference to a multitude of things, and as thus related will be universal. The form animal, *e.g.*, is an abstract intelligible or metaphysical idea. When an act of thought employs it as a schema to unify several species, it acquires its logical aspect of generality; and the various living beings qualified to have the name animal applied to them constitute the natural class or kind. Avicenna's view of the universal may be compared with that of Abélard, who calls it "that whose nature it is to be predicated of several," as if the generality became explicit only in the act of predication, in the proposition, and not in the abstract, unrelated form or essence. The three modes of the universal before things, in things, and after things, spring from Arabian influence, but depart somewhat from his standpoint.

The place of Avicenna amongst Muslim philosophers is seen in the fact that Shahrastānī takes him as the type of all, and that Ghazālī's attack against philosophy is in reality almost entirely directed against Avicenna. His system is in the main a codification of Aristotle modified by fundamental views of Neoplatonist origin, and it tends to be a compromise with theology. In order, for example, to maintain the necessity of creation, he taught that all things except God were admissible or possible in their own nature, but that certain of them were rendered necessary by the act of the creative first agent — in other words, that the possible could be transformed into the necessary. Avicenna's theory of the process of knowledge is an interesting part of his doctrine. Man has a rational soul, one face of which is turned towards the body, and, by the help of the higher aspect, acts as practical understanding; the other face lies open to the reception and acquisition of the intelligible forms, and its aim is to become a reasonable world, reproducing the forms of the universe and their intelligible order. In man there is only the susceptibility to reason, which is sustained and helped by the light of the active intellect. Man may prepare himself for this influx by removing the obstacles which prevent the union of the intellect with the human vessel destined for its reception. The stages of this process to the acquisition of mind are generally enumerated by Avicenna as four; in this part he follows not Aristotle, but the Greek commentator. The first stage is that of the hylic or material intellect, a state of mere potentiality, like that of a child for writing, before he has ever put pen to paper. The second stage is called in habitu; it is compared to the case of a child that has learned the elements of writing, when the bare possibility is on the way to be developed, and is seen to be real. In this period of half-trained reason it appears as happy conjecture, not yet transformed into art or science proper. When the power of writing has been actualized, we have a parallel to the *intellectus* in *actu* — the way of science and demonstration is entered. And when writing has been made a permanent accomplishment, or lasting property of the subject, to be taken up at will, it corresponds to the intellectus *adeptus* — the complete mastery of science. The whole process may be compared to the gradual illumination of a body naturally capable of receiving light. There are, however, grades of susceptibility to the active intellect; *i.e.*, in theological language, to communication with God and His angels. Sometimes the receptivity is so vigorous

in its affinity, that without teaching it rises at one step to the vision of truth, by a certain "holy force" above ordinary measure. (In this way philosophy tried to account for the phenomenon of prophecy, one of the ruling ideas of Islam.) But the active intellect is not merely influential on human souls. It is the universal giver of forms in the world.

In several points Avicenna endeavoured to give a rationalistic account of theological dogmas, particularly of prophetic rule, of miracles, divine providence and immortality. The permanence of individual souls he supports by arguments borrowed from those of Plato. The existence of a prophet is shown to be a corollary from a belief in God as a moral governor, and the phenomena of miracles are required to evidence the genuineness of the prophetic mission. Thus Avicenna, like his predecessors, tried to harmonize the abstract forms of philosophy with the religious faith of his nation. But his arguments are generally vitiated by the fallacy of assuming what they profess to prove. His failure is made obvious by the attack of Ghazālī on the tendencies and results of philosophic speculation.

Ghazālī.—To GhazLli (*q.v.*) it seemed that the study of secular philosophy had resulted in a general indifference to religion, and that the scepticism which concealed itself under a pretence of piety was destroying the life and purity of the nation. With these views he carried into the fields of philosophy the aims and spirit of the Muslim theologian. His restless life was the reflex of a mental history disturbed by prolonged agitation. Revolting, in the height of his success, against the current creed, he began to examine the foundations of knowledge. The senses are contradicted by one another, and disproved by reason. Reason, indeed, professes to furnish us with necessary truths; but what assurance have we that the verdicts of reason may not be reversed by some higher authority? GhazLli then interrogated all the sects in succession to learn their criterion of truth. He first applied to the theological schoolmen, who grounded their religion on reason; but their aim was only to preserve the faith from heresy. He turned to the philosophers, and examined the accepted Aristotelianism in a treatise which has come down to us—The *Destruction* of *the Philosophers.* He assails them on 20 points of their mixed physical and metaphysical peripateticism, from the statement of which, in spite of his pretended scepticism, we can deduce some very positive metaphysical opinions of his own. He claims to have shown that the dogmas of the eternity of matter and the permanence of the world are false; that their description of the Deity as the demiurgos is unspiritual; that they fail to prove the existence, the unity, the simplicity, the incorporeality or the knowledge (both of species and accidents) of God; that their ascription of souls to the celestial spheres is unproved; that their theory of causation, which attributes effects to the very natures of the causes, is false, for that all actions and events are to be ascribed to the Deity; and, finally, that they cannot establish the spirituality of the soul, nor prove its mortality. These criticisms disclose nothing like a sceptical state of mind, but rather a reversion from the metaphysical to the theological stage of thought. He denies the intrinsic tendencies, or souls, by which the Aristotelians explained the motion of the spheres, because he ascribes their motion to God. The sceptic would have denied both. G. H. Lewes censures Renan for asserting of Ghazālī's theory of causation—"*Hume n'a rien dit plus.*" It is true that Ghazālī maintains that the natural law according to which effects proceed inevitably from their causes is only custom, and that there is no *necessary* connection between them. But while Hume absolutely denies the necessity, GhazLli merely removes it one stage farther back, and plants it in the mind of the Deity. This, of course, is not metaphysics, but theology. Having, as he believed, refuted the opinions of the philosophers, he next investigated the pretensions of the Allegorists, who derived their doctrines from an imam. These Arabian ultramontanes had no word for the doubter. They could not, he says, even understand the problems they sought to resolve by the assumption of infallibility, and he turned again, in his despair, to the instructors of his youth—the Sūfīs. In their mystical intuition of the laws of life, and absorption in the immanent Deity, he at last found peace. This shows the true character of the treatise which, alike in mediaeval and modern times, has been quoted as containing an exposition of his opinions. The work called *Tlze Tendencies* of *the Philosophers,* translated in 1506, with the title *Logica et Philosophia Algazelis Arabis,* contains neither the logic nor the philosophy of Ghazālī. It is a mere abstract or statement of the Peripatetic systems, and was made preliminary to that *Destruction* of which we have already spoken.

This indictment against liberal thought from the standpoint of the theological school was afterwards answered in Spain by Averroes; but in Baghdad it heralded the extinction of the light of philosophy. Moderate and compliant with the popular religion as Alfarabius and Avicenna had always been, as compared with their Spanish successor, they had equally failed to conciliate the popular spirit, and were classed in the same category with the heretic or the member of an immoral sect. The 12th century exhibits the decay of liberal intellectual activity in the Caliphate, and the gradual ascendancy of Turkish races animated with all the intolerance of semi-barbarian proselytes to the Mohammedan faith. Philosophy, which had only sprung up when the purely Arabian influences ceased to predominate, came to an end when the sceptre of the Muslim world passed away from the dynasty of Persia. Even in 1150 Baghdad had seen a library of philosophical books burned by command of the caliph Mostanjid; and in 1192 the same place might have witnessed a strange scene, in which the books of a physician were first publicly cursed, and then committed to the flames, while their owner was incarcerated. Thus, while the Latin Church showed a marvellous receptivity for ethnic philosophy, and assimilated doctrines which it had at an earlier date declared impious, in Islam the theological system entrenched itself towards the end of the 12th century in the narrow orthodoxy of the Asharites, and reduced the votaries of Greek philosophy to silence.

In Spain.—The same phenomena were repeated in Spain under the Mohammedan rulers of Andalusia and Morocco, with this difference, that the time of philosophical development was shorter, and the heights to which Spanish thinkers soared were greater. The reign of al-Hakam the Second (961–976) inaugurated in Andalusia those scientific and philosophical studies which were simultaneously prosecuted by the Society of Basra. From Cairo, Baghdad, Damascus and Alexandria, books both old and new were procured at any price for the library of the prince; 27 free schools were opened in Cordova for the education of the poor; and intelligent knowledge was perhaps more widely diffused in Mohammedan Spain than in any other part of Europe at that day. The mosques of the city were filled with crowds who listened to lectures on science and literature, law and religion. But the future glory thus promised was long postponed. The usurping successor of Hakam found it a politic step to request the most notable doctors of the sacred law to examine the royal library; and every book treating of philosophy, astronomy and other forbidden topics was condemned to the flames. But the spirit of research, fostered by the fusion of races and the social and intellectual competition thus engendered, was not crushed by these proceedings; and for the next century and more the higher minds of Spain found in Damascus and Baghdad the intellectual aliment which they desired. At last, towards the close of the 11th century, the long-pent spiritual energies of Mohammedan Spain burst forth in a brief series of illustrious men. Whilst the native Spaniards were narrowing the limits of the Moorish kingdoms, and whilst the generally fanatical dynasty of the Almohades might have been expected to repress speculation, the century preceding the close of Mohammedan sway saw philosophy cultivated by Avempace, Abubacer and Averroes. Even amongst the Almohades there were princes, such as Yusiif (who began his reign in 1163) and Yaqūb Almansūr (who succeeded in 1184), who welcomed the philosopher at their courts and treated him as an intellectual compeer. But about 1195 the old distrust of philosophy revived; the philosophers were banished in disgrace; works on philosophical topics were ordered to be confiscated and burned; and the son of Almansiir condemned a certain Ibn-Habīb to death for the crime of philosophizing.

Avempace.—Arabian speculation in Spain was heralded by Avicebron or Ibn Gabirol (*q.v.*), a Jewish philosopher (1021–58). About a generation later the rank of Muslim thinkers was introduced by Abii-Bakr Muhammad ibn Yahya, surnamed Ibn-Bājja, and known to the Latin world as Avempace. He was born at Saragossa, and died comparatively young at Fez in 1138. Besides commenting on various physical treatises of Aristotle he wrote some philosophical essays, notably one on the *Republic* or *Régime* of *the Solitary*, understanding by that the organized system of rules, by obedience to which the individual may rise from the mere life of the senses to the perception of pure intelligible principles and may participate in the divine thought which sustains the world. These rules for the individual are but the image or reflex of the political organization of the perfect or ideal state; and the man who strives to lead this life is called the *solitary*, not because he withdraws from society, but because, while in it, he guides himself by reference to a higher state, an ideal society. Avempace does not develop at any length this curious Platonic idea of the perfect state. His object is to discover the highest end of human life, and with this view he classifies the various activities of the human soul, rejects such as are material or animal, and then analyses the various spiritual forms to which the activities may be directed. He points out the graduated scale of such forms, through which the soul may rise, and shows that none are final or complete in themselves, except the pure intelligible forms, the ideas of ideas. These the intellect can grasp, and in so doing it becomes what he calls *intellectus acquisitus*, and is in a measure divine. This self-consciousness of pure reason is the highest object of human activity, and is to be attained by the speculative method. The intellect has in itself power to know ultimate truth and intelligence, and does not require a mystical illumination as Ghazālī taught. Avempace's principles, it is clear, lead directly to the Averroistic doctrine of the unity of intellect, but the obscurity and incompleteness of the *Régime* do not permit us to judge how far he anticipated the later thinker. (See Munk, *Mélanges de phil. juive et arabe*, pp. 383–410.)

The same theme was developed by Ibn-Tufail (*q.v.*) in his philosophical romance, called *Hayy ibn-Yakdhān* (the Living, Son of the Waking One), best known by Pococke's Latin version, as the *Philosophus Autodidactus*. It describes the process by which an isolated truth-seeker detaches himself from his lower passions, and raises himself above the material earth and the orbs of heaven to the forms which are the source of their movement, until he arrives at a union with the supreme intellect. The experiences of the religious mystic are paralleled with the ecstatic vision in which the philosophical hermit sees a world of pure intelligences, where birth and decease are unknown. It was this theory which Averroes (1126–98), the last and most famous of the thinkers of Muslim Spain, made use of in his doctrine of the unity of intellect.

Averroes.—For Aristotle the reverence of Averroes was unbounded, and to expound him was his chosen task. The uncritical receptivity of his age, the defects of the Arabic versions, the emphatic theism of his creed, and the rationalizing mysticism of some Oriental thought, may have sometimes led him astray, and given prominence to the less obvious features of Aristotelianism. But in his conception of the relation between philosophy and religion, Averroes had a light which the Latins were without. The science, falsely so called, of the several theological schools, their groundless distinctions and sophistical demonstrations, he regarded as the great source of heresy and scepticism. The allegorical interpretations and metaphysics which had been imported into religion had taken men's minds away from the plain sense of the Koran. God had declared a truth meet for all men, which needed no intellectual superiority to understand, in a tongue which each human soul could apprehend. Accordingly, the expositors of religious metaphysics, Ghazālī included, are the enemies of true religion, because they make it a mere matter of syllogism. Averroes maintains that a return must be made to the words and teaching of the prophet; that science must not expend itself in dogmatizing on the metaphysical consequences of fragments of doctrine for popular acceptance, but must proceed to reflect upon and examine the existing things of the world. Averroes, at the same time, condemns the attempts of those who tried to give demonstrative science where the mind was not capable of more than rhetoric; they harm religion by their mere negations, destroying an old sensuous creed, but cannot build up a higher and intellectual faith.

In this spirit Averroes does not allow the fancied needs of theological reasoning to interfere with his study of Aristotle, whom he simply interprets as a truth-seeker. The points by which he told on Europe were all implicit in Aristotle, but Averroes set in relief what the original had left obscure, and emphasized things which the Christian theologian passed by or misconceived. Thus Averroes had a double effect. He was the great interpreter of Aristotle to the later Schoolmen. On the other hand, he came to represent those aspects of Peripateticism most alien to the spirit of Christendom; and the deeply religious Muslim gave his name to the anti-sacerdotal party, to the materialists, sceptics and atheists, who defied or undermined the dominant beliefs of the church.

On three points Averroes, like other Muslim thinkers, came specially into relation, real or supposed, with the religious creed, viz., the creation of the world, the divine knowledge of particular things, and the future of the human soul.

The real grandeur of Averroes is seen in his resolute prosecution of the standpoint of science in matters of this world, and in his recognition that religion is not a branch of knowledge to be reduced to propositions and systems of dogma, but a personal and inward power, an individual truth which stands distinct from, but not contradictory to, the universalities of scientific law. In his science he followed the Greeks, and to the Schoolmen he and his compatriots rightly seemed philosophers of the ancient world. He maintained alike the claim of demonstrative science with its generalities for the few who could live in that ethereal world, and the claim of religion for all—the common life of each soul as an individual and personal consciousness. But theology, or the mixture of the two, he regarded as a source of evil to both—fostering the vain belief in a hostility of philosophers to religion, and meanwhile corrupting religion by a pseudo-science.

The latent nominalism of Aristotle only came gradually to be emphasized through the prominence which Christianity gave to the individual life, and, apart from passing notices, as in Abélard, first found clear enunciation in the school of Duns Scotus. The Arabians, on the contrary, emphasized the idealist aspect which had been adopted and promoted by the Neoplatonist commentators. Hehce, to Averroes the eternity of the world finds its true expression in the eternity of God. The ceaseless movement of growth and change, which presents matter in form after form as a continual search after a finality which in time and movement is not and cannot be reached, represents only the aspect the world shows to the physicist and to the senses. In the eye of reason the full fruition of this desired finality is already and always attained; the actualization, invisible to the senses, is achieved now and ever, and is thus beyond the element of time. This transcendent or abstract being *is* that which the world of nature is always *seeking*. He is thought or intellect, the actuality, of which movement is but the fragmentary attainment in successive instants of time. Such a mind is not in the theological sense a creator, yet the onward movement is not the same as what some modern thinkers seem to mean by development. For the perfect and absolute, the consummation of movement is not generated at any point in the process; it is an ideal end, which guides the operations of nature, and does not wait upon them for its achievement. God is the unchanging essence of the movement, and therefore its eternal cause.

A special application of this relation between the prior perfect, and the imperfect, which it influences, is found in the doctrine of the connection of the abstract (transcendent) intellect with man. This transcendent mind is sometimes connected with the moon, according to the theory of Aristotle, who assigned an imperishable matter to the sphere beyond the sublunary, and in general looked upon the celestial orbs as living and intelligent. Such an intellect, named active or productive, as being the author

of the development of reason in man, is the permanent, eternal thought, which is the truth of the cosmic and physical movement. It is in man that the physical or sensible passes most evidently into the metaphysical and rational. Humanity is the chosen vessel in which the light of the intellect is revealed; and so long as mankind lasts there must always be some individuals destined to receive this light. What seems from the material point of view to be the acquisition of learning, study and a moral life, is from the higher point of view the manifestation of the transcendent intellect in the individual. The preparation of the heart and faculties gives rise to a series of grades between the original predisposition and the full acquisition of actual intellect. These grades in the main resemble those given by Avicenna. But beyond these, Averroes claims as the highest bliss of the soul a union in this life with the actual intellect. The intellect, therefore, is one and continuous in all individuals, who differ only in the degree which their illumination has attained. Such was the Averroist doctrine of the unity of intellect — the eternal and universal nature of true intellectual life. By his interpreters it was transformed into a theory of one soul common to all mankind, and when thus corrupted conflicted not unreasonably with the doctrines of a future life, common to Islam and Christendom.

Opponents of **Averroism.**—Averroes, rejected by his Muslim countrymen, found a hearing among the Jews, to whom Maimonides had shown the free paths of Greek speculation. In the cities of Languedoc and Provence, to which they had been driven by Spanish fanaticism, the Jews no longer used the learned Arabic, and translations of the works of Averroes became necessary. His writings became the text-book of Levi ben Gerson at Perpignan, and of Moses of Narbonne. Meanwhile, before 1250, Averroes became accessible to the Latin Schoolmen by means of versions, accredited by the names of Michael Scot and others. William of Auvergne is the first Schoolman who criticizes the doctrines of Averroes, not, however, by name. Albertus Magnus and St. Thomas devote special treatises to an examination of the Averroist theory of the unity of intellect, which they labour to confute in order to establish the orthodoxy of Aristotle. But as early as Aegidius Romanus (1247–1316), Averroes had been stamped as the patron of indifference to theological dogmas, and credited with the emancipation which was equally due to wider experience and the lessons of the Crusades. There had never been an absence of protest against the hierarchical doctrine. Berengar of Tours (11th century) had struggled in that interest, and with Abélard, in the 12th century, the revolt against authority in belief grew loud. The dialogue between a Christian, a Jew and a philosopher suggested a comparative estimate of religions, and placed the natural religion of the moral law above all positive revelations. Nihilists and naturalists, who deified logic and science at the expense of faith, were not unknown at Paris in the days of John of Salisbury. In such a critical generation the words of Averroism found willing ears, and pupils who outran their teacher. Paris became the centre of a sceptical society, which the decrees of bishops and councils, and the enthusiasm of the orthodox doctors and knights-errant of Catholicism, were powerless to extinguish. At Oxford Averroes told more as the great commentator. In the days of Roger Bacon he had become an authority. Baton, placing him beside Aristotle and Avicenna, recommends the study of Arabic as the only way of getting the knowledge which bad versions made almost hopeless. In Duns Scotus, Averroes and Aristotle are the unequalled masters of the science of proof; and he pronounces distinctly the separation between Catholic and philosophical truth, which became the watchword of Averroism. By the 14th century Averroism was the common leaven of philosophy; John Baconthorpe is the chief of Averroists, and Walter Burley has similar tendencies.

Meanwhile Averroism had come to be regarded by the great Dominican school as the arch-enemy of the truth. When the Emperor Frederick II. consulted a Muslim free-thinker on the mysteries of the faith, when the phrase or legend of the "Three Impostors" presented in its most offensive form the scientific survey of the three laws of Moses, Christ and Mohammed, and when the characteristic doctrines of Averroes were misunderstood, it soon followed that his name became the badge of the scoffer and the sceptic. What had begun with the subtle disputes of the universities of Paris, went on to the materialist teachers in the medical schools and the sceptical men of the world in the cities of northern Italy. The patricians of Venice and the lecturers of Padua made Averroism synonymous with doubt and criticism in theology, and with sarcasm against the hierarchy. Petrarch refuses to believe that any good thing can come out of Arabia, and speaks of Averroes as a mad dog barking against the Church. In works of contemporary art Averroes is at one time the comrade of Mohammed and Antichrist; at another he lies with Arius and Sabellius, vanquished by the lance of St. Thomas.

The School of **Padua.**—It was in the universities of north Italy that Averroism finally settled, and there for three centuries it continued as a stronghold of Scholasticism to resist the efforts of revived antiquity and of advancing science. Padua became the seat of Averroist Aristotelianism; and, when Padua was conquered by Venice in 1405, the printers of the republic spread abroad the teaching of the professors in the university. As early as 1300, at Padua, Petrus Aponensis, a notable expositor of medical theories, had betrayed a heterodoxy in faith; and John of Jandun, one of the pamphleteers on the side of Louis of Bavaria, was a keen follower of Averroes, whom he styles a "perfect and most glorious physicist." Urbanus of Bologna, Paul of Venice (d. 1428), and Cajetanus de Thienis (1387–1465), established by their lectures and their discussions the authority of Averroes; and a long list of manuscripts rests in the libraries of Lombardy to witness the diligence of these writers and their successors. Even a lady of Venice, Cassandra Fedele, in 1480, gained her laurels in defence of Averroist theses.

With Pietro Pomponazzi (*q.v.*) in 1495, a brilliant epoch began for the school of Padua. Questions of permanent and present interest took the place of outworn scholastic problems. The disputants ranged themselves under the rival commentators, Alexander and Averroes; and the immortality of the soul became the battle-ground of the two parties. Pomponazzi defended the Alexandrist doctrine of the utter mortality of the soul, whilst Agostino Nifo (*q.v.*), the Averroist, was entrusted by Leo X. with the task of defending the Catholic doctrine. The parties seemed to have changed when Averroism thus took the side of the Church; but the change was probably due to compulsion. Nifo had edited the works of Averroes (1495–97); but his expressions gave offence to the dominant theologians, and he had to save himself by distinguishing his personal faith from his editorial capacity. Alessandro Achillini, the persistent philosophical adversary of Pomponazzi, both at Padua and subsequently at Bologna, attempted, along with other moderate but not brilliant Averroists, to accommodate their philosophical theory with the requirements of Catholicism. It was this comparatively mild Averroism, reduced to the merely explanatory activity of a commentator, which continued to be the official dogma at Padua during the 16th century. Its typical representative is Marc-Antonio Zimara (d. 1552), the author of a reconciliation between the tenets of Averroes and those of Aristotle.

Summary. — Meanwhile, in 1497, Aristotle was for the first time expounded in Greek at Padua. Plato had long been the favourite study at Florence; and Humanists, like Erasmus, Ludovicus Vives and Nizolius, enamoured of the popular philosophy of Cicero and Quintilian, poured out the vials of their contempt on scholastic barbarism with its "impious and thrice-accursed Averroes." The editors of Averroes complain that the popular taste had forsaken them for the Greek. Nevertheless, while Fallopius, Vesalius and Galileo were claiming attention to their discoveries, G. Zabarella, Francesco Piccolomini (1520–1604) and Cesare Cremonini (1550–1631) continued the traditions of Averroism, not without changes and additions. Cremonini, the last of them, died in 1631, after lecturing 12 years at Ferrara and 40 at Padua. The great educational value of Arabian philosophy for the later schoolmen consisted in its making them acquainted with an entire Aristotle. At the moment when it seemed as if everything had been made that could be made out of the frag-

ments of Aristotle, and the compilations of Capella, Cassiodorus and others, and when mysticism and scepticism seemed the only resources left for the mind, the horizon of knowledge was suddenly widened by the acquisition of a complete Aristotle. Thus the mistakes inevitable in the isolated study of an imperfect *Organon* could not henceforth be made. The real bearing of old questions, and the meaninglessness of many disputes, were seen in the new conception of Aristotelianism given by the Metaphysics and other treatises. The former Realism and Nominalism were lifted into a higher phase by the principle of the universalizing action of intellect—Zntellectus in *formis agit universalitatem.* The commentaries of the Arabians in this respect supplied nutriment more readily assimilated by the pupils than the pure text would have been.

Arabian philosophy, whilst it promoted the exegesis of Aristotle and increased his authority, was not less notable as the source of the separation between theology and philosophy. Speculation fell on irreligious paths. In many cases the heretical movement was due less to foreign example than to the indwelling tendencies of the dominant school of realism. But it is not less certain that the very considerable freedom of the Arabians from theological bias prepared the time when philosophy shook off its ecclesiastical vestments. In the hurry of first terror, the Church struck Aristotle with the anathema launched against innovations in philosophy. The provincial council of Paris in 1209, which condemned Amalricus and his followers, as well as David of Dinant's works, forbade the study of Aristotle's *Natural Philosophy* and the Commentaries. In 1215 the same prohibition was repeated, specifying the Metaphysics and Physics, and the Commentaries by the Spaniard Mauritius (*i.e.,* probably Averroes). Meanwhile Albertus Magnus and Thomas Aquinas, accepting the exegetical services of the Arabians, did their best to controvert the obnoxious doctrine of the Intellect, and to defend the orthodoxy of Aristotle against the unholy glosses of infidels. But it is doubtful whether even they kept as pure from the infection of illegitimate doctrine as they supposed. The tide meanwhile flowed in stronger and stronger. In 1270 Étienne Tempier, bishop of Paris, supported by an assembly of theologians, anathematized 13 propositions bearing the stamp of Arabian authorship; but in 1277 the same views and others more directly offensive to Christians and theologians had to be censured again. Raymond Lully, in a dialogue with an infidel thinker, broke a lance in support of the orthodox doctrine, and carried on a crusade against the Arabians in every university; and a disciple of Thomas Aquinas drew up a list (De *erroribus philosophorum*) of the several delusions and errors of each of the thinkers from Kindi to Averroes. Strong in their conviction of the truth of Aristotelianism, the Arabians carried out their logical results in the theological field, and made the distinction of necessary and possible, of form and matter, the basis of conclusions in the most momentous questions. They refused to accept the doctrine of creation because it conflicted with the explanation of forms as the necessary evolution of matter. They denied the particular providence of God, because knowledge in the divine sphere did not descend to singulars. They excluded the Deity from all direct action upon the world, and substituted for a cosmic principle the active intellect,—thus holding a form of Pantheism. But all did not go the same length in their divergence from the popular creed.

The half-legendary accounts which attribute the introduction of Arabian science to Gerbert, afterwards Pope Sylvester II., to Constantinus Africanus and to Adelard of Bath, if they have any value, refer mainly to medical science and mathematics. It was not till about the middle of the 12th century that under the patronage of Raymond, archbishop of Toledo, a society of translators, with the archdeacon Dominicus Gundisalvi at their head, produced Latin versions of the Commentaries of Avicenna and Ghazālī, of the *Fons* Vitae of Avicebron, and of several Aristotelian treatises. The working translators were converted Jews, the best-known among them being Joannes Avendeath. With this effort began the chief translating epoch for Arabic works. Avicenna's Canon of *Medicine* was first translated into Latin by Gerard of Cremona (d. 1187), to whom versions of other medical and astronomical works are due. The movement towards introducing Arabian science and philosophy into Europe, however, culminated under the patronage of the emperor Frederick II. (1212–50). Partly from superiority to the narrowness of his age, and partly in the interest of his struggle with the Papacy, this *Malleus* ecclesiae *Romanae* drew to his court those savants whose pursuits were discouraged by the Church, and especially students in the forbidden lore of the Arabians. He is said to have pensioned Jews for purposes of translation. One of the scholars to whom Frederick gave a welcome was Michael Scot, the first translator of Averroes. Scot had sojourned at Toledo about 1217, and had accomplished the versions of several astronomical and physical treatises, mainly, if we believe Roger Bacon, by the labours of a Jew named Andrew. But Bacon is apparently hypercritical in his estimate of the translators from the Arabic. Another protégé of Frederick was Hermann the German (Alemannus), who, between the years 1243 and 1256, translated amongst other things a paraphrase of al-Fārābī on the Rhetoric, and of Averroes on the Poetics and *Ethics* of Aristotle. Jewish scholars held an honourable place in transmitting the Arabian commentators to the schoolmen. It was amongst them, especially in Maimonides, that Aristotelianism found refuge after the light of philosophy was extinguished in Islam; and the Jewish family Ben-Tibbon were mainly instrumental in making Averroes known to southern France. (See JEWISH PHILOSOPHY.)

ARABIAN SEA (anc. Mare Erythraeum), the north-west section of the Indian ocean, bounded east by India, north by Baluchistan and southern Persia, and west by Arabia and the "horn" of Africa. It has two important branches—the Gulf of Aden, connecting with the Red sea through the Strait of Bab-el-Mandeb; and the Gulf of Oman, leading to the Persian Gulf. The sea, long a centre of coastwise sailing, forms part of the chief highway between Europe and India. Its islands are few and insignificant, the chief being Socotra, off Somaliland, and the Laccadives. The coasts, save for the Indian shore between Bombay and Karachi, are steeply tilted and fall into deep water.

ARABIC ACID, also known as arabin and *gummic* acid. is the chief constituent of gum arabic. (See GUMS.) It can be obtained as an amorphous precipitate by treating with alcohol an aqueous solution of gum arabic in the presence of hydrochloric acid. It is soluble in water and insoluble in alcohol. Pure arabic acid, or λ-*arabinosic* acid, $C_{23}H_{38}O_{22}$, differs from the naturally occurring gum acid which is a compound of arabinosic acid with the sugar residues, arabinan and galactan.

ARABICI, a religious sect originating about the beginning of the 3rd century, mentioned by Augustine (De Haeres, c. lxxxiii.), and called also θνητοψυχῖται ("mortal-souled") by John of Damascus (De Haeres, c. xc.). Their distinctive doctrine was a form of Christian materialism, showing itself in the belief that the soul perished and was restored to life along with the body,

ARABIC LANGUAGE. In the 7th and 8th centuries, Arab conquests and the expansion of Islam spread the Arabic language into many countries outside Arabia, and in some form or other it is spoken (sometimes, along with other languages) in Mesopotamia, Syria, Palestine, Egypt, Malta, north Africa, and in certain districts further south; *e.g.,* in the Sudan. Nigeria, the western Sahara, and Zanzibar. Arabic was formerly spoken in Spain, which produced important contributions to Arabic literature, in the Balearic islands and Sicily (up to the end of the period

of Arab domination), in the island of Pantelleria, between Sicily and Tunis (up to the 18th century) and in Madagascar.

Even in Arabia itself the Arabic language exhibits dialectic differences, and such variations are still more marked in countries more remote from the land of its origin. But the written language has almost invariably conformed to that type which has been conveniently denominated as classical Arabic, characterized by an extraordinary richness of vocabulary and the logical, systematic character of its grammatical structure.

Alphabet. — The Arabic alphabet consists of 28 letters. (For pronunciation, see W. H. T. Gairdner, The Phonetics of Arabic, 192j.) To these may be added ' (hamza), the glottal stop. (For a discussion of the divergent theories on hamza, see C. Landberg, Glossaire *Datînois,* p. 1,744, sqq., 1923.)

Roots. — Most Arabic words (except those of foreign origin) can be traced back to a triliteral root; some words are considered to be derived from roots of two consonants only (*v.* Th. Noldeke, *Neue Beiträge zur semitischen Sprachwissenschaft,* pp. 109–178, 1910). By combining these consonants with certain other letters, the original idea associated with the root can be modified in such a manner that the three letters of the root (provided that one or more of them is neither hamza, wāw nor yā) can in most cases be clearly recognized; *e.g.,* from the root KTB "write," we have *KaTaBnā* "we wrote," *naKTuBu* "we will write," *KāTiB*^{un} "writing, a writer," *KiTāB*^{un} "a book," *maKTaB*^{un} "a place of writing, a school," *muKTiB*^{un} "a teacher of writing," *taKāTaBā* "they two corresponded with one another," *astaKTiBu* "I will ask (him) to write," *wa.KtaTaBa* "and he got his name written down (in the register)," *KuTTāB*^{un} '(scribes," *muKāTaBat*^{un} "correspondence," etc.

Verbs. — The Arabic verb has only two tenses: Perfect and Imperfect.

The Perfect tense of the Indicative of the Active of the simple verb, formed from the root QTL (meaning "kill"), is as follows:

	Sing.	Dual	Plural
3 m.	*qatala*	qatald	qatalli
f.	qatalat	*qatalatā*	*qatalna*
2 m.	*qatalta*	*qataltumā*	*qataltum*
f.	qatalti		*qataltunna*
1 m.f.	qataltu		*qatalnā*

In some verbs (generally intransitive) the vowel following the second radical is i, in others (always intransitive) u.

The Imperfect Indicative Active tense, from the same root, is:

	Sing.	Dual	Plural
3 m.	*yaqtulu*	*yaqtulāni*	*yaqtulūna*
f.	taqtulu	*taqtulāni*	yaqtulna
a m.	*taqtulu*	*taqtulāni*	taqtullina
.	*taqtulīna*		taqtulna
1 m.f.	*aqtulu*		*naqtulu*

If the vowel following the second radical in the Perfect is *i,* that of the Imperfect is generally a; if this vowel in the Perfect is *u,* that of the Imperfect is invariably u.

The Arabic verb has in the Active five moods, viz., the Indicative (both Perfect and Imperfect), the Subjunctive and Apocopated (Imperfect only), the Imperative (having a special form) and the Energetic (both Apocopated and Imperative).

The Perfect and Imperfect Passive differ from the corresponding tenses of the Active in that the first radical of the Perfect is always followed by *u* and the second radical by *i;* while in the Imperfect the prefixes take u and the second radical a. The Passive has the same moods as the Active, with the exception of the Imperative and the Energetic of the Imperative, the Apocopated being used instead.

The meaning of the simple verb may be modified in various ways by the addition of one or more letters to the root, and thus 14 derived conjugations may be formed. The commonest of these and of the changes of meaning they imply are as follows: — II, by doubling the medial consonant of the root the meaning is intensified (*e.g., KaSaRa* "he broke," *KaSSaRa* "he smashed"); or an intransitive verb becomes transitive (*e.g., FaRiḤa* "he was glad," *FaRRaḤa* "he gladdened"); or a transitive verb becomes doubly transitive (*e.g., ḤaMaLa* "he carried," *HaMMaLa* "he made to carry"). III adds *ā* after the first radical, with the idea of reciprocity or effort (*e.g., KaTaBa* "he wrote," *KāTaBa* "he corresponded with," *GhaLaBa* "he overcame," *GhāLaBa* "he tried to overcome"). IV prefixes hamza, with a causative meaning (*e.g., JaLaSa* "he sat," *'aJLaSa* "he made to sit"). V (ta+II, *e.g., taKaSSaRa* "it is smashed") and VI (ta+III, *e.g., taKāTaBā* "they are in correspondence with one another") and VII (n+I, *e.g.,* wa *nKaSaRa* "and it is broken") and VIII (*ta* inserted between the first and second radicals, *e.g., FaRaQa* "he divided," *wa FtaRaQa* "and it went asunder") commonly express a state or condition. IX doubles the third radical and is used chiefly of colours and defects (*e.g.,* wa *ṢFaRRa* "and it is yellow"). X (st + I, *e.g., GhaFaRa* "he pardoned," wa sta — Fara "and he asked for pardon") has a variety of meanings — asking for, reflexive, denominative, etc. Conjugations XI to XV are comparatively rare.

These forms of the simple verb undergo modifications if the second and third radicals are identical, or one of the radicals is hamza or W or Y.

Articles. — There are two articles: (1) definite *l* "the" (originally a demonstrative pronoun, '(this, that"); at the beginning of a sentence al, and always so written, except after the preposition *li* "for," and (2) indefinite *n* "a, an," affixed to the end of a noun, etc.; *e.g., li l* ntaliki "for the king"; *li malikin* "for a king."

Nouns. — There are two declensions of nouns in the singular: (1) triptote, *u* (nom.), *i* (gen.), a (acc.); (2) diptote, *u* (nom.), a (gen. and acc.); the latter never takes the indefinite article and conforms to (1) when determined by the definite article or by a following genitive. There are terminations for the dual and plural. But the idea of plurality is more often expressed by means of singular collective nouns, among which are the so-called "broken plurals," of which there are 29 varieties, each associated with some one or more forms of the singular noun.

Gender. — There are two genders only, masc. and fem. (For the theories on the origin of gender, *v.* A. J. Wensinck, Some aspects of gender in *the* Semitic *languages;* 1927.)

Numerals. — The cardinal numbers (with the exception of the first two, which are adjectives) are all substantives and are followed, from 3 to 10, by the genitive of the broken plural (where possible) and take the fem. form when the objects numbered are masc., and vice versa: — from 11 to 99, by the acc. sing.; 100 and 1,000 by the gen. sing.

Dialects. — It is not possible here to give an account of the dialectical peculiarities of the different local varieties of Arabic, but details may be found in regard to the more important of these in the grammars enumerated below: — Egypt: W. H. T. Gairdner, *Egyptian* colloquial Arabic (1926); J. S. Willmore, The spoken Arabic of Egypt (1905); D. C. Phillott and A. Powell, Manual of Egyptian Arabic (1926); Syria and Palestine: G. R. Driver, A grammar of the colloquial Arabic of Syria and Palestine (1925); H. H. Spoer and E. N. Haddad, *Manual* of Palestinian Arabic (1909); Mesopotamia: J. Van Ess, *The* Spoken Arabic of Mesopotamia (1917); A Socin, Der *arabische* Dialekt *von Mosul und Mardīn* (1904); Algeria: A. G. P. Martin, Mkthode *déductive* d'arabe *nord-africain* (1919); Morocco: M. Gaudefroy-Demombynes et L. Mercier, *Manuel d'arabe marocain* (1913); Nigeria: G. L. Lethem, *Colloquial* Arabic, Shuwa dialect of *Burnu,* Nigeria, and of the region of Lake Chad (1920); Tunis: J. Clermont, *L'arabe parlé tunisien* (1909); Sudan: A. Worsley, Sudanese *Grammar* (1925); S. Hillelson, *Sudan* Arabic, an English-Arabic *vocabulary* (1925); Malta: H. Stumme, *Maltesische* Studien (1904).

BIBLIOGRAPHY.—W. Wright, *Grammar* of the Arabic Language (1896); H. Reckendorf, Die *syntaktischen Verhältnisse* des *Arabischen* (1898); J. B. Belot, *Cours pratique* de *langue* arabe (1902); Socin-Brockelmann, Arabirche Grammatik (1909). (T. W. A.)

ARABIC LITERATURE begins with the poems and proverbs of the northern Arabs of the 5th and 6th centuries after Christ. Of written literature, prior to the redaction of the Koran, nothing is known.

PRE-ISLAMIC POETRY

The origins of Arabian poetry can only be guessed at. Poets to whom the earliest pieces are attributed already exhibit a fully-

developed art. Their poems are couched in elaborate metres, of which 16 in all were recognized when the metrical system was eventually standardized in the 8th century by Khalīl ibn Aḥmad (*q.v.*). The historical development of these metres from a simple iambic measure has yet to be elucidated; some were possibly of recent introduction, due to foreign influences, in Khalil's time. In all the verse is divided into equally-balanced halves, and the same rhyme is retained at the end of each verse throughout the poem. The rule that every verse should form an organic whole gives a certain jerkiness to the poem, making it easy to displace lines and to extract choice passages for inclusion in anthologies. The poetic language was that of the desert Arabs, somewhat standardized and amplified by dialect variations. This language became, under the influence of the Koran, the standard language of all later Arabic literature, and its excessive richness led in time to the compilation of commentaries and lexicons.

In form and content the poems fall into two groups. On the one hand are the occasional poems, of from two to 20 lines, called out principally by the emotions of war or revenge. Praise of his own tribe and satire of its enemies were indeed the original functions of the primitive poet (*shā'ir, i.e.,* "kenner" or medicineman). An important place is taken by elegies, for which a number of poetesses, notably Khansā (*q.v.*), are specially famed. Distinct from these poems is the elaborate ode (*qaṣīda*) of from 60 to 100 lines. In this form there is a regular scheme, which is followed whatever the subject of the poem. In the opening verses (called the *nasīb*) the poet is supposed to be on a journey. He halts with his companions at a deserted camping-ground, whose mouldering traces recall the memory of an ancient passion, and tells of his love and the sorrow of parting. After this section he continues his journey and describes his camel or horse, comparing it to some wild animal of the desert. The natural descriptions or accounts of the chase introduced in this connection often form the most attractive part of the poem. His journey at last leads up to the occasion of the poem, which may be praise of his tribe or of his own gallantry, descriptions of camp or desert life (such as a storm), or most frequently panegyric of some patron in whose honour the poem has been composed, and from whom the poet expects a reward. It may well occasion surprise that a volume of poetry so uniform, so artistic within its limits, and of a metrical regularity rarely violated in spite of the complex metres, should have been produced by the poverty-stricken and predatory inhabitants of a barren country.

Transmission. — The oral transmission of these compositions over a period of from 150 to 250 years, or even longer, was carried out by a class of professional reciters (*rāwīs*), amongst whom many of the most famous poets were numbered. The powers of memory with which the reciters are credited are remarkable, but even on the most favourable view it must be allowed that the poems thus preserved were liable to suffer mutilations, omissions and transpositions. The divergences in the text of many ancient poems are very great, and frequently portions of different poems are found pieced together. Unfortunately several of the most famous rāwīs, especially two of those who first undertook the writing down of the early poems in the 8th century, Ḥammād ar-Riiwiya (*q.v.*) and Khalaf al-Aḥmar, are suspected of dealing in the most arbitrary manner with their material, and roundly declared to be clever forgers. On these and other grounds the authenticity of much so-called pre-Islamic poetry is open to serious question, and some scholars even reject the whole or all but a small portion outright."

Dīwāns.—The poems attributed to the early bards have come down to us in two kinds of collections. We have on the one hand many *dīwāns,* or collected poetical works, of individual poets, and in particular of all the principal bards, Amru'ul-Qais, Tarafa, Zuhair, Niibigha, 'Alqama, A'shā and Labīd (see under each separately, and below under *Mu'allaqāt*). In addition the *dīwāns* of several minor poets have been edited, Lyall's edition of 'Abid ibn Abraṣ (London, 1913) deserving special mention, and one tribal *dīwān,* that of the tribe Hudhail. Among the many poets of whom only a few pieces survive two robber-poets and outlaws, Ta'abbafa Sharrā and Shanfarā, are specially celebrated, and the poems attributed to them, whether genuine or not, breathe in magnificent language a courage and hardihood rarely if ever equalled in any literature. Along with the work of the desert poets some interesting relics have come down of a different class of poetry. The Christian 'Adi ibn Zaid, a townsman of Hira (*q.v.*), wrote wine-songs as well as graver verse. There were Jewish poets, of whom Samau'al ibn 'Ādiyā is the best-known. Controversy still rages over the religious poems attributed to Umayya ibn abi'ṣ-Ṣalṭ, which bear a remarkable resemblance to passages in the Koran, though Umayya rejected Mohammed's mission. Of the other poets conteniporary with the Prophet, the *dīwān* of Ḥassān ibn Thābit, Mohammed's "court-poet," is interesting from that circumstance, and a panegyric addressed to him by Ka'b ibn Zuhair (known from its opening words as *Bānat Su'ād*) is one of the most celebrated of Arabic qaṣīdas.

Anthologies. — The second category consists of collections or anthologies, of which three, the *Mu'allaqāt*, the *Ḥamāsa* and the *Mufaḍḍalīyāt,* are held in special favour.

Al-Mu'allaqāt is the title of a group of seven pre-Islamic odes. The name signifies "the suspended," the traditional explanation being that these poems were hung up by the Arabs in or on the Ka'ba at Mecca. But this legend must be entirely rejected, as a pure fabrication based on the name, which was taken in its literal sense. The selection of the seven poems is ascribed, with much probability, to Ḥammād ar-Rāwiya, in the 8th century A.D. His collection appears to have consisted of the same seven poems which are found in modern editions, composed respectively by Amru'ul-Qais, Tarafa, Zuhair, Labīd, 'Antara ibn Shaddād, 'Amr ibn Kulthiim, and Hiirith ibn Hilliza, to which later scholars appended three other poems, one each of Niibigha, A'shā, and 'Abid ibn Abraṣ. The lives of these ten poets were spread over a period of more than 100 years. The earliest was Amru'ul-Qais (*q.v.*), regarded by many as the most illustrious of Arabian poets. He was a scion of the royal house of the tribe Kinda, which lost its power in the year 529. 'Abid ibn Abraṣ was a contemporary of Amru'ul-Qais, and belonged to the enemies of Kinda, the Banii Asad. The Mu'allaqa of 'Amr hurls defiance at the king of Hira, 'Amr ibn Mundhir (554–568), who was afterwards slain by the poet. The same prince is addressed by Hiirith in his Mu'allaqa, and a few satirical verses directed against him by Tarafa have been preserved. The productive period of 'Antara, Zuhair and 'Alqama is probably to be placed in the end of the 6th century, which is certainly the date of Niibigha (*q.v.*). The poem of A'shā contains an allusion to the battle of Dhū Qār, in which a Persian force was defeated by the tribe Bakr between 604 and 610. Labīd (*q.v.*) is the only one of the ten who embraced Islam, though his *Mu'allaqa,* like almost all his other poetical works, belongs to the pagan period. The *Mu'allaqāt* represent almost every type of ancient Arabian poetry in its excellences and its weaknesses. In order rightly to appreciate them we must translate ourselves into the world of the Badawin and seek to realize the peculiar conditions of his life, together with the views and thoughts arising from these conditions. In the *Mu'allaqa* of Tarafa we are repelled by a long, anatomically exact description of his camel, but such a description had an extraordinary charm of its own in a society where every man was a perfect connoisseur on this subject. In the *Mu'allaqas* of 'Amr and Ḥārith we can read the haughty spirit of the powerful chieftains, boastfully celebrating the splendours of their tribe. The song of Zuhair contains the practical wisdom of a sober man of the world. The other poems are fairly typical examples of the customary qasida, and bring before us the various phases of Badawin life.

Al-Ḥamāsa is an anthology compiled by the poet Abū Tammām (*q.v.*) about 836 AD., from, it is said, the materials contained in the library of a citizen of Hamadhān. The collection is so called from the opening book, containing poems descriptive

[1] *See* Ahlwardt, *Bemerkungen über* die Aechtheit der *alten* Arabischen Gedichte (Greifswald 1872); Lyall, Introduction to the *Mufaḍḍalīyāt* (see below); Margoliouth in Journal of Royal Asiatic *Society,* July 1925, 417–449; and (in Arabic) Ṭāhā Husain, Fi'l-adab al-jāhilī (Cairo, 1927).

of constancy and valour in battle, patient endurance of calamity, steadfastness in seeking vengeance, manliness under reproach and temptation, all which qualities make up the attribute called by the Arabs *ḥamāsa*. It consists of ten books, containing in all 884 poems or fragments, divided as follow: (1) Gallantry (*Ḥamāsa*), 261 pieces; (2) Dirges, 169 pieces; (3) Manners, 54 pieces; (4) The Beauty and Love of Women (*Nasīb*), 139 pieces; (5) Satires, 80 pieces; (6) Hospitality and Panegyric, 143 pieces; (7) Miscellaneous Descriptions, 3 pieces; (8) Journeying and Drowsiness, 9 pieces; (9) Pleasantries, 38 pieces;, (10) Dispraise of Women, 18 pieces. The first two books together make up more than half the bulk of the work. The poems are for the most part fragments selected from longer pieces, though a number are probably entire. They are taken from the works of Arab poets of all periods down to that of Abii Tammām himself, but chiefly of the poets of the pre-Islamic time and of the 1st century of the Hijra (622–719). Many of the poems belong to the class of extempore or occasional utterances, as distinguished from qaṣīdas. While the latter abound with comparisons and long descriptions, in which the skill of the poet is exhibited with much art and ingenuity, the poems of the Hamisa are short, direct, and for the most part free from comparisons. It is due probably to the fact that Abii Tammām preferred this style of composition for his collection that he has chosen hardly anything from the works of the most famous poets. The fragments in the fourth book, however, are generally taken from the opening verses of qaṣīdas, or alternatively from the productions of the school of erotic poetry of the early Islamic period. The worth of the *Ḥamāsa* as a store-house of ancient legend, of faithful detail regarding the usages of the pagan time and early simplicity of the Arab race, can hardly be exaggerated. The high level of excellence which is found in its selections, both as to form and matter, is remarkable, and caused it to be said that Abii Tammām displayed higher qualities as a poet in his choice of extracts than in his own compositions. What strikes us chiefly is its exceeding truth and reality, its freedom from artificiality, the evident first-hand experience which the singers possessed of all which they sang. It has the true stamp of the heroic time, of its cruelty and wantonness as of its strength and beauty.

When "the *Ḥamāsa*" is spoken of, that of Abii Tammām, as the first and most famous of the name, is meant, but several collections of a similar kind, also called *Ḥamāsa,* exist, the best-known of which is the *Ḥamāsa* of Buhturi (*q.v.*).

The *Mufaḍḍalīyāt* is an anthology of poems named after Mufaddal ibn Ya'lā, of the tribe Dabba, who compiled it for the instruction of the future caliph Mahdi, between 762 and 784. It has recently been edited and translated by Lyall (Oxford, 1921). Mufaddal was a careful and trustworthy collector both of texts and traditions, and is praised by all authorities on Arabian history and literature as in this respect greatly the superior of Ḥammād and Khalaf. The collection, which in its present form contains 126 pieces of verse, long and short, is of the highest importance as a record of the thought and poetic art of Arabia in the time immediately preceding the rise of Islam. Almost all the poets represented belong to the days of "the Ignorance," and though a certain number of those born in paganism accepted Islam, their work bears few marks of the new faith. The ancient virtues — hospitality to the guest and the poor, profuse expenditure of wealth, valour in battle, faithfulness to the cause of the tribe — are the theme of praise; wine and games of chance, forbidden by Islam, are celebrated by poets who professed themselves converts; and if there is no mention of the old idolatry, there is also little spirituality in the outlook on life. The 126 pieces are distributed between 68 poets, and the work represents a gathering from the compositions of those who were called *muqillūn* "those of whom little has survived," in contrast to the famous poets whose works had been collected into *dīwāns*. At the same time many of them are extremely celebrated, and among the pieces selected by Mufaddal several reach a very high level of excellence. A remarkable feature of the work is the insertion of ten pieces by Muraqqish the Elder, a poet who is assigned to the end of the 5th century A.D. It is probable that the compiler set down all that he could gather of this ancient bard, and that his interest in him was chiefly due to his antiquity. The *Mufaḍḍalīyāt* differs from the *Ḥamāsa* in being a collection of complete odes, while the latter is an anthology of brilliant passages, selected for their interest or effectiveness. It is, of course, not the case that all the poems are complete; many are mere fragments, and even in the longest there are often gaps, but Mufaddal evidently set down all that he could collect of a poem, and did not, like Abii Tammām, pick out only the best portions. We are thus presented with a view of the literature of the age which is much more characteristic and comprehensive than that given in the *Ḥamāsa* and enables us to form a better judgment of the general level of poetic achievement.

In addition to these anthologies, numerous excerpts are contained in the works of later compilers, notably the Book *of* Poetry and Poets of Ibn Qutaiba (*q.v.*), the *'Iqd al-Farīd* of Ibn 'Abd Rabbihi (*q.v.*), and the greatest work of this kind, the *Kitāb al-Aghānī* ("Book of Songs") of Abu'l-Faraj (*q.v.*).

(C. J. L.; TH. N.; H. A. R. G.)

POST-ISLAMIC POETRY

Umayyad Period. — During the 1st century after Mohammed there was little change in the general character of Arabic poetry. The four outstanding poets were Akhṭal (*q.v.*), Farazdaq (q v.), Jarir (*q.v.*), and Dhu'r-Rumma (ed. Macartney, Oxford, 1919). In the work of the last-named it is already obvious that the qaṣīda is becoming a stereotyped and archaic exercise. In the partisan feuds which still rent, though on a wider scale, the Arab world, both major and minor poets carried on the traditions of tribal panegyric and satire. Yet at the same time, the new conditions of city life, both in the conquered lands and in the now metropolitan cities of Arabia, brought about a change in Arab manners and pursuits, which led to the rise of new modes in poetry. The love-lyric was established as an independent art by 'Omar ibn Abi Rabi'a of Mecca and his fellow-countryman Jamil. Simultaneously a sort of Platonic love became the theme of several poetic romances associated with the tribe of Udhra, and attributed to various poets and poetesses, of whom the most famous are Majnūn Bani 'Amir and Lailā. The poems of the Caliphs Yazīd I. (680–683) and Walid II. (743–744) were the precursors of the wine-songs and hunting-poems of the next period. An attempt to remodel the qaṣīda in the freest of Arabic metres, the iambic *rajaz,* was made by 'Ajjāj and his son Ru'ba. Although the experiment failed, the *rajaz* metre was retained for impromptus and long descriptive poems.

'Abbāsid Period. — While it is still an open question how far Persian influences contributed to these developments, there can be no doubt that the Persian atmosphere of the court of Baghdad after the establishment of the 'Abbasid caliphs in 750 strongly favoured the new tendencies, which reached their apogee in Abii Nuwās (*q.v.*) and a brilliant company of poets contemporary with him. Henceforward Arabic poetry flows in a number of channels. The exponents of the classical tradition, such as Buḥturi (*q.v.*), continued to imitate the subjects, mannerisms, and metres of the old desert poetry, with but one modification, the substitution for the old imaginative phrases of rhetorical tropes (*badi'*), a fashion set by Muslim ibn Walīd (d. 803), followed by Abii Tammiim, and carried to the verge of excess by Mutannabi. On the other hand the school of Abii Nuwās used metres with much greater freedom and excelled in anacreontic and occasional verse. Even for this later period the text or authenticity of many poems is far from certain. The only dīwān hitherto published in a critical edition is that of a comparatively unimportant poet, al-Wa'wā of Damascus (d. 988; ed. Kratchkowsky, Petrograd (Leningrad), 1914, with a valuable introduction on the poetic art of the post-Islamic period). Generally speaking, the poets sought less after depth and originality than elegance in expression and brilliance in metaphor, and the polished and delicate productions of the later writers, such as Baha ad-Din Zuhair (d. 1258), recall in some measure English 17th century and Augustan verse. Nevertheless there were some who struck out new paths; Abu'l-'Atāhiya (d. 828), whose moralizing verse is

expressed in unaffected popular language; Ibn al-Mu'tazz (d. 869), the author of a long historical poem and of other brilliant and original verse; Abu-l-'Ala al-Ma'arri (*q.v.*), in whose *Luzūmiyyāt* Arabic poetry touches its deepest human note; and the mystical poets Ibn 'Arabi (*q.v.*) and Ibn Fāriḍ (*q.v.*).

Western Poetry. — In Spain and the West, Arabic poetry at first continued along traditional lines, represented by Ibn Hāni of Seville (d. 973). In the following century Ibn Rashiq of Qayrawiin (d. 1070), Ibn Zaydūn of Cordova (d. 1071), Mu'tamid, king of Seville (d. 1095) and his wazir Ibn 'Ammār (d. 1078), with whom was associated also the most famous of the Arab poets of Sicily, Ibn Hamdis, were the principal among a galaxy of poets who released themselves from the old conventions, and made their verse a vehicle of self-expression. A still greater breach with tradition was the rise of strophic verse, which the stronger conservative influences had hitherto succeeded in repressing in the East. In Spain strophic verse took the form called muwashshah ("the girdled"), marked by internal rhymes with a rhyming refrain. Though it was practically confined to erotic verse, it made great strides; on the one hand it exercised a strong influence on the nascent Provençal poetry, while in the other direction it reached Egypt at the end of the 12th century and rapidly took root there. Several other popular forms of strophic verse were invented about the same time or shortly after, of which one, the *zajal,* in the colloquial language, was raised to literary rank by the troubadour Ibn Quzmān (d. 1160).[1]

The number of anthologies of the later poetry is very large. Many were devoted to special genres, especially wine-songs; amongst those of more general scope the most noteworthy are the Yatimat ad-Dahr of Tha'ālibī (*q.v.*); the *Qalā'id al-Iqyān* of Fath b. Khāqān (d. 1134), a brilliant anthology of Spanish-Arabic verse; and the *Khizānat* al-Adab of 'Abd al-Qiidir of Baghdad (d. 1682), professedly a commentary on the verses cited in an earlier work on grammar.

BELLES-LETTRES

The growing refinement of social life in the 8th and 9th centuries is reflected in the rise of a prose literature intended to entertain the reading public, supply the elements of polite education (adab), and convey moral instruction in a palatable form. The earliest books of this class were the translations by Ibn Muqaffa' (d. 760) of two old Persian works on manners, and of the Fables of Bidpai (*q.v.*), under the name of Kalila wa-Dimna. The last work has ever since been regarded as a classic. The development of the essay, a medley of citations and reminiscences from poetry, history, traditions, etc., was due to the genius of Jāḥiz (*q.v.*). Its contents were more systematically organized by Ibn Qutaiba (*q.v.*), especially in his *'Uyūn al-Akhbār,* which was the model for the most famous work of its kind, the 'Iqd *al-Farīd* of Ibn 'Abd Rabbihi (*q.v.*), of Cordova. In the following century the Faraj ba'd ash-Shidda and *Nishwār al-Muhāḍara* of Taniikhi (d. 994; latter ed. Margoliouth, London, 1921) mark the growing predominance of the anecdote. Of the numerous later works of this class the most famous is the *Mustaṭraf* of Abshihi (d. 1446).

With the introduction of rhyming prose (*saj'*) Arabic belles-lettres reached their most characteristic form. The credit for this step is given to Abii Bakr Khwiirizmi (d. 1002), whose Letters in this style set a fashion followed amongst others by Hamadhiini (*q.v.*) and Abu'l-'Alā. Hamadhiini was also the creator of the *Maqāma* or "Assembly," than which probably no more elaborate literary exercise has ever been conceived. The central figure of the *Maqāmāt* is always a witty vagabond, who in various assemblies of scholars puts all his rivals to shame by his wit, eloquence, scholarship and poetic gift. The most famous *Maqāmāt* are those of Hariri (*q.v.*).

The last class of works which may be included under this heading are the popular romances and story-cycles which found their way from the most diverse sources into Arabic literature. Of these works of entertainment the most familiar are the *Thousand and* one Nights (*q.v.*; see also SINDBAD **THE** SAILOR), and a collection of fables related to those of Aesop and ascribed to Luqmān (*q.v.*). The historical romances are dealt with in the following section. (H. A. R. G.)

[1] On Ibn Quzmān and the relations between Arabic and Provençal poetry see Ribera, *Discurso leido* ante la Real Academia *Española* (Madrid, 1912).

HISTORY AND BIOGRAPHY

Historical Composition. — The earlv Arabic historians differ from all others in the unique form of their compositions. Each event is related in the words of eye-witnesses or contemporaries, transmitted to the final narrator through a chain of intermediate reporters, each of whom passed on the original report to his successor. Often the same account is given in two or more slightly divergent forms, which have come down through different chains of reporters. Often, too, one event or one important detail is told in several ways on the basis of several contemporary statements transmitted to the final narrator through distinct lines of tradition. The writer, therefore, exercises no independent criticism except as regards the choice of authorities, and sometimes he states which of several accounts seems to him the best. A second type is that in which an author combines the different traditions into one continuous narrative, but prefixes a statement as to the lines of authorities used or followed. In this case the writer recurs to the first method, already described, only when the different traditions are greatly at variance with one another. In yet a third type of history the old method is entirely forsaken, and we have a continuous narrative only occasionally interrupted by a citation of the authority for some particular point. But the principle still is that what has been well said once need not be told again in other words. The writer, therefore, keeps as close as he can to the letter of his sources, so that quite a late writer often reproduces the very words of the first narrator.

The appearance of the Prophet with the great changes that ensued, the conquests that made the Arabs lords of half the civilized world, supplied a vast store of new matter for relations. Thus it came about that at Madina, where the Prophet had lived so long, and where his first successors and the majority of his companions continued to live, a school was gradually formed, where the chief part of the traditions about Mohammed and the rise of Islam took a form more or less fixed, supplemented by the traditions of various provincial schools. Thus by the end of the 1st century of Islam many dictata were already in circulation.

Early Compilations. — In the and century (719–816) real books began to be composed. The materials were supplied in the first place by oral tradition, in the second by the dictata of older scholars, and finally by various kinds of documents, such as treaties, letters, collections of poetry, and genealogical lists. The oldest extant history is the biography of the Prophet by Ibn Isḥāq (*q.v.*), at least in the revision of Ibn Hishām (*q.v.*). This work is generally trustworthy, though in dealing with Mohammed's early life and the story of his ancestors it is mixed with tables and illustrated by spurious verses. A second life of the Prophet, by Ibn 'Oqba (d. 758), exists only in fragments. We fortunately possess the Book of ***the*** Campaigns of the Prophet by Wāqidī (*q.v.*) and the important Book of Classes of his disciple Ibn Sa'd (*q.v.*). Wāqidī had much more copious materials than Ibn Isḥāq, and though he gives way much more to a popular and sometimes romancing style of treatment, the additional details he supplies set various events before us in a clearer light. The monographs of Abū Mikhnaf (d. 748) and Madā'inī (d. 840) are known only by excerpts contained in the works of later writers. A just estimate of the relative value of the historians can only be reached by careful comparison in detail. This has been essayed by Briinnow in his study on the Kharijites in which the conclusion is reached that Abii Mikhnaf and Madā'inī are both well-informed and impartial. Of the other early sources, the narratives of Sayf b. Omar have been thoroughly examined by Wellhausen, and found to be inferior in accuracy. Along with these should be mentioned Abii 'Ubaida (*q.v.*), and Azraqi, whose excellent History of Mecca was the first of many histories of the Holy cities. A further important point to notice

in the 2nd century is that in it Persians began to take part in the creation of Arabic historical literature. Ibn Muqaffa' translated the great Book of *Persian* Kings, and others followed his example. Tabari and his conremporaries preserve to us a good deal of the information about Persian history transmitted through such translations.

General Histories. — The 3rd cenlury (816–913) was far more productive than the 2nd in general works, in addition to monographs and works on special branches by various authors. Ya'qūbī (*q.v.*) wrote a short general history of much value and Ibn Qutaiba (*q.v*) a useful *Handbook* of History. Both are surpassed by Balādhurī, the author of a valuable narrative of *The Arab* Conquests and a large genealogical history of the Arabs. All these histories are more or less thrown into the shade by the great *Annals* of Tabari (*q.v.*), whose fame has never faded from his own day to ours. As a literary composition they do not rank very high, nevertheless the value of the book is very great. The author's selection of traditions is usually happy, and the most important episodes are treated with most fulness of detail. The Annals soon came to be dealt with in various ways. They were published in shorter form, with the omission of names of authorities and many poetical citations; on the other hand some interpolations were made, one in the author's lifetime and perhaps by his own hand, and many later writers added supplements. Miskawayh (or Ibn Miskawayh, d. 1030), the first writer to compose a general history as an organic structure with the aim of displaying its human and instructive aspects, drew almost entirely on Tabari down to 907; the two final volumes (Amedroz and Margoliouth, Eclipse of the Abbasid *Caliphate,* Oxford. 1920–21) contain original material and show him to be a writer of talent. In 963 an abridgement of the Annals was translated into Persian by Bal'amī, who, however, interwove many fables. Ibn Athir (*q.v.*) abridged the whole work, usually with judgment, but sometimes too hastily. Many other writers also took Tabari as their main authority, but sometimes consulted other sources and so add to our knowledge, notably Ibn Jawzi (d. 1201), who adds many important details. In later times Ibn Athir's abridgement supplanted the original work as a source, *e.g.,* in the works of Abu'l-Fedā (*q.v.*) and Ibn 'Amid (al-Makīn; see ELMACIN).

Later Works. — The number of historical and biographical works composed in the later centuries is very large. The most important writers, Mas'ūdī, Bīrūnī, Ibn Athir, Abu'l-Faraj (see BAR-HEBRAEUS), Ibn Khaldiin, Maqrizi, Suyūṭī, Maqqari, and Hajii Khalifa, are the subjects of special articles. Of other works several are worthy of special mention. The Annals of Eutychius (d. 940; ed. Cheikho, Paris, 1906) are important as representing the Christian tradition. The Book of *Wazirs* of Hilāl aṣ-Ṣābi' (d. 1056; ed. Amedroz, Beyrouth, 1904) is a mine of information for the social life of the 9th and 10th centuries. The history of Mahmud of Ghazna (*Kitāb al-Yamīnī*) of 'Utbi (d. 1036) set the fashion of rhetorical composition in history, which was followed by 'Imād ad-Din (d. 1201) in his histories of Saladin and of the Saljuq dynasty, and was carried to excess in the History of Tamerlane of Ibn 'Arabshāh (d. 1450). The later compilers could also draw on numerous local and dynastic histories, many of which are now lost. In most cases these works are of purely technical interest, being either bare statements of facts in chronological order, or else designed to glorify the dynasty and oozing adulation from every page. Full, scientific, and impartial accounts, such as was given (over a somewhat wider field) by 'Abd al-Latif (*q.v.*) in his Description of Egypt, are rare. Not all local histories, however, dealt with political events; some were more concerned with local theologians, scholars and saints. Of this class the most important surviving work is the still unedited History of Damascus of Ibn 'Asākir (d. 1176), a vast compilation in 30 volumes, in which history crosses the borderline into biography. Of the great biographical dictionaries proper, one, the famous work of Ibn Khallikān (*q.v.*), has already gained a reputation outside the Arabic world, but there are many others which scarcely yield to his in interest. Amongst these are the newly-recovered Dictionary of Men of Letters of Yāqūt (*q.v.*); the Lives of the Physicians of Ibn abi Usaibi'a (see IBN USAIBI'A); the History of the Philologists of Ibn Qifti (d. 1248); a number of early Spanish-Arabic biographies; the vast dictionary of Safadi (d. 1363), still scattered in loose volumes through half the libraries of Europe and the East; not to speak of numerous dictionaries of the early heroes of Islam, of students of tradition, of theologians and jurists of the various rites, and many other classes and groups. The value of these works is that they present to us, as the history-books seldom do, authentic portraits of the lives of the people, and extort our admiration for the many generations of teachers and scholars that patiently knitted up the threads of culture, again and again shattered by war, rapine and pestilence that bound the Mohammedan world together from Morocco to the Indies.

The 14th and 15th centuries are remarkable for the appearance of encyclopaedic compends, intended as handbooks for the official classes. The two earliest, the Encyclopaedia of Nuwayri (d. 1332) and the *Masālik al-Abṣār* of Ibn Faḍlallāh (d. 1348), are in course of publication at Cairo, a later work, the *Ṣubḥ al-A'shā* of Qalqashandi (d. 1418) having already been printed there in 14 large volumes (1913–19). Though the writing of memoirs and of historical compendiums (generally beginning with the Creation) continued during the following centuries, few works outside those of the writers already mentioned attained any note, until the publication of the History of Egypt and the Diary of Jabarti (Gabarti, d. 1825), who may be regarded as the last (and not the least worthy) representative of the old school of Arabic historiography.

Historical Romances — A word must be said of the historical romances, the beginnings of which go back to the first centuries of Islam. The veneration paid to the Prophet and love for the marvellous soon gave rise to fables about his childhood, his visit to heaven, etc., which, with many Jewish legends, and the Yemenite fables circulated by 'Abid ibn Sharya in the 1st century, have found their way even into sober histories. Romantic legends clustered round the history of the conquests, and the fortunes of 'Alī and his house, and history was often forged for party ends. The people accepted all this, and so a romantic tradition sprang up with a literature of its own. In the oldest specimens, such as the Conquest of Egypt and the *West* by Ibn 'Abd al-Hakam (d. 871; ed. Torrey, Yale univ., 1922), truth and falsehood are mixed. Most of the extant literature of this kind is, in its present form much more recent, *e.g.,* the *Story* of the Death of Husayn by the pseudo-Abti Mikhnaf and the *Conquest* of *Syria* (see WĀQIDĪ). Further enquiry into the origin of these works is needed, but some of them were plainly directed to stirring up fresh zeal against the Christians. In the 6th century A.H. some of these books had gained so much authority that they were used as sources, and thus many untruths crept into accepted history.

Distinct from these are the popular romances, which have never been taken for serious history. The most famous are the Story of *'Antar,* a romance of Arabian desert life (see under 'ANTARAH IBN SHADDAD); the *Story* of *Sayf* ibn Dhi *Yazan,* centred on Yemen and Abyssinia; and the *Story* of the *Banī Hilāl,* one of the Arab tribes which took possession of the Libyan desert in the 11th century. (M. J. DE G.; H.A.R.G.)

TECHNICAL AND SCIENTIFIC LITERATURE

Geography and Travel. — Arabic geographical literature was stimulated in the first place by Greek mathematical geography and the necessities of administration. The first road-book was written in the 9th century by Ibn Khūrdādhbih, the royal postmaster at Sāmarrā, to give particulars of the provinces and their revenues. Soon afterwards love of travel and intellectual curiosity produced a valuable series of descriptive works, of which those of Ya'qūbī (*q.v.*), Ibn Hauqal (*q.v.*), Mas'ūdī (*q.v.*), and Maqdisi (Mokaddasi) are the most famous. While these early writers prided themselves that their knowledge was derived from personal investigations, their successors, Bakri (*q.v.*), Idrisi (*q.v.*), Yāqūt (*q.v.*), and Abu'l-Fedā (*q.v.*), nevertheless contrived to compile excellent geographical treatises based almost entirely on written and narrative sources. There are also accounts of embassies and journeys both into Central Europe and the remoter parts of

Asia. Ibn Jubair of Valencia wrote an admirable journal of his travels to and from Mecca by way of Syria and Egypt in 1181–84. In the 14th century Ibn Baṭṭūṭa (*q.v.*) earned the title of "The Traveller of the Arabs" by his extensive journeys. The commercial relations long existing between the Persian Gulf and India and the Far East produced several exceedingly interesting works on those countries, notably the Chain of Histories and Marvels of *India,* besides manuals of navigation in prose and verse. In the 10th century some Spanish-Arab sailors even set out from Lisbon to cross the Atlantic. In later times geography shared the general decline, and, except for the geographical sections of the great encyclopaedias mentioned in the preceding section, was merged into cosmography. The works of the earlier cosmographers, Qazwini (d. 1283) and Dimishqi (d. 1327), are not indeed without interest and importance, but with the economic ruin of the Arabic world all study of geography ceased. (See further under GEOGRAPHY.)

Philology.— The beginnings of the study of Arabic grammar can be traced to 'Iraq early in the 8th century, where the two cities of Baṣra and Kiifa produced rival schools of philology, a third being afterwards established in Baghdad (see Fliigel, *Die grammatischen Schulen* der Araber, Leipzig, 1862). The earliest systematic treatise on grammar was written by Sibawaihi of Basra, and among the other members of this school were Abū 'Ubaida (*q.v.*), Asma'i (*q.v.*), Mubarrad, and Ibn Duraid (*q.v.*). The rival school of Kūfa claimed to be less antiquarian, but exercised less influence. The principal founder of the school of Baghdad was Ibn Qutaiba (*q.v.*). The most important services rendered by the older philologists were the collection of the old poetry and of materials for lexicography. On their shoulders stood the later systematizers, such as Jauhari (*q.v.*), Tha'ālibī (*q.v.*), Jurjānī (*q.v.*), Zamakhshari, Sakkākī (d. 12 29), author of the standard text-book on rhetoric, and Ibn Malik (d. 1273), who wrote a celebrated metrical summary of grammar in a thousand lines.

The great Arabic dictionaries are of late date; the two most esteemed are the *Lisān* al-'Arab of Ibn Manẓūr (d. 1311) and the commentary called *Tāj al-'Arūs* by Murtaḍā Zabidi (d. 1790) on the *Qāmūs* of Fairūzābādī (*q.v.*).

Philosophy and Science.—Arabic philosophical and scientific studies are dealt with elsewhere (see ARABIAN PHILOSOPHY and historical sections of ASTRONOMY, CHEMISTRY, MATHEMATICS, MEDICINE, etc.; a general survey is given by G. Sarton, *Introduction* to the history of Science, vol. i., Washington, 1927). All such studies came to the Arabs through Syriac translations from Greek, supplemented by Indian and possibly Persian influences, and were confined to comparatively small circles of students.

MODERN LITERATURE

While the writing of books and composition of poetry continued in Egypt and Syria, and sporadically elsewhere, throughout the 17th and 18th centuries, little of originality or value was produced. During the 19th century the new political, social, economic and intellectual movements resulting from contact with Europe prepared the way for a revival of Arabic letters, particularly in Syria and Egypt. This took on the one hand the form of a throw-back to Classical Arabic models, represented in Syria by Nāṣīf Yāzijī (1800–71), the author of *Maqāmāt* on the model of Hariri, and in Egypt by the activities of the orthodox theological seminary of al-Azhar. On the other hand the influences exerted by the missionary schools in Lebanon, and the Western sympathies of Mohammed 'Ali (*q.v.*) and Ismā'īl Pāshā (*q.v.*) led to a rapid and superficial assimilation of Western ideas, fostered by the translation of large numbers of French works, especially scientific works, novels and plays. The westernizing movement was strengthened by the creation, in the last decades of the century, of an Arabic daily press (see EGYPT: *Modern* History: Literature), which has contributed to the evolution of a new and more flexible literary style, and also of an Arabic theatre. While the modernist school has been represented by many influential writers in the East, its advanced wing is formed by the recent group of Syro-American writers belonging to the large Lebanese communities now settled in the United States, Brazil and elsewhere in the New World. In Egypt a movement of reconciliation between the two schools, initiated by Shaykh Mohammed 'Abduh (d. 1905) had much success, but in default of a leader to succeed him has itself broken into a conservative and a modernist wing. The present situation is therefore on the whole less productive than concerned with clearing the ground for new foundations. The effects of this instability and hesitation are most marked in the work of the leading modern poets. In subject and content Western influences tend to predominate, but the style and conventions remain for the most part those of the classical age. Nevertheless the many experiments now being made in Egypt and also in the Lebanon, where the modernist movement is triumphant, give abundant evidence of vitality. In Damascus and 'Iraq, the traditional disciplines have only within the last few years been challenged by Western influences, either directly, or mediated through Egypt and the Lebanon.

BIBLIOGRAPHY.--There is no complete history of Arabic literature. An exhaustive bio-bibliographical survey is given by C. Brockelmann, Geschichte der arab. *Litteratur* (Reimar, 1898–1902). R. A. Nicholson, A Literary History of the Arabs (1907, etc.,) is the best general work on the subject. It is full and reliable, and contains a classified bibliography of general works. A list of translations is contained in an appendix to Arabic Literature, An Introduction, by H. A. R. Gibb (Oxford, 1926). More elaborate biographical and bibliographical data will be found in the Encyclopaedia of Islam (Leyden, 1913, proceeding), and a large number of literary sketches in Carra de Vaux's Les *Penseurs* de *l'Islam* (1921–26). For 19th-century writers see article by H. A. R. Gibb in *Bulletin of* the School of *Oriental* Studies, vol. iv., part 4 (London, 1928). (H. A. R. G.)

ARABIN: see ARABIC ACID.

ARABI PASHA (1839?–1911), more correctly AHMAD 'ARĀBĪ, to which in later years he added the epithet *al-Miṣrī,* "the Egyptian," Egyptian soldier and revolutionary leader, was born in Lower Egypt in 1839 or 1840 of a fellah family and entered the army as a conscript. Said Pasha gave him a commission in 1862, and he served in the Abyssinian campaign of 1875 under Ismail Pasha. A charge of peculation, unproved, was made against him in connection with this expedition and he was placed on half-pay. He joined a secret society formed by Ali Rubi with the object of getting rid of Turkish officers in the Egyptian army. In 1878 he was employed by Ismail to foment a disturbance against the ministry of Nubar, Rivers Wilson, and de Blignières, and received in payment a wife from Ismail's harem and the command of a regiment. In the agitation against the government of Tewfik Pasha, Arabi was put forward as the leader of the discontented Egyptians; he was in reality little more than the mouthpiece and puppet of abler men such as Ali Rubi and Mahmud Sami. On Feb. 1. 1881., Arabi and two other Egyptian colonels, summoned before a court-martial for acts of disobedience, were rescued by their soldiers, and the khedive was forced to dismiss his. then minister of war in favour of Mahmud Sami. A military demonstration on Sept. 8, 1881, led by Arabi, forced the khedive to increase the numbers and pay of the army, to substitute Sherif Pasha for Riaz Pasha as prime minister, and to convene an assembly of notables. Arabi became under-secretary for war at the beginning of 1882. Sherif fell in Feb., Mahmud Sami became prime minister, and Arabi (created a pasha) minister of war. Arabi, after a brief fall from office, acquired a dictatorial power that alarmed the British Government. British and French warships went to Alexandria at the beginning of June; on the 11th of that month rioting in that city led to the sacrifice of many European lives. Order could only be restored through the intervention of Arabi, who adopted a more distinctly anti-European attitude. His arming of the forts at Alexandria was held to constitute a menace to the British fleet. On the refusal of France to co-operate the British fleet bombarded the forts (July 11) and a British force, under Sir Garnet Wolseley, defeated Arabi on Sept. 11, at Tel-el-Kebir. Arabi fled to Cairo where he surrendered and was tried (Dec. 3) for rebellion. In accordance with an understanding made with the British representative, Lord Dufferin, Arabi pleaded guilty, and sentence of death was imme-

diately commuted to one of banishment for life to Ceylon. The same sentence was passed on Mahmud Sami and others. After Arabi's exile had lasted for nearly 20 years, however, the khedive Abbas II. exercised his prerogative of mercy, and in May 1901 Arabi was permitted to return to Egypt. He died at Cairo on Sept. 21, 1911. Arabi, as has been said, was rather the figure-head than the inspirer of the movement of 1881–82 and was probably more honest, as he was certainly less intelligent, than those whose tool, in a large measure, he was. The movement which he represented in the eye of Europe, whatever the motives of its leaders, "was in its essence a genuine revolt against misgovernment" (Lord Cromer in Egypt, No. 1, 1905, p. 2), and it was a dim recognition of this fact which led Arabi to style himself "the Egyptian."

See EGYPT: ***History;*** also Lord Cromer's ***Modern Egypt*** (1908).

ARABISTAN, Persia: *see* KHUZISTAN.

ARABLE. The social movements of the age, especially the later developments of the industrial revolution in Britain, have given a peculiar emphasis to the word arable and the condition it describes. For purposes of agriculture the "land" is commonly divided in British official statistics into grass land and arable land, or soil that is left continuously undisturbed and soil that is at intervals ploughed or otherwise cultivated. But the two are not so easy to distinguish, either by the casual observer or the statistician, as they once were. The practice of sowing "leys" is now very common. "Seeds," as they are generally known among farmers, are sown on the arable land along with or rather later than the cereal crop, and when the corn is cut, giving place to sown mixtures of grass or clover, the field may assume very nearly the appearance of a meadow; and may never return to tillage.

In the period of depression of British farming that began in 1920 many farmers sowed "seeds" in order to watch events. If times continued bad, the "leys" would be allowed to remain for the maximum period and thereafter in the worse cases degenerate into grass. If, on the other hand, prosperity returned they would be ploughed up. But the general distinction holds. Arable land is usyally ploughed, or otherwise stirred once a year, but it is still classed as arable, if the intention is to use the plough again, as soon as the "seeds" have served their purpose. It is becoming a custom therefore in official statistics to divide the arable area in a country into two main groups: the land actually ploughed in any one year and the acreage carrying clover and sown rotation grasses.

Proportion of Tillage. — The proportion of tilled land at various junctures has changed more abruptly in Britain than in any other country of which authentic accounts exist. One of the most remarkable facts in Domesday Book is the great amount of arable land recorded at that date in many English counties. At its publication in 1086 the plough was a very simple machine — with a short handle and a big wheel — and the sods were broken with a mattock, the harrowing done with a large rake. Nevertheless, the arable area in general was much bigger at the end of the 11th century than at the beginning of the 19th. The most remarkable figures relate to Somerset and Gloucester. In Somerset the tilled area had reached 577,000 acres in 1086, and 238,456 in 1907. The end of the period of abundant tillage may be dated from 1348, the year of the Black Death. But other causes were at work, as well as pestilence. We know that meadow land was much more valuable than arable long before the plague, being rented on the average at 2s. as compared with 6d. for ploughed land. The relapse of arable to grass in the 14th century was not made good. The doggerel maxim "Up horn, down corn" was popular at a later age, and Tudor husbandmen in all parts of the country "substituted pasture for tillage, sheep for corn. They took their seats on the woolsack, and maidens of all degrees were spinsters." When mutton became more important than wool towards the close of the 18th century, farming improved, but there was no general break-up of the sheepwalk. The modern Danish proof that arable will carry more stock than grass land was not yet appreciated. In subsequent history the proportion of arable to pasture has oscillated this way and that, in rough relation to the price of wheat (which touched its highest points in 1855 and 1921). But the loss of arable has been continuous in Great Britain in modern times since the disastrous harvest of 1879. The weather of that year was the occasion for an acceleration of a change due to more lasting causes, such as cheaper transport and the ploughing of virgin land overseas, in North America, in the Argentine, in Australia and in other places.

Decline of British Arable. — Taking the single years 1871 and 1921 the arable area of Britain declined by about 4,300,000 acres, from 14,950,000 to 10,680,000; and the proportion of arable from 56·8% to 41·5%. If only the cultivated area is taken (excluding rough grazing) about one-third is ploughed annually and two-thirds are either permanent grass or rotation grasses. In regard to the proportion of arable in England the country may be roughly divided into three groups. The eastern counties from the Thames to Flamborough Head are markedly arable. The south-eastern counties of Kent, Sussex, Surrey, Hants and Berks, with Oxford and Worcestershire, occupy a middle place, and all western counties, with Northumberland, Durham and the West Riding are chiefly grass.

While the proportion of arable land to grass decreased in Britain it was notably augmented in many countries of a very different nature. When Danish farmers began to surrender corn-growing for dairying, they often increased the ratio of arable land, plus lucerne or some such cultivated green crop. They grew gramineous crops for fodder instead of grain for food, and diminished the permanent grass to a minimum.

The most salient extension of arable land in the world is to the credit of the so-called prairie provinces of Canada; and a like development continues to progress in Australia. A good example of the purposeful extension of the corn area is to be seen in the south of Western Australia. The Canadian figures are very remarkable. There were only a half million acres under wheat in 1871. Then the discovery of a wheat that would ripen in the north and endure the climate sent the ploughs to the far north, and the arable area for growing wheat alone had increased in 1926 to 23,000,000 acres, with prospects of yet greater extension.

While the arable area in northern Canada has been increased, thanks chiefly to the "creation" of new varieties of grain, many of the hot, dry lands of the south of the United States have come under cultivation thanks to the art of "dry farming," or so treating the surface by repeated but shallow tillage that the moisture cannot escape by capillary attraction. (W. B. T.)

(See AGRICULTURE and AGRICULTURAL STATISTICS.)

ARABS. The term Arab as used in the Sudan signifies any people professing Islam, however dark-skinned they may be, so that while the term has an obvious cultural value it is strictly speaking of little ethnic significance. But in a broad sense the word may be taken to denote a congeries of tribes claiming, even if they have it not, a predominantly Caucasian ancestry, boasting a particular historic tradition, and speaking a Semitic language. In this sense, in contrast with the older stocks of the Sudan, the Arabs are comparatively new comers. In spite of an early slow infiltration via the Abyssinian hills and spasmodic driftings towards the Nile Valley from Mediterranean lands, it seems certain that the Arabs did not exert any considerable influence in the northern Sudan before the decay of the Christian kingdoms of Dongola and 'Alwah after the 13th century. There seem to have been only two great movements into the Sudan, the first taking place in the 13th and 14th centuries as the result of the conquest of the Christian Kingdom of Dongola, the second following the Turkish conquest of Egypt in the 16th century. This seems to be the view taken by MacMichael, but before his work appeared J. W. Crowfoot, using material published (in Arabic) by Naum Bey Shoucair, had pointed out the influence exerted in the Arabization of the Sudan by the Fung, who appear in history as a horde of blacks under a leader tracing his ancestry to the Beni Ommayya. Makrizi (1366–1442) shows how completely at an earlier date the kingdoms of Dongola and 'Alwah barred the way to Arab penetration up the Nile valley, but there was no precise knowledge of the factors that led to the downfall of this barrier until the publication by MacMichael of a hitherto untranslated

passage in Makrizi referring to the Guhayna, who, in the pre-Islamic period occupied Nejd and the neighbourhood of Medina, where a section dwells to this day. Many migrated to Egypt, taking part in the conquest. They reached Aswan by the ninth century, and by the fourteenth century had penetrated far into Nubia. "At first the kings of the Nuba attempted to repulse them, but they failed; then they won them over by giving them their daughters in marriage. Thus was their Kingdom disintegrated, and it passed to certain of the sons of the Guhayna on account of their mothers, according to the custom of the infidels as to the succession of the sister or the sister's son. So their Kingdom fell to pieces, and the A'rab of Guhayna took possession of it. But their rule showed none of the marks of statesmanship . . . they remain nomads following the rainfall like the A'rab of Arabia."

This dual policy of following the rainfall and of intermarriage led to the rapid spread of those mixed stocks all now calling themselves Arab, though this process was for some time confined to the country north of the confluence of the two Niles and the Arabization of the Central Sudan was in great part a result of the conversion to Islam of the Fung, who, assisted by Arab immigrants, did much to overthrow the Kingdom of 'Alwah. But in spite of the spread of Islam no great spread of Arab mode of life or thought seems to have taken place in the central Sudan, the land being divided into small kingdoms subject to the Sultan of Sennar. The country may have continued in much the same condition for some three centuries, though doubtless throughout the whole of this period Arabic influence was slowly spreading. The last phase began scarcely a hundred years ago. The Egyptian conquest of the Sudan by Mohammed Ali broke down the last remains of the independent kingdoms, indeed the tendency of the whole of the last century, including the great upheaval with which it terminated, was towards the destruction of the older groupings and modes of thought and the substitution of the Arab tribal system and Arab speech.

Tribal Divisions.—The Arabs of the Sudan are divisible into two great moieties, one calling themselves Guhayna and tracing their origin to the eponymous founder of the tribe, the other claiming descent from 'Abbas, the uncle of the Prophet. Thus in the Sudan the name Guhayna is used in a broad as well as in a narrow (tribal) sense. In the latter it is restricted to certain nomads inhabiting the Sennar Province, but in the wider sense it is understood to include the Baggara and the vast group of camel nomads in Kordofan, all of whom if pressed will claim descent from Abdulla el Guhani. The other great division of the Sudan Arabs, even larger and more loosely knit than the Guhayna, that claiming 'Abbas as their ancestor, may be called the Ga'aliin. In the main this group is sedentary. The fusion of the Arabic element with the older settled inhabitants of Nubia was so close that MacMichael applies the term Ga'aliin-Danagla to this great moiety, which includes most of the riverain tribes as well as a number of sedentary tribes in Kordofan.

Apart from this genealogical and to a great extent ethnological classification there is another used by the Arabs themselves, *i.e.*, the broad division into nomads and sedentaries, the former being again divided into camel-nomads (Ahl Ibl), and cattle folk (Bakkara) (q v.), who are mainly nomads, while the sedentaries may be considered to-fall into two much less well defined groups, namely riverain cultivators, *i.e.*, users of the sakia and other sedentary villagers. However there are sedentary sections or divisions of many nomad tribes, and the condition of minor groups may vary from time to time The distinction between camel and cattle men is more radical, and is largely determined by geography, for camels should not be taken south of latitude 13° N., owing to fly, whereas cattle, which require more water, are successfully pastured south of this latitude as far as the Bahr el-Arab and westwards into southern Darfur. Moreover the great nomadic tribes, such as the Kababish and Kawahla, have a smaller infusion of negro blood than the riverain tribes of the north or the sedentaries of Kordofan, though the amount varies from tribe to tribe and even in different divisions of the same tribe, the richest divisions, *i.e.*, those possessing most slaves, tending to contain the highest proportion of members with negro or negroid features, so that most black blood is often found in the richest and most influential divisions of these tribes.

On the physical side it may be suggested that the great majority of the nomads are dolichocephalic, though stature and build vary; skins are of every colour, and noses of every form, nor can the shape of the nose and the colour of the skin be correlated.

Details concerning particular Arab tribes are given in MacMichael's works. Belonging to the Ga'aliin group are the Ga'aliin proper, and most of the northern riverain tribes such as the Gawabra and Bedayria (who might with as much truth be classed as Danagla, inhabitants of Dongola, *i.e.*, Nubians), the Rubatab, the Batahin, the Shaikia and also many of the tribes of Kordofan, including the Gawama'a (perhaps the most negroid of Kordofan Arabs), the Gima'a and the Ghodiat. To the Guhayna, using the term in its wider sense, belong the Rufa'a, the Shukria and the great mass of camel nomads of Kordofan such as the Kababish and their rivals the Kawahla, the Lahawiin and the Dar Hamid (the last with many sedentary sections). The Guhayna proper are now represented by a small group of tribes in the neighbourhood of Kassala where they are subject to the Shukria. The designation Fezara, common in writings of the 18th and earlier 19th centuries, when it was applied to certain of the strongest camel-owning nomads, *e.g.*, the Dar Hamid, is now scarcely used in Kordofan.

Mode of Life.—The typical organization of the Arabs is represented by the tribe, under the control of a sheikh, an office normally hereditary but sometimes elective. Within the tribe are a number of sections with patrilineal descent, themselves often formed by smaller groups, the term *khasham beit* being sometimes applied to the true section and sometimes to one of its smaller divisions. Each section has its own sheikh, subordinate to the tribal sheikh, and much importance is attached to the preservation of the tribal and sectional genealogies (nisba). The size of a tribe or section may fluctuate from time to time with the popularity and strength of its sheikh or leader; a strong and just man will attract to his unit families or groups of families from other tribes, and these in time may give rise to sections or lose their identity in that of their adopted unit. Among the sedentary population tribal organization is naturally weaker than among the nomads.

The daily life of the town Arabs of the Sudan probably varies but little from that of their fellow-townsmen throughout the Near East, and perhaps much the same may be said of the sedentary agriculturists. That of the nomads is conditioned by the severity of the dry season and the organized effort that is required to meet it. Movements of families are no casual wanderings, nor except in the wet season, are groups of tents to be found scattered over the country, but all movement takes place en *masse,* the whole life of the tribe being regulated by the supply of water and of grass for men and cattle. Since permanent watering places are few (their use formerly often led to fighting, and even nowadays is a fruitful source of bad feeling) it is necessary each year to dig temporary wells in localities in which the water bearing strata come within reasonable distance of the surface. This requires considerable man-power, hence the common dry season unit is a (tribal) section under its sheikh.

Although the Arabs of the Sudan observe the outward forms of Islam, including the fast at Ramadan and abstention from alcohol, there is a strong and widespread cult of the dead in one form or another, a belief which is hardly counterbalanced by confidence in the efficacy of holy writings. Thus, while almost every Arab wears a charm (*hegab*), which in fact or theory contains a passage from the Koran. the most valid oaths are sworn not upon the Holy Book but upon the shrine of some local holy man. The belief in the evil eye (*q.v.*), is universal, and many of the sedentary Arabs are as superstitious—using the word to signify unorthodox belief—as are the Egyptian peasantry- with whom they share the names of some of their spirits. The nomadic tribes on the other hand, if less religious in that their fear of the supernatural is less, are free from many unorthodox beliefs of their settled co-religionists. Among the leading men at least of the

Kababish the writer found none of that fear of the dark or of empty spaces, or belief in afrit, which is common in the mixed population of the towns, nor as far as he could discover are the *zar* and zikr—religious exercises inducing auto-hypnosis, and sometimes hystero-epileptic seizures—which are frequent enough among the town dwellers and villagers, found among the nomads.

But though the precepts of the Koran with regard to marriage, inheritance, and so forth, are followed where there is an explicit direction, there is everywhere an important substratum of pre-Islamic or non-Islamic beliefs, habit and custom being largely governed by an older social condition, which, if not matrilineal, at least had many matrilineal traits. Thus among the nomads of Kordofan the wedding tent is built in that part of the settlement in which live the bride's people, who provide by far the greater part of the tent material and its furniture; so too in the payment of blood money, it is not only relatives of the slayer's clan who provide this but his mother's people are also expected to contribute. Another most interesting series of pre-Islamic customs are described by Crowfoot (Sudan Notes and Records, Vols. I, 1918, II, 1919, V, 1922), in connection with the marriages, circumcision and pregnancy, of the riverain Arabs, and in northern and central Kordofan, though these customs are not found among the nomads of the west nor the Baggara of the south. Essentially these ceremonies centre round certain insignia called jirtik, the name being applied both to the rites and collectively to the insignia worn, one of the most important elements being a bracelet on which is threaded a blue or green stone, or sometimes a particular kind of glass bead. Usually the various ornaments are previously dipped in milk, and are worn thereafter during forty days. It is to be noted that in the case of marriage the jirtik ornaments can only be worn once, whether by boy or girl, so that even if marriage has not been consummated neither party wears the jirtik insignia for a second wedding.

ARACAJÚ, a city and seaport of Brazil, capital of the state of Sergipe, 170 mi. N.N.E. of Bahia, on the river Cotinguiba, or Cotindiba, 6 mi. from the coast. The municipality, of which it forms a part, had a population in 1890 of 16,336, about two-thirds of whom lived in the city itself. Its population (1940) was 59,460. Aracajú is on the right bank of the river at the base of a ridge of sand-hills. Good limestone is quarried in its vicinity, and the country tributary to this port produces large quantities of sugar. Cotton is also grown, and the back country sends down hides and skins for shipment. The anchorage is good, but a dangerous bar at the mouth of the river prevents the entrance of vessels drawing more than 12 feet. The port is visited, therefore, only by the smaller steamers. The river is navigable as far as the town of Maroim, about 10 mi. beyond Aracajú. The city was founded in 1855.

ARACATÍ or **ARACATY,** a city and port of Brazil, in the state of Ceará, 75 mi. S.E. of Fortaleza, on the River Jaguaribe, 8 mi. from the sea. Population of the municipality (1890) 20,182, of whom about 12,000 belonged to the city; (1940) 29,307, of whom about 18,000 belonged to the city. A dangerous bar at the mouth of the river permits the entrance only of the smaller coasting steamers, but the port is an important commercial centre, and exports considerable quantities of cotton, hides, maniçoba, rubber, fruit and palm wax.

ARACEAE or **AROIDEAE,** the arum family, a large group of monocotyledonous plants containing upwards of 100 genera and more than 1.000 species, of which the cuckoo-pint in Great Britain, and the jack-in-the-pulpit, found in eastern North America, are familiar examples.

Neither of these small plants, however, gives more than meagre indication of the characters of this interesting plant family, which attains its most conspicuous development in the tropics.

The aroids are generally herbaceous, often, however, reaching gigantic size; but they are sometimes shrubby climbing plants. Many are peculiar in form and habit and grotesque in appearance. Various climbing species of *Philodendron* have feeding roots which penetrate the soil and clasping roots that fix the plant to its support. Some are epiphytes, and a few, such as the water lettuce (*Pistia stratiotes*), are floating plants.

The leaves, which show great variety in size and form, are generally broad and net-veined, though sometimes sword-shaped and parallel-veined.' In Arum (*q.v.*) the blade is simple. In other genera the leaves are divided and sometimes very large; those of *Dracontium* (tropical America) may be 15 ft. high. In the ceriman (*Monstera*) the large perforated leaves appear as if cut full of holes. The small flowers are crowded on thick, fleshy spikes (spadix), which are usually enveloped by a large leaf (bract), the spathe, which is often the most conspicuous feature of the plant. For example, in the cuckoo-pint the spathe is large and green; in the jack-in-the-pulpit it is purple-striped; in the callas it is white or yellow; and in the anthuriums it is scarlet. In *Amorphophallus,* a genus of about 80 species characteristic of tropical Asia and Malaysia, the "flower" (really an inflorescence consisting of the spathe and the spadix) varies from a few inches to several feet in diameter. The largest is the *krubi* of Sumatra *Amorphophallus titanum,* its spathe being up to 4 ft. in diameter and its spadix attaining a height of 8½ ft. While this has been claimed to be the largest flower in the world, it is really an inflorescence. its numerous individual flowers being small in size. The true flowers are often extremely simple, sometimes, as in *Arum,* reduced to a single stamen or pistil. The fruit is a berry. Usually the plant tissues are exceedingly irritating when brought in contact with mucous membranes, because of the presence of myriads of minute needle-like crystals of oxalate of lime in the plant cells.

WILD ARUM (ARUM MACULATUM), COMMONLY "LORDS AND LADIES"
A. Details showing mode of development of the flowers
B. The plant itself
C. The berries, exposed when the large sheathing leaf that encloses them withers

The underground stems (rhizomes or tubers) are rich in starch; those of the tropical taro (*q.v.*) providing a valuable article of food. From the rhizomes of the cuckoo-pint Portland arrowroot was formerly prepared.

The starchy corms of the jack-in-the-pulpit, after proper treatment to eliminate the raphides, were utilized for food by the Indians of eastern North America.

Besides the cuckoo-pint, the Acorus *calamus* (*q.v.*) or sweet flag occurs in Great Britain, though it is supposed to have been introduced. In North America about 15 native species of aroids are found, chiefly in the southern and eastern United States. Among these are the jack-in-the-pulpit, green dragon, golden club, skunk cabbage. wild calla, water-lettuce (*qq.v*) and sweet flag. Only one native species, the western skunk cabbage (Lysiclziton *kamschatensis*), occurs on the Pacific coast.

In tropical America taro (Colocasia) is replaced in cultivation by the yautia (Xantkosoma) which, like the taro, is an important food plant. Because of their unusual foliage and inflorescence numerous species of *Alocasia, Anthurium, Caladium,* Colocasia, *Dieffenbachia, Scindapsus, Xanthosoma,* and other genera are grown in greenhouses for ornament and as curiosities.

A good series of tropical aroids may be seen in the aroid house at Kew, and in the United States in the display greenhouse of the New York Botanical Garden. Perhaps the best collection in tropical gardens is that in the Botanical Garden at Buitenzorg, Java.

For a monographic treatment see A. Engler and A. Engler and K. Krause, Araceae. Pflanzenreich 24. 37, 48, 55, 60, 64, 71, 73, 74 (IV 23) (1908–20).

ARACHNE, in Greek mythology. the daughter of Idmon of Colophon in Lydia, a dyer in purple. She had acquired such skill

in the art of weaving that she ventured to challenge Athena. Offended at her having depicted the amorous adventures of the gods, and enraged at the perfection of her work, the goddess tore it to pieces. Arachne hanged herself in despair; but the goddess out of pity loosened the rope, which became a cobweb, while Arachne herself was changed into a spider. The name Arachne means "spider."

ARACHNIDA. The Arachnida are a class of animals belonging to the phylum Arthropoda and comprising the scorpions, spiders, mites and their allies, which are typically terrestrial air-breeders, and also a host of marine forms, mostly extinct, of which the king crabs are the only existing representatives. The name was originally restricted to the terrestrial species resembling the in-

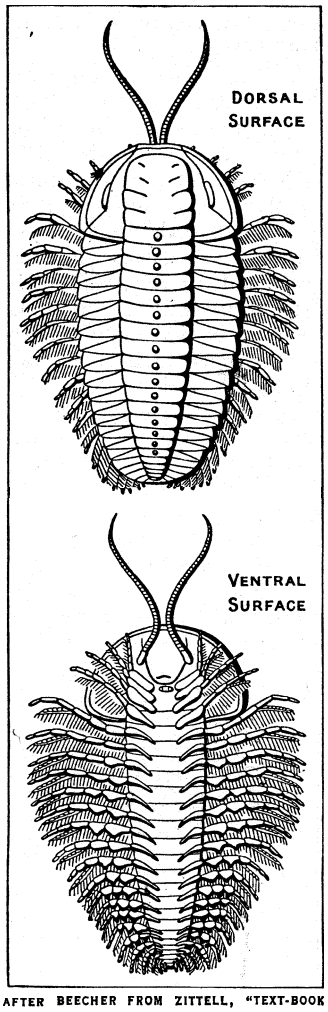
FIG. 1.— DORSAL VIEW OF THE KING CRAB (LIMULUS), WITH THE POST-ANAL SPINE CUT SHORT

sects, centipedes, etc., in the possession of organs adapted for atmospheric respiration; king crabs possessing gills or branchia being for that reason associated with the Crustacea. But in 1881 Ray Lankester proved conclusively that the king crab (*"Limulus"*) must be regarded as an arachnid on account of the fundamental resemblance between it and the scorpion in all essential structural characters. This conclusion, which is generally accepted, focused attention upon the Trilobita (*q.v.*), a great group of extinct marine arthropods. previously classified as crustaceans but exhibiting many points of likeness to the king crabs. In 1902 Lankester gave cogent reasons for the belief that the Trilobites were primitive Arachnida and placed them in that class; and this opinion was confirmed by the subsequent discovery of numerous fossils linking them with king crabs and their allies. So far as external characters are concerned—and these are the only characters known in the extinct species—the arthropods here referred to as the Arachnida agreed in the following particulars:

(1) The body is divided into two main regions or parts, the prosoma or cephalothorax, and the opisthosoma or abdomen; (2) the prosoma, carrying the mouth, is composed of five or six somites or segments and is marked off from the opisthosoma by the fusion of more or fewer, generally all, of the dorsal plates or terga to form a heavy shield or carapace which bears the eyes, when present. It is usually attached to the opisthosoma by a movable joint and, excepting the Trilobites, is further separated from it by the structure and function of its appendages. (3) Except in one degenerate family of mites, each segment of the prosoma is provided with a pair of appendages or limbs of which one pair only is situated in front of the mouth (preoral). The next are behind the mouth, or postoral, and the first pair of these at least is concerned with the mastication of food or with feeding in some other way. The remaining three or four pairs are mainly or wholly locomotor in function. (4) The opisthosoma and its appendages are much more variable in structure and agreed throughout the different orders in two characters only, the anus opens upon the last segment and the genital ducts on the first or second. It is only by the position and function of the anterior appendages of the prosoma that the Arachnida mainly differ from the Crustacea. In the Crustacea there are two pairs of preoral appendages, the second pair, corresponding to the first postoral pair in the Arachnida, having taken up a preoral position and lost their masticatory function, the third pair, not the second pair as in the Arachnida, being the first pair of jaws. Possibly some representatives of the Trilobites will be found to link the Crustacea with the Arachnida, showing that we must look to the Trilobites as the common ancestors of the two classes.

According to the theory of the evolution of the Arachnida and the interpretation of this morphology propounded by Ray Lankester and adopted in this article, the better known terrestrial forms, the scorpions, spiders and mites traced their descent and their structural characters from marine forms of which the Trilobites are the oldest known representatives.



AFTER BEECHER FROM ZITTELL, "TEXT-BOOK OF PALAEONTOLOGY" MACMILLAN & CO.

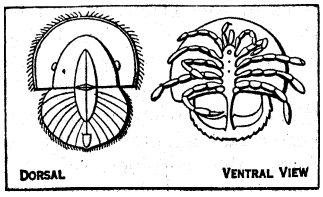
FIG. 2.—RESTORATION OF A TRILOBITE (TRIARTHRUS BECKI) SHOWING THE SINGLE PAIR OF TACTILE PREORAL APPENDAGES, AND THE FOUR PAIRS OF POST-ANAL APPENDAGES BELONGING TO THE ANTERIOR SECTION OF THE BODY

In the Trilobites the prosoma is composed of five segments, with its dorsal plates welded into a carapace provided with compound lateral eyes. The mouth, situated near the middle of its lower surface, is bordered in front by a plate acting as an "upper lip" or labrum and behind by a small plate, the "lower lip" or labium. The preoral appendages are long, many jointed feelers or antennae, and the basal segments, or coxae, of the four pairs of postoral appendages act as jaws. The rest of the limb consists of two branches: an endopodite, used for crawling, and an exopodite carrying a number of branchial filaments. The opisthosoma is very variable in the number of its segments; but in the earliest forms there is a great number of them, all freely jointed together in a series, and each segment except the last carries a pair of appendages approximately like those of the prosoma in structure and function, the last or telson, carrying the anus, being sometimes provided with a post-anal caudal spine.

The next stage was the restriction of the number of segments of the body to 18 or 19, the loss, in most cases at all events, of appendages on some of the posterior segments and a change in the structure in function of the appendages of the prosoma and opisthosoma, those of the prosoma losing to a great extent, if not wholly, their branchial function and becoming specialized for locomotion and the prehension and manipulation of food, those of the opisthosoma retaining for a time the double function of respiration and locomotion but later, as in the king crabs, losing their locomotive function and becoming specialized for the most part as carriers of the branchial plates attached, to the branchial filaments of the Trilobites, to the outer branch or exopodite.

In the stage represented by the king crabs and many of their extinct allies, the prosoma consists of six segments with six pairs of locomotor or prehensile limbs and the appendages of the opisthosoma are reduced to six pairs corresponding to the first six segments of this region in the adult. The appendages of the first

of these segments cover the genital apertures and form the genital operculum. It probably carried branchial plates in some forms, but these have disappeared in the living king crab. It must be noted, however, that this segment, the genital, is morphologically the second segment of the opisthosoma because in the course of its development the king crab shows in front of the genital somite a transient somite, which cannot certainly be traced in the adult. This pregenital somite is important because it appears again in some of the terrestrial Arachnida but its occurrence is so inconstant that the genital somite is regarded as the first of this region in this article. The limb-bearing region of the opisthosoma is called the mesosoma in contrast with the metasoma, the limbless region of the body behind it, which carries the anus and the caudal spine.

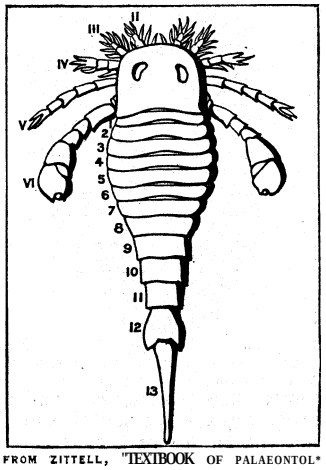


AFTER LEUCKART FROM KORSCHELT, AND HEIDER

FIG. 3.— TRILOBITE LARVA OF THE KING CRAB (LIMULUS)

The most important allies of the king crab as witnesses of the kinship between that group and the terrestrial air-breathing Arachnida are the Eurypterida which resemble scorpions much more closely than the king crab resembles them, namely in shape, in identity in the number of somites, 18, exhibiting precise differentiation into the three categories prosoma, mesosoma and metasoma, composed of six somites each and the narrowing of the freely jointed, limbless metasoma to form, with the postanal spine, a tail-like termination to the body. But since only the exoskeleton of the Eurypterida is known, we must look to the king crabs for the evidence of relationship in the internal organs.

The following are the principal anatomical resemblances between them: (1) The alimentary canal is provided with a powerful suctorial pharynx, worked by special muscles, and with lateral segmentally-arranged diverticula, the so-called "gastric glands." (2) The vascular system is highly developed, consisting of a dorsal many-chambered "heart," from which arises a rich supply of arteries enveloping or intimately connected with the central nervous system. There is also a paired series of veno-pericardial muscles passing from the great ventral venous sinus to the pericardium and constituting a mechanism aiding flow of blood along the veins which pass from the sinus to the heart. (3) On each side of the prosoma there is an excretory gland, the "coxal gland," which opens by a pore between the basal segments (coxae) of the fifth and sixth appendages. (4) Lodged in the prosoma between the ventral nerve-mass and the alimentary canal is an internal skeletal plate, the "entosternite," a fibro-cartilaginous structure giving support to the numerous muscles of the limbs and other organs and arising apparently from the solidation of connective tissue and of the inner portion of the great dorso-ventral and longitudinal and crural muscles. (5) The ovaries and testes form a closed network and are not in the form of simple, or simply branched, tubes. (6) Median and lateral eyes are present. The medians are composed of two layers of cells (diplostichous) and the laterals of a single layer (monostichous), the elements of the lateral eyes in the scorpions being separated, whereas in the king crabs they are coalesced to form a compound eye.



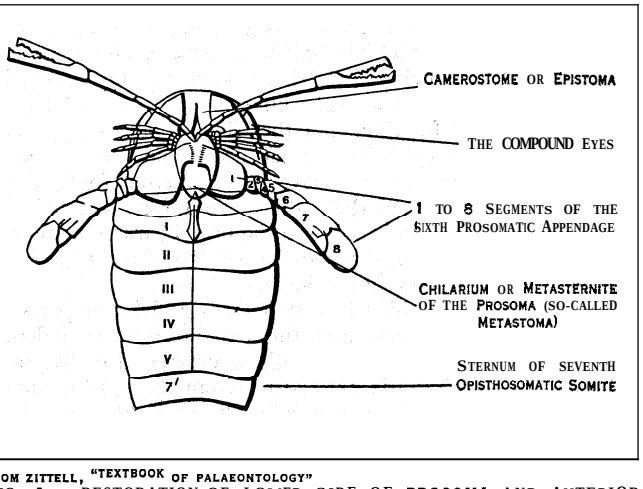
FROM ZITTELL, "TEXTBOOK OF PALAEONTOLOGY"

FIG. 4 — DORSAL VIEW OF PTERYGOTUS, SHOWING THE SCORPION-LIKE SHAPE OF THE BODY

The principal structural differences between the typical scorpions on the one hand and the king crabs and Eurypterida on the other are concerned with adaptations to life on the land, a new departure which marked a further stage in the evolution of the class. Of these adaptations atmospheric respiration is the most important. As already explained the respiratory organs of the king crabs are clusters of branchial lamellae, called gill-books, of which there is a pair upon the second to the fifth appendages of the opisthosoma. In the scorpions the respiratory organs are four pairs of small sacs, containing clusters of super-imposed lamellae, and they open by spiracles upon the sternal plates of the third to the sixth somites of the opisthosoma. These lamellae, called lung-books, are developed in the embryo behind the base of the four pairs of transient bud-like limbs. They closely resemble even in microscopic details the gill-books of the king crabs: and Lankester's query that they are modified insunk branchial lamellae is generally accepted. But in the embryo scorpion there is also a pair of bud-like limbs in the first and second segments of the opisthosoma. These persist, the first pair developing into a double or single plate, the genital operculum, and the second into a pair of peculiar tactile organs, called the combs or pectines, which consist of a jointed shaft provided with a series of teeth, the whole structure recalling and evidently representing the branchial exopodite of the Trilobite limb. Thus in their structure and development the pectines and lung-books of the scorpions bear out the view of the descent of this group from marine forms with branchial plates on the exopodite of five pairs of limbs of the opisthosoma; and further evidence of this head is supplied by the discovery in Silurian strata of a scorpion which lived in the sea and in a measure links the typical scorpions with the Eurypterida.

Less important adaptations to terrestrial life in scorpions are certain modifications of the last four pairs of limbs of the prosoma for walking on land and the forward shifting of the mouth from the middle of the lower side of the prosoma to the anterior end, thus freeing the basal segments of the last two pairs of limbs from function of manipulating or masticating food which they perform in the king crabs and Eurypterida.

Although according to the theory of the evolution of the Arachnida here briefly sketched, the scorpions are the most primitive of all the terrestrial orders of the class, they cannot be regarded as the direct ancestors of any one of them. Nor can any of these other orders, the most specialized or the most degenerate, being directly derived from another. In some cases they exhibit puzzling gross resemblances associated with profound structural differences. Throughout the series a general tendency is traceable towards the shortening and simplification of the opisthosoma, usually called the abdomen, towards the disappearance or fusion of its segments, its coalescence with the prosoma or cephalothorax, obliteration of the distinction between mesosoma and metasoma; and these changes are accompanied by simplification of the digestive, nervous and alimentary systems. The eyes also tend to disappear; but apart from them the organs connected with the cephalothorax are generally at least as elaborate as in the scorpions, sometimes more so, and these call for special mention.



FROM ZITTELL, "TEXTBOOK OF PALAEONTOLOGY"

FIG. 5.— RESTORATION OF LOWER SIDE OF PROSOMA AND ANTERIOR PART OF THE POSTERIOR REGION OF THE BODY OF THE PTERYGOTUS

I–V. are gill-bearing appendages of the posterior region

Alimentary System.—The Arachnida subsist almost wholly upon the soft tissues of their prey which are drawn into the minute mouth by suckers. The labrum may act in this manner (Solifugae, Palpigradi, Acari), or the pharynx, which is in front of the brain, as in the Scorpiones, Pedipalpi and Araneae; or the stomach which is just behind the brain as in the Araneae and Pedipalpi, which are thus provided with two alimentary suckers. In the scorpions there is only one pair of diverticula from the midgut in the cephalothorax, but there are four pairs of segmentally arranged diverticula in the Araneae (spiders) or even five in some Pedipalpi (*Thelyphonus*).

Excretory Organs.—Excretory tubules physiologically similar to those of insects but morphologically different from them open into the gut in the abdomen in scorpions, Pedipalpi, Araneae and Solifugae, but are absent in the Opiliones. The coxal glands have been found in all the orders; but they are more elaborate in the Pedipalpi and Araneae than in the Scorpiones. The position of the orifice varies. In some (Chelonethi, Mygalomorph spiders) it is close to the base of the fifth appendage as in scorpions and king crabs; in others (Pedipalpi, typical Araneae, Palpigradi, Solifugae) it is behind the base of the third appendage. No doubt in the ancestor of the Arachnida, possibly in Trilobites, there was a pair of coxal glands in each somite of the prosoma.

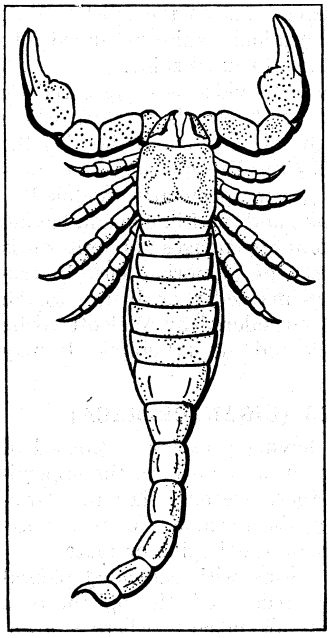
Entosternite.—The most highly developed entosternite is found in the Pedipalpi and Araneae, which also contain the primitive pregenital somite. In these orders this plate is more like the entosternite of the king crabs than it is in the scorpions; in the Solifugae it is largely, if not wholly, replaced by a chitinous ingrowth (entosclerite) from the ventral surface.

The Generative Organs.—The essential glands, testes and ovaries are usually simple and tubular but in the Chelonethi they are joined by transverse bands and are reticulated, as in the scorpions and king crabs. Some remarkable phenomena connected with the copulation of the Arachnida may be referred to in this connection. In the king crabs fertilization is effected after the eggs are laid; but in the air-breathing forms the eggs are fertilized within the body of the female but the sperm of the male is introduced in a variety of singular ways. The scorpions copulate front to front, the genital orifices of the two sexes being mutually applied during the process. The same method is probably adopted by the Pedipalpi and Chelonethi. In the Opiliones, so far as is known, the male and female stand facing one another and the male thrusts forward his penis, which is relatively of great length, beneath the cephalothorax of the female into her generative orifice which in many genera opens only a short distance behind the mouth. In other orders, however, the method of pairing is quite different, one of the pairs of cephalothoracic appendages being modified as an intromittent organ. In the spiders (Araneae), the terminal segment of the second pair, or palpi, is furnished with an apparatus adapted for taking up the liquid sperm after it has been deposited on a sheeting of web, and carrying it until the male finds a female and fertilizes her by inserting the organ into her generative ducts. Functionally similar organs occur upon the terminal segment or tarsus, of the fifth pair of limbs in the Ricinulei and upon the mandibles or chelicerae of the Solifugae. But in these cases the apparatus is adapted for the transmission of spermatophores into the female.

The Respiratory Organs of air-breathing Arachnida have been extensively used in classification on account of the diversity in structure and position they exhibit. Pulmonary sacs with "lung-books" very similar to those of scorpions are found in the Pedipalpi and many Araneae (spiders); but in these orders they open behind the sternal plates of the first and second abdominal somites. In other spiders, however, the lung-books of the second somite, and occasionally of the first as well, are replaced by tracheae, called "tufted tracheae," composed of a wide sac from which a number of fine tubes are given off. Two pairs of similar tracheae opened by spiracles upon the sides of the second and third somites of the abdomen in the Chelonethi. In the Solifugae there is a pair of spiracles on the sterna of the second and third and occasionally of the fourth somites; but the tracheae which arise from these are of a different type, consisting of long branching tubes strengthened by a spiral thread as in the insects. A pair of similar tubular tracheae open ventrally upon the second abdominal somite in the Opiliones; and four pairs open dorsally upon the first four somites in some Acari (Notostigmata).

Spiracles are also present in the cephalothorax and are equally variable in position. In the Ricinulei there is a single pair of tufted tracheae opening above the base of the appendages of the fifth pair, and in the Solifugae a pair of tubular tracheae open ventrally behind the base of the appendages of the fourth pair. In the Acari, in which the tracheae may be tufted or tubular, spiracles may open above the appendages of the first pair, above the fourth pair or in the articular sockets of the third, fourth, fifth or sixth pairs; and in some Opiliones there is a spiracle from the fifth segment (tibia) of the last four pairs of appendages.

The Tracheae and the **Ancestry** of Air-Breathing **Arachnida.**—The tracheae are a morphological puzzle upon the solution of which two diametrically opposed hypotheses of the descent of the Arachnida mainly rest. In accordance with the view that the lung-books of the scorpions, Pedipalpi and some Araneae (spiders) were derived from branchial lamellae like those of the king crabs, their presence upon the first and second abdominal somites in the Pedipalpi and Araneae and upon the third to the sixth in the scorpions suggests that in earlier members of the king crab and Eurypterine stock they were also present upon the genital operculum, making altogether six pairs of clusters. It also involves Lankester's conclusion that the lung-books were the primitive type of respiratory organs in the air-breathing form, that they were subsequently partly suppressed or replaced by tracheal tubes on the abdomen and were functionally supplemented by additional tracheae with spiracle opening upon various parts of the cephalothorax; and the belief that these cephalothoracic spiracles and tracheae are adventitious organs gained support from their presence on the tibia of the legs of some Opiliones.



RESTORED AFTER THORELL S INDICATIONS BY R. I. POCOCK

FIG. 6.—DORSAL VIEW OF PALAEOPHONUS, A MARINE SCORPION OF THE SILURIAN PERIOD

This view of the matter has not, however, been accepted by all authorities. Leuckart, and following him, Hansen and Sörensen, believed that segmentally arranged typical tubular tracheae, like those of insects, were the earliest form of respiratory organs in the Arachnida and that from these they derived the tufted tracheae and from the tufted tracheae, lung-books. The primitive Arachnida in fact were terrestrial air-breathers. Hansen also believed that in these primitive forms the cephalothorax was divided into two regions, a head, or cephalon, composed of four somites and bearing the eyes, mouth and four pairs of appendages, and a thorax consisting of two free somites with separate terga and two pairs of appendages. The acceptance of this opinion compels the belief that the Palpigradi are the most primitive of existing Arachnida so far as the cephalothorax is concerned, with the Solifugae standing next to them. Bernard went a step farther and pictured the primitive Arachnida as a terrestrial air-breathing arthropod composed of 18 somites, each provided with a pair of limbs, approximately alike throughout the series, a pair of tracheal spiracles and alimentary diverticula.

These theories need not be further discussed. But it may be pointed out that neither involves a denial of the kinship between the scorpions and the king crabs and their allies because the branchial lamellae of the latter may have been derived from the pulmonary lamellae of the former. They involve, however, the

conclusion that the king crabs and Eurypterida were derived from air-breathing land forms which became adapted to living in the sea, a conclusion diametrically opposed to theconclusion upheld in this article which maintains their descent from the Trilobites whose kinship with the king crabs was never questioned until the affinities of the latter with scorpions were established.

CLASSIFICATION

The Arachnida are classified as follows:—

Grade **1. Anomomeristica.**—Number of somites typically great and variable, usually exceeding eighteen. All the somites of the opisthosoma except the last with a pair of appendages structurally and functionally like the postoral appendages of the prosoma. The dorsal area trilobite.

SUB-CLASS TRILOBITA

The tergal plates of the anterior five somites fused to form a dorsal shield or carapace, The preoral appendages long and antenniform. All the postoral appendages biramous, the external branch branchial, the internal locomotor or also maxillary in function. For the other characters and classification see TRILOBITA.

Grade **2. Nomomeristica.**—Number of somites never exceeding 18 in the adult. Some of the somites of the opisthosoma without appendages. When appendages are present on this area, they are structurally and functionally differentiated from those of the prosoma. The dorsal area, except in some Xiphosura, not trilobite.

SUB-CLASS LIMULAVA

Resembling the Trilobita in having the prosoma composed of five somites, the preoral appendages antenniform and the appendages of the opisthosoma provided with a locomotor inner and a branchial outer branch.

Order Copura. Nine pairs of appendages on the opisthosoma, none on its last three somites, the terminal somite expanded into a swimming plate but without a postanal caudal spine.

This order containing the family Sidneyidae is represented by genera of mid-Cambrian age. The best known is Sidneyia which in its 12-jointed opisthosoma and absence of "trilobation" of the dorsal surface superficially resembles the Eurypterida. The postoral appendages of the prosoma are very peculiarly modified.

Resembling apparently the Trilobita and the Limulava in having prosoma five-segmented as the preoral appendages antenniform is a group, the Agalaspina (*Agalaspius*), of Cambrian age. In certain other respects this group shows marked resemblance to the Xiphosura, which follow, and it is considered by Walcott to be the intermediate between that order and the Trilobites. It may for the present be left unclassified.

SUB-CLASS MEROSTOMATA (GIGANTOSTRACA)

Differing from the Limulava in having prosoma composed of six somites, the preoral appendages not antenniform, the appendages of the opisthosoma, of which there are only six pairs, laminate and not locomotor in function, the terminal somite not expanded into a caudal fin but with a postanal spine or plate.

Order Xiphosura. Trilobite-like forms with expanded pleural areas, the dorsal surface generally "trilobate," the opisthosoma with nine or ten somites and its appendages, where known, biramous.

Most of the genera of this order are Palaeozoic and extinct. They differ from the Mesozoic and existing king crabs (Limulidae) in having the opisthosoma distinctly segmented. Well defined genera are *Belinurus, Hemiaspis, Pseudoniscus,* and others; but their classification needs revision. The discovery in these that some genera related to *Agalaspius,* formerly regarded as closely akin to these forms, have Trilobite-like appendages and other characters may show that these ancient forms are not so nearly related to the Limulidae as has been supposed.

Order Eurypterida. Chiefly differing from the Xiphosura in being typically scorpion-like in shape, without pleural areas, with the opisthosoma composed of 12 somites of which the posterior six are limbless and the anterior six provided with unbranched plate-like appendages, the first carrying a median rod which probably acted as an ovipositor in the female, as a penis in the male.

The Eurypterida occur in Palaeozoic strata and are wholly extinct. Some of them, being over two yards in length, are the largest arthropods known. They exhibit great variation in the structure of their prosomatic limbs, the last pair being frequently modified as broad paddles (*Eurypterus,* Pterygotus), or the last two pairs may be very long and act as oars (Stylomurus). The preoral appendages may be long, massive pincers (Pterygotus) or insignificant in size. By these and other characters the group is divisible into a number of families and sub-families.

SUB-CLASS PECTINIFERA

Differing from the Merostotana in having the first pair of appendages of the Mesosoma (abdomen) represented by a very small genital operculum, without a rod-like ovipositor or penis, and the second pair converted into the pectinei or combs; in the last of all external trace of the remaining four pairs in the adult; in the small size of the basal segment of the last pair of legs and its loss of maxillary function, the breaking up of the lateral eyes into separate ocelli and the presence of poison glands in the postanal spine.

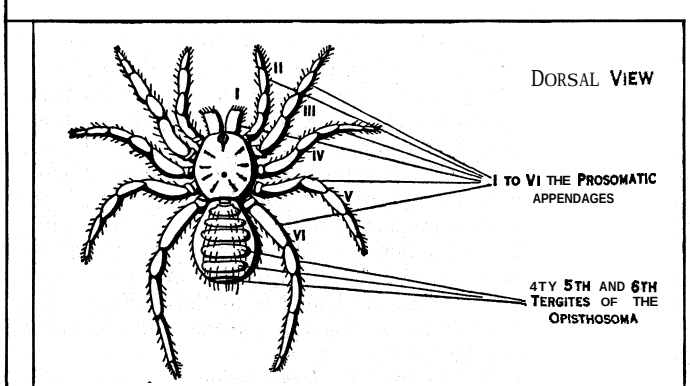
Order Scorpiones. The first pair of appendages (mandibles) small, three jointed and chelate; second pair (palpi) long, massive and chelate, the remaining four pairs (legs) locomotor, with the basal segments of at least the two first acting as jaws.

Sub-order Apoxypoda. Legs short, composed of stout sub-equal segments, the last or tarsus pointed and armed at most with a single claw, the basal segments of the last two pairs meeting in front of the sternal plate of the cephalothorax and the pectines with a short inner branch (endopodite). Family Palaeophoridae (*Palaeophorus.*)

This sub-order contains the Silurian scorpion which was undoubtedly marine. It has no trace of spiracles and probably breathed by means of branchial lamellae as in the Eurypterida.

Sub-order Dionychopoda. Legs long, with unequal segments, the last truncated and armed with two claws; the last two pairs of legs with their basal joints (coxae) abutting against the sternal plate; the pectines without endopodite.

To this sub-order belong all the recent scorpions which are referred to four families, Buthidae, Pandinidae, Vaegovidae and Bothorinidae. A number of genera from the Coal Measures mostly resembling recent forms in essential characters are also known. One nf them (Eobuthus), however, has no trace of spiracles, the respiratory lamellae being probably concealed beneath the ventral plates of the abdomen as in *Palaeophorus.* It may have been a water-breather, living in the Carboniferous marshes.



BY COURTESY OF POCOCK AND PICKARD-CAMBRIDGE

FIG. 7.— DORSALVIEW OF LIPHISTIUS, A PRIMITIVE SPIDER

SUB-CLASS EPECTINATA

Distinguished from the Pectinifera by the absence of pectines and of a long tail-like termination to the body, by the presence of not more than 11 somites in the abdomen, excluding the pregenital somite, and of at most four pairs of small appendages upon the abdomen in the embryo. Also when lung-sacs are retained, they belong to the first and second abdominal somites not to the third, fourth, fifth and sixth.

SUPER-ORDER Caulogastra. Distinguished from the rest of the Epectinate Arachnida, as well as from the Scorpiones, by the deep constriction of the retained pregenital somite to form a slender, stalk-like waist between the cephalothorax and abdomen and by the presence of a pair of spiracles opening alongside the genital orifice on the first abdominal somite.

Order Pedipalpi. Abdomen composed of 11 somites with distinct tergal and sternal plates, without spinning appendages. Mandibles chelate or hernichelate, without poison-glands. Palpi very large and prehensile, their basal segments meeting in the middle line. Legs of first pair long slender clawless and tactile; see PEDIPALPI.

Sub-order Uropygi. Abdomen with a postanal sclerite, which, with the narrowed last three somites, forms a tail-like termination to the .body. The last somite with a pair of defensive, acid-secreting glands. The cephalothorax long and narrow. Basal segments of the palpi almost immovably fused to form a trough beneath the mouth. Legs of the first pair with only the terminal segments many-jointed.

Tribe Urotricha (Oxopaei). Postanal sclerite forming many-jointed flagellum. Two pairs of lung-sacs. Carapace unsegmented with median and lateral eyes. Palpi chelate, folding almost in a horizontal plane.

The single family Thelyphonidae contains many genera (*Thelyphonus, Hypoctonus, Mastigoproctus,* etc.), occurring in the tropics of Asia and America. **A** genus (Geralinura) has been found in the Coal Measures.

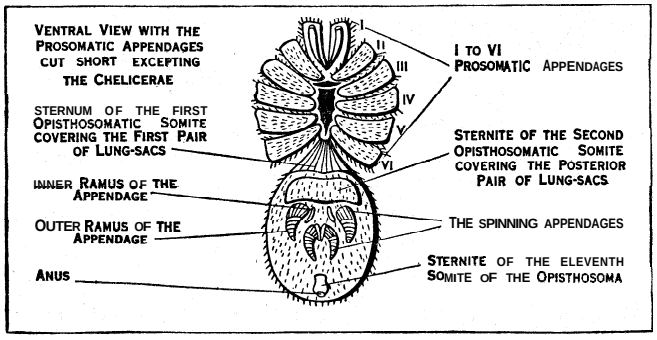
Tribe Tartarides. The postanal sclerite short, unjointed. Only one pair of lung-sacs retained. Cephalothorax segmented, its last two somites free. A mere trace of eyes at most remaining. Palpi not chelate, folding in a vertical plane and armed with a terminal piercing claw.

The single family Hubbardiidae (Hubbardia, *Schizomus,* Tri*thyreus*) is distributed in the warmer parts of Asia, Africa and America, and contains very small, less highly organized form than the Thelyphonidae.

Sub-order Amblypygi. Differs from the Uropygi in the absence of a caudal termination to the body and of acid-glands, in having a broad cephalothorax with its appendages radiating round a broad sternal area, the palpi more freely movable and armed with many spines, and the legs of the first pair long and antenniform.

The numerous genera (*Phrymus, Tarantula, Charis,* etc.), belonging to the group, which is found in the warmer parts of Europe, Asia, Africa and America, are referred to three families. The genus *Graeophorus* occurs in the Coal Measures.

Order Araneae (Spiders). Distinguishable from the Pedipalpi mainly by the following characters: (1) The abdomen is provided



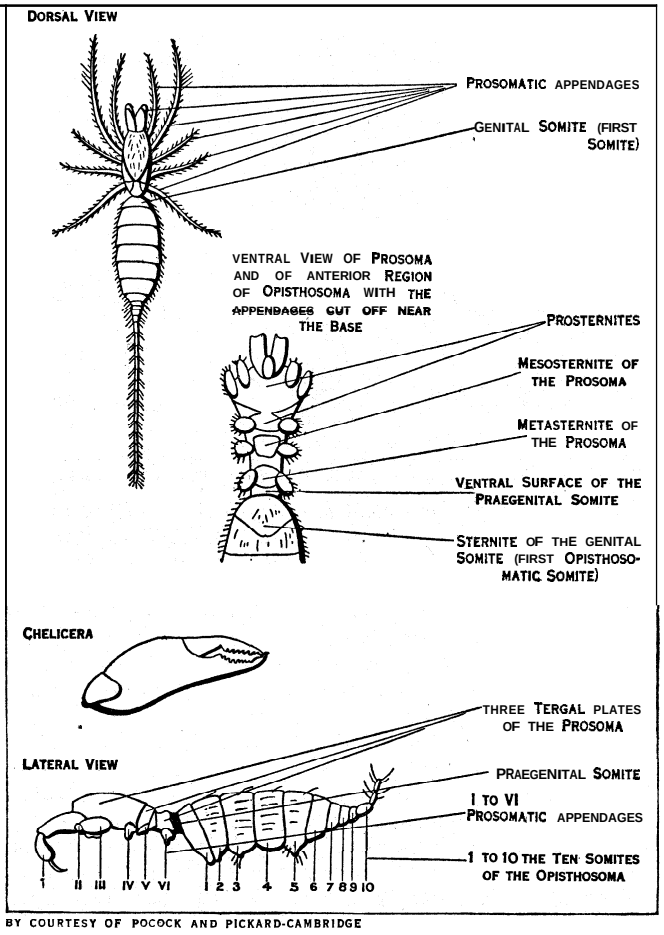
BY COURTESY OF POCOCK AND PICKARD-CAMBRIDGE

FIG. 8.— VENTRAL VIEW OF LIPHISTIUS, WITH THE LEGS CUT SHORT

with two pairs of appendages, which belong morphologically to the third and fourth somites and are the manipulators of the silk secreted in the abdominal glands, the ducts of which open upon them. (2) The mandibles are provided with the poison-gland opening close to the tip of the second segment which is transformed into a piercing fan. (3) The palpi are small, pectiform, not prehensile; their basal segments are not united but are separated by the labial sternal plate which forms a lower lip to the mouth. In the males the terminal segment carries the intromittent organ. (4) The first pair of legs are locomotor, like the other pairs.

That the Araneae are tolerably closely related to the Amblypygi is forcibly attested by the structure of the coxal glands, the endosternite and the alimentary canal.

Sub-order hfesothelae. Abdomen segmented, with 11 tergal plates and two sternal plates covering the lung-sacs and genital orifice, followed by the two pairs of biramous spinning appendages which retain their embryonic position in the middle of the lower.



BY COURTESY OF POCOCK AND PICKARD-CAMBRIDGE

FIG. 9.—KOENENIA, THE ONLY GENUS OF THE PALPIGRADI

surface of the abdomen, traces of seven sterna between these appendages and the anus.

The single genus *Liphistrus* of the family Liphistiidae, restricted to the East Indies, is the most primitive spider known. Apparently related is *Arthrogiosa* from the Coal Measures.

Sub-order Opisthatheae. Abdomen at most indistinctly segmented posteriorly, without tergal plates and the sternal plates represented only by the pulmonary opercula. The spinning appendages at the posterior end of the body close to the anus.

All existing spiders, except the Lithistiidae, belong to this sub-order which is divisible into two tribes.

Tribe hfygalomorphae. The plane of the articulation of the mandibles to the cephalothorax is vertical, distal segment or fang closing backwards in a line sub-parallel to the long axis of the body. Coxal glands opening on the fifth cephalothoracic somite. Two pairs of lung-sacs always present.

This tribe, confined to tropical and temperate regions of the world, contains the bird-eating spiders (*Avicularia,* Thevaphosa, etc.), often called tarantulas, the trap-door spiders (Cteniza, *Nemesia,* etc.), the purse–web spiders (*Atypus,* etc.) and others. They are referred to several families, the Theraphosidae, Ctenizidae, Atypidae, etc., the Theraphosidae being the largest spiders known.

Tribe Arachnomorpha (Araneae verae). The plane of the articulation of the mandibles horizontal, the fangs closing almost transversely inwards; the coxal glands opening on the third somitc of the cephalothorax.

This tribe, the most specialized section of the order in struc-

ture and instincts, contains most of the living species of spiders. They exhibit great variation in the structure and position of their breathing order, in the formation of the mouth parts, the number and distribution of the eyes, the construction of their spinning appendages and of their external genital organs. By these variations they have been classified into a number of families, Araneidae (Aranae, *Nephila*), Lycosidae (Lycosa, *Ocyale*), Attidae (Attus), Phaleidae (*Pholeus*), Dysderidae (Dysdera) and others too numerous to mention. (See SPIDER, TARANTULA.)

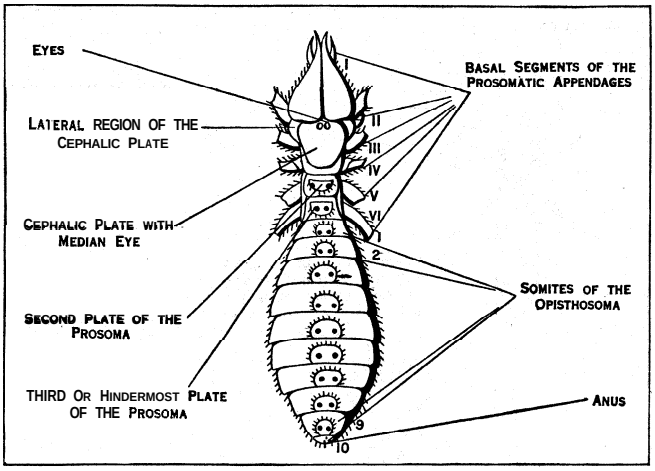


FIG. 10.— DORSAL VIEW OF GALEODES, WITH THE LEGS CUT SHORT

Order Palpigradi. Resembling some Pedipalpi in the tail-like termination of the body and the segmented carapace, but differing essentially from them in having ten abdominal somites without separated terga and sterna, in the absence of breathing organs in the large, chelate, three-jointed mandibles, the slender, pediform palpi with their basal segments widely separated, jointed to the sides of a large sternal plate and disconnected from the mouth, which opens at the end of a projecting proboscis, and in the palpiform locomotor first pair of legs.

The order contains one genus *Koenenia;* family Koeneniidae. It is a minute arachnid found in Europe and America.

SUPER-ORDER Cucullata. Distinguished from the rest of the Arachnida by the presence of a large plate jointed to the front of the carapace and folding like a hood over the mandibles, by the construction of the first and second abdominal segments and their concealment between the third segment and the cephalothorax which can be locked together by means of the basal segment by the last pair of legs; and by the telescoping of the reduced last three segments of the abdomen within the enlarged sixth segments.

Order Ricinulei (Podogona). Mandibles chelate, two jointed, palpi small, chelate, basally united to form a suboral trough and in contact with the corresponding segments of the second legs, which like those of the succeeding pairs meet in the middle line practically obliterating sterna. A single pair of tufted tracheae above the base of the third pair of legs. Intromittent organ of male on the tarsus of these limbs.

Family Cryptostemmidae (*Cryptostemmus, Cryptocellus*). These remarkable arachnids are found in tropical Africa and America. Related genera (Paliachera, etc.) occur in the Coal Measures.

This order was classified by Hansen and Sörensen with the orders above referred to the Caulogastra, the group being comprehensively called the Micrura.

SUPER-ORDER Pseudoscorpiones. Differing from the Caulogastra in the absence of a "waist" the large size of the dorsal plate of the pregenital somite, the absence of spiracles on the first abdominal somite, the presence in the cephalothorax of silk glands opening upon the mandibles, which are provided with a special organ, the serrula, for manipulating the silk.

Order Chelonethi. Carapace unsegmented. Mandibles two jointed, chelate. Palpi very large and chelate, their basal segments and those of the four pairs of legs meeting in the middle line and replacing the sterna. Abdomen sometimes with 11 freely jointed somites, second and third with a pair of spiracles.

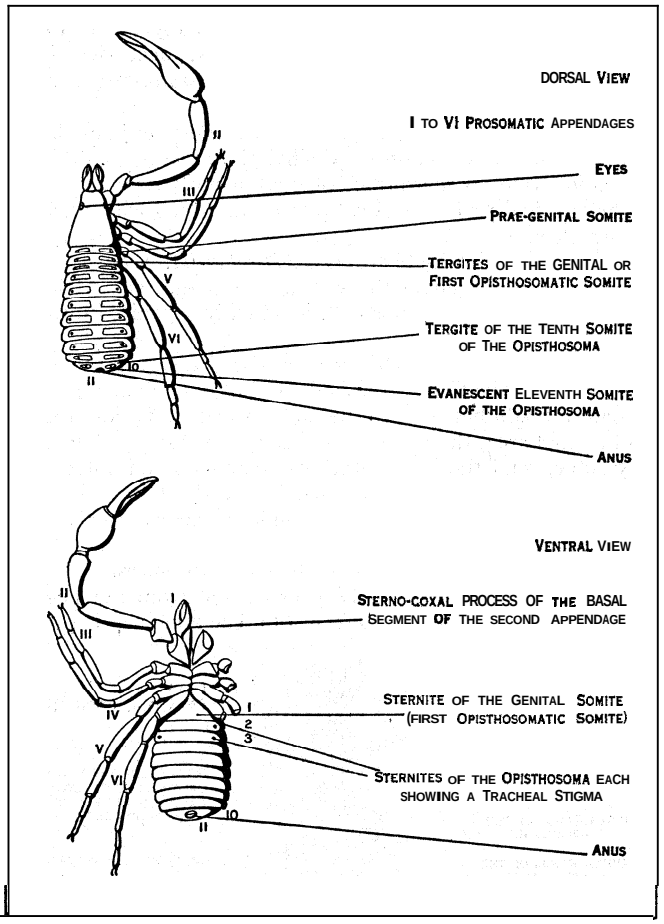
Sub-order Panctenadactyli. The serrula, on the movable digit of the mandible fixed throughout its length, an accessory process on the immovable digit. Carapace narrow in front, mandibles small. Families Cheliferidae (Chelifer), Garypidae (Garypas).

Sub-order Hemictenodactyli. The serrula, free at its distal end; no accessory process; carapace wide, mandibles large. Families Obisidae (*Obisium*), Chthoniidae (Chthonius).

The arachnids of this group are all of small size, their large pincer-like palpi giving them a superficial resemblance to scorpions. Their old-fashioned popular name, book-scorpion, was due to the discovery of specimens in libraries. Most of the species, however, live under stones or bark where they feed upon mites. etc.

SUPER-ORDER Mycetophora. Differing from the foregoing orders of Epectinate in having the first, or genital, somite of the abdomen jointed to the cephalothorax without the intervention of a waist or of the pregenital somite and in the presence of spiracles on the fourth segment of the cephalothorax; and distinguishable from all orders by the firm articulation of the mandibles to the sides of the carapace, the partial freedom of the fourth tergal plate from the carapace and the presence of racket-shaped processes or malleli on the basal segments of the fourth legs.

Order Solifugae. Cephalothorax jointed, its fifth and sixth segments free. Mandibles two jointed, powerful and chelate. Palpi pediform and tactile, their basal segments fixed, dissociated from the mouth which is at the apex of a porrect proboscis. Legs with their basal segments fused across the middle, replacing the sterna. Abdomen with ten somites, the second, third and sometimes the fourth with ventral spiracles. Intromittent organs of the male situated on the mandibles.



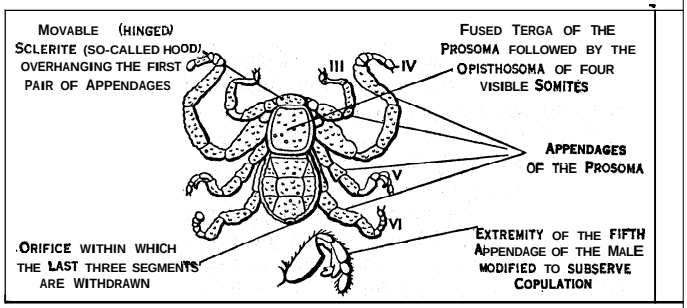
BY COURTESY OF POCOCK AND PICKARD CAMBRIDGE

FIG. 11.— DORSAL AND VENTRAL VIEWS OF GARYPAS, ILLUSTRATING THE CHARACTERS OF THE PSEUDOSCORPIONES. THE LEGS OF THE LEFT SIDE ARE CUT SHORT

Families Galeodidae (Galeodes), Solpugidae (Solpuga). The Solifugae, mostly large active, rapacious Arachnida, are found in the warmer parts of the eastern and western hemispheres. They

are a very distinct group, showing some resemblances to the Palpigrada.

SUPER-ORDER Phalangiomorphae. Distinguished from the preceding groups of Epectinates in the following characters:—(1) The cephalothorax and abdomen are widely confluent. (2) The sternum of the genital somite is indistinctly defined in the adult, the genital orifice being thrust forward between the last pair of



BY COURTESY OF POCOCK AND PICKARD-CAMBRIDGE

FIG. 12.—DORSAL VIEW OF CRYPTOSTEMMA, ONE OF THE PODOGONA

legs. (3) There is a pair of foetid glands opening upon the cephalothorax. (4) The basal segments of the first and generally of the second pair of legs act as jaws.

Order Opiliones. Mandibles chelate and three jointed. Palpi variable, their basal segments acting as jaws. Legs locomotor in function. Abdomen containing ten somites more or less fused together, the second with a pair of spiracles. Male and female respectively with a long penis and ovipositor.

Sub-order Palpatores. Palpi small, pediform. Sternum of cephalothorax short.

Tribe Eupnoi. With accessory spiracles on the fifth segment of the legs. Family Phalangiidae (Phalangidum).

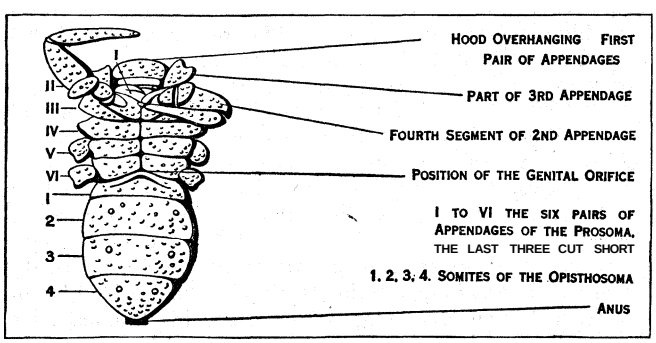
Tribe Dyspnoi. No accessory spiracles on the legs. Families Nemastomidae, Trogulidae, etc.

Sub-order Laniatores. Palpi prehensile with a piercing claw. Sternum of cephalothorax long and usually very narrow. Families Gonyleptidae (*Gonyleptis*), Oncopodidae (*Oncopus*), etc.

Sub-order Cyphophthalmi. Palpi pediform; sternum of cephalothorax minute or absent, the foetid glands are glands on a high tubercle. Family Sironidae (*Siro*, Stylocellus).

The Opiliones are found in temperate and tropical latitudes of the eastern and western hemispheres. Most of the British species, belonging to the Phalangiidae, are remarkable for the extreme length and thinness of their legs and the small pill-like bodies.

SUPER-ORDER Rhynchostomi. Resembling the Phalangiomorphae in the wide confluence of the cephalothorax and abdomen; but



BY COURTESY OF POCOCK AND PICKARD-CAMBRIDGE

FIG. 13.—VENTRAL VIEW OF CRYPTOSTEMMA

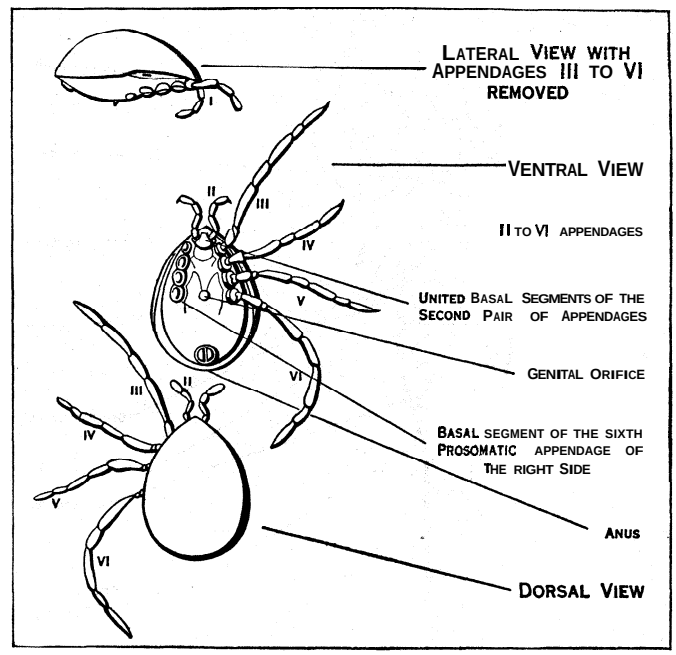
essentially distinguished by the presence of a wide sternal area between the basal segments of the legs, which are disassociated from the mouth and have no maxillary function, and by the fusion of the basal segments of the palpi beneath the mouth which lies at the front end of the body.

Order Acari (mites and ticks). Mandibles and palpi very variable, either the one or the other, frequently both, modified, closely associated with the labrum to form a suctorial proboscis which may be borne on a special segment, the capitulum, Abdomen sometimes showing indications of ten segments defined by shallow grooves, typically without trace of segmentation.

Sub-order Euacari. Parasitic or free-living, sometimes aquatic or marine, forms with a short abdomen and four pairs of normal locomotor legs. Families Oribatidae, Gamasidae, Ixodidae, Trombidiidae, etc., classified by the spiracles.

Sub-order Tetrapoda. Vegetable parasites with the abdomen very long and annulated, the third and fourth pairs of legs absent. Family Eriophyidae (Gall-mites).

Sub-order Vermiformia. Parasitic forms living in the hair-follicles of Mammalia, with the abdomen long and annulated and



AFTER THORELL

FIG. 14.—ONE OF THE ORDER OF ACARI, ILLUSTRATING THE STRUCTURE OF THE MITES AND TICKS

four pairs of legs, short, conical and three-jointed. Family Demodicidae (Demodex), the cause of follicular mange. (See MITE, TICK.)

Most of the existing orders of terrestrial Arachnida are represented in the Coal Measures. But those deposits have yielded remains of genera referable to three distinct orders, the Haptopoda, Phalangiotarbi and Anthracomarti.

The Haptopoda in the wide confluence of the cephalothorax and abdomen, the apparent fusion of the abdominal segments and the pediform palpi superficially resemble some Opiliones; but in the presence of 11 abdominal segments, the structure of the abdominal sterna, the separation of the basal segments of the postoral appendages of the cephalothorax by a distinct sternal area and the tactile function of the legs of the first pair resemblance may be traced to some of the Caulogastra. One genus only, Plesiosiro, family Plesiosiromidae is known.

The Phalangiotarbi also recall the Opiliones in the above mentioned characters, but are distinguished from all the other orders by the progressive increase in length of the abdominal segments from the first to the ninth, and in the radial arrangements of the large wedged-shaped basal segments of the four pairs of legs round the small sternal area, those of the first pair concealing the basal segments of the other palpi; the genital sternal plate was situated between the last pair of legs. Families Phalangiotarbidae (*Phalangiotarbus*), Architarbidae (Architarbus, *Geraphrynus*).

The Anthracomarti had a wide movable joint between the cephalothorax and abdomen, the abdomen consisting of as many as ten segments provided with pleural plates, those of the eighth overlapping small ninth and tenth segments; the pediform palpi and four pairs of legs were separated by a distinct sternal area very much as in the Araneae; but the structure of the abdomen is distinctive of the order. Families Brachypygidae (Brachypyge),

Anthracomartidae (*Anthracomartus*), Anthracosironidae (*Anthracosiro*), Eophrynidae (*Eophrynus*).

It is significant that although these extinct orders show gross resemblances to existing orders of epectinate Arachnida, serving to link more closely constituents of that section into a coherent assemblage, no fossil forms are known bridging in any way a structural interval between the Epectinata and the Pectinifera.

Certain other groups, namely the Pycnogoniea or Pantopoda, the Tardigrada and the Linguatulida or Pentastomida were formerly referred to the Arachnida. The last two seemed to have no claim to be so classified. For particulars concerning them see TARDIGRADA, and PENTASTOMIDA. The Pycnogonida (*q.v.*), however, are like the Arachnida in some respects and were retained in the class by Lankester. But they are here regarded as a distinct class on account of several important characters they possess. There may be, potentially at all events, eight pairs of appendages set apart for locomotion, prehension or other purposes instead of the six pairs seen in the Nomomeristis Arachnida. Also the abdomen, always large and conspicuous in the Arachnida, as here understood, is reduced to a mere anal knob. More important still is the lodgement in the four parts of the body of the genital glands which open upon the basal segments of more or fewer of the appendages. These features in the organization of the Pycnogonida cannot be brought into agreement with that of the true Arachnida the orders of which form a coherent assemblage of more or less intergradational types of Arthropoda. (R. I. P.)

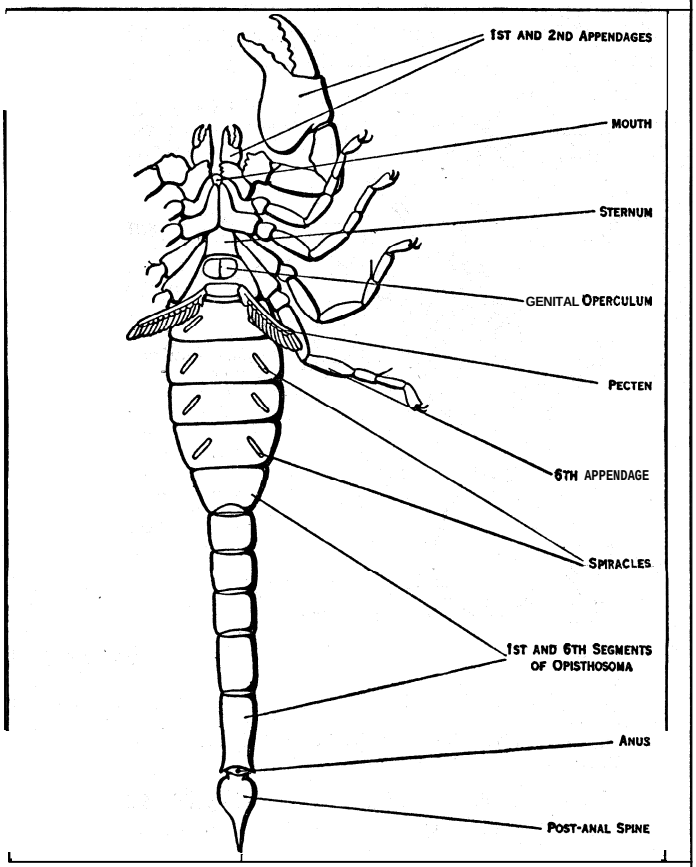


FIG. 15—VENTRAL VIEW OF SCORPION (PANDINUS), WITH THE POST-ORAL APPENDAGES OF THE PROSOMA CUT SHORT ON THE LEFT SIDE

ARACHOSIA, a far eastern province of the Persian empire and that of Alexander. It was early lost by the Seleucids and became part of the rising Parthian empire. It lay north of Gedrosia (Baluchistan) and occupied the southern portion of Afghanistan (*q.v.*). Its chief town was Alexandria Arachosiorum. (See also PERSIA: *Ancient History.*)

ARAD, a town in western Rumania, capital of the department of the same name. The population of the town in 1939 totalled 75,725. It lies on the right bank of the River Mures and consists of the inner town and five suburbs. Arad is a modern-built town and contains many handsome buildings, including a cathedral. It is the seat of a Greek-Orthodox bishop and possesses a Greek-Orthodox theological seminary, two training schools for teachers — one Hungarian and the other Rumanian — and a conservatoire for music. It has a museum containing relics of the Hungarian revolution of 1848–49. One of the public squares contains a martyrs' monument, erected in memory of the *13* Hungarian generals shot here on Oct. 6, *1849,* by order of the Austrian general Haynau. Arad is an important railway junction and the largest industrial and commercial centre of western Rumania. Its principal industries are distilling, milling, machinery-making, leather-working and saw-milling. A large trade is carried on in grain, flour, alcohol, cattle and wood. Arad was a Turkish fortress during the 17th century. The new fortress, built in *1763,* played a great rôle during the Hungarian struggle for independence in *1849.* It was captured by the Hungarians on July *1, 1849,* and was their headquarters during the latter part of the insurrection. Here Kossuth issued his famous proclamation (Aug. 1849), and here he handed over the supreme military and civil power to Görgei. The fortress was recaptured shortly after Görgei's capitulation at Világos.

The town of New Arad, on the opposite bank of the Mureș, is practically a suburb of Arad, with which it is connected by a bridge. It was founded during the Turkish wars of the 17th century, growing up round works erected by the Turks for the capture of Arad.

ARAGO, DOMINIQUE FRANÇOIS JEAN (1786–1853), French physicist, was born Feb. *26 1786,* at Estagel, Perpignan, eastern Pyrenees. He was the eldest of four brothers. Jean (1788–1836) emigrated to America and became a general in the Mexican army. Jacques Etienne Victor (1799–1855) took part in L. C. de S. de Freycinet's exploring voyage in the Uranie from *1817* to *1821,* and on his return to France devoted himself to journalism and the drama. The fourth brother, Etienne Vincent (1802–92), is said to have collaborated with Balzac in the *Héritière* de *Birague,* and from *1822* to 1847 he wrote a great number of light dramatic pieces, mostly in collaboration. A strong republican, he was obliged to leave France in *1849,* but returned after the amnesty of *1859.* In *1879* he was nominated director of the Luxembourg Museum.

François Arago was educated at the municipal school of Perpignan and at the Ecole Polytechnique, but instead of entering the army as had been intended, he became secretary to the Paris observatory. He became acquainted with Laplace, and through his influence was commissioned, with J. B. Biot, to complete the meridional measurements which had been begun by J. B. J. Delambre, and interrupted since the death of P. F. A. Méchair (1744–1804). The two left Paris in *1806,* and began operations among the mountains of Spain, but Biot returned to Paris after they had determined the latitude of Formentera.

Arago was left alone to make the geodetical connection of Majorca with Iviza and Formentera. The expedition coincided with the French invasion of Spain, and the astronomer was involved in a series of amazing adventures. In making his escape from the Balearic islands to Algiers he was captured by a Spanish corsair, and spent three months in Spanish prisons. Released with other prisoners at the demand of the Dey of Algiers, he spent six months in Africa before he returned to Marseilles. He was in quarantine there when he received his first letter from A. von Humboldt, who became his lifelong friend. Through all his vicissitudes Arago had preserved his observations and records. Though he was still only *23* years of age he succeeded J. B. L. Lalande in the chair of analytical geometry at the École Polytechnique, and became one of the astronomers at the Royal Observatory.

In *1830* he entered the chamber as republican deputy for Seine Inférieure. In the chamber he advocated many important practical measures for the advancement of science and for technical development in railways, telegraphs, etc. In the same year he was made director of the observatory, and perpetual secretary of the Academy of Sciences. During the reign of Louis Philippe he was absorbed in his scientific work, but after the

revolution of 1848 he joined the Provisional Government as minister of war and marine. Arago carried important reforms during his short tenure of office. He improved the sailors' rations, abolished flogging, and did away with political oaths. He also secured the abolition of Negro slavery in French colonies.

In 1852 when Louis Napoleon's Government demanded an oath of allegiance from all its functionaries Arago resigned his post as astronomer at the Bureau des Longitudes, but the Prince-President declined to accept his resignation. Arago died in Paris on Oct. 2 1853.

Arago's fame as an experimenter and discoverer rests mainly on his contributions to magnetism and optics. He found that a magnetic needle made to oscillate over non-ferruginous surfaces, such as water, glass, copper, etc., falls more rapidly in the extent of its oscillations according as it is more or less approached to the surface. This discovery was followed by another, that a rotating plate of copper tends to communicate its motion to a magnetic needle suspended over it ("magnetism of rotation"). Arago is also fairly entitled to be regarded as having proved the long-suspected connection between the aurora borealis and the variations of the magnetic elements.

In optics he has the credit of stimulating the genius of A. J. Fresnel, with whose history, as well as with that of E. L. Malus and of Thomas Young, this part of his life is closely interwoven. In the beginning of the 19th century these three philosophers were shaping the modern doctrine of the undulatory theory of light. Fresnel's arguments in favour of that theory were not acceptable to Laplace, Poisson and Biot, the champions of the emission theory; but they were ardently espoused by Humboldt and by Arago, who had been appointed by the Academy to report on the paper. An intimate friendship sprang up between Arago and Fresnel. They carried on together further researches, which led to the enunciation of the fundamental laws of the polarization of light known by their names.

Arago constructed a *polariscope,* which he used for observations on the polarization of the light of the sky. To him is also due the discovery of the power of *rotatory polarization* exhibited by quartz, and last of all, among his many contributions to the support of the undulatory hypothesis, comes the *experimentum crucis* which he proposed to carry out for comparing directly the velocity of light in air and in water or glass. On the emission theory the velocity should be accelerated by an increase of density in the medium; on the wave theory, it should be retarded. In 1838 he communicated to the Academy the details of his apparatus, which utilized the revolving mirrors employed by Sir C. Wheatstone in 1835 for measuring the velocity of the electric discharge; but owing to the great care required in the carrying out of the project, and to the interruption to his labours caused by the revolution of 1848, it was not until the spring of 1850 that he was ready to put his idea to the test; and then his eyesight suddenly gave way. Before his death, however, the retardation of light in denser media was demonstrated by the experiments of H. L. Fizeau and J. B. L. Foucault, which, with improvements in detail, were based on the plan proposed by him.

BIBLIOGRAPHY.—Arago's *Oeuvres* were published after his death under the direction of J. A. Barral, in 17 vols., 8vo (1854–62); also separately his *Astvonomie populaire,* 4 vols.; *Notices biogvaphiques,* 3 vols.; *Notices scientifiques,* in 5 vols. *Voyages scientifiques,* in 1 vol.; *Mémoires scientifiques,* in 2 vols.; *Mélanges,* in 1 vol.; and *Tables analytiques et documents importants* (with portrait) in 1 vol. English translations of various portions of his works have appeared.

ARAGON, constituent kingdom of the Spanish monarchy, administrative unit until 1833, now divided into the three provinces of Saragossa, Huesca and Teruel (*qq.v.*). The north frontier of Aragon follows the Pyrenean water-parting, from the peak of Anie (2,504m.), the last of the great peaks towards the west, to the peak of the Aneto (3,404m.) in the Maladetta group. Thus Aragon is backed by the western, or forward, *échelon* of the high Central Pyrenees, nearly to the point where the headwaters of the River Garonne separate it from the eastern. From this background of high peaks the descent to the lowlands of the Ebro is less rapid (average gradient $3\frac{1}{2}$ in 100) than the descent towards the Garonne on the French side (7 in 100). The difference is due to the much greater development on the south side of topographical features parallel to the principal axis of the chain. Thus the River Aragon—finding at Jaca the soft marl which runs from east to west in a belt from Pamplona, in Navarre, to Boltaiia—is diverted west and forms the broad valley of the Canal de Berdun; the influence of this belt is seen also in the course of the Cinca and of certain minor streams. East of Boltaiia the rivers flow directly south, and the first of these, the Noguera Ribagorzana, gives the eastern boundary of Aragon. South of the belt of marl, a series of sierras—roughly aligned from west-north-west to east-south-east—of which the Sierra de Guara (2,070m.) is the most important, runs from the River Aragon to the Sierra del Montsech (1,693m.) in Catalonia; these sierras overlook the great, saucer-shaped central lowland on their south, across which runs the River Ebro. The heart of Aragon is this lowland and more strictly that part to which the descent from the crest of the Pyrenees is most obviously a descent by steps. The approaches to the defile by which the Ebro cuts its way from this enclosed basin through the Catalan coastal chain to the sea belong to Catalonia from Fayón downstream. The western boundary of Aragon runs more or less diagonally across the sierras bordering the central plateau so as to include within Aragon, in the south, the greater part of the sierra belt, while in the north the commanding Sierra del Moncayo (2,315m.), immediately overlooking the Ebro lowland, forms an advanced bulwark of Castile. The descent from the central plateau is again by steps, and the border of Aragon is defined so as to cover the important structural depression, occupied in part by the River Jiloca, which runs from Calatayud, on the river Jalón, to Teruel. From the eastern limit of this depression the boundary runs to the Ebro at Fayón so as to include in Aragon the headwaters of the streams flowing to the Mediterranean. It is clear from the above that Aragon divides naturally into zones, parallel in the north to the Pyrenees and in the south to the border of the plateau. In the first zone, that of the high Pyrenean valleys, cultivated patches sustain scanty village populations; there is some mining—the cobalt mines are interesting—but the forest and the high summer pastures are the chief resources.

The next, the limestone zone to the south, includes picturesque scenic forms carved by the rivers; it is represented as high as the Pyrenean crest in the Monte Perdido (3,352m.), one of the Three Sisters group. The zone is of no economic importance, but its strategic interest is obvious from the structure. Behind the protecting sierras to the south, Sierra di Guara, etc., beyond which the Muslims made no lasting conquest or impression, sprang up early in the Muslim period the countships of Aragon, with centre at Jaca, Sobrarbe, with centre at Ainsa, and Ribagorza, at first forming a single fief with Pallás. Until its establishment as an autonomous fief in 875, Ribagorza-Pallás was dependent on Toulouse through Cerdagne, and the influence sf the easy Segre-Cerdagne pass across the Pyrenees extended as far westwards as the Ésera, the western boundary of Ribagorza. The separation of Pallás, the amalgamation (between 1034 and 1038) of Ribagorza with the western countships, which had always looked west to Navarre, and the declaration of Aragon as an independent kingdom (*c.* 1034) defined the boundaries of Upper Aragon as dmcribed above.

The lowland zone, which dips from an altitude of 500m. to the Ebro (at zoom. near Saragossa) and rises again to the south towards the sierras, is by no means uniform. The frequency of local regional names, Monegros, Desierto de Calanda, Llano de Violada, indicates variations which express themselves sometimes in the nature of the soil (especially in the presence or absence of gypsum), but principally in the presence or absence of a non-brackish water-supply. Huesca, in the north of the zone, on the old road from the coast by Lerida which, to-day as always, avoids the arid, waterless plateau of Los Monegros, was an important town long before Saragossa, the natural centre of the lowlands. In the period following the final establishment by Augustus of Roman authority in the entire peninsula and with the new appreciation of the importance of the line of the Ebro as a base-line in strategical schemes envisaging the peninsula as a

whole, Saragossa became a most important nodal point of communications. Standing at the point of confluence with the Ebro of the Gallego valley, by which came the road from the Pyrenean pass of *Summus Portus,* and of the Huerva on the south, Saragossa was also within 15 miles of the mouth of the Jalón, the entrance to the pass leading by the Sierra Ministra and the river Henares to the Tagus, and in Saragossa was focussed the importance of the central lowland from which radiated all the routes to the interior of the peninsula. These advantages of site the city has always enjoyed, *mutatis mutandis,* in a degree corresponding with the degree of unification of the peninsular regions. The central lowland of Aragon had its most complete historical expression in the Muslim period as the kernel of the kingdom of Saragossa. Not always able to maintain its independence of the Umaiyads of Cordova or of the Moroccan dynasties controlling the south, nor able always to control the north of its own area where the cities had climatic advantages and where Huesca had a much older tradition, the kingdom did not long survive the capture by Aragon of Monzfrn (1089) and of Huesca (1096); Saragossa itself fell in 1118. The union of the enlarged kingdom of Aragon, now centred in Saragossa, with the maritime state of Catalonia (1135) gave it a new Mediterranean outlook. The circumscription of Aragon by Castile both on the north, where the district of La Rioja and the plateau of Soria became finally Castilian, and on the south, where the conquest of Murcia for Castile drove a wedge between Valencia, held by the Aragonese, and the Muslims of Granada, forced eastwards the expansion of Aragon and led to the foundation of the Aragonese empire, for which *see* general article on Spain.

The southern part of Aragon would form one single zone of hill country were it not for the strip of sheltered valleys along the line of the Jalón and of the depression marked by the towns of Calatayud, Daroca and Teruel. With Albarracin, on the upper Guadalaviar, these towns formed the four communities which dominated the hill pastures for many centuries. The peach ripens in the valleys, where the irrigated lands are intensely cultivated; apart from these the sheep pastures on the hills are the principal resource.

In temperature Lower Aragon is intermediate between that of Old Castile with its low mean winter temperatures and that of New Castile with its high mean summer temperatures. Northward from the Sierra de Guara the seasons are reduced more and more to long severe winters and short cool summers; in a lesser degree the same is true of the highlands of Aragon. The rainfall is small save on the Pyrenean front, and we note the approximate equality both of the winter and summer minima and of the spring and autumn maxima. The deficiency of the rainfall, which does not exceed 500mm. annually over the greater part of Aragon, and falls below 300mm. in the neighbourhood of Saragossa, has made irrigation a prime necessity. For irrigation conditions are less favourable than they appear at first sight to be if one considers only the schematic arrangement of lowland with surrounding hills and mountains and the apparent abundance of the water-supply in the rivers. This ideal *schema* is discounted by the unfavourable conditions of relief and of soil, which have made the provision of canals proper, as opposed to mere trenches, imperative for irrigation, and by the extreme seasonal variation in the rivers, to meet which schemes are now in progress for the construction of enormous dams on their upper courses. Large capital expenditure under State leadership has made irrigation in Aragon a political question; the phrase *política hidráulica* was coined here to describe the impassioned campaigns of Joaquin Costa (1846–1911) on its behalf. In the most recent times a new and wider conception of the whole problem of irrigation in the north-east has led to the establishment by royal decree (March 5, 1926), of the *Confederación Sindical Hidrográfica del Ebro* with headquarters in Saragossa, which grew from a scheme for a reservoir at Reinosa, province of Santander, of capacity 550,000,000 cubic metres to regulate the Ebro. The indirect social and political consequences of assembling round one table delegates from Castile, the Basque Provinces, Navarre, Aragon and Catalonia for vital economic business may be even greater than the direct economic consequences of a unified irrigation policy. Of the canals the most important are the Imperial canal (96 kilos in length with 12 kilos of annexes), with intake from the Ebro on the right bank below Tudila and terminating at El Burgo, below Saragossa; the Canal de Tauste (34½ kilos), on the opposite side of the river; the Canal de Aragon y Cataluiia, with intake from, the Ésera near Olvena, the principal canal terminating near the junction of the rivers Segre and Cinca. The largest reservoir is that of La Peña, on the River Gallego, with a capacity of 25,000,000 cubic metres. The Moneva reservoir, on the River Aguas, with a capacity of 11,000,000 cubic metres, is the largest in south Aragon. These figures are dwarfed by those of the proposed new reservoirs and canals. Besides the Reinosa reservoir mentioned above, those of Sotonera on the Gallego and of El Mediano on the Cinca enormously exceed in capacity any existing reservoir; they form part of a scheme for the irrigation of Upper Aragon, which includes the construction of a canal 146 kilos in length for the irrigation of Los Monegros, a canal which, if constructed, will be the longest in Europe after the Cavour canal, in Italy.

ARAGONITE, one of the mineral forms of calcium carbonate ($CaCO_3$), the other form being the more common mineral calcite. It crystallizes in the orthorhombic system, and the crystals are either prismatic or acicular in habit. Simple crystals are, however, rare; twinning on the prism planes being a characteristic feature of the mineral. This twinning is usually repeated often on the same plane and gives rise to striations on the terminal faces of the crystals; often, also, three crystals are twinned together on two of the prism planes of one of them, producing an apparently hexagonal prism. The mineral is colourless, white or yellowish, transparent or translucent, has a vitreous lustre, and, in fact, is not unlike calcite in general appearance. It may, however, always be readily distinguished from calcite by the absence of any marked cleavage, and by its greater hardness (H.=$3\frac{1}{2}$—4) and specific gravity (2.93); further, it is optically biaxial, whilst calcite is uniaxial.

The mineral was first found as reddish twinned crystals with the form of six-sided prisms at Molina in Aragon, Spain, where it occurs with gypsum and small crystals of ferruginous quartz in a red clay. It is from this locality that the mineral takes its name. Fine groups of crystals of the same habit are found in the sulphur deposits of Girgenti in Sicily. Fibrous forms are also common. A peculiar coralloidal variety known as *flosferri* ("flower of iron") consists of radially arranged fibres: magnificent snow-white specimens of this variety have long been known from the iron mines of Eisenerz in Styria. The calcareous secretions of many groups of invertebrate animals consist of aragonite (calcite is also common); pearls may be specially cited as an example.

Aragonite is the more unstable of the two modifications of calcium carbonate. A crystal of aragonite when heated becomes converted into a granular aggregate of calcite individuals: altered crystals of this kind (paramorphs) are not infrequently met with in nature, whilst in fossil shells the original nacreous layer of aragonite has invariably been altered to calcite. The thermal springs of Carlsbad deposit spherical concretions of aragonite, forming masses known as pisolite or *Sprudelstein.*

ARAGUA, one of the smaller States of Venezuela lying principally within the parallel ranges of the Venezuelan Cordillera and comprising fertile and healthful valleys. It is bounded on the east by the Federal District and State of Miranda, on the south by Guarico and on the west by Carabobo. Pop. (1941) 138,108.

Aragua has a short coast-line on the Caribbean, west of the Federal district, and a port at Ocumare is growing. Cattle, swine and goats are raised, and the state produces coffee, sugar, cacao, beans, cereals and cheese. The climate of the higher valleys is sub-tropical, the mean annual temperature ranging from 74° to 80°. The capital, Maracay (population, 1936, 29,759), is situ-

ated in the fertile Aragua valley 1,500 ft. above sea level and 77 mi S.W. of Caracas, with which it is connected by a fine highway. There is also a highway to Ocumare, to La Victoria, to Valencia, etc. Other important towns are La Victoria (population 8,000); Villa de Cura (population 7,550); and Cagua. The most important features of recent progress are the 225 mi. of highways traversing the state (1940), providing outlets for agricultural and other products.

ARAGUAYA, ARAGUAY or **ARAGUIA, a** river of Brazil and principal affluent of the Tocantins, rising in the Serra do Cayapó, where it is known as the Rio Grande, and flowing in a north by east direction to a junction with the Tocantins at São João do Araguaya, or São João das Duas Barras. Its upper course forms the boundary line between Goyaz and Matto Grosso. The river divides into two branches at about 13° 20′ S. lat., and unites again at 10° 30′, forming the large island of Santa Anna or Bananal. The eastern branch, called the Furo, is the one used by boats, as the main channel is obstructed by rapids. Its principal affluent is the Rio das Mortes, which rises in the Serra de São Jeronymo, near Cuyabá, Matto Grosso, and is utilized by boatmen going to Pará. Of other affluents, the Bonito, Garças, Cristallino and Tapirapé on the west and the Pitombas, Claro, Vermelho, Tucupá and Chavante on the east nothing definite is known as the country is still largely unexplored. The Araguaya has a course of 1,080m., considerable stretches of which are navigable for small river steamers, but as the river below Santa Anna island is interrupted by reefs and rapids in two places—one having a fall of 85ft. in 18m., and the other a fall of 50ft. in 12m.—it affords no practicable outlet for the products of the State. It was explored in part by Henri Coudreau in 1897.

See Coudreau, *Voyage au Tocantins-Araguaya (1897).*

ARAKAN, a division of Burma (*q.v.*), a strip along the eastern seaboard of the Bay of Bengal, from the Naaf estuary, on the borders of Chittagong, to Cape Negrais. Length from northern extremity to Cape Negrais, about 400m.; greatest breadth in the northern part, 90m., gradually diminishing towards the south, as it is hemmed in by the Arakan Yoma mountains, until, in the extreme south, it tapers away to a narrow strip not more than 15m. across. The coast is studded with islands, the most important of which are Cheduba, Ramree and Shahpura. The Arakan Division does not extend as far south, the coastal strip for a hundred miles northwards from Cape Negrais lying in the Bassein District of the Irrawaddy Division. The division has its headquarters at Akyab and consists of four districts—namely, Akyab, Northern Arakan Hill Tracts, Sandoway and Kyaukpyu, once called Ramree. Its area is about 16,000 sq.m. The population at the time of the British occupation in 1826 did not exceed 100,000. In 1831 it amounted to 173,000; in 1839 to 248,000; in 1901 to 762,102; in 1911 to 839,896, and in 1931 to 1,008,535.

The principal rivers of Arakan are—(I) the Naaf estuary, in the north, which forms the boundary between the division and Chittagong; (2) the Mayu river, an arm of the sea, running a course almost parallel with the coast for about 50m.; (3) the Kaladan river, rising near the Blue mountain, in the extreme north-east, and falling into the Bay of Bengal a few miles south of the Mayu river, navigable by vessels of from 300 to 400 tons burden for a distance of 40m. inland; and (4) the Lemro river, a considerable stream falling into the bay and a few miles south of the Kaladan. Farther south nearness of the boundary range makes the rivers short. Among them the Dalet and the An are navigable by boats; others are the Sandoway, the Taungup and the Gwa streams, the latter of which alone has any importance, owing to its mouth forming a good port of call or haven for vessels of from 9 to 10ft. draught. There are several passes over the Yoma mountains, the easiest being that called the An (or Aeng) route, leading from the village of that name in Arakan to Ngapè and Minbu in Central Burma, and the Taungup route leading from Taungup in Arakan to Prome on the Irrawaddy. Only one-tenth of this very hilly division is cultivated and rice occupies over nine-tenths of the cropped area. Other crops include fruits, chillies, dhani and tobacco. The natural vegetation of the lower slopes of the hills (up to 3,000ft.) is evergreen forest, in most areas too wet for teak; of the higher slopes a forest of evergreen oaks. But the forests have been destroyed over huge areas by native cultivators and their place taken by a useless tangle of bamboo.

The natives of Arakan trace their history as far back as 2666 B.C., and give a lineal succession of 227 native princes down to modern times. According to them, their empire had at one period far wider limits, and extended over Ava, part of China and a portion of Bengal. This extension of their empire is not, however, corroborated by known facts in history. At different times the Moguls and Pegus carried their arms into the heart of the country. The Portuguese gained a temporary establishment in Arakan; but in 1782 the Burmese conquered the province and it was ceded to the British in 1826, under the treaty of Yandaboo. The former capital, Arakan, is on an inferior branch of the Kaladan river. Remoteness from ports and harbours, and extreme unhealthiness have led to its gradual decay and Akyab (*q.v.*) is now the chief town in Arakan. The old city (now Myohaung) lies 50m. north-east of Akyab.

The Arakanese are Burmese, but separated from the parent stock by the Arakan Yoma mountains, and they have a dialect and customs of their own. Like the Burmese, they are Buddhists.

(L. D. S.)

ARAKCHEYEV, ALEKSYEI ANDREYEVICH, COUNT (1769–1834), Russian soldier and statesman, was descended from an ancient family of Great Novgorod. In July 1791 he was made an adjutant on the staff of Count N. I. Saltuikov, who recommended him to the tsarevich Paul Petrovich for reorganizing the army corps maintained by the prince at Gatchina. Arakcheyev won the confidence of Paul by his zeal and technical ability. His inexorable discipline soon made the Gatchina corps a model for the rest of the Russian army. On the accession of Paul to the throne Arakcheyev was immediately promoted, and was entrusted with the reorganization of the army. He remorselessly applied the iron Gatchina discipline to the imperial forces, beginning with the Preobrazhenskoe Guard, of which he was colonel. He soon became generally detested, but pursued his course unflinchingly and introduced many indispensable hygienic reforms. Nevertheless the opposition of the officers proved too strong for him, and on March 18 1798 he was dismissed from all his appointments. Arakcheyev's first disgrace only lasted six months. On Aug. 11 he was reinstated and on May 5 1799 was created a count, the emperor himself selecting the motto: "Devoted, not servile." Five months later he was again dismissed, this time on the strength of a denunciation subsequently proved to be false.

During the earlier years of Alexander I., Arakcheyev was completely overlooked; but on April 27 1803 he was recalled to St. Petersburg, and employed as inspector-general of the artillery. His wise reorganization of the whole department contributed essentially to the victories of the Russians during the Napoleonic wars. The commissariat scandals which came to light after the peace of Tilsit convinced the emperor that nothing short of the stern and incorruptible energy of Arakcheyev could reach the sources of the evil, and in Jan. 1808 he was appointed inspector-general and war minister. When, on the outbreak of the Swedish war of 1809, the emperor ordered the army to cross the ice of the Gulf of Finland, it was only the presence of Arakcheyev that compelled an unwilling general and a semi-mutinous army to begin a campaign which ended in the conquest of Finland. On the institution of the "Imperial Council" (Jan. 1 1810), Arakcheyev was made a member of the council of ministers and a senator, while still retaining the war office. Subsequently Alexander was alienated from him owing to the intrigues of the count's enemies, who hated him for his severity and regarded him as a dangerous reactionary. The alienation was not for long. True, Arakcheyev took no active part in the war of 1812, but all the correspondence and despatches relating to it passed through his hands, and he was the emperor's inseparable companion during the whole course of it. In Alexander's last years Arakcheyev was his chief counsellor and friend, to whom he submitted all his projects for consideration and revision. On the accession of Nicholas I.,

Arakcheyev, thoroughly broken in health, gradually restricted his immense sphere of activity, and on April 26 1826 resigned all his offices and retired to Carlsbad. His last days he spent on his estate at Gruzina, carefully collecting all his memorials of Alexander. Arakcheyev died on April 21 1834. In 1806 he had married but lived apart from his wife.

ARAL, a lake or inland sea in western Asia, between lat. 43° 30' and 46° 50' N., and long. 58° 0' and 62° E. It was known to the ancient Arab and Persian geographer6 as the Sea of Khwbrizm or Kharezm, from the neighbouring district of the Chorasmians, and derives its present name from the Kirghiz designation of Araldenghiz, or Sea of Islands. It is the fourth largest inland sea of the world having a total length of 280 miles and a width of some 130 miles. The maximum depth is only 63 metres, in a depression parallel to the west coast, and the average is only 16 metres. Its altitude is 74 metres above the Caspian, *i.e.*, 48 metres above the ocean. It is surrounded on the north by steppes; on the west by the rocky plateau of Ust-Urt, separating it from the Caspian; on the south by the alluvial district of Khiva; and on the east by the Kyzyl-kum or Red Sand Desert. The north shores are low, and broken by irregular bays such as those of Sary-chaganak and Paskevich. On the west an almost unbroken wall of clay formation extends from Tschernyshewa bay southwards, and attains a height of some 250 feet. On the south is the delta of the Oxus (Jihūn, Amu-darya), one of the arms of which, the Laudan, forms a swamp, 130km. long and 30km. broad, before it discharges into the sea. The Jaxartes (Sihūn, Syr-darya) enters in the north-east and is suspected to be shifting its embouchure to the north. These rivers bring down vast quantities of sediment; the delta of the Syr-darya increased by 34 sq.km. between 1847 and 1900. The eastern coast is fringed with multitudes of small islands, and others, some of considerable size, lie in the open towards north and west. Frequency and violence of storms, and almost total absence of shelter hinder navigation; there is little shipping save some flat-bottomed boats of the Kirghiz. The north-east wind is the most prevalent, and sometimes blows for months together. The salinity of Aral is only 10·7 per cent. The surface temperature varies between 32°F. in winter, when long stretches of the coast are ice-fringed, and 80°F. in late summer (E. Berg, 1900–8). Variations of level are remarkable and irregular and quite unconnected with the Briickner 35-year cycle, but the old idea that the sea disappears at times is wrong. Until 1880 the sea had long been diminishing and this gave rise to the idea, in western Europe, that the inland basins of west central Asia were drying up, but from 1880 to 1908 the level rose by nearly 3 metres, and there was increased utilization of the waters of Amu-darya and Syr-darya in their upper courses for irrigation. Islands previously linked with the shore became widely separated from it. Between the 13th and 16th centuries and in antiquity the Amu-darya may have sent an arm to the Caspian south of the Ust-Urt plateau. Within historic times also the Aral sea may have had a connection with the Mertyyi Kultuk gulf of the north-east Caspian, and in this case would then have been a freshwater lake. Its level was much higher in post-Pliocene times, for shells of Pecten and Mytilus species occur in the Kara-kum desert 55km. to the south of, and 24 metres or even perhaps 65 metres above, the present sea. The fish of Aral are freshwater species and some of its rapid streams still preserve the ancient fish type *Scaphirhynchus.* Fishing is not so productive as in the Caspian but fish are sent to Turkistan, Merv and Russia. The shores are uninhabited, the nearest settlements being Kazala, 90km. east on the Syr, and Chimbai and Kungrad in the Amu delta. The Orenburg-Tashkent Railway passes near the north-east corner of Aral.

ARALIA, a genus of aromatic herbs, shrubs and small trees of the aralia or ginseng family (Araliaceae), containing about 35 species, in North America, Asia, Malaya and Australia. Some are cultivated for ornamental foliage and some possess medicinal properties. The stems and leaf stalks are often spiny or bristly; the leaves are usually much divided into toothed leaflets; and the small flowers, which are borne in panicled umbels, are sometimes very numerous, the entire inflorescence being showy. Among the North American members of the genus are the American spikenard (*A. racemosa*), which grows from 3 ft. to 6 ft. high in rich woods from New Brunswick to South Dakota and south to Georgia and Missouri; the Virginian sarsaparilla (*A. nudicaulis*), a foot in height, found in woods from Newfoundland to British Columbia, south to North Carolina and Colorado; the bristly sarsaparilla (*A. hispida*), about 2 ft. high, native to sandy clearings from Newfoundland to Hudson bay and southward to North Carolina and Indiana; the Elk clover (*A. californica*), a robust form, sometimes 10 ft. high, found along mountain streams in California and Oregon; and the angelica tree, Hercules' club or devil's walking-stick (*A. spinosa*), a spiny shrub or small tree, sometimes 40 ft. high, native to low grounds from New York to Indiana and southward to Florida and Texas, frequently planted for ornament and sometimes escaping to roadsides and thickets. The Chinese angelica tree (*A. sinensis* and *japonica*) is the east Asian counterpart of the North American *A. spinosa,* but is less prickly and has more showy flowers. Many hardy varieties of the Chinese angelica tree are in cultivation. Nurnerous greenhocse plants called aralias are species of *Polyscias* and related genera of the aralia family. Ginseng (*q.v.*) is obtained from *Panax shenseng,* native to China, a plant closely related to the aralias.

ARAM, EUGENE (1704–1759), English scholar, and murderer, was born of humble parents at Ramsgill, Yorkshire. In 1745, when he was schoolmaster at Knaresborough, a man named Daniel Clark, his intimate friend, after obtaining a considerable quantity of goods from some of the tradesmen, suddenly disappeared. Suspicions of being concerned in this swindling transaction fell upon Aram. His garden was searched, and some of the goods found there. As, however, there was not evidence sufficient to convict him of any crime, he was discharged, and soon after set out for London, leaving his wife behind. For several years he travelled through parts of England, acting as usher in a number of schools, and settled finally at Lynn, in Norfolk. During his travels he had amassed considerable material for a projected Comparative Lexicon of the English, Latin, Greek, **Hebrew** and Celtic Languages. He was undoubtedly an original philologist, who realized, what was then not yet admitted by scholars, the affinity of the Celtic language to the other languages of Europe, and could dispute the then accepted belief that Latin was derived from Greek. But he was not destined to live in history as the pioneer of a new philology. In Feb. 1758 a skeleton was dug up at Knaresborough, and some suspicion arose that it might be Clark's. Aram's wife had more than once hinted that her husband and a man named Houseman knew the secret of Clark's disappearance. Houseman was at once arrested and confronted with the bones that had been found. After denials, he confessed that he had been present at the murder of Clark by Aram and another man, Terry, of whom nothing further was heard. He also gave information as to the place where the body had been buried in St. Robert's Cave, a well-known spot near Knaresborough. A skeleton was dug up here, and Aram was immediately arrested, and sent to York for trial. Houseman was admitted as evidence against him. Aram conducted his own defence, and did not attempt to overthrow Houseman's evidence, although there were some discrepancies in that; but made a skilful attack on the fallibility of circumstantial evidence in general, and particularly of evidence drawn from the discovery of bones. He brought forward several instances where bones had been found in caves, and tried to show that the bones found in St. Robert's Cave were probably those of some hermit who had taken up his abode there. He was found guilty, and condemned to be executed on Aug. 6 1759, three days after his trial. While in his cell he confessed his guilt. and asserted that he had discovered

a criminal intimacy between Clark and his own wife. On the night before his execution he made an unsuccessful attempt at suicide by opening the veins in his arm.

His story has been romanticized in verse by Thomas Hood ("The Dream of Eugene Aram") and in prose by Bulwer Lytton *(Eugene Aram).* Reports of the trial are in (Borrow's) *Celebrated Crimes,* the *Newgate Calendar, Tyburn Chronicle* and similar publications. The best study is E. R. Watson, *Eugene Aram* (1913).

ARAMAIC LANGUAGES: *see* SEMITIC LANGUAGES.

ARAMEANS, the former inhabitants of Aram, a country or north Semitic kingdom extending from the western borders of Babylonia to the highlands of western Asia. Their central city was Zenjirli to the north of Aleppo and here many inscriptions have been found. In the Septuagint and Vulgate the name of this territory appears as Syria and the Arameans were in race, language and religion a part of the north Semitic family.

ARANDA, PEDRO PABLO ABARCA DE BOLEA, COUNT OF (1719–98), Spanish minister and general, was born at the castle of Siétamo, a lordship of his family near Huesca, in Aragon, Aug. 1 1719. The first half of his life was spent alternately in travel, in soldiering and in diplomacy. He introduced the Prussian system of drill into the Spanish army, and was director-general of artillery under Ferdinand VI. He threw up that post because he was not allowed to punish fraudulent army contractors, and was for some time in disgrace. But he came into favour again under Charles III., and when riots in Madrid (1766) compelled the king to leave the capital, Aranda was summoned to restore order. As president of the council of Castile he showed himself an inflexible administrator, and carried out many important reforms.

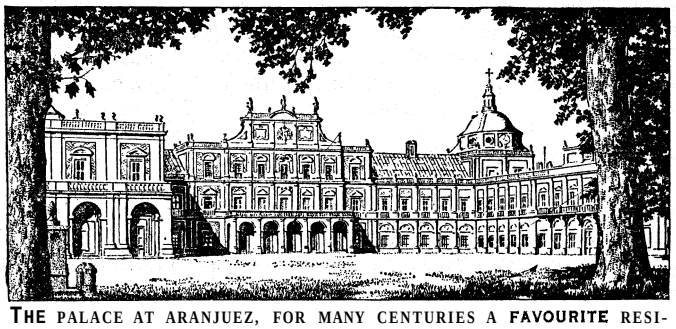
The chief event of his ministry, which lasted until 1773, was the expulsion of the Society of Jesus from Spain. During his travels Aranda had come under the influence of Voltaire, and he probably persuaded the king that the Jesuits were plotting against him. In 1767 the Order was expelled, its members being transferred to Italy. They suffered great hardships, and their brethren in South America, who were also expelled, suffered even more. Aranda's ability, his remarkable capacity for work, and his popularity made him indispensable to the king. But he was a trying servant, for his temper was captious and his tongue sarcastic, while his aristocratic arrogance led him to display an offensive contempt for the *golillas* (the stiff collars), as he called the lawyers and public servants whom the king preferred to choose as ministers, and he permitted himself an amazing freedom of language with his sovereign. He was held responsible for the diplomatic humiliation of Spain over the Falkland Islands, and at last, in 1773, Charles III. sent him as ambassador to Paris in a disguised disgrace. Aranda held this position till 1787.

In the reign of Charles IV., with whom he had been on familiar terms during the life of the old king, he was for a very short time prime minister in 1792. In reality he was merely used as a screen by the queen, Maria Louisa and her favourite, Godoy. His temper, which had become perfectly uncontrollable with age, made him insufferable to the king. He was imprisoned for a short time at Granada, and was threatened with a trial by the Inquisition. The proceedings did not go beyond the preliminary stage, and Aranda died at Epila, Jan. 9 1798.

Sre Don Jacobo de la Pezuela in the *Revista de España,* vol. xxv. (1872); Don Antonio Mª Fabié, in the *Dtccionario general de politica administracion* of Don E. Suarez Inclan (Madrid, 1868), vol. i.; M. Morel Fatio, *Études sur l'Espagne* (2nd series, Paris, 1890).

ARAN ISLANDS or SOUTH ARAN, three islands lying across Galway bay, on the west coast of Eire, in a southeasterly direction, forming a natural breakwater. They belong to County Galway, and their population was 2.109 in 1936. They are Inishmore (or Aranniore), the great island in the north; Inishman, the middle island; and Inisheer, the eastern island. The first has an elevation of 354 ft., the second of 259 ft., and the third of 202 ft. Their formation is carboniferous limestone. These islands are remarkable for a number of architectural remains of early date. In Inishmore there are remains of a circular cyclopean tower, called Dun-Aengus, ascribed to the Fir-holg or Belgae, or to Aengus, who reached Aran islands from Scotland in the 1st century A.D. There are seven similar structures in the group. Inishmore also bears the name of *Aran-na-naomh,* Aran-of-the-Saints, from the number of its religious recluses. On Inishmore are remains of the abbey of Killenda. When Christianity was introduced, Aran became one of the most famous island-resorts of religious teachers and ascetics. The total area of the islands is 18 sq.mi. The works of the Irish dramatist, John Millington Synge, are partly responsible for the general fame of the islands.

ARANJUEZ, a town of central Spain, 30 mi. S. of Madrid, on the Tagus, which above this receives few tributaries for a long distance, but here joins with the Jarama from the north. This



THE PALACE AT ARANJUEZ, FOR MANY CENTURIES A FAVOURITE RESIDENCE OF THE KINGS OF SPAIN

is the crossing point for the southern road and rail from Madrid. Pop. (1930) 15,245. The *vega* or united flats of the two rivers is very large and fertile and forms a market garden for Madrid (especially for asparagus and strawberries). Part is pasture for brood-mares, and the Hippodrome is the "Epsom Downs" of Madrid. The Grand Masters of the Order of Santiago moved from Ocaña (7 mi. S.E.) in the 14th century to this natural oasis. Their summer residence and the perpetual mastership passed to the crown in the 16th century, a succession of royal residences was built here, rivalling for a while the Escorial, Buen Retiro and San Ildefonso. Ferdinand VI. (1746–59) built the town, one of the few in Spain on a prearranged plan; it was closely associated with Charles IV. (1788–1808), for whom his father laid out the Jardín del Principe, and who built the Casa del Labrador (1803). Charles was forced to abdicate (1808).

See O. Jiirgens, *Die Spanische Stiidte* (Hamburg, 1926).

ARANY, JANOS (1817–1882), Hungarian poet, was born at Nagy-Szalontá on March 2, 1817. His family were small Calvinist yeomen of noble origin, whose property consisted of a rush-thatched cottage and a tiny plot of land. An only son, late born, seeing no companions of his own age, hearing nothing but the voices of his parents and the hymns and prayers in the little Calvinist chapel, Arany grew up a grave, gentle, and precocious child. From 1832 to 1836 Arany was a teacher, then a travelling actor. Remorse for the despair of his father, who had meant to make a pastor of this prodigal son, drove him home, carrying all his property tied up in a handkerchief. Shortly after his home-coming his mother died and his father became stone-blind. Arany at once resolved to remain with his father. He obtained a conrectorship and in 1840 a notaryship. He married Juliana Ercsey, the penniless orphan daughter of an advocate. The next few happy years were devoted to his profession and a good deal of miscellaneous reading, especially of Shakespeare (he learnt English in order to compare the original with his well-thumbed German version) and Homer. Meanwhile the reactionaries of Vienna were goading the Magyar Liberals into revolt, and Arany composed a satirical poem in hexameters, entitled "The Lost Constitution," for which he received a prize (1846) from the Kisfaludy Society, the great literary association of Hungary. He won a second prize with his *Toldi* (the first part of his epic trilogy), and found himself famous. Petofi was the first to greet him as a brother. In 1848 the people of Szalontá elected him their deputy to the Hungarian parliament. But neither then nor subsequently (1861, 1869) would he accept a parliamentary mdndate. In 1819-he was in the civil service of the revolutionary government, and after the final catastrophe returned to his native place, living as best he could on his small savings till 1850,

when Lajos Tisza, the father of Kálmán Tisza, the future prime minister, invited him to his castle at Geszt to teach his son Domokos the art of poetry. In the following year Arany was elected professor of Hungarian literature and language at the Nagy-Koros gymnasium. He also attempted to write another epic poem, but the time was not favourable for such an undertaking. The miserable condition of his country, and his own very precarious situation, weighed heavily upon his sensitive soul. Moreover, reflection on past events made clear to him not only the sufferings but the defects and follies of the national heroes, and a bitterly humorous vein in his writings dates from this time. Thus *Bolond Istók,* the first canto of which he completed in 1850, is full of sub-acrid merriment. During his nine years' residence at Nagy-Koros, Arany composed some beautiful Magyar ballads, and wrote two dissertations on the technique of the ballad in general: "Something concerning assonance" (1854), and "On Hungarian National Versification" (1856).

When the Hungarian Academy opened its doors again after a ten years' cessation, Arany was elected a member (1858). In 1860 he was elected director of the revived Kisfaludy Society, and went to Pest. In November, he started *Szépirodalmi Figyelö,* a monthly review of Magyar criticism and literature, better known by its later name, *Koszeru.* He also edited the principal publications of the society, including the translation of Shakespeare's works, to which he contributed the *Midsummer Night's Dream* (1864) *Hamlet* and *King John* (1867). The same year he won the Nádasdy prize of the Academy with his poem "Death of Buda." From 1865 to 1879 he was the secretary of the Hungarian Academy.

He issued an edition of his collected poems in 1867, and in 1880 won the Karácsonyi prize with his translation of the *Comedies of Aristophanes* (1880). In 1879 he completed his epic trilogy by publishing *The Love of Toldi* and *Toldi's Evening,* which were received with universal enthusiasm. He died suddenly on Oct. 24 1882. The first edition of his collected works was published in 1884–85.

Arany first gave Hungarian literature a national direction. He compelled the poetry of art to draw nearer to life and nature, extended its boundaries and made it more generally intelligible and popular. He wrote not for one class or school but for the whole nation. He introduced the popular element into literature, but at the same time elevated and ennobled it. What Petofi had done for lyrical he did for epic poetry. Yet there were great differences between them. Petofi was more subjective, more individual; Arany was more objective and national. As a lyric poet Petofi naturally gave expression to present moods and feelings; as an epic poet Arany plunged into the past. He took his standpoint on tradition. His art was essentially rooted in the character of the whole nation and its glorious history. His genius was unusually rich and versatile; his artistic conscience always alert and sober. His taste was extraordinarily developed and absolutely sure. To say nothing of his other great qualities, he is certainly the most artistic of all the Magyar poets.

See *Posthumous Writings and Correspondence of Arany,* edited by László Arany (Hung.) (1887–89); article "Arany," in *A Pallas Nagy Lexikona,* Kot 2 (Budapest, 1893); Mór Gaal, *Life of Janos Arany* (Hung.) (1898); L. Gyöngyösy, *János Arany's Life and Works* (Hung.) (1901). Translations from Arany; *The Legend of the Wondrous Hunt* (canto 6 of *Buda's Death),* by D. Butler (1881); *Toldi, poème en 12 chants* (1895); *Dichtungen* (Leipzig, 1880); *Konig Budas Tod* (Leipzig, 1879); *Balladen* (1886).

ARAPAHO, an Algonkin Plains tribe, bison hunting, and tepee dwelling, on the upper Platte and Arkansas rivers at the time of the first white settlement. In 1942 there were approximately 1,900 on reservations in Wyoming and Oklahoma. Besides the northern and southern divisions now recognized, there are submerged remnants of two or three other groups, once perhaps tribally independent, since they spoke distinct dialects; besides the Atsina or Gros Ventre, close to the Arapaho in speech, but chiefly associated with the Blackfoot during the 19th century. Arapaho is one of the most divergent Algonkin languages, suggesting that its speakers have been long separated from the body of the stock, presumably on or at the edge of the Plains. They were non-agricultural and clanless, kept a bundle containing a tubular pipe as tribal fetish and were divided into seven age-graded ritual societies for men and one for women, besides practising the Sun dance in elaborate form. Their ceremonial system, decorative art and other traits indicate them as one of the nuclear or typical tribes participating in Plains culture.

They adhered vigorously to the messianic Ghost dance religion of 1889–1891.

See A. L. Kroeber, *Bull. Amer. Museum Natural Hist.,* vol. xviii., 1902; G. A. Dorsey, *Field Mus. Publ. Anthr. Ser.,* vol. iv., 1903; Dorsey and Kroeber, *ibid.,* vol. v., 1903.

ARARAT, a municipal town in Ripon county (Western district) in about the S.W. centre of Victoria (Australia). It is situated towards the western end of the western Victorian highlands and is flanked on the south and east by a range of hills, the Pyrenees. The "mountains" in this area are worn-down plateau-like remnants of very early formations composed of rocks of granitic character. But in addition extensive lava-flows (basalt) have occurred and the soils derived from these are very fertile. Ararat, therefore, standing at about 1,030ft. above sea-level, and having a fairly regular rainfall of 23–24in. (mean annual) is the centre of a flourishing agricultural and pastoral area (wheat, vines, sheep, etc.). Gold mining (reef as well as alluvial gold from "deep leads"), besides quarrying, is carried on in the vicinity, and the excellent timber resources of the area have been exploited.

Ararat is a railway junction of local importance. It is situated on the main overland (Adelaide-Melbourne) line, about 130m. from Melbourne. The lines of the South-western system (Casterton, Hamilton) take off from here, and Portland and Warrnambool are rising ports of this area. Ararat's population has increased steadily from 3,580 in 1901 to 4,653 in 1921 (1940, 4,960)

ARARAT, the culminating point of the Armenian plateau, 17,000ft. above the sea. The *massif* of Ararat rises on the north and east out of the alluvial plain of the Aras, here from 2,500ft. to 3.000 ft. above the sea, and on the south-west sinks into the plateau of Bayezid, about 4,500ft. It is thus isolated on all sides but the north-west, where a *col* about 6,900ft. high connects it with a long ridge of volcanic mountains. Out of the *massif* rise two peaks, "their bases confluent at a height of 8,800ft., their summits about 7m. apart." The higher, Great Ararat, is "a huge broad-shouldered mass, more of a dome than a cone"; the lower, Little Ararat, 12,840ft., is "an elegant cone or pyramid, rising with steep, smooth, regular sides into a comparatively sharp peak" (Bryce). On the north and west the slopes of Great Ararat are covered with glittering fields of unbroken *névé.* The only true glacier is on the north-east side, at the bottom of a large chasm which runs into the heart of the mountain. The great height of the snow line, 14,000ft., is due to the small rainfall and the upward rush of dry air from the plain of the Araxes. The middle zone of Ararat, 5,000–11,500ft., is covered with good pasture, the upper and lower zones are for the most part sterile. There is poetical fitness in the legend that Ararat was the resting-place of Noah's Ark, inasmuch as this mountain is about equally distant from the Black Sea and the Caspian, from the Mediterranean and the Persian Gulf. Round Mt. Ararat gather many traditions connected with the Deluge. The Garden of Eden is placed in the valley of the Araxes; Marand is the burial-place of Noah's wife; at Arghuri, a village near the great chasm, was the spot where Noah planted the first vineyard, and here were shown Noah's vine and the monastery of St. James, until village and monastery were overwhelmed by a fall of rock, ice and snow, shaken down by an earthquake in 1840.

From the Armenian plateau Ararat rises in a graceful isolated cone far into the region of perennial snow. It was long believed by the Armenian monks that no one was permitted to reach the "secret top" of Ararat, with its sacred remains, but on Sept. 27, 1829, Dr. Johann Jacob Parrot (1792–1840) of Dorpat, a German in the employment of Russia, set foot on the "dome of eternal ice." Ararat has since been ascended by a number of climbers, among them D. W. Freshfield (1868), James Bryce (1876), A. V. Markov (1888), P. Pashtukhov and H. B. Lynch (1893). There are a number of glaciers in the upper portion, and

the climate of the whole district is very severe. The greater part of the mountain is destitute of trees, but the lower Ararat is clothed with birches.

Both Great and Little Ararat consist entirely of volcanic rocks, chiefly andesites and pyroxene andesites, with some obsidian. No crater now exists at the summit of either, but well-formed parasitic cones occur upon their flanks. There are no certain historic records of any eruption. (*See* also ASSYRIA.)

ARAROBA POWDER, a drug occurring as a yellowish-brown powder, varying in tint, which derives an alternative name —Goa powder—from the Portuguese colony of Goa, where it appears to have been introduced about the year 1852. The tree which yields it is *Andira araroba* of the natural order *Leguminosae*. It is met with in low and humid spots in the province of Bahia. The tree is from 80 to 100ft. high and has large imparipinnate leaves, the leaflets of which are oblong, about 1½in. long and ⅔in. broad, and somewhat truncate at the apex. The flowers are papilionaceous, of a purple colour and arranged in panicles. The Goa powder or araroba is contained in the trunk, filling crevices in the heartwood, and yields to hot chloroform 50% of crude chrysarobin, which has a definite therapeutic value and is contained in most modern pharmacopoeias. It occurs as a micro-crystalline, odourless, tasteless powder, very slightly soluble in either water or alcohol which contains pure chrysarobin ($C_{15}H_{12}O_3$), di-chrysarobin methylether ($C_{30}H_{23}O_6{\cdot}OCH_3$), di-chrysarobin ($C_{30}H_{24}O_7$). Chrysarobin is a methyl trioxyanthracene and exists as a glucoside in the plant, but is gradually oxidized to chrysophanic acid (a dioxy-methyl anthraquinone) and glucose.

The drug is a powerful irritant. Modern dermatologists use only chrysophanic acid, which may be applied externally and given by the mouth in doses of about one grain in cases of psoriasis and chronic eczema.

ARAS, the anc. *Araxes, Phasis* (Xenophon), *Ras* (Turkish and Arabian), *Yerash* (Armenian), *Rashki* (Georgian), a river which rises south of Erzerum, near the source of the Euphrates, in the Bingeul-dagh, and flows east through Armenia. It is about 600m. long, and its chief tributary, the Zanga, flows by Erivan and drains Lake Gokcha. It is a rapid muddy stream, dangerous when swollen by the melting snows of Armenia, but fordable in its ordinary state. It formerly joined the Kura; but in 1897 it changed its course, and now runs directly into the Caspian. On an island in the river stood Artaxata, the capital of Armenia from 180 B.C. to A.D. 50.

ARASON, JON (1484–1551), Icelandic bishop and poet, succeeded Gottskalk in the see of Holar in 1522; but he was soon driven out by the other Icelandic bishop, Ogmund of Skalholt. In 1548, when a large number of the islanders had accepted the reformed doctrines, Arason and Ogmund joined their forces and attacked the Lutherans. Civil war broke out, and in 1551 the bishop of Holar and two of his sons were captured and executed. Arason, who was the last Roman Catholic bishop in Iceland, is celebrated as a poet and as having introduced printing there.

ARATOR, of Liguria, a Christian poet, who lived during the 6th century. He was educated by Laurentius, archbishop of Milan, and Ennodius, bishop of Pavia. He practised as an advocate, and was appointed to an influential post at the court of Athalaric, king of the Ostrogoths. About 540 he took orders. He gained the favour of Pope Vigilius, to whom he dedicated his *De Actibus Apostolorum* (written about 544), which was much admired in the middle ages. A text was published by Hübner, 1850.

See Leimhach, "Der Dichter Arator," in *Theologische Studien und Kritik* (1873); Manitius, *Geschzchte der christlich-lateinischen Poesie* (1891).

ARATUS, of Soli in Cilicia, a minor Greek didactic poet, a contemporary of Callimachus and Theocritus, was born about 315 B.C. He resided at the courts of Antigonus Gonatas and Antrochus I. of Syria and died in Macedonia about 245 B.C. His only extant works are two short poems, or two fragments of his poem *Phainomeiza* written in hexameters; an imitation of a prose work on astronomy by Eudoxus of Cnidus, and *Diosēmeia* (on weather signs), chiefly from Theophrastus. The work has all the characteristics of the Alexandrian school of poetry. His poem attracted the notice of specialists, such as Hipparchus. Amongst the Romans it enjoyed a high reputation (Ovid, *Amores*, i. 15, 16). Cicero, Caesar Germanicus, and Avienus translated it; the two last versions and fragments of Cicero's are still extant. Virgil has imitated the *Prognostica* to some extent in the *Georgics*. One verse from the opening invocation to Zeus has become famous from being quoted by St. Paul (Acts xvii. 28).

ARATUS OF SICYON (271–213 B.C.) Greek politician. He set up a democracy in Sicyon (251) and brought it into alliance with the Achaean League (*q.v.*) of which he became the moving spirit, being elected general in alternate years. From 243, when he captured from Antigonus the fortress of Corinth, the League aimed at replacing Macedonian ascendancy in the Peloponnese by free democracy; Megalopolis joined in 234, Attica was freed in 229, and the League reached its zenith in 228 with the accession of Argos. But Aratus could not brook a rival, and rather than admit the supremacy of Cleomenes III. of Sparta (*see* CLEOMENES) he undid his own work and called in Antigonus Doson. Cleomenes was defeated (221), but the League became subject to Macedonia. Aratus was a skilful diplomatist but an unsuccessful general.

AN ARAUCANIAN INDIAN WOMAN OF CHILE WHO HAS ADOPTED THE EUROPEAN STYLE OF DRESS

ARAUCANIA, the name of a large territory of Chile, South America, south of the Bio-Bio river, belonging to the Araucanian Indians at the time of their independence of Spanish and Chilean authority. The loss of their political independence has been followed by that of the greater part of their territory, which has been divided up into the Chilean provinces of Arauco, Bio-Bio, Malleco and Cautin, and the Indians, much reduced in number now live in the wooded recesses of the three provinces last named.

ARAUCANIAN, a linguistic stock of South American Indians, comprising a number of different tribes, originally occupying a considerable area in central Chile. Some have regarded them as allied to the tribes of the Argentine Pampas, and therefore as invaders and immigrants in Chile, where the true Araucanians have probably long been residents, being quite distinct from the nomadic Puelchean tribes of the Pampas. Considerable invasions of the latter probably occurred in pre-Spanish times, when the originally sedentary Araucanian group was divided into two parts, the Picunche north of the Maule river, and the Huilliche from the Tolten river south to Chiloe. The newcomers who occupied the region in between, mixed with the older Araucanians and ultimately adopted their speech, although retaining something of their old nomad culture. They stopped the Inca conquest at the Maule, and successfully opposed the full strength of the Spanish forces for two hundred years—a struggle immortalized in Ercilla's epic poem entitled "La Araucana." Under

Spanish pressure considerable bodies of Araucanians moved eastward across the Andes into the Pampas, where since the latter part of the 16th and particularly in the 18th and early 19th centuries they occupied considerable areas.

The Araucanians were a sedentary, agricultural and hunting folk, living in numerous small villages, in houses of poles and thatch. In Araucania proper, these were small, for single families; elsewhere large and communal. Their clothing was of wool or skins, and generally rather meagre. They made considerable use of body painting but not of tattooing. The bow, spear and club (the club often flattened and bent at the end) were their main weapons, and hides or occasionally united strips of whalebone, together with skin shields served for body armour and protection. Reed and pole *balsas* or rafts were in use for coastwise navigation, while toward the south, three-plank boats, called *dalcas* with rudimentary sails, were known. The totemic clan was the basis of their social organization, the clan chiefs being the normal leaders of the rather scattered population. The elaborate and centralized form of government, with tribal chiefs and "national" leaders was a post-Spanish development. The Araucanians had no religious structures or temples, but had a well-developed religious ritual, centred in the veneration of the clan ancestors and the clan totems, puberty rites and victory in war. In the last mentioned case, human sacrifices occurred, with ritual cannibalism. The dead were normally buried, either in heavy, canoe-shaped wooden coffins, or in stone cists. Persons dying away from home were cremated.

See R. E. Latcham, *La organizacion social y las creencias religiosas de los antiguos Araucanos* (Pub. Museo de Etnologia y Antropologia de Chile vol. iii., pp. 245–868); J. T. Medina, *Los Aborijenes de Chile* (Santiago, 1882).

ARAUCARIA, a genus of coniferous trees included in the tribe *Araucarineae.* They are magnificent evergreen trees, with apparently whorled branches, and stiff, flattened, pointed leaves, found in Brazil and Chile, Polynesia and Australia. The name of the genus is derived from Arauco, the name of the district in southern Chile where the trees were first discovered. *Araucaria imbricata,* the Chile pine, or "monkey puzzle," was introduced into Britain in 1796. It is largely cultivated, and usually stands the winter of Britain; but in some years, when the temperature has fallen very low, the trees have suffered much. Care should be taken in planting to select a spot somewhat elevated and well drained. The tree grows to the height of 1 joft. in the Cordilleras of Chile. The cones are from 8 to 8½in. broad, and 7 to 7½in. long. The wood of the tree is hard and durable. This is the only species which can be cultivated in the open air in Britain. *Araucaria brasiliana,* the Brazilian pine, is a native of the mountains of southern Brazil, and was introduced into Britain in 1819. It is not so hardy as *A. imbricafa,* and requires protection during winter. It is grown in conservatories for half-hardy plants. *Araucaria excelsa,* the Norfolk Island pine, a native of Norfolk Island and New Caledonia, was discovered during Captain Cook's second voyage, and introduced into Britain by Sir Joseph Banks in 1793. It cannot be grown in the open air in Britain, as it requires protection from frost, and is more tender than the Brazilian pine. It is a majestic tree, sometimes attaining a height of more than 220ft. The scales of its cones are winged, and have a hook at the apex. *Araucaria Cunninghamii,* the Moreton Bay pine, is a tall tree abundant on the shores of Moreton Bay, Australia, and found through the littoral region of Queensland to Cape York Peninsula, also in New Guinea. It requires protection in England during the winter. *Araucaria Bidwilli,* the Bunya-Bunya pine, found on the mountains of southern Queensland, between the rivers Brisbane and Burnett, at 27° S. lat., is a noble tree, attaining a height of 100 to 150ft., with a straight trunk and white wood. It bears cones as large as a man's head. Its seeds are very large, and are used as food by the natives. *Araucaria Rulei,* which is a tree of New Caledonia, attains a height of 50 or 60ft. *Araucaria Cookii,* also a native of New Caledonia, attains a height of 150ft. It is found also in the Isle of Pines, and in the New Hebrides. The tree has a remarkable appearance, due to shedding its primary branches for about five-sixths of its height and replacing them by a small bushy growth, the whole resembling a tall column crowned with foliage, suggesting to its discoverer, Captain Cook, a tall column of basalt.

ARAUSIO, BATTLE OF. From 202 B.C., when the battle of Zama "gave the world to Rome," the tide of Roman expansion rolled onwards without serious check or menace for nearly a century. Then, however, a thunder-cloud gathered beyond the Alps which sent a shiver of fear through Italy. It was the first—and after it came a long interval—of the great migrations which lapped and ultimately submerged the bulwarks of Rome. The two principal tribes—or, really, nations—were the Cimbri and the Teutones, and after a pause of several years in Gaul they moved afresh towards Italy. So seriously was the menace viewed that the consul Maximus was sent (105 B.C.) with an army to reinforce the existing army of the proconsul Caepio. Caepio resented the loss of his independent authority, although he joined Maximus at Arausio (mod. Orange) on the lower Rhone. While Maximus was prudently negotiating, Caepio attacked the Cimbri single-handed, although having to fight with the river at his back. He was overwhelmed and the consular army was drawn into the disaster—comparable in scale with Cannae. Happily for Rome the Cimbri and Teutones inexplicably turned aside from Italy and followed the route to Spain. The disaster at Arausio and the urgent need to raise fresh forces gave the *coup de grâce* to the traditional system of citizen armies, already decaying, and supplied the impetus which enabled Marius, elected consul two months later, to develop the highly-trained long-service professional army. The new model was soon to be "christened" at Aquae Sextiae (Aix) (*q.v.*). (For an account of the modern town *see* ORANGE.)

ARAVALLI HILLS, an Indian mountain range; running for 300m. in a north-easterly direction, through the Rajputana states and the British district of Ajmere-Merwara, situated between 24° and 27° N., and between 72° and 73° East. The series of ridges and peaks, with breadth varying from 6 to 60m., are generally from 1,000 to 3,000ft. in elevation, the highest point, Mount Abu (5,650ft.), being in the extreme south-west. Geologically they belong to the primitive formation characteristic of the Indian Deccan-granite, compact dark blue slate, gneiss and syenite. Masses of rose-coloured quartz give a dazzling snow-like appearance to the peaks. The Luni and Sakhi rivers, from the steep north-western slopes, turn south-west to the Gulf of Cutch. Two distinct river systems drain the south-eastern slopes; one debouches in small streams on the Gulf of Cambay, while the other unites to form the Chambal river, a tributary of the Jumna and the Ganges system. The Aravalli hills are for the most part bare and thinly populated, with large areas of sand and stone, or huge masses of quartz. The valleys are generally sandy deserts, with sparse oases of cultivation. Occasionally, however, a fertile tract marks a natural drainage line, *e.g.,* that of Ajmer city, with its lake. The Aravalli hills send off rocky ridges north-east through the states of Alwar and Jaipur, which reappear in the form of isolated hills near Delhi.

ARAWAKAN, one of the most important and widely extended of the linguistic stocks of South American Indians, whose name is taken from the Arawaks, one of the earliest and best known tribes. The Guana, the most southerly tribe of this stock, were on the upper Paraguay river, in southern Matto Grosso in Brazil. The Moxos and Baures were in northern Bolivia, whence a practically continuous belt of Arawakan tribes extended northwards and north-westwards from the upper Tapajoz across the whole of the upper Amazon drainage to the mouth of the Orinoco and the Guiana coast. The Antis or Campas on the Apurimac river north-west of Cuzco in Peru were outlying members of the stock in the west, as were the Goajiras in the peninsula of the same name in Colombia. Tribes of this stock also held the whole northern and eastern coast of the continent from the Amazon delta to the Orinoco, and may, prior to the Carib invasions, have extended westward continuously through Venezuela far into Colombia. From the South American mainland they extended northward through the whole chain of the Antilles to the Bahamas. At the end of the 15th

century, however, the Caribs had ousted them from all the Lesser Antilles, and were beginning to raid the larger islands, held by tribes known as the Tainos, further north.

Physically the Arawakan tribes are in the main of medium or slightly under medium stature, and appear to be prevailingly brachycephalic or round-headed. Culturally they rank among the more advanced tribes of the eastern half of the continent, being sedentary agriculturalists and makers of excellent pottery and textiles.

BIBLIOGRAPHY.—See A. F. Chamberlain, "Nomenclature and Distribution of the Principal Tribes and Sub-tribes of the Arawakan Linguistic Stock" (Journ. *Soc. Americanistes* de Paris, n.s. vol. x. pp. 473–496); M. Schmidt, Die Aruaken (Leipzig, 1917).

ARBACES, according to Ctesias (Diodor. ii. 24 ff. 32), one of the generals of Sardanapalus, king of Assyria and founder of the Median empire about 830 B.C. But Ctesias's whole history of the Assyrian and Median empires is fabulous; his Arbaces and his successors are not historical personages. From the inscriptions of Sargon of Assyria we know one "Arbaku Dynast of Arnashia" as one of 45 chiefs of Median districts who paid tribute to Sargon in 713 B.C. *(See* MEDIA.)

ARBE (Serbo-Croatian RAB), an island in the Adriatic sea, forming the northernmost point of Dalmatia, Yugoslavia. Population 6,354. Arbe is 13 mi. long; its greatest breadth is 5 mi. The capital of the same name is a beautiful walled town on a steep ridge on the west coast. At the seaward end is the 13th-century cathedral, behind which the belfries of four churches, at least as ancient, rise in a row along the crest of the ridge; behind these again are the castle and a background of desolate hills. In another part of the island are excellent state forests. One of the palaces is the birth-place of Marco Antonio de Dominis. Fishing, agriculture, tobacco growing, marble quarrying, and the ancient silk industry are maintained. There are excellent springs. Arbe was occupied by Italy in World War II.

ARBELA (modern Erbil), an important foothill town in N.E. Mesopotamia (Iraq), about 48 mi. E. by S. of Mosul in 36° N. and 44° West. In ancient times Arbela (Arba-'ilu) formed one of the group of cities of Assur, the other members of the group being Ashur, Nineveh and Nimrud, all close to one another. It was, however, an old Sumerian settlement and its goddess appears to have been Ninlil, who there became the consort of the god Ashur. The town lies in the centre of a very productive wheat country, lying as it does on the edge of the mountains between the greater and lesser Zab, with a more abundant supply of water than to the south. The modern district still is engaged in the production of cereals, which are traded down the Tigris to Baghdad. Arbela has an estimated population of 25.000, most of whom are Kurds. It lies on the caravan route between Mosul and Baghdad. and Mosul and Rowanduz. It is also the projected terminus of a branch line from Mosul. Owing to its command of the foothill routes and its water supply, Arbela, unlike most other ancient cities in Mesopotamia, has preserved its position ever since early times. Arbela is the name popularly but not quite correctly given to the decisive battle in which Alexander the Great overthrew Darius and the Persian empire in 331 BC. *See* GAUGAMELA *(ARBELA).* BATTLE OF.

ARBER, EDWARD (1836–1912), English man of letters, was born in London on Dec. 4, 1536, and was killed in a taxi-cab accident in London on Nov. 23, 1912. Arber is associated with the "English Reprints" (1868–80), by which an accurate text of the works of many English authors, formerly only accessible in rare or expensive editions, was placed within reach of the general public. Among the 30 volumes of the series were Gosson's *School of Abuse,* Ascham's *Toxophilus,* Tottel's *Miscellany,* Naunton's *Fragmenta Regalia,* etc. It was followed by the "English Scholar's Library" which included the *Works* (1884) of Captain John Smith, governor of Virginia, and the *Poems* (1882) of Richard Barnfield. In his *English Garner* (1877–96) he made an admirable collection of rare old tracts and poems; in 1899–1901 he issued *British Anthologies,* and in 1907 began a series called *A Christian Library.* He also accomplished single-handed the editing of two invaluable bibliographies: *A Transcript of the Registers of the Stationers' Company, 1553–1640* (1875–94), and *The Term Catalogues, 1668–1709; with a number for Easter Term 1711* (1904–06), edited from the quarterly lists of the book-sellers.

ARBITRAGE, the term applied to the system of equalizing prices in different commercial centres by buying in the cheaper market and selling in the dearer. These transactions, or their converse, are mainly confined to stocks and shares, foreign exchanges and bullion, and are carried on between the various financial centres of the world. When prices are affected in any country by some local financial or political event of outstanding importance, all other markets are sooner or later influenced. For instance, a crisis in France would immediately depress all French securities, and by exciting the fears of capitalists, would stimulate transfers of funds and raise all the exchanges against France.

The scale of profit on arbitrage transactions varies with the risks entailed. Take for instance arbitraging in exchange. Dealing in francs between London and Paris in terms of sterling is a simple operation and the risk of loss is very small, since such transactions are almost invariably carried on by telephone and can be closed almost immediately. When on the other hand arbitrage dealers in London and Paris operate in guilders, Swiss francs or dollars, there is a double risk and the margins of profit aimed at are somewhat larger. Nevertheless, the slightest advantage in any market is put to profit, and International exchanges are adjusted with extreme rapidity.

For example, a dealer wishes to buy French francs which he can obtain in London at 176.70 and he telephones to his Paris correspondent asking him how he would buy sterling. If he bids 176.71, it is clear that Paris offers him an advantage of 1 cent per £ sterling. The dealer may, however, think that a still better rate can be obtained in the international market, and he rings up his agent in Amsterdam and asks him at what price he will sell French francs. The reply is fl. 4.933 for each frs. 100. in order to ascertain whether or not this offer is advantageous, the dealer has to learn the rate at which he can obtain the guilders with which to reimburse his Amsterdam agent and he finds that he can get fl. 8.73 per £: on this basis he calculates what will be the net outturn.

Arbitrage in exchanges is usually calculated by chain rule as follows:—

$$\frac{8.73 \times 100}{4.93\frac{3}{4}} = 176.81$$

Another example: When a purchase of Swiss francs is desired the arbitrageur finds that London sells Zürich at 20.72½ Swiss francs per £, Paris quotes 853.70 French francs for 100 Swiss francs, and New York offers Swiss francs at $22.57 per 100, and he can buy dollars from the "Control" in London at 4.68⅛. He figures by the chain rule, and as a result buys his Swiss francs in New York, buying dollars with which to do so in London:—

$$\frac{176.80 \times 100}{853.70} = 20.71$$

$$\frac{4.68\frac{1}{8} \times 100}{22.57} = 20.74$$

Pure arbitrage in foreign exchange has been curtailed by the establishment of Equalization Funds in various countries, the administrators of which funds "peg" the exchanges so that arbitrage profits are eliminated. The Tripartite Agreement between Great Britain, France and the United States is an outstanding example of how the arbitrageur is being squeezed out of the market. By agreement the participants "earmark" the gold for one another to cover the operations in exchange, in that way saving the heavy cost of freight and insurance which the arbitrageur has to pay in moving gold from one country to another.

Arbitrage in Stocks.—Arbitrage in stocks and shares is more complicated and fraught with considerably greater risks. The expense of transferring stocks from one country to another is heavy. Not only is interest lost while the actual stocks are travelling, but

in many countries bonds have to bear the burden of local stamps, and however high the stamp duty may be in one country, there is no reduction in the amount that must be paid to render bonds negotiable in another.

To give an example, Geduld Proprietary Mines are good delivery in London and also in Paris. The stamp duty in 1939 was 2 per cent in England, and about 3 per cent in France, so that before these shares could be actually transferred to London from Paris, with a profit to the dealers, allowance must be made for cost of insurance, shipping, brokers' commission, and the full stamp duties.

There are other elements of speculation that beset stock and share arbitrageurs, even if on both sides they are members of the Stock Exchanges of their respective countries and so avoid paying brokerages. When the London operator buys abroad, unless his seller elects to keep the result of his sale in sterling, the London buyer has to provide foreign currency and run the risk of any variation in the rate of exchange. He may find also that it is more costly to fix his exchange for forward delivery than for actual spot. Again, he is constantly up against Government restrictions of all sorts, both British and foreign, which are formulated whenever a Government desires to counteract any tendency on the part of its subjects to export capital and so depreciate its exchange. So long as these difficulties exist, the volume of business done by arbitrageurs in stocks and shares by no means keeps pace with any increase in the amount of stocks and shares dealt in in the Stock Exchanges of the world, and the tendency is for investors and speculators to send their Stock Exchange orders abroad to the country where the market is the most free and is the least penalised by taxes and restrictions.

Examples of arbitrage transactions with Paris and New York:—

LONDON TO PARIS

Bought in London:

100 East Geduld, 11 3/32		£1,109. 7. 6
Commission		7.10. 0
Contract Stamp		3. 0
Insurance		1. 0. 0
		£1,118. 0. 6

converted at 176.72 = frs. 197,577.37

Sold in Paris:

100 East Geduld at 20.43		frs. 204,300.00
Commission 2‰	frs. 408.60	
Insurance	792.00	1,200.60
		203,099.40

leaving a profit of frs. 5,522.03 at 176.72 = £31.5.0d.

LONDON TO NEW YOXK

Bought in London:

100 U. S. Steel at 50 1/8		£1,002.10. 0
Commission		5. 0. 0
Contract Stamp		3. 0
		£1,007.13. 0

Sold in New York:

100 U. S. Steel at 47 7/8		$4,787.50
Commission	$17.00	
Sales Tax	9.00	
Borrowing Tax	4.00	30.00
		$4,757.50

Dollars sold at 468.32 = £1,016.1.8d., leaving an arbitrage profit of £8. 7. 6d.

It often happens that the margin of profit is not as big as the examples quoted, so it follows that in order to save the expense of shipping, insurance, stamps, etc., the arbitrageur endeavours to turn his position by re-buying abroad and selling in London.

Operations in Gold.—For restoring the equilibrium of international balances, recourse is frequently had to gold and again the arbitrageur exercises his ingenuity in finding out where gold can be obtained at the cheapest rate and whether, after he has paid expenses, the net outturn will be better than remittance by telegraphic transfer. The profit is often small, as will be seen by the following example in which the arbitrageur buys 174 bars of gold and sells his exchange a week ahead at 4.67½, making a profit of £354.14.5d:—

Purchase in London:

Say 174 bars. Fine ozs. 70,244.097 at 148/6½	£521,708.15. 2
Plus buying commission, ¼‰	130. 8. 6
	£521,839. 3. 8
Freight, £521,500 at 5s.6d. per cent	1,434. 2. 6
Insurance, £532,000 at 2s.6d. per cent	665. 0. 0
Boxes and packing	8.16. 0
Consular invoice	10.10
Interest, 7 days at 1%	100. 9. 8
	£524,048. 2. 8

Realization in New York:

Fine ozs. 70,242.678 at $35.00		$2,458,493.72
Less ¼‰ and $1 per 1,000 ozs. melting (U. S. Assay Office charges)		6,216.74
		$2,452,276.98
Trucking charges and Customs entry in New York	$80.57	
New York Bank's handling commission	613.07	693.64
		$2,451,583.34

at 4.67½ = £524,402.17s.0d.

If the arbitrageur could only sell his dollars at 4.68, for the $2,452,276.98 he would only obtain £523,842.16s.0d., leaving him a loss of £200.

Sometimes, when exchanges are under such strict control that exchange arbitrage is rendered almost impossible, it occurs that arbitrage in stocks and shares becomes simpler and more active for this reason. In normal times if one contemplated doing business of this nature, it is necessary if one wishes to avoid speculation as much as possible, to guard not only against fluctuations in the prices of the stocks dealt in, but also against possible adverse movements in exchanges. For instance, if the arbitrageur buys U. S. Steel shares in London and sells them in New York, the estimated profit might vanish, or even turn into a loss, if the value of the pound sterling were to depreciate materially in New York before he covered his exchange. A transaction that would leave a normal profit if the pound were obtainable at $4.68 might result in a loss if the exchange were to move to $4.70 before he had time to purchase his sterling. But when the dollar-sterling exchange is under strict control both in Great Britain and in the United States, the rate of exchange does not play so important a part in the transaction. which can be covered at leisure without undue risk.

Arbitrage in stocks and shares is continuous between the London and the Provincial stock exchanges. Exchange does not enter into these transactions at all. Nor does it to any appreciable extent in arbitrage between London and Johannesburg. A very large volume of business is done in gold mining shares between these two cities.

Before China was forced off the silver standard on Nov. 4, 1935, a large and profitable arbitrage business used to be done in that metal between London and Shanghai. The method was a simple one. If the arbitrageur foresaw a profit in shipping silver from China to London he could at all times sell it "forward" in London, as there has been for a very long time an official quotation on the London market for silver for delivery in two months' time. On the other hand if he visualized a profit in buying silver in London and shipping it to Shanghai, he could buy it either for prompt delivery or for delivery in two months' time. The advantage of the latter would be that, should the Anglo-Chinese exchange veer round during the interval between the purchase of the silver and its delivery, he could reverse his position by reselling his silver in London and, simultaneously, reselling

his sterling in Shanghai, thereby saving the cost of freight and insurance twice over and also the loss of interest while the silver was in transition. This, in fact, was very frequently done. The arbitrageur did not confine himself to direct business between Shanghai and London. Considerable arbitrage transactions took place also with India and the United States. Should China at any future time return to a silver standard there is no doubt but that arbitrage in silver with that country would be resumed.

To be a successful arbitrageur, it is of vital importance to be well informed, to be quick so as to get in before one's competitors, and to have a reliable and energetic counterparty. Tendencies change very rapidly and demands or supplies of stocks, shares and exchange are rapidly filled up. (S.; E. L. F.)

ARBITRATION, a term derived from the nomenclature of Roman law, and applied to an arrangement for taking, and abiding by, the judgment of a selected person in some disputed matter, instead of carrying it to the established courts of justice. In disputes between States, arbitration has long played an important part. (*See* ARBITRATION, INTERNATIONAL.) The present article is restricted to arbitration under municipal law; but a separate article is also devoted to the use of arbitration in labour disputes. (*See* INDUSTRIAL RELATIONS.)

Law **of** England. — The law of England as to arbitration is now substantially included in the Arbitration Act, 1889, and certain amending statutes. The principal act is an express code as to proceedings in all arbitrations, but "criminal proceedings by the Crown" cannot be referred under it (ss. 13, 14). The statute subdivides its subject matter into two headings: I., References by consent out of court; II., References under order of court.

I. Here the first matter to be dealt with is the submission. **A** submission is defined as a written agreement to submit present or future differences to arbitration, whether a particular arbitrator is named in it or not. The capacity of a person to agree to arbitration, or to act as arbitrator, depends on the general law of contract. **A** submission by an infant is not void, but is voidable at his option. (*See* INFANT.) Counsel has a general authority to deal with the conduct of an action, which includes authority to refer it to arbitration, but he has no authority to refer an action against the wishes of his client, or on terms different from those which his client has sanctioned; and if he does so, the reference may be set aside, although the limit put by the client on his counsel's authority is not made known to the other side when the reference is agreed upon (*Neale* v. Gordon Lennox, 1902, A. C. 465). The committee of a lunatic, with the sanction of the judge in lunacy, may refer disputes to arbitration. (See INSANITY IN LAW.) As an arbitrator is chosen by the parties themselves, the question of his eligibility is of minor importance; and where an arbitrator has been chosen by both parties, the courts are reluctant to set the appointment aside. This question has arisen chiefly in contracts for works, which frequently contain a provision that the engineer shall be the arbitrator in any dispute between the contractor and his own employer. The practical result is to make the engineer judge in his own cause. But the courts will not in such cases prevent the engineer from acting, where the contractor was aware of the facts when he signed the contract, and there is no reason to believe that the engineer will be unfair (Ives and Barker v. *Willans,* 1894, 2 Ch. 478; *Hickman &* Co. v. Roberts, 1913, A. C. 229). So, too, where a barrister was appointed arbitrator, the court refused to stay the arbitration on the mere ground that he was the client of a firm of solicitors, the conduct of one of whom was in question (Bright v. River Plate Construction Co., 1900, 2 Ch. 835). The Arbitration Act, 1889, provides that a submission, unless a contrary intention is expressed in it, is irrevocable except by leave of the court or a judge, and is to have the same effect in all respects as if it had been made an order of court. Provision is made for failure to appoint arbitrators or umpires. The court may compel parties to carry out an arbitration, not only in the above cases by directly appointing an arbitrator, etc., or by allowing one appointed by a party to proceed alone with the reference, but also indirectly by staying any proceedings before the legal tribunals to determine matters which come within the scope of the arbitration. Where the agreement to refer stipulates that the submission of a dispute to arbitration shall be a condition precedent to the right to bring an action in regard to it, an action does not lie until the arbitration has been held and an award made. The court will refuse to stay proceedings where the subject matter of the litigation falls outside the scope of the reference, or there is some serious objection to the fitness of the arbitrator, or some other good reason of the kind exists. Under the Arbitration Clauses (Protocol) act, 1924, proceedings may also be stayed in respect of matters to be referred to arbitration in pursuance of agreements to which the protocol of Sept. 24, 1923, on arbitration clauses applies.

An arbitrator is not liable to be sued for want of skill or for negligence in conducting the arbitration (*Pappa* v. Rose, 1872, L.R. 7 C.P. 525). When a building contract provides that the certificate of the architect, showing the final balance due to the contractor, shall be conclusive evidence of the works having been duly completed, the architect occupies the position of an arbitrator, and enjoys the same immunity from liability for negligence in the discharge of his functions (Chambers v. *Goldthorpe,* 1901, 1 Q.B. 624).

An arbitrator (and the following observations apply *mutatis mutandis* to an umpire after he has entered on his duties) has power to administer oaths to, or take the affirmations of, the parties and their witnesses; and any person who wilfully and corruptly gives false evidence before him may be prosecuted and punished for perjury (Arbitration act, 1889, sched. i. and s. 22). At any stage in the reference he may, and shall if he be required by the court, state in the form of a special case for the opinion of the court any question of law arising in the arbitration. The arbitrator may also state his award in whole or in part as a special case (*ibid.* s. 19), and may correct in an award any clerical mistake or error arising from an accidental slip or omission. The costs of the reference and the award — which, under sched. i. of the act, must be in writing unless the submission otherwise provides — are in the arbitrator's discretion, and he has a lien on the award and the submission for his fees, for which — if there is an express or implied promise to pay them — he can also sue (Crampton v. Ridley, 1887, 20 Q.B.D. 48). **A** professional man, undertaking the duties of arbitrator without any stipulation as to payment, cannot be presumed to be giving his services gratuitously, and is therefore entitled to remuneration (*Macintyre* Bros. v. Smith, 1913, S.C. 129, p. 132).

If there is no express provision on the point in the submission, an award under the Arbitration act 1889 must be made within three months after the arbitrator has entered on the reference, or been called upon to act by notice in writing from any party to the submission. The time may, however, be extended by the arbitrator or by the court. An umpire is required to make his award within one month after the original or extended time appointed for making the award of the arbitrators has expired, or any later day to which he may enlarge it. The court may by order remit an award to the arbitrators or umpire for reconsideration, in which case the reconsidered award must be made within three months after the date of the order. An arbitrator is a competent witness in an action to enforce his award, and in modern practice in commercial arbitrations he is entitled to support in the arbitration or before an umpire, the case of the party appointing him.

An award must be *intra* vires; it must dispose of all the points referred; and it must be final, except as regards certain matters of valuation, etc. (see In Re *Stringer* and Riley Brothers, 1901, 1 K.B. 105). An award may, however, be set aside where the arbitrator has misconducted himself (an arbitrator may also be removed by the court on the ground of misconduct), or where it is ultra vires, or lacks any of the other requisites — above mentioned — of a valid award, or where the arbitrator has been wilfully deceived by one of the parties, or some such state of things exists. An award may, by leave of the court, be enforced in the same manner as a judgment or decree to the same effect. Provisions for the arbitration of special classes of disputes are contained in many acts of parliament; *e.g.,* the Acquisition of **Land**

(Assessment of Compensation) act, 1919, the Agricultural Holdings act, 1923, the Small Holdings and Allotments acts, 1908–26, the Light Railways acts, 1896 and 1912, the Lands Clauses acts, the Housing act, 1925, the Rating and Valuation act, 1925, and the Workmen's Compensation act, 1925–26. In 1892 a chamber of arbitration for business disputes was established by the joint action of the corporation of the City of London and the London Chamber of Commerce. The London Chamber, or as it is now styled, Court of Arbitration is simply a joint committee of persons nominated partly by the City Corporation and partly by the London Chamber of Commerce, which appoints arbitrators to deal with disputes referred to it irrespective of the nationality of the parties.

II. The court or a judge may refer any question arising in any cause or matter to an official or special referee, whose report may be enforced like a judgment or order to the same effect. This power may be exercised whether the parties desire it or not. The official referees are salaried officers of court. The remuneration of special referees is determined by the court or judge. An entire action may be referred, if all parties consent, or if it involves any prolonged examination of documents, or scientific or local examination, or consists wholly or partly of matters of account. (See the Supreme Court of Judicature [Consolidation] act, 1925, ss. 88–97.)

Scots Law.—The Arbitration (Scotland) act, 1894, unlike the English Arbitration act, 1889, did not codify the previously existing law, and it becomes necessary, therefore, to deal with that law in some detail. It differs in important particulars from the law of England. Although (as in England apart from the Arbitration act, 1889) there is nothing to prevent a verbal reference, submissions are generally not merely written but are effected by deed. The deed of submission first defines the terms of the reference, the name or names of the arbiters or arbitrators, and the "oversman" or umpire, whose decision in the event of the arbiters differing in opinion is to be final. Formerly, where no oversman was named in the submission, and no power given to the arbiters to name one, the proceedings were abortive if the arbiters disagreed, unless the parties consented to a nomination. But under the Arbitration (Scotland) act, 1894, s. 4, where arbiters differ in opinion, they, or, if they fail to agree on the point, the court, on the application of either party, may nominate an oversman whose decision is to be final. The deed of submission next gives to the arbiters the necessary powers for disposing of the matters referred (*e.g.*, powers to summon witnesses, to administer oaths and to award expenses) and specifies the time within which the "decree arbitral" is to be pronounced. If this date is left blank, practice has limited the arbiter's power of deciding to a year and a day, unless, having express or clearly implied power in the submission, he exercises this power, or the parties expressly or tacitly agree to its prorogation. The deed of submission then goes on to provide that the parties bind themselves, under a stipulated penalty to abide by the decree arbitral, that, in the event of the death of either of them, the submission shall continue in force against their heirs and representatives, and that they consent to the registration, for preservation and execution, both of the deed itself and of the decree arbitral. The power to enforce the award depends on this last provision. Under the common law of Scotland a submission of future disputes or differences to an arbiter, or arbiters, unnamed, was ineffectual except where the agreement to refer did not contemplate the decision of proper disputes between the parties, but the adjustment of some condition, or the liquidation of some obligation, contained in the contract of which the agreement to submit formed a part. And by the Arbitration (Scotland) act, 1894, s. 1., an agreement to refer to arbitration is not invalid by reason of the reference being to a person not named, or to be named by another, or to a person merely described as the holder for the time being of any office or appointment. An arbiter who has accepted office may be compelled by an action in the court of session to proceed with his duty unless he has sufficient cause, such as ill-health or supervening interest, for renouncing. The court may name a sole arbiter, where provision is made for one only and the parties cannot agree (Arbitration [Scotland] Act, 1894, s. 2); and may name an arbiter where a party having the right or duty to nominate one of two arbiters will not exercise it (ibid. s. 3). Scots law as to the requisites of a valid award is practically identical with the law of England. The grounds of reduction of a decree arbitral are "corruption," "bribery," "false hood" (Scots Act of Regulations, 1695, s. 2j). An attempt was made to include, under the expression "constructive corruption," among these statutory grounds of reduction, irregular conduct on the part of an arbitrator, with no suggestion of any corrupt motive. But it was definitely overruled by the House of Lords (*Adams* v. Great *North* of Scotland Railway [1891], **A.** C. 31). The statutory definition of the grounds of reduction was intended, however, merely to put an end to the practice which had previously obtained of reviewing awards on their merits, and it does not prevent the courts from setting aside an award where the arbitrator has exceeded his jurisdiction, or disregarded any one of the expressed conditions of the submission, or been guilty of misconduct. The original rule was that a private arbiter could not demand remuneration except in virtue of contract, or by implication from the nature of the work done, or if the reference was in pursuance of some statutory enactment (c g., the Lands Clauses [Scotland] act, 1845, s. 32). The view taken by the courts of this question in modern times is expressed in the case of Mncintyre Bros. v. Smith, cited on p. 219.

Judicial references have been long known to the law of Scotland. When an action is in court the parties may at any stage withdraw it from judicial determination, and refer it to arbitration. This is done by minute of reference to which the court interpones its authority. When the award is issued it becomes the judgment of the court. The court has no power to compel parties to enter into a reference of this kind, and it is doubtful whether counsel can bind their clients in such a matter. A judicial reference falls like the other by the elapse of a year; and the court cannot review the award on the ground of miscarriage. By the Court of Session act, 1850, s. 50, a provision is introduced whereby parties to an action in the supreme court may refer judicially any issue for trial to one, three, five or seven persons, who shall sit as a jury and decide by a majority.

Law of Ireland.—The Arbitration act, 1889, did not extend to Ireland. There has been no independent legislation on the subject since the treaty of 1922, either in Northern Ireland or in the Irish Free State. In both, the Common Law Procedure (Ireland) act, 1856, provides, on the lines of the English Common Law Procedure act, 1854, for the conduct of arbitrations and the enforcement of awards. Irish statute law, both before and since the establishment of the Free State, contains numerous provisions for arbitration under special enactments.

Indian and Colonial Law.—The provisions of the English Arbitration act, 1889, have in substance been adopted by the Indian Legislature (see act ix. of 1899), and by many of the colonies; *e.g.*, No. 24 of 1898, Natal; c. 20 of 1899, Bahamas; No. 10 of 1895, amended by No. 4 of 1923, Gibraltar; No. 29 of 1898, Cape of Good Hope: s. 7 of this last statute excluded from submission to arbitration criminal cases, so far as prosecution and punishment are concerned, and, without the special leave of the court, matters relating to status, matrimonial causes, and matters affecting minors or other persons under legal disability; Trinidad and Tobago, No. 35 of 1898; Ontario, No. 3j of 1909 (consolidating), No. 36 of 1909 (appointment of Chambers of Arbitration); Leeward Islands, No. 11 of 1907; Saskatchewan, No. 20 of 1920 (consolidating); Nigeria, No. 17 of 1914; Federated Malay States, No. 17 of 1912; Victoria, No. 2,265 of 1910. In Newfoundland the Board of Trade was authorized in 1910 (No. 1 of 1910) to appoint committees of arbitration and committees of appeals to decide matters voluntarily referred to them. The award of any such committee is to have the effect of a judgment of the supreme court.

Law **of** France.—Voluntary arbitration has always been recognized in France. In cases of mercantile partnerships, arbitration was formerly compulsory, but in 1856 (law of July 17, 1856) jurisdiction in disputes between parties was conferred on the Tribunals of Commerce (as to which see ***Code de Commerce,***

arts. 615 *et* seq.). The subject is fully dealt with in the Code de *Procédure* Civile (arts. 1,003–1,028). The submission to arbitration (*compromis*) must, on pain of nullity, be acted upon within three months from its date (art. 1,007). The submission terminates (i.) by the death, refusal, resignation or inability to act of one of the arbitrators; (ii.) by the expiration of the period agreed upon, or of three months if no time had been fixed; (iii.) by the disagreement of two arbitrators, unless power be reserved to them to appoint an umpire (art. 1,012). An arbitrator cannot resign if he has once commenced to act, and can only be relieved on some ground arising subsequently to the submission (art. 1,014). Each party to the arbitration is required to produce his evidence at least 15 days before the expiration of the period fixed by the submission (art. 1,016). If the arbitrators, differing in opinion, cannot agree upon an umpire (*tiers* arbitre), the president of the Tribunal of Commerce will appoint one, on the application of either party (art. 1,017). The umpire is required to give his decision within one month of his acceptance of the appointment; before making his award, he must confer with the previous arbitrators who disagreed (art. 1,018). Arbitrators and umpire must proceed according to the ordinary rules of law, unless they are specially empowered by the submission to proceed as amiables *compositeurs* (art. 1,019). The award is rendered executory by an order of the president of the Civil Tribunal of First Instance (art. 1,020). Awards cannot be set up against third parties (art. 1,022), or attacked by way of opposition. An appeal against an award lies to the Civil Tribunal of First Instance, or to the court of appeal, according as the subject matter, in the absence of arbitration, would have been within the jurisdiction of the justice of the peace, or of the Civil Tribunal of First Instance (art. 1,023).

Up to the end of 1925 the law of arbitration in France had regard only to the submission of existing disputes, although clauses were sometimes incorporated into contracts providing that they should be governed by English law and thus rendering the reference of future disputes possible. The law of Dec. 31, 1925, for the first time makes general arbitration valid in French law (Sirey, Lois Ann., 1925). A law of June 21, 1924, codifies the law as to arbitration between master and servant, the institution of arbitration courts for dealing with differences, the election of judges, and the extent of their jurisdiction. The law becomes part, and is entitled Book IV., of the Code du Travail.

Other Foreign Laws.—The provisions of French law as to arbitration were followed in Belgium (Code de Proc. *Civ.*, arts. 1,003 et seq.); and a convention (July 8, 1899) between France and Belgium regulates, *inter alia,* the mutual enforcement of awards. The law of France was also reproduced in substance in Holland (Code of Civil Procedure, art. 62 et seq.). The German Imperial Code of Procedure did not create any system of arbitration in civil cases. The matter is at present regulated by the Code of Civil Procedure, 1879 (arts. 1,025 et seq.). Courts of Arbitration, connected with large trade associations, chambers of commerce and stock exchanges were set up. Provision is made for the reference of existing or future disputes. The reference is to two arbitrators, unless the submission otherwise provides. If the arbitrators reach a deadlock and notify it to the parties, the submission is void. There is apparently no provision for the appointment of an umpire. An order of court is necessary for the enforcement of the award. The law is unsatisfactory and its early amendment is considered probable (43 Law Quarferly Review, 205). Spain followed the French Law (Code Civ. Proc., arts. 1,003–1,028; Civil Code, arts. 1,820–1,821). In Norway the "Arbitration Bureau for Goods," which had been operating in connection with the exchange since 1870, was in 1905 rearranged and subjected to a new regulation as "the Arbitration Bureau of the Exchange." See also the following foreign laws: Brazil C.C. arts. 1,037–1,048; Japan, general law, Code Civ. Proc., and special provisions for mediation, as regards leased lands and houses, Nos. 41 and 339 of 1922, and 17 of 1924, and as regards commercial cases, No. 42 of 1926.

The legality of agreements for genera1 arbitration was recognized by a protocol signed at Geneva under the League of Nations on Sept. 24, 1923. This occasioned the Act of Great Britain, chap. 39 of 1924; the French law of Dec. 31, 1925, above mentioned, and those laws of other ratifying States.

The United States.—Beginning with the English common law of arbitration as it existed in the early 18th century, including perhaps the substance of 9 and 10 William III. ch. 15 (Shriver v. State, Md., 1837, 9 Gill and J. 1; contra, Shearer v. Mooers, Mass., 1837, 19 Pickering 308), the several jurisdictions of the United States have in the past deviated far less from that system than has the mother country. Thus, the dictum in *Vynior's* Case (1609, 8 Coke 81 b) as to revocability and the doctrine of the illegality of attempts to "oust the court of its jurisdiction" are still put forth as common law (Cochrane v. Forbes, 1926, 257 Mass. Rep. 13j. Echoes are still found in cases of a rule going back to feudal times excluding titles to realty from the list of arbitral matters (*Bunnel* v. Reynolds, 1920, 205 Mo. App. 653). The rule that none but actual controversies already arisen can be made the subject of an agreement of arbitrators is still repeated (Cocalis v. *Nazlides,* 1923, 308 Ill. 152). Though there are numerous references in the statute books to arbitration in particular cases such as disputes among stockholders of corporations, in the main the statutes prior to the New York Act of 1920 (except in Pennsylvania) hardly went beyond 9 and 10 William III. ch. 15, making it possible by agreement to give to a submission the quality and effect of a rule of court.

Among the causes contributing to the tardiness of this legislation were the spirit and the letter of several clauses in the Federal and State Constitutions, such as those making the courts coordinate with the legislatures and those pertaining to the right of trial by jury and to due process of law. In fact, the question of the constitutionality of arbitration statutes is still occasionally raised in the courts (Cf. *Exell* v. Rocky *Mountain* Bean and Elevator Company, Colorado, 1925, 232 Pacific Rep. 680). Compulsory arbitration unless accompanied by adequate provisions for an appeal to the ordinary courts has been deemed unconstitutional (St. Louis, I. M. and *S.* Ry. Co. v. *Williams,* 1887, 49 Ark., 492; In re compulsory *arbitration,* 1886, 9 Colo. 629). When such appeal is provided for, as in the Pennsylvania Act of 1836, compulsory arbitration has been upheld.

Blackstone (3 *Com.* 16) speaks of an award as the equivalent of "the agreement of the parties, or the judgment of a court of justice." As between the views assimilating the award to the one or the other, with their corollary treatment of the arbitrators as agents or as judges, and of the entire proceeding as a business negotiation or as a mode of trial, the tendency of the U.S. courts has been generally in the direction of the view that arbitration is essentially a mode of trial. At least holdings are found contrary to those in England under the common law: giving arbitrators judicial exemption from civil liability for mistakes or even fraud in the performance of their functions; allowing them to tax their own costs; to correct errors after an award is made; and many minor points (Harvard Law Review, xl., 129).

In spite of this conservatism of the courts and the legislature the use of arbitration has increased in the United States for commercial matters, largely under the influence of chambers of commerce and trade associations. The New York State Chamber of Commerce has printed (1913) its earliest arbitration records, consisting of minutes of its committees from 1779 to 1792. The Year Book on Commercial Arbitration in the United States for 1927 contains the provisions for arbitration including forms, rules and regulations, and panels of arbitrators in trade associations in 30 principal branches of commerce, and a comprehensive list of chambers of commerce, exchanges, municipal courts, legal aid societies, and bar associations furnishing arbitration facilities in every part of the country. The attitude of bar associations, and particularly

the American Bar Association, has been friendly and, in view of a possible conflict of interest, even generous. Largely through the efforts of the latter there has been passed a Federal arbitration act (in effect Jan. 1. 1926) limited, of course, to types of disputes cognizable in the Federal courts (cases in admiralty, inter-state commerce, diversity of citizenship) and excluding employment contracts even from these. The act embodied, like the earlier New York (1921) and New Jersey (1923) acts and the contemporary Massachusetts (1925) and Oregon (1925) acts, these three principles: arbitration agreements in writing are valid; they are made enforceable and irrevocable; they may embrace matters not yet in dispute. With the exception of the provision for future disputes these principles are also embodied in the act drafted (1925) by the Commissioners on Uniform State Laws affiliated with the American Bar Association (adopted in Nevada, 192j, North Carolina, 1927, Wyoming, 1927). Provision is further made for guidance by the court on questions of law, for the aid of the court in compelling the attendance and testifying of witnesses, for a limited judicial review, and, in the case of the Uniform act, for provisional and ancillary remedies for the preservation of the property involved and for securing satisfaction of the award.

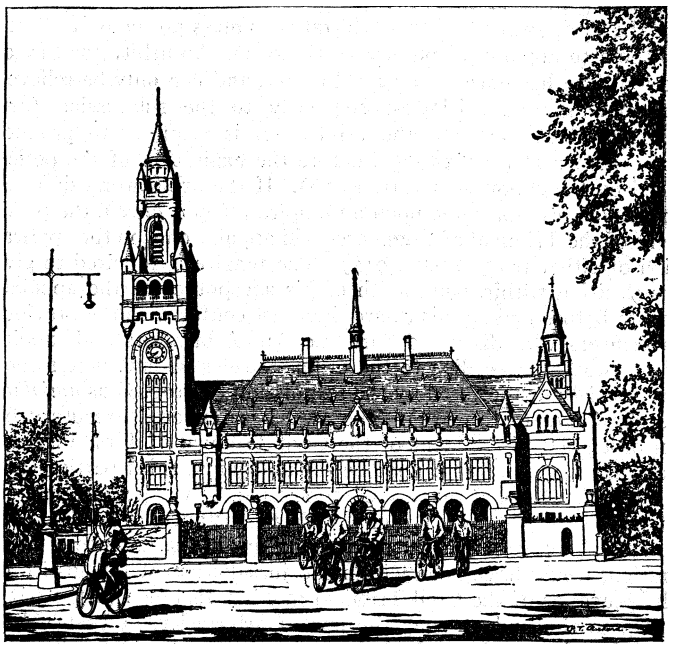
ARBITRATION, INTERNATIONAL. International arbitration is a proceeding in which two nations refer their differences to one or more selected persons, who, after affording to each party an opportunity of being heard, pronounce judgment on the matters at issue. It is understood, unless otherwise expressed, that the judgment shall be in accordance with the law by which civilized nations have agreed to be bound, whenever such law is applicable. Arbitration differs from mediation (*q.v.*) in so 6ar as it is a judicial act, whereas mediation involves no decision, but merely advice and suggestions to those who invoke its aid.

Arbitral Tribunals. — An international arbitrator may be the chief of a friendly power, or he may be a private individual. When he is head of a state he is not expected to act personally; he may appoint a delegate or delegates to act on his behalf, and avail himself of their labours and views, the ultimate decision being his only in name. In civil arbitration an arbitrator cannot delegate his office without express authority. The analogy between the two fails to hold good in another respect also. In civil arbitration, the decision or award may be made a rule of court, after whicli it becomes enforceable by writ of execution against person or property. An international award cannot be enforced directly; in other words it has no legal sanction behind it. Its obligation rests on the good faith of the parties to the reference, and on the fact that, with the help of a world-wide press, public opinion can always be brought to bear on any state seeking to evade its moral duty. The obligation of an ordinary treaty rests on precisely the same foundations. Where there are two or any other even number of arbitrators, provision is usually made for an umpire. (See BERING SEA ARBITRATION and "ALABAMA" ARBITRATION.)

Arbitral tribunals may have to deal with questions either of law or fact, or of both. When they have to deal with law only, that is to say, to lay down a principle or decide a question of liability, their functions are judicial or quasi-judicial, and the result is arbitration proper. Where they have to deal with facts only; *e.g.*, the evaluation of pecuniary claims, their functions are administrative rather than judicial, and the term commission is applied to them. "Mixed commissions," so calied because they are composed of representatives of the parties in difference, have been frequently resorted to for delimitation of frontiers, and for settling the indemnities to be paid to the subjects of neutral powers in respect of losses sustained by non-combatants in times of war or civil insurrection.

Awards. — International awards, as already stated, differ from civil awards in having no legal sanction by which they can be enforced. On the other hand, they resemble civil awards in that they may be set aside; *i.e.*, ignored, for sufficient reason, as, for example, if the tribunal has not acted in good faith, or has not given to each party an opportunity of being heard, or has exceeded its jurisdiction. An instance under the last head occurred in 1831, when it was referred to the king of the Netherlands as sole arbitrator to fix the north-eastern boundary of the state of Maine. The king's representatives were unable to draw the frontier line by reason of the imperfection of the maps then in existence, and



THE PEACE PALACE AT THE HAGUE, HOLLAND, THE SEAT OF THE HAGUE TRIBUNAL, THE INTERNATIONAL COURT OF ARBITRATION

he therefore directed a further survey. This direction was beyond the terms of the reference, and the award, when made, was repudiated by the United States as void for excess. The point in dispute was only finally disposed of by the Webster-Ashburton treaty of 1842.

Subject-matter. — The history of international arbitration is dealt with in the article PEACE, where treaties of general arbitration are discussed. The rapid growth of international arbitration may be gathered from the following figures. Between 1820 and 1840, there were eight such instances; between 1840 and 1860, there were 30; between 1860 and 1880, 44; between 1880 and 1900, 90. Of the governments which were parties in these several cases Great Britain heads the list in point of numbers, the United States of America being a good second. The present article is concerned exclusively with arbitration in regard to such existing differences as are capable of precise statement and of prompt adjustment. These differences may be arranged in two main groups:

(a) Those which have arisen between State and State in their sovereign capacities;
(b) Those in which one State has made a demand upon another State, ostensibly in its sovereign capacity, but really on behalf of some individual, or set of individuals, whose interests it was bound to protect.

To group (a) belong territorial differences in regard to ownership of land and rights of fishing at sea; to group (b) belong pecuniary claims in respect of acts wrongfully done to one or more subjects of one state by, or with the authority of, another state. To enumerate even a tenth part of the successful arbitrations in recent times would occupy too much space.

Permanent Court of Arbitration **of** The Hague. — The establishment of a permanent tribunal at The Hague by the convention of 1899, for the pacific settlement of international disputes marks a momentous epoch in the history of international arbitration. This tribunal realized an idea put forward by Jeremy Bentham towards the close of the 18th century, advocated by James Mill in the middle of the 19th century, and worked out later by Mr. Dudley Field in America, by Dr. Goldschmidt in

Germany, and by Sir Edmund Hornby and Mr. Leone Levi in England. The credit of the realization is due, first to the tsar of Russia, who initiated the Hague Conference of 1899; secondly to David Jayne Hill, at that time assistant secretary of State of the United States; and thirdly to Lord Pauncefote (then Sir Julian Pauncefote, British ambassador at Washington), who urged before a committee of the conference the importance of organizing a permanent international court, the service of which should be called into requisition at will, and who also submitted an outline of the mode in which such a court might be formed. The result was embodied in the following articles of the convention, signed on behalf of 16 of the assembled powers on July 29, 1899.

(Art. 23.) Each of the signatory powers is to designate within three months from the ratification of the convention four persons at the most, of recognized competence in international law, enjoying the highest moral consideration, and willing to accept the duties of arbitrators. Two or more Powers may agree to nominate one or more members in common, or the same person may be nominated by different powers. Members of the court are to be appointed for six years and may be re-nominated. (Art. 25.) The signatory powers desiring to apply to the tribunal for the settlement of a difference between them are to notify the same to the arbitrators. The arbitrators who are to determine this difference are, unless otherwise specially agreed, to be chosen from the general list of members in the following manner:—each party is to name two arbitrators, and these are to choose a chief arbitrator or umpire (*sur-arbitre*). If the votes are equally divided the selection of the chief arbitrator is to be entrusted to a third power to be named by the parties. (Art. 26.) The tribunal is to sit at The Hague when practicable, unless the parties otherwise agree. (Art. 27.) "The signatory powers consider it a duty in the event of an acute conflict threatening to break out between two or more of them to remind these latter that the permanent court is open to them. This action is only to be considered as an exercise of good offices."

Several of the powers nominated members of the permanent court pursuant to Art. 25, quoted above, those nominated on behalf of Great Britain being Lord Pauncefote, Sir Edward Malet, Sir Edward Fry and Professor Westlake. On the death of Lord Pauncefote, Major-General Sir John C. Ardagh was appointed in his place.

Another institution created by this Convention (*see* Art. 9) is the so-called international commission of enquiry, designed to facilitate a solution of a dispute arising from a difference of opinion on points of fact, and not involving the honour or vital interests of the parties.

The contracting Powers also agreed to have recourse to the good offices or mediation of one or more friendly Powers, in cases of serious disputes, before appealing to arms, and that such recourse should not be regarded as an unfriendly act.

At the Second Peace Conference of The Hague in 1907 the convention was redrafted, but in essentials remained unchanged. One important addition was the creation of summary procedure by means of a smaller tribunal composed of three judges. Each party is represented by an agent only and the proceedings are in writing.

Hague Cases and Commissions of Enquiry.—Since the first case, The *Pious Fund* of *the* Californias, heard in 1902, some 18 disputes have been submitted to the Permanent Court of Arbitration and three to investigation of the facts by commissions of enquiry Some of these are now regarded as authoritative expressions of the law upon the issues raised. The pre-war cases are reported in The Hague Court Reports (1916), edited by James Brown Scott, and the post-war in vols. 16, 17 and 20 of the American Journal of International Law.

In the Dogger Bank incident of 1904 the commission of enquiry was empowered by the parties, Great Britain and Russia, not only to ascertain the facts, but also to determine the liability.

Arbitral Procedure.—Not the least of the benefits of The Hague convention of 1899 (strengthened by that of 1907) is that it contains rules of procedure which furnish a guide for all arbitrations whether conducted before The Hague court or not. These may be summarized as follows:—The initial step is the signing of a compromise by the parties clearly defining the subject in dispute and other terms and conditions of the arbitration. The next is the choice of the arbitrators and of an umpire if the number of arbitrators is even. Each party then by its agents prepares and presents its case in a narrative or argumentative form, annexing thereto all relevant documents. The cases so presented are interchanged by transmission to the opposite party. The hearing consists in the discussion of the matters contained in the several cases, and is conducted under the direction of the president who is either the umpire, or, if there is no umpire, one of the arbitrators. The members of the tribunal have the right of putting questions to the counsel and agents of the parties and to demand from them explanation of doubtful points. The award is delivered in open court by the president in the presence of the parties, the agents and counsel. Any application for a revision of the award must be based on the discovery of new evidence of such a nature as to exercise a decisive influence on the award and unknown up to the time when the hearing was closed, both to the court itself and to the party asking for the revision. These general rules are universally applicable, but each case may require the application of special rules which each tribunal must make for itself. One such special rule relates to the language to be used. This must vary according to convenience and is therefore made ad *hoc.*

LATER TREATIES

Until 1911 progress in arbitration had been confined within certain limits, questions involving national honour or vital interests being excluded from its operation. In 1911, however, an effort was made to widen its scope. The credit for the innovation is probably due to the United States, as the new idea was first embodied in treaties between that power and France and Great Britain respectively, though these treaties were not ratified.

Arbitration Treaties Before the War.—As between other powers, various arbitration treaties embodying to a greater or less extent the idea of an all-embracing agreement were made; and it is regrettable to record that those which were put to a severe test failed entirely to prevent a resort to force of arms, thus apparently demonstrating the truth of the argument that arbitration on questions involving national honour or vital interest was foredoomed to failure. In July 1914, arbitration on the disputed points in Austria-Hungary's ultimatum was proposed by Serbia, and Britain proposed mediation. But this conciliatory procedure was unsuccessful.

In the Italo-Turkish War no time was given for any possible pacific intervention, and in the Austro-Hungarian conflict with Serbia the same method of excluding pacific intervention was adopted. In the Italian conflict with Greece over the Janina murders it was the same again, in spite of the parties being pledged to arbitration. These instances show that arbitration must be of immediate and automatic application if it is to prevent a disaster.

Some account of the leading provisions of the arbitration treaties of 1911 between Great Britain and the United States and between France and the United States must be given. Apart from the provision that the treaties were to embrace all manner of disputes and differences, various preliminary stages of procedure were provided, which may be summarized as follow:

1. Request by either party to submit any difference between them to a joint high commission of inquiry.
2. Power to either party to postpone the reference to the high commission for one year from the date of the request, in order to afford an opportunity for diplomatic discussion and adjustment of the questions in controversy.
3. Appointment by each party of three of their nationals, these to form the joint high commission.
4. Holding of the inquiry by the joint high commission, the inquiry to be followed by a report upon the particular question or matters referred to it, for the purpose of facilitating the solution of the disputes by elucidating the facts and defining the issues, the report to include also such recommendations and conclusions as may be appropriate.
5. If the diiference persist, the case becomes the subject of an agreement to refer the matter to arbitration, such agreement to provide for the organization of the tribunal which will arbitrate, and to determine the question or questions at issue.

The object of the treaties, however, was not only to provide automatic application, but also to divert attention from the issue to the method of settlement, and thus to enable diplomacy to gain time, while providing the means of obtaining a calm examination of the points involved.

Arbitration under the Covenant.—Since the World War a new era for arbitration has begun. Arbitration had been regarded as having attained a sufficiently high status in international relations in being promoted by permanent treaties to the position of a recognized adjunct of diplomacy. The Covenant of the League of Nations gave it a much higher rank, and the activities with which it was sought to invest the League would practically displace diplomacy in its present representative form. Arbitration tended to replace direct negotiations between the ministers whose departments were concerned, suppressing, or at any rate relegating to a secondary position, the use of the diplomatic channel.

Under the Covenant the members of the League agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or to enquiry by the Council of the League, and they bind themselves in no case to resort to war until three months after the award by the arbitrators or the report by the Council.

The members of the League agree that whenever any dispute shall arise between them which they recognize to be suitable for submission to arbitration and which cannot be ,satisfactorily settled by diplomacy, they will submit the whole subject-matter to arbitration.

The members of the League also agree that they will carry out in full good faith any award that may be rendered, and that they will not resort to war against a member of the League which complies herewith. In the event of any failure to carry out such an award, the Council shall propose what steps should be taken to give effect thereto.

It is seen that these provisions do not pretend to include all difficulties, but are confined to such matters as all parties may regard as arbitrable. Another clause, however, provides that "disputes as to the interpretation of a treaty, as to any question of international law, as to the existence of any fact which if established would constitute a breach of any international obligation, or as to the extent and nature of the reparation to be made for any such breach, are declared to be among these which are generally suitable for submission to arbitration."

The attitude of the British Government in respect of these provisions of the Covenant was expressed in a speech made by Lord Balfour on July 6, 1925, in which he stated:

Arbitration is the thing; there is no question which can arise which will not be submitted to arbitration. If arbitration be really observed, war will be impossible. If either party to a dispute refused to arbitrate or to carry out a decision of arbitration, our obligation and that of the other parties would be to throw in our whole strength to defend the aggrieved party.

On the continent of Europe this confidence in the future of arbitration is equally strong. Before the World War, arbitration was regarded as a permissive method and though the term "compulsion" was used, it mas merely in the sense that contracting parties had bound themselves to submit the cases specified in their engagement to arbitration. Under the Covenant, as Lord Balfour interprets it, compulsion is given a much more effective sense.

Geneva Protocol — To secure further the inclusion of all differences between nations, and to apply compulsory arbitration as a substitute for war, the Geneva Protocol, adopted on Oct. 2, 1924, but never ratified by the Powers, provided a systematic procedure of conciliation, arbitration, and forced compliance with the League's decisions, for the prevention of war. This took the form of an exhaustive amplification of the above-cited articles of the Covenant.

Its provisions were as follows:—

1. If the dispute submitted to the Council is not settled by it, . . . the Council shall endeavour to persuade the parties to submit the dispute to judicial settlement by arbitration.

2. (a) If the parties cannot agree to do so, there shall, at the request of at least one of the parties, be constituted a committee of arbitrators. The committee shall so far as possible be constituted by agreement between the parties.

(b) If within the period fixed by the Council, the parties have failed to agree, in whole or in part, upon the number, the names, and the powers of the arbitrators and upon the procedure, the Council shall settle the points remaining in suspense. It shall, with the utmost possible despatch, in consultation with the parties, select arbitrators and their president from among persons who, by their nationality, their personal character, and their experience, appear to it to furnish the highest guarantees of competence and impartiality.

(c) After the claims of the parties have been formulated, the committee of arbitrators, on the request of any party, shall through the medium of the Council request an advisory opinion upon any points of law in dispute from the Permanent Court of International Justice (*q.v.*), which in such case shall meet with the utmost possible despatch.

3. If none of the parties asks for arbitration the Council shall again take the dispute under consideration. If the Council reaches a report which is unanimously agreed to by the members thereof, other than the representatives of any of the parties to the dispute, the signatory States agree to comply with the recommendations therein.

The Protocol unfortunately amplified also the coercive clauses, military and economic, in case either party to a dispute failed to comply with the pacific solution proposed or arrived at by the League. Owing more particularly to these coercive provisions Great Britain repudiated the Protocol. The United States, which had been foremost in promoting arbitration, did not adopt the Covenant owing mainly to these very coercive provisions which the Protocol made the mistake of amplifying. Great Britain's repudiation of the Protocol prevented its general application.

As regards economic coercion against a power which declines to accept arbitration, it is not a principle much more feasible than coercion by force. Suspension of trade between any two industrial countries may be as much a loss to the one as to the other. Feeling in Great Britain and the United States seems practically unanimous in distrusting the application of any coercive method whether or not a domestic interest is involved. Until some new method is found of accentuating moral force which will not have the defects of the sanctions provided by the Covenant, the moral force of universal public opinion seems destined to be the only guarantee of respect for arbitration and its award.

Meanwhile Germany, Sweden, Finland and S itzerland have concluded treaties of arbitration in which questions of national honour and vital interests are not reserved. In these a new element has been added to the system of compulsory treaties, in the form of a standing committee of competent persons appointed by the two contracting States, to which all difficulties can be referred for examination and counsel.

At the sixth meeting of the Assembly of the League of Nations the failure of the Protocol of 1924 was dealt with in a report containing the following paragraph:—

At the moment when the declarations of certain governments have shown that an early entry into force of the Protocol for the pacific settlement of international disputes is not to be expected, several delegations have been anxious to affirm the fidelity and unanimity with which the members of the League remain attached to the triple object underlying that draft treaty, namely, arbitration, security, and disarmament, and to indicate methods or measures by which an approach might be made to this object, pending the achievement of a general settlement which many consider indispensable.

The government most particularly concerned in the wrecking of the Protocol was that of Great Britain. Its attitude produced among the other members of the League of Nations the impression that Great Britain, in spite of her active championship of arbitration, was not prepared to accept the obligations resulting from strict compliance with the provisions of the Covenant. This impression was shared by many Englishmen, but Lord Balfour's statement made it clear that it was erroneous; and it was not surprising that, later on, the foreign secretary, Sir Austen Chamberlain, should take the lead in calling a special conference to deal with the problems existing in Central Europe, under the auspices of the Covenant itself. Great Britain thus showed that while observing her traditional attitude of distrust towards international generalities, she was genuinely attached to the principle of arbitration and was ready to give it the widest feasible scope.

Locarno Pact. — The result of the conference called by the British Government at Locarno in Oct. 1925 was a pact under which the Powers between whom difficulties are most likely to arise undertake in no circumstances whatever to resort to war. They pledge themselves to submit disputes of every kind to some form of peaceful procedure. This agreement must be taken in conjunction with Article 16 of the Covenant, which provides that disputes as to the interpretation of a treaty, as to any question of international law, as to the existence of any fact which, if established, would constitute a breach of international obligation, or as to the extent and nature of the reparation to be made for any such breach, are declared to be among those generally suitable for submission to arbitration or judicial settlement.

Both the Geneva Protocol and the Pact of Locarno adopted the same principle as that which underlay the abortive Anglo-American treaty of 1897; though that treaty was called a treaty of arbitration it was at the same time a treaty of conciliation. It is interesting to note that Lord Salisbury, who acted, it is believed, on the advice of Lord Alverstone, initiated the negotiations for the treaty in question in a draft, the first proposition of which was as follows:

Her Britannic Majesty and the President of the United States shall each appoint two or more permanent judicial officers for the purposes of this treaty, and on the appearance of any difference between the two Powers which, in the judgment of either of them, cannot be settled by negotiation, each of them shall designate one of the said officers as arbitrator; and the two arbitrators shall hear and determine any matter referred to them in accordance with this treaty.

This principle, though it was not adopted in the treaty of 1897, has been adopted in practically all the new treaties of arbitration entered into since the conclusion of the World War.

The important object of international arbitration is further dealt with in a number of articles of which the following may be mentioned: EUROPE: HISTORY; LEAGUE OF NATIONS; LOCARNO, PACT OF; SANCTIONS AND GUARANTEES; TACNA-ARICA; WORLD COCRT.

ARBOGAST (died 394), a barbarian officer in the Roman army at the end of the 4th century. His nationality is uncertain, but Zosimus, Eunapius and Sulpicius Alexander (a Gallo-Roman historian quoted by Gregory of Tours) all refer to him as a Frank. Having served with distinction against the Goths in Thrace, he was sent by Theodosius in 388 against Maximus, who had usurped the empire of the west and had murdered Gratian, and completely defeated him. Tbeodpsius then appointed him chief minister for his young brother-in-law, Valentinian II. In 392, Valentinian died mysteriously at Vienne (in Gaul); Arbogast named as his successor Eugenius, a rhetorician, and proclaimed himself the champion of paganism. In May, 394, Theodosius marched against him and defeated him at the battle of the Frigidus. Arbogast escaped to the mountains, where he committed suicide (Sept. 8 394). Arbogast appears to have been an energetic statesman and one of the greatest soldiers of the later empire.

See T. Hodgkin, *Italy and her Invaders* (1892), vol. i. chap. xi. and note at end.

ARBOIS, a town of eastern France, among the wine-growing northern foothills of the Jura, about 30 mi. S S.W. of Besançon, in the department of Jura. Pop. (1936) 3,434. The church of St. Just, founded in the 10th century, has a 16th-century belfry and good wood-carving. Two towers of the old walls remain, and there is a chbteau of the dukes of Burgundy. A church of 1384 is used as market-hall. At Arbois Pasteur spent most of his youth. The red and white wines of the vicinity are famous.

ARBOIS DE JUBAINVILLE, MARIE WENRI D' (1827–1910), French historian and philologist, was born at Nancy Dec. 5 1827. In 1S51 he left the École des Chartes with the degree of palaeographic archivist. He was placed in control of the departmental archives of Aube, and remained in that position until 1880, when he retired on a pension. Appointed in 1882 to the newly founded professorial chair of Celtic at the Collège de France, he began the *Cours de littérature celtique* which in 1908 extended to 12 volumes. For this he himself edited the following works: *Introduction a l'étude de la litttrature celtique* (1883); *L'Épopée celtique en Irlande* (1892); *Etudes sur le droit celtique* (1895); and *Les principaux auteurs de l'antiquité à consulter sur l'histoire des Celtes* (1902).

He was among the first in France to enter upon the study of the most ancient monuments of Irish literature with a solid philological preparation and without empty prejudices. We owe to him also *Les Celtes depuis les temps les plus reculés jusqu'à l'an 100 avant notre ère* (1904); a study of comparative law in *La Famille celtique* (1905); *Recherckes sur l'origine de la propriété foncière* (1890). He died in Feb. 1910.

ARBON, a town of Switzerland, on the Lake of Constance 18m. S.E. of Konstanz. Pop. (1844) 660; (1930) about 8,570. The name comes from the Latin *Arbor Felix.* It has Neolithic pile-dwellings and a castle begun in the 4th century. Linen manufacture began in the 18th century and cotton followed in the 19th. Motor-cars are also made.

ARBOR DAY, the name applied to an annual tree-planting day generally observed throughout the United States. It originated in Nebraska, where it was first observed on April 10, 1872. The plan of devoting a certain day each year to the public planting of trees and the name Arbor Day were proposed by J. Sterling Morton, then a member of the State board of agriculture and later U.S. secretary of agriculture. In 1885 Arbor Day was made a legal holiday in Nebraska, and since that date about a third of the States have made similar enactments. At first the efforts to extend its celebration were made chiefly through agricultural associations and town authorities, but about 1882 the plan of making it a school festival was inaugurated. As such, the observance of Arbor Day has spread throughout the United States and far beyond its borders. Moreover, its scope and purpose have been greatly broadened. From simple exercises and the planting of single trees to beautify public grounds, it has become the occasion for impressing on the minds of school children the importance of forestry and for the planting of thousands of seedling trees to reforest otherwise waste lands. The time of celebration varies in different States—sometimes even in different localities in the same State—but April or early May is the rule in the northern States, and February, January and December are the months in the various southern States.

Schauffler (ed.) *Arbor Day* (1909); John Howard Brown, "Arbor Day and Its Founder," vol. viii. p. 313–20 *Americana* (1923); Lewis Charles Everard, *Arbor Day, Its Purpose and Observance,* U.S. Dept. of Agriculture, Farmers' Bulletin No. 1492 (1926); *Arbor Day in Poetry,* compiled by Carnegie Library School Association (1926).

ARBORETUM, a place where trees and shrubs are cultivated for scientific, ornamental or other educational purposes; that portion of a botanical garden used for woody plants. There are many such collections of hardy plants in cities and private parks. Rich men often spare neither pains nor money to get important collections to adorn their estates, many of which have later been given to cities to be used as public parks. When properly maintained they make creditable arboretums. The modern arboretums contain plants as specimens or collections arranged according to some definite method—it may be systematic relationships, or commercial uses, or perhaps, to show ecological adaptations. The entire field of possibilities is seldom covered by any one arboretum, but each one specializes in a few projects for which it is particularly equipped or well situated.

As early as the middle of the 16th century Rent du Bellay of Touvoys, France, in co-operation with Pierre Belon made a good collection of trees and brought into France seeds of exotic species from western Asia. This collection long remained the richest and most beautiful in France or perhaps the world. About 1720, Duhamel du Monçeau, head of the French Marine, and a scientist, gathered plants from all over Europe and North America to plant on his two estates. The plants were classified, arranged and planted in a methodical manner resulting in what might be called the first arboretum made with scientific purposes. From his experience with the collection, du Monçeau wrote and published in 1755 a book on characteristics and cultivation of trees and shrubs. This collection of plants and the publication had a great influence on study and early distribution of imported plant species. Many of these imported types can still be found in France.

One of the most complete arboretums in the world is that at Kew, England, in the Royal Botanical Gardens. It had its beginnings as far back as 1762 though it was not thrown open to the public until 1841. To the latter date the ground, not exceeding 11ac., had been held as a private estate by members of the royal family. In 1845 the pleasure grounds and Royal Gardens at Kew, occupied by the king of Hanover, were given to the nation and placed under the care of Sir William Hooker for the purpose of establishing an arboretum. Hooker and his son, Sir Joseph, kept steadily at the task until the gardens and arboretum were among the finest and most complete in the world. The arboretum monopolizes a large portion of the entire garden (288ac.) with trees and shrubs representing some 4,500 species and varieties. In addition to the arboretum at Kew, important collections of trees and shrubs in Great Britain are those at the Royal Botanic Gardens in Edinburgh and at the Glasnevin Garden in Dublin, and a small select collection at Oxford. On the continent of Europe the classical example is the *Jardin des Plantes* in Paris. Here the gardens are very formal and make a striking effect.

In the United States the Arnold arboretum at Boston ranks with Kew in size and completeness. This institution had its beginnings in 1869 when James Arnold left in trust $100,000 to be used for the promotion of agriculture or horticulture. Through an agreement made with Harvard college officials in 1872, the Arnold bequest was used together with a 125ac. tract of land, bequeathed by Benjamin Bussey, for the establishment of a tree garden Charles Sprague Sargent was made the first director. He held the position until his death in 1927. During this time he

made a notable arboretum, the best in the United States and ranking favourably with the best in the world. Its 260 ac. in 1943 were planted with more than 6,536 species and varieties of trees, shrubs and vines belonging to some 340 genera. Of these, 2,418 species or varieties are exotic, coming particularly from Japan, China, Siberia and the Himalayas. The Arnold arboretum by agreement is a part of the regular park system of Boston, but, being under the management of a great university like Harvard, it has an aspect differing entirely from an ordinary park.

Among the other most outstanding arboretums in the United States are the Missouri Botanical garden in St. Louis, Mo., the Morton arboretum near Chicago, Ill., and the Hilland gardens in Rochester, New York, the Boyce Thompson arboretum in connection with the Boyce Thompson Institute for Plant Research, Yonkers, New York, and the Boyce Thompson Southwest arboretum at Superior, Ariz. The Boyce Thompson arboretum combines a large collection of trees and shrubs with a great plant research institute thus utilizing the greatest range of possibilities of an arboretum. The National arboretum at Washington, D.C., was established by an act of congress in 1927. It has an area of some 400 ac., owned and controlled by the United States department of agriculture. The California Botanical garden at Los Angeles, Calif., received a gift of 2,000 ac. of land, part of which is being used for the arboretum and part of which can be sold for capital and maintenance.

To serve most people an arboretum must have a scientific, an economic and a cultural aspect. On the scientific side the arboretum furnishes all types of hardy plants for the systematic botanist, the plant pathologist, the plant physiologist, the plant breeder and the entomologist. From this will come a thorough study of diseases and rational control measures; a better knowledge of soil requirements and cultural methods; many new plant hybrids from controlled cross breeding; and new methods of combating insect pests. The nurserymen and horticulturists look upon an arboretum as a place where plants are tested and displayed for the purpose of showing their economic possibilities. In this way the forester selects the species which fulfil specific needs for paper pulp, trees for hardwood lumber, etc. The nurserymen select from the arboretum species that they can fit into the landscape for the increasing demands of the public. Lastly, the public in general looks upon an arboretum as an unusually fine park, a place to go when in need of peaceful rest and a place that offers a chance to increase one's knowledge about nature.

For a directory of 161 botanical gardens and arboretums in the United States giving acreage, location, ownership, number of species, annual budget and name of present director, *see* American Association of Nurserymen *Proceedings*, 64th Annual Convention. For a historical sketch of botanical gardens and arboretums of the world, *see* Brooklyn Botanic Garden *Record*, vol. 27, no. 3, pp. 151–406, July, 1938. (P. W. Z.)

ARBORICULTURE, the scientific management of trees (Lat. *arbor*, a tree). In its broadest sense arboriculture includes that part of horticulture which deals with selection and cultivation of ornamental and fruit trees and shrubs and that part of forestry known as silviculture. Because of its broad meaning the word arboriculture is seldom used in practice. More specific meanings can be conveyed by such words as pomology which means the scientific cultivation of fruit trees or silviculture which means the scientific management of trees for commercial timber purposes.

The growing of woody plants for educational and scientific purposes has been practised since the middle of the 16th century when a collection of trees was made at Touvoys in France by René du Bellay. Many of the different phases of arboriculture have received particular attention from scientists and there are specialists in different fields; *e.g.*, systematic relationships, diseases of trees and shrubs, insect pests, pruning of trees and shrubs, soil management, ecology and propagation.

The systematists classify plants according to likes and unlikes, placing them in their proper genera and families. The pathologist studies diseases of plants and works out rational control measures. The entomologist is interested in insects that feed on economic plants and, like the pathologist, tries to find ways to exterminate or control the pests. The ecologist studies the habitats and environmental effects on plants, ever trying to find ideal conditions which would insure their maximum development. The plant propagator specializes in the multiplication of plants by means of seeds, cuttings or grafting. It is his problem to find the best and most economical methods to multiply valuable plants. If plants do not come true from seed, as is the case with varieties and hybrids, he must work out methods for vegetative propagation.

(P. W. Z.)

GENERAL PRACTICE

In arboriculture the cultivator's aim is to produce specimen trees with fine trunks carrying evenly balanced heads of well developed branches, whereas in silviculture well-grown trunks free from branches, produced in the shortest possible space of time, are the first requirement, and the minimum branch area only is tolerated that will keep a tree in good health and help in providing the necessary food required to build up the trunk. Isolated, the one is seen as a handsome specimen, the other as a gaunt trunk bearing meagre branches about the upper part. Further, in arboriculture trees are widely spaced in order to facilitate branch development and display, but in silviculture they are grown close together so as to suppress side branches, encourage height growth, and to obtain the largest possible quantity of timber from the area on which they stand. However, there are common grounds on which the two sections meet and function together. The best marked instances are park and hedgerow trees which are grown partly for decorative purposes and partly for profit. Such trees are often allowed to form large heads of branches but they are usually felled at the time of their greatest commercial value.

Propagation and Pruning. — Arboriculture may be regarded from many different standpoints. The scientist considers it from the point of view of collections of different kinds of trees drawn together from many parts of the world for the purpose of study. The owner of a large estate practises it in connection with the amenities of his property; the ordinary householder in connection with the adornment of his garden; municipal and county council suthorities as a means of beautifying the parks, gardens, streets and roads under their control, and so on. However, in whichever way arboriculture may be practised there are certain fundamental operations. Of these propagation is one. There are many methods of propagation. Some trees are raised from seeds, others from cuttings, grafts or layers. In some instances a tree may succeed quite well if propagated by one of two or three methods, but there are others that must be raised by one and one only of the several means if the best results are required. Propagation must be followed in most cases by one or more years in nursery quarters, where, by careful attention and training the foundation for the future tree is laid.

Pruning constitutes a very important item in this early training. A tree must be encouraged to develop with a single strong leading shoot. Branches are very liable to develop at the expense of the leading shoot. If side branches are suppressed or removed too rapidly there is a tendency for the tree to become spindly and unable to support its own weight, therefore pruning is so directed that the correct balance is maintained between the main axis and leaf-bearing branches, by first shortening and later on very gradually removing side branches. Root pruning is also practised during the nursery period. This is done by biennial transplanting. At that time long roots are shortened to encourage fibrous roots, for the more fibrous roots a tree possesses, the better is it likely to re-establish itself when removed from the nursery to a permanent position. Trees may sometimes be transferred to permanent positions when no more than two or three years old and a foot or two in height, or they may be allowed to remain many years. Street and avenue trees are often allowed to remain in nursery quarters until they are eight or 10 years old and 1j to 18ft. high. Some kinds of trees cannot be transplanted successfully after they have attained a height of 3ft. or 4ft. Pines succeed very much better if they are planted in permanent positions when less than 1ft. high. As a rule deciduous trees transplant

better than evergreens after they have attained a height of several feet.

Securing Vertical Growth. — Trees that are growing in open positions have a very decided tendency to develop in a lateral rather than vertical direction and to counteract this defect it is necessary to shorten and sometimes remove side branches. Trees should be pruned every second year until such a time as a single, strong leading shoot is keeping well in advance of side branches. After that less frequent pruning may be required. For a considerable time, however, it will be necessary to remove the lower branches now and then. Once the trees have attained the desired height branch development may be allowed to go on unchecked. In the case of old trees it is often necessary to remove one or more lower branches to balance the tree or lift the lower branches from the ground in order to disclose distant objects, open out vistas, or expose the trunk, for in some instances a view of the trunk adds very materially to the effectiveness of the tree. The removal of dead and broken branches from old trees is a very necessary practice in arboriculture. When dead branches are allowed to remain on the trees they are not only a source of danger to living parts but to other trees and dangerous living branches should also be shortened or cut off.

When the higher branches of trees such as oaks or elms die, the tree may often be rejuvenated by lowering the whole head to a point well below the dead part. With care the contour of the head can be left rather similar to the original, and in the course of a few years new branches will be formed, which will effectively hide the wounds and form a new head. Whether branches are removed from young or old trees they should, whenever possible, be removed in a line parallel with the bark of the trunk. A wound formed in this manner is almost sure to heal well but should only a short snag be left it will not heal properly. All wounds must be covered with a coat of coal-tar or some other antiseptic and protective substance as soon as made. Where cavities of dead wcod occur in trees they should be cleaned out, as much as possible of the dead wood removed, the surface painted with a strong solution of carbolic acid, and afterwards with coal-tar if possible. The cavity should then be built up with cement, concrete or asphalt, the surface being so finished that water will be thrown off. Ivy should not be allowed to encircle young trees but there is little use in removing it from old and fully matured trees. In some instances it may even help to support decaying trees and is certainly effective during winter. Pruning may be carried out during summer, autumn or early winter.

Botanical Grouping. — When arboriculture is practised for scientific purposes it is a good plan to arrange the trees in botanical sequence, placing the species of each genus together and allowing the related genera to follow each other. Soil conditions may not always allow this; then digressions must be made. More than one tree of each kind should be planted and they should be allowed enough space to develop to their full size. This will probably necessitate nurse trees being planted between the permanent examples, which can be removed as occasion warrants. Proper records must be kept of all collection trees, whence obtained, when planted, height and condition when planted and any other pertinent matters. They must also be properly labelled.

Garden **Plantings.**—When trees are planted for decorative purposes care must be taken to select kinds suitable for the available positions and they must be given ample space for their full development. Conifers should not upon any account be chosen for gardens in or about manufacturing towns where the atmosphere is heavily smoke-laden, or impure-through chemical fumes. Deciduous trees give better results, but they must be very carefully chosen for such places. When the atmospheric conditions are fairly clear of impurities and the soil is good, almost any hardy tree will thrive. Ericaceous plants, arbutuses, rhododendrons and the like, however, do not thrive where lime is present in the soil to any appreciable extent. For public parks arboriculture should take an educational form; trees suitable for the neighbourhood should be planted and given every chance of developing into fine specimens, in order that residents in the neighbourhood may make a choice of those suitable for their own gardens.

Street **Plantings.**—Too little thought is given to trees planted in streets and by the sides of roads, yet they have a very great bearing upon the amenities of towns and the countryside. Trees should not be planted in very narrow streets and roads; they are in the way, are often injured by traffic, and their branches must be constantly cut back to keep them within bounds. Where gardens adjoin narrow roads it is better to encourage the owners to plant small trees in their gardens in order that they may overhang the footpath, rather than plant trees on the sidewalk. In wide streets trees can be used with very great advantage. Even in such positions, however, they are often planted too close together and it is doubtful whether upon any occasion they need be spaced closer than 60ft. Close planting results in severe pruning and it is wise to avoid heavy pruning as much as possible. In the past, street and road trees have had a great deal to contend with by the presence of water and gas-pipes, etc., laid near the roots. Each time one of the services requires attention the roots of the trees are injured and very often premature death of the trees can be traced to such injury. New roads should be provided with proper accommodation for such services in order that injury to the trees may be avoided.

Care is necessary in selecting the right kinds of trees for definite soils and positions, and vigorous trees should be specially prepared for the purpose. Park, hedgerow and coppice trees should either be native trees or such exotics as will harmonize with native trees. Kinds with variegated foliage for instance are more in place within the confines of the garden than planted in association with common species. (See also ARBORETUM; TREE PLANTING.) (W. D.)

ARBORVITAE (Tree of Life), a name given by Clusius to species of *Thuja*. The name *Thuja* was adopted by Linnaeus from the *Thuya* of Tournefort and seems to be derived from the Greek word *θύος*, signifying sacrifice, presumably because the resin procured from certain species was used as incense. *Thuja* comprises a genus of five species belonging to the cedar or cypress family (Cupressaceae). *Thuja occidentalis* is the eastern arborvitae or northern white-cedar of eastern North America and ranges from Canada to the mountains of North Carolina and Tennessee. The tree attains a height of 40 to 50 ft. and features decussate. scale-like leaves borne in flattened sprays; when bruised they exhale an aromatic odour. Members of the Cartier expedition to Canada in the early 16th century were given a brew by the Indians which they claimed would cure scurvy. Having high regard for its medicinal worth they took back several trees on their return to France. Gerard's *Herbal* records the introduction of this tree in Britain prior to 1597, where it has long since become a favourite ornamental.

The giant arborvitae or western redcedar (*Thuja plicata*), is a native of western North America. It attains gigantic proportions in the forests along the Pacific slope, where it is often 150 to 200 ft. tall and 5 to 10 ft. in diameter. The wood is exceedingly durable and is used for shingles, siding, poles, posts, and mine props.

Another species of arborvitae is *Thuja orientalis,* known also as *Biota orientalis.* The latter generic name is derived from the Greek adjective *βιωτός,* formed from *βίος,* life, probably in connection with the name "tree of life." This is the Japanese hiba or Chinese arborvitae. It was cultivated in the Chelsea Physic garden in 1752, and was believed to have been sent to Europe by French missionaries. It has roundish cones, with numerous scales and wingless seeds. The leaves, which have a pungent aromatic odour, are said to yield a yellow dye. There are numerous varieties of this plant in cultivation, one of the most remarkable being *pendula,* with long, flexible, hanging, cord-like branches. The variety *pygmaea* forms a small bush of only a few inches in height. (E. S. HR.)

ARBÓS, E. FERNANDEZ (1863–1939), Spanish violinist and composer, was born in Madrid and trained at the conservatoire there, and later at Brussels and at Berlin under Joachim. He became a professor at Hamburg and then at Madrid, becoming known meanwhile as one of the finest violinists of the day; and after visiting England in 1890 and establishing his reputation there he became professor at the Royal College of Music in London. In 1908 he returned to Spain and became conductor of the symphony orchestra of Madrid, the post he retained until his death. As a composer he is best known by his violin pieces, and by a comic opera. El *Centro de la* Tierra (1895).

ARBOUR, originally "herber" or "erber" (O.Fr. *herbier,* from Lat. *herbarium,* "a collection of herbs," *herba,* "grass"); the word came to be spelt "arber" through its pronunciation, as in the case of Derby, and by the 16th century was written "arbour," helped by a confusion of derivation from Lat. arbor, a tree, and by change of meaning. A grass-plot or lawn, a herb-garden and a shady bower of interlaced trees, or climbing plants trained on lattice-work. The application of the word has shifted from the grass-covered ground to the covering of trees overhead. "Arbor" is a term applied to the spindle of a wheel, particularly in clock-making.
